VOLUME XXI., NEW SERIES.

VOL. XLVI., OLD SERIES.

LONDON:

PUBLISHED FOR THE PROPRIETORS, 171, FLEET STREET.

1871.

LONDON:
PRINTED AT THE JOURNAL OF HORTICULTURE OFFICE,
171, FLEET STREET.

TO OUR READERS.

"It is most unreasonable that you ask me to write our usual Preface. I have not had a day's fallow before for six months, so now I am off for a fallowing, and I mean to have it.

"I have been to see some Fig-orcharding close to the cottage where honest and moderate John Selden was born, and in that cottage is the warning carved by his own hand and knife—'Thief, avaunt!'.

"Now, in the preface you might introduce that when warning some of our contemporaries, foreign and domestic, not to continue copying from our pages without acknowledging whence they obtained the riches.

"Looking from my lodging window I see a neighbour, trowel in hand, stirring a bit of parterre which a tablecloth would cover, and he reminds me of little Dr. Jowitt, of Oxford memory, of whom it was written—

'Dr. Jowitt a little garden made,
And round it placed a little palisade.
A little garden taketh little wit to show it,
And little wit had little Dr. Jowitt.'

You might give that as clinging to 'gardening under difficulties.'

"Tell our readers, also, that we have long since felt that we Editors are types of Christian Charity, for we bear all things, hope all things, and endure all things, suffer long, and are *kind*—put an emphasis on the last word. Who but we would have returned gentle answers to the man who abused us for not naming forty-five plants he sent without paying the carriage; and the old dame who said we are 'totally unfit to be Editors,' because we did not specially state that she had a Bantam commended at the Fuddly-cum-Pipes Show? Tell them, in addition, that we trust they will duly appreciate our new type, superior paper, and other liberalities.

"To our correspondents and staff-contributors say something courteous; slide in that some of them have written for us for twenty-four years, and yet are as vigorous as those stalwart chaps who have been 'of ours' only for as many months. The old chaps will like that.

"Then you must say something very civil to 'our readers.' Don't say anything about Happy New Years, that's 'stale and unprofitable.' Perhaps you may embody it all in the Spanish greeting, 'May your shadows never be less.'

"We have never said anything to advertisers, so be civil to them; quote Cowley's lines—

'What shall I do to be for ever known,
And make the distant all my own?'

"Reply by an inuendo."

The Editor who received the above from his Co-Editor ventures to print it without a comment or addition.

INDEX.

Abutilon Darwinii, 215; wintering, 227
Acacia lophantha, wintering, 206
Accidents, 910
Achimenes, failing, 207; select, 514; soil, 185
Acorn over water, 14
Æcidium cancellatum, 471
Agaricus procerus, 365
Ageratums, propagating, 186
Agriculture, past and present, 195
"Agricultural Chemistry and Geology," 509

From observations taken near London during forty-three years, the average day temperature of the week is 74.8°, and its night temperature 50.3°. The greatest heat was 92°, on the 7th, 1852; and the lowest cold 33°, on the 9th, 1863. The greatest fall of rain was 1.10 inch.

COVENT GARDEN MONOPOLISTS.

CAN nothing be done to break through the hateful monopoly of Covent Garden? No one can doubt it is a monopoly as close and as injurious to both consumers and producers as any that existed in the time of the Tudors.

Let anyone set up a business in Edinburgh, or Glasgow even, and try to procure his fruit anywhere else than in Covent Garden, and see if he will not be undersold till he is driven out of the trade or broken.

Let anyone ask the price of any article in Covent Garden, and then try to sell the same, and I think he will not only be astonished at the difference between the prices asked and offered, but will be equally astonished to find how little it matters who is the particular tradesman he inquires of.

If you have anything so very superior to sell that no one has anything like it to offer, Covent Garden is, perhaps, the best market in the world if you take it and sell it yourself. But for ordinary producers, Covent Garden is, I think, a worse market than that of any large town in England.

If anyone wants a new sensation let him consign a good lot of fruit to the most respectable person in Covent Garden, say twice a-week for a month, and then ask for the "account sale." I think he will hardly repeat the operation. I once heard of a Liverpool merchant, who was in the habit of accounting for the loss each person who consigned goods through him to his market (Brazil) generally sustained, writing by mistake on a consignment of cast-iron, "injured by rats;" but he was a solitary individual, and his conduct was talked about even in Liverpool.

My own experience of Covent Garden is very limited. I once had some Cucumbers so very fine a little after Christmas that I wrote to a friend, and asked him to inquire the price in Covent Garden of good Cucumbers, thinking mine worth sending. His reply was, "I am asked for good ones 3*s.* 6*d.* to 5*s.*" I thought half that price will do for me, so sent a box to the man I understood was A1 in the market. I kept his letter as a curiosity. It stated that the writer would be glad of another box at once; that the Cucumbers were the best ever seen in the market at that time of the year, and even volunteered the statement that they were much finer than some just received from a celebrated grower near Liverpool, who had hitherto sent the best. On receiving a request for a third box, which I at once forwarded, I gently insinuated that an account of the price I was to receive would be satisfactory. The cash was promptly forwarded, and amounted to 9*s.* a dozen, from which packing had to be deducted. My London friend wrote rather strongly, and, from curiosity, advised me to try another shop. I did so, and received 8*s* a dozen. This was the last time anything went from my place to London to be sold.

This subject has been brought to my recollection by seeing an account sent to a nobleman lately by a dealer in Covent Garden for fruit, &c., supplied this season, from which I made the following extract:—

	£	*s.*	*d.*
"*May* 1*st*, 1871.			
24 lbs. Strawberries	28	16	0
20 lbs. Grapes.....	24	0	0
"*May* 10*th*.			
30 lbs. Strawberries	36	0	0"

There is no doubt that those who deal in perishable goods ought to have large profits to cover risks, but it would be very interesting to know if any of your readers have sold Strawberries at these dates, and the prices they obtained. May 10th is not so very early that one would expect to be charged 24*s.* a-pound for Strawberries. Those who can buy fruit at these prices may be trusted to take care of themselves, but the supply of ordinary wholesome fruit to the lower orders of a crowded city like London ought to be provided on free-trade principles. No licensed salesman ought to be required to sell any man's produce, but the producer and consumer ought to come together as in other towns. Why are not other free markets opened for the sale of fruit and vegetables in London?—J. R. PEARSON, *Chilwell, Notts.*

[We rejoice that this subject has been brought prominently to notice by Mr. Pearson. The monopoly is now a more oppressive evil even than formerly, and there are now supplies to be obtained which will facilitate the removal of the evil. There are thousands of amateur gardeners who would gladly dispose of their surplus fruits and vegetables could they readily obtain access to purchasers, and receive fair payments. We hope to have suggestions from many correspondents on this subject, not only for the sake of producers, but for the sake of consumers.—EDS.]

FORMING A KITCHEN GARDEN.

A WELL-MANAGED kitchen garden is always an interesting and instructive sight, and from it some useful lessons may be gained at all seasons. Its position, aspect, shelter, the nature and peculiarities of its soil and subsoil, the kinds of fruit cultivated, the form, health, and productiveness of the trees, the modes of pruning, training, and general culture followed, form ample matter for inquiry and discussion at all times, but more especially during winter, while at other times a host of subjects, by far too numerous to mention separately, claim our attention.

In selecting a site for a kitchen garden the chief things to be sought for are a deep fertile soil, sloping gently to the south or south-west, well sheltered on the north and east sides by high banks, or hills, or lofty umbrageous trees, and with an abundance of pure water close by and yet springing from a considerable elevation above the highest garden levels, so that it may be brought to the garden through pipes, and distributed among the crops by means of a hose and jet. While alluding to this most efficient method of watering, it may be well to advert to the kind of water that may safely be used—rain water, or that which is exposed constantly to the softening and warming influence of sun and air, is undoubtedly the best for all kinds of plants; but while granting this, I cannot but think that undue stress has been laid upon the evil

attending the application of cold spring water to growing crops. Some writers have even gone so far as to say that the effect of such water is so hurtful, that rather than use it they would withhold water altogether. Now, in arranging the water supply of a new garden, our thoughts naturally turn to the hot thirsty months of summer, when water is required in such abundance. For several years I have been obliged to use cold spring water in summer, giving it daily to flowers, fruit trees, and vegetables in large quantities, and in some instances twice a-day. The water is pumped through pipes to the flower garden, and carried in waterpots to other parts fresh and cold as it comes up from the spring far down in the earth; yet, though the water has been poured upon the soil covering the roots of the plants, the warm soil and rich mulching through which it first passes undoubtedly very materially alter its character before it reaches the spongioles of the plants. Sweeping assertions are rarely quite sound, and looking fairly at the results of my own practice, I can hardly suppose that those who altogether condemn the use of spring water among growing crops have ever given it a fair trial. It is right to say that for pot plants this water was exposed to the air for a few hours, and then used with most satisfactory results.

The pipes through which the water passes from ponds or reservoirs should be 1½ inch in diameter, and of cast-iron, each length having a socket at one end into which the small end of the next length is thrust and soldered with lead. This main pipe should, of course, be laid underground deeply enough to be safe from frost, and along the most direct route into the garden, as branch pipes can be connected with it at any point required. There should be plenty of these branches, with stop-cocks and nozzles at different points, so that a short length of hose may suffice for watering the whole of the garden. The laying of so many branch pipes, of course, involves a somewhat larger outlay in the first instance, but it invariably proves to be the most economical and efficient plan in the end, because a long length of hose is not only unwieldly, but owing to the wear and tear it undergoes it soon requires renewing. The size of the hose should be in proportion to the pressure of the water, but I would not recommend it to be less than five-eighths of an inch in diameter, and if larger the watering will, of course, be done more quickly. It should be of indiarubber, and of good quality; that bearing the technical name of 2-ply is best, it being really a tube composed of two layers of canvas between indiarubber.

After the site of the garden is selected and cleared of any trees or other encumbrances, the first work to be done is to thoroughly drain it; in doing this care must be taken to lay the pipes evenly and with sufficient fall to carry off the water quickly. All the tributary or branch pipes should be 2 inches and the mains 4 inches in diameter. The depth at which these drains are laid below the surface must depend altogether upon the nature of the soil. In a light, deep, open soil the water is best kept at 4 feet below the surface, the drains being 30 feet apart, but in heavy tenacious soils half that depth, or even less, is best, and the distance of the drains from each other should be reduced to 20 feet.

Next to the draining comes the building of the walls, which should be entirely of the best kiln bricks, and the height should be from 10 to 12 feet above the ground line, and the thickness about 14 inches. Care must be taken to have enough doors in the walls to afford easy access to the premises and grounds close by. In all gardens exceeding an acre in size there should be a pair of folding gates large enough to give admission to a manure cart. If a broad walk crosses the centre of the garden from these gates, soil and manure may be carted in and distributed on all sides with much ease and expedition. Supposing this central walk to be 9 feet wide, all the other walks should be about 5 feet wide, and made thoroughly hard and sound with a depth of 9 inches of gravel, or broken stone surfaced with gravel. For edgings to the walks nothing can be better or neater than the dwarf-growing Box. Edging tiles present a very neat and finished appearance for a time, but much of this is lost when the tiles become displaced and broken from the sinking of the earth and other causes. If the gradients of any of the paths are very sharp, as they are made drains and gratings should be laid. Such drains can, of course, be easily connected with the regular garden drains. The making of these drains will be more fully explained in a future paper on road-making.

If the glass houses are built in the garden they should be arranged in a neat compact block, so as to encroach upon the space as little as possible, and also because when so arranged they present a more imposing appearance, and are heated much more easily and economically than they could be if placed in the haphazard and loose fashion too often to be seen. The building of glass houses is a matter requiring much care and forethought, especially when the work is not done by a regular horticultural builder. In a well-built house we have an excellent combination of strength, lightness, and elegance; considerable mechanical ingenuity is also displayed in the details of such buildings. In order that the plants cultivated in them may enjoy a higher and more equable temperature than our climate affords, we should so construct them that while all chilling draughts or cold showers are entirely excluded, copious supplies of fresh air may be given at will, and as little obstruction as possible be offered to the sun's rays. The best houses for all purposes are those having all the framing and sash-bars of light woodwork, to which sufficient stability is imparted by suitable ironwork judiciously fitted to the interior. Such houses are far superior to those which have the framework and fittings entirely of iron, as they are not so much affected by extreme heat or cold; they are much cheaper and are equally durable.

The preparation of stations for the fruit trees is an important, and in poor soils a somewhat costly, undertaking if well done; for unless the young trees have an abundant supply of rich loam to feed upon they are quite certain to fail to make a satisfactory growth. In carrying out this operation I can offer no better advice than that given by Mr. Errington under the heading of "Stations for Fruit Trees."

After marking out the desired position for the stations, the first thing to be considered is whether the ground is naturally too wet or too dry. If the former, the hole need only be half the prescribed depth; the other half may rise above the ordinary ground level. If too dry there is no occasion to elevate the surface, only care must be taken not to place the collar of the tree too deep, which is a serious fault under all circumstances. The stations should be made to extend 3 feet on each side of the position for the tree, thus producing an excavation of 6 feet square. A depth of 2 feet is amply sufficient for any fruit tree, and especially for a dwarfing plan. The soil should then be thrown entirely out, and 4 or 5 inches more must be allowed for some impervious material, which shall presently be described. In throwing out the soil care must be taken to place it in samples, or both labour and material will be wasted. It very frequently happens that three distinct samples of soil or subsoil will come to hand during the operation. Of course all clayey, or sour, and badly-coloured subsoil must be rejected, and its amount will be supplied by the new material to be introduced; and if this is scarce, any ordinary surface soil may be in part substituted. In filling the materials back again the best of the original surface soil must be kept downwards, mixing it thoroughly with the new soil; the inferior or second-rate soil may be kept to dress the surface with. As to character of soil to be introduced, that depends partly upon the soil already existing in the garden, as well as on the kind of fruit tree about to be planted. If the soil is naturally sandy and dry, a very stiff or clayey loam should be selected; if naturally clayey, any fresh, mellow, sandy loam, or even the parings of roadsides, commons, or lanes will prove excellent material. The furrowings of old leys from what is considered good wheat soil are, however, of all other soils the best adapted for general fruit culture. Whatever materials are used, let it be remembered that the more of turfy matter that can be introduced the longer will the compost endure. Any sort of turf, even from hungry situations, is most relished by fruit trees. If, nevertheless, no turf can be obtained, and the soil is loose and poor, it is well to introduce any refuse vegetables of a dry character, such as decayed bean or pea haulm, ordinary straw, old thatch, or indeed anything of a decaying vegetable character which is strong in fibre and enduring. If any manure is thought necessary, it should be fresh from the stable or cow-shed, as such will endure longer in the soil, merely using one barrowful of mellow and rather rich soil to plant the tree in. As before observed, the inferior portion of the soil may be reserved to dress the surface of the station with, after the tree is planted; here it will do no harm, and will be in an improvable position.

We now come to the hard materials for the bottom of the hole, 4 or 5 inches in depth, as before stated. It matters not what this is composed of: broken stones from quarries, brickbats, chalk, cinders, or clinkers, &c., all are eligible. These being rammed hard, throw a coating of fine-riddled cinders or very fine gravel over the whole: this secures drainage, and

prevents the roots entering the subsoil to any injurious extent. —(*Cottage Gardener, Vol. I., page* 88.)

In planting some hundreds of young fruit trees last autumn I followed this excellent method in all its most important details; and as all the stations were surrounded by a firm hard mass of clay, the additional precaution was taken to connect all of them by means of suitable pipes with the garden drains nearest to them.

In selecting the fruit trees, if the collection is not a large one, it is best to keep to those kinds whose merits are well established, for, if novelties or scarce varieties are sought for, vigorous plants are hardly ever to be had.

Following this work comes that of preparing the garden soil. Whatever be its nature, it should certainly be stirred to a depth of 18 inches or 2 feet, taking care to keep the best soil uppermost and working-in a liberal dressing of manure. There should be no hesitation about the last-named operation, for if the soil is to give some returns quickly it must have liberal treatment. It is very rarely indeed that fresh-stirred soil, when thus devoted to vegetable culture, is not greatly benefited and improved by a plentiful admixture of some nitrogenous manure. Take, for instance, a poor shallow soil resting upon clay, and from which the nutriment has been absorbed for a long course of years by the roots of forest trees; when the wood is cleared away the surface is seen to be covered with decayed vegetable matter resulting from the annual fall of leaves. Too much stress should not, however, be laid upon the value of this substance to counterbalance the poverty of the soil, for in such a case, if vegetable culture is attempted without the aid of plenty of good farmyard manure it will result in a miserable failure. When a piece of land is surrounded by a wall, and thus transformed into a garden, far greater results are expected from it than before, even if it had been under cultivation, and therefore vigorous measures must be taken to thoroughly enrich the soil with manure in proportion to its strength and the requirements of the intended crops.

Supposing this work to have been done soon enough to bring the soil into tolerable condition during winter, as the planting season arrives, plantations of Asparagus, Sea-kale, Rhubarb, Artichokes, Horseradish, and herbs should be made in proportion to the requirements of the family. All these, which may be regarded as permanent crops, must be planted in a deep rich soil. In planting Asparagus I prefer single rows 4 feet apart, with the plants 1 foot from each other in the rows. Strawberry beds should be principally on some of the borders, a collection of the best kinds forming an interesting and attractive feature in a garden.

As the fruit trees planted within the garden walls are hardly ever sufficient to supply all the requirements of a family, an orchard is made near the garden, and yet well away from the dressed grounds. All kinds of fruit required for culinary purposes should be grown here, so as to keep most of the choice dessert sorts in the garden. Without specifying particular kinds for orchard culture, it may be stated that there should be a good assortment of cooking Apples, Pears for stewing, and Cherries, Plums, and Quinces for tarts and preserving. Medlars, Filberts, and Black Currants should also be planted. If a favourable position for such a purpose can be secured behind the north wall it is to be preferred, as then the orchard, soil yard, a space for odd frames and pits, and the sheds and undergardeners' rooms can all be snugly enclosed with a substantial boarded fence, starting from the wall at the east and west ends, and describing a square or semicircle or any form best suited to the features of the enclosed space, or the surrounding land and trees if there are any. The sheds and garden offices include a tool shed, stokery, fruit room, Mushroom house, store shed for roots, bothy, office, and potting shed; to these it will be well to add a rough shed for soil, and a workshop for the men, to be used in showery weather. In this building there should be a carpenter's bench and suitable tools for rough carpentry. Where there are no regular carpenters or painters kept for the estate work, there should always be a handy man about the garden, able to do any such odd jobs as glazing and painting, or repairing barrows and other things; it is a serious matter to have to send five or six miles for a glazier in the forcing season, or at any time for so frivolous a matter as putting in a fresh pane of glass.

In writing this article, without entering very closely into details, I have striven to enforce the importance of making the garden and all its surroundings of as compact a character as possible, not only for the sake of economising space, but as the basis of real efficiency; it being far easier to manage such a garden thoroughly well in every part, than if, as is sometimes the case, the land devoted to the culture of fruit and vegetables consists of two or three separate portions, so far apart from each other as to make the work of superintendence a very arduous and frequently most unsatisfactory undertaking.—Edward Luckhurst.

NEW AND OLD ROSES UNDER TRIAL.

Lately I gave a list of Roses under trial. Some have not yet given satisfaction, but I will only speak of successes.

The following I can highly recommend:—1, Perfection de Lyon (Ducher); 2, Madame Chirard (unknown); 3, Edward Morren (Granger); 4, The Duke of Edinburgh (Messrs. Paul); 5, Marquise de Mortemart (Liabaud). The first three are first-rate in every respect. 1 is the finest Rose I have seen for many years; 2 is quite fit to go with it; 3 is magnificent and a great improvement on Jules Margottin; 4 is of a most lovely colour; 5 is not surpassed in delicacy of colour. Its growth, however, is only moderate. 4 is a free grower, but the first three are strong growers, and will long stay in a good catalogue. These are all I can speak of at present.

There are some old Roses that deserve a word of praise—Madame Guinoisseau, pale rose; Triomphe de Caen, a velvety crimson purple; Général Jacqueminot; Madame Emile Boyau, variable flesh, but often marked like beautiful Madeline. They are moderate growers, abundant and free bloomers, and admirable for bedders. The last two have been overlooked by the "fast coaches." They are beautiful Roses.

A few words about Souvenir de Poiteau. The blooms of the true sort are very even and smooth in aspect, the colour is a salmon-rose. I have two plants under this name from another firm, but they are Marie Cirodde, and their blooms are as rough as those described by Mr. Pochin. I cut down twelve plants of Marie Cirodde, a fine grower, on account of its rough aspect, and budded them with the Duke of Edinburgh, which, though very beautiful, has as yet been hardly full enough. Eleven plants survived the winter and are blooming nicely.

The Roses are wonderfully fine here, and abundant. Over one thousand people have visited the gardens since Whit-Tuesday. I allow rich and poor to come when they like.

I have overlooked a most beautiful white Bourbon, Marguerite Bonnet; it is a good grower, has fine foliage, and wins ladies' hearts.—W. F. Radclyffe.

PATIENCE UNDER THE CUCUMBER DISEASE.

I have grown Cucumbers very extensively for years, but I cannot say that I have been successful all the time, for, like many of my unfortunate neighbours, I thought the Cucumber disease was caused by neglect. As I always adhere to the motto, "Prevention is better than cure," I used every precaution to prevent its paying me a visit; but, like many more, I am entirely beaten by it, for it visited me in its very worst form for three years. I am happy, however, to add that it has now entirely disappeared, and I confess that I am as ignorant as to its departure as I was at first of its coming.

I have grown Cucumbers in the same houses all the time, besides other houses, of which I have made a temporary use, but I am convinced that none of your writers has at present made any correct statement as to its cause or cure.

Like Mr. R. Fish, on page 271, I find the only plan to adopt is to plant frequently, for I have found the disease generally most affects the old plants. Much has been said as to composts, giving air, care of temperature and watering; and attention to all of these, I admit, is very necessary, even where the disease is at present a stranger; but I have tried every means that could be thought of. I have grown Cucumbers in houses built expressly for them, in Pine stoves, in vineries; I have also grown them in frames of wood, in brick pits, under handlights, and out of doors on beds of leaves—but no matter where, the disease found them out; soil, temperature, and situation made no difference.

My opinion is that, like the Potato disease and the cattle plague, the Cucumber disease will have its course. Besides the three years I had it so badly, it was in all about five years before it entirely left me; and, from what I have seen, I think that once it makes its appearance at a place, from five to seven years must elapse before it entirely disappears. As to different modes of culture, I have tried all, and my Cucumbers are now flourishing under the same treatment as that I adopted in 1867,

and then I could scarcely ever cut a respectable fruit. So I venture to ask, Has soil, temperature, watering, &c., anything to do with the Cucumber disease? My own experience replies, Nothing whatever.

As regards remedies, I think there are none, for I tried everything I could think of. At first I thought, like many others, the disease must be caused by something being wrong at the roots, and, if I remember aright, the first application that I used was lime and water. I soon found this had no effect, although I was advised to try it by a great grower of Cucumbers. After this failed I thought of the wonderful effects of charcoal on some kinds of plants, and I at once tried it. I had a lot beaten up almost into powder, put it into a tub of water overnight, and in the morning used it after adding sufficient hot water to make it warm. I used charcoal several times, both in water and in the soil, but to no purpose. The disease was as bad as ever; and other liquids of different natures were of no use. I had, as I have stated, plenty of room and houses for my purpose, therefore I tried everything I thought likely to prove a remedy at the same time. One house I kept very wet, the atmosphere damp, the temperature high; next to it I kept a house with, say, the soil dry, the atmosphere damp, and the temperature low, and I went on changing in different ways in eight houses, some a long distance from others, and some in the same range, but I have seen very little difference; if there was any, I think it was in favour of keeping the soil rather dry when the disease made its appearance, and preserving a moist atmosphere and cool temperature, and, as should always be done, giving air early. It seems strange, but I could grow a crop of Melons without seeing the least sign of disease in the same house. The Cucumbers so badly infected, had only been taken out three days previous to planting the Melons. In fact, I never saw the least sign of disease on the Melons, and I hope I never shall.—Animo et fide.

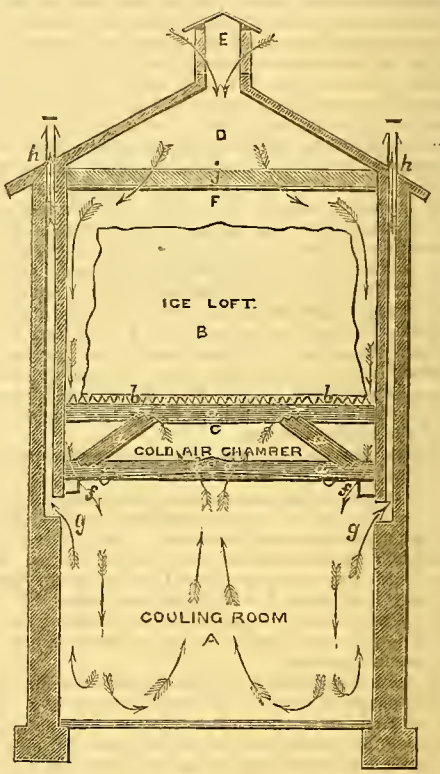
ICE-HOUSES.

The practical rules to be observed in the harvesting, storing, and preservation of ice may be briefly summed up as follows:—1. Secure the purest and most solid ice; it should, particularly, be free from organic substances. 2. Get the ice when it is coldest; it is decidedly beneficial to store it with a temperature considerably below the melting point. 3. Put it up in a compact and solid body, so that the least amount of surface may be exposed to extraneous influences. 4. Do not directly surround or cover it with organic substances, such as straw, shavings, and sawdust. 5. Preserve considerable space about the body of the ice, and ventilate the same; that no water should be allowed to stand around or below it, is a matter of course. 6. Keep the organic substances forming the non-conducting material in the walls and roof of the ice-house dry, in order to prevent any evolution of heat from decay or rot.

A knowledge of the fact that heated air rises, and the cold air remains on the lowest plane of a room, led to the expedient of placing the ice over a room intended to be cooled. But next arose the question regarding the most economical and efficient method of transmitting the cooling effect of the ice through the ceiling into the room below. Wood was first used, but this allowed little of the coolness of the ice to be transmitted into the room below. Then the ice was so packed as to have flues, with holes through the ceiling below them, where the air coming in contact with the ice was cooled, and this lowered the temperature of the room beneath. By this arrangement, however, the ice wasted rapidly, and the flues soon became so large as to prove of no benefit just at the season when the cooling effects of the ice were most desirable. Lastly, some one conceived the idea of making the ceiling of iron, which would most directly cool the uppermost air in the room and cause it to descend, making room for other air to be cooled and descend in like manner. These ceilings were most eagerly taken hold of, and praised as perfection. But their use has developed many great defects. The galvanising scales off, allowing rapid corrosion of the metal; the seams become broken, allowing the water to run through; the room below is not properly ventilated; the condensing of the vapour in the room upon the surface of the iron causes a constant shower; besides, they are very expensive.

To overcome these objections, and reduce the amount of the first outlay to a minimum, an ice-house is proposed, the construction and arrangement of which are as shown in the annexed diagram.

The accompanying engraving shows an upright cross section of an ice-house, with cooling-room A. *a a* are trussed timbers placed about 4 feet apart, for the support of slat floor B, upon which the ice is placed, allowing the air beneath to have direct contact with it. Space C, is a cold-air chamber, with water-tight bottom, which is inclined, in order to collect the ice water in troughs following the sides of the structure. Space F, over the ice, should be about 2 feet, and the ceiling should be covered on the under side of the joist with common boards, and be filled from 8 to 10 inches thick with loose shavings, the object being to allow the air to pass in finely-divided currents from space D into F. On the top of the roof is the injecting ventilator E, and in the walls are flues terminating into ejecting ventilators, *h*. The movements of the air will naturally be as indicated by the arrows. The warmer air in A will rise, and ascend through



the apertures *d*, into chamber C, touch the ice, become cooled, and fall back into A through aperture F. The atmospheric air will enter space D, and divide itself through ceiling *i*, into space F, pass over the exposed surface of the ice, and descend along its four sides through the slat floor B, into chamber C, and thence into room A, for use. An equal quantity of foul air must needs be allowed to escape through openings *g*, and ejecting ventilators *h*.

The advantages of this arrangement may be briefly enumerated as follows:—I. It is cheap. 2. It is durable. 3. It is in strict accordance with physical laws. 4. It accomplishes the necessary ventilation of the ice in two ways: it sends the cool air from above and around the ice, which would otherwise be totally lost, into the room A; and since the air is continually supplied from the atmosphere, preserves the purity of the air in room A. 5. The cold air in chamber C is peculiarly advantageous, since it allows the transmission of cool air into rooms located by the side of cool-room A.—(*American paper in English Mechanic and World of Science.*)

[We have carefully looked over this plan for an ice-house. The chief thing valuable we see in it, is "Do not directly surround or cover the ice with organic matter, such as straw, shavings, sawdust, &c." There are two things that seem to us very objectionable; first, we see nothing of the cheapness spoken of, for to have an ice-loft, a building must be constructed with a cooling chamber beneath, quite as large as the ice-loft over it; and again, by the plan proposed, the atmospheric air, however finely sifted, must pass over the body of the ice before it gets to the cooling chamber. We can fancy what air between 70° and 80° would soon do when passing over

a mass of ice. We could think of a system of reversal, such as the air entering at *h h*, and escaping at E; but we are inclined to think the whole idea of ventilating ice to be a mistake. The sloping bottom of the ice loft, so as to convey all water from melted ice from the sides is good; but then no ice well will long keep ice if, by sufficient trapped drainage, provision is not made against any stagnant water, and the fogs and exhalations that would rise from it. The trap in the drain is to prevent the heated air of summer passing in, whilst the redundant water goes out. Had we to make such a house, we should be satisfied with good open drainage at the bottom of the cooling room, commencing with a drain; then we would do away with all the double floors, cold-air chambers, and ventilating shafts, fill the place with ice from bottom to top, and have a small ventilator or pipe at E, under control, to let out any mists or fogs that might accumulate over and round the ice. The plan shown, however, is ingenious, and we should like to have the opinions of others as well.—EDS.]

ROYAL HORTICULTURAL SOCIETY.

JULY 5TH.

MORE unfortunate weather there could hardly have been than that which occurred on the day when the Royal Horticultural and National Rose Show was held, and, moreover, that after a long series of days disastrous to the beauties of the Rose. The north of England did not put in an appearance, the south was fairly represented, but under the adverse circumstances we need not be surprised that the Show was not so good, take it all in all, either in quantity or quality, as some of those in former years. There was much of what is technically called "roughness," and there were many damaged petals. We are pleased to add, however, that the attendance of visitors was very good, notwithstanding a thunderstorm early in the afternoon, accompanied with a heavy downpour of rain.

The Roses were the great feature of the day, and from the later period at which the Show was held they were, on the whole, superior to most of those exhibited at the Crystal Palace, both in size and freshness. Still, the weather in the interval between the two shows has been unfavourable. The number of stands exhibited, doubtless owing to these causes, was not so great as we have seen on former occasions. In the nurserymen's class for seventy-two single trusses, Messrs. Paul & Son had beautiful examples of Queen Victoria, Duke of Edinburgh, Madame Victor Verdier, Louis Van Houtte, Paul Neron, La France, Triomphe de Rennes, Camille Bernardin, Dr. Andry, Duchesse de Caylus, Mdlle. Julie Daran, Leopold Hausburg, Exposition de Brie, Princess Mary of Cambridge, Souvenir de Malmaison, Céline Forestier, Maréchal Vaillant, Mdlle. Thérèse Levet, Caroline Sansal, Duchesse de Morny, small, but fine in colour; Souvenir d'Elise, Elie Morel, Marie Baumann, Maurice Bernardin, Marie Rady, Baroness Rothschild, Maréchal Niel, and Olivier Delhomme. Messrs. Francis & Co. sent a stand in which there were many inferior blooms. Messrs. Paul were first, Messrs. Francis second.

The next class was for forty-eight, three trusses of each. Messrs. Paul & Son were first with John Hopper, Horace Vernet, Prince of Wales, a globular Rose; Paul Verdier, very beautiful; Victor Verdier, Beauty of Waltham, in fine condition; Général Jacqueminet, Camille Bernardin, Mdlle. Thérèse Levet, La France, very fine; Elie Morel, Duke of Edinburgh, Alfred Colomb, lovely; Madame Caillat, Marie Baumann, Madame Laurent, Leopold Hausburg, Marguerite de St. Amand, Baroness Rothschild, Centifolia rosea, Duc de Rohan, Charles Rouillard, and Triomphe de Rennes. Mr. Turner came second with stands in which were fine trusses of La France, Anna de Diesbach, Climbing Devoniensis, Duke of Edinburgh, Baroness Rothschild, Miss Ingram, Gloire de Dijon, Céline Forestier, Edward Morren, Camille Bernardin, Alfred Colomb, Beauty of Waltham, and Victor Verdier.

For twenty-four Hybrid Perpetuals, three trusses of each, Messrs. Paul & Son were again first with, among others, splendid trusses of Duke of Edinburgh, Marie Baumann, Marie Rady, Madame Vigneron, Duc de Rohan, Baroness Rothschild, Maurice Bernardin, Lælia, Centifolia rosea, Alfred Colomb, and Marquise de Mortemart. Some others, though fine, were a little overblown. Second came Mr. J. Fraser, of Lea Bridge Road, who had beautifully coloured very fresh trusses of Victor Verdier, Dr. Andry, Baroness Rothschild, John Hopper, Alfred Colomb, Duke of Edinburgh, Marguerite de St. Amand, and Xavier Olibo . Mr. Turner, of Slough, sent Duke of Edinburgh, La France, Charles Perry, and several others very fine. Messrs. Francis & Co. also exhibited in this class.

Class 6 was for twenty-four single trusses. Mr. Turner was first with Denis Helye, Duke of Edinburgh, Madame Clémence Jeigneaux, Horace Vernet, Marguerite de St. Amand, François Treyve, Victor Verdier, Climbing Devoniensis, and fine examples of others. Second came Mr. Walker, Thame, with John Hopper, Marie Baumann, Marie Rady, &c.; third, Messrs. Veitch. In both of the last two collections there were fine blooms of varieties already named.

In the amateurs' classes competition was more brisk. For forty-eight single trusses the Rev. G. Arkwright, Pencombe Rectory, Bromyard, was first with excellent examples of La France, Esmeralda, fine in colour; Baroness Rothschild, Triomphe de Rennes, Princess Mary of Cambridge, Souvenir d'un Ami, Madame Knorr, Mrs. Charles Wood, Souvenir d'Elise, and Madame Hector Jacquin. Second came T. Laxton, Esq., Stamford, with John Hopper, Exposition de Brie, Marguerite de St. Amand, Charles Lefebvre, Pierre Netting, Abel Grand, fine, others good, and Annie Laxton, a pretty pink seedling. Third came Mr. Chard, gardener to Sir F. Bathurst, Clarendon Park, Salisbury; and fourth, R. N. G. Baker, Esq., 9, Salisbury Mount, Heavitree, who had very large trusses but too far gone.

For thirty-six, Mr. Ingle, gardener to Mrs. Round, Birch Hall, Colchester, was first, Mr. Chard second, R. N. G. Baker, Esq., third, and Mr. P. Steddart, gardener to H. J. G. Rebow, Esq., Wivenhoe Park, fourth. In these stands we noticed fine specimens of Marie Baumann, Duke of Edinburgh everywhere good, La France, Nardy Frères, John Hopper, Senateur Vaisse, Victor Verdier, Baroness Rothschild, Adam, Marie Rady, Alfred Colomb, Emilie Hausburg, and others.

For twenty-four, single trusses, Mr. J. Skinner, gardener to Capt. Christy, Westerham Hill, was first with trusses which, though not large, were for the most part in fine condition, especially John Hopper, Victor Verdier, Jules Margottin, Charles Lefebvre, Duc de Rohan, Prince Camille de Rohan, and Louis Van Houtte. Mr. W. Soder, gardener to O. Hanbury, Esq., was second; Mr. Wakely, Rainham, Kent, third; and R. B. Postans, Esq., Brentwood, fourth, some of his trusses being remarkably fine.

In twelves, Mr. J. C. Quinnell, Brentwood, took the first place, the Rev. C. C. Ellison, Bracebridge Vicarage, Lincoln, the second, Mr. Wakely third, and Mr. Soder fourth. Victor Verdier, Baroness Rothschild, Madame C. Joigneaux, John Hopper, Charles Lefebvre, Alfred Colomb, Madame Furtado, Elie Morel, Napoléon III., and Marie Baumann were represented by beautiful trusses.

Of new Roses of 1869 or 1870, the best twelve came from Messrs. Paul & Son, and the best were Mr. Gladstone, noticed last week; Paul Neron, Comtesse d'Oxford, splendid glowing colour; Marquise de Castellane, Louise Van Houtte, very fine; Ferdinand de Lesseps, Mdlle. Eugénie Verdier, Catherine Mermet (Tea), and Madame Laurent. Mr. Turner was second with a stand in which some of the blooms had been damaged by the weather. Mdlle. Eugénie Verdier, Louisa Wood, Miss Poole, fine; Comtesse d'Oxford, and Lord Napier were the best. Aristide was very good, and Tippoo Sahib, though weather-stained, appeared to be a very desirable variety. For twelve trusses of any Rose of 1869-70, Messrs. Paul & Son were first with Comtesse d'Oxford, brilliant in colour, a fine Rose. Mr. Turner was second with Miss Poole, in fine condition, and, as remarked in a previous report, a fine Rose. For six trusses of any new Rose of 1869-70, Messrs. Paul & Son were first with Louis Van Houtte, rich velvety, shaded dark crimson. The same firm also exhibited Mdlle. E. Verdier, very open, though of a beautiful rose colour. No second prize was awarded.

The best collection of yellow Roses came from Messrs. Paul & Son, and consisted of fine trusses of Triomphe de Rennes, Céline Forestier, Gloire de Dijon, with pretty buds of Madame Falcot, but Maréchal Niel far from equalling its usual beauty. Mr. Steddart was second, and Mr. May, Stisted, third. Tea-scented and Noisette Roses were not so fine as we have seen them. The best twelve in the amateurs' class, from Mr. Thorneycroft, Floore, Weedon, were, however, very good, especially Devoniensis, Narcisse, and Céline Forestier, but not large. Mr. Steddart was second, and Mr. Tranter, Upper Assenden, third.

Mr. Turner, of Slough, was first for twelve single blooms, showing among others admirable examples of Marie Baumann, Lord Herbert, Victor Verdier, Duke of Edinburgh, La France, and Marguerite de St. Amand. Mr. Hermans, Herenthals, Antwerp, was the only foreign exhibitor of Roses, and they were hopelessly damaged in transit.

Mr. William Paul offered prizes for three blooms of his beautiful new Rose Princess Christian, but we did not notice any stand in competition.

Roses in pots could not have been shown in finer bloom than they were by Mr. Turner, Messrs. Paul & Son, and Messrs. Veitch. For number and size of blooms, considering that the exhibitors were limited to 8-inch pots, they were marvellous. Duke of Edinburgh, Baroness Rothschild, Impératrice Charlotte, Queen Victoria, from Mr. Turner; Edward Morren, Maurice Bernardin, and others from Messrs. Paul and Veitch were magnificent. Messrs. Veitch also exhibited in the miscellaneous class a large and fine group.

Prizes were offered by his Grace the Duke of Buccleuch, President of the Society, for the best group of three plants in pots for dinner-table decoration. The first went to Mr. Chard for plants of Areca aurea, about a feet high, and Hyopherbe Verschaffeltii 1½ feet taller. Mr. Bull came in second with Geonoma Schottiana, Dæmonorops plumosus, and Dekenia nobilis. Messrs. E. G. Henderson & Co. were third. Mr. George, gardener to Miss Nicholson, sent dwarf beautifully-fruited Aucubas. The President also offered prizes for groups suitable for the dinner-table, and consisting of flowers or fruit, or both combined. Messrs. Phillips & Pearce, of Bond Street, were first with a design very similar to that which they exhibited at the Crystal Palace a year ago, and very elaborate in its details. The centre-piece was bordered with a bread-looking glass edge, the stem gracefully entwined with Cissus discolor, and pendant glasses, suspended by chains from

glass branches, were filled with blue-corolla'ed Fuchsias, those in the two end stands being furnished with a kind having a white corolla. The top glasses in each case contained Heaths. Mr. Chard was second with March stands, and Miss Hassard third with a graceful design. An extra prize was awarded to Mr. Soder, gardener to O. Hanbury, Esq.

Miscellaneous collections, though not so numerous as usual, formed an effective part of the Exhibition. Mr. Turner, Slough, sent splendid cut trusses of Verbenas; Mr. Hooper, Bath, Carnations, Cloves, and Pinks; and Messrs. E. G. Henderson & Son, a large collection of Tricolor Pelargoniums.

From M. Dallière, Ghent, came a number of Palms and other fine-foliaged plants; from Messrs. Rollisson, Tooting, a similar group; from Mr. Bull, Chelsea, a numerous group of Orchids, Palms, Lilium auratum, &c. M. Dallière sent a fine group of Marantas; Messrs. Rollisson a large mixed group containing several fine specimen Orchids. From Mr. Turner, Slough, came a case with a plant of Tricolor Pelargonium Rainbow, with large and magnificently-coloured foliage.

Mr. Linden, of Brussels, sent Epidendrum Frederici-Gulielmi, a very fine rosy purple kind, and several fine specimen Orchids; also a collection of Marantas, and other fine-foliaged plants, of which Dieffenbachia meleagris, Eldorado, and chrysophylla had leaves very beautifully marked. Mr. Denning, gardener to Lord Londesborough, had a collection of Orchids, of which Angulon Clowesii was remarkable for the size and number of its yellow Tulip-like flowers, being, in fact, the finest specimen of this plant we remember seeing. Mr. Turner, of Slough, exhibited a brilliant group of new Show Pelargoniums.

Fruit Committee.—G. F. Wilson, Esq., in the chair. Mr. C. Turner, The Royal Nurseries, Slough, sent three splendid bunches of Black Hamburgh and Buckland Sweetwater Grapes, for which a special certificate was awarded. Mr. J. Douglas, Loxford Hall, sent a bunch of a seedling White Grape, a cross between Buckland Sweetwater and White Frontignan, possessing a large share of the Frontignan flavour; a very promising variety, which Mr. Douglas was requested to submit again when fully ripened. Mr. Cruickshank, gardener to Lord Belper, Kingston Hall, Derby, sent a bunch of Chasselas Musqué, and another of Muscat Muscadine, the latter quite ripe, but neither of high flavour. The Committee were not exactly agreed as to their correct names.

Mr. Douglas, Loxford Hall, Ilford, sent a magnificent dish of Lucas Strawberries, but rather wanting in flavour, like all Strawberries this season. A special certificate was awarded. Mr. Paul, Waltham Cross, sent a dish of Waltham Seedling Strawberry of good appearance, but flavour wanting. Mr. Tretman, Spring Grove Nursery, Isleworth, sent a dish of Royalty Strawberry, a new variety certificated last season, possessing a slight Hautbois flavour. Messrs. Paul & Sons sent a collection of Strawberries, as follows:—Premier, Melius, Princess Alice Maude, British Queen, Abd-el-Kader, François Joseph II., large and coarse; President, Marguerite, Dr. Hogg, large and firm; and Sir Harry. None of the varieties were good in flavour. Mr. Tillery, gardener, Welbeck, sent a very fine dish of Galande Peaches and Violette Hâtive Nectarines. A special certificate was awarded.

Mr. Douglas sent a seedling Melon with deep green flesh, and of good rich flavour; also a scarlet-fleshed variety named Gem, of fair quality. Mr. Gilbert, gardener to the Marquis of Exeter, Burghley, sent a fruit of his selected Meredith's Cashmere Melon, a large, yellow, fine-looking sort. This was very juicy and sweet. A special certificate was awarded.

Mr. Perkins, gardener, Warren House, Stanmore, sent a Ripley Queen Pine, weighing 5½ lbs., grown in twelve months from a sucker, and one old Queen Pine, 5¼ lbs., produced in the same way. This was considered a most meritorious exhibition of superior skill in Pine culture, and received a special certificate, the Committee regretting that they had not the power to bestow a higher award.

Mr. Laxton, Stamford, sent examples of three new hybrid Peas. Omega, a dwarf early variety in the way of Little Gem; the Pods were very fine, deep green, well filled, and very promising. Achievement, a very large pale green pod some 7 or 8 inches long. Superlative, deep green pod, 8 inches long and very handsome. The Committee, whilst considering them very fine productions, have decided not to certificate any Peas until they have been tested in the Society's grounds at Chiswick. Mr. Wright, gardener to Capt. Lake, Newlands, near Sittingbourne, Kent, sent a dish of a new early white wrinkled Marrow Pea of good quality.

Mr. C. Turner, The Royal Nurseries, Slough, sent an example of a seedling Cucumber named Wizard, a fine, clean, black-spined variety. The Rev. C. C. Ellison, Bracebridge Rectory, Lincoln, sent a seedling Cucumber named Lick-'em-all, a good variety which has received many prizes, but which in the example shown had no great merit.

Mr. A. Colbourn, gardener to J. Blyth, Esq., Woolhampton, Bucks, sent some very large examples of Mushroom, which were considered very coarse. Mr. A. Parsons, Daneshury, sent a good specimen of the Giant Puff Ball.

Mr. W. Taylor, 9, Southbrook Road, Lee, sent examples of the old Chenipodium Quinoa, recommended for agricultural purposes, &c.

Mr. Wrench, London Bridge, sent examples of Roiffea or Reed Grass, dried and used as matting. It seemed a very excellent substitute, and is coming much into use for tying plants, and a first-class certificate was awarded.

Messrs. Carter & Co. offered prizes for the best six dishes of Peas, including Laxton's Supreme, Laxton's Quality, and Carter's Hundredfold. Mr. Cox, gardener to Earl Beauchamp, Madresfield Court, was first with fine examples of the above, Laxton's Alpha, Veitch's Perfection, and Laxton's Quantity. Mr. Frisby was second with, in addition to the named sorts, Dwarf Waterloo, Alpha, and Supreme. Messrs. Chard, Miles, Lumsden, and Brown, also sent good dishes, but for their size none of the pods were so full as could have been desired.

Floral Committee.—Dr. Denny in the chair. First-class certificates were given to Mr. Turner for Pinks Dr. Masters and Shirley Hibberd; both of them large and very finely laced, the former with more of a crimson tinge. Mr. Wiggins, gardener to Walter Beck, Esq., Isleworth, sent a very fine collection of Show Pelargoniums, containing several very promising kinds. Ada with a maroon top shading off to rose at the edge, with rose-coloured lower petals, received a first-class certificate, as also did Enterprise. Messrs. E. G. Henderson and Co. had a similar award for Petunia Coquette, semidouble, white, purple centre and purple border. The same firm had a second-class certificate for Enchantress Pelargonium, apparently of the Blanche-fleur type, and likewise exhibited a hybrid Ivy-leaved Pelargonium of very free leafy habit, a variegated Hydrangea japonica, Carnations and Picotees, the results of crossing Dianthus moschatus with various members of the same family. Silver Tricolor Pelargonium Minnie Warren was also shown in a basket as a good dwarf edging variety, which it decidedly is.

Messrs. Backhouse, of York, exhibited Lithospermum petræum with beautiful heads of cobalt-blue flowers; also Linum salsoloides with white flowers. Both of these had first-class certificates. Mr. Bull had a first-class certificate for Asophila Shepherdii, a graceful tree Fern on a dwarf stem, and one of the second class for Lobelia Erinus Omen, purple and white, a pretty variety. He also sent Musas and other plants with fine foliage. Mr. Croucher, gardener to T. Peacock, Esq., Hammersmith, had a first-class certificate for a variegated form of Agave Verschaffeltii. Mr. Green, gardener to W. W. Saunders, Esq., had a similar award for Houlletia odoratissima antioquensis, a singular Orchid with brown sepals and petals. Mr. Hepper, gardener to P. Millard, Esq., The Elms, Acton, sent some beautiful specimens of the flowers of Passiflora quadrangularis, and two grafted plants of Coleus, the one exhibiting three the other four varieties.

From Mr. George, Putney Heath, came several seedling bedding Pelargoniums, of which Charming Rose, a Nosegay, appeared to be very free-flowering. Mr. Walker, nurseryman, Thame, sent a collection of Auricula-eyed Sweet Williams; Mr. Chater, Gonville Nurseries, Cambridge, a variegated-leaved Horse Chestnut, together with seedling Roses of no merit, and a hybrid Pelargonium, said to be sweet-scented, but with that quality not pronounced. G. F. Wilson, Esq., sent some of the Lilies he exhibited at Nottingham, and drawings of others, and Mr. Fraser, Lea Bridge Road, Ixora floribunda, very dwarf and remarkably free-flowering, forming quite a bouquet. Mr. Stevens, Ealing, had a fine collection of Balsams, for which he received a first-class certificate.

The exhibitions in connection with the permanent International Exhibition since we last noticed them (and they have received less notice than they deserve), have undergone several changes. The space at the principal entrance in Exhibition Road has been cleared, and devoted, as it should be, to plants. Here Messrs. Standish & Co., of Ascot, and Messrs. Lane, of Berkhampstead, exhibit fine collections of Conifers, &c. Messrs. Standish have at present a specimen of Begonia Sedeni, the most splendid in colour we have yet seen, and covered with flowers. Mr. W. Paul has a grand display of cut Roses, besides a charming mixed collection. Mr. Wills maintains his room decorations in as excellent order and taste as ever.

THE LOQUAT—FRUIT CROPS—MIDSUMMER FROST.

Having been travelling in Italy lately, in the vicinity of Naples, I frequently met with a fruit called there "Nespoli di Japone," or Japan Apple. It is pear-shaped, flesh in colour and somewhat in taste resembling an Apricot, sometimes containing only one, and sometimes as many as four stones in each fruit; the stones solid throughout—that is to say, not having a shell and kernel like other stone fruit. I cannot find it under the name of "Nespoli" anywhere. Can you give me the proper name for it? [Eriobotrya japonica, or Loquat. It has fruited in this country.]

Your correspondent, "L. Roscorla," speaks of self-sown Geraniums. Here (Oakham), notwithstanding the severity of the past winter, not only seedling Geraniums, but also Asters, Nasturtiums, and Mignonette have sprung up abundantly wherever those plants were grown last summer.

In this district I think our fruit prospects are not over-good, with the exception of Gooseberries, which are certainly above an average crop. Currants are much blighted. Apricots turn yellow prematurely and fall off, in consequence of the harsh easterly winds and the absence of sunshine. Strawberries are a very variable crop—in some gardens abundant, in others

none. In almost every instance that I have heard of, that usually best of all Strawberries, Keens' Seedling, has this year less fruit than almost any other variety.

On the night of the 24th ult. the aurora borealis was very brilliant for a short time, and during the night the thermometer registered as low as 35°.—E. C. [At Rugby, on the same night, we are informed by Mr. Harris, gardener at Naseby Woolleys, there was a frost so severe as to turn the Potato leaves quite black.—Eds.]

THE ROYAL HORTICULTURAL SOCIETY'S EXHIBITION AT NOTTINGHAM.

JUNE 27TH—JULY 1ST.

In continuation of our report of this Show—the most successful of any of the country exhibitions which the Society has yet held—we now take up the

VEGETABLES.

These were not shown so numerously as at some of the Society's previous country shows, but the quality was excellent. Messrs. Carter and Co. offered a silver cup, or £10, and a second prize of £2, for the best collection, including Carter's Hundredfold, Laxton's Quality, Dwarf Waterloo, and two other varieties of Peas. The cup was taken by Mr. Garland, gardener to Sir Thomas Dyke Ackland, Bart., Killerton, with the above-named Peas, fifty heads of Asparagus, averaging 8 inches in length, and weighing altogether 7½ lbs., excellent Cabbages, Lettuces, Broad Beans, Celery, Onions, Carrots, Parsnips, Turnips, and Beet. The whole of these, we understand, were produced from Messrs. Carter's seeds. The second prize went to Mr. D. Lumsden, gardener to Lady M. Nisbet Hamilton, Bloxholm Hall, Sleaford, for excellent Globe Artichokes, Broad Beans, Cabbages, Leeks, Onions, Potatoes, Radishes, &c. Mr. Gilbert, gardener to the Marquis of Exeter, Burghley, also competed, but unsuccessfully, though taking the gardeners' prize, with £5 added by the Marquis of Exeter, for eight kinds of vegetables and four kinds of salads—a prize first proposed by himself. Second, third, and fourth prizes were also offered in the same class; the fourth, by Mr. Chapman, of Gloucester, being his patent exhibiting case. Mr. Gilbert exhibited his vegetables in a box neatly bordered with fine Curled Parsley, and it contained very fine Telegraph Cucumbers, Mushrooms, Cauliflowers, Orangefield Tomatoes, Dwarf Kidney Beans, William I. Peas, Lettuces, Beet, and Mustard and Cress. An excellent collection from the Rev. C. C. Ellison, Bracebridge Vicarage, Lincoln, was second; Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, being third; and Mr. G. Craddock, gardener to Lord Willoughby de Broke, Compton Verney, fourth. Messrs. Lumsden, Frisby, Meikle, Holah, Peachey, and others also sent very fine-grown vegetables. The Loughborough Horticultural Society's prizes for six kinds of vegetables, exclusive of Potatoes, shown on trays not exceeding 30 inches square, were taken by Messrs. G. Heafford & Son, Loughborough; Mr. Draper, Dorrington; and Mr. Nicholson, Collingham. In the artisans' class for the same, Messrs. Basford, Biddle, and Clarke, of Loughborough, and Mr. Lacy, Bloxholm, were prizetakers in the order in which they are named.

Potatoes, very clean and good, were shown by Mr. Taylor, of Malpas; Mr. Craddock, Compton Verney; Mr. Biddle, Loughborough; and in the class for four dishes, in which prizes were offered by the Loughborough Horticultural Society, Messrs. Pickworth, Biddle, Nicholson, Montiney, and Heafford & Son had excellent samples.

Cucumbers were numerously shown in the class in which prizes were offered by T. R. Starey, Esq., and the Local Committee. The Rev. C. C. Ellison was first with a white-spined variety, called Lick-'em-all; Telegraph, from Mr. Bolton, gardener to W. Worswick, Esq., Birstall Hall, was second; Berkshire Challenge, from Mr. Mitchell, gardener to T. Cross, Esq., Ruddington Hall, third. From Mr. Lumsden came a brace of the Sooly Qua Cucumber, which is probably a variety of Luffs.

GARDEN STRUCTURES, IMPLEMENTS, &C.

Of these strictly speaking the Show was not very extensive; fully one-half of the articles exhibited were such as pertained but very little to horticulture. They attracted some little attention, no doubt, but perambulators, beds and bedding, grates and fire irons, carriages and leather, which formed the major part, have very little claims to notice at a horticultural show.

Of hothouses there were several, although nothing very special, and chiefly confined to local talent. The most commanding and substantial, a perfect model of a plain, substantial, span-roofed house, was that exhibited by Mr. Forster, of Beeston, the builder of Mr. Pearson's world-famous orchard houses. This was after the same style, and is specially worthy of commendation, light and airy, yet firm and strong. The patent ventilating system of Mr. Forster, by means of cog-wheels, is likewise very admirable. A small moveable pit also was deserving of special commendation, being exceedingly well adapted for amateurs. Messrs. Wheeler & Humphreys, of Nottingham, also exhibited a very substantial span-roofed house with patent ventilating gear. Messrs. Dennis & Co., of Chelmsford, exhibited several erections of galvanised iron, which, although light and airy, and no doubt durable, had not by any means a neat appearance. We cannot say we like them. Mr. Messenger, of Loughborough, exhibited a large range of houses on his principle of construction, which had a very light and airy appearance—just a little too slim, if one might say so; the bracing and tying together of the various parts being well contrived, so as to avoid centre supports.

Mr. W. P. Ayres exhibited one of his imperishable hothouses, which are certainly deserving of especial notice. As far as iron and glass are concerned they may lay some claim to the title assumed. The whole of the outside of the roof is glass laid down like the slates or tiles on the roof of a house, no putty being used, so that nothing but the glass is exposed. The glass is held in its place by little zinc or tin laps. The shelves also are made of some hard material like terra cotta. We like many of the principles exceedingly. Mr. Bickley, of Birmingham, exhibits a small house showing an ingenious mode of glazing. The bars run transversely across the house about 18 inches apart; on these the glass is laid and supported by little strips of zinc nailed to a piece of wood. We liked this very much. Mr. Voice, of Harcross, Sussex, also exhibits another novelty in ventilation. The house is furnished with a centre cap or lantern, which can be elevated at pleasure to one side or the other. By this means ventilation can always be provided on the leeward side, and cold draughts of air may be in a great measure prevented.

Messrs. Green & Sons exhibited a number of their patent lawn mowers, rollers, &c. Messrs. Fellows & Bates had also on show Ransome's Automaton lawn mower. The Climax lawn mower is a very ingenious handy little machine, the grass box being placed behind instead of in front, and the cut grass being jerked backwards. By this means the knives can cut quite close up to any object. We look upon this as one of the best of late novelties.

Mr. Ormson, of Chelsea, and Messrs. Weeks, exhibited examples of their boilers, which are well known, and require no special notice. Messrs. Jones & Rowe had on view also Mr. Westland's Witley Court boiler, with furnace-door and everything complete. This seems to be a very powerful boiler, but rather complex in construction.

Mr. Matthews, of the Potteries, Weston-super-Mare, had on show a great stock of flower pots, ornamental vases, flower stands, &c., which were specially worthy of commendation. There has been a great want for cheap, handsome flower pots, which Mr. Matthews seems now likely to supply. Mr. Sankey, Bulwell Potteries, Nottingham, had also a goodly stand of flower pots, &c., of admirable make.

A rather ingenious apparatus for the application of the liquid compositions for the destruction of aphides, &c., on plants, named Frettingham's vaporiser was shown. A small portion of the liquid is placed in the vaporiser—a bottle which is filled with some tubes like a soda-water bottle, and by blowing through these tubes, the material is distributed in thin spray over any part of the plant, with scarcely any waste.

Mr. Rendle had on view a great number of his patent plant protectors, and in great variety, giving the protection of a single flower pot to that of a good-sized house. Many of Mr. Rendle's appliances will be found extremely useful, especially to amateurs. The most of the other subjects were of a very miscellaneous character, and call for no special remark.

A DINNER of horticulturists was held at the Exchange Rooms at Nottingham on the 27th ult. The Rev. S. R. Hole presided. We need only give a few extracts from the records of the "doings of that day."

The CHAIRMAN said he had never said grace with more satisfaction than he had done that day. He was not an epicure, but he felt somewhat, as the poet expressed it, "Fate cannot harm me, I have dined to-day" [laughter]. Englishmen used to have no difficulty about dining; but somehow or other there had been some difficulty previously in holding a gardeners' dinner at these annual meetings. They had previously wanted the presence of those who were at the head of the Society, but here they were to-night [cheers]. They had the best show to-day that ever the Society had had in the provinces [cheers], and there had been no want of harmony in making it a happy one throughout [cheers]. In reply to the question which had been put as to why they were so anxious about the dinner, he said the gardeners who came to these meetings had great sympathy and fellowship for each other; they wanted to cement their old friendships, and to meet men they had heard about all their lives. Did not young painters wish to know a Millais, or a young soldier a Napier? He had known the time when he would have gone forty miles to meet Thomas Rivers, of Sawbridgeworth [cheers]. What they wanted was unity, and they had it to-day more than they ever had it before. He saw many around him who had talked about it, and it was a matter of congratulation that the wind had gone from the north into the west [cheers and laughter]. He would tell them who had been one of the greatest advocates and promoters of this union—that was the chief magistrate of Nottingham, who sat on his right hand [cheers]. The Mayor told him that he had astonished him in making that remark, but he (the speaker) had attended every meeting of the Committee, and had found his Worship working in the most generous way to forward the interests of the Society, and with the greatest energy and goodwill that any man could show [cheers]. His Worship offered to take the chair when this dinner was proposed, but he was anxious for anyone to take it who knew more of gardening than himself [cheers]. He gave them "The health of the Chief Magistrate of the town," and

he might congratulate him on the happy day this had been for Nottingham and the grand Exhibition over which he had, so to speak, presided [cheers].

The Mayor returned thanks, and proposed "The Council of the Royal Horticultural Society."

Colonel Scott, in reply, said it was a great honour to reply to the toast, and went on to observe that the Society had done much to humanise mankind [cheers]. Mr. Hole had made some comments upon the difficulties in connection with the dinner. He did not know the ins and outs of the question, but he reminded them that the Society had a great many difficulties to contend with. It was made up of heterogeneous elements. There was first the florist, who looked at a flower in relation to its regularity; then they had the horticulturist proper, who delighted in looking at everything in the light of colour or beauty of form; then there was the botanist, who thought that it was the most important thing that a flower should have its right name given to it; and also the physiological horticulturist, who thought of nothing but the scientific point of the question [hear, hear]. Besides these classes, however, they had the outside public to consider. Horticulture was like painting, there was wanted not only the artists, but the people to admire the works that were produced. Many of those present were men of business, and they were pretty well aware that, in a mundane point of view, the absence of the public would be the worst thing that could befall them [hear, hear]. Still, he did not think the Horticultural Society needed any apology; they were doing their duty manfully and well. He dwelt on the progress the Society was making, and said the Show in Nottingham was one which would bring thousands to see it. He could not help referring to the Local Committee, who had worked so hard to secure a success, and he wished also to acknowledge the efforts of those who had brought together so large a number of plants, also to those who had judged them so well, but who, for the next three or four days, would not have a very happy life of it [cheers]. Last, but not least, they returned their thanks to the Mayor for the honour he had done them, and also for the courtesy and geniality and all those qualities for which they had been indebted to so great an extent for the success of the Exhibition [cheers]. He thanked them from his heart for the way in which they had been received, and hoped this would be one of a series of meetings at which they would meet together [cheers].

In reply after his health being drunk with great *eclat*, the Chairman said his heart was that of a gardener. He must not make a pun on the Mayor's name, but he certainly was the right *Man-ning* (in) the right place wherever he went [cheers]. He (the Chairman) should look back upon this day as one of the happiest in his life [cheers]. This was the first day in which they had bridged over a little chasm which had existed between science and practical gardening [cheers]. He did not pretend to be anything but a lover of flowers. He loved every flower that was grown—that was his idea. The man who could not admire every flower in a wood as well as any Orchid, was not a true gardener. If he did so, however, he was a true florist [cheers]. The Chairman then told a very droll anecdote, and told it well. In a village nine miles from Nottingham there lived a clergyman, and there also used to live a clerk. We were getting rather tired in this age of the conversational duet between the parson and the clerk, and so the latter race was not quite so flourishing. But there lived in this village a clerk, and he did not think he was offending against propriety when he stated that his name was Kemp. Kemp was a tailor and he played on the violin [laughter]. All things went very happily, the clergyman employing the clerk to make clothes for himself and livery for his man, and he (Mr. Hole) thought it right that native talent should be thus encouraged. Unfortunately, one day there came to the clergyman a new groom, who declared that he would not have his clothes made by Kemp. The clergyman weakly and thoughtlessly listened to the council of the groom, and allowed him to go to a very excellent man and tailor, whom they all liked—Mr. Finn [cheers and laughter]. The man went to Mr. Finn, and the next Sunday when the clergyman gave out the hymn the fiddle of Kemp made no sign [laughter]. Again the clergyman gave out the hymn, repeating the first verse, but the fiddle made no sign. There was consternation in the heart and countenance of the parson, and he turned to that part of the church from which the music proceeded for an explanation, and after a pause there was a messenger sent, and the reply was, "If you please, sir, Kemp says as Finn may fiddle" [laughter]. He hoped that in the same way working gardeners would not be put on one side for science, or they might reply, "Science may fiddle" [cheers]. He said to the Council of the Royal Horticultural Society, "Come to us, as you have done to-night, in a kind and friendly way, and be friends with the British gardener" [cheers]. He then warmly thanked the company for the way in which they had drunk his health [cheers].

Major Trevor Clarke and Colonel Scott both denied that the Council of the Royal Horticultural Society was in any way inimical to the practical gardener.

Phytosmegma.—This is a new insecticide, brought out by Mr. Pooley. We have had it tried on the red spider, and also upon the green aphides which infest the Plum and the Rose, and the black variety which curls up the leaves of the Cherry. It killed all the insects it touched, and a Cherry leaf encrusted with the bodies of the slain formed an interesting object under a magnifying glass. The inventor states that the liquid will not injure tender foliage. We tried it on a young Melon leaf, which is rather a susceptible subject, and it produced no injury whatever. The only thing which showed the slightest injury was the tender top of an Apricot shoot growing under glass. Few things are so tender as this; even water at times affects it. When, however, the Apricot leaf has expanded, the phytosmegma does it no harm.

FRUIT GROWING COMMERCIALLY.

(*Concluded from page* 440.)

Prospects of Fruit-Growers.—Being asked to add some further remarks on the future prospects of the fruit-grower, it will be easily perceived that speculation that way must be liable to the many vicissitudes which befall, more or less, all conjectures. Nevertheless, there are some rules or laws on which a theory may be based, that is not likely to be affected by any but extraordinary changes, and with the first of these may be classed the certainty that the British fruit-grower must in future make up his mind to compete with the continental grower, for the consumer will not willingly surrender an iota of free trade which has already brought such quantities of foreign fruit into the English market. On the contrary, fruit from districts that have never yet sent any may be expected hereafter to reach our shores. The great and increasing accommodation afforded by the railway system on the Continent, if backed by a wise and liberal government, will afford means of transporting to England fruits from a greater distance than has ever yet been dreamed of, the probability being that earlier Cherries than the south of France produces may reach us from Africa, the sea voyage from the French possessions in that country to Marseilles not being a long one, or it may be Turkey, or some other countries bordering on the Mediterranean, may turn their attention to the supplying of the English market. The cheapness of land and labour, aided by a more congenial climate, may enable him to successfully compete with the home grower, whose conditions are just the reverse of these, only he is on the spot, and avoids those heavy expenses and delays incident to a long journey, besides the injuries inflicted on fruit gathered so long before they are ripe, as fruit must of necessity be that is brought all the way from Algeria. But we shall not be surprised at its being sent this distance, or even further, for the spirit of adventure is abroad, and in these days every nation having an article to sell is anxious to dispose of it to the best bidder, so that in future we must not expect merely the competition at present existing between our home-grown fruits and those of some of the countries nearest our shores; for the area our fruits are drawn from is increasing, and the only apparent bar that is likely to be imposed hereafter on the fruits of other countries reaching our markets is the time required on the journey, but that may be lessened more than many are aware of. The opening of the Mont Cenis Railway will enable the journey from the sunny plains of Italy to London to be reckoned by hours, and early fruits may pour in from that quarter in unexpected quantities, travelling by rail being so much more expeditious than by water, and, assuming a good understanding to be come to between the governments of France and Italy, it seems not unlikely but the choicest products of the latter country may find their way here; the journey, far as it may seem, is not more than half that of the great American railway which crosses that continent between New York and San Francisco, and short as the time has been since that undertaking was first opened to the public, the consignments of fruit from the Californian to the Atlantic States, have already told on the markets of the latter, the fine climate of the far west enabling it to compete successfully with the older colonies, although its produce has to be sent over upwards of 3000 miles of rail. With that example before us, we need not be surprised on hearing of fruit being sent long distances to us, the only impediment would seem to be the unavoidable delay in crossing the Channel, and for a time, no doubt, the governments of countries nearest to us, as France or Belgium, might impose some restrictions on goods passing through their territories not being of their own production, but it is likely these difficulties will eventually give way, and the London market be thrown open to and of easy access to the fruit-growers of southern Europe. The intending planter had therefore better keep this in mind, for it is possible the very article he thinks he can send to market at a moderately early period in the season, may have already been there a month from some more favoured land,

and the novelty which always attends the introduction of every kind of produce to table for the first time will have worn off, and high prices will be no longer likely to be realised.

For the reasons given as above, against planting early fruits with the hopes of profit, I would say there is a good one for planting for the late season, for there is less likelihood of competition here. An English Apple in March, when good, far exceeds those of any other country I am acquainted with, although those from abroad look better, but the hot summer of the Continent would seem unfavourable to the Apple attaining that juicy condition which renders it palatable at table as a dessert fruit, or a favourite in the kitchen for its cooking qualities, and I am of opinion we must in future depend on those of home growth for all that is useful in this fruit. Buyers who like an article to look at may be tempted by the more showy appearance of Apples of foreign growth, and it is possible a better class of fruit from the north of Europe may eventually find their way here in quantity, as I have seen very fine samples of Apples from Sweden and Norway at a fruit exhibition, but of their quality I have no knowledge. If they be good, and obtainable in quantity, I see no reason why they should not be sent here as well as fish and other perishable articles from these countries. Once let it be shown that a profit can be made, and the merchant will furnish the article required, be it from the antipodes or the interior of the largest continent, yet I somehow think the home grower will always have the late market season in his own hands, and I would advise his plantations to be regulated to meet that requirement.

It will be easily perceived, that what I have said on the propriety of aiming at the growth of the best keeping Apples in preference to early ones in future, relates to other fruits. Only in the matter of Pears it is likely France and the Channel Islands will compete with us in the late kinds, as well as those in the middle of the season. Plums seem already to have been too extensively planted of late years. The glut of last year will, no doubt, check further increase that way. Damsons, especially, will, I think, be more than are necessary to meet the demand half a dozen years hence; but it is difficult to foresee the public requirements; and were I called upon to plant a large area at the present time, I would certainly have a large portion of it in soft fruits, as not likely to have to compete so seriously with the foreigner, and, if the soil and situation suited, I would plant early Pears and late Apples, omitting altogether both Plums and Cherries, the latter fruit being, in my opinion, likely to be superseded by a superior article from the south of Europe. Of Plums there seem to be plantations enough already. Further, I would again say here, what I commenced with, that I would not recommend the planting of an orchard on any but the best of soils and sites, for, although it is quite possible to make a soil, it is another thing to make a purse, and in the growth of an article where there are so many chances of a failure, it is prudent to make them as few as possible, by selecting only the best sites for an orchard, and if it does not pay on these it will not pay at all; certainly it will not do so on one of an adverse kind.

One more remark may be made on the subject of making orchards pay, and that is one of some delicacy, but it ought not to be omitted, as a remedy may perhaps be found. Cannot the middle man, or men, who stand between the grower and the consumer, afford to live with a less profit than at present received? For the difference between what the consumer has to pay and what the grower receives is certainly out of all proportion to what it ought to be. True, the article is a perishable one, and must be used-up in some way, but it is not more perishable than the carcase of a sheep or bullock, and yet the difference between what the producer receives and the consumer pays in this trade is but a fraction of what is the case in the fruit trade. Why this should be the case I am at a loss to know, unless it be that a reformation in the fruit trade is wanted; for, unless I be wrongly informed, it is in the late-keeping kinds of Apples that these discrepancies are the greatest, and not in the soft fruit. This matter requires explanation at other hands, as well as some other apparently unaccountable transactions in the fruit trade; for, however good the crop of Apples may have been in the country, and the prices accordingly low, it is a notorious fact that an Orange can be bought cheaper in the streets of London after January than an Apple can. The one has to brought some 2000 or 3000 miles, the other 20 or 30, or more, rarely 100, and at the time alluded to the one seems about as perishable an article as the other. One thing must be considered by the home-grower, and that is, if it will pay to import Oranges such a distance to sell in the streets as cheaply as Apples grown in Kent are sold there, what may not competition do when it more especially settles into the Apple trade? Perhaps the best answer to this is, that the trade in Oranges is in a more healthy state; the various parties through which they find their way from the grower to the consumer are each satisfied with a moderate profit, hence the reasonable rate they are retailed at. Why the same cannot be done with home-grown fruits is a question I should like some one else to solve, for upon it depends more of the success or failure of fruit-growing as a profitable calling than on any especial mode of culture, and the sooner the poor householder in London and elsewhere can buy the fruit he wants at a rate not exceeding 50 per cent. more than what the grower receives, the better it will be for all concerned. The butcher receives nothing like this, yet he lives, and the article he deals in is quite as perishable as fruit.

NOTES AND GLEANINGS.

It is most gratifying to state, that the Royal Horticultural Society's Exhibition at Nottingham has been, in a financial as well as in a horticultural sense, the most successful of the Society's country shows. The receipts were as follows:—

	£	s.	d.
Tuesday, June 27th	150	7	6
Wednesday, ,, 28th	395	2	0
Thursday, ,, 29th	624	0	7
Friday, ,, 30th	343	17	10
Saturday, July 1st	393	13	3
	1907	1	2
Season Tickets	600	0	0
Total	2507	1	2

To this amount is to be added the rent of spaces for miscellaneous exhibitions, &c.

—— Lapageria rosea has in most gardens been only cultivated in a greenhouse temperature, and so far from being kept cool, this lovely climber is frequently exposed to a temperature more nearly approaching that of the stove, or of what is called an intermediate house. At Colston Bassett, Nottinghamshire, in the garden of G. F. Davie, Esq., it has stood out of doors four winters not remarkable for their mildness, and it was only in that of 1870-71 that it suffered. It was then killed down to the ground, but is again springing up, and will doubtless be as vigorous as ever. The experiment of planting the Lapageria out of doors in the warm climates of Devonshire, Cornwall, and other southern counties is well worthy of trial, but near London we fear it would fare worse than in Notts.

—— At the dinner given to the Judges of the Crystal Palace Rose Show on the 24th ult., the Rev. H. H. Dombrain, as Chairman, presented to Mr. Wilkinson, who has for many years superintended the flower shows, on behalf of exhibitors and Judges, a very beautiful silver claret jug and cup, and in doing so expressed his thanks on behalf of the subscribers, to Mr. Wilkinson, for his unvarying kindness and courtesy, and his regret that owing to the increased duties devolving on him since Mr. Bowly's death, that he would not be brought into such close contact with them as formerly. Mr. Wilkinson replied in suitable terms.

—— Upwards of fifty of the *employées* of Mr. B. S. Williams, of the Victoria and Paradise Nurseries, Upper Holloway, held their usual summer festival on the 23rd ult., at the Rye House. The toast of the day was their worthy employer, received with hearty cheers and musical honours; this was responded to most appropriately by Mr. Williams, senior, who is a very old and much-respected resident in the neighbourhood, who was of the party by their special request.

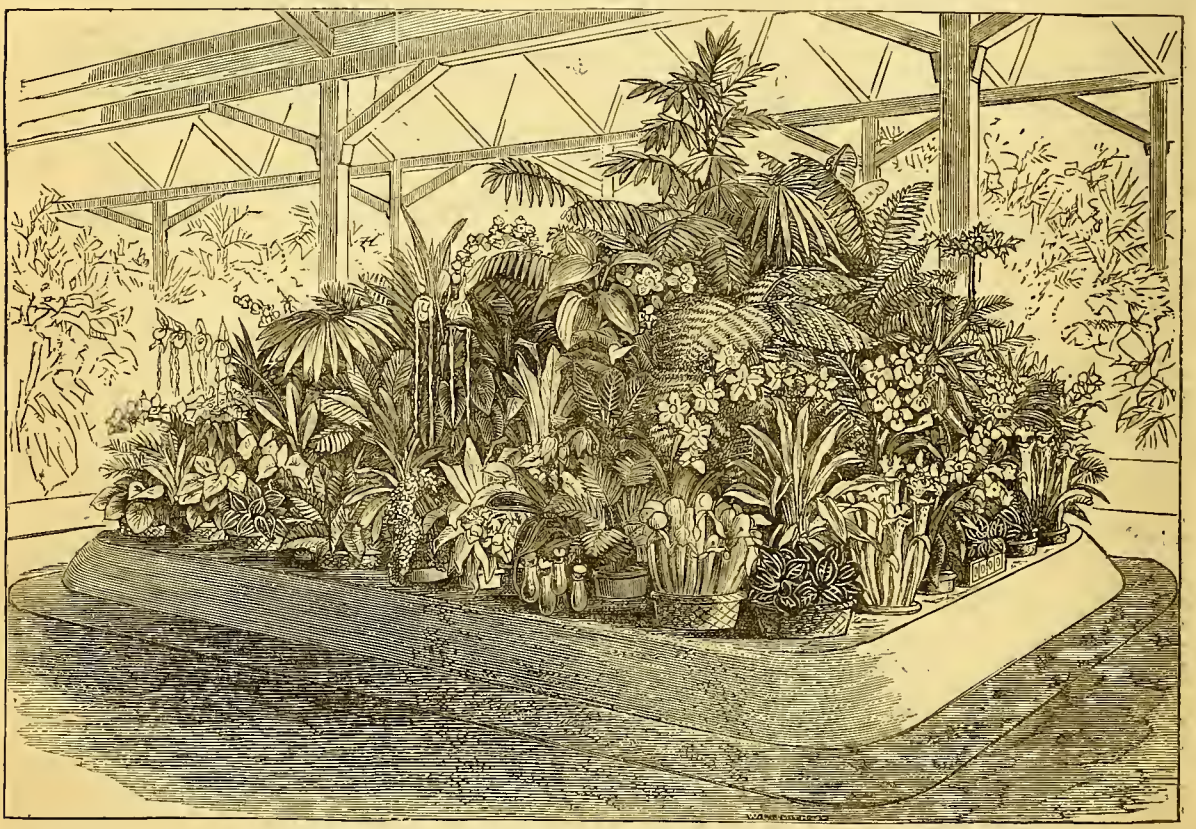
—— In compliance with a requisition numerously and respectably signed by the inhabitants of Chippenham, a public meeting was held at the New Hall, on the 26th ult., for the purpose of considering the advisability of establishing a Horticultural and Cottage Garden Improvement Society. The Mayor presided.

Mr. James Stone, who first brought the matter before the public, said he had been actuated by two motives in asking his Worship to convene the meeting. First, that such a Society would be the means of attracting the inhabitants of neighbouring towns and villages to come and circulate some money in the town. Secondly, that such a Society possessed claims of a much higher and nobler character—viz., the moral and material improvement of the cottagers, and his experi-

ence as secretary of such societies at Lyme Regis and at Calne, for a period of twelve years, had convinced him that such objects might be attained if properly conducted, and if careful vigilance be exercised to prevent any infringement of the rules. They all knew with what different feelings the inmates of a cottage were regarded—those whose gardens are well kept, and those where, to use a Wiltshire phrase, all is in a "muggle." The Rev. J. Rich (vicar), endorsed all that Mr. Stone had said, and proposed that a Horticultural and Cottagers' Garden Improvement Society should be established. The Rev. A. Headley, who for a long time past has been connected with our Journal, expressed himself in favourable terms of the formation of such a society. He considered such societies did great good, and if a show took place he should like to see plenty of bunting displayed in the streets, bell-ringing, and so on, to draw the people out. There was no lack of cash in the neighbourhood, and also a large number of gentry who would be able to contribute largely to the show by sending their choice flowers and plants. He had great pleasure in seconding the proposition, and should be happy to render any assistance that lay in his power. The Mayor put the proposition to the meeting, and it was carried unanimously. He expressed his willingness to allow the show to be held in that portion of Mouckton Park occupied by him, if agreeable to Mr. West Awdry.

MESSRS. VEITCH'S GROUP OF NEW AND RARE PLANTS AT THE NOTTINGHAM SHOW.

The accompanying is a representation of the beautiful group of plants exhibited by Messrs. Veitch at the Royal Horticultural Society's Show at Nottingham—a group not merely remarkable for the beauty of its arrangement, but equally remarkable for the beauty of the plants composing it, and the perfection of culture which they displayed. Last week we gave a meagre list of the plants of which it consisted, and figured one of the most prominent, the Darlingtonia californica, and we then remarked that as regards arrangement, rarity, and quality it was the most perfect group we had ever seen. As such we have thought its appearance deserved to be preserved as a *souvenir* of the great exhibition which has just closed, and as such we present it to those of our readers who were there present; while to those who were not so fortunate we would remark that though no effort of the artist, without the aid of colours, could give a just idea of the effect of the group, the engraving, being truthful and admirably executed, will afford at least some idea of its beauty as a whole.



SOME PREDATORY INSECTS OF OUR GARDENS.—No. 11.

Of all the butterflies which haunt the woodland spaces, perhaps the most charming in appearance, and not far below others in the gracefulness of their movements, are the species known popularly as the Fritillaries. This, perhaps, may seem an irrelevant observation, so let me explain. Undoubtedly there are some sincere lovers of Nature to be found now amongst gardeners as well as agriculturists; yet the admiration with which an individual regards a beautiful object is likely enough to be lessened when he finds, or is told, that the thing in question is, in some way, injurious, and interferes with his particular pursuit; therefore I was sorry to see what I must regard as an unfair accusation brought against the fair Euphrosyne, otherwise called the Pearl-bordered Fritillary. The author of a well-known and excellent book upon gardening classes this amongst the enemies of the horticulturist while it is in the larval state. It devours, so he says, the cultivated Violet, and he recommends hand-picking as the remedy. But the butterfly is so exceedingly partial to woods and shady places, and usually so very restricted in its flight, that it rarely visits gardens, and certainly might deposit eggs there, yet I am inclined to think the instances of this are so few as to be quite exceptional. Mr. Newman, in his remarks upon the species, says that it is a very difficult caterpillar to find, dropping from its food-plant at the slightest touch; therefore hand-picking would not be of much service were any remedy needful. Nor are there two broods each year, as stated in the book in question; the young caterpillar hybernating and becoming adult in April. So that, by misapprehension doubtless, this elegant butterfly has been placed in the list of destructive insects, from which it should surely be erased.

The numerous species of the genus Salix, which are so interesting (or so teasing) to the incipient botanist, have their claims upon the attention of the gardener too. For the purpose of scientific study, or for curiosity merely, the Willows have been occasionally cultivated to some extent, originating, in fact, a name, "Salicetum," which has been applied to a nursery or plantation of these trees and shrubs. In such a place at Vienna three hundred kinds were reported to have been distinguished, and at Woburn, in our own land, 160 species, in the Duke of Bedford's grounds, of which an account with figures appeared in 1828. But in what a variety of ways do we find Willows and Osiers, after they are cut down, brought into everyday use by the gardener! As poles for fencing, as handles for various implements, and as props, the longer shoots and branches are often handy. The slimmer twigs are used freely, as every frequenter of our London vegetable markets knows, for tying up in bundles a variety of garden produce; and in the garden itself these same shoots bind trees and shrubs to walls or supports. Nor are the growing Willows without their uses too. Employed in hedges, these plants answer well in both dry and moist soils, and consideriog their rapid growth, I have wondered that gardeners in our suburbs do not more frequently make Willow hedges. The White Willow (S. alba) has been especially commended as an admirable screen for plantations of young timber trees. Dispersed here and there in a garden, be it flower, fruit, or kitchen, it is unquestionable that Willows or Sallows are an improvement, looking at the spot from an artistic point of view; and if S. caprea, the Goat Willow, be introduced, the flowers, which are very beautiful, will benefit the bee hives, should the gardener be an apiarian too. The Weeping Willow (S. babylonica) is familiar to most of us, as seen in pleasure grounds and cemeteries. About the west and south of London I have seen with regret the grubbing-up of some, which I thought might well have been spared; and one of the pleas put forth in favour of their removal has been that they harbour much blight—insects, especially, I presume, being thereby intended. And it must be granted that few trees could be indicated which are more exposed to the attacks of different species belonging to almost every order of insects, and infesting, in turn, every part of the Willow, from the topmost twigs down to the root. Possibly, too, some of these, being first attracted to a garden by the presence of Willows, might afterwards distribute themselves over other plants or trees. This would hardly be likely, however, to be a very frequent occurrence, and the greater proportion of the Willow-feeders are confined to that, or to allied species, such as the Poplar. But the inroads made upon it by these marauders tend sadly to mar the appearance of Willow hedges, and the trees grown for ornament frequently display denuded branches or a decaying trunk, from whose wounds exudes decomposing sap, and around which lie fragments of bark and wood, trophies of the execution done by insect jaws. Only a few days since, passing through some market gardens near Putney, I noticed a hedge, composed of Salix alba and fragilis, which had been nearly stripped of its leaves. The individuals which had done the work had departed, but from the appearances I conjecture that some species of Saw-fly was responsible for it. The pseudo-caterpillars, as they are called, of the Saw-flies are to be seen more or less plentifully upon Willows and Osiers most years, and along the banks of the Thames they do some damage to the Osier beds, for they will gnaw the shoots as well as the leaves. Unpleasant-looking creatures are they, with their globular shiny heads and flabby bodies, the anal extremity of which is usually lifted in the air. These feed in parties, and so exposed that one would expect they would become frequently a prey to birds; though some do, I do not think many are thus disposed of. These Saw-flies belong to the family of the Tenthredinidæ; the females being provided with a peculiar instrument by which the eggs are deposited on the plants they selected, the leaf or twig being usually slightly punctured, though in a different manner to that produced by the auger of the Gall-flies. The caterpillars of these flies (and though called flies, we must remember they have four wings, and are next-of-kin to bees, yet stingless, however formidable their taile may appear), can be easily picked or swept off the trees when of some size, but then they have often done a good part of their injurious work upon the leaves. The digging-up of the earth round the trees has been recommended, if it be done at the time the insects are in the pupa or chrysalis state, when they generally enter the ground.—J. R. S. C.

Militæa Euphrosyne.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Take advantage of dry weather to eradicate any weeds that may have sprung up during the late rains; and when the soil is not sufficiently dry for hoeing, hand-weeding should be adopted. As the production of strong *Asparagus* next spring will mainly depend on the culture in the summer, let the beds, after being cleaned, be mulched with short grass or half-rotten manure. Liquid manure, in which a portion of salt has been dissolved, should then be applied freely for the next month or six weeks, or the salt may be spread over the beds, to be washed in by the rains or waterings. *Globe Artichokes* and *Sea-kale* will be improved by similar treatment. Should the weather become suddenly dry, water freely *Cauliflowers*, *Lettuces*, *Radishes*, and other vegetables which require to be grown quickly to have them crisp and tender. We need scarcely add that in all cases vegetables will be improved in size by giving manure water, if it can be obtained in sufficient quantities for all purposes. Continue planting out Celery as required, and the early crop may have a slight earthing-up, having previously taken off any lateral buds and well watered the rows. Sow a good supply of the earlier *Cabbages* or Chappel's *Colewort* for autumn and winter supply. *Endive* should now be planted out and another sowing made. A crop of *Parsley*, to stand over the winter, should now be sown in a dry sheltered spot. Every yard of ground that can be spared should be prepared and planted with winter vegetables. Stir the surface of the soil amongst all growing crops where practicable; it will enable the rain to percolate through it with greater equality, as well as check vegetation.

FRUIT GARDEN.

Most kinds of fruit now ripe or ripening will require the protection of nets to preserve them from birds, which in most country places are troublesome neighbours. As the early Cherries are gathered, shift the netting to other kinds yet to ripen. Peaches and Nectarines should have their final thinning when the stones in the fruit become firm and hard, as all the risk of their dropping during the stoning process will then be over. Vines against walls should be closely nailed to the wall to obtain what benefit of the little heat that can be had this cloudy summer. Figs must be treated the same, pinching out the point of the current year's wood, except the leaders, when they have made five or six joints. The breastwood may now be removed from Pears and Plums against walls, cutting away only a portion, say the upper part, of the tree first, then after an interval of two or three weeks another portion, and finally finishing by a third cutting of the lower part. By this plan there will be less danger of the cut-back shoots starting again, and the lower shoots, which are generally the weakest, will gain additional strength by being allowed a few weeks longer to grow. When Strawberry plants have ceased to bear for the season, and have borne on the same ground for three successive years, they ought to be trenched down, and the succession kept up by making fresh plantations of those that have been forced, taking care that the soil is trenched and well manured at least 2 feet in depth. Currants that are growing against walls or other fences ought now to be matted over to protect the fruit for use in autumn and winter. See that the shoots of young grafts are nailed or tied up as they advance, to prevent them being broken by the wind.

FLOWER GARDEN.

The recently planted beds will still require watching to get the plants in them fairly on the start. The heavy rains have chilled the ground, and some of the more tender or badly rooted subjects look sickly. The surface soil in some situations will have become hard and crusty after the late heavy rains, in which case the crust should be broken and neatly raked over when dry weather sets in. Proceed with pegging and otherwise training growing plants as they advance till they occupy their allotted space, when more freedom of growth may be permitted; but in flower gardens laid out in the French or geometrical style the utmost symmetry should be preserved, if not in all the beds, yet in those that may be termed counterpart beds. As the grounds and shrubberies are much more frequented by company at this season, pay the more attention to keeping the

greatest neatness and order in every part where there are hands to admit of it. Flowering shrubs as they go out of bloom should have the dead flowers, &c., removed and slightly cut back. For the same reasons remove the seed-pods from Rhododendrons, tree Pæonies, &c. These little attentions will be followed by an increased growth of the plants and with the greater certainty of their blooming next season. The propagation of Carnations, Picotees, Cloves, &c., should no longer be delayed. Hedges should be cut with the shears, unless when formed of large-leaved plants, as Laurel, Turkey Oak, &c., where the knife only should be employed, as the leaves look badly when clipped with the shears. As a deciduous plant for hedges nothing is better than the Turkey or hybrid Lucombe Oak; and the Taxodium sempervirens will be found a most eligible plant for making evergreen hedges, as it grows quickly, bears the knife well, and has an agreeable appearance. Tulips may now be taken up. Allow the skin and roots, after carefully removing the soil, to remain; these can be better taken off when the bulb is dry. Store them away either in cabinets with the drawers properly numbered, or put them in thin paper, allowing them to dry gradually in an airy shady place.

GREENHOUSE AND CONSERVATORY.

Hardwooded plants, including most of the genera from New Holland, which bloom early in the spring, and which, after blooming, received the necessary pruning, &c., will now be so far advanced in their growth, that any requiring to be repotted should at once have a shift. After turning them out loosen the outside roots before replacing them in their new pots, to enable them to take to the fresh soil the more readily. Keep them close for a few days, especially if the roots have been much disturbed, and damp them once or twice daily overhead; water carefully at first, taking pains to insure the old ball having its proper share, until the roots become established in the new soil. Attention at this season should be directed to the stock of plants intended to furnish the supply of bloom during the next winter, as it is requisite plants should complete their growth early for this purpose. Among Heaths, those which flower through the winter should be encouraged to complete their growth, as they are great favourites in most places; a considerable number of such kinds as E. hyemalis, Willmoreana, gracilis, vernix, regerminans, &c., should be grown. Continue Epacrises under glass till their growth is complete, but more air and light should be allowed them, increasing it as the wood becomes firmer; towards the end of the month they may be placed out of doors in any open situation, but where they can be protected from heavy rains. Balsams, Thunbergias, and other annuals intended to decorate the conservatory and show house for the next two months should be finally potted, using soil of a light and rich description. Keep down red spider with the syringe, and maintain the plants in good health. Thunbergias and other climbers should be neatly trained to their respective trellises as they advance. Kalosanthes and Calceolarias are now in full beauty. Watch the green fly, and fumigate on its first appearance. A few of the more forward Gladioli and other Cape bulbs, Lilium eximium, auratum, and lancifolium should be introduced to supply the places of Pelargoniums now on the wane. Brugmansias and similar plants of vigorous habit should be frequently assisted with manure water; as they are often troubled with the red spider, the engine or syringe must be constantly at work to keep it down, taking care, however, not to injure their fine foliage.

STOVE.

Besides the above, such stove plants as are intended to flower at the same time, including Justicias, Eranthemum pulchellum, Euphorbias, Jasminums, &c., should be looked at. Many of these plants, for reasons formerly stated, require to be kept in small pots, and such should be watered with liquid manure to grow them on without potting them into too-large pots. Others may have a shift, but they will bloom more freely by being kept rather under-potted. Several kinds of Gesneras are valuable for the same use, and should be grown for winter flowering. The last batch of Achimenes may now be potted and kept in a close frame for a late show of bloom. Encourage plants now established by liquid manure. Young plants growing into specimens will require constant stopping and tying-in to get them into proper form.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

The morning of June 25th was one of the most trying of the season, the frost having browned some of the best leaves of the Coleus, which we had exposed fully to harden off before filling the beds and lines at once with good-sized plants. Dwarf Kidney Beans also suffered a little, but nothing else seemed to do so, with the exception of a few leaves of Iresine Herbstii. We have done nothing in the kitchen garden, except routine work, providing for successions, and gathering abundance of Peas, and dwarf and Mazagan Broad Beans. We planted out some beds of large Celery plants in fine condition, raising them with large balls, and planting them in well-aired decayed dung and soil, the heavy showers enabling us to dispense with all waterings. The rains have done wonders for Peas, Cauliflowers, Cabbages, Lettuces, and Onions, the last of which, as well as Carrots, Parsnips, and Potatoes, seem as yet promising for the season.

FRUIT GARDEN.

Owing to a press of work we have not got on so far as is desirable with shortening and nipping the points out of the shoots of fruit trees. We netted Strawberries, as the birds are bad enough now, and will attack them more when dry weather comes. We have seen comparatively few blackbirds and thrushes since the rains, soft food in the shape of worms and molluscs being so plentiful in the meadows. Late Cherries had also to be netted, or the chance of gathering would have been small. The crop on walls has been very heavy. The crop on some dwarf standards, which used to bear heavily, has been next to a failure. For almost the whole time the trees were in bloom the flowers were either wet or slightly frosted, and in consequence most of the bloom, footstalks and all, dropped off. There was not enough of frost to injure them if the bloom had been dry. We find, too, that on some Apple trees which set their fruit very thickly, a good many little fruit have dropped, owing to the wet and cold. Melons have been very good after the change from the dull drizzling weather. A few hours of bright sunshine afford to fruit what no artificial heat can supply, though that and fresh warmed air judiciously applied can do wonders.

Peach trees with their fruit swelling have been rather freely watered with manure water or sewage. Peach trees ripening have had less water, but those from which the fruit has been gathered have had a watering, as it is desirable to have the wood more plump and well swelled out before submitting it to a drier more maturing process. There is a slight mistake near the bottom of the third paragraph, col. 1, page 463; the words "sound fruit" should be "thinned-out fruit." We had pretty well the scores named of ripe fruit at a gathering. The scores alluded to were those thinned-out previously, and they were few in number, as the imperfect setting in the dull weather rendered much thinning unnecessary. The improvement in the weather has told on the setting and swelling more freely of the Vines in the orchard house.

Unheated Glass Cases for Orchard Houses.—If not particular as to the time of the fruit ripening, provided you give plenty of water to the roots, and keep the shoots and leaves healthy and free from insects, you may leave air on night and day, and the fruit will ripen about the same time as, or just a little earlier than, it would do on the open wall, and with little extra trouble in management. We are now speaking chiefly as to Peaches, Nectarines, Plums, &c. If you wish to have very late fruit of these and the later Plums—that is, to come in after the fruit is gathered from the wall, then, after the fruit is set and swelling, not only leave on air when safe night and day, but slightly shade the house or have a double glass roof. We have not done so much in this way as we could wish, but that little convinces us that with a slightly shaded or double roof in the warmest months of summer, and a free circulation of air, we should find little difficulty in gathering Peaches and Plums a month or more later than we could have them from the open walls, and being defended from autumn rains, &c, the flavour would be vastly superior. When we wish to use our unheated glass case in order to forward our fruit, we must take a little more pains in regulating air, so as to take advantage of the sun heat. In sunny days most likely all the air-ventilators may require to be open from 9 A.M. to 3 P.M. in June, July, and August. If early rising cannot be depended on, it is safest to leave a little air all night; but then the house may be damped and shut up early in the afternoon, and a little air at top may be given in the evening. It is less the regular heat than the high temperature from sun heat that brings the fruit forward. Still, if the air can be given early, however little, in a morning, before the sun tells much on the house, the fruit will swell faster, if after the house is shut up, say between three and four o'clock, with sun heat, it remains shut until morning, as there is genc-

rally a considerable amount of air that will find its way into orchard houses independently of air-giving. There is no cause to be alarmed at a high temperature during the day from sun heat, if air is given early, to prevent the chance of the accumulation of heated, confined, scalding vapour. Providing the temperature rises gradually, fluctuates, and falls gradually, and there is no chance of confined heated vapour, there will be no danger. There is no heat so cheap as sun heat, and if you wish to hasten maturation by its aid alone you must make the most of it by giving less air morning and afternoon. Orchard houses that fall to 45° or 55° at night in June and the beginning of July, would rise with air given early, though not in abundance, to above 90° by midday; but other things, as moisture, attended to, there would be no harm done, and such a house damped and shut up before 4 P.M. would retain a good deal of warmth in the first hours of the evening. No inconvenience, but quite the reverse, is experienced in consequence of the plants having a great but safe difference of night and day temperature. The comparatively cool temperature at night relieves them, and presents them with more of their natural condition than if, as used to be in forcing houses, the night and day temperature were more uniform.

For the early ripening of Grapes in unheated glass cases, even when such early kinds as Hamburghs, Muscadines, and Sweetwaters are grown, it is best to make the most of the sun heat early in the summer. It is judicious to keep the houses as cool as possible in spring, with abundance of air, until the Vines have broken freely, but after that the more they are assisted with sun heat the sooner and better the Grapes will ripen, and the sooner they are ripened the better they will hang, if that should be desirable. Making the most of the sun heat in July would be of much more advantage than it would be to do so in September and later.

Where there are two orchard houses, and one with Vines as well as Peaches, it is best to make the latter the earlier of the two, as the shutting-in sun heat to forward the Peaches will be just what is wanted to forward and mature the Grapes.

In late vineries, where the fruit is intended to hang throughout the winter, it is now better to give fire heat in cold weather, so as to hasten maturity, instead of giving such artificial heat in the autumn when the sun is losing its power. The sooner such late Vines mature their fruit the better it will hang if a somewhat dry atmosphere be then maintained.

ORNAMENTAL DEPARTMENT.

We have now planted out our beds of Coleus, &c. We have already stated how some of the finest leaves were browned on a number of plants on June 25th. We question if they would have suffered so much if they had been planted out, instead of standing in pots to be thoroughly hardened-off. We have frequently referred to the fact that plants standing in pots are more likely to be affected by the extremes of heat and cold than those planted out. Hence, even on the outside of a cottage window, plants will thrive better and require much less attention, if planted out in a box—ornamental or otherwise—than they would do standing singly in pots. These Coleuses furnish a case in point. Wishing to have enough and to spare, we struck a good many late, four or five in a common 60-sized pot. Not wishing to be troubled potting them, we planted them out in a bed when struck, at about 7 inches apart, and placed some sashes over them for a few weeks; thus treated they soon made fine, bushy, dwarf plants. These have been fully exposed for more than three weeks—rather more exposed, in fact, than those in pots, but they suffered so little in comparison with the pot plants that we have left many of the latter alone, and supplied their places with some scores, we might say a few hundreds, of these rather smaller but better-coloured plants, raising them with good balls, as for this purpose they make masses of fibres as freely as a Calceolaria.

This simple fact also points to the importance of defending the pots of tender, and especially hardwooded fibrous-rooted plants—as Heaths, Epacrises, and Rhododendrons, alike from bright sun and low temperatures. A pit will thus be better than the open ground. Any simple material which will protect the pots, if not plunged, will also be of advantage. We have known some fine Rhododendrons in pots greatly injured by a bright sun beating on red pots, and thus burning-up the fine roots close to the sides of the pots. When such pots are left too long unprotected out of doors, much injury is often caused by the burning of the roots. Azaleas and Camellias often suffer from the roots being frosted, from the plants in pots standing out of doors too late in the autumn, and then there are endless inquiries as to the cause, when flower-buds fall or shrivel-up.

But to return to the Coleus. What beds we made we filled-up at once with strong bushy plants, and we hope they will be all right for the season. Four are edged with the white-leaved Centaurea, and four with Polemonium cæruleum variegatum. We do not like to do, and undo, and do again, but we did so in the case of the Polemoniums. They had been planted five weeks, but unfortunately, too far—15 or 18 inches—from the grass edging, and they were also planted quite high enough. Our general distance of edgings from grass is 1 foot, and this brings the plants quite close enough to the grass long before the season is over. Thinking it over, and finding no plan better, we raised these Polemoniums and planted them deeper and nearer to the grass lawn. Besides the labour, there was no other difficulty, as the plants had rooted well, and could be lifted with large balls, and when watered showed no signs of their being moved. Such things must be done at times, however undesirable, as, if these Polemoniums had been let alone, the autumn would have come before the fine foliage had covered the earth between them and the grass, and half the beauty of the beds would, therefore, have been destroyed. These beds lend a great charm at once to a composition group, as before they were introduced the masses of yellow Calceolaria were rather too obtrusive. We shall even now have too much of yellow and orange until we have more bloom on masses of scarlet, and pink, and various-coloured Geraniums, which will not be what they ought to be until we have a little more bright weather. The rains have done much in exciting free growth in Geraniums, but as we plant rather thickly, what we want is more massive bloom. The rains have just suited the Calceolaria, and though many blooms were washed off, there are still fine masses and plenty of bloom-heads showing. To our eye there is nothing that makes-up for the want of Calceolarias in a composition group. There would be fewer failures if it were borne in mind that no amount of bright sun will injure them if the roots are kept damp and cool.

As soon as the ground shall be a little warmer we shall endeavour to mulch our Calceolarias, as by this means with the least, or a minimum amount of watering we shall secure comparative coolness and moisture at the roots. Our plants did well all through the dread dryness of last summer when much watering was with us out of the question, and we attribute their flourishing almost entirely to the mulching and the frequent breaking of the surface of the mulching with a hoe. The mulching was chiefly half-rotten dung and leaves broken rather fine with the points of a fork. This does very well for the middle part of beds, but for the outsides the material should be more decayed and be sifted through a coarse sieve for neatness, and if a little lime and soot be added birds will not care so much to scratch it about in search of worms.

We went on with potting, regulating, changing, cutting-making, &c., as indicated in previous notices. The frost made sad blanks among established plants of Cloves, and Carnations so useful to cut in armfuls, but Pinks well established have been very useful. We must put-in a lot of pipings or cuttings. Large pieces with a space of the old wood will strike in a shady place if time be given. Small pieces with a joint or two from the top will strike freely in sandy soil under a hand-light. Oiled paper as a cover does well. For such cuttings we save labour and time by rarely using a knife. Take hold of the shoot of the Pink or Clove, near its base, with one hand, so as to hold it steadily, catch the upper part about the second joint firmly with the other hand, give a sharp pull, and out comes the cutting clean from the joint or node, wanting nothing in general but to be dibbled in and receive a little protection. The cuttings, cleaner at the bottom than made with a knife, can thus be taken in as short a time as the process is described.—R. F.

TRADE CATALOGUES RECEIVED.

James Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, London, S.W.—*Catalogue of New and Beautiful Plants.*

Joseph Meredith, The Vineyard, Garston, Liverpool.—*Catalogue of Stove and Greenhouse Plants, Bedding and Ornamental Plants, &c.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All

communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Abnormal Mimulus (*J. R. G. G.*).—We never saw one similar. If propagated from, the progeny would probably revert to the normal form.

Herbal (*Cheshire*).—There is no herbal with coloured plates such as you name.

Who is a Cottager? (*Gorm's House*).—"What is a cottager? Does any person living in a cottage, and occasionally employing skilled labour, come under this head?" Certainly not. When a committee of a local horticultural society offer a prize or prizes for cottagers to compete for, they mean those who are not gardeners, and who earn their living by manual labour, and cultivate their gardens by the aid of their own families only.

Seedling Roses (*H. Curtis & Co.*).—Your blush Hybrid Perpetual Rose, Bessie Johnson, is very fine, very vigorous in growth, and certainly is well scented. We much admire also the seedling from Charles Lefebvre; in colour it equals Général Jacqueminot, in doubleness surpasses it. Whether it equals it in other excellencies, of course we cannot say.

Crystal Palace Rose Show.—Three of the first prizes for amateurs were won by R. N. G. Baker, Esq., Salutary Mount, Heavitree.

Petals of Roses (*J. F. K*).—See what we said last week about the Pot-pourri.

Variegated Ash (*W. French*).—Your specimens are nicely variegated, but we have seen the leaves of the Ash tree even more variegated—almost white—after a severe winter. There is already a permanent variegated variety to be had in the nurseries.

Replacing Picea Nordmanniana Leader (*Sigma*).—We should train one of the side shoots erect, choosing the strongest and most likely to form side shoots. It is probable that the tree would in a year or two form another leader, which is far preferable to a lateral or side branch, which at best is little more than a branch, and does not put out side shoots all round like a leader, but on two sides only. However, train up a side shoot, and if another leader be formed you can remove the branch, while if no leader be formed you will gain time.

Pelargonium Treatment (*J. B. S.*).—Place the plants out of doors in an open but sheltered situation, and water sparingly. In the second week of August cut back all the shoots to within two or three eyes of their base, and the second week in September shake the plants out of the pots, and place them in others a size less. Place them in a cold frame with a moderate amount of air, and shade for a few hours if the weather be bright. Remove them to your house at the close of September, and place them near the glass, giving abundance of air. For flowering at the end of May they should not be stopped after the last week in April. You will find full particulars in "Florists' Flowers for the Many," free by post from our office for five stamps.

Select Double-flowered Pelargoniums (*T.*). — Camelliæflora, Victor, Wilhelm Pfitzer, Victor Lemoine, Madame Lemoine, Cottingham or Double Tom Thumb, Abundance, Vanguard, C. Glym, Grenadier, Dauntless, and Cavalier.

Sowing Seeds of the Fir Tribe (*Idem*).—Sow them in March in good rich loam, sandy rather than heavy, and in pans well drained, covering the seeds with fine soil to a depth equal to their diameter. Set the pots or pans in a cold frame in a shady place, but not under trees, or the position may be sunny if the lights are brushed over on the inside with whitening and milk. Keep them just moist, and when up admit plenty of air. The hardier and common kinds are best sown out of doors in sandy soil in a sheltered position.

Wintering Plants in a Cold Pit (*F. G.*).—Of the plants you name, Camellias, Begonia Veitchii (probably quite hardy), Daphne Fortuni (also hardy), may be wintered safely in a cold pit, and the Grevilleas, Daphne indica, and Mesembryanthemums of the hardier kinds, may be wintered there with protection in severe weather. The Paulownia imperialis does not flower either from the wood not being sufficiently ripened, or your climate being too cold. Perhaps if it were planted in warm, well-drained soil the wood would be sufficiently ripened for flowering. If you were to take it up and plant it in a tub, that would probably induce flowering. Roses of the Hybrid Perpetual class are best struck without heat, taking ripe shoots just after flowering, or early in July, when the flowering is over, placing them singly in small pots, and setting them in a cold frame, where they should be kept close, shaded, and sprinkled with water every morning. These will be rooted in about six weeks; then admit air, gradually harden off, and transfer to larger pots in September.

Plant Habitats (*R. G.*)—Croton variegatum, nat. ord. Euporbiaceæ, East Indies. Chamærops humilis, nat. ord. Palmaceæ, South of Europe. Phœnix reclinata, nat ord. Palmaceæ, Cape of Good Hope. Sabal Adansonii, nat. ord. Palmaceæ, Florida. Cissus discolor, nat. ord. Vitaceæ, Java. Maranta zebrina, nat. ord. Marantaceæ, Brazil. Anthurium cordifolium, nat. ord. Orontiaceæ, Brazil. Musa Cavendishii, nat. ord. Musaceæ, China. Phœnicophorium sechellarum, nat. ord. Palmaceæ. The Musa is probably vittata, having white stripes or bands on the leaves. It is very fine. It is from tropical Africa.

Acorn Growing over Water (*J. W.*).—We presume the radicle or root is already in the water, and that it is the shoot that nearly reaches the cork of the bottle. If so, remove the cork and allow the shoot to grow upwards, placing some charcoal in the water to keep it sweet. If you wish to keep the plant any length of time, it will be necessary to take it out and pot it in loam.

Woodlice in Garden (*J. R.*).—We do not know of anything that will so effectually clear a garden of these pests as a few bantam fowls. It is necessary to have them with their claws in "boots" of leather, so as to keep them from scratching. Toads are the next best destroyers of woodlice. We know no wholesale mode of destruction.

Vine Leaf Yellow (*B. H. Margetts*).—On the leaf enclosed to us there is no trace of mildew or insect pests, and we think the leaf has simply assumed its sere condition by the stopping of the channels of the leaf-stalk. It is not uncommon, and you have nothing to fear on that account. From the size of the leaf we think your Vines are very healthy and have good treatment.

Pinus austriaca Seedlings Damping-off (*Somerset*).—The plant sent to us is "black-legged," or damped-off, from want of air and too much water, and probably the plants are crowded. Remove them at once to a cold frame, and in a few days place them outside. It is the hardiest of all Conifers, thriving where no other will. The leaf of Gloire de Nancy Geranium is perforated in consequence of some injury which it has sustained in a young state, and the hole becomes larger from the growth of the parts surrounding. The beetles are not of a kind injurious to garden plants, and we only name such.

Grub on Asparagus Stems (*D. H.*).—It is the grub of the Asparagus beetle (Crioceris asparagi). The stems of Asparagus are robbed of their bark, and the future produce of the plants proportionately weakened, by this small, brightly-marked beetle, of which we give a drawing, showing it of its natural size and magnified. The Asparagus beetle is rather more than a quarter of an inch long; prevailing colour blue-black, upper surface of thorax red, antennæ black, wing-cases edged with orange and varied with cream-coloured and blue-black marks. This beetle is found upon the stems of Asparagus during the summer and until September. The eggs, which are oval and slate-coloured, are fixed by one of their ends to the young spray of the Asparagus. The grubs are soon hatched from these, and are fleshy, greyish green, gradually thickening towards the tail, marked with black spots, and having black legs. They feed on the bark of the spray. As soon as full-grown, after shedding their skin several times, they bury themselves in the earth of the Asparagus bed, forming a parchment-like cocoon, in which they remain, for the most part, throughout the winter, and the beetle comes forth from the cocoon in June. We say "for the most part," because we incline to Mr. Westwood's opinion, that some of the beetles live through the winter. One was found in our garden during May, long before any Asparagus shoots appeared. Dusting the grubs with white hellebore powder destroys them; but it should be applied very early in the morning, whilst they are moistened with dew.

Fruit of Cydonia japonica (*K. L.*).—It is eatable and not injurious, but very unpalatable.

Size of Savoys and Borecole for Planting (*Idem*).—We should not like them more than 6 or 8 inches high before planting out, but if you cannot plant them for some time yet, we would take them up and replant at twice their present distance apart, and the check consequent on removal, with the increased distance, would do much to keep them stiff. It is well to move them with balls wherever it can be practised.

Lapageoia rosea and Ficus elastica Propagation (*C. M. Major*).—The Lapageria rosea is very difficult to strike from cuttings, and is best raised from seed; indeed, plants from layers or cuttings are too uncertain in growth to be of value. Sow the seed in spring in peat, in a hotbed, keep the soil wet, and when the young plants are well-established remove them to a warm greenhouse. Ficus elastica cuttings root freely, also layers, but cuttings are preferable. We usually cut our plants down in spring, and make the shoots into cuttings, taking off the growing point with about three leaves, remove the lowest leaf, cut transversely below that, and then insert the cuttings in two parts sandy loam, one part sandy peat, and one part silver sand, in small pots, tying the leaves together with a view to taking-up less room. The remainder of the shoot cut into lengths of two joints each, remove the leaf from the lowest, and insert singly in 3-inch pots. Place the cuttings in a bottom heat of from 75° to 80°, cover them with a hand-glass, and keep close, moist, and shaded until rooted, which they will be in about three weeks. When the pots are filled with roots shift the plants into a larger size, and in a short time you will have good plants. Now is a good time to put in the cuttings. They strike best with a leaf attached. Eyes strike freely enough if put in like Vine eyes, and placed in brisk heat. They are longer in making plants than cuttings.

Aspidistra lurida variegata Treatment (*A Subscriber*).—It is a greenhouse plant, and does well in a compost of equal parts of light loam, leaf-soil, and sandy peat, with good drainage. Afford it a rather shady position, a good supply of water when growing, and keep it rather dry in winter.

Parsley Fern Culture (*Idem*).—The cause of your not succeeding appears to be the soil. Provide for it a somewhat elevated position in the rockwork, forming it of limestone, and give a compost of two parts peaty soil, limestone, and one part of yellow loam, with one part of limestone broken and intermixed. Water freely in summer, and afford shade from sun. If you grow it in a pot, use the compost above named, keep the plant in a shady part of a cold house, and admit air constantly.

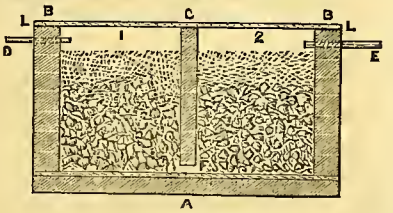
Brine of Pickled Pork (*H.*).—It will be an excellent application to your Asparagus and Sea-kale beds, but as it is saturated with salt you had better put four gallons of water to each gallon of the brine.

Taking Water from a Stream (*W. K.*).—As the stream after passing through your field turns the wheel of a flour mill, you cannot legally interrupt the flow of water so as to prejudice it as a motive power for that mill. There is no equitable objection to your taking water from the stream to water your plants, if not taken in such quantities as to diminish the stream.

Plants' Leaves Turning Yellow (*L. L.*).—We should be better able to answer if we knew the aspect of the greenhouse, whether the sun has free access to the roof or front between the two dwelling-houses. If there

is not a pretty free admission of sunlight, we think your thick-rolled non-transparent glass for the roof was a mistake, and if so, you will have to be satisfied with fine-foliaged plants, Ferns, &c., instead of flowering plants. If the aspect is good, is there nothing wrong in the paint, heating, or early air-giving?

Tanks and Filters (*H. F. M.*).—For your tank under ground, 10 feet long, 5 feet wide, and 5 feet deep, we would not advise you to have less than a 9-inch brick wall, and laid in cement, as well as plastered over with cement, having a portion of clean rough sand mixed with it. If water were a great object we would make the tank larger. You will not be so secure unless you lay the bricks in cement, but the joints may be as thin as you please. The great point in such work is to use hard-burned bricks, and not to lay any of them until they have been soaked in a tub of water for a few minutes after every air-bubble has been spent. Before cement plastering the inside let the bricks be damped again, so that the cement may catch the bricks firmly at once. After being finished it is as well that the tank should stand a few days before the water is admitted. From its being underground there will be no danger of frost injuring the tank; the water will be very clear if filtered, but if it be shut out from all atmospheric influences it will for a time be rather hard for domestic purposes. The filtering is entirely for securing purity and clearness; and for tank purposes and rain water from buildings two filters are better than one. It is no disadvantage to have a large filter, except that the water must stand in it before it goes to the tank. For your tank we should say that from 20 to 24 inches each would be enough, but the larger the filters the more seldom will they want cleaning. The filter thus made is just a little tank divided in two. A would be the base of the filter, laid one brick and tile thick in cement. B would be the end and side walls, at least faced with cement; we would prefer laying and facing in it. C would be the division, brick-on-bed, and there would be little use in laying that in cement. At the base of this cross wall, if from 20 to 30 inches across, there should be three openings at the bottom, say of 4 or 5 inches each, so that the water should pass freely from No. 1 to No. 2. Place these filters in the handiest position as respects the tank. Having finished the walls, commence with No. 1 division, and place some clean pebbles and stones at the bottom, piling them up, but lessening in size as they come near the surface, and at the surface use only clean-washed pebbles and gravel. One reason for having these fine is, that by lifting the stone or slate covering—best if there is a cover for each division—you can remove and renew this fine surface without disturbing the rest of the filter. The water entering from the roofs of the houses by the pipe D, discharges itself into filter 1, and passing down rises again to its level through the openings in the dividing wall, C, into filter 2. This filter 2 should have the clean stones smaller, and for a third of its depth near the top should consist chiefly of finely-washed shingle and clean charcoal free from dust. Lumpy clean charcoal should at least equal the quantity of stones and pebbles in this second division. All this is easily done when the well-washed materials are handy. But for the desire expressed we should not have deemed such details necessary, yet we know of many cases where tanks have been made, and great complaints have also been made of the dinginess of the water from sooty roofs. A little additional expense for a double filter would have saved all such complaints. If in the course of time the filters become dirty, there would be no great labour in taking out all the filtering materials, washing them, and replacing them, with the addition of a little more clean charcoal lumps. It will at once be seen that in a brisk shower the water pours into division I, passes through the openings at the bottom in the dividing wall, C, rises through the stones, shingle, and charcoal in division 2, and passes clear and pure by the pipe, E, into the tank. As to the size of the tanks, we generally under-estimate the water that falls on roofs. In the generality of cases, if it could be saved, it would suffice for the wants of the inmates of the house. (*An Amateur*).—See the preceding answer. Of course that applies to filtering roof water for a rather large tank. For smaller reservoirs smaller filters would answer. We do not know exactly what you want. For mere domestic purposes, where only a small quantity of clear water would be required, a large earthenware vessel, with a cover to it and a tap near the bottom, or even a nice clean barrel, would suffice; but in either case the packing of the interior must be done on the same principle as that recommended for larger filters—the rougher materials at the bottom, and the smaller, clean shingle and washed charcoal near the surface. Unless the water is very sooty or muddy, such will act a good time without requiring cleaning. For a larger affair, where brick would be cumbersome, strong wood lined with zinc or lead might be used. Many underground filters are made with brick and good mortar, and then lined with cement. The plan recommended is, however, the best.



L, L, surface level.

Vines Infested with Red Spider (*E. S.*).—The Vines being much infested we advise you to heat the flue to a temperature of 160°, and then paint it with a composition of sulphur brought to the consistency of thin paint with a solution of 2 ozs. of soft soap to the gallon of water. Choose a calm evening, shut up the house, apply the composition with a brush, doing it well, and two or three times over, so that fumes of the sulphur may be given off, and unless they be so offensive to the lungs as to drive the operator out of the house, they will not destroy red spider. It is well to let the flue gradually cool after keeping it for an hour or two at the temperature named, and in the following morning give a thorough syringing. We should continue the syringing until the Grapes show colour for ripening. Syringe, therefore, forcibly with clear rain water every evening. The best mode of lessening the drying influences of hot air or flues is to have the cover of fire-tiles dished in the centre about an inch to hold water, and that mostly gives off moist heat sufficient to keep down red spider and thrips. You might have galvanised troughs made to be on the flue, and keep them full of water. If 3 feet long, the width of the flue, and 2 or 3 inches deep, they would be sufficient for the purpose if placed 6 feet apart.

Melon Blossoms (*T. M.*).—The female flowers will require your aid to be fertilised.

Nectarine Leaf Discoloured (*G. S.*).—The shining whiteness of the leaf enclosed seems to be a result of the cold sunless weather we have so long had. We have seen several such leaves, and consider the cause to be their development in very dull weather and a moist atmosphere, and the sun breaking forth and changing their colour. Had they been directly opposed to the sun's rays they would probably have been browned—in fact, they generally assume a brown appearance afterwards. Nectarine leaves are more subject to this loss of colour than those of Peach trees. It is not injurious to the trees.

Camellias and Azaleas not Flowering (*H. L. B.*).—The dry heat in winter, unless excessive, would not cause the Camellias to cast their buds, but this evil may have been a result of too little or too much water at the roots, and not unlikely of an inactive state of the roots. The Azaleas could not flower as they had no flower-buds, owing to the non-ripening of the wood. Continue both in the cool house, and afford abundance of air. They will ripen the wood better and be more likely to flower than if they were placed out of doors this cold wet season. The Eugenia Ugni should be kept in a light airy position in a cool house, and have a moderate amount of pot room; indeed, it should be under rather than over-potted. The main point is to secure the ripening of the wood, and for that an abundance of air and light are necessary. The petals of the Roses had all fallen, but we cannot name florists' varieties. They are too numerous.

Tacsonia Van-Volxemi Seedlings Torpid (*E. T. M.*).—The cause of the seedlings not growing is evidently their not being potted-off from the seed-pans until they were 6 inches high, and then into 5-inch pots. They have received a check. Place them in a bottom heat of 70° to 75°, and continue them there with but little water until they begin to grow, and then water so as to keep the soil moist, but let it be dry before giving any, and then afford a good supply. After they have roots reaching the sides of the pots and are growing freely, gradually withdraw them from the hotbed, and harden them off, removing them to the conservatory again, and plant-out in a well-prepared border.

Various Plants (*Idem*).—*Dipladenia amabilis* is a stove twiner, and requires a compost of three parts turfy peat, one part light fibrous loam, half a part each of charcoal, in pieces from the size of a pea to that of a hazel nut, and silver sand, the whole well mixed. Good drainage is necessary. Water the plant abundantly in summer when growing, but in winter keep dry. *Spiræa japonica*, after flowering, should be planted out in good rich soil in an open position, and be well supplied with water in dry weather until the foliage turns yellow, or plunge the plants in the pots in an open situation, and water abundantly in dry weather. *Ixora coccinea* is a stove plant, and does well in a compost of equal parts of sandy fibrous peat and fibrous loam, and one-sixth each pieces of charcoal, broken pots or crocks, and silver sand. Water freely when growing, but keep rather dry in winter. No plants are more benefited by a gentle heat when commencing to grow than are these plants. *Lasiandra macrantha* is a greenhouse or cool stove plant, doing well in an intermediate house. It needs a compost of peat two parts, and one of sandy loam, good drainage, and a good supply of water when growing, and to be kept moist at all times. It is a tall leggy subject, and inferior in every way to Lasiandra macrantha floribunda, one of the finest and freest-flowering of greenhouse plants.

Plant Leaves Mottled (*W. C. H.*).—The Camellia leaf is variegated, a not uncommon occurrence when the roots are in an unhealthy state. It is due to bad drainage or too much water. The other leaves are probably mottled from the plants being kept in a very close atmosphere and very moist, and the sun shining upon them whilst wet causes the discoloration. It may, however, be a result of the late cold weather; it being very dull and cold for weeks, the juices of the plants are ill-elaborated, and are not able to withstand the fierce rays of the sun. Perhaps a little more air, and especially in the early part of the day, would afford a remedy.

Extra Working (*B. B. D.*).—With only one man you must have been worked off your legs to manage such an increasing place, and if you did all that extra work without extra remuneration you are both to be pitied and blamed; to be pitied because you became such a slave to your own enthusiasm, and to be blamed because you did the labour that ought to have devolved on two or three more. We do not think that such long hours of continuous labour as you have had benefit anyone in the end. There are plenty of proprietors who will put up a little extra glass, or enlarge pleasure grounds, if the addition cost them no more to keep up during the year. The gardener who under such circumstances doubles his work, acts with his eyes open. Before he recommends such improvements and additions he should first count the cost to himself, instead of grumbling at being killed with work afterwards. You erred in not seeking help, and we should not be at all surprised if the person who succeeds you do not obtain much, if not all, the help you asked for. If you laboured so hard, and for so many hours, you were doing an injustice to yourself and your brother workmen. With regard to your furnishing most of the plants in the houses, conservatory, &c., the recent decision of a police magistrate will make many think seriously on the whole question of borrowing and lending cuttings, &c., among gardeners, but it will be a sad thing when a neighbourly feeling among gardeners is lessened, even in this respect. However, the tendencies of the times seem to point to the propriety of this giving and receiving being done more sparingly. It, to a certain extent, interferes with the work and trade of the regular dealer. What costs a proprietor little is too often little valued. Whatever is thus obtained becomes at once the property of the proprietor. We have met with instances of men who, like our correspondent, had to leave collections of their own gathering without a word of acknowledgement, and whilst many sympathised, there were not wanting others who roughly muttered. We cannot but come to the conclusion, that for the bulk of plants wanted in a garden, it will be most satisfactory to all parties to go to the market, and more especially as from the severe competition everything, except novelties can be obtained on such cheap terms. We hope our correspondent will be more fortunate in his next place.

Manure from Earth Closets (*R. H.*).—It is not necessary to keep the manure, but it is well to mix it with four or five times its bulk of soil or ashes, and then apply it to the ground, digging it in before planting. The preferable plan is to apply it to the ground before digging, then dig it in, and before planting turn over the ground with a fork. The maggot you

speak of is not produced by the manure, nor is this more insect-favouring than any other kind of manure. The maggots are, no doubt, those which occur in smbury, so destructive to the Cabbage tribe. The best remedy is salt at the rate of about 1 lb. per square yard applied a few days before cropping. For sowing and pricking-out Broccoli, Cauliflowers, &c., the ground should not be rich from recent manuring, as it is apt to cause damping of the stem, or "black-legging," and undue luxuriance instead of a stiff sturdy growth.

Ants on Lawns (*Constant Reader, J. S.*).—To drive away the ants we advise you to give the lawn a dressing with guano at the rate of 2 cwt. per acre, and on the hillock sprinkle a little of the same, as much as can be held between the thumb and two forefingers, and if the hillock is large twice that quantity. They may be destroyed by pouring into the hillocks spirit of turpentine diluted with six times its volume of water.

Caterpillars on Gooseberry and Currant Bushes (*Mary*).—Dust over them fresh white hellebore powder, and next day syringe the trees. Two or three applications will be needed to subdue them.

Name of Plant (*D. M.*).—Bougainvillea spectabilis.

POULTRY, BEE, AND PIGEON CHRONICLE.

POULTRY-KEEPING UNDER DIFFICULTIES.

No. 2.

In recounting my earlier poultry experience, as I did the other day, it is strange even to myself how vividly bygone times and scenes revive upon the mind, and how even the individual birds that at various times stocked the yard of my brother and myself, live their short lives over again, and take me back to be once more a schoolboy with my fowls. I mention it chiefly, because I am inclined to think that if I know anything or care anything about poultry now, it is greatly owing to the fact that I have hitherto always had to be my own poultryman, and have all my life known my birds almost as I have known my friends. I do not undervalue the help of experienced poultry-managers, many of whom it is a real pleasure to me to know and talk with, and whose assistance I would gladly avail myself of were it possible; but I think sometimes that the individual who is compelled to do without such aid, has an indescribable pleasure connected with his fowls which the more fortunate proprietor does not possess. They become almost dear to him, and there is a higher kind of pleasure in having birds perfect of their kind, when year after year you have bred them yourself, mated them yourself, fed them yourself, and, in fine, stamped your own views and individuality upon them. Perhaps from want of means or knowledge you began with only middling stock; then there is a rare fascination in looking over the broods year after year, and seeing how your care and skill are rewarded by the perfecting of beauties, and the banishment of defects, till at last your yard becomes one of the recognised sources for obtaining the best stock in the kingdom. It is in the true sense *your work*, and it may be carried on, and may become known and acknowledged entirely apart from exhibition; for it is a well-known fact that some of the best birds are never shown. It is this spirit I would, if I could, seek to cultivate. I care little about getting more people to try to win prizes, but I care a great deal about getting more to keep and love fowls, and my object in the present two or three papers is to prove that anyone may keep them.

Some of the birds in my schoolboy days were pets indeed. There was one, in particular, which somehow got stunted while with the hen, and never grew much larger than a Bantam. I have never in all my life seen another bird so tame. Some of the elder branches of the family looked upon our poultry-keeping in general as rather a nuisance; but everyone had a kind word for little "Brownie." She would jump up on anyone's finger to be fed, and, indeed, rarely fed in any other way; but for myself her affection was unbounded. Being small she could fly like a bird, and she always did fly whenever I came in sight, making a "dead shot" at me wherever I was, and always alighting on my shoulder. She was an exemplary mother to her own chicks, but a regular little vixen to all besides, and to her sister fowls as well, whom I believe she thought were trying to supplant her in her monopoly of affection. At last she got drowned, which saved us the pain of deciding what to do with her; for it is the worst of having individual pet fowls—no one can bear to kill them. They may become old and unprofitable—no matter, you cannot kill a thing that comes every day to eat out of your hand. For this reason, while I would hae study, and personal interest, and always kindness, I would strongly advise everyone not to make especial pets of his fowls. Pets and profit, in limited space at least, rarely go together.

The limited space, however, brings me back to my small garden, in which my poultry-keeping has now been six years carried on to my benefit both in mind and body. Before that, myself and "Mrs. Nemo" kept our fowls, as in my boyish experience, in a stone-paved yard, and I may say with the same success. They cost us almost nothing, for the potato peelings and kitchen scraps, with a very little sprinkling of meal, were all they needed, and even the chickens cost little more. But I soon became tired of the mongrels we commenced with. I had once had pure-bred Cochins, and the fancy revived again, so we tried first Hamburghs, and then Spanish. The Hamburghs did not do well on account of the confinement, and the Spanish I had not patience for, their faces were such a never-ending trouble and anxiety. So I sold off both at pretty fair prices, and, having been many months studying, and daily more admiring the breed, I determined directly after our removal to keep Dark Brahmas. Had I then had any conception of the celebrity my strain would attain, I would have endeavoured to have secured a house with more ground, but my object at that time was simply in the first place eggs for the table at a low price, and in the second, an out-door recreation, which should benefit my very indifferent health without, if possible, costing money.

I thought at first half our garden might do, and I am sure "Mrs. Nemo" hoped so, but our first success at exhibiting spoilt us, and next season we took up literally every inch of ground. The consequence was, that with really much better birds, for some time I could never win again, the birds being overcrowded, and having no chance to get into condition. For instance, one of the best hens I ever had was hatched from my first stock the first breeding season; but I never could get more than a high commendation for her, though she bred all my best chickens for three years; but when I sold her last year, though then four years old, she won a first prize within six weeks. This has repeatedly been my experience, and I would impress, therefore, on all who may be in similar circumstances, that in such limited space prizes can only be secured by rearing comparatively few chickens. Higher excellence and greater real reputation amongst fanciers may be obtained by rearing more; but unless some friend in the country will co-operate, most of the honours of exhibition must be foregone. An exception may, perhaps, be made in favour of red, brown, or black fowls, such as Spanish, or Partridge Cochins; but as regards any breeds in which white forms a part of the plumage, I do not think more than a dozen or so can be reared to be shown with credit. Competition now is closer than it used to be, and birds that would have won even ten years ago, will not win now. Not only perfection in points, but faultless condition are now necessary, and it is in these small yards chiefly fail. In actual quality I believe they usually surpass the larger ones, perhaps for the reason that the confined space allows of closer study and more careful mating; but in show condition they can rarely compare. For this nothing is equal to grass, and the shade of living trees.

I say all this because I would by no means raise false hopes in anyone. If I were asked, What can be done in such a space as I named the other day? I certainly do not pretend that the leviathan breeders and exhibitors can be competed with in all respects; but with care and study, one of two things generally may be done. By keeping only one first-class breeding pen, and devoting all the other space to grass and chickens, and setting all your own selected eggs, a few birds may be annually reared, which shall carry off honours at the best shows with any competitors; or, on the other hand, by giving up exhibiting, except in rare cases, and devoting the space exclusively to the greatest possible amount of produce, a strain may be speedily established of such a quality that the best breeders shall be glad to secure stock from it for their own yards at high and remunerative prices; and one or two shows annually shall give sufficient honours to dispose of all surplus eggs and stock to general purchasers. I say either of these may be done; it does not of course follow they will be, for there is a natural "faculty" in breeding fowls, and some people do not seem to "have it in them" to really learn the secrets of any breed at all. But a love for the pursuit—a fondness that can survive disappointment and disaster, will generally command success, and will produce better specimens in a few years from very ordinary stock than mere money can do from the very best birds that are to be procured. The hobby, therefore, need not be an expensive one as some imagine, even at the commencement; whilst judgment will almost always make it remunerative in

the end. But I have again reached the end of my tether for this week.—L. Wright.

ELY POULTRY SHOW.

A very liberal prize schedule of this Show called for a response from most of the principal breeders, both of poultry and Pigeons, in the kingdom. The arrangements of the Honorary Secretary, Mr. Holden, were complete, and it would be a difficult task to name a show that was carried out more satisfactorily; the tent afforded ample space and light, and what was of far greater importance, complete protection from the rain that fell in torrents early in the morning; still every pen was perfectly dry, and as there was bright sunshine long before midday, this year's Show will be one of the most successful ever yet held by the Society. The attendance of visitors was remarkably good. Lady Adeane very kindly gave an additional prize for the best pen of any description of poultry exhibited, and no less than fifteen of the first-prize pens competed very closely for it. The trial between the best four pens, respectively Duckwing Game fowls, Black Spanish, Golden-spangled Hamburghs, and Golden-pencilled Hamburghs, was unusually close. As will be seen, the pen of Duckwings was the successful one; it was shown in faultless condition by Mr. Matthew, of Stowmarket. Mr. Russell Hall, of Cambridge, and Mr. Jeffries, of Ipswich, were respectively exhibiting Game fowls and Game Bantams that might serve as examples of condition to any of even the most practised breeders. In the *Hamburgh* and *Poland* classes Messrs. Beldon and Pickles proved the closest of antagonists, adding much to the public interest of the meeting, as so perfect specimens of these breeds seemed but little known in the district. The result was, the prizes thus severely fought for were pretty closely divided. Strange to say, the Grey *Dorkings* were exceedingly poor, but a few pens of White ones made ample amends. Some capital *Crève-Cœurs* were on view, and were here evidently regarded as novelties. The Cambridge *Turkeys* were grand as a class, but the water fowls, particularly the "Fancies," were, as might be expected, in the worst of show trim.

The *Pigeons* showed to great advantage in Billott's well-known exhibition pens; all the highest classes were well filled, and a few very well-shown Toy, Ice, Hyacinth, and Spot Pigeons added greatly to the attractions of this division of the Show.

Although no prizes were offered for *Rabbits*, Himalayan and Angoras could not be better represented.

Dorkings.—*Coloured.*—1, E. W. Southwood, Fakenham. 2, H. Yardley, Birmingham. *c*, G. S. Hall, Ely. *Any variety except Coloured.*—1, W. J. Woodhouse, West Winch, Lynn. 2, Rev. F. Tearle, Gazeley Vicarage, Newmarket.

Game.—*Black-breasted or other Red.*—1 and 2, S. Matthew, Stowmarket. *hc*, F. R. Hall, Cambridge; H. E. Martin, Fakenham. *Any other Variety.*—1 and 2, S. Matthew.

Cochin-China (Buff).—1, H. Yardley. 2, No competition.

Crève-Cœurs.—1, J. J. Malden, Biggleswade. 2, Rev. N. J. Ridley, Newbury.

Game Bantams (Any variety).—1 and 2, W. B. Jeffries, Ipswich. *c*, F. Richardson, Chatteris; W. J. Reader, Ely; W. J. Woodhouse.

Bantams.—*Sebrights, Golden or Silver.*—1, G. F. Hodson, North Petherton. 2, H. Yardley. *White.*—1, H. Beldon, Goitstock. 2, Rev. F. Tearle. *Any other Variety.*—1, S. & R. Ashton, Mottram. 2, H. Beldon. *hc*, H. Pickles, jun., Earby; C. Reed, Cambridge; A. Storrar, Peterborough; Rev. F. Tearle.

Hamburghs.—*Golden-spangled.*—1, H. Beldon. 2, H. Pickles, jun. *c*, Miss C. E. Palmer, Farnborough. *Silver-spangled.*—1 and *hc*, H. Pickles, jun. 2, H. Beldon. *Golden-pencilled.*—1, H. Pickles, jun. 2, W. K. Tickner, Ipswich. *Silver-pencilled.*—1 and 2, H. Pickles, jun. *hc*, H. Beldon. *Black.*—1, H. Beldon. 2, No competition.

Polands (Golden or Silver).—1 and 2, H. Beldon. *hc*, H. Pickles, jun.; W. K. Patrick, West Winch (2).

Spanish.—1, H. Beldon. 2, C. Howard, Peckham. *hc*, J. Woodhouse.

Brahma Pootra.—*Dark.*—1, H. Beldon. 2, J. S. Dew, Gamlingay Mills. *hc*, W. Mansfield, Cambridge. *Light.*—1, H. M. Maynard, Holmewood, Ryde. 2, Rev. N. J. Ridley.

Any other Variety.—1, T. Nash, Carlton (Silks). 2, H. Yardley (Cuckoo Polands). *hc*, C. Howard.

Selling Class.—1, R. W. Smith, March (Partridge Cochin). 2, W. King, jun., Bottisham (Coloured Dorkings).

Turkeys (Cambridgeshire).—1, G. S. Hall, Ely. 2, Rev. N. J. Ridley. *hc*, H. Dey, Waterdon, Ely.

Ducks.—*Rouen.*—1, J. Goodliffe, Stilton. 2, T. F. Upsher, Sutton. *Aylesbury*—1, C. Tunnrall, Whittlesford. 2, H. Taylor, Soham. *Any other Variety.*—1, S. & R. Ashton, Mottram (Garganeys). 2, G. S. Hall (Mandarin). *hc*, J. Goodliffe (Black East Indian). *c*, J. Goodliffe (Carolina); G. S. Hall (Mandarin).

Geese (Any variety).—1, Withheld. 2, H. Bultitaft, Bedwellhay Grange.

Special prize given by Lady Adeane for best pen of Poultry exhibited.—S. Matthew, Stowmarket (Duckwing Game).

PIGEONS.

Carriers.—1, H. Yardley. 2, F. W. Metcalfe, Cambridge. *hc*, H. M. Maynard; F. W. Metcalfe; A. Storrar, Peterborough.

Tumblers.—1 and 2, J. M. Braid.

Owls.—1, H. Yardley. 2, G. S. Hall.

Pouters.—1 and *c*, G. S. Hall. 2, H. Yardley.

Barbs.—1 and 2, H. M. Maynard. *hc*, H. Yardley.

Fantails.—1, H. Yardley. 2, H. M. Maynard. *hc*, A. Baker.

Jacobins.—1, G. Roper, Croydon. 2, H. Yardley. *hc*, H. M. Maynard. *c*, A. Storrar.

Turbits.—1, G. Roper. 2, H. Yardley *hc*, R. Ruston, Chatteris.

Runts.—1 and 2, H. Yardley.

Any other Variety.—1, H. Yardley (Spots). 2, F. W. Metcalfe (Ice Pigeons). *hc*, T. C. Marshall, Peterborough (Hyacinths).

Selling Class.—1, H. Yardley. 2, T. F. Upsher (Barbs). *hc*, G. S. Hall (Nuns and Runts).

Rabbits.—*hc*, S. H. Fisher, Wimblington; F. Richardson, Chatteris.

Judge.—Mr. Edward Hewitt, Sparkbrook, Birmingham.

Warrington Poultry Show.—The undermentioned subscriptions towards the £10 cup for Partridge Cochins, and the five-guinea cup for White Cochins, have been received by the Secretary, Mr. C. Layland:—For the Partridge Cochin cup: Warrington Agricultural, &c., Society, £2 2*s.*; Richard Teebay, Esq., £1 1*s.*; J. H. Dawes, Esq., £1 1*s.*; Edward Tudman, Esq., £1 1*s*; Edward Leech, Esq., £1 1*s.*; J. K. Fowler, Esq., 10*s.* 6*d.*; Horace Lingwood, Esq., 10*s.* 6*d.*; Thomas Stretch, Esq., 10*s.* 6*d.*; Julius Sichel, Esq., 10*s.* 6*d.*; R. B. Wood, Esq., 10*s.* 6*d.*; James Watts, Esq., 5*s.* For the White Cochin cup: Mrs. Agnes Williamson, £1 1*s.*; Richard Smalley, Esq., 10*s.* 6*d.*; Allan J. E. Swindell, Esq., 10*s.* 6*d.*; Reginald S. S. Woodgate, Esq., 10*s.* 6*d.*; A. D. Cochrane, Esq., 10*s.*; Edward Fearon, Esq., 5*s.*; Julius Sichel, Esq., 10*s.* 6*d.*

LARGE FOWLS WITH BANTAMS.

In his interesting remarks upon Bantams, "Wiltshire Rector" says that breeders of large fowls can keep Bantams without any fear of a *mésalliance*, and in your answers to correspondents of last week I notice a similar statement. As I have ocular proof to the contrary, as the following facts will show, I should like to ask readers of "our Journal" if they have had any similar occurrences, and how far it is possible to estimate the probabilities of such crosses? I allowed a monster Dark Brahma cock, weighing 14 lbs., to run with my White Game Bantams, who revel in a small vinery as a residence. After waiting three weeks I gave a sitting of eggs to a friend who was very desirous of obtaining White Game Bantams pure and simple. But, lo! the chicks had tolerably good pea combs, and were moderately feathered on the legs. They are now six weeks old, with fast-growing tails, pencilled necks, wings and tail black and white, breast white, as large as the maternal parent, and bidding fair to rival the paternal. The Brahma cock was removed after the hatch, and in fourteen days eggs were saved. These were hatched a few days ago, but every chick among seven is as true as could be desired.—James Long, *Vine Cottage, Plymouth.*

VALUABLE PIGEONS STOLEN FROM EXHIBITIONS.

Recently a very valuable Carrier Pigeon belonging to Mr. While, of Birmingham, the bird having taken a first prize there, and many previous prizes, was stolen from Belle Vue Gardens, Manchester. An action was commenced by the owner to recover his loss, and I regret to learn that he was nonsuited with heavy costs. Subsequently another valuable and noted prize Carrier belonging to Mr. Yardley was stolen from Romford Poultry Show, having taken a first prize there. It is strange that such a misfortune should happen to two men of Birmingham. It is high time something be done to protect valuable birds, as no redress can be obtained as the law now stands. These continued losses will deter many who have good birds from showing them, unless committees of shows can offer better security to exhibitors. I would suggest that directly a prize is awarded at any show, the door of the pen should be made secure by a small padlock. This could easily be done, as wire pens are now generally used. Two or three keys could be made to pass any number of locks, and at a nominal cost.—F. Waitt.

THE OWL PIGEON.

The Birmingham Columbarian Society, having given their ideas respecting the properties the various breeds of domestic Pigeons should possess, deserve the thanks of the would-be fanciers, yet in some instances I have differed with them as have others, though in no case so much as in the description of the Owl Pigeon. With respect to this bird the Society say, that "From near the end of the lower beak should fall in nearly a straight line a loosely-hanging feather-covered skin or 'dewlap,' terminating at its lower extremity in the gullet, from which should protrude evenly on either side a large and full-feathered frill or ruffle." This ought *not* to be in the Owl, but in the Turbit. The Owl ought *not* to have what is termed the gullet nor a frill, but the head set on an evenly-rounded neck with no frill but a circular patch of feathers on the breast, that is called the rose. These properties were carefully bred for by the old fanciers, notably amongst whom were Messrs. Bowler and Matthew Wicking, who was without doubt one of the best breeders of Toy Pigeons of his day. Also Mr. Jones Percivall, Mr. Carrol, Mr. Bellamy, and several others too numerous to mention, also myself.

With regard to the colour called the powdered blue mentioned in the article, the Society do not seem to know much

about them, and in this I can also enlighten them. This breed was produced by the late Mr. Matthew Wicking and myself many years ago (at least neither of us ever saw any until we bred them), and they were got from a light blue and a mealy and selected, and bred on. We called them powdered blues because the necks of the birds being of a bright blue, and the tips of the hackle-feathers nearly white, it gave them a powdered look; hence the term powdered blue.

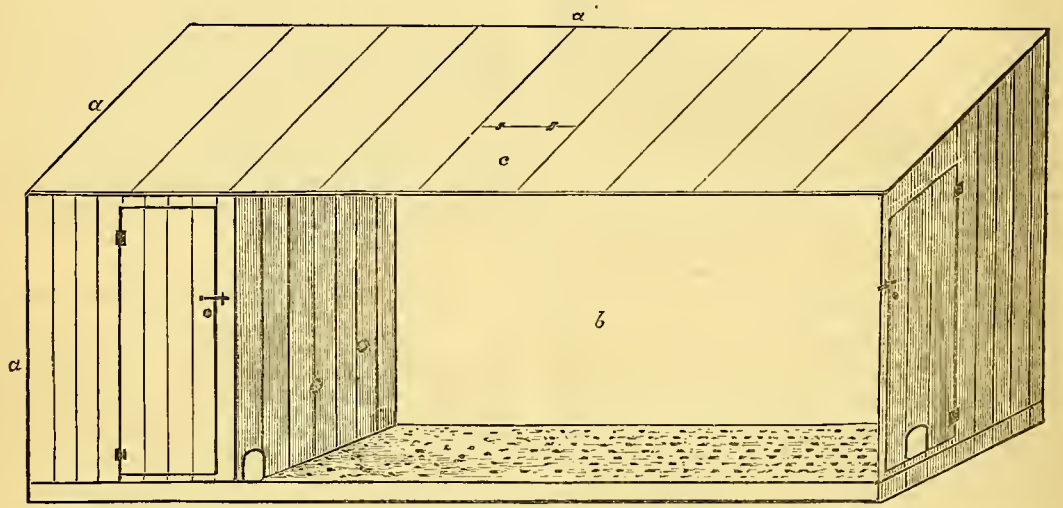
As to the quality of the birds I kept, I may mention that I refused twelve guineas for a pair in those times, long before Pigeons were selling at the absurd prices that they are now realising, and which to my thinking they are not worth, some of the breeds not now being so good as they used to be. Take the Fantail for instance, which is far too large and coarse in neck and body for what it ought to be and was. Then, again, one scarcely ever sees a good Jacobin now—I mean like those we used to have with the frill hiding the eye of the bird as they stood.

But to return to my subject, the Owl. The question of gullet or no gullet, frill or rose, was discussed at the last Pigeon Show at the Crystal Palace, when all the old fanciers were of one opinion, and that was—no gullet, no frill, but a rose on the breast.

With regard to black not having been obtained, I can only say that I have seen Owls of the deepest jet black, and good in other respects.—Harrison Weir, *Weirleigh, Kent.*

BANTAMS IN CONFINEMENT.

Mr. Blakston some time ago was chiefly the cause of my having Canary fever; before that I was smitten with Bee fever, which is chronic, through reading your Journal; and now "Wiltshire Rector" has been the cause of a severe attack of Bantams on the brain. I have never recovered from the effects of the former two, although this trying season tests my patience sorely, and now I write seeking your advice under the last-named malady.



a, *a*, Park palings.
b, Galvanised wire netting, sparrow-proof. *c*, Food-flap.
Height, about 4 feet 6 inches. Width, 4 feet. Length, 15 feet.
Aspect, facing south-west.

I enclose a plan of a small house and run in which I purpose keeping not more than a dozen Bantams, probably half that number at present. I should be very glad to make them both of shorter dimensions if possible, as I am extremely fond of my garden, which is but 60 feet by 25 feet. Would you also kindly tell me what kind of Bantams are most suitable to my case (I may mention, also, that my purse resembles my garden in smallness), and what kind and quantity of food to give my proposed new pets? My garden is enclosed by what are called, I believe, "park palings." Must the house be lined inside with anything to exclude draught? I wish to avoid expense as much as possible, for, being no carpenter myself, I must employ one to make the house. I give no dimensions of the length of the house and run separately, as I want you to tell me how much smaller they each may be. I would allow the fowls a run on the lawn now and then, but am afraid to give them complete liberty, as I have chiefly to depend upon annuals for the borders. Is it necessary to clip one wing of each bird, as my palings are only 5 feet high, or had I better enclose them in a wire run when on the lawn? I am fairly successful with bees and Canaries, so may I hope to make my new pets pay their expenses by proper attention? Does the house require any other ventilation than that afforded by the palings? The spaces are not large enough to see through when facing the palings. It is simply the space between where these overlap each other that I inquire about. Would a window be requisite for the house? if so, under the eaves of the roof would be the best place, I imagine.

Kindly give me also some hints about nest-boxes—of what materials they should be composed, how situated, &c. I wish I knew where to obtain the American nest-box, of which perhaps you may not have heard. I only know that it is said to consist of a box with a false bottom fixed by a delicate spring, which, when the hen lays an egg, gives way by the weight of the egg, and, depositing the egg gently in a nest of hay underneath, the spring, relieved of the egg's weight, closes up the box again. All this is done very quickly, and the poor hen getting up to have a fond look at her egg sees nothing there, so she sorrowfully sits down again and lays another, only to be again disappointed, and so on *ad infinitum*. Perhaps the editor of one of the American journals will say where to obtain these nests, and, I may add, the fowls as well, which are so accommodating, as, of course, they must be an American invention (I mean breed) as well!

An early reply to the above queries will greatly relieve my feelings, and at the same time much oblige—C. A. J.

[I am very glad that I have given you an attack of "Bantams on the brain," but to benefit you thoroughly the complaint must develope itself well; it is just like measles, the more it comes out the better for the patient. I advise you to obtain a sitting of Black Bantams' eggs; it is well to begin from the egg; then the birds become thoroughly your own, tame, and used to their home. The Blacks are more patient of confinement than the Game, also less fond of roving and flying. Your sketch is very good, but capable of slight improvements—thus, have the opening from the roosting place to the wired enclosure at the front of the partition, not at the back. It will be more handy for you to enclose with a sliding door when cleaning the larger part out, or in winter, or when wanting to catch a bird. Have a similar opening, as marked, in the door at the end for letting the birds out into your garden, or this might be in the door of the roosting place. The nests should be just to the left of the door in the roosting place, and on the floor. Any little odd boxes a foot square or less, and 5 or 6 inches high,

will do. Set a brick in front of each for the hen to walk to her nest easily. The boxes should be moveable, so that the whole place could be more readily cleaned out. Two perches, one lower and the other higher, the lower 2 feet from the ground, the higher 3 feet, should be as marked. Take care that the higher one is not so near the back as to touch the cock's tail, and cause a bent tail. Let the perches be straight, slightly rounded, and wide enough for the birds to rest on, not mere sticks. Let the night place be 4 feet square, the door 2 feet wide. No window is needed; the hole into the day part will give light enough, and fowls like to be snug, and not peeped at while laying. I hope you will give them the range of your garden under the conditions I mentioned in my former paper; they will greatly benefit your garden, and you need not raise your palings until you see whether the birds fly over, then add wire—the widest pattern and cheapest will do, inclining it a little inwards, and the birds will not get over. A little ventilator high up, covered by a slide, would be an advantage in summer, but eggs and warmth go together in winter. Buy our "Poultry Book," price 6*d.*, for other hints and chicken management. The park palings do not certainly make a warm wall. I should give them a couple of coats of gas tar outside, and a good mortar plastering inside; remember, a cold roost makes the eggs the fewer. Feed with barley, sometimes barleymeal or Indian corn, giving only just as much as they eat readily. Most fowls are over-fed, and then comes disease. After the morning's meal, dinner-plate scrapings and remains of vegetables will do—indeed, with a family, half a dozen Bantams cost next to nothing. When pastry is made, any odd bits are greedily eaten, and anything that in a larger establishment would be kept for the pig, all kinds of house scraps, &c. When your lawn is mown throw part of the grass in, and almost daily give some green food. Dry road dust in a heap will make them a dust-bath, which is an absolute necessity, and the floor of both parts must be dry.

As to the American nest-box, it must have been invented by some cruel as well as 'cute Yankee, who said, with a grin, "Guess I do that ere hen." Fancy depriving a poor hen of her cackling glory at the sight of her egg. I love to see the new-laid eggs in the neat straw-lined nest, from which some of my little children delight to take them and carry them in to mamma, a pleasure only second to the hen's on seeing the fruit of her care and pains.—Wiltshire Rector.]

RABBITS AT THE STROUD SHOW.

In reply to "J. Hume's" remarks, I cannot see that he has any cause of complaint, for, according to his own admission, he entered his Rabbit to compete for the cup under a misapprehension of the conditions according to which it was to be awarded. Surely that was no fault of the Committee. Why should he endeavour to detract from the merits of the cup-winner, by stating it was awarded to Mr. King for a lot of second and third-class Rabbits? This is a perversion of the facts. Mr. King took two first prizes, two second prizes, and one third. How can it be said that those Rabbits in a show confessedly very superior were second and third-class, being good enough to win from such competitors?—R. Barrett, *Hon. Sec., Stroud.*

A Negro Discussion about Eggs.—We are indebted to an exchange for the following:—"In the fairest village of Western New York the 'culled pussons,' in emulation of their white brethren, formed a debating society for the purpose of improving their minds by the discussion of instructive and entertaining topics. The deliberations of the society were presided over by a venerable darkey, who performed the duties with the utmost dignity peculiar to his colour. The subject for discussion on the occasion of which we write was—'Which am de mudder of de chicken—de hen wot lay de egg, or de hen wot hatches de chick?' The question was warmly debated, and many reasons *pro* and *con.* were urged and combated by the excited disputants. Those in favour of the latter proposition were evidently in the majority, and the president made no attempt to conceal that his sympathies were with the dominant party. At length an intelligent darkey arose from the minority side, and begged leave to state a proposition to this effect: 'Spose,' said he, 'dat you set one dozen Duck's eggs under a hen, and dey hatch, which am de mudder, de Duck or de hen?' This was a poser, was well put, and nonplussed the other side, even staggering the president, who plainly saw the force of the argument, but had committed himself too far to yield without a struggle; so, after cogitating, and scratching his wool a few minutes, a bright idea struck him. Rising from his chair in all the pride of conscious superiority, he announced, 'Ducks am not before de house; chickens am de question: before I rule de Ducks out!' and do it he did, to the complete overthrow of his opponents."—(*Canadian Poultry Chronicle.*)

FOUL BROOD.

I finn a hive of pure Ligurian bees contains no ripe brood, all the sealed brood being in a putrid state. I also find eggs and grubs which look healthy. I fancy it must be a case of foul brood, and if so, would it not be better to destroy it at once—combs, honey, and bees? I have a very prosperous apiary, consisting of eleven hives, which I am afraid may become infected should I let it remain.—J. B.

[We have no doubt that this is a case of foul brood, and should advise that the bees be at once destroyed, with the exception, perhaps, of the queen, which, being apparently a pure Ligurian, may be worth preserving, and is moreover not likely to convey infection to the stock to which she may be transferred. The combs should be drained and melted down, but kept all the while out of the reach of bees, and the honey may then be used for any purpose other than bee-food. The hive, after being thoroughly cleaned and scraped, should be washed over both inside and out with a saturated solution of chloride of lime, and it will be safer to let it lay by for a couple of seasons before again using it.—A Devonshire Bee-keeper]

OUR LETTER BOX.

Mr. W. Jackson, Blakedown, Kidderminster.—"The week before last I saw in your Journal a complaint from Mr. Hall, Cheltenham, that he had sent to Mr. W. Jackson, Blakedown, near Kidderminster, stamps for Spanish eggs, and that he could not obtain the eggs or any reply to his letters. I wrote you stating that I had been served in just the same way by this Mr. Jackson, the exception being, that the eggs I wanted were 'White-crested Black Polish' You publish Mr. Jackson's reply, that he sent the Spanish eggs to Mr. Hall on the 30th May. Although more than six weeks ago I sent the money, I have received neither eggs nor cash from Mr. Jackson, and numerous letters remained unanswered, until I put the matter in the hands of the Kidderminster Police, when Mr. Jackson wrote to say he would send the money, but he has not done so. He cannot urge the excuse he has in Mr. Hall's case, as 'Brighton' is quite sufficient to find me, even if he had not my full address. The eggs I ordered, mind, were 'White-crested Black Polish.' Mr Hall's eggs and mine I should think are confused, in the letter I have received from the police. I enclose copy, and the date you will observe is (not the 30th of May, when Mr. Jackson says he sent the eggs to Mr. Hall, but) the 24th of June.

[Copy.]

"'County Police Station, Wolverley, near Kidderminster,

"'26th June, 1871.

"'Sir,—The Superintendent of Kidderminster Borough Police handed me a letter on Saturday last, respecting Mr. Jackson, of Blakedown, and some Spanish eggs. I beg to inform you that I called at Mr. Jackson's on Saturday, the 24th inst., he was not at home, his mother told me that the eggs were sent that morning to your address at Brighton. Please let me know if you have received them.—Yours, &c., Thomas Matthew, Wolverley.'"

"'Mansel Bayly, Esq.'"

I never ordered any Spanish eggs, nor have any Spanish or any other eggs been sent to me at all, by Mr. Jackson's own admission in stating he would return the money, which up to the present time he has not returned. Query, were the Spanish eggs sent on the 24th June those for Mr. Hall? At any rate I have received neither eggs nor money.—M. Bayly."

Brahma Crosses (*B. T.*).—The object of the cross is to make a hardy breed. It is sought to combine the vigour of the Brahma and the quality of the Dorking. As a rule, in a cross the produce takes more after the female than the male. The Dorking is deservedly more esteemed than any other fowl for the quality of its meat, and for the quantity of choice over the offal parts. The only charge ever brought against it is that in some climates it is delicate. It is for this cause a remedy is sought in crossing with the Brahma, and that it is effected by putting a cock of that breed with Dorking hens.

Brahmae Dying (*J. L.*).—The symptoms you describe are consistent with those that follow poison, especially the crop full of water. Internal heat causes inordinate thirst, and the poison causes the heat. It would not show itself in the crop or trachea, but you would find the intestines partially honey-combed, and showing large red blotches. They may easily find something unwholesome in a conservatory. If they do not, it is an unhealthy place for them. Let them live entirely out of doors with the hen, the latter under a rip in a dry, sunny place. Feed on ground oats, barleymeal, bread and milk, and chopped scraps, no buckwheat nor sharps. If you do this we believe the disease will disappear. Your chickens have been killed by kindness.

Woodbridge Bird Show (*W. Barnes*).—Proceed in the County Court against the Secretary forthwith.

Partridge Eggs not Hatching (*Bubo*).—"We'll have a starling which shall be taught to speak, and nothing shall it say but 'moisten your eggs.'" Every week we say the same. We fancy it would be well for the world if all people confined themselves to their own business in all things, as they do "*in re*" poultry queries. The Partridge whose nest was disturbed, left her eggs every morning at early dawn in search of food; at that time the grass, or corn, or clover reeked with dew, and she returned to her nest with breast feathers dripping wet. This kept the eggs moist, and the young would have had no difficulty in emerging from

the shell. When the nest was cut out, and the eggs were put under a hen, she was allowed to leave them once a-day in a dry place; the eggs were not moistened, and the membrane inside the shell became of the colour and substance of gutta percha. All the strength of the poor little fellows was expended in chipping the egg, and they died of exhaustion. Had you wetted the eggs for a few days before hatching all would have lived. Young Partridges are hatched a month old in vigour and "gumption."

Vermin in Fowl-house (*Mrs. B. & W.*).—Thoroughly lime-white the whole of your house. Mix the lime very strong, and let it be laid on thickly. No hole nor corner may be missed. It is often thought that if the bricks are faced with limewash, all is done that is necessary. In truth nothing is done till every hole and corner are not only found but thoroughly cleansed. As a rule, the poultry-house, instead of a "thorough turn out," gets only "a lick and a promise."

Eggs Unproductive (*A. A. C. H.*).—You will not be more successful with an incubator. You do not wet your eggs enough. The cannibal hen is a rare monstrosity, kill her. The other failures must arise from some mismanagement. Try again. Let your hens be shut in their sitting places, moisten the eggs daily for ten or twelve days before hatching. On the twentieth day put them all in a pail of warm water. Leave them there ten minutes or a quarter of an hour. As soon as the hen has hatched part remove the shells carefully. Leave the chickens twelve or fifteen hours under the hen, and then put her under a rip in a dry sunny place with her chickens.

Hen Paralysed (*Rhos*).—We know of no large show till Birmingham where there is such a class. It is probable she is injured in the back, or she has a stoppage. She may be injured in the way you mention. It frequently happens. You can do no wrong by giving an ample tablespoonful of castor oil every other day for a week. This will give some relief, and if she still show a disposition to sit, indulge her with seven eggs, and let her sit next the wall.

Brahma Hen Breathing with Difficulty (*H. F. H.*).—You cannot do better than give some strongly camphorated water, also some camphor pills, each the size of a garden pea. Dose, two every night till the bird be relieved. Time must show the cause of the red cross. It savours of Malay blood.

Crêve-Cœurs' Feathers White (*J. B.*).—It is very difficult to keep Crêve-Cœurs for two or three years without some white feathers creeping up in the top-knots. We speak of the very best of their breed, and those which for the first twelve months of their lives had not a suspicion of white. They would seem to be among Crêve-Cœurs like grey hairs in the human subject. They are, therefore, not a disqualification, but rather a grave disadvantage, if such are shown against birds that have no white feathers. We should not consider fowls with white throats and blue wings Crêve-Cœurs, and they would, beyond doubt, be disqualified anywhere.

Toulouse Goose (*Toulouse*).—We imagine there is an internal rupture, and the bird is incurable.

Breeding Geese (*F. G.*).—For breeding, not more than three Geese to one gander must be kept, and their breeding powers continue undiminished until more than twenty years old. They require a wide range, affording plenty of grass and still water. The Goose-house for the four should not be less than 8 feet long by 6 feet wide, and high enough for a man to stand in upright. A smooth floor of brick and good ventilation are necessary. Over the floor a little clean straw should be spread every second day, after removing that previously used, and washing down the floor. A compartment about 2½ feet square should be assigned to each Goose for laying and sitting, and when one is hatching the gander and other Geese must be shut out from her. Wherever a Goose lays her first egg she is very pertinacious in there depositing the remainder.

Bantam Hen Blind in One Eye (*I. W. B.*).—The loss of an eye by accident is only a disadvantage; blindness from disease should be a disqualification. Where the eye is discoloured, as in your case, it is a disqualification. Ground oats, kitchen scraps, bread and milk, chopped egg, curd, and bruised wheat or barley are all good for chickens. Sue the secretary of the show in the County Court.

Canker in Young Pigeons (*A Reader of the Journal of Horticulture*).—Apply a strong solution of alum with a feather twice a-day. You will probably find that soon the substance gets loose; then remove it, and apply the alum and water for the last time. This will do if you discover the disease in time; but if it has gone down the throat to the crop it is too late for any remedy. Feed the birds very sparingly if they are old enough to feed themselves; bread crumbs are soft and suitable. Pull out some of the feathers of the tail.

Pigeons and Cherry Trees (*C.*).—The Pigeons would not injure the trees. They do not roost.

Stocking a Dovecote (*E. B. T.*).—You had better advertise, stating exactly what you require. You will be able to select from the replies.

Belgian Pigeons (*H. J. R. L.*).—Write to Mr. Sutherland, Coombe, Croydon.

Blue Egg in an Aviary (*J. S.*).—Neither the Linnet, Canary, Chaffinch, nor Redpole lays a "blue egg like a Hedge Sparrow's;" but eggs occasionally appear to lose their distinctive characteristics. Some Canaries lay an almost colourless egg, others one decidedly inclining to blue. It may possibly belong to the Canary or the Redpole. The Bramblefinch's egg I know nothing of.—W. A. Blakston.

Goldfinch with Canary (*F. S. S.*).—The young ones cannot do without their mother. That is certain, she must remain with them. You cannot, therefore, do wrong, if you suspect the Goldfinch of infanticide, by putting him in solitary confinement. You will, at least, discover who is the delinquent. Some Canaries appear to enjoy eating the extremities of the young ones. The Greenfinch and Canary produce a very common-place-looking Mule. Greenfinch and Goldfinch is better.—W. A. Blakston.

Canary's Eggs Clear (*C. R.*).—Cause: The cock is useless. Remedy: Proceedings in the Divorce Court.—W. A. Blakston.

Cross-breeding Rabbits (*A. E.*).—The Belgian Hare Rabbit is now introduced into warrens for the purpose of increasing the size of the common variety, and if not turned out until say five or six months old, all the better, to insure their doing well. We know a large breeder who is sending thirty to a nobleman for his warrens. The Silver-Grey also may be introduced into the warren to advantage for the sake of its superior fur.—C. R.

Fertilising Queens in Confinement (*G. C.*).—Mr. Woodbury made an experiment in this direction last year, and failed completely. He intended to try the Hungarian process this season, but has, unfortunately, been debarred by ill-health from giving any attention to apiarian pursuits.

REMARKS.

28th.—Generally bright and fine, cool in evening.

29th.—Warmer during the forenoon, fair evening.

30th.—Slight rain from 7.30 A.M. to 9 A.M., rather dull in the morning and occasionally during the day, alternating with very bright sunshine, and much warmer.

July 1st.—Heavy rain in the morning, and at intervals all day.

2nd.—Fine morning, heavy rain at noon and early afternoon, fine evening, heavy rain about 10 30 P.M., and during the night.

3rd.—Windy with heavy showers, alternating with sunshine all day.

4th.—Fine early morning, heavy showers and bright sun by turns all day, very heavy rain between 2.45 and 2.47.30 P.M., 0.089 inch falling in those 2½ minutes.

The week similar to many of its predecessors, very cool for the season and damp.—G. J. Symons.

COVENT GARDEN MARKET.—July 5.

Owing to the unsettled state of the weather the markets here have not been so well attended, neither has there been the quantity of goods offered by the growers which there usually is at this season; good descriptions of fruit, however, obtain fair prices, and are likely to do so for a few weeks to come. Potatoes of every description are heavily supplied, and continental produce also.

From observations taken near London during forty-three years, the average day temperature of the week is 75.1°, and its night temperature 50.6°. The greatest heat was 94°, on the 17th, 1834; and the lowest cold 33°, on the 17th, 1863. The greatest fall of rain was 1.60 inch.

AZALEA CULTURE.

THERE are few flowers so highly appreciated as the Indian Azalea, or more generally cultivated for the decoration of the greenhouse and conservatory, as well as for exhibition purposes. It can be had in flower from January until midsummer, or later; the early-forced flowers having the advantage over those produced later, inasmuch as they continue longer fresh. Bright sunshine and dry east winds in May and June cause the brightest colours to fade quickly, even under shade. The Azalea is also one of the easiest cultivated of what are called hardwooded greenhouse plants; added to this the exceeding beauty and varied colours of the flowers, with their innumerable shades and stripes, are at all times welcome.

The Azalea is a native of China, and the original colour is said to have been scarlet. The culture of this plant is very generally understood by practical gardeners, but there are, I have no doubt, numerous readers of the Journal to whom a few cultural remarks would be useful. The Azalea is propagated by grafting and by cuttings, the new varieties being raised from seeds and from sports of other varieties. Grafting is the most usual method of propagation, a strong-growing purple-flowered variety being much used for stocks. Side-grafting is the method to be preferred, and is best performed when the plants are in strong heat in July and August. The graft should be inserted at from 6 inches to a foot above the surface of the soil, thus allowing a clear stem below the graft. If plants are raised from cuttings they should be trained in the same way, allowing no shoots to grow out from the main stem at a less distance than 6 inches from the surface; indeed, the most handsome and symmetrical specimens which I have seen have had a clear stem of from 1 to 2 feet in height. Grafting is also sometimes performed in the following manner:—When it is desirable to obtain a large plant of a new or choice variety, a plant of some common strong-growing sort must be placed in heat in July; the temperature should be about 70° at night, with a proportionate rise by day, and any number of grafts that can be obtained may be inserted in the previous year's wood. All that is required is a close moist atmosphere and shade.

The Azalea can be raised from cuttings as freely as Verbenas. I struck a number in this way some years ago in the orchard house, at that time unheated. A number of 5-inch pots were nearly filled with sandy peat, allowing space for a surfacing of silver sand. From nine to a dozen cuttings were inserted in each pot, and the whole of them placed under hand-glasses. This was about the first week of August, and nearly all of them were potted off singly, and they made neat little plants the same season.

As soon as flowering is over all decayed blooms and seed pods should be picked off, and the plants placed in a house by themselves, if it is convenient; and where artificial heat can be applied to them the house in which they make their growth should be kept close and moist, and the plants freely supplied with water at the roots, as well as syringed overhead at least twice a day. The plants will not flower satisfactorily if they be allowed to remain in the greenhouse during the growing period, most likely smothered with Geraniums and the usual occupants of such houses in the early part of July.

Training the plants into a proper shape should be attended to at an early stage of their growth. At the metropolitan exhibitions the pyramidal form is that which is most frequently seen, and in many cases the plants have presented a very formal and unnatural appearance; yet in some instances where the shoots have not been too closely tied-in, and the trellis to which the plants have been trained has not come to an abrupt termination at the apex, but has been more rounded, the plants have been decidedly effective. I have seen very handsome specimens of Azaleas in the neighbourhood of Paris; these were trained to a single stem, with umbrella-like heads, and as they stood in a position where the eye of the spectator was above them the effect was good. The Azalea is also well adapted for specimens in the ordinary bush form, the plants rather wider at the top. Small standard specimens with neat round heads, and grown in 6-inch pots, are unsurpassed when in flower for table decoration, and if kept in cool rooms will continue in beauty for a long period.

Whatever form of training be adopted, much depends on the skill and judgment of the cultivator being directed towards making the plants look natural. Much tying and twisting of the shoots will be found objectionable, and if a plant is well set with flower buds, doing so causes the flowers to look crowded, and hinders them from being seen to the best advantage when the plant is in bloom; in most cases it is highly desirable to thin the flower buds shortly after they are set, in order to obtain larger as well as more perfectly-developed flowers. Very vigorous shoots do not ordinarily form flower buds; they can, however, be made to do so by pinching them during growth, when they will throw out a number of weaker shoots, which will doubtless form flower buds on each shoot.

During growth I have found occasional waterings with weak guano water very beneficial, especially to those plants which have not been repotted. After growth has been completed, and the buds are formed, a much drier atmosphere and more air are desirable, and when the plants are sufficiently hardened it is much the best plan to turn them out of doors for a time, removing them to their winter quarters before the soil in which they are growing is too much saturated with the autumn rains. In winter, when the plants are at rest, they will continue in the best health in a comparatively low temperature; rather allow the thermometer to fall to the freezing-point than apply too much artificial heat. It is also the custom with some to allow the plants to become quite dry at the roots in winter. I think this a great mistake; large numbers of the young hair-like roots are killed, and the plants shed their leaves prematurely and to a much larger extent than is desirable. I never allow Azaleas nor any plant of similar constitution to be overdry in winter, and it is highly important that sufficient water

should be given to thoroughly saturate the ball of roots at each watering.

Those plants which set their buds earliest should be selected for early flowering. Nearly all the varieties are adapted for forcing, but those with white flowers—such as the old white and Fielderi, are peculiarly well adapted for early blooming. I obtain flowers in abundance at Christmas from the above, by placing the plants in October in a Pine house, where the night temperature is 65°. A succession of flowers may be obtained by placing fresh lots of plants in the forcing house at intervals of three weeks. It is undesirable to bring Azaleas into a high temperature directly, a night temperature of 45° being quite high enough to start with. An early vinery or Peach house is a capital place for them, where they can be started with the Vines or Peach trees, as they require exactly similar treatment; the Azaleas will be showing flower and may be removed to the greenhouse before the leaves are fully expanded on the fruit trees; remove them to the greenhouse as soon as the first flower or two open their petals, as the flowers which expand in a high temperature are flimsy, and do not continue fresh nearly so long as those produced in a cooler and drier atmosphere.

The varieties are now very numerous, and fresh candidates for popular favour continue to present themselves; doubtless, the very best varieties are exhibited at South Kensington, and those of the highest merit are duly reported on in this Journal. I will add a list of the very best proved varieties—Alba, the best white for forcing; Chelsoni, Criterion, Duc de Nassau, Duchesse Adelaide de Nassau, Etoile de Gand, Extranei, Fielderi, Flower of the Day, Iveryana, Madame Ambroise Verschaffelt, Madame de Cannart de Hamale, Madame Miellez, Magnificent, Mrs. Turner, President Humann, Stella, and the deciduous variety with deep yellow flowers—Sinensis.—J. Douglas.

AN EXPERIMENT WITH THE CALCEOLARIA.

Last autumn at propagating time it occurred to me to try an experiment with the bedding Calceolaria. My object was to select a course of treatment during the winter and spring months, which, if successful, would have the effect of retarding the growth of the plants so as to have them in a better state for bedding-out at planting time, and also to prove if such treatment would ensure or promote a more regular course of flowering than is generally the case during summer. I have for some time thought that bedding Calceolarias are often too liberally treated, and I know that in many parts of the country the spring months have almost passed away before it is considered safe to trust the bedding stock in the flower garden. Such generous treatment induces a too early development of wood and flowers, or, in other words, the plants are before the gardener's time. The plants flower very soon after planting out, but in an imperfect form; but during all this time fresh growth for future flowering has been so checked, that before the second or best lot of bloom can show itself the cool nights of autumn come on, favouring the growth of wood rather than of flowers, and the result is no more bloom on the Calceolaria. It is, perhaps, useless to talk of early planting, as I do not think the plants would be any better of that, and in very few places, if any, could that be practised so as to meet all requirements in a design.

I therefore resolved to try an experiment at once—the most simple and least troublesome experiment I could think of. Accordingly, last October, I cleared a strip of ground 3 feet wide along a Strawberry bed; the surface had a gentle slope towards the south, and was elevated about 6 inches above the garden walk, but was fully exposed to the east and north as well as other points. The soil had not been dug up for a year or more, nor was it dug then, for I merely cleaned and levelled the surface, raking it fine. It was common garden soil, with a large portion of road grit in it. Along the centre I put in several hundreds of cuttings 3 or 4 inches apart. I watered them but did not shade them, and allowed them to take their chance, except that they were slightly protected from the frosts by sticks bent over them and canvas laid on; and during that severe frost when the thermometer fell to 4°, or 28° below freezing, they had only the addition of some short litter. They remained covered up except at suitable intervals, when light was let in for an hour or two, but they were frozen through again and again for weeks. There were none of them rooted just before the severe frost, though most were callussed; but after the thaw roots sprang out quickly, and the foliage assumed a healthier colour, but apparently the plants did not grow till March. After that the centre shoot was pinched out of every plant and they began to make side shoots, but so dwarf and compact were the plants that they looked pretty and were admired by most people. They had no protection after March, but were exposed to all weather, and several times were covered with snow; the earth about them was very hard and never loosened, but merely kept clean; it was also very poor. The growth of these plants was so slow that they were no further forward in the first week of June than those growing in frames were in the first week of March; consequently at planting-out time they were just in a fit state for the flower garden, being dwarf and compact plants with only one flowering shoot, yet their growth was a lot of nice wood that will produce a blaze of bloom at the proper time. The object in placing them in poor soil was to secure slow growth, also that they might grow the more vigorously when transferred to the flower garden.

It will be seen, that from the time the cuttings were put in till planting, they were never moved. If at the end of the season I am only able to say that the plants have succeeded as well as the others, I shall have the satisfaction of knowing that even then the experiments would be a success, in so far that the results were obtained with far less trouble and with means that are so simple and inexpensive as to be within the reach of all.—Thomas Record.

ROSES THIS YEAR.

I am again tempted to give you my notes on the Roses with me this year. The four that have given me the most unmixed pleasure have been La France, Marie Baumann, Baroness de Rothschild, and Xavier Olibo. Of these, La France has bloomed continuously, every bloom good, with the finest perfume of any Rose I know. Last week I had two perfect blooms over 5 inches in diameter, well filled up to the centre. This is, indeed, a first-class Rose. The other three have bloomed continuously and well. Duke of Edinburgh is very fine, but hard to keep in colour. Louis Van Houtte, good grower, a splendid Rose, bloomed well for a young plant. Madame Eugénie Verdier, Marquise de Mortemart, fine flower, but shy grower. Dupuy-Jamin, lovely Rose, fair growth, and a good bloomer. Princess Christian, an honour to its raiser, will, I think, be equal to Baroness Rothschild. Thyra Hammerick, very profuse in bloom, but very hard to get a perfect flower. Clémence Raoux, more peculiar than beautiful, not one in twenty-four fit to put in a stand. Edouard Morren, the same fault, but when a perfect bloom is obtained it is splendid; both these, with Pierre Notting, are very prone to mildew. Reine Blanche, very rough, but at times fine. So much for my experience of the new Perpetuals. Of old favourites, I have had magnificent blooms of John Hopper, Victor Verdier, Jules Margottin (always ready and always good), Duke of Wellington, and Lord Macaulay; in fact, of all my stock of old favourites I have had a fine supply.

Of my particular friends, the Teas, it is yet too early to say much, as I always pinch them back so as to have my chief blooms in autumn. I am more and more delighted each season with Rubens and Souvenir d'Elise. Of these two I have blooms now which will go in a stand of twelve which will be grand; they are, I am certain, among the best of the Teas. Maréchal Niel, owing to cold east wind, has not been up to the mark of past seasons. Many of my friends, when I have mentioned Madame Falcot, have replied, "Oh! it is very well in the bud." I find in early spring and late autumn that it is only second to Maréchal Niel. Any who were at the Bath May Show must have remarked the splendid examples of that Rose shown there.

Of the new Teas, Unique is much more inclined to make wood than bloom, but it is certainly beautiful when in its perfection. Adrienne Christophle cannot fail to become a favourite, it is so very distinct. I am more favourably inclined to Monplaisir than I was, but it will never equal its parent Gloire de Dijon nor yet its sister Belle Lyonnaise.

Your correspondent thinks it strange to find seedling Geraniums that have stood the winter. I have now taken up three hundred of the most promising self-sown Geraniums that have stood the winter in the borders, and have had to throw away as many more for want of room to keep them. There are several already showing for Tricolors and Bronzes.

There are no Apples in the orchards here this year, but I have a fair amount on pyramidal trees. Pears, Plums, Strawberries, Gooseberries, and Currants are in great abundance; but it has taken much labour and abundance of soft soap and

quassia to save them from the extraordinary blight of this spring.—Stiff Soil, *Somerset.*

COVENT GARDEN MONOPOLISTS.

Mr. Pearson's letter, with which your Journal of the 6th inst. commences, relates to a crying evil, and the only way to strike at its root is co-operation. Let an association be formed to start a co-operative store for the sale of flowers, fruit, and vegetables. There will be no occasion to look for purchasers. The only fear would be that the manager would at first be unable to cope with the enormous supply that would be proferred him.

If you, sir, would start the affair by getting a number of names to form a guarantee fund, I have no doubt the thing might be easily managed.

The Horticultural Co-operative Society (limited), for the establishment of a store for the reception of fruit, vegetables, and flowers grown by the members of the Society, with the object of obtaining fair prices for amateurs and gardeners for their productions, which the monopoly of Covent Garden at present prevents, and also to enable members to procure garden produce at the lowest possible prices.

The produce to be sold at such prices as may be found advisable, the profits being shared amongst the members (both growers and purchasers), after payment of expenses.

A capital of £2000, in £2 shares, to be held by members only, £1 being paid-up, would give a fair start to the concern, and if a few hundred pounds were guaranteed to secure the preliminary expenses, there could be no reasonable doubt of success. The management would have to be settled in committee, and the price of members' tickets.

I shall be glad to be a shareholder, and if you take the affair in hand shall thank you to place my name on the list for £25 for the guarantee fund.—J. P., *of York.*

In the middle of May this year I sent to a most respectable person, highly recommended, in Covent Garden, 12 lbs. of Grapes. He would take, I believe, 24 lbs. a-week from me. I thought I would try half that number first. They were selling in London for from 12*s.* to 18*s.* per lb. As your correspondent says, "I thought half that price will do for me." After waiting some weeks, I thought at last I had better ask for the "account sale." The answer was, that the fruit was nearly useless to him, or not marketable, or something of the kind, that he had it still by him, and scarcely expected to sell it; but yet notwithstanding, good self-denying man, he actually sent me 2*s.* 6*d.* per lb. However, I have not since put his charity to a test, as I get, or rather got then, 5*s.* per lb. at home. I shall not try Covent Garden again.—F. G.

[We have other letters for which we hope to find space next week.—Eds.]

EARTHING versus NOT EARTHING POTATOES.

Having some experience, I may be allowed to report progress. By way of preface I may say that I have to keep up a supply of new Potatoes from as early a period as it is possible to have them firm and full-flavoured, and not watery and insipid. That usually is the first week of March, and the supply is continued daily up to the middle of June either from pots or frames. I will first speak of Potatoes in pots, depending as I do on them for the earlier supplies; indeed I do not reckon on them from frames until the middle of April, and these are planted in November.

For pots I employ a form of Ashleaf known, I think, in some parts as the "Creeper," probably from the Potatoes being formed at a considerably further distance from the stem than is the case with many other early kinds, and it produces them very even in size, few being small. I grow one large set in a 9 inch and three good sets in an 11-inch pot, and sometimes two in a 10-inch pot. I also grow Myatt's Prolific in pots in about equal proportions with the Ashleaf. Myatt's Prolific is also an excellent variety for pots. I grow an equal proportion of both. The pots are half filled with soil, the sets introduced and just covered with soil. That is one part. In another lot of pots the sets are placed about 5 inches deep, or are covered with that depth of soil. Those just covered with soil are up the height of the pots and earthed by the time those earthed at planting are appearing. They are placed under like conditions of treatment, and the result is precisely the same.

Again, I plant a three-light frame—I use no other for Potatoes—on a good sweet bed of dung and leaves, in November, just covering the sets with soil, and I earth-up when the plants are 6 inches high. Another frame is planted with the sets covered from 4 to 5 inches deep. There is no material difference in the produce as to size, quantity, or quality. One method is as good as the other.

I must, however, observe that if non-earthing be intended, the sets must be placed so deep in the first instance that there will be sufficient room or depth of soil in which to form tubers; if they are planted shallow the produce will be useless from greening. I once planted in a frame Early Oxford, a round sort of excellent properties, placing the sets about 3 inches deep. They were not earthed, and the whole was a loss, more than half the tubers being greened, and the rest so small as to be of no practical value. On the other hand, a frame planted with sets at the same depth, and earthed about 3 inches deep with light loam and leaf soil, afforded an excellent crop. For frames, however, Early Oxford has too large a haulm.

We now come to out-door crops. I planted four rows of Myatt's Prolific, each about 80 yards long, on a south border, all the sets being about 6 inches deep; and of the four rows three have had the earth drawn to them, and one was left as planted. The row not earthed-up is about 1 foot from the wall, and at the present time (July 1st), the tubers are small and unfit for use, but those of the other three rows are fit for use, and are in every respect good. I have also another row of the same variety under a west wall and not earthed; these are not fit for use. The crop, however, promises to be good, and the tubers will not green.

Finally, I have about 80 yards of row of Ashleaf under a south wall, planted so as not to require earthing-up, and these are as yet too small. In the open ground I have several rows of the same variety, planted about 4 inches deep, that have been earthed-up; the crop is good—in fact we have been using them for several days.

The conclusions I draw are—1, That deep planting to save earthing-up must be resorted to, otherwise the tubers will green. 2, That planting 4 inches deep and subsequently earthing-up, are favourable to an earlier and better crop, and prevent greening. 3, That for most of the round kinds, which form tubers near the stem and surface, earthing-up is absolutely necessary, otherwise the crop will be very much damaged from greening. 4, That drawing the earth to the stem tends to render the soil drier, warmer, and affords a stiffer shorter haulm, a superior crop, and encourages earlier ripening, a point of consequence in our climate.

In taking up the Ashleaf on July 1st I found diseased tubers. In a season like this the shallower Potatoes have been planted the better. They will be all haulm if the present wet continue. They are now fine in appearance, being very even.

Whilst writing on Potatoes I may say that Red-skinned Flourball has come up very irregularly, and so have the American varieties. I have under trial about twenty roots each of Red-skinned Flourball and Pink-eyed Lapstone. They are both the produce of one tuber each of last year, and they differ widely in the haulm, the one having the Lapstone foliage but more stiff, and the other is more slender. In habit and hardiness they seem all right. As regards flavour I can tell better after August.—G. Abbey.

I had twenty or thirty varieties or samples of Potatoes to grow for trial last summer, and among them the Early Rose, which was to be thoroughly tested in all its points. For that purpose I planted one-half the sample on a piece of heavily-manured ground, forking between the rows when the plants appeared, and later in the season I earthed them up to a good height, hand-weeding them, &c., till they were ripe. They yielded an enormous crop, in about equal quantities of large and small tubers, and, speaking of them as a stock, they had degenerated very much from the original. The other half sample I planted at the same time on ridged ground, placing the sets in the hollows with a good dressing of manure, and forked the ridges down level, so that the Potato sets would be about 6 inches below the level at the time of planting. They had nothing whatever done to them till ripe, with the exception of occasional hand-weeding, when they proved all that could be desired. In the first place they exceeded in weight the half sample first noticed, and were much better in quality, being well-shaped, well-developed specimens, with few small ones among them, and equal, if not superior, to the original stock. Secondly, they were from a week to ten days earlier, which is

a great consideration where the tubers are wanted for table, and the ground the Potatoes are occupying is required for other purposes. With regard to the above trial, therefore, the non-earthing system was the more satisfactory.

I am of opinion that in general the non-earthing system is preferable for all early varieties, both as regards quality and productiveness, with the additional merit of being fit for table a week or ten days earlier as a rule, and, of course, a certain amount of labour is saved, which to market-growers is a consideration; but for all main crops, which are supposed to remain in the ground till late in the autumn, I should consider it advisable to earth-up, as the Potatoes which would form in the ridges would lie much drier than on the level. This, in a wet season, would act as a preventive against disease, second growth, &c., without mentioning the conveniences at lifting time.—P. D.

NOTES ON ROSES: HEREFORD, NEWARK, AND MANCHESTER.

Having, after judging at Nottingham, been to judge also at Hereford, Newark, and Manchester, I send you a few notes on the Roses, which may prove of some interest to your readers.

The Show at Hereford was good, especially among the amateurs, who came out in great force, especially Mr. R. N. Baker, who has already been so successful at the Crystal Palace and elsewhere. The Rev. G. Arkwright, the Rev. J. B. M. Camm, Mr. C. N. Newdegate, and the Rev. J. M. Smythe were also exhibitors of very good stands of Roses, though Mr. Baker was *facile princeps*, taking first honours in each class he exhibited in. Among the nurserymen, Messrs. Paul & Son were first, Mr. J. Keynes second, and Mr. G. Davison, of Hereford, third. Mr. Cranston was not able to exhibit for competition, but staged some very fine blooms at the orchestra end of the room. Noticeable among the older Roses were Annie Wood, Marie Baumann, Beauty of Waltham, Triomphe de Rennes, Xavier Olibo, François Louvat, and La France. These were shown by Messrs. Paul & Son, who also exhibited the very best Miss Ingram I have ever seen. Mr. J. Keynes exhibited very good examples of Maurice Bernardin, Madame Vigneron, Mrs. Charles Wood, Souvenir d'un Ami, Madame Willermoz, La France, and Mdlle. Eugénie Verdier. In Mr. Baker's stand were very fine specimens of Paul Verdier, Dr. Andry, Mdlle. Marie Rady, President Willermoz, and Antoine Ducher. Mr. Camm had very fine ones of Vicomtesse de Vezins, Paul Neron, Centifolia rosea, Abel Grand, and Lord Napier.

Among the new Roses were good examples of M. Liabaud, Louis Van Houtte, Prince of Wales, Ferdinand de Lesseps, Marquise de Ligneris, Annie Laxton, Auguste Neumann, Madame Creyton, Nardy Frères, and Edward Morren.

A very noticeable feature in the exhibition were two boxes of twenty-four blooms—one of Centifolia rosea, exhibited by Paul & Son, another of La France by Mr. Keynes; they were so evenly balanced in point of merit that they were awarded equal first.

The competition at Newark was chiefly confined to local nurserymen and amateurs, but very good blooms were exhibited by Messrs. Merryweather, of Southwell, and Mr. Frettingham, of Beeston. The Rev. S. R. Hole exhibited a good stand of thirty-six, though, owing to the weather, not quite up to his usual mark. The same may be said of the Roses shown by the Rev. N. Pochin, and it was an exceedingly close contest between Mr. Hole and Mr. Pochin for the first prize in thirty-six, Mr. Hole eventually winning by the superior merit of some of the first blooms, especially Madame Furtado, Souvenir d'un Ami, and Marquise de Mortemart. Mr. Pochin's stand was so good that, as there was no third prize awarded, the Judges recommended the Committee to add the value of the third prize to the second. Many of the Roses exhibited showed signs of the severity of the spring frosts, which have been very prevalent in Nottinghamshire.

The competition among amateurs, especially in twelves and sixes, was very close; and the Rev. C. C. Ellison, of Bracebridge, showed an exceedingly good stand of eighteen blooms, very fresh both in colour and foliage. I will not attempt to enumerate the sorts exhibited, as it is only a repetition of names.

From Newark I went to judge at the first Rose Show at Manchester, which, considering the season, may be put down as a great success, although there were very few exhibitors from the north. Mr. George Paul (Paul & Son) carried everything before him in the nurserymen's classes, and I have seldom seen better blooms. Mr. Mitchell also showed some very good blooms, one of John Hopper being the best of that sort I have ever seen in any stand. There was a close competition among the amateurs in the thirty-sixes, the Rev. G. Arkwright being placed first, and the Rev. S. R. Hole third. The Rev. S. R. Hole was first for twenty-foure and twelves.

There were some very nice ball-room bouquets and bridal bouquets of Roses exhibited, although some showed the common failure of being too large. The first-prize bridal bouquet was exceedingly good, made up with great taste, and not too large, although some might object to the use of pink Moss Rose buds; but a slight amount of colour helps, in my opinion, to relieve the dead white of ordinary bridal bouquets.

The collection of new Roses exhibited by Messrs. Paul & Son was especially good; and a stand of twenty-four blooms of Comtesse d'Oxford shows that it will be a great acquisition. On the whole, the best new Roses of the last two years I have seen are Mdlle. Eugénie Verdier, Comtesse d'Oxford, Marquise de Mortemart, Marquise de Castellane, Augnste Neumann, very dark; Nardy Frères, the best purplish-crimson I have yet seen; Ferdinand de Lesseps, Edward Morren, Dupny-Jamin, a very fine-shaped Rose, large, with smooth petals, something like Alfred Colomb, but with more violet; Princess Christian; Madame Liabaud, an improved Virginal; La Motte Sanguine, fine in colour, but rather irregular in outline; and Louis Van Houtte, nearly the colour of the old Duc de Cazes, but a finer Rose. Of these I no hesitation in recommending the first four—Nardy Frères, Dupuy-Jamin, Madame Liabaud, and Louis Van Houtte.

Of older Roses which have been particularly good this year La France stands first, then John Hopper, Baroness Rothschild, Alfred Colomb, Charles Lefebvre, Madame Thérèse Levet, Maréchal Vaillant, Paul Verdier, Centifolia roses, Abel Grand, Duke of Edinburgh, fine in colour, but rather irregular, nearly always quartered this year; and Dr. Andry. Messrs. Paul exhibited some very fine blooms of Marie Baumann at Manchester, but otherwise I have not seen it so often exhibited as last year.—C. P. Peach.

HORTICULTURAL IMPLEMENTS AT THE NOTTINGHAM EXHIBITION.

"The true epic of our time is, not arms and the man, but tools and the man, an infinitely wider kind of epic."—*T. Carlyle.*

The great success which has attended the Royal Horticultural Society's Show at Nottingham induces me to ask, through your valuable Journal, whether the Council would adopt on the next occasion some better method in the arrangement of goods in that portion of the ground set apart for trade? It is scarcely in keeping with the high purposes for which the Royal Horticultural Show is held, that the visitor on entering finds himself in the midst of a fancy bazaar, and that the principal approaches to the grand marquee are lined with booths, similar to those we see on fair days in market towns. None but the most persevering of sight-seers would be likely to see anything beyond this in the trade ground. The manufacturers of implements, tools, and apparatus used in horticulture ought to be recognised by the Council, as having a claim to a constant and prominent place at the Show. There is no need to exclude other trades, but it is by no means necessary that dealers and manufacturers of goods having no special interest to the horticultural world, should monopolise the best places. Next in point of attraction to the show of plants and fruit, come the implements and apparatus used in the garden. They have contributed some share, however humble, to the great triumphs of the horticulturist. It would but be in agreement with the proper fitness of things, if the principal avenue to the marquee were set apart for the use of manufacturers and their representatives; then let the sellers of agricultural implements and miscellaneous goods take the second and third places. Of course, if it is absolutely necessary to the prosperity of the Royal Horticultural Society that the vendors of toys and the retailers of beer should have the most prominent positions in the trade ground, by all means let them have it. No one, however, who saw the thousands that poured into the Park on each day of the Show would suppose that it stood in need of any such support.

A manufacturer does not attend the Show merely to make sales. That branch of trade is now permanently established, and there is always ample stock in the hands of agents to meet the wants of the public. It is the only time during the year, and for that district in several years, that he has the oppor-

tunity of meeting both professional and amateur gardeners, who have always some inquiries to make or who wish to test the merits of some novelty in garden requisites. By the present arrangements that opportunity is not given them. Therefore, let the Council institute a new organisation of the trade-yard, which will give the visitors convenience of access to the manufacturers of implements and apparatus, concentrate their attention on the special purposes for which the Show is held, and add to its completeness.—GEORGE BAINES, *Lightcliffe*.

BIRMINGHAM ROSE SHOW.

JULY 6TH AND 7TH.

THE tenth annual Rose Show was held in the Town Hall, Birmingham, on Thursday and Friday last, and notwithstanding all the drawbacks of this wet and variable summer, there was an excellent exhibition. Had all those who gave notice of their intention to compete come forward, the Exhibition would have been the largest yet held at Birmingham, but owing to the lateness of the season and the bad weather the withdrawals were extremely numerous, and the competition open to all England, especially in the nurserymen's classes, was chiefly confined to southern growers.

In the nurserymen's open classes Mr. Keynes, of Salisbury, carried all before him, being first in every case. The varieties which he exhibited in the greatest perfection in his stands of seventy-two singles, forty-eight and twenty-four triples, were Xavier Olibo, Baroness Rothschild, Ferdinand de Lesseps, Duke of Edinburgh, François Lacharme, Dupuy-Jamin, La Motte Sanguine, Elie Morel, Marie Baumann, Comtesse d'Oxford, Marquise de Castellane, La France, Exposition de Brie, Madame Sertot, Abel Grand, Victor Verdier, Sénateur Vaisse, Madame Willermoz, Madame Charles Wood, Pitord, Ville de Lyon, Alfred Colomb, Prince Camille de Rohan, John Hopper, Paul Néron, Antoine Ducher, Madame Vigneron, Clémence Raoux, blush with coppery-rose spots; Louis Van Houtte, shaded crimson and scarlet; Emilie Hausburg, Mdlle. Engénie Verdier, Nardy Frères, Abbé Giraudier, Fisher Holmes, and Charles Lefebvre. Mr. Cranston, King's Acre, Hereford, was second for seventy-two single trusses; Mr. Durbin, Englishcombe, Bath, third; and Messrs. Perkins & Son, Coventry, fourth. Mr. Durbin was second for forty-eight, and third for twenty-four triples; while Mr. Cranston was second for twenty-four. Mr. Turner, of Slough, was unfortunately too late for competition, but exhibited splendid trusses of Madame Victor Verdier, Centifolia rosea, Général Jacqueminot, Climbing Devoniensis, Victor Verdier, Miss Ingram, Princess Mary of Cambridge, Triomphe de Rennes, Monsieur Woolfield, Caroline de Sansal, Duke of Edinburgh, Paul Verdier, Abel Grand, Marie Baumann, Horace Vernet, Beauty of Waltham, and Baroness Rothschild. In other stands we noticed good examples of Impératrice Charlotte, Souvenir de Malmaison, Marguerite de St. Amand, and the varieties already named.

In the nurserymen's classes, in which competition was restricted to residents in the counties of Warwick, Worcester, and Stafford, Mr. F. Perkins, Regent Street, Leamington, was first both for twenty-four singles and twelves triples, while Mr. J. F. Smith was second; Mr. E. Holmes, Whittington Nursery, Lichfield, third; and Mr. C. Kimberley, Stoke, Coventry, fourth.

In the amateurs' classes there was a much better show than we expected, but here, again, many of the successful stands came from the southern counties, but many very excellent trusses were from the outskirts of Birmingham itself.

For thirty-six single trusses Mr. R. Draycott, gardener to E. Studd, Esq., Uppingham, was first with Beauty of Waltham, splendid; Duc de Rohan, Maurice Bernardin, Fisher Holmes, Gloire de Dijon, and Exposition de Brie. The second place was taken by Mr. Joseph Davis, gardener to Mrs. King, Wilton, Salisbury; the third by Mr. C. J. Perry, The Cedars, Castle Bromwich; and the fourth by Mr. Parnell, Rugby. In the different stands were good examples of Horace Vernet, Marie Baumann, Mdlle. Annie Wood, Alfred Colomb, Senateur Vaisse, and Fisher Holmes.

For twenty-four Mr. Moore, gardener to Thomas Lloyd, Esq., The Priory, Warwick, was awarded the first prize, the second going to the Rev. P. M. Smythe, Solihull, for fine trusses of Madame Charles Crapelet, Charles Lefebvre, Leopold I., Exposition de Brie, Elie Morel, and Abel Grand. Mr. Draycott, Hallaton Hall, was third; Mr. S. Evans, Arbury, Nuneaton, fourth; and equal fifth prizes were given to J. H. Arkwright, Esq., Hampton Court, Leominster, and Mr. Brown, gardener to Mrs. Alston, Elmdon Hall. Several good stands were shown by unsuccessful competitors. For three trusses of eighteen varieties, the prizetakers were Mr. S. Evans, Mr. C. J. Perry, J. H. Arkwright, Esq., and R. N. G. Baker, Esq., Heavitree, Devon. La France, Charles Lefebvre, Marie Baumann, Paul Verdier, Dr. Andry, Gloire de Dijon, Charles Lawson, and Mdlle. Marie Rady were well represented in this class. In the next, that for twelve single trusses, Mr. J. E. Cavell, Oxford, was first with splendid trusses of Duke of Edinburgh, La France, Madame Clémence Joigneaux, and Lord Suffield. Mr. Whittle, Leicester, was second; Mr. Moore, gardener to T. Lloyd, Esq., third; Mr. C. J. Perry, fourth; and Mr. Choyce, Penwall Grange, Atherstone, fifth.

The next four classes were confined to amateurs residing in the counties of Warwick, Worcester, or Stafford. The best stands of twenty-four came from Captain Webb, Elford House, Tamworth; Mr. C. J. Perry; the Rev. P. M. Smythe, Solihull; and Mr. Brown, Elmdon Hall. Among these were excellent blooms of Cœur de Lion, Centifolia rosea, Beauty of Waltham, Marquise de Mortemart, Le Rhone, Charles Lefebvre, Felix Genero, &c. For twelve, Capt. Webb was again first, Mr. Smallman being second, and Mr. S. Smith, Broom House, Stourbridge, third. An extra prize was awarded to Mr. C. Cooper, Moseley. There were excellent trusses in all these stands, as well as in some others which did not find a place in the prize list. For eighteen and twelve, single trusses, open only to exhibitors from the counties named not showing in any other class, both first prizes went to Mr. C. Butler, Castle Bromwich.

There were also, as usual, classes confined to exhibitors resident within four miles of Stephenson Place, Birmingham, and in these were very creditable stands from Mr. Cooper, gardener to Misses Anderton, Moseley; Mr. T. Hopkins, Ussley Brook, Acock's Green; and J. E. Mapplebeck, Esq., Moseley. Mr. Smallman was first in the maiden class.

Of new Roses sent out in 1869-70-71, Mr. Keynes and Mr. Durbin were the only two exhibitors, and they took positions in the prize list in the order in which they are named. The best were Louis Van Houtte, Comtesse d'Oxford, Clémence Raoux, large but somewhat variable; Emilie Hausburg, Marquise de Castellane, Marquise de Mortemart, Mdlle. Eugénie Verdier, Ferdinand de Lesseps, Paul Néron, La Motte Sanguine, Nardy Frères, and Dupuy-Jamin.

The best twelve trusses of a yellow Rose were Triomphe de Rennes, from Mr. Keynes; Mr. C. J. Perry was second with Gloire de Dijon, as good as we have seen it this year; and Mr. Durbin third with Triomphe de Rennes. For the best twelve trusses of any dark crimson or rose-coloured variety, Mr. Keynes was again first, showing splendid trusses of Marquise de Castellane, also Madame Charles Wood. In the corresponding class for blush Roses, Baroness Rothschild from Mr. Cranston and Mr. Keynes was first and second.

There was a good show of bouquets. Miss Pope, King's Norton, sent two which were very prettily arranged; one was formed of Lilium lancifolium in the centre, surrounded by successive rings of Forget-me-not, double rose Pelargoniums, Stephanotis, double scarlet Pelargoniums, with a bordering of Maiden-hair Fern. The other bouquet, less formally arranged, was even more beautiful. Mr. Perkins, Mr. H. Pope, Miss Cole, Birchfields; Mr. R. Vertegans, of the Chad Valley Nurseries, Edgbaston; and Mr. C. H. Harrison contributed tastefully arranged bouquets; and in dinner-table decorations Mr. Perkins, Miss Cole, Mr. Vertegans, and others furnished well-filled stands. One from Miss Mort, chiefly of Lycopods and Ferns, if contrasted with gay-coloured flowers placed elsewhere in the room, would be an agreeable relief. It was pretty and quiet.

Mr. Vertegans sent several stands of cut Roses, but could not compete as his collection is only now coming into good bloom. Mr. Keynes sent vases. Messrs. F. & A. Dickson, of Chester, also sent stands. Mr. Perry contributed stands of fine cut Verbenas, of which Minnie, with a lilac eye; and the Rev. R. C. Carter, pale blush with a crimson eye, received first-class certificates. Messrs. Mapplebeck & Lowe exhibited a large assortment of garden chairs, garden engines, syringes, swing water-barrows, tools, &c.; Mr. Harris, seats with awning to wind up, lawn-mowers, rollers, &c.; and Mr. Kaye, Didsbury, cases of beautifully skeletonised leaves, &c.

CHILDREN'S FLOWER SHOW AT VICTORIA DOCKS.

THE first annual show in connection with the children of St. Mark's church and schools, Victoria Docks, was held in the infant school-room, Nelson Street, on Friday, the 23rd ult. The idea was originated at the commencement of the present year of organising a children's window plant show, under a parochial committee, and rapidly the matter has been brought to a practical and successful issue.

There is something worthy of especial commendation in the idea of training the little ones to acquire a love for the beautiful in nature. Residing in a region where little else is heard by day but the din of hammers, the shrieking of engines, and the whirling of machinery, and little else at night but the shouts of noisy, drunken revellers—as the records of the local police courts can too often testify—there is nothing in the surroundings of the district, nor the moral atmosphere which pervades it, calculated to elevate the children above a very low standard of mental culture. True, at the present day, the arduous labours of the ministers of the district are producing a beneficial effec' on the masses who reside in the Dock districts; and the newly-elected School Board gives great promise of effecting real good among the juveniles; but in the absence of the latter valuable adjunct, all honour is due to those gentlemen who, by dint of assiduity and patience, have successfully inaugurated what will doubtless prove a great aid towards the amelioration of the lower and humbler classes.

The system pursued by the committee is a capital one, although from the large number of plants, a large amount of trouble is necessarily entailed. In March or April, the whole of the plants which are to compete for the prizes are registered with a seal and ticket, and some idea may be gained of the extent of the show when we mention that there were no less than three hundred plants thus registered for the present exhibition. The infant school-room had been tastefully

decorated with flags of all nations, which was done under the personal supervision and through the kindness of Mr. Linch, dock-master at the Victoria Docks. The flowers were arranged on tables down the centre of the room, and had a very pretty appearance. For the embellishment of the show, some choice cut flowers were kindly contributed by Sir Antonio Brady, Mr. Christopher Boyd, of Cheshunt, Mrs. Adams, of Plaistow, and Mr. Bidder, of Mitcham. The competitors exhibited some fine specimens of Petunias, Mignonette, Fuchsias, Calceolarias, Musk Plants, and Geraniums.

The attendance during the afternoon was very satisfactory. The proceedings were enlivened by the performances of the drum and fife band, in connection with the Bishopsgate Schools. At half-past five o'clock the prizes, thirty-one in number, and consisting of writing cases, desks, books, pictures, games, &c., were distributed to the successful competitors by the Rev. H. J. Bodily, president of the committee, who in the course of a few appropriate remarks to the children, said there seemed to be a determination on the part of the committee to carry the show on for another year. He expressed the great regret he felt at the absence of Mr. Boyd, as he knew how much that gentleman would have liked to have been present. Before his departure for America he expressed his great sympathy with the scheme, and was very desirous that it should succeed. Mr. Gatty, the Honorary Secretary, also addressed the meeting, urging on the children the necessity for cultivating cleanliness and neatness of growth in their plants. He stated that upwards of £20 had been raised towards expenses, from friends in the country and a few local gentlemen, and after meeting all demands there would be a substantial balance. This announcement was received with applause. Each recipient of a prize was loudly cheered on stepping forward, and a little fellow named Taylor received a very large share of applause.

Tea was now provided in the adjoining school-room, when about one hundred sat down. After tea a social meeting was held, when there was a large audience. Several glees were given by the choir of the iron church; Mr. and Mrs. Everett gave some excellent specimens of vocalisation; pianoforte and vocal selections were performed by Miss Adams and Miss Brown, of Plaistow; while some excellent recitations were given by Mr. Hernaman, and one of the boys in the band. With such attractions the proceedings could not fail to be pleasant.

[I was remarking a short time ago to a London city man, that not only had profane swearing ceased among gentlemen, but it was happily much less heard among the poor. He replied, "You should hear how they swear at the Docks. If you ask a man to lend a hand and he is willing, he adds an oath to convince you that he is; if angry and unwilling he swears at you; in working they swear, in idling they swear. Oh! how they swear at the Docks." I remarked with a shudder, "What an atmosphere to bring up children in!"

Such was my connecting idea with the Docks of London, and when the foregoing report came into my hands, as I sat here, in leafy west of England, amid the trees and flowers, and the smell of the new-made hay, borne through my window, mingling its sweetness with that of the Roses before me, and when I read its title, "Children's Flower Show at Victoria Docks," I added, "Ah! and how they swear at the Docks!" but having read the article how much better an association of ideas shall I now have with those Docks. This is, indeed, the age for giving advantages to children. What cheap, and pretty, and interesting books are now issued for them, instead of the dear, dull, didactic ones of our childhood! Now, there is education to raise the poorest, hospitals to nurse them if sick, days in the country for town children, clergymen and ladies working for them and with them, so many means and appliances are there to train them for future usefulness and respectability. And I have the greatest possible pleasure in recording yet another means of doing heart-good to the poor town children—viz., the starting a children's flower show at the Victoria Docks. If children cannot be brought up in the country, the next best thing is to endeavour to bring the country to them, and this is most readily done by giving them an opportunity of gratifying that taste for flowers which all children have naturally. How strong an instinct or taste this is! Each little one as soon as it walks among the Daisies, stops, and stoops to pluck them, gathering a posy of them in its warm plump hand. I have sometimes thought that this arose in part from the nearness of the children to the flowers; their eyes look straight and close into them, and the flowers look straight up to them, the two are so near; whereas we, tall grown-up folks, are high above them, and look not so closely into the world of flower beauty at our feet. But the poor town children cannot get to the flowers, they make attempts and get hold of dying cast-away nosegays, and play with, and pet, and caress them, sitting in their rags on door-steps, up courts and back streets, but they seldom get near flowers in their bloom and beauty. Surely, then, it was one of man's best thoughts which prompted the good people at Victoria Docks to have a children's flower show in their infant school-room. What pure pleasure was given to the little Sarahs, and Eilens, and Fannys, and Williams, and Georges who gained a prize, pleasure for their mothers too. What a world of happiness to very many must that show have caused! I commend the account of it to our readers generally, but particularly to town clergy and other town dwellers. I hope this good example may find many imitators, and so a pure taste will be nourished, and it may be both heart and life raised to a higher standard, for contact with purity always benefits, and nothing on earth is so pure as its flowers, for truly and sweetly thus sings of them John Keble—

"Relics ye are of Eden's bowers,
As pure, as fragrant, and as fair
As when ye crowned the sunshine hours
Of happy wanderers there.
Fallen all beside—the world of life,
How is it stained with fear and strife!
What passions rage and glare!
But cheerful and unchanged the while
Your first and perfect form ye show,
The same that won Eve's matron smile
In the world's opening glow."

I wish all success to the good endeavours of the good people at Victoria Docks.—Wiltshire Rector.]

POTATO DISEASE.

I have a plot of ground 30 yards square, planted with American Early Rose Potato, the greater part of which is very much affected with the Potato blight. I have dug-up several of the affected roots and find the tubers very much diseased. I have also some Bovinia and Red-skinned Flourball, similarly affected, but not to such an extent as the former. I believe all the above to be American varieties. I have some of Paterson's Victoria planted alongside the Americans, and they are at present free from disease. I believe the disease to be at present confined to the Americans, as I have not heard of its appearance amongst any of the English varieties.—T. J. Harrison, *Farnden, Cheshire.*

ROYAL BOTANIC SOCIETY'S SHOW.

July 12th and 13th.

This has proved one of the best of the shows held by the Society this summer, although the weather on the first day was by no means favourable; but the absence of many of the large specimens seen at the earlier shows is compensated for by a very good exhibition of fruit, which is always an attraction at London shows, especially as there has been of late so little of it. Of table decorations, epergnes, *et hoc genus omne*, there is a large display, exciting among the ladies a great amount of interest, though it may be questioned whether such objects would not be better relegated to a place by themselves, instead of forming a part of the contents of the great tent. The attendance of visitors was very good.

Among the exhibitions of stove and greenhouse plants in flower, those from Mr. Ward, gardener to F. G. Wilkins, Esq., Leyton, both of twenty in 12-inch pots, and of six in pots of any size, deserve particular notice, especially the latter, although they come second to a collection from Mr. Baines, gardener to H. Micholls, Esq. Mr. Ward has a splendid specimen of the richly coloured Erica Parmentieriana rosea, and of Pleroma elegans one of the finest specimens we have ever seen, being covered with its large violet flowers, which render it so effective when "well done," which it seldom is. Allamanda grandiflora in the same collection is also fine; Statice profusa, very good though beginning to pass; and Erica obbata. Mr. Baines, however, well deserved the first position, having a magnificent Erica obbata; Anthurium Scherzerianum, very fine, with twelve spathes, and in fruit; Allamanda Aubletii; Hedaroma tulipiferum, very fine; Dipladenia amabilis, and Erica Parmentieriana rosea, splendid. Mr. Wheeler, gardener to J. Philpott, Esq., has also good specimens, as also have Messrs. Jackson & Son, of Kingston, and Mr. Kemp, gardener, Albury Park, in the class for plants in 12-inch pots.

Of fine-foliaged plants, Mr. Baines sends a magnificent pan of Sarracenia purpurea, Phœnicophorium sechellarum, Croton pictum large and beautifully coloured, and Theophasta imperialis. Messrs. Burley and Wright take the remaining prizes.

In Orchids, of which there are but few, Messrs. Ward, Wright, and J. Wheeler among amateurs, and Messrs. Williams, Rolliesen, and Bull are the successful exhibitors.

Palms and Exotic Ferns are freely contributed, the best coming from Mr. Williams, of Holloway, Messrs. Burley, Baines, Carr, and Wright; we noticed among the Palms fine specimens of Latania borbonica, Sabal Blackburniana, &c.

Of British Ferns Messrs. Ivery, as usual, have a large assemblage.

Tricolor Pelargoniums from Messrs. Stevens, Carter & Co., E. G. Henderson, and F. & A. Smith are, as usual, excellent; and among

amateurs they are well represented in collections from Messrs. Goddard, Thomas, and Welsh. Of Zonal kinds in flower, Mr. Catlin, gardener to Mrs. Lermitte, Finchley, has truly grand specimens.

New plants are shown in large groups by Mr. Williams, Messrs. Veitch, Mr. Bull, and Messrs. E. G. Henderson. Mr. W. Paul has a fine group of new Pelargoniums not for competition, also Lilium auratum beautifully flowered, as well as splendid cut blooms of Roses. Messrs. Cranston, Paul & Son, Cant, Fraser, and Kimberley, have also stands of cut blooms in fine condition; whilst among amateurs, Mr. Ingle, Mr. Farren, and Mr. Chard stand conspicuous. Mr. Hooper, of Bath, has, as usual, very fine Carnations, Picotees, and Cloves, as well as fancy Pansies; and Messrs. Downie, Laird, and Laing's Phloxes and Bronze Pelargoniums deserve more than a word of praise.

In dinner-table decorations, &c., we did not notice much above the ordinary run, though some of the arrangements are tasteful enough. There is in general still a great tendency to overload with flowers, to render the arrangements too elaborate. Our leaning is towards simplicity. Miss Hassard, St. Ronans, Norwood, is first for a dinner-table decoration; Miss Harris, Clarendon Park, Salisbury, second, and she is also second for an epergne with growing plants, no first being awarded, and first for the same with cut flowers and fruit, Miss Hassard being second in this case. For a table bouquet Miss Annie Williams is first, Miss Harris second. Miss Buster and Miss Hassard are equal second for hand bouquets tied. Mr. Wills, Sussex Place, Brompton, is first for a bridal bouquet, Mrs. R. Tanton and Mr. J. W. Chard being second and third; Mr. Perkins, Leamington, being first, Mr. Tanton second, and Mr. Cranston third for hall-room bouquets. In rustic standing baskets, the prettiest in our opinion comes from Mrs. Cole & Sons, and consists of Panicum variegatum, Dracæna Cooperi, and blue Lobelia. Several other prizes were awarded.

First-class certificates were awarded to Mr. Parker, Tooting, for Izora amabilis; to Mr. Bull for Bignonia Roezliana, Amorphophallus spectabilis, Alocasia Marshalli, Philodendron hybridum, Dioscorea spectabilis, Pteris serrulata cristata, and Goniophlebium glaucophyllum; to Messrs. E. G. Henderson & Son for Hydrangea japonica speciosa; to Mr. B. S. Williams for Rhopala granatensis; to Mr. H. Wendland, Inspector of the Royal Gardens, Herrenhausen, for Æchmea Mariæ-Reginæ; to Messrs. Ivery & Son for Polystichum angulare pulchrum Bellairsiæ, P. angulare Marshalli, and P. angulare vulgare Whytei; to Messrs. Standish for Bouvardia leiantha grandiflora; and to Messrs. Rollisson for Davallia clavata. The following floral certificates were given—viz., to Messrs. Perkins, Leamington, for Coleus Lady Leigh, and to Mr. C. Kimberley for Tricolor Pelargonium Gem of Tricolors.

FRUIT.

Of collections of fruit only two are shown; the one comes from Mr. Lynn, gardener to Lord Boston, Hedsor, the other from Mr. A. Johnson, gardener to the Marquis of Aileshury, Savernake Forest. Both are remarkably good. That from Mr. Lynn, to which the first prize was awarded, consisted of large bunches of Black Hamburgh Grapes, General de la Marmora, a Queen Pine, Victory of Bath Melon, splendid Grosse Mignonne Peaches, Elruge Nectarines finely coloured, Bigarreau Napoléon Cherries, and Sir Joseph Paxton Strawberry, very large and fine. Mr. Johnson sends two good Pines, excellent Black and White Grapes, good Peaches, Nectarines, Strawberries, Cherries, and a Melon. Collections of six dishes of out-door fruit come from Mr. Lynn, Hedsor, Mr. Bones, gardener to D. McIntosh, Esq., Havering Park, Mr. Kemp, and Mr. Pizzey, and consist of Red, White, and Black Currants, Raspberries, Gooseberries, Strawberries, Cherries, and Winter Greening Apples.

Grapes are very numerously shown, and for the most part very good. The best 12-lb. basket of Black Grapes comes from Mr. Berry, gardener to J. Da Silva, Esq., Burntwood House, Wandsworth Common; the berries beautifully coloured, and, though not large, very even in size. Mr. A. Johnson is second, and Mr. G. Osborne, Kaye's Nursery, Finchley, third, both with fine berries as regards size, colour, and bloom. Mr. Sage, gardener to Earl Brownlow, Atherstone, and Mr. Wallis, gardener to J. Dixon, Esq., Astle Park, also send fine baskets.

The best basket of White Grapes is Muscat of Alexandria well ripened, from Mr. Feist, gardener to R. Ashby, Esq., Staines. The second best, not so fully ripened, comes from Mr. Osborne; and third, is Mr. Davies, Friern Barnet.

In single dishes of Black Hamburgh, Mr. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, takes the lead with good-sized, finely-coloured bunches. The second-prize dish, from Mr. Walker, gardener to H. J. Atkinson, Esq., Acton, consists of good, compact bunches, well coloured; Mr. Lane, gardener to J. Miles, Esq., Friern Barnet, is third, with large, fine bunches, but not well coloured. Large bunches come also from Mr. Reid, Possingworth, and Messrs. Wright, Lee.

In Black Grapes of any other kind, Madresfield Court, black as night, from Messrs. Standish, of Ascot, is first; the same firm also sends Royal Ascot. Mr. Hicks, gardener to C. Scholfield, Esq., is second with Black Prince, moderately good. Third comes from Mr. Barham, gardener to Lord Ormanthwaite, Warfield Park, with good bunches of Black Muscat of Alexandria.

In Muscats Mr. Ritchie, gardener to R. H. Prance, Esq., Frognal, Hampstead, is first with large-berried symmetrical bunches of Bowood Muscat; Mr. Barham is second with Muscat of Alexandria, fine bunches, tolerably ripe; and Mr. Kemp, gardener to the Duke of Northumberland, Albury Park, third with good, compact, but not large bunches. Very large bunches of the same kind, but not sufficiently ripe, come from Mr. A. Wright, gardener to C. H. Roberts, Esq., Regent's Park, and Mr. Davies, Friern Barnet, the three weighing 13 lbs., and Mr. Walker, Acton.

Of other white kinds, Buckland Sweetwater, finely ripened, from Mr. Cole, gardener to E. S. Budgett, Esq., Ealing Park, is first; Ascot Citronelle, a deliciously-flavoured long-hanging Grape, from Messrs. Standish & Co., of Ascot, being second. This, though not large in berry, is one of the most delicious Grapes we have tasted. Third comes Mr. Pizzey, gardener to Sir E. Perry, Fulmer, Slough, with White Muscadine.

Of Pines there are twenty-one shown. The best Queen is one of 6 lbs., from Mr. Jaques, gardener to J. C. P. Cunliffe, Esq., Hooley House, Croydon, small-crowned and well-swelled. Second is Mr. Akehurst, gardener to J. Copestake, Esq., Highgate, with a fruit having by far too large a crown; third, Mr. J. Deaville, gardener to Lady Edwards, Wooton Hall, Ashbourne. Messrs. Godfrey, Wheeler, and Cole also send good fruit. For any other variety Mr. Bertram, gardener to R. T. Crawshay, Esq., is first with a Providence not fully ripe of 9¼ lbs.; second comes Mr. Ward, gardener to T. N. Miller, Esq., Bishop Stortford, with a fine Smooth Cayenne of 7 lbs.; the same kind from Mr. Rochford, market gardener, Page Green, Tottenham, is third.

Of Melons there is a fair show. The green-fleshed kinds principally shown are Queen Emma, Golden Gem, and Bailey's, but there are several hybrids; as usual, Gem is the chief scarlet-fleshed kind.

Of Peaches, splendid dishes of Royal George and Violette Hâtive, come from Mr. W. Birse, gardener to J. F. Lermitte, Esq., Finchley; of Barrington and Grosse Mignonne from Mr. Reid, gardener to L. Huth, Esq., Possingworth; of Royal George and Violette Hâtive from Mr. Bones; of Grosse Mignonne and Violette Hâtive from Mr. Lynn, gardener to Lord Boston, Maidenhead; and these kinds, as well as Noblesse, are well shown by other exhibitors.

Nectarines comprise fine specimens of Violette Hâtive, Balgowan, Elruge, Hunt's Tawny, and Newington from Messrs. Davey, Birse and Kemp.

Of Cherries, Messrs. Cole, Walker, and Godbold sent fine dishes of, Bigarreau Napoléon, Black Tartarian, and Mr. Smith the Elton.

In Strawberries, four dishes, Mr. Douglas, gardener to F. Whitbourn, Esq., has remarkably fine fruit of the Frogmore Late Pine, Lucas, Admiral Dundas, and British Queen. Mr. Clarke, gardener to J. C. Browne, Esq., Horsham, has Empress Eugénie, very fine. Large fruit of President, Lucas, and Sir C. Napier come from Mr. Smith, gardener to the Earl of Gainsborough, Exton Park; and of Frogmore Late Pine, Sir C. Napier, and British Queen, from Mr. Pizzey.

Mr. Harvey, gardener to P. Wroughton, Esq., Worsley Park, Wantage, sends four good Pines, grown on the Hamiltonian system, being the third crop in two years and seven months. Mr. Akehurst, gardener to S. Copestake, Esq., has three good, ripe-fruited Pines in pots; and of Vines in pots. Mr. Wisker, gardener to J. A. Rose, Esq., Wandsworth Common, has two plants with well-ripened bunches. Messrs. Lane have also good examples, though the bunches are not so well coloured; and from Mr. Cole, gardener to E. Budgett, Esq., Ealing Park, come two fine Vines trained with 3-feet stems, and forming a circular table-head, from each of which are suspended eight good bunches. These were grown in 12-inch pots and afterwards repotted.

Of other fruit, Mr. Osman, gardener to F. R. Holland, Esq., Stanmore, has very fine Brown Turkey Figs; Mr. Harvey, Wooley Park, Wantage, two fruit of Stephanotis floribunda; Mr. Osman has also excellent French Crab Apples; and Mr. Deaville sends Bedfordshire Seedling, plump, and in fine preservation.

BALSAM CULTURE.

As it is necessary to make two or three sowings for sake of succession, we think it useless to fix any date; the seeds may be sown in almost any soil (if it be of a light nature), and plunged in a mild hotbed. In a few days the young seedlings will appear. Great care must be taken to have them near the glass. As soon as they are fit to be handled, select a number of deep thumb pots, and a quantity of soil consisting of leaf mould and loam—the same temperature as that from which they were taken. They should be potted as deeply as possible, not to cover the leaves. Now is the most critical period of their growth. The best plan will be to have a small hotbed prepared for them; there is then no difficulty in treating them as they should be. Little shading is necessary—the less the better, as they are so inclined to run upwards. As before remarked, they cannot be too near the glass, if they do not come in actual contact with it. A little air is necessary on all occasions, as it tends to stubby and substantial growth. By the next shift the grower will see if he is to have nice plants; as soon as the bottom shoots are got hold of, there is no diffi-

culty in growing fair plants. When long enough they must be pegged down, and every after-shoot must be kept down by means of pegs, or ties of Japan flax. The Balsam is even more brittle than the young shoots of Vines, and the trainer must exercise considerable caution in tying or pegging. Some people feel satisfied with an 8-inch pot for their largest plant, and we believe this to be the most economical and most useful system. Very nice plants, loaded with bloom, can be grown in 8-inch pots with very little trouble; but to grow specimens is a very different consideration—an 11 or 12-inch pot will grow a specimen 3½ feet in diameter, and this we consider a fair specimen. If plunged in a spent hotbed, with the sashes tilted to admit as much air as possible, and every bloom picked off as it appears, they will grow like Willows; and when the roots have thoroughly searched through the soil and exhausted it, they will stand any reasonable amount of feeding. The best Balsams we ever saw grown were at Cullen House by Mr. Milne in 1868; and being one of Mr. Milne's assistants, we had the advantage of seeing their treatment. The plants alluded to were trained as we generally see show Pelargoniums. A trellis was formed of green-painted sticks and dark cord, so that every shoot could be pulled down by means of soft flax ties, at the same time hidden from the eye. By the month of August the plants were all that could be desired; certainly their appearance in the show-room at Cullen could not but satisfy Mr. Milne for all his trouble as regards the training. Will you, Mr. Editor, or any of your correspondents, be good enough to state which is the proper mode of training? We saw Balsams at different shows in Lancashire last summer trained as Chrysanthemums are in Scotland, and we think the system highly objectionable, as they look unsightly unless they are shouldered up by a Geranium or two to hide their bare legs. —Wm. Hinds, *Childwall Lodge, Liverpool.*—(*The Gardener.*)

THE NIGHT-BLOOMING CEREUS.

Of this, Cereus grandiflorus, there is one large old plant here which I have heard several gardeners and gentlemen say is the largest of its kind in England. It flowers here every year, and in 1869 there were 131 flowers opened from May 29th to June 28th, and as many as sixty-seven open in one night. This year it has just finished blooming; the greatest number open at one time being thirty-one, when we had the plant photographed by the magnesium light. The size of the plant is as follows—5½ feet high, 9 feet across, and 1½ foot through. It is trained on a strong iron trellis, and every year's fresh growth is laid on the top and closely tied-in on the sides.—R. Maitland, *Pendyffryn Gardens, Conway.*

[This is the finest specimen bloomed in this country of which we have any information. We have more than once been taken to see, by lantern light, one or two blooms on small specimens. The finest we ever saw was trained over the trellised arcade admitting from the Ganges to the house of the Curator of the Botanic Gardens at Calcutta. Its hundreds of blooms and the fire-flies darting among them are vividly remembered.—Eds.]

WINDOW GARDENING.

We are glad to see that societies for the encouragement of this very desirable object continue to find promoters in the metropolis. Lately an exhibition of plants was held in the front court of the Royal Hospital, under the auspices of a Society lately formed in Upper Chelsea, under the presidency of Lord Cadogan, and the vice-presidency of the parochial clergy. In spite of the prevalence of adverse weather, the plants which had been registered six weeks previously, did credit to their owners, and prizes were awarded to about sixty competitors. The noble President, who distributed these prizes, had a kind word of encouragement both for successful and unsuccessful exhibitors. A band of the corps of commissionaires played a selection of popular music during the afternoon. The result of this first attempt to promote window gardening in the parish was very satisfactory, and gave abundant promise of greater success in the future.

Lord Shaftesbury presided over a meeting in the well-known Dean's-yard, Westminster Abbey, for the promotion of window gardening, a purpose supported by the Lord Chancellor, the Dean of Westminster, Canon Conway, and others of the clergy and laity of the surrounding districts. A spacious tent in the enclosure held the flower show, the result of the spring and summer cultivation by dwellers in the neighbouring nooks and corners. Of three hundred exhibitors, sixty were awarded prizes, which were duly distributed before a very fashionable assembly to the winners, who were chiefly of the lower class in the labouring population. Lord Shaftesbury, after giving all the prizes awarded, told the other exhibitors, amid great cheering, that though they had not won prizes, yet it had been determined to give them some "crumbs of comfort" in adding something for each. He assured them, however, that it was well to begin in most things with a failure, for success in starting made people "priggish" and "cocky," while a breakdown often led to renewed effort and to a more certain and continuous success. He then spoke of the benefits arising to the poor and lowly from the cultivation of flowers, even though it might be in a tiny pot on a narrow ledge. In that cultivation the dullest mind was expanded, for the man, woman, or child who cultivated a flower saw the benefit of air, water, and light to the growing plant, and the blooms which followed care, and they naturally would have their thoughts directed to the Providence who bestowed all these gifts on His creatures, and to the advantages of ventilation and cleanliness. He dwelt particularly upon the existing need for some of the exhibitors and dwellers in these corners to use water, with soap, on themselves—an admonition not uncalled for as regarded some present. After a jesting comment on the combination of pleasant names, as Rosemary, Sweet Apple, Cherry Tree, and Paradise, with most unpleasant places in London, he congratulated his old friend, Old Pye Street, upon taking prizes at this Show, and said that whatever education the London School Board decided upon giving the street Arabs, he should not be satisfied unless a knowledge of Nature's beauties was imparted, and with this they would find sermons in babbling brooks, open books in the green fields, and God in everything. The Dean of Westminster and Canon Conway spoke, and the meeting concluded with cheers for the noble Chairman and for the Dean, who is the President of the Society.

SHOULD ONE EXHIBITOR RECEIVE ALL THE PRIZES?

At the leading exhibitions there are, now, restrictions in the size of pots in large collections of plants, so as to allow young exhibitors a chance for competing, and I think the time is opportune for drawing attention to a practice that prevails at small local exhibitions, and which in my opinion equally needs reforming. The question I would like to ask and see discussed in your columns is this—Is it fair, or not, that an exhibitor should be allowed to carry off all the prizes in a single class? The practice prevails in this locality as well as in others, and what I am surprised at is, that in the open classes or in collections of plants or fruits it is disallowed, but with single specimens and single dishes of fruit or vegetables it is the rule. Why the line is drawn I cannot understand. One reason I have heard urged is, that better exhibitions are obtained by permitting this; but I greatly doubt if such is the case, as in small districts it is well known where there is an exhibitor who excels in any particular thing, and his productions in that class are soon left to compete amongst themselves. It may be the right way to get a good exhibition, but it is not the right way to create a competition. I always understood that the first and proper aim of flower shows is the advancement of horticulture, by causing an emulation amongst gardeners or amateurs, and when an exhibitor showed the best he had, and took the first prize, it showed his superior skill; he should then be content with the honour he achieved, and allow the next best exhibitors to take the other prizes. It would appear as if the relative merits of the exhibitions are not considered at all according to this rule, that one might bring all his produce in any class, stage it in single specimens or dishes, and let the judges pick out which they might think proper, thus setting up his own produce to compete against itself.

My motive in bringing this question forward is entirely in the interest of fair play to small growers. I believe that many are deterred from exhibiting, knowing that they have no chance with a few of the local lions who go in and devour the lion's share, while they must stand back aghast until the noble animal is overgorged; then they may go in and pick up a few crumbs here and there. Of course there is no blame attached to the exhibitors; they receive the schedule, and are bound to accept its conditions, right or wrong. I have conversed with several gardeners on the subject, and nearly all were of my opinion. It is the committees who draw up the schedules to whom we must look for reformation; all that the exhibitors can do is to protest against such conditions. I shall be glad to see the matter discussed.—A Yorkey.

ON THE PROTECTION OF FRUIT TREES FROM LATE FROST.

A very large number of gardeners deem protection of some sort necessary; a few declare against protective measures in any degree, and not very fairly comparing small things with great, class them in the same category with corn laws and pro-

tective tariffs. The differences of individual experience are sufficient, no doubt, to account for some divergence of opinion as to the extent of protection necessary; but the almost universal prevalence of frost, or equally destructive winds, up till a late period in spring, should leave little room for doubt as to the expediency of the practice to some extent. Perhaps too much protection is as bad in its results as no protection; and thus the non-protectionists may find some justification of their views in the failures of those that coddle their trees, under the impression that they are retarding them, till they become unnaturally sensitive of every change that occurs in our fitful spring weather. It is quite possible to protect overmuch as it is possible to clothe ourselves overmuch. The Hibernian gentleman who put on his entire wardrobe, consisting of three suits and an overcoat, and yet felt cold, neither succeeded in making himself more comfortable nor in bracing himself up to a better state for enduring cold. So with our fruit trees; we may clothe them to the extent of frustrating our own object, and weakening their powers of endurance.

Much ingenuity has been displayed in devising fabrics for the purpose of protecting fruit trees. Some of these fabrics are well, others ill, adapted for the purpose; yet each has its advocates. Some prefer a dense or heavy covering, such as canvas or frigi domo, along with the attendant labour and trouble of daily removing in the morning and putting it on at night. Others think the lighter kinds of protecting materials, such as Haythorn's hexagon netting and the thinner kinds of tiffany, the most effective protectors for either blossom or fruit. Perhaps no kind of material in use for the purpose meets all the requirements. Haythorn's netting, the least dense and most elegant of all, is, I believe, too thick, too obstructive of light, and too bad a conductor. The object of protection should not be to increase artificially the temperature around our trees, but to prevent excessive loss of heat by means of radiation or blasting winds. A much slighter covering than any in use is sufficient to effect this. It is no uncommon thing to find a tender Peach or Apricot under an overhanging leaf quite safe, while those exposed directly to the action of radiation are destroyed. The thin leaf, with its tissues charged with moisture, is a pretty good conductor, yet it is quite sufficient protection for the fruit it shelters, and the fact is suggestive.

Some apply their protection long before their trees are in any danger, and believe they are retarding them. The use of this it is difficult to see; for supposing that it is possible with safety to retard trees that are stirred into activity, say in February or early March, by the slight increase of the mean temperature of day and night that takes place so early in the year, is the application of protection, as soon as they are suspected to be on the move, the proper means to adopt in order to accomplish this object? I am not satisfied that it is so, for having had some experience of most of the materials commonly used, I have observed that they all tend to increase the mean temperature of the day by raising the actual temperature of the night, while they have much less influence in depressing that of the day than is generally supposed. The weather itself is perhaps the most effectual retarding agent we could wish in spring, north of the Tweed at least.

But granting that the application of the most approved protecting fabric acted so as to retard the activity of the trees, what, it may be asked, is the good gained by the practice? Not much, that is very apparent. Could we retard them for a month, which is impossible, we should not then be able to pronounce them past danger; for there are not any grounds for assuring ourselves that the more tender kinds of fruit—such as the Peach and Apricot—are safe till the middle or end of May. It is from March till the middle of May that danger to our fruit crops is most to be apprehended from frost; and it is pretty clear, I think, that it is impracticable to retard the action of the trees to any considerable extent, so as to tide them over the critical period in greater safety. Any covering, be it light or heavy, if it is composed of non-conducting material, will have the effect of surrounding the subject protected by it with a more equable atmosphere, less liable to fluctuations of temperature than the outer air. Every cultivator knows that such a condition is the most favourable for steady progress in vegetable activity, and that plants accustomed to such a condition are much more susceptible to injury from any sudden decrease of temperature than those that are subject to greater variations. Those, therefore, that practise that system which is named retarding, practically extend the period of danger by hastening its commencement, for there is no possibility of correspondingly shortening it at the other end, and they also increase the danger by rendering their trees more susceptible of cold when extreme occasions arise.

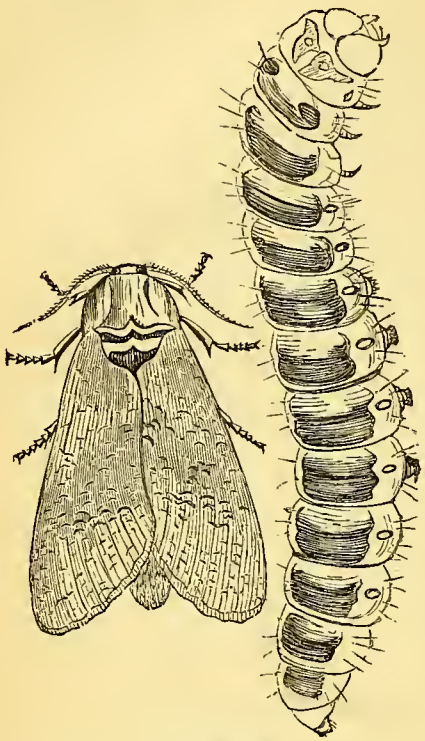
My own experience is all in favour of the thinnest possible protection, to be put on only when it is no longer safe to postpone doing so, and to be kept permanently fixed as long as protection is thought necessary. In my own case circumstances leave me no choice between old herring-nets and nothing. During the past three years they have been used only in part for the purpose, there not being sufficient of other fabrics to cover all subjects deemed worthy of, or in need of, protection, but during the present year nothing has been used except old herring-nets. We use them twofold; and scanty protection though they may appear to be, we have proved them quite capable of carrying safely through as good crops as there are going this year of Apricots, Peaches, and the better kinds of Plums, &c. Yet we were not exempt from the exceptionally severe weather that prevailed from March till the beginning of the second week of June; on the 15th March we had 17° of frost; on the 7th, 8th, and 9th April we experienced 6°, 9°, and 12° of frost each night respectively; and again on the 16th of May we had 10° of frost. On these very severe mornings, and others less severe, but still frosty, which preceded and followed them, we, in addition to our preventive measures, employed also restorative means in the shape of cold water from the garden engine; the trees were kept drenched from peep of day till the sun had warmed the atmosphere. I believe this did much good; I am persuaded, at least, that it did no harm. Our thinnings of Apricots would have furnished the trees twice over with fair crops. Peaches will not bear thinning, but there is a respectable sprinkling on most trees. Plums are fair crops, and Cherries also are fair; Apples and Pears, neither of them protected, are exceedingly thin crops.

This subject of the protection of fruit in spring is interesitng as well as important, and to many, I have no doubt, it would be acceptable to see it fairly discussed from various points of view.—W. Sutherland, *Minto Gardens.*—(*The Gardener.*)

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 12.

About this time of the year the sombre-looking Goat Moth (Cossus ligniperda), may be detected in the day extending itself on the tree trunks. At night it flies about rather languidly, the females depositing their eggs in the crevices of the bark. The unscientific human individual who has been accustomed to associate the word "moth" with a tiny creature destructive to cloth or to seeds, is considerably puzzled when informed that this large-winged insect is also a moth. In some counties, nevertheless, we find that the name, "Moth-owlet," is applied to this, and to other dull-coloured species, such as the Old Lady, indiscriminately. Common as is the Goat Moth near the metropolis, and in various localities, there are some parts of England where it does not occur at all. Doubtless, on the principle of compensation, other species make up there for its absence, and help to bring to the ground many a goodly tree. For the caterpillar of the Goat is an internal feeder in the wood of many of the Ulmaceæ, though particularly frequent in the Willow. From the circumstance that in the same trees are generally to be found hosts of small beetles, also wood-borers in their larval condition, a fierce controversy was waged as to whether they worked simultaneously, or whether the first transgressor was the moth, and the beetle merely came-in at the finish, though the latter are certainly to be found sometimes at trees uninfected by the Goat. In my opinion, which I give with hesitation, the beetles in question, which are of the Weevil family, and of the genus Scolytus, and allied genera, follow the caterpillars, or other and larger wood-eaters, and do not attack trees healthy and sound. The peculiar odour of the Goat caterpillar gives one a clue to its presence, and is so persistent that several washings are needful to remove it from the hands should the creature have been taken hold of. A story has been passed from author to author, which is to the effect that the Romans in their age of epicurism devoured a fleshy grub they called Cossus, and which was this odoriferous and repulsive caterpillar. The first half may be true, the second is exceedingly doubtful. It is not at all easy to find the young caterpillar of the species before us, and yet it is in the early stage that one would wish to operate upon it were it possible. My own supposition is grounded on what I have observed in the case of the Leopard Moth, another wood-feeder, that for a time, at least, it lives between the bark and the wood

before it constructs a mine. The mines, or tunnels, are extensive and cross each other in various directions, very slender at first, while those tenanted by the full-grown caterpillar will almost admit a finger. We find on examination that tracks of



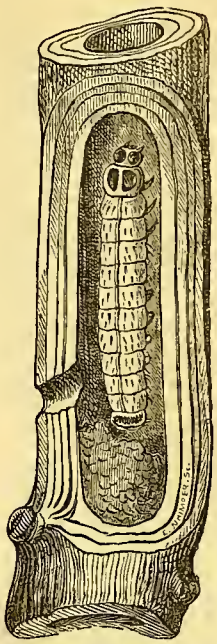
Cossus ligniperda.

different sizes are to be found in various parts of the tree, and that the caterpillar does not, as was thought, bore towards the centre as it becomes large. In cutting down trees the Goat caterpillar, as it reposes without eating during the winter, has been discovered in a habitation specially prepared, and this has been thought its usual practice. Some entomologists, however, report having discovered it then in a partially active condition. The chrysalis is placed very ingeniously in such a position that when the moth makes its exit there is only a

Wood-Leopard Moth—Zeuzera Æsculi.

thin film of wood between it and the outer world, which film is easily pushed aside ; the tail of the pupa-case remaining imbedded serves as a sort of lever to assist the moth to escape. The most effectual way of dealing with this species is by the extirpation of the moth. It is one of those sometimes attracted to any sweet compound spread upon trees, and it may also be caught just after emergence, by enclosing in gauze bags trees which have been attacked. We may reckon that each female moth killed is equivalent to the destruction of several hundred young caterpillars. A full and interesting account of the economy of the Goat caterpillar has been given by Mr. Newman.

A species which, compared with the preceding, is but a pigmy —namely, the Red-tipped Clearwing (Sesia formicæformis), is found plentifully in the twigs of the Osiers and shrubby



Wood-Leopard Moth—Caterpillar.

Wood-Leopard Moth—Skin of Chrysalis.

Willows, rarely or never touching trees. This caterpillar, which is white and fleshy, proceeds very much in the manner of the Currant Clearwing already described. The moth flies about flowers in the sunshine, or basks on the Willow leaves. Another Sesia, known as the Osier Clearwing (bembeciformis), feeds similarly, and is larger, yet not sufficiently abundant to do much injury. It is partial to the stumps of Salix capres, in which collectors seek for it as an entomological prize, obtaining it, if possible, when nearly full-grown. Some think that while very young this caterpillar feeds on the bark of the root. A long list of moth caterpillars might be given, all of which are frequenters of the Willow, and disfigure the foliage. Some years ago I noticed multitudes of the hairy caterpillars of the Satin Moth (Liparis salicis) on some trees in Batterses Park ; the species is now scarce near London. In various places along the Thames and Lea I have found the brown caterpillars of the appropriately-named moth, the Dismal (Orthosia upsilon). They sally forth at night in some seasons by hundreds, feeding in the spring. Throughout the day they conceal themselves under loose bark. That very peculiar caterpillar, called the Puss, is also a Willow-feeder, but not to an extent to be at all injurious. Various small moths belonging to the Tortrix family also help to disfigure considerably both Willows and Osiers, and one of these, which I have seen in abundance near London, is that of Earis chlorana. It binds the leaves together very ingeniously while in the caterpillar state, living in the centre of the bundle, and when of full size spins a snug cocoon of a boat shape. The moth flutters about the Willows in the daytime.

We find in the works of the old herbalists that a curious account is given of what was called the "Rose Willow," and to which various virtues were attributed. Mr. Bind exhibited at the Entomological Society, in 1865, a number of these, which had been taken from lofty Willow trees. The grub, for which they form an abode, produces a fly, Cecidomyia rosaria. Another species, C. marginemtorquens, does considerable harm in some districts, forming red and yellow rolls. Of another of these midges or gall-flies (C. salicis) Mr. Müller gives an interesting account. This seems to be most partial to the White Willow (Salix alba) when growing in hedgerows. He observes that "it makes havoc through the summer in the tips of the leading shoots. These attacks cause the young terminal leaflets to wither, and to form a small bird-shaped nidus, within which the larvæ, to the number of from three to eight, pass their metamorphosis. When the perfect insects have left the shoots

this rapidly withers away, turns brown, and at last drops." By hymenopterous insects of the Cynips family are also produced galls of various forms upon the leaves, occurring sometimes in close clusters.

Other beetles, too, besides those already mentioned, are found infesting the Willow. The large grub of the Musk Beetle (Aromia moschata) bores into the wood, not going very far in. The scent of this species is perceptible a long way off. Some are external feeders, as is the larva of Cryptorhynchus Lapathi. Very common in some places on the S. babylonica and other Willows is the pretty Chrysomela, called vulgatissima. The eggs are deposited in order by the parent beetles, and the larvæ feed together in little parties, going methodically from leaf to leaf. By means of a net the blnish green beetles may be swept off the foliage by hundreds in the early summer.—J. R. S. C.

EARLY RIVERS CHERRY.

It is now many years since the Early Purple Guigne Cherry was distributed by the Horticultural Society among its Fellows. I have had it more than twenty years, and always noticed with interest its earliness and excellence; but its delicate habit, it being liable to canker and gum, prevented its extensive cultivation. It is but a few years since it occurred to me to improve it by raising seedlings from it, and then again I found difficulty in procuring fruit thoroughly ripe, for the stones from unripe fruit would not vegetate. This is a common thing with early fruits; the pulpy covering ripens, but not the seeds. At last the orchard house came to my aid, and in the hot summer of 1865 some stones from very fine ripe fruit were sown. In 1866 they made plants from 1 to 2 feet high. In that summer their tops were cut off, and their buds placed in some Mahaleb stocks. In 1867 they made a fine growth of some 4 to 5 feet. In the autumn of the same year they were potted; in 1868, in the orchard house, they formed blossom buds; in 1869 Early Rivers bore its first crop; in 1870 and 1871 the tree bore abundantly, and its fruit were as large as those of its parent, a trifle later, but very rich and good, and the tree luxuriant and healthy.

Early Rivers Cherry.

There are other seedling trees of the same race; all have given fine fruit, and one of them is remarkable for its earliness. Early Rivers in 1870 ripened with its parent; in 1871 it was three or four days later.—Thos. Rivers.

[This very excellent Cherry, which we figure to-day from a cluster sent us by Mr. Rivers, has been very appropriately named. It possesses merits of a high order, and, we feel satisfied, will become one of our most popular varieties. The fruit is produced in large clusters of ten to twelve, two to four on a very short common peduncle. Fruit 9-10ths of an inch in diameter, roundish heart-shaped, and somewhat uneven and "hammered" on the surface, slightly pitted on the apex, and with a distinct style point; suture not well defined. Skin black. Stalk 1¼ inch long, rather slender, green, with a small, rather deeply-embedded disk. Flesh very tender, sweet, and agreeably flavoured. Stone extremely small, perhaps the smallest in any Cherry.]

NOTES AND GLEANINGS.

The Ruling Passion.—During his stirring recital of the suffering and destruction endured at Chatillon by the useless cross-fire of the insurgents (*e.g.*, 2400 shells putting only six men *hors de combat*) and Versaillais, M. Amédée Latour thus deplores one of his grievances:—"What a suffering for a lover of the garden like I am! Here I have under my eyes my magnificent Pear tree covered with blossom and devoured by caterpillars. I can count sixteen frightful clusters of them. To destroy them the tree must be climbed, and that is an impossibility; for being in sight of the forts at Issy and Vanves, the instant the artillerymen perceive any object in the garden or at the windows, they throw a shell. Woe to anyone who ventures to light a candle in any of the upper rooms."—(*Times.*)

—— A gentleman near Enstone, Oxfordshire, had a Mushroom (Agaricus campestris) brought to him this week which

measured 2 feet 10 inches round, and was perfectly sound and fresh.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Asparagus beds during the present month can hardly have too much manure water from the stable or farmyard tank. On dry friable soils salt may be applied with advantage, but it should not be used on strong adhesive ground, as it keeps the soil wet in winter and decays the roots. Finish planting out the principal crops of *Broccoli* and *Winter Greens* with as little delay as possible. Proceed with planting *Celery* as ground can be spared, using plenty of manure, and afford a liberal supply of water. Let it not be forgotten that good kinds of *Cabbage* sown immediately on ground previously saturated with water will produce abundance of nice young Cabbages throughout the ensuing winter. Attend to the staking of late *Peas*, and keep the ground moist about those in a forward state, giving them a good soaking occasionally. This will be the best preventive of mildew. See to keeping up a supply of *Salads*, *Spinach*, &c.

FRUIT GARDEN.

Many inquiries continue to be made by persons occupying small gardens, as to the principles of disbudding and stopping trained trees. Trees thus situated, it may be readily perceived, are placed under circumstances of a highly artificial character, and the sure consequences of confining them to a wall or a trellis will be the production of a vast amount of useless spray, and a considerable increase of labour, by which the cost of the fruit is much enhanced, even when success is obtained. However, since many of our improved Pears for the dessert, as well as some other fruits, cannot be produced in proper flavour without an increase of warmth and light, more especially the latter, they will, no doubt, continue to be grown by individuals who esteem horticultural productions, not by their mere marketable value, irrespective of flavour, but chiefly on account of the latter quality. Limitation of the roots, then, I would urge is the only sure foundation of a dwarfing system, which is, or ought to be, in varied degrees, the guiding principle in all artificial training. If the trees are gross, entirely take away as many shoots as will permit the solar rays to reach the organising bud for a future blossom; the rest may be left as safety valves to decoy any undue amount of sap in a temporary way, taking care, however, to pinch off their terminal shoots. The process here recommended is applicable to nearly all our fruit-bearing trees. The late showery weather has been very favourable for the growth of Strawberry runners, and a sufficient stock for forcing next season should be potted at once and placed in a close shady frame until they become established, which will soon be the case. Prepare ground for fresh plantations by heavy manuring and trenching, or, if ground cannot be obtained, at once select the strongest runners and plant them on a shady border in rich soil, to be transplanted with balls of earth next month.

FLOWER GARDEN.

Go over the beds frequently, and keep the young shoots of Verbenas, &c., neatly regulated and pegged down until the ground be fairly covered, after which the shoots may be allowed to grow more at liberty. On poor, dry soils two or three applications of weak manure water, given at intervals of a few days, and when the ground is moist, will greatly assist in getting the beds covered without loss of time. See that Dahlias and Hollyhocks are securely staked and kept properly tied as they advance in growth. Remove dead flowers and seed from Roses, and give the autumn-flowering varieties plenty of manure water, in order to keep them in vigorous health, and secure plenty of wood for blooming in autumn. Those budded on the Dog Rose must be kept clear of suckers, which, when allowed to grow, weaken the head, besides having an unsightly appearance. Budding should be proceeded with during cloudy weather. Give plants infested with green fly a liberal watering with the engine, or syringe them with tobacco water. Mildew is sometimes very troublesome after this season, and no time should be lost in dusting the infested plant with sulphur, for the enemy will soon spread and destroy the foliage, and ruin the plant for blooming in autumn. Proceed with the propagation of herbaceous plants as expeditiously as possible, in order to have the work out of hand and the glasses, &c., at liberty. Take advantage of showery weather to give the walks and lawns a good rolling, and endeavour to keep the grass short and neatly mown, for nothing looks worse than badly-kept grass. The amateur's interest is kept up by the progressive development of the Carnation and Picotee, which will speedily reward all his care and attention by the development of their beauties; the Tulip, Ranunculus, Auricula, and Polyanthus have passed away for the season, and the especial favourites previously named will for a time fill the void. Take care that the ligatures are occasionally eased, or the stem in its growth is apt to become contracted and deformed: the buds, also, if perfect flowers are desired, must be carefully bound round. Some florists tie with shreds of matting, others recommend indiarubber bands, but hitherto I have found nothing better than thread rubbed with bees' wax. When the shoots are sufficiently long, layering may be commenced; this is performed by cutting through the second or third joint, bringing the knife out on the lower side, making a "tongue;" the small portion of stem beyond the joint is cut back to it, and when pegged down in the soil, which should be fine and friable, it will there emit roots. The amateur, after a few trials, will be enabled to perform this operation with facility. Seedling Polyanthuses should be carefully shaded from the sun's rays and watered with a fine rose. This will prevent the ravages of the red spider. Ranunculuses will be better out of the ground as soon as the foliage is withered; they must be gradually dried; when this is done too rapidly it is detrimental to those which happen to be in a weak state.

GREENHOUSE AND CONSERVATORY.

Shading should be used sparingly here except on bright days, for during unsettled weather plants require all the light afforded by conservatories, the roofs of which are partially shaded by twiners, and are greatly benefited by an occasional gleam of sunshine. The beauty of most softwooded plants will be considerably prolonged by the use of weak manure water, which should be given frequently. Indeed, such plants as Achimenes, Clerodendrons, &c., may be had in full beauty from June to October through being liberally supplied with manure water, but this must not be given too strong at first. Keep the atmosphere as moist as can be done, but avoid damp or cold nights, by leaving sufficient air to cause a gentle circulation, and spare no attention to keep the plants clear of insects. Stock for autumn and winter flowering will require careful attention to bring it sufficiently forward, for, so far, the season has been unusually cold, with comparatively little sunshine. Chinese Primroses, especially the double varieties, if at all backward, should be placed in a cold frame and shaded from the sun, where they will make rapid progress, particularly if the pots stand on a slight bottom heat. Cinerarias for early flowering should also be potted and started at once, choosing the strongest suckers and placing them in a close shady frame till rooted. These are sometimes very subject to the attacks of thrips at this season; but if they are kept cool and moist, and smoked occasionally, there is no danger of their not being clean and growing vigorously.

COLD PITS.

The stock here will be growing freely, and should be frequently examined individually to see that all is going right; for plants when growing rapidly very speedily suffer through any neglect in watering, or from the attacks of insects. Examine young specimens which were potted early in the season, and shift at once such as require more pot room, so as to have the pots moderately well filled with roots before winter, in which state they are much more easily carried over the winter than when either over or under-potted. Leschenaultias should be carefully examined for green fly, and smoked at once if at all infested, and the flowers should be regularly picked off young plants of these as they appear. Chorozemas, Bossiæas, &c., must also be frequently examined for red spider, and should be laid on their sides on a clean mat and thoroughly washed with the syringe, repeating this as often as may be necessary to thoroughly eradicate the insect. Young specimens of valuable hardwooded plants should be carefully trained, keeping the shoots neatly tied-out or pegged down, in order to secure close compact foundations, upon which the future success very largely depends.—W. Keane.

DOINGS OF THE LAST WEEK.

A very trying week for those who had hay cut and almost made, and yet not in, owing to the frequent and heavy showers. The 7th was one of the best drying days of the season, but the 8th has brought a falling barometer and frequent showers. Never did Turnips look better, and where thinned early they are not likely to suffer from mildew as those unthinned and

crowded are very likely to do if the weather do not become drier. Some of these drenching close days made us look to Potatoes rather closely, but as yet we see no signs of the disease, though the crop is all the heavier on account of the moisture. Though we have had many downpours that have greatly assisted in filling our reservoirs, we have been surprised how short a distance the rains have penetrated, owing to the great dryness of two summers in succession. The rains in filling ponds and pools will be of great service, as the water in most deep wells is getting very shallow. Much grass for hay in this quarter is still uncut, and if fine weather come to dry it, the yield will be very heavy.

Dutch Barns.—Since we first alluded in these pages to Dutch barns—that is, large buildings roofed, but open at the sides, except for a certain height, and plated with zinc or tin to exclude vermin, these buildings are becoming more common in well-managed establishments, as the trouble and expense of thatching are avoided, and the straw used for thatching can be turned to better purposes. We cannot recollect just now what a gentleman told us as to the economy of such houses, and how few years of the expense of straw and labour in thatching sufficed to pay all the expenses of the open barn. There are just two ideas well worthy the attention of those contemplating having such a building for holding their hay and corn crops. First, whatever the floor—wood, asphalt, or consolidated concrete washed in with a little cement, it is advisable that it should be above the surrounding ground level, and that air-drains should pass beneath it, with gratings to prevent vermin going in from the outside, and fine-pierced gratings or sheets of iron with small holes over openings inside. Then, again, if over these openings tubes or air-shafts similarly pierced with holes are placed, all crops stored will be kept in a sweet healthy condition, and in bad damp seasons the crops will be housed with more safety than when built in stacks in the usual manner. It often seems a marvel to us how corn-growing can pay when the cornstacks are built on the ground, merely with some faggots and old straw beneath them in which mice and rats may do as they like, destroying often a good per-centage of the crop, and deteriorating the whole with their noxious excreta and effluvia. In such open-sided, roofed barns, if the side walls are from 24 to 30 inches in height, and there is a band of zinc or tin some 12 inches deep all round, no mouse nor rat will ever pass it, and there can be no loss from such vermin, unless they pass in concealed in a sheaf or a large forkful of hay. Times are coming when a first-outlay will be of less consequence, as thus the yearly saving will soon make up for the outlay. This is a matter to be thought of by gardeners, who are often the haymakers; but even in gardening proper the question is now gaining in importance, "How can the greatest amount of enjoyment be realised with the smallest possible outlay?" and regular annual outlays are in general more to be avoided than a good sum spent at once so as to secure future economy. Makeshifts are all very well, and most of us must be content with them, but for proprietors and holders of long leases these makeshifts are often very dear shifts in the end.

Makeshifts.—Perhaps there is no class so guilty of resorting to makeshifts as gardeners. The most successful are often those who are most ready to devise temporary means to meet temporary difficulties. In the light of true economy, though such schemes suit the purpose, they can scarcely be defended, as the labour, as well as the thought and reflection and continual mental strain, are considerable. For instance, we have a lingering love for the old hotbeds, small and large, both for temporary and more lasting purposes, and where plenty of such heat can be obtained, except in a few of the darkest months of winter, the bed and the frame will pretty well rival the pit or the house heated by hot water. We do not like to give up for another serious consideration, and that is the fine lot of the most valuable manure for a garden these decayed hotbeds of dung and leaves supply, all grass cuttings for linings adding just so much more valuable nitrogenous material to the mixture. For sweet vegetables and flourishing flower beds nothing beats such material from hotbeds, and we often fear that when gardeners have no hotbeds they may feel the great difficulty of the manure question, for few gardens will bear continuous and close cropping merely with the help of artificial manures, unless muck from such manures as the above be also supplied. But with all this we are not blind to the fact that now the beds are more independent of such considerations as the above mere makeshifts; and if the manure is to be purchased every year, and the time of preparing it, &c., taken into consideration, it would on the whole be the cheapest in the end to have a pit, or rather little house, heated by fire heat.

Then, again, as respects cold pits and frames, they require great care in protecting them in severe weather in winter, and the protecting material, however cheap, costs money, and with the greatest care there is still a liability of breaking glass, so that we are fully convinced it would be the most economical in the end to run a couple of 3 or 4-inch pipes for hot water to keep out ordinary frosts, and reserve a covering of a mat or a little dry litter for some very extreme weather.

Heating Small Houses.—We have read Mr. Pearson's remarks on the monopoly of fruit-selling with much pleasure, and we have no hesitation in saying that there are hundreds and thousands of little unheated houses, &c., and therefore yielding only a small part of the pleasure and the profit they otherwise would do, because so many of our first-rate hot-water men think it beneath them to have anything to do with such little jobs, or they make such a marvel and a secret of what, after all, is a very simple matter, or speak of a price which is quite alarming. Such simple heating is now becoming a little more common, because country tradesmen are seeing the importance of not despising little jobs. Mind, we say nothing of large jobs; these, on the whole, are generally done economically, with a suitable remunerative profit, and we do not see how a little job cannot be done on the same principle. We had a little house which we wished to heat to keep out frost, and we consulted several, but all went far beyond our calculations, and in the end we took a small flue beneath the tiled floor, and it answered admirably, and cost little more in shillings than we had been asked pounds for hot water. For medium-sized houses, merely to be kept temperate and look neat, nothing in our opinion will beat the small flue beneath the floor, the tile of the floor forming the top of the flue, and the flue being under the pathway.

Even for glass cases, or orchard houses, a small stove would often be a great convenience, for in such a case covering would be troublesome and expensive. Let us, then, do our best with makeshifts, but not lose sight of the fact, that more outlay in heating at first would often prove true economy before many years were over. These matters, however, will bear alluding to again, as being of great importance to proprietors as well as their servants. For instance, it is not uncommon to find a large flower garden well filled on the present fashionable grouping or massing system, and yet after the plants were turned out it would puzzle an experienced person to say where or whence they could come. But doing things in such a way involves a great amount of time and labour in moving from place to place, which might have been in a great measure saved if there had been more glass room in the first instance.

KITCHEN GARDEN.

In the kitchen garden, besides attending to successions, the chief work has been hoeing and forking the surface soil among all growing crops where it had been crusted and baked by the rains. It is often amazing how this *surface-stirring* acts upon such plants from merely letting the air into the soil. Plants that looked as if they would stand still, grew rapidly after the forking. Where rapid growth is the object, we do not think that our less-experienced readers are yet quite aware of the importance of this surface-stirring. They are sometimes nonplussed by what they consider the contradictory practice of gardeners in this respect. For instance, some time ago a keen young enthusiast could not make out why we stirred the ground amongst Calceolarias, and passed over beds of Scarlet Geraniums, though the ground was crusted in the one case as well as the other. Well, the first were flowering pretty freely, and we wished them to grow freely, and thus furnish successions; the Geraniums had grown freely, but the ground was cool, and they had not bloomed so freely as we wished. There had been two or three days of bright sun that would heat the crusted ground sooner than the stirred ground. The caked surface would so far lessen growth, and just in proportion would prompt the plant in self-defence to do what it could in the production of flowers. We like to see free growth, but very free growth does not generally accompany free blooming and fruiting. We have no occasion to go to flowers for an example, however, though it just came in our way. Let us go to the Cabbage plant. If we wish to have as soon as possible a compact nice head we must surface-stir, &c. If we wished a Cabbage plant to throw up its flower-stem as soon as possible, then we would plant firm, keep the ground firm about it, and never think of watering with slops or anything else. Ere long, most likely, a tiny flower-stem will come from a tiny plant.

Just so in the case of a Cauliflower, even though in this case it is the massive incipient flower we eat. If we wished a Cauliflower plant to produce its button of a base, and bloom and seed as soon as possible, we would treat it on the solid hard principle, just as some do who never find any difficulty in securing a saucepan or pot large enough to get a head of Cauliflower into it—not that we are lovers of huge heads, we like them the size of two folded fists, though fine, white, compact heads, uniform all over, from 12 and more inches in diameter, are not by any means to be despised where there are children round the board. But to get heads of such a size we must think nothing of button heads, and early blooming and seeding, further than to avoid them. We must try by surface-stirring, mulching, manure-watering, &c., to bring the plant to a good size before the base of the bloom-head is formed, and then we may expect a large symmetrical head to come from a strong well-developed plant.

Several times when we have been anxious to secure even a few early Peas and garden Beans, we have acted on the solid comparatively starving system. When we wished to have large gatherings though later, we stirred the soil, &c., to encourage growth before the blooms and buds appeared. We have rows of Peas just now quite strong enough not to need any encouragement to growth, as less of vigour in the growth would render them less liable to the attacks of mildew, which would be very apt to appear if the earth underneath the roots were becoming dry whilst there were so many showers. The only signs of mildew we see at present among all our thick plantings, &c., is on a row of late Peas, a few inches in height. The ground was well prepared, and we should think there was no stagnant moisture, but a number of the leaflets are affected. We have strewed over them a little lime and soot; a little sulphur might have been added. Both sulphur and lime, when the latter is at all fresh, are great enemies to all kinds of mildew.

As Peas have been abundant, we have let our Asparagus all grow for a fortnight, it having yielded wonderfully this season, all the more desirable, as spring vegetables were scarce. We could still, if we wished, gather sprouts of the Asparagus Kale, and the little shoots are exceedingly sweet, but as Cabbages, Cauliflowers, and Peas have been plentiful, there is little use for them now. We lately alluded to the summer management of Asparagus and Sea-kale.

FRUIT AND ORNAMENTAL DEPARTMENTS.

Were it not like harping at one time too much on one string we might have gone to any length for illustrations of the importance of *keeping the soil open, and keeping the soil compressed*, just in proportion as the object aimed at was free growth or free fruiting. A young fruit tree planted in the ground need not be planted very firmly at first, as free growth is wanted. The same rule holds good in the case of a fruiting plant in a pot, but when we wish to secure abundance of healthy flower-buds, we cannot make the potting too firm. As it is not too late to give young fruit trees in pots their last potting if deemed necessary, the soil round the ball can scarcely be made too firm. To prevent cracking on the surface, and allow the free passage of water, the surface may be left loose to the depth of half an inch or so. With such a pricked-over surface to secure these objects, the soil in Peach houses where the trees are established can hardly be too consolidated. The digging or forking them over deeply is worse than labour thrown away. The same principle applies to all dwarf fruit trees out of doors. To keep them fruitful in little space, the ground about them must be firm; but it may often be necessary to prick over the surface soil with the points of a fork, and even to mulch, to allow water to enter, for if the soil is much drier above, the roots in self defence will go downwards after moisture, and the deeper they go the less likelihood will there be for wood and buds being thoroughly matured. This, too, explains what has seemed to be a mystery to many of our readers, how a Peach, an Apricot, or a Pear will often fruit much better against the wall of a cottage, with a hard or pitched path over the roots, than on the wall of a gentleman's garden, with a rich border in front of it. It is not the position, but it is the digging and constant cropping of the border that do the mischief. Either the roots are encouraged to grow too freely, or forced, to escape the digging, to go deeper down, and in either case the wood produced is apt to be spongy and less matured than in the case of a tree forced to make shorter and stumpier wood, and therefore better ripened, and more able to withstand the severest frosts. The tree against the cottage wall, when fully established, may go on bearing for years, producing its stumpy well-ripened wood without receiving assistance at the roots, even though mostly covered by a pitched pebble or a hard gravel walk; but if the wood should begin to show signs of weakness it will be strengthened by loosening the surface in places, and supplying the soil with manure-waterings. Much of the mystery would be removed if the simple fact were clearly noted and understood, that where free early blooming and fruiting are the chief objects, then much will depend on having roots near the surface, and in a compact firm soil. Years ago we were much struck with the difference in the appearance of fruit trees planted widely apart in lines in a large orchard. Part of the orchard, after a few years, had been laid down in grass, and part was yearly cropped between the trees with Potatoes, Turnips, Cabbageworts, &c. In the latter part the trees grew far more freely and luxuriantly, but they did not fruit in proportion to those that had the grass pasturage over the roots. We did not see then, as we think we see now, that the greeter fruitfolness was mainly owing to the lessened luxuriance, and that again was chiefly owing to the greater compactness of the soil from not being stirred up at all.

Something would be gained were it clearly understood that free rooting in open soil, though tending to luxuriance of growth, does not equally tend to early and abundant blooming and fruit-bearing. As a case in point, it is time to prepare Strawberry runners for forcing. The mode adopted is of less consequence, and free rooting may be encouraged at first in loose soil, but during the bright days of autumn the soil can hardly be too much consolidated, so as to secure the greatest amount of fertility next spring. The compactness of the soil by the resistance given forces the roots to divide into countless numbers of small healthy fibres instead of a less number of larger rootlets and larger-mouthed spongelets.

In the ornamental department the same rule holds good. To make young plants grow freely they need not be potted firmly. For free blooming the reverse should be the case. In all hair-rooted plants, as Heaths and Rhododendrons, this is highly necessary; but, as stated the other week, when such plants in pots are set out of doors the pots should be protected from extreme heat and cold. Where flowering shrubs and trees are established, the less they are dug about the better. A slight surface-stirring and even mulching, are different affairs altogether. The same principle is of importance in the case of shrubs, &c., at all tender. It is wise, by elevated planting and compact soil, to be satisfied with less luxuriance of growth, so as to secure the ripening of the wood.

Besides routine as adverted to lately, and getting on with fresh arrangements, we pricked-off and potted Primulas, Poinsettias, Euphorbias, Justicias, Eranthemums, &c., keeping the latter in rather small pots for securing abundance of bloom in little space. When our window gardeners keep their plants in pots we advise them to have more plants and smallish pots for securing the greatest amount of continuous bloom. We shall presently pot a lot of Geraniums, &c., left over from bedding. Part we shall put under glass to give us neat flowering plants for the autumn, part we shall place out of doors and nip off all flowers, so as to bloom them in winter.—R. F.

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

GRAPES DISEASED (*Bertram*).—They are severely ulcerated, or, as gardeners term the disease, "spotted." The roots being outside the house probably causes the disease. They do not supply a sufficiency of sap to maintain healthy growth. Mulching over the border, and watering with tepid weak liquid manure might check the disease.

ROSES (*Patelin*).—The two are different.

ROSE PRINCESS CHRISTIAN (*G. C.*).—It died in my garden in the spring. Last year was too trying for infants. I thought it a promising

Rose, it was not quite full, nor can we expect Roses to be full on such weak stocks. I have observed that Roses which are not full enough on weak stocks often become full on strong stocks, and that Roses which appear to be the very thing on weak stocks, become stuffy and hesitating bloomers on strong stocks. Buy Marie Rady, Edward Morren, Perfection de Lyon, and Madame Chirard. Baroness Rothschild is a beautiful Rose. In the delicate line, Marquise de Mortemart is extra beautiful, but not a strong grower.—W. F. Radclyffe.

Budding Roses (*Amateur*).—I am not aware that there is any difference in the growth of Roses budded in July and August. Roses may be budded on the Manetti stock any time between May and September. In fact, success depends greatly on the sappiness of the stock and slice. July is probably the best month in the year for budding. Briar Roses may be budded as soon as the bark of the stocks will run, until the end of August. After budding the stocks, if the sun is strong, put a leaf over the bud. If the weather be dry, water the stocks well before budding.—W. F. Radclyffe.

Pansies (*Mrs. B.*).—If our correspondent will furnish us with some details as to how she loses her Pansies and when, we will endeavour to assist her. There are various causes from which they sometimes fail, and unless we have something more definite, our advice might be utterly useless. Are they cultivated as directed in our "Florists' Flowers," which can be had free by post from our office for five postage stamps?

Bedding-out Plans (*X. Y. Z.*).—Our "Flower-Garden Plans" will suit you exactly. You can have it free by post if you enclose 5*s.* 4*d.* with your address.

Melons not Setting (*A Young Gardener*).—It is a very common cause of failure, and chiefly arises from imperfect root action, often occasioned by a deficiency of bottom heat. Let that be kept at 70° to 75°, and when the fruit is setting maintain a rather dry atmosphere, but have the soil in a moist condition; indeed we water plants in houses or pits just the same whether they are in or out of flower, only when in flower we do not water overhead. The main points are to keep the flowers dry when open, to give abundance of air, to impregnate the flowers on a fine day, and after the corollas close to syringe or maintain a moist atmosphere. You do not say your soil is good strong loam, and that you make it very firm. We tread ours hard, and we have short-jointed wood, the plants not growing so freely nor going so much to wood. Your treatment we should consider good.

Charles Lefebvre Rose Buds not Opening (*A Friend*).—We think the cause is the cold spring and the removal last winter. You can only mulch with short manure, and water copiously both overhead and at root in dry weather.

Select Scarlet and Salmon-flowering Zonal Pelargoniums (*Idem*).—*Scarlet*—Coleshill, Thunderbolt, and Phœbus. *Salmon.*—Sunnyside, Renown, and Herald. Lime water applied frequently to Geraniums would injure them. It is of no value as a liquid manure.

Mr. Radclyffe's Strawberries and Roses (——).—I have not measured nor weighed any Strawberries this season. Cockscomb is not in crop this year at all, I have just planted out (July 6th) runners of it; and Eliza, Dr. Hogg, and Mr. Radclyffe have been extra fine. They are first-class fruits. The finest crop of all—all being good—is on Wonderful. La France is a strong grower and a good conservatory Rose; it is very hardy, but soils in bad weather. Occasionally a bloom is grand. I greatly prefer Baroness Rothschild, Marguerite de St. Amand, Marquise de Mortemart, and Madame Emile Bevan. Alfred Colomb is a free grower, but has limp wood. It is one of the finest Roses. Marie Baumann is also one of the very finest-shaped Roses, quite perfect, but it is a shy grower. I have never till now proved Madame Fillion; it is a good grower, distinct, beautiful, and a free bloomer.—W. F. Radclyffe.

Geranium Leaves Red (*W. E. W.*).—The Geranium leaves are not, as you suppose, infested with a red fungus; they are sound, and the powder on them is the pollen (orange-coloured) of some plant, probably some overhanging flower. The leavee have the edges destroyed owing to the sun's rays falling on them whilst wet, or from syringing the edges are kept constantly wet.

Tulip Bulbs with Split Skins (*H. G. M.*).—The Tulip bulbs will not be any worse. Allow the skins to remain, and place the bulbs on shelves in a cool dry place. The salt sprinkled over the Cabbages so as to destroy the young heart leaves will, we should say, have destroyed them, and we do not think they will recover. The haulm of the Potatoes blackened by the same cause will not, we fear, be reproduced in time for the formation of a good crop of tubers. Without haulms the tubers will not swell.

Urceolina Culture (*T. C.*).—It is the same as U. pendula, and is a beautiful, half-hardy, bulbous plant, bearing an umbel of drooping yellow flowers tipped with green. It requires to be kept dry in winter and in a cold pit. Our correspondent says, "I have had Lilium giganteum in the open border three years, the last two winters without protection. This spring it sent up a flower-stalk, and is now beautifully in bloom. Vallota purpurea flowers with me year after year in the open air, with no other favour shown it than being planted rather deeply just outside the 9-inch wall of a cool house."

Camellias after their Buds are Set (*G. H. H.*).—Keep them in a cool airy house, and water them as required so as to keep the soil moist. A house with an east aspect is best from the present time up to October; but if you have not that, afford a slight shade from bright sun. We are unable to account for the Currant bushes dropping the fruit before ripening, but should attribute it to attacks of aphis, for which there is no better remedy than syringing with 1 oz. of soft soap to the gallon of water. The seeds for sowing in the greenhouse to bloom next winter and spring are Primulas, Cinerarias, Calceolarias (herbaceous), and Mignonette.

Vine Leaves Yellow (*E. R. P.*).—The yellow leaves on the Buckland Sweetwater, in a cool house where no artificial heat is given, we attribute chiefly to a stoppage of circulation in the footstalk of the leaf, which might partly be the result of a sudden check or too much shade. We have frequently seen a few leaves on a Vine thus affected, and, as we judged, from similar causes; but when the leaves are generally healthy this may give no more uneasiness than finding a few yellow leaves drop from a deciduous tree out of doors in June. There are marks on the leaves that show signs of blotching before they became yellow; and as you say these yellow leaves are found at the top of the house, we would exercise greater particularity in early air-giving. See notes at page 12. No means, however, will make these yellow leaves green again.

Vine Leaf Wanted (*Inquirer*).—The eruptions on the lower side of the Vine leaf are a sort of warts, which are apt to make their appearance when the atmosphere is close and moist, or when there is a want of free reciprocal action between the roots and leaves. Your repotting the plant lately might be the cause. We once knew half a dozen Vines in pots begin to show this warty appearance after potting and being otherwise well attended to; but on some plants being turned out it was found the plants had been potted with the ball dry, and the moisture escaped through the new soil without soaking the roots. If this is not the case with you give more air, and keep the atmosphere less moist.

Early Cabbage (*Cabbage Seed*).—Little Pixie is a nice early little Cabbage. For thrift, however, where you do not mind the heads being small, provided you obtain a great return in little room, nothing we think beats Veitch's Matchless. This kind will do well in rows 16 inches apart and some 10 or 12 inches in the row. As we lost so many of our Cabbages last winter we sowed this under glass in March, pricked out and planted out, and towards the end of June we cut fine-hearted little Cabbages, green, and just showing blanching at the heart. Larger, really when up to the mark regular fillbasket kinds, raised at the same time, we have cut few from at the beginning of July. This Matchless was first brought out by Mr. Atkins when he was a nurseryman at Northampton. We think the Messrs. Veitch have improved upon it. The heads are more compact and upright, and therefore perfect themselves in little room, and there is no waste of large parasol-like leaves where there is nothing to eat them. In favourable winters this little hardy kind yields nice heads early in spring.

Gardener's Cottage (*B.*).—You will find good examples of lodges and gardeners' cottages in Loudon's "Encyclopædia of Architecture." Very good plans of cottages have been given in our pages, as the gardener's house at Trentham, at Lough Crew, Ireland, and that of Mr. Robson at Linton Park. A gardener's house should, to be comfortable, have at least six rooms—three bedrooms above, and a parlour, sitting-room, and kitchen below, with an outbuilding for scullery, wash-house, &c. It is often desirable to keep lodges low—all the rooms on one floor, and in that case it is desirable that the walls should be dry, with plenty of ventilation given. It is very undesirable to use soft porous bricks, however desirable in colour, for such a building. It is often advisable in such cases to consult a good tradesman in the neighbourhood.

Panes of Glass in 100 Feet (*G. W. S.*).—Cut into sizes of 20 inches by 14, the number we think could easily be found by multiplying 20 by 14 together, and making the product the divisor of the number of square inches in 100 square feet. We make the number of panes fifty-one and three-seventhe of a pane. Fifty-one panes would be near enough.

Wireworms in Strawberries (*C. Z.*).—They are not wireworms but snake millipedes, Julus pulchellus. In beds of long-bearing Strawberries they often abound. We know of no remedy but paring off and burning the top spit of the soil.

Insects (*W. H. M.*).—Your Rose insect was completely smashed in the post. It was evidently the larva of one of the Saw-flies, probably Cladius difformis. Powder the leaves with fine lime powder.—I. O. W.

Name of Fungus (*M. C., Salterbridge*).—The fungus is Scleroderma vulgare, certainly not edible.

Names of Plants (*George*).—Corydalis lutea, Yellow Fumitory. (*A. C.*).—Hemerocallis flava, Yellow Day Lily. (*R. H. W.*).—Elæagnus angustifolia, the Oleaster. It is, so far as we know, quite innocuous, and we see no reason why you should not plant it as proposed. It has no affinity whatever with Cotoneaster. (*A. F. E.*).—1, Dictamnus Fraxinella; 2, Campanula persicifolia alba. (*Thos. Pearson*).—1, Polystichum angulare, var. lineare; 2, Adiantum bispidulum; 3 and 4, Selaginella Kranssiana (S. hortensis); 5, Microlepia novæ-zelandiæ. (*Truro*).—3, Linaria Cymbalaria; 4, Sedum aizoideum variegatum; 5, Leptospermum bullatum. (*H. J.*).—1, Fabiana imbricata; 4, Tradescantia virginica; 5, Liatris squarrosa; 6, Astrantia major. (*R. C.*).—Your Fern most decidedly is not A. Farleyense. It is A. tenerum. (*Lilium*).—Perhaps Lilium candidum, but the scent is quite strong enough for L. auratum. No one could tell the name precisely from such a specimen.

POULTRY, BEE, AND PIGEON CHRONICLE.

VALUABLE PIGEONS STOLEN FROM EXHIBITIONS.

It has now become imperative on all true and honest poultry amateurs to aid the authorities in exposing, and, if possible, placing in the hands of justice those mean and dishonest individuals, be they who they may, who would personally in the first instance either literally steal, or who afterwards would knowingly receive when stolen, a Pigeon of great original cost, and one that perchance, in some cases at least, the defrauded owner could not replace, even if anxious to do so, by an outlay however liberal. I allude, of course, to the absolute theft of choice and valuable Pigeons at public shows as brought by Mr. F. Waitt before your readers in last week's Journal. Such practices appear now to be sadly on the increase, although most poultry committees are at the present hour making use of an amount of vigilance that would augur well for future prevention. There are amateurs who express their decided belief that these thefts are carried on by persons having no especial predilection as amateurs, but "who steal for stealing's sake," or, as they style it, from simply a spirit of "kleptomania." I confess my liking is to call such practices by their well-known appellations. Theft is theft. I believe every person can be honest if he is inclined to be so, and I also regard the selection of the best birds as a cogent and decisive proof there is at

least "much method in their madness." Let this practice arise, then, from whatever causes it may, I feel deeply that the best interests of exhibitors, and all who feel pleasure in our exhibitions, are enlisted not only in its prevention, but equally in the thorough exposure of the guilty parties, or otherwise few owners will entrust valuable Pigeons to the hazards of a public show-pen.

Admittedly there is much solid truth in the old adage, that "prevention is better than cure," but I know there are many like myself who would much rather detect the depredator than simply prevent his repetition of conduct so unworthy and disgraceful. I quite agree with Mr. F. Waitt, that padlocks might be placed on the pens when judging is completed, and Mr. Waitt continues, "two or three keys could be made to pass any number of locks, and at a nominal cost." So far as this plan goes it has its merits, but unquestionably an extra key might possibly get into other hands besides those of the committee, for the man who by preconcert would steal a first-class Pigeon, would not hesitate much if a lock only stood as a bar between himself and the bird coveted.

I feel assured watchful eyes can do more to prevent the continuance of this practice than locks however carefully constructed; and in the hope it may enliven others to a sharp look-out for the offender, I hereby promise that I will myself give a reward of a guinea to the party who by his evidence is the first to bring to conviction the person who has been lately criminating himself. In common justice my impression is this, that as most conflicting reports are now afloat, at least some of the accused must be unjustly suspected. It would be well, therefore, if any other amateur choose to aid by a subscription, to do so at once, and thus if more than one person is implicated, let us try to promote a split and exposure, that will be hailed with delight by all save the guilty ones.—Edward Hewitt, *Sparkbrook*.

I quite agree with Mr. F. Waitt that some steps should be taken by exhibitors to protect their birds when at exhibitions, and it appears to me the most desirable course will be to call upon the managers of shows to be responsible for the birds' safety whilst in their custody. It is all very well for the law to be that negligence must be proved before exhibitors can recover, but it appears to me that such is already done when the birds are stolen, as if sufficient and honest attendants were employed to watch the birds could not be removed without detection.

I think I may safely assert that in the majority of cases poultry exhibitions are carried out for the purposes of profit, therefore the least the managers can do is to recoup exhibitors for any loss sustained by reason of theft; and if owners of valuable birds will combine together and exhibit only at those places where the management gives an indemnity against theft, it will, in my opinion, lead not only to better protection, but be an assurance to exhibitors that they will receive the value in the event of their property being unfortunately stolen.—Columba.

HALIFAX POULTRY SHOW.

The following is a list of the awards made at this Show, which was held on the 1st inst.:—

Game.—*Black-breasted and other Reds.*—1, J. Hodgson, Bradford. 2, C. W. Brierley. *hc*, J. & W. Harker, Bingley. *Duckwings.*—1, J. F. M. Fitton, Holmfield, Ovenden. 2, W. Sugden. *Any colour.—Cock.*—1, W. Fell, Adwalton. 2, C. W. Brierley, Middleton. *hc*, T. Denton, Southowram; J. Sunderland, Hipperholme. *Hen* or *Pullet.*—1, C. W. Brierley. 2, W. Sugden, Holly Bank, Rastrick. *hc*, W. Fell. *c*, J. Dyson, Halifax. *Any other Variety.*—1, C. W. Brierley. 2, R. & H. Walker, Gomersal. *hc*, J. Sunderland.

Spanish.—1, C. W. Brierley. 2, J. Powell, Bradford. *hc*, H. Beldon, Goitstock, Bingley; J. Thresh, Bradford.

Dorkings.—1, W. H. King, Rochdale. 2, T. Braden, Earby, Skipton. *hc*, J. White, Warlaby, Northallerton.

Cochins.—1 and 2, H. Lacy, Hebden Bridge. *hc*, H. C. & W. J. Mason, Drighlington.

Brahmas.—1, H. Lacy. 2, H. Beldon. *hc*, E. A. Bennett, Marsden Hall, Burnley.

Hamburghs.—*Golden-spangled.*—1, H. Beldon. 2, F. Greenwood, Rochdale. *hc*, H. Pickles, jun., Earby, Skipton. *Golden-pencilled.*—1, H. Beldon. 2, H. Pickles, jun. *hc*, S. Smith, Northowram, Halifax. *Silver-spangled.*—1, H. Beldon. 2, H. Pickles, jun. *Silver-pencilled.*—1, H. Pickles, jun. 2, H. Beldon. *Black.*—1, C. Sidgwick, Keighley. 2, C. W. Brierley. *hc*, H. Beldon.

Polands and French Fowls.—1 and *hc*, H. Beldon. 2, H. Pickles, jun.

Game Bantams (Any other variety).—1, J. Dyson, Halifax. 2 and *c*, F. Steel.

Bantams.—*Black Red.*—1, F. Steel, Marsden Hall, Burnley. 2, J. R. Robinson, Sunderland. *hc*, A. Smith, Southowram. *Black Rose-combed.*—1, J. Walker, Halifax. 2, S. & R. Ashton, Roe Cross, Mottram. *hc*, H. Pickles, jun.; W. Moor, Keighley; Miss E. Cannan, Bradford. *Any other Variety.*—1 and 2, H. Beldon.

Selling Class.—1, W. Firth, Birkenhead (Spanish). 2, H. Frankland, Church (Cuckoo Creel Cochins).

PIGEONS.

Carriers.—1, T. Waddington, Feniscowles, Blackburn. 2, E. Horner, Harewood; J. Holden, Wibsey Slack, Low Moor; E. Horner, Harewood.

Pouters.—1, J. Hawley, Bingley. 2 and *hc*, E. Horner.

Tumblers.—*Short-faced.*—1, J. Fielding, jun., Rochdale. 2, E. Horner. *hc*, H. Yardley, Birmingham; T. Waddington; W. Hughes, Leeds. *Any other Variety*, —1, J. Hawley, Bingley. 2, E. Horner. *hc*, W. Lund, Shipley; W. Lishman, Girlington, Bradford.

Owls.—*English.*—1, W. Hughes. 2, J. Shackleton, Halifax. *hc*, J. Thresh; E. Lee, Birchenly, Colne. *Foreign.*—1 and 2, J. Fielding, jun. *hc*, H. Yardley; T. Waddington.

Trumpeters.—1 and 2, E. Horner. *hc*, R. Wade, Halifax.

Fantails.—1, T. Waddington. 2, H. Beldon. *hc*, H. Yardley; E. Horner.

Jacobins.—1, F. Waitt, King's Heath, Birmingham. 2, T. Waddington. *hc*, T. Waddington; A. H. Jubb, Halifax; E. Horner.

Dragoons.—1, T. Waddington. 2, E. Horner. *hc*, T. Waddington; H. Beldon; W. Whitworth, Kirby Lees, Halifax.

Antwerps.—1, E. Horner. 2, W. Lund. *hc*, J. W. Collinson, Halifax; W. Lund.

Barbs.—1, E. Horner. 2, J. Fielding, jun. *hc*, J. Holden; E. Horner.

Turbits.—1, J. Fielding, jun. 2, W. Lishman, Girlington, Bradford. *hc*, H. Yardley; E. Horner; W. Lund.

Any other Variety.—1, W. Lishman. 2, H. Beldon. *hc*, H. Yardley; T. Waddington (2); E. Horner.

Selling Class.—1, H. Beldon. 2, R. Wade. *hc*, E. Horner; W. Lund.

Judges.—*Poultry and Pigeons:* Mr. J. W. Thompson, Southowram, and Mr. J. Dixon, North Park, Bradford.

NEWARK POULTRY SHOW.

This well-regulated Exhibition was held on the 6th inst. in a tent erected for the purpose. A large amount of rain fell in the earlier part of the day, and this interfered to some extent with the receipts. Turner's pens were used, and the arrangements permitted an easy inspection of the stock. Although several other exhibitions took place at the same time, the entries were good, and most of the birds were in nice order.

Dorkings were of fair quality, but there was only one pen of *Spanish*, it was, however, very good. The *Cochins* were a very good class, Buffs being first and third, and Partridge second; and the *Brahmas* were also of fair quality; but in the above two classes, as also in those for *Hamburghs*, there were several empty pens, the birds having been, no doubt, delayed in their transit from one show to another. In Red *Game* Black Reds were first and Brown Reds second, but in several other pens the birds were wrong in colour of eye, several Brown Red cocks having red eyes, and Black Red hens dark eyes. There were two good pens of Duckwings in the Variety class, but the rest were very poor. Goldens won all the prizes in the Spangled *Hamburgh* class, but in the Pencilled class a nice pen of Silvers was first and Goldens second. In *French Fowls* Crêve-Cœurs were first and Houdans second and third, and in the Any other variety Sultans of rare excellence were first and Buff Polands second, but the third was withheld. The Red Game *Bantams* were not good as a class, although some of the birds were of great merit; but the Piles in the next class were the gems of that section. In Bantams "Black or White" the birds were all of the former colour, and the class much better than we have seen of late; and in the Variety class a very good pen of Silver Sebrights was first, Chinese Booted second, and Japanese third. The Selling classes were well filled, and several lots changed hands.

In point of quality the *Pigeons* were superior to the poultry, and though the classes were few they were well supported. In Carriers the winners were all Blacks, the two first pens beating in form of wattle only two capital pairs shown by Mr. Mitchel, of Birmingham, running close for the primary honours. The first-prize Pouters were Reds, and the second and third Whites; and in Tumblers the first were a correct pair of Almonds, the second Black Mottles, and the third Almonds. The winning Barbs were good, the first being Dark Duns, the second Blacks, and the third Reds. Jacobins were very good throughout, and Reds won all the prizes, Mr. Tomlinson's first-prize pair being remarkably long and close in hood and chain. Trumpeters were poor, but the Fantails were a much better lot of birds, and in Turbits Yellows were first, Reds second, and Blues third. Many more prizes might have been given in that judges' puzzle, the Variety class, as almost every pen was worthy. A perfect pair of Yellow Dragoons was placed first, Foreign Owls second, and Ural Ice Pigeons third. In the Selling class we observed several cheap and useful pairs of birds, most of which would no doubt be claimed. Almond Tumblers were first, Blue Pouters second, and White third.

Dorkings.—1, Miss J. Milward, Newton St. Loe. 2, W. Bearpark, Ainderby Steeple. 3, H. Eyre, Newark.

Spanish.—1, T. C. & E. Newbitt, Epworth.

Cochins.—1 and 2, H. Lacy, Hebden Bridge. 3, J. H. Bradwell, Southwell. *hc*, W. A. Burnell, Southwell; W. F. Checkley, Moulton.

Brahmas.—1 and 2, H. Lacy. 3, Dr. Holmes, Whitecoats, Chesterfield. *hc*, J. S. Dew, St. Neots.

Game.—*Black-breasted and other Reds.*—1, C. Chaloner, Steetly, Whitwell. 2, W. Bearpark. 3, B. Jarvis, Mansfield. *hc*, J. Tyler, Loughborough; G. Doubleday, Upton; G. H. Branston, Newark; S. Beighton, Farnsfield. *c*, J. H. Bradwell. *Any other Variety.*—1, C. Chaloner. 2, J. H. Bradwell. 3, B. Jarvis. *hc*, G. Henfrey, Mappleback.

Hamburghs.—*Gold or Silver-spangled.*—1, J. Rollinson, Lindley. 2, W. H. Tomlinson, Newark. 3, W. Bearpark. *hc*, W. Beecroft, Nottingham; R. D. Borne, Boston. *Gold or Silver-pencilled.*—1, W. Bearpark. 2, W. Howarth, Burton-on-Trent.

French Varieties.—1 and 2, Mrs. J. Cross, Brigg. 3, J. Elgar, Newark.

Game Bantams.—*Black-breasted and other Reds.*—1, S. Beighton. 2, T. C. and E. Newbitt. 3, Pickering & Dugglehy, Great Driffield. *hc*, H. Shumach, Southwell. *Any other Variety.*—1 and 2, T. C. & E. Newbitt. 3, H. Shumach.

Bantams.—*Black or White.*—2, Mrs. Proctor, Hull. 3, G. Holmes, Great Driffield. *hc*, A. Storrar, Peterborough. *c*, J. H. Bradwell. *Any other Variety* 1, Rev. G. F. Hudson, North Petherton. 2, H. Draycott, Humberstone. 3, Mrs A. Woodcock, Leicester.

Any other Variety.—1 and 2, W. H. Tomlinson.

Selling Class.—*Cock.*—1, W. Roe, jun., North Scarle Field. 2, T. J. Harrison, Westmoreland. 3, J. H. Bradwell. *hc*, J. Tyler; J. Elgar; J. F. Loversidge, Newark; Miss J. Milward. *Hens.*—1, W. Boulton, Sheffield. 2, W. Sunday, Radcliffe-on-Trent. 3, T. F. A. Burnaby. *hc*, W. F. Checkley; J. Thomson, Sheffield.

Local Class.—*Cock.*—1, T. Payne, Winkburn. 2, G. Henfrey. 3, J. Johnson, Newark. *Hens.*—1, G. Jackson, Newark. 2, Mrs. Easter, Stubton. 3, H. Hallam, Kirklington. *hc*, J. M. Otter, Newark. *c*, J. Savage, Southwell.

PIGEONS.

Carriers.—1 and 2, E. Horner, Harewood, Leeds. 3, F. W. Metcalfe, Cambridge. *hc*, T. Waddington, Feniscoles; W. H. Mitchell, Moseley.

Pouters.—1 and 3, E. Horner. 2, W. Nottage, Northampton. *hc*, T. Waddington; H. Draycott.

Tumblers.—1 and 2, E. Horner. 3 and *hc*, T. Waddington.

Barbs.—1 and 3, E. Horner. 2, T. Waddington.

Jacobins.—1, W. H. Tomlinson. 2, T. C. & E. Newbitt. 3, F. Waitt. *hc*, T. Waddington; F. Waitt, King's Heath; E. Horner (2).

Trumpeters.—1, E. Horner. 2, T. Waddington. 3, J. Elgar.

Fantails.—1, T. Waddington. 2, 3, and *hc*, W. H. Tomlinson.

Turbits.—1 and *hc*, T. Waddington. 2, O. E. Cresswell, Hanworth. 3, E. Horner.

Antwerps.—1, E. Horner. 2, W. H. Mitchell. 3 and *hc*, W. H. Tomlinson.

Any other Variety.—1, A. W. Wren, Lowestoft. 2, E. Horner. 3, T. Waddington. *hc*, T. Waddington; T. Chambers, jun., Northampton; E. Horner; T. C. Marshall, Peterborough.

Selling Class.—1, G. Brendnell, Nottingham. 2, J. F. Loversidge. 3, S. Robson, Ferrybridge. *hc*, F. Waitt; W. Nottage; E. Horner; T. C. Marshall.

The Judge was Mr. E. Hutton, Pudsey, Leeds.

BECCLES POULTRY SHOW.

July 5th and 6th.

This Exhibition was, we are informed, carried out in all its details by the sole efforts of Mr. Wm. Groom, of the London Road, Ipswich, under a very distinguished list of patrons, and certainly all the arrangements were complete and most satisfactory. The poultry was shown under a tent 140 feet by 30 feet, and four other tents contained a large horticultural exhibition. The Show was kept open till dusk, and was exceedingly well attended, the band of the Fusileer Guards adding to the general attractions. After the Show was closed for the evening, a gala of fireworks and balloon ascents took place. About £200 offered in prizes, with the novelties just alluded to, caused Beccles to assume an unwonted gaiety of appearance, for all the principal parts of the town were profusely decorated with evergreens and banners.

Grey *Dorkings*, as a class, were sadly wanting in condition, and there were many cases of diseased feet prevalent. A pen of birds in this class that were suffering from confirmed roup, were very properly at once returned to the owner. All three of the winning pens of *Spanish* fowls were excellent, but the remainder were as certainly indifferent. The *Cochins* were first-rate, and every breed was well shown, the cup falling to a pen of White. *Brahmas*, both Light and Dark, were good, but the generality of the hens sadly out of plumage. The cup was awarded to the Dark variety. When we mention that Mr. Pickles was exhibiting his best pens of *Hamburghs*, little more need be said in praise of these varieties. In *Game*, Mr. Matthews, of Stowmarket, had it pretty well his own way, but Mr. Julian's two pens that had travelled from Beverley were also prizetakers. *Crève-Cœurs* were the best of the French fowls, but some superior *La Flèche* were also on the prize list. The "Variety" class was much beyond mediocrity, Golden Polands standing first, Silver Polands second, and Silky fowls third. In *Game Bantams* the Show was good. Pekins, Silver-laced, and Black Bantams stood in the prize list in the order in which they are named, the whole class being good.

The classes for fowls hatched in 1871 were better than any hitherto together this season, most of the birds shown being in capital condition, and remarkably forward when the unfavourable character of the spring for early hatches is considered.

The selling classes were so good that it would have well repaid any amateur his travelling expenses to have obtained such good specimens at so trifling an expenditure.

We cannot refrain from drawing the especial attention of our readers to pen 90, in the printed catalogue, described as exhibited by Miss Newson. "Cock (Mule bird), by Brown Red Game cock and Guinea fowl, aged two years." It was, indeed, a most singular bird, and was accompanied by its maternal parent, a good specimen of the common Guinea fowl. The size of the "Mule" was remarkable, being greater by far than that of any Game cock in the Show. The wings and sides were bright chestnut spotted with white; the head betrayed neither the crown of the Guinea fowl nor the comb and wattles of the Game cock, but was feathered-up closely to the base of the bill, the plumage of this part being of a most singular character, whilst the conformation of skull was different to anything that has ever appeared at an exhibition of poultry. The tail was tolerably long, and beautifully and very closely striped with black and white. The legs, though heavy and coarse, were more like those of the mother's than the cock parent. It was very restless and noisy, its voice being most peculiar. We regret to find that a large entry of Mr. Fowler's birds, from Aylesbury, came to hand long after the awards were completed. So much for trusting to the last available train. The promptitude of Mr. Groom, the Manager, is worthy of all praise, all prize-winners who applied being paid on the spot, and we find the poultry was returned with punctuality.

(*From a Correspondent.*)

Notwithstanding a very liberal schedule, there were only 185 entries; this, I think, was in a great measure owing to the fact that, although many of our largest exhibitors reside in the district, none of their names appeared in connection with the management; and exhibitors, when they find brother exhibitors associated with the direction, look upon it as a guarantee that their birds will be well cared for and their interests justly considered.

In the *Cochin* class some fine birds were to be seen, but I much preferred the second-prize pen, belonging to Lady Gwydyr, to Mr. Lingwood's first; I should have given them the cup. The most noticeable feature in the Cochin class for Any variety was the paucity of feathers in the cocks' tails. I heard some time back of an exhibitor being disqualified for artificially inserting a feather in a cock's tail, is it not equally dishonest to remove objectionable once? I hope this will not escape the disapprobation of the Judge in future. In this class a pen of Mr. Fowler's arrived too late for competition, or otherwise they would have been in the prize list. In the *Brahma* class the cup justly fell to the Darks; the first and second were good birds, the third being faulty in comb. The first-prize Light Brahma was very small, the second a much finer bird, but shown with a poor companion. In the *Game* classes Mr. Matthews carried almost all before him, winning in the "Any Reds" with a very neat Black, and being second with a slashing Brown; he was also first and second in the Any other variety of Game with some Duckwings. The *French* class was good and some remarkably superior Polands appeared in the Any variety class. The Game *Bantams* appeared in great force, and some nice birds were to be seen. I much preferred two highly-commended pens to the prize-winners.

Dorkings (Any variety).—1 and Cup, Henry Lingwood. 2, F. Parlett. 3 and *hc*, J. Frost.

Spanish (Any variety).—1, J. F. Sillitoe. 2, Nichols Bros. 3, W. Saunders.

Cochin-China.—*Cinnamon or Buff.*—1, Henry Lingwood. 2, Lady Gwydyr. 3, H. Lloyd, jun. *vhc*, H. Lloyd, jun.; Lady Gwydyr. *hc*, J. Sichel; Henry Lingwood; H. D. Dent. *Any other Variety.*—1 and Cup, J. N. Whitehead. 2 and 3, Horace Lingwood.

Brahma Pootra.—*Dark.*—1, Cup, and 3, Horace Lingwood. 2, H. Dowsett. *hc*, J. Sichel. *Light.*—1, Dr. D. C. Campbell. 2, J. Parea. 3, Rev. N. J. Ridley. *hc*, H. M. Maynard; H. Dowsett.

Hamburghs.—*Gold or Silver-pencilled.*—1 and 3, H. Pickles, jun. 2 and *hc*, W. K. Tickner. *Gold or Silver-spangled.*—1, H. Pickles, jun. 2, L. Wren. 3, H. Pickles, jun. *vhc*, R. Wilkinson.

Game.—*Black-breasted and other Reds.*—1 and 2, S. Matthew, Stowmarket. 3, H. M. Julian, Hull. *vhc*, G. Barton; R. Postle. *hc*, H. E. Malin. *Any Variety.*—1, Cup, and 2, S. Matthew (Duckwing). 3, H. H. Julian (Duckwing Game).

French (Any variety).—1, J. Sichel, Timperley (Crève-Cœur). 2, Rev. N. J. Ridley (La Flèche). 3, W. Tippler (Houdans). *hc*, T. C. Hawken.

Game Bantams (Any variety).—1, Cup, and 2, W. B. Jeffries (Black Red Game). 3, W. Adams (Duckwing Game). *vhc*, J. Dutton (Black-breasted) *hc*, H. W. Wallace (Black-breasted Red Game); W. Adams (Black Red Game) (2); C. H. Webb (Duckwing Game); J. Drake; J. Robinson. *c*, Rev. W. F. Dixon; T. Fenn (Black-breasted Red Game); J. Robinson.

Bantams (Any other variety).—1, J. Sichel (Pekin). 2 and *vhc*, M. Leno, Markyate Street (Laced). 3, S. & R. Ashton, Mottram (Black). *hc*, Miss M. Jodrell (Japanese); Rev. F. Tearle (White). *c*, Mrs. Bishop; G. B. Francis (Black, Rose-combed).

Any other Variety.—1 and Cup, W. K. Patrick (Polands). 2, H. Pickles, jun., Skipton (Silver Polands). 3, Rev. F. Tearle. *vhc*, W. K. Patrick; Miss Newson. *hc*, R. Wilkinson; T. H. Readman; T. Harwood; Lady Gwydyr. *Cockerel.*—1, Horace Lingwood (Partridge Cochin). 2, S. Matthew (Black-breasted Red Game). 3, F. Parlett, Great Baddow, Chelmsford (Coloured Dorking). *vhc*, J. R. Rodbard (Dorking). *hc*, W. Dring (Houdan); Lady Gwydyr; J. F. Loversidge, Newark-on-Trent. *c*, J. Dutton (Coloured Dorking). *Pullets.*—1, S. Matthew (Black-breasted Red Game). 2, T. A. Dean (Light Brahma). 3, J. R. Rodbard (Spanish). *vhc*, J. R. Rodbard (Dorking); J. Jeken (Black-breasted Red Game); Lady Gwydyr. *c*, E. Brown (Dorking); W. Dring (Houdans); H. D. Dent (Cochins).

Selling Class.—*Cock.*—1, T. H. Readman (Golden-pencilled Hamburgh). 2, H. Dowsett (Brahmas). 3, A. Bowman (Brown-breasted Red Game). *hc* Rev. F. Tearle (White Dorking); W. Tippler (Houdan). *c*, Rev G. Gilbert. *Hens.*—1, Nichols Bros. (Spanish). 2, J. Dutton (Buff Cochins). 3, H. Dowsett (Brahma). *hc*, W. White (Spanish); Lady Gwydyr; Rev. G. Gilbert; J. F. S. L. Barber (Black-breasted Red Game). *c*, H. H. Tippler (Dark Brahma). *Miscellaneous.*—1, Lady Gwydyr. 2, Rev. G. Gilbert (Aylesbury Duck). 3, Mrs. J. Mayhew (Cambridge Turkey). *hc*, Rev. W. F. Dixon (Rouen Duck).

Prize to exhibitor who received the highest number of marks without obtaining any prize, Mr. Nicholls.

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

THE BOSTON POULTRY SHOW.

Very few shows have improved with the rapidity of the Boston Exhibition. In general quality almost every class was well represented and the arrangements were, unquestionably, of the highest character the whole of the poultry, &c., being shown under an excellent tent of 150 feet by 40 feet. The band of the Coldstream Guards was in attendance, and the number of visitors was satisfactory, although a heavy shower about mid-day was, no doubt, detrimental to the receipts at the gates.

The Buff cup *Cochins* were very excellent birds, the hen in the cup pen being far superior to those generally met with. The prize pens of both Dark and Light-feathered *Brahmas* were superior, but the remainder in these classes were very weak. Black *Spanish* were especially good, and the *Hamburghs* comprised many of the most noted pens in the kingdom; Mr. Pickles, with these and Silver-spangled *Polands*, being a chief prizetaker. Although the prize *Game* fowls were very perfect, a number of otherwise excellent pens were, by some oversight of the owner, shown though they were "duck-footed." A grand pen of Black Reds were the cup-winners. Most of the best pens of Game *Bantams* were overshown. Silver-laced Sebrights and Blacks were respectively the winners in the extra Bantam class. The Local class (confined to twelve miles from Boston) contained some birds of very good character. The Selling class was comparatively a failure. In a general *Duck* class Aylesburys were first and Rouens second. Silver Chinese Pheasants and French Partridges received the prizes in a "fancy class." The Almonds, Pouters, and the Carriers were admirable among the *Pigeons*, and the *Rabbits* were both good and

weighty. The show of *Cage Birds* was not very large in numbers, but they were good in quality.

DORKINGS.—*Coloured.*—1, R. Wood. 2, T. Fox. *hc*, H. Lingwood. *c*, W. J. Woodhouse. *Any variety.*—1, W. J. Woodhouse. 2, No Competition.
COCHIN-CHINAS.—*Buff.*—1 and Cup, H. Lacy. 2, H. Lingwood. *Any variety.*—1, H. Lacy. 2, H. Bletsoe, Barnwell, Oundle.
BRAHMAS.—*Dark.*—1 and 2, H. Lacy. *Light.*—1, J. Pares, Postford, Guildford. 2, H. Whiteley. *hc*, E. Smith.
SPANISH (Black).—1, Newbitt & Co. 2 and *hc*, J. F. Dixon.
HAMBURGHS.—*Golden-spangled.*—1 and 2, J. Rollinson. *hc*, R. D. Borne, Boston. *Golden-pencilled.*—1, J. Rollinson. 2, H. Pickles. *Silver-spangled.*—1, Cup, and 2, H. Pickles. *Silver-pencilled.*—1 and 2, H. Pickles.
GAME.—*Black-breasted.*—1 and Cup, C. Chaloner, Stectley, Whitwell. 2, W. Boyes, Beverley. *Any other Variety.*—1, C. Chaloner. 2, Miss M. Fletcher.
BANTAMS.—*Black-breasted Game.*—1 and Cup, W. Grice. 2, Newbitt & Co. *hc*, W. J. Cooke, Wainfleet, Boston; S. S. Mossop. *c*, Newbitt & Co.; W. Adams, Boston. *Any other Variety.*—1, M. Leno. 2 and *c*, H. Pickles. *hc*, G. S. R. Cayless; Newbitt & Co. (2).
FRENCH FOWLS.—1, J. J. Maldon. 2, R. Coney, Alford.
ANY OTHER VARIETY.—1, Cup, and 2, H. Pickles. *hc*, G. W. Thomas.
LOCAL CLASS.—1, H. Marriott. 2, E. Smith. *hc*, E. Smith; J. Thorpe. *c*, Mrs. Westmorland.
SELLING CLASS.—1, B. Jarvis. 2, E. Smith.
DUCKS (Any variety).—1, H. B. Bletsoe. 2 and *c*, W. Dudding.
PHEASANTS (or other fancy birds).—1, G. W. Thomas. 2, H. Speller.

PIGEONS.

CARRIERS.—*Black.*—1, Cup, and 2, R. Fulton. *c*, F. Waddington; J. C. Ord. *Dun.*—1, R. Fulton. 2, Withheld.
POUTERS (Any variety).—1 and 2, R. Fulton. *vhc*, T. Hawley.
TUMBLERS.—*Almond.*—1, R. Fulton. 2 and *c*, J. Ford. *hc*, T. Waddington; R. Fulton. *Any other Variety.*—1 and Cup, R. Minnitt. 2, J. Ford. *hc*, W. J. Woodhouse. *c*, R. Fulton.
BARBS.—1, R. Fulton. 2, H. Yardley. *c*, H. Yardley; S. Waddington.
FANTAILS.—1, H. Yardley, Birmingham. 2, S. Waddington.
TURBITS.—1, A. Kitching. 2, H. Yardley. *c*, S. Waddington.
ANTWERPS.—1, H. Yardley. 2, J. Collinson.
ANY OTHER VARIETY.—1, H. Yardley (White Owls). 2, S. Waddington (Ice). *hc*, J. Cross; S. Waddington; H. Boyer; H. Larver. *c*, J. C. Ord; A. M. Adam.

CAGE BIRDS.

PADROT.—*Grey.*—1, V. Ross. 2, Mrs. Ostler. *hc*, T. Spikins. *Variegated.*—1 and *hc*, Miss Jenkins. 2, G. E. Storr.
PARROQUET OR LORRY.—1, Miss C. Dows. 2, No competition.
CANARY.—1, W. Caistor. 2, — Lewis. *hc*, Miss M. Dowsett. *c*, C. Jackson.
CANARY MULE (Any variety).—1, Mrs. Bailey. 2, J. N. Harrison.
LINNET, GOLDFINCH, OR ANY OTHER ENGLISH FINCH.—1, J. N. Harrison. 2, G. W. Thomas. *hc*, P. Keighley.
LARK.—1, J. Eaves. 2, T. Hobster. *hc*, J. N. Harrison.
THRUSH OR BLACKBIRD.—1, J. Brower, Wormgate, Boston. Extra 1, R. D. Borne. 2, J. E. Greenall. *c*, Mrs. Ashby; — Mnschamp.
RABBITS.—*Any Pure Breed.*—1, A. H. Easten. 2, H. Cawood. *hc*, A. H. Easten; A. Reynolds. *Heaviest.*—1, — Taylor. 2, T. Mumby. *hc*, A. Porter.

The Judges were—for *Poultry*, Mr. Edward Hewitt, of Birmingham; for *Pigeons* and *Rabbits*, Mr. W. Massey, of Spalding; and for *Cage Birds*, Mr. J. W. Harrison, of Spalding.

POULTRY SHOW FOR WILTSHIRE.

PERMIT me to draw the attention of your readers to the fact that the principal poultry and Pigeon fanciers of Wiltshire, feeling the need of more shows in the south and west of England, and believing that a county annual exhibition is likely to be better supported and more attractive to exhibitors and visitors than one connected merely with our town, are endeavouring to obtain subscriptions from fanciers generally and from the local gentry for the furtherance of their purpose. Mr. G. Saunders Sainsbury, of Devizes, Mr. Alfred Heath, of Calne, and Mr. W. H. Stagg, of Netheravon, are being active in the matter; and Mr. John Marsh, of the Market Place, Devizes, is the Hon. Secretary. Some money is already promised, but more is needed if the show is to take place. It will be to the interest of fanciers of poultry, Pigeons, and cage birds to have such a show established in a county easily reached on every side, and having the large and well-lighted Devizes Corn Exchange for a place of exhibition.

My own idea, however, is that the show should move each year, and that Salisbury, Chippenham, Warminster, and other towns might be advantageously visited; but money, friends, money, or the dream must remain a dream. If subscriptions flow in in sufficient numbers the show will be duly advertised in this Journal.—WILTSHIRE RECTOR.

THE SEX OF EGGS.

MR. WOODBURY, and most other enlightened apiarians, have had, no doubt, on their minds that the eggs of a queen bee are of both sexes, some female and some male, and cannot be altered by the treatment they may receive in their cells. Some excellent letters on the question, written in an excellent spirit, from the pen of Mr. Woodbury, were inserted in the "Handy Book of Bees," and have been read with great interest. Those letters were written to convince the author of that work that his opinions were erroneous on the question discussed. Though the facts and arguments of Mr. Woodbury were weighty, they did not "fully convince" the author of the correctness of Mr. Woodbury's conclusions: hence he suggested an experiment which, to his mind, would settle the question—viz., to put a bit of drone comb containing eggs into a queenless, eggless hive. Last year several attempts were made to find eggs in drone comb without success. On the 12th or 13th of June of this year I found one hive had lost its queen on her marriage tour; and the bees of that hive were in a state of great commotion and bewilderment, running hither and thither, inside and outside the hive, searching for their lost queen. The commotion and search for lost queens, when there are no eggs in their hives, by the bees, are well known to bee-keepers of experience. Here was an opportunity for the experiment suggested.

A bit of drone comb full of eggs and maggots was cut from a hive yet unswarmed. The bit was cut into three pieces, and fixed separately in the queenless, eggless hive. The reception of the eggs hushed almost instantaneously the roar and rush of the bees into perfect quietness and rest. At once the bees commenced to build some royal cells around some of the grubs in the comb thus imported. Daily were those cells examined, and on every examination the bees were found carefully nursing and tending the grubs in the royal cells. In a few days the cells were sealed up, and then carefully guarded by the bees. Never did a human mother sit more proudly and complacently over the cradle of her child than did the bees apparently over these royal cells. The time for hatching arrived, but no cell yielded a queen. On the sixteenth day I tore the cells out for examination, when I found that their inmates were a mass of putrefaction; only one grub had taken the insect form, it was quite white, and smaller in size than the drones in the adjoining cells. It, too, was apparently becoming foul. The experiment, then, was a complete failure, so far as queen-making goes. Why the bees attempted to make queens from such grubs is a question left for wiser heads than mine to answer. I am thankful for the opportunity of recording the experiment and its results.—A. PETTIGREW.

DO OLD QUEENS LEAVE THEIR HIVES?

IN reference to the article in No. 355, entitled "Queens Leaving their Hives," by "B. & W.," I must admit that if the cases of swarming are correctly reported, they are not only well worth recording, but very exceptional; but in whatever curious circumstances such strange anomalies occurred, I must entirely dissent from the inference drawn by the writer that the swarm issuing from the driven Ligurian stock was headed by the old queen of the removed hybrid hive, and that, therefore, we have here a proof that queens sometimes leave their hives after becoming mothers on other than swarming occasions. Such a statement coming from so accomplished an apiarian as "B. & W." certainly surprises me, and shows that the "mystery" of the bee hive is not confined alone to non-scientific apiculturists. I have been a close observer of the habits of mother queens for many years, and no such occurrence ever took place in my experience, of a mother queen taking a pleasure aërial trip, and, moreover, I believe it never happens.

Presuming that "B. & W." witnessed the issuing of the swarms referred to, and that there is no mistake as to this, I would rather seek a solution of the facts on other grounds. I shall, therefore, suppose that when the Ligurian stock was driven it was on the eve of swarming, that it had nearly matured young princesses, and that having received an immense accession of bees belonging to the removed hybrid hive, the first matured queen went off with the swarm on the third day after the operation—viz., on the 24th of May, and the second swarm issuing from the same stock on the 8th of June, was headed also by a young princess, sister to the former. The swarm issuing from the removed hybrid hive on the 7th of June, on the other hand, would in this way be headed by its own old queen, which "B. & W." conjectures had gone out on a pleasure trip, and went back to its old site, and, consequently, headed the swarm of the 24th of May, from the Ligurian stock.

I venture to make these suggestions to "B. & W.," and he will have it in his power to verify or disprove their correctness by an examination of the hives, if frame hives, or by noticing the progenies of the swarms of the respective Ligurian and hybrid stocks, when, if I am right, the results will correspond to the suggestions now made.—J. LOWE.

FERTILISING QUEENS.—Mr. Doolittle communicates to the *American Bee Journal* a plan of fertilising queens, which he thinks far preferable to any other mode of artificial impregnation. The method was practised by a neighbour, and is as follows:—He selects a stock with plenty of the best drones, and sets it fifteen or twenty rods from any other stock, and as

soon as the queen hatches he clips one wing. He then raises a bed of sawdust 3 or 4 feet square, lays thereon a good broad bottom board, and sets the hive on it, so that the queen can crawl back when she comes out. He has tried queens in this way for three seasons, and they are all very prolific. A queen can be introduced from any stock, and in-and-in breeding thus prevented.

TREATMENT OF SWARMS AND STOCKS.

I DID not carry out my plans towards the hybrid stock, still I am obliged for your advice as stated in page 395 of the Journal of June 1st. I begin to hope I am not quite "so timid withal" as you described me, as I have, I believe, properly hived a fine swarm, which issued on the 27th ult., from the hybrid stock. I had never taken one before, and to add to my difficulty it settled in the midst of a currant bush, the end of the cluster resting on the ground. I left them under the bush, after hiving, until evening, and then transferred them into a frame hive, placing them next to the stock in the bee-house (one of Neighbour's, to hold three hives). The swarm works very feebly, few bees leaving the hive. Is this usual? They hang in a thick cluster inside, down to the frames; the cluster seems smaller than when I took them, and I feared some bees might have been lost by going back to the bush next morning, but if so I could not help it, having been much pressed for time when hiving them. I could not put them on their proper stand at once. I thought, perhaps some also might have gone to their old home again, the entrances being so close together, but the stock does not seem correspondingly stronger. Have I made any mistake? I noticed many drones when hiving the bees, but none leave the hive, and I see no traces of their slaughter. Would they also remain inside? The stock seemed minus drones after the swarm issued; now there are many, but they may of course have been subsequently hatched out.

On the evening of June 28th I found a young queen or princess under the stock; she seemed lively, so next morning, after smearing her with honey, I carefully allowed one bee to pass into the glass which covered her, but they began fighting at once; when they left off I let another one pass up, which behaved very differently, so I introduced about six more, but they worried her instantly, so not knowing what to do, I covered up the glass and left her to her fate, as I did not know but what she was to have been the new queen, and had missed the hive after her flight. Did I do right in this case?

If there is anything more to be done to the swarm and stock I should be obliged if you would kindly tell me, and also if you consider they are going on properly. I put on a bee-dress and gloves when hiving the swarm, but did not "tie down my trousers" as you kindly recommended, and yet I was not stung at all!—C. A. J.

[The recent unfavourable weather was doubtless the cause of the apparent idleness of the old stock as well as of your newly-hived swarm, which latter may even perish from starvation, owing to the same cause, unless succoured by a timely supply of food. The cluster would naturally contract into smaller dimensions than at first, say the morning after hiving, but it ought to extend rapidly as combs are built, which, however, cannot be accomplished if food is short. Some bees have probably been lost owing to the delay in putting the hive in its place, and many more are likely to have returned to their old hive. A Neighbour's bee-house "to hold three hives" should never be occupied by more than two at the outside, and these ought to be placed as far asunder as possible. If three colonies must be placed in it, two ought to work from entrances made at each end, and only the centre one from the front. Drones will show freely enough whenever the weather becomes favourable. The young queen found on the 28th was doubtless a supernumerary princess which had been discarded from the hive, and upon which all your trouble was of course wasted.]

LIGURIAN BEES.—A word for the Italians. I find them very peaceable when compared with the black bees. I can open a hive of Italians at any time when they are raising brood without smoke, and not have one offer to sting me, unless by some mishap I jar them so as to arouse them, which takes considerable. Besides this you can find the queen readily; the young bees do not drop from the comb as the black ones do, and as far as my experience goes, they will make one-third more honey. I have one stock of Italians that gave me one good swarm and 125 lbs. box honey the first season. The Italians, to be pure, should all have three yellow bands, and some will occasionally show the fourth.—G. M. DOOLITTLE (in *National Bee Journal, American*)

HINGES TO BAR-AND-FRAME HIVES.

MAJOR MUNN, in his last communication to "our Journal," says I am "mistaken in thinking that the bar-and-frame hive which he gave to the Apiarian Society was hinged," and concludes with the strange assertion, "the triangular hive, therefore, never was hinged." What I really did say was "his triangular ones were merely devised to enable him to lift his combs into observation frames, and so far was he from considering them truly moveable, that he at first fixed them to the hive by means of hinges."

Now, what are the facts according to the Major's own showing? In his last article we are informed "these triangular bar frames were so arranged on the sides of the enclosing outer box as to have an iron rod run through the whole of the eight frames"—that is, if language has any meaning, they were hinged to the box by means of a continuous pin running through eight or more pivots. In his pamphlet, bearing the date 1851, he describes his frames thus:—"In one of the two ends of the top bar there is a small handle fixed, as at *t*, and at the other a small piece of brass with a hole in it, as at *w*. This forms the eye of the pivot for the bee frame to work upon, and has a brass pin run through it when about to be lifted into the observation frame." It thus appears that every frame on being raised for inspection into the observation frame required to be furnished with a complete hinge, and remained fixed until the pin connecting the eyes of the pivots was withdrawn, or the eyes themselves were unfastened. I do not quarrel with the Major for any improvements that may have been adopted in the way of facilitating the undoing of his hinges, but I adhere to the statement that his triangular frames were at first fixed to the hive by means of hinges. I prefer believing my own eyes to any assertion the Major may make, and to show that the position I have taken up is correct, I call a witness who writes under the *nom de plume* of "SUDBURY," and with whom, perhaps, the Major may be acquainted. That gentleman, in the Journal of July 25th, 1867, page 70, remarks, in reference to Munn's hive, "the only one I ever saw with hinges to the frames is in the Edinburgh Museum." Thanks, Mr. "SUDBURY," for your testimony. You have, then, seen the hive of Munn with hinges, and perhaps others could see it as well as you if they would take the trouble of paying a visit to the Edinburgh Museum, where, if what I called a cranky hive is found to be not worth looking at, a great many other things will be found worthy of study and admiration.

I have no wish to misrepresent the Major's hive as originally constructed, nor to deprive him of the credit of anything to which he is entitled; but I did, and still do think, that his conduct in altering the text of Bevan without distinguishing what belongs to Bevan and what to himself, and making the new edition of the work an advertising medium for his "bar-and-frame hive," deserves the highest censure.—THE WRITER OF THE REVIEW OF MAJOR MUNN'S EDITION OF DR. BEVAN'S "HONEY BEE."

A GIANT OF THE FOREST.—The *New York Times* states that a solid section cut from one of the original "big trees" of Calaveros county, California, is in New York, on its way to a European museum. Five men were employed twenty-five days in cutting down this huge tree; its height was 302 feet, and its largest diameter 32 feet. The specimen was cut at a distance of 20 feet from the base. The stump is covered over, and is now used as a ball-room, being so large that thirty-two persons can dance a double cotillon on it and leave room for the band and spectators. If one has sufficient patience, the age of the tree might be determined by counting the angular rings; but, to save trouble, it has been already ascertained that there are more than 2500 of them, each representing a year.—(*Times.*)

OUR LETTER BOX.

MR. JACKSON, KIDDERMINSTER (*F. H. S. and others*).—You have all similarly suffered; it is needless to publish more relative to him.

STROUD SHOW.—"I deny that I made any perversion when I said that the cup was given to a lot of second and third-class Rabbits; for although,

as Mr Barrett says, Mr. King took two firsts, two seconds, and one third prize, yet one of the firsts was in the selling class, where it is well known to the fancy that, as a rule, only second and third-class or inferior Rabbits are entered to sell at a low price, in consequence of their defects in the best points. I have no wish to depreciate Mr. King's stock, still less to find fault with the committee. I was induced to make the remarks I did more for the interest of the Society in the future than to find fault with the committee for the past.—J. Hume."—[We cannot insert more on this subject.]

Large Fowls with Bantams.—"E. E. F." quite corroborates what Mr. Long says about keeping large fowls and Bantams together. "E. E. F." has Crève-Cœurs and White Bantams, which have been allowed to run together, thinking from the great difference in the size there would be no fear of crossing. Alas! nearly all the Bantam chicks have hatched jet black, only four or five have been pure. The black chicks are considerably larger than the Bantams, but have neither comb nor tufts like the Crève-Cœurs.

Crossing Toulouse and Common Geese (*Another Disheartened*).—There is no doubt, in the first instance, the Toulouse gander was put to his companions too late in the season. The eggs of the second year had been impregnated, or they would not be rotten; they would have remained clear without any change taking place in them. They may have been chilled by exposure to the weather, or by being left too long by the Goose. There is no doubt a change had taken place in the eggs. A germ had been developed, and it had then been suffered to perish, hence the decay. Did the Geese sit on their own eggs? We advise you not to be disheartened, but to try them again, but let them run entirely together. Have no other gander. Scatter your eggs about. Let the cottagers who keep Geese have some of the eggs to sit, and pay them at ten weeks old for all they hatch and rear. It will answer the purpose of both. When you are dealing with the produce you must recollect they will not be as good sitters as the unmixed common birds. The Toulouse do not sit. Do not put more than three Geese to a gander.

Le Pigeon Voyageur (*X. Y. Z.*).—Look on page 20 of our last week's number relative to "Belgian Pigeons."

Pigeons with Flight-feather Shafts Bare (*Yorkshire*).—The sand and the sawdust so industriously supplied by you all over the floor and nests are most likely the cause of your trouble. We never have a grain of sand or sawdust in our loft. Such things at best only cause dust to fly in the eyes of the birds. We have the floor swept clean and clear every morning, and nothing but food trays, water supply, and a low pan containing broken mortar and a little salt mixed with it. We like the floor to be as free from dust as those of our own bedrooms.

Smerle Pigeons (*J. Good*).—We do not know. Some one who has them for sale will advertise perhaps.

Fantail Pigeons not Rearing their Young (——).—It has been the same with our birds; we have only raised one young one this season. First there was the very cold winter injuring the old ones, then their young seemed weak; then first there was the cold spring, and now cold and damp summer; consequently on the least absence from the nest of the parents their young die at once. It is a very bad year both for Pigeons and Canaries. We have lost dozens of young birds, Pigeons and Canaries.

Himalayan Rabbit Points (*F. Sabbage*).—The points of excellence in the Himalayan Rabbit are undoubtedly the darkness of extremities, especially nose and ears, which should be of as deep a shade as possible, and all the same; yet at times one ear will be a little darker than the other, and, perhaps, the hind feet will incline to a grey, which is objectionable. No white foot is allowable. The ears should be erect, rather short, eye clear pink, and the general appearance of the Rabbit well-proportioned, not "stumpy," as is often the case; weight from 6 to 8 lbs.

Warts on Eyelid of Rabbit (*Idem*).—Apply a thin paste of sulphur, sweet oil, and two or three drops of creesote to the parts affected, avoid as much as possible touching the eye in the application, as the pain will be acute. If it be merely an attack of scurf, tobacco water should be made by putting half an ounce of Limerick roll tobacco in a small teacupful of warm water, and allowing it to stand three hours; then apply with caution to the parts affected. If used in the early stage of the attack once or twice will probably be sufficient to effect a cure.

Swarm Returning (*Alpha*).—We should remove the super forthwith, as the bees cannot be expected to complete it after throwing-off a maiden swarm. Returning swarms is often so Sisyphean a task, in the absence of the facilities for excising royal cells presented by moveable-comb hives, that we would advise your accepting the swarm, or even swarms, if more issue, and placing it or them in proximity to the parent hive, with the view of uniting them by driving in the autumn.

Autumnal Care of Bees (*Prospero*).—You ask, "Is there anything I can especially attend to now about my bees? they are very strong and active." We cannot do better than extract the following from our "Bee-keeping for the Many:"—"Now, as early swarms appear to be so very desirable, it may be asked, What are the most likely means of insuring them? And, in reply to this question, we would say, Leave the stocks rich in store in the autumn, the contents of each hive weighing, at least, from 20 to 25 lbs., and let the population also of each hive be very numerous; if it be not so, add the bees from weak hives into it. Where second and third swarms have been hived by themselves they will generally be found too poor to live through the winter, even with feeding; and where this has been done, they may be put two or three together. Those persons who have been so fortunate as to get their glasses filled with honey will now be preparing to take them off; but we would recommend everyone to do it with great caution, and not only first to weigh the matter well in their own minds, but also to weigh their hives, and if it can be satisfactorily proved that they will contain 20 lbs. of honey each when the glasses are removed, all well; but if not, let the glass or box remain upon the stock hive until the bees have emptied it of its honey; as soon as this is ascertained let it be removed."

Queens Piping—Uniting Stocks (*A. B.*).—Piping does occasionally, although rarely, occur prior to the issue of a first or prime swarm, but in such a case we should suspect that a young queen had already escaped, and probably committed matricide. Stocks that are intended to be united in autumn should, if possible, be located in close proximity to each other, and the doubled hive may, as soon as the union is effected, be shifted to a position midway between the two; or, if these conditions cannot conveniently be fulfilled, an arrangement might possibly be made to exchange driven bees with some friendly bee-keeper, whose apiary is situated some distance off.

Earwigs.—*G. G. P.* inquires if they can be kept out of a house, and if so, how?

REMARKS.

5th.—Very heavy shower at 0.45 P.M., and lesser ones until 4.30 P.M. Morning and evening fine.

6th.—Showery in morning, fine in afternoon and evening.

7th.—Rather dull in morning, but very fine all the rest of the day; sun very hot, but a cool breeze.

8th.—Rather cooler, but a beautiful day.

9th.—Fine morning, rain at noon and at intervals all day; heavy rain at 7 P.M., 0.16 inch falling in ten minutes.

10th.—Fine morning, but showery all day, and heavy rain all night.

11th.—Heavy rain in morning and till 5 P.M., then fine evening.

The rain of Monday and Tuesday was unusually heavy, the total amount being more than 1½ inch. The only fair comparison with previous records is, however, by taking the twenty-four hours ending with 9 A.M., and then the amount is 1.23, which has only been exceeded since 1858 on the following occasions—1859, September 26th, 1.66; 1861, November 13th, 1.42; 1863, June 19th, 1.55; 1867, July 25th, 1.82; 1871, July 10th, 1.23.—G. J. Symons.

COVENT GARDEN MARKET.—July 12.

The supply during the past week has been much lighter and prices fully maintained. Bush fruit has been comparatively scarce, especially Currants, blight having struck them over a large area round London. Importations are large, and comprise Peaches, Nectarines, Apricots, Cherries, Currants, and the usual kinds of vegetables.

From observations taken near London during forty-three years, the average day temperature of the week is 73.4°, and its night temperature 50.7°. The greatest heat was 93°, on the 23rd and 24th, 1868; and the lowest cold 32°, on the 23rd, 1863. The greatest fall of rain was 1.48 inch.

EARLY PROLIFIC AND JAMES VEITCH STRAWBERRIES.

THE spring of 1871, as regards England and Belgium, may be set down as unfavourable to the production and ripening of Strawberries in the open ground. Several days in which the temperature was unusually high for March hastened the flowering of the plants, which began in the last fortnight of April, was continued throughout May, and even now (June 10th) is still going on. Despite the bitter northerly winds, especially at night, the first blossoms set. On the nights of May 17th—18th, and May 19th—20th, there were frosts of 3° C. (5½ Fahr.) which destroyed a large number of the flowers and embryo fruit of the least hardy varieties, whilst in others the flowers, and the fruit which had been set, were perfectly uninjured.

Two varieties deserve special mention, not only on account of their marked hardiness but other valuable properties, and I will now endeavour to point out their principal features as observed by myself during three consecutive seasons. Early Prolific, one of Dr. Roden's seedlings, is a masterpiece. It is early, and free bearing, even when propagated from the latest runners of the previous year, no matter what part of the runner is taken. The plant increases at its base or collar by aggregation, and produces a superabundance of runners. Indeed, its tendency to increase itself too early and too rapidly will be considered a fault by those who for thirty years have fixed the points of excellence in the Strawberry. This, however, is not a fault in the opinion of many growers, and is to a great extent compensated for by good properties. These are as follows:—Early ripening; at the present time (June 10th), though it is a late season, out of twenty-eight plants in a bed some 40 feet long by 7 wide I count twenty-three large fruit ripe and ripening, whilst on May 25, 1870, there were several fruit ripe. I have never met with any variety which sets fruit so freely, or ripens it so quickly, as this. Its great productiveness may be judged from the fact that on two three-year-old stock plants there are respectively five and seven trusses of flowers, and one hundred and seven berries set in the one case and ninety-two in the other, neither flowers nor berries having been injured by the late spring frosts. Its hardiness is sufficiently proved by what is stated above.

I am doubtful whether a full description has been published, and therefore give one. The roots are fleshy, and then somewhat woody, stouter than in most other varieties; the crown is narrow, pointed; the leaf-stalk, 5, 6, or 7 inches long, is not so strong as the flower-stalk. The flowers are produced lower than the foliage. The flower-stalk is clothed with horizontal hairs, and those on the pedicels, as well as on the lower lobes of the leaves, are ascending. The leaves are pale green, shining on the upper side, longish heartshaped, narrow and convex rather than broad and flat, the blade deeply cut. The flower has a small corolla like all the varieties of La Constante race. The fruit is large, long-conical. Seeds light brown, not deeply embedded. Colour cerise carmine, shining. Flesh cream-coloured, firm, juicy, with a fine, vinous, and high flavour.

James Veitch Strawberry is a seedling raised by Mr. Ferdinand Gloede, and by a happy thought dedicated to the late Mr. James Veitch, of Chelsea. All who were acquainted with him know his ability as a cultivator, and his devotion to the cause of horticultural progress in all its branches. It is much to be regretted that he was so soon snatched from the exercise of his favourite art, and from affectionate intercourse with his family and numerous friends. If Mr. James Veitch had been alive last summer he would have been the first to admit that the Strawberry which bears his name is a picture of beauty when a two-year-old plant, whether grown in a pot or in the open ground, is loaded with its numerous, large, and fine fruits. The growth of this variety is somewhat too luxuriant, and it increases too rapidly. These are the faults that will be found with it, but when the grower shall have convinced himself of the good qualities of the plant bearing such an abundance of large and handsome fruit that it forms quite a picture, he will be glad to grow it, and will retain it longer in cultivation than any other variety I know, although I cultivate fifty of the best kinds sent out during the last ten years. This is my opinion, and I hope that in less than two years it will be that of all amateur growers of the Strawberry.

I will now add a few words descriptive of the peculiarities of the plant and its fruit.

As already stated, the plant is very vigorous and hardy, whatever the season, and whatever the soil, provided this be well dug. Further, it is hardy in its reproductive characters, withstanding alike the severities of the winter and the late frosts of spring. All the flowers set from the first to the last. The roots are strong and stout, the crown large, doubling or tripling itself in a growing season. The leaf-stalk is from 5 to 6 inches long, and clothed with horizontal hairs. Those on the partial foot-stalks of the flowers are inclined upwards. The leaves are long heart-shaped, not shining much on the upper side, nearly flat, not of a deep green, and are widely and deeply cut. The flowers are middle-sized, borne beneath the foliage. The flower scape rises 2 inches above the crown of the plant, and forms two or three divisions, each producing five or six berries, according to the age of the plant. I have counted on a three-year-old plant five crowns having nine flower scapes bearing 117 fruit, of which the earliest produced were of very large size, and the successional fruit not so large, but all of a tolerably regular conical shape. In 1869 the first fruits were ripe on the 6th of June, in 1870 on the 2nd of June, and in the present year on the 12th of June. From this date to the 28th we have gathered from three beds of this variety (consisting of about three hundred one-year-old plants, fifty two-year-old plants, and six three-year-old plants) from 2¼ to 4½ lbs. of fine berries every day. The berries are generally of a regular conical shape, and in colour of a somewhat glossy dark red. The flesh is white, tinged with rose in the

centre, and with crimson beneath the skin; it is juicy and brisk, with a slight Apricot flavour.

In conclusion, the two varieties which form the subject of this article will, I think, be considered by most Strawberry-growers as being improvements on existing kinds, and, as such, deserving of trial both in the open ground and in pots under glass, whether forcing or mere forwarding be the object in view. Notwithstanding what I have stated, I am far from thinking that no further steps in advance can be made in raising new varieties from seed, with the view of obtaining in the long run a Strawberry which shall to the fullest extent come up to that standard of excellence which competent judges have laid down for many years.—J. De Jonghe, *Brussels*.

P.S.—I have delayed sending this article till the present time in order to assure myself of the accuracy of my observations. I think English growers who have the two Strawberries referred to will confirm, if they have not already proved, the truth of what I have advanced.—J. De J.

TANK-HEATED CUCUMBER AND MELON HOUSES.

Everyone conversant with Cucumber and Melon culture must have noted the greater vigour of the plants in dung-heated beds as compared with plants grown in houses in which hot-water pipes supply the bottom heat. It was suggested some time ago—I believe first by Mr. Rendle—that bottom heat from a tank of heated water was the nearest approach to the genial warmth of fermenting leaves or dung; for whilst it afforded the necessary warmth it was accompanied by vapour, as in the case of fermenting materials, which is essential to successful plant-growth. Though the principle has met with general approval, the tank system of heating has been adopted to only a limited extent; and where it has been tried it has after a time fallen into disuse, owing, in a great measure, to the wearing-out of the material employed and the expense of replacing it.

I am a believer in the system, and see nothing but the expense to hinder its general adoption; and the cost is not after all very much greater than that of the chamber system of furnishing bottom heat, the only difference being making the chamber watertight. I have seen tanks of wood and others of zinc, but they soon wear out, and are more costly at first than one formed of masonry and cement.

Fig. 1 is the ground plan of a span-roofed Cucumber or

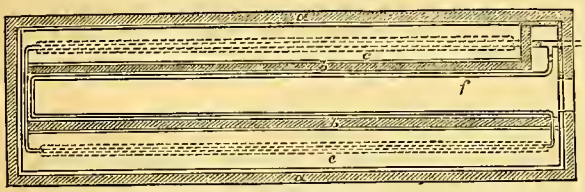

Fig. 1.

Melon house, as shown by the section, *fig.* 2. The external walls, *a*, are 14 inches thick, and the internal walls, *b*, 9 inches, or one brick, thick. These walls should have a good foundation, so that they may remain firm. The tank is shown at *c*; it

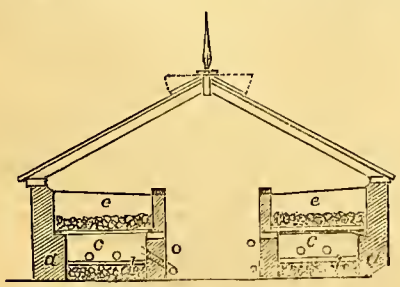

Fig. 2.

should have a good foundation of concrete, 6 inches of rough stone being placed at the bottom and rammed hard, and on that 2 inches of finer material run with lime, it being best to lay it on after it has been mixed with lime riddlings and made soft. This laid on 2 inches thick and level, sprinkled over with gravel thinly, and rammed firm, will, when it dries, form a good bed for the cement. Some, to prevent sinking, lay with bricks and run with cement so as to fill the joints. This is a good plan. When it is dried the tank is cemented about half an inch thick, including the sides, 1 foot up the walls all round as well as at the bottom. In *fig.* 2, *d* is the cemented bottom, *c* the tank with the cemented sides. The concrete and cement is 1 foot deep, and the depth of the tank is the same. The tank is covered with flags, or slates will do, the ends resting on the walls, the joints being left open. On these are laid from 6 to 9 inches of rubble for drainage, and then the soil *e*. For giving vapour to the atmosphere there are slides in the walls of the tank next the path; they are best of iron. Sliding air-bricks answer well; they may be put in at every 2 feet, and they can be opened or shut at will.

Figs. 3 and 4 are respectively the ground plan and section of a lean-to house, with a short light at the back. The house

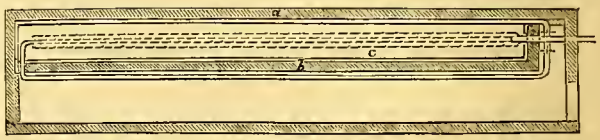

Fig. 3.

is similar in all its arrangements to that represented in *figs.* 1 and 2, therefore the same references apply to all. The top heat in *fig.* 1 is given by four hot-water pipes, two flows and returns, one above the other, in the pathway *f*; whilst in *fig.* 4 there are two in front (*h*), and two in the pathway *i*.

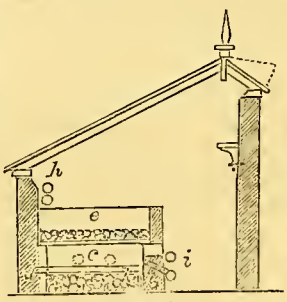

Fig. 4.

Now as to the depth of water in the tank. It need not be more than 3 inches, and if the water is to circulate 2 inches will be sufficient; but as the volume of water is considerable and the circulation in such cases sluggish, it follows that the temperature will vary at times considerably: hence I consider it preferable to have water sufficient to just cover, or barely cover, two 4-inch hot-water pipes, which I would place in each tank, as shown by the dotted lines. The water would of course be deeper than if it were intended to circulate, but then we gain a more uniform temperature and can regulate it to a nicety; whereas, if it circulates, the water must pass into the boiler ere it can become warmed throughout the extent of the tanks.

There must be valves on the flows, so that the water can be made to circulate in the tanks only, or in the pipes in the walks, working them separately or together. Of the boiler I need say nothing. I have had the working of a great many, and have come to the conclusion that there is not much to choose between them; but I still hold to the tubular class, and have come to look on wrought iron with favour. I thought it something to have a boiler not likely soon to wear out, as one of cast iron, but I find such do wear out as soon as a well-made wrought-iron boiler, whilst the latter for heating quickly is vastly superior to a thick cast-iron boiler. There are tubular boilers which will burn any and every kind of fuel, and they take up no more room than a saddle boiler, and are not fettered by a patent. They are made of wrought iron rivetted together, and the tubes are the reverse of those in tubular boilers generally, the fire being where the water is in others; in fact the fire goes straight through enclosed by water, and does not run round tubes of water, which only cause the fire to drive more quickly to the chimney.

Heating by tanks is very important to the horticulturist and but little practised; I should, therefore, be glad if those interested therein would favour us with their views and experience. —G. Abbey.

LAYING DOWN BROCCOLI.

I have given this practice a fair trial, having for the last fourteen years left some plants standing as they grew by way of comparison, and I have found laying the best plan. Out of three hundred Broccoli so treated last winter I did not lose thirty, and out of one hundred left as they grew I lost all but ten. In the winter of 1860-61 I experienced the same result.

Snow's Winter White Broccoli was always killed with me till last winter, when it was all saved in consequence of its being accidentally laid down. The garden is in a very low position, exposed to spring frosts, damp, &c.; in winter frost cuts down the shrubs to the ground.—W. Neave, *Gardener to Rev. C. R. Manning, The Rectory, Diss.*

HOP CULTIVATION FOR ORNAMENT AND USE.—No. 5.

Quantity of Hops Grown.—Until a few years ago Hops were charged with an Excise duty amounting to somewhat less than 2*d.* per pound, and the amount of duty payable being known soon after the crop was secured, buyers and sellers could tell exactly what weight of Hops had been produced. Indeed, speculation as to the probable quantity was so largely entered into while the crop was growing that it has been said as much money was wagered on the Hop duty as would pay it. The Excise returns gave the number of acres under crop, and the yield per acre, as well as the amount in each district of the collection. The number of acres in the kingdom varied from 45,000 to upwards of 60,000, and it is believed that now the duty is abolished there are from 65,000 to 70,000 acres under Hops.

The home-grower, however, has the terror of the foreign producer, and the fact of some of the continental Hops being equal to the best of the home-grown, and the less expense which the foreigner incurs in cultivation, will probably keep prices from ever again attaining the figures they have sometimes done. Amongst Hops of foreign growth those from Bohemia are esteemed the best, next come the Bavarian; the Belgian and American being both inferior. From inquiries made it appears that these countries are not exempt from the misfortunes which the home-grower has so often to contend with, and it does not appear that the Hop crop can be looked upon anywhere as so great a certainty as Wheat and other things. Countries warmer than those named are found not to answer, and the later parts of Great Britain and other countries have not a long-enough season to ripen this precarious crop. Besides, only a certain quantity being wanted, it is not likely that Hops can be grown anywhere with profit, except on such soils and situations as produce them of good quality or in abundance. Trials resulting in failures have been made in other places in England than those where Hops are mostly grown. Not long ago I met a gentleman from Gloucestershire who lamented his bad luck, attributing it to the superabundance of insect life, which he thought might not be so great had there been a large number of Hop plantations in his neighbourhood instead of only one. How far this doctrine may be correct I am unable to say, but I would not advise anyone to embark in the speculation on a large scale without making himself master of its details; while as an ornamental plant of the first class, and for purposes of experiment, I would advise all who have the means to try a Hop plant or two. Its beauty, apart from the interest attaching to a plant of such utility, entitles it to a place in many districts where its name is all that is known of it.

Varieties.—Into the varieties of Hops it is not an easy matter to enter, for a very experienced grower, to whom I put the question a short time ago, assured me there are as many as there are days in the year; but a few of the most popular sorts may be named. That which produces the most valuable Hops is unquestionably the Golding, a variety which I believe originated about Canterbury, a fertile valley a few miles to the south of that city being called the Golding valley, although I believe the kind was named after a grower of the name of Golding, which is a common one in Kent. It is a tall-growing Hop, likes a dry situation, and requires tall poles. It is thought to be more liable to mildew than other kinds, and it never produces such heavy crops as the Grape and Jones's variety, but it commands a much higher price in the market, and is extensively cultivated in the best Hop-growing districts of Kent. There are several varieties of it; one of the most recent is said to be much earlier than the original. The next most popular variety is the Grape Hop, a shorter but more prolific kind, in which the individual Hops, being larger and mostly clustered at the top, present a fine mass to look upon. The produce per acre of this variety has occasionally exceeded 30 cwt. It is extensively grown in the Weald of Kent and in Sussex, and succeeds better on the stiff lands of those counties than the Golding. It is not, however, of such good quality as that famed variety, but far exceeds it in productiveness. There are also several sub-varieties of it, but mostly having local names.

Jones's Hop is an early variety and a great cropper, but its qualities in the brewhouse have been found fault with of late years; nevertheless it is well worth trying as an experiment in gardens and other places, for its earliness might perhaps enable it to perfect itself where some other Hops might not. Many growers have a few of it to enable them to begin picking with, and for a like reason some grow a few of a kind called Colgate Hops, which is later than all the others, and though in some respects resembling the Golding in requiring long poles, it is much inferior to that variety. It is, however, very hardy, but not the best climber—not sticking so closely to the pole as some others, and when it does reach the top and become loaded with Hops, it sometimes slips down; but this can easily be prevented where the plant is grown for ornament by sticking a few nails in the poles, or something of that kind. The plant is perhaps the prettiest of all the varieties of Hop, being more evenly loaded with bearing branches from the bottom upwards, and requiring a 14 or 16-feet pole. It seems to thrive well in the district eastward of Tunbridge Wells, and extraordinary crops have been sometimes produced. In the same neighbourhood the Brenchley Prolific Hops are also much grown, and, in fact, have spread themselves almost everywhere. This variety more resembles the Grape Hop, only it does not confine its growth so much to the head. The poles may be about the same height, and the plant in other respects may be described as resembling that variety in many ways. There are many other varieties of Hops, some with only local names.

Cultivation of the Ground, &c.—The cultivation of the ground is almost invariably effected by hand. Advantage is taken of frosty weather in winter to carry out to the garden what dung is wanted, and this, being spread, is dug when the weather is favourable with a three-pronged fork, locally called a spud. This spud is a formidable tool, and I have often thought it needlessly heavy, generally weighing from 8 to 9 lbs. The prongs are usually square, the points flattened wedge-shaped, and the socket-handle, which contains a considerable weight of iron, is very much bent crane-necked fashion. But heavy and uninviting as the tool seems to be, those accustomed to it look with contempt on the steel digging forks met with in ironmongers' shops; and as their work is all done by the piece we must not criticise their tools too much, since they manage to dig Hop gardens for from 15*s.* to 18*s.* per acre, and sometimes less. Orchards in tillage are also dug with the same tool, and, whatever may be said of its ugliness, there is no question but it is more suitable than a spade. Whether the light steel digging fork of our best factory make is not as good, is a question which I think a future generation will answer in the affirmative

The cultivation of the Hop, however, is not confined to one digging, for no sooner has the bine been tied in May than a sort of scuffler, termed a nidgett, is called into requisition. This implement has six or more teeth, with a sort of flat shoe at the points of each, and is narrow enough to work in the alleys, when a light horse is put to it, and with a boy to lead and a man to guide, the ground is gone over several times to render it as fine as possible; but if it should be too rough or stubborn for this implement to take effect, either a narrow roller is run between, or the large clods are broken by hand, and then the nidgett is applied. Weeds, of course, rarely appear till later in the season when this operation ceases, and as they are generally annual weeds, they are thought not to be of much account, and are left till after the crop is gathered. Sometimes, in fact, a few Turnips are sown broadcast over the ground about the beginning of August, and although they are much trampled upon at Hop-picking time, a useful piece of sheep feed is provided. This practice is not general.

Manures of various kinds are applied, and one of the most popular is night soil, used in summer, a pailful or so being given to every hill; even yard dung is sometimes applied at this season, and very often guano is scattered over the hills. In winter all kinds of manure are used that have not the reputation of being made up, for the Kentish Hop-grower prefers a simple article to a mixed one, suspecting, whether truly or not, that the latter contains but little that is valuable. There are, however, few things that have the reputation of being manure that have not been tried—waste fish, London refuse of all kinds, woollen rags, wool and cotton waste, blood manure, guano, and a hundred other articles have all been tried in turn, and with varied success. The fact of the Hop producing but little manure (although the bine when cut is

crushed up in the farmyard) renders something of the kind all the more necessary, and in this respect there is no lack of enterprise in the Hop-growers, large sums being paid yearly for such manures.

Shelter from high and destructive winds is of great importance, and as the most hurtful are from the south-west, the force of those from that direction must be broken if no natural shelter exists. High hedges are sometimes met with, and I think some trimmed hedgerows in the parish of Loose must be 40 feet high; but it sometimes happen some corner or side of a Hop garden is exposed by the cutting away of a coppice or some other cause; in this case a temporary screen is often erected by setting up a row of tall naked Hop poles, touching each other, and one tied horizontally to them on the leeward side about 8 feet from the ground affords the means of fixing brace poles to keep the whole up. Sometimes a sort of basket-work hurdle, made of hazel rods and tied high up a row of poles, is used, and sometimes a row of a common kind of Hop is planted to serve as a screen, and the poles put in a line about a foot apart. Occasionally, likewise, two rows of poles are placed in a sort of *chevaux de frise* fashion, only instead of each being at an angle of 45°, they are at one of about 80° or so with the ground, and Hops are grown on them. The Colgate Hop, being a tall hardy variety, is often employed in this way, and with good results. As shelter even for the gateway to the garden is often thought necessary, if the gate is to the windward side, some of the means alluded to are adopted.—J. Robson.

ROSES AT THE JERSEY EXHIBITION.

Having just returned from a trip to the Channel Islands, perhaps you will kindly permit me to say a few words upon the Exhibition recently held in Jersey. It appears to have been a great success, much more so than its most sanguine supporters could have hoped. My object, however, is to draw the attention of your readers to what I, as well as many others, consider a glaring omission in the award of the Judges. It appears that this Exhibition was founded on the Summer Rose Show, yet, notwithstanding the fact that the Rose-growers had to keep back their Roses from flowering a month later than their natural time in order to meet the wishes of the Committee, and the Roses shown were of a very superior quality, no medals of any description were given to successful competitors in this department. This could not arise from want of funds, neither could it be from want of merit.—Tourist.

CUCUMBER FAILURES.

I have so often given opinions and tendered advice to the readers of the Journal that I may fairly, I hope, ask for opinions and advice in return, and trust some of the able gardeners who contribute to its columns can solve my difficulties—too late, I fear, to do me any good this year, but not too late to benefit me for another season.

I have grown Cucumbers for a great many years in the same plain homely way—that is, in a common dung frame of two lights, and have never had any difficulty; but this year I am completely floored. I have not deviated in the least from my practice of former years. I had good plants, planted them in good time, and they have grown uncommonly well. There is no symptom of disease of any kind; the leaves are large and perfectly free from thrips and green fly; the fruit sets well, grows to about 3 inches in length, and there remains for a fortnight or ten days. It does not damp off immediately, but ultimately does so. Now why is this? "Perhaps you allow too much bine." Well, I cut it out very hard, and when my neighbour Mr. Woodford had a look at it he said, "Try to let it run as it likes." I did so for a while, but no better success attended this. In fact I am completely bothered, and no one who has seen it can suggest a cause or propose a remedy. If there were disease or unhealthiness I could account for it, but as these do not exist I am quite at sea. Will Mr. Fish, or Mr. Luckhurst, or some other of our friends help me?—D., *Deal.*

["D., *Deal's*," case is by no means a solitary one. I have experienced the same thing frequently, and in a variety of seasons. Look to the soil. I am inclined to think it will be found to have settled down into a close mass, containing a superabundance of moisture, and with the roots in a state of gradual decay. In a wet cold season like the present, care should be taken to maintain a lively heat in dung beds by means of frequent linings, from which the cold chilling showers should be excluded as much as possible by means of straw hurdles, or a thatching of reeds, straw, or heather. If the bed has been exposed to the influence of the extraordinary succession of cold nights and dull showery days peculiar to this season, it is most probably so sodden with moisture as to afford no heat, and, in fact, precisely in the worst possible condition for either promoting healthy root action or maintaining a lively steady temperature in the box itself, both highly important and necessary conditions to successful Cucumber culture.

If upon examination it be found that the plants have some healthy roots, remove as much of the sour soil as it is possible to do without damaging many of the roots, and cover them with a slight layer of rough sweet turf. If there is none partly decayed, which is best, pare some thinly from any well-exposed meadow. Thin out the vine, cutting away all the weaker growth, and retaining only a very few of the strongest shoots, with the tops pinched off; then remove as much as possible of the outside of the dung-bed, and apply a lining of fresh hot dung, taking care to exclude all rank steam from the interior of the box. Shade slightly if the plants droop at all, and exercise caution in watering. So treated, healthy plants will fill the turf with roots in a few days; then add more turf, but not too much at a time, laying it on roughly and unevenly, so that the air may easily penetrate it on all sides, and as the roots increase supply them with liquid manure freely and frequently, giving air as freely as the temperature will admit, and you should have no further difficulties about the crop.

Cucumber failures are more frequently owing to the use of improper soil than is generally supposed. As I stated a short time ago, the plants may flourish for a time, and even produce some fine fruit, but as the soil settles down into a close sodden inert mass, so surely does barrenness ensue, or if some fruit do appear, they are under-sized and misshapen; and what is so tantalising in connection with this state of things is that the plants remain apparently as healthy as at first, and even continue to make fresh growth. All kinds are alike; I have even seen that wonderfully free-cropping variety, Masters's Prolific, almost without fruit, and yet looking as healthy as possible.—Edward Luckhurst.]

ROYAL HORTICULTURAL SOCIETY.

July 19th.

This was only a minor Show, and held in a tent on the croquet ground; still, though it did not attain the dimensions of some of the earlier exhibitions, the quality was good, and the attendance, although on one of the most sultry days of the season, was likewise good.

Of Carnations and Picotees there was a fine show, though the competitors were not numerous. Mr. Turner, of Slough, was first for twelve Carnations with Colonel Wyndham, James Merryweather, William Cowper, King John, Purity, Sarah Payne, Annihilator, Falconbridge, Juno, Antonio, Kentish Volunteer, and a seedling. Mr. Norman, 98, Crescent Road, Plumstead, was second, and Mr. Hooper, Widcombe Hill, Bath, third. The prizes offered by the Metropolitan Floral Society were taken by Mr. Pizzey, gardener to E. Perry, Esq., Slough, and Mr. Norman, the former having Juno, James Merryweather, Sir R. Peel, Count Pauline, Mars, Earl Stamford, Splendour, Sarah Payne, Royal Scarlet, Antonio, Prince Albert, and Eccentric Jack. Mr. Norman had Sir David Wood, Premier, Splendour, Delicata, Dreadnought, Black Diamond, Juno, Falconbridge, Poor Tom, Sarah Payne, Robert Bowles, and James Webb. For twelve Picotees Mr. Norman was first with fine blooms of Master Norman, and seedlings Purity, John Norman, Morning Star, Edith Ingleton, Charles Williams, Esq., Prince Arthur, Miss Davies, John Dixon, Mrs. A. Ingleton, William Ingleton, and Mrs. Garrett. Mr. Turner was second with large and fine blooms of Christie, Mrs. Fisher, Miss Turner, Empress Engénie, Mr. Tutton, Gem of Roses, Admiration, Purity, Lord Valentia, and three seedlings. Third came Mr. Hooper, Bath, also with excellent blooms. The Metropolitan Floral Society's first and second prizes went respectively to Mr. Norman and Mr. Pizzey. The former had among others General Tulloch, Mrs. Brown, Mrs. Delafrore, Prince Arthur, and other seedlings already named.

The only collection of six Phloxes in 8-inch pots came from Messrs. Downie, Laird, & Laing, and were in beautiful bloom for such small-sized pots. The varieties were Monsieur Saison, brilliant crimson; James Mitchell; Pladda, white, purple eye, very fine; George Wyness, lilac, large; Mrs. Taylor, blush; and Captain Speke. A collection in 12-inch pots also came from the same firm, forming magnificent masses of bloom.

Prizes were offered for perennials in 12-inch pots, the plants not to exceed 2 feet in height. There was only one exhibitor, Mr. Parker, of Tooting, who took a well-deserved first prize with specimens beautifully grown and flowered, including Campanula carpatica, forming quite a mass of blue bells; Coreopsis lanceolata, rich deep yellow; Œnothera venusta, sulphur yellow; Calystegia pubescens flore-pleno; Trades-

cantia virginica rubra, splendid colour; Veronica maritima alba, Armeria plantaginea, and Betonica hirsuta.

Of miscellaneous groups Messrs. Veitch had one consisting of several handsome Palms, Dracæna porphyrophylla, and other new kinds; new Crotons, fine specimens of Cypripediums, Saccolabiums, Dendrobium Bensoniæ, Grammatophyllum Ellisianum with an immense spike, Oncidium obryzatum, and other Orchids; Darlingtonia californica, Begonia Sedeni, Lapageria alba, and several pots of Lilium auratum. Mr. Williams sent fine specimens of the variegated New Zealand Flax, Yucca quadricolor, Dasylirion acrotrichum, Alocasia zebrina, Dracænas, and other fine-foliaged plants; Adiantum farleyense, upwards of a yard in diameter; Hymenophyllum demissum, Todea superba, Trichomanes Leschenaultiana; and among Orchids Miltonia spectabilis, very fine; beautiful example of Cattleya Warneri; Thunia alba, remarkably fine; and Cypripedium superbiens. Besides these were several fine specimens of flowering stove and greenhouse plants, including Cochliostema Jacobianum, to the beauty of which we have often before called attention, together with other new plants. Mr. Denning, gardener to Lord Londesborough, sent a collection of Orchids, in which Oncidium macranthum was conspicuous as forming a festoon 10 feet long, bearing twenty-nine of its yellow and crimson flowers, each only a little less than 4 inches in diameter. Of Saccolabium Blumei Mr Denning had also a magnificent specimen with twelve fine racemes. The others were Oncidium Lanceanum and Dendrobium formosum, very fine; Cattleya Schilleriana, beautiful purple; Aërides Huttoni, with spikes of rose-coloured flowers; Stenia fimbriata, and several specimens of Miltonia spectabilis. Messrs. E. G. Henderson contributed a neat group of Palms and fine-foliaged plants; and from M. Jean Verschaffelt, Ghent, came a dozen handsome standard Orange trees.

From Mr. Mann, Brentwood, came a collection of zonal Pelargoniums; from Mr. Turner, of Slough, cut trusses of show Pelargoniums; from Mr. Hooper, Bath, stands of Carnations, Pinks, and Picotees; from Mr. Bragg, Slough, Carnations, Pinks, Pansies, and Sweet Williams; and from Mr. Shenton, Biggleswade, cut blooms of Pansies, also rustic window boxes made of cork.

Several extra prizes were awarded.

Fruit Committee.—G. F. Wilson, Esq., F.R.S., in the chair. Mr. John Hepper, The Elms, Acton, sent good specimens of Veitch's Autumn Giant Cauliflower from plants sown September 7th, 1870, to show that it is not only useful as an autumn variety, but for summer use. Mr. Smith, gardener to the Earl of Gainsborough, Exton Park, Oakham, sent a seedling Cucumber raised between Carter's Champion and Worcester Prize, but it was considered coarse. Mr. J. James, gardener to W. F. Watson, Esq., Redlees, Isleworth, sent a seedling Pea called James's Prolific, producing a large pod and large peas. The Committee recommended that it be sent to the garden to be tried along with other varieties in the collection next year.

Mr. Bland, gardener to Lord Kilmorey, Isleworth, sent two dishes of fine fruit of Grosse Mignonne Peaches, to which a special certificate was awarded. Mr. Tillery, of Welbeck, sent a collection of fruit consisting of one dish of each—Bigarreau Napoléon, large, and very handsome; Lucas Strawberry, also good, Cockscomb; and Elruge Nectarine. A special certificate was awarded to the collection. Mr. William Paul, Waltham Cross, sent fruit of a seedling Strawberry called Waltham Seedling. It is large and handsome, of a good deep colour, which stains the flesh throughout; the flavour was not quite approved, but the Committee were of opinion that in a more favourable season it will prove an excellent variety.

Mr. Bradley, of Littledale, Halam, sent a seedling Strawberry, "The Amateur," which was much admired, both for its size, colour, and flavour. It was awarded a first-class certificate. Messrs. Standish & Co., of Ascot, sent fruit of the Ascot Citronelle Grape, a very early variety of Frontignan, with a high Frontignan flavour, and remarkable piquancy. It was awarded a first-class certificate. A remarkably attractive exhibition of Pines was sent by Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, consisting of Enville, 11 lbs. 4 ozs.; Smooth-leaved Cayenne, 7 lbs. 8 ozs.; Charlotte Rothschild, 6 lbs. 8 ozs.; Queen, 5 lbs. 10 ozs. They were all produced from plants sixteen months old. A special certificate was awarded to them.

Messrs. Rivers & Son, of Sawbridgeworth, sent a dish of a very large and handsome black Cherry called Bigarreau Noir de Schmidt. The flesh was very firm and of excellent flavour. It was awarded a first-class certificate. Mr. Fleming, of Cliveden, sent specimens of a very large round white Fig, without any stain of colour in the flesh. The fruit had been kept too long after being gathered, and had become mouldy. Mr. T. Sampson, Houndstone Nursery, Yeovil, sent a dish of Apples of last year's crop.

Mr. G. Lee, Clevedon, sent, but too late to be submitted to the Committee, fruiting branches of Lee's Prolific Black Currant, which received a first-class certificate last year, and fully maintained the high position then given to the variety.

Messrs. Carter & Co. offered prizes for the best collections of vegetables, including Carter's Imperial Wonder and Laxton's Supreme Peas, and Carter's Improved Garnishing Parsley. There was only one exhibitor—Mr. Miles, gardener to Lord Carrington, Wycombe Abbey, who took the first prize, and had excellent Cabbages, Lettuces, Broad Beans, Peas, Carrots, Student Parsnips, Parsley, Giant Rocca, and White Lisbon Onions, Salsafy, Scorzonera, Celery, Beet, Shallots, Globe Artichokes, Turnips, Potatoes, Vegetable Marrows, Asparagus, and Broccoli.

Floral Committee.—Mr. J. Fraser in the chair. Mr. Z. Steveos, gardener to the Duke of Sutherland, Trentham, received special certificates for fine examples of Barkeria spectabilis and Odontoglossum hastilabium, the latter being a cut specimen. Messrs. Veitch, of Chelsea, sent Dendrobium Griffithianum majus, with a close pendulous raceme of delicate orange yellow flowers with a yellow lip. From Messrs. Jacob-Makoy & Co., Liége, came Tillandsia platystachys complanata, but, when we saw it, without flowers. This received a first-class certificate. M. Jean Verschaffelt, Ghent, exhibited a dozen Agaves, imported from Mexico in 1870 and 1871; first-class certificates were given for A. Mescal foliis variegatis, A. Regeli macrodontha, A. elegantissima, a very handsome kind, and a new unnamed species. Mr. Green, gardener to W. Wilson Saunders, Esq., sent several interesting plants, among which were a new plant from Angola, a South African Rochea and Albuca. M. Jean Verschaffelt also sent a collection of new plants, in which were Encephalartos Broomii, very beautiful, and, if we mistake not, the same as that which Mr. Bull has several times exhibited without a name; a new species of Zamia from New Caledonia; and a species of Dicksonia. Each of these received a first-class certificate. In the same collection were Hechtia sanguinea with purple-tinged leaves, and a Cyathea from St. Catherine's. Mr. Laurence, gardener to Bishop Sumner, Farnham Castle, sent perhaps the finest specimen of Dendrochilum filiforme ever seen, being nearly 2 feet in diameter, and tasselled all over with its peculiar inflorescence. For this he was awarded a special certificate, as also for a specimen of Maxillaria venusta. Mr. Wendland, The Royal Gardens, Herrenhausen, Hanover, exhibited Æchmea Marie Regina, which in splendour yields to no other Bromeliad, magnificent in colour as many of them are. The bracts are of the loveliest and deepest of rose colours, and the flowers will probably be blue.

From Messrs. E. G. Henderson & Son came several new Lobelias, very dwarf, not exceeding 3 inches in height, very compact, and also forming dense masses of flower. First-class certificates were given for Celestial Blue, pale blue, with a white eye, and Brilliant, dark blue, with a white eye. Purple Prince was also fine in colour, free flowering, and, if it will retain its hue, very desirable. Messrs. Carter & Co., High Holborn, sent a basket of Trichinium Manglesii, very fine; a beautiful pan of Dichorisandra musaica, and several Golden Tricolor Pelargoniums, of which Prospero was fine in colour, and Last of the Clan—which would be welcome to some—a well-coloured kind. Mr. Chapman, Earlswood, sent Invincible Blue Sweet Pea, violet, a good kind; Mr. Ley, Croydon, a Begonia, not very attractive; Mr. Chambers, gardener to J. Lawrence, Esq., Beddington, a golden-leaved Geranium called Golden Gift; and Mr. Woods, Claygate, a seedling scarlet Zonal. Mr. Mann, of Brentwood, also sent several scarlet Zonals, but none were judged worthy of a distinction.

Messrs. Paul & Son, Cheshunt, exhibited several boxes of very fine cut Roses, for which they received a special certificate, also taking first-class certificates for Louis Van Houtte and Comtesse d'Oxford; Mr. Cranston, of King's Acre, Hereford, also received a special certificate; Madame Charles Wood was very fine. Messrs. Veitch also sent stands, together with one of Spiræas; for the latter they had a special certificate. S. callosa, S. Douglasii, and S. ariæfolia were very fine. Messrs. Lee, of Hammersmith, exhibited Lobelia White Perfection, which we have favourably noticed before; on this occasion it received a first-class certificate. The panful of it, though grown in the open air, was quite a mass of milk-white blossom. Mr. Hepper, gardener to C. P. Millard, Esq, The Elms, Acton, sent a number of dwarf Cockscombs very even, but not with large heads; Mr. Cunningham, Moor Park, Rickmansworth, Verbena White King, a very promising variety, but the Committee required to see the flowers on the plants; Mr. Macintosh, Hammersmith, Pelargonium lateripes grandiflorum, with larger flowers than the ordinary Ivy-leaved Pelargonium, apart from which the plant would have deserved an award as a specimen. It had a first-class certificate. Mr. Norman, Plumstead, had first-class certificates for Picotees Mrs. Brown and Morning Star, and one of the second class for Lady Holmesdale. Mr. Hooper, Bath, sent Picotee Lady-in-white. Fuchsia Sunray, from Mr. Milner, with the foliage diversified with rose, had a first-class certificate.

G. F. Wilson, Esq., Weybridge, sent a beautifully-flowered group of Lilies—such specimens, in fact, as have rarely been exhibited, but being a member of the Society's Council he could not compete for a prize, and was therefore awarded only a special certificate. They consisted of Lilium longiflorum of the ordinary variety, the large variety of the same, and the variety having the leaves edged with white; L. tigrinum, a giant variety of the same; a Lilium brought by Mr. W. Robinson from the Rocky Mountains; and one whose name is doubtful. Mr. Denning, gardener to Lord Londesborough, had a special certificate for his fine group of Orchids. Mr. Williams, of Holloway, exhibited Miltonia Warscewiczii, a pretty little variegated Ivy, Agave stricta, and a number of other interesting plants.

Red-skinned Lapstone Potato.—I am made to say in last week's Journal, page 23, that "I have under trial about twenty roots each of Red-skinned Flourball, &c.;" it should have been Red-skinned Lapstone, &c.—a kind, I believe, solely in

my hands, and which was raised here. It is more hardy than the old Lapstone, has stronger haulm, but short, and a pale red skin, not unlike Red-skinned Flourball in colour. It is early—much earlier than the Pink-eyed Lapstone, or Red-sprouting Lapstone, a variety raised at the same time as the Red-skinned Lapstone. For hardiness and cropping they will come up to "D., *Deal's*," standard, whilst of their quality I have great expectations. I hold the Lapstone to be the finest quality of Potato, and only wanting in hardiness, and this I think I have secured both in early and late varieties.—G. Abbey.

ENTOMOLOGICAL SOCIETY'S MEETING.

The last meeting for the present season was held on the 3rd inst. at Burlington House, Piccadilly, Mr. A. R. Wallace, the President, being in the chair. An extensive series of entomological publications from various continental and English societies and authors was announced as having been presented since the preceding meeting.

Mr. S. Stevens exhibited various species of insects captured during a recent visit to Ireland, among which was the extremely rare Chlænius holosericeus, taken near Killaloe, on Lough Berg. Erastria Bankiana was flying by hundreds in the same locality. He also saw several collectors who confirmed the capture of Notodonta bicolora, having seen the unique specimen whilst still alive in the hands of its captor.

Mr. Champion exhibited the fine and very rare Emus hirtus (one of the large Staphylinidæ), taken recently in the New Forest under cow dung, and various new species of Hemiptera.

Professor Westwood exhibited the minute-book of the old Entomological Society, founded in 1780, now in the possession of Mr. Drewitt, of Christ Church, Oxford.

Mr. Blackmore exhibited a collection of insects recently made in Fez and Tangiers by himself, including the rare Lucanus Barbarossa and various Locusts, of which L. tataricus had only occurred singly, but L. peregrinus had appeared in great swarms exactly as described by the prophet Joel, their dead bodies lying on the seashore in heaps for miles. Mr. Dunning read the description of a machine invented in America, and used near the Salt Lake, for destroying these insects, consisting of two moveable rollers, and costing 75 dollars.

The Rev. W. H. Wayne sent some specimens of Strawberries destroyed by young Juli, and young Carrots gnawed apparently by the larvæ of a small two winged fly, Psila Rosæ. Mr. Herbert Druce exhibited several boxes of Butterflies of great beauty and rarity from South America; and Mr. Stainton a singular specimen of the small Moth Botys fuscalis, the face of which was still covered by the anterior portion of the shell of the chrysalis, which, however, had not retained in it the antennæ, which were fully developed.

Mr. Sydney Saunders communicated a monograph of the Strepsiptera, a group of parasites within the bodies of bees and other Hymenoptera, which he considered to belong to the order Coleoptera. Mr. Müller exhibited leaves of Vines exhibiting great numbers of yellow spots, caused by exceedingly minute gall-making Acaridæ of the genus Phytoptus.

Professor Westwood communicated descriptions of various new exotic Papilionidæ, in which he drew the distinction between species as originally created and local varieties or sub-species, which he considered might have been produced by modifications in the physical conditions in which certain individuals had been placed; a view which was opposed by Mr. Jenner Weir, who expressed his entire disbelief in an original creation, a term which ought to be discarded from science!!

Mr. Riley, the State Entomologist of Ohio, who was present as a visitor, and whose appearance was warmly greeted, made some observations on the dissimilar form in the clasping organs of certain Butterflies belonging to the Hesperiidæ, which had lately been described by Mr. Scudder, contending that not only in these insects, but also in the Cicadæ, the form of these instruments varied greatly in individuals of the same species. He also presented copies of his State Reports on the insects destructive to crops in Ohio, and exhibited several boxes of such insects.

Mr. W. H. Bates read a paper on the sections of Cicindelidæ, and especially on the genus Oxygonia of Mannerheim.

LARGE PRODUCE.

I have just cut a "monstrous" Lettuce, the length of which is 23 inches, circumference 19 inches, weight 2 lbs. 2 ozs. I have about six more tied up, apparently of the same size, more than one hundred of nearly the same size, and three hundred which have yet to prove themselves, but which are so strong that they promise to rival the one I cut to-day. I may say that, with the exception of quite the outside leaves, the Lettuce is good to eat all through, crisp, delicate, and tender.

With regard to the Kentish Invicta Pea, I bought a quart from Messrs. J. Dickson & Sons, of Chester, in the spring, and sowed in February. I have now gathered seven pecks from the plants it produced. The Peas of Sangster's No. 1 are only just ripe, although sown in the autumn.

Fruit here is generally bad; but by good fortune for a fortnight I have never been without Strawberries; they will not, however, thoroughly ripen. The Currants, Raspberries, &c., are generally wanting. Wall fruit none.—R. F. S., *Stafford*.

SPRING FLOWERS.

At a meeting of the Gardeners' Mutual Improvement Society held at York, Mr. John Russell, gardener and florist of Fulford Road, made the following remarks:—

I want to draw more attention to this class of flowers, as I am satisfied if you could be induced to do it a complete change might be effected in some of the most charming productions of Nature which are now comparatively neglected. How strange, and yet how true, that though everyone seems fond of them, they are so little improved! Improved! Nay, they positively have moved backwards. Take, for instance, one of the loveliest families of them all, the Stock. There was a time when you could see Bromptons growing in many a cottage garden with magnificent spikes of double flowers, such as can be now rarely, if ever, met with, and as to the Intermediate, it seems almost an impossibility to find a good strain for love or money. Why is this? Look at the Polyanthus. Many of the good varieties in the florists' lists now are such as I remember thirty years ago. Go back the same period with Dahlias, since the days of Springfield Rival; and with Geraniums, Garth's Perfection, or Gaines's King; where are they now? Long, long ago, gone. Observe also the Wallflower. Is it better now than when we were boys? Dahlias, Fuchsias, and Geraniums are very beautiful in their way, and it is you who have made them so. But do you not think that if you and others of the same profession had paid as much attention to these old flowers that they would have been long ago improved? It is marvellous to see what a change can be effected in a garden by right management.

Look at that pretty edging of gold now to be seen almost everywhere. One would imagine an army of men had been gilding all the Box-edging. Its forefather, the old green Feverfew, always had a taste for living in a garden, but somehow its presence was not altogether appreciated, and it was ruthlessly pulled-up wherever seen, only to be found again the next hoeing time. What good was it? Certainly old ladies made a decoction of it to cure some kind of complaint, and that was all. Some of the younger branches of the family, I suppose, thinking they had been green long enough, have done what people sometimes do in political matters, changed colour, and now the Golden Feather, or *par excellence*, Pyrethrum parthenifolium aureum is the great gun of the day.

To my subject of spring flowers. I believe no small portion of their value is in the associations connected with them. A gentleman who has spent most of his life in India, not long ago said to me, "Now, I require some plants, but I do not want any of those longifloras or elegantissimas, or that kind of thing; I should like some Wallflowers, Daisies, Pansies, &c. I understand them, but I do not know anything about those other confounded things." What we call rare plants were no novelty to him in a warmer clime. He had seen Nature adorned with everything the most fantastic and beautiful, but old English spring flowers were associated with his earliest recollections of childhood. The Christmas Rose is letting the world see how well a plant can bloom amidst frost and snow; it is a great curiosity. Then comes the Aconite with its welcome yellow blossoms. But, then, the Snowdrop, when it comes causes almost as great a sensation (and at a much less expense) as the first baby; everyone talks of the first Snowdrop, yet no prize flower is this for amateurs to put on their spectacles to judge its merits—a little humble plant, but it tells a tale of spring; though had Nature, under Providence, placed it in autumn after the gorgeous flowers of summer, it would in all probability have been passed unheeded. Now follow in quick succession the Crocus, the single Anemone, the Arabis, the Daisy, the Pansy, and hosts of others, which are old faces. What a fine effect can be produced with the most trifling expense the whole of winter with these few sorts:—The Golden Feather, Red Spinach, and Stachys lanata; the Gold-edge Daisy, and Cerastium! With just these either in beds or in cones, or hillocks thrown up, you may make a very gay appearance. But you must have good plants ready to put out when they are wanted. For this purpose the first two should be sown in July, and of the latter cuttings or divisions should be put in a few weeks beforehand. Of flowering plants you should grow in large quantities Aubrietia græca. I have seen patches of it this spring rivalling the blue Lobelia in its palmiest time.

A lovely plant which everyone should get is Myosotis rupicola; in masses it must be grand. Alyssum saxatile compactum, too, is most effective in beds. Of this and the Aubrietia you may grow hundreds from a shilling packet of seed, and with these and the Imperial Gold-finder, Trentham Blue, Yellow, and White Pansies, the different Daisies, Polyanthuses, Wallflowers, a few dozen Tulips, and other well-known things you make a very gay show, but this only as a beginning. I do not expect all gardens to be made like Trentham at once. In our own neighbourhood, I am told at Escrick Park the beds of Tulips and Pansies this spring were worth going a long way to see. You should walk round these places where new spring flowers can be obtained, and, perhaps, nowhere can you have such an opportunity as Messrs. Backhouse's. Pick up any little gem that you think may be made effective in masses, and do your best with it to get up a stock. There are many others which are very beautiful—the Hepaticas, the Gentian, Alpine Auriculas, Phlox frondosa, Nelsoni, and others, but

which you cannot get a stock of at once without expense. If you have none get an odd plant or some seeds of each.

I think, too, if you had your beds looking gayer in spring your employers would not be so anxious to start bedding-out so early; and, though I do not wish to touch upon this subject, I may remark by the way, that in small places particularly, you would have more time to collect your stock of plants together and to get them of a more uniform size, which is a very important matter in bedding-out.

A very effective plant I omitted to mention is Omphalodes verna; I noticed some grand clumps of it at Heslington Hall in early spring, of a much brighter hue than the Forget-me-not. Ah! I think I have not mentioned that before; but if ten thousand more beautiful plants bloom at the same time, we cannot do without that. Shakespeare says, "What's in a name." Who dares to say there is nothing in the name of this Forget-me-not! How many thousands of these flowers are annually sent on their mission of love!—more than the Postmaster-General knows of—they tell their own tale. It is an old flower, and it is an old tale, and I venture to say both will be in existence as long as this world lasts. Will your Gold and Bronze Geraniums last so long?

Now, take as much care about your strain of Wallflowers, &c., as you do about your Primula and Cineraria; grow the other spring flowers as assiduously as you do your Geraniums and your Verbenas; study their arrangement as tastefully as you do your bedding-out plants, and I most unhesitatingly assert that before long you will realise a display for three or four months in early spring little, if anything, inferior to your best show in summer.

In conclusion, I have no doubt to many of you, perhaps to most of you, all I have said is like an old song. You know books are not in a general way written for schoolmasters, though they may refresh their memory from them. A parson does not expect to reclaim a whole congregation; he will tell you if he has done one good he has succeeded in his mission, and allow me to add, if any one remark I have made, or any hint I have thrown out be of the slightest service to anyone, my time will not have been spent in vain.

COVENT GARDEN MONOPOLISTS.

What we require to open the eyes of both buyers and sellers of fruit in the London market is positive information as to the prices paid and received for fruit, &c., at certain dates. I have given the price charged in Covent Garden in May. A gentleman, whose letter I enclose, sends me a list of prices he received. You will see he says for very superior fruit carried by hand he received in March 16*s.* a-pound; in April 8*s.*, except once, when he obtained 12*s.*; in May 6*s.* to 7*s.* I think you will find, judging from information I receive, that producers who get about one-fourth of the retail price are not considered badly paid. It is when they get less than this that they begin to grumble.—J. R. Pearson, *Chilwell.*

"July 7th, 1871.

"Dear Sir,—Having read your article on 'Covent Garden Monopolists,' and being, like yourself, disgusted with the prices allowed to the producer, I have sent you a copy of the account for forced Strawberries which I have sent to what is supposed to be salesman A1. The fruit was fine, and in market two hours after having been picked, as I sent my man up with each lot required. I also give the price in the main avenue of the market each morning. The fruit not being so fine as mine, and partly stale, I fully expected to see half these prices in my return. Those entered as seconds were nothing but refuse, for which I have received more than half the price of fine fruit. I am an amateur, and not depending on the produce. How those get on who have to make a living by forcing I cannot tell. I have only been at it two years, and have had good crops, but this has nearly given me a sickener. No doubt there are hundreds like myself who will be greatly obliged if this evil can be removed, and a fair price allowed to the producer.—I remain, &c., George Lee."

"The following is the statement of prices:"—

1871.		My price.	Price in the Avenue.
March 29	10 ozs. best	1*s.* per oz.	3*s.* per oz.
April 1	1 lb. best	1*s.* per oz.	
„ 3	4 lbs. best	12*s.* per lb.	44*s.* per lb.
„ 5	2½ lbs. best	8*s.* per lb.	36*s.* per lb.
„ 10	5 lbs. best	8*s.* per lb.	32*s.* per lb.
	1 lb. small	4*s.* per lb.	
„ 12	1½ lb. best	8*s.* per lb.	32*s.* per lb.
	½ lb. seconds	2*s.* per lb.	
„ 17	2¾ lbs. best	8*s.* per lb.	20*s.* per lb.
„ 24	4 lbs. best	8*s.* per lb.	12*s.* to 20*s.*
	3½ lbs. best	8*s.* per lb.	
	1 lb. small	5*s.* per lb.	
May 1	3 lbs. best	6*s.* per lb.	12*s.* to 20*s.*
„ 5	4½ lbs. best	7*s.* per lb.	For these lots I did not get prices in the Avenue.
	¾ lb. small	3*s.* per lb.	
„ 8	3 lbs. best	6*s.* per lb.	
„ 12	3 lbs. best	7*s.* per lb.	
„ 17	1½ lb. best	7*s.* per lb.	

One's first idea in connection with an attempt to quash such a monopoly is to endeavour to start one or more establishments of a similar character, which, by means of the powerful and wide-spread agency of The Journal of Horticulture, shall challenge and fix the attention of all persons interested in such matters, or who are desirous to occasionally dispose of their superfluous garden produce. As this would, doubtless, be a very costly and speculative undertaking, could not something be done by the Royal Horticultural Society?

So many gentlemen now dispose of the choicest productions of their gardens, that surely the Society would not consider it derogatory to its dignity to afford them and others greater facilities for doing so than now exist.

Do not the permanent exhibitions of horticultural implements in the arcades at South Kensington, and the nurserymen's stands in the International Exhibition, point the way? If some such plan were adopted I think it should not be confined to the Fellows of the Society, but garden produce of a superior quality should be received from all, as, otherwise, it might prove hurtful to the market gardeners.

Moreover, for such a plan to be successful there must be as full and constant a supply as the nature of the season will admit of, so that purchasers when going to the market might always be able to obtain what they wanted.

If a suitable building were provided, good taste would produce such an arrangement of the goods offered for sale as would always form an attractive sight. We should thus have a market without the filth or clamour of Covent Garden; for, if costermongers were admitted, both they and greengrocers should, I think, be compelled to make their purchases and remove them by a stated hour every morning, after which no wholesale business should be done. Respectable persons would thus be able to inspect the goods, and make purchases, free from annoyance, or to enjoy a stroll through what must be a pretty and animated scene.—Edward Luckhurst.

VILLAGE HORTICULTURAL SOCIETIES.

[We are so frequently asked to furnish approved rules for these societies, that we reprint those which follow. They were the result of the long and successful experience of the late Rev. Abner Brown, founder and manager of the prosperous "Village Horticultural Society," at Pytchley, Northamptonshire.—Eds.]

Why should not thousands of similar villages have their little societies? Most parishes contain some active young people who take delight in their gardens, and can afford a day or two now and then, and a few shillings yearly (a very few are needed) to promote such innocent and healthful enjoyment, such advantageous means of good, to themselves and others?

It is evident that the rules suited to one locality will usually require some modification to adapt them to another. But if such societies are fully to exert the beneficial influence of which they are capable, a few broad and fundamental principles, such as the following, must not be overlooked, whatever be the minor details adopted.

The circle of neighbourhood should be so restricted, as that each member may know with whom he will probably have to compete, and that the distance of the show-room from each cottage member's home will not require him to lose any part of his day's work in bringing his specimens, or seeing the show. The expressions, "our parish,"—"our village,"—comprise so many old-English and home ideas, that the expression "our society," may advantageously be made to correspond with them. Whatever be the limits fixed they should be steadily adhered to; for the advantage of doing so will eventually overbalance any temporary advantage resulting from breaking through them.

The exhibitors and specimens should be classified, in order that those who have small or poor gardens should not feel success hopeless, by being required to compete with such as have necessarily much better means of gardening. By classification, also, an opening is made for members who have no other garden than a cottage window for a few flower-pots, and even for school-children, who have nothing beyond the wild flowers from the lanes and hedges.

In order to prevent general discouragement, professional gardeners who may be members should be restricted as to the number and amount of their prizes. Their prizes should be for such specimens as require unusual skill and opportunity to bring to excellence, and for which, therefore, there will be necessarily few competitors. The profits of such members

should result chiefly from the general stimulus given by the society to gardening and flower-buying.

The judges, especially of cottage specimens, must be entirely raised above the reach of suspicion; and that not only by personal character, but by such regulations as make partiality impossible, or altogether unlikely. The object sought to be gained by village societies is not so much the absolute excellence of specimens, as a relative and growing improvement in the quantity and quality of food raised by cottagers, and in the beauty and variety of their flowers, and the tastefulness of their nosegays. There should, therefore, be some means provided for rewarding evident efforts at improvement, even where the actual quality of the specimens will not allow them to be compared with those of members who have tried longer, or with more tact and ability, and which deserve and receive prizes for their intrinsic excellence.

The subscriptions of cottagers should be small; both because their income is very scanty, and in order that the unsuccessful should not feel the loss of their subscription very material. Yet some subscription should be required, lest the feeling of independence and self-respect, that jewel of English character, should be injured by the prizes being felt to be alms.

A large number of small prizes is more efficacious than a few of larger amount; for a small sum of money can thus be spread influentially over a larger number of persons, and be made to encourage improvement among a larger variety of produce.

A part of each year's regular subscriptions should be laid aside as a fund, which, with the aid of occasional donations, may gradually enable the Society to provide an ample stock of materials for the shows. Fourteen dozen of plates and dishes, with the Pytchley Society's name printed on them at the potteries, cost £3 9*s*. A set of stages, consisting of long, green-painted shelves, and benches and frames, fitting into each other, and forming, when piled up, several platforms, commodious, and yet easily removed, cost £9 15*s*. Chain festoons, crowns, loyal devices and letters, the Society's name, arches, ornaments, &c. (nearly all of iron), for decorating with flowers; frames to hold nosegays, and cases to preserve choice blossoms in water, were accumulated from time to time. The expense of these, and of printing, for the use of members, repeated editions of the rules, circulars, handbills, prize cards, &c., has been, in all, almost £30. Had it been necessary, the efficiency of the Society, though not its attractiveness, might have been preserved at even a smaller outlay.

The specimen tickets used are pieces of pasteboard, 1½ inch square, on each side of which is printed a number in large figures; and the prize cards are similar pieces, about 3 inches square, with the words "first prize," or "second prize," or "extra prize," &c., printed on each side. As there are three classes of members, and competition must be avoided between specimens belonging to different classes, there are tickets and prize cards of three colours: some of white pasteboard, appropriated to the ordinary members; some of red, for cottagers, and some of green, for children; each class of tickets being further distinguished by having a different series of numbers—viz., Nos. 1 to 49; Nos. 50 to 99, and Nos. 100 to 149. The tickets are in parcels of twenty-five, each ticket of a parcel bearing the same figures.

The show-book is a quire of foolscap paper, stitched into a pasteboard cover, and renewed every year. It is so ruled on each page as to have one column for the number, one for the exhibitor's name, one for the kind of specimen brought, and one where the prizes are afterwards entered opposite the successful specimens. The whole of a member's specimens are entered consecutively in the same place, under his number for that show; and his number depends on the order in which he happens to arrive in the morning among the exhibitors. Separate pages are kept for the white, red, or green ticketed specimens.

Immediately after school on the evening of the day before a show, the stages are raised, and the festoons, devices, arches, &c., decorated with flowers, and fixed in their places. The show day, is, of course, a holiday to the scholars. In the morning after the show day, the stages, &c., are removed and stowed away, and the room is ready again for school at its usual hour.

On the show day, after all the specimens have been brought in and registered in the show book, they are arranged on the stages; specimens of the same sort and class being placed side by side, and each bearing a ticket with its owner's number and colour. When this is completed, the show book is removed, and the judges are admitted and left entirely by themselves, ignorant of who are the owners of any of the specimens. Comparing each specimen with those only which bear the same coloured ticket, the judge affixes a prize card of the same colour to the best and second best of the sort; and finally examines the variety of specimens bearing the same number, to reward with some extra prize (if possible) evident efforts to do well, where the specimens have not attained sufficient excellence to deserve the prize competed for. After the judging is over, the secretary brings the show book; the prizes are entered, by means of the number, in the proper column opposite the specimen; and the judges learn, for the first time, who have gained the prizes. The doors are then opened to visitors.

The prizes given are small, that they may be numerous; and the largest are adjudged to those articles which are most useful and most troublesome to rear. The highest prize for specimens is 1*s*., the lowest 3*d*.; but those for allotments and gardens are from 4*s*. to 2*s*.

It would greatly increase the efficiency of such a village society, could it be made to bear upon larger and better gardens as strongly as it does upon cottage gardening: This would be the result of its funds being sufficiently ample to allow a higher scale of prizes among the white ticket specimens than among the others; and to remove the necessity which many of the ordinary members kindly feel and act upon, of returning their prizes. It is also evident that if the cottage members in a parish are very numerous, the prizes must be few, unless the cottage subscriptions are higher than 6*d*., which, however, might have a discouraging effect in founding a new society.

Expenditure.—The outlay for each show consists of the prizes paid; and the necessary allowances and trifling expenses for those who give their time to preparing the show-room, managing the laborious part of the show, and clearing the room after. The greater the number of specimens, the more prizes must be given, and the more hands will be required to do the necessary work. The amount of allowance and expenses has ranged from 2*s*. in the autumn show of 1837, to 11*s*. 6*d*. in the autumn show of 1848. The sum which can be devoted in prizes depends upon the general funds of the year, and the money received at the door on the show-day. Sometimes an unexpected donation, not wanted that year for the purchase of stock, has allowed a large sum to be given in prizes; or, on the other hand, a call for printing or other extra outlay, has reduced the sum to be divided below the average. In the spring show of 1837, sixteen prizes to ordinary members cost 2*s*. 3*d*., and seven to cottagers and children cost 4*s*. 9*d*.; in the spring show of 1848, twenty-five prizes to ordinary members cost 10*s*. 3*d*; eighty to cottagers cost £1 19*s* 3*d*.; and twenty-nine to children cost 9*s*. In the summer shows the number and amount have been on the whole a trifle less. In the autumn show of 1837, the ordinary members received thirty-four prizes, costing 13*s*.; the cottagers and children twenty, costing 15*s*. 9*d*. In that of 1848, the ordinary members received forty prizes, costing £1 0*s*. 5*d*.; the cottagers eighty-four, costing £3 8*s*. (including £1 for six prizes among the allotments and gardens), and the children thirty-one, costing 9*s*. 3*d*. The whole yearly outlay for prizes and show expenses in 1837 (three shows), was £2 7*s*. 6*d*.; and in 1841 (three shows), £6 13*s*. 6*d*.; in 1846 (two shows), it was £7 16*s*. 7*d*.; and in 1848 (two shows), £8 19*s*. 1*d*. The sums expended in purchase of stock, &c., were made to depend on the funds; the amount so employed in 1837, was £2 5*s*. 11*d*.; in 1839, was £10 11*s*. 1*d*.; in 1842, was 3*s*. 6*d*.; and in 1846, was £10 10*s*. 6*d*.

Rules of the Pytchley Horticultural Society.

1. Objects and Funds.—To encourage useful and ornamental gardening, good culture of cottage allotments, and the keeping of bees; by giving prizes for horticultural efforts made and specimens raised in the parish. It is supported by the subscriptions of members, the donations of friends, and the money received at the doors for admission on show days.

2. The Society.—It consists of such inhabitants of the parish as subscribe to its funds and agree to be bound by its rules; and is managed by a committee of three or four members, along with the clergyman (being a subscriber). A general meeting may be held in the fall of the year, for accounts or other business, should the majority of adult members wish.

3. The Members.—Any inhabitant of the parish may become a member; but persons not living in the parish cannot be members. Members who disregard the rules, annoy their fellow members, refuse to abide by the judges' decision, or act unfairly in regard of specimens or otherwise, may be expelled from the Society by the committee.

Subscriptions are payable in advance, and for the whole year at once. Members are of three classes:—

Ordinary subscribers, called also *White Ticket Members*, paying not less than 2*s.* 6*d.* yearly: unless they be small tradesmen, whom the commitee may admit at 1*s.* yearly.

Cottagers, called also *Red Ticket Members*, paying 6*d.* yearly, or if in the Provident Society, 4*d.*

Children, called also *Green Ticket Members*, paying yearly, if in the parish Sunday School, 1*d.*; if not, 3*d.*, or 2*d.* according as their parents are, or are not, in the Provident Society.

Young persons, above the age of children, living at home with their parents, pay, on becoming members, half of what their parents do or would pay, but never above 1*s.* each; and their specimens will be judged along with those of the class to which their parents do or would belong.

4. The Show Days.—The Spring show is on, or as near, Royal Oak day (29th May) as it can be conveniently fixed. A Summer show is occasionally held in July or August. The Autumn show is in the middle of September, or as soon after as the harvest of the season will allow. The day of each show is fixed by the committee according to the forwardness of the season, and so as not to interfere with the neighbouring markets or fairs, nor to fall on Saturday or Monday. The village crier goes round the parish with notice a week before, and a few circulars are sent beforehand to the neighbouring towns and villages. The doors of the show are opened to the public at three o'clock.

5. The Specimens.—All specimens shown for any purpose must really belong to the member showing them. If shown for prizes, they must have been raised in the parish by the member, or must have been growing for three months before in the member's own garden, house, allotment, or field, in the parish. Mushrooms, wild flowers, wild fruits, wild pot-herbs, shown for prizes, must have been gathered wild in the parish by the member showing them. Flowers or plants which cannot be shown for prize, may be shown for ornament or sale, providing they really belong to the member showing them; and have the owner's name, or the words, "not shown for prize," distinctly marked upon them. The quantity sent as a specimen must be sufficient for fairly judging the general quality, but need not be more—for instance, eight of common fruits, roots, Seakale, Rhubarb, &c.; four of fine fruits, Celery, Lettuce, Artichoke, &c.; two of Cauliflower, Cabbage, Cucumbers, Gourds, Mangel-Wurtzel, &c; fifty Asparagus; a pound or pint of small fruits, early Peas, early Potatoes, &c.; half a gallon, or a Society's plateful, of Potatoes, Peas, Beans, &c.

The same specimen cannot gain more than one prize in a year, and, if shown again, should have the owner's name. (For children's specimens, see the list of prizes which follow these rules.) No member can have two prizes for two different specimens of the same article. A certain amount or number of prizes will be fixed, beyond which the specimens of any professed gardener cannot gain.

6. Judging the Specimens.—The judge or judges are appointed by the committee. No specimen belonging to any judge can be shown for prizes in that show for which he is judge. If shown at all it must bear his name. The room shall be ready for the judges at twelve o'clock; but, whether or not, the judge shall not enter it until the specimens are all finally arranged, and no person but the judges shall be in the room at the time of judging. No specimen which has the owner's name upon it, or the owner of which is or has been in any way made known to any of the judges, or which has upon it no ticket, can gain a prize under any circumstances. The specimens with white tickets, those with red tickets, and those with green tickets, shall be judged as three separate classes; each specimen against the others bearing its own colour of ticket, and not against specimens bearing any other colour than its own.

7. Admission to the Shows.—The door is opened to the public at three o'clock. Every member has free admission to each show of the year, for himself and his wife; but cannot send any other person instead, nor take in, without payment, either a friend or child of any age. No person, except a member or his wife, can come into the room at any time of the day or evening without paying.

Visitors pay not less than 6*d.* each for admission to each show. Cottagers, whether of the parish or not, pay 1*d.* each. Children, whether in arms or not, half-price.

A box or bag is at the door to receive the donations of any visitor who may be willing to aid the funds.

No one is permitted to touch the specimens. The man in charge of the room is directed to turn out any person, whether member or visitor, who injures the specimens or acts improperly. Dogs are not allowed in the show-room.

At night, when the specimens are about to be removed, no more visitors, nor members who have not specimens in the show, will be admitted; and visitors already in, or members not having specimens there, must leave the room.

8. Rules for Preventing Confusion.—The show-room is open to receive specimens at eight o'clock in the morning, and specimens not brought into the room before a quarter-past ten will be refused; or if shown, must have the owner's name on them without a ticket, and cannot gain a prize.

Each specimen as it is brought is entered in the show book (on the white, red, or green page, according as it belongs to an ordinary member, a cottager, or a child) along with the owner's name and his number for that show; and a separate ticket, answering in colour and number to the entry in the show book, is fixed to every specimen brought by that member.

Every member must bring in all his specimens at one time, and must see that a ticket with his own number is put upon each of his specimens. Not more than two members with specimens are allowed in the room at the same time.

At the End of the Show.—No member must move or take away his own specimens until some person appointed by the committee give each specimen to its owner.

Children's prizes will be first paid and their specimens removed, and the room cleared of all children; nor after this, will children be allowed to come in again.

Cottagers' prizes are next paid, and their specimens given out, and those who have received their specimens, or have none in the show, must leave the room entirely. In coming at the last to take away their specimens, it is desirable, in order to avoid crowding, that members should come as much as possible in turns, or only a few at once. If a member wish friends or relations who have not paid for admission to help in removing specimens, those friends or relations must stay outside of the show-room outer gate.

The white ticket members will receive their prizes and specimens after the cottage members are done with.

Specimens of fruits, roots, or vegetables unclaimed at the end of the show will be sold for the benefit of the Society.

List of the Prizes offered.

Class I.—*For Fruits and Vegetables usually Grown for Food.*

The best specimens in their seasons of fruits, vegetables, roots, Mushrooms, salads, pot-herbs, or Beet and Mangel-Wurtzel leaves for use as Spinach.

The best specimens at the Spring show, of old Apples, old Onions, and old Potatoes.

The best collection of six or more various sorts of the same fruit, root, or vegetable.

Class II.—*For Open-air Flowers.*

The best single blossom of flower or shrub grown wholly in the open air.

The best mixed garden nosegay (without wild flowers.)

The best mixed nosegay of choice open-air flowers.

The best bunch, plate, or collection, of different sorts of the same open-air flower. According to the competition, there will be one prize among all the collections, or one for the best Roses, another for the best Pansies, &c.

Class III.—*For Greenhouse (or tender) Flowers.*

The best greenhouse (or tender) plant in blossom.

The best collection (in flower-pots) of six or more different sorts of the same such plant in blossom.

The best collection of different sorts of the same greenhouse (or tender) flower.

The best mixed nosegay of such flowers.

Class IV.—*For Bees; provided three or more Members are Bee-keepers.*

The earliest thriving swarm of bees.

The heaviest hive of honey (not less than 20 lbs.).

The greatest number of thriving swarms (not fewer than four), in one year.

The greatest weight of honey (not less than 50 lbs.), taken in one year.

The greatest weight of honey (not less than 1 lb. from one hive), taken in one year without destroying the bees.

Class V.—*For Allotments, Gardens, and Samples of Grain, &c.*

The Churchclose allotment which the churchwardens, after examination at three seasons, shall declare to be the cleanest, best-farmed, and best-cropped. [A first and second prize among allotments of members, and a first among allotments not occupied by members.] The prizes will be agricultural or gardening tools.

The best-farmed, best-cropped, and cleanest allotment in any other field in the parish, constantly let out in cottage allotments. [One prize.] A tool, as above.

The best samples of white grain (fifty ears each), grown on the allotments of members.

The best samples of Mangel-Wurtzel, Turnips, Peas, and Beans, being part of a real crop of at least one pole in extent, on a member's allotment.

The best crop of Turnips, not less than ten poles, grown after some other crop the same year, in any allotment.

The cottage garden of a member, which after inspection in summer and winter, shall have been found on the whole cleanest, neatest, best-stocked, and best-cropped. [One or two prizes, according to competition.]

Class VI.—*For Cottages.*

The cottage of a member (who has occupied it a full year, and is not above one quarter behind in his rent), which shall, during the previous six months, be found the cleanest, neatest, and most respectable-looking, inside and outside. [A first and second prize.] The prize will be some useful domestic article, chosen by the wife.

The cottage of one who is not a member, which answers the above conditions. [One prize, of the above kind.]

CLASS VII.—*For Children's Specimens.*

The best nosegay of wild-flowers only ; bunch of useful wild pot-herbs; plate of Brambles, Nuts, or other useful wild fruit; plate of Mushrooms; plate of Watercresses. These must have been gathered in the parish, by the children's own hands, and put together by themselves. N.B.—No prize will be given to grown-up members for any such specimens, except for Mushrooms.

The best single blossom of an open-air flower; mixed garden nosegay, without any wild flowers ; nosegay of different sorts of one flower; tender or house flower in a flower-pot; plate of small fruit. [All these, and the trees or plants on which they grew, must be really the children's own property, reared by their own hands, or grown three months in their own possession, or on their own spot of garden-ground. What is grown in the family garden, or should properly belong to a family garden, cannot be shown as children's specimens.]

Any member may offer for sale at the show any specimen which is really his own, by marking on it the words "for sale," and the lowest price intended to be taken. If it is not shown also for a prize, he shall mark on it his name. Specimens sold shall have the purchaser's name marked on them, but must not be removed, without leave of the managers, until after the show. Specimens not belonging to members cannot be shown for any purpose whatever.

White ticket members, who return their prizes, may choose at the Society's cost, from among the flower plants shown for sale, a plant, in testimony of their prizes, and of the obligation they confer on the Society by relieving its funds.

Cottagers and children—that is, red ticket and green ticket members, who shall gain at any one show, six or more first prizes, shall, if the funds allow, receive a small order, according to the value of their prizes, to buy at the Society's cost, a plant from any other member.

Plants or flowers, granted as above, may be shown for prizes at the next show, provided they have not already gained their former owner a prize in the same year.

Cottage members, who leave their prizes towards purchasing bees, shall receive 2*s.* beyond their prizes, when they amount to within that sum of the price of a stock.

PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

ERIA EXTINCTORIA (Extinguisher-spurred Eria). *Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monandria.—A pigmy, leafless Orchid. Native of Burmah. Flowers white with pink blotch. —(*Bot. Mag.*, *t.* 5910.)

PASSIFLORA CINNABARINA (Scarlet Passion-Flower). *Nat. ord.*, Passifloreæ. *Linn.*, Monadelphia Pentandria.—Native of Australia. Greenhouse scarlet-flowered climber.—(*Ibid.*, *t.* 5911.)

MILLA CAPITATA (Capitate Milla). *Nat. ord.*, Liliaceæ. *Linn.*, Hexandria Monogynia.—Native of California. Flowers purplish blue.—(*Ibid.*, *t.* 5912)

RHYNCHOSIA CHRYSOCIAS (Golden-flowered Rhynchosia). *Nat. ord.*, Leguminosæ. *Linn.*, Diadelphia Decandria.—Native of the Cape of Good Hope. A beautiful yellow-flowered climber. (*Ibid.*, *t.* 5913).

ARISÆMA CONCINNUM (Handsome Arisæma). *Nat. ord.*, Aroideæ. *Linn.*, Monœcia Polyandria.—Native of the Sikkim Himalaya. Female spathe green; male white and purple streaked.—(*Ibid.*, *t.* 5914.)

GREVILLEA MACROSTYLIS (Long-styled Grevillea). *Nat. ord.*, Proteaceæ. *Linn.*, Tetrandria Monogynia.—A valuable compact addition to our hardwooded Australian plants. Flowers crimson.—(*Ibid.*, *t.* 5915.)

DENDROBIUM CHRYSOTIS.—"This beautiful plant was flowered by Messrs. Brooke & Co., of Manchester, for the first time in this country in September last. It is a beautiful stove epiphyte, somewhat resembling Dendrobium fimbriatum oculatum (the so-called D. Paxtoni of gardens), but differing in the much more deeply-cut fringe of the lip, in having on the disc of the lip two dark blotches instead of one, and more particularly in bearing its flowers on the yet leafy stems, the flowers of D. fimbriatum appearing on stems which have become ripened and leafless. It was imported from Assam. The stems are slender, rod-like, 3 feet to 4 feet long, bearing thin, oblong-acute, sessile leaves, while the large showy flowers form drooping spikes 6 inches to 9 inches long, and are of a bright orange-yellow colour, with two dark spots on the disc of the lip. The sepals and petals are ligulate, narrower than in D. fimbriatum, while the lip is more rhomboid, edged with a beautiful deep moss-like fringe. When exhibited in September last, at South Kensington, it obtained the award of a first-class certificate."—(*Florist and Pomologist*, 3 s., iv., 145.)

LARGE MUSHROOM.—The growth of Mushrooms has been remarkable here (Bromsgrove), and doubtless elsewhere too. The first large one I gathered I had the curiosity to measure; it was 10½ inches in diameter, 5½ inches high, and weighed 1 lb. 2 ozs. I have since gathered many as large and larger.—ARTHUR RYLAND.

NEW EDIBLE ROOTS.

BOTANICALLY speaking, the term root, as applied to many of our esculents, is incorrect. That most common and indispensable of our so-called root crops, the Potato, is really a tuber, or fleshy underground stem, the "eyes" being the buds from whence spring the branches or young plants. We have, however, elected to include under the above head of roots all those underground productions botanically known as tubers, and of these there are many that would appear worthy of persevering efforts at cultivation in this country as articles of food. When we consider what the Potato is like in its native country of Chili—a waxy tuber not larger than a Walnut, and when we see what a system of culture has done, and that in comparatively modern times, to bring this little tuber to its present perfection, we are led to think that a similar agency, if properly and patiently conducted, might result in giving us some new esculents, not absolutely to displace our old and well-tried friend the Potato, but to supply the deficiencies, when such arise in the Potato crops, as well as to act in honourable rivalry with it.

Knowing, then, how much we are indebted to Chili for giving us the Potato, we will direct our attention to some other products of the South American continent; and first may be mentioned the Ullucus tuberosa, a little twining or prostrate plant, belonging to the natural order Basellaceæ, and known to the natives as *oca-quina*. These plants are largely cultivated in Bolivia and the Andes of Peru for the sake of the tubers, which are scarcely so large as a Walnut, are of a yellowish colour, and are in appearance not unlike small Potatoes; they are produced underground at the ends of long thread-like branches. Like the native Chilian Potatoes, they are waxy, and if not sufficiently cooked, stick to the teeth like gum or glue. The natives cook them in a precisely similar manner to the true Potato, by exposing them for three or four nights to the atmosphere in an elevated situation, occasionally throwing water upon them, so that they become frozen, after which they are placed in the sun to dry; the final result is a starchy and palatable tuber, instead of a waxy one with an earthy flavour. These tubers have been grown in England, but have never, to our knowledge, been subjected to a system of cultural experiments.

Oxalis crenata, native of Peru, and O. tuberosa, native of Bolivia, are both cultivated in their native countries for the sake of their tubers, which in O. crenata are small, the average weight of each being about 2 ozs.; and a single plant is said to produce about ½ lb. weight of them. In O. tuberosa they are about the size of a large marble, and have much the appearance of little immature Potatoes. The tubers of both species, indeed the entire plants, have an acid flavour, owing to the presence of oxalic acid; this objectionable flavour, however, disappears in the process of cooking, the acid principle being converted into saccharine matter, and the tubers becoming floury. O. crenata has been grown in this country, and was, at one time, recommended as a substitute for the Potato. How far cultivation might increase the size of the tubers, and improve their quality, has not been proved; but it is beyond doubt that some good result might be attained. A Mexican species (O. Deppei) produces fleshy fusiform roots of moderate size, which are edible. Arracacha esculenta is another South American tuberous plant. In habit it is similar to the Hemlock, to which it is botanically allied. The roots are large, and divided into fleshy lobes, about the size of an ordinary Carrot. It is cultivated in the cooler mountain regions of Northern South America, where the roots form a regular article of food; and when boiled, they are said to have a combined flavour of a Chestnut and a Parsnip. The plants thrive in their native country, where the mean temperature of the warmest month is 62°, and of the coldest month 57°. It was, therefore, at one time thought that they might be cultivated advantageously in the South of England and in some parts of Ireland. They might, perhaps, be satisfactorily grown in some of our colonies.

Amongst tuberous plants of North America used for food, the Apios tuberosa is worthy of notice. It is a twining plant, belonging to the Pea family, and grows in hedges and bushes on the mountains from Pennsylvania to Carolina. The tubers are small, but are produced in large quantities, and are very mealy; the plants grow well in England in ordinary garden soil, and can be increased almost indefinitely by separating the tubers.

The Prairie Turnip (Psoralea esculenta), also a leguminous plant, is a native of N.W. America, where the large tuberous

roots are eaten either raw or boiled, and constitute a large proportion of the food of the natives. The tuber has a dark-brown skin, and is said to have an insipid taste. The plant has been introduced into our hothouses. The Sweet Potato (Batatas edulis) and the Yam (Dioscorea, sp.) are not altogether unknown in England; indeed the first-named was introduced as a delicacy long before the Potato itself, and has frequently been confounded with it by the earlier writers. At the present time the plants are largely cultivated in most tropical and subtropical countries; several varieties are known, some producing very large tubers. They have an agreeable, sweetish taste, and are very nutritive, containing more flesh-forming matters than the common Potato. The Sweet Potato is sometimes seen in this country, but it should be more generally introduced and used as an esculent. The Yam is likewise occasionally brought from the West Indies, and though not often used with us, it is too well known to need description.

Having drawn attention to a few of the tuberous-rooted plants of foreign countries, some of which have been before recommended, and others of which appear to us likely to prove useful, were they submitted to a series of careful and patient experiments in cultivation, we will, before concluding our subject, point out one or two European and British plants as examples of what may be found amongst our own indigenous vegetation. The Parsnip Chervil (Chærophyllum bulbosum) is common in France, and has been known to gardeners in this country since 1726, while some attention has been given to its culture as an esculent. The root is similar in form and size to a small Dutch Carrot, and is outwardly of a grey colour, with a white mealy interior. When boiled the flavour somewhat resembles that of the Potato; it is wholesome and nutritive, and has been recommended for cultivation with us as a vegetable. In the Hebrides the roots of the Goose-weed or Silver-weed (Potentilla anserina) are not unfrequently collected by the people in times of scarcity, and boiled or roasted for food. The roots of the Bistort (Polygonum Bistorta), though containing a large quantity of tannin, and consequently very astringent and bitter, when raw, are, after being steeped in water and roasted, edible and nutritious. In Russia and Siberia they are much used when there is a scarcity of bread.

We do not mean to imply that all the plants here mentioned are suitable either for cultivation or use as food plants in this country. We have described a few of the most likely, and referred to others, to show that the resources, either by culture or by a system of commerce, are unlimited.—John R. Jackson, A.L.S.—(*Food Journal.*)

THE CHESTNUT TREE OF MOUNT ETNA.

The traveller in Sicily will recollect the little village of Giarre, about half way between Messina and Catania; and since the opening of the railway between these cities, with a station at no great distance from its principal street. On the seaside below the town is the shipping port of Riposto, and between Riposto and Giarre lies a fertile plain, rich in Olive and vineyards. Giarre itself has not much to boast of, except perhaps it might do so of the glorious views to be seen from the slight elevation on which it stands. One long principal street, a large plain chapel, a very second-rate inn, and then there is nothing more to be said of the village. It is, however, the nearest town with an inn to the famous giant Chestnut tree of Mount Etna, and as such is visited by tourists. This fine old tree grows in the Bosco or woody region close above the town and on the slope of Mount Etna. A narrow, steep road, gradually ascending, leads from Giarre to La Macchia; the broad bed of a river now (in the end of May) rolling down nought but clouds of dust, is passed, and the lava beds formed by the eruptions of 1689 and 1735 are traversed, and at last S. Alfio is reached. This village is about four and a half miles from Giarre, and from it a very fine view of Etna is obtained. The mountain, however, from this side looks low and by no means as imposing as when seen from the sea. A little beyond S. Alfio the road turns to the left, still leading upwards, until all of a sudden the giant tree breaks upon the view, the road itself running through its very midst. It stands about 4000 feet above the sea level, and it requires a good three and a half hours to walk to it from Giarre.

The Chestnut tree of Mount Etna.

It has been calculated that this tree is about one thousand years of age. It is a tree, therefore, old enough to have its early history lost in myth; but still it has its story; and this story tells us that long ago a certain Queen of Arsgon was passing by this way, when, from the effects of the weather, she and her suite, which consisted of one hundred mounted persons, took shelter under the shadow of its trunk and boughs, and so to this day and from this fact it is known as the Castagno di Cento Cavalli. This story is said to be generally believed, and, at any rate, does not appear to have been much discussed. Not so the tree; and very many opinions may be quoted, all more or less differing as to its age and size. Some believe, or have believed, that the tree was as large as the story tells us it was, that the interior of the vast trunk has since then decayed away; leaving a number of separate pieces, each large enough to form a big tree, which pieces are covered with bark only on their outer surface. Others assert that there were here several large trees, more or less joined together, and demonstrate on the pieces of these trees still standing the barky layers surrounding the whole of their stems.

Not very long ago there were still four pieces standing, each of them of the dimensions of a very large tree. In the space surrounded by these pieces stood a hut, in which the annual crop of Chestnut fruit was stored. One of these trees, or portions of the tree, has since disappeared. The hut has now been removed, and the road, sufficiently wide to allow of a carriage, runs between the remaining pieces and over the ground on which the hut was built. As you approach, one large piece of the tree is to the left-hand side of the road, and two larger pieces are to the right. It is very probable that many of the pieces believed to have belonged to the one original vast stem, were really stems themselves of independent trees, and such would appear to be the case with the large trunk to the left of the present roadway. But there is a strong probability that the two immense pieces to the right of the road were at one time united, and that they form part of the original tree. The annexed woodcut is from a photograph of these pieces. Both of them are deeply hollowed out. The base of the trunk to the right of the woodcut is very much decayed away, and several men could shelter in it; and the portions of the stems seen on looking at the picture are devoid of true bark. If these two portions once formed a single stem, then, indeed, though it might not have thrown a shadow sufficiently large to shade a hundred horsemen, yet it must have been a very giant among all the forest trees Even now, in its decadence, the three

stems are objects of sufficient interest to lead us to ask for them the reader's attention.—E. P. W.—(*Nature.*)

NEW EDITION.

The New Method of Growing Fruit. By the Rev. JOHN FOUNTAYNE. Third Edition, much enlarged. "Journal of Horticulture" Office.

FROM the fact that this pamphlet of Mr. Fountayne's has reached a third and enlarged edition, it would appear that his new method of growing fruit by a "combination of vinery, orchard house, and conservatory, by which Grapes, stone fruit, and flowers may be grown together in perfection in the same house," has met with a considerable amount of favour with the public. We have seen the house erected by Mr. Fountayne in the Royal Horticultural Society's garden at Chiswick, where every attention has been given to it by Mr. Barron, and we can affirm that under his management there is not only a house of healthy and unusually vigorous Vines, but a moving platform of fruit trees in pots, which would do credit to any establishment. Those who wish to see this new system of Mr. Fountayne's in full operation should pay a visit to the Society's garden at Chiswick.

WHY AND HOW A CABBAGE HEADS.

ALL plants have an aptitude and inherent capacity for storing up supplies of plant-food for future use. Among the annuals the growth is so rapid that this tendency is not so perceptible. The biennials and perennials show it in various ways; sometimes it is in the thickened root, sometimes in the rhizome, the bulb, or the tuber, but oftenest in the buds. Preparation being thus made for the future, there is a period of rest more or less extended; then follows a rapid growth—inflorescence, maturing of the seed, and exhaustion. Among the perennial and woody plants this is done towards autumn in the form of buds, and it is here I find the explanation of the Cabbage-heading process.

A bud as it stands in winter on the tree, with its compact folds of leaves and shortened axis, is only a small head; and a Cabbage head is only a large bud with compact leaves and shortened axis, resting for a period and accumulating starch and other plant-food for the supply of the flowering process and ripening of seeds. It is perhaps a universal law in all vegetation which is prolonged for any time, that the collecting and storing-up of plant-food takes place preparatory to the exhaustive process of maturing seeds. The Turnip, Beet, &c., store theirs in the root; the Cauliflower in the flower-stems; some do it in the thickened leaves, but the most common mode is by buds.

The Cabbage, after growing for a certain period, begins to form its "bud," and, as in other cases, there is a shortening of the axis of growth so as to compress into the bud the embryo of the future inflorescence. Starchy matter accumulates, and other peculiar compounds are elaborated, the leaves become blanched by exclusion from light, and it becomes a hard solid bud. After a certain period of rest a new growth commences, the axis elongates rapidly, inflorescence takes place, and as the process goes on the leaves become green from exposure to light, and finally flaccid and exhausted. The same process takes place in spring time in the bursting of every bud, and the rapid growth and elongation of the axis. The bud and the "head" are the same process taking place under different conditions of growth.—(*American Gardener's Monthly*)

"HOE YOUR OWN ROW" is our only reply to "A YOUNG GARDENER" who writes complaining, "The foreman gives me harder work than to the other two, and I know that I could do the lighter jobs better than they."

"If you want to have riches,
And want to have friends,
Don't trample the mosses down,
And look for the ends;
But always remember,
Wherever you go,
The wisdom of practising
Hoe your own row!

"A good many workers
We've known in our time—
Some builders of houses,
Some builders of rhyme!
And they that were prospered,
Were prospered, we know,
By the intent and meaning of
Hoe your own row!

"We've known, too, a good many
Idlers who said,
'I've a right to my living,
The world owes me bread!'
A *right*, lazy lubber!
A thousand times No!
'Tis his, and his only,
Who hoes his own row."

NOTES AND GLEANINGS.

THE Rev. B. T. Lowne, M.R.C.S., read a paper at the meeting of the Society of Biblical Archæology, July 4th, on THE FLORA OF PALESTINE. He considered that it comprised eight distinct elements, four of the dominant existing floras of Southern Europe, Russian Asia, North Africa, and that of Arabia and North-western India. Each of these floras was stated to occupy a distinct region of the country. Interspersed with these are found numerous examples of plants belonging to palæarctic Europe, constituting its fifth element. The Arctic flora of Hermon and Lebanon constitutes the sixth. Mr. Lowne thought further that the Cedars of the Lebanon and the Papyrus of the Jordan lakes were the remnants of two ancient and almost extinct floras belonging to two distinct geological periods. Mr. James Collins read a paper ON THE GUMS, PERFUMES, AND RESINS MENTIONED IN THE BIBLE, particularly pointing out the fact that few of them were indigenous to Palestine, and that many have been wrongly named by the Greek and later botanists. In the course of his observations Mr. Collins detailed the characteristic differences between the true and false Balm of Gilead, Ladanum, Sandal-wood, &c., and the greater or less efficacy of their medicinal properties. Mr. Lowne and Mr. Collins brought for exhibition a large number of mounted specimens, and a complete collection of gums, perfumes, &c., to illustrate their respective papers.—(*Nature.*)

WORK FOR THE WEEK.

KITCHEN GARDEN.

LET as large a piece of ground as can be spared be thoroughly trenched and heavily dressed with manure, to receive the latest crop of *Cauliflowers*, which must be planted without delay. This crop will prove the most useful of the season, and with care in taking up the heads when ready, and hanging them in a dry shed, it may be made to afford a supply from the end of October till January. The Walcheren *Broccoli* or Cauliflower is considered the best for this purpose, as, in fact, it is for all other plantings; it grows more compact, its foliage affords better protection to the head than that of the other sorts, being of a more cup-like habit, and it does not open so soon when hung up. Make a plantation of Grange's Broccoli to succeed the above. Make a good sowing of *Lettuces* now for autumn use, as also of *Endive* and *small Salads*. Care must be bestowed on gathering and drying the various sorts of *Herbs* in request by the family; choose a dry day, pull or cut them just as the bloom begins to expand, and spread them thinly in a dry shed, which is preferable to drying them in the sun; when dry they can be tied in convenient bundles and hung in their winter quarters. Stake the late crops of *Peas* with care, and in the case of the Victoria Pea stop the shoots when as high as the stakes. Pay general attention to all advancing crops, stirring the surface of the soil, and earthing-up such as require it. Pinch the points out of shoots of *Tomatoes*, and keep them properly nailed up.

FRUIT GARDEN.

Strawberry plantations which are to stand to bear another crop must have superfluous runners cut away between the rows, and all weeds carefully removed, but on no account let any of the foliage be cut away at this season, as is sometimes practised. A more improper mode of culture cannot be conceived than that of cutting off every leaf to the earth as soon as the plants have done bearing. Net Morello Cherries to preserve them for autumn use. Currants and Gooseberries should have all the watery, useless shoots thinned out.

FLOWER GARDEN.

Attend to greenhouse plants now placed out of doors. See that worms do not effect an entry into the pots and close the drainage; attend to the routine of tying, stopping, and other details. Pinks and Cloves may now be layered, and a stock of cuttings of Scarlet Geraniums put in. It is the fashion in most gardens of the present day to introduce rusticwork to a great extent for seats, arbours, flower baskets, &c. I question the propriety of using bark and rods for vases. I always wish

to see them covered with flowers, but I can gaze with lasting delight upon the classic form of a Warwick or other elegant-shaped vase, which heightens, by contrast, the beauty of the flowers which it contains.

GREENHOUSE AND CONSERVATORY.

The Camellia plants that are now out of doors should be liberally washed with the engine, using clear water. The soil should be examined in due time to discover its actual state and that of the roots. Those that require it should be surfaced with good, healthy, rough soil, charcoal, flints or rubbly stones, removing all unkindly soil about the edge of the pots or tubs. The buds of the early-flowering plants should be thinned in due time, and in doing this it is necessary to take care to choose for blossoming only the most healthy, strong, and prominent buds. The conservatory will now be principally occupied with the border specimens and a few of the choicest stove and greenhouse plants, with an occasional contribution from the Orchid house, because, as the flower garden should now be gay, it is less necessary to crowd flowers into this house; therefore trust rather to rarity and superior cultivation for exciting attention at this season than to glaring masses of common plants. The specimens in the borders must be attended to with water, and a good soaking of liquid manure in a clear and weak state will now be very beneficial. Climbers must also be neatly trained, and every part of the plant houses, vases, &c., be kept as clean as possible. Give plenty of air both night and day, but if the house contain many tender stove plants shut it up for an hour in the evening. Many of the stove plants in some establishments will now be occupying the greenhouse while the regular occupants are in the open air; but as many greenhouse plants, such as Eriostemons, Chorozema Henchmanni, Boronias of various kinds, and late-blooming Croweas, require the aid of a little heat to insure their making a good growth, they may be kept in the house with the stove plants, regulating the temperature so as to be supportable to all plants. Keep a moist atmosphere, especially towards the evening, and shut up for an hour or two about the time the sun leaves the house. The greenhouse specimens in the open air will also require attention. Pimelea spectabilis must be cut in pretty closely. Dillwynias will require to have the straggling shoots cut in, especially such as clavata, rudis, and juniperina. Chorozemas must also be shortened back, and Daviesia latifolia should have the old blooming wood removed to encourage the young growth as much as possible. Boronia serrulata and pinnata should be stopped boldly back, and be kept in gentle heat to start them into full growth. Keep a look-out for mildew, and as prevention is better than cure, dust them occasionally with sulphur after syringing them. Plants of Aphelexis of all kinds, the flowers of which are beginning to fade, must be attended to, cutting the flower stems close off at the base, and stopping the leading branches if the plants are growing loosely. When the plants begin to make fresh growth encourage them with a little manure water, and the same may be done with all the plants previously noticed under this head.

STOVE.

As many of the principal plants of this house will now be in the conservatory, advantage must be taken of their absence to encourage the subjects for winter blooming, especially such as Justicias, Eranthemums, Begonias, Aphelandras, Euphorbias, &c.; and a batch of Achimenes picta and Gesnera zebrina must be started for the same purpose. Plants of Stephanotis done blooming, must be set in the full sun and in an airy place to ripen the wood; and Clerodendron splendens and late plants of the other kinds must also be encouraged. Rondeletia speciosa is an excellent winter plant where sufficient heat can be afforded; and Torenia asiatica and Pentas carnea, especially the latter, are desirable plants. If not already done, Luculia gratissima and Pinciana must be placed in a sheltered corner in the open air to ripen the wood and set the bloom. Never mind the leaves turning brown, they will soon recover that when placed in heat again. Maintain a moist growing heat with plenty of air, and guard against insects.

STORE PIT.

See well to the selection of good varieties of Primula sinensis as they show flower; encourage their growth by giving them a liberal shift as soon as they are proved. See that the Cinerarias and Calceolarias are standing in a cool shady place. The Calceolarias should be top-dressed as soon as they begin to make growth, to encourage the young stock. A quantity of stocky plants of the scarlet and variegated Geraniums, Heliotropes, late-struck Fuchsias, &c., should be duly encouraged for late autumn flowering.

FORCING FRAMES.

These structures should now be producing for the conservatory and mixed greenhouse an abundance of well-grown Cockscombs, Balsams, Globe Amaranths, Thunbergias, Gloxinias, Achimenes, and a host of other articles. The growth of specimen Fuchsias should be encouraged, also that of late-flowering Pelargoniums, the Japan Lilies, Erythrina Crista-galli, chimney Campanulas, &c.; these will maintain a display. Guernsey Lilies should be ordered in due time; these are remarkably pretty and useful autumn-flowering plants.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

WE planted out beds of *Celery* after nipping out every sucker, and let the most forward beds alone, except one little piece which had been assisted for a time with glass, and which has been earthed up. We have no faith in earthing-up our first main crops more than three weeks or so before we send the produce to table. We feel a little mortified at one thing—part of a bed had glass protection for a time, and when planted out the plants at one end stood 4 inches higher than the rest of the bed which had been less kindly treated. Of course, we meant the most forward part to come in first, but now on looking over the bed it would be difficult to say which is the forward part, and which the later, the whole looks so uniform. Both were treated alike, and planted out after due and full exposure. How is it, then, that the last have so quickly overtaken the first? There are many of these simple matters which the most clever among us cannot understand, and it is a good point gained when we can confess our ignorance, for the feeling of ignorance is the first step that must be taken in acquiring true knowledge. We have for many years noticed that Celery always grows most rapidly some eight weeks after the sun has passed his greatest altitude, and even then when a partial shade is given. Our beds run north and south, and have had a flickering shade hitherto, from heavily-cropped early Peas on the top of the ridges between the beds. These Peas are of no use to us now for the best table, but they come in for pea soup, and the servants' hall, where they are liked quite as well when they have a little "bone in them," and are not individually so easily squeezed into a jelly between the thumb and finger. We shall leave them standing a little longer, and as long as they can help us in the above direction, as we especially value them for the little shade they give.

We staked the last sowing but one of *Peas*, and run cords beyond the sticks along the sides of luxuriant rows, which were likely to be broken, and which, perhaps, would not have been so had if the sticks had been put in as we wished—a rather difficult thing to get done, for there will ever be a disposition to bring the sticks together in a sharp point at the top, or even to make them cross each other, instead of each row of sticks standing \ / obliquely outwards from the row, like an open vessel—___/ In the latter case the Peas have room within the sticks to ramble, and yet are protected. In the other they come out beyond the sticks, and are liable to be snapped and broken by every brisk breeze. May we ask some of our readers, "How they gather Pea pods fit for use?" Some time ago we felt as if our hair would have lifted off our hat at seeing a man making the pods come to him by a pull of sheer strength, thus either loosening or pulling up the Pea plant, and doing his best to prevent the other younger pods on the stem swelling and maturing. There is no quicker, safer, nor more workmanlike way of gathering Peas than taking a small sharp-pointed knife in your hand, and nipping the stalk of the pod in two between the blade and thumb. This will cause no injury whatever to the Pea plant.

We sowed Lettuce, Endive, Turnips, Radishes, and Onions for salads, and as successions. A little more thinning was also deemed necessary in the main spring beds of Onions, especially the later-sown. If we had the chance we would now mulch and manure Asparagus, so as to have it strong next year.

FRUIT GARDEN.

We have layered many Strawberry runners, and will most likely prick out a lot in beds, to be raised for potting and planting. We have had some fine Strawberries out of doors, but not at all equal in quantity to the crop in most years. Our Peach trees out of doors are becoming worse and worse, the wood giving way even after the fruit had swelled considerably. We attribute it entirely to the keen frost of winter, the sudden

changes, and the long periods of damp foggy weather. Some persons who have escaped this infliction are rather priding themselves that the favourable result is owing to their own good and peculiar management. This may be the case, though we believe that in the long run it will be found that the peculiar management had nothing to do with it. We have lived to see fine Peach trees that one would have thought nothing could injure next to killed after they had borne heavy crops for years, and this has taken place three times at least on trees on the same wall. The age of the tree often makes it more liable to such serious inflictions. We recollect a case in point. A friend who had planted his trees three years after ours were planted, as much as insinuated that we had ourselves to blame for the state of the trees. Two years afterwards what were his fine trees previously were made a wreck, and then he, too, had cause for grumbling.

ORNAMENTAL DEPARTMENT.

Put walks and lawns in good order, and hope the former will give little more trouble for the season. Hollyhocks, Dahlias, and strong herbaceous plants need to be well supported, and, all things considered, one stake is better than many, the side shoots being looped easily, so as to hang gracefully without anything like a bundle being made. Some plants are tied so stiffly as to resemble the lint on the rock or distaff our grandmothers used for their spinning-wheels. We should like to see a general sweeping reprobation passed on a forest of sticks, and whittled ones too, for supporting separately any twig and shoot of a plant.

Out of doors here our flower beds would have been nowhere during the strong winds and battering rains but for the little bushy twigs and sticks stuck in and hidden slightly among Calceolarias, Geraniums, Ageratums, &c. These bushy sticks hold the plants firmly, and yet not so firmly but that they yield a little to the wind without the chance of breaking or of being pulled up by the roots, and now there is scarcely the point of a twig to be seen.

No time should be lost in having little shoots of Pinks, Mule Pinks of various colours, Pansies, and many herbaceous plants inserted as cuttings. They will do well in sandy soil in a shady place; better still if the soil has been moved to the depth of 4 inches, rough stuff placed beneath, and covered with fresh sandy soil, with sand covering the mere surface, and then a hand-light placed over the cuttings. These will strike more rapidly still if a little bottom heat be given to them.—R. F.

TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

Books (*A Reader*).—For instruction in vegetable physiology, purchase Henfrey's "Introductory Lectures on Botany," edited by Dr. Masters. The price is 12s., we believe. (*J. K.*).—There is no separate work on the culture of the genus Erica. There is a long descriptive list of the species and their culture in the "Cottage Gardeners' Dictionary," under the titles Erica and Heaths.

Weights of Pine Apples (*Amicus*).—At the Royal Horticultural Society's Exhibition at Nottingham, the heaviest Pine Apple was a Providence. It weighed 11 lbs. 5 ozs. The heaviest Queen Pine Apple weighed 5¾ lbs.

Covent Garden Monopolists (*R. G. M.*).—Your case is one of private debt, and not suitable for publication, as you have your remedy in the County Court.

Jerusalem Artichokes (*H. S.*).—If you want good-sized tubers you must let the plants grow.

Bouquet (*A. G.*).—Bouquet is a French word, synonymous with nosegay. It may be either large or small, for holding in the hand or for decorating a vase. In whatever sense the English word nosegay is used, the same is applicable to bouquet.

Japanese Honeysuckle (*A. Ryland*).—The Tartarian Honeysuckle belongs to the Xylosteum or Fly Honeysuckle section of the genus Lonicera, and is, consequently, quite distinct from the Japanese.

Berberis (*C. H. P.*).—It is impossible to name it without having a specimen.

Staging for a Greenhouse (*A Constant Subscriber*).—To make the most of such a house as yours with the least possible trouble, we would have a level platform of 2 feet in front, a pathway of 2½ feet, and a raised stage behind. It would be more picturesque to have four circular stages with raised shelves, terminating in a place for a large plant, separate these all round by 2-feet paths, and have a narrow shelf in front, and a narrow border behind for plants to cover the back wall; but this will involve a much larger outlay, and on the whole will not give more plants justice.

Royal Botanic Society's Show (*G. W.*).—The Messrs. Brown you refer to, were of 24, High Street, Marylebone, who had a number of garden engines, tools, &c., and an improved step chair.

Painting Greenhouse Stage (*Welshpool*).—We should paint it light brown.

Seedling Pansies (*A. Clark*).—They are the darkest we have seen. Send plants to the Floral Committee of the Royal Horticultural Society.

Over-luxuriant Shoots of Roses (*H.*).—You do not say whether the "gourmend Rose shoots" are of Roses on a Briar stock, or on a Manetti stock. If it is on a Briar and the head requires no regulation, cut the gourmands away altogether, or, if you please, you may greatly shorten them, and cause them to break and flower. If the Roses are on a Manetti stock, let the gourmands grow to the full height of the tree, and then cut off the tops. They will make good repairers of the bush next year, and probably bloom this autumn.—W. F. Radclyffe.

Dark Rose for a Conservatory (*J. Mackenzie*).—I cannot name any red Rose that gives single flower buds. The best two for your purpose, and both beautiful, are Charles Lefebvre and Duc de Cazes; the former is rich, variable, crimson; and the latter purple crimson. There is no crimson Rose equal to Charles Lefebvre. Maurice Bernardin, vermilion, is also one of the very best Roses.—W. F. Radclyffe.

Surfaces of Rose Leaves Eaten (*R. S.*).—There are two insects which thus attack the foliage of the Rose—the Antler Saw-fly, and the Saw-fly of the Rose. You will see in Cranston's "Rose Book" a description of both. I believe that the leaves sent have been attacked by the latter. He recommends syringing with a solution of soot and quicklime, also shaking the trees over a cloth. The caterpillar of the Antler is bright green with hairs, and with a dark line down the back, and one much darker on each side. It is half an inch long. The Rose Saw-fly caterpillar is also half an inch long with orange-coloured head, with small black spots on each side. It descends into the earth in the autumn. It causes the leaves to look as if scorched by fire. I advise the sufferer to fork fresh-slaked lime into the ground beneath the trees in the autumn.—W. F. Radclyffe.

Pelargonium and Geranium (*Thaumastes*).—We fully sympathise with you now you find that flowers you have always called Geraniums are named Pelargoniums, and we persist, botanically heretically, in calling all the Scarlet and other bedding-out varieties Geraniums. Yet there is no doubt that there is a great difference between the Storksbill and Cranesbill—they constitute two different genera; but there is no very great difference between what are commonly called the Geraniums used for bedding purposes, and the Pelargoniums used for in-door flowering. Both are Pelargoniums. Pelargonium is characterised by having usually seven stamens, and unequal-sized petals; Geranium, by having ten stamens, and equal-sized petals; and Erodium, by having five fertile anthers usually. The three genera are nearly allied.

Stems of Vines Decaying (*G. B.*).—As the stems of your Vines have the appearance of being bruised and bitten, probably some animal has done it. We have seen fungus destroy the roots and permanently injure the Vine. It attacked the roots of one Vine in our early house last year, and again this season. We removed all roots affected, and every portion of mould having any trace of spawn, replacing with fresh loam. All Grape-growers should look out for the attack of the new Vine disease; it is first discerned by the appearance of warty excrescences on the back of the leaves. We had it in a house of new Vines last year, and were obliged to root out every plant and burn it, at the same time removing all the soil half a mile from the garden. We have seen no trace of the terrible enemy since. In the case of this disease the Vines die off suddenly, and on examining the roots they will all be found to be dead. Imperfect drainage may be the cause of your Vines being unhealthy. If the border is all right, the roots healthy to the extremities, and the leaves kept free from red spider and mildew, they will recover.

Grapes Diseased (*P. J.*).—It is a clear case of Oïdium, and your only remedy is flowers of sulphur, not pounded sulphur.

Grapes in a Ground Vinery (*J. D.*).—From your description we consider your Grapes are spotted, and that chiefly arises from the supply of sap being deficient, and in your case we think it is caused by the coldness of the ground rendering the root-action sluggish. The evil might have been prevented if you had given air proportionate to the heat, or a slight shade for a few hours in the early part of the day. In this dull, cloudless season there is no necessity to whiten the glass, nor, indeed, at any season for Grapes in a ground vinery, as success mainly depends on the sun heat. Your crop is too heavy; that is why the berries are so small. Remove the smallest berries; they are stoneless, and will not swell off well. All the bunches should have been thinned as soon as they were fairly set. You will have small berries, and wedged together, and if the season should continue cold and wet the bunches may lose more berries from decay than you need have removed in thinning. We would thin even yet, and tie up the shoulders of the bunches.

Rhubarb for Early Spring Use (*Idem*).—It is now too late to sow seed, and that mode of raising the plants is not desirable for your purpose We advise you to procure roots, and to plant them in November or early in spring, but November is preferable. The ground should be deeply trenched and heavily manured, well mixing the manure with the soil as the trenching proceeds. The soil should be light rather than heavy, and the situation open. Plant in rows 4 feet apart, and place the plants 3 feet apart in the rows. Cover the crown about 2 inches. After planting mulch the ground with stable litter. All the care the plants will need the first year is to keep them clear of weeds, and water them as often as you like after the middle of May with liquid manure up to the close of July. No leaves ought to be removed the first year, but in the second the supply will be good. For market purposes we advise Royal Albert, Linnæus, and Victoria, which last comes in about a fortnight after the others. If you only require one kind for early use, we should prefer Linnæus.

Dr. Hogg and President Strawberries—Forming Cordons—Wall-trained Peach Trees—Plums Cracking (*Amateur*).—The roundish high-coloured fruit is President, the other is Dr. Hogg. Cut one-third of the length of your cordon trees, and pinch the point out of the growing shoot once or twice in a season. After the wood of the side shoots is somewhat firm, cut them over at the fourth or fifth leaf; pinch back all after-growths. Your Plums cracking and the gum exuding from them, is the result of the wet season; it generally happens immediately after "stoning," when the fruit is rapidly increasing in size. We have Rivers's Early with scarcely a sound fruit on the tree. You can do nothing to your tree to prevent it. In a dry season they would be all right. Do not allow the shoots of your Peach and Nectarine trees to run into and cross

each other; cut back to a young shoot, and lay it in in place of the older wood which has been removed.

SEEDLING GERANIUM (*A. S.*).—The petals were all shed; colour good, but not differing from others; truss large. If it were much differing from many old varieties, which it is not, no one could decide on its merits without seeing the plant.

SELECT GERANIUMS FOR EXHIBITION (*E. H.*).—*Zonals:* Lord Derby, Dr. Lindley, Mrs. William Paul, Christine, Monsieur Rendatler, The Bride. *Nosegays:* Lady Constance Grosvenor, Chilwell Beauty, International, Rose Rendatler, Duchess, Duchess of Sutherland. *Golden Tricolors:* Sophia Dumaresque, Sir Robert Napier, Lady Cullum, Lucy Grieve, Prince of Wales, Sophia Cusack. *Silver Tricolors:* Italia Unita, Charming Bride, Impératrice Eugénie, Prince Silverwings, Mrs. John Clutton, Lass o' Gowrie.

SELECT VERBENAS FOR POT CULTURE (*Idem*).—G. P. Tye, Mrs. Pochin, Polly Perkins, Shakespeare, Beauty of Kent, Magnificens, Black Prince, Lælia, King of Verbenas, Nemesis, Conspicuous, Ace of Trumps, White Queen, Miss Wimsett, Mrs. Reynolds Hole, Florence Fiddian, Fanny Martin, Mrs. Eckford, Ont-and-Outer, Shirley Hibberd, Achievement, Spot, Mauve Queen, Anatole Leroy.

SELECT HERBACEOUS PLANTS (*Flds.*).—Agrostemma Coronaria flore-pleno, crimson; Alyssum saxatile compactum, yellow; Anemone apennina, blue; A. hortensis fulgens, scarlet; Anomatheca cruenta, salmon with red spots; Aquilegia fragrans, lemon; Arabis albida, white; Aubrietia deltoidea grandiflora, blush lilac; Aster alpinus, lilac purple; Betonica grandiflora, purple; Campanula aggregata, blue; Cheiranthus Marshalli; Colchicum alpinum, rosy purple; Convallaria rosea, rosy red; Cyclamen neapolitanum, red; Cynoglossum spenninum, blue; Delphinium Belladonna; Dianthus cruentus, deep scarlet; D. floribundus, pink; D. puugens, white; Dodecatheon Meadia, lilac; Draba aizoides, yellow; Erigeron speciosus, bluish purple and yellow; Helleborus niger, white; Hepatica angulosa, blue; H. triloba, blue and red, double and single varieties; Hypericum calycinum, yellow; Iberis saxatilis, white; Iris altica, yellow, veined purple; I. reticulata, blue purple, blotched yellow; Lilium tenuifolium, scarlet; Narcissus juncifolius, yellow; Œnothera macrocarpa, yellow; Œ. taraxacifolia, white; Orobus vernus, purple; Phlox verna, rose; Pulmonaria angustifolia rubra, purplish red; Scilla sibirica, blue; Sempervivum californicum, fine for edging, leaves in green rosettes, tipped brown; Silene alpestris, white; S. Schafta, rosy pink; Sisyrinchium grandiflorum, purple; Symphytum caucasicum, blue; Trollius asiaticus, orange yellow; T. europæus, lemon; T. napellifolius, yellow; and Zephyranthes candidus, white. These do not exceed 18 inches in height, though soil, &c., make considerable differences.

WHAT ARE ORNAMENTAL PLANTS? (*H. F. S.*).—Your prize list is so vaguely worded that under the title "Ornamental Plants," any plants and all plants, tender or hardy, that are cultivated for ornament in the stove, greenhouse, or garden, may be exhibited in that class. The committee, perhaps, intended the class for ornamental-foliaged plants; if so, cannot they publish that?

VEGETABLE MARROW FRUIT NOT SWELLING (*One in Trouble*).—We should attribute the non-setting of the fruit to want of heat, but it may arise from want of light, as you say the plants are at the back of a Cucumber frame. They cannot have too much sun, nor, when the weather is hot, too copious supplies of water. We should fertilise the flowers, and unless the weather be very much warmer than it has been with us for the past eight weeks, no water will be required. Watering in dull cold weather does no good to such plants as these. Warmth is, we think, what is needed, and with it we have no doubt your plants will do well; without it they will probably fail.

TOMATO SEED SAVING (*C. P.*)—Let the fruit remain on the plant until thoroughly ripe, then gather and lay it on a shelf in a warm house for a few days; afterwards squeeze the fruit into a saucer of water, and with the hand wash the pulp from the seed. The seeds will sink. Run off the water clear of the pulp, place the seed in the sun to dry, and when thoroughly dried store it in paper in a cool dry place.

COMPOSITION FOR REDUCING THE LIGHT IN A GREENHOUSE (*Subscriber*).—All things considered we do not think anything equal to whitening and skimmed milk, bringing the whitening to the consistency of thin paint, and applying it with a thin brush to the inside of the roof. There is no wash that you could apply to the outside that would be permanent, if it must resist rains, but the above wash applied to the inside would not be liable to be washed off, and in autumn could be removed and light admitted to the plants. In winter greenhouse plants cannot have too much light. Could you not have a few rapid-growing climbers? We have our greenhouse-roof covered partially with Tacsonias Van-Volxemi and molliesima, and Passifloras Comte Nesselrode, cærulea racemosa rubra, and Countess Guiglini, and they are now in fine bloom, and will continue so until autumn. They have a fine appearance, very different from any artificial shading.

JASMINE NOT FLOWERING (*E. M. M.*).—You do not say on what aspect your plant is situated, but we presume it is south, which is best, though it succeeds tolerably well on both east and west aspects. The soil, we suppose, is well drained, and light rather than heavy. Train in the shoots required for extension at about 9 inches apart, and from them will proceed side or foreshoots, which usually flower when 12 inches long, but if they do not, stop them at the second or third pair of leaves. The stopping will concentrate the forces of the plant on the bases of the shoots, and from the light and air admitted the wood will ripen with greater certainty, and on that depends the next year's flowering. In the case of flowering shoots we consider it well to cut them back after flowering to within a few inches of their base. Between the main shoots you may lay in any vigorous shoots, but it is best to avoid overcrowding, and in winter, or rather early in spring, cut-in all the side or front shoots to within an inch of their base, and shorten the extension shoots to the firm wood. In very dry, hot weather, when the plant is flowering, give a good soaking of water once or twice a-week.

RHODODENDRON CASTING ITS LEAVES (*Idem*).—The casting of the leaves may be due to dryness at the root, arising from the plant being raised considerably above the surrounding level. In this case we would lower the plant, still keeping the collar rather high, and give a mulching of cow dung. It would have been well not to have allowed the leafless plant to flower. Remove the seed vessels; allowing them to remain weakens the growth considerably. Water freely in dry weather. Do not cut the plant back unless leggy, and if it is so, not until next April. Lower the plant in September.

BOX EDGING FAILING (*T. C.*).—We cannot account for the Box edging failing, but we attribute it to soil, or, perhaps, you reside in a smoky district. Without data we can form no opinion. On gravelly soil we have found it do well.

EXHIBITION STANDS FOR ROSES AND DAHLIAS (*W. H. M.*).—The boxes may be made of inch deal, and the length for twenty-four Roses should be 4 feet; for eighteen, 3 feet; for twelve, 2 feet 2 inches; and for six, 1 foot 6 inches. Breadth in every case 1 foot 6 inches; height at back, 6 inches; height in front, 4 inches. We extract the foregoing dimensions from the excellent "Book about the Rose," by the Rev. S. Reynolds Hole, who adds:—"The covers, being 7½ inches in depth at the back, and 5 inches in front, 4 feet 1 inch in length, 1 foot 7 inches in breadth, and having a narrow beading within the four sides, half an inch from the bottom of the lid, overlap the boxes, leaving ample room for the Roses, and are secured for travelling by stout leather straps. Within the boxes some exhibitors have holes pierced at equal distances on a uniform surface of wood; but as Roses differ in size it is more convenient to have the facility of placing them where we please, and for this purpose it is desirable to have strong laths ⅜-inch in depth, and 1⅞ inch in width, extending the length of the box. These laths should be six in number, and should be nailed on two strong pieces of wood, crossing the box one at each end, 2 inches below the surface. The upper and lower laths should be fixed one-eighth of an inch within the box, and the four remaining so arranged that there will be five interstices 1¼ inch in width—three for the Roses and two merely to reduce the weight. There will be a space of 1¼ inch between the laths and the upper edge of the box, to be filled as follows: Cover the laths with sheets of brown paper, two deep, and cut to fit the box, and upon these place the best moss you can obtain. The Roses are placed in tubes of zinc 4½ inches in length, 2 inches wide at the top, gradually tapering until they become 1 inch in width at the centre, the tops being moveable. This top is taken off, and the stalk of the flower being brought through until the Rose is held securely, it is replaced upon the tubes, previously filled with pure rain water." A stand for twenty-four blooms of Dahlias should be 48 inches in length, by 18 inches in width from front to back. It should be raised at the back 7 inches, and 3½ inches in front. The holes should form three lines of eight each, and should be 6 inches from centre to centre, and 3 inches from the outside. The metal tube for the water may be 1 inch in diameter, and should fit into the holes of the board; the wooden tube to receive the bloom, and fitting into the metal tube, should rise 1⅞ inch above the board. The colour of the board should be a lively bright green. The dimensions of a stand for twelve blooms of Dahlias can be easily deduced from the foregoing. Such a box as that just described would be suitable for Roses if shown in single trusses; for single blooms of Roses the dimensions would be almost too large, while for bunches of three trusses it would scarcely afford sufficient space. For Roses the tubes may be fastened to the bottom of the box, not using a board as in the case of Dahlias, and the spaces filled up with fresh green moss. The most suitable colour for a box for Roses is dark green. You may use several boxes in showing a number of trusses or blooms. Chapman's cases are excellent, especially where flowers have to be sent to a distance. The Verbenas you may set up according to taste.

CUCUMBERS NOT SWELLING (*A Beginner*).—The cause of the fruit going off is deficient root-action, and in your case we think a deficiency of bottom heat. The bottom heat ought to be confined beneath the bed or border in which the plants are grown, or how can you maintain the required bottom heat of 70° to 75°? We would confine the heat by a 4½-inch wall, with openings at every 3 feet, and sliding doors to let out any excess of heat. What you call the "old sow" is usually called the woodlouse. The best plan of destroying these insects is to place a little hay loosely round the sides of the structures they infest, and in the morning pour boiling water down the walls a little above the hay. This, of course, kills all it touches, and repeated several times will entirely destroy them, though they will in time reappear. When this method cannot be adopted on account of the boiling water being likely to injure plants, your best plan will be to place a boiled potato wrapped lightly in a little hay in a small flower-pot, and put the pot on its side where the woodlice are troublesome. This trap should be examined every morning, and the woodlice secreted in the hay shaken into boiling water. A number of traps of this kind, put down every night and examined in the morning, will soon thin their numbers. (*W. H. C.*).—Your Cucumbers are suffering in the same way as those referred to in the preceding answer.

PIT FOR WINTERING BEDDING PLANTS (*A Cottage Gardener*).—Without a path inside we consider 6 feet quite wide enough. When wider, pits are not handy for the examination of the plants. The front we would have 1 foot 4 inches, and the back 2 feet 2 inches high. By all means construct the sides and ends of inch boards, with a 1½-inch cavity for sawdust. The boards will need to be bolted together, putting in a piece of wood about 1½ inch wide at every 3 feet, and the depth of the frame, the bolts passing through it. The boards should be tongued and grooved. The side ventilators we consider unnecessary. We should think in the warm position you describe bedding plants of the hardier kinds may safely be wintered. You may work a propagating frame in a window facing the north, removing the plants, when struck, to your frame. The earliest time you can remove Apple and Pear trees is as soon as the majority of their leaves have fallen. Against the gable of your house due south, and with the kitchen flue running up the centre we think an Apricot would be the most profitable fruit tree. Grapes might do, but in these days of cheap glass out-door Grapes bring but little. Espiran and Royal Muscadine are good for walls. Plant in March, and 4 feet apart, training up with two rods.

COOL-HOUSE MANAGEMENT (*Subscriber*).—For the next two months you will need no higher temperature than that afforded by the sun. You must give as much air as possible on fine days, and a little all night, even in dull weather. No fire will be needed, unless the temperature, from a continuance of cold weather, fall below 55°, and then you may give a little fire heat to have the temperature at from 50° to 55° at night when the fruit is ripening; but except in very dull and cold weather no harm will result from not employing fire heat. If the days are hot and the nights cold the fruit will ripen perfectly, though the temperature at night may fall below 50°. From 50° to 55° is the night temperature most suitable, and on that a rise of 10° on dull days, and from 15° to 20° or more on bright days will suit. The main point is to give abundance of air.

GLAZING (*Subscriber in Berks*).—You should refer to the page and volume. When grooves are used for glazing they should be deeper and wider than the glass. If the glass is to be fixed from beneath firmly in the groove without putty, slips of indiarubber, or narrow list, or soft cord, may be used with advantage. Were it not for getting the squares out easily, even if we had grooves, we would use putty; but the other modes admit of the squares being removed with little trouble. Tight grooves would be dangerous, and therefore the groove must depend on the size of the glass. One disadvantage in fixing glass in grooves with putty is, that when a square is broken there is a difficulty in taking the broken pieces out of the grooves.

GAS-HEATING (*An Amateur*).—We cannot say more as to gas-heating than is contained in No. 841. We are rather shy in giving the size of boiler and pipe for gas-heating, so much depends on the management. Were the case our own, in such a small house as 18 feet by 12, we would have two or three of the small iron stoves now so common, place an argand burner beneath or in each, and take a quarter-inch pipe from the top through the roof If you could have a small stokehole outside, the best mode would be to take a small flue beneath a tiled floor. The expense of erecting such a house would depend on its height, whether it was to be a span-roof or a lean-to, or whether the glass was to be fixed in sashes, or merely laid on rafter sash bars, and large squares were used orchard-house fashion. For such work our advertising columns supply the lowest prices.

BOILER NOT WORKING WELL (*A. S.*).—We consider the removal of the boiler desirable, constructing a shed for it. Take care to have the boiler low enough, so that the water may have a gentle rise from the top of the boiler to the termination of the flow pipe, not allowing any depression until the highest point be gained. There you should have in each compartment or house an air pipe, which should be somewhat longer or higher than the feeding cistern. By all means heat the pits with hot water. It is well to have pipes on the same level to insure regularity of heating, but they may be on different levels, only you will need to attend more to the valves.

NAMES OF FRUITS (*R. B. L.*).—No. 1, Sir Joseph Paxton; 2, Comte de Paris; 3, President. Remove the suckers from your standard Roses.

NAMES OF PLANTS (*Barnes*).—Spiræa ariæfolia. (*G. Bayliss*).—Davallia pyxidata, one of the Hare's-foot Ferns. (*Castro*).—Stove plant, Tradescantia discolor. Fern, Nephrodium pubescens. (*Mrs. St. John*).—It is a very charming white Lily wort, Hyacinthus princeps of Baker, a plant of recent introduction from South Africa, and only quite lately named. A figure will be found in Mr. W. W. Saunders's publication, the "Refugium Botanicum," at plate 175. Of course it is very widely separated from all the more commonly known Hyacinths. (*Rhubarb*).—You are unreasonable to expect us to name twenty-two specimens. We adhere to our rule to name not more than six. 1, Lastrea Filix-mas; 6, Nephrolepis exaltata; 7, Scolopendrium vulgare crispum; 8, Athyrium Filix-fœmina; 10, Lastrea Filix-mas, polydactyla; 18, Blechnum Spicant. (*J. G., Brighton*).—We well remember your Rose specimens arriving, but what became of them we cannot tell. We apologise for this, and beg you will send us other specimens. (*J. W.*).—Both your names are correct. 1, Alsine tenuifolia; 2, Lotus tenuis, which, by-the-by, is only a narrow-leaved variety of L corniculatus. (*G. B. A.*).—Euonymus japonicus. It is a greenhouse plant, and succeeds well under ordinary greenhouse treatment. It blooms at the present season of the year, but its flowers have nothing whatever to recommend them, being green, small, and insignificant. (*Peter Paterson*).—Santoona chamæcyparissus. (*G. J.*).—The Ransom or Ramps, Allium ursinum. Pronounce Lichen as if it were spelt "Li-ken." (*E. M. T.*).—Begonia fuchsioides. (*Clare*).—1, Anagallis tenella, Bog Pimpernel; 2, Euphrasia officinalis, Eyebright; 3, Thymus Serpyllum, wild Thyme. (*J. F. Cranswick*).—1, Cystopteris fragilis, var. dentata; 2, C. fragilis, typical state; 3, Platyloma rotundifolia; 4, Nephrodium decursivo-pinnatum. We offer you the following list from which to select; all are "pretty little gems." All will do well in a greenhouse, and several of them are hardy:—Ceterach officinarum; Asplenium Trichomanes, var. incisum; Lastrea glabella, or L. decomposita, var. glabella; Notholæna flava, or chrysophylla; N. nivea—both of these are sometimes referred to the genus Cincinalis; Microlepia (or Davallia) novæ-zelandiæ; Asplenium fontanum; Cheilanthes hirta, C. marantæ, or C. alabamensis; Cystopteris fragilis and its var. dentata; Asplenium viride and A. lanceolatum; Myriopteris (or Cheilanthes) myriophylla or lendigera; Aleuropteris mexicana; Lastrea rigida; Polypodium calcareum, and P. Phegopteris. We should add some of the dwarfer varieties of Lady Fern. (*A Young Gardener*).—1 and 2 are both Alyssum saxatile; No. 1 in a younger and more robust condition, blooming in its prime; No. 2 from an older seed-bearing plant, less vigorous than the other. 3, Erysimum odoratum; 4, Corydalis lutea. (*For-an-Darroch*).—Your Grass is an exceptional condition, and is somewhat intermediate between Festuca duriuscula and F. pratensis. We incline to think it is the former, as its spikelets are few-flowered and the outer palea is clearly awned, but it is somewhat more robust than ordinary for this species. F. pratensis should have more flowers in a spikelet and have no awns; hence we discard the idea of referring your specimen to this species, although a figure in "Fl. Danica" (t. 1323), agrees well with your plant and is authentic. The other names you suggest we decidedly repudiate. F. racemosa is a myth, and was never applied except to a South American plant from Quito. (*H. M. J.*).—Kœlreuteria paniculata. (*Mrs. Pollock*).—Centranthus ruber.

POULTRY, BEE, AND PIGEON CHRONICLE.

A WILTSHIRE POULTRY SHOW.

WITH reference to the remarks of "WILTSHIRE RECTOR" as to a proposed show of Poultry and Pigeons for Wiltshire, I must ask you to allow me to supplement his remarks and say, Our object is to establish a show to be held annually either in Devizes, or some other town in the county which can provide a suitable building; but to enable us to do this we must to a very great extent depend upon the help we receive from exhibitors out of the county, as, unfortunately, there are very few in it. I may add that there will be a meeting of the provisional committee the first Thursday in August to decide whether the show takes place or not, and this must entirely depend upon the promises of support we then receive; so that I would urge upon all those disposed to help us to communicate with the Honorary Secretary, Mr. John Marsh, 42, Market Place, Devizes, as early as possible. Any suggestions made to him will receive the best consideration of the committee. In the meantime our Honorary Secretary or any of the committee will be glad to give any information which may be required. Any gentlemen feeling disposed to attend the meeting, to be held at Mr. Marsh's office on Thursday, August 3rd, at eleven o'clock, will be gladly welcomed.—ONE OF THE COMMITTEE.

THE ANTWERP, THE VOLANT OR WHITE EYE, AND THE ANTWERP CARRIER PIGEONS.

I ASSUME the Antwerp proper to be the Dove-faced, silver-eyed Pigeon, of mealy or strawberry plumage and reddish-barred wings, notorious for its almost irreclaimable wild nature—a Rock Dove, except in colour of feather. And on this assumption I conceive the Volant or White Eye to be the offspring of the Antwerp proper and the Belgian or French White House Dove, so showing the silvery white eye and mealy or strawberry-tinted white plumage of its parents, and displaying the power of flight of the Antwerp proper, accompanied by the domesticated habits of the House Dove, and thus bred on for enduring high flights over home, in which it is becoming famous. And I assume the Antwerp Carrier to be of the Antwerp proper and the Dragoon descent, and also bred on, but for homing flights, for which its inherent propensities, thus derived, amply qualify this Pigeon. Some of these birds are ash, some blue, and others chequered, the ash showing the mealy or strawberry caste of the Antwerp proper, with the reddish bars of its wings; and some have the silvery eye of the Antwerp proper, and others the Dragoon orange or fiery-red eye. Therefore "mongrels" and cousins are the Volant or White Eye and the Antwerp Carrier, as I assume and conceive them to be; but no purist can apply the epithet "mongrel" to either bird in its ordinary signification.—READER.

[We sent your note to the same authority as before, and he replies:—"My opinion of the origin of the 'White-eyed' Pigeons, as described by 'READER,' is published on page 450 of your last volume. His peculiar questions are most difficult to understand, and almost impossible to reply to in a satisfactory manner. 'Antwerps proper,' as he calls them, originally took their name from the city in Belgium bearing that name. They are, as I have before said, esteemed almost exclusively for, and judged by, their aërial performances as *voyageurs*, and therefore they are of all sizes, colours, and shapes, ranging from the Carrier to the Owl, from which two varieties they have most of them unquestionably sprung. These birds are very numerous, very cheap, and very ugly; the latter point, like that of the bull dog, is often regarded as a sure indication of high quality. However, the Belgians have, in their endeavours to utilise the instinct of the Pigeon, profited greatly, as well as amused themselves, and have also by the supposed admixture of the Carrier, Owl, and Barb, been the means of our obtaining the show Antwerp, now so greatly admired and earnestly sought after in England; and although the additional cross of the Barb may not have improved their flying properties, it has added greatly to their appearance as show birds. Their colours are Blues, Blue Chequers, Duns or Mealies, and Red Chequers. I have in my possession a Mealy hen, which has won ten prizes, flying from Paris to Brussels; she is a singular mixture of the Carrier, Owl, and Barb, and possesses the size, strength, and wart of the former, the sprightliness of the Owl, and the massive head of the Barb. I have upwards of a hundred Antwerps, and have kept them for years, won very many prizes in the show pen, and in a quiet way have tested their homing properties, and proved them good. All Pigeons may be termed 'Volants;' with any special breed of that name I am unacquainted."]

MOULTON POULTRY SHOW.

THIS Show, though a manifest improvement on those which have preceded it at the same place, was, no doubt, considerably injured by the show held the day before at Oundle, a large proportion of the birds having been entered for both meetings. The weather was ockily fine, though the early morning did not look at all promising. The best of

the classes was that for *Game* fowls, in which double the number of prizes could with justice have been awarded; a remarkably fine pen of Duckwings, the property of Mr. Boyes, of Beverley, won the cup. The *Cochins* and the *Spanish* were also very good, but were in both cases evidently much the worse for travelling. Many of the *Hamburghs* and *Bantams* were exceedingly good, and the first-prize pen of Spanish in the Selling class, was one of the cheapest we have seen for a long time.

There was an excellent show of *Pigeons*, in which Mr. Yardley was specially successful, being there with a strong entry of his best birds. We believe the financial success of the Show was most satisfactory, and a contemplated revision of next year's prize schedule will, doubtless, much increase the entries.

The following is the prize list:—

Dorkings (Grey).—1 and 2, J. Longland, Grendon.

Spanish.—1, J. Stephens, Walsall. 2, H. Yardley, Birmingham. *hc*, H. Thornycroft, Floore; H. F. Cooper, Walsall.

Game.—1 and Cup, W. Boyes, Beverley (Duckwings). 2, B. Cox, Moulton. *hc*, B. Cox; T. Hancock, Northampton; J. Fletcher, Stoneclough, near Manchester (3 pens).

Cochins.—1 and *hc*, H. Lloyd, jun., Handsworth, near Birmingham (Buffs). 2, J. Stephens, Walsall (Partridge).

Brahmas.—1, H. Yardley (Dark). 2, J. Bonser, Moulton (Light).

Hamburghs.—1, W. Bearpark, Ainderby Steaple. 2, J. Stephens. *hc*, B. Cox; Swallow & Chambers, Northampton.

Game Bantams.—1, H. Yardley. 2, B. Cox, Northampton. *Any Variety.*—1, H Yardley (Blacks). 2, W. Bearpark.

Selling Class.—1, W. Nottage, Northampton (Spanish). 2, J. Stephens (White Cochins). *hc*, J. Brown; H. Thompson; W. F. Checkley.

Ducks (Rouen).—1 and 2, B. Cox.

PIGEONS.

Carriers.—1, H. Yardley. 2, Martin & Owen, Kettering. *hc*, Swallow and Chambers; Higgins & Sassall, Northampton.

Pouters.—1, Martin & Owen. 2 and *c*, Higgins & Sassall. *hc*, W. Nottage (2); H. Yardley.

Owls.—1, H. Yardley. 2, W. Norby, Northampton. *c*, Martin & Owen.

Any other Variety.—1, W. Nottage. 2, H. Yardley. *hc*, Swallow and Chambers; Martin & Owen; Higgins & Sassall.

Any Variety Bred in 1871.—1, H. Yardley. 2, Swallow & Chambers. *hc*, Swallow & Chambers; W. Nottage. *c*, Martin & Owen.

Judge.—Mr. E. Hewitt, Sparkbrook, Birmingham.

OUNDLE POULTRY SHOW.

From the first institution of this poultry show it has been a most popular annual meeting, but, unfortunately, for several years on the days of exhibition the weather has been very unfavourable. We are glad, however, to say that this year, though at times during the day (July 12th), sharp showers caused some uneasiness to the managers, throughout the afternoon the attendance exceeded their most sanguine anticipations.

On the morning of opening some considerable delay arose from neglect on the part of the railway company in the delivery of the exhibition pens on the show ground, as agreed for at latest on the previous evening, although they had been confided to them for transit several days previously. These pens did not arrive on the ground until somewhere about eight in the morning, but a few willing exhibitors gave a helping hand; so indefatigable were they that the entrance of the public was not interfered with in any way. Surely railway companies, knowing well the urgency of the case, should make greater efforts to prevent delay in delivery, as the very stability of a show is placed in jeopardy by the non-fulfilment of these contracts with punctuality.

Looked upon as a whole the entries were quite equal to those of previous seasons; but it was the subject of general remark how suddenly, from the effects of the heavy rains, not a few of the very best pens of fowls were fast lapsing into deep moult. As usual, Messrs. Longland and Wood were keen opponents in the *Dorking* classes. Several prizes were taken away this year, however, in these classes by other exhibitors, the Rev. E. Bartrum's two pairs of Dorking pullets being very well shown. On the whole the *Game* fowls were not nearly so good as they usually are in this neighbourhood. A first-rate Brown Red cockerel, sent by Mr. B. Cox, of Moulton, as being a fowl of good promise, is worthy of special note. *Spanish* were throughout as well shown as any variety in the show; and the *Cochins*, as will be seen by referring to the prize list, comprised specimens from the yards of not a few of the most noted breeders. *Brahmas* were few and indifferent. The Golden-spangled *Hamburghs* were excellent, but chiefly overshown.

Pigeons competed, as by rule, in pens of threes, each pen to contain a different variety. The competition was unusually good, but several competitors placed themselves completely out of court by sending two or even more pens of the same breed. The roominess of the tents was a very favourable feature of the show, and met with the warm approbation of the visitors.

Dorkings.—*Cock.*—1 and 2, R. Wood, jun., Clapton. 3, J. Longland, Grendon. *Cockerel.*—1, Mrs. F. Stephens, Abbott's Ripton Hall. 2, J. Longland. *Hens.*—1, J. Longland. 2 and 3, R. Wood, jun. *Pullets.*—1 and 2, Rev. E. Bartrum, Great Berkhamstead.

Game Fowls.—*Cock.*—1, 2, and 3, S. Deacon, jun., Polebrook. *Cockerel.*—1, B. Cox, Moulton. 2, Brenthall & Kyte, Nottingham. *Hens.*—1 and 3, H. Lotan, Oundle. 2, B. Cox. *Pullets.*—1, Brenthall & Kyte. 2, S. Deacon, jun.

Spanish (Black).—*Cock.*—1, J. Stephens, Walsall. 2, J. F. Dixon, Cotgrave. 3, E. Smith, Oundle Rectory. *hc*, H. Thornycroft, Floore. *Hens.*—1, J. F. Dixon. 2, W. Woodhouse, King's Lynn. 3, W. R. Bull, Newport Pagnell. *hc*, J. Stephens; E. Smith (2). *c*, H. Thornycroft; G. Wyman, Peterborough; W. R. Bull. *Chickens.*—1, Withheld. 2, J. Stephens. 3, E. Goodliffe.

Cochin-Chinas.—*Cock.*—1 and 3, H. Lloyd, jun., Handsworth. 2, J. Stephens. *hc*, J. N. Beasley, Pittsford Hall; H. H. Bletsoe, Barnwell. *c*, H. H. Bletsoe; *c*, J. Watts. *Hens.*—1, J. Stephens. 2, H. Lloyd, jun. 3, H. H. Bletsoe. *hc*, W. F. Checkley, Moulton; J. N. Beasley; J. Watts. *Chickens.*—1 and 2, H. H. Bletsoe. 3, H. Phillips, Northampton. *c*, J. F. Loveridge, Newark; H. Lloyd, jun.

Brahmas.—1, H. Yardley, Birmingham. 2, W. Stevens, Northampton. 3, J. Watts.

Hamburghs.—*Gold and Silver-pencilled.*—1, W. R. Tickner, Ipswich. 2, E. Goodliffe. 3, W. Bearpark, Ainderby Steeple. *Gold and Silver-spangled.*—1, J. Stephens. 2, B. Cox, Northampton. 3, T. W. Swallow, Northampton.

Bantams.—*Game.*—1, L. Calcott, Oundle. 2, J. R. Marriett, Titchmarsh. *Any other Variety.*—1, H. Yardley. 2, J. Watts. *c*, H. Wyman, Ashton, Towcester.

Any other Variety.—1, H. Yardley. 2, J. R. Marriott. 3, W. Prentice, Aldwinckle.

Selling Class.—1, L. Calcott. 2, E. Smith. 3, Rev. A. Longhurst, Fotheringhay.

Geese.—1 and 2, S. Deacon, jun., Polebrook. *hc*, E. Goodliff (2).

Ducks.—*Aylesbury.*—1, H. H. Bletsoe. 2, S. Deacon, jun. *Rouen.*—1 and *c*, R. Wood, jun. 2, E. Goodliff. *Any other Variety.*—1, E. Smith. 2, E. Goodliff.

Turkeys.—1, M. Kew, Market Overton. 2, Mrs. G. F. Baker, Barnwell Mills. *hc*, J. A. W. Underwood, Warmington; J. Craig, Fotheringhay.

Pigeons.—1 and 2, H. Yardley (Almonds, Yellow Barbs, Black Carriers, Spots, White Owls, and White Pouters). *hc*, R. Andrew, Peterborough (White Pouters, Blue Owls, and Black Carriers).

Rabbits.—*Heaviest*—1, E. C. Sherard. 2, No competition. *Lop-eared.*—1, E. C. Sherard. 2, H. Ashby, Oundle. *Fancy variety.*—1, J. Clipston, Oundle. 2, W. H. Laxton, Oundle.

Mr. E. Hewitt, of Sparkbrook, Birmingham, was the Judge.

ECCLESHILL POULTRY SHOW.

This was held on the 15th inst.; although but recently instituted, and begun on a very small scale, it has attained a fair position among the annual gatherings of the West Riding of Yorkshire.

The Black Red *Game* were only of moderate quality, but the Brown Reds were considerably better; and in the "Any other variety" class we considered the second-prize pen much better than the first; both were Piles. The third prize was withheld. In single cocks the first was a very good Brown Red, but out of feather. The cup for Game was awarded to this bird. The *Spanish* were a very good class, and the birds in faultless condition; but both *Cochins* and *Brahmas* seemed to be showing the effects of the season, most of them exhibiting signs of moult. In both the Silver-spangled and Pencilled *Hamburghs* Mr. Beldon had the classes to himself, winning all the six prizes. The rest of the Hamburghs were also very fine in quality and condition for the time of year. In the "Variety" class Gold Polands were first, Silver second, and Crêve-Cœurs third. There was a class for chickens of any variety, but these were poor on the whole. Game *Bantams* were fair, the first-prize pen in Black Reds being birds of this season, and very promising in quality. Black Bantams were good, but the third prize was unaccountably withheld. The cup for Bantams was won by an unusually good pen of Whites. In the variety class for *Ducks*, the first were handsome Bahamas, and the second common Teals, but there was only one pen of the larger varieties.

Pigeons showed the greatest improvement both as regards numbers and quality, many of the best birds in the kingdom being shown, principally in consequence of the offer of two cups, one for the best pen, and the other for points, decided only by prize-taking. The first of these was won by Mr. Horner with a most exquisite pair of Almond Tumblers. The winner of the second was Mr. Taylor, of Huddersfield, with sixteen points against fourteen, by Mr. Lishman, the latter having gained four first prizes and one second, and the former two first and five second prizes; three points being allowed for a first, and two for a second prize. Carrier cocks were an extraordinary class. Both the winners were Blacks, the second superior in quality but out of feather. In hens the first was Black, and the second Dun. In Pouter cocks the first was a Blue Pied, 20 inches in feather, and 7 inches in limb; the second White, 18¾ inches in feather, and 6¾ inches in limb. This bird was in splendid condition and fine in girth. The best bird in the Pouter classes was the first-prize Blue hen, 18½ inches in feather, 7⅝ in limb, perfectly marked, and the show and style quite up to the taste of the most fastidious amateur. The second was a handsome Yellow, 18¾ inches in feather, and 6¾ inches in limb, the colour being of a superior order. There were several birds in both classes measuring well, but deficient in marking, and rantish in appearance. Short-faced Tumblers were next on the list. The winners were all Almonds, and the contest very close. In common Tumblers the first were Black Mottles, and the second Black Balds. Barbs were a good class. The first prize went to Duns, and the second to Blacks. Of English Owls there was a large show, the quality of head being excellent. Blues were first, and Silvers second; the hen in the latter pen possessing the best-formed rose we have seen of late. The first in Turbits were Yellows, perfect in form and colour, but rather larger than desirable; the second Blacks of good colour, but rather foul in thigh. Fantails were good throughout, the first being very small and delicate in appearance, and combining that fine nervous expression so rarely seen of late; the second were larger but good in tail and carriage. Both the winners in Jacobins were Red, the prize being closely contested. In Dragoons, the first were Reds of excellent colour, and the second Blues; there was also a capital pair in nest-feather. There was but one real Short-faced pair of Antwerps in the Show, and these were only half-moulted young ones, although the second were a nice pair of birds, but larger than the first. The class for Working Antwerps contained some excellent birds, most of them being of the true racing variety. In the "Variety" class, Mottled Trumpetere were first, and Porcelain Swallows second. The rest in the class were highly commended.

The first in *Rabbits* were nice Himalayans, and the second Angoras.

There was also a show of *Cage Birds*, but these did not show in great numbers, the time of year being inappropriate for this purpose, but there were some good birds, notably the first-prize Yellow Norwich, which was one blaze of colour, the second in that class being a good Belgian. The first in Buffs was a Belgian of good properties, and the second Norwich.

GAME.—*Black-breasted Red.*—1, C. Chaloner, Whitwell, Chesterfield. 2, W. Fell, Adwalton. 3, J. W. Thornton, Bradford. *Brown-breasted Red.*—1, Miss J. A. Aykroyd, Eccleshill. 2, J. Hodgson, Bradford. 3, F. Sales, Crowle. *Any other Variety.*—1, B. Jarvis, Mansfield. 2, F. Salea. 3, Withheld. *Any colour.* —*Cock.*—1 and Cup, G. F. Ward, Wrenbury, Nantwich. 2, C. Chaloner. 3, Withheld. *Hen.*—1, J. Fell. 2, C. Chaloner. 3, W. Spencer, Haworth.

SPANISH (Black).—1, T. C. & E. Newhitt, Epworth. 2, H. Beldon, Goitstock. Bingley. 3, J. J. Booth, Silsden, Leeds.

COCHIN-CHINA.—1, H. Lacy, Hebden Bridge. 2, J. Sichel, Timperley, Cheshire. 3, H. Beldon.

BRAHMA POOTRA.—1, Cup, and 2, H. Lacy. 3, H. Beldon.

HAMBURGHS.—*Silver-spangled.*—1, 2, and 3, H. Beldon. *Golden-spangled.*—1, J. Rollinson, Lindley, Otley. 2 and 3, H. Beldon. *Silver-pencilled.*—1, 2, and 3, H. Beldon. *Golden-pencilled.*—1 and 3, H. Beldon. 2, J. Rollinson. *Black.* —1, C. Sidgwick, Keighley. 2, H. Beldon. 3 J. Smith, Gilstead, Bingley.

ANY OTHER VARIETY EXCEPT BANTAMS.—1 and 3, H. Beldon. 2, J. Sichel.

ANY BREED.—*Chickens.*—1, C. Sidgwick. 2, J. Clayton, Allerton (Game). 3, W. H. Baxter, Idle (Cochins).

GAME BANTAMS.—*Black-breasted Red.*—1, W. F. Entwisle, Westfield, Cleckheaton. 2, W. Grice, Crosshouse, Bootle, Carnforth. 3, W. Adams, St. Clements, Ipswich. *Brown-breasted Red.*—1 and 2, W. F. Entwisle. 3, Withheld. *Any other Variety.*—1 and 2, W. F. Entwisle (Pilea and Duckwings). 3, J. Stabler, Driffield (Pilea). *Any colour.*—*Cock.*—1, W. F. Entwisle. 2, J. Blamires, Great Horton, Bradford. 3, Withheld.

BANTAMS.—*Black.*—1, S. & R. Ashton, Roe Cross, Mottram. 2, J. Walker, Halifax. 3, Withheld. *Any other Variety.*—1 and Cup, H. Beldon. 2, J. Sichel, Timperley (Pekin). 3, J. Watts, Hazlewell Hall (Japanese).

SELLING CLASS.—1, B. Jarvis, Mansfield. 2, H. Beldon (Game). 3, Frankland and Aspden, Church Hall, Accrington.

DUCKS.—*Aylesbury or Rouen.*—1, J. Newton, Silsden, Leeds (Rouen). *Any other Variety.*—1 and 3, W. Binns, Pudsey (Brahma and Brown Decoy). 2, S and R. Ashton (Carolina).

PIGEONS.

CARRIERS.—*Cock.*—1 and 2, G. J. Taylor, Fartown, Huddersfield. *hc*, J. C. Ord, London; E. Horner, Harewood, Leeds (2); J. Lishman, Bradford. *Hen.* —1 and 2, G. J. Taylor. *vhc*, E. Horner. *hc*, G. J. Taylor; E. Horner.

POUTERS.—*Cock.*—1, J. Lishman. 2, E. Horner. *hc*, H. Yardley, Birmingham; G. J. Taylor; J. Lishman. *Hen.*—1, J. Lishman. 2, G. J. Taylor. *hc*, G. J. Taylor; E. Horner; J. W. Cannan, Bradford.

TUMBLERS.—*Short-faced.*—1 and Cup, E. Horner. 2, G. J. Taylor. *vhc* F. Moore, Burnley. *hc*, H. Yardley; T. Waddington, Feniscowles. *c*, F. Moore; E. Horner. *Common.*—1, J. Lishman. 2, J. M. Braid, Cambridge. *hc*, J. Preston, Allerton, Bradford; J. Lishman.

BARBS.—1, E. Horner. 2, G. J. Taylor. *hc*, T. Waddington; E. Horner.

OWLS (English).—1 and 2. J. W. Cannan, Bradford. *hc*, J. Thresh, Bradford; J. Crosland, jun., Wakefield; W. H. Baxter.

TURBITS.—1, J. Lishman. 2, G. Roper, Croydon. *hc*, H. Yardley; G. J Taylor; H. G. Poole, Bradford; J. Lishman.

FANTAILS.—1, J. F. Loversidge, Newark, Notts. 2, T. Waddington. *vhc*, W H. Tomlinson, Newark-on-Trent. *hc*, H. Yardley; J. Lishman.

JACOBINS.—1, G. Roper. 2, W. H. Tomlinson. *hc*, G. J. Taylor; T. Waddington; J. W. Cannan.

DRAGOONS.—1, W. S. Stanhope, Eccleshill. 2, F. Graham, Birkenhead. *vhc*, W. H. Mitchell, Moseley, Birmingham. *hc*, T. Speight, Bradford; E. Horner.

ANTWERPS.—*Short-faced.*—1, J. Cundall, Copt Hewick, Ripon. 2, J. W Collinson, Halifax. *hc*, J. Jackson, Eccleshill. *c*, H. Yardley. *Working.*—1, W. Lund, Shipley. 2, E. Horner. *hc*, J. Cundale; J. Jackson; W. Lund D. Riddiough, jun., Bradford; J. Crosland, jun.; Clayton & Bairatow.

ANY OTHER VARIETY.—1, J. Cundale. 2, J. Lishman. (Whole class highly commended.)

SELLING CLASS.—1, F. Moore, Burnley (Tumblers). 2, H. Stanhope, Eccleshill. *hc*, T. Speight; E. Horner; J. Lishman.

Point Cup for Pigeons, G. J. Taylor.

CAGE BIRDS.

CANARIES.—*Clear Yellow.*—1, J. Shepherd, Bradford. 2, L. Belk, Dewsbury. *hc*, J. Whitaker, Great Horton; W. Heap, Queensgate, Bradford. *Clear Buff.* —1, J. Whitaker. 2, W. Heap, Bradford. *hc*, G. Gott, Calverley; J. Shepherd. *c*, Hutton & Fawcett, Baildon. *Even-marked.*—1, J. Shepherd. 2, L. Belk. *Any other Variety.*—1, J. Shepherd. 2, L. Belk (Ticked Belgian). *hc*, Hutton and Fawcett; W. Heap.

MULES.—1, T. Nowell, Baildon. 2, W. Heap. *hc*, J. Shepherd.

LARKS.—1, T. Barrett, Manningham. 2, J. Close.

BRITISH BIRDS (Any other variety).—1, W. Heap. 2, J. Shepherd.

FOREIGN BIRDS (Any other variety).—1, J. Shepherd. 2 and *c*, W. Heap.

RABBITS (Any variety).—1, J. Buckley, Bradford. 2, J. Preaton, Allerton. *hc*, J. Thwaites, Bradford.

JUDGES.—*Poultry:* Mr. C. W. Brierley, Rhodes House, Middleton; Mr. John Douglas, Clumber. *Pigeons, Rabbits, and Cage Birds:* Mr. E. Hutton, Pudsey.

CRYSTAL PALACE CAT SHOW.

A CAT Show? Yes, a veritable show of cats was held at the Crystal Palace, on the 13th inst., at which about 150 cats were present. Taking into consideration the large number of cats kept in London alone, the Directors of the Crystal Palace, from a suggestion of Mr. Harrison Weir, resolved to hold a Show, and the result far exceeded their most sanguine expectations. Early in the morning the visitors began to arrive, and up to the time of closing there was no cessation, nearly 20,000 persons striving to obtain a sight of the household pets, though many, unfortunately, were unable to do so owing to the cages having been arranged in a double line instead of a single, which would have afforded to the public a view of two sides of each cage instead of one, and thus distributed the pressure; but even the railway companies were taken by surprise as to the number of visitors, and hundreds of people were left behind at the different stations from want of room to carry them forward.

But to the Show. There was a hope that the famous Edinburgh cat would be sent, but the owner considered it too far. Yet one was there from South Bermondsey of a heavier weight—21¾ lbs. being nearly a pound more than the celebrated Scot. The next in weight was a black and white, which only turned the scale at 18¾ lbs. The Duke of Sutherland contributed a fine specimen of the British wild cat, genuine and rare. It was caught in a trap in Scotland, and had lost a part of its fore foot. Anything more savage than it could scarcely be imagined, for after many attempts were made to get it out of its travelling-den into the exhibition-cage, it was resolved to show it as it was, rather than risk the danger of its escape.

The white cats were well represented, and in the Long-hair class a very beautiful Angora with deep blue eyes was awarded the first prize. In the Short-hair class the two distinct kinds of white contended—viz., the yellow-white and grey-white, the former taking the first prize. The cat sent as a Tortoiseshell Tom was not, in reality a true tortoiseshell, the colour being of a grey tabby, yellow tabby, and white, instead of black, yellow, and red. The Judges only awarded a second prize to it. The long-haired cats were large, and some of them of very lovely colours, such as a very light fawn, light grey, deep black, dark brown, and other varieties. There, also, were the Manx cat with tiny tail, and the Crimean cat almost tailless; Indian cats of a rich uniform Rabbit-grey, sandy cats, and black cats, the first prize of the last colour being exceedingly brilliant. There, also, were a couple of Siamese cats, marked and of the same hue as the pug dog, and of light and delicate form; and there, also, were cats, four of which had double feet on the fore legs, and nearly so on the hind, and also many other novelties. In fact, the collection was well worthy of attention, and was, without doubt, a very great success, so much so, that the Crystal Palace Company intend to have another Show in the autumn.

One would scarcely believe that the public would be so wrong as to enter black cats in a white class, white cats in a tabby class, and black and white in a tabby class, yet such was the case, and many were the disqualifications in consequence. Such carelessness, or thoughtlessness, seems to us almost wilful.

The Judges were the Rev. G. Camming Macdonna, the well-known breeder and owner of the celebrated St. Bernard dog, Mr. John Jenner Weir, F.L.S., and Mr. Harrison Weir, F.R.H.S., who exhibited a very beautiful blue tabby (not for competition), called "The Old Lady," aged twelve years, which attracted considerable attention on account of her fine quality of colour.—OLD TOM.

THE SEXES OF BEES' EGGS.

IN resuming my pen—which expression must, however, be taken metaphorically rather than literally, since I dictate these lines from a recumbent position, in faltering accents, and I fear me in somewhat uncertain grammar, to be transcribed by the active and untiring fingers of the loved and loving one, to whose watchful care and unwearying tenderness I owe it, under God's providence, that I have at length emerged from a prolonged sojourn in the dark valley of the shadow of death into the twilight of a tardy and uncertain improvement, which, however, I trust may yet prove to be the actual dawn of permanent recovery—I say, then, that in resuming my pen after very many months of painful and enforced abstinence from writing on my favourite subject, I cannot refrain from thanking "R. S.," Mr. S. Bevan Fox, and many other friends and apiarian contributors to "our Journal," whose able and interesting communications have so well replaced my own humble contributions on bee subjects. I owe also my best thanks to "B. & W." and numerous apiarian friends and correspondents who have either publicly or privately expressed their warm sympathy and kind wishes. "Sweet," it is said, "are the uses of adversity," and surely one of the sweetest of these is that kindly phase of human nature which in times of suffering and affliction knits together more firmly the bonds of family affection, converts acquaintances into friends, and elicits expressions of heartfelt sympathy from distant and almost unknown correspondents, who might heretofore have been well deemed ignorant of everything regarding us save the bare fact of our existence. To all these, and proud am I to say that there are many such, I would also tender my warmest acknowledgments and heartfelt thanks.

Having said thus much on matters personal to myself, I now turn to the main subject of this communication. Whilst fully agreeing with "B. & W.," that nothing of this kind can be proved beyond a doubt by a single experiment, and that it is possible that a queen may on very rare occasions deposit, as if by mistake, a worker egg in a drone cell, in the same manner as isolated drone eggs are sometimes found to have been laid in worker cells, I am bound to say that no such instance has ever presented itself to my notice, and that I believe that if ever it occurs it is so rare a case that, so long as Mr. Pettigrew avoids transition cells, and experiments only with such eggs as are deposited in those of the full drone size, he may spend the remainder of his life in the pursuit without succeeding in developing a single queen bee from any egg which he may find placed in a drone cell. The fact that all eggs laid in these cells will produce drones and nothing else, is moreover fully esta-

blished by a witness whose evidence Mr. Pettigrew himself will scarcely venture to set aside. Mr. Quinby, the eminent and practical American apiarian, whose opinions on this point originally coincided with his own, and from whose "Mysteries of Bee-keeping," several passages in support of his peculiar views are quoted in Mr. Pettigrew's "Handy-Book of Bees" (which passages are, however, nearly all either entirely omitted or materially modified in the later edition of Mr. Quinby's book), has since made the identical experiment which has been unsuccessfully attempted by Mr. Pettigrew, and he now declares that the attempt to rear queens from eggs deposited in drone cells has so utterly failed with himself and others, that he and they have "no longer any hope of success." He adds, moreover, that "the reason undoubtedly is, that eggs laid in drone cells are not impregnated."

It seems to me, however, that the most conclusive proof of the inability of bees to reverse the sex of an egg after it has once been deposited in the comb, is afforded by those rare and singular instances in which, as if by mistake and by some default in their usually unerring instincts, they without interference on the part of the apiarian, attempt of their own mere motion to raise a queen from a drone egg or grub. Only one such instance has ever come under my own direct observation, and this was recorded at the time in the pages of "our Journal." Writing at a distance from home, I am, unfortunately, unable to refer to back numbers, but the circumstances were briefly these:—Some years ago, in the course of my then numerous queen-rearing operations, I formed a small swarm or nucleus, to which I gave a comb containing worker-brood in all stages, for the purpose of enabling the bees to raise a queen. It happened, moreover, that this comb consisted partly of drone cells, in which also were eggs and young brood, and at the point of junction between the drone and worker cells was formed the only royal cradle which the bees attempted to construct, but which nevertheless appeared to progress favourably, and was in due course completed. Watching assiduously as I did the development of all my royal protegées, I found that in this case fruition was unduly delayed, and becoming impatient I cut open the royal cell on the twenty-fourth day after the formation of the swarm, when instead of the expected defunct princess, I found to my astonishment a living and fully-developed drone apparently on the point of making his first appearance on life's stage.

Now, surely in this case Mr. Pettigrew's attempted experiment must be deemed to have been—however unwittingly, and, perhaps, because unwittingly—most fully and fairly carried out. The bees themselves selected a male egg or grub, lavished upon it all the extra material, food, and attention requisite for the development of a queen, and succeeded in producing only an ordinary drone!—A Devonshire Bee-keeper.

It is quite apparent from several productions on bees which appear from time to time in the Journal, and which are written by gentlemen of long experience and practical acquaintance with apiculture, who have bestowed, no doubt, not a little time and study in elucidating the natural history and economy of bees, and, moreover, have given the results of that experience and study to the public—it is quite apparent, notwithstanding all this, that the "bee hive" is still, confessedly by them, a great "mystery" unexplored—full of anomalies and unsolved problems, as knotty as Mr. Pettigrew's queenless hive studded over with fictitious royal cells, of which we have an account in your last number.

As to the physiological mystery which appertains to the sexual character of the eggs when they first leave the ovaries of the queen, and the change which science asserts some only undergo on their passage outwards, I shall at present say nothing; but that each egg is "sexually" fixed as deposited in the cell by the queen is a fact beyond all contradiction. Mr. Pettigrew's experiment is a most conclusive refutation of the views which in his "Handy-Book" he seeks to establish; albeit, though quite true, it is not at all new. Such abortive attempts at queen-rearing from drone eggs I have frequently witnessed, and when some years ago the fact first presented itself to my notice, I watched with as much interest and curiosity as to results as did Mr. Pettigrew; but, alas! when the mountain brought forth, instead of a beautiful queen there was produced a monster drone. This last week another instance came to my notice. A friend of mine artificialised a hive by division; for the queenless half, unfortunately as it appeared, no royal material was to be had—all drone cells and brood. He asked me to look at the beautiful royal cells which depended from the combs. I did so, but my suspicions were immediately aroused by observing no worker brood, and by the royal cells being constructed on drone combs. I opened one, and found, as anticipated, it contained a drone nymph, luxuriating for a brief space on royal dainties, and receiving all the outward marks of royal dignity and honour. With Mr. Pettigrew I join in astonishment at the delusion. No doubt the instinct of the bee is here somehow at fault; perhaps it is also at fault when royal cells are constructed and sealed in cases where there are no grubs at all. But be this as it may, no royal bee or queen can be reared except from female or worker eggs, and Mr. Pettigrew must abandon his untenable theory, which is one of a bygone age, that eggs have no sexual character, and that the common bees have anything to do in imparting such characteristics to the eggs after they are deposited by the queen in the cells.—J. Lowe.

QUEENS LEAVING THEIR HIVES.

Your correspondent, Mr. Lowe, must explain on other grounds the remarkable circumstance which I mentioned three weeks back. The driven Italian hive was rather weak at the time I made the swarm out of it, being, in fact, only about three parts full of comb and bees, and saved by spring feeding from perishing of famine. Moreover, I carefully examined the combs after driving in search of possible royal cells, of which I was much in need. Finding none I cut out a large piece of brood comb wherewith to make another artificial swarm before I substituted the hive for the strong and full hybrid stock. I feel quite certain that there could not have been within it any royal brood.

Neither is there any mistake as to the issuing of the swarms referred to, which I witnessed myself—both of them. Not only so, I watched the gradual development of royal cells in the hybrid hive. I saw one or two of them distinctly sealed up on the 26th of May. But the strongest evidence in favour of the correctness of my surmise lies in the fact that the swarm which issued on the 24th of May, out of the Italian driven hive, has proved equally defective in purity of breed as its parent stock, the hybrid; whereas, the second swarm which issued from the same Italian stock on the 9th, has extremely well-marked bees of all ages. I may add that the swarm of the 24th of May, sent out a magnificent "maiden" swarm on the 13th of July, which gave me the fullest opportunity of inspecting the quality of the hybridisation. In the one case not more than half the bees, if so many, are well marked, whereas in the other it is difficult to see a badly marked bee. I know not what other inference is to be drawn from the facts I have stated. It may be an exceptional case, which only proves the rule. Still I have always considered it far from proven that "queen bees never take aërial excursions" on fine days in summer time.—B. & W.

BEES ADAPTED TO LOCALITIES.

Frederick William Vogel, an eminent Prussian bee-keeper, says:—"An improved breed equally suited to all parts of an extensive country is an impossibility. For each particular district an improved breed specially suited may be produced. In a cross, resulting from the Italian queen with the black drone, degeneration became apparent in the second generation, the hybrids divided numerically, one portion resembling the Italian, and the other the black bees. In the fourth or fifth generation some of these hybrids reached again the pure Italian others the pure black bee."

AN OLD SWARM OF BEES.

There is a swarm of bees in the adjoining town of Knox, Albany Co., that has occupied the same comb for the past fifteen years, and in the same hive. The swarm was found by Benjamin Gallup in the town of Watervliet, Albany Co., fifteen years ago, on a pine shrub along the roadside. He went to a farmer's house and procured a box 18 inches square inside. After hiving the swarm in this box, he secured them, with proper ventilation, and brought them home, some eighteen miles from the spot where he found them. They have remained in the same box ever since, and have cast off swarms every season, with the exception of three seasons. The comb has never been renewed since the bees have occupied the box. At present they appear to be in fine condition to commence the season's work, and

the prospects are they may continue to do well for some years.

Now, there is something that accounts for this swarm prospering so long in the same box and comb, and that is, their casting swarms nearly every season left the hive with a young fertile queen; the queen being very fertile kept the colony strong in numbers, which is the best protection against the moth and in preserving the comb. It also goes to show the necessity of keeping our colonies furnished with young fertile queens. If this be attended to, we need not fear, with proper management, but that success will crown our efforts in bee-culture, if blessed with favourable seasons.—P. J. Severson, *Albany Co., New York.*

Cheltenham Poultry and Pigeon Show.—The schedule of prizes is tempting. There are twenty-one silver cups, and the money prizes are three good ones in every class.

OUR LETTER BOX.

Beccles Poultry Show.—Mr. R. Wilkinson, of Waterden Road, Guildford, informs us that it was he, and not Mr. Nicholls, who took the prize as the exhibitor receiving the highest number of marks without obtaining a prize.

Polish Hen Hatching a Brood (*C. B.*).—We are always glad to hear of such deviations as that noticed in your communication to us. As a rule, Polands are non-sitters, so are Hamburghs; but they both occasionally take us by surprise as your hen has done. Are you sure she is perfectly true? There may have been a cross, though it does not show itself in the feather. We shall be curious to know whether she will continue the accomplishment or not. We are glad to hear so good accounts of your chickens, ours have been very healthy.

Quantity of Food for Fowls (*Ilkley*).—Your Swan at this season should want little feeding, the weeds should supply him with all he wants. The Geese should live principally on grass. Wild Ducks, Teal, and Widgeon, should pick up the greatest part of their own living. Wood Ducks are small feeders. Pigeons will eat till they are hungry again. Water Hens live entirely on grass. We hope your hay will be up before you read this, and that your poultry will all be at liberty. From your saying that 21 lbs. of corn will not feed your stock, we expect you allow all to feed together, and that the weak go to the wall. For this reason they are not in condition. You have 123 head of feeders, and 21 lbs. of corn divided among them will not be much. The Swan, the four Geese, and five Turkeys, would eat it all if you gave them time. No poultry nor game care to seek food, if they can have it provided, and your birds must be managed rather than indulged. The cocks, hens, and chickens should form the first division, and you would find it more profitable to give them food ground and mixed, than to give the corn whole. Then the Turkeys should be fed, and let Ducks and Pigeons have a struggle for the remainder. That which Swan, Geese, and Ducks may require if they find the meal insufficient, they will find in the water. The fowls, &c., will do the same on the grass. If you throw the Ducks food in the water, some sinks, and much is carried away This is lost. Throw it on the ground or in some very shallow clear place, with a gravelly bottom, where the Ducks can both see and reach that which has sunk. By attending to this the 21 lbs. will keep your birds in condition during the summer, not afterwards.

Aylesbury Ducks' Bills Yellow (*Wild Duck*).—Water has a great effect on the bills of Aylesbury Ducks. Hard water and peat water change the colour for the worse; but you must bear in mind they get darker as the birds become older, and they are never so delicate as when they are ducklings. It is beneficial to them to have their food in a vessel filled half way up with small grit, and with only sufficient water to cover it. If their food is put in this they have to get it among the grit, and the friction has a good effect on the bills, but there must be neither gravel nor gravel stones—they are injurious. It is also good for them to be turned out in grass with the cold dew or white frost on it. Some water has the property of turning them, and therefore if you intend to exhibit you will do well to shut them up for a time. Their bills will improve, and they will increase in weight. Straw or yellow bills disqualify Aylesburies. If you want large eggs you must keep either Spanish or Crêve-Cœurs; neither of them sit. For sitting, laying, and the general purposes of a fowl of all work, we know nothing better than the Brahma, next the Cochin, but neither of them lays large eggs.

Light Brahma Chicks' Feathers (*Inquirer*).—There is always a change in colour when the chicken plumage changes for hard feathers. It is very desirable the black flight should remain, but the black feathers on the back are by no means desirable.

Chrissy-Millie Chicken.—"Punch's" cartoon records that the season of mammoth gooseberries has arrived; but another season has also arrived—that of duplicate animated things. We have two single women made into one, Chrissy-Millie, a horse with six legs, and now we see the following:—Mr. Fleming, saddler, Kennoway, Fifeshire, has a hen which has hatched a chicken with four feet, four wings, two necks, and two heads. We have heard of two perfect Hares united by their backs. No greyhound could catch them, for when one was tired he turned over and the other Hare took up the running!

Portraits of Pigeons (*H. J. R. L.*).—The Antwerp appeared in No 464, the Carrier in No. 471, the Dragoon in No. 473, the Pouter in No. 483, the Almond Tumbler in No. 489, the Barb in No. 500, the Flying Tumbler in No. 509, the Fantail in No. 512, and the Turbit in No. 523. If you send back the two numbers which are wrong we will return them. Consult our advertising columns; we cannot recommend dealers.

Bees' Swarming (*Severn Valley*).—It is very unusual for so long a period as fifty-five days to elapse between the issue of a first and what we infer from your letter to have been the second swarm. We think it most probable that the latter will require further assistance in respect of food. The personal appearance of the surviving queen will, doubtless, by this time have enabled you to decide for yourself to which race she belongs. Without knowing how long the royal cells had been sealed over when you saw them we cannot undertake to offer an opinion on the point.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

12th.—Very fine early and till noon, slight shower at 2.30 P.M., a short heavy one at 4.5 P.M., and showery the rest of the day, but the whole product very small.

13th.—Rain at 8 A.M.; fine day with slight shower in the evening.

14th.—Warm and fair throughout, fine evening, and bright sunset.

15th.—A most beautiful day, but rather warm though there was a nice breeze.

16th.—Fine, but very oppressive, feeling (though not looking) storm like.

17th.—A most delightful day, the great heat being tempered by a cool breeze.

18th.—Still splendid weather, sun very hot, but a delightfully cool breeze.

A very warm week. July 15th (St. Swithin), is usually the hottest day in the year, although that has not been the case this year, reference to the above table will show that the temperature was very high.—G. J. Symons.

COVENT GARDEN MARKET.—July 19.

The beneficial change in the weather has had a marked influence on the market, and supplies of bush fruit have greatly improved both in quantity and quality. Importations are heavy, and a large quantity of West Indian Pines have come to hand in excellent condition. Hothouse produce is receding in price, now the London season is drawing to a close. Potatoes are heavily supplied, and only the best samples maintain their price.

From observations taken near London during forty-three years, the average day temperature of the week is 75.4°, and its night temperature 50.4°. The greatest heat was 92°, on the 2nd, 1856; and the lowest cold 31°, on the 2nd, 1864. The greatest fall of rain was 1.39 inch.

COVENT GARDEN MONOPOLISTS.

MR. PEARSON never did greater service to fruit-producers than when he sent to The Journal of Horticulture his communication on the doings of the Covent Garden fruit monopolists. In my time I have had something to do with some of the Covent Garden fruiterers, and can verify all that Mr. Pearson writes about their dealings with us poor innocents in the country. Being, like many other gardeners, in want of a Pine or two, and perhaps Melons, for a particular occasion, and having got them, I thought it no sin when I had a glut of these fruit to send to the salesman double the quantity in weight as an equivalent. But, "tell it not in Gath," when the hills came in the Pines were charged 10*s.* per pound, and the Melons in proportion, and no notice whatever taken of my consignments. This, of course, was a sickener, and ended my experiments in fruit-bartering in Covent Garden. There is one good which the fruit monopolists do, and that is, when fruit has to be procured from them, they show gardeners' employers the high prices they have to pay for it, and so stop some of the grumbling at home about the expenses of keeping up the gardens. No doubt some kinds of fruit are of a very perishable nature, and salesmen must charge good prices to make up for their risk, but there is no reason why extortionate ones should prevail, as at present.

Many amateurs with orchard houses would be glad to send some of their produce for sale in Covent Garden if there were a chance of obtaining a fair price from the fruiterers. Gardeners, likewise, when they had their employers' sanction to sell their surplus productions, would be able to send in some seasons quantities of fruit, which is often spoilt from want of gathering. Thus in London, and in all large cities and towns, consumers would obtain their fruit at reasonable prices if the monopoly in Covent Garden were broken up.

If glass protection were generally applied for the growth of our more valuable fruits, consumers would always find for sale in the market plenty of fruit, and dealers would not need to depend for their supply upon France or the Channel Islands. Without the collapse, however, of the monopoly in Covent Garden this desirable state of things could not happen; and perhaps the best plan would be that of "J. P.," of York (page 23), where he recommends forming a Horticultural Co-operative Society. This Society, to be efficient, should have branches in all large cities and towns to supply all fruits in season at reasonable prices, and I have no doubt, after all the expenses of management, a good dividend would be secured to the shareholders. The Covent Garden salesmen would then have mostly to depend upon the fruit they grew themselves or on foreign supplies, and we should soon see a fall in their prices when they could not control the markets as at present.—A Gardener.

I was happy to see the prices given by the retail fruiterers, &c., in Covent Garden Market commented upon by Mr. Pearson, of Chilwell. I fully concur in every word he says, and, moreover, think something might be done to get rid of such a monopoly.

I have been a grower of fruit for several years, sending it to Covent Garden, and, as a matter of course, as regularly as the year comes round I have my annual growl, also my self-gratulation that my existence does not depend upon the prices given by the dealers in the market. Nevertheless, on behalf of the consumer, as well as the grower, I most willingly and emphatically enter my protest against such unfair proceedings. Of course a large margin must be allowed to the retail salesman who deals in such perishable articles as fruit, &c., "but there is reason in roasting an egg," and by way of illustration I, in the early part of June, sent up a box of Nectarines, allowed by all who saw them to be magnificent (and so they were both in size and colour), the Covent Garden prices at the time being quoted, "Nectarines per dozen 12*s.* to 24*s.*" I received the magnificent sum of 6*s.* per dozen, this subject to salesman's commission, &c. This appears to be too glaring, but it is only one of a number of similar cases I could quote.

Could not something be done that would be beneficial both to the consumer and grower? Why in these days of free trade is a person requiring a pound of Grapes to pay 20*s.* per pound, and the grower to get 2*s.* 6*d.*, or may be lucky indeed if he receive 5*s.*? Surely some enterprising individual or company might be found to put a stop to this monopoly, and at the same time be the means of enabling persons who at present are totally unable to do so, even in cases of sickness, to purchase a bunch of Grapes—so refreshing to many an invalid—at a reasonable cost, and yet give the growers a fair remunerative price for their trouble and anxiety.—Elruge.

I think my case is even worse than the one quoted by Mr. Pearson in your number of July 20th. By the return enclosed you will see I received on April 5th, for a box of very fine Strawberries weighing 1¾ lb., the large sum of 5*s.* 6*d.*, from which was deducted 1*s.* for carriage and commission. The price in the Avenue on the same day was 36*s.* per pound.—J. Ridgway, *Fairlawn, Tonbridge.*

ALPINE PLANTS

AT MESSRS. OSBORN'S NURSERY, FULHAM.

Probably there is no class of plants so little known as those called Alpines, under which name are included many besides those having their native habitat in mountainous districts. Possessing a quaintness of form as beautiful as it is interesting, these pretty plants deserve the notice they are at length attracting. After inspecting a collection of them, and seeing how exquisitely neat is the growth of almost all, and what a marvellous variety of form and colour is developed both in the foliage and blossom, one feels surprised that plants possessing such rare beauty should have been so long neglected.

Having lately had an opportunity of seeing the fine collection of rare alpine plants cultivated by Messrs. Osborn, I purpose offering a slight description of some of

the most select, most of which have been grown at this nursery for many years, not for profit, for, as Mr. Thomas Osborn told me, there has till very lately been little, if any, demand for them, but simply because it is the rule of the firm never to discard a really good thing.

Taking the Saxifrages first, we have Saxifraga Aizoon, and Aizoon minor, the latter having a very close compact growth; S. ceratophylla, a fine distinct kind, with deeply-serrated foliage; pectinata, a compact grey kind; next comes the true longifolia of Backhouse, a perfect gem, like a grey rosette; pulchella, very neat and dwarf; and moschata, of still more compact growth; then we have Guthriesna variegata, neat, pretty, and bright; oppositifolia, and atropurpurea.

Among the Sedums there are S. reflexum, very fine; anglicum; grandiflorum; glaucum, very beautiful; Telephium atropurpureum, with almost black foliage; brevifolium, a beautiful kind, forming a bright compact mass, very neat and effective; the pretty grey farinosum; and those two compact kinds, Lydium and Wightmannianum.

Sempervivum californicum, from its being used so largely in public gardens, is now well known, but there are others deserving special notice. Of these calcaratum is very similar to californicum, but more compact; acuminatum, a distinct brown kind; the beautiful miniature hirtum; montanum, quite a gem among Sempervivums, and spinosum, a very rare variety, remarkably compact, and quite distinct from all others.

Of other plants worthy of notice, there are the neat-growing Aubrietia deltoidea variegata, Campanula garganica, Nepeta violacea, Trifolium fimbriatum, with pretty purple flowers; the very dwarf-growing Thymus corsicus; our own native Thymus Serpyllum albus, dwarf, compact, and pretty; and the very beautiful Thymus micans, each plant forming a compact mass, so dense as to appear like the half of a green ball resting upon the soil, the entire surface being studded with flowers of a delicate pink. The well-known Trifolium rubrum must not be omitted, its dark-green-edged foliage being very striking and effective. Silene alpestris, too, with its pure white flowers, is a useful plant, as is the very pretty marsh plant Parnassia palustris, another white-flowering plant. Then there are Lychnis Lagascæ, with a profusion of bright pink flowers; the pretty spring-flowering Soldanellas, Linum flavum with its fine deep yellow flowers, Linaria triornithophora with fine spikes of purple flowers, a fine old species, very rarely to be met with, but most worthy of a place in all gardens; the pretty trailing Linnæa borealis; the purple-flowering Rhexis virginica; Campanula pulla, dwarf and effective, with purple pendant bell-like flowers; Gentiana acaulis, with its deep blue flowers; Gentiana gelida, with smaller flowers; and G. septemfida, producing its flowers in trusses. These are all fine and distinct. To this list may be added the Vetch-like Astragalus hypoglottis; Androsace lanuginosa, with pretty pale pink flowers; Androsace ciliata, a charming little plant of very dense, compact growth, and with flowers of a rich deep pink; Achillea tomentosa, with bright yellow flowers, and the pretty Fern-like Thalictrum adiantoides, which, as its name implies, much resembles a Maiden-hair Fern.

It will be understood that this list represents a mere tithe of the Fulham collection. They are the kinds that struck me as being the most beautiful and distinct of those I saw; and although I may have failed to note many other worthy varieties, yet I can confidently recommend all I have selected as being of sterling merit.

Very many of these plants will thrive in ordinary garden beds; they are, therefore, valuable for edgings or mixed groups along the front of herbaceous borders; but the real home for them, and the place in which they flourish best, is the rockery —there, if rightly managed, they display their marvellous and varied forms to the greatest advantage, some thriving best in sheltered nooks formed by the projecting rocks, while others clothe the rocks themselves with a beautiful enamel of deepest green or silvery grey. Wonderful examples of plant life are these gems of the vegetable kingdom. The miniature growth, the great variety of form and colour, both in foliage and blossom, which they offer to us, should cause them to be cared for and treasured very much more than they have been hitherto. They are objects of interest at all seasons of the year, and certainly if we seek for refinement in our gardens we shall find it developed in a much larger degree in this class of plants than in any other; for so exquisitely delicate and varied are the colours, and so beautiful the forms of most of them, that all other plants appear huge and coarse beside them. The curious dwarf growth seems to invite one to explore, and to thoroughly enjoy them we must do so—a mere passing glance will not suffice; so diverse are their characters and so intricate their forms, that we may always find something fresh to interest us.

It may be useful to add a word or two upon the culture of these plants. This is by no means a difficult matter, yet there are a few conditions necessary to success. The most important of these are: Not to build the rockery in a shaded position, but in an open, airy place, well away from tall overhanging trees; it is not shade that is wanted to keep the plants flourishing in summer, but a deep, rich, fibrous loam, with an abundant mixture of broken stones, so that the roots may penetrate deeply, and that the soil in which they are growing may be drained thoroughly; for though these plants are so dwarf, yet they send their roots deep down in the earth, and then we find them flourishing in full vigour through all the vicissitudes of adverse seasons. One other essential condition to the successful culture of these plants in summer, and in summer only, is a moderate but continuous supply of water, such as might be had from the overflow of a small fountain. This, dripping gently over the highest rocks, would spread just that coolness around the plants which they like so much. Of course all the kinds will not flourish in the same soil, or with just the same treatment. To those who may contemplate forming a collection, however small, I would say, Find out the conditions under which the plants you select are known to flourish in their wild state, study them, and with that liking for them which is certain to grow upon you, will come the requisite knowledge of their requirements.—Edward Luckhurst.

A BIT OF SOUTH DEVON.—No. 1.

Here am I in that city of villas, Torquay, and though I have seen many other towns in each of the British islands, not one of them in beauty equals this; it is compounded of thickly-wooded steep-sided valleys, studded on either hand with white residences, wide apart, and each framed in a surrounding of luxuriant trees. Whichever road you take, whichever side of whichever valley you traverse, you pass a series of villas so long-continued that you become weary of looking upon them, each tasteful, each indicating wealth, each encircled by a well-kept garden, and the tenants of which are exuberantly luxuriant; but more of them by-and-by. I must have an outpouring first against that general prejudice and delusion that Torquay is too hot to be desirable as a summer resort. I entertained that opinion myself, but I ventured to believe the records furnished by meteorologists, and I find that their figures are not fictitious; more of them hereafter. On the 18th of this now month of July, the day on which these present sentences are written, I looked during mid-day at one of the publicly-exposed thermometers on the Strand—the day intensely bright, almost cloudless, wind south-west—and that thermometer in the shade stood at 70°. Now, I will wager an acre to a footsbreadth that it has been hotter than that at Scarborough on this same day and hour, and at London 10° hotter. "Ah! that was an exceptional day." No, it was not exceptional, friend Peter Prejudiced, for here is the record of three previous days, published in "The Torquay Directory:" July 14th, 67°; 15th, 72°; 16th, 72°.

Why Torquay is thus temperate is fully explained by its vicinity to the sea, and the evaporation from the profuse and luxuriant vegetation in and around; for let me remind your readers that in the hottest parts and in the hottest season of India ice is made by mere evaporation about the vessel containing the water.

What shall I select from my jottings to enlarge upon next? That which first most forcibly struck me—the colour of the soil. It is red, very red, as if formed of ground bricks, and is, I believe, the new red sandstone of geologists worn by the action of the elements into a cultivatable consistency, or rather inconsistency, for it is very light, a large proportion of it being silica, and the colour imparted by an excessive amount of the red oxide of iron. Next was I struck by the profusion of a red, or rather pink, flower, which, in multitudes and masses, is on every old wall and in the chinks and clefts of the rocks; I never saw it so profuse in other parts of the kingdom; it is the Spur Valerian (Centranthus ruber). I thought that the colour of its flowers and those of the Herb Robert (Geranium Robertianum) seemed more intense than in my more eastern-dwelling neighbourhood, and when I walked among the flowers in the "Devon Rosery" the same intensity of red colours prevailed. There was a Cockscomb with its comb so intensely crimson that it seemed to emit rays of colour; the crimson leaves of the

Coleuses and the petals of the Roses all seemed more fervid than ours eastward. I expressed that such was my impression, and that I thought that the oxids of iron in the soil was the cause of the increased colour. Mr. Curtis responded that he had long entertained the same opinion.

Burckhardt describes the gratification, somewhat saddened in his case, upon reading the name of an old friend written on a pyramid in Egypt. I, too, remember the joyful recognition on an Indian cricket ground of one who in long-gone years had been in England a brother clubbist; and now it has been my gratification to recognise in Mr. Curtis one whom as a lad I must have met, and about whose related belongings I know much. There is a Devon proverb, "Good cob, good shoes, and good hearts last for ever." In the instance of Mr. Curtis and his family I will be hostage that the last instance in the proverb is truthful—I was welcomed as if an old tried friend had reached them. There 's a free-gardenery as well as a freemasonry, and we all might have smoothed our chins self-complacently when Mrs. Curtis remarked, "There's always something good in those who love gardening."

The name of Curtis is interwoven with flowers and their culture for a full century—William Curtis, with whose name the "Botanical Magazine" is identified; Samuel Curtis, of Glazenwood, his son-in-law, and continuer of that magazine; and Henry Curtis, his son, author of "Beauties of the Rose," formerly of the West of England Roseries, Bristol, and now of the Devon Rosery, Torquay. William, the grandfather, abandoned a large medical practice for the pursuit of natural history, especially of its fairest member—botany, and it now seems incredible that he selected ground in the Grange Road, Bermondsey, for his botanic garden. You would not allow me space for many notes about him, but I must tell how he was the first to obtain superior engravings and colouring of flowers. Previously to the appearance of his "Flora Londinensis," whoever has had occasion to consult the published portraits of plants will agree with me in appreciating the progress he effected. He not only had the difficult task of finding and instructing artists, but he had the further difficulty of keeping them, for when they attained to excellence there were many bidders for their services. The calico printers tempted away his first artist, Mr. Kilburn, and he so succeeded in their service, that he lived long enough to die in some affluence at Beddington Corner, near Croydon. He had not a competitor in such designing, for the great cotton manufacturers, Peel & Yates, had at that time only two patterns, "the great bird's-eye," and "the little bird's-eye!" To Kilburn succeeded Sydenham Edwards, but he also departed from Mr. Curtis and established an opponent periodical, "The Botanical Register." The fondness for floral illustration proved hereditary, and well do I remember the beautiful flower groups painted for Mr. Samuel Curtis by Mrs. Pope. Mr. Henry Curtis has also been a sketcher of flowers; some specimens are before me, and others are known to the public in the "Beauties of the Rose."

But of the two now gone, each was, and the living is, a practical gardener, and William Curtis deserves especial remembrance as the introducer of Sea-kale into the kitchen garden. He published a pamphlet on its culture, and gave with each a box of the Kale's seed. Samuel Curtis cultivated a large nursery and orchard at Glazenwood, near Coggeshall, in Essex. Well do I remember seeing him dredging his Apple trees with lime by the aid of an implement he had invented, and, as a lad, still more did he secure my regard by tumblersful of his sparkling Black Currant wine. Henry Curtis has especially devoted himself to Rose culture. And now I arrive at my notes written down at the Devon Rosery.

This nursery is about a mile from the town on the Paignton Road, and is five acres devoted entirely to the propagation and culture of Roses. Let no one proceed thither expecting to see ornamental arrangements, or the slightest attempt to prefer the ornamental before the useful—it is a thoroughly practical establishment, where in their season all the operations of propagation and culture may be seen, and any of the approved varieties, old or new, purchased in any number from one to a thousand. Budding was the order of the day when I was there, and it will surprise your amateur readers to know, that the head budder could insert and tie one thousand buds in ten hours. I never knew of but one more nimble, and he could complete twelve hundred in the same space of time.

I have seen the Roses in their prime at many of the nurseries where they are a speciality, and I have seen their selected specimens at the London exhibitions, but none of them surpassed in any quality, and none of them equalled in luxuriance, the Roses here. The foliage is unsurpassable in size and freedom from disease—verdure is the rule, brown spots the exception.

Mr. Curtis, as already noted, is a practical rosarian, and he is a man of science too, just the variety of man from whom to obtain literary cuttings, and the following are some:—

"The Manetti is a hardy, strong-growing, semi-double pink Rose, introduced from Italy about thirty years ago by Mr. Rivers, to whom all Rose and fruit-growers are so much indebted. The Céline Rose (Hybrid Bourbon), of most robust growth, with a bright rose-coloured double flower, was introduced as a stock for budding by myself twenty-seven years ago, and is still found the best stock on which to bud some sorts that will not grow well on the Manetti, such as Noisettes, Teas, &c. The more robust-growing varieties of Roses budded on these stocks form splendid objects trained as pyramids, or for pillar Roses by the sides of lawns, &c. Manetti-worked Roses have the advantage of being easily grown in cold, windy, and exposed situations; even in the north of Scotland they are not killed if grown below the snow line."

Some may attribute Mr. Curtis's preference for the Céline stock to the natural fondness of a first introducer, but he has a reason for his fondness—"its fibrous roots are so numerous."

"Dwarf Roses, budded on the Manetti stock, will flourish well in almost any soil, as well as in those soils of a light, dry, sandy character, which are unfavourable to the Briar. Roses on their own roots prefer a warm light soil, with leaf mould and sand, and it is useless to attempt to grow them in a true stiff Briar soil. Their roots are generally more delicate the first year than those of Roses on the Manetti or Céline."

I will conclude, for the present, with a list of old Roses—best of the best—selected by Mr. Curtis and approved by Mrs. Curtis. Mr. Peter Prejudiced will "Humph! What had she to do with them?" Much, for however skilful a man may be in cultivating a Rose, I put aside his opinion as to its colour and form for that of a lady of taste—and such is Mrs. Curtis—and one evidence is on the table before me in a bouquet of wild flowers and native Ferns only. The Roses are grouped according to their colours.

WHITE AND CREAM.

Acidalie, B. White.

Boule de Neige, H.P. White. This fragrant Rose has petals so stout and Camellia-like, that it is especially suitable for wearing in a lady's hair.

Devoniensis, T. Cream. "Powerfully scented, and largest of its family. It was raised by the late G. Foster, Esq., of Oatland, near Devonport, and is believed to be a progeny of the Yellow China, fertilised by yellow Noisette Smithii growing by its side."

Homer, T. Cream, frequently tinted.

Madame Bravy, T. Cream, model of form.

Madame Noman, H.P. White.

Mademoiselle Bonnaire, H.P. White.

Sombreuil, T. White. Half Bourbon. Highly scented.

Virginal, H.P. White.

White Bath Moss, S. White.

BLUSH AND FLESH COLOUR.

Alba mutabilis, H.P. Blush.

Clémence Raoux, H.P. Flesh.

Madame Rivers, H.P. Flesh.

Madame Rothschild, H.P. Flesh. One of the finest of this section.

Madame Vidot, H.P. Blush.

Madame Willermoz, T. Pale salmon. Large, and foliage fine.

Marguerite Bonnet, B. Flesh.

Marquise de Mortemart, H.P. Flesh. Dwarf.

Mrs. Bosanquet, C. Flesh.

Rubens, T. Pale flesh.

Sophie Coquerelle, H.P. Blush. Good as a standard.

Souvenir d'un Ami, T. Pink flesh. Large, fine form. Raised by M. Bellot, a florist at Fongères, near Moulines. Introduced in 1846.

PINK AND ROSE COLOUR.

Abel Grand, H.P. Pink. Large, highly scented, good as a standard.

Baronne Prevost, H.P. "Bright rose, the prince of Perpetuals. Raised by M. Deprez, of Yebles, near Paris, and sent out in 1844."

Blairii No. 2, S. Hybrid China. Pink. Good for a pillar.

Comtesse de Chabrillant, H.P. Rose. Fragrant.

Edonard Morren, H.P. Rose.

Lælia (also called Louise Peyronny), H.P. Bright rose, very hardy, very fragrant.

Madame Clert, H.P. Pale rose.

Madame Jacqnier, H.P. Rose.

Madame Knorr, H.P. Bright rose, "more fragrant than the old Cabbage Rose."

Marguerite de St. Amand, H.P. Pink. Good as a standard.

Monsieur Noman, H.P. Pink.

Monsieur Woolfield, H.P. Deep rose.
Pavillon de Pregny, H.P. Purple rose, "reversa of petals satiny white."
Perfection de Lyon, H.P. Rose.
Reine de Midi, H.P. Rose.

CARMINE, SCARLET, AND LIGHT CRIMSON.

Alfred Colomb, H.P. Scarlet. Very fine.
Annie Wood, H.P. Carmine.
Beauty of Waltham, H.P. Carmine.
Catherine Guillot, B. Carmine.
Charles Lee, H.P. Crimson.
Clotilde Rolland, H.P. Light crimson.
Dr. Andry, H.P. Crimson. Large and stout-petaled.
Duc de Rohan, H.P. Crimson.
Dupuy-Jamain, H.P. Carmine.
Exposition de Brie, H.P. Crimson.
Felix Genero, H.P. Carmine. "Very fragrant, noble foliage, makes a good stand. A superb Rose."
John Hopper, H.P. Crimson. Hardy; good as a standard or for a pillar.
Jules Margottin, H.P. Carmine. "A superb Rose, blooms abundantly in autumn; good as a standard, and for forcing."
La Brillante, H.P. Carmine.
Laurent Descourt, H.P. Crimson.
Madame Clémence Joigneaux, H.P. Carmine. Large.
Madame Victor Verdier, H.P. Scarlet. Fragrant; good as a standard.
Mademoiselle Marie Rady, H.P. Crimson. Very large and double; good as a standard.
Marie Baumann, H.P. Scarlet. Fine and fragrant.
Maréchal Vaillant, H.P. Carmine.
Souvenir de Poitean, H.P. Crimson.

CRIMSON, DARK CRIMSON, AND PURPLE.

Charles Lefebvre, H.P. Dark crimson. Very large; attar-scented.
Duke of Edinburgh, H.P. Crimson.
Eugène Appert, H.P. Crimson.
Fisher Holmes, H.P. Crimson. Camellia-like.
John Keynes, H.P. Dark crimson and fragrant.
Madame Moreau, H.P. Crimson.
Senateur Vaisse, H.P. Dark crimson.
Xavier Olibo, H.P. Purplish crimson. Peculiar in colour, and fragrant.

YELLOWS.

Céline Forestier, N. Pale. Fragrant. Nearly evergreen. Good for bed, wall, or standard.
Gloire de Dijon, T. Buff. Fruit-scented. Good as a climber or standard.
Madame Margottin, T. Citron. Very fragrant.
Mademoiselle Adèle Jongant, T. Pale.
Maréchal Niel, T. Golden. Very large and fragrant; blooms early and late. Good for a wall.
Triomphe de Rennes, N. Pale. Peculiarly scented.

Be it remembered that the foregoing is only Mr. Curtis's selection from the "old" Roses. I must reserve his notes on last year's varieties until a future communication, for I have not done yet with Torquay.—G.

LAXTON'S ALPHA PEA.

I AM desirous of recording my experience of this fine variety. Grown by the side of other varieties acknowledged to be the best, and under precisely the same conditions, this beats them all. It is not the earliest, but is only a week later than Carter's First Crop, and four days behind Dickson's First and Best. Sown on the same day as Little Gem, it was gathered the same day as that excellent dwarf. As to productiveness, Alpha, without being the best, is amongst the best, and equal in yield to varieties of inferior quality. It attained a height of 4 feet, and was covered with pods from within less than a foot from the ground. It has been common enough to find pods containing nine full-sized peas, a few have been opened with ten; and yesterday, on looking for the finest pod, it was found to contain twelve fine peas. In quality, it is the opinion of several better judges than myself, that Alpha is the very best of its season, being superior to Little Gem by its more delicate and sugary flavour. Altogether this is a variety of great excellence, and will hold high rank amongst its numerous rivals for some time.

This Pea has grown a foot above the limited height of the vendors, but this season is ruinous to orthodox heights of Peas, First Crop averages fully 3½ feet; Laxton's Supreme is now 5 feet high, and will easily reach another foot, and I have rows of Champion of England, at this moment just ready for gathering, 8½ feet high, placing the rod fairly anywhere by the side of the rows without touching the haulm. This, held up to its legitimate extent, reaches above 9 feet. That, however, is not the fair and accepted mode of stating the height of Peas. These measurements are not given as being extraordinary, but as showing the necessity of making allowances for weather influences, and the propriety of giving the heights of Peas as approximative, and so, in the case of new kinds, preventing reflections which have been, and perhaps will be again, indulged in by the public against the dealers.—J. W.

BROOKLAND, CHARMINSTER, NEAR DORCHESTER.

THE RESIDENCE OF W. WEBSTER, ESQ.

"WHERE there's a will there's a way" is an old and trite proverb, which as often receives its illustration in gardening as in anything else—a truth I have more than once exemplified in my own horticultural experience, and which has been abundantly shown in the case of the gentleman whose garden I visited the other day in my annual Dorsetshire tour—alas! I fear to be my last. When real love for flowers is aided by the very needful adjunct of a little hard cash, it is astonishing what difficulties can be overcome.

No one, in passing by the road which leads through the village of Charminster, would suppose that behind the wall which abuts on the high road there is such a treasury of horticultural beauties as Mr. Webster has already accumulated. Time was when there were plenty of jack snipes in the place where now stands the garden, so rich in its varied productions; and I, who saw it only two or three years ago, can hardly believe the change which has taken place. The house abuts on the road, but, once inside, you are no longer aware of that, so open is the whole scene. A glass verandah filled with flowering plants, and with its roof covered with Vines, runs along the front of the house, and this again opens into a range of houses comprising stove, vineries, and greenhouse, all built on Mr. Cranston's plan, and for elegance of form and the ease with which they are ventilated they seem to me the very models of what houses ought to be. As these houses are well known and constantly advertised in the columns of the Journal, there is no need that I should detail their mode of construction. Mr. Webster is more satisfied with them than ever. There is also a nice propagating house, of course the usual adjuncts of pits and frames, and in all of them are to be found some of the richest and rarest of the horticultural introductions of late years. Amongst Ferns there were a fine plant of Adiantum farleyense, and young, promising examples of the beautiful Filmy Ferns Todea superba and Todea pellucida, while Platycerium alcicorne was treated here in an original way, which was certainly most effective. A large pot, somewhat like a Sea-kale pot, was turned upside down, holes were made in it, and another pot placed inside with peat; the Fern was planted here, and, pushing itself through the holes, gradually laid hold of and spread over the pot, and so the whole surface of it will gradually become covered.

Grapes were exceedingly well grown, although on a small scale as compared with many places. I saw strong Vines well filled with fruit of the Muscat Hamburgh, and very large bunches of Trebbiano and other good kinds, while Black Hamburgh, as usual, formed the *pièce de resistance*. The first crop was over, and the successions were rapidly coming forward. Strawberries had been forced in abundance, and the plants placed in the border were furnishing good second crops of bloom.

I saw in the houses a nice plant of the very curious Ataccia cristata, not often seen, but always sure to excite wonder when in flower, so unlike is it to anything else, and so doubtful some would be in looking at it whether it were a flower or not; while most of the more recent introductions in both stove and greenhouse plants were to be found here.

But perhaps that part of the garden in which I was most interested was the rock garden, for, although small, it contained a most interesting collection of alpine plants, many of which were growing and flowering in great profusion. Intermingled with them were also some nice specimens of our best British Ferns. Most of the finer varieties of Sedums and Sempervivums were mixed with Campanulas, Gentians, Violas, and Primulas. Noticeable among them I saw Omphalodes verna alba, Dianthus deltoides, Sisyrinchium grandiflorum, Primula cortusoides—the old variety had been, I was assured, a perfect mass of flower; the same had been the case with Aquilegia cærulea. Dianthus alpinus, Silene rupestris, and, as the auctioneers say, others too numerous to mention were thickly studded all over the rockwork. It is most encouraging to those

of us who have so long advocated the growth of these alpines and herbaceous perennials to find them now coming so much into favour, for here not only was this garden devoted to them, but in the borders were to be found fine masses of many of our favourites. Delphinium Belladonna and D. Keteleeri had been very fine; the former is certainly unequalled for the brilliancy of its azure blue. Nor must I omit to mention a summer-house completely covered with Clematis Jackmanni and Clematis rubro-violacea with thousands of blossoms open and opening all over it. The plants had been cut down to within 2 feet of the ground, and had now covered the whole of it with bright foliage and still brighter flowers, and afforded another illustration of the many uses to which these showy plants can be put.

I need say no more to prove that Mr. Webster is "well to the front" in the various departments of gardening, and rarely does one meet husband and wife so thoroughly at one in all connected with horticulture as in the kind and hospitable friends to whom I owed a pleasant and profitable visit.—D., *Deal.*

GREENHOUSE PLANTS.—No. 5.

PLANTS SUITABLE FOR PILLAR AND TRELLIS ARCHWAYS.

In many greenhouses there are wooden or iron pillars supporting the roof, and in others there are in addition trellis archways. The fronts of some greenhouses are so high as to admit of plants being trained to trellises or wires fixed to the front uprights. For training on these, very vigorous-growing plants are not required; the freest-growing climbers are not suitable, whilst for others the positions are wholly unsuitable. The following, however, are good:—

Abutilon striatum.—Of erect habit. Leaves bright green, with rather long footstalks; flowers bell-shaped, orange, striped or veined with red. It is of very free growth, the flowers being solitary, and produced from the axils of the leaves almost continuously, but most freely from June to the end of summer. The plant is apt to become bare of shoots at the base. To obviate this the shoots should be stopped at every foot of growth upward, and when the plant becomes bare at the bottom the shoots may be cut to within a few inches of its base in the spring, keeping it rather dry for a short time, and when the fresh shoots are a few inches long repot it, or if it is planted out, remove the surface soil and top-dress. A compost of two parts of light fibrous loam, one part peat, and one part leaf soil or old cow dung, with one-sixth of silver sand, will grow the plant well. Good drainage is necessary. Keep the plant rather dry in winter, and when growing afford a good supply of moisture at the roots, with frequent syringings.

Acacia juniperina.—Habit drooping. Leaves small. Flowers pale yellow, produced abundantly in April.

A. dealbata.—Leaves long, much divided, having a Mimosa-like appearance. Flowers yellow, in May.

A. oleifolia elegans.—Leaves medium-sized entire, pale green, and glaucous. Flowers yellow, from October to May. In my opinion this is the most graceful of all the Acacias.

The Acacias require a compost of equal parts of sandy peat and light turfy loam, with one part of leaf soil; also good drainage, an abundant supply of water when growing, and the soil moist at all seasons. Being liable to become leggy, the best plan is to cut them in after flowering in spring. The plants should be well furnished with shoots from the base, keeping them plentifully branched by frequently stopping the shoots.

Akebia quinata.—Leaves five-cleft or five-leafleted. Shoots twining. Flowers rosy lilac, produced in March or April. Soil two parts fibrous loam, and one part fibrous sandy peat, with a free admixture of sharp sand and good drainage. The pruning required is to cut away the old shoots after flowering, and to encourage fresh shoots from the base. Water the plant very freely in summer, but keep it dry in winter, not, however, allowing the foliage to suffer. Syringe well in summer.

Bomarea multiflora.—This is a twining plant with orange red flowers. Water it freely in summer, and keep it dry in winter, syringing freely in summer.

Billardiera mutabilis.—A climbing plant. Flowers crimson, produced in July and August. Prune it early in spring, cutting out the old wood, watering freely in summer, and in winter keep it moderately dry, syringing freely. Soil fibrous loam and sandy peat in equal proportions, with one-third of leaf soil, and a free admixture of sand.

Brachysema acuminatum.—Leaves rather long, entire, green above, glaucous underneath. Flowers pea-shaped, crimson, in March and April.

Brachysema hybridum.—Flowers crimson and cream-coloured, in March.

Brachysema latifolium.—Leaves much larger than those of the others. Flowers crimson, in May.

These plants are subscandent, and of stiff habit. The shoots, however, are rather long, and should not be stopped, but be allowed to hang down. Prune the plant after flowering, cutting it in rather closely, and encouraging fresh shoots, giving a gentle sprinkling overhead morning and evening. Water freely when growing, and keep it dry in winter, but not so as to affect the foliage. Soil equal parts of sandy peat and fibrous loam, with one-fourth of leaf soil.

Cobæa scandens variegata.—This well-known variegated climber is very effective on trellises. Its leaves are variegated, being white and pink. The shoots may be trained either upwards or downwards. The essential point is to secure good fresh foliage in the early part of the season. It is not nearly so hardy nor so rampant as the plain-leaved form. Cut the shoots back in spring, keeping the plants dry for a time, and encourage young shoots from the base, or where practicable. In winter keep it rather dry, but in summer water well. Syringe freely in the evenings of hot days. Soil sandy loam two parts, sandy peat one part, and leaf soil one part, with good drainage.

Fagelia bituminosa.—An evergreen twiner, with pretty pea-shaped yellowish purple flowers, in June. The soil should be rough, with free drainage; it may be peat and loam, with some lumps of charcoal, broken pots, and silver sand. Prune the plant in summer after flowering, thinning out the shoots well where very close. Water freely in summer, but moderately in winter.

Habrothamnus elegans.—Of free growth, and very free-flowering late in winter and in spring, and sometimes it blooms continuously. The flowers are borne in dense clusters, and being drooping have a fine effect. Their colour is bright carmine.

Habrothamnus fasciculatus.—Flowers crimson, in clusters early in spring. This is one of the finest of greenhouse plants. All the Habrothamnuses are beautiful for cut flowers.

Habrothamnus aurantiacus.—Flowers orange, and sweet-scented. It blooms in autumn and winter.

As the species of Habrothamnus produce their flowers on the current or last year's wood, pruning should be deferred until the flowering is past, and then they may be cut in rather hard, leaving some shoots at the base so as to keep that part well furnished. Any rampant shoots may be stopped in summer, but not after July. Water freely in summer whilst the plants are growing, and when a good growth has been made and it becomes stationary lessen the supply of water; indeed, only give enough water to keep the foliage from flagging. When the flowers begin to expand water copiously. Soil turfy loam and fibrous peat in equal parts, old cow dung one part, charcoal and silver sand half a part each, with a free admixture of sandstone. Good drainage is necessary. The plants are best in borders.

Hoya carnosa.—An evergreen twiner, with dense clusters of wax-like pinkish-white flowers. It is a first-rate plant for pillars. Water it freely when flowering and growing, but when at rest keep it dry, only do not allow the leaves to shrivel. The plant cannot be kept too dry in winter. Drain extra well, and afford a compost of equal parts of sandy fibrous peat, fibrous light loam, old cow dung, charcoal in lumps from the size of a hazel nut to that of a walnut, broken bricks, and old lime rubbish, well mixed.

Mimosa prostrata.—Of prostrate growth, as its name implies, but when trained to wires or a pillar its shoots hang down gracefully, and have a fine effect. The foliage is pretty, and the flowers are pale pink, produced in summer. Soil sandy loam two parts, and one part each of sandy peat and leaf soil, with a free admixture of sharp sand. It seeds freely, and the best plants are those raised from seed sown in a hotbed in spring. Water freely in summer, keeping the plant rather dry in winter. Prune it in spring before the growth commences, thinning out the shoots where too close together, and spur them well in. A gentle syringing in hot weather is very beneficial.

Mitraria coccinea.—This is a fine pillar plant, having splendid scarlet flowers about April or May. Confine the pruning to thinning-out the old wood, and shortening any irregularities of growth after flowering, and encourage the plant with a gentle sprinkling of water overhead, not watering too much at the root—indeed, giving no water until the soil becomes dry, then afford a good supply before the foliage suffers. In winter keep the plants dry. Soil two parts sandy loam, one part sandy

peat, and one part leaf soil, with half a part each of lumps of charcoal and silver sand. Provide good drainage.

Pergularia odoratissima.—This is of quick growth, and may be said to be the Stephanotis of the greenhouse, to which plant it is allied, but the flowers are green and sweet-scented. It blossoms in summer. It is rather slow in establishing itself in a greenhouse, but is there not nearly so liable to be attacked by red spider and other insect pests as when grown in a stove. It requires to be freely watered when growing, and to be kept dry in winter. Soil fibrous loam, sandy peat, and leaf mould in equal parts, with half a part of old cow dung and lump charcoal, and a free admixture of sharp sand. Good drainage should be provided.

Pronaya elegans.—An evergreen twiner, with pretty blue flowers in July and August. It is allied to Sollya. Soil sandy peat and loam in equal parts, with a free admixture of sharp sand, together with good drainage. Water the plant freely when growing and flowering, but in winter keep it moderately dry.

Plumbago capensis.—Flowers pale blue, produced at the end of summer (August and later). Its flowers are very fine, but the plant is of straggling growth, for which there is no remedy except stopping, but if that be resorted to after June the flowers will be few. The plant should be cut-in rather closely in February, keeping it rather dry for about a fortnight, and then encourage growth by copious waterings and free syringings. A good growth being made, water sparingly, and this check will generally induce flowering. After November keep it dry. Soil turfy loam two parts, one part leaf soil, and one part sandy peat, with a free admixture of sharp sand, and good drainage.

Rhynchospermum jasminoides.—Flowers white and fragrant, in July. It is very useful for bouquets. Water freely when growing and flowering, and in winter keep it dry, but not so as to affect the foliage. It requires good drainage, and a compost of two parts fibrous light loam, one part sandy fibrous peat, half a part each of old cow dung and lump charcoal, with a free admixture of sharp sand. It will hardly need pruning in ten years, and then cut out the old worn-out shoots and encourage fresh ones.—G. Abbey.

IMPORTANCE OF AN INTEREST IN GARDENING AND NATURAL HISTORY TO THE YOUNG.

I lately held converse with some of the men who will leave their marks for good on the times. Singularly enough the above was the theme that occupied the attention of several of them, and it was said that enough had not been done in this direction in "our Journal," and that as a beginning I ought to say a few words on the subject.

I feel the importance of giving a right tone in this direction to the young of both sexes in all ranks of society. In one sense this is more necessary in the case of the children of the artisan and the more humble labourer than in the case of those more favoured by circumstances, or who have had the benefit of a more extended and finished education, which would naturally open up wider sources of investigation and enjoyment.

I would strongly recommend all such encouragement from three considerations. First, it is necessary, for the health of body and mind, that both should be employed, and the more employed the better, provided we do not go to such extremes as to transgress the laws that must ever regulate our physical and moral well-being. Secondly, the study of the simple, the natural, the pure, and the beautiful by the young will be one of the best antidotes against the indulgence in gross and debasing pleasures. Many a lad and many a man seek pleasurable excitement in channels that will ultimately be ruinous, who might never have cared for such indulgences if other sources of excitement of a more mellowing character had been presented to his notice, such as a book to read, a garden to clean, a plant to tend, a bird to feed, a beautiful insect in all its wondrous transformations to study. And lastly, call it contractedness or selfishness if you will, still it is no less a law of our humanity, especially strongly manifested in the young, but never absent even in the case of the old, unless the heart has become old and as much shrivelled up as the half-mummied body—the law manifested in the fact that to insure anything like enjoyment we must have something to care for, something to pet, something to love, something that in a proprietary sense must be inherently and peculiarly our own. And thus, on the same principle, if the object petted be a living thing capable of responding in some measure to our cares for it, the more attractive it will be. I can recall to recollection many instances in which the sportive kitten, the cosy tame rabbit, the faithful affectionate puppy, the kiss-and-kise-me dove and pigeon, the favourite strutting cock of the yard, or the still more aristocratic bantam (but whose love to his owner was even greater than his assumed dignity), the high warbled cheering note of linnet and canary when a certain knock was heard at the door, and more especially when a certain head and shoulders showed within it; the appearance of the window plant after its roots were watered and its leaves were washed, cleaned, and sponged, and when every bit of flower and foliage seemed to look you in the face and say, O, how I thank you for your care!—I can recall to memory instances such as these which have exerted a more mellowing kindness-securing and kindness-diffusing power than could be realised by looking on the finest painting or sculpture, or beholding the most magnificent scenery the world can afford; and chiefly because these living things could make a return for the care bestowed, and because, also, the possessor could look on each or either as his or her very own.

With all our contest with flinty selfishness, the moral reformer will be sure to fail if he do not bring even this strong self-appropriating feeling to work for him rather than against him. I have known of hard-featured orange-nut-and-cake basket women in the streets of London shivering with cold, shivering still more because they found themselves alone and destitute of human sympathy (though living as it were in passing crowds of men and women) who would deprive themselves of what they really wanted that they might take home the accustomed piece from the catsmeat man to the little pussy in the little room that purred and mewed its satisfaction, and did its best to enliven the room, otherwise so poor and so dingy. No neighbour's cat could have so cheered the lone woman. And in a similar case when the poor woman went home to her garret in St. Giles's, having sold little during the day, with little for her supper, with visions of a frowning landlady about the not strict payment of rent to the day and hour, and she found her heart hardening, sinking, and despairing, because no one seemed to care for her—what a relief it was to her for the tear to find its way down her furrowed cheek as she watered and washed the leaves of the pretty plant in the broken teapot in the window, and found herself in imagination away at the cottage in the Wolds, and in meadows gay with Buttercups and Daisies, whilst every clean and flourishing leaf spoke of cheerfulness and the foreshadowing of happier days! The plant became what it was to her because she attended to its every want, because it was exclusively her own. The finest plant in a gentleman's garden would have exerted no such mellowing, humanising power.

Now for a few simple deductions. Damp not, but encourage all such tastes for pets, be it bird or plant, even in very young people. I have known gardeners greatly annoyed because young ladies and gentlemen were always troubling them about seeds and plants for their gardens, and food for their pets, &c.; and such a mess they did make of it all! Order and good management require that the children should not interlope or interfere on the gardener's domain proper; but surely a place could be set aside for the young folks, and a particular place or position awarded to each, that each might do the best, and carry out a particular hobby without interfering with the peculiar leanings of his neighbour; and all this it is wise in every way to encourage. It is well to encourage sympathy between the highest and the lowest in station, and the young lady and the young gentleman who labour in their plots until thoroughly exhausted may well be expected to feel more sympathy with the working man than the young gentleman who has never had his hands blistered or his shoulders aching from wielding a mattock, using a spade, or trundling a heavily-loaded barrow.

Again, I have often found mothers, and fathers too, so objecting to their young folks having any pets of their own, that to carry out the natural craving it had to be indulged-in in a concealed sort of way—a very bad thing, for in every matter it is well that the most perfect confidence should exist between child and parent. "I might as well have a perfect Babel as these screeching and howling sounds. A managerie with its filth and odours could be no worse than my boys pester me with, with their beasts and birds in every corner they can get hold of," said a mother not long ago. Ah! but mother, if you arrest the gratification of such tastes you might have tastes formed for other things that will give such pulls at your very

heart chords, that in comparison the screeching you complain of would be the sweetest music. Direct all such tastes aright, and you may wield a mighty power on your loved young ones for fostering habits of order, of attention, of thoughtfulness, of cleanliness, and kindness. Be assured that the boy or girl who will allow a bird to pass unheeded its usual feeding time, who will allow it or its cage to be encrusted with filth, who would act cruelly to animal or insect, is not the most likely to be very careful not to wound the feelings of his or her fellow-creatures in future life.

In the country even the humblest may less or more indulge the gratification of such tastes, but in our large towns, where room is so scarce and dear, such humble people must pretty well confine themselves to the smallest birds, and to plants inside and outside the windows. For this, in the case of the plants, little more is required than constant attention, and a peck or two of fresh soil obtained, if in no other way, from the roadsides of some suburban highway. When such plants are grown for their own sakes and the pleasure they confer they will ever exert a power in arresting the indulgence in the low and degrading, and the culture of them, therefore, should be encouraged in every possible way.

Previous to the conversation referred to I had not been able to open the Journal of the 13th, and therefore did not see the account of the Children's Flower Show at the Victoria Docks, or the more-than-interesting comments of the "WILTSHIRE RECTOR" (so like him) at page 26; but as he is very anxious to receive hints as to the managing and conducting such societies and shows to the best advantage in town and country parishes, I hope that those experienced in such matters will kindly aid him, as I have had no personal experience in this promising field.

In conclusion, I would add that the poorest and humblest of us have our feelings, and that therefore the more a warm sympathy is developed in unobtrusive deeds rather than as a matter of ostentation, the more that a kind patronage is felt rather than paraded, the more that a kind regulated help is given so as to enable the poorest better to help themselves—the more likely will be success to follow all such well-meant benevolent effort.—R. FISH.

THE NIGHT-BLOOMING CEREUS.

I WISH to ask particulars as to the situation, aspect, &c., in which is growing the fine specimen of Cereus grandiflorus described by Mr. Maitland, at page 28. If he can give particulars of its native country I shall be glad, as I have in my collection three plants, all under the name of Cereus grandiflorus, and all different. One plant came from Demerara, one from New Providence, and one from an English collection, and under any circumstances I shall much value the details of culture, as I have never had more than three flowers upon either of my plants in a season.—C. M. MAJOR.

[In reply to your correspondent, the situation in which the plant is growing is the south end of the plant stove. It is planted-out in a border 18 inches wide, by 9 feet long. The compost which I use consists of one-fourth old lime rubbish, one-fourth broken bricks and charcoal, and one-half fibrous loam, well mixed. As regards culture, plenty of moisture is given while the plant is growing, and until it has completed its fresh growth; then I gradually withhold water until the end of September, from which time up to March the plant is left perfectly dry. The native country of this Cereus is Jamaica, and the plant we have came from there. Its flowers are white, and have a strong Vanilla scent. Any further details I will give with pleasure.—ROBERT MAITLAND, *The Gardens, Pendyffryn, near Conway.*]

THE BOTANY OF LOWER WHARFEDALE.

BEING on my summer's ramble, and a great lover of natural history, I took up my abode at Barden, Skipton-in-Craven, on the lower part of the "lordly Wharfe," beneath the barren and rugged gritstone heights of Simon Seat and Barden Fell, contrasting well with those aged and noble groves that overhang the rocky river, and the fertile and luxuriant foliage beneath. The natural woods of the hillside are chiefly Oak, with more Rowan and Birch, and less Hazel and Ash, than across the river in the limestone dales. The principal Mosses of the stream are Racomitrium aciculare, Hypnum flagellare, and Hypnum palustre; the bogs upon the hillsides abound in Sphagnums, Bartramia fontana, Bryum ventricosum, Hypnum fluitans, and cuspidatum, here and there Mnium subglobosum, and the moss-covered walls abound in Weissia, Dicranum, &c.

Within an area of only 100 acres, I never in all my botanical rambles met with so rich a display of plants and Ferns; and as many may be seeking quiet and repose, and may wish to refresh their memories, or become acquainted with botany, I am induced to send a list of the flowering plants and Ferns which surround the comfortable farm house in which myself and family have taken up a temporary abode.

Towering mountains, extensive forests, and rapid streams, constitute a grand and awe-inspiring scene, while we

> "Sit by mossy mountain
> Where a sweet stream has birth,
> And look around with admiring eye
> On the lovely things of earth,—
> The Lichen, the Moss, and the mountain flower,
> And the wild bee revelling there."

On the antiquities of the district I will not dilate, but simply mention Ilkley, with its Saxon crosses and Roman encampments, Bolton Abbey and its princely demesnes, Barden Tower, and Kilnsey Hall. All tend to make this now-easily-accessible place one of the most delightful summer residences in the north of England.—D. FERGUSON, *Coatham, near Redcar, Author of the "Natural History of Redcar."*

P.S.—In my garden with a north-west aspect, Cineraria maritima, Silene pendula, Lasthenia californica, Calceolarias, and seedlings of self-sown Geraniums, endured the winter, which was very severe.

PLANTS OBSERVED AT DUBLEY, IN THE HIGHEST PART OF LOWER WHARFEDALE.

Verbascum Thapsus
Centaurea acabiosa
Orchis conopsis
ustulata
bifolia
maculata
Scabiosa succisa
Thalictrum flavum
Geranium sylvaticum

ROSES AT THE JERSEY EXHIBITION.

I SEE in your number of the 20th inst. that "TOURIST" remarks on the absence of medals for Roses, and the fact (?) of the Exhibition having been founded on the Rose Show. As I was Judge of the fruit and flowers I can assure you that these statements are not correct. A bronze medal was actually awarded to the best blooms of Roses, and the show of these merited no more. The Exhibition was founded on the show of Channel Islands' cattle.—T. C. BRÉHAUT, *Richmond House, Guernsey.*

AMERICAN EARLY ROSE POTATO.—My experience of the Early Rose Potato is the same as that of Mr. T. J. Harrison (page 26).

I have it side by side with Kidneys and Jersey Blues. The Early Rose is badly blighted, neither of the others touched, nor have I heard of blight about here as yet.—W. L., *Birchington.*

THE PROGRESS AND CONDITION OF THE ROYAL GARDENS AT KEW.

The following are extracts from the Director's report for 1870:—

The total number of visitors in the year 1870 has been 586,835, as against 630,594 in 1869, and 502,369 in 1868.

Total number on Sundays	265,585
„ on Week-days	321,250
	586,835

Greatest Monthly attendance (June)	145,029
Smallest Monthly attendance (December)	2,871
Greatest Week-day attendance (Whit-Monday, June 6th)	41,572
Smallest Week-day attendance (December 9th)	11
Greatest Sunday attendance (June 5th)	19,365
Smallest Sunday attendance (February 13th)	70

Number of Visitors in each Month of the Year 1870.

January	4,971	Brought forward	422,723
February	5,494	August	74,831
March	10,487	September	58,119
April	88,557	October	21,706
May	65,307	November	6,585
June	145,029	December	2,871
July	102,878	Total	586,835
Carried forward	422,723		

1. Botanic Gardens.—The improvements in the laying-out of the grounds of this department, which have been in progress for the last five years, are now nearly brought to a close by the remodelling during the past year of the herbaceous ground; by the construction of the Rose walk, 215 yards long, along the wall bounding the herbaceous ground on the west, which has been heightened by the addition of 3 feet of pierced brickwork; by the fencing-off of the reserve ground; by the completion of the terrace on which the new range of stoves, &c., stands (which is, however, only partially planted); and by the formation of the paths leading to this. Many Pines and other evergreen trees have been transplanted, chiefly by the transplanting machine, and placed as screens to shut out the view of the backs of the houses on Kew Green, and the fronts of those along the Richmond Road; and many deciduous trees have been introduced along the walks; large beds of Rhododendrons, Laurels, and other shrubs have also been planted along the principal paths.

An attempt has been made to utilise the Deodars, with which some parts of the garden were too much crowded, by placing a number of them at equal distances along a line concentric with the Yew fence which encloses the Palm-house area, leaving a broad grass walk between the fence and the Deodars. Similarly many of the scattered Atlas Cedars have been transplanted, and now form an avenue along the curved walk leading to the back of the old Victoria house. Other Conifers, together with the scattered Wellingtonias, have been planted along the vista which leads from the west door of the Palm house to the great Cedar in the pleasure grounds.

Large beds of mixed flowering, evergreen, and deciduous shrubs have been planted on both sides of all the gates leading through the wire fence into the pleasure-grounds, and in other exposed places, with the view of mitigating the effects of the hot summer winds and cold winter ones, which since the denudation of the grounds by the loss of trees and old shrubberies, every now and then devastate the gardens. The terrace on which the Palm house stands has been re-levelled for the first time since its construction in 1846; its angles have been filled with large beds of Laurels and Rhododendrons, and the whole terrace bordered with Ivy.

A great deal remains to be done in bringing the many young trees that have from time to time been planted in old shrubberies and on the lawns into picturesque groups, and many more have still to be introduced. Most of the old shrubberies want renewal or clearing away, and the American garden behind the Palm stove, which has suffered severely from the summer drought, requires replanting throughout.

The banks of the ornamental water are constantly being washed away by the ripple, owing to the depth of water close to them; they should be wattled and planted with clumps of Osier, Sedge, &c.

2. Pleasure Grounds.—The effects of the long and severe summer's drought on the old trees in this department have been disastrous; they have perished by hundreds, Elms, Ashes, Beeches, and Sycamores especially; many, no doubt, from having approached the limits of the age which such trees attain on so excessively poor a soil as that of Kew, but more, perhaps, through having been drawn up in thick plantations, and thus starved from the first.

Active steps have been taken to clear large areas of dying and dead trees, to trench the ground, and clear it of old roots, and plant closely a mixture of young trees of all sorts, which will be thinned out as they grow. This operation has enabled me to arrive at an approximate estimate of the ages of some of the more common trees in these grounds, and of the average duration which the several sorts have attained.

The oldest trees in the grounds are undoubtedly Oaks, English Elms, and perhaps Hawthorns, of which some of the first and last may be relics of the aboriginal forests that covered this part of England; whilst the oldest of the Elms were undoubtedly all planted. No data have been obtained for ascertaining the age of the Oaks, but probably none exceed three hundred years, and the majority date from the reign of George II. The only large ones that remain are several near the Brentford Gate, one near the upper end of the lake, and several near the Queen's Cottage grounds.

The largest English Elms of which the rings have been counted are about two hundred and fifty years old, but there are a few near the Palace gates which have probably attained three hundred years. Of these the top of that nearest the gates was blown off this winter, and the stump removed; but the butt was too far decayed for its rings to be counted. All the old Elms in the grounds and their outskirts are in rows, and were either planted along former walks, or came up in hedgerows, and were spared when the domain was enclosed and the hedges removed. Of Elms under two hundred years old there were innumerable examples throughout the grounds; these were for the most part suckers from the roots of older Elms, which, coming up amongst other and better trees, have done irreparable damage to them; the English Elm being of all plants the most impoverishing in light soils.

Of the old Hawthorns, the last fine one perished during the summer's drought; they abounded at one time on the gravelly parts, and appeared to be of the same age as the old Richmond Park Hawthorns.

Beech, Oak, and Maple are the only other trees that have sprung up spontaneously in the grounds, and all from originally planted trees. The oldest Beeches were planted in George II.'s reign, and are about one hundred and fifty years old; but of these there are very few indeed; the largest of them is a magnificent tree near the Brentford Gate, with a trunk 10½ feet in girth at 5 feet above the ground; its branches, which sweep and root in the ground, form a circle 116 paces in circumference. It is showing signs of decay.

The majority of the Beeches, which formed eight-tenths of the arboreous vegetation of Kew, are part of an extensive and dense plantation, made about 1750, but which, having been wholly neglected during the succeeding hundred years, have impoverished one another to such an extent that the majority are already diseased and fungussed. It is upon this Beech forest that the winter gales and last summer's drought have told most heavily; the majority, having no root-hold, could not resist the blasts, and the loss of one is immediately followed by that of its neighbours, both from the admission of the wind, and from the sun's rays drying and heating the surface of the previously shaded soil over their roots.

Of other trees there are several good Limes, Evergreen Oaks, Spanish and Horse Chestnuts, all from one hundred and fifty to two hundred years old; these trees have thriven well, and last long in the soil of Kew. The Ashes, Poplars, Acacias, and Willows average only from one hundred to one hundred and fifty years, and the Birches sixty to eighty years.

The only good Coniferous trees of any age at Kew are Cedars of Lebanon and Larches; many of the former were planted about 1750, but of these not a dozen remain; the largest having attained a girth of 11 feet at 5 feet above the ground. The Spruces, Scotch Firs, Pinasters, and Weymouth Pines have all been ruined by being crowded amongst forest trees. The Hemlock Spruces, with which the path by the Richmond Road was ornamented twenty years ago, are everyone dead; the last, which stood near the Pagoda, having succumbed to the drought of the past summer. Of Planes there never were many; a few fine Orientals, planted in 1740—50, remain in the King of Hanover's grounds, one near the old Palace, and one near the Temple of the Sun.

The above comprise all the trees of which there were any quantity in the grounds previous to their being made over to the public in 1845; since which time four-fifths have either died or have been removed to make way for buildings, avenues, paths, &c.

Between 1840 and 1865 many efforts were made by my predecessor to keep up the sylvan scenery of the pleasure grounds, by planting Conifers amongst the old trees, in every available open space, especially Deodars, Cedars, Scotch, Douglas, Austrian, Corsican, and Weymouth Pines, Pinus longifolia, Smithiana, and Spruces of various sorts, besides forest trees innumerable; but as permission could not be obtained, either to make sufficient clearances or to disturb the roots of the old trees by trenching the ground, these plantations have utterly failed. On the other hand, he covered many acres of unoccupied land, by the river and elsewhere, and in the Queen's cottage grounds, with plantations, which have all done well, and are now being thinned, by transplanting young trees from them to fill the clearances which are being made elsewhere.

Eight hundred yards of "blind paths" for carts, &c., have been made through the woods, with gravel from the lake beds.

The lake in the pleasure grounds, which was half finished in 1869, has since been completed, and the whole of the ground on the south side of it cleared, covered with good soil, and prepared for the formation of the new pinetum, the planting of which will be begun forthwith. In reference to this pinetum I have to state that, as no complete public arranged and named collection of hardy Conifers exists in

England, the establishment of such a one at Kew is looked forward to with much interest by both collectors and nurserymen. Of the latter, two of the most eminent, Messrs. Lawson, of Edinburgh, and Dickson and Turnbull, of Perth, have presented to the Royal Gardens specimens of every species and variety that was to be found in duplicate in their extensive collections. Mr. M'Nab, of the Edinburgh Botanic Gardens, has also sent many valuable plants for this department. Many thousand loads of good loam from the lake bed have been carted to those parts of the grounds, especially on the east side, where the soil is excessively poor, preparatory to forming new plantations, and the rest of the soil has been put round the roots of the trees wherever it was thought advisable.

3. Interchange of Living Plants and Seeds.—The demands upon this establishment, especially from India and the Colonies, for tropical and temperate plants and seeds; and from planters, forest and garden superintendents, for information of all sorts, increase annually; and these demands are of so miscellaneous a nature that it is often difficult to keep up with them.

Six more active and intelligent young gardeners have been sent to the Cotton, &c., plantations in India, in which country there are upwards of thirty former Kew *employés* engaged in various departments of horticulture and arboriculture. A skilful gardener has been sent to the Botanic Gardens in Jamaica, which are being revived under the energetic government of his Excellency Sir J. P. Grant; and another to take charge of the Agri-Horticultural Society's Garden at Madras.

The success of the Cinchona experiment is now fully established in the Sikkam-Himalaya, the Neilgherries, Khasia Mountains (East Bengal), Ceylon and Jamaica. The bark from the first-named localities has commanded a price equal to the Peruvian in the English market; nineteen cases of red bark from Darjeeling having been bought by Messrs. Howard & Sons for 1*s.* 9*d.* per lb., which these gentlemen inform me is what South American bark of the same age would have fetched. No less than a ton of prepared bark has been sent to London from Ceylon, the produce of seeds sent to Dr. Thwaites from Kew in 1861.

I was assured by the late Dr. Anderson, Superintendent of the Calcutta Botanic Garden, and the successful introducer of the plant into Sikkim, that it will in a very few years be produced there in any quantity at the rate of 3*d.* per lb.

I continue to have demands for Cinchona seed from many quarters, which I am enabled to supply from seeds ripened in the Ceylon plantation under Dr. Thwaites's superintendence.

Great exertions are being made by the Indian Government to introduce the Ipecacuanha plant into India; in which operation this establishment has been called upon to take an active part. This is due, partly to the limited and uncertain supply of the drug received from America, and more to the revival of the old practice of administering it in large doses in cases of dysentery, upon which it acts as a specific. It is a singular fact, that the introducers of the Ipecacuanha into European practice, the Brazilian traveller Marcgrav and the physician Piso (in 1648), explicitly stated that the powder is a specific cure for dysentery, in doses of a drachm and upwards; but that this information appears never to have been acted upon till 1813, when Surgeon G. Playfair, of the East Indian Company's service, wrote testifying to its use in these doses. Again, in 1831, a number of reports of medical officers were published by the Madras Medical Board, showing its great effects in hourly doses of five grains, till frequently one hundred grains were given in a short period; testimony which, notwithstanding its weight, was doomed to be similarly overlooked till quite recently, when it has been again brought directly under the notice of the Indian Government, which is making very vigorous efforts to introduce the culture of the plant into suitable districts of India.*

The numbers of plants, seeds, &c., sent out, is as follows:—

Hardy trees and shrubs	1494	Packets of seeds.....	4911
Stove and greenhouse plants	5186	Ward's cases	34
Herbaceous plants.....	1317	Recipients	150

The receipts have been:—

Hardy trees and shrubs	971	Seed packets	2676
Stove and greenhouse plants	1409	Ward's cases	30
Herbaceous plants	1219	Donors	152
	3599		

The greater proportion of plants sent out has been to Jamaica, Ceylon, India, Australia, Algeria, the United States, and to continental gardens; of seed to all the colonies, and the United States; and of Ward's cases to the West Indies, Australia, and Natal.

A very extensive correspondence was commenced last year with H. Capron, Esq., the active commissioner of the Department of Agriculture of the United States of America, by which means a vast number of American seeds, and especially of Californian and Rocky Mountain trees, have been procured and distributed to the colonies.

Messrs. Booth, of Hamburgh, have presented a second selection of the rarer European and American forest trees of their nurseries to the Arboretum, including many kinds that are not to be found in English collections. It is a curious fact that the rage for introducing Coniferous trees into English parks and gardens has almost extinguished the culture of all but a few deciduous trees; and I have now to apply to foreign nurseries for the rarer Maples, Oaks, Ashes, Limes, Poplars, &c., which were so extensively planted in English parks in the early part of this century, and which when the Kew Arboretum was made in 1840-50, were to be procured at the suburban nurseries. Messrs. Lee, of Hammersmith, have promised a full set of their hardy deciduous trees, &c., and Mr. W. Paul, of Waltham Cross, and others, have most liberally supplied many deficiencies.

Besides the above, the following contributions are of special value, or interest—viz.

Mr. C. F. Carstensen, H.B.M. Vice-Consul, Mogador; the true Euphorbium of commerce, the drug of which has been imported into Europe for upwards of two thousand years, whereas the plant producing it was never previously known to Europeans. Seeds of the Argan tree.

M. Kuffmann, Botanic Gardens, Moscow; live plants of the drug Sumbul, from Central Asia, another important medicine, whose origin was previously unknown.

A third hitherto unknown plant, yielding a drug of the greatest value, has been for the first time introduced into Europe during the past year—namely, the true medicinal Rhubarb, from Western China; of which a healthy live plant has been received from the Jardin d'Acclimatation of Paris.

4. Museums.—The substitution of printed for written labels throughout the collections is being proceeded with. An improved method of mounting the specimens of seed-vessels, cones, &c., is being carried out, which will greatly facilitate their inspection, and at the same time improve the appearance of the collection. Methylated spirit is being used for preserving the fleshy fruits instead of acetic acid, which it is found does not permanently prevent decomposition.

5. Herbarium and Library.—About ten thousand specimens have been received, chiefly as donations, in this deparment.

(Signed) Jos. D. Hooker, *Director.*

* I am indebted for most of these facts to my friend, Dr. Christison, F.R.S., who informs me that he has habitually referred to them in his courses of University lectures, and has long wondered how it was that medical men should have so long and so obstinately shut their eyes to this truth. The merit of proposing the introduction of the Ipecacuanha plant into India, is, I believe, due to Dr. Murray, Director of the Medical Staff of the Indian army, and the operation was being energetically conducted by Dr. Anderson, late Superintendent of the Calcutta Botanic Gardens, who at the period of his untimely death (in October last), had procured a large quantity of plants for transport to India.

NOTES AND GLEANINGS.

The Vice-Chancellor Sir R. Malins has made an alteration in the constitution of the Managing Committee of the Oxford Botanic Garden. A petition was presented by the University of Oxford, the Vice-Chancellor of the University, Dr. Liddell, and the Professor of Botany there, Mr. M. A. Lawson, for the purpose of obtaining a variation of a scheme made in pursuance of a Master's report, dated in 1833, whereby a perpetual committee, consisting of the Vice-Chancellor, the Proctors for the time being, and the Regius Professor of Physic, with "the seven seniors resident upon the physic line," was established for the management of the Physic Garden at Oxford, in accordance with the will of Dr. William Sherrard, made in April, 1728. Dr. Sherrard by his will gave £3000 for the maintenance of a Botany Professor of the Physic Garden at Oxford, upon condition that the University should settle a perpetual fund for maintaining the garden. A suit was instituted shortly after Dr. Sherrard's death, in which it was settled that the University should pay £150 a-year for keeping up the garden in question, and the Royal College of Physicians were appointed visitors of the gardens. It was now proposed that the Committee constituted as above mentioned should be replaced by three resident members of Convocation, who should be nominated by the Vice-Chancellor and Proctors of the University, subject to the approbation of Convocation, and should hold office for ten years, and be styled "Curators of the Botanic Garden." The Vice-Chancellor approved the proposition, and made an order to carry it into effect.

—— It will be perceived by our advertising columns that a supplemental Rose Show will be held at the Crystal Palace on August 5th, but we have been favoured with no further information on the subject.

—— The Cultivation of the Poppy in China, which has been more than once prohibited by Imperial edicts, appears to be increasing everywhere, and becoming a profitable trade. In Szechuen, where the climate is warm and the season early, two crops at least are produced on the same ground annually. The seed of the Poppy is sown in February, the plants flower in April, and the fruits are so far matured by the middle of May, that the juice is collected, and the stalks removed and burnt directly after; but previous to this the second crop, which may be either Indian Corn, Cotton, or Tobacco, is sown, so that almost by the time the Poppy is cleared from the field the new crop makes its appearance. The profit derived from the cultivation of the Poppy is not only the result of a fair market value

and a ready sale, but also from the fact that much of the work in the plantation, especially the gathering of the juice, can be done by the children of the family. The scratchings or incisions being made in the capsules in the morning, the juice which has oozed out in the course of the day is collected in the evening, and after simply exposing it to the sun for a few days it is ready for packing. The seed not required for sowing is used for food.—(*Nature.*)

—— Metropolitan Floral Society.—"D., *Deal*," states, in answer to many applications, that the schedules will be sent from the Crystal Palace to all previous exhibitors, that he will send off those for other applicants as soon as he receives them, and that the Show is fixed for the 30th and 31st of August, instead of the 24th and 25th as previously announced.

—— Fertilisation of the Bee Orchis.—Mr. Darwin, in his "Fertilisation of Orchids," states his belief that the Bee Orchis presents a physiological difference from all other British Orchids, and is habitually self-fertilised. I had, yesterday, an opportunity of observing a number of these plants in one of its abundant localities in Surrey, and at a time when fertilisation must have been completed. In every plant almost all the capsules were considerably swollen, and were loaded with apparently fertilised ovules. In most of the withered flowers the remains of the pollinia were still visible in the position described by Mr. Darwin, hanging down before the entrance to the nectary, in immediate proximity to the stigma, and rendering it almost impossible to believe that the flower had ever been entered by any insect of considerable size, which must inevitably have carried away the pollinia with it. The fact that the Bee Orchis, the most "imitative" of all our native plants, is never visited by insects, is a very suggestive one. If, as might well have been assumed, the object of the "mimicry" is the attraction of bees, the device appears to have signally failed.—Alfred W. Bennett.—(*Nature.*)

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 13.

Really one cannot feel at all surprised that agriculturists and horticulturists should utter some complaints at the weather we have had throughout a great part of the spring and summer of 1871. We look usually—shall we say it?—for a display of a certain measure of dissatisfaction when we question individuals belonging to either class with regard to atmospheric influences. The weather is an Englishman's topic, often an unpleasant one, and doubly so to a man whose pocket, or whose reputation and his feelings are affected thereby. Conversing lately with a friend who is a gardener, I attempted to check the jeremiad he was indulging in by remarking that he had at least one reason to be thankful—the cold easterly winds and the generally unseasonable weather had, as I perceived by my own observations in the country, done much to retard or diminish the development of insect life. But he was up in arms directly. "That's all you know about it. Certainly there are not many caterpillars, and some other sorts of insects I haven't seen which I mostly see, but there's hosts of flies; and as for the blight, why, there's quantities of it on everything, and what's more, it came with those very easterly winds you're praising up." This was an argument I could not gainsay, and I soon found the truth of his assertion as to the abundance of aphides, for they swarmed both on plant and tree, and are at this moment dispersed, in all stages and of varying ages, over our suburban gardens west and south of the metropolis, the number being beyond the average. Even the Limes and Planes about our parks and squares are thick with them. But as to their being brought by the wind, and an east wind in particular, here I have my doubts, though quite aware that they do perform aërial migrations, as I have myself observed, and as others have recorded instances. My friend seemed half inclined to suppose that blight travelled across the city, and had reached us westerns from the districts in Kent and Essex which are adjacent to London. This, however, is evident from inquiry—that whatever the folks there may have parted with in the aphis line, they have a sufficiency still left.

However, fortunately for us, where aphides most do congregate, thither resort, not only their friends the ants, but also their very numerous enemies. Ladybirds are about just now in force, and also the larvæ of Syrphi. Unfortunately, as it appears, the aphides are more hardy than some of their devourers; and I have seen the Syrphi moving about on a cold day as if they were decidedly uncomfortable and "out of sorts," perhaps suffering from rheumatism, while the aphis tribe about them were digging away most contentedly into the juices of the plants they were attacking. Just now, too, I see many individuals of the Lace-winged Fly (Chrysopa perla), emerging from the pupa condition, and these will soon produce a large family of their descendants, great lovers of aphis flesh. A very elegant yet unpleasant insect is the fly in question, for it can develope under some circumstances an odour which is rather worse, as I think, than sulphureted hydrogen. Not always is it thus odoriferous, and one observer has suggested that it is a sexual peculisrity. Not unfrequently a specimen of it will be brought to an entomologist by some friend with the exclamation, "See, here's a beautiful fly!" To this the response naturally is, "Oh, very much so! but I would rather not take it in my hand, if you will excuse me."

It is so frequent an occurrence to find the Hawthorn hedges defoliated in May and June that even naturalists do not always have their attention drawn to the fact, and observe who has been the depredator or depredators, for there are sometimes several at work together. A common offender is the Little Ermine Moth (*Yponomeuta padella*). And not only is this species abundant on Hawthorn and allied plants, but the caterpillars also disfigure and damage various fruit trees with their webs, and contrive thus, by the protection they afford, to escape many of the insectivorous birds while diligently pursuing the employment of stripping the boughs. When this page meets the reader's eyes the moth is in the imago state, and quantities of these small, and certainly pretty Ermines may be seen fluttering about around the spots where they had lived as caterpillars, intent on providing for the continuance of the species, a subject in which the horticulturist may be expected to feel little sympathy. A few weeks since the caterpillars were approaching maturity, and I saw thousands of them on Apple and Pear trees in different parts of Surrey. Professor Westwood has informed us that in the north of France, some years since, the Apple trees for miles were defoliated by these troublesome creatures, which are fortunately rendered sufficiently visible by their webs after they are a week old. Upon a web being pulled down some of the inmates are sure to escape, and, getting off, establish fresh colonies, for the caterpillar of the Little Ermine drops by a thread when alarmed, and reaches the ground if it can. However, a diminution of their numbers may be thus made, and more especially should the trees be examined when the insects have entered the pupa condition, for precautionary measures then taken may save the trees from much injury the following season. It is usually the habit of these caterpillars when ready to change, to spin up in the common web, each making for himself an inner encasement of silk. Some few straggle off to walls, palings, and odd nooks. The web, or social tent, spun by the caterpillars of the Little Ermine is more annoying than that produced by other gregarious species, because it is generally extended indefinitely. The Lackey, for instance, spins its web, and when food near it gets scarce the brood migrate and form another. In the species before us a sort of offshoot is made from some angle of the web, by means of which more leaves are enclosed; and thus they proceed every day until quite a mass of silk is produced, intermingled with the cast-off skins and the excretions of the caterpillars. One writer on entomology has stated, that "the mass of silken threads and webs is of such a size and toughness that even the very sparrows can scarcely make their way through them when they alight on the tree." In this, however, there is some exaggeration.

Yponomeuta padella.

The eggs of the species, though laid in the summer on the twigs, are not hatched until the succeeding spring. So far as I have observed, the broods which appear from the different patches of eggs fraternise freely with each other; and a caterpillar, which has by some mishap been turned out of house and home, is received without question into the first colony whither he can make his way.

Amongst the annoying insects which certainly seem to have become more abundant here of late years is the common Crane Fly or Daddy Longlegs (Tipula oleracea), the ravages of which formed a subject of comment with that most worthy of the older naturalists, Réaumur. He noticed that in Poitou the

grass of extensive districts was destroyed by means of the larva, so that the cattle suffered severely. He entertained the delusive notion that it fed upon earth, and only injured vegetation by its mining operations. Mr. Stickney was able, however, to assure Mr. Kirby that it devoured the roots, and that the administration of very large doses of lime had little effect upon it. Mr. Kirby adds, that under the vague name of "the grub" two species are confounded—namely, Tipula oleracea and cornicina; and others also, we might now say, though the former species is the most troublesome and unfriendly to the gardener as well as the agriculturist. Many a lawn and grass plat have I seen scathed by the insidious work of these larvæ; and in one instance, in particular, going through a public garden, where a new path had been cut through some turf, I was amazed at the dense and disgusting masses of Tipula larva which were laid bare. Describing the ravages of the species at Holderness, Mr. Kirby speaks of having counted 210 grubs in a single square foot; but though I cannot claim to have made an exact calculation, I believe that in the case referred to the number was still larger, so closely were they packed together. Even under favourable circumstances only a proportion of these reach the perfect condition, being diminished in number by various parasites, and they are also a favourite article of food with birds. Rooks especially, when hunting for them in the fields, are scared away or perhaps shot by the ignorant, or, it may be, by the better educated, on the supposition that they are attacking the vegetation. As Mr. Newman suggests, the best remedy for this and other insect pests is the encouragement of birds. For use on a small scale he recommends water in which Walnut leaves have been boiled, and a weak solution of carbolic acid has also been proposed.

A few years back some consternation was occasioned in one of our London parks by the subterranean proceedings of Tipula oleracea, large patches of the ground presenting a dismal appearance. The Minister was questioned regarding the matter in the House, and he replied with calmness and a delightful absence of scientific knowledge that there had been a "plague of insects," but that proper remedial measures were being taken. In spite of these the species still frequents the grassy slopes of Hyde and St. James's Parks, where the perfect insect furnishes much amusement to youngsters from the decided indifference it shows as to parting with its legs—a rather awkward case for those who believe in acute insect sensibilities. —J. R. S. C.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 19.

DRAWING PLANS.

To draw and transfer *fig.* 42 to the ground. Draw lines E F and G H at right angles; draw square *a*, *b*, *c*, *d*. From centre *o*, being the point where the two lines intersect, describe a circle; the points where the circle cuts the diameter lines give the points 1, 4, 9, 12. From point 1, with radius 1, 3, draw arc 3, terminating at points *c e*. From the same point, with radius 1, 2, draw arc 2, terminating at points *a* and *c*. From point 9, on the same line, draw similar arcs as arcs 10 and 11. From point 4, on diameter line G H, with radius 4, 6, draw arc 6, meeting arc 3 at point *e*; from the same point draw arc 5, terminating at points *a* and *b*. From point *a* draw arcs 7 and 8; draw corresponding arcs from points *b*, *c*, and *d*. From point 12 draw arcs similar to those drawn from points 1, 4, and 9. Draw the outside circle from centre *o*, also draw lines *m n*, *r s*, *t u*, *v w*.

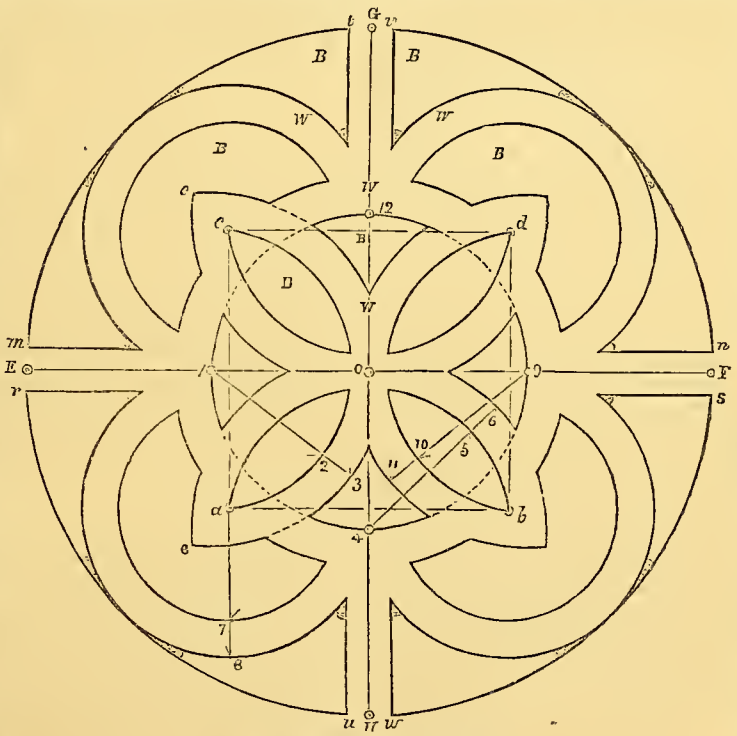

Fig. 42. Scale 16 feet to the inch.

To transfer to the ground the design represented in *fig.* 42. The diameter of the circle is 58 feet. Lay line E F, and bisect it at right angles with line G H; where the lines cross each other insert a peg as at centre o. From centre *o*, with a string 29 feet long, trace the outside circle. Find square *a*, *b*, *c*, *d*, as before described—the side is 23 feet 3 inches—insert a peg at each point, as at points *a*, *b*, *c*, *d*. On each side of centre *o*, on lines E F and G H, measure 13 feet 3 inches, and insert a peg at each point, as at points 1, 4, 9, 12. From the peg at point 1, with a string 15 feet long, trace arc 3, terminating at points *c e*, as shown by radius 1 3. Reduce the string 3 feet, and trace arc 2, terminating as at points *a c*. From the peg at point 9 trace arcs 10 and 11. From the peg at point 4, with the same length of string, trace arcs 5 and 6. From the peg at point 12 trace similar arcs. From the peg at point *a*, with a string 12 feet long, trace arc 8; reduce the string 3 feet and trace arc 7. From the pegs at points *b*, *c*, and *d*, with the same lengths of string, trace arcs corresponding to arcs 7 and 8. On each side of the diameter lines E F and G H measure 18 inches, and insert pegs as at points *m n*, *r s*, *t u*, and *v w*, and lay lines connecting points *m n*, *r s*, &c., thus forming entrance walks from the outside of the circle. Where the lines cross each other are the angles of the beds. The lines are intended to be in Box, as are also the dotted points of the outside beds as shown. B indicates the beds. W the walks.—M. O'Donnell, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

BEDFORD HORTICULTURAL SHOW.—July 20th.

Being somewhat anxious for a holiday and to breathe a fresh atmosphere, I took a short ride in the train from Luton to Bedford, hoping to be cheered up by what I saw, and, what are always so exhilirating to me, the shakings by the hand and the friendly greetings of old and respected friends. On all these points the Bedford Show proved to me to be a red-letter day, to be indelibly marked in my recollection. A good deal, of course, depended on the fine day, for, with plenty of rain before and plenty afterwards, none fell on that day; so that the ladies had no reason for staying away for fear of spoiling their beautiful dresses. I had no sooner entered the horticultural grounds at noon—the agricultural show had opened hours before—than I thought how very clever the Bedford people must be to have all entries arranged,

staged, judged, and the prizes awarded before the great expecting public were admitted; but I found that even for them the hour was too early, and some of the judging had to be done in crowds.

Then, again, I thought how powerless the lords of creation were, even helped by all the bâtonniug, and banter, and sarcasm of *Punch*, to change in one iota the line or the dimensions of a lady's dress. I have had my own notions of the swelled-out ballooning that made a roadway necessary for a single lady; of the danger to your own limbs, if you courted propinquity, from the rubs and thumps from iron hoops; and of the worse than waste involved in having the bottoms of dresses so long as to make the work of the scavenger unnecessary in clearing pathways from filth and dust, as if it were the very height of perfection to turn the skirt of a dress into a sweeping broom. But to the astonishment of such a comparative hermit as I, here were some thousands of beautifully dressed ladies, the width of whose garments at the base would hardly exceed a perpendicular line dropped from the shoulder, and, what is more, the most comely of these dresses were as many inches above the ground level as to show a pretty foot and ankle. The wondrous goddess Fashion seems to regulate these things at will, and when invention is rare just repeats the past. I have a strong recollection of having seen just such dresses many years ago. An old friend of mine, long gone to his rest, used to say that his home-spun, home-weaved wedding coat, which lasted his lifetime for Sundays and seemed little the worse at last—for sheddy was then unknown—had been three times the very pink of cut and fashion. Tastes in gardening matters change much in the same way. With all the excess of hooping a little of it was very good, as it enabled a lady to walk with comfort and ease. We are often surprised that it is not thoroughly seen, that every bundling-up of skirts, holding them up—anything and everything that impedes the free use of feet and hands in walking, just so far interferes with ease and gracefulness of motion, and thus lessens the attractions of the sweetest flowers of earth.

Though Agriculture and Horticulture are such twin sisters that they ought to go hand in hand with each other, we have had reasons for coming to the conclusion that it was not advisable for them to have their great fête days at the same time; the greater interest was so apt to overshadow the less if more attractive one. There seemed no room for such a surmise at Bedford. I know nothing of the arrangements between the sister Societies and saw no schedules, but a mere fence and wicket separated the show grounds of the one from the other, and that of itself was a great advantage; and at whatever show-ground you entered you passed into the other at half price, and to save trouble there were no returns from one to the other. I was told that both Societies were satisfied with the number of visitors, and however the agricultural might have been visited in the forenoon, the great preponderance of numbers seemed to be in the horticultural department in the afternoon. The show of fine stock and of the newest and best implements in the agricultural department was very attractive.

In the horticultural department preparations had been made on the most extensive scale in the shape of tents and marquees, almost sufficient for a metropolitan gathering. If a drenching rain had suddenly come, how the spare space would have been prized! In judging from the quality exhibited, I should hope that in future the lovers of quantity will also be gratified. The show of vegetables from cottagers and gentlemen's gardeners was, as is generally the case in this and neighbouring counties, very fine, well worthy the appellations of good, better, best, and the only difficulty seemed to be, where all was good, to find the best. Kidney Potatoes were shown as if they had been previously cast in a mould, so uniform in size and shape were they; and in Rounds the prizes were awarded to beautiful flattish Potatoes, without showing the indentation of an eye, and only wanting the least thing in length to make them in every feature and look a Kidney. I heard some ladies and gentlemen asking each other what constituted a round Potato, and I heard no satisfactory answer given. No real round Potato with eyes much sunk would have had the least chance with these flattish symmetrical tubers, which are in reality more kidney-shaped than round. Until a clearer definition be given, the great bulk of good round Potatoes that show much of an eye have no chance at an exhibition table. I should be inclined to take the word "round" in its natural sense, and apply it to a Potato where the longest and shortest diameter were as nearly of the same length as possible. I listened to a discussion between two great gardeners, each an authority on such subjects, in relation to the Early Rose Potato, a long Kidney, with eyes rather deep, and a buff-coloured skin. One stated that, for early forcing, with him it beat by a fortnight the earliest varieties of Ash-leaved, Handsworth, &c., and turned out as mealy as a flour-ball. The other contended that in such dripping seasons as this, out of doors this vaunted sort was only fit for cattle. Both agreed it was very prolific. More information would be desirable, especially to all who have but little room to try improved sorts. There was one drawback as respects the vegetables, and especially the Potatoes, none were named, and I heard many inquiries in this direction, that a legibly-written card would at once have satisfied. Societies and exhibitors should bear in mind that visitors come for improvement and instruction as well as pleasure and sightseeing. Some Peas were new to me, but I could not ascertain what they were. The only vegetable I noticed named was a large basket of fine specimens of Laxton's Supreme Pea, not for competition, brought by Mr. Manning, of Tingrith, not from the garden, but his own freehold farm. Taken altogether, whether in separate dishes or collections in baskets, the vegetables were well worth going a journey to see. There were some fine Cucumbers, one brace long and symmetrical, with a small girth, but no name was appended.

As a hint to young gardeners, I may say that if one has to provide for a large establishment, he must make vegetables the first speciality, and fruit the second, for after all our refinement we must eat to live, and thus what satisfies the appetite will ever among the masses have stronger claims than that which merely gratifies the eye.

With the exception of a few good bunches of Grapes for competition, the fruit was chiefly confined to Raspberries, Gooseberries, and Currants. I noticed only two small dishes of Strawberries. True, the table was graced with fine Grapes, Melons, and Pines from Mr. McKay, of Woburn, and Mr. Manning, but these were merely for looking at before going to grace the dinner-table. With the fine gardens round Bedford there is great room for extension here.

The ornamental department was more distinguished for quality than quantity, and here fine foliage reigned supreme over the merely bright in flowers. True, there were fine cut Roses, well-arranged bouquets, baskets of flowers, and floral stands for the table, which I could scarcely see for the crowds round them, and the judging of which when I am concerned, I always desire to escape from, and to give up to a committee of ladies. I think, too, in the country, and especially in summer, the stems of these hand flowers should be real, and the handle not a make-up of wires and sticks. With so much of the artificial, why not have artificial flowers at once? A little dusting and washing would make them always fresh, and the perfume most desired could at once be supplied. There is a danger that we forget the natural too much in wooing the artificial. One great speciality was a number of baskets of wild flowers and grasses, made up, I presume, by young ladies, who each, no doubt, thought she ought to have the one prize of a sewing machine. Pity the judges who were compelled to pass so many and fix on merely one. More interest would have been attached to this attractive feature, if there had been more diversity in the arrangement, if each kind had been kept more separate, and if there had been even an attempt at nomenclature.

In mixed collections of plants Messrs. Wood & Ingram stood first. I had long known the Huntingdon Nurseries to be distinguished for fruit trees, ornamental trees, shrubs, florists' flowers, and small glass houses that turned out immense quantities of small plants, but the size of the plants exhibited showed there must have been great progress in glass houses, &c., since I saw the nursery years ago. Among their plants were a huge dense bush of Croton pictum; a beautiful glossy-green plant of Neottopteris australasica with fronds fully 4 feet in length, and 11 inches in width; a very fine plant of Cibotium Schiedei, with fronds more than 6 feet in length and wide in proportion; a fine plant, with large round foliage, of Verschaffeltia splendida; a huge healthy bush shrub of Croton variegatum; a fine plant with bright green leaves of Dracæna australis; a large plant with fine foliage of Theophrasta imperialis; a good specimen of Phormium tenax variegatum, showing a high flower-stalk with swelling buds; a good plant of Croton angustifolium; more Dracænas, including the white and yellow-edged green-leaved Reginæ; finishing with a noble specimen of Dicksonia antarctica.

Mr. D. McKellar, gardener at Colworth Hall, took the second place for a more mixed collection containing the good old Rush-like plant Russellia juncea, Cissus discolor, Chamærops humilis, Hibiscus Cooperi with finely mottled foliage, Coleus Albert Victor as a pyramid, a very tall standard Fuchsia, Begonia fuchsioides well bloomed, Croton variegatum, and a huge plant of Musa Ensete which must have required a waggon to bring it, and would have needed a tent on purpose high enough to show it off.

Just to show what could be done in very little houses and in very little room, Mr. Sheppard, the well-known nurseryman at Bedford, who had hands and head full enough for one day, had beautiful, compact, yet perfect specimens, fit for the best table decoration, of such plants. A fine bright variety of Ixora crocata, Sanchezia nobilis variegata from Ecuador, with white-striped leaves, Ficus elastica, Dicksonia antarctica, Neottopteris nidus, Eurya latifolia, Clerodendron Balfourii, Pandanus elegantissimus, Pteris cretica, Allamanda neriifolia, Caladium Chantini, and a pretty little plant of Pandanus javanicus. Many would be frightened at the room required for large specimens but might take courage and find space enough for such compact little specimens as the above. Mr. Sheppard, among a mixed collection, chiefly of hardy Ferns, exhibited a nice little shrub with white corymbs of flowers, called, I think, Sweetia caffra, that seemed as if it would like an intermediate house.

Besides what I have noticed, the bulk of the plants in pots consisted of Ferns, Mosses, and Coleus. Owing to the pressure I could not catch the names of the different exhibitors who showed nice plants; but Mr. McKellar, who was not afraid to bring the Musa Ensete, had less reason to dread bringing huge Ferns from Colworth, thus standing first. For instance, the name has escaped my memory of a fine Fern with a diameter of head 8 feet across; a Lomaria gibba, with a pretty head, 5 feet in height and 6 feet across; a fine dense plant of Gymnogramma chrysophylla with a diameter of head of 6 feet; an Adiantum formosum, 8 feet; Adiantum trapezoides, 8 feet 6 inches; and a noble specimen of the Bird's-nest Fern, Neottopteris nidus, close on 9 feet in diameter of head, length of average-sized leaves 5 feet, and width of each across, 11 inches. Then among hardy Ferns there were the cambricum variety of the common Polypodium, 2½ feet

across; and Polystichum proliferum angulare, 6 feet across. Of Lycopods Selaginella circinalis was 24 inches; Martensii variegata, 26 inches, and Martensii, 30 inches in diameter of head, proving that these things are made a speciality at Colworth. Coleuses were shown in the sharp-pointed, sugarloaf, pyramidal style, averaging a height of 6 feet, and 5 feet in diameter at the base, showing the plants must have room; but, as stated above, that may be no deterrent to the possessing and admiring of healthy little plants.

I have hinted that there was a scarcity of flowering plants in pots, but I had nearly forgotten one very attractive feature of a fine combination of flowering and bedding plants in a bed, which seemed to command great notice. At the entrance of a large tent Mr. Sheppard had a large long parallelogram bed, raised something like a foot above the grass level, and all the surface that could be seen was clothed with the greenest moss. In this bed a fine collection of bedding plants, including the Tricolor Geraniums, &c., were arranged in circles, ovals, triangles, and white-leaved and purple-leaved plants and Lobelias and Alternantheras formed alike the edging and the division to the groups, with Echeverias and Sempervivums for an edging all round. The whole bed, planted much on the same principle as the huge parterre of Mr. Robson, looked very tempting and pretty. I heard more than one lady say, "I wish I could lift it as it is," and that done in pieces would not have been difficult, as I presume every, or almost every, plant was in a pot, and the pot concealed by the moss. A very little difference in the arrangement would have presented a beautiful symmetrical parterre, but Mr. Shepherd stated that that was less the object than to get in rather a pretty way as good an assemblage and variety of bedding plants as possible. I could at once see the difficulty of thoroughly balancing the fine group, as of some plants there were few in number, but doing so would have rendered what was beautiful still more complete and finished.

These meagre outlines of what was seen in a day chiefly devoted to pleasure, will, I think, convince many, as it has convinced me, that if the town of Bedford will it, it may become as distinguished for its horticultural shows as it has already been distinguished for the cleanliness of its streets, and the cheapness and the excellence of its educational institutions.—R. Fish.

EXTRACTS FROM THE REPORT ON THE BRISBANE BOTANIC GARDEN.

In the Experimental Department the plants of commercial value, which have been enumerated in former reports, continue to thrive as well as ever. Of these, particular mention may be made of the Indigofera tinctoria (Indigo), the Rubia tinctorum (Madder), the Coffea arabica (Coffee), the Thea Bohea (Tea), the Zingiber officinalis (Ginger), the Curcuma longa (Cardamom), the Amomum Melgueta (Grain of Paradise), the Manihot utilissima (Cassava); the fibrous plants—viz., the Jute (Corchorus capsularis), the Sun Hemp (Crotalaria juncea), the Queensland Hemp (Sida retusa), the China Grass Cloth Plant (Bœhmeria nivea), &c. I have been careful in cherishing the development of these and kindred plants, and it is a matter of satisfaction to know, that beneficial results will likely follow from the increased interest evinced in their cultivation, as is shown from the numerous applications for seeds and plants which have been made during the past year.

With respect to the valuable practical results that have followed the introduction of several of this order of commercial and food plants, it is a source of gratification to be able to state that in many instances private enterprise has proved successful, the first experiment having been made from seeds or plants procured from the gardens. This especially applies to the articles Cotton and Sugar, which, as generally known, are becoming year by year more important as staple exports of this colony. It is to be hoped and trusted that other plants of commercial value and importance, such as Coffee, Tea, Tobacco, &c., may claim the attention of the settler, as they are no less a source of profit, nor less easily cultivated, than the Sugar and Cotton plants. In some of the districts—particularly on the sea coast—some thousands of plants of the Coffee have been distributed in response to applications; and without doubt we shall hear ere long of the plant being extensively, if not generally cultivated. The demand for cuttings and young plants of the Silkworms' trees, Morus alba and Morus multicaulis, is greatly on the increase, more especially from East and West Moreton and the Darling Downs districts.

We have received during the past year hundreds of cuttings of various valuable Grape Vines, and nearly all these, with several American varieties already on hand, have been distributed to persons embarking in the cultivation of the Vine. They are mostly wine-producing sorts. In the department of Sugar Canes, there has been an immense demand for cuttings during the past year. From all the Sugar-growing districts, the applications have far exceeded any previous demand.

The applications for various products of the gardens are largely on the increase. The grand total of recipients of plants and seeds from the gardens numbers 530 persons, irrespective of societies, or private individuals where no such associations exist, who have from time to time been supplied with seed, &c., for purposes of distribution. Among this number of persons 60,980 plants, cuttings, and packages of seeds of various kinds have been supplied.

It is gratifying to be enabled to report that a quantity of the Artocarpus integrifolia (Jack fruit), and other useful plants, have been planted by Commander Bedwell, R.N., during a cruise in the surveying schooner "Pearl," on several of the islands bordering the coast.

A Large Mushroom.—["The cry is still, They come."—Eds.]—This morning was brought to me a Mushroom of the following dimensions: Circumference, 2 feet 10½ inches; diameter, 1 foot; weight, 1 lb. 5¾ ozs. It was gathered in a field near the river Swale at Helperby, in the North Riding of Yorkshire.—Henry Wilson.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Ply the fork incessantly amongst the growing crops of *Broccoli, Cauliflowers*, and *Winter Greens*, and continue to manure and trench up every piece of ground as it becomes vacant. Prepare trenches for late *Celery;* water the growing crops, and stir the soil about them. Reserve and get ready a patch of ground for the sowings of *Cabbages* to stand the winter; the soil should be of a light sandy nature, and not too rich, as it encourages a luxuriant growth, which is apt to make them tender. Plant out finally the strongest *Endive* from the early sowings, and sow also more for late crops; the Small Green Curled is very good for the purpose. *Garlic* and *Shallots* should now be taken up and dried for storing. Sow also more *Lettuce*, and keep up a good succession of *Radishes* and *Salads*. Pull up the crops of winter *Onions;* lay them in rows with the roots turned to the sun, and frequently turn them until the stalks are withered, when they will be fit for storing; as they are liable to decay if bruised, they should be carefully handled, and not be thrown about like so many stones. Let them be very dry when stored, and spread out very thinly, not laid in heaps. The late-sown *Peas* should have attention paid to watering and staking.

FRUIT GARDEN.

Espalier Apples and Pears should have the leaders tied-in, and the superfluous shoots spurred-in. Attend also to choice Apples and Pears planted in the open quarters but not trained; remove superfluous shoots, and try the effect of tying downwards the points of some of the strongest shoots. It has a very good effect on trees inclined to grow too luxuriantly. Attend to stopping and nailing wall fruit trees in general, and prosecute the thinning of Grapes on the open walls. Remove all runners from Strawberries not required for making fresh plantations.

FLOWER GARDEN.

Dahlias which have attained a good size should now have their side shoots properly thinned out, leaving three or four of the strongest and best-set shoots. Examine the fastenings carefully; if they have become too tight and are cutting the stem remove them, and retie them with a stronger material, allowing plenty of room to admit of the stem increasing in size. See that the pots on the tops of the stakes are gone over every morning, and destroy all the earwigs which are found. A little soot sprinkled on the plants when wet with dew is an excellent preventive to their ravages; as long as that remains the earwigs will not touch the foliage. Beds of Phlox Drummondi and strong-growing varieties of Verbenas should have some short bushy twigs stuck amongst them, thereby affording them a little support as they grow up, and tending to preserve the outline of the bed. Do not neglect surface-stirring this dry weather; for my own part I would rather see the surface of the soil looking fresh and rather rough, and covered with little lumps of earth, than have it raked smoothly, and at the same time as hard as if it were intended for a billiard table. The rockery, a valuable adjunct to the flower garden, should now have a thorough cleaning; clear away all flower-stems and dead leaves. A few stones had better be placed in front of the tender-rooted species to afford a little shade and protection from the powerful rays of the sun. Half-hardy plants put out here in June should have their shoots spread out and pegged down. Nail the shoots of Fuchsias and Petunias to old stumps or roots that may have been introduced amongst the rockwork; treated in this way they produce a gay and pleasing effect during the autumn months. Carnations and Picotees will require copious watering during the present dry weather. It will be advisable to thoroughly moisten the soil contained in the pots when moisture is applied, which is far better than the little-and-often system. Earwigs are extremely destructive to this class of flowers by eating off the lower part of the petals;

it is usual to trap them in tobacco-pipe heads placed on the tops of the sticks which support the plants; the bowls, however, must be new, for if they have been smoked the smell of the tobacco will prevent the earwigs' entrance, and defeat the object in view. Pinks which have been lately planted out must be watered, and, if possible, shaded with an awning of calico; remove decayed petals from those flowers in which there is an appearance of seed. As the seed-pods of Pansies ripen they should be gathered and dried in a shady place. Take care at all times to save seed only from flowers of good form and stout petals. Tulips may now have the outside skins removed; very small offsets will be as well in the ground, and a bed of fine and suitable soil should be prepared for their reception. Florists would do well to pay more attention to these offsets by well and clean growing; whatever trouble they bestow will be amply repaid by the fine blossoms which their well-grown maiden roots will produce.

GREENHOUSE AND CONSERVATORY.

At this period, many plants which are commonly considered as inmates of the stove or greenhouse the whole year round would be much benefited by a thorough exposure to the elements. It may, however, be observed that no exotic plants should be subjected to this process, but those which have made a new growth previously in-doors. It must be remembered also that an unclouded July sky is a very different thing to the flickering shade produced by the rafters and styles of a hothouse roof, and some caution is necessary for a week or so at first in turning out plants of this kind. The practice is to place them in a northern aspect for a few days; they thus become gradually inured to sunshine, and all that is necessary after this is to put them in a situation sheltered from the winds, but by no means under what is termed the shelter of trees. As to the selection of kinds, I shall, of course, pass by those which come from the very hottest regions of the globe, and suggest that all gross climbers and plants of elongated and rambling habit be subjected to this process for a month or so. To carry out and do justice to such a plan, some thin screen should be provided to throw over the plants in very bright weather. Without this, although the plants may not be constitutionally damaged, they may become so discoloured in the leaf as to be a blemish instead of an ornament when housed. Another matter must be considered—not only may the leaf suffer, but the roots, especially those of a hair-like character. The remedy is placing the pot inside an empty one, which will act as a non-conductor, or plunging the plants. When the latter plan is adopted some extra precautions should be taken against the common earthworm. Some of the larger specimens in the conservatory and mixed greenhouse will soon become exhausted, and preparations having been made so as to secure a reserve stock, this should be well attended to in regard to timely shifting, watering, &c. If such a course be followed up good specimens will always be at hand to fill up blanks occasioned by declining stock. Let young rooted Pelargoniums be potted-off in due time; and protected Cinerarias, too, whether seedlings or suckers, should have regular attention; those intended for autumn work should be potted without further delay. The forward Achimenes will have produced abundance of suckers; these taken off, and encouraged in a propagating frame, will produce a very late display. Propagation of all kinds should now be a weekly business; rooted cuttings should be potted-off betimes. Now that many of the Camellias, Azaleas, and other plants have been removed to their summer situations out of doors, painting or other repairs required for any of the plant houses will be more conveniently done than at any other season. Where houses are painted sufficiently often to keep the paint always good, which is the cheapest method in the end, there will be no difficulty in getting the wood dry: but where the wood is allowed to become nearly bare before repainting is thought of, the house should be kept dry inside, covering the outside with some waterproof material in the case of showers, and allowing a fortnight of bright drying weather to thoroughly dry the wood before the work is commenced.

STOVE.

If there are sickly or badly-rooted specimens here they must be frequently examined for red spider, otherwise they will become a nursery for this pest, from which it will soon spread to adjoining plants. See that young growing stock is not allowed to suffer from want of pot-room, and attend carefully to watering, giving manure wter to all plants in free growth that enjoy it. Gardenias, &c., which have been removed to the conservatory while in bloom should be replaced in heat as soon as their beauty is over, in order to allow of their growth being ripened before the dull cloudy days of November set in Although shading Orchids must now be promptly and carefully attended to, allow them as much light as they will bear without injury, using a very light screen, and only when absolutely necessary. Keep the foliage clear of insects and dust, by frequent syringings or spongings as may be necessary.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

As it is hardly possible to have too much of a good thing, we wheeled a lot of half-rotten dung and leaves on a Strawberry quarter, from which we had gathered all that was worth waiting for, and then trenched dung and Strawberry plants down preparatory to planting strong plants of Broccoli. If we had been at all short of *manure*, and had not wished to get the dung out of sight, we could have dispensed with the manure, as the Strawberry plants, and the rich surfacings they had several times received, would have been a good preparation for the Broccoli. The store of nutriment trenched down will, however, tell on the present and succeeding crops for some years, as the deeper-placed manure will become very sweet as it is brought time after time nearer the surface. But for thus at once disposing of the massive Strawberry plants, we should in many instances have mixed the manure more regularly through the staple of the soil. There are even cases, such as making fresh beds or quarters of Strawberries, where we are inclined to do both; place some manuring material at the bottom of the trench, to entice the roots to go downwards, and mix manure also with the general staple, that manure being of a more decomposed character, to encourage early and rapid growth.

In the case of Broccoli and Greens to stand the winter, provided the top spit is fair for porosity and richness, we have frequently noted that the plants on the whole do better when the most of the rather fresh manuring matter is placed at a considerable distance from the surface. The plants thus grow sufficiently before the winter, but they are kept compact instead of flabby, and thus pass through the frost and changes of winter more easily than if the growth had been more luxuriant; and then, as the warm days of spring come on, the roots make a regular network in the rich food at the bottom of the trench, and it seems almost impossible to cut and gather too much from the plants. Even now, past the middle of July, we could gather crisp little shoots of the Asparagus Kale, and but for having plenty of other vegetables, we might have left the Scotch Cabbaging Kale in order to cut young shoots from it, only we sadly wanted their room.

These little shoots are not so attractive to the cook as fine Cabbages and huge Cauliflowers, but for delicacy and sweetness we know nothing in the green vegetable way to surpass them, as when nicely boiled they are as soft as so much rich marrow. We would here repeat the caution given in the spring, when most of us had the mortification to see our fine Broccolis less or more departing, do what we could to save them; and that is, that all with limited room in their kitchen garden should give the most of the space they can command to *Brussels Sprouts and Scotch Kale.* Savoys are all very well, and large heads are fine fill-dishes for a family, and the little Ulm Savoy is as sweet as a tender Cabbage, but they are, in general not so delicate to eat, nor so much to be depended on through the winter, as the Brussels Sprouts and Scotch Kale.

On the whole, we prefer the old fair-sized Brussels Sprouts from home seed or imported seed to most of the new varieties, each of which has some distinguishing property of its own. We have grown most of them, and have fallen back chiefly on the older kind, just as we have done in the case of the Vegetable Marrow. For richness and delicacy the old oblong plain variety is still by far the best. Where the climate is not very bad the tall Scotch Borecole yields quantities of side shoots. In small places where less is required, the dwarf Scotch Cabbaging Kale is most desirable, as the little side shoots have a tendency to turn in somewhat Cabbage fashion. Veitch's Dwarf is also very good, hardy, and beautifully curled. We like these even better than the Cottagers' Kale, which is a coarser vegetable, and in severe frosts we find the above Scotch Curlies stand as well. The Cottagers' Kale, if strong, yields a profusion of gatherings in the spring months.

Where there is room for a row we would advise all readers to appropriate it to the Asparagus Kale. The mere head it makes is of little consequence comparatively; the great attraction is

the multitude of shoots it throws out after the head has been removed, and these, taken clean off when from 3 inches to 4 inches in length, are in reality a good sweet substitute for the shoots of Asparagus. The gatherings from a row of good plants are astonishing. All these plants produce more in proportion to the earliness of cutting-off the head of the plant. We think that the heads of these Kales are more tender after they have had a touch of frost; and sometimes when the head of a Brussels Sprout is removed, it is advisable to leave the larger leaves at its base, as a little protection to the small shoots, or sprouts, on the stem of the plant. Every large leaf left near the top arrests free radiation, and, therefore, is so far a defence from severe frosts. The head, too, of a Brussels Sprout has a flavour all its own, quite different from the sweet little knobs along the stem, and altogether superior to a young Savoy, which it rather closely resembles. As the frost last winter cut-up so many of our Cabbage plants, we were glad to keep the greens named above much longer than usual, and, therefore, we had a good opportunity of testing their usefulness. In cutting the heads of Brussels Sprouts at all early, it is well to daub the cut part with clay and lime to prevent the stem cracking, as the wet and frost would tell on the stem.

There is one use to which the Scotch Kales are put in the north, that is seldom adopted in the south. The seed is sown late in the autumn, the plants are turned out in spring, as we do with spring Cabbages, and if the sewage from the cottage is given to them they grow with great rapidity, and then as they grow the larger leaves are cut in two, and under the name of "stewings," are cut again into small pieces, and along with dressed barley, a little oatmeal and water, and what little bit of meat can be obtained, form in many a cottage, and even a tradesman's home, the chief dish at the midday meal. Such a dish is a far different and very superior affair to the "Kail brose," so celebrated in Scottish song. That altogether was a very rough primitive get-up, and only fit for men emerging from semi-barbarism, or for men, if at all refined, yet seized with a sort of monomania to keep-up mere existence on the hardest and most economical of terms. Even in London we have heard Englishmen, despite the northern dialect, which they could not quite master, singing about the "Scottish Kail brose," with as much enthusiasm as if before them there steamed a round of beef, and a rich plum pudding; but we much feared that if, even when a little hungry, a dish of the "Kail brose" were put before them, it would soon have damped the fervour of their singing.

Cooking Vegetables.—We have several times touched on this subject, and only touched upon it because it is not in our peculiar province. With all our boasted progress, in general we are poor cooks, and do not make the most of what is within our reach. Meat is often underdone or overdone, and thus deprived of its nourishing properties; but the vegetables! Anything seems good enough for them in too many cases. At market and public dinners this is still very observable. We have seen Cabbages and Savoys that could have done little more than passed through scalding water; they were as hard as so many pieces of chips of wood, and would have been better even in their raw state, for then they would have shown a little green about them. On dining once with a gardener, the Peas on the table (Jeye's Conqueror), were, indeed, "ne plus ultras," and did not the eyes of the mistress of the house sparkle as everyone praised the Peas, and they were delicious. Three or four great cooks have told us that they hardly could spoil that Pea try how they might, for when young it wanted so little boiling, and the colour kept such a rich green. However, the next day we think it was, at a horticultural dinner, the same Pea in similar excellent condition when gathered, became by some peculiar process, a hard, dirty-looking, yellowish mess, that no one would do more than taste and then leave alone.

We recollect the late Mr. Loudon telling us that when he was in the habit of visiting large gardens, and was often asked by the gardener to have some refreshment at the midday meal, he was frequently very much surprised, either at the total absence of vegetables, or their rarity in the shape of a small dish of Potatoes, or at the very inefficient way as to cooking in which they were brought to table—Potatoes sodden and soft instead of dry and floury, which they would have been if properly attended to. We also recollect the worthy veteran referring to the families of some head gardeners that were more than ordinarily delicate in their constitutions, and thus required great care in rearing them and expense for doctoring, and expressing his opinion that matters, humanly speaking, might have been very different if the children had partaken of more vegetable food. Bold as he was, he had been so much criticised for some of his utterances, that he heartily wished that some one with authority to teach his advice would impress on young gardeners, who were likely to spend the most of their lives in a garden, to endeavour in choosing a partner for life to get a helpmate who already knew, or who would not be above learning, how to cook vegetables so as to present them at table most tempting to the appetite, most healthful as food, and most pleasing to the eye. Yes, the doing such a simple thing as the sending nice, soft, sweet, green Peas to table is a matter worthy of consideration. No doubt our sisters have made great advances since Mr. Loudon was in the zenith of his fame, but even now we fear there is great room for improvement, and that, too, in large as well as small establishments; and the one practical deduction we wish to make is just this, that it would be a good thing if some lady were to give us short, simple, but minute directions as to the cooking of our common vegetables in the best and most economical way.

Cauliflowers.—We have to record a little disappointment. Our hand-light Cauliflowers never did better. Our second lot seemed equally promising, and had only the fault of forming the heads too much at a time. However, they had every appearance of proving of first-rate quality. We had watered them with sewage before the rains came. The somewhat continuous drenching rains seemed to have changed them; instead of the heads keeping in a close compact mass as we wish to see them, they began to open, and shoot, and spread. We never like the idea of even the denizens of the servants' hall, if possible, having the chance of tiring of any one thing, but a goodly portion of these fine Cauliflowers had to go there, as the heads were too open for the dining-room table. The person who could speak with most authority told us that for mere consumption nothing could be better, they were so sweet, tender, and soft. This we found to be quite correct. As it was we suffered no inconvenience, as there were still enough of compact heads to go on with. We are inclined to think that the extra drenching was the chief cause of this spreading, and the rich sewage before the rains which we could not foretell might also be a predisposing cause. Have any of our readers met with similar results? Have they been able to trace it to a similar or to any different cause? Our next successions as yet seem to be all safe and promising. Of course these opening and spreading heads were of little value, except for immediate use, in comparison with the firm, compact, white heads. How can we make sure of preventing this opening and spreading? It often takes place to a considerable extent in dripping rainy autumns. Our opinion is, that less nourishment and more room to the plants would have modified this tendency, but then we could not know of these heavy downpours of rain.

Celery.—Planted out the last, or nearly the last, of our plants. For a wonder with us, the earliest beds, except where planted out, have as yet received no more waterings. The rains have been ample for the purpose. We have had comparatively little to do with the water cart, but as a counterbalance the grass lawn, and especially that which was fresh laid, has required great attention. It would hardly pass muster three days without the machine or scythe going over it.

FRUIT GARDEN.

With regard to summer-pinching, pruning, &c., see previous notices. We proceeded with planting out the last forced *Strawberries*, some of the first planted out coming into bloom. We also prepared young plants for forcing, and for fresh plantations. For the former purpose we do not think that any place is better than fixing the runner in a small pot, and, when fully established, and filling the pot with roots, cutting the string, and repotting firmly in a larger pot, as fully explained and detailed a few weeks ago. Let enthusiastic beginners, however, clearly understand, that it is on the details being carefully carried out that success will depend. Great troubles and great disappointments often ensue, because seemingly little things are deemed of no importance. We say nothing to those who force their thousands of pots, but to beginners we may here repeat, "Attend especially to the small matters referred to." Then for getting an early return from fresh plantations in the open ground, when there are no forced plants to fall back upon, it will often be the most economical plan to layer the runners in pots, and then, having the ground in good order, to turn the plants, well rooted, from the pots into the ground, as then you may expect a fair crop the first summer after planting. Where ground is scarce, and you cannot spare it for a couple of months or so, then the best plan is to turn the young plants into a bed with rich lumpy material,

near the surface, putting them 6 or more inches apart, and when the ground is ready lifting the plants with balls and planting them firmly in the ground prepared for them.

With regard to preparing ground for Strawberries out of doors; the duration of the plantation, according to the plants used, or the treatment given, may be fixed at from two to three, or four, or more years. During that time it is advisable that no spade should interfere with the roots, and that the mere breaking of the surface, to prevent caking and cracking, should be done with the hoe or the points of a fork. Hence the importance of deep-stirring the soil at once, and the importance, too, in proportion to the length of time the plantation is to continue, of having some manure at the bottom of the trench, and also of having manure incorporated with the bulk of the soil. The plan we like best is to place a layer of manure not much decomposed on the surface, and trench that down, the greater part of the manure being at the bottom. Then when the piece is thus trenched, to place a layer of sweet decomposed hotbed or other dung, and with spade or fork to incorporate that with the soil for a spit in depth, so as to give vigour to the young plants at once.

Before turning the plants out it is well to solidify the surface soil. If the soil is inclined to be stiffish loam—the very soil for Strawberries—then a tramp and a light roll will be enough before planting; but if the ground is of a light, sandy, open texture, it can hardly be made too firm before planting, or tramping round the plants afterwards. In either case anything like surface-caking or cracking must be avoided by surface-stirring and surface-mulching. We have known cases where Strawberries had done little good in light open soil, that bore immense crops when the ground was consolidated, and where, instead of lightening the surface of the ground in spring, men trod up firmly to the plants between the rows, the point of a fork just being drawn along afterwards to give free access to water, mulching to prevent all caking and cracking.

In choosing young plants it will be prudent, as far as possible, to take them from fruiting fertile plants.

We must leave other matters just to say a word about *cutting the leaves from Strawberry plants* when they have done bearing. Some practise the cutting system, others stigmatise it as horrible and barbarous. Now, each plan may be the better according to circumstances. For instance, in good loamy soils, where the plants grow strong but dwarf and compact, and the leaves continue pretty fair as to greenness, the mowing or cutting off such foliage would not be advisable or defensible. The chief thing in such cases would be to clean the plants of runners, clean, surface-stir, and mulch, and let well alone. Even in light land, but consolidated and mulched, there would not be much necessity for doing more than the above in cleaning, &c.; but in very light sandy soil, and where, though we may mulch, we either have not or cannot consolidate the soil to suit the Strawberry, it may often be the best plan to cut the leaves, or the greater part of them, leaving only the small ones near the heart untouched. We have seen the leaves under such circumstances with nearly double the length of footstalk they would have in stiffer soil, and by the time the fruit was gathered the foliage would often be getting brown and spotted, and therefore could do little in the way of perfecting the buds for a future year. Under such circumstances in July, or even to the first week of August, we would not hesitate to remove such exhausted leaves, and encourage fresh ones to spread out near the ground, and thus perfect buds and encourage free rooting. In good loamy soil we would remove no leaves, and never use a spade between the rows.—R. F.

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

Books (*Ariba*).—London's "Villa Gardener" is the only book we know of that will suit you.

Gardeners' Examinations (*John Jones*).—We believe there will be no summer examination by the Royal Horticultural Society this year.

Geraniums (*James Noon*).—This is merely a sport of foliage to which many seedling Geraniums are liable.

Bovista gigantea (*W. X.*).—We presume you are aware that Bovista gigantea is a large Puff-ball—a fungus. We do not know that it has ever been cultivated.

Weights of Pine Apples at Nottingham Show.—"In reply to your correspondent 'Amicus' respecting the weights of the Pine Apples at Nottingham, I exhibited two Queens in my collection of fruit weighing respectively 5 lbs. 14 ozs. and 6 lbs. 1 oz.—G. T. Miles, *Gardener to Lord Carrington.*"

Rose Leaves Diseased (*W. M.*).—It is difficult to decide what occasioned the damage to the Rose leaves. I have examined them with a glass, and can see no fungus spores. It never occurs under glass. I believe it was occasioned by a severe frost which we had a few days ago; or it may be attributed to atmospheric causes. There is no cure for it. The leaves will drop. Glass is the only sure preventive.—W. F. Radclyffe.

Maréchal Niel Roses not Flowering (*T. E. C.*).—There is, we fear, no royal road to make Maréchal Niel bloom. Leave all strong shoots unpruned, and thin out the weak. If one of the standards could be transplanted and trained against a south wall it would be almost sure to bloom the first year after transplanting.

Roses Mildewed (*Lady King*).—Your Rose leaf has been attacked by mildew, often caused by drought at the root. Most probably the bud was eaten by the earwig. The Antler Saw-fly's grub will also eat the margins of leaves and perforate the leaves with small holes.—W. F. Radclyffe.

Leafing of the Oak and Ash (*Fincastle*).—The popular opinion in the midland counties is, that if the development of the leaves of the Oak precedes that of the Ash the weather during harvest will be fine; but that the weather will be wet if the Ash-leafing precedes that of the Oak. The rhymed form of the proverb is—

"If the Oak's before the Ash
Then you'll only get a splash;
If the Ash precedes the Oak
Then you may expect a soak."

The leafing of the Oak usually precedes that of the Ash.

Potting, Stopping, and Striking Chrysanthemums (*Probo*).—The plants in 4-inch pots should be at once placed in 9-inch pots, using a compost of two parts turfy loam, one part leaf soil or old manure, and one-sixth of sharp sand. They should be stopped now to induce bushiness, and may be again, but not after the second week of August. Cuttings of the points of the shoots put in now, and placed in a gentle heat, will root freely, and if not stopped but potted in 5-inch or 6-inch pots, will make nice plants for late flowering.

Climbers for a Dwelling-house (*Flora*).—For the south aspect we would have Cloth of Gold, Lamarque, Climbing Devoniensis, Gloire de Dijon, and Maréchal Niel Roses; Berberidopsis corallina, Wistaria chinensis, Lardizabala biternata, Passiflora cærulea, Jasminum grandiflorum, Magnolia grandiflora (Exmouth variety), Ceanothus azureus, C. Veitchianus, Punica Granatum, and its double red and double yellow varieties, or you may omit the last two. Plant 4 feet apart for so high a wall (30 feet). For the east wall, you may have Aristolochia Sipho, Cydonia japonica, Japanese Honeysuckle, Clematis Jackmanni, C. Fortunei, C. Standishi; Cratægus Pyracantha, Cotoneaster microphylla, and Cydonia japonica alba. On the north aspect Ivies are most suitable, the Irish and Rægner's are good. We would plant Virginian Creeper (Ampelopsis hederacea), alternately with the Ivy at 3 feet apart to insure the speedy covering of the wall.

Peach Stones not Vegetating (*T. G.*).—You will not facilitate their vegetation by grinding the edges of the stones, but you can cleanse them and place them in sand at once, and in February plant singly in pots at about an inch apart in light loam. Cover them about an inch deep, and place them in a hotbed; or you may sow the stones in October in pans, keeping them in a cool house free from frost, in February place them in a hotbed, and when well up remove them to a cool house.

Ananassa sativa variegata Treatment (*W. G. C.*).—It is a stove plant, and from October to February would succeed in a temperature of 50°; during that period keep it dry at the roots. The minimum temperature should be 55° in March, 60° in April, and 65° in May, and 65° should be the minimum up to September, when the temperature may fall 5° per month until 50° be reached. A temperature of 40° will not injure the plant, but is not desirable. We question whether it can be grown satisfactorily in a greenhouse. We have known it grown in a vinery with a winter night temperature of from 40° to 45°, the Vines being started in February, and from March there is no material difference in the temperature of a stove and vinery.

Peach Tree Heading-back (*A Learner*).—You will not gain anything by cutting back the tree which is blighted and has its shoots at the top of the wall, unless there are young shoots at the base; then by all means cut away any long bare branches; if not, defer heading-back until next February.

Melon Leaves Withering (*C. R.*).—We hardly think your plants are infested with red spider, nor by thrips. If you had had an attack of those pests the plants would not have recovered unless remedial measures had been adopted. Send us a leaf and we shall probably be able to give you some information.

Evergreen Climbers for a Shady Conservatory Wall (*K. P.*).—For the situation nothing would do so well nor look so neat as the small-leaved Ivies, of which the following are good:—Hedera Helix digitata, Donerailensis, and lobata with green leaves; and marginata Cullisi, elegantissima, and palmata aurea. They could be grown in pots, but are best planted out. On the other wall on which the sun strikes after twelve o'clock, we fear Maréchal Niel Rose would not do. We advise Habrothamnus fasciculatus, H. elegans, Luculia gratissima, and Camellias. There is nothing better than Camellias. They would succeed in boxes, but best planted out. The plants may be obtained of any of the principal nurserymen.

Lady Downe's Grapes Mildewed (*J. S.*).—They are affected with mildew. Probably the atmosphere of the house is too cool, too moist, and not sufficiently ventilated. The berries sent are past cure. The

remedies are sulphur, more heat, and better ventilation. We must add, however, that we are not sure whether some other cause is not at work. Are the roots too deep, and in a cool, moist border?

Vine Leaves Warted (*R. S.*).—Your conjecture is a correct one. The Vines have taken up more moisture than the leaves can digest. The remedy you suggest will no doubt prove effectual.

Echeveria secunda glauca Propagation (*An Old Subscriber*).—It is best raised from seed. Drain the pot to half its depth, then fill to the rim with a compost of two parts sandy loam, one part sandy peat, and one part lime rubbish, covering the surface with very fine soil. Water the soil, then scatter the seed on the surface, and cover with silver sand very lightly. Place the pot in a frame with a temperature of 70°, and to lessen the necessity of watering shade from bright sun. Keep the soil just moist without making it very wet, and when the plants are fairly above ground remove them to a greenhouse and afford a light airy position. When they have two or three leaves pot off singly in small pots. Sow in March.

Black Tripoli Grape (*Idem*).—The Welbeck Black Tripoli is the same as the Frankenthal, Victoria Hamburgh, or Pope's Hamburgh. It has roundish oval very large berries, with juicy, vinous, rich flesh, and is the most useful Grape in cultivation, succeeding under the same conditions as the Black Hamburgh.

Destroying Rose Aphis (*R. W.*).—Boil ¼ lb. quassia in a gallon of soft water for ten minutes, strain, and add to the water ¼ lb. soft soap. Apply with a painter's small brush. This will be far more effectual than soot water.

Names of Plants (*Lantana*).—There is little doubt that the plant to which you refer under the name of "Umbrella Fern," is the Dipteris Horsfieldii of Robert Brown, a truly noble Fern, which inhabits the South Sea Islands, and which, strangely enough, occurs also in Malacca and the Malay Archipelago We have no knowledge whatever respecting the stated introduction of the plant, but only hope in case of such an event, that the plant will become firmly established in our gardens. The plant is, like most other Ferns, possessed of a plurality of names, that of Polypodium Dipteris (of Blume), being the one adopted in Hooker and Baker's "Species Filicum" (see p 362), whilst Polypodium conjugatum, Dipteris conjugata, and Drynaria Horsfieldii are all synonymes. A very interesting note respecting this plant occurs in Dr. Seemann's "Mission to Viti" (pp. 14, 15). He says—"The boys took us to a ravine where some years ago Dr. Harvey, of Trinity College, Dublin, had collected a fine Fern (Dipteris Horsfieldii, *J. Sm*), which has magnificent fan-shaped leaves, when growing in favourable situations from 8 to 10 feet high, and 4 feet across. The plant is found in all parts of Fiji, New Caledonia, and various other islands, and has never been introduced to our gardens, nor did any of my specimens survive being taken out of their native soil." (*D. M.*). —Melilotus officinalis, the Melilot. (*K. J.*).—1, Peperomia Saundersii, usually known in gardens as P. arifolia var. argyrea; 2, Oplismenus imbecilis variegatus (the Panicum variegatum of gardens); 3, Selaginella Willdenovii (S. cæsia arborea of gardens); 4, Cyrtomium falcatum; 5, Farfugium grande; 6, Begonia argyrostigma. (*Ignoramus*).—1, Ervum hirsutum; 2, Vicia sepium; 3, Chenopodium urbicum; 4, Atriplex patula; 5, Gnaphalium uliginosum; 6, Rumex Acetosella. (*Mrs. St. John*).—Albuca species, but we cannot determine which. (*Subscriber*).—Limnanthes Douglasii. It is a beautiful spring bedding plant if sown in autumn. (*A Subscriber*).—Cissus discolor. (*Rhubarb*).—Having named six, we did not retain the others. If you send half a dozen more we will endeavour to name them, but we decline to undertake to keep large batches of specimens in order to name them by instalments.

POULTRY, BEE, AND PIGEON CHRONICLE.

VALUABLE PIGEONS STOLEN FROM EXHIBITIONS.

It gave me great pleasure to see Mr. Hewitt's letter on this subject in your Journal of July 13th. I can support all he says, more especially as to the best interests not only of exhibitions but of exhibitors being interested in this matter; for if such practices be allowed to continue all the loss, as in my case, falling on the exhibitor, I am convinced that public Pigeon exhibitions will very soon be things of the past. In consequence of my own loss, and previously to the robbery of Mr. Yardley's bird, not only myself but a number of others (still, however, as ardent in the fancy as ever), had determined not to exhibit again until shows were conducted in a different manner, and either greater precautions taken for the safe keeping of the birds, or committees made liable for their negligence.

I shall be very glad indeed to second Mr. Hewitt's kind offer by myself giving a reward of £5 for the recovery of my Black Carrier cock stolen from the late Manchester Show, and the conviction of the thief. Some stir seems likely now to be made in the matter, and if it do not result in the punishment of those who have already offended, it will at least do good in the reform of public exhibitions. A little ordinary care on the part of committees or secretaries would easily prevent such practices. I would suggest as perhaps the easiest applied and safest preventive, that a light iron bar or chain should be run along the fronts of, say, every six or twelve pens, with a padlock at each end. This could readily be removed to clean or feed the birds, and would effectually prevent any abstraction by unauthorised persons. Hitherto the greatest negligence has been apparent in regard to the safe keeping of valuable birds by the committees of shows, as anyone might see on visiting our public exhibitions persons handling birds without the slightest interference on the part of the authorities. After my late action at Manchester I met both an exhibitor and a purchaser at the very show from which my bird was stolen, and the former stated to me that at the close of the show he took away all his own birds without any interference, and the latter did the same with a pair of birds he had claimed. I think the sooner such management is stopped the better, and only hope that exhibitors are now beginning to be a little more alive to their own interests by having matters put on a rather more fair footing—namely, that those who make the profit should also bear the loss.—James F. While, *Birmingham.*

I am quite of the opinion of Mr. Hewitt, that watchful eyes are the best means to prevent valuable birds being stolen from poultry shows; and as the secretaries of the various shows do not employ enough people to tend the birds, I think it high time for fanciers to take the matter in their own hands. Mr. Hewitt is willing to give a reward of a guinea to the party who, by his evidence, shall be the first to bring to conviction the person who has been lately committing himself; I will give the same amount, and I trust many more fanciers will do the same thing, as I feel certain it is the only means to prevent these losses. I am also willing to give the same amount to any person who will by his evidence convict any person of stealing Pigeons from any of the forthcoming shows this season, or I will subscribe the like amount to any fund that may be formed for the same object.—Frank Graham, *Birkenhead.*

All fanciers and exhibitors will warmly thank Mr. Hewitt for the manner in which he has taken up this subject, and I will place a similar amount to that which he offers at his disposal, or in the hands of any properly appointed person, feeling sure that other exhibitors will interest themselves to raise a sufficient sum to tempt any accomplice, not being the actual offender, to "split" on his confederate and bring the offender speedily to justice. Should this movement be liberally responded to, further steps can soon be decided on, and will, doubtless, prevent a repetition of these dishonest practices.—F. Waitt, *Albert Villa, Alcester Road, King's Heath, Birmingham.*

I beg to add my little mite (5*s.*) to the reward offered by Mr. Hewitt, trusting it may soon be called for to pay some one for their trouble in detecting the offender. I believe that these robberies are carried on by one fellow.—James Coleman, *West Bromwich.*

A few friends, in consideration of the loss Mr. J. F. While, of Birmingham, sustained at the late Manchester Show, and the expenses he incurred in bringing the matter to trial, desire to present him with the following subscriptions:—Mr. H. Yardley, Birmingham, 10*s.* 6*d.*; Mr. James Watts, Hazlewell Hall, 10*s.* 6*d.*; Mr. W. H. Mitchell, Moseley, 10*s.* 6*d.*; Mr. F. F. Foster, Birmingham, 10*s.* 6*d.*; "Sympathy," Birmingham, 10*s.* 6*d.*; Mr. Frank Graham, Birkenhead, 5*s.*; Mr. J. T. Bradley, Birmingham, 5*s.*; Mr. Massey, Birmingham, 5*s.*; Mr. Anderson, Birmingham, 2*s.* 6*d.*; Mr. J. Coleman, West Bromwich, £1.

HATCHING DUCKS' EGGS UNDER DIFFICULTIES.

I placed eleven Duck's eggs under hen No. 1; she sat for six days and then deserted them. I found them quite cold, but having another hen wanting to sit, I put her on. No. 2 sat five days and then left her nest. I thought it was then a hopeless case, but one of my men had a hen wanting to sit, and proposed that we should try her. It was then noon; he did not leave work till five, and had three miles to walk home, and the eggs were cold. I put them in water as hot as I could keep my hand in, for ten minutes, then placed them in a cucumber frame until the men left work, when I put them in a piece of flannel. They were then taken three miles, put under a hen, and eventually nine ducklings made their appearance and are going on well.—W. L., *Birchington.*

Poultry Judging.—A meeting of poultry exhibitors was advertised to be held at Wolverhampton during the recent

meeting of the Royal Agricultural Society. We do not know who attended, except the Rev. A. G. Brooke, Mr. Wood, and Mr. Tudman. It was agreed by them that a Poultry Club is desirable, that judges are not uniform in their awards, and that they are not allowed sufficient time to make them.

WESTWARD HO! POULTRY EXHIBITION.

This took place on the 20th inst. The weather was fine, and no committee could more fairly have deserved success. The tents were large and commodious, and the only improvement that could have been made would have been placing the Pigeons not so high, so that ladies and children might have enjoyed a better view of them.

A few really good Grey *Dorkings* composed the first class on entering the tent, but a good hen with a bad cock, or the contrary, was the order of the day. Some of these birds were individually of great frame and good colour, but the selection was certainly open to much improvement. A few good White Dorkings in their own class were the recipients of the prizes, but the entry was limited. Three extraordinarily good pens of Black *Spanish* fowls were comprised in the winning pens; they were, perhaps, a little too heavy in the face, but such excellent birds for breeding stock as are rarely met with. *Game* fowls were good, but very fast going out of condition, the hens more particularly so. *Cochins* were quite up to the average; Buffs, Partridge, and Whites being successful in the order they are named. In the *Brahmas* all the three prizes were given to the Dark-feathered variety, the very best hen in the class being in a highly-commended pen, but, unfortunately, mated to a cock worse than indifferent. The *Hamburghs*, except the Silver-pencilled ones, showed a great improvement over those shown at any previous meeting in this district. *Polands* were likewise excellent. In the Variety class *Crêve-Cœurs* stood first in a capital entry, *Houdans* second, and Black Hamburghs third. In a large class for the best cock of any variety or pure breed, a wonderfully perfect Black Minorca stood first, a Brown Red Game cock and White Cochin taking the remaining honours. In a general chicken class, open to any breed, a first-rate pen of Grey Dorkings, exhibited by the Rev. G. F. Hodson, stood far a-head, but the cockerel in this pen lacks age materially for present exhibition; the second-prize birds were Brown Red Game, and the third Dark Brahmas. Game *Bantams* were below par, and, with the exception of the two pens, one of Gold-laced and the other Nankeen Bantams, the variety Bantam class was so indifferent that the third prize was withheld, being the only case of non-award on the prize list. *Geese*, *Turkeys*, and *Guinea Fowls* were all very good, and a very complete collection of *Rabbits* had their admirers.

No previous show in these parts was ever held at which *Pigeons* formed so prominent and excellent a division, one of our most noted breeders sending the choicest specimens for competition; besides these, however, were most excellent pens entered from the immediate neighbourhood. We cannot, though briefly, but allude to a most disgraceful attempt at imposition made by a rather extensive exhibitor to secretly blight the reputation of an opponent undeservedly. It appears a letter, covering several pieces of writing paper, was sent to the Hon. Secretary, stating the informant's personal knowledge that certain pens of his rival, which he specified, had the tail feathers fastened in, and that whilst he strictly prohibited the mention of his (the accuser's) own name, he knew the truth of his assertion; that the owner had frequently boasted of the successes of his trickery; and that the writer was only anxious to prevent deceptions so base injuring the "honest exhibitor," &c. After the awards were made and returned the Judge was made acquainted with the accusation, and that gentleman at once intimated his conviction the whole imputation was "fabricated from beginning to end." With three gentlemen of the Committee, who at his request accompanied him, an adjournment to the Show tent proved the accusation false from beginning to end, as anticipated. The letter sent contained also a specific promise, that if the accused were punished, the informant's entries would be greatly increased on future occasions. We think we cannot be supposed to speak at all uncharitably when we express our opinion that the whole accusation was written with a knowledge of its falsity. Although we forbear to mention by name the author of this unwarrantable charge, we cannot but suggest to him that his conduct is the most likely of anything to injure poultry exhibitions. A really worthy punishment for such conduct would have been to have withheld all the prizes that had been awarded to the writer of the letter, as the loss would have been possibly suggestive that in all the affairs of this life "honesty is the best policy."

Dorkings.—*Coloured.*—1, E. Burton, Truro. 2, Mrs. A. C. Thynne, Penstowe, Stratton. 3, Mrs. P. Coffin, Portledge. *White.*—1, J. H. Nicholls, Tangier, Lostwithiel. 2, W. Pickard, Hartland. 3, Mrs. Macgregor, Hallsannery, Bideford.

Spanish.—1, S. R. Harris, Cusgarne, St. Day. 2, F. Brewer, Lostwithiel. 3, G. Tonkin, Bristol.

Game.—1, H. Gibson, Brockenhurst. 2 and 3, S. R. Higham, Morchard Bishop. *hc* and *c*, Dr. W. King, Bullmore, Falmouth.

Cochin-China.—1, S. R. Harris. 2, J. Beard, St. Blazey. 3, F. Brewer. *hc*, T. M. Hawke, St Day.

Brahmas.—1 and 2, E. Burton. 3, S. Richards, Truro. *hc*, Mrs. A. C. Thynne.

Hamburghs.—*Gold-pencilled.*—1, R. Lorum, Exeter. 2, S. R. Harris. 3, G. Lins, Par Station. *hc*, S. Richards. *Gold-spangled.*—1, S. R. Harris. 2, J. W. Banbury, Bude. 3, J. Medway, Newton Abbott. *Silver-spangled.*—1 and 2, S. R. Harris. 3 and *hc*, J. Clark, St. Day. *c*, W. M. Lancaster, Berridon, Bradworthy. *Silver-pencilled.*—1, S. R. Harris. 2 and 3, J. Walter, Bideford.

Polands.—1 and 2, J. Beard. 3, S. R. Harris.

Barnnoor.—1, W. Bailey, Kilkhampton. 2 and 3, D. Barrable, Paize, Ponghill. *hc*, G. H. Pinckney, Barnstaple. *c*, A. Trewin, Kilkhampton; C. Withecombe, Buckland Brewer.

Bantams.—*Game.*—1, Miss E. How, Woodville. 2, F. Cooper, Ampney Crucis. 3, F. W. Palmer, Barnstaple. *c*, S. Veal; W. How, Woodville. *Any other Variety.*—1, Rev. G. F. Hodson. 2, Miss B. How. 3, Withheld.

Any other Variety.—1, T. E. Hawkin, Lostwithiel (Crève-Cœur). 2, F. Brewer, Lostwithiel. 3, C. Magge, Melksham. *hc*, S. Veal, Langtree; H. Leworthy, Newport, Barnstaple; E. Burton, Truro; W. Littlejohns, Pilton, Barnstaple; R. E. Holman, jun., Bideford. *c*, W. Courtney, Barnstaple. *Cock.*—1, S. R. Harris. 2, M. Huxtable, Wheddon. 3, F. Brewer. *hc*, G. Britton, jun., Bishop's Tawton. *c*, G. W. Wilkey; W. Gordon, Morchard Bishop. *Chickens.*—1, Rev. G. F. Hodson, North Petherton. 2, Mrs. M. Huxtable. 3, J. Heal, Parkham. *hc*, S. E. Hawkio, Lostwithiel. *c*, J. Long, Plymouth.

Guinea Fowls.—1, S. Symons, Tawstock. 2, W. M. Lancaster. 3, G. H. Pinckney, Barnstaple. *hc*, R. B. Molesworth, Bideford.

Ducks.—*Aylesbury.*—1 and 2, S. R. Harris. 3, G. M. Oliver, Dreason, Bodmin. *hc*, T. E. Hawkin. *Common or Any other Variety.*—1, G. Copp, Tawstock. 2 and 3, J. Heal, Parkham. *Any Variety.*—1, Rev. G. F. Hodson (Rouen). 2, S. R. Higham (Rouen). 3, J. Heal.

Geese.—1 and 3, W. M. Lancaster. 2, W. Saunders. *c*, J. Heal (2).

Turkeys.—1, Mrs. A. C. Thynne. 2 and 3, J. Heal.

PIGEONS.

Carriers.—1, H. Yardley, Birmingham. 2, E. Burton. *hc*, R. B. Molesworth, Bideford.

Barbs.—1 and 2, H. Yardley. *hc* and *c*, J. C. Bullen, Newport, Barnstaple.

Pouters.—1, H. Yardley. 2, H. Porker, Taunton.

Fantails.—1, H. Yardley. 2, E. A. Bazeley, Bideford.

Jacobins.—1, H. Yardley. 2, J. & C. Bullen.

Trumpeters.—1, H. Yardley. 2, R. B. Molesworth.

Common.—1, H. Yardley. 2, W. Geary, Barnstaple.

Any other Variety.—Equal 1, H. Yardley (2). Equal 2, F. Braund, Bideford; H. Henry, Beaford. *hc*, H. Gibson, Brockenhurst; J. & C. Bullen. *c*, E. A. Bazeley; J. & C. Bullen.

Rabbits.—1 and 2, C. Leat, Tiverton. 3, T. Hodges, Bideford (Himalayan). *hc*, J. C. Nosworthy, Barnstaple (Lop-eared); C. Leat; W. H. Baker (2).

Mr. Edward Hewitt, of Sparkbrook, near Birmingham, was the Judge.

BEDFORD AGRICULTURAL SOCIETY'S POULTRY SHOW.

The first show of poultry held at Bedford for many years took place on the 20th inst., and proved a great success; it was in connection with the Agricultural and Horticultural Society. The attendance was numerous, and the Poultry Show, which was under a large tent, was much crowded. The town of Bedford subscribed handsomely. Independently of collecting £120 for poultry and horticultural prizes, it gave upwards of £60 in cups and prizes to the Agricultural Society. The pens were supplied by Mr. George Billett, of Southampton, and Mr. W. B. Jeffries, of Ipswich, gave his services as Judge.

The *Cochins*, *Game*, and *Brahma Pootras* were very good; but the other classes, with the exception of a few specimens, were bad.

The following is a list of the awards:—

Dorkings (Any variety).—1, J. Longland. 2, Rev. J. G. Baker. *Cock.*—1, Rev. J. G. Baker. *c*, J. Longland.

Cochins (Any variety).—1, G. Shrimpton. 2, H. Lloyd, jun. *hc*, G. Shrimpton; R. B. Stafford; J. K. Fowler. *c*, B. Newland. *Cock.*—1, R. Crawley. *hc*, J. K. Fowler; G. Shrimpton; H. Lloyd, jun.

Game.—*Black-breasted Red.*—1 and 2, R. Hall. *hc*, R. B. Stafford; Capt. Moutressor. *c*, W. H. L. Clare. *Any variety.*—1, R. Hall. 2, W. H. L. Clare. *hc*, W. H. L. Clare; J. H. Bradwell. *Cock.*—1, R. Hall.

Spanish (Any variety).—1, W. Nottage. 2, W. R. Ball. *hc*, J. K. Fowler. *Cock.*—1, C. Wright.

Hamburghs (Any variety).—1, — Swallow & Chambers. 2, — Arnold.

Brahma Pootra (Any variety).—1, A. B. Hamilton. 2 — Stevens. *hc*, H. Clark; M. Leno. *c*, J. Holmes.

Game Bantams.—*Black-breasted Red.*—1, C. Read. 2, Capt. Newland. *hc*, G. Dickens. *c*, W. J. Reeder (2). *Any variety.*—1, J. Allen. 2, W. Y. Johnson. *Cock.*—1, P. M. Payne.

Bantams (Any variety except Game).—1, R. B. Stafford. 2 and *hc*, M. Leno. *Cock.*—1, P. M. Payne.

Any other Variety.—1, J. Malden. *hc*, P. M. Payne; Miss Roe; J. K. Fowler.

Farmyard (Local).—1, F. Powers. 2, N. Clarke. 3, T. Cranfield.

Ducks.—*Aylesbury.*—1 and 2, J. K. Fowler. *Rouen.*—1 and 2, J. K. Fowler. *Any variety.*—1, Rev. A. Orlebar. 2, M. Leno.

Guinea Fowls (Any variety).—1 and 2, Mrs. Street.

Geese (Any variety).—1, W. K. Fowler. 2, G. Davies.

PIGEONS.

Carriers.—1 and *hc*, H. Yardley. 2, — Swallow & Chambers.

Pouters.—1, H. Laver. 2, H. Yardley. *c*, W. Nottage.

Jacobins.—1, G. Roper. 2, H. Yardley.

Antwerps.—1, W. R. Ball. 2, W. Nottage.

Fantails.—1, J. Loveraide. 2, H. Yardley.

Trumpeters.—1, H. Yardley. 2, P. M. Payne.

Any Variety.—1, W. Nottage. 2, D. Dean. *hc*, W. H. Boyer; — Swallow and Chambers; H. Yardley; H. Laver.

CLECKHEATON POULTRY SHOW.

The following are the awards made at this Show, held on the 22nd inst.:—

Game.—*Black Red or Brown Red.*—1, C. W. Brierley, Middleton. 2, R. Hemingway, Shelf. *Blue or Grey Duckwing.*—1, C. W. Brierley. 2, J. Mason, Worcester. *Any variety.*—1, C. W. Brierley. 2, R. & H. Walker, Gomersal. *Cock.*—1, E. Aykroyd, Eccleshill. 2, C. W. Brierley.

Dorking.—1, T. Briden, Farby, Skipton. 2, W. H. King, Rochdale.

Cochin-China (Any variety).—1, H. Beldon, Bingley. 2, H. Lacy, Hebden Bridge.

Spanish (Black).—1, C. W. Brierley. 2, H. Beldon.

Brahma Pootra.—1 and 2, H. Lacy.

Hamburghs.—*Gold or Silver-pencilled.*—1, H. Beldon. 2, S. Smith, Northowram. *Gold or Silver-spangled.*—1 and 2, H. Beldon.

Pheasants (Black).—1, C. W. Brierley. 2, H. Beldon.

Game Bantams.—*Black Reds or Brown Reds.*—1, G. Noble, Staincliffe. 2, W. F. Eatwisle, Wike. *Any variety.*—1 and 2, W. F. Entwisle.

Bantams (Any variety except Game).—1, H. Beldon. 2, S. & R. Ashton, Mottram.

Any other Variety.—1 and 2, H. Beldon.

TURKEYS.—1, E. Leech, Rochdale. 2, Rev. N. J. Ridley, Newbury.
GEESE (Any variety).—1, E. Leech, Rochdale. 2, G. F. Thompson, Cleckheaton.

JUDGES. — *Poultry:* Mr. James Dixon, Bradford; Mr. Richard Teebay, Fulwood, Preston.

ANTWERP, VOLANT, OR WHITE EYE PIGEONS.

I SEE what is stated at page 56, but still we do not get at the information sought. There is but one Antwerp Pigeon which I call the Antwerp proper, and it is the Dove-faced Antwerp, which frequents the loftier buildings of the city of Antwerp, as our Daws and Starlings do steeples and towers; in short, as you see Pigeons in the dome of St. Paul's, London—wild Doves, or the tramps and vagrants of Pigeon society. So is the Dove-faced Antwerp a wild Dove, in the city of Antwerp, and, probably, in the Belgian towns and provinces, such as I describe. I wish to learn if it is not a cross-bred bird between this Dove-faced Antwerp and Dragoon (and Owl, too), that is represented as the Antwerp or *voyageur* Pigeon we all know so well, such as were flown from the Crystal Palace lately; not our toy show Antwerps, useless on the wing; in short, if these Voyageurs are not Dove-faced Antwerp and Dragoon (Owl, too) Skinnums?

And I would learn, if the White-eye (Volant) is not either Dove-faced Antwerp and Tumbler crossed—perhaps House Dove crossed—or Dove-faced Antwerp under domestication—reclaimed Doves, indeed; for I think the Dove-faced Antwerp is the House Dove, become homeless and partially wild, as Daws and Starlings, and vagrant Pigeons are.

"Volants" all birds are, more or less, and some insects and reptiles too; but the Volant Pigeon is so called in demonstration or rather signification of its remarkable flying powers. And Volants are White Eyes; but whether Dove-faced Antwerps pure or crossed, as suggested, remains to be told. The "Volant" is indigenous to certain provinces in Belgium only, and a *rara avis*, generally speaking. Mr. Sutherland, of Combe, I believe, knows this Pigeon. In Lancashire we want to know what White Eye (Volant) is.—READER.

P.S.—The White-eye Volant I am told is also called "The Cumulet," whatever that signifies. Is it some prolific speciality, or gregarious habit, or has it reference to cloud—cumulus—flights?

MIDDLETON POULTRY SHOW.—This Show, which of late years has been very successful both as regards the number and the quality of the poultry and Pigeons exhibited, is fixed for September 20th and 21st. There are fifty-two classes for poultry, seventeen for Pigeons, and six for Rabbits, in all seventy-five classes, and the prizes include several cups.

SUCCESSFUL SWARMS—DRIVING.

I BOUGHT a stock of bees this spring. A month ago a swarm came off which I put in a straw hive, but the bees did not seem to settle, and I suspected they were going off to some place which they had chosen. In about half an hour they began to return to the stock hive again, in a quarter of an hour they had all done so. Is it probable the old queen which would go with this swarm was lost? In fourteen days, the weather being unfavourable all that time, there was another swarm which I secured; it has been fifteen days in the hive, and this is quite full of comb, and 9 lbs. heavier. I have heard no piping in the old stock, neither do I think it will swarm again. It has sufficient honey to keep its population during the winter and spring, and has on it a glass cap (10 inches by 5 inches), which is full, except a small piece of comb at the side. There is pure honey in all the combs, no bee-bread, and the bees are now sealing it quickly.

The white clover, which is the chief honey plant here at present, will last for some time, but haymakers are robbing the fields of much of our bee food. I purpose sending my bees to the moors in about three weeks' time. Would it answer to drive the old stocks at the expiration of twenty-two days from the date of swarming? Would they make sufficient honey, if the season be favourable, to maintain their population during the winter? I would not object to feeding in the spring. In the autumn, when the brimstone fumes are killing our little favourites, I could drive some bees and add to the old stocks; in this way I should get an extra hive. If the glass-cap were not all sealed, I would put it on the top of the swarm until all were sealed. Would giving beeswax to the bees be of any advantage to them in making comb?—T. R.

[It is very probable that the old queen was lost when the first attempt at swarming was made, and that under the circumstances no second issue will take place. If you now drive the stock you are likely to sacrifice a great quantity of brood, the usual conditions being entirely altered by the too-probable loss of the old queen. The expelled bees may or may not be able to collect sufficient food to last the winter; all depends upon the character of the remainder of the season, which, of course, no one can foresee, but a removal to the moors would afford them a better chance. If the driven bees are put into a moveable-comb hive, a few sheets of artificial comb given to them two or three days after the operation might possibly be an advantage.]

PREVENTING SWARMING.

THERE are several causes which, if put in operation, will tend to prevent swarming; but to reduce it to a practical science requires considerable tact and attention. One point is to have large hives and plenty of room; another, to keep none but young queens. This lessens the tendency to swarm. Moveable comb hives are indispensable. We have several apiaries at a distance from home, and do not find it necessary to watch them daily in the swarming season, as was the tedious old-time custom. As above mentioned, we supply each colony with plenty of room and a young queen. During the season when swarms are most likely to issue, a man examines each hive as often as every eight or nine days, and if any queen cells are in process of construction, cuts them off. They cannot mature any more queens within the next interval before examination, and if any cells are then found they are cut out in the same way, and so on till they cease.

The wing of the queen is clipped close, so that if any cells should be overlooked, and a swarm should issue, she could not fly, and, being unable to accompany the bees, they would return to the hive.

There is danger of the queen being lost by dropping to the ground in front of the hive and not finding her way back. This can be avoided by using what is called a "queen yard," being simply a plank in front of the hive 18 or 20 inches square and 4 inches high, with a strip of tin 2 inches wide set in all round the top, projecting inwards, parallel with the bottom of the box. The bottom should be tight, with a strip of wire cloth, 3 or 4 inches wide, across the side next the hive, to make it cooler. Make an opening in that side corresponding to the entrance of the hive at the bottom, and a passage through which the bees must pass into the queen yard before taking flight. The queen cannot fly, and cannot crawl over the projecting tin, and will readily return to the hive. I know of no possible means of preventing swarms with the box hive, as the queen cells are often inaccessible.—(*Moore's Rural New Yorker.*)

APIARIAN GLEANINGS.

TO FIND THE QUEEN.—I know of no method of finding the queen, except by looking till you see her. She is generally to be found on one of the brood combs. Handle the combs gently, so as not to alarm the bees, and she will remain much more quiet. The Italian queens being generally highly-coloured, can be distinguished much more easily than the natives, and are much less disposed to run about in fright over the combs.

TO REMOVE BEES FROM A FRAME of honey or brood, hold it perpendicularly to avoid breaking-out the combs, and give it a sharp, sudden motion downwards, with force enough to dislodge most of the bees. The few still adhering can be brushed off with the feather-end of a stiff quill or a small wing.—M. QUINBY.—(*Moore's Rural New Yorker.*)

OUR LETTER BOX.

Books (*P. J. J.*).—We think you must mean the "Poultry-keepers' Manual," price 5*s*., free by post 5*s*. 4*d*.

Dark Brahma Cock Crop-bound (*C. G.*).—Your fowl must have had a wonderful constitution to live through your treatment. We cannot imagine much worse feeding than yours. It is far more fitted for a pig than for a fowl. It is said that certain Indians, when unable to procure food, eat earth to stay the cravings of an empty stomach. Your fowl must have laced his "olla podrida" in the same spirit. For some time after each operation the food should have been plain thick gruel, administered frequently, and very little at a time, not such a hotch-potch as he had. Till you alter your feeding you will always have crop-bound birds. Give up your thirds, cabbage, potatoes, and muizemeal. Give ground oats, barleymeal, or even whole corn. Be careful in giving small quantities at a time, and your bird will do better, but he will be long in recovering the double operation. If you have another as good we do not advise you to keep the patient.

Fowls to Supply Chickens and Eggs (*H. B. B.*).—You cannot do better than keep the Brahma Pootra if you mean to eat the eggs and chickens yourself. If you mean to send to market, we advise you to keep Dorkings, provided they can always have the run you speak of.

Hamburghs Catarrhed (*W. H.*).—Your Hamburghs have a cold; all the breed are subject to it. You say they seem well, and lay well. All they want is a stimulant. Nothing is better than some bread and ale, and a little camphor in their water. If the cold be treated in this way it will pass. If the weather change for real summer weather, dry and hot, we shall hear no complaints of the sort; but with lessening days, cool mornings and evenings, and tropical showers (six hours sooner or six hours later, *vide* Francis Moore Physician, in his learned treatise, "Vox Stellarum"), we have little hope of perfect health and ease for man or other bipeds.

Preventing Fowls Sitting (*E. W.*).—We are tired of remonstrating with those who, like you, complain fowls are always sitting. The act, or propensity, or nuisance as you term it, is one strictly in accordance with all the attributes of fowls. As to their being always sitting, it is a question of lapse of time. If you chose twenty children, all born February 13th, 1871, you will not be surprised if on the 13th of February, 1872, they are twelve months, if in 1892 they are all of age, and looking on you as "an old fogey." It may be, the burden of twenty coming of age the same day may be hard to bear. If you had chosen them in four divisions, with one year's interval, they would not all come of age at once. If your chickens are all of the same age, they will all lay and want to be broody the same day; if you choose them at one or two months' interval, there will be the same interval in their laying and broodiness, and you will have nothing to complain of. Broodiness in a pullet is a question of age; in a hen, it is a question of season. If you keep pullets, you may depend on their laying, but if you keep hens they will only lay in the spring. We suppose your only objection is, that the hens do not lay when they are sitting.

Distinguishing the Sex in the Egg (*E. E. F.*).—We thank you for your letter, and your experiences. We do not believe in the sexes of eggs, and have little faith in the eggs of pullets. They are generally supposed to be the worst eggs they will lay. We have tried all the modes suggested, and have come to only one conclusion—that the earliest chickens have a tendency to the male sex. It is curious that a Crêve-Cœur should sit, and as you put her on Duck's eggs, thus showing her the sweets of maternity in their sourest sense; it is probable she may rejoice it was only the exception, caused by some disarrangement of the organs, and she may avoid such visitations, and such gentle cares in future.

Making Hens Recommence Laying (*Cressy*).—We can only recommend you patience. Feed your fowls moderately but well. Do not have recourse to any cabbage, potato, or patent foods. No stimulants. Every hen if she meet with no accident, lays her stipulated number of eggs, and whether she does it in four years or in one, she will lay no more. Everything that is done in the way of forcing to lay, tends to produce disease of an incurable character. Meat feeding forces laying.

Crossing Dorkings (*C. M. S.*).—We had not thought there was a pure Red Dorking cock left. We never see one now. The late Prince Consort had them, also Sir John Cathcart, and Mr. Fisher Hobbs. You may safely keep the produce, and the chickens will show the Red blood next year. It will be no disadvantage to them. It cannot be too generally known and understood, that no colour should be allowed to influence the chances of success of a pen of Dorkings in general competition. All can compete except White. They have classes apart. Silver-Greys can compete in the general class.

Dubbing Game Chickens (*E. W. S.*).—The age of five months is full early for dubbing, but if your chickens are shown with full heads they will have no chance against those that are dubbed. The best food for a journey is bread sopped with water, and put in a vessel fastened to the side of the basket in which the bird is packed.

Keeping Hamburghs (*J. C., Riversdale*).—They do not thrive in confinement; they must have a good run. Brahmas, Cochins, or Spanish will suit you much better. We should choose the first-named.

Double Egg (*J. N.*).—We are much obliged by your communication. It was for many years declared that these double eggs were not fruitful, but experience has proved the contrary. We have many instances recorded in which, as in your case, twins have been produced, not always joined together. The weight, 5¼ ozs., is very great. Hens sometimes lay each for a week and then discontinue. It does seem an anomaly and a difficulty that fourteen eggs should produce fifteen chickens, but it is not the less true, and we thank you for the authentication of it.

Woodbridge Show.—"I wish to know if any exhibitor at this Show has received any prize money. I have not, and although the Secretary promised to send it at a certain date I have seen nothing of it. I am waiting until another exhibitor is ready, and then we are going to try and get it in the County Court, and I advise all others to do likewise.—Howarth Ashton, *Polefield, Prestwich*."

Antwerp Pigeons, &c. (*Reader*).—We think that no more need be published. The question has been already asked, replied to, and rejoindered. Birmingham boys have as good a right to maintain their opinions as Lancashire lads. They each claim truth, and it may be, "truth disclaims them both."

Second Swarm Deserting their Hive.—The errant swarm may have returned to the old hive, although it seems more probable that they have gone off altogether. We cannot account for their deserting their hive, although discouragement owing to unfavourable weather may possibly have been the cause, and in this case a timely supply of food sufficient to enable them to proceed with comb-building, might, perhaps, have saved them.

REMARKS.

19th.—Hazy in early morning, fine but occasionally cloudy, storm-like, with a few drops of rain at 7 P.M.

20th.—Fine morning, cool air and bright sun all day, but cloudy at night.

21st.—Hazy and cloudy till noon, so of course cooler, very fine afterwards.

22nd.—Hazy morning, slight shower at noon, and a short heavy one between 5 and 6 P.M.; all else fine.

23rd.—Fine early, thunder at 11.55 A.M., slight shower at 1 P.M., and two or three afterwards.

24th.—Rainy morning, sunshine and showers during the day, but wet evening and night.

25th.—Fine, early; strong wind and frequent heavy showers, vivid flash of lightning, and very long, though rather distant, peel of thunder at 3.2 P.M.

Barometer rather lower than last week, temperature slightly higher, the difference between the dry and wet being precisely the same, 5°.9. The latter part of the week alternating splendid sunshine and heavy showers.
G. J. Symons.

Errata.—Barometer, April 29th, should be 29.388, and July 14th, 30.032.

COVENT GARDEN MARKET.—July 26.

We are now better supplied with general produce than for some time past, and a fair attendance of buyers has kept the stands clearer in consequence. Pines and Grapes are very plentiful; Peaches and Nectarines quite sufficient for the demand.

From observations taken near London during forty-three years, the average day temperature of the week is 74.6°, and its night temperature 50 4°. The greatest heat was 90°, on the 6th, 7th, and 8th, 1858; and the lowest cold 35°, on the 4th, 1865. The greatest fall of rain was 0.88 inch.

THE CULTURE OF WINTER SALADS.

TO provide salads in summer is not difficult, but to keep up a supply throughout the winter is not so easy. It requires considerable skill and forethought, and it is just what every gardener, however small the place, should try to do, because the demand for winter salading is rapidly increasing, and the chances are that he will some day be called upon to grow them, when he would find it much to his advantage to have given them a share of his attention.

Hitherto, I believe, the French gardeners have excelled the gardeners of this country in the culture of their salads, but I do not think that the perseverance of the English will long allow that to be the case; the French may, and perhaps always will, have a greater variety of materials with which to make up a salad than we have, or indeed than English palates require; but I think salad culture is destined ere long to develope itself in this country to as great a degree as in France, and to become an object for special preparation in most gardens.

Under the head of salads for winter I mean to include the early spring months, or that period before which it will not be safe to attempt to raise a supply out of doors. The materials which I have found most in demand are Lettuces, both Cabbage and Cos, Endive of sorts, Corn Salad, Mustard and Cress, Watercress, Parsley, Celery, and Radishes, also Chicory. Beetroot, which is frequently used, would, of course, be supplied from the summer-grown crops, and the same may be said of the Celery, which will in most seasons be fit for use up to March or April.

For Lettuces and Endive it will be necessary to have plenty of glass protection, such as temporarily-constructed garden frames, hand-lights, and bell-glasses, or what the French call cloches. Any of these, or all of them, may be arranged on a sloping border, or any sheltered place with a sunny aspect There are very few places where there are not a few glazed lights to spare, and in the absence of any other protection these may be used as follows:—Select the spot and level the soil, stake out a piece of ground equal in width and length to the number of lights to be used, drive strong stakes into the soil, and nail a 6-inch board to them for the front, and one a foot or more in width for the back; let the under edge just touch the top of the soil—when the lights are laid on there will be one of the most handy and useful structures that can be put up for temporary use. The soil inside may be dug out to any depth, so as to admit of heating materials being placed inside, hotbed-fashion, in case of need; but for the protection of full-grown Lettuces and Endive, or salads which require to be blanched fit for use, only a few inches of soil need be taken out, unless from its poorness a better sort is required. Bear in mind that in these structures there must always be space allowed between the plants and the glass for the circulation of air, as, during bad weather in winter, much attention to air-giving will be necessary.

Last summer, when I took charge of these gardens, I found that a very large quantity of all kinds of salading would be required during the winter and spring, I therefore set the men to erect several ranges of the temporary frames described, and nothing could have answered the purpose better. Some of them were filled with sturdy plants of Parsley; a few lights were devoted to Tripoli Onions, while the remainder were filled with Lettuces and Endive in various stages of growth, always reserving enough space for the reception of a good store of various sorts of salading in a fit state for use. If the roots of such plants are packed carefully in a dryish soil the leaves remain fresh and good for a long time. During the severe weather last winter I erected some temporary benches in the packing shed, placed on them a few inches of soil, packed the Lettuces and Endive as closely as convenient, and they kept in first-rate condition. Again, after the Endive is used up, which is about February or March, these frames are employed for forwarding spring Lettuces and Onions, Radishes, Mustard, Cress, and Parsley, as well as various plants for out-door crops.

The earliest crop of Radishes is generally sown with the early crop of Carrots in December or at the beginning of January on a gentle hotbed; they can again be sown among early crops of Potatoes on a bed of leaves. Great care must be exercised that the heat is not too strong, otherwise the Radishes run too much to top. Another precaution it is as well to mention should be taken—that is, not to use the soil for such crops as Carrots and Radishes too light and rich; if so, the same result will be produced. A good plan is to press the soil firmly about the roots after the plants have made a fair share of top-growth; this will induce them to swell at the bottoms, and check top-growth.

Next I will speak of Mustard and Cress. There are often complaints made about the difficulty in getting the latter to vegetate. I have experienced the same result, but it has been with old seed; I have never had any difficulty with new seed. The plan which I adopt is to sow the seed in shallow boxes of convenient width, and never to cover it, but merely press it into the soil with the hand. Do not sow too thickly, otherwise the gummy substance produced upon the seeds by moisture congeals, and destroys the vitality of the seed. Gentle heat and moisture constitute all that is required besides the above. There ought to be no intermission of supply between the first in-door crop and the last out-door crop. I begin to sow in-doors during the last week of October, or sooner if the weather is precarious.

Corn Salad, or Lamb's Lettuce, though not always required for the salad bowl, is, nevertheless, a very excellent and agreeable salad. It is very much in request here. Its culture is of the easiest kind, and when once established in a garden it will come up freely enough without sowing, but to make sure of a good supply, a sowing is made in August for autumn use, and two more in September for winter use. In many parts of England it requires no other protection than that afforded by a wall, and when hard frosts set in I generally cover it with long litter or fern, and cut it as required, but doubtless it would be improved by being grown in some cool place protected by glass.

Chicory is, I think, becoming more commonly used than

any other sort or salading, except Endive or Lettuce. It is a good addition to a salad, though it has been thought too bitter for some tastes, but those who are accustomed to eating it take no notice of that. It is not so bitter if forced quickly, but if forced slowly it is both bitter and tough. My mode of treating Chicory is in May to sow a good breadth in rows, 1 foot apart, in the open ground, selecting good deep soil, and encouraging the growth so as to produce good-sized roots. In the autumn I dig them out of the ground in the same way as Carrots, taking care not to break them. After drying, the roots may be packed away, minus the tops, in some dry cool shed, where they will be secure from frost, using dry earth or ashes to pack them in. When forcing commences, which with me is about the beginning of November, a hotbed is prepared of sufficient size to afford a heat of about 70°. The position for such beds is by no means of particular importance, for I have placed them in dark sheds or cellars, or in any out-of-the-way corner of the garden, and in brick pits or garden frames, and if every ray of light be excluded, any of these places will answer the purpose well. If a bed cannot be afforded for forcing Chicory alone, the roots may be potted thickly, and placed in any heated structure. They must be kept dark, and supplied with plenty of water. The young leaves will soon push forth, well blanched and tender, and when from 4 to 6 inches long are fit for use. This salad is the easiest to force of any that I know, and may be enjoyed by anyone having the most limited means for forcing it.

Of Lettuces and Endive, in order to have a good stock of plants for winter use, successional sowings should be made frequently between July and November. The earliest sown will come to perfection in the open borders, and also later sowings if the weather be mild. The stock, however, should be so regulated as to have a large quantity of plants approaching maturity, so that all store places under glass may be filled up when frost sets in. Hand-lights and cloches may be used with advantage to protect the plants left in a forward state in the open ground. The cloches, of which I have several dozens, are the handiest and most useful means of protection I know, and they should be in use in every garden. The way to make the most of them is to place the plants in groups of five or seven, close enough for the cloche to cover the whole. During hard frost a little protection must be given at night. Cloches are also remarkably handy for bringing forward Lettuce in the spring, for protecting or growing Parsley, and for many other purposes.

I hope the hints I have given will be found useful to those who may be called upon to supply a winter salad; but remember, there is much to be left for the cultivator's own judgment to apply according to circumstances which I cannot foresee. By the methods described, I have to supply some thousands of heads and bunches of the different salads mentioned during the autumn, winter, and spring.—Thomas Record.

STRAWBERRY CULTURE.

Last season Strawberries, owing to the excessive heat and drought, ripened nearly together, but where they were well supplied with water at the roots the quality was very superior. The present season has been equally remarkable for wet; in many cases the fruit was deficient in colour and flavour, and decayed on the ground before it was quite ripe. In a season like the present, the best way to ripen the fruit, and to preserve it for a few days after it is ripe, is to stick small sprays of Elm, Beech, Hornbeam, or anything similar, round the plants, and allow the fruit to hang over from the clefts of the spray. In a dry, scorching season the fruit is sometimes scalded, but in a wet season this is the only way to preserve it intact.

The failure out of doors has been amply compensated by the unusual excellence of the pot fruit. A very large crop has been gathered with considerably less attention as regards watering. In continued dry, hot weather the amount of watering pot Strawberries require is enormous. Various means have been tried to obviate, to some extent, the necessity of so much watering, such as placing the pots in saucers of water, or setting them on turf, but I do not approve of either system. To obtain the finest-flavoured fruit the pots should stand upon a wooden platform or shelf as close as possible to the glass, and in a position where a current of air can pass over and under them, especially when the fruit is ripening; and air at that time should be admitted both by night and day. The fruit, as a consequence, will be highly coloured and rich in flavour.

The following varieties were grown in the orchard house this season, and they ripened in the order of their names:—Premier, British Queen, Mr. Radclyffe, Lucas, President Wilder, La Constante, Souvenir de Kieff, and Frogmore Late Pine. From some cause, but what I know not, nearly two-thirds of the plants of Souvenir de Kieff were "blind," and the same circumstance occurred with the plants in the bed out of doors. This is an excellent Strawberry, but if it has a failing of this sort it is not to be recommended. Lucas was very good indoors, and is very fine out of doors; beautiful in colour and excellent in flavour under the circumstances. British Queen and Mr. Radclyffe are much alike; both are first-class, and always to be depended upon for a crop of the finest dessert fruit. President, which ripens earlier than any of the above except Premier, which ripens about the same time, should be grown by everybody. Frogmore Late Pine, planted out and in pots, is unsurpassed as one of the latest varieties; the fruit is large, and, with its peculiar Pine flavour, most excellent. The plant is also an abundant cropper. Those who require fruit of the largest size and late should grow Admiral Dundas and Cockscomb; the latter is also of good flavour.

The new varieties which I have not as yet seen noticed are President Wilder, which is of dwarf, compact habit; the fruit is not of the largest size, but there is plenty of it, and the flavour is good, especially out of doors. Triomphe de Paris is of free growth, and an excellent variety for pot-culture. Alexander II. also promises well. The fruit is of large size, somewhat irregularly formed, and of a bright red colour; it is, unfortunately, one of the most tender sorts, and the plants were much cut up last winter.

It may be useful to state the method of culture pursued here with the Strawberry in pots as well as in the open garden. We commence to layer the runners both for pot-culture and for planting out about the first week in July. The Strawberry requires good potting material—turfy loam and rotted manure, in the proportion of four of the former to one of the latter. A single crock is placed at the bottom of a 3-inch pot, and a little soot over this to help to keep the worms out; the loam is then pressed firmly in. The pots are arranged close together in a double row between two rows of Strawberries, and a runner is fixed in the centre of each pot with a small peg. In a fortnight the runners will be established in the pots, and may be cut clean from the plants, placing them in a position freely exposed to the sun and wind; of course not in a continued draught, as no plant will do well in such a position. The plants should also stand on a hard bottom, or each pot should be set singly on a brick.

When the plants have well filled the small pots with roots, they should be shifted into the pots in which it is intended they should fruit; 5 and 6-inch pots are the most suitable, and the compost should be the same as that previously used. I have tried a larger size than 6-inch pots, but do not think that such are so suitable. In potting it is hardly possible to ram in the compost too hard. The pots should not be filled too full: half an inch or more space should be left below the rim to allow of sufficient water being given; and it may be as well to note here that the plants should not have a drop of manure water until after their season of rest and until the flower-trusses appear, when manure water may be occasionally given until the fruit shows signs of colouring, then it must be withheld. During the period of growth the plants should not only stand in an open position, exposed to the sun morning, noon, and night, but ample space should be allowed between the pots in order that the leaves may have room to develope themselves. The only attention the plants require after potting them is to water freely and pinch off the runners as they are formed, and about the middle of October to remove them to cold frames, where the pots should be plunged to prevent the frost from injuring the roots. The pots can be removed to the forcing houses as they are required.

For culture in the open ground, and to obtain the best results, much the best system is to make a fresh plantation annually, and, as already noticed, the runners should be layered in small pots. It is the best way, as not only do the plants go out without experiencing any check to their growth, but they may remain in the pots a week or two if the ground is not ready for them. They can be planted after any crop—Peas, Potatoes, or spring Cabbage. If the ground is cleared before the end of July, it should, if possible, be trenched and well enriched with manure a fortnight before planting. I plant in rows 2 feet apart, and allow the same distance between the plants. This distance is the most suitable for all the varieties, except such as Presi-

dent Wilder, La Constante, Black Prince, and others of the same type. In such a season as this a distance of 2 feet is much too close for the stronger-growing varieties; the leaves have so overshadowed the fruit that sun and air cannot reach it. It is also worthy of note that the best fruit as well as the heaviest crop is obtained the first year after planting. The varieties recommended for pot culture are the best also for growing in the kitchen-garden quarters. Of course, the different qualities of soil have much influence on the quality of the fruit. The flavour is also much affected by position; an open airy exposure suits the Strawberry best. Sheltered from cutting winds, but not shaded, Frogmore Late Pine on our light sandy loam is one of the best late sorts; on some clayey soils it does not succeed.—J. Douglas.

A BIT OF SOUTH DEVON.—No. 2.

"What's in a name?" Much. It is quite true that "a Rose by any other name would smell as sweet," but that is no satisfactory response to the query. The name applied always indicates much. "Ned" is a different man from "Edward." "Bet" is not a woman like unto "Bessie." Then, again, where local names of things are gentle, poetic, the people of thereabouts are not "Nottingham lambs" nor "Paris communists." For example—a confirmatory example: hereabouts the fair blue flowers of Germander Speedwell, Veronica Chamædrys, are called "Angels' eyes," a name as soft as the people's clotted cream.

What a different commencement from that intended when I took pen in hand! But whilst I am a vagrant my habits partake of my infirmity of purpose. I intended first to say, and say it now, that since I last wrote I have had the pleasure of a long chat with Mr. Edward Vivian, the well-known meteorologist; he was on the verge of starting to join the Association of Science at Edinburgh, but kindly spared me an hour. He fully confirms the conclusion I had reached relative to the summer temperature of Torquay. His meteorological observations here extend over many years, but I will confine my quotation to his summary of results during the last ten years.

"Mean summer temperature and highest extreme—

Torquay..	55°.7, 82°.	Clifton..	55°.2, 91°.	Ventnor....	56°.3, 82°.
Exeter....	56°.5, 91°.	Oxford..	55°.3, 90°.	Greenwich .	56°.0, 94°.

Mean winter temperature and lowest extreme—

Torquay..	44°.7, 18°.	Clifton..	41°.3, 7°.	Ventnor....	44°.9, 21°.
Exeter....	43°.8, 14°.	Oxford..	41°.2, 16°.	Greenwich .	41°.4, 8°.

Mean daily range of temperature—

Torquay.....	9°.8.	Clifton	13°.4.	Ventnor	9°.2.
Exeter.....	14°.6.	Oxford	14°.2.	Greenwich.....	16°.3.

Annual amount of rain in inches, and number of days on which it fell—

Torquay ..	28.9, 154.	Clifton ..	29.3, 131.	Ventnor	27.7, 152.
Exeter	27.3, 135.	Oxford ..	25.5, 153.	Greenwich..	22.2, 147."

Collateral evidence of the absence of great summer heat is the fact that when Mr. Vivian resided in Hertfordshire he ripened Black Cluster Grapes on the open wall, but he has failed in his endeavour so to ripen them at Torquay.

My sole object in thus demonstrating that Torquay is a temperate sea-side summer resort is to remove the delusion which causes many to avoid, except in winter, this most beautiful locality, deficient in no one requirement, and with a Flora including many rarities, and all, whether rare or common wayside plants, characterised by very special luxuriance.

I record one relative warning. The plant-seeker will find it stated in Stewart's "Handbook of the Torquay Flora," that here is to be found the Maiden-hair Fern, but Mr. Vivian and Mr. Gosse, both residents, assure me that it is no longer a tenant of the Torquay cliffs. They both tell of "one little pet specimen on Berry Head," the whereabouts of which is kept secret from all but a select few, lest it should become known to that ruthless invader—a visiting collector. Never have I seen that Maiden-hair so fine as in the fernery of Mr. Gosse at St. Mary Church. (There's a softened name, again. How far more grateful to the ear than when the genitive *s*, as usual, is appended.) That excellent sketcher in words of Nature lives now surrounded by his trim garden, fernery, orchard and Orchid houses. If you who are reading these notes are not acquainted with his "Year by the Sea-side," make its acquaintance, and be grateful to me for introducing you to that book and its author, for in that you will see his mind. I know his genial personage, too, having just renewed an acquaintance some years have interrupted. He has a collection of about two hundred species and varieties of Orchids, and is annually adding to them. He has just purchased at a Stevens's auction that must for the present be considered a variety of Anæctochilus (Goodyera) Dawsonianus, but I venture to think it is the species, for the leaves are green, and those of the specimens at present bearing the name are coloured. Then, his fernery, with its walls and buttresses all completely clothed with most luxuriant specimens, hanging over and concealing a tank of slightly-tepid water, in which gold fish live and breed in comfort. How I pity those in glass globes! There, too, is that lovely bog plant, Ansgallis tenera, carpeting with its pale-green leaves the soil's surface, and figuring the carpeting with hundreds of its delicate pinky flowers. Why are not bog plants more cultivated? Mr. Gosse knows how to cultivate as well as how to collect, and he knows that he knows how, and, like another cultivator, would discharge the man who did not plant Cabbages with their roots in the air if he was so ordered. But Mr. Gosse is more than a cultivator and sketcher of Nature. Like the pilgrim turned hermit and cultivating his herb garden, Mr. Gosse can say, "My staff is not thrown aside, I keep it ready for my journey to a better land."

This reference reminds me that in the 15th century hereabouts were the resorts of pilgrims for embarkation towards the shrine in Spain of St. Jago de Compostella. In 1434 the Mary of Brixham was licensed to carry thirty pilgrims, the John of Teignmouth the like number, and the Catherine of Dartmouth forty. The district was likely to be fertile of pilgrims even if its population were not more superstitious then than now, for I have been told that a bed of Lilies of the Valley was not planted because he who did the planting would die within twelve months.

Mr. Curtis's notes on the new Roses of 1870 have just reached me, but before detailing them let me prevent any mistake arising from my remark that his rosery is strictly a practical establishment, by stating that he is a very frequent and very successful exhibitor. Even whilst I have been here he took prizes at Teignmouth, and just previously he did likewise at Clifton when contending with other great Rose-growers. Let me add for the benefit of amateurs this extract from his experience:—"I find guano and soot the best fertilisers for Roses." And now for his

NOTES ON THE PRINCIPAL ROSES OF 1870.

Abbé Giraudier, H.P. (Raised by Levet). Deep rose colour, somewhat in the way of Madame Charles Wood.

Albion, H.P. (Liabaud). A large, well-shaped, bright red Rose, but of moderate growth.

Alexander Humboldt, H.P. (Charles Verdier). A free bloomer, of the prevailing crimson colour.

Auguste Neumann, H.P. (Eugène Verdier). Dark rich shaded crimson, with thick petals. Good.

Baron Chaurand, H.P. (Liabaud). Very dark shaded crimson, with stiff Bourbon-like petals and rosette centre. Medium size and strong growth.

Belle Lyonnaise, T. (Levet). Fine shaded yellow, of vigorous, climbing, Gloire de Dijon habit, and, as far as I have seen, having more yellow with less of the buff tint than our invaluable old friend.

Blanche de Meru, H.P. (Charles Verdier). A small blush Rose of medium growth.

Catherine Mermet, T. (Guillot fils). Full size, distinct flesh rose colour, beautiful. The bud well coloured and graceful.

Countess of Oxford, H.P. (Guillot père). Carmine, very large. Rather deeper in colour than Victor Verdier.

Ducher. A good white Chiua.

Edward Morren, H.P. (Granger). Light carmine rose, of fine form and very double; of extra size. Rather uncertain, specimens sometimes occurring truly magnificent. A good grower.

Eliza Boëlle, H.P. (Guillot père). Light pearly blnsh, in the way of Mdlle. Bonnaire, but a stronger grower.

Ferdinand de Lesseps, H.P. (Eugène Verdier). Rich shaded crimson. Large and of fine form, of the Madame Victor Verdier type; fragrant and superb. A fine exhibition Rose.

General Grant, H.P. (Eugène Verdier). Dark maroon crimson, globular. A strong grower.

Jeanne Guillot, H.P. (Liabaud). Lilac rose, medium size. Not much to recommend it but its stroug growth.

Jnles Seurre, H.P. (Liabaud). Red, the old colour. No acquisition.

La Motte Sanguine, H.P. (Vigeron). Bright cherry crimson, very large and effective. Rather more massive than Glory of Waltham, of the same shade of colour.

Le Mont Blanc, T. (Ducher). White, tinted yellow, medium size.

Louis Van Houtte, H.P. (Lacharme). Rich shaded crimson maroon, deeply cupped, fine form. In the way of Louis XIV., but a stronger grower, very fragrant. A fine exhibition Rose.

Louisa Wood, H.P. (Eugène Verdier). Light vermilion crimson, often very striking in colour, and brighter than Madame Caillat. Of fine form and highly scented, will be found a great acquisition a a pillar Rose.

Madame Ducher, T. (Ducher). Pale yellow, pretty. Of medium size.

Madame Dastour, H.P. (Pernet & Co.). Brilliant cherry crimson; of fine half-globular shape, in the way of Victor Verdier. Good, though of medium growth.

Madame Le François, H.P. (Oger). Rosy pink. Habit and shape of Chabrillant, but not so good.

Madame Levet, T. (Levet). Shaded yellow and buff. Very evidently a seedling from Gloire de Dijon.

Madame Liabaud, H.P. (Gonod). Light pearly or rose blush, nearly white; of beautiful circular shape to its centre. In the way of Virginal, but of rather stronger growth. A decided acquisition. We could wish this gem rather larger for our exhibition stands.

Madame Trifle, T. (Levet). Yellow, shaded salmon and buff; large, of good dark foliage and habit. A Gloire de Dijon seedling.

Mdlle. Eugénie Verdier, H.P. (Guillot fils). Beautiful flesh blush, very large and showy. Of somewhat more expanded form than Madame Rothschild, and like Victor Verdier in growth.

Marquise de Castellane, H.P. (Pernet & Co.). Clear brilliant cherry rose colour; very large, striking, and beautiful. Of good habit, and a great acquisition.

Marquise de Mortemart, H.P. Beautiful light flesh blush; of good size and circular outline, but of dwarf growth.

Paul Neron, H.P. (Levet). Full rose colour; immensely large and massive. A very strong grower.

Princess Christian, H.P. (Paul). Fine shaded flesh rose colour. Habit and foliage of Victor Verdier.

Perle Blanche, H.P. (Touvais). White, delicately tinted flesh; globular and massive, style of La Reine. A hard opener.

Reine des Beautés, H.P. (Gonod). Light blush; a very strong grower. The plants have not yet flowered sufficiently to be proved.

Souvenir de Baron Rothschild, H.P. Dark purplish crimson. Not much of an acquisition. A free bloomer.

Susanna Wood, H.P. (Eugène Verdier). Rose colour. Of medium growth.

Thomas Methven, H.P. (Eugène Verdier). Brilliant carmine; growth strong.

Thyra Hammerick, H.P. Light flesh rose, large and circular; of medium growth.

Tour Bertrand, T. (Ducher). Yellow, shaded buff and flesh. A seedling from Gloire de Dijon, which it much resembles.

Unique, T. (Guillot fils). Flesh, edged and tinted with rose. Peculiar and distinct.

Clémence Raoux, H.P. (Granger). Flesh blush tinted and bordered. Of flat, expanded, massive form. Poor habit.

Those forty varieties were all proved in the Devon Nursery, and the notes record Mr. Curtis's opinions. I will add for the satisfaction of one of the "old Gooseberries" and his daughter, that I saw several specimens of Mr. Curtis's new Rose "Bessie Johnson." I can attest that it is a large, fragrant, pale pink flower, and of vigorous habit. Mr. Curtis says of it, "It is superior in perfume to most of the full-sized blush Roses, with the exception of La France; decidedly superior to Reine Blanche; is distinct, and a very free autumnal bloomer, of the fine habit and growth of Abel Grand."

I must conclude. It is raining steadily, and disagreeably near to the 20th, when Devonians expect the heavy rain, which they call from that anniversary "St. Margaret's Flood;" but it shall not drive me away, for "I have not yet done with Torquay."—G.

P.S.—The rain was last night; glorious sunshine this morning. Off to Berry Pomeroy Castle.

CUCUMBER FAILURES.

Many thanks, Mr. Luckhurst, for your answer to my plaint. Would that I could say it has solved the difficulty for me, but, truth to say, it has not. The day after I received the Journal my and your former neighbour, Mr. Woodford, came down to see me; he knew my case, and I put your letter into his hand. "Well," he said, "we will go and have a look at the bed," and so we did. So far from finding the bed soddened or the roots dead, we found the hills filled with fine, white, clean, healthy-looking roots, and the soil so loose and friable that one could put his hand right down to the manure without any difficulty; in fact, a better-looking bed could not be. So, again, I am at a loss. I find several of my neighbours similarly situated, and in one case the owner has, I know, made all the bed with turf as you have described; so I fear I must put it down as one of those things with "no fellow can understand."—D., *Deal.*

Large Lettuce.—I have frequently grown Lettuces to a much larger size than those spoken of by "R. F. S., *Stafford.*" After reading his remarks in your number of July 20th I visited my Lettuce bed, and cut two of the Paris White Cos, weighing respectively 3½ and 4½ lbs., and measuring 25 inches in circumference. About two years ago I cut two of the same sort, which together weighed 11½ lbs. They were all cultivated in the usual way for the use of a family, and had they received a little more attention would undoubtedly have acquired a much more prodigious size. I know of no Lettuce so useful for summer as the Paris White Cos. For years I have procured my seed from a remarkably fine selected stock. Not only have the Paris Cos Lettuces grown from this seed won the admiration of visitors for their enormous size, but connoisseurs who have tasted pronounced them the best and sweetest of Lettuces.—Uriah Hain, *Rousham Gardens, Oxfordshire.*

THE PORTUGAL QUINCE.

Some time since (about two years) I received some Portugal Quince stocks from Mr. Scott, of Crewkerne, and at the same period some from Mr. Rivers. They differ so widely in habit that I am tempted to ask your opinion as to which is the true sort, the small or the large-leaved. I enclose some of both. I find that the former strikes from cuttings, and has the appearance of the Angers Quince. The latter will not strike from cuttings but must be layered; this bears large fruit.—Inquirer.

[The large-leaved variety is doubtless the Portugal Quince, easily distinguishable from the Angers.—Eds.]

THE POTATO CROPS AND THE DISEASE.

I send you a report of the progress of the Potato disease in this neighbourhood (Ilford). There was an appearance of it about the end of June in plainly-discernible black blotches on the leaves and stalks, and about the 1st of July I dug up a plant of Veitch's Improved Early Ashleaf, and found three diseased tubers. This variety and Hogg's Early Coldstream were planted on a south border fully exposed to the sun, for the earliest crop. On the 1st of July the thermometer fell to the freezing-point, with a continued low temperature until the 14th; from the 2nd to the 15th 2·38 inches of rain fell. The disease made rapid progress in the garden, which is highly manured, consequently the crop is more susceptible to the disease. Rivers's Royal Ashleaf was attacked all along the lines. The haulm of Early Coldstream was soon a mass of decay: but very few tubers of this variety were diseased in the garden, and none in the field. I did not examine many of the second early crop. The haulm is a little touched in places. I lifted two roots of a promising variety named Derbyshire Hero, which was kindly given me to try by my friend Mr. Laing, of Downie, Laird, and Laing, and two roots of White Don. None were diseased. Of the last-named I never saw such a crop of even-sized Potatoes.

But it is in the fields and amongst the farmers that anxiety is felt. A neighbouring farmer had a fine crop of Kidneys, of which he thought much—nearly all are diseased. The Early Shaws, a variety which has been grown about here for more than a quarter of a century, were attacked first, and in some fields many were diseased, while the later sorts showed by the too-easily-discerned spots on the haulm that a continuance of weather favourable to the progress of the disease would soon make sad havoc with the main crops. The farmers, fearful for the loss of their crops, hurried them into market, and caused a rapid fall in the price. The Shaws are only second-rate as regards quality, and the very best "ware" were only fetching £3 per ton.

It was both interesting and instructive to watch the development and progress of the disease during the early days of July, until a kind Providence caused a change in the weather on the 14th. The air seemed to change, and the thermometer showed a rapid rise in the night temperature; it registered 61° on the 15th, 65° on the 16th, and 60° on the 17th, with a continued, rather dry, west wind, and a day temperature ranging from 80° to 85°. The disease was apparently stayed; the black spots on the leaves seemed to dry up, and the rest of the leaf remained of a healthy green up till to-day, July 27th. There is no disease in the main crop at Loxford over a range of seventy acres yet standing; and I again dug up a root of White Don to show the produce to a gentleman from Fife, who declared he never saw such a crop of large even-sized Potatoes and no disease. A young farmer told me yesterday that "down the country" the disease is very wide-spread, and some crops much injured, especially in the neighbourhood of Upminster.—J. Douglas.

The weather in our midland districts has been warmer in the past week, but is still very unsettled and at a very critical

point for the harvest. The Potato disease is likewise appearing amongst the second earlies, and everything is favourable at present for its full development and virulence amongst the late crops should August be wet and warm.—W. T.

Potatoes in the Vale of Gloucester are going, I fear, very fast, by the disagreeable smell that comes from the black-spotted tops, and many are complaining of dry diseased ones even now.—Thomas Gee.

The Potato crop in Cornwall has thus far turned out exceedingly satisfactory, the yield being larger than for some years and the quality very good. Unfortunately, however, the disease is reported to be spreading rapidly in many localities owing to the long-continued rain.—(*Devonshire Paper.*)

THE PROTECTION OF FRUIT TREES FROM FROST.

The most certain protection for wall fruits is to have the bearing wood thoroughly ripened to insure a crop.

It is with great diffidence I enter on a beaten path. The remarks of Mr. Sutherland, extracted from "The Gardener," and published in the Journal of July 13th, page 29, together with the pointed remarks of Mr. Fish in "Doings of the Last Week," in the same number, on the firmness of fruit-tree borders, have induced me to give my treatment of Peach trees against the open walls without the slightest protection having been ever afforded them for a period of eight years, during which time I never failed to secure a good crop of fruit, owing, I believe, to the system of root-management I adopted in order to secure short, hard, well-ripened wood.

I think it proper to commence with the making of the border, and I consider 8 feet to be a sufficient width, allowing 3 feet 6 inches from the wall for a path to nail, prune, disbud, &c., leaving 4 feet 6 inches of a bed to the edging of the walk, to be cropped as will be afterwards stated. There are very few gardeners, I believe, but have often remarked the injurious effects large heavily-cropped and highly-manured borders have on the fruit-bearing qualities of trees planted against walls; the continual digging, manuring, &c, inducing the trees to produce gross wood, water shoots, &c. Large roots running into the border and down into the subsoil, no fruitful shoots nor ripe wood can be secured when the roots get below the influence of solar heat. To correct the evil influence of planting in borders treated and cropped according to old-fashioned ideas, I adopted the following course of treatment.

The site of the border was high and dry; the soil was about equal parts of decayed sods and old garden soil thoroughly mixed, and in a healthy dry state. When filling-in, I had each layer of 6 or 8 inches in depth well rammed, and thus proceeded until I had 16 inches of soil firm and compact. I gave a good slope to the border, planted the young Peach trees in a half-circular space, cut about 6 inches in depth out of the solid border, planted as shallow as possible, and put on a mulching. I gave them the usual treatment young trees receive, and after the first year's growth, I mulched the border in March with very old hotbed manure, as recommended by Mr. Rivers many years since for light soils, and rammed it firmly. I next covered over the mulching to the depth of 1½ inch with sods and garden soil, and sowed in drills successions of Turnip Radishes, Early Dutch Turnips, and Onions, but no other vegetables. The hard manured bottom underneath the dressing of earth just suited such root crops, and never have I seen them better, but not large in size. I took care to have all crops off the Peach border by the 1st of September, in order to allow the solar rays to penetrate the border, and assist in ripening the young wood for the next year's crop.

The wood produced in the second year was in character and hardiness more like the young wood of an Apricot than Peach wood. The trees were studded over with fine triple-eyed, short, stubby shoots, and there was not a single robber shoot on any of the trees. The fruit were of a very large size. I measured a few of them, and the following were their dimensions—one Royal George Peach, 11 inches in circumference, one 10½ inches, one 10 inches, and several—in fact, the remainder—were all from 9 to 9½ inches each. Of Noblesse there were several from 9½ to 10½ inches in circumference.

My treatment during the first year I repeated yearly. When the border wanted water I gave a thorough watering. Previous to watering I went over the ground with a large-pronged fork, and drove it down in the border, moving it backwards and forwards to give width to the holes made by the prongs, and this was done closely around and over the roots, so as to allow the water to sink in freely. The character of the wood every year since has been the same as already described—as brown as if varnished, hard, stiff, and so well able to bear up against any rain storms, that instead of nailing or tying the bearing wood for the ensuing year's crop, after the last disbudding takes place, I allow it to grow from the wall in order to secure a better ripening of the wood. It always ripened more thoroughly growing in such a manner than if laid-in, and I have such proof of the practice being good, that I shall ever continue it. I have never had such crops of fruit (Peaches) as since I adopted the foregoing treatment, which, however, may be practised by many gardeners for anything I know to the contrary.

I should not omit stating that I protected the roots as in the case of Vines and Vine borders, for I believe the roots should be protected until the crop is set, and not protecting them at the most critical period for the safety of the crop causes many of the failures of which we hear. Let failures arise as they may from the many causes repeatedly stated in the gardening world, I have been able without the least protection to secure splendid crops yearly for the eight years during which I have had the management of the trees. I have been a constant reader of your Journal for the greater part of the time, and have often read of failures of the Peach crop, even where protecting materials were in use, but every season I found my crop quite safe with the usual thinnings, and I have become a firm believer in unripened wood being the chief cause of all the failures that take place. Let me point out the case of the wood in a vinery having been badly ripened—what follows? Why, a bad show of small bunches, and a very bad setting of the berries, although quite safe from the influence of frost and cold winds; and I assert that what takes place in the vinery from badly ripened wood, happens likewise to the Peach out of doors. I do not mean to assert that we can ever adopt a system of culture that will make the Peach tree live in health to a good old age; but we can assist materially in prolonging its existence, and have the benefit of splendid crops of fruit without the aid or expense of glass structures. In order to do so we must give up the old-fashioned border cropped with vegetables, but we can sow in succession the crops I have already named, and in the manner described, without the slightest disturbance to the roots of the tree.

In making fruit-tree borders let us make them firm, and if the compost is dry ram it hard; then it will be unfavourable to the formation of large roots, but will assist materially in causing masses of small fibres to spring upwards, assisted by the mulchings, to the surface, there to receive nourishment yearly at our hands, and be within the influence of solar heat.

I treated all the wall trees—viz., the Plums, Pears, Apricots, &c., in a similar manner to the Peach trees. The Plum tree I need not state requires taking up and replanting often, to make it produce fruitful wood, and I found firm borders most useful in causing the Pear on the Pear stock to produce freely at an early age. Borders for the Pear worked on the Quince need not be so firm. I have never resorted to any root-pruning, and the production of fruit-bearing spurs and wood was beyond my expectations; the size of fruit and abundant crops equally so. —J. McD.

POISONOUS FUNGI.

Having noticed accounts of large Mushrooms in two or three of the last numbers of The Journal of Horticulture, and having gathered several in an old pasture adjoining the vicarage grounds, I had the curiosity to measure one of them, the dimensions of which were as follow:—Diameter, 12 inches; height, 7½ inches; and weight, 1 lb. 6 ozs. I have gathered several in the same ring or circle, but none of them, I think, quite so large as this.

As many species of Fungi are used as food, or rather as condiments, and accidents arise in consequence, it may not perhaps be out of place to give briefly the medical treatment to be adopted in the event of poisonous Fungi being eaten. Vomiting should be excited as quickly as possible by a solution of sulphate of zinc or copper. A dose of castor oil or croton oil should be administered, or, what is better still, a large dose of spirits of turpentine. When the aperient has taken effect, small but repeated doses of ether, or ether and opium, should be given in some mucilaginous fluid.

The symptoms produced by these substances are illustrated

by the following case. A man, ten minutes after eating a considerable number of the Agaricus campanulatus by mistake for the Agaricus campestris, was suddenly attacked with dimness of vision, giddiness, debility, trembling, and loss of recollection. In a short time he recovered so far as to be able to go in search of assistance, but he had hardly walked 250 yards when his memory again failed him and he lost his way. His countenance expressed anxiety; he reeled about, and could hardly articulate. The pulse was slow and feeble. He soon became so drowsy that he could be kept awake only by constant dragging. Vomiting was then produced by means of the sulphate of zinc; the drowsiness gradually went off, and the next day he complained merely of languor and weakness. It appears from other cases that the symptoms are sometimes those of irritant, at others of narcotic poisoning; in most instances the two classes of symptoms are combined.—E. H. Marriott, *Fernhurst Vicarage.*

ROYAL HORTICULTURAL SOCIETY.

August 2nd.

Pelargoniums of the various sections known as Tricolors, Gold and Bronze, and Golden Selfs, constituted the principal, almost the exclusive, feature of the Show. Its extent was accordingly somewhat limited, for the rage for some of these, especially the Tricolors, appears to be dying out. The Show was held in a tent in the croquet ground, and only wanted the introduction of a few more plants to give diversity. The Royal Horticultural Society cannot be said to be unfortunate in the weather this year, for the day was one of the warmest we have had this season, and the attendance proportionably good.

Prizes were offered by W. Morris, Esq., Vice-Chairman of the Floral Committee, for the best group of Golden Variegated Zonal or Tricolor Pelargoniums, consisting of not more than six seedling plants. Messrs. Downie, Laird, & Laing were first with Stanstead Eclipse, a splendid bright-zoned kind as regards the young leaves, the old broadly banded with brownish black; Adonis, also finely coloured, with a well-marked golden edging; Decision, broadly edged with yellow; Flora McNab, large leaves, bright crimson zone, vandyked with dark crimson; Blythe Hill, and Brightness. Second came Mr. Turner with Salt Hill Rival; Lightning with a beautiful bright-coloured zone; Beauty; Peacock, dark crimson washed with rose and bright crimson; Rainbow, vigorous and bright, and F. Stainton. Messrs. F. & A. Smith sent Champion very fine in colour, Masterpiece, and others; and Mr. Mann, Brentwood, also exhibited. The prize, likewise offered by Mr. Morris, for the best plant selected from the class just noticed, was awarded to Adonis.

Class 3 was for the best collection of Variegated kinds. Mr. Turner, of Slough, was first with a numerous collection nicely grown and set up. Conspicuous among them were Princess of Wales, Mrs. Headley, Mr. Turner, Baroness Burdett Coutts, Miss Pond, Albion Cliffs, white-variegated; Miss Rutter, May Queen, white-variegated; and Mdlle. Christine Nilsson. Messrs. E. G. Henderson were second with a very good, evenly-grown collection; and Mr. Pestridge, Greenway Nursery, Uxbridge, third with good basketsful. An extra prize was awarded to Messrs. F. & A. Smith, of Dulwich, for a fine collection; and Messrs. Bell & Thorpe sent also a large well-grown set of plants, including many handsome varieties of their own raising.

For three plants of a Golden Tricolor variety Mr. Turner was first with Miss Morris, extremely brilliant in colour; Messrs. Carter & Co. were second with Prince of Wales, with large foliage, broadly edged with yellow, and of fine habit of growth; whilst Macbeth, with a broad rich dark chocolate and crimson zone, from Messrs. Bell & Thorpe, of Stratford-on-Avon, was third.

For the best Silver Tricolor Mr. Turner was again first with Mrs. Rousby. From the same exhibitor came also Miss Pond and Lady Brooke Bridges.

In Gold and Bronze varieties Messrs. Downie, Laird, & Laing had the lead, taking the first prize with Maréchal MacMahon, with magnificent foliage, broadly banded with rich reddish chocolate. The plants were everything that could be desired as respects fine growth and colour. Rev. C. P. Peach and Reine Victoria, lighter in colour of zone, were also very fine. The second prize went to Mr. Keeler, Beckenham Nursery, for Conqueror, very good. Messrs. E. G. Henderson and Mr. Cannell, of Woolwich, also exhibited good plants.

The best Golden-leaved self was Golden Circle from Messrs. E. G. Henderson & Son; the second best, Golden Gift, from Mr. Turner. The best Silver-edged was Blushing Bride from Mr. Pestridge, Uxbridge, with, however, a dark zone. The second prize went to Mr. R. Postans, Brentwood, for Miss Kingsbury. There were, however, only these two exhibitors in this class.

The only two exhibitors of Ivy-leaved kinds were Mr. Turner, of Slough, who was first with the splendid-coloured Willsii, and Mr. Macintosh, of Hammersmith, who was second with three finely-grown plants of the large-flowered Ivy-leaf shewn at the last meeting.

For the best Nosegay variety in bloom, Messrs. Bell & Thorpe were first with Charles Dickens, rosy scarlet, with magnificent trusses of bloom; Mr. Cannell, of Woolwich, being second with his lively rose-coloured, free-flowering Master Christine. Messrs. Bell & Thorpe also sent seedling David Garrick, scarlet, with immense trusses; and Mr. Turner Sybil, bright orange scarlet, fine in colour.

The first prize for the best Zonal in bloom was awarded to Mr. Mann, Brentwood, for Triumph, dark scarlet; the second went to Mr. Turner for Madame Jules Elyse, salmon suffused with scarlet, the flowers produced in large trusses.

In Double-flowering Pelargeniums, Messrs. Bell & Thorpe were again successful with a fine plant of Miss Evelyn, bright rose. Second came Messrs. J. Carter & Co. with C. Glym, bright orange scarlet; and third came Messrs. Downie & Co. with Victor Lemoine in fine bloom, showing also a good plant of Marie Lemoine.

The only group of six Clematis shown was from Messrs. Jackman, of Woking, who had in tubs plants from 4 to 5 feet high, and about 2½ feet in diameter. These well deserved the first prize that was awarded them, being covered with flowers. The kinds were Rubella, Magnifica, Alexandræ, very free-flowering, Jackmanni, Prince of Wales, and Mrs. Bateman.

Among miscellaneous subjects, a fine group of Lilium auratum came from Mr. Turner, of Slough; and from Messrs. Downie, Laird, and Laing a remarkably fine admirably-grown group of seedling Gold and Bronze Pelargoniums, together with basketsful of established varieties, as Reine Victoria, Black Douglas, and Impératrice Eugénie, lifted from the open ground and showing how well they stand the weather. Messrs. F. & A. Smith sent a fine group of Balsams, and Mr. Mann one of Zonal Pelargoniums. From Messrs. Bell & Thorpe came three baskets of Petunia Single Beauty, a free-flowering purple-veined kind of excellent habit for out-door gardening; also a fine collection of cut blooms of double and single-flowered Zonal Pelargoniums. Mr. Hooper, Widcombe Hill, Bath, contributed beautiful stands of Pinks, Carnations, Picotees, and Pansies. Mr. Turner sent fine stands of Carnations and Picotees; and Mr. Norman, Plumstead, a stand of twelve new Picotees. From Messrs. Shenton, Biggleswade, came a stand of forcing Pink Flower of Eden, which received a first-class certificate June 8th. Mr. Porter, gardener to Mrs. Benham, Sion Lodge, Isleworth, sent cut Roses, Pentstemons, and Gladiolus. From Mr. Cannell, camo a magnificent stand of cut Zonal Pelargoniums, and a stand was also exhibited by Mr. Mann, while cut blooms of their fine varieties of Clematis were shown by Messrs. Jackman & Son, of Woking. Several extra prizes were awarded.

Fruit Committee.—G. F. Wilson, Esq., F.R.S. in the chair. Mr. Gilbert, of Burghley Gardens, sent a selected Pea from Laxton's Alpha, but the Committee decided that no opinion should be given on Peas except when grown in the collection at Chiswick. It was reported that the trial of Peas and Potatoes would be made at Chiswick next year. Mr. Frisby, Blankley Hall Gardens, Sleaford, sent the old Grotto Pea under the name of Coral Rock. Mr. Evershed, Munsted Gardens, Godalming, sent three sorts of seedling Peas, called Evershed's West Surrey, Munsted Dwarf, and Glossy Marrow. Mr. G. Taber, Rivenhall, Essex, sent an Improved Early Long-pod Bean, which was considered the same as Mackie's Monarch. Mr. Evershed, of Munsted Gardens, sent specimens of a fine stock of Paris White Cos Lettuce. He also sent fruit of a Vegetable Marrow obtained by crossing the Custard with Moore's Vegetable Cream. It is a large, egg-shaped, cream-coloured fruit. Mr. D. Piccirillo, of Wigmore Street, sent four specimens of the Giant Early White Tripoli Onion, the aggregate weight of which was 11¼ lbs. He also exhibited four of the Giant Rocca, weighing 10¾ lbs. The New Queen Onion, exhibited by the same gentleman, was evidently the same as Nocera. Messrs. Veitch & Son sent Early Perfection Potato, a handsome Potato, which it was recommended to try in the garden next year. Mr. B. Porter, The Gardens, Isleworth Lodge, sent Rintoul's Early White Don Potato, a very large hollow-eyed variety. Messrs. Bell & Thorpe, Stratford-on-Avon, sent twelve sorts of Potatoes. Messrs. J. & C. Lee, of Hammersmith, sent Lee's Hammersmith Early Kidney Potato, which was recommended to be tried in the collection at the Chiswick garden.

Mr. Gustave Convreux, of Nogent, Haute Marne, sent specimens of his sécateurs of various sizes. Mr. Tillery, of Welbeck, sent a Melon called Eastwell Seedling, a handsome-looking Melon, but the flavour was gone. Mr. Meakes, gardener to R. Fowler, Esq., Petersham, Surrey, sent two fine fruit of Ingram's Scarlet Gem Melon, a large, handsome, deep-orange-coloured Melon, beautifully netted, but it was not ripe. Mr. Frisby, gardener to H. Chaplin, Esq., Blankney Hall, Sleaford, sent fruit of Shipley's Apricot, but they were not sufficiently ripe. Mr. William Knight, of the Floral Nursery, Hailsham, sent a dish of a seedling Peach, raised by George Darby, Esq., of Markly, Warbleton, Sussex, called Knight's Markly Admirable. It is large and somewhat oval, with a large nipple on the apex. It was grown in a cool house, and was now perfectly ripe. The flavour is particularly rich, and superior to other early Peaches. Mr. Laurence, gardener to Bishop Sumner, Farnham Castle, sent fruit of Prunus dasycarpa, or Black Apricot. Mr. Charles Turner, of Slough, sent three bunches of Golden Champion Grapes of large size. Mr. Rivers, of Sawbridgeworth, sent a valuable collection of ten varieties of Filberts and Nuts. These were all grafted on Corylus arborescens, and thereby induced to a habit of remarkable fertility. Corylus arborescens was received by Mr. Rivers from Bonth, of Hamburg, many years ago. It is now used as a stock for half-standards. It forms a large tree, and is a prodigious bearer. The varieties were:—1, Red

Filbert, a grafted head; 2, White Filbert, a grafted head; 3, Purple Filbert; 4, Knight's Large Cob, a grafted head; 5, Dwarf Prolific, a grafted head; 6, Atlas Nut, a grafted head (this is Corylus algeriensis; the clusters are often large, containing from fifteen to twenty nuts); 7, Lambert Filbert, a grafted head; 8, Gordon's Thin-shelled, a grafted head; 9, Fértile de Coutard; 10, Cosford Nut.

Prizes were offered for the best single dishes of early Plums. The best were Early Green Gage, finely ripened, from Mr. Douglas, Loxford Hall Gardens; the second best, Morocco, from Mr. Porter, gardener to Mrs. Benham, Isleworth.

Prizes were likewise offered for the best collection of Gooseberries, twelve fruits of each variety. Mr. Turner, Slough, was first, showing no less than seventy kinds in fine condition. The second place was taken by Mr. G. Sharp, gardener to W. Martin, Esq., Shermanbury; the third by Mr. Beach, gardener to C. J. Herries, Esq., Sevenoaks. Mr. Sharp had some very fine fruit of Red London, Whitesmith, and Caroline. An unsophisticated Londoner of our acquaintance took the first-named for Plums! For the twelve heaviest fruit Mr. Sharp was again first with "Rubesin," green, and Mr. Beach was second with Green Overall.

Floral Committee.—Mr. J. Fraser in the chair. The novelties on this occasion were not numerous. A good number of new Picotees were shown, and of them the following had first-class certificates—viz., from Mr. Norman, of Plumstead, Ada Ingleton, Miss Ingleton, and Beauty of Plumstead; and from Messrs. Wood & Ingram, of Huntingdon, Delicata Charles Williams, Esq., exhibited by the former, and Miss Fanny Ingram by the latter, had second-class certificates. Messrs. Kelway, of Langport, Somerset, exhibited several very beautiful seedling varieties of Gladiolus, of which Hogarth, Oberon, and Pictum received first-class certificates. Messrs. Carter & Co., of High Holborn, had a second-class certificate for Golden Tricolor Prospero, beautiful in colour; and a special certificate was given to Messrs. E. G. Henderson & Son, for a collection of these varieties. A certificate was likewise awarded to Thomas Laxton, Esq., of Stamford, for Jewel, a double variety. Mr. Guildford, gardener to R. Tryon, Esq., had a first-class certificate for Coleus Tryoni, which was most improperly removed before the public were admitted. The leaves, we are informed, are singularly and beautifully marked.

Mr. Young, of the Milford Nurseries, Godalming, sent Juniperus chinensis aurea, which was awarded a first-class certificate, as being a beautiful golden variety. A special certificate was given to Mr. Parker, of Tooting, for a fine example of Renanthera coccinea; also to G. F. Wilson, Esq., for a group of Liliums, including fine specimens of L. Fortunei and L. Leichtlinii. Mr. Fraser received a first-class certificate for Dracæna Fraseri, with broad leaves edged with rose and crimson, a very handsome kind. A like award was made to Messrs. E. G. Henderson for Begonia multiflora elegans with pale red flowers, not equal in effect to those of B. Sedeni. The same firm also sent a collection of Platyceriums, dwarf Lobelias, and Pelargoniums; the most showy of the latter was one with very pale lilac flowers called Multiflora striata. Messrs. Rollisson, of Tooting, likewise sent some beautifully grown Lobelias of various colours, several of them trained as small pyramids in the style in which they were exhibited by Messrs. Bell & Thorpe a year or two ago.

Mr. Green, gardener to W. Wilson Saunders, Esq., Hillfield, Reigate, received a first-class certificate for a species of Cyrtanthus, from the Cape of Good Hope, and he also exhibited several other plants of botanical interest. Mr. Laurence, gardener to Bishop Sumner, Farnham Castle, had first-class certificates for Anæctochilus ordianus, with beautiful deep green leaves veined with pale yellow, and for an Acineta called sella turcica.

Mr. Cunningham, gardener to Lord Ebury, Moor Park, Herts, again sent Verbena White Lady, noticed at the last meeting, but no award was made. Mr. Hooper, of Bath, sent Carnation Fairest of the Fair, a pleasing flower; Mr. Cripps, Tunbridge Wells, Clematis Lady Maria Meade, a large lavender variety with a deeper-coloured band in the centre of each petal; also Catalpa syringæfolia aurea with beautiful golden-tinged leaves. Mr. Cannell sent a number of cut trusses of Verbenas, and Mr. William Paul a collection of his new Zonal Pelargoniums.

PARAFFIN AND SOFT SOAP AS A REMEDY FOR AMERICAN BLIGHT.

These I can assure you form a speedy and effectual remedy when applied properly, care being taken the mixture do not touch the leaves. To one pint of paraffin oil, or any quantity that may be required, put in a jar a sufficient quantity of soft soap to make the whole of the consistency of train oil. Apply with a paint brush to the parts affected.—T. J. Harrison, *Farndon.*

MUSA ENSETE AT KEW.

To all who have a love for tropical plants I would say, Go and see the noble specimen of Musa Ensete at Kew, it is quite the feature of the Palm House just now. The immense leaves of this stately plant springing from near its base, and bending gracefully high overhead, cannot fail to impress lovers of such plants with a sense of its dignity and grandeur. Nor is this all, for as one glances upwards the beauty of the foliage is much enhanced by the effect of the light playing upon its upper surface, and thus revealing the exquisite delicacy of its texture and colour, which last is heightened and rendered all the more striking by the contrast of the deep red midrib standing out so boldly along the under side of each leaf.

This magnificent plant is by far the finest of its kind I have seen, and I should suppose it hardly has its equal in this country.—Edward Luckhurst.

COVENT GARDEN MONOPOLY.

I remember two years ago a gentleman telling me he had sent a quantity of Cherries to Covent Garden, for which he received very poor returns; so, as he happened to be in town shortly afterwards, he took the opportunity to visit the market, and there, to his great surprise, he found that the man to whom his fruit had been consigned had both a wholesale and retail business, "So," said he, "of course he sold my fruit to himself at the price he paid me, and afterwards to the public at high retail prices."—E.

METROPOLITAN FRUIT, FLOWER, AND VEGETABLE MARKETS.

A special meeting of the Market Gardeners, Nurserymen, and Farmers' Association was held on July 25th at the Bedford Head, Maiden Lane, Covent Garden, under the presidency of Mr. H. Meyers, to consider the question of removing the business of Covent Garden Market to Farringdon Market. Several speakers addressed the meeting, and it appeared that the refusal of the Duke of Bedford to afford proper accommodation to the stall-keepers in the market, whereby they suffered considerable loss, was the cause of the present movement. In wet weather the stalls were flooded—the water standing 5 or 6 inches on the ground. Hence the fruit became useless, and having been thrown aside, found its way to the barrows and baskets of the costermongers, by whom, in its half-decayed state, it was retailed in the poor districts, creating diarrhœa and other diseases among the humbler classes. One speaker, who was corroborated by others, said that Mr. Gye, the lessee of the Royal Italian Opera premises, had asked the permission of the Duke of Bedford to open the Floral Hall as a fruit and vegetable market, offering at the same time to indemnify the Duke against the expense of alterations, and to pay 25 per cent. on the tolls. The offer, however, was refused. Under these circumstances the market gardeners and stall-keepers felt themselves compelled to look out for some other place. Application had been made to the Corporation respecting the site of Farringdon Market. The plans of the proposed improvements at the latter place, prepared at the instance of the Markets Committee of the City of London, by their architect, Mr. Horace Jones, were laid on the table, and inspected by the meeting. The Chairman then read a letter he had received from Mr. Bontems, of the Architect's Office, Guildhall, stating the Markets Committee were not quite prepared to speak definitely as to the question of rent, but when ready to do so they would ask the Association to meet the Committee. Mr. Potter, living at Farringdon Market, was in favour of having the new floral and vegetable market closer to the new meat market than Farringdon Market was. Mr. Rudkin, Common Councillor, explained the plans, and assured the tenants of the old (Farringdon) market that the Corporation were not antagonistic to their interests. The interests of the old tenants would be the first to be considered. There was a larger area in Farringdon Market than in the other suggested site, and if the site between the railway and the new meat market were fixed on, the streets in the neighbourhood must be widened to accommodate the additional traffic, and the stall-keepers would have to pay the cost. At present Farringdon Market was almost a dead letter in the hands of the Corporation, as it brought them in only £350 a-year. It was intended to lower the market to a dead level with Farringdon Street, and to do the same with Stonecutter Street, just leaving an incline sufficient to carry off the water. As to rent, he could say in his individual capacity—not pledging the Corporation—that the rent would not exceed that paid in Covent Garden. Within a month he thought the Corporation would be able to provide the needful accommodation. After further discussion, a deputation, consisting of five vegetable growers and five florists, was appointed to wait upon the City Markets Committee as to rent, tolls, &c., and to report to a future meeting.

At a special Court of Common Council held at the Guildhall on July 27th, Mr. Bontems said that the question of Farringdon Market was referred to the Markets Committee. The Committee thought they saw their way to the enlargement of the market and making it a perfect success. They had sought interviews with those interested in the trade and who knew best the requirements of such a market. They had sought information from them as to what would be necessary to be done in Farringdon Market to make it suitable for their purpose. The President of the Market Gardeners' Association, who was a friend of

his, finding that he was chairman of the Markets Committee, asked him if the Corporation could accommodate the salesmen at Covent Garden. He said that the Committee would be happy to receive from the Association any information they were disposed to give; and that if they could provide any accommodation for them in Farringdon Market, they would be happy to receive them. The Committee had set the architect to work to prepare desirable plans, and to submit them to those best acquainted with what was wanted, to see if they required any alteration. Then, when they were as perfect as possible, they would be submitted to the Court.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 20.

DRAWING PLANS.

To draw and transfer *fig.* 43 to the ground. Draw line 1, 7, representing 58 feet; divide it into six equal parts, as 2, 3, 4, 5, 6, 7. The points thus found are the centres from which to describe the circles. Produce line 1, 7, to points G H; bisect line G H with line E F at right angles; where the two lines cut each other is centre 4. From point 1, with radius 1 *a*, draw arc *a*; from the same point draw arc *b*, as shown by radius 1 *b*. From point 2 draw arcs *c* and *d*, as shown by the thick and dotted lines. From point 3 draw arcs *c* and *f*; draw similar arcs from points 5, 6, and 7. From centre 4 draw the outside circle, then draw lines 8 9, and 10 11. On each side of the diameter line G H draw straight lines, as shown in the centre—that is, between the arcs drawn from centres 3 and 5.

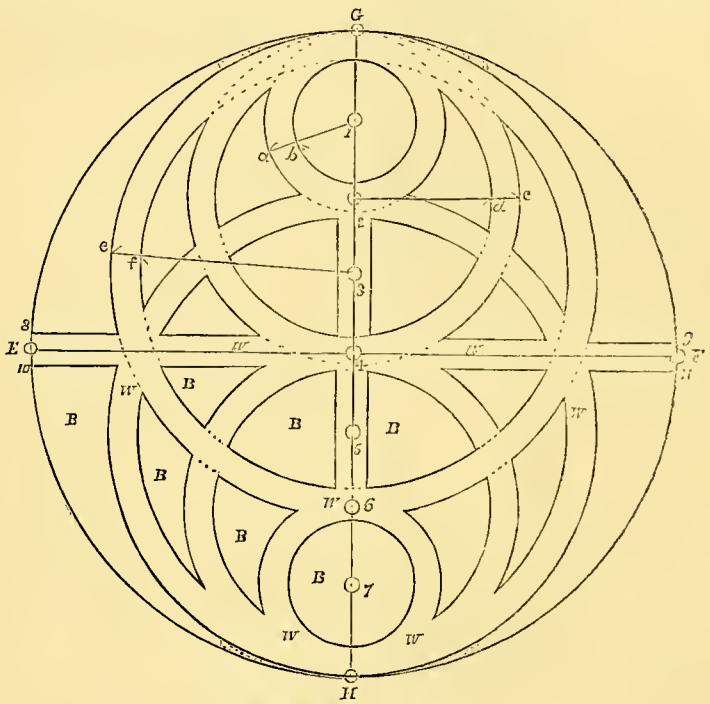

Fig. 43. Scale 24 feet to the inch

To transfer *fig* 43 to the ground. The diameter of the outside circle is 82 feet. Lay line E F, and bisect it, at right angles, with line G H; where the two lines cut each other is centre 4; insert a peg at that point. From the peg at centre 4, with a string 41 feet long, trace the outside circle. On each side of the peg at centre 4, on line G H, measure 29 feet 6 inches; insert a peg at each point, as at points 1 and 7. On each side of the same peg measure 19 feet 3 inches, and insert pegs as at points 2 and 6. Again, from the same point measure 10 feet on each side, and insert pegs as at points 3 and 5. From the peg at point 1, with a string 12 feet long, trace arc *a*. There it is better to trace the circles, as shown by the thick and dotted lines. Where the lines traced cut each other are the angles of the bede. Reduce the string 4 feet and trace circle *b*. From centre 2, with a string 21 feet 3 inches long, trace arc *c*; reduce the string 4 feet and trace arc *d*. From centre 3, with a string 31 feet long, trace arc *e*; reduce the string 4 feet and trace arc *f*. From centres 5, 6, and 7 trace corresponding arcs and circles to those traced from centres 1, 2, and 3. On each side of the diameter line E F measure 2 feet, insert a peg at each point, as at points 8, 9, and 10, 11; lay a line from peg 8 to peg 9, and from peg 10 to peg 11. On each side of the diameter line G H measure 2 feet, and lay lines—that is, between the arcs traced from centres 3 and 5. The lines are in Box; B beds; W, walks.—M. O'Donnell, *Richmond.*

NOTES AND GLEANINGS.

In a previous volume were some notes about Finderne Flowers (Vol. xvii., page 82). Inquiry was made without success for their names, but a correspondent in "Notes and Queries" writes as follows:—"After a careful investigation of the locality and identity of the Finderne flowers, it is satisfactorily ascertained that they are Narcissus poeticus, a plant indigenous to Palestine, and of doubtful nativity in England. —Anna Harrison." We think that this Narcissus, the common Daffodil, is a native of England. We have seen it wild in the woods and other places in many counties.

—— Mr. W. G. M'Ivor, Superintendent of the Cinchona Plantations of the Bengal Government in British Sikkim, has published a lengthy report, of which the following is an abstract:—"The plantations are situated in the Valley of Rungbee in the Himalayas, about thirteen miles from Darjeeling, which seems admirably adapted for the growth of Cinchona. The climate is very moist, being rarely free from rain. Nevertheless the state of the plantations is reported as very unsatisfactory; the plants have nothing like the luxuriant foliage which characterises those grown in Southern India on the Nilgherries. They seem to thrive for three or four years at the most, and then become diseased." Mr. M'Ivor says that trees of equal height do not produce so much bark as in the South of India, being of more slender growth, and the bark being thinner.—(*Nature.*)

—— Sigismund Rucker, Esq., one of the foremost Orchid-growers in this country, is about to give up their culture, and his magnificent collection has passed into the hands of Messrs. Veitch, and will be disposed of at Stevens's rooms. The sale of the first portion of this extensive and rare collection is to take place on the 8th and 9th inst., and will, doubtless, attract purchasers not only from all parts of the country but from abroad; for in forming and keeping up the collection no cost was spared, and the highest skill was exercised to maintain it in the best possible state of cultivation.

—— Mr. Thwaites, in his "Enumeration of Ceylon Plants," says that from the large extent of forest land which has been and is now being appropriated to Coffee cultivation, there is little doubt that some of the indigenous plants will in time become exceedingly rare, if not altogether extirpated, or exist only in the Botanic Garden, into which as many as possible are being introduced. The obtrusive character, too, of a plant brought to the island less than fifty years since is helping to alter the character of the vegetation up to an elevation of 3000 feet. This is the Lantana mixta, a verbenaceous species introduced from the West Indies, which appears to have found in Ceylon a soil and climate exactly suited to its growth. It now covers thousands of acres with its dense masses of foliage, taking complete possession of land where cultivation has been neglected or abandoned, preventing the growth of any other

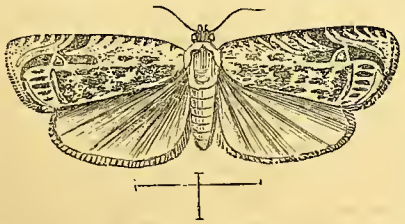
plants, and even destroying small trees, the tops of which its subscandent stems are able to reach. The fruit of this plant is so acceptable to frugivorous birds of all kinds that, through their instrumentality, it is spreading rapidly, to the complete exclusion of the indigenous vegetation from spots where it becomes established.—(*Nature.*)

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 14.

Does it not at first appear a little remarkable, that amongst those who pursue the study of insects, or who collect them as an amusement merely, so great a preponderance will be found confining their attention to the order Lepidoptera? Some few species of other orders have had their ardent students, it is true, especially those which, living in societies, such as the ant and the bee, display marvellous instincts; and late years have swelled the number of beetle collectors: but the majority of entomologists prefer butterflies and moths, and seek them out partly because of the surpassing beauty they present to view, and partly because their transformations possess more seeming interest than those of flies or beetles, and they are certainly more easily observed. Lepidopterists, consequently, outnumber all the other insect-hunters in the proportion of at least a dozen to one. And though it is not very easy to create an interest in the popular mind regarding the beauty of any insect, it is by exhibiting some butterflies or moths that we do sometimes manage to create an impression.

This brings me to the observation with which I had meant to commence my paper, but at which I have arrived in a circuitous way—viz., that of the two principal divisions amongst our Lepidopters, it is usually supposed that the butterflies far surpass the moths in gaiety of colouring. To some extent this holds good, when we examine only the larger species amongst the moths, but if we look at some of the diminutive individuals, we find such brilliant hues as would put them fully on a level with the gay and sportive butterflies, as far as beauty extends, if they had but size. There are many of these small moths which are denizens of our gardens—a few actually injurious to fruit or vegetables, a larger number rather annoying than really hurtful, because by their destructive powers, or by the habitations which they form for themselves, they disfigure various plants and trees. An insect may be so small as to be apparently insignificant; but when even a tiny moth larva occurs by the thousand, or a multiple of that figure, it is easy to see the effects produced thereby. A very obvious instance of this is given us by a species which occurs abundantly in woods nearly every season, and strips the Oaks of their leaves. Showers of the Green Oak Moth (Tortrix viridana), may be shaken from their resting-places on the boughs of the trees in July, and feeble and harmless as is the perfect insect, its progeny can make the lofty "monarch of the forest" assume a rather desolate aspect early in the summer.

This, however, does not visit gardens, but it has plenty of near relatives which do so, and a very notable one is the Wœberian Tortrix (Semasia Wœberana). It differs, however, in its habit from the Green Oak Tortrix, inasmuch as the caterpillar is not a leaf-feeder, but devours the inner bark of trees, working away very perseveringly, and only betraying its presence by a sort of powdery substance, or "frass," which is ejected from the minute holes which are observable in the outer bark. As is often the case with our larval enemies, we only become conscious of the mischief this species is doing when the worst has almost been done—at least by that particular brood. Wood, in his recently published little work on British moths, speaks of Tortrix Wœberana as a particular enemy of the Peach, the Plum, and other allied species which produce drupes. But Kirby and Spence had long ago pointed out that it frequently attacked Pomaceous trees, and it is unquestionably the fact that both the Apple and the Pear have their vigour impaired thereby, though it may not, in the case of these, so far affect the tree as to diminish the amount of fruit produced.



Tortrix Wœberana.

The caterpillars of this species rarely, if ever, touch the solid wood of the tree, confining themselves to the inner layer of the bark, as observed, and seemingly only making holes in the outer bark for the purpose of convenient migration from one part of the tree to another. In most years two broods have been noticed in the south. There is invariably one in April, from which moths emerge in May, and another hatch may be looked for in July, followed by moths again in August. It has been recommended by some to strip off and destroy all the bark which appears to be infected; a rigorous remedy indeed, and likely to result in worse consequences than the disease! With more show of reason, others advise the application of a little oil to all the holes which are seen—a rather tedious process certainly. The best preventive would be to destroy the eggs, which are largish for the species, could they be found, but this is not easy, since the parent moths usually conceal them in cracks. No very effectual plan of dealing with this and other sub-cortical larvæ has been devised.—J. R. S. C.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Attend to destroying weeds at all favourable opportunities, as their seeding this month entails endless trouble in the autumn. Plant thickly a good breadth of *Cabbages* in rich ground, to furnish Winter Greens. Put in a good breadth of *Endive* and *Lettuce* for the autumn supply, and sow some hardy sort of Lettuce for planting-out under south walls, or in frames, to come in after the frost cuts off the out-door supply. Attend to cutting and drying *Herbs* as they are ready. Prepare ground for winter *Onions*. The main breadth of *Spinach* should be sown at once. Dig-down exhausted plantations of Strawberries, and have the ground planted with winter crops if there is not already sufficient of these planted, and make a further sowing of *Turnips*, if these are likely to be scarce before the winter is over. In sowing at this season crops which do not come to perfection till spring, and which are expected to grow more or less throughout the winter, the ground should not only be well manured but trenched to a considerable depth, that the rains and snows of winter may pass quickly beyond the reach of the roots, and that a comparative dryness and warmth may be thus maintained around the roots of growing plants. Those who have observed how quickly snow thaws on well-drained land owing to its high temperature, will at once understand how important the above conditions are to crops which are expected to make way in the depth of winter.

FRUIT GARDEN.

No superfluous shoots ought to be kept on Peaches, Nectarines, and Apricots after this month, so that the wood for the ensuing year may be well ripened. Pears, Plums, and Cherries on the walls and espaliers are amenable to the same laws. The Alpine Strawberry ought to be encouraged this month by trimming-off runners and placing slates under the fruit. About the end of the month is a good time to plant a bed of Hautbois Strawberry; if planted earlier they sometimes blossom in the autumn.

FLOWER GARDEN.

Where bedding-out on a large scale is practised, the propagation and preservation of the annual supply of plants becomes an important part of the gardener's duty. That the result may answer the expectation at planting time, a careful calculation of the number required, and the means there are of preserving them through the winter, should be made. The next thing to consider is the kinds which require immediate attention to have them well-established before winter, those which may be deferred a month or so longer, and, again, what can be propagated in sufficient numbers in the spring, provided a few store pots of each be kept for the purpose. In the first class may be placed nearly all the varieties of Fancy and bedding-out Geraniums (except Scarlets and their allies, which may wait a short time longer), Crassulas, Lantanas, Mesembryanthemums, Hydrangeas, and plants of similar habit, which require to be established and have their wood matured before winter. Next may follow Heliotropes, Salvias, Verbenas, Petunias, Lobelias, &c.; of the latter three, if pit or house-room is an object, a few store pots only of each kind need be kept, as with the assistance of a little heat in the spring a stock is soon obtained, and spring-struck plants if properly grown generally start better than older ones. The new plants which have been planted out on trial should likewise have their distinctive features noted down, with their colours and habit, to ascertain if in any certain class a better colour or habit is

obtained. The number of new plants is so great that an annual trial is necessary to keep what are really acquisitions. Dahlias are growing very rapidly, and will require to be gone over frequently to keep the side branches securely tied-in, for when left untied they are readily broken off by a thunderstorm. Hollyhocks must be securely tied to their stakes. Continue to remove dead flowers from Roses, and give plenty of manure water to the autumn-blooming varieties. Plant out rooted cuttings of Pansies, &c., in nursery-beds, in a shady situation, keeping them well watered, if the weather proves dry, until they become established. Finish budding Roses if not already done; also layer border Carnations, Picotees, and Cloves without further loss of time.

GREENHOUSE AND CONSERVATORY.

It will be much to the advantage of the inmates of plant houses to reduce the shading after this time, to enable the plants to ripen their summer's growth, allowing more air to keep down the temperature, and to check any tendency to a second growth which may show itself, and which can only take place at the expense of next season's bloom. I have previously indicated where a second growth is desirable, as in the case of young plants growing into specimens, but wherever a perfect show of bloom is expected, every means should be taken to prevent it. Epacrises, winter-flowering Heaths, and other things requiring to have their wood ripened early, may now be placed in a sunny exposure; as the wood is already formed, nothing remains but to get it well ripened, and although water must be given equal to the plants' demands, a dry air and warm atmosphere are essential to the perfect ripening of the wood, and consequent formation of bloom-buds. The different varieties of Epiphyllum, if their growth is sufficiently advanced, should have the same treatment. Give a shift to Chinese Primulas and Cinerarias; and Chrysanthemums, Salvias, and other autumn-flowering plants should be placed in their blooming-pots if not done previously. A thin arrangement of the pot specimens will be advisable on account of the permanent occupants of the beds or borders, which at this season should be allowed plenty of space in order to secure strong, well-ripened wood, for unless this is obtained they will not bloom finely.

STOVE.

Brugmansias, Clerodendrons, and other large soft-leaved plants should be frequently washed to keep down red spider, and be well supplied with liquid manure to preserve them in a vigorous state of health. Ixoras which have been cut down for next year's blooming should have their shoots neatly staked out as they advance, and will require to be placed in more light and to be kept somewhat drier, that the gradual ripening of the wood may be assisted. Remove Achimenes, Gloxiuias, Tuberoses, and plants of the same habit, from the conservatory when on the wane, and replenish from the reserve house to keep up the display. Passifloras will be growing fast, and will require frequent training. Thin out weak and over-strong shoots, and reserve only sufficient to produce the desired effect; the blooms will be considerably finer, and the plants themselves more capable of producing well matured wood when these little attentions are performed regularly. Various other stove climbers as Combretums, Quisqualis, Allamandas, &c., will bloom for a considerable portion of the summer if the shoots on which the flowers are borne are slightly cut-in when the blooms decay, as anything which prolongs the period of beauty with these favourites is valuable. The above should be constantly practised. The growing season for Orchids is far advanced, therefore encourage any backward plants with plenty of heat and moisture while this can be safely done. See that plants growing on blocks and in baskets are properly supplied with moisture at the root; to prevent any mistake handle every plant at least once a-week, and immerse those found to be dry in tepid water until the material about their roots is well soaked.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

Of this we have said enough in recent weeks' notices. We sowed Radishes, Turnips, Onions, Lettuces, Spinach, Cabbages, and a sprinkling of Cauliflower. We *staked Peas*, the last for this season, and lined with soft cord some that were bearing heavily and getting beyond the protecting sticks. A gentleman said to us the other day, "While the best early Peas are grown in fields for feeding purposes, and even some of the best new kinds are thus grown in fields, how is it that you gardeners make so much to do about sticks, and holstering Peas up when they thrive so well on the open ground without such care and trouble?" Our reply is that we have grown Peas in rows without any staking, but space for space we had not the return in quantity and quality which we obtained from staked rows. Then, for daily gathering, the ground had to be trampled, and the plant of the Pea more injured, and when thus grown and allowed to spread about as the plants liked, nothing else could be grown on the ground; whilst between rows staked up, frequently more than the value of the main crop could be taken off the ground in temporary crops, as Spinach, Lettucee, and Radishes, and if the spaces were fair for width, also Turnips and Potatoes.

We instanced lately how a little shade in the hottest months did so much good to Celery by giving to it the natural conditions it desired. For these and similar reasons it will in general in small gardens be the most economical and the best-paying mode to keep up Peas by some mode, whether stakes, hurdles, wire, or cord lines. In our practice we have had heavy crops of Peas grown as in a field without sticks, but they would compare neither in yield nor quality with those staked up, ground for ground, and then we lost all the intermediate crops, ease of gathering, &c.

FRUIT GARDEN.

Here the work has chiefly been a continuance of that of previous weeks, broken in by gathering fruit for preserving on the two best breezy days, and thus housing it in good condition. Our chief defect this year has been in Strawberries, that did not out of doors show the usual amount of bloom, and therefore we could not send the usual quantity for preserving. Even for table they are now becoming thin, though we shall obtain fair gatherings from those forced and first turned out.

From some dwarf standard Cherry trees we have had little to gather—not worth netting, in fact, but trees against walls have been well loaded, and the fruit very fine. The bloom on the standards was as plentiful as usual, but it was bathed almost constantly in wet or hoar frost, and the bloom nearly all fell. The protection of the wall and earlier blooming saved the others. These are now getting thin, with the exception of such kinds as the Florence, which will require some weeks to ripen. Morellos promise to be a heavy fine crop, and as the birds had begun on them as soon as they showed the least change of colour, we have had to net them up securely.

There has been great devastation among the Currants in this neighbourhood, the whole plant as well as fruit being covered with fly, the plants in many cases dying. We had on walls some plants that suffered severely, though we used the engine freely, but those in the open ground suffered but little, and the rains washed the fruit clean. The rains also provided soft food for numberless birds, so that we have been less troubled by them than usual. In dry days we were obliged to gather Raspberries, or we soon would have had all the ripe fruit nibbled. These have been good with us, though there are many complaints about the thinness of the crops and the smallness of the fruit in many cases.

In the dry weather before the rain the birds carried off green fruit of Cherries, Raspberries, Strawberries, and even Currants when they were quite hard, and long before they showed any signs of colouring, but after the rain they gave up their depredations. It is as well not to cry out too soon. A friend who grieved over the short bloom of his earliest Strawberries has told us that later kinds never did better, and thus he was enabled after the forced ones were over to keep up a good supply. We do not like a break in gathering, but nevertheless, after Strawberries have been in use from forcing for four months, we sometimes think that those from the open ground would be more valued if there were a little interval between the in-door and the out-door gatherings. Perhaps there was never such a difference in the yield of the different kinds of fruit than has been apparent in different parts of the county this season. Some friends tell us that they have had abundance where we find scarcity, and they have had a poor crop when we have had abundance. A friend in Devonshire informs us that the Cherries on walls were next to a failure; here they have been unusually good, though Cherry trees as small bush standards, as already stated, were next to a failure, though for many years they never missed a crop. Could we note and register the circumstances and causes of such various results, we might gain much useful information. In the case of fruit, very little will often make all the difference between a heavy crop and no crop.

ORNAMENTAL DEPARTMENT.

Oh! for a nice little *lawn*, never to be seen but at its best,

instead of a large reach of pleasure grounds, which can rarely be gone over in time to commence in time at the beginning again. In such a season as this, lawns growing healthily could not be kept neat unless gone over every four days—three days would have been better. The labour involved in keeping a large lawn is enormous, and where labour is restricted, and the lawn almost constantly made a special object on every change of company, &c., other things must be neglected or be put off long after they should have been attended to. It is not without reason that we advise all who wish to have everything neat and comfortable to be moderate as to the extent of short grass, as, on the whole, it is the most expensive thing in a garden, and after all a small piece well kept is more attractive and pleasing than ten times the space if it can only be kept indifferently. We make these remarks because it is a growing evil to have large lawns without a proportionate amount of labour to keep them well. We have no objection to fifty or a hundred acres or much more in short grass if the labour is proportionate, and the grass is really well kept, and without involving the necessity of neglecting other things. Fifty acres in a rough state will not yield the pleasure of one acre well kept.

We find, with all our attention to heights in the flower garden, a little tying and training will be necessary, as some plants have grown more than usual, and others, as Scarlet Geraniums, &c., have grown less, owing to the coldness of the soil. These Geraniums with us are not showing the massiveness that they did last season, notwithstanding its dryness, and as yet the masses of bloom are not at all equal. On sandy light soils the masses of bloom have been more nearly up to the mark. Our Calceolarias have never been better. Verbenas we have pretty well discarded, as for several seasons, however vigorous and fine the plants, we rarely saw a bloom on them, the buds being nipped off every night by four-footed intruders. This season we have suffered chiefly in this direction in Roses and blue Lobelias. The fresh shoots, and even leaves and buds, of the former are nipped off, and the latter stumped in to the ground, the bitter juice of the shoots acting, we presume, as a condiment or a medicine, for otherwise one would think it could not be pleasant. It is rather singular that in some places this Lobelia is stumped in as above, whilst in other places similarly exposed the blue wreaths are left untouched.

We cut down and pruned back *Pelargoniums* that had been hardened by exposure after blooming, and put others past their best in the open air to harden them off. In wet weather it is well to turn the pots on their sides. Many tender plants will do well in a sheltered place out of doors if the pots are protected, and the heads kept for a little time from the fierce sun. As alluded to above, we made cuttings of Pelargoniume, which will do very well in the open air, but better still in a cold frame or pit under a glass covering. Slips of all Pinks and Cloves may still be inserted. Some varieties of Mule Pinks are very pleasing. Stirred the soil in which were growing flowering plants in pots, and surfaced with fresh compost. Potted Fuchsias, Balsams, and feathered Cockscombs for late flowering. We regulated twiners, and in the present state of transition, as we are sadly hampered for room for plants, smoked an early vinery before placing a lot of plants in it, as there was just a sign of thrips on a few leaves, so as to give us more room for a few weeks, when other places will be ready for receiving them.

Were it not for interfering with the symmetry of the beds we would soon begin propagating for next season's display, but the small cuttings we took off last year in September are now strong, bushy plants, and showing bloom pretty freely. We fear we shall be obliged to adopt a similar treatment, and take small cuttings from the base of the plants; but from what we stated in the spring, and what we have observed since, such shaded cuttings will not be likely to yield a profusion of bloom so early in the season as cuttings taken from parts of the plant more exposed to the sun and air. To attain this object, however, without at all spoiling the outlines of beds, there ought to be a reserve garden for producing cuttings, and also for gathering cut flowers, as, when the latter are greatly in demand, the taking them from beds robs these so far of their brilliancy. We have had no such reserve as yet.—R. F.

TRADE CATALOGUES RECEIVED.

W. Rollisson & Sons, Tooting, London.—*General Catalogue of Stove, Greenhouse, Hardy and Bedding Plants, Trees, Shrubs, &c.* (256 8vo. pages.)

H. Cannell, Station Road, Woolwich. — *Autumn Catalogue of Fuchsias, Pelargoniums, Pentstemons, Calceolarias, &c.*

C. L. Allen & Co., 76, Fulton Street, Brooklyn, New York.—*Wholesale Catalogue of Hyacinths, Tulips, Crocus, Lilies, Gladiolus, &c.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

Books (*C. L.*).—Blackwoods' "Geography."

Pears for Exhibition (*G.*).—All fruit for exhibition at the Royal Horticultural Society's Committee meetings should be addressed to Mr. A. F. Barron.

Peas (*C. M.*).—We cannot with certainty name Peas from pods only. Those sent appear to be Prizetaker.

India-rubber Joints (*Delta*).—Mr. T. S. Truss, Friar Street, Blackfriars Road, London, S.E.

Vegetables for Exhibition (*J. Lock*).—They should be clean, but not necessarily washed. If Potatoes lift clean they should not be washed; if not, they should be, but they must not be scrubbed or polished.

Lastrea opaca Fronds Shrivelled (*J. Fuller*).—Judging from the frond we think the shrivelling has arisen from a sudden check, owing to dryness of the atmosphere, or it may have been caused by a forced development. From the length of the stipes we should say the latter is the cause. We have known it do well in a shady position in a cool greenhouse, and kept regularly supplied with water. Place it nearer the glass, and keep it moister, shading from bright sun. Such occurrences are not rare under the most favourable circumstances, and plants exhibiting the same tendency as yours will in another season, under similar conditions, be quite healthy.

Exmouth Magnolia not Thriving (*An Amateur*).—You give us no data to form an opinion by, but we presume that it is planted out in rich, rather strong loamy soil, and has good drainage and a sheltered position, or is planted against a wall with a south or south-west aspect. Under such conditions it ought to thrive, water being given plentifully in dry weather. Mulch with cow dung, and add some peat and leaf soil if the soil be poor, or sand if it is very heavy.

Vines for Unheated Vinery (*Idem*).—You do not say where you live, but south of the Tyne, and not over 300 feet above sea level, the following Grapes ripen perfectly in a cold house:—Early Saumur Frontignan, Early Smyrna Frontignan, and Sarbelle Frontignan (these have small berries and bunches, but are desirable on account of the Frontignan flavour); Chasselas Vibert, Chasselas Royal, Royal Muscadine, Foster's White Seedling, General della Marmora, Buckland Sweetwater, and White Romain. These are white or amber-coloured. Black Grapes are:—Trentham Black, Gros Colman, Duc de Magenta, Frankenthal, Black Champion, and Black Hamburgh.

Peach-tree Management (*Idem*).—The trees being planted as maidens, we conclude they were headed-down and have made shoots. Select one as a leader, and dispose of the others as side shoots, allotting an equal number to each side, say two on each, selecting the strongest and best situated, rubbing off all others, training neatly and securing them to the wall, but leaving room for the shoots to swell. If any laterals appear, take out their points at the first leaf or leaves. In February cut back the leader to five eyes, and the side shoots to one-third their length, cutting to a wood or triple bud. Bréhaut's "Modern Peach Pruner" gives full instructions on Peach-tree pruning. It may be had free by post from our office if you enclose 3s. 8d. with your address.

Solution for Dipping Pelargoniums (*Thomas Gee*).—Quassia chips boiled for ten minutes in a gallon of water and then strained will, when cooled, form an excellent bath for Pelargoniums; a quarter of a pound of quassia chips is the proper quantity. It is usual to add soft soap, but that, it should be borne in mind, is not suitable for plants with soft hairy leaves, though it answers admirably for those with smooth leaves, as Roses, Fuchsias, &c. We use tobacco water for Pelargoniums, Cinerarias, Calceolarias, and similar softwooded plants, pouring half a gallon of boiling water on 1 oz. of the strongest shag tobacco, covering up closely and allowing the liquid to stand till cool; then we strain it. It answers perfectly.

Thinning Oranges (*Inquirer*).—It is a good practice to thin the fruit of the Orange as well as those of other fruit trees, but not until the fruit is of the size of a marble. The more you thin, the finer will be the fruit both in size and quality.

Ricinus (*Idem*).—The plants now about 18 inches high may flower in September, but it is likely they will not flower this season. Planted out in a sheltered situation they would have a fine appearance in September, but considering the advanced period of the season we should keep them in pots for the conservatory. The flowers are not showy; the leaves give the plant its decorative appearance.

Laying Edging Tiles (*Amateur*).—The great fault of many prepared edging tiles is that they have not sufficient base on which to stand, and to remedy this we have occasionally put in a brick on the flat underneath them, and secured them to it with cement; but this is also liable to subside if the soil is not very firm, still not to such an extent as when narrow-edged tiles are merely inserted in the ground. We have some common bricks that have done duty as edgings to shrubbery walks for upwards of twenty years, and yet look tolerably well, the ground they were fixed in being firm, and it is only where the roots of trees or shrubs have heaved them up that there is anything to complain of. They were laid in diagonally—*i.e.*, with an angle up; but where edgings are put in adjoining plots of ground kept dug, it is difficult to prevent the unevenness of which you complain. If your edging material is narrow at the bottom, it would be best to employ a handy mechanic to fix the tiles to bricks laid underneath, especially if the line be a straight one, but as a rule mechanics are not good hands at a curve. Should this method appear too expensive, we know of nothing better than firmly ramming the ground

before fixing the tiles, and after that being careful not to disturb them by digging too near.

Fruit Trees (*J. V.*).—No doubt you may use the clear water from the tank with advantage to the fruit trees.

Vines Diseased (*W. E.*).—It appears to us, from the leaves you have sent, that your Vines have had too much water, and probably some liquid manure.

New Show Roses (*J. G. S.*).—The best six exhibition Roses which have been produced within the last three years are, in my opinion—1, Madame la Baronne de Rothschild; 2, Perfection de Lyon; 3, Madame Chirard; 4, Edouard Morren; 5, Louis Van Houtte; 6, Marquise de Mortemart. No. 5 is the finest dark Rose, but it is not, I fear, a good grower. No. 6 is also a delicate grower, but is lovely. I mention two others that are good Roses and fair growers—7, Duke of Edinburgh, and 8, Dupuy-Jamain; they are both handsome Roses, and all are free-bloomers. The four first-named Roses are strong growers; delicate growers will not last long in this climate.—W. F. Radclyffe.

Cutting down Jerusalem Artichokes (H. *S.*).—If you cut off the tops of these at the middle of July at 1 foot high they will produce tubers, but these will be considerably smaller than were the plants not headed down at all. It is advised by some to cut off the stalks about half way early in August to admit more freely the light and air, and when large tubers are not wanted doing so gives a nice even-sized tuber, by some preferred to large, knotty, irregular-shaped tubers, and not nearly so watery. We have known the tops cut off three times in a season, and fresh shoots still produced. The Jerusalem Artichoke is almost as difficult to eradicate as the Horseradish.

Climber for Covering a Low Trellis (*A New Subscriber*).—It would be best covered with Ivy, which forms a very close covering in a short time, and affords warmth which you need. The Irish Ivy (Hedera Helix canariensis) is free-growing and fine, but we should plant Rægner's Ivy (Hedera Rægnerisna). Procure at once some strong plants in pots and plant them out, watering well if the weather be dry. The plants would become well established before winter. Virginian Creeper, and also Ampelopsis Veitchii, would suit, but you seem to forget that they lose their leaves in winter.

Cabbage Plants Blind (*W. L.*).—The cause of the Cabbage, Broccoli, and others of the Brassica tribe coming blind is some defect in the seed; but blindness does not result from what is known as bad seed, being more frequent in true selected stocks than in impure samples. There is no mode of guarding against such occurrences; but in planting out all the Cabbage tribe the plants should be examined, and those not having centres should be rejected. The evil is apparent when the plants have made three rough leaves or never.

Staves-acre (*Idem*).—It is the seed of Delphinium Staphisagria. Dr. Hogg, in his "Vegetable Kingdom," says, page 18, "From the seeds of Delphinium Staphisagria, or Staves-acre, an alkaloid substance called delphine is extracted, which exerts violent poisonous properties in very small doses, acting chiefly on the nervous system. The seeds of the plant are so violently emetic and cathartic as never to be administered internally, but are principally applied to some kinds of cutaneous eruptions, and in powder for destroying the pediculi of the head. A strong tincture has also been used with advantage as an embrocation in rheumatic affections. In some countries the seeds are used to intoxicate fish in the same manner as Cocculus indicus." If you try the seeds along with quassia chips for destroying insects, as stated at page 352 of last volume of The Journal of Horticulture, we should be obliged if you would communicate the result.

Cheilanthes elegans Fronds Falling (*A Constant Subscriber*).—The fronds are always liable to breakage at the base, and in your case this tendency is increased by the temperature 60°) in which it grows, the footstalks being long and unable to support the frond. Place it in an airy and but slightly shaded position in a greenhouse. Water the plant well, but do not keep the soil in a saturated state, and besides giving abundant drainage, add one-fourth sandstone in lumps between the sizes of peas and walnuts to the compost, which may consist of two parts sandy peat, one part loam, and one part silver sand, with the sandstone above named.

Treatment of Imported Ferns (*Idem*).—The Ferns you are expecting from the West Indies should be placed on arrival in pots just sufficient to hold the roots, using a compost of two parts peat, one part yellow loam, and one part silver sand, with good drainage. Place them in a house with a temperature of from 60° to 65° at night, and 70° to 75° by day, with a rise of 10° from sun heat, shading from bright sun. Sprinkle lightly overhead morning and evening, and frequently sprinkle the path and other surfaces with water during the day, so as to maintain a moist atmosphere. Water so as to keep the soil just moist, and when the Ferns begin to grow water more freely.

Croton variegatum Culture (*Idem*).—Use a compost of two parts sandy peat, one part light turfy loam, one part leaf soil, and half a part of charcoal, in lumps from the size of a pea to that of a hazel nut, and silver sand, with good drainage. The watering should be moderate, and copious when the plant is growing freely. Pot in spring before it begins to grow, and again in June or July, if necessary. It requires a light, moderately airy position in a house with a temperature of, from April to October, 60° to 65° at night, and 70° to 75° by day, with a rise to 80° or 85° with sun; from October to April a night temperature of 55° to 60°, and 65° by day, with a rise of from 10° to 15° or more from sun heat. A moist atmosphere is essential for free growth. The botanical name of the Artillery Plant is Pilea muscosa.

Liquid Manure for Asparagus (*W. P., Asparagus*).—Guano water at the rate of 1 oz. to the gallon of water is an excellent manure for Asparagus, and, indeed, all kitchen-garden crops. For the Asparagus you may make it of the strength of 2 ozs. to the gallon, and add 1 oz. of salt to every gallon, giving a good soaking as often as you like from now till the early part of September, and up to the middle of that month if the weather be dry.

Vine Leaves Rusted (*A Constant Reader*).—The leaves enclosed to us are not infested with red spider, but slightly rusted, otherwise they are quite healthy. Having the red spider on the upper part of the Vines, it is very likely the lower part will be attacked.

Clematis Propagation (*W. S.*).—The surest way is to layer the firm shoots in September, and by the following autumn they will be well rooted. The layering may be done in pots sunk in the ground, and the shoot tied to a stake. Clematises may also be increased by cuttings of the side shoots in summer, when they become firm, or about August, putting them in in light sandy soil on a shady border, and covering with a hand-glass.

Peach Tree Casting its Fruit (*T. G.*).—The dropping from imperfect stoning was most likely owing to an imperfect fertilisation at the blooming period, though the same thing sometimes takes place when a tree is over-vigorous. The growth seems to leave an insufficient amount of vigour for stoning perfectly. Hence, watering must be managed with care at the second swelling.

Flue-heating a Small Greenhouse (*R.*).—The proposed earthenware drain pipes will be ample for your purpose, but you will require to have at least 2 feet from the stove or furnace brick, to prevent breakage. In going round the sides and one end of such a house, it is best to take the pipes into a square place instead of having rounded pipes for the corners, as each of these square receptacles would enable you to clean the flues easily by placing a tile on it. The great drawback to these earthenware pipes is that they are apt in such a small place to become overheated, and the pipes or joints to burst. For such a small house as yours we would prefer, instead of your pipes, a small furnace outside, and a 5-inch flue beneath the floor, the flue being covered with tiles as the floor, or rather part of it. In your case we would advise you to have a lap for your glass of rather more than one-eighth of an inch, and to glaze in the usual way. Unless the house roof is very flat indeed you will not be troubled with drip from the laps. True, you might place your squares edge-to-edge without laps, and if straight-cut you would need nothing whatever between the squares; but whether you place the squares in grooves or not, at the sides there must be room left for the side-expansion of the glass, or the squares will soon chip where they join edge-to-edge on the slope. You may pack the squares in the grooves with cord, list, &c., but you cannot do it in the best way, we fear, without infringing patents, and therefore for your small house we would say, Glaze in the usual way.

Storing Diseased Potatoes (*J. H. C.*).—"In 'clamping' your diseased Potatoes, however careful you may have been in sorting out the rotten ones, some that are beginning to turn bad will certainly have been overlooked, and these will propagate the evil throughout the mass. The whole will be lost if you thus store them. At this time of the year, especially, you will most likely have at liberty the bays of the barn, or cattle-feeding and other sheds Carefully sort the Potatoes, spread them out thinly in the twilight of the bays of the barns or sheds, and have them looked over and turned once a-week. Those showing the least sign of the disease should be collected and boiled down, with about a handful of salt to each bushel, and used for the pigs. Let the water be well strained away from them when cooked. Should there be more than the pigs can consume within a reasonable time, have the bulk well rammed down into the hog-tubs, to be used as wanted. In a month or so the crop of the tubers operated upon as above may be considered safe, and unless 'clamping' is absolutely necessary, I would far prefer storing them in lofts, or any cool and dry place where there is twilight, so as to have them under observation and secure from the winter's frost. I would not allow them to be heaped together too thickly, so as to encourage long and exhausting sprouts; and thus managed capital seed may be expected of them next spring. The largest and most-matured tubers, should you require them for consumption, may be sorted as taken up, then housed in a dark place, and the diseased ones as they occur singled out from them as stated; but, of course, their bulk must be kept in the dark, for if allowed to become greened they would be unwholesome for human food. I trust the later-planted eleven acres may escape the disease, and this is possible from the favourable change which has taken place in the atmosphere. When lightning and thunder, and 'white rain' occurs just as a crop of Potatoes is sufficiently matured—viz., about setting the skins of the tubers, the energies of the foliage are then taxed to the utmost, and possibly weakened to a degree which makes it more susceptible of the attacks of the disease, and then a continued sultry moist atmosphere becomes fatal. Dryness and the ridge-and-trench system of cultivating the Potato are the only preventives of the evil, as I have for so many years explained in these pages, but at the present moment I have satisfactory proof of their efficacy before my eyes.—Robert Fenn."

Screen from a Railway (*An Ignorant Amateur*).—The quickest way to get a screen between you and the railway is—first, trench the ground two spades deep, even although you may have to disturb the few trees you have already planted. The best of the Fir tribe for your soil is the Austrian Pine, which will succeed well, and you may plant thickly as nurses Black Italian Poplars, which will run up rapidly, and which you can cut out after the Pines have attained the desired height. The Pines ought not to be more than 2½ to 3 feet high when planted, and you will find that these will make a screen much more rapidly than larger plants, which in all probability would remain stunted for some years before they began to grow.

Insects (*R S.*).—So far as we can judge from the smashed state of the insects sent, they appear to be Nematus Capreæ, one of the many species of Saw-flies. Cannot you tell us something of their habits? (*T. V.*).—Your caterpillar on the Pear was completely smashed, but from what remains it seems to be that of the common Vapourer Moth, Orgyia antiqua. (*R. G. N.*).—The insects sent, which have attacked your Vines, Cucumbers, &c., are the common Weevil, Otiorhynchus sulcatus. They hide under the loose earth by night, and come out to feed after dusk. Lay a towel under the plants and shake them well some time after dusk, when the insects will fall on the cloth, looking like bits of earth, with their limbs folded up. They may be killed with boiling water.—I. O. W.

Names of Plants (*Lady King*).—It is a very beautiful variety of Acer Pseudo-Platanus, which we have never seen before. (*A. B.*).—Nostoc commune, an Alga, not a fungus, very common on dry exposed surfaces, scarcely visible except after rain The structure is very pretty under the microscope.—M. J. B. (*A. R.*).—Melilotus arvensis is the name of your yellow-flowered Trefoil, and Hypnipeis repens that of the Fern. (*Monmouth*).—1, Ruellia maculata, or, if you wish to be very correct, Strobilanthus maculatus, a very shy-blooming plant; 2, Cassia lævigata. (*J. D.*).—The leaf of some umbelliferous plant, not recognised at sight. Be good enough to send when it blooms. (*W. D.*).—1, Malva Tournefortiana; 3, Campanula pusilla alba; 4, Achillea Millefolium; 5. Statice Limoninm; 6, Gentiana asclepiadea alba; 7, Epilobium hirsutum.

(*C. A. J.*).—Erythræa Centaurium. The grass is Poa compressa. Seedling Lobelias come up quite commonly. The noise is inseparable to the machine as constructed. (*C. R. S.*).—Your bulb is a Tulip. (*Hang-down*). Cyanotis vittata, or Tradescantia zebrina. (*A. R.*).—Rhus Cotinus.

POULTRY, BEE, AND PIGEON CHRONICLE.

HATCHING EGGS.

In the Journal of July 27th I found a case similar to one of which I now forward you an account.

The house in which our Geese are secured at night until the goslings are so large that there is not room for them, contains at one end three compartments, in which the Geese lay and sit. They are made by nailing some old boards together, and have a small entrance for the Geese, with a door falling over. In one of these a few weeks ago a hen desired to sit, and on June 14th I received a sitting of Houdan eggs. The hen sat well until Sunday, June 25th, when she left her nest in the morning as usual, about half-past eight, to take refreshment. After doing so she tried to return to her nest, but could not, and the next morning was found sitting in another house on some fresh eggs. Her own were cold; and though she was at once put on them, they were not all warm until nearly evening. The trap-door must have been closed when she left her nest, but she could push it open, and thus got out. She was off her eggs at least twenty-three hours, and had sat half the time—ten days. Of course I expected no chickens. But out of the remaining sixteen (she having broken one previous to the disaster), she hatched no less than fourteen chickens, all of which are now doing well.—S. G. Witcombe, *Broadleaze, West Coker, Yeovil.*

DRIFFIELD POULTRY AND PIGEON SHOW.

We are glad to say the success of this year's Show was unprecedented, the visitors flocking-in from all the neighbouring districts at an early hour. The weather, contrary to general expectation, proved fine, and everyone seemed well satisfied with the general arrangements. There is one rule, however, that would, if cancelled, add much to the interest felt in the Pigeon division of the Show, for by the present arrangement every exhibitor of Pigeons has to provide his own pens, consequently the birds cannot be seen to equal advantage by the Judges and the public; but the mixed character of the baskets, some close wicker-work, some open work of the same material, and some, again, wire, gives a mixed appearance anything but pleasing.

The *Game* fowls were magnificent, Mr. Boyes, of Beverley, with a strong entry, sweeping the board. The *Spanish* were also extraordinarily good, and we noticed a few exceedingly well-bred Ptarmigans. The fancy *Water Fowls* were well represented from the ponds of Mr. Richardson, of Meaux Abbey, Beverley, and some few pens of White Call Ducks, from Mr. Young, of Driffield, were also much admired. Mr. Harry Adams, of Beverley, exhibited some first-rate Almond Tumblers, and the *Pigeons* generally were good, the Owls and Dragoons being better than those commonly met with.

Dorkings.—1, D. White, Driffield. 2, R. W. Richardson, Beverley. *hc*, O. A. Young, Driffield; Mrs. Beresford Peirse, Bedale Hall. *Cock.*—1, W. Botham, Driffield. *c*, R. Smith, jun., Norton, Malton. *Chickens.*—1, D. White. *hc*, R. W. Richardson.

Spanish.—1, R. Smith, jun. 2, T. C. & E. Newbitt, Epworth. *hc*, G. Holmes, Driffield. *Cock*—1, T. C. & E. Newbitt. *hc*, D. Maynard, Driffield.

Game (Black-breasted and other Reds).—1 and 2, W. Boyes, Beverley. *c*, G. Holmes. *Cock.*—1, W. Boyes. *c*, O. A. Young.

Game (Any other variety).—1 and 2, W. Boyes. *Cock.*—1, W. Boyes. *Chickens.*—1, W. Pierce, Driffield. 2, R. Smith, jun.

Cochin-China.—1, W. J. Peace, Driffield. 2, G. Blakey, Kilham. *Cock.*—1, R. Dawson, Beverley. *c*, O. A. Young; F. Winter, Driffield. *Chickens.*—1, R. Dawson. *hc*, W. Leason, Driffield; R. Stahler, Driffield.

Hamburghs (Golden-spangled).—1, T. Holmes, Driffield. 2, G. Holmes, *hc*, H. Naylor, Driffield. *Cock*—1, G. Holmes. *hc*, J. Anderson, Malton.

Hamburghs (Silver-spangled).—1, H. Holmes. 2, T. Holmes. *Cock.*—1, H. Holmes.

Hamburghs (Golden-pencilled).—1, H. Holmes. 2, T. Holmes. *c*, R. Wilson, Malton. *Cock.*—1, H. Holmes.

Hamburghs (Silver-pencilled).—1, C. Holmes, Driffield. 2, H. Holmes. *Cock.*—1, H. Holmes.

Hamburghs (Any variety).—*Chickens.*—1, O. A. Young. 2, T. Holmes. *c*, A. Marshall, Driffield.

Farmyard Cross.—1, W. Horner, Malton. 2, Miss B. Robinson, North Frodingham. *hc*, G. Bromby, Pilwood, Cottingham. *c*, R. P. Moon; T. Coverdale, Dunswell; H. Merkin, Driffield *Cock.*—1, Miss B. Robinson. 2, J. W. Stabler, Driffield. *hc*, J. Wales, North Frodingham. *c*, G. Pounder, Kirbymoorside.

Bantams (Game).—1, Pickering & Dugdleby, Driffield. 2, C. Holmes. *hc*, W. Adams, Ipswich; Miss E. Stahler, Driffield; T. C. & E. Newbitt. *Cock.*—1, Holmes & Wood, Driffield. *hc*, J. D. Maynard, Driffield. *c*, Miss J. Stahler, Driffield; T. C. & E. Newbitt.

Bantams (Any other variety).—1, Nicholson & Holmes, Driffield (Black). 2, T. C. & E. Newbitt (Black). *c*, G. Leason, Driffield (Black). *Cock.*—1, W. G. Pardon, Driffield (Black). *hc*, G. Holmes (Black).

Selling Class.—*Cocks.*—1, R. Loft, Woodmansey. 2, W. Boyes (Brown Red Game). 3, C. Holmes (Golden-spangled Hamburgh). *hc*, Miss B. Laycup, Driffield; R. Wilson, Malton; W. G. Purdon. *Hens.*—1, T. Young (Black Spanish). 2, R. W. Richardson. 3, G. Wilson (Dark Brahmas). *hc*, R. W. Richardson; O. A. Young; R. Loft; T. H. Trigg, Driffield; W. Horner. *c*, C. Holmes (2); R. P. Moon; W. J. Peace; T. C. & E. Newbitt

Geese.—1. O. A. Young. 2, T. Croft, Pluckham. *Goslings.*—1, Mrs. J. S. Jordan, Elmswell Hall. 2, O. A. Young. *hc*, Mrs. D. Robinson, Swaythorpe; Mrs. Kirby, Driffield

Turkeys.—1, M. Merkin, Driffield. 2, W. Chater, Driffield. *Poults.*—1, O. A Young. 2, S. Holmes, Sunderlandwick.

Ducks (Aylesbury).—1 and 2, O. A. Young. *Ducklings.*—1, R. Smith, jun. 2, O. A. Young.

Ducks (Rouen).—1, Miss Jordan, Eastburn. 2, Mrs. R. Stabler. *Ducklings.*—1, O. A. Young.

Ducks (Any other variety).—1 and 2, R. W. Richardson (Carolinas and Pintails). *hc*, O. A. Young (White Call Ducks). *Ducklings.*—1, O. A. Young (White Call Ducks).

PIGEONS.

Croppers.—1, H. Adams, Beverley. Extra 2, R. P. Moon.

Carriers.—1, R. P. Moon. Extra 2, H. Yardley, Birmingham.

Jacobins.—1, R. G. Sanders, Leven. *c*, Davis & Thompson, Hull.

Fantails.—1, Davison & Thompson. *hc*, H. Adams.

Tumblers.—1. H. Adams. *hc*, H. Yardley.

Barbs.—1, H. Yardley. *hc*, H. Adams.

Nuns.—1, H. Yardley. Extra 2, J. W. Rawlinson.

Any other Variety.—1, H. Adams (White Dragoons). Extra 2, H. Yardley (Blue Owls); R. P. Moon (White African Owls). *hc*, R. Youll, Sunderland (Blue Turbits). *c*, J. Noble, Driffield (Trumpeters); F. Hickson, Driffield.

Selling Class.—1, R. G. Sanders (Jacobins). 2, H. Adams. 3, F. Hodgson. *hc*, H. Adams.

RABBITS.

Any Breed.—1, W. Donkin, Driffield. 2, T. R. Luna, Hull. *hc*, J. Humphry, Driffield. *c*, A. Donkin, Driffield.

The Judges were Mr. W. Boulton, of Beverley, and Mr. E. Hewitt, of Birmingham.

LISKEARD POULTRY SHOW.

(*From a Correspondent.*)

The third annual show was held at Liskeard on July 27th, when the delightful weather, superior quality of the entries, and the exertions of a good working committee, and increased number of visitors (upwards of three thousand having paid for admission to the grounds) combined to make it a decided success.

Game were first and best. The winner of last year's cup was first and second with good birds well shown, also first for Hennies or other white-legged Game fowl suitable for table purposes, Hennies being a speciality of this district. It is matter of regret that poultry shows have not improved the quality of fowls in the same proportion as quantity or size, and this remark equally applies to exhibition cattle, roots, &c., as in nearly all cases coarseness is found combined with size, and it is well known that the largest animals and birds are not the most profitable. No one cares to see a very large fowl at table; the yellow skin, large bone, and lanky form, of the Asiatic breeds, not proving so tempting to the appetite of either epicure or invalid as our old Sussex or English Game breeds, with their delicate white skins and plump forms. Of course this does not apply to the Anglo-Malay breed known as Game in the show pens. The prize *Dorkings* were very superior. *Bantams* were good throughout. The Selling class contained some good specimens, notably a pen of Brown Red Game, which gained the prize for the best pen of poultry in the Show. *Ducks* were of great merit, the first-prize pen being claimed at five guineas.

Of *Pigeons* the prize Carriers and Tumblers were perfection. The awards were made by Mr. John Callicott, Tavistock.

Game.—*Hennies and other White-legged* (Suitable for table purposes).—1, J. Reynolds, Redruth. 2, H. B. Love. *hc*, R. Martin. *Any variety.*—1, 2, and Diploma, J. Reynolds. 3, H. Brown, St. Austell. *hc*, H. Edwards.

Dorking.—1, 2, and *hc*, E. Burton, Truro. 3, Lady Vivian, Glyna, Bodmin.

Spanish.—1 and Diploma, S. Harris, Cusgarne. 2, H Edwards, Liskeard.

Malay.—1, J Dennis, Liskeard. 2, C. White, Liskeard. 3, Withheld.

Cochin or Brahma.—1, S. Harris. 2 and 3, E. Burton.

Polish.—1 and 3, J. Beard, Par Station. 2, S. Harris. *c*, Miss Murray.

Hamburghs.—Special and 2, S. Harris. 1, C. Marshall, Liskeard. 3, S. Richards, Truro. *hc*, Lady Vivian.

Bantams.—Special, P. Callicott. 1 and 3, J. Pearson, Liskeard. 2, F. Bulmore, Helston.

Selling Class.—1 and prize for best pen in the Show, R. Clagg, Liskeard (Brown Red Game). 2, H. Hart, St. Austell (Black Red Game). 3, E. Burton (Dorkings). Extra 3, T. Moorshead, Liskeard. *hc*, W. Yelland, Liskeard (Polish).

Ducks.—1 and 2, S. Harris (Aylesbury). 3, G. Oliver, Bodmin (Aylesbury).

Turkeys.—1, M. Oliver, Liskeard. 2, J. Burrows, Liskeard.

Pigeons.—*Carriers.*—1 and 2, E. Burton. *Tumblers.*—1 and 2, E. Burton. *Fantails.*—1, J. Lord, St. Blazey. 2, R. Courtney, Liskeard. *Any variety.*—1, J. Deacon, Liskeard (Jacobins). 2, E. Burton (Runts). 3, J. Lander (Love Turbits).

From the prize list of the Liskeard Poultry Show, it will be seen that the Judge awarded in the Bantam class a first prize to his own birds, which were, of course, entered in his own name. He also awarded a first prize to the Secretary, simply admitting that he gave his services. Such a proceeding is calculated to disgust all honourable exhibitors, and that an authoritative opinion may be given to parties to the proceeding, I should be glad if you would expose the affair. —J. L.

HASLINGDEN POULTRY SHOW.

The seventh annual Exhibition was held on July 26th. The were about three hundred pens of poultry and Pigeons. Several classes were allotted to chickens, of which there was a fine show. The competition for Hamburgh chickens was very keen. The prize adult *Spanish* were remarkably fine. *Cochins* and *Brahmas* were good. The adult Golden and Silver-spangled *Hamburghs* were very good. The class for Golden-spangled contained six remarkable pens, all worthy of a first position. The chickens were generally forward and very promising. Golden-spangled and Blacks were, perhaps, the most noteworthy. In the Any variety class Golden Polands were first, and Sultans second. A good pen of Buff Cochins was first in the Selling class. The Game *Bantams* were not numerous, but the prize pens

were first-class, though some of them were rather deficient in condition. In the class for Any other variety of Bantams, the best Whites we have seen for some time were first, good Blacks second.

The *Pigeon* classes were very fairly filled, many choice specimens competing.

COCHIN-CHINAS.—*Buff or Cinnamon.*—1 and 2, W. A. Taylor, Manchester. *hc*, J. Watts, King's Heath, near Birmingham; H. Lacy, Hebden Bridge. *Chickens.*—1 and *hc*, W. A. Taylor. 2, E. Leech. *Any other Variety.*—1, W. A. Taylor (Partridge). 2, E. Leech. *Chickens.*—1, E. Leech. 2 and *hc*, C. Sidgwick, Keighley (Partridge).

BRAHMAS.—1 and *hc*, H. Lacy. 2, H. Beldon, Goitstock, Bingley. *Chickens.*—1, J. Ashworth, Rochdale. 2, W. A. Taylor. *hc*, T. A. Dean, Moreton-on-Lugg, Hereford; J. Ashworth.

DORKINGS.—1, D. Gellatly, Meigle. 2, W. H. King, Mosa Mills, Rochdale. *hc*, J. Stott, Bealey, near Rochdale. *Chickens.*—1, E. Leech. 2, W. H. King. *hc*, W. H. King; J. Stott.

FRENCH FOWLS.—1, B. Beldon. 2, J. K. Fowler.

SPANISH (Black).—1 and 2, C. W. Brierley. *hc*, H. Beldon. *Chickens.*—1, J. Walker, Wolverhampton. 2, W. G. Mulligan, Springfield, Belfast. *hc*, H. Wilkinson, Earby, Skipton; Clewa & Adkina, Walsall; N. Cook, Chowbent.

GAME.—1 and 2, C. W. Brierley. *Cock.*—1 and 2, C. W. Brierley. *Cock* (local).—1 and 2, Morris & Wood, Accrington. *hc*, R. Holt, Loveclough, Crawshawbooth.

GAME BANTAMS.—1, G. Hall, Kendal. 2, J. R. Robinson, Sunderland. *hc*, T. Sharples, Rawtenstall. *Cock.*—1 and *hc*, T. Sharples. 2, J. R. Robinson. *Any other Variety.*—1, H. Beldon. 2, S. & R. Ashton, Mottram (Black). *hc*, J. Walker, Halifax (Black); R. Pickles, Pinfold, Edenfield (White).

HAMBURGHS.—*Golden-pencilled.*—1, H. Pickles, jun., Earby, near Skipton. 2, S. Smith, Northowram. *hc*, H. Beldon; T. Wrigley, Middleton. *Chickens.*—1 and 2, T. Wrigley. *hc*, J. Thornton, Airworth Lane, Keighley; H. Beldon.

HAMBURGHS.—*Silver-pencilled.*—1, 2, and *hc*, H. Pickles. *Chickens.*—1, J. Smith, Earby. 2 and *hc*, H. Beldon. *c*, H. Smith, Morton Banks, Keighley.

HAMBURGHS.—*Golden-spangled.*—1, H. Beldon. 2, J. Fielding, Newchurch. *hc*, H. Beldon; J. Newton, Silsden; B. Pickles; N. Marlor, Denton, near Manchester. *Chickens.*—1, B. Pickles. 2 and *hc*, N. Marlor.

HAMBURGHS.—*Silver-spangled.*—1, H. Pickles. 2, H. Beldon. *hc*, J. Fielding G. & J. Duckworth, Church. *Chickens.*—1, J. Fielding. 2, G. & J. Duckworth. *hc*, T. Fawcett, Baildon, near Leeds; G. Mitchell, Keighley.

HAMBURGHS.—*Black.*—1, D. Lord, Stacksteads. 2, N. Marlor. *hc*, C. W. Brierley; H. Hoyle, Whitewell Bottom, near Newchurch. *Chickens.*—1, C. Sidgwick. 2, Stott & Booth, Huntley Brook, Bury. *hc*, C. Sidgwick; S. Cox, Stacksteads; E. Brierley, Heywood; W. A. Taylor.

TURKEYS.—1, F. Leech, Rochdale. 2, J. Houlker, Blackburn.

GEESE.—1, J. K. Fowler, Aylesbury. 2, E. Leech.

DUCKS.—*Aylesbury.*—1 and 2, J. K. Fowler. *Rouen.*—1, J. Newton, Silsden. 2 and *hc*, E. Leech. *Any other Variety.*—1, C. W. Brierley, Middleton. 2, H. B. Smith, Brooklands, Preston (East Indian). *hc*, C. W. Brierley; H. B. Smith (Shelldrakes).

ANY OTHER VARIETY.—1 and *hc*, H. Beldon. 2, G. Anderton (White Sultans).

SELLING CLASS.—1, W. A. Taylor. 2, E. Leech. *hc*, J. Watts; J. T. Travis, Rochdale (Brahmas); W. Wilson, Crawshawbooth (Black Spanish).

PIGEONS.

CARRIERS.—1, H. Yardley. 2, E. Horner, Harewood, Leeds. *hc*, J. Stanley Salford, Blackburn; T. Waddington, Feniscowles, near Blackburn.

TUMBLERS.—1, F. Moore, Burnley. 2, E. Horner. *hc*, H. Yardley; J. Fielding, jun., Rochdale; E. Horner.

BARBS.—1, E. Horner. 2, J. Stanley. *hc*, H. Yardley; J. Fielding, jun.; E Horner; J. Stanley.

OWLS.—1, H. Yardley. 2, E. Horner. *hc*, J. Ashworth, Blackburn; J. Fielding, jun.

CROPPERS.—1 and 2, E. Horner. *hc*, T. Waddington, Feniscowles.

FANTAILS.—1, J. S. Loversidge, Newark. 2, B. Yardley.

TURBITS.—1, J. Fielding, jun. 2, H. Yardley. *hc*, W. Kitchen, Feniscowles E. Horner.

DRAGOONS.—1 and 2, T. Waddington. *hc*, H. Yardley; T. Charnley, Blackburn; J. Stanley.

TRUMPETERS.—1 and 2, E. Horner.

JACOBINS.—1, E. Horner. 2, T. Waddington.

ANTWERPS.—1, E. Horner. 2, R. Brierley, Fishpool, Bury. *hc*, J. Stanley.

ANY OTHER VARIETY.—1, E. Horner. 2, H. Yardley. *hc*, W. Kitchen; T. Waddington.

ANY VARIETY (Local).—1 and *hc*, W. Kemp, Haslingden. 2, J. Brown, Cribden End, Haslingden.

RABBITS.—*Spanish.*—1, C. Gravil, jun., Thorne. 2, J. Irving, Blackburn. *hc*, H. Cawood, Thorne, Doncaster. *Angora.*—1, J. Butterworth, Rochdale. 2, A. H. Easten, Hull. *hc*, B. Cawood. *Himalayan.*—1 and 2, J. Butterworth. *hc*, A. H. Easten. *Silver-Grey.*—1, S. Greenwood, Hebden Bridge. 2, A. L. Rawstron, Haslingden. *hc*, S. G. Hudson, Hull. *Any other Variety.*—1 and 2, S. G. Hudson (Dutch Rabbit and Belgian Hare.

JUDGES.—*Poultry and Pigeons:* Mr. T. J. Charlton, Bradford; Mr. S. Fielding, Trentham Park. *Rabbits:* Mr. J. Boyle, jun., Blackburn.

Two years ago Haslingden only offered one class for *Rabbits*, but at their last show they made five classes, and succeeded in bringing up double the number of entries in comparison to the show of last year, through simply having them shown singly. In my measurement of the Lops I shall give the fair and honest length and width, not with the inch, and in some cases 1½ inch, usually added by most judges. This being the first time I have acted as Judge, I mean to start what I hope every other Rabbit judge in the future will do, and only give the real measurement of the Lops. I know of many who have begun the Rabbit fancy by purchasing a Lop, of course thinking to find it measure what they had bought it for, but, to their disgust, found it deficient an inch or more, and consequently threw up entirely. I will say no more on this subject, but trust what little I have said will cause the subject to be well sifted, and that this should be the case is the desire of more fanciers than myself.

The Lop-eared class was throughout very fine. The first-prize doe was 21⅞ inches by 4¾; the second, a very promising Tortoiseshell doe, was 21⅛ inches by 5. The highly commended pen of Mr. Cawood, 21⅝ by 5, was good in ears, but a very small Rabbit.

Angoras were but moderate. The first prize went to a small but good-woolled Rabbit from Mr. Butterworth, the second to one from Mr. Easten, a large Rabbit, in very bad condition; for this I should prescribe a much freer use of the comb.

Silver-Greys were the largest and best class in the Show; there were nine entries. The first prize went to a large and well-silvered doe from Mr. Greenwood; the second to a fine Rabbit from Mr. Rawstron. Mr. S. G. Hudson's highly commended doe would have come off better had she escaped the very heavy rain that continued the whole of the morning, and beat right into the Rabbit pens, wetting many of them through.

Of Himalayans the entries numbered eight, but some very poor specimens were shown.

The Any other variety class was small; the first prize went to a nice little yellow and white Dutch, the second to a fine Belgian Hare.

—JAMES BOYLE, JUN., *Blackburn.*

ESTON AND NORMANBY CAGE BIRD, PIGEON, AND RABBIT SHOW.

(From a Correspondent.)

THIS Show was held on July 29th. Though the entries were not very numerous, they included some excellent specimens.

Pigeons formed a show in themselves, Mr. Yardley entering largely. In Carriers the winners were Blacks, and were decidedly the best pair we have seen in the north this year. A good pair of Duns was third. Fantails were a fair class, many of the birds evidently going into moult. The winning Turbits were Blues, good in colour, but somewhat too large in body. Mr. Yardley's Red Jacobins were easily first in their class, and were claimed early in the day. Barbs and Trumpeters call for no special remark. The first and second-prize Owls were both foreign Whites. In Pouters, the first and second-prize birds were Whites, the winning cock being in splendid condition, and of good length in limb and feather. The winning Nuns were beautiful birds; and Black Magpies stood at the head of their class. The "Any variety" class seems to have puzzled the Judge, for we much preferred Mr. Yardley's Spots, and pens 170 and 171, to the second-prize Dragoons. The Selling class contained some cheap birds of fair merit.

There was also a good display of *Rabbits* and *Cage Birds*. The pens were well arranged, but the time for opening the Show anything but satisfactory.

PIGEONS.

CARRIERS.—1, R. Harrison, Darlington. 2, H. Yardley, Birmingham. *c*, W. Taylor, Weardale.

FANTAILS.—1, W. Bearpark, Northallerton. 2, J. F. Loversidge, Newark. *vhc* H. Yardley, *hc*, T. C. Taylor, Middlesbrough. *c*, R. Harrison.

TURBITS.—1, R. Wilson, Thirsk. 2, J. G. Dunn, Newcastle-on-Tyne. *hc*, H. Yardley; W. Bearpark. *c*, T. C. Taylor.

TUMBLERS.—*Short-faced.*—1, W. Bearpark. 2, H. Yardley. *hc*, R. Wilson. *c*, J. Robinson, Middlesbrough; T. Helmsley, Lackenby. *Common.*—1, W. R. and H. O. Blenkinsopp, Newcastle-on-Tyne. 2, T. C. Taylor.

BARBS.—1, H. Yardley. 2, R. Wilson. *hc*, W. R. & H. O. Blenkinsopp. *c*, W. Taylor; T. C. Taylor.

OWLS.—1, R. Wilson. 2, H. Yardley.

TRUMPETERS.—1, J. Cundale, Ripon. 2, R. Wilson.

POUTERS.—1, W. Bearpark. 2, H. Yardley. *hc*, R. Harrison; R. Wilson; T. C. Taylor.

NUNS.—1, H. Yardley. 2, W. Bearpark. *hc*, R. Wilson.

MAGPIES.—1, J. Cundale. 2, W. Bearpark. *hc*, H. Yardley.

ANY VARIETY.—1, W. Bearpark (Blue Dragoon). 2, J. G. Dunn, Newcastle-on-Tyne (Yellow Dragoons), *hc*, R. Harrison; R. Wilson; J. Cundale; W. R. and H. O. Blenkinsopp. *c*, T. C. Taylor.

SELLING CLASS.—1 and 2, T. C. Taylor.

RABBITS.—*Lop-eared.*—1, W. Wilson, Middlesbrough. 2, —Dobson, York. 3, —Kettlewell, York. *Himalayan.*—1, T. Moore, Normanby. 2, W. Donkin, Driffield. 3, A. H. Easten, Hull. *Angola.*—1, G. Robinson, York. 2, C. Anton, York. 3, A. H. Easten.

BLACKBURN POULTRY SHOW.

THE day on which this was held (July 27th), was the most summer-like of any we have had this year, and the ground was thronged with visitors. The pens, which were ranged round two sides of a large field, gave the poultry plenty of room. Grey *Dorkings* did not show to advantage—in fact, they were mostly in deep moult; but the Dark *Brahmas* were very good. Of *Spanish*, Messrs. Brierley and Beldon showed three pens that would stand well at any show. In *Game* fowls the noted pens belonging to Mr. Brierley carried everything before them. *Cochins*, both Buff and Partridge-coloured, were of great merit; but the *Hamburgh* classes were the strong feature of the Blackburn Show, the district being the home of the breeders of these beautiful varieties. All the classes of *Ducks* were as good as could be desired, and public attention was arrested by the exhibition of Whistling Ducks, Shovellers, Teal, Mandarins, Labradors, and a few other well-shown breeds. *Geese*, too, were perfection, and present in numbers, but not a single entry of birds of this year's hatch for the *Turkey* prizes was made, and only three for old birds. The classes devoted entirely to birds bred in 1871 were well filled with the choicest specimens, the successes of many of which will no doubt be heard of hereafter, as very few of the chickens were early-hatched ones. The Committee were most anxious to oblige everyone, and we congratulate them on their well-deserved success.

DORKINGS.—*Grey.*—1, J. Stott, Healey, Rochdale. 2, J. Robinson, Garstang. *White.*—1 and 2, J. Robinson. *Any colour.*—*Cock.*—1, T. Briden, Earby, Skipton. 2, J. Robinson.

BRAHMA POOTRA.—1 and 2, H. Lacy, Hebden Bridge. *hc*, H. Beldon, Goitstock, Bingley.

SPANISH.—1 and 2, C. W. Brierley, Middleton, Manchester. *hc*, H. Beldon.

GAME.—1 and 2, C. W. Brierley. *Cock.*—1 and 2, C. W. Brierley. *hc*, W. Perrin, Nantwich, Cheshire.

COCHIN-CHINA.—1, H. Lacy. 2, E. Leech, Rochdale. *hc*, F. H. Green, Windsor, Belfast, Ireland.

HAMBURGHS.—*Golden-pencilled.*—1, H. Beldon. 2, J. Robinson. *Silver-pencilled.*—1, H. Beldon. 2, J. Robinson. *hc*, J. Robinson; B. Bee, Goosnargh, Preston. *Golden-spangled.*—1, H. Beldon. 2, J. Robinson. *hc*, H. Beldon; J. Newton, Silsden, Leeds. *Silver-spangled.*—1, J. Robinson. 2, H. Beldon. *Black.*—1, J. Robinson. 2, C. Sidgwick, Keighley. *c*, C. W. Brierley.

BANTAMS.—1, S. & R. Ashton, Roe Cross, Mottram, Manchester. 2, H. Beldon. *hc*, H. B. Smith, Brooklands, Broughton, Preston; G. Hall, Kendal; G. Anderton, Accrington.

CRÈVE-CŒUR.—1, H. Beldon.

HOUDANS.—1, W. Hibbert. 2, F. H. Green.

ANY OTHER VARIETY.—1, H. Beldon. 2, G. Anderton. *hc*, H. Beldon; J. Robinson; T. Wakefield, Golborn, Newton-le-Willows: J. Kitchen, Blackburn.

GEESE.—1, S. H. Stott, Preston. 2, E. Leech. *c*, J. Honlker, Revidge, Blackburn.

Trickett, Waterfoot, Manchester. 2, H. B. Smith, Brooklands, Broughton, Preston. *Any other Variety.*—1, C. W. Brierley. 2, H. B. Smith (Mandarins). *hc*, H. B. Smith (Shelldrakes); S. & R. Ashton, Roe Cross, Mottram, Manchester; S. H. Stott: C. W. Brierley.

TURKEYS.—1, E. Leech. 2, J. Cunningham, Blackburn. *hc*, J. Honlker, Revidge, Blackburn.

CHICKENS.

DORKINGS.—*Grey.*—1, J. Robinson. 2, J. J. Walker, Kendal. *c*, W. H. King, Sandfield, Rochdale (2); E. Leech. *White.*—1 and 2, J. Robinson. *c*, M. Fairhurst, Woodlands, Ormskirk.

GAME.—1 and 2, J. Carlisle, Earby, Skipton. *hc*, C. W. Brierley.

COCHIN-CHINA.—1 and 2, C. Sidgwick. *hc* and *c*, J. Robinson.

HAMBURGHS.—*Golden-pencilled.*—1, J. Webster, Whitby. 2, H. Beldon. *hc*, J. Robinson. *Silver-pencilled.*—1 and 2, H. Beldon. *hc*, J. Robinson. *Golden-spangled.*—1, J. Robinson. 2, E. Brierley, Heywood, Manchester. *Silver-spangled.*—1, H. Beldon. 2, J. Robinson. *hc*, G. Brown, Sandhills, Walsall.

BANTAMS.—1, H. Beldon. 2, Rev. C. J. Perry-Keene, Halsall, Ormskirk.

GEESE.—1, S. H. Stott. 2, J. Houlker. *hc*, E. Leech.

DUCKS.—*Aylesbury.*—1, E. Leech. 2, H. Frankland, Church, Accrington. *hc*, B. Bee, Goosnargh, Preston. *Rouen.*—1, J. Scotson, Little Byrom, Lowton, Newton-le-Willows. 2, T. Wakefield. *hc*, P. West, Abram, Wigan; S. H. Stott; J. Newton, Silsden, Leeds. *Any other Variety.*—1, H. B. Smith (Labrador Ducklings). 2, A. & J. Trickett, Waterfoot, Manchester.

EXTRA STOCK.—*hc*, T. Wakefield.

RABBITS (Extra Stock).—*vhc*, J. Boyle, jun., Blackburn (Lop-eared). *hc*, J Irving, Blackburn (Tortoiseshell, Black, and White); J. Boyle, jun. (Silver Grey and Himalayan).

Messrs. Hewitt and Baxter were the Judges.

CROYDON POULTRY SHOW.

THIS Show was held on July 26th in Haling Park, the seat of J. Watney, Esq., who kindly allowed the Exhibition to take place amidst his noble Chestnut trees. The entries numbered 250 pens, an immense increase over last year's, and the Show proved a great success. Many of the best birds from all parts of the kingdom competed for the prizes. The visitors were very numerous, including many London exhibitors. All fanciers know how pleasant it is to meet one another, shake hands, and then commence discussing the merits of the different birds and the prospects of the young ones. These things they did at Croydon with evident pleasure to each other. The courtesy and exertions of the Honorary Secretary, Mr. Rowland, contributed largely to the day's enjoyment and success.

It was rather late in the day before the Judge was able to announce the winners; this was no doubt caused by the superiority of the birds and the close competition in many of the classes. The judging on the whole was very satisfactory, and there were few grumblers amongst the disappointed ones. We were surprised to find that no prizes were offered for Pigeons, especially as so many Pigeon breeders and exhibitors live in Croydon, and there is there a very active Columbarian Society, but no doubt next year this omission will be rectified.

Grey *Dorkings* stood first; many of the birds were in deep moult, and the whole class was only moderate in quality. In the Any variety class a very poor pair of Whites took the first prize and Blues the second. We noticed a good pair of Silvers, but the hen had an enlargement of the crop, or they would have been differently placed. *Spanish* were an uncommonly good even class. One of the best-filled pens in the whole Show, No. 17, contained a good-faced bird with middling comb matched with a wretched hen. With one or two exceptions all the hens were inferior when compared with the cocks. Several winners at other shows had to put up with a high commendation here. Buff and Partridge *Cochins* were good, but several were badly shown and in wretched condition. In the Any variety class there was a wonderfully nice lot. The first-prize pair of Whites were beautifully white and clean in feather. What washing they must have had, and what immense trouble must have been taken in arranging their feathers after the bath! but their splendid appearance repaid the operator. The awards in Dark *Brahmas* were hardly satisfactory. All the birds were good and received notice, except two pens. The Judge must have been puzzled as to which was the best pair. Several of the Light looked yellow on the hackle and saddle feathers by plumage soiled, and would no doubt have looked better if washed. We wash our bodies for the sake of appearance and comfort, then why not wash a fowl to improve its beauties? Otherwise they were grand birds. *French* were divided into two classes. The first-prize Crêve-Cœur cock was an unusually good bird. All the *Game* were in excellent feather and condition. *Hamburghs* were numerous, but inferior, except the winners. *Polands* were few but good, particularly the first-prize pair, which were in fine condition and plumage. One of the best classes in the Show was the *Bantams*, the whole of which were well shown. The Any other variety class produced a numerous entry, but the awards were bad, going to a wretched pair of Black Hamburghs, white in the face, red earlobe, and the cock with a wry tail. The pair were hardly worth as many shillings as priced at pounds, and that was only £2 10s. This was the more to be regretted, as there were many superior birds in the class. *Ducks* and *Geese* were good, and a nice lot of young ones was exhibited.

A Grey Dorking was first in the *Single Cock* class, and there was a very rakish-looking Game bird, but he only received a high commendation. *Spanish* stood first in the hen class, being very good in face, and open in lobe. We heard £10 refused for them. The prize for *Bantam* hens went to a pair of this year's birds, very neat and small, slightly white on the ear, but very quickly claimed at the catalogued price, two guineas.

Although no prizes were offered for *Pigeons*, still there was a very pretty show made by the members of the Croydon Columbarian Society. Mr. Jayne exhibited some pretty Tumblers, and made us covet a little gem of a hen. We always have a liking for Tumblers. Mr. Wiltshire sent some grand Carriers; Mr. Corker Dragoons, which we much admired; Mr. Sutherland a number of Belgian Pigeons, similar to those started from the Crystal Palace a short time since.

The whole of the birds were exhibited in Mr. Billett's pens, and the neatness and general finish these pens always convey to the mind, add greatly to the appearance of the birds, and the attractiveness of the Show.

DORKINGS.—*Grey.*—1, G. H. Langford, Sherborne, Guildford. 2, J. Smith Shillinglee Park, Petworth. *c*, — Sutherland, Coombe Lodge, Croydon; J. Smith; F. Parlett, Great Baddow, Chelmsford. *Any other Variety.*—1, J. H. Nicholls, Lostwithiel (White Dorkings). 2, B. Fuller, Rookery, Dorking (Blue-speckled Dorking).

SPANISH.—1, Messrs. Nichols, Camberwell. 2, C. Howard, Peckham. *hc*, R. Wright, Holloway Road, London; E. Smith, Lark Hill, Timperley.

COCHINS.—*Buff or Cinnamon.*—1, E. Smith. 2, J. K. Fowler, Aylesbury. *hc*, J. Pares, Postford, Guildford. *Brown or Partridge.*—1, C. Howard. 2, H. Lingwood, Needham Market. *Any other Variety.*—1, E. Smith (White Cochins). 2, Mrs. A. Williamson, Queenborough Hall (White Cochins). *hc*, J. N. Whitehead, Gnaton, Torquay (White Cochins).

BRAHMAS.—*Dark.*—1, H. Dowsett, Pleshey, Chelmsford. 2, W. Stevens, Northampton. *hc*, H. Lingwood; H. Dowsett. *c*, E. Smith; J. K. Fowler. *Light.*—1, Mrs. A. Williamson. 2, H. M. Maynard, Ryde, Isle of Wight. *hc*, J. R. Rodbard, Wrington, Bristol. *c*, Dr. Campbell, Brentwood.

HOUDANS.—1 and 2, W. Dring, Faversham. *hc*, J. K. Fowler. *c*, Hills & Co., Great Woodcote.

FRENCH.—*Any other Variety.*—1, E. Smith (Crêve-Cœurs). 2, Rev. N. J. Ridley (La Flèche). *hc*, J. S. Price, Potter's Bar (Crêve-Cœur); J. J. Malden, Biggleswade (Crêve-Cœur); T. E. Hawken (Crêve-Cœur).

GAME.—*Black or Brown-breasted Reds.*—1, S. Matthew, Stowmarket. 2, W. H. Stagg, Netheravon. *hc*, F. Harding, Chingford; Rev. G. S. Cruwys, Cruwys Morchard, Tiverton. *Piles or Duckwings.*—1 and 2, S. Matthew, Stowmarket. *hc*, J. H. Salter, Tolleshunt Darcy, Kelvedon (2); Rev. G. S. Cruwys.

HAMBURGHS.—*Gold or Silver-spangled.*—1, E. Phillimore, Cheltenham. 2, H. Pickles, jun., Earby. *hc*, Miss C. E. Palmer, Odiham; H. M. Maynard; W. H. Tomlinson, Newark-on-Trent. *c*, G. Slade, Chiselhurst. *Gold or Silver-pencilled.*—1, H. Pickles, jun. 2, R. S. S. Woodgate, Pembury, Tunbridge Wells. *c*, W. K. Tickner, Ipswich.

POLANDS (Any variety).—1 and 2, W. P. Patrick, West Winch, Lynn. *hc*, H. Pickles, jun.; W. K. Patrick.

GAME BANTAMS.—*Black or Brown-breasted.*—1, Rev. E. S. Tiddeman, Childerditch Vicarage, Brentwood. 2, A. A. Vander-Meersch, Tooting. *hc*, Rev. E. S. Tiddeman; E. S. C. Gibson, Ryde. *Pile or Duckwing.*—1, A. A. Vander-Meersch. 2, H. J. Jones, Reigate. *Any other Distinct Variety.*—1, Rev. G. S. Cruwys. 2, A. E. Smith (Pekins). *hc*, P. Crowley, Waddon House, Croydon (Black); R. S. S. Woodgate (Japanese); E. S. C. Gibson (Japan Frizland); Rev. G. S. Cruwys.

ANY VARIETY NOT BEFORE NAMED.—1, J. H. Nicholls (Black Hamburghs). 2, A. E. Smith (Andalusians). *hc*, Rev. N. J. Ridley (Malay); J. Bissenden, Canterbury (Black Gueldres); J. P. Fearon, Burdhurst, Croyden (Japanese Silks); R. S. S. Woodgate (Silkies); W. H. Tomlinson, Newark-on-Trent (Sultans). *c*, Miss C. E. Palmer (Scotch Dumpies).

DUCKS.—*Rouen.*—1, H. Dowsett. 2, J. K. Fowler. *hc*, — Sutherland. *Aylesbury.*—1 and 2, J. K. Fowler, Aylesbury. *hc*, W. Jacob, Shepperdswell. *c*, S. N. Rowland, Caterham Valley. *Any other Variety.*—1 and 2, — Sutherland (Shell Ducks and Domesticated Wild Ducks). *Farmyard.*—1, — Sutherland. 2, M. Coleman. *hc*, J. W. & J. Hill. *Ducklings.*—1, J. K. Fowler (Aylesbury).

GEESE.—1, J. K. Fowler. 2, P. Crowley. *c*, J. H. Sheppy, Wallington, Surrey. *Goslings.*—1, J. K. Fowler. 2, J. Pares. *hc*, P. Crowley (2); J. H. Sheppy.

COCK OR COCKEREL.—1, J. Chisman, Rounham, Southampton (Grey Dorking). *hc*, — Whitehead (White Cochin); R. Hall (Game).

HENS OR PULLETS.—1, Messrs. Nicholls (Spanish). *hc*, R. S. S. Woodgate (Gold-pencilled Hamburghs); Mrs. General Dunn, Inglewood House, Hungerford (Dorkings); W. Dring (Houdans); H. Brown (Spanish); O. E. Cresswell, Hanworth Rectory, Feltham (Silver-Grey Dorkings). *c*, A. E. Smith (Spanish).

BANTAMS.—*Cock or Cockerel.*—1, W. Dring (Black Red). *Hens or Pullets.*—1, T. W. Anns, Clapham (Black-Red Game). *hc*, H. F. Nalder, Croydon (Pile Game Pullets).

SELLING CLASS (Any variety).—1, F. Brewer, Lostwithiel (White Cochins). 2, R. J. G. B. Knight, Wrotham, Sevenoaks (Houdans). *hc*, B. Mollett, Eccleston Square, London (Black Spanish).

Mr. G. Saunders Sainsbury, of Devizes, was the Judge.

THE OWL PIGEON.

WE trust that we may be excused for not replying more promptly to Mr. Harrison Weir's remarks (pages 17 and 18) on our notes respecting the Owl Pigeon. The opinions of our members assembled were taken on the subject: hence the delay.

We are pleased to hear that Mr. Harrison Weir gives us credit for our good intentions in placing before the fancy our views of the merits and demerits of the various breeds of domesticated Pigeons. We are also gratified that congratulations upon our efforts have been received by us from all quarters of England, and from various parts of America; and our pleasurable task is rendered still more delightful because we have ample assurances that we are not working in vain, but, on the contrary, are doing some good. We, of course, expect differences of opinion. It would be a remarkable exception if in the Pigeon fancy alone there were perfect unity. There

always has been a diversity of thought on all subjects, and it is well, too, that such exists; and were it not that Mr. Harrison Weir is looked upon as an authority on Pigeons he might still enjoy undisturbed his own views of a perfect Owl, and we would have simply requested fanciers to read our article on the Owl and Mr. Weir's remarks, and then draw their own conclusions. But as Mr. Weir is not only an accomplished artist, but an eminent judge of Pigeons, we cannot let his adverse opinions pass unnoticed. To do so might appear to some fanciers as equivalent to our conversion to his peculiar views, and might influence would-be fanciers in their search for choice birds of this variety. We will, therefore, again direct their attention to our article on the Owl (see vol. xx., page 429), and also to Mr. Weir's contrary opinions (see July 6th, pages 17 and 18), taking a few extracts from each to show in what respects the Birmingham Columbarian Society and Mr. Weir differ as to the qualities of a standard Owl Pigeon.

Our views are:—"From near the end of the lower beak should fall in nearly a straight line a loosely-hanging feather-covered skin or dewlap, terminating at its lower extremity in the gullet, from which should protrude evenly on either side a large and full-feathered frill or ruffle. This ornamental frontispiece should extend low down the breast, and finish off in a sort of rose or radiation of feathers, &c." To the above quotation Mr. Weir objects by saying, "The Owl ought not to have what is termed the gullet, nor a frill, but the head set on an evenly-rounded neck with no frill, but a circular patch of feathers on the breast that is called the rose." Thus it will be seen that we want rose, frill, dewlap, and gullet, whilst Mr. Weir is content with the rose, or patch of feathers as he terms it, and adds that the points above enumerated by us belong to the Turbit.

Let us see what "The Treatise," published in 1765, says—"The feathers on the breast open and reflect both ways, expanding something like a rose, which is called the purl by some, and by others the frill, and the more the bird has of that the better, with a gullet reaching down from the beak to the frill." Mr. B. P. Brent says (page 53), "The gullet of the Owl should be well developed, frill rose-shaped." And, again, we find in the old work on Pigeons, above alluded to, the following description of the Turbit, which the author says, "should have a round button head, with a gullet; and the feathers on the breast (like that of the Owl) open and reflect both ways, standing out almost like a fringe, or the frill of a shirt, and the bird is valued in proportion to the goodness of the frill or purl;" and apart from antiquated notions whether for or against our views, Mr. Weir has himself pourtrayed a pair of Owls, and the head study of another, in all of which the "dewlap" is conspicuous. We have also in support of our views most modern fanciers, and many veteran Pigeon keepers, many ancient records, and Nature herself for our guide, the study of which shows clearly that the Owl Pigeon has dewlap, gullet, frill, and rose. These birds are no strangers to us, no new variety, or obscure breed recently brought to light; they are an ancient race, and are also by nature frilled birds from neck to breast; and whatever strange twists and twirls such feathers sometimes take upwards, downwards, inwards, outwards, a study of this variety, as nestlings in pin-feather, will reveal clearly the course such feathers are intended to take, and will be more convincing to those who are inclined to be captious than an exhaustive volume on the subject.

We admire the rose on the breast of the Owl greatly, and consider such point indispensable, but for a perfect specimen we must have also a frill in continuation from the top of the rose, also gullet and dewlap, without which such birds are imperfect developments of the breed, and however much we may admire them as eccentricities, we do not think well to extol their merits as perfect birds. Pigeons of the Owl type possessing rose only are rarely to be found; they are, indeed, isolated specimens, freaks of Nature springing from the parent stock, and as such they should be regarded, and not held up as possessing the fundamental qualities of the breed. They should have their place with us, and command our admiration too; but such singular specimens must and should give place to those of higher merit of the true type such as we have described.

Mr. H. Weir says we (the Birmingham Columbarian Society) do not seem to know much about the Powdered Blue specimens, and kindly volunteers a little enlightenment as to the origin of the Powdered Blue variety and its name. Mr. Weir says, "This breed was produced by the late Mr. Matthew Wicking and myself many years ago (at least neither of us ever saw any until we bred them), and they were got from a Light Blue and a Mealy, and selected and bred on. We called them Powdered Blues, because the necks of the birds being of a bright blue, and the tips of the hackle feathers nearly white, it gave them a powdered look; hence the term Powdered Blue." That Mr. Weir may have bred the lighter-coloured or Powdered Blue Owls as he describes—viz., from Light Blues and Mealies, we do not doubt—indeed we know they are thus produced; we only wonder that Mr. Weir should take credit to himself and the late Mr. Wicking as the originators of this breed. It is true he has qualified such observation by the following addendum—"At least neither of us ever saw any until we bred them." Were there no enterprising and experimenting breeders prior to the nineteenth century who tried the amalgamation of Blues, Mealies, and Silvers? Did not chance ever bring them together and produce the same effect? Let us refer back just a hundred years and see what Mayor says. "The Blue ones," he writes, "should have black bars cross the wings, and the lighter they are in colour, particularly in the hackle, the more they are valued." And we find also in Mr. Tegetmeier's work on Pigeons, in speaking of the Owl he says, "It is to be regretted that the old Powdered Blue and Silver Owls, being of extreme beauty, should be allowed to pass away."

We must leave our readers to form their own opinions as to the originators of this breed; but we would simply say, Ask any old fancier if he knows what Silvery-hackled Blue Owls are and how long he has known of them, and he may perhaps have a long yarn to spin in praise of the beauties his great-grandfather had of that variety. We will not dispute the right or title as co-sponsor which Mr. Weir claims, in conjunction with the late Mr. Wicking, at the re-christening of the variety now known as Powdered Blue, for probably Mr. Weir did thus name them. This, although not of material importance, is news to us, and for such enlightenment we desire to express our thanks; in other respects we remain unmoved. Our views of an Owl of standard merit are unaltered; and, should such be necessary, we are prepared to give modern authority, ancient record, or ocular demonstration, in substantiation of the opinions we have promulgated.—THE BIRMINGHAM COLUMBARIAN SOCIETY.

I READ with interest the remarks on the properties of the Owl Pigeon by one to whom every true fancier is indebted for his services at the most important shows, and for his pencil productions; but allow me to ask him, Mr. Harrison Weir, on what ground was based the decision at the Crystal Palace? I have good reasons to suppose, only on the appearance of their best specimens, which by the trial they have undergone in order to be produced, "very finely powdered" and "forcing," or from being rather too weakly and close bred, have lost their most important property, the full frill, and not by a reference to the original breed and country, and their first breeders—the venerable Turks—who claim the honours of producing both the Owl and the Turbit, besides other rare beauties. What would the Almond breeders in England say, if some of the fanciers here breeding the Almonds, which I have imported into this country, should breed differently to what they should be bred, and establish to their own taste an improved standard?

The most venerable fancier I have known here (twenty years ago, then quite shaky, but still, to my delight, not more shaky now), who from boyhood inherited from his yet-and-for-ever venerated father, the most beautiful of Toy Pigeons, when I translated to him Mr. Harrison Weir's remarks on the Owl, most comically came out with a proverb, which exactly translated means, "Come my grandfather to show you your father's inheritance." In my twenty-five years' experience of the fancy, and in my travels, I have discovered that we are indebted to the Mahomedans for the best of our Toy Pigeons, but especially for the Owls and Turbits. This granted—and there is not the least doubt—I beg to give the original standard of the two breeds.

With the exception of markings and caps they should be one and the same breed, and I believe had Mr. Weir seen perfect Turbits, as he has the perfect Owls occasionally met with in England, he would alter his views. But unfortunately a perfect-shaped Turbit does not yet exist in England; you only meet the rather thin-beaked, not short enough, narrow-headed, mousey-shaped bird; while the head of a Turbit, according to the original producers of the breed, should be, with the exception of the cap, as beautiful as that of the Owl, and you may well imagine the beauty of a Turbit with such a head; and as

for the frill, the so-called rose, it is only a deteriorated frill, which unfortunately only the best, or rather close-bred Owls in England possess, and especially the small White; thus missing one of their most important points, the full—never too full—frill. Let us endeavour honourably to serve the uninitiated, instead of imitating the fox who lost his tail, because the best Owls in England are generally short of frill, to attach to it the fancy name of rose, and try to persuade the fancy to imitate this deterioration. I shall suggest, as this venerable Turk does, to my fellow English fanciers, to breed the Turbits as fine as the Owls in head, and both those handsome varieties as full-frilled as possible, and when they attain this object, let them compare them with the Owls possessing the rose and the now existing Turbits, and then decide. Specimens of perfect-shaped Turbits I have forwarded to our Society at Birmingham, though rather revolutionised in markings by the present fashion here.—H. P. Cariria, *Smyrna.*

The Birmingham Columbarian Society describe the eye of the Owl Pigeon as being orange red, a point Mr. Weir fails to catch, as diffarent from Mr. Brent's description of such eye, as pearl or gravel colour, though Mr. Weir corrects the Society on other points. Will Mr. Weir tell us the genuine colour of the Owl Pigeon's eye?—Reader.

VALUABLE PIGEONS STOLEN FROM EXHIBITIONS.

I agree with Mr. Hewitt and Mr. Graham that watchful eyes are the best safeguards. I would suggest that committees of shows should guarantee the safety of the birds while in their possession. I think that if they were to charge 3*d.* or 6*d.* per pen extra for the entries they would be able to have additional men to watch. As regards the chains and locks my opinion is that they would be useless, because those who intended stealing would effect their purpose unless a watch were kept upon them. My bird, value £20, was stolen from Romford at half-past four in the afternoon; this would have been impossible if the birds had been well looked after. Messrs. Jennison offered Mr. While £5 towards his loss, but the Committee of Romford Show have not offered me any compensation. I will give £5 for the recovery of my Carrier and the conviction of the thief, I will also give a guinea to any person who will by his evidence convict any thief or thieves stealing Pigeons from any forthcoming show this season, or will subscribe a guinea to any fund which may be formed having the same object in view.—H. Yardley, *Market Hall, Birmingham.*

DEATH OF MR. T. W. WOODBURY.

I little thought—when, on the 20th of this month (July), after an enforced cessation of some months, owing to severe and protracted illness, there appeared another of those papers bearing the signature so well koown to the readers of "our Journal" of "A Devonshire Bee-keeper," in which he most feelingly announced his partial but uncertain improvement, and his looking hopefully forward to permanent recovery, and in which he most gratefully tendered his "warmest acknowledgments and heartfelt thanks" to myself and others who had assisted him with the pen, and to numerous friends and correspondents who had expressed their warm sympathy with him during his illness—I little thought, I say, that this would prove to be the last contribution hearing his signature, or that before the succeeding week's number could reach us we should have been shocked to hear of his almost sudden death. It is, however, my sorrowful task to have to inform the editors, and numerous apiarian and other readers and correspondents of this Journal, of the melancholy fact. On the night of Wednesday, the 26th, soon after the time of his retiring to rest, he was seized with a violent internal pain, and in a very short time, before the doctor who had been sent for could arrive, he had ceased to exist.

Thus has the unbroken friendship of twenty-two years been severed. It was in the summer of 1849, in consequence of a short paragraph from my pen which appeared in one of our local prints, that I received a letter from Mr. Woodbury, expressing his interest in the communication. A few weeks after this he called on me, and from that time commenced an intimacy which soon ripened into warm friendship. We had both for some years been ardent bee-keepers, but our acquaintance and mutual interest in the beloved subject, together with our numerous walks and rambles connected with apiarian pursuits, added, if possible, fuel to the fire.

In the autumn of 1850 I removed to Ireland, and, of course, our personal inter-communication on bee matters received a check. I soon established a prosperous apiary in my new home, but my friend was not so fortunate. During the following year, chiefly owing to the knavery of the people in the country in whose garden he had kept his bees, his hives dwindled away to a very low ebb, and for a time he relinquished active bee-keeping in disgust. Still, however, his real interest in the subject remained.

I returned to reside in Exeter in the autumn of 1854, and very soon set to work to surround myself with a more extensive apiary than I had ever had before. Mr. Woodbury took a very great interest in all my proceedings, but he maintained that he should not himself again enter the lists as a bee-keeper. But example is contagious. Being interested in observing the prosperity of my bees, and in the progress of some beautiful supers which were being filled, he could not resist the impulse, and on one occasion of my calling at his house, I found him surrounded with planks and tools, busily engaged in making bee-boxes. He was the very best amateur carpenter or cabinet-maker that I ever knew; his workmanship was really beautiful. Whatever he did in this, as in other matters, he did thoroughly. Mr. Woodbury then informed me that he should not exceed four stocks of bees, and for some time he adhered to his resolution. With the ordinary bar hive he became so exceedingly expert a manipulator, that when the third edition of Langstroth's book was published, he could not at first perceive any advantages that moveable frames possessed over moveable bars. It was not until I had made several frame hives, somewhat after Langstroth's pattern, but previous, however, to my having had any of them stocked with bees, that he candidly told me that he had become a convert to the utilities and capabilities of the, to us, new principle, and that he should set to work at once to make some. By a happy combination of adaptation he utilised all his boxes, loose bars, and combs, and succeeded in turning out the form of hive which has ever since enjoyed so wide a reputation—viz., the Woodbury hive. From the time of his adoption of this hive, and of his introduction of Ligurians into his apiary, Mr. Woodbury greatly extended his operations, and his four original colonies soon became vastly increased. For the accounts of his introduction of Ligurian queens; of his first and subsequent attempts at their propagation; of his failures as well as his successes; of the history of the successful tranemiseion of Ligurian colonies to Scotland, Ireland, America, the Cape, Australia, and elsewhere, I can only refer our readers to the pages of past numbers of the Journal during the space of many years.

I have hitherto spoken of our departed friend chiefly in relation to his career and chara.ter as an apiarian, and it is with greater difficulty and diffidence that I approach the subject of his domestic relations. I have endeavoured, most imperfectly I fear, to describe him in the character of a warm, sincere, and enduring friend. To this must be added, and all who have known him intimately will bear me out in the assertion, that in all the relations of domestic life he was almost, if not quite, incomparable—a devoted son, sacrificing self for the happiness and comfort of aged parents, a most loving and affectionate husband and father. I felt it to be indeed no small privilege to be permitted to join the family circle with almost the freedom and non-constraint of a near relative.

In conclusion I have only to add, that I am sure that all the readers of the Journal, and all the contributors to its columns, whether interested as apiarians or otherwise, will experience deep feelings of sorrow for the loss of one who has for so many years contributed so largely to its columns, and I may be permitted to add, to its value and interest as a weekly periodical. Since the commencement of his illness, Mr. Woodbury expressed to me his deep regret that he had not during the time of health, given to the world the benefit of his large experience in a thoroughly comprehensive work on the honey bee. Still we may truet that in his numerous writings on the subject, "he being dead, yet speaketh."—S. Bevan Fox.

OUR LETTER BOX.

Mrs. Clarke, of Alconbury House, near Huntingdon.—W. Corbat, Esq, Strasbourg House, Castle Connell, Ireland, says—"I wrote to her in answer to her advertisement, for two Frizzled fowls and two Ptarmigan fowls, and sent her £2. She acknowledged having received the money, but said the fowls were sold, and in a short time would send me others. As she did not do so I wrote for the money; this she promised to send but never did, and in the end would not answer my letter."

POINTS OF DUCKWING GAME FOWLS (*G. H.*).—The hackle of a Duckwinged Game cock should be perfectly clear, the breast should be quite black, the tail also. The Duckwing should be distinctly marked in common and Silver Duckwings, but in the ordinary there may be and frequently is the copper saddle. The hackle of such a bird should be straw-coloured, but in the Silver it must be white. In all points of shape, carriage, &c., the rules are the same for all classes. The distinction is only in colour.

AGE OF MOULTING (*W. L.*).—Hens do not moult till the end of summer or beginning of autumn. That is the natural time after they have done laying and sitting. The old worn-out plumage of the summer, good and close enough for the hot and dry weather, would prove but a sorry protection against sleet, snow, and frost in the winter. Chickens, being chickens, do not moult, but their feathers change. We believe each new feather is a sort of Phœnix, and rises from the annihilation of its predecessor. One exception may be made, young cocks may be seen with their necks covered with huge stubs, as though they were moulting, but it is not so; it is to them like the visible whisker on the adolescent's face, taking the place of the scarcely perceptible down. You may set the eggs at once.

REMOVING TAR FROM FOWLS' FEATHERS (*J. L.*).—We believe chloroform will remove it, also naptha. We are not sure, as we have never tried it for the purpose. The presence of a little tar on the plumage is not a very serious objection, as it cannot for a moment be supposed it was put on purposely.

POULTRY HOUSE PERCHES (*C. T. S.*).—Pheasants never roost at the end of a branch. Almost all birds choose a large perch, and we are strongly in favour of it. We take a fir tree about 8 or 9 inches in diameter, and saw it in half. It is then placed on uprights 24 inches from the ground, with the bark on and round side uppermost. We have always thought crooked breasts indicated either weakness of constitution, or undue growth from stimulating or excessive feeding, or woful mistakes in perching, perhaps the combination of all these may succeed in producing the crooked breast. Perching is the natural rest. If the resting place be wide, but slightly rounded, there will be no Duck-heel. On such a perch as we have described little clasping is necessary. The bird well and naturally balanced rests on it; but if it be sufficiently narrow to make clasping necessary, the bird remains there by effort, and that is not rest. Young cocks, especially, are apt to be lanky; they become long on the leg, "for ever and anon," when on "their daily avocations," they leave off walking to sit down; they are neither tired nor lazy, but they are weak. Such birds on an improper perch clasp it to the extent of their power; but narrow and painfully round, there is not support until they get their breasts to rest upon it. That which will be bone is then only cartilage, and it takes the impression of the so-called perch. Procrustes was curious in roosts, and might have copied many we have seen advantageously for his system of suiting no one.

HEN WITH A BROKEN TOE (*M. R. F.*).—Bind it up in a large quill, or in any sort of splint you may prefer. It would, doubtless, heal if left alone, but it always remains enlarged, and is often very unsightly.

EXHIBITING CHICKENS (*H.*).—The last days of August are not very early for a chicken show. It allows you to show birds that are eight months old, and they are getting on towards maturity. In judging chickens early in the autumn, if age be considered, it is with a view to distinguish the earliest hatched, because early hatching is a great merit. Sufficient attention is not paid to that point. Apart from showing, the most remunerative breeding is that which is earliest. We think you may safely show your birds with every prospect of success. They are very good, and so far as weight is concerned, are above the average. The heavier but younger cocks are so weak and lanky, that they show to great disadvantage.

POLAND AND HAMBURGH HENS SITTING (*J. R. Y.*).—We can say to you, as to our former correspondent, We are much obliged by your communication. We shall be glad to receive all such. Polands and Hamburghs are subject to "*écarts*" in these matters. We have not before heard of Houdans having a weakness for a brood. We shall now send out our bellman, offering a reward for a sitting Spanish hen. We merely observe to those who marvel, that an exception does not prove the rule.

EGG PRODUCTION (*N. W.*).—If the eggs are only intended for the table the cock is quite unnecessary.

DISTINGUISHING THE SEX IN THE EGG (*E. E. F.*).—You must not think because we do not believe in the sexes of eggs, that we are not interested in the subject of which your letter treats. We dare not repeat the usual platitudes about "picking shells on the shore while the vast ocean," &c., or "that we know only enough to teach." &c. We believe we know a great deal about poultry, but we do not know all, and we are happy to learn. Our columns are open to such subjects; enter the lists. We will answer for fair play, and all our weapons are blunted. If at the end your cocks turn out pullets, and our pullets cocks, we will say, "Brother, brother, we are both in the wrong," and begin again.

SEBRIGHT BANTAMS (*Mrs. E. Wilkinson*).—I regret to hear of your losing so many of your Sebright chickens. One great difficulty, however, you surmount—viz., the difficulty of hatching, for few fanciers hatch many, as clear eggs are sure almost to be very numerous. There must be some cause for your great losses which you have not discovered. It is true that the season has been bad, but it is not so now. Your treatment seems good, save and except the pepper, which is wrong. My plan is this—the first few days chopped egg and bread, then bread and milk, bread just moistened with milk, and the egg also; then grits (whole grits) as soon as they can eat them, potato and gravy, and meat minced very small; grass cut with scissors into very short lengths from the first. I am careful to keep every kind of damp from them. When the chickens grow older I give them ground Indian corn and pollard, half-and-half, mixed thick with water or milk, varying it with oatmeal and pollard. Variety of food is, I am sure, good—no two meals alike. Ants' eggs are relished, and good; indeed, I fancy animal food is particularly beneficial to Bantams. Try to find out the cause of your deaths. I incline to think the birds must pick up something injurious. The chickens which have full range of the garden are remarkably healthy. Do not give up the beautiful Sebrights, but persevere.—WILTSHIRE RECTOR.

CURE OF LICE IN PIGEONS (*C. P. Davies*).—Cleanliness is the great preventive. As to getting rid of the lice, you may adopt various plans. Dust sulphur into or rather under the feathers, or Persian insect powder. Paraffin poured on the perches has also been recommended. A practical fancier once in these pages recommended the following method of treatment:—Take a small pot of sheep ointment, place it in a basin of warm water to melt it; then take a small piece of stick, cutting one end flat, dip it into the ointment, and put a small quantity just above and below the vent, under each wing, and under the throat or neck of the bird. One anointing of this kind would be sufficient. The ointment is mercurial, therefore but little should be used.

VARIOUS (*M. R. F.*).—If your Pigeons have had a wire cage in front of their new home in which to sit and see the country around, they will now probably keep where they are. It would, however, do no harm to confine them a fortnight longer. A loft is all the better for being light and airy. Blue Dragoons may have either the white or blue rump. It constantly happens among common Pigeons that a pair out of the same nest mate together and breed. So doing, however, fancy birds would deteriorate if done too often. Give your Pigeons old tares, small beans, peas, Indian corn, barley, either mixed, or change from one sort of food to another frequently.

MARKET FOR SURPLUS HONEYCOMB (*J. D. K.*).—We do not think you will meet with any house in London who will give you the price for honeycomb that you mention. Write to Messrs. Neighbour, 149, Regent Street, London.

A MAIDEN SWARM (*Darby*).—You did perfectly right in returning the swarm. The queen sent is apparently an old one, if we may judge from the ragged wings and its somewhat stunted size. The smaller bee is an ordinary worker.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

26th.—Fine, but very windy; two or three showers; a very fine sunset, but very cold.

27th.—Very fine all day.

28th.—Rain in early morning; fine shower between 10 and 11 A.M.; fine day, but very heavy shower between 8 and 9 P.M.; fine night.

29th.—Fine but windy; heavy rain at 4.20 P.M, fine after.

30th.—Rainy morning, at 6 P.M., and again at 10 P.M., fine after.

31st.—Fine all day, hot sunshine, but with nice breeze.

1st.—Beautiful day.

The total rainfall during July was 4.125 inches, and it fell on eighteen days, being in both cases above the July average. The total fall since January 1st is, however, only 15.823, being but slightly above the average, the early months being mostly dry, very little more rain having fallen in the first five months than fell in June and July.—G. J. SYMONS.

COVENT GARDEN MARKET.—AUGUST 2.

THERE is very little alteration to note here. Business remains much as usual: a slight diminution in the supply of Currants, Raspberries, and Gooseberries, but no alteration in price worth notice. Potato trade dull with a very heavy supply; prices range from 30s. to £5 per ton.

From observations taken near London during forty-three years, the average day temperature of the week is 74.2°, and its night temperature 50.8°. The greatest heat was 93°, on the 10th, 1844; and the lowest cold 33°, on the 11th, 1864. The greatest fall of rain was 1.14 inch.

PINE APPLE CULTURE AND JUDGING.

OCCASIONALLY one sees Pine Apples exhibited at the meetings of the Royal Horticultural Society, accompanied with the statement that they have been produced within twelve months from the time of potting the sucker. Mr. Perkins, of Stanmore, had two very handsome Queens recently produced in that way. Of course most experienced Pine-growers are aware that much depends upon the size of the suckers when they are taken from the parent plant. I have seen suckers from Pine plants nearly as large as the plants from which they were taken, and under generous and careful treatment these would most likely produce fruit in a twelvemonth, or less. A Pine plant will succeed well in an excessively high temperature combined with a moist atmosphere, it will sooner arrive at maturity; but it is very questionable if fruit ripened under such circumstances will be of good flavour. Some of our most successful Pine-growers maintain a very high temperature in their houses. My own treatment is opposed to a very high temperature, and as the Pine worthily holds the highest position amongst exotic fruit, a friendly discussion on the best means of attaining the greatest measure of success in its culture would be both useful and instructive.

Pines are not grown at this place to a large extent, and where the means are limited it is better to aim at obtaining a succession of fruit by starting a few plants at a time than it is to start a houseful, and have a superabundance of fruit for a month or two, and afterwards none for a long period. The fruit is most valued here at Christmas, and from our small stock of fruiting plants I always manage to obtain a few fruit at that time. I cut last winter about a dozen Smooth-leaved Cayenne and Charlotte Rothschild. As regards flavour, the merits of the two varieties were about equal, but having grown both sorts together during the last six years, upon the whole I prefer the Smooth-leaved Cayenne. The Black Jamaica is superior to either in flavour for winter, but the fruit is generally small, and not freely produced. I have cut this variety over at the level of the pot to induce it to throw up, and have found it start into growth again, and not throw up its fruit for twelve months. There are two varieties of this, as well as of the Smooth-leaved Cayenne, and there is also some confusion with Charlotte Rothschild. The true variety of this has broad leaves of a healthy dark-green colour; the other has much narrower leaves, and fruit of very inferior quality and size. The true Smooth-leaved Cayenne has likewise much broader leaves than the other. Of the Jamaica, the best variety has also broad leaves of a reddish colour, and the fruit has large pips, and is likewise redder. The Montserrat is often grown under the name of Jamaica. The best way to get out of the difficulty, and clear up the confusion that exists, would be for the Royal Horticultural Society to offer prizes for each sort separately, and to specially invite growers to send fruit.

I may briefly state the method of culture pursued here. Smooth-leaved Cayenne and Charlotte Rothschild do not produce suckers freely, and as they are valuable they are taken off as soon as they are strong enough, and potted. The Queens freely produce suckers, so that only the strongest of these are selected. I like them to be a foot or 18 inches long before taking them off, and I pot them at once in from 6 to 8-inch pots, according to the variety and size of the suckers. The pots should be plunged immediately in a brisk bottom heat, but no water should be given for six days afterwards, for they are liable to decay at the bottom if they are watered at once, especially in the winter. I had a very fine-flavoured Pine from Pernambuco in January, and wishing to raise some plants of it, I potted three suckers which sprang from the base of the fruit, and, by accident, they were, shortly after potting, watered with tepid rain water, and in less than ten days every one of them was in a state of putrefaction at the base, and in a day or two would have been past recovery. I cut every particle of decay clean off, repotted them in some sandy material, and placed a small portion of sharp sand round the base of each sucker. They all recovered, and have made fine plants. I formerly repotted the plants into 10 and 11-inch pots, shifting them into 13 and 15-inch pots to fruit them in, but I now give them only one shift, placing the Queens and Jamaicas in 11-inch pots, and Charlotte Rothschild and Smooth-leaved Cayenne in 13 and 15-inch pots.

The compost I use for Pines is turfy loam, to which is added a sixth part of decayed manure, and a small portion of pulverised bones and broken charcoal. In potting I ram in the compost firmly with wooden rammers, plunging the pots afterwards in a brisk bottom heat, and, as with the suckers, no water is given until six days at least after repotting Of course the ball of earth and the compost should be moderately moist at the time of potting.

This is the best time to add fresh tan to the beds, as, after the roots have reached the sides of the pots, the excessive heat that arises from a fresh tan bed, or fresh tan being added to the old, will, if the pots are plunged to the rim, sometimes burn the roots. I have found the tan in the beds almost spent, and that the temperature had declined to 80°, but by merely adding a few basketfuls of fresh tan, and turning the bed over, the bottom heat has been increased to 120°. I always take the precaution when turning over the tan to plunge the pots only to half their depth, and when the heat has declined I fill up the space to the rim of the pots with fresh tan, which will again cause a rise of temperature in the bed. It is not desirable to depend entirely on tan for bottom heat. Here the tan beds are about 7 feet wide, and 2 feet 6 inches deep, and at the bottom are placed two 3-inch pipes, and piers are built to support iron gratings, so that a chamber is formed of the depth of 10 inches, thus allowing 20 inches for tan. The desired amount of bottom heat can be obtained from the pipes alone, but I fancy a renewal of the tan is conducive to the health of the plants.

During their season of rest Pine plants should not be excited by very great heat; a temperature of from 55° to 60° is, perhaps, the best. When an under gardener I had

charge of several Pine houses, and one winter it happened that the fruiting house was required for another purpose, and the Pine plants were removed to a house where in severe weather the night temperature could not be kept much above 45°. They were as fine a lot of plants as I ever saw, and on starting them into growth about the end of January they were very unsatisfactory—few large fruit were produced, and many monstrosities.

Another matter which demands great care is watering. I seldom use manure water, and not at all after the flowering period. I have had more Pines deteriorated in quality through using manure water than from any other cause. If the plants are supplied with manure water after a certain stage of their growth the fruit will undoubtedly be black at the core, and will not keep long after it is ripe. I remember the late Dr. Lindley drawing attention in a leading article to a houseful of fine fruit being rendered worthless from the use of guano water when the fruit was swelling off; in every case the fruit was black at the core, showing that the source of decay had originated in the first place in the roots, and been transmitted from them through the stem. As to fruiting Pines in twelve months from planting the sucker, where this has been done, either the suckers have been of unusual size, or a high temperature has been maintained. The houses here, though not large, are well built, and of the most approved construction, and well provided with hot-water pipes, and I do not generally obtain Queens in less than eighteen months, Cayennes and Charlotte Rothschild in from eighteen months to two years.

I will now make a few remarks on judging Pines at exhibitions. At the leading exhibitions they should always be shown in classes; at the very least there should be a class for Queens and one for any other variety, and it would be well if there were a set of rules drawn up as a guide to exhibitors. I exhibited a very handsome Smooth leaved Cayenne some years ago at an autumn show, and the first prize was awarded to a Queen not half the weight, in much the same condition, and on drawing the attention of one of the judges to the award, he said that Queens were always preferred. At a recent fruit show in London a not-very-handsome, though tolerably good, Providence of from, I should say (the weight was not stated), between 8 and 9 lbs., was placed in a higher position than a really handsome well-ripened Queen of an ounce or two short of 6 lbs. I believe it was a wrong decision; the judges evidently were guided by size, and did not know the relative qualities of the two varieties. I hold that a Queen of 6 lbs. should be placed before a Cayenne of 8 lbs. or a Providence of 10 lbs. Of course whatever points or rules be laid down, much must be left to the judges, such as the condition of the fruit, the time of the year at which the exhibition is held, &c. A Queen Pine in winter might be expected to be dry and flavourless, when a Cayenne or Jamaica would be juicy and rich. The judges ought to be practical men who not only know the relative qualities of the same class of fruit, but also know something of the difficulties to be contended with in finishing off a house of well-coloured Grapes or in producing a well-swelled, fairly-proportioned Pine Apple.

I have made these remarks partly in the hope that some one better qualified than I am may have something to say on this subject.—J. Douglas.

THE SELECTION OF ROSES.

I have often seen inquiries in the Journal as to the selection of Roses, and in one point of view I have nothing to say against the selection given in reply to those questions. How could I when they have been in so many instances given by Mr. Radclyffe? But there are other points of view in which to look at the matter of selection. I see at Rose shows people taking out their note-books and putting down the names of any sorts that strike them as fine, without having any reference whatever to habit or constitution. Now I am about to plead on a different side to that which I generally do. Some call me "a bigoted old florist," because I so rigidly maintain the necessity of rating form and substance as the very first requisites in all florists' flowers. Will it be esteemed an inconsistency on my part, or a diminution of the estimate of my bigotry, if I now advocate the retention of some Roses in our gardens which both selections in the Journal and note-books ignore? Both are founded on the one notion, to take what are called exhibition flowers and to exclude all others. But this is surely incorrect in one point of view. All are not exhibitors, and we want variety as well as real merit as a florists' flower, and yet I see by degrees flowers excluded from our gardens which ought to be retained for some quality which they possess in an eminent degree, and I come forth now as the advocate of these condemned criminals.

Eugène Appert.—Well do many of us remember the sensation produced at Hanover Square Rooms at, I believe, the second National Rose Show, when Mr. Standish brought out a box of blooms of this splendidly coloured Rose. It is very irregular in outline, very rough, but in colour unapproached, I think, by any Rose, on account of the thick velvety character of its petals. Then its foliage is in itself a picture, and makes the Rose easily distinguishable from any other in the garden.

Général Jacqueminot.—Some three years ago my friend Mr. Radclyffe gave me what he had of this brilliant Rose, describing him as a "loose fellow," and discarding him. Some of the most brilliant flowers I have had this year have been from these very plants, while I have seen it exhibited in great perfection in many stands. For some reason the year has been favourable for it, and those who have retained it have been rewarded.

Jean Cherpin.—"Oh! a great deal too thin—not enough stuff in it." Quite true; but where have you such a colour? It is the nearest approach that we have to the old Tuscan Rose—that deep claret colour which we all admire. It is true that it soon fades, but when in bud and just expanding it is exquisite.

Baronne Prevost.—"A platter," "Flat as a saucer," &c. Yes, but with all that a fine old Rose. In form I think Cécile de Chabrillant the model; but then the Rose may have other forms. Charles Lefebvre is very different, yet it is a fine Rose; La France different from either of them, and yet how beautiful, especially this season. So Baronne Prévost, although quite different from any of the foregoing, is a fine Rose well worth growing.

Madame Guinoisseau.—This Rose is not to be found in some catalogues that I have before me, and yet it is a fine double Rose of a bright colour, much better than many which have elbowed it out.

Souvenir de Dr. Jamin never was and never will be a show Rose; too small for that, but of an exquisite colour—crimson shaded with violet, and worthy of retention.

Duchess of Norfolk.—Rarely seen, but a fine climbing or pillar Rose, and ought to be used for that purpose.

Fisher Holmes.—Another Rose of peculiarly brilliant colour, scarlet shaded with dark velvety crimson. It is sometimes disappointing, but yet it ought to be retained for its colour alone.

Professor Koch.—A deep rich crimson. It is true we have many of the same shade, and probably better Roses, but it is a vigorous and free-blooming variety, and I should be sorry to discard it.

President Willermoz.—A very vigorous free-growing Rose, with flowers of a most lovely shade of pink. I have seen it in some winning stands this year; but wherever I have been in gardens it seems almost unknown. It is not of more than three or four years' standing, and although not quite so full as one could wish, it is still a very striking garden Rose.

La Lisette de Beranger.—A Rose of 1868, I believe; exceedingly pretty and free, especially in the autumn. It is of a very delicate flesh colour, and later in the year the edges of the petals are margined with deep pink.

Prince Léon.—A very old Rose, somewhat delicate in habit, but when caught rightly a most beautifully shaped flower. Mr. Rivers, no mean judge, calls it one of the most beautiful of Roses.

Comte de Nanteuil.—How rarely now does one see this in exhibition stands, and yet it deserves a place in every garden, being a cupped, deep rose-coloured flower.

Monsieur de Montigny.—One of the largest Roses grown, and a very fine garden flower.

Such are some of the Roses for which I claim a place. There may be others, but these occur to me, and I hope if Rose lovers think of any others they will add them to this list. —D., *Deal.*

THE MORELLO CHERRY.

In an amateur's garden a few days ago I saw a Morello Cherry tree growing as if it were comparatively wild, against a piece of wall having a western aspect. The tree just looked as if it had not been touched in the way of pruning or training for at least the last two years, yet its branches were loaded with the finest fruit, and came out from the wall in the

manner described. Such an instance as this may serve to show that where well-trained trees are not required—though I should certainly not recommend this plan in every case—it is much better, so far as quantity of fruit is concerned, to let the trees have their natural freedom. Too much restricting of wall trees in some instances is apt to weaken their constitution, and it makes them much more liable to be attacked by different kinds of vermin which would not otherwise molest them.—ROBERT MACKELLAR.

A BIT OF SOUTH DEVON.—No. 3.

THE monks of the olden time were as wise—some people think they were wiser—in the care of their bodies as of their souls, and the monks of Tor were not less wise than their brethren. They built their abbey on the sheltered shore of a bay, where a greater variety and abundance of fish are caught than in any other spot of England's sea-boundary. I was at Brixham recently, not far from Tor Abbey, and saw such heaps of whitings, soles, and red mullets as I never before looked upon. Then these monks of Tor selected for their herb garden one of the best-soiled, best-watered, and best-sheltered plots; it is in a valley, with a stream of water sparkling through its whole length. Mr. Curtis, perhaps, thought they were trusty guides in such a selection; at all events he agreed with their estimate, and secured the ground for the site of his rosery. It is on the side of the road to, and close to Paignton. Who that knows anything of kitchen-gardening is ignorant of the Paignton Cabbage? He may have always seen it spelled "Penton," but Paignton is its true name, after that of the place of its origin. Who can say that it was not raised by the monks of Tor in this their garden? It has been known so long that, as lawyers say, "the memory of man runneth not to the contrary." It is just such a pot herb as monks would covet—large, firm-hearted, and strong-flavoured. It is extensively grown hereabouts, and is found to be produced finest when sea-weed is used to manure for it the soil.

This recurrence to Mr. Curtis's rosery may appropriately introduce the following additions and corrections he has sent to me:—

"A few Roses that were omitted in the list of good old varieties. *White and Cream.*—Alba Rosea, T.; Baronne de Maynard, H.P.; Niphetos, T.; and Souvenir d'Elise, T. *Blush and Flesh.*—President, T.; and Souvenir de la Malmaison, B. *Pink and Rose.*—Anna de Diesbach, H.P.; Centifolia rosea, H.P.; Colonel de Rougemont, H.P. (an improved Baronne Prevost); Elie Morel, H.P.; La France, H.P.; and Moss Laneii, S. *Carmine, Scarlet, and Light Crimson.*—Antoine Ducher, H.P.; Duchesse de Caylus, H.P.; Camille Bernardin, H.P.; Madame Caillat, H.P.; and Victor Verdier, H.P. *Crimson, Dark Crimson, and Purple.*—Duke of Wellington, H.P.; Général Jacqueminot, H.P.; Pierre Nottiog, H.P.; and Prince Camille de Rohan, H.P. *Yellow.*—Madame Falcot, T.; Solfaterre, N.; and Persian Yellow, S.

"The following were inserted by mistake, and should not be included among the best old varieties:—Clémence Raoux, Edward Morren, Charles Lee, La Brillante, and Laurent Descourt."

I have mentioned, in more than one sentence of my previous "Bits," the extreme luxuriance of the vegetation hereabouts. It is so everywhere around, but in no place more so than at Haccombe. And I must diverge here—I can't help it, for I am quite vagrant now—to observe, as I did previously at Ilfracombe, what a multitude of places combe-named there are in Devon. Fifteen are within a circuit of five miles round here; and well there may be, for "combe," being interpreted, is "a wooded valley," and most truly are they such to which the name is applied, and none more so than those of Haccombe Park. It is the most beautiful of the small parks that I have ever seen. It is a cluster of small well-wooded combes, the trees all noble, especially the Beeches. It is and has been the seat of the Carews for five centuries, one of the three old British families commemorated in the Devon historic lines intended for rhyme—

> "Crocker, Crnwys, and Coplestone,
> When the Conqueror came were found at home."

Leaving your card at the mansion you are admitted to the church adjoining. I wish your pages were archæological as well as horticultural, poultrycultural, and apicultural, for then I would pour out much of "notes of things that were" relative to the statues and brasses over the Haccombes and Carews of whom all that is mortal rests there. I will drag in, however, a note on the horseshoe and three-fourths of a horseshoe nailed to the church door. Tradition says that a wild Carew wagered Haccombe against another manor that he would ride on his horse whilst swimming to and back from some marvellous distance in the sea, won the manor, took off the horse's shoes, nailed them to the church door, and turned the horse out into the park to work no more. I don't believe it, any more than I believe that the bit of skin I once saw on Great Horkesley church door was part of that of a freebooter the people had caught and flayed. I believe that the shoes are testimonials of the superstition that witches and evil spirits could not pass where a horseshoe reversed, as these are, was affixed. Let it not be objected that such a guardian could not be needed for a church, for then and here the Devonians believed that all priests had dealings with the Evil One and were conjurers. One caught boys stealing Apples near the church, and by his magic kept them powerless in the tree until the congregation saw who were the culprits. That's a little bit relative to orcharding, so let me slide in another little bit relative to the Devonian superstitions, and you may be lenient because it gets within the confines of another of your departments. Fairy rings prevail in some of the very many pastures here, and I am assured that on moonlit nights a black hen and chickens may be seen within some of these magic circles; but my informant, not being learned in poultry classification, could not say whether they are Black Spanish! Let me add as I have mentioned the Fairy ring (though you and I know that Mushrooms not fairies make it), that the Devonian Fairy, or Pixy, is less modest than in other counties, for a local rhyme describes him—

> "Little Pixy, fair and slim,
> Without a rag to cover him."

There, now, I will for the remainder of this "Bit" be entirely horticultural, confining my notes to that which we all have on our hearts, the encouragement of cottage gardening.

During the past fortnight within two or three miles of Torquay have been held four horticultural and cottage gardeners' shows, and the reports I have from each is that it exceeded all previously held. This growing fondness for gardening among all classes is to be rejoiced over. "Our Journal" has aided much in this progress back to "the pursuit in Paradise." I could cover pages on the topic; but "WILTSHIRE RECTOR" and Mr. R. Fish, to which I will add an extract from an address delivered by a Devon rector, render any addition from my willing pen needless.

The four cottage gardeners' shows to which I have referred are St. Mary Church, Upton, Torre, and Paignton. Let me observe, to commend, that they offer prizes to be competed for by children. Bend the first shoot in the direction you would have the plant grow.

The following is an extract from the very excellent address of the President of the Paignton Society, the Rev. Prebend Hall, at the time he delivered the prizes:—

"The Society was not established so much to give prizes, as with the view of giving employment at vacant periods, and in that way aiding the industry of the competitors and their own respectability. One thing for which the exhibition has been distinguished is the distribution of prizes for the good culture of flowers, vegetables and fruits; and he hoped, in the observations he should make, that the one word which ran through his mind would run through theirs also, and that word is 'cultivate.' The love of flowers is inherent in the human heart. The child that could just walk, and the old man just tottering near the grave, welcomed the flowers as friends and as treasures which the spring and summer brought. Besides, too, he knew that many a man, the son of a labourer, who lived perhaps in this or other counties, when he went to the great towns, London, Birmingham, Manchester, or Leeds, very often carried with him a little flower pot, the plant in which he treasured, and which reminded him of his former home. In fact what is called 'window gardening' is carried on most successfully, and to a very great extent, in some parts of London, especially in Westminster, and among the Spitalfields weavers. If we have a few friends come to dinner, what do we do? We ornament the tables with flowers. If we have friends in our house we send to their rooms a bunch of flowers; or if, as it sometimes happens, a singer or an actress departs from the stage, they are, as one was recently, overwhelmed with bouquets of flowers. On the great festivals of the Church, also, we are glad to adorn our churches with flowers and fruit, and place the choicest on the Lord's table. In our marriages we place a coronet on the brow of the bride; and we weave a chaplet to the memory of some beloved one departed, and drop it on the grave with tender feeling and affectionate remembrance. This country is now celebrated for the production of flowers. It is but little more than 400 years ago that there were scarcely any flowers in England. A celebrated botanist (Linnæus) came from Sweden, and on passing through the wolds of Yorkshire, and seeing the country covered with golden Furze, was so delighted that he fell down on his knees and thanked the God of Nature for ornamenting the landscape so beautifully. Now, however, by means of cultivation and searching in different climes, we have added to our flowers a stock which makes England the country where there is the greatest exhibition of floriculture. Of

flowers. and 'flowers of the field,' we are reminded in many ways. Thus in Scripture we are told that 'we all do fade as a leaf,' and that 'we are like the grass of the field;' and our blessed Lord, when He delivered His sermon on the slope of the mountain, looking on the choicest of flowers growing on the plain beneath, said, 'Consider the Lilies of the field, how they grow, they toil not, neither do they spin; and yet I say unto you that even Solomon in all his glory was not arrayed like one of these.' Lilies, such as were thus described, are, however, not there to be found; but what the Saviour no doubt alluded to was the Anemone, which is a great ornament to that part of the world. The Rose, a plant now cultivated largely by us, was formerly scarcely known in England, and was imported into this country in the first instance from Provence. The Rose does not grow in the Holy Land; what is mentioned in Scripture as that flower is either what is now known as the Rhododendron, or more likely the Oleander. That mentioned as the 'Rose of Sharon' is a Cistus; and the 'Apples of Sodom' are more like Potatoes. There is a plant more recently introduced into this country and grows very well, the Benthamia. In the summer its leaf is a lightish green, but as the winter approaches it becomes leathery. The leaves did not fall off, but on watching it a little tinge of green would be seen on the stalk, and this would pass through the whole of the leaf, until at last it became as green as it was the year before. It might be a conceit of his, but he had thought, as we might take sermons from stones, why not take sermons from plants like this, which appeared to him to have something of a symbol of the resurrection?"

Shall I go on? No, but "I have not yet done with Torquay."—G.

THE ARRANGEMENT OF CUT FLOWERS.

In some minds the conception of the right method of arranging cut flowers, particularly as exemplified at horticultural exhibitions, is extraordinary, and certainly very surprising after the frequent opportunities afforded to the public by such exhibitions to examine and compare the sprightly elegance of a tasteful well-arranged bouquet with the heaviness and glare of the majority of its opponents.

Visiting an exhibition of a provincial horticultural society lately, I was forcibly reminded of this weak point in modern horticulturists by a particularly glaring example of bad taste—a centre stand for a dinner-table. The maker had evidently some inkling of the right principles of floral decoration, but it was only an inkling—no more, for it was equally evident that he had not mastered even the first principles of the art he essayed to practise.

It may be well to describe this flower-stand. It consisted of three circular pans or saucers, attached at equal distances, one above the other, to a centre stem of about 20 inches high; the saucers were almost flat, and well graduated in size, the bottom one measuring about 12 inches across, the middle one 9, and the top 6. So far all was as it should be, and one would ask for no better utensil for the purpose; but each saucer was packed with as many Roses as could be well crammed together, while from the edges projected a bold fringe of Maiden-hair Fern. It will, therefore, be understood that every requisite for the production of a chaste and elegant effect was present; but owing to the miserably faulty arrangement of the flowers, an unsightly effect, the reverse of what it should have been, was the result.

At no time would one ask for better materials for the decoration of a dinner-table stand than a well-assorted selection of partly-expanded Roses, with a fair proportion of buds and clean, healthy foliage. These should be so arranged that each flower may have ample space to show the full beauty of its combined charms of form and colour, both in foliage and blossom, and thus, while attracting attention as objects of rare beauty individually, the whole of the flowers used would contribute to the general effect in the best possible manner. A few Fern fronds may always be introduced with safety, and frequently with advantage. In the example I have quoted, if fewer flowers had been used and a little of the Maiden-hair Fern mingled with them, the flat heavy effect might have been altogether avoided. The crowding together of a quantity of cut flowers in a confused mass is opposed to good taste and offensive to the eye, which, instead of being attracted and interested, soon tires of the glare and confusion, and turns to objects of quiet grace and chaste simplicity for that enjoyment which it sought for and would have found in a well-made bouquet.

By way of application I will offer one or two simple rules for the arrangement of cut flowers.

1. In selecting the flowers, let the colours be few, distinct, and such as will harmonise with each other.

2. Do not crowd the flowers; let each have space enough to be fully seen. In doing this avoid extremes; looseness is just as objectionable as over-crowding. Our aim should be to produce a compact, graceful bouquet without stiffness or formality.

3. Use enough greenery among and in contact with the flowers to divide bright colours, and to impart the requisite air of quietness and repose. Everything in Nature is well-balanced; each cluster of bright flowers has its foil of green foliage, contributing much to its beauty.

4. In arranging the flowers there should be a leaning to massing those of the same kind in moderate quantities, rather than towards indulging in too much sub-division. This refers more particularly to the smaller kinds of flowers.

Lastly, in order to be really successful in this work, I would say to all learners, Use your eyes, and miss no opportunity of gaining instruction. Many of us have a feeling that we could do great things in the world if we had the chance; let us be sure, then, that no effort is wanting on our part to make the most of everything likely to improve our minds and add to our knowledge and skill. I am quite sure if this were so we should not see such repeated examples of unskilful practice, even in the arrangement of a few cut flowers.—Edward Luckhurst.

A PEACH-TREE BORDER.

"An old story retold." The excellent article of "J. Mc.D." in No. 540, page 85, has reminded me forcibly of the following article, written by Mr. Rivers in his "Miniature Fruit Garden," page 102, sixteenth edition, many years since. It seems so apposite and so in accordance with what should be in practice, that, with permission, I send it to you for insertion if you think it "a word in season" and worthy of a place.—Constant Reader.

"In our southern counties, where light sandy soils abound, the difficulty of making Peach and Nectarine trees trained to walls to flourish is well known; in spring they are liable to the curl and the attacks of aphides, in summer they are infested with the red spider, so that the trees are weakened, and rarely give good fruit; they seem, indeed, to detest light soils. The following method of preparing borders for them in such soils may be well known, but I have not seen it described by any gardening author.

"The idea has come to me from observing Peach trees trained to walls refuse to do well in the light sandy soil forming a part of my nursery, except near paths, and to grow and do well for years in the stiff tenacious loam forming another part. My bearing trees in pots, for which I use tenacious loam and dung, rammed down with a wooden pestle, also bear and flourish almost beyond belief, and so I am induced to recommend that in light soils the Peach-tree border should be made as follows:—

"To a wall of moderate height, say 9 or 10 feet, a border 6 feet wide, and to a wall 12 feet high, one 8 feet wide, should be marked out. If the soil be poor and exhausted by cropping, or if it be an old garden, a dressing of rotten dung and tenacious loam or clay, equal parts, 5 inches in thickness, should be spread over the surface of the border; it should then be stirred to 2 feet in depth, and the loam and dung well mixed with the soil. The trees may be planted during the winter, and in March, in dry weather, the border, all over its surface, should be thoroughly rammed down with a wooden rammer, so as to make it like a well-trodden path; some light half-rotten manure, say from 1 to 2 inches in depth, may then be spread over it, and the operation is complete. This border must never be stirred, except with the hoe, to destroy weeds, and of course never cropped. Every succeeding spring, in dry weather, the ramming and dressing must be repeated, as the soil is always much loosened by frost. If this method be followed Peaches and Nectarines may be made to flourish in our dry southern counties, where they have hitherto brought nothing but disappointment.

"The two grand essentials for Peach culture are stiff loam, or a very firm soil, and a sunny climate."

TACSONIA VAN-VOLXEMI.

Is the fruit of the above magnificent climber eatable? I have a plant which is producing an abundance of fruit about the size of a hen's egg and of much the same shape. The flowers are exceedingly striking and showy, on account of the brilliant crimson colour. The flower-stem, or stalk, is very slender, from 9 inches to a foot in length. This plant ought

to be trained festoon-fashion, the most graceful form for training climbers either out of doors or in the conservatory, more particularly those with pendulous flowers.—C.

[The fruit is eatable, and we have been informed by Mr. Van Volxem that he has enjoyed it when travelling under the influence of a tropical sun.—Eds.]

NATIONAL GOOSEBERRY SHOW.

This was held at the Sir John Falstaff Inn, Market Place, Manchester, on August 5th.

COVENT GARDEN MONOPOLISTS.

You will no doubt consider with us that the only fair, just, and reasonable criterion of market prices is the price at which market gardeners supply their customers; and judging by this standard, referring to our sales on account of gentlemen's gardeners, in comparison with those on account of professional growers, and with our daily purchases from the market gardeners attending this market, we can find no reason for the discontent recently expressed in your columns, leaving the enormous and increasing foreign supply out of the question altogether.—W. H. Gulliford, F.R.H.S., *Covent Garden.*

GARDENERS' RIGHT TO PLANTS.

About six years ago I bought Tricolor Geraniums Sunset, Italia Unita, and others. I asked my employer's consent to my raising seedling Geraniums, saying I should do so chiefly in my own time. I also added that I should be able to exchange and procure the new varieties as they came out. My employer's answer was, "I do not see why you should not, and I daresay you will get a trifle by doing so." Two years ago last May my employer allowed me to take them to the exhibition at Kensington. All was open and fair, I thought; I disposed of the duplicate plant to a nurseryman, and received new varieties in exchange; I also received a trifle for myself. I bought my own pots, and spent the summer evenings in growing the plants. I kept duplicate plants of my seedlings for my employer, and had a fine collection of Tricolor and other Geraniums. For doing this I was told I was to leave my situation, and have done so. I have written to my employer (an old lady seventy-seven years of age) for a character, but she declines to give it. Can I compel her to do so? I have served her eight years, and never had anything against me. I also brought to her excellent references from my previous employers. I never had a blot on my character.—An Old Subscriber.

[According to your statement your case is a very hard one. It only proves what we said a short time ago, that no man is safe to enter upon such a course of bartering, exchanging, and selling without a written agreement to that effect from his employer. A person said the other day, "Why, that would be like calling a lady's or a gentleman's word in question." "Well, do they not forget as well as other people? and surely my character and respectability are as much to me as a mere word can be to any employer." We think that the whole system of a gardener paying for pots to grow favourites, and then exchanging or selling them, borders, or rather more than borders, on the dangerous, and temptations are apt to come in the way which ought rather to be kept out of the way. Appearances, too, are to be consulted; and though it might be true that after buying pots, and counting your evening hours, and exchanging, there was little benefit to yourself, there would be no want of gossiping as to the "fine thing you were making out of the plants." Without a special written agreement, then, we say decidedly to a gardener, Be content to be a servant, and cultivate what your employer purchases. We have known cases where gardeners raised some good seedlings, and for quietly disposing of them got themselves into trouble. We would advise you to write again to the lady in the most courteous way, state shortly the facts of the case, and solicit as a favour that she would not decline to give a character to you after eight years' service. Unfortunately, however well conducted you may have been, and however faithful your conduct to your employer, you have no right to demand or compel an employer to give a character. Of this we intend to say something by-and-by. On the whole the gentry use their power well; but it is a hard case for a good servant to be entirely at the mercy of a mere whim or caprice of an employer, and especially of one who rarely gives a character to anyone. We have known some hard cases among gardeners, such as where a good deserving man might have starved if some of the head gardeners in the neighbourhood had not stood his friends, stated the real facts of the case to some of the leading nurserymen, and thus enabled him to get a much better place without applying for a character to his last employer. All such things, however, should be avoided, and you had better propitiate your employer even if you should be a little humble over it. Could you not bring to your help the good testimonials from former employers?—R. F.]

GLAZING WITHOUT TOP PUTTY.

I notice by your answers to correspondents, that you are frequently asked for a cheap mode of glazing without the top putty, which so soon cracks and looks bad. If the glass is bedded in putty in the ordinary way and well sprigged, the top putty may be omitted. I think you may recommend this mode. Mr. W. Paul, of Waltham Cross, has several houses so glazed, and there is no more drip—his foreman thinks less—than in those glazed in the ordinary way, and the appearance

is neater and cleaner. A large house 116 by 30 which we are now building for him will be thus glazed. The fillet of the rafters should be painted twice after the roof is glazed, and the brush run a quarter of an inch on the glass.—W. Rivett.

MR. SHEPPARD'S NURSERY, BEDFORD.

Having an hour or more to spare before the opening of the Horticultural Show, and having previously apprised Mr. Sheppard of our intentions, we—that is, Mr. Cadger and myself—had the place all to ourselves, and had a very pleasant walk round this neatly-kept, well-arranged nursery.

Amongst the things that first struck our attention on entering were some nice beds of Alpines and Stonecrops, now, happily, coming into fashion, arranged chiefly in rows, with a good-sized plant named at the end of each row. Among the newer subjects, as Echeveria secunda glauca and metallica, Sempervivum californicum, &c., were a fine lot of Stonecrops, including Sedum variegatum roseum, a fine variegated Sempervivum, and some neat little plants of Aubrietia purpurea variegata, with small, dense, white shoots and small leaves, just the plant for those who delight in the dwarf in floral display, and admirably fitted to come in as a hardy companion to the Alternantheras in small scrolls and edgings. Of itself this is a neat compact plant a few inches in height, but in contrast with such plants as Alternantheras it would be invaluable. Were I doing small scrollwork I should multiply it by hundreds.

Here, too, if I mistake not, I found what I have not lately seen, a lot of neat little plants of the Plumbago Larpentæ, named after Lady Larpent, and introduced from China about 1845. As far as I recollect Mr. Donald Beaton helped in his enthusiasm to bring this plant into rather too prominent notice as a bedding plant, which the fugaceous character of its thin petals and the lateness of its blooming did not warrant. Still the colour is a beautiful light blue, the habit of the plant good, and on a mound or a wild rockery it looks very pretty in the autumn. I had it in such a position for many years, but in recent changes I fear it has gone along with other good old plants. Mr. Knight, the predecessor of the Messrs. Veitch at Chelsea, had the stock and brought it out, and meant to make a little fortune by it, as, so far as I recollect, the first small plants were three half-guineas each. I was never deceived myself, for on visiting the nursery at the end of July Mr. Knight turned the key of the private house where the rarest plants were kept, and said, "There, Mr. Fish, what do you think of that? A beautiful healthy young stock." And so it was, a whole houseful of Plumbago Larpentæ; but what of the bloom? for hardly a single bloom was to be seen. And I added, "If the plant do not bloom freely out of doors before this time you will get yourself into trouble after such a sounding of trumpets." Mr. Knight was himself deceived; but, as a characteristic of the man, I believe he offered to all purchasers in other plants the value paid, such as Azaleas, Camellias, bulbs, &c. As the plants were not in bloom I may even now be mistaken as to its identity, but if true it is well worthy of a place on a knoll in the rockwork or select shrubbery.

Passing groups of Cytisus, Coronilla, Crassula, &c., in their summer quarters, and a fine group of hardy Ferns in pots in a shaded corner—among which Athyrium Filix-fœmina cristatum and Lastrea Filix-mas cristata preponderated—I must notice two dwarf yellow-flowering plants, of which there were a considerable quantity in pots and beds, anything but new, as they have been in the country for the best part of a century, but both would be useful for dwarf beds, especially to those who say they are forced to give up the yellow Calceolarias and substitute in their place yellow-leaved plants, as Tricolor Geraniums—very beautiful it is true, but still to my eye not filling up the place of yellow flowers. The first of these plants is Linum flavum, rarely growing more than from 6 to 9 inches in height, and producing its bright yellow flowers in great abundance. This plant is hardy in light well-drained soils, but in damp places it is well worthy of a little protection in winter, as a dry frame or a dry place in an orchard house. It is freely propagated by seeds and cuttings. It is very suitable for a dwarf yellow bed or dwarf edgings, and in a low regular figure would come in well with the low crimson and purple Alternantheras. The second is a low but strong-growing herbaceous plant, growing from a foot to 15 inches in height, but may be kept lower by trailing and pegging down. It is the Œnothera macrocarpa, bearing in great abundance its large bright orange flowers. Hardly anything will produce such a mass of dwarf colouring, and yet this fine old plant is getting to be comparatively neglected. It is not often that the seeds ripen perfectly, owing, I presume, to our not being able to give it the bright sunlight it enjoys in North America, but the plant is easily propagated by division just as growth commences in spring; still the best mode of propagating it is to slip off the young shoots in spring when from 2 to 3 inches long, and insert them in sandy soil under a hand-glass or other covering. A good white companion with large flowers, and the plant quite as dwarf, may be obtained in Œnothera taraxacifolia (or Dandelion-leaved), the foliage being cut and lobed.

There was one thing in which I was disappointed, and I deserved to be so, as I might have known I could not at this season of the year see what I expected. On my visit last year the houses were crammed with small bedding plants, &c. These were on shelves, tier above tier, and many on back walls, supported on moveable irons merely set in sockets, all the shelves and irons being removed when not wanted, so as to afford room to taller plants in summer. I thought I could do much in the way of makeshifts and cramming, but I felt I was far behind Mr. Sheppard, and wanted to see more of it, but, of course, these shelves were all gone, to come back again in winter.

Notwithstanding the large bed at the Show previously referred to, there were still a good many bedding plants to come and go upon, and there were planted out groups of the best Tricolor Geraniums and the best scarlets, including Vesuvius, a bright scarlet, which I will increase, and a good quantity of a dwarf, full-petalled, zonal-leaved, dark scarlet, called Glow. I have measured some of ours in a small bed, and find that from the surface of the bed to the top of the flowers is just 8 inches. I can safely recommend this beautiful variety for small beds or low edgings.

Amongst the combinations of grouping flowering plants—a very good thing close to a house, as affording hints to the possessors of the smallest gardens as to the most effective modes of arranging them—I was most pleased with a long parallelogram bed, as far as I recollect about 25 feet in length and 5 or 6 feet in width. This bed was formed into a sort of chain in the centre, the links formed of Perilla, and the longer pieces of three ovals. It was filled with Tricolor Geraniums; Louisa Smith at one end, Sunset at the other, and Italia Unita in the centre. All round the Perilla, kept dwarf, and the Tricolors, was a row of Golden Pyrethrum. The intermediate spaces were closely filled with Lobelia Erinus compacta and Alternantheras alternately, whilst the edging all round was planted thickly with Echeveria glauca. There was just one departure from strict symmetry, and this was at one corner; instead of the Lobelia there was the Leptosiphon roseus, a pretty little annual for miniature flower beds. Such an arrangement was more artistic and telling than planting in mere mixture or in lines, and could be diversified at will by circles, triangles, &c.

In walking round I noticed fine flowering plants of the feathery Sumach (Rhus Cotinus), Spiræa ariæfolia, the old Spiræa frutex with its upright mass of flowers, good quarters of fine young plants of Wellingtonia gigantea, Cupressus, &c.; but I must be content, in addition to neatness, with noticing two or three of the specialities of the nursery. By the sides of the principal walks there are stiff specimens of the best Cypresses, Pinuses, and evergreens, with room enough for every plant to grow freely without encroaching on its neighbour, and looking as if they were often lifted and replanted. The same rule seemed to be likewise carried out, not only as respects fruiting trees, &c., but to be extended to the commoner forest trees, even Spruce trees in general having room to develope themselves without crowding. Of course such plants could not be sold at the same money as those the same in height but drawn up thickly in lines. For all particular, and even general purposes, the plants that had room in the nursery, if fairly taken up, would prove to be the cheapest bargain in the end—a simple fact that many planters are slow to learn. Lastly, every piece of ground unoccupied by nursery stock was carefully filled with the best kinds of roots, vegetables, and fruits. No doubt these would help to supply the many orders received for such things at the elegant shop in the High Street. I can easily imagine that the changing of the crops from nursery stock into that which is eatable would greatly tend to keep the ground in good heart, and be especially suitable when the nursery was close to a town. We would no doubt have seen more if Mr. Sheppard had been with us, but my friend and myself found in his absence there was much to learn.—R. Fish.

Thomson on the Vine.—We are glad to see another and a seventh edition of this popular "Treatise on the Vine" of

which we have already had several notices in our pages. We have only to remark that this new edition has an additional chapter treating on the preparation of young Vines for planting, and that we hope it will meet with the same hearty reception which the former editions have enjoyed.

CRYSTAL PALACE SUPPLEMENTARY ROSE SHOW.—August 5th.

I have never been more impressed with the extent and successful culture of the Rose than by the Exhibition held on Saturday. We have had a most unfavourable season, we are in August, and yet I have never seen a more excellent lot of Roses than at this supplementary Show; never had a more difficult task in judging from the very excellence of the blooms, and never, I think, saw so few indifferent blooms. Let one proof of this suffice. In the large class for sixty blooms there were respectively the following indifferent blooms (not positively bad, but indifferent):—2, 5, 4, 7, 7, and this in August; while there were some magnificent examples of our finest and best Roses. It was the same, too, with amateurs. Probably the trusses exhibited by Mr. Baker, of Heavitree, last show were better than any on Saturday, but, as a whole, I never saw a more even lot of Roses; and although I have found fault with the term Hybrid Perpetual, has not the fact of a show being held at this time somewhat redeemed the title? Nor were the exhibits confined to one part of England—Cranston for Herefordshire, Paul & Son for Hertfordshire, Turner for Buckinghamshire, Keynes for Wilts, Harrison for Yorkshire, Cant for Essex, were all there, showing that the whole country could and did supply its quota.

There is yet one other fact about this Show which I must notice before I pass on to the table decorations, and that is the arrangement, a matter for which I was to some extent responsible, as I suggested it to Mr. Wilkinson. The boxes were arranged on double tables, and the space between them filled up with foliage plants, and most creditable was it to Mr. Williams, the in-door garden superintendent, that he was able to supply so large an amount of good plants for the purpose. It met with universal approbation, and will, I hope, be continued, although it entails much trouble.

And now as to the Table Decorations, a most ticklish matter to write upon, as anyone might have known who heard the various comments passed. The fact is, people have different standards to judge by. One person thinks that the amount of work ought to be the criterion of excellence, another simplicity, another the beauty of the flowers, without reference to arrangement; and so each person forms a standard of his own. Now, my judgment is that in nearly every instance the thing was overdone. I believe that it is because it has been overdone that so complete a revulsion has taken place in the best circles, and that a few simply arranged flowers or dwarf plants are now the only things permitted. It has, in fact, become a bore. Take nine-tenths of those exhibited on Saturday: they could not have been arranged under three or four hours by two, three, or even more persons, and who is going to spare their own time or their gardener's for this? The most simple and, I think, most effective vase for a drawing-room was one containing a couple of blooms of the white Water Lily and a few Fern fronds, and this deservedly had the first prize. Evidently simplicity ruled in this case. One table was arranged with plants inserted in the table, as recommended by "W. T." in the *Gardeners' Chronicle*, but in this case the plants were Stocks, utterly unfitted for the purpose, even if the plan be a good one, which for private use I do not think it is. It does very well for a large public institution, where trouble is not much thought of, and where it is of no great consequence to see your *vis-à-vis*. On many tables the March stands were made use of, while one had very tall stands with pendent glasses—very pretty, but not suitable for a private room. There were none that exhibited overcrowding in so monstrous a form as last year, and I believe the taste will become more refined, and hence all these competitions will do good. It is, I think, useless to attempt to describe table decorations—they must be seen, for even drawings give but a poor idea of them.

I cannot conclude this brief notice without bearing my testimony to the admirable manner in which Mr. Newman carried out the arrangements. He has, since Mr. Wilkinson has become Manager, taken his place, and I do not think that it is possible for a better selection to have been made.—D., *Deal*.

Our correspondent, "D., *Deal*," has so happily described the leading features of this Show, that he has left us only the mere matters of detail. The great improvement effected by Mr. Wilkinson by the introduction of plants of various heights, sizes, and characters along the centres of the naves, thus taking away the flat appearance which long lines of cut blooms present; the excellence of the Roses; the defects of the table decorations—all these have been so truthfully recorded, that we have nothing left to say respecting generalities.

In the nurserymen's class for sixty single trusses, Messrs. Paul and Son took the lead with stands in which there were but few trusses which could be found fault with, and many extremely fine. Among the latter we noted Xavier Olibo, François Treyve, Comtesse d'Oxford, Alfred Colomb, John Hopper, Elie Morel, Mdlle. Annie Wood, Maréchal Vaillant, Victor Verdier, Madame Laurent, Emilie Hausburg, finely imbricated; Camille Bernardin, and Leopold I. Mr. Cant, Colchester, took the second prize with fine examples of Paul Neron, Sophie Coquerelle, Alfred Colomb, Emilie Hausburg, Sénateur Vaisse, Ferdinand de Lesseps, Charles Lefebvre, Pierre Notting, Camille Bernardin, and Baroness Rothschild, with Souvenir de Conlommier, splendid in colour. Mr. Cranston, of Hereford, and Mr. Keynes, of Salisbury, were equal third, having fine examples of Souvenir de Malmaison, Madame Jacquier, Rushton Radclyffe, Marie Baumann, Louis Van Houtte, Duc de Rohau, and kinds already named. Mr. J. Durbin, Bath, and Mr. Harrison, Darlington, also exhibited in this class.

For three trusses of forty-eight varieties, Messrs. Paul & Son were again first, Mr. Keynes being second, and Mr. Cranston third. In this class there were splendid trusses of Camille Bernardin, Leopold I., Madame Moreau, Ferdinand de Lesseps, La France, Emilie Hausburg, Baroness Rothschild, Paul Neron, John Hopper, Marquise de Castellane, Victor Verdier, Abel Grand, Duchesse d'Orléans, Louis Van Houtte, Dupuy-Jamin, Reine de Midi, and Madame Charles Wood.

For twenty-four triples the awards went to Messrs. Keynes, Paul and Son, Cant, and Cranston in the order named, the varieties already noted being the most conspicuous. Reine Blanche, white, was noticeable in Mr. Keynes's stand. Mr. Durbin and Mr. Harrison likewise exhibited in this class.

Excellent stands of twenty-four single trusses from Messrs. Perkins and Son, of Coventry, Mr. Turner, of Slough, and Mr. Walker, of Thame, were respectively first, second, and third; and Mr. Jennings, Shipston-on-Stour, was fourth. Besides the varieties already named as fine, the most noteworthy were Madame Treyve, Madame C. Joigneaux, Duke of Edinburgh, Madame Victor Verdier, Edouard Morren, Baron Haussman, Madame Alice Dureau, Charles Rouillard, Marguerite de St. Amand, Abbé Girandier, and Jules Chrétien. Messrs. Coppin, Mann, Parker, of Rugby, Pilcher, of Horsham, and Woollett, of Caterham, also exhibited in this class.

In the amateurs' classes, Mr. Draycott, gardener to T. T. Paget, Esq., Humberstone Hall, and Mr. C. J. Perry, Castle Bromwich, were respectively first and second for forty-eight and thirty-six single trusses; Mr. Moore, gardener to T. Lloyd, Esq., Warwick, and Mr. Draycott being first and second for twenty-four. The other awards in these three classes went to Mr. Davis, Mr. Ingle, Mr. Farren, and Mr. Watson. The varieties most noticeable were the same as in the nurserymen's classes, and though excellent trusses were set up, they were not, on the whole, so good. For twelves, the two principal prizes went to Mr. May and Mr. Bridge, both of Stilsted, Braintree.

Yellow Roses were shewn in large numbers, but not in such perfection as in former years. They were of the usual kinds. The prize-takers were Messrs. Paul & Son, Keynes, and Cranston. For Tea-scented, Messrs. Cant, Keynes, and Paul & Son were the successful exhibitors in the nurserymen's class. Mr. Keynes had, among others, nice specimens of the new kinds—Madame Thérèse Levet, Madame Trifle, and Catherine Mermet; the first two seedlings from Gloire de Dijon, and greatly partaking of it in character. Mr. Stoddart, Mr. Bridge, and Mr. Chard were the amateur prizetakers.

Foremost among miscellaneous subjects, and a beautiful exhibition in themselves, were two groups of Phloxes exhibited by Messrs. Downie, Laird, & Laing, of Stanstead Park Nurseries, Forest Hill, and the Phloxes were bordered with, in their way, not less beautiful Bronze-zoned Pelargoniums. One of the best of the new Phloxes in these groups was Brian Wynne, dark purplish-crimson, fine in truss, and good in habit. Philippa Penglase is a fitting lighter-coloured companion to the preceding, with a very fine truss of deep rose, carmine-centred flowers. Other noticeable new varieties are A. F. Barron, rosy-lilac, with a crimson eye, extra fine in spike and habit; Shirley Hibberd, rosy carmine shaded with orange, dark centre; Mrs. Laing, soft rosy lilac, reflexed, about 2 feet in height, one of the best for pot culture; and Monsieur Caillard, rich orange salmon, very free-flowering and fine. Of older varieties we noted Monsieur W. Bull, very fine lilac with a white centre, very compact; M. Malet, lilac, white centre; Mr. Balfour, rosy crimson; Madame Domage, pale blush, rosy purple eye; Monsieur Maurin Saison, salmon red, with a metallic violet tinge, very fine and free-flowering; and Liervallii, one of the finest of the striped kinds. All these belong to the late-flowering section. An extra prize was given for these groups, and a similar award was made to Mr. Bristowe, gardener to R. P. Harding, Esq., Dulwich, for well-bloomed specimen Fuchsias; to the Rev. H. H. Dombrain, Westwell Vicarage, for excellent cut spikes of Gladiolus; and to Mr. Hooper, Bath, for a collection of Pinks, Carnations, &c. Mr. Mann, Brentwood, sent a collection of Zonal Pelargoniums; Mr. Donovan, gardener to R. Hibberd, Esq., Upper Norwood, some good Noblesse Peaches; and Mr. Perry, Castle Bromwich, had a fine stand of Verbenas, of which Emma Weaver, blush, with a large centre, had a first-class certificate. A similar award was made to Messrs. Downie & Co. for Maréchal MacMahon, a fine bronze-leaved Pelargonium, exhibited last week at Kensington. Mr. Young, Milford Nurseries, Godalming, again exhibited his golden Chinese Juniper, and received a first-class certificate. A remarkably fine stand of Alfred Colomb Rose came from Mr. Cranston.

NOTES AND GLEANINGS.

The Lindley Library, which by agreement is deposited in the rooms of the Royal Horticultural Society, at South Kensing-

ton, is open for the use of the public, under the following regulations :—

1. The library is open for consultation on all week days from 10 A.M. to 4 P.M.; except on the meeting and exhibition days of the Royal Horticultural Society.

2. The Trustees reserve the right of closing the library for purposes of re-arrangement, cleaning, &c., when such may be required.

3. The Fellows and officers of the Royal Horticultural Society shall have access to the library at all times, when it is open, on application to the Assistant Secretary, Royal Horticultural Society.

4. Gardeners and others, not Fellows or officers of the Society, must make application to one or other of the Trustees, or to the Assistant Secretary of the Royal Horticultural Society, for permission to use the library, and shall sign their names and addresses in a book provided for that purpose.

5. Persons requiring the loan of books to be taken from the library must make written application to the Trustees (addressed to the Librarian for the time being, at the offices of the Royal Horticultural Society, South Kensington), who are prepared to accord this privilege on the following conditions—viz. :

(*a*) That the borrower be personally known to one or more of the Trustees or officers of the Society, or at least shall produce satisfactory references.

(*b*) That the borrower sign a receipt for the volumes, before removing them from the premises, in a book provided for that purpose; undertake to restore the books in good condition, and generally to comply with the regulations laid down by the Trustees.

(*c*) That not more than three volumes be lent to one person at the same time.

6. The Trustees will exercise their discretion as to what books shall be lent out, but as a rule unbound periodicals, expensively illustrated works, and works of common reference, such as are likely to be in frequent requisition within the library itself, must not be removed from the premises.

7. All books borrowed shall be returned to the library within one calendar month from the date of issue, but an extension of time may be granted on application to the Trustees.

8. The Assistant Secretary or Acting Librarian is empowered to demand of the borrowers such books as are detained beyond the prescribed time, and to take such steps as may be necessary to secure the prompt return of the same.

9. The loss of any book, or any injury sustained, shall be made good by the person who has lost or injured the same.

10. The Trustees reserve the right of repealing or altering these regulations from time to time as may be required.

The Acting Librarian is James Richards, Esq.

— KNIGHT'S MARKLY ADMIRABLE PEACH.—We omitted to state in our report of the last meeting of the Fruit Committee, that the excellent Peach called Knight's Markly Admirable, exhibited by Mr. Knight, nurseryman, Hailsham, received a first-class certificate.

—— MR. RUCKER'S ORCHIDS.—The following are some of the prices realised at Stevens's Rooms on the first day's sale (August 8th), of this magnificent collection :—

Aërides Lobbi, splendid specimen, £12 12*s.*; Masdevallia species, bought by Mr. Rucker for M. elephanticeps, £5 10*s.*; Cymbidium eburneum, fine plant, £8 10*s.*; Masdevallia candida, £6 10*s.*; Saccolabium guttatum, Mr. Rucker's No. 3 variety, £8; Cattleya Dominiana, fine variety, showing flower, the finest specimen in the country, £21; Epidendrum vitellinum majus, best variety, very fine plant, in flower, £16 10*s.*; Odontoglossum triumphans Marshallianum, £7; Cattleya Ruckeri, very rare, fine plant, £15 15*s.*; Vanda Denisoniana, fine plant, fourteen leaves, £5; Cattleya labiata, autumn-flowering variety, the finest specimen in the country, £36 15*s.*; Vanda Batemanii, in flower, twenty-two leaves, £5 10*s.*; Phalænopsis amabilis, fine specimen, one of the three plants originally imported by Messrs. Rollisson, £8 10*s.*; Phalænopsis Schilleriana, £6 10*s.* and £4; Cattleya Devoniana, £15; Colax jugosus, very rare, £8 10*s.*; Aërides quinquevulnerum, fine plant, in bloom, twenty leaves, £7; Angræcum sesquipedale superbum, a fine specimen, £15 15*s.*; Oncidium Barkeri, £7; Cattleya Mossiæ superba, splendid specimen, £9; Dendrobium Wardii, fine plant, rare, £15; Cypripedium lævigatum, fine plant, two strong growths, £8 10*s.*; Aërides Veitchii, fine specimen, £22 1*s.*; Aërides Fieldingii, from Borneo, a rare variety, £14 10*s.*; Cattleya exoniensis, fine plant, £12 12*s.*; Epidendrum verrucosum or nemorale, £11; Vanda insignis, true, £12 15*s.*; Dendrobium Bensoniæ, a very fine variety, in bloom, £5; Dendrobium nobile pendulum, magnificent specimen, in basket, £15.

WORK FOR THE WEEK.

KITCHEN GARDEN.

PAY due attention to thinning-out and surface-stirring amongst all advancing crops. Gather and store seeds of such choice vegetables as it may be considered advisable to preserve, but anything very extensive in this way ought never to be attempted in gardens exclusively devoted to the purpose of cultivating vegetables for family use, as in most cases disappointment and inferior qualities will be the result. Anyone at all conversant with the nature of kitchen-garden produce is well aware how much the quality of vegetables becomes deteriorated when grown and seeded upon the same ground year after year. Prudence and economy would, therefore, suggest leaving seed-saving to those who make it both a business and a study. Whatever remains undone in the way of planting-out *Broccoli* and *Winter Greens*, must be finished without delay. Now is a good time to sow a few *Carrots* to stand through the winter. Sow also *Parsley* for winter and spring use. Still keep up successional sowings of *Lettuces* and *Radishes*, the growing crops of which must be liberally supplied with water. Sow also a tolerable breadth of winter *Onions*, the Strasburg and Tripoli are the best. Sow thickly for drawing young for salads and for transplanting. About the middle of the week is the proper time to sow Prickly *Spinach* for the winter; the ground should be good, but not too richly manured, as it is apt to make the plants grow too strong, which renders them the more liable to injury from frost. Seize the opportunity of a shower to sow another breadth of late white *Turnips*.

FRUIT GARDEN.

Peaches, Nectarines, and Apricots, must have constant attention in keeping them well nailed to the walls to guard against high winds; the fruit, also, must be exposed to the action of the sun as much as possible to secure fine flavour and good colour. Continue to make fresh plantations of Strawberries; let the ground be deeply trenched, and apply, if possible, a good portion of fresh stiff loam. Strawberries generally succeed best on ground with a cold bottom.

FLOWER GARDEN.

Propagation of the stock for next season should be commenced at once, and carried on with expedition, so as to secure a lot of strong, well-established plants before winter, and without the necessity of keeping them so close and warm as to induce weakly growth and a watery habit. To be able to winter bedding stock safely with ordinary care, the cuttings should be put in sufficiently early in the autumn to allow of having them well established and fit to be exposed to the open air by the middle of next month. Hollyhocks are very general favourites, but do not afford cuttings freely. These should be examined often for any cuttings which they may afford, as those rooted about this time will make fine strong plants for next season. Attend to the tying of these and Dahlias, and go over the masses of Verbenas, &c., frequently, for the purpose of regulating the growth, and preserving order and neatness. Sow at once Ten-week and Intermediate Stocks for spring-flowering; also transplant Brompton and Queen Stocks, and if the situations in which they are to flower are not at liberty prick them out in nursery beds, allowing them plenty of space to prevent weakly growth. Proceed with all expedition to layer Carnations and Picotees. Remove decayed petals from those pods in which seed is formed. Plant out seedlings in beds where they may stand through the winter for blooming. Plant out Pink pipings on rich prepared beds. The amateur must recollect that if he requires fine laced flowers they must be planted and well established before autumn. Water Dahlias; at this season they require a good supply. Auriculas and Polyanthuses in pots must not be forgotten amid the many demands on the amateur's attention at this season. Keeping in a shady place and clear of dead leaves and weeds, will be sufficient. Attend to saving choice perennial and biennial flower seeds; these should be watched daily, and collected as they ripen. I do not urge this operation being carried out to a great extent, as the returns would not be adequate to the expense and trouble of collecting and cleaning, except in the case of those showy species and varieties some of which every flower gardener possesses and cultivates. Take the opportunity of fine days for collecting; tie them up into bundles, and label them correctly. Those which have burst their seed vessels should be gathered into pans; place them in the seed room till a wet day occurs, when they can be rubbed out.

GREENHOUSE AND CONSERVATORY.

We shall soon have short, sunless, damp days and long nights; therefore look over the stock of pot plants, and see that none of them are suffering from want of pot room or other attention necessary to assist them to make young wood for flowering next season. Also see that proper care is afforded to any late-growing plants in the borders, for while in active growth much more water will be necessary, and insects will be much more troublesome than in the case of plants that have com-

pleted their growth. Look carefully after the Luculias, and keep them clear of their great enemy black thrips, affording them plenty of water at the roots, and give an occasional supply of weak clear manure water to old plants that may not be growing freely, until they have made plenty of wood to insure a grand display of flowers, but manure water should not be given to young specimens in vigorous health, as it is apt to induce too gross a habit, in which state they seldom flower profusely. The Luculia is amongst the most splendid and useful of our conservatory plants, and well deserving of every care and attention, and when planted in the border it is also one of the easiest to manage. To secure fine heads of blossom, however, the plants should be afforded a comparative rest of a few weeks after about the middle of next month, keeping the roots rather dry, and exposing the plants as freely to air as can be done without injuring the foliage, or the adjacent specimens. See that old large specimens of Camellias are not allowed to become too dry at the roots after they have set their buds, for this is what generally causes them to drop their buds, about which we hear so many complaints. Young vigorous plants, however, frequently require to be watered rather sparingly at this period to prevent them making a second growth. Cinerarias for early flowering should now be growing freely; attend to them with shifting, &c., as may be necessary, for if they are to form large specimens for flowering in winter, they must not be allowed to sustain any check after this time; also take off suckers and pot for spring flowering as they can be obtained. Herbaceous Calceolarias will now demand attention; put in cuttings of favourite sorts in order that they may be rooted as soon as possible. The stock of hardy shrubs in pots for next season's forcing, if their growth is completed, may be laid on their sides facing the south; this will assist to ripen their wood and prevent their making autumn shoots. After a short time remove them to the shade of the north wall for the winter.

STOVE.

Many hardwooded spring-flowering specimens when kept growing late in the autumn where there is not sufficient sunshine to properly ripen the wood, seldom flower strongly; therefore give every encouragement to such as have not made their growth, and use the shading very sparingly after this time. The twiners here will now be at perfection; keep them well supplied with water at the roots, and pay frequent attention to regulating the shoots and disposing the blooms in the most effective manner. The Allamandas are fine plants for pot culture, but to have them in perfection they must be planted out in the border of the stove, and trained to the pillars or back wall, where they flower magnificently during a great part of the year. The brilliant Clerodendron splendens, the Combretums, Echites splendens, Stephanotis floribunda, and many other first-rate plants do extremely well when treated in the same manner and trained near the glass.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

We prepared ground for sowing Cabbages, Lettuces, Endive, Turnips, Radishes, Spinach, and Onions. For all such crops that are to stand the winter, and produce heavily in spring, it is well to have the ground deeply stirred, the manure placed at the bottom, and the surface left a little firm, and rather poor in comparison. We believe we should have lost fewer of our Cabbages last winter if the first layer of soil had been less rich, and the plants had grown less in the beginning of the winter. If, however, we were sure of the weather, it would be quite different; for standing well it is advisable that plants should be encouraged to root deeply, and to take hold of the richest soil.

Peas have produced much more than common this season. Even Veitch's Perfection has been perfection as to quantity with us, which, when compared with others, it hardly was before. We have compared some of the new sorts with old ones, but taking size, colour, and flavour, we find as yet none equal to the Ne Plus Ultra or Jeyes's Conqueror; the only drawback is, that it will grow to such a height that in such a season as this poles as well as long sticks would be necessary to do it justice. From the kindness of a friend we hope ere long to see and form an opinion on some of the best new Peas which we have not grown ourselves. In the meantime, we are fortified in the above opinion from the simple fact that having sent for table fine Supremes and Perfections, a message came that they would do admirably for certain purposes, but if possible to send a good dish of the large blue Pea as the chief vegetable for dinner. This Conqueror Pea is almost the only one we know that needs no help, but a short boiling in soft water with just a grain of salt in it. It needs with soft water no carbonate of soda to keep it green, and it is so sweet that a dash of sugar spoils it, and we would say the same of any rich sauce or dressing.

Scarlet Runners we like to see covering tall sticks, as one of the prettiest sights in a garden when in full bloom and full bearing, but weight for weight of pods we have obtained as much from rows of Runners at the same distance apart that had their points nipped out several times, and which would thus without sticks get broad at bottom, and not be more than 18 or 24 inches in height. When thus grown, we have frequently placed a little long grass or litter along the sides of the row to keep the pods clear from the dashing up of earth by heavy rains. Unless, then, for a few rows of the dwarfer and earlier Peas, we would say that it would not be profitable for the cottager to grow them unless he could stake them; whilst, on the other hand, hardly anything would give him such an amount of rich nutritious food as the Scarlet Runner grown in rows, say 4 feet apart, and without the expense and trouble of staking; though a pinching-out of the points of the strongest shoots would be desirable, even if repeated twice or thrice after the plants showed bloom. The stopping causes the first blooms to set more freely, and rather helps others to show more quickly, and we hardly know of anything more ornamental than a dense row of such Beans, clothed from end to end with masses of bloom concealing the pods below, and the more freely the latter are gathered, so as to prevent the ripening of the seeds, the more freely will successions of bloom and pods come.

Merely as an ornamental row, or as part of a ribbon-border, we would much rather use these Scarlet Runners, stumped in, so as to show masses of bloom—which they will be sure to do if the pods are rather closely picked—than use Beet or coloured Greens, which, however beautiful, remind one too much of the salad and the kitchen, which the mere masses of flowers do not. For masses of scarlet where the ornamental and the useful must be combined, commend us to the Scarlet Runner grown as a mass without staking.

Even here as to masses of bloom, much will depend on closely picking off the young pods. One pod allowed to ripen its seed perfectly, will exhaust the plant more than a score of pods with the seeds just forming. Some cottagers have done well by sowing their Runners in boxes, or in a place where they could protect them with a cloth in April, hardening off, planting out early, and protecting with a few leafy twigs at first, and then they would be satisfied with moderate gathering, and save the seed for sale to neighbouring seedsmen. In some seasons this paid well, but on the whole where there is a family to supply, it will generally be most economical to allow as many pods to ripen as will furnish enough of well-matured seeds for the following year, and gather all the rest when comparatively young.

We have tried taking up the roots late in autumn and packing them closely in dryish earth during the winter, and then planting them out at the beginning of May, but, on the whole, we came to the conclusion that it was the more profitable plan in the long run to depend on the seeds, and in a very cold and backward spring to give the young plants a little simple protection. The most prolific varieties of the Kidney Bean are very economical for the cottager, such as the Negro, the Cream-coloured, Sir Joseph Paxton, and the Newington, when the pods are used whole; but even if small rows of these are grown 2 feet apart, they will not yield such an amount of nutritious food as dwarf rows of Runners 4 feet apart.

Whilst for small cottage gardens in the country, then, we recommend these dwarf unstaked rows of Runners, we cannot forget seeing many small court gardens in London and other large towns, and in thickly-populated suburban districts, where the Runners, planted against the boundary fences of brick or wood, and encouraged to mount up on so many cords or pieces of string, made you forget for several months that you were in a sooty atmosphere, and in imagination, at least, you could find yourself in the country with all its attractions, whilst the food obtained from such a lovely covering of fences anything but pretty, was very considerable. An old friend of ours, now at the Antipodes, used to grow the Runners, Rhubarb, Sea-kale, and the bulk of our common vegetables in a small garden, in a very close neighbourhood just over the bridges in London. He was hemmed-in with buildings on every side, but there was an opening for the pretty free entrance of

sunlight from the south-west. These Runners, and many other plants, will do well with a little extra care if there be an opening from east or west, but better still one to the south. If the opening is only to the north, little or nothing could be expected, though even in such cases we have seen fair returns. The great secret of success in the case referred to was simply this—after warm days in July, August, and September, as there was plenty of water laid on, he used a syringe, engine, or watering-pot with a fine rose, to wet and partly wash the leaves of the plants.

For the benefit of all our young readers who, living in towns, mean to try for a prize at a flower show, we would let out the great secret that though soil, and watering at the roots, and general attention are all necessary, the keeping the leaves clean by sprinkling, washing, and sponging is the most important of all. With such care it is rarely that an insect will have the rashness to show itself. Clear water is also the best antidote against a sooty sulphurous atmosphere. Of course a minimum of such attention is required in the clear atmosphere of the country. Our friend in London, however, used to say that after even valuing his odd hours of labour spent on his little garden, he could have small salad, Lettuces, Cabbages, and Scarlet Runners at about half the money he would have had to have paid the greengrocer; but then what was to be bought was not worth half of that which was fresh gathered or cut just before using.

Peas proved a poor return in such a close, shaded, sulphurous, and sooty atmosphere. Nothing on the whole paid better than the Scarlet Runners. We well recollect that on the gable of an outhouse they were fully 20 feet in height, and some hoops thrown over the walks in several places put one in mind of Eden's bowers, and caused grimy London to be out of mind for a time.

It may be here worth noting that our first acquaintance with the Scarlet Runner when a boy in Scotland, was seeing it treated as a flowering plant by some cottagers, who in matters of taste were far in advance of their fellows. We looked upon the beautifully-marked seed as something wonderful, and we clearly recollect how they sowed two or three seeds in a 7-inch pot in April, kept the pot inside the window until the plants were a foot or more in height, and then turned them outside on the sill, one at each corner, and trained them to a string fastened to a few nails up and round the window, and most beautiful they looked with their masses of green leaves and bright flowers. We presume any pods that appeared were plucked off, and we question very much if these lovers of the beautiful knew how to use them, if they had permitted them to grow.

No doubt matters have greatly altered since then in this respect, but it has often appeared to us somewhat singular that a people, and more especially, perhaps, the peasantry and artisans, should have been so distinguished as the Scotch for rugged moral force and intellectual vigour, and yet have so little love—nay, a sort of contempt, for that which would have so ministered to the variety, and the healthiness, and economy of their dining-tables. We can recollect that when a well-to-do weaver grew his fine Lettuces, and used them as an accompaniment for breakfast and tea, and at other times, there was a sort of looking-down upon him as a mean epicure, who wished to imitate "the gentility." The last time we had the chance of looking in on cottage gardens in Scotland there was a great advance in the variety of vegetables grown; but even then they were not up to the mark of what may every day be seen in the cottage gardens of the south, though the owners of the latter may not be so distinguished as the former for general knowledge and intellectual vigour. We do not see why a certain amount of mental vigour should not be accompanied with that refinement that enables one to enjoy and appreciate the blessings that Providence has put within our reach. We do admire the self-restraint in the young, which leads to a stern denial of what otherwise would be pleasing, in order to attain a good definite purpose; but we have no sympathy with that real or affected narrow stoicism, which treats with indifference the blessings and enjoyments that Providence has placed within the reach of honest industrious effort. There can be no doubt that variety of food is not only pleasing, but greatly contributes to health and enduring strength. In contradiction to this, we have been referred to the ploughmen in Scotland, so robust and muscular when young, though the chief items of their living used to be milk and oatmeal; but in answer we could also have referred to the great number that became prematurely old and enfeebled.

The *Celery grub* greatly disfigures Celery by leaving so many brown lifeless spots on the leaves. Nothing can reach it, secure as it is between the two skins of the leaf, except squeezing or nipping-off and burning. The fly that deposits the egg from which the maggot comes is easily kept away, if a little fine soot is dusted over the leaves. Soot-watering is not so effectual, as the smell does not continue so long. We have reason to think that a few fresh spruce branches stuck among the branches keeps the fly away. We have scarcely been troubled with this maggot annoyance since we gave a slight sprinkling with fine soot once or twice during the summer.

FRUIT GARDEN.

Some *Peach trees* have suffered so severely that all which remains to be done is to take the crop which they yield and replant in fresh soil. We have known fine walls that wanted renewing thus three times in something more than thirty years, the trees standing healthy only fourteen or fifteen years after planting, and generally less or more succumbing after a winter more than usually cold. Where only slightly affected, care must be taken to secure healthy growth by removing all unhealthy parts, curled and blotched leaves, stopping any strong shoots that the healthy sap should be more equally diffused, freely using the syringe early in the afternoon after a bright day, and assisting the roots by mulching, and in some cases fresh soil. In most cases where the trees have suffered most this season, the roots had nothing to do with it, the extreme cold with warm intermissions, and then cold again with damp, having injured the wood to the core. In many cases the trees showed little signs of what they had passed through until the blossom began to open, but the channels of communication had been so injured that in many cases small shoots and even branches died-off outright. Such a season shows the importance of a glass covering for walls for keeping the trees dry, and a still atmosphere around them in the most severe frosts.

Our Apricot trees suffered a good deal, but more in the wood than in the blossom-buds, as though some gaps have been left, and several branches now are threatening to give way, the crop on the whole is heavy but late. Few Apricots would be gathered ripe in July this year much north of London, at least we should say so, judging from what we have seen. As soon as possible we shall go over our bush fruit and shorten and thin summer shoots. It is difficult to get done what we wish to do.

Cut off young Strawberry plants preparatory to placing them in fruiting pots in an exposed place. Our fruit is getting thin, and when over we shall have the rows and beds cleaned, dressed, and mulched as soon as possible.

Grapes that are ripe may now have plenty of air and be kept cool. Late Grapes swelling freely, and even beginning to show signs of colouring, will be all the better of a little additional heat in this dull weather. In a bright day it will hardly be wanted. Let us bear in mind, that Grapes ripe by the middle of September will be better to eat, and will keep hanging better through the winter, than those we gave fire heat to to ripen later. Singularly enough the red spider is more apt to make its appearance in houses in such a variable season as this, than when the sunshine is more regular and bright, and that, perhaps, because we are less thoughtful of atmospheric moisture than in bright weather. Hence, sulphur on open parts of the wall where sun would strike, or on the heating medium, be it pipe or flue, is of importance for keeping that little enemy away even in late houses; but let it be clearly recollected, that in placing sulphur on a heated medium, the heat should not be above 160°, rarely reach 170°. Even when leaves escape, many kinds of Grapes suffer in the berry if the heat is higher than the above temperature. Many plants also suffer, and especially fine Ferns like the various Maiden-hairs.

The first part of the season was good for Melons. What we have lately passed through has scarcely been so good. We hope there will be a bright autumn for the benefit of those who love this rather trying fruit. It is well so to regulate the shoots by disbudding, as not to have too much foliage exposed to a declining sun. The Melon shrinks more from the knife than the Cucumber does, and therefore more should be done by disbudding than knifing or cutting the shoots off. Melons, too, when grown in pits or houses heated by hot water are more sensitive to sulphur fumes than Cucumbers. In such pits, and even frame boxes, it is safest to use it with a little lime to wash the walls inside exposed to the sun's rays, and not to put the sulphur on the heating medium.

ORNAMENTAL DEPARTMENT.

Never did the lawns show a richer green, and never could a

season be more propitious to fresh-laid turf. Even now, however, our Pelargoniums, though fair, are not up to the mark in massiveness of bloom. They delight in a warm soil and bright sunshine. We want more sun also to give massiveness as well as colour to the Coleus. A good judge the other day greatly preferred the Coleus Verschaffelti edged with the white-leaved Centaurea to that edged with the Polemonium cæruleum variegatum, which we had recommended as the best edging. We must say there was rather more than mere fancy in the opinion of our friend. Last season, in the full blaze of the sun, the Polemonium was splendid. This season, so comparatively dripping and dull, the Polemonium is not so bright, and has more green and less of white and yellow in its beautifully cut foliage. In a favourable season we still think that nothing can surpass it, but this year as yet we must own the Centaurea is quite as effective. The Coleus as yet is even darker than usual.—R. F.

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

Books (*S. R.*).—Pearson on "Orchard Houses" you will find to convey all the information you require. It can be had from our office for nineteen stamps. (*C. Adams*).—The only book on subtropical gardening in the English language with which we are acquainted, is Mr. Robinson's. On geothermal culture there is no separate work, but you will find much on the subject in the early volumes of this Journal. (*H. B. H. Turner*).—The "Farm Manual" may be had from the office for sixty-four stamps. "Roses in Pots," by William Paul, is the only work on pot Roses.

Cucumber (*Am I right?*).—No doubt the presence of green fly is accompanied with a slow growth, but not necessarily with a weakness of constitution. The cause of the slow growth may be atmospheric and not constitutional. Your friend is right who kept his bed warm and his plants in a growing condition.

Gros Colman Grapes Cracking (*Kew*).—Your Grapes are cracking in consequence of the humidity of the house caused by syringing the Azaleas and Camellias.

Strawberries in Ground Vineries (*H. R. Du Pré*).—You may grow Strawberries in pots in your ground vineries along with the Vines, but it is not desirable, as by the time the Strawberries are ripe the Vines will require all the space. The Strawberries will likewise in all probability introduce red spider to your Vines. You should lift the plants with a ball of earth and pot them at once. We like fruiting-pots of Strawberries to be well filled with roots before the middle of October. You will find instructions for the management of pot Strawberries in the Journal for August 3rd. You must use 8-inch pots, and these must be plunged during winter in order to prevent the frost from injuring the roots, introducing the plants into the ground vineries about the 1st of March. Set the pots on the slates.

Chrysanthemums (*Brisbane*).—If your Chrysanthemum is a Pompon, it is not unusual for a stray flower to appear so early in the season. There is a class of summer-flowering Pompons.

Various (*A Young Gardener*).—We believe the reason for cutting off the leaves of Leeks or any other plants when they are planted out, is to prevent too great evaporation before the root action begins. Filmy Ferns are so called because of their thin and translucent fronds. Orchids and orchidaceous plants are synonymous terms to designate plants which belong to the natural family of which Orchis is the type.

Grapes Shanking (*T. H.*).—Doubtless the roots of your Vines have spread into an unsuitable material, but we would not destroy the Vines as they are only five years old, and the wood and foliage are in good condition. Have they been overcropped in previous years? as this is a frequent source of shanking. As no border has been made we would make one, and we would do it at once if the present crop of Grapes is not worth saving. Begin by marking off the extent of your border; 9 feet wide will do; dig a trench 3 feet 6 inches deep just outside the border, and turn out the old soil with forks, working from the trench towards the front wall, and saving all healthy roots. The fresh compost should be prepared and be at hand ready to be wheeled in directly the old material is removed. Maintain a moist close atmosphere in the house, and shade if the sun is powerful. The Vines will establish themselves before winter, and you may expect a moderate crop of fruit next year. We would plant a few young Vines at the same time to make sure, although we have great faith in renovating the old ones.

Rose Bessie Johnson (*T. W. Johnson*).—Write to Mr. Curtis, Devon Rosery, Torquay, ask him when it is to be placed in commerce, and order one for that time.

Manure Scarce (*H. C.*).—In such a hungry soil as yours artificial manures soon lose their force, unless assisted with rougher organised decomposing material, which you say you cannot purchase either from farmers or cow-keepers, which shows they know the value of such manures. We do not know how you are situated otherwise, but were we in your place we would make the most of weeds, mowings of short grass—a powerful manure, dressings of the sides of roads, edgings of walks, throw all together to ferment and decompose, and add half a peck of salt to what would make a cartload of material when partly rotted down, but not too much decomposed. Your subsoil being merely stirred up and left, such material would greatly enrich the top soil, and the saline matter introduced would help by attracting and retaining moisture. With such aid we do not think you could use any artificial manure that would be safer and better than dissolved bones or superphosphate of lime. If you could not obtain such material as the above, you might add a little of the nitrate of soda to give you bulk of produce, and the refuse of that would all come in again as valuable manure. You will be in no danger from the superphosphate. For a lasting manure nothing beats bones ground or crushed into small pieces like peas and beans, but such manure does not tell the first season like the superphosphate.

Rolled Glass for Plant Houses (*W. T.*).—We would prefer the patent rolled glass for the roofs of all kinds of plant houses. We should not object to the front glass being the same, except for this—that you would not see in or out. On the whole we would prefer the front to be sheet glass merely on that account. In the case of fruit houses we prefer the clear sheet, as in dull seasons the most direct light is needed. We may be prejudiced, however, in this. For plant houses there is enough of light from rolled glass, and no shading is necessary. We must add, however, that our experience has been more limited with fruit houses, but it led us to the above inference.

Arrangement of Small Lean-to Greenhouses (*An Old Subscriber*).—We think you should have considered all matters before building your front wall. If that wall had been on arches or piers we would have had a border inside 2 feet wide, planted the Vines there, and let the roots go out. In this case we would have the border a few inches from the wall-plate inside, and sloping from the same height outside. As your wall is built, and your proposed flue does not interfere with such an arrangement, we would have a border in front 2½ feet wide, well drained, and within an inch of the wall-plate, there plant the Vines, and keep them there with surface mulching. A 4½-inch wall separating the border from the pathway would take up altogether nearly 3 feet of your space. This border we would span over with slats of wood on which to set the pots. Then you could have a 3-feet table or stage at back, and a 2-feet pathway. If the flue is in the way of the above arrangement, then plant the Vines outside and introduce them through the wall or slits in the wall-plate; but daily we witness the havoc made by vermin on the stems of Vines planted outside, otherwise for such a house the Vines will do well. (*H. P.*).—Your proposed arrangement will answer very well. As in answer to another correspondent, we would advise the front wall to be arched, and to have a narrow border inside, in which to plant the Vines, so that the roots may pass out, whilst the stems are safe and protected. From 20 to 24 inches is a good depth for Vines. Below that there should be a drain and at least 6 inches of rubble, unless the ground is drained naturally. Good rotten turf is the best soil for a Vine border, with half a bushel of bruised bones and two bushels of lime rubbish to a cartload of soil, with a little rotten dung; but we prefer, instead of using much dung in the soil, to give strength by annual mulching or top-dressing. For your place we would have four Vines, and, on the whole, there is nothing better than the Black Hamburgh. If you liked a musk flavour you might have one Muscat Hamburgh and one White Frontignan. The Royal Muscadine would give you larger bunches, but not the Muscat flavour. When you have proved your Vines, and feel so disposed, you may let one Vine fill the house, but we would plant at least four at first.

Lobelias (*A. E. F. C.*).—The Lobelias were far too much gone for us to distinguish them. We think what you call the grassy one is gracilis, best for hanging from baskets, vases, &c. The other, we think, is a variety of L. Erinus compacta. The best compact blue is speciosa, and one of the best varieties is the Trentham Blue. Our London nurserymen keep these very good and true.

Covering North Wall of a House (*J. J. S.*).—We are sorry that we cannot recommend you a pamphlet on house ventilation, and we do not know what the house referred to is—a dwelling-house or a plant-house. For plant houses the subject has been frequently noticed in our pages; the great point is to give air at the highest point early. The same rule holds good in a dwelling-house, only draughts must be avoided. To cover the northern side of a house surrounded by Laurels, nothing is better than Ivy, and you may choose very pretty-leaved varieties. Nothing so much tends to a dry wall inside as covering the outside of the wall with Ivy. If flowering plants are desired, then the hardier Rhododendrons would do, but not like Ivy.

American Blight (*G. M. F.*).—From your description we have no doubt of its being American blight. At this season the best remedy is to syringe forcibly with 2 ozs. of soft soap to a gallon of water, directing it with such force as to wash the insects off. Or you may apply spirits of turpentine to the branches infested, taking care that it does not drop on the leaves, for it will destroy them, and when the leaves have fallen dress the trees with paraffin oil, applying it with a brush, and working it into every crack and crevice.

Fuchsia Origin (*Idem*) —No Fuchsia is a native of Britain. The kinds now cultivated have been obtained by hybridising and cross-breeding, and mostly from F. gracilis, F. macrostemon, and F. tenella, all introduced from Chili. The other species are from Mexico, Chili, Guatemala, Brazil, and New Zealand.

Tacsonia Van-Volxemi (*T. B.*).—The fruit is eatable; but previous to use it should be perfectly ripe. We have no doubt of its making an excellent preserve if treated like Melons. Tacsonia mollissima fruit is excellent for the same purpose. They should be ripe.

Scott's Wasp Destroyer (*W.*).—It may be purchased of most of the principal seedsmen. There is no danger attending its use to the plant.

Onion, Leek, and Carrot Grubs (*J. M.*).—We know of no effectual cure after they have taken possession. Strong lime and soot water will modify the evil, but if put on strong enough to dislodge them all, the remedy would be almost as injurious as the disease. The only preventive is to sweeten the ground well before sowing, and if there is a little doubt as to worms, to add some fresh lime and incorporate it well with the soil, or some ammoniacal liquor from the gas works. Several times on a piece of ground—say 40 feet by 20, we have scattered a gallon of tar, in the beginning of winter, and that was all sweet enough before sowing time, but incorporating it with the soil caused the destroyers to shift their quarters, if it did not kill them.

Insuring Vines Growing Equally well (*Idem*).—Nothing more can be done than giving them all similar care and attention. How with all that care some out of the number refuse to grow like the rest, is one of the things that no one can understand. As an M.D. you must often see how strangely children differ that started life seemingly with the same vigorous constitutions, and from healthy parents, and yet some will continue strong and robust, and others will become puny and weak, notwithstanding even

the extra care. We are just as ignorant of the change in habit and constitution that takes place in plants. Generally our attention will be rewarded with health and vigour, but often we are disappointed, and unable to assign the reason. A very little difference in the treatment of a Vine after planting will make a great difference as respects growth. Not so long ago we saw young Vines that seemed rather going backwards than forwards, and all on the surface seemed right enough, but on poking down with a stick for 3 inches or so, the cause was obvious—the water given had never reached the bulk of the roots.

PREVENTING RED SPIDER (*Idem*).—The best preventive against red spider in a house, where Peaches and Grapes are grown, is the free use of the syringe with clear water, and then the next best where such water cannot be applied, or even along with it, are the fumes from sulphur, provided the body on which the sulphur is placed, be it pipe or flue, or empty spaces on the wall of a house where the sun strikes, shall not be above 160°, or very little more; all above that in temperature is verging on the dangerous. The fumes of sulphur when ignited will kill every living thing. Fumes thrown off at 160° are safe, and with a moist atmosphere for a short time the red spider cannot endure them.

SELAGINELLA (*W. S.*) —A Selaginella is not a Fern, and consequently cannot be shown in a collection of Ferns; and Tomatoes, though fruit, are not so in the sense of a collection of fruit for exhibition. You would not expect the fruit of the Egg Plant to be admissible in such a collection, and why should you wish to show the Tomatoes?

ORCHARD HOUSE (*J. C. H.*).—The Strawberries fruited in your orchard house this season will do very well in the open ground next year if planted out now. Hoya carnosa and Oleander are propagated by cuttings.

CUCUMBER SEEDING (*W. E C.*).—There is no need to allow the fruit to hang after it is ripe, which you can tell by its becoming yellow.

STEPHANOTIS FLORIBUNDA (*E. G.*).—We cannot possibly say what the value of the seeds of Stephanotis floribunda is. You should ask a seedsman. The prices of Grapes in Covent Garden you will find in our market report.

APPLE (*Bell & Thorpe*).—Your seedling Apple is very handsome, and has a powerful fragrance. The flesh is very white, and the skin coloured with a delicacy of a Peach. The flavour is brisk, and has not the spicy aromatic character of the Irish Peach and Early Harvest, which are now in season.

NAMES OF PLANTS (*H. J.*).—We should be most happy to serve you, but we cannot undertake to name florists' flowers. (*W. R. N.*).—We cannot undertake to name varieties of Achimenes. (*Robert Maitland*).—Cuscuta Epithymum, var. Trifolii.

POULTRY, BEE, AND PIGEON CHRONICLE.

DE OMNIBUS REBUS.

WE are not sure Captain Marryatt's carpenter was altogether wrong when he said that everything repeated itself once in a given number of years. He recollected somewhere about twelve hundred years before having been on the same spot, under the same captain, and in the same storm. It is said that Lord Melbourne affirmed that if letters were locked up in a drawer for a month they answered themselves. [Query? Editors J. OF H.] The lord and carpenter may both have been wrong, but if it be true that "history repeats itself," there was something of truth in their theories; and history does repeat itself, and it will repeat itself so long as seasons come in their due course, and breeding comes on at its natural time, and people eat eggs and poultry. We were led into this train of thought by the presence of many letters and queries, and by application from one we could ill spare for a holiday. We have somewhere read of an old lady, a grandmother, who was sitting in her son's parlour, when a pet grandchild was brought in. He had fallen from an apple tree, and broken his arm. It gave the old lady a turn. "Don't say so," said she; "bring him to me." They did so, and she administered a sound box on the ear. "Mother, mother," said the father of the child, coming in, "what is that for?" "Oh! dear, dear," cried the old lady, "now you are coming to worry me. The child's always breaking his arm." So we said to our right hand, "You are always wanting a holiday." "I don't always get it, then," he said. "I have not missed a day's work since this time twelve months." "Very well; then take your usual holiday," said we, and fell into the reverie which heads this chapter. It is wonderful how much we may learn from observation. Thus we are convinced, and we know hundreds who agree with us (being on the subject of holidays), that when we are on our trip the days get shorter every day, and when we return they suddenly lengthen. We should like to make a bargain with Time. Let us go to the hatter. "If you knew Time as well as I do," said the hatter, "you wouldn't talk about wasting it. It's him." "I don't know what you mean," said Alice. "Of course you don't!" the hatter said, tossing his head contemptuously. "I dare say you never spoke to Time!" "Perhaps not," Alice cautiously replied; "but I know I have to beat time when I learn music." "Ah! that accounts for it," said the hatter. "He won't stand beating. Now, if you only kept on good terms with him, he'd do almost anything you liked with the clock. For instance, suppose it were nine o'clock in the morning, just time to begin lessons; you'd only have to whisper a hint to Time, and round goes the clock in a twinkling. Half-past one, time for dinner!" "That would be grand, certainly," said Alice, thoughtfully; "but then I shouldn't be hungry for it, you know." "Not at first, perhaps," said the hatter, "but you could keep it to half-past one as long as you liked."

Unfortunately this is only a theory; if it were not we would, in our present idle mood, keep it at Monday morning for the next month. We would write nothing. The very weather is like the dormouse in the book we have just quoted, sleepy. Heavy and continuous rain yesterday; bright hot sun to-day, rather pale and watery; the veriest whisper among the leaves; atmosphere heavy, and some of the shady plagues just waking up at times sufficiently to sting.

Seedy and worn out, ought to lie by and moult. Beautiful process. Summer heats are passed; days get shorter, nights longer. The temperature lowers; and Nature, good mother, rewards her followers by providing clothing meet for them. It is the moment of their rest. The year's work is done; the eggs are laid, the chickens are hatched, reared, and able to take care of themselves. All the energies of the hen must be devoted to clothing. But all our fowls are not kept in a state of nature, and consequently some little care is necessary. The production of the new plumage is a hard work. Thus, it is seen, everything gives way to it. The comb perishes for a time, the old feathers become shabbier every day, and the hen apparently is losing health and condition. It is not so. The reproductive process is going on within. For every feather that falls there is a blue and red pipe, called a "stub," waiting to take the place of the feather, to fill up the hole left by the quill, and by growth to supply a substitute yielding warmth, protection, and beauty. The lower end of this stub is red, being full of blood. The blue upper part is composed of a very fine outer lining, containing the feather folded up; this will pierce the lining and grow to its natural length. The feather of the smallest of the West Indian or tropical birds and the 6-feet feather of the tail of the Reeves's Pheasant, or the longest and handsomest feather in the Peacock's tail, alike originate in the small stub.

We sometimes hear that birds do not moult. Their bodies are not in a fit state. A heated condition is fatal to moulting. The body must be cool and well nourished. All these stubs are like flowers in a garden; the body is the earth in which they are planted, and from which they must derive their moisture and nourishment. Ground foods, such as ground oats, are best for them. Lettuces, such as are run to seed, are excellent. Meat, hempseed, canary, buckwheat—all foods should be avoided. Helping through the moult by medical treatment is like making fowls lay by stimulants. You accomplish a fact in a short time, but it is not done as well as it would have been had Nature been left without assistance.

It was a very old idea with the early poultry-keepers that hempseed was good during the moulting season. Nothing can be so bad. It is the most heating of all seeds; it dries up and impoverishes the skin and fevers the body. The stubs are burnt up in their sockets; the feather ceases to develope; it dries and perishes, becomes a plague and an itching, and the bird scratches it off. This is most frequently the case with small birds, as Bullfinches, Canaries, larger ones as Parrots of all tribes. An old friend of ours, a physician, always used to ask young ladies brought from school to consult him, what they liked to eat. They always said they did not know. "But I do," said the good old man; "slate pencil, sealing-wax, paper, string, spice, especially cinnamon, sweets of all kinds, lemon and orange peel, cocoa-nut. That is why you come to see me." Just so. When we see the Parrot, or Bullfinch, or Canary with naked neck and poll, wings with only quill feathers, and the apology for a tail, we say, "Hempseed, canary, sugar, and biscuits." When we hear of a yard moulting badly and find the birds out of condition, when we see the new clothing certainly worse than the old, we think of hempseed, canary, meat, beer, carefully cooked food, and everything done to tempt them to eat: hence their nakedness. Poor Pheasants and Partridges! The first gorgeous in his resplendent plumage, the latter with his bold eye and bright horseshoe, and nobody to look after them!

Hempseed not only interferes with moulting, but where it is given the plumage becomes much darker. We have seen a light brown bird turn nearly black in two moultings when fed with it. Canary seed does not cause heat but immense fat. It takes away all desire for action, causes the feathers to decay, and the bird to pass its time squatting drowsily about.

Call this a poultry paper! "All this sack to a pennyworth of bread!" All we can learn from it is to let our fowls alone during the moulting season. We all know that; so we do, but we do not all practise it. It is not easy to let things alone. You tell the surgeon you have a feeling of heat and pressure amounting to pain at the back of your neck. He says, "We shall see to-morrow, but above all leave it alone, do not touch it." You are sure you know as much as any of the wise ones of "our Journal," and you are sure a little so-and-so would be good for the fowls when moulting. If this paper prevents one from giving it we shall be satisfied. We had intended to touch on other topics, but must defer them till next week.

THE POULTRY AND PIGEON SHOW OF THE ROYAL AGRICULTURAL SOCIETY OF IRELAND.

At this Show, held in Dublin on the 1st, 2nd, 3rd, and 4th inst., there were 342 entries of poultry and Pigeons, and considering the time of year, the birds were mostly in excellent trim. Silver-Grey *Dorkings* took the lead, and among them were some good birds. The chickens of this variety were a large class, but they were not in a forward state. Coloured Dorkings were good, as also the chickens, but we regret to say some small adult birds were found in this class, and they were immediately thrown out of competition. In adult *Spanish* were some good hens, but the cocks were not noteworthy. The chickens were a capital class, some of the birds being very forward and of unusually good quality in face and drop. The *Game* were few in number but good in quality. The whole of the classes were for adult birds only. There were some good Buff *Cochins* in both classes, some of the chickens being very good in shape and leg-feathering. The Partridge-feathered were very good, but the chickens were poor. Both classes of Dark *Brahmas* were well filled, and were good in quality. The first-prize adult hen was remarkably good in marking, but the male bird was suffering from moult. The second-prize hen was very fine in ground colour, but wanting in lacing. The chickens were also good and forward. Light Brahmas in the adult classes were but poor, but the chickens much better. There was but one class for *La Flèche*, and the birds were all old except one pen, and of unusually good quality. The first-prize birds were about the best pair we remember to have seen since the introduction of the variety. The first-prize *Malays* were very large and sound in colour, and the *Crève-Cœurs* also good. *Houdans* were good, but the White-crested *Polands* not nearly so fine as we saw at some of the first shows, and the Gold and Silver birds of that variety were in very bad feather. *Hamburghs* were good in both classes, the first-prize Golden-pencilled being of great merit. These birds were shown, the Pencilled in one, and the Spangled in the other class, but we think a division of the colours advisable. The first-prize Game *Bantams* were Red, correct in all particulars; but the second-prize pen was out of feather. There were some good birds in the Bantam variety class, the first being black in fine plumage, and the second a neat pen of Golden Sebrights. In the class for birds not previously specified, Scotch Greys were first, and Sultans second.

In the classes for *Single Cocks*, the Dorkings were good, and the Spanish but moderate. Of Game, the first-prize bird in Black Reds was a fine close-feathered bird as good in hand as in the show-pen; and the first in Brown Reds, though a young bird, was good in all properties. The first prize in Cochins was a Lemon Buff extremely good in all points; but in this class, we regret to say, a most marked case of tail-trimming was discovered. The first-prize Brahma cock was in faultless condition, and one of the most perfect birds we ever saw; he was claimed immediately the Show opened. The Malays, Crève-Cœurs, and La Flèche were all very good, but there was no award made in the Poland class.

The more substantial varieties of poultry—viz., the table fowls, *Ducks*, *Geese*, *Turkeys*, &c., were exceedingly good and of almost uniform quality, the contest in all the classes being extremely close, and the entries large, although the varieties were well divided. In Turkeys of this year there were several pairs of male birds, and one undoubted pair of adult birds.

The classes for *Pigeons* were not numerous. In Pouters, Blue Pied were first, and Whites second, and we also noticed an extremely promising pair of young birds of that colour, which, though squeakers, ran close for the second honours. Carriers were but poor, but the Tumblers good, the first being Almond, and the second Blue Baldpates. Fantails were well shown, and the Nuns very good. The two winning pairs were perfectly free from trimming, although one pair was passed by, as the crests of both birds had undergone manipulation.

Among Ornamental *Water Fowl* there was a very pretty pair of Bahama Ducks.

Dorkings.—*Silver-Grey.*—1, G. N. Purdon, Killucan. 2, S. Mowbray, Mountrath. *hc*, J. C. Cooper, Limerick; R. P. Williams Glaslinn, Clontarf. *Chickens.*—1, W. G. Mulligan, Belfast. 2, J. C. Cooper. *hc*, S. Mowbray; Mrs. Warburton, Kill, Naas. *c*, Mrs Warburton.

Dorkings.—*Coloured.*—1, G. A. Perrin, Chantilly, Longhlinatown. 2, S. Mowbray. *hc*, Mrs. Warburton. *c*, G. A. Stephens, Dublin. *Chickens.*—1 and 2, J. C. Cooper. *hc*, S. Mowbray. *c*, F. H. Green, Windsor, Belfast.

Spanish.—1, J. C. Cooper. 2, E. J. Poer, Limerick. *c*, J. C. Cooper; R. P. Williams. *Chickens.*—1, W. G. Mulligan, Belfast. 2, J. Barlow, Chapelizod. *hc*, S. Mowbray; J. Barlow; W. G. Mulligan.

Game.—*Black-breasted Red.*—1, G. A. Perrin. 2, T. Haffield, Bray. *c*, Miss Perrin. *Brown-breasted Red.*—1, G. A Perrin. 2, T. Haffield. *hc*, E. J. Poer. *Any Variety.*—1, G. A. Perrin. 2, T. Haffield (Duckwing Birchen Grey). *c*, E. J. Poer (Duckwing Game).

Cochin-China.—*Buff.*—1 and 2, W. H. Perrin. *hc*, J. K. Millner, Cherbury, Blackrock; Mrs. Hay, Spike Island, Queenstown. *Chickens.*—1, F. H. Green. 2, W. H. Perrin. *c*, W. H. Perrin (2); J. T. Downmann, Kingstown; F. H. Green.

Cochin-China.—*Brown or Partridge-coloured.*—1, Mrs. Taaffe, Milton. 2, G. A. Stephens. *c*, R. P. Williams. *Chickens* —1 and 2, F. H. Green.

Cochin-China.—*Black or White.*—1, Mrs. Taaffe. *Chickens.*—1, F. H. Green. 2, Miss L. Warburton, Kill, Naas.

Brahma Pootra.—*Dark.*—1, G. A. Stephens. 2, R. W. Boyle. *vhc*, Mrs. Warburton. *hc*, W. G. Mulligan; Mrs. Taaffe. *Chickens.*—1, J. C. Cooper. 2, L. F. Perrin. *hc*, Mrs Warburton (2).

Brahma Pootra.—*Light* —1, J. T. Downman. 2, Mrs. G. Mulligan. *c*, Dr. Duncan, Finglas. *Chickens* —1, W. M. A. Wright, Braganza, Dalkey. 2, J. T. Downman. *hc*, W. M. A. Wright. *c*, J. T. Downman.

La Flèche.—1, 2, and *hc*, G. A. Stephens.

Malays.—1, Hon. J. Massy, Limerick. 2, T. Haffield.

Crève-Cœur.—1, Hon. J. Massey. 2, J. M'C. Pickering, Dundrum. *hc*, E. J. Poer.

Houdans.—1, G. A. Stephens. 2 and *hc*, J. C. Cooper.

White-crested Black.—1, W. G. Mulligan. 2, R. P. Williams. *hc*, J. K. Millner. *Gold or Silver-crested.*—1 and *hc*, G. A. Perrin. 2, R. P. Williams.

Hamburghs.—*Golden or Silver-pencilled.*—1, S. Mowbray. 2, F. Connor, jun.

Hamburghs.—*Golden or Silver-spangled.*—1, S. Mowbray. 2 and *c*, F. Conner, jun.

Bantams.—*Game.*—1, G. A. Perrin. 2, G. Downman. *hc*, E. J. Poer.

Bantams.—*Any Variety* —1, G. A. Stephens (Black). 2, F. Connor, jun. *hc*, T. Reynolds, Dundrum (Sebrights); E. J. Poer (White Rose-combed).

Any other Variety.—1 S Mowbray (Scotch Grey). 2, J. C. Cooper (Sultans). *hc*, J. C. Cooper; S. J. Kennedy (Common Pheasants).

Ducks.—*Rouen* —1, W. G Mulligan. 2, R. W. Boyle. 3, J. C. Cooper. *hc*, Mrs. C. L. Ellison; J. K. Millner *c*, S. Mowbray; R. P. Williams. *Aylesbury.* —1, R. P. Williams. 2, Hon. J. Massy. 3 and *hc*, S. Mowbray.

Geese.—*White.*—1, S. Mowbray. 2 and 3, Mrs. Warburton. *hc*, Hon. J. Massy. *Goslings.*—1, S. Mowbray. 2, J. C. Cooper.

Geese.—*Grey or Mottled.*—1, R. P. Williams. 2, J. C. Cooper. 3, W. H. Perrin. *hc*, J. C. Cooper; W. H. Perrin. *c*, J. C. Cooper. *Goslings.*—1, 2, and 3, J. C. Cooper.

Geese.—*Any other Variety.*—1 and 2, R. P. Williams (Sandwich Island and Cereopsis Geese). *hc*, Mrs. Warburton.

Turkeys.—1, S. Mowbray (Cambridge). 2 and 3, J. C. Cooper (Cambridge and Norfolk). *Cock* —1 and *hc*, J. C. Cooper (Cambridge). 2, S. Mowbray (Cambridge). *Poults.*—1 and *hc*, J. C. Cooper (Cambridge). 2, 3, and *c*, Miss L. King, Geashill (American).

Ornamental Water Fowl.—1, R. P. Williams (Bahama Ducks).

Cottagers' Prizes. — *Any Distinct Breed.* —1, M. Magrath (Dorkings). 2 and 3, W. Magrath, Blessington (Silver-Grey Dorkings and Brahma Pootras). *Ducks.*—1 and 2, M. Magrath (Rouen and Aylesbury). 3, W. Magrath (Aylesbury).

SINGLE COCKS.

Dorking.—*Silver-Grey.*—1, J. C. Cooper. 2, R. P. Williams. *hc*, S. Mowbray. *Coloured.*—1, F. H. Green. 2, Mrs. Perrin. *hc*, Hon. J. Massy.

Spanish.—1 and *c*, J. C. Cooper. 2, R. P. Williams. *hc*, F. H. Green.

Game.—*Black-breasted Red.*—1, T. Haffield. 2, G. A. Perrin. *Brown-breasted Red.*—1, G. A. Perrin. 2, T. Haffield. *Any other Variety.*—1, G. A. Perrin. 2, C. Reynolds (White). *hc*, R. P. Williams (Gold-crested Polish); E. J. Poer (Duckwing Game).

Cochin-China.—*Buff.*—1, Mrs. Hay. 2, J. C. Cooper. *hc*, W. H. Perrin; F. H. Green. *Any other Colour.*—1, Mrs. Hay (Partridge). 2, Mrs. Taaffe. *hc*, J. K. Millner (Partridge.)

Brahma-Pootra.—*Dark or Light* —1, Mrs. Warburton (Dark). 2, Hon. J. Massy (Dark). *c*, T. Felton.

Crève-Cœur and La Flèche.—1, E. J. Poer. 2, Hon. J. Massy.

Malay.—1, Mrs. Taaffe.

Houdan.—1, G. A. Stephens. 2, F. H. Green.

Hamburgh —*Gold or Silver-pencilled.*—1, F. Connor, jun. 2, Hon. J. Massy.

Bantams.—1, F. L. Perrin. 2, E. J. Poer. *hc*, Mrs. Taaffe.

Pigeons.—*Pouters.*—1, E. A. Seale, Kilgobbin, Co. Dublin. 2, J. Dowling, Blackrock. *hc*, F. W. Zurhorst, Dublin. *c*, J. K. Millner; J. Dowling. *Carriers.* 1 and 2, J. Dowling. *c*, E. A. Seale. *Tumblers.*—1, 2, and *hc*, E. A. Seale. *Fantails.*—1, 2, and *hc*, E. A. Seale. *Nuns.*—1, E. A. Seale. 2, J. Dowling.

The Judge was Mr. Hutton, Pudsey, Leeds.

GREAT HORTON POULTRY SHOW.

The second annual Show of the above Society took place on the 5th inst. In point of numbers there was a considerable improvement as compared with last year, and the day being fine the visitors were very numerous.

In the *Game* the single Black Red cock shown by Mr. Fell, and the Brown Red by Mr. Hodgson, were especially fine. The entries in *Hamburghs* were but poor, but the quality good. The cup for the best pen was given for an excellent pair of Buff *Cochins*, closely pressed by the Brown Reds previously named. A cup was offered for Game *Bantams*, and was won by Brown Reds, although the second-prize pair of Black Reds were of equal merit, the decision being based upon the rarity of the first-named colour. In the class for Any other variety of Bantams, Blacks won both prizes, the first being chickens of this year, and the second adults.

Of the *Pigcons*, the Carriers were of moderate quality. The Pouters were good, and among the Dragoons there were many good birds but badly matched. In Owls the winners were Blue English, and White Foreign. The first-prize Yellow Turbite were of rare excellence, and the Tumblers good, both pairs being Almonds. The cock in the first-prize pen had the most perfect head we ever saw. Jacobins were moderate, and the Fantails good, but the Barbs poor, and the Antwerps were good, but not in the best feather. In the Variety class, Black Trumpeters were first, and Porcelain Swallows second.

Game.—*Cock.*—1, W. Fell, Adwalton. 2, C. Naylor, Horton. *hc*, J. Duxbury, Clayton. *Hen.*—1, W. Fell. 2, J. Smith, Horton. *hc*, H. Jennings, Allerton. *Black-breasted and other Reds.*—1, J. Hodgson, Bradford. 2, R. Hemmingway, Shelf. *Duckwing.*—1, H. E. Mason, Drighlington. *Any other Variety.*—1, W. Fell.

Hamburghs.—*Gold-spangled* —1, H. Bowker, Keighley. 2, H. Beldon, Bingley. *Silver-spangled.*—1 and 2, H. Beldon. *hc*, H. Bowker. *Gold-pencilled.*—1, H. Beldon. 2, H. Bowker. *Silver-pencilled.*—1 and 2, H. Beldon. *hc*, H. Bowker. *Black.*—1, H. Beldon. 2, H. Wood, Lidgett Green.

Spanish.—*Black.*—1, H. Beldon. 2, J. Powell, Bradford.

Cochin-China.—Cup and 1, H. C. Mason. 2, H. Beldon.

DORKINGS.—*Any Colour.*—1, W. Malton, Bowling.
POLANDS.—1, H. Bowker. 2 and *hc*, H. Beldon.
BANTAMS.—*Game.*—1 and *hc*, J. Blamires, Horton. 2, J. Elam, Horton. *c*, E. K. Fox, Great Horton. *Any other Variety.*—1 and *hc*, H. Beldon. 2, J. Preston, Allerton. *c*, H. Bowker.
SELLING CLASS.—1, J. Powell. 2, J. Duxbury.
RABBITS.—*Any Variety.*—1, J. Buckley, Bradford. 2, S. Johnson.

PIGEONS.

CARRIERS.—1, J. Holden, Wibsey Slack. 2, F. Horner, Harewood. *hc*, H. Yardley, Birmingham; E. Horner. *c*, H. Snowden, Great Horton.
CROPPERS.—1 and 2, E. Horner. *hc*, Clayton & Bairstow, Girlington; J. Thresh, Bradford.
DRAGOONS.—1, E. Horner. 2, H. Yardley. *hc*, J. Greenwood, Queensbury; G. W. Robinson, Halifax.
OWLS.—1, J. Holden. 2, A. H. Jubb, Halifax. *hc*, E. Rhodes, Great Horton; E. Horner.
TURBITS.—1, Clayton & Bairstow. 2, W. Poole, Bradford. *hc*, J. G. Dunn, Newcastle; Clayton & Bairstow.
TUMBLERS.—1, E. Horner. 2, H. Yardley. *hc* J. Thresh. *c*, J. Holden.
JACOBINS.—1 and 2, E. Horner. *c*, H. Yardley; Clayton & Bairstow.
FANTAILS.—1, H. Yardley. 2, Clayton & Bairstow.
BARBS.—1, H. Yardley. 2, E. Horner.
ANTWERPS.—1, Clayton & Bairstow. 2, J. W. Collinson. *hc*, Clayton and Bairstow; E. Horner.
ANY VARIETY.—1, J. Thresh. 2 and *hc*, Clayton & Bairstow. *c*, A. Murgatroyd, Bradford.

JUDGES.—Mr. W. Cannon, Bradford, and Mr. E. Hutton, Pudsey, Leeds.

WAKEFIELD POULTRY SHOW.

THE following prizes were awarded at this Show, held July 29th:—

GAME.—*Black or Brown Reds.*—1, G. F. Ward, Wimbury, Nantwich. 2, C. W. Brierley, Middleton, Manchester. *Any other Variety*—1, C. W. Brierley. 2, B. Jarvis, Mansfield. *Chickens.*—1 and 2, B. Jarvis.
SPANISH.—*Black.*—1, C. W. Brierley. 2, H. Beldon, Goitstock.
COCHIN-CHINA.—1, H. Lacy, Hebden Bridge. 2, C. H. Wood, Accrington.
BRAHMA POOTRA.—1 and 2, H. Lacy.
HAMBURGHS.—*Gold-spangled or Pencilled.*—1 and Cup, H. Beldon. *Silver-spangled or Pencilled.*—1, H. Beldon. *Any other Variety.*—1, H. Beldon.
GAME BANTAMS.—1, E. Payne. 2 W. Adams, Ipswich. *Any other Variety.*—1, H. Beldon. 2, S. & R. Ashton, Mottram.
CHICKENS.—*Any Variety.*—1, B. Jarvis. 2, C. & J. W. Mason, Drighlington.
DUCKS.—1, C. W. Brierley. 2, E. Leech, Rochdale.

PIGEONS.

CARRIERS.—1, H. Yardley, Birmingham. 2, E. Horner, Harewood.
POUTERS.—1, H. Yardley. 2, E. Horner.
BARBS.—1, E. Horner, 2, H. Yardley.
DRAGOONS.—1, H. Stanhope, Eccleshill, Leeds. 2, F. Graham, Birkenhead.
TOUMPETERS.—1 and Cup, E. Horner.
TURBITS.—1 and 2, E. Horner.
JACOBINS.—1 and 2, E. Horner.
NUNS.—1, J. Watts, Birmingham. 2, H. Yardley.
FANTAILS.—1, J. Walker, Newark. 2, H. Yardley.
TUMBLERS.—1, E. Horner. 2, H. Yardley.
OWLS.—*English.*—1, R. Brudley. 2, H. Adams, Beverley.
ANTWERPS.—*Short-faced.*—1, E. Horner, 2, W. Jarvis. *hc*, J. W. Collinson, Halifax; H. Stanhope. *Long-faced.*—1, H. Stanhope. 2, J. W. Collinson. *hc*, E. Oldroyde, Osset (3); C. Ambler, Wakefield. *Six Working.*—1 and 2, E. Oldroyd. *hc*, H. Drake, Wakefield.

RABBITS.

SPANISH.—1, A. H. Easten, Hull. 2, H. Cawood, Thorne, Doncaster.
ANGORA.—1, J. Barron, Castlemere, Rochdale. 2, A. H. Easten.
HIMALAYAN.—1, J. Boyle, jun., Blackburn. 2, A. H. Easten.
SILVER-GREY.—1, S. Greenwood, Hebden Bridge. 2, J. Boyle, jun.

JUDGES.—*Poultry, Pigeons, and Rabbits:* Mr. W. Cannon, Bradford; and Mr. E. Ackroyde, Eccleshill, Bradford.

LONG SUTTON POULTRY SHOW.—We have received a prize schedule of the Show of poultry, Pigeons, and Rabbits to be held at Long Sutton, on the 4th and 5th of next October. The general arrangements of commodious tents for the careful protection of all the specimens will be carried out just as in former years, and admit of no improvement. The prizes offered are most liberal. Fifteen silver cups of the value of five guineas each are offered for the principal classes, and prizes in the general classes of 20*s.* and 10*s.* are also given. A class for ornamental birds, each pen to consist of any number, will, doubtless, cause not only a very heavy but most attractive entry. A five-guinea cup to the most successful exhibitor, to be awarded by points, will secure many extra competitors, and doubtless the next Show will eclipse its predecessors. A very stringent rule against trimming will be strictly enforced. In certain classes, 28, 29, 30, and 49, the prize and commended birds will be disposed of under the hammer, and any sum obtained beyond the price at which they are entered in the catalogue, will be equally divided between the Committee and the exhibitor.

MELTON MOWBRAY POULTRY SHOW.

THIS Society dates the institution of a Floral, Horticultural, and Fruit Show from some three years back, but it was not until the Show of last Thursday that poultry, Pigeons, and Rabbits formed part of the Exhibition. This new feature added much to the general attraction, and a remarkably fine day amply secured the financial success of the undertaking. The Show took place in the park directly opposite Lord Wilmot's hunting box, and perhaps a more lovely place for such a purpose has rarely been chosen. The acting Committee, though quite inexperienced in poultry matters, carried out all their arrangements as methodically as though conversant with the management of a poultry show for a long series of years. They worked well, both as a body and individually, and deserved the success they attained. The tents were very spacious and well ventilated, and Messrs. Turner, of Sheffield, supplied all necessary exhibition pens.

Dorkings were in many cases of very high character, but were as a rule in deep moult. *Spanish* were as good a class as any in the show tent; and although only a couple of entries were made in the class for *Cochins*, Mr. Woodcock and Mrs. Williamson may dare competition at almost any meeting. Mrs. Williamson's Light *Brahmas* we have scarcely seen equalled throughout the season, their condition and markings being first-rate. *Hamburghs* were one of the weakest points in the whole Show; they appear to be almost unknown in the district, but one or two annual exhibitions will quickly alter this shortcoming. *Game fowls* were good but mostly out of condition, and unexpectedly the Game *Bantams* were far below par.

The *Water fowls* and *Turkeys* were all good; and among the *Geese* a pen of White Spanish, a scarce variety, were shown in capital condition.

Pigeons, with the exception of the Pouters, were not good, but we must except a pair of winning Archangels in the Variety class. A little different arrangement of the prize schedule would much improve this section of the Show in future years.

Rabbits formed a first-class show, and there was a numerous entry.

Mr. Edward Hewitt, of Sparkbrook, near Birmingham, was the Judge.

CROYDON POULTRY SHOW.

CONSIDERING the number of poultry shows to which our attention is now invited, and the consequently large choice offered to exhibitors, it may be well to know to which not to send our birds. It is always painful to complain, and it has never but once before been my lot, in a considerable experience, to feel forced so to do about any poultry show management. In the points which I am about to enumerate I believe the mismanagement of the late Croydon Show to have been so great and so reprehensible that silence would be equally unjustifiable.

On Wednesday, July 26th, I made my way to the Show, which was held in a park. At the lodge a policeman informed me that it did not open till one o'clock; that there was no objection, however, to my going to the tent, though it then wanted half an hour to the time. Arrived at the tent I found the same privilege accorded to several others, acquaintances, apparently, of the authorities there, which I have not the honour to be. We were supposed not to go more than a certain distance inside—quite far enough, however, to give a view of the whole tent, and to reveal several particulars hardly satisfactory to exhibitors—1, That then (about 12.45) the judging of the 250 pens had not advanced far, supposing the Judge to take the classes in order, and to finish one before he began another. 2, That a list of the pens and their exhibitors—in fact, a proof sheet of the catalogue—was posted up in the tent while the judging went on. 3, That the rain came through the tent like spray on to the birds, the pens, of course, being open at the top. A policeman in charge informed me, with more satisfaction to self than me, that he had been obliged to keep his waterproof cape on all night in the tent. 4, That the larger number of the baskets were piled up in the open air, and after a drenching night were saturated through linings and straw, and their labels rendered almost illegible.

This was the first act in the proceedings. At one o'clock I was advised to return to the lodge to purchase a ticket of admission. This I unwisely did, for once outside the gate it was impossible to get back. No ticket-vendor arrived till long after the time announced, and in the meantime I stood in dripping rain at the gate. When at last he put in an appearance he was not allowed to sell tickets on account of the Judge's delay. At last, about 1.40, I was allowed to have one, and proceeded towards the tent; but, though "Admission from one till five" was printed on the ticket, I was soon called back, reprimanded for going near the tent, in which I had been an hour before, and deprived of my ticket. A few minutes later tickets were generally sold. I once more proceeded to the tent, bought a catalogue (with no awards), and found no prize cards up. At last these came, and were irregularly put up at intervals for half an hour. I had already seen enough of the Show to make me despond on the subject of awards. I will not animadvert on them, as I might be partial. I never heard such dissatisfaction before. The above is a plain and accurate account of what happened, and, I need hardly say, shall not happen to me again at Croydon.—O. E. CRESSWELL.

P.S.—I may add, 1, That through the Secretary's carelessness in not numbering class and pen on my labels I never felt certain that my birds would be penned till I saw them. 2, That I have heard from a great patron of the Show that his birds arrived from Croydon dripping "as if from a washtub," and one with roup, hitherto unknown in his yards.—O. E. C.

I VENTURE to trouble you with some few remarks upon certain points connected with this Show which may not be unworthy of the attention of the Committee, of the subscribers to the funds, and of exhibitors. The schedule of prizes issued by the Committee was undoubtedly good both with regard to the number of classes and to the amount of the prizes offered for competition in each class. A very fair number of entries, and an exhibition of poultry quite up to the average in most instances in point of quality, were thus secured; but I am inclined to

think, that unless more attention and care are in future bestowed on various details, the Show will soon become a thing of the past. The tent in which the birds were arranged was much too small, as well in height as in width and length. As regards its height, it was so low that in walking under it one felt almost inclined to stoop, whilst it was so narrow that there was not sufficient space between the rows of pens to admit of the spectators passing round in two lines; and in consequence of the want of length the pens were placed two and even three high. The result of the latter arrangement was not only to bring the birds in the top row much too near the canvas, but to place many pens either too high or too low for being seen properly. It should also be noticed that there was a great want of ventilation, and that the spectators, instead of being made to enter the tent by the right hand and to go out by the left, were permitted to enter and to walk about at their pleasure, a circumstance which caused much jostling and confusion. In several pens, moreover, the birds were not only without water, but without any vessel for containing it.

The judging, too, was by no means satisfactory. I am aware that this is a delicate subject with which to deal, and that it may be supposed that I write as a disappointed exhibitor. I would beg leave, however, to say that I write under no such feeling, and that, as I had the opportunity of being an eye-witness of how other exhibitors fared at the hands of the Judge, I can well understand how the birds which I exhibited there, and which have taken prizes at larger shows under Mr. Hewitt, Mr. Tegetmeier, and Mr. Baily, were not successful. In order to point out how the Judge did his work, I may mention that in several classes prizes and honours were given to the worst pens, or to pens which possessed absolute disqualifications for them. In the Variety class the first prize was awarded to a pen of Black Hamburghs, the cock in which had not only imperfections in his comb and large streaks of red on the earlobes, but also a wry tail, whilst the hen had an imperfect and a lop comb! In the classes for Bantams, a pair of Duckwings obtained the second prize, although the cock was about the worst in the Show. In the classes for Brahmas, too, the awards would probably be acquiesced in by few, whilst amongst the Spangled Hamburghs they were quite in keeping with that in the Variety class already mentioned; red earlobes, lop combs, and an almost total absence of bars on the wings, with other imperfections, constituting apparently no drawbacks to distinction. I positively saw one hen in a highly commended pen which had a comb which was not only a lop-comb, but which was also almost oval, large, pretty nearly destitute of both spikes and pike, and having a large hollow in the centre.—OBSERVER.

I WAS first with White Dorkings, and first with Black Hamburghs in the Any variety class. Your reporter states that the Dorkings "are a very poor pair," and the Hamburghs "a wretched pair, white in face, red earlobe, and the cock with a wry tail," and hardly worth 2*s* 6*d*. I hope you will, as you always do, promote fair play, and not allow my reputation to be damaged. They are not wretched, nor red in ear, neither are they white in face, nor wry in tail; and, moreover, these two pairs of birds so depreciated by your correspondent I have exhibited ten times, and won ten first prizes—that is, they have won first prizes wherever exhibited, and are fit to win anywhere in the kingdom. Mr. Hewitt has judged them twice and called them very good birds—J. H. NICHOLLS.

[In reply to Mr. Nicholls's communication, I beg to state my remarks on his pens of poultry exhibited at Croydon were quite correct, as I can substantiate by the evidence of four other gentlemen, who are well able to form an opinion. The Hamburghs were certainly most inferior, with face and ear as I described, and even Mr. Nicholls himself seemed to think but little of them, as he only priced them at 50*s*., a very poor price for a pair of birds which had been exhibited ten times and won ten first prizes.—YOUR CORRESPONDENT.]

THE LATE MR. WOODBURY.

No expressions we could employ would more forcibly or more correctly express our deep regret for the loss of our friend, than that outpouring of genuine feeling which was contributed to our columns last week by Mr. Bevan Fox. We can now add but little to the following biographical notes:—

THOMAS WHITE WOODBURY was born in London on December 14th, 1818. His father, an eminent linguist, was then resident there, but subsequently removed to Exeter, and entered into partnership with the late Mr. Woolmer, proprietor of the *Exeter and Plymouth Gazette*. Our friend, also, was connected with the *Gazette*, and took an active part in its management. On retiring from his connection with the *Gazette*, and after a residence of two years in Birmingham, Mr. Woodbury returned to Exeter, and having a sufficient private fortune did not again enter into any business. But he never was an idle man, and among other pursuits he devoted a considerable portion of his time to the study of bees. In the year 1854, Mr. and Mrs. Woodbury suffered severe affliction by the death of their only son, and she survives, with two daughters, to mourn their still greater loss.

Of Mr. Woodbury's contributions to our columns no other comment need be made than that they were invariably the results of practice; his replies to correspondents were characterised by sound judgment and courtesy, and even when he exposed the mistakes of "The *Times*' Bee-master," he wrote without asperity, and was contented when he had established the truth. No man showed less consciousness of superiority, although as an observer of Nature he was so sufficiently publicly known as to have been approvingly noticed by Mr. Darwin. What he was in private life Mr. Bevan Fox has told, and a neighbour says, "To see him amongst his bees was no small pleasure, so gentle and patient and kind was he, and so willing to convey to others the store of information acquired by years of observation and research."

SUPERS—DRONE SLAUGHTER.

I HAVE been a disciple of a "COUNTRY CURATE" for a number of years. I began this year with two stocks, a black and a Ligurian. The black has been very strong, and yet I have prevented its swarming. The Ligurian hive was weak and required feeding, although at the end of 1870 it was very strong in bees, and weighed 6 lbs. more than the black stock. I have taken a glass of honey from the black stock, June 9th and on June 26th part of a small box, but in all not more than 6 lbs. of honey. Since then the weather has been very bad and I have let them keep what they have.

I did not expect the Ligurians to swarm, but I found that they increased in numbers very rapidly at the beginning of July; on the 12th I placed a small glass on the hive, which they occupied at once, but on the 20th they swarmed, and I found had not made any comb in the glass.

I placed (*à la* "COUNTRY CURATE") the swarm in the old stock's place, to prevent a second swarm. The bees at once began to kill the drones, and did so up to twelve o'clock yesterday (July 28th), when a second swarm issued. They are still killing the drones, although their use cannot yet be dispensed with. Is this usual? I have seen cast out of the hive three queens which were quite healthy, and I have returned them. I have collected eight perfect young queens, which have been cast out of the hive.—APIS.

[In the first place we should fancy your supers are too small to be of much real use either in preventing swarming or in obtaining good quantities of honey. Killing off the drones at such a time generally shows that there is little or no honey in the flowers to be collected, but there will most probably be a sufficient number of drones, either from your own or from other hives in the vicinity, left to fulfil all the duties required. At so late a period of the summer as when your first swarm issued, we should not be disposed to advocate the removal of the stock and the putting the new swarm in its place.]

LATE SWARMING.

I HAVE had some very late swarms from my apiary this season, and the issue of some of them, I think, it would have been difficult to have prevented. During the last week in July I had no less than four swarms, each of them large enough to fill an ordinary straw hive. I was always under the impression that late swarms were generally very weak ones; however, in this case, it is quite the reverse. The ungenial weather we have had here during the last two months has, I think, been the cause, it having been either dull or very windy the greater part of the swarming season, and, consequently, the bees have been prevented from taking wing at the proper time. A few bright days would bring the second crop of clover in flower, which would be a great help to the bees. With feeding twice or thrice a-week I have no doubt I shall be able to save them. I should be glad to know whether any of the readers of "our Journal" have had such late swarming, and if so, can they account for it?—T. J. HARRISON, *Farndon, Cheshire*.

[Late swarming has been very prevalent in all parts of the country this season, but the majority of the swarms will not survive the winter.—EDS.]

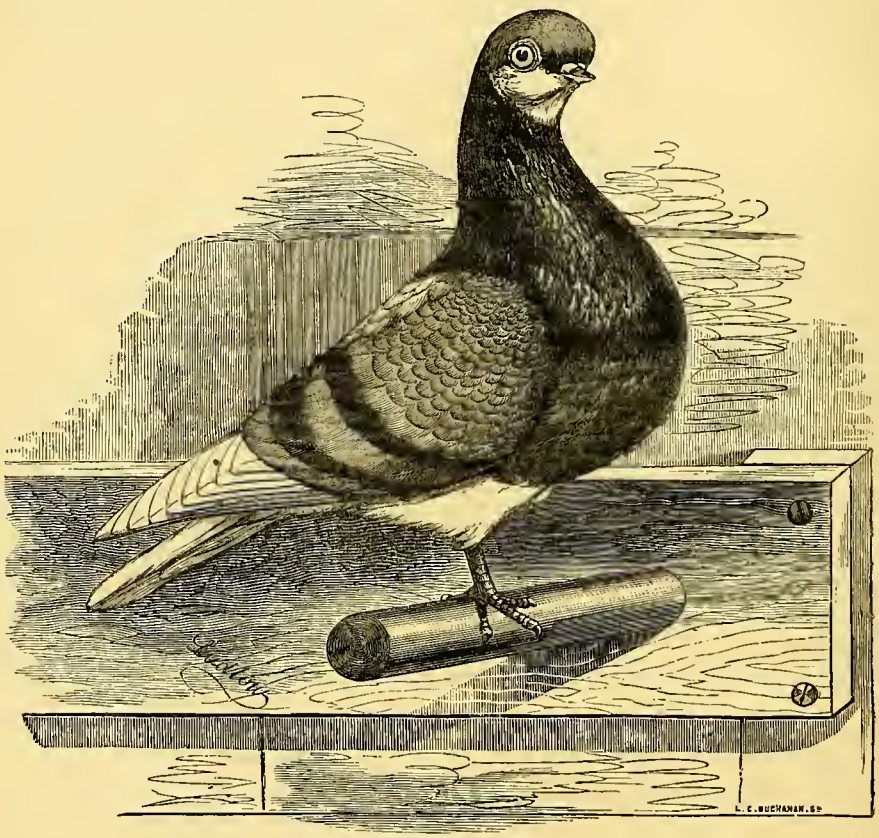
THE BALDHEAD AND BEARD PIGEONS.

WE have this week the pleasure of placing before the readers of THE JOURNAL OF HORTICULTURE the portraits of two of the prettiest and most interesting varieties of our fancy Pigeons—the Short-faced Bald and Beard Tumblers, two varieties which we have no hesitation in saying have not of late years received that attention and consideration to which their beauty and merit deservedly entitle them. We very much question

if there is any fancy which possesses greater attractions and interest for the breeder than the one in question. A prettier sight we are certain it is impossible to gaze upon, than a first-class loft of these charming and sprightly little pets, when the plumage is rich and clean, and the colours of the several varieties evenly represented. In a great measure we suppose this apparent neglect must be attributed not so much to want of appreciation, as it is to the one characteristic which they in common with all their Short-faced brethren more or less participate in.

In answer to the question often put, "If you admire the varieties so much, why do you not keep them?" the invariable answer nearly always comes, "Oh! because they require so much attention and are so difficult to breed good, even if you can breed them at all." Now, this difficulty of rearing the progeny of all the Short-faces, as we remarked with regard to the Almond, is more imaginary than real. The impression seems somehow to have got abroad amongst the fancy of the present day, and serves to turn in another direction the inclination of many a fancier, and in nearly every instance without a trial. We have only emphatically to repeat that this impression is entirely unfounded, and that if the right system is pursued, the breeding of Short-faces is, so far as our experience goes (and it is not inconsiderable), a far easier and more pleasing task than the rearing of high-class young Carriers and Pouters. Yet how many are there who persevere in that direction! We will, however, say a little more on this point further on, and in the meantime turn to the primary object of these notes.

In setting forth the points of the two varieties in question, their similarity, with one exception, will render only one description necessary. As colour is in our opinion the most im-



The Beard.

portant property, we will commence by remarking that the standards are red, yellow, black, blue, and silver, the latter two possessing the black bar common to all their brethren of these colours. Richness and depth of colour are essential features, and more particularly is this so in reference to the three first-mentioned. To obtain this with the correct marking will be found a task of no easy accomplishment. The eye should be white, or what is termed the "pearl eye," bright and full. In structure the birds should be as small as possible, compact, and short in the body, flights, and tail; the neck short and tapering into a full broad chest; the legs short, and the feet small and neat.

Regarding the shape of the head we have a word or two to say, merely by way of suggestion. As in all Tumblers, it should be as round as possible, with a short, fine, and straight beak. We must confess, however, that it is a matter of surprise to us that no ardent enterprising lover of the Bald and Beard has endeavoured to place upon them the broad and lofty skull of the Almond. That it would enhance their beauty and value we think no one will deny. In this direction we think there is ample scope for improvement; but fanciers of late years do not seem to hold this opinion, very little, if anything, having been done by them to improve the varieties in this particular, or, perhaps, we might also add in any other. Small and beautiful enough in colour and marking we do frequently see them, but in every other respect they are merely their longer and larger *confrères* repeated. The answer may, and no doubt will be made, that all this is very fine, and very much more easily talked about than done. But has it not been done with the Almond by our fathers? Why cannot we repeat it in the Short-faced Bald and Beard. Surely we must not conclude that there are not as much ability and zeal in the fancy now as there was fifty or one hundred years ago. Veterans tell us so, but we will not believe it, nor that the birds of their youth far excelled anything of the present day.

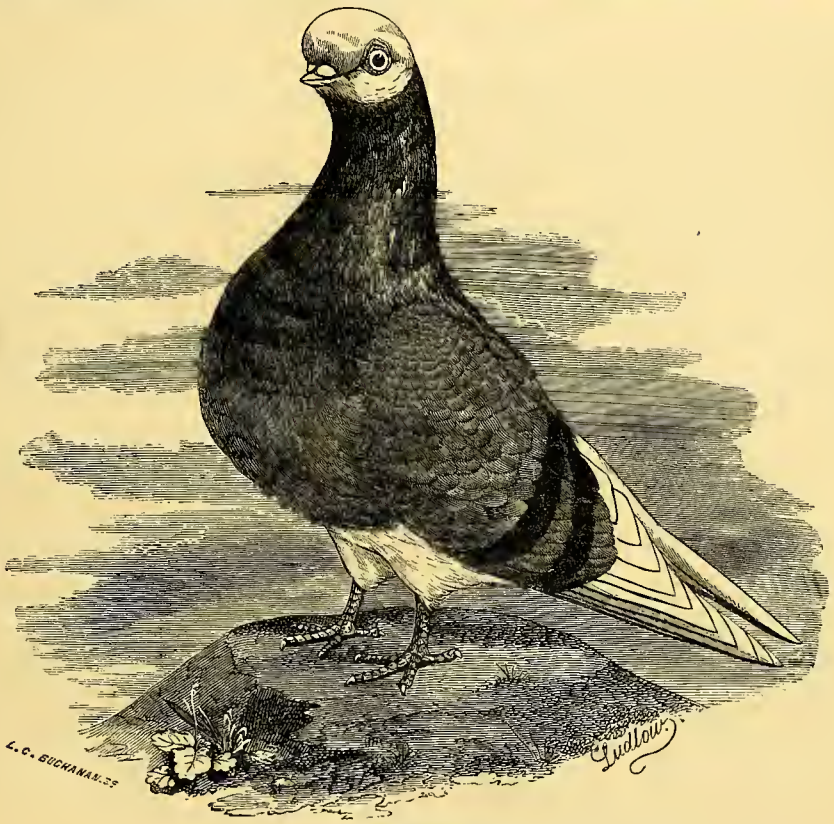
And now as to the markings. The body should be self-coloured; the first ten flight feathers in each wing, together with the rump, tail, belly, and thighs, of a pure white, as shown in the portraits. And here the similarity in the two varieties terminates and the distinctive characteristic steps in which gives to each its name. The head of the *Baldhead*, as far down as the ear and just under the lower jaw, should be white; the line of demarcation being clearly and evenly defined, or, as it is termed by fanciers, they must be "clean cut." The head of the *Beard* is the same colour as the body, but it should have a crescent-shaped band, or beard-like marking, of white

feathers on the throat immediately under the lower mandible, as will also be seen in the admirable sketch, which we think fanciers generally will agree with us equals, if not excels, any former production from the pencil of our able and esteemed Secretary, Mr. J. W. Ludlow.

We have now, we think, said all that is necessary to lead to a right judgment in reference to the varieties before us, but by way of conclusion we think a few remarks in reference to Short-faced breeding will neither be unacceptable nor out of place. As far as regards the Bald and Beard in particular, there is no doubt but they are much better nurses than the Almond and other Short-faces, as in many instances we have known them rear their own progeny strong and well. They are not, however, to be depended upon even in the most favourable weather —it is, in fact, the exception and not the rule; so that if anything like success is to be achieved a staff of nurses is an essential requirement, as, in fact, it is to every breeder of high-class birds.

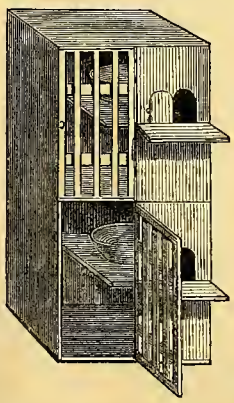
For this purpose none are better than the flying or common Baldheads. We do not allude to the excessively long-faced birds, but to a medium between them and the Short-faces, known as "pleasant-faced" birds.

All that is necessary in reference to nests, hatching, shifting, &c., was fully explained in our article upon the Almond; it is, therefore, unnecessary to repeat it here. What we more particularly wish to say at present is upon a most important and neglected feature in connection with Pigeon-breeding, the providing of proper accommodation for the nurses or feeders. The common notion is that any out-of-the-way hole or corner is quite good enough for them. Their requirements are generally the last to be attended to either as regards cleanliness or food, whereas common sense ought to make it apparent that the



The Baldhead.

very opposite treatment should be their lot. The warmest, driest, and most comfortable portion of the loft should be set apart for them; and if convenient they should be allowed full liberty in the open air, the benefit of which will soon be perceptible in the manner in which the important functions allotted to them are discharged. A hopper of vetches and a constant supply of pure fresh water should always be at their command. Our experience is, that by keeping them to one kind of grain they feed better and keep their young better supplied than by feeding in any other way, and no food is more wholesome or more suitable for Short-faces than tares. In our own lofts on this principle the death of a young one is a rare occurrence, and then it is from no neglect of the nurses; on the contrary, many of them are constantly rearing three and even four young ones, and always in the kindest possible manner. But for the pens such a loft should be provided with. They should be 2 feet in height and length, 18 inches deep. Half the front, as shown in the diagram, is closed with a board or blind, and the other half with a wicket or wire gate. Inside from the blind to the back is fixed a shelf 1 foot from the floor and the same width, on to which opens through the blind a small door for the egress and ingress of the birds, with a ledge for them to alight upon. On the shelf is placed the nest-pan, and as soon as the old birds are ready to lay again, it should be shifted with the young to the floor beneath, and a clean one substituted.



The advantage of the above plan must be apparent at a glance. The young birds cannot disturb the old birds while sitting, it puts them entirely out of danger when they begin to leave the nest, causes them to learn to feed themselves early, so that when they are able to ascend to the shelf they are ready for removal to the general loft. These pens have, amongst many other advantages, those of being readily and thoroughly cleaned, they give the loft a neat and uniform appearance, and in every way add to the pleasure of the fancier in ways unnecessary to detail. Notwithstanding that we have never seen these pens in use in any other loft, we wish to claim nothing original or novel in their production. It is possible

that they may be in use in many breeding establishments; but for those who have not adopted them, and want to be successful Pigeon breeders, especially of Short-faces, we have only to say, "Try them and you will not be disappointed in the result."—Birmingham Columbarian Society.

OUR LETTER BOX.

Mrs. Clarke, of Monk's Wood House, Huntingdon, writes us in reference to what appeared in "Our Letter Box" last week, that she "could not send Mr. Corbet a pair of White Ptarmigan and a pair of White Friesland fowls, valued at quite £5, for £2 the four birds." In that case we think Mrs. Clarke ought to have returned the money.

Hamburghs at Croydon Poultry Show.—"Mr. Reginald S. S. Woodgate wishes to state that in the Pencilled Hamburgh class at the Croydon Show his birds were highly commended, while those of Mr. H. Pickles, jun., took first and second prizes." [Mr. Reginald S. S Woodgate ought to have satisfied himself as to the facts before making so positive a statement as that which induced us to alter what was correct to that which was incorrect, but that he was honest in making that statement we fully believe from his expressed regret and the whole tone of his letter.—Eds.]

Spanish Hen Sitting (*Constant Reader*).—We thank you much, and hope many will follow your good example.

Breeding Lemon Buff and Cinnamon Cochins for Exhibition (*A. J.*).—It is exceedingly difficult to breed cocks and pullets fit for exhibition from the same parents. There is not much difficulty about colour. If the parents are correct in that particular, and are pure-bred, there is little doubt of their producing perfect birds in that respect. To produce the Lemon, the most beautiful of all colours, you have to watch the parents narrowly. There is a tendency to a darker shade of hackle in the hen, and to a white patch on the wing of the cock. Both these end in Silver Cinnamons. The original Cinnamons are hardly to be found The hen had a very dark brown hackle, and a body very much the colour of a dark Cochin egg. The cock was all over the colour of wetted cinnamon. As a rule, all fowls take more after the hen than the cock, and you should mate accordingly. Scan the size of the future cup bird closely, and see in what he is deficient, remedy it in the hen you choose for his mate. Do the same in breeding your pullets. Breed from none with capital defects, they are sure to be hereditary.

Eggs for Table (*P. H. S.*).—You do not require to keep a cock, but if you object to that course, borrow one once a-fortnight. You will do quite as well without one. You may choose between Cochins, Brahmas, and Crêve-Cœurs. We think the second.

Agate Cock and Kite Hen (*An Exhibitor*).—Your birds not matching would, we fear, greatly diminish your chance of a prize.

Pigeons Diseased (*W. T. S.*).—Your birds have roup—cold is the cause; Pigeons will bear any amount of heat, but cold weather or cold draughts injure them. Some strains of Pigeons are very much inclined to roup, so it would seem to depend partly on bad constitution. Mix hemp seed in the food Roup is very hard to cure; indeed, there is no certain cure. "Some get rid of it," says "A Foreigner," "by a dose or two of charcoal powder, some by a dose of carbonate of soda or a pinch of alum, and some by a dose of flowers of sulphur. Some are recovered by one remedy, some by another, and some never." We believe this to be the truth. Warmth keeps the roup away, and cold brings it on. Loss of an eye is no absolute disqualification for a bird.

Keeping Rabbits not in Hutches (*W. H. H.*).—Rabbits may be kept with success in so-called pits, or artificial warrens; perhaps a circular one looks the best. It may be of any diameter, from 8 to 12 feet, according to the number of Rabbits intended to be kept, and about 4 feet deep, in a sandy soil. One half the diameter should be left at about 2½ feet from the bottom of the pit for the Rabbits to burrow in and make their nests. The bottom and sides of the pit should be boarded or protected with wire netting to prevent the Rabbits burrowing outwards or downwards, and so escaping. The whole should be covered with a roof—it may be of straw to give a rustic appearance—at 6 feet from the ground, to admit air and prevent too much wet. Surround the open space with wire netting to prevent the entrance of enemies. A door in the netting and ladder will be requisite for feeding and capture. Rabbits may be kept with success in "courts" walled round on the cold sides, and having mounds of earth thrown up against the wall to a height of 3 or 4 feet, and 2 or 3 feet in thickness from the wall, all the rest being an open space, in which they can caper about in a half-wild state, and thus treated they will no doubt pay for the expense. We should suggest as the best varieties to turn out, either in a pit or court, the Belgian Hare Rabbit and Silver-Grey, or either of these or both mixed with a few common Rabbits. The two varieties named are now introduced into warrens, the Belgian for its size, as it weighs from 8 to 10 lbs., and the Silver-Grey for its more valuable skin.

Bullfinches Losing their Feathers (*C. J R.*).—The looseness of feather may possibly result from hunger and their exposure to cold, inducing a general derangement of the system. The true moulting season is now just at hand. Keep them warm, and encourage them to moult in earnest, and most probably they will take care of their new clothes. The diet is excellent.—W. A. Blakston.

Canary not Singing (*A Fancier*).—You should have detailed your sorrows earlier in the season, as it is now too late to make up lost time. A whole season's good conduct on the part of a Canary is no guarantee for the future, any more than a protracted period of misconduct of the most flagrant character should be accepted as evidence of worthlessness. I could enumerate instances without number in which apparently sterile parents have developed into fruitful vines; cruel, selfish, indifferent mothers into most affectionate nurses; and even cannibals into decent, well-conducted members of society. And the converse is equally true. It by no means follows because the vendor of your bird got three nests from him last season that the same success must of necessity attend him this year. Such a warranty—a mere dealer's puff, should not have been given, nor should any credence have been accorded to such an assertion. But beyond this (and it is just these little annoyances which make purchasers look with suspicion on dealers), the fault rests entirely with the bird "He was a capital singer"—itself an evidence of health, but continued to sit panting on the perch, has never begun to sing, and is now going to moult. It is only an everyday instance of the fact that Canaries are a precarious stock. Very little disarranges them. A sudden change in the weather, a draught, a chill will prove the fallacy of counting your chickens before they are hatched. Keep the bird warm and away from draughts; indulge him occasionally with a drop or two of sherry in his water; be kind to him, because he claims the attention at your hands, but when you have nursed him through the moult my advice is, Give him away.—W. A. Blakston.

Uniting Expelled Bees (*C. G.*).—The time for taking up hives varies according to the district, some, such as heath countries, being later than others, but, on the average, the end of August is as good a time as any. It is not necessary to capture the queen, but if you can do so without much trouble all the better.

Transferring Bees from Straw Hives to Woodbury Hives (*G. F. Tabram*).—Provided you transfer all the combs of the straw hives into the frames, and give liberal feeding in addition, there is no reason why you should not be able to effect the transfer at once; but we should prefer leaving it until April of next year, when the operation will be found attended with much less difficulty. We have not been in the habit of reducing the size of our hives by putting in dividing frames, but see no objection to your doing so. We prefer having hives of different sizes, and shifting according to the strength of the colonies.

Drone Slaughter (*C. A. J.*).—Your bees slaughtering their drones does not prove that the hives have or have not queens. It is usually considered to be a sign that the best of the honey season is over, at least for the time.

REMARKS.

2nd.—Beautiful day, rather too warm, there being no wind to temper the heat. Cloudy between 4 and 5 P.M., but no rain.

3rd.—Hazy in early morning, very fine after 11 A.M.; fine sunset; a little more wind in the evening, and consequently cooler.

4th.—Rain in the night and early morning, showers during the day, fine evening.

5th.—A lovely day throughout: sunshine, pleasant breeze, and no rain.

6th.—Rather cloudy in morning, but a lovely day; hot, but a little wind.

7th.—Dull early, but a splendid summer day; breeze from north in the afternoon.

8th.—Hazy in early morning, sky nearly cloudless all day, very little wind till evening.

The warmest week this summer, and yet not oppressive, there being a nice air, especially in the evening.—G. J. Symons.

COVENT GARDEN MARKET.—August 9.

The supply of soft fruit has much moderated this week, and Currants and Gooseberries are nearly over. Good samples now command rather high prices. Importations are very heavy, and comprise Peaches, Nectarines, Green Gage and other Plums, Apricots, and Melons. Grapes and Pines are quite sufficient for the trade.

From observations taken near London during forty-three years, the average day temperature of the week is 72.5°, and its night temperature 49.9°. The greatest heat was 92°, on the 18th, 1842; and the lowest cold 38°, on the 18th, 1866. The greatest fall of rain was 0.81 inch.

VINE BORDERS AND YOUNG VINES.

NO set of rules or directions, however comprehensive, can be framed to meet all requirements or to suit every case, no matter for what particular purpose or process of cultivation they may be required. In the very numerous articles published in the pages of "our Journal," and the varied directions given in separate works on the culture of the Grape Vine, each writer appears to, and undoubtedly does, put forth cultural rules deduced from his own experience. Some are brief, comprehensive, and to the point, while others are more discursive, and even go so far as to enter into the most minute details, each kind of soil for the border being weighed and measured to a nicety. The latter method is all very well as far as it goes; but such advice is only really valuable to those who are able to procure the sorts and quantities of soil indicated. Where it is not so, such strict rules must often prove very puzzling to those who, knowing little, if anything, of the accommodating nature of the Vine, and the ease with which it may be cultivated successfully, are left in doubt whether, in the event of their not having the desired materials, they may venture to infringe these rules by substituting the best soil they can command. I think, therefore, that in laying down such rules while naming the most suitable soils, it would be well to state in what a variety of soils the Vine is known to flourish, and that if the border is so made that the roots may have an abundance of sweet fertile soil to ramble in and feed upon, with ordinary care in culture success is almost sure to follow.

The large number of young Vines planted every year is surprising. One of our largest growers of pot Vines told me last season that his stock, numbering many thousands, was nearly exhausted long before the season for planting was over. It is therefore certain that there are every season numerous beginners in Vine-culture; and having made a border for a range of vineries last season, in which the Vines have grown in a very satisfactory manner, it may be useful to some if I give a few of the chief details of the work.

The soil and subsoil on the site of the border were first of all thoroughly examined. The soil proved to be a poor shallow loam, and the subsoil a very stiff retentive clay saturated with moisture. It was, therefore, quite evident that the soil was worthless for the purpose, and that means must be adopted to guard the roots from contact with the cold wet subsoil. In making the border I was allowed to use an abundance of turf taken fresh from a bed of red loam strongly impregnated with oxide of iron; a large heap of old pond mud was also at my disposal. This had had a quantity of lime mixed with it; it had been lying in a sunny corner for a number of years, had been turned once or twice, and had become so thoroughly pulverised and sweetened that it was in reality an excellent, strong, friable soil. To these two kinds of soil was added a quantity of bricks, which, from some cause—probably from being badly tempered—had become completely shattered to fragments in the burning, and were therefore useless for building; but they were, I thought, admirably adapted for mixing with the Vine soil, which would thus be prevented from ever settling down into a close inert mass. In mixing the soil no stated quantity of either kind was used, but care was taken to let the turf largely predominate. Crushed bones were used at the rate of 1 cwt. to each foot in length of the border, which, I should state, is 20 feet wide, 3 feet 6 inches deep at the back, and 2 feet deep in front. This quantity of bones may appear excessive, but I do not think it will be thought so when I have explained how they were used, as I will now proceed to do.

The bottom of the border was concreted in the usual way, and made to slope well from the back to the front. Rows of 2-inch drain-pipes were laid upon and across the concrete at regular distances, and connected with a row of pipes running along the front of the border; then came a layer of rubble several inches deep—among this a few bones were cast; and instead of covering it with rough sods, as has been so often advised, enough bones were scattered over it to keep the soil from working down among the stones. My motive for doing this was, that although the turf at first prevents the soil from mixing with the rubble, yet as the turf decays, so surely does the soil gradually settle down among the stones. The bones, while preventing all this, will offer a rich store of food to the roots for a long time. It is well known how soon Vine roots reach the bottom of a border; it seemed to me, therefore, that by using some crushed bones as I have stated, the border would be more thoroughly drained and more durable. The quantity of bones given will afford enough for this purpose, and a fair quantity for mixing with the soil.

In selecting Vines for planting care should be taken that each plant is as vigorous and healthy as possible; they cannot well be too strong. Stout fruiting canes are altogether preferable to the weakly "planting canes" as they are called, and which are so frequently used, though costing nearly as much as the stronger plants. Fine fruiting plants of the choicest kinds can now be had for 7*s.* 6*d.* each; it must therefore be granted, I think, that it is true economy to purchase such in preference to others costing nearly as much, and yet so weak as to require at least an additional season to bring them into a fit state for producing good fruit.

Whatever kind of canes are used, it is of the highest importance that the whole of them should be uniform in size and strength, because the treatment under which strong Vines with plenty of sound roots will flourish, is often very hurtful to weakly plants. The cause of this is very apparent. The fine prominent buds of the strong Vines, excited by the steadily-increasing temperature, break forth into vigorous growth; and the abundant healthy roots form spongioles so quickly that when the stored-up sap in the canes is exhausted, or nearly so, the roots are ready to supply the demand made upon them. So the Vines, sustaining no check, mount the trellis quickly and with surprising vigour. Not so the weaker plants; they will

indeed burst into growth as freely as the others, but they have not the requisite strength to produce rootlets so fast as the larger Vines, and consequently, after growing a few inches in length, the shoots, not being supplied with sap nearly so fast as they require it, and yet being subjected to the lively temperature so suitable to their stouter neighbours, grow slowly and so weakly that the delicate foliage is destroyed by the first hour or two of bright sunshine. Thus the Vines sustain a shock so severe that they take all the season to recover from its effects. It is, therefore, very certain that such weak Vines ought to have a house to themselves, where they can be kept at a temperature suited to their strength, so that, growing slowly at first, they may pass unscathed through the critical period of the formation of the first young roots, and produce canes of tolerable size, though altogether inferior to the more robust Vines.

One other point in the culture of young Vines is so important that it cannot be too often reiterated—it is that those having the care of them should keep themselves as thoroughly and constantly acquainted with the condition and progress of the roots as they do of the shoots, so that the Vines, being freely supplied with water when they need it, may be kept in full vigour throughout the growing season.—Edward Luckhurst.

DENDROBIUM CHRYSANTHUM.

In the rich collection of Orchids at Ferniehurst, Baildon, near Leeds, several plants of the above-named Dendrobium are now clothed with their magnificent golden yellow flowers; but most worthy of our notice are two exceedingly sturdy growths, one of which measures 4 feet in length, bearing seventy flowers, the other 5 feet 6 inches, and bearing eighty flowers, forming two splendid strings of bloom. This is a plant which deserves more attention than it generally receives, newer introductions having put it a little in the shade; but although it has been in the country for upwards of forty years, it is still one of the most lovely and attractive Dendrobiums we have. The plants referred to are rendered still more attractive than they otherwise would be from their retaining the foliage, which greatly improves the appearance of the flowers.

Dendrobium chrysanthum is a plant of easy culture, which should be in every collection. It succeeds best when grown in a hanging pan or basket filled with peat and moss, good drainage being provided. It requires a moderate amount of heat and moisture during the growing season, after which it may be removed to a cooler house, where it will amply repay the cultivator by producing a profusion of its rich flowers.

At Ferniehurst, in another house, there are a few pans of Disa grandiflora superba in excellent condition. In one pan I noticed thirteen spikes. The plants are growing close to the glass, by which means the flowers, which are bright scarlet and crimson, veined with pink, are brought to perfection. There are not many, I think, who meet with great success in the cultivation of this lovely Orchid; but in the Odontoglossum house it seems quite at home, and better health could not be attained. Close to it are some good specimens of Oncidium macranthum; on five plants I counted one hundred of its rich flowers, forming quite a mass. Two or three are excellent varieties; one of the plants flowered some time ago, and had, I was told, a spike 12 feet in length bearing forty-four flowers. Of all Oncidiums yet known I think this the most lovely and interesting. It was introduced into this country by Messrs. Backhouse & Sons, of York.—N. G. S.

PROTECTING FRUIT TREES.

There was an interesting article at page 29 about the protection of fruit trees from frost, and I can entirely endorse the opinions therein expressed. My garden is unfavourably situated in a county where neither soil nor climate is adapted for high-class wall fruit. It is at a considerable elevation, and near mountains, the mists from which give us too much moisture, and hide the sunlight. We have very cold spring winds and frosts. Few in this neighbourhood are so adventurous as to attempt Peach-growing on open walls, but owing to my having a warm, well-sheltered, snug corner, I planted on the south wall a Malta Peach, which had become a fine healthy tree, and blossoms well yearly, but had never set a fruit. This spring my gardener, seeing it covered with splendid bloom, suggested, as our Cherry netting was then lying idle, that we should hang a couple of the nets, so as to be double, from the wall coping, which projects 4 or 5 inches, and support the double thickness at a little distance from the wall on a few rough sticks over the tree. The netting is of a large mesh, and seemed so very transparent and so slight a protection when put up that I had no hope it would effect the end in view, but the event proved otherwise; for I need not tell you that the late spring, from its cold and damp, was particularly unfavourable for fruit-setting, but the result is that my Malta Peach tree was so covered with fruit that we have been obliged to thin it heavily more than once, and its present crop is, I think, thicker than it strictly ought to be.—C. R.

THE POTATO DISEASE.

I hear of this from all quarters, but hope that the extent of the evil as yet is greatly exaggerated. It manifested its presence here (near Luton) a few days ago by the withering of some of the leaves when they ought to have been very green, but very few of the tubers are as yet affected. Still, I am never sure of those which have been taken up and housed in a seemingly clean and healthy state without a speck or flaw, as in former years I have found the apparently sound Potatoes have been tainted, and the taint spread in the store heap however dry the earth with which they were covered. The crops seem to be unusually heavy, and if only a few tubers become diseased the loss will not be much felt, and the price will not be much raised. I have been looking for the visitation for weeks after such dull showery weather, and more especially as my rows were closer together than they ought to have been, and often planted as intermediate crops, and therefore having the least instead of the greatest amount of sun and air.

Judging from what has come under my own observation, I think there is nothing very alarming as yet, though the reports that reach us rather belie such hopes. I am unable to do more in the way of advice than to give a hint, and that founded on two experiments in former years, and therefore too few to enable one to say surely whether the result might be cause and effect, or merely a fortunate coincidence.

In almost all cases I believe that the disease first attacks the stems and leaves, and it will do this all the sooner in proportion to the vigour and luxuriance of the plant, the richness of the soil, and the continued extra moisture and decreased direct sunlight in the atmosphere. After plants have been slightly attacked I have known them throw off the disease, and put out fresh foliage if there was a sudden change in the weather from close, moist, and dull to the breezy, bright, and warm. In the majority of cases, however, when once the evil commences it goes on less or more even as respects the tops, and ere long begins to affect the roots. The great object then is to limit its action on the roots, and the two cases I have referred to seemed to show that by removing the tops as soon as they were tainted the tubers beneath suffered less. The sooner this is done the better, so that the disease should not pass as far down the stem as the surface of the ground. Of course all action in the tops being thus taken away, the tubers will grow little or nothing afterwards, but they will ripen and mellow a little more after the tops are withdrawn. Late Potatoes, where the tubers have scarcely become even waxy when attacked, will scarcely ever, if even the tubers are not seized with the disease, be fit for the tables of any but those who delight in a waxy Potato. It is strange what different tastes exist on this subject. I like a mealy Potato, not a bit of the outside boiled away, and soft and mellow to the heart when cooked. A friend of mine, a lady, and a good general cook too, cannot bear a Potato unless it is juicy and waxy, and has what she calls something of a stone at the heart or centre when cooked. Now as regards removing the haulm as soon as it is much affected. On a nice piece of Potatoes, seemingly as much alike as possible, I let one part remain, as the tubers were not ripe; the second part I cut down close to the ground; and the third part I treated in the same way: but having some quicklime and a heap of burned and charred refuse a little warm, and containing a considerable quantity of ashes from weeds, &c., I had a number of barrowloads mixed together, and threw the mixture on the top of the stems thus cut down. On taking the Potatoes up, the part left to itself had fully one-fourth of the tubers diseased, and after housing and covering with dry soil, charcoal refuse, &c., more than another fourth turned out unfit for use. In the part cut down, one-twelfth of the crop was bad, and about one-tenth of those stored went wrong in the heap. Of those cut down and roughly dressed with what is an enemy to all fungi, about one-thirtieth was spotted with the disease, and of those stored hardly one was affected.

Such simple facts are too limited to permit one to draw a safe inference, but they might afford a hint in a promising direction in the case of all late Potatoes where the tubers are far from ripe. When the tubers, as in the case of the early kinds, are mature, it would be the wisest policy to take them up at once and keep them dry and cool.—R. Fish.

CULTURE OF CLIANTHUS DAMPIERI.

Until this year I have failed to flower this most lovely plant. It is known by the name of the Parrot-beak Plant and the Glory Pea of New Zealand. The first and the only time I saw it in flower was at one of the Regent's Park Shows in 1861. I was so struck with its beauty that I determined to grow it, but I have failed from then until now. I sowed seeds year after year as recommended in the catalogues and books. The seedlings came up, attained 6 or 8 inches in height, and then damped off.

This Clianthus is an annual or biennial. Some sow it in the autumn and flower it in the following summer, treating it, in fact, as a biennial—a bad plan, as the chances are that it will not survive the winter. I now give what I consider to be the whole secret of success. On the 1st of February put two seeds in the pot in which the plants are intended to flower—an 8-inch pot is quite sufficient. For soil use turfy loam and a little well-decomposed dung, with a mixture of silver sand; charcoal drainage is good, and a little turfy fibre to surround the collar of the plant I consider is of great importance. Plunge the pot or pots to the rim in a brisk bottom heat, and if a square of glass is placed over them the seeds will germinate sooner. If one seed come it is well, but if two vegetate it is better. By no means separate them, as two plants make a splendid specimen, or rather a better display. Over-watering is fatal; give only a little when they are in need of it. Plenty of light and air must be afforded.—C. M. McCrow, *Nash Court, Faversham.*

THE BROAD-LEAVED DANDELION AS A WINTER SALAD.

Chicory and Endive are, as Mr. Record observes in his paper on winter salads, very useful and excellent, but it is nothing as compared with the new hybrid Dandelion introduced into this country by Messrs. Stuart & Mein. This is a decided improvement on the Chicory, and is equal to and as fine-looking in the salad-bowl as the Broad-leaved Batavian Endive (Scarole of the French). The culture recommended by Mr. Record for the latter will suit this well in an ordinary way, but when this Dandelion is two years old it is extraordinarily large and fine. Sown even now, the plants by next year's winter will fill a bushel measure.

Instead of lifting the roots we put pots or boxes over the crowns, and cover them with a little litter or leaves as with Sea-kale. The same plants, of course, will last for several years, whereas the Scarole requires to be sown every year. I should be glad if Mr. Record would try it, and I am confident he and others will thank me for bringing it to their notice. I used to be amused to see the cultivated beds of Dandelion at the *potager* of Versailles; and when I left France my friend, Mr. Hardy, told me he expected this large-leaved Dandelion, which was then newly introduced, would prove a great acquisition to his salad supply. I have no doubt but it will be used extensively everywhere in France, and especially about Paris, where diuretics are much required by the people. M. André Leroy once told me he employed hundreds of people in his department to gather in spring immense quantities of the Dandelion for the Paris markets. It is a remarkable fact that most French people study the medicinal qualities of everything they eat more than we do. Asparagus they eat, not so much as a matter of taste, but because it is good for the system. I am not speaking of Parisians, who are very like ourselves in liking doctors and medicine always in sight, but of the genuine French country folk, who understand at least the preservation of health in its natural simplicity. I never saw a country house, for instance, without a bag of Lime flowers to use as a tisane, or the garden without the *guimauve* or Marshmallow, the roots of which make a most valuable wash in a family in certain cases, whether for a cold in the head or any annoyance where the mucous membrane is affected.

But I find I am wandering from what I really had to say—simply to recommend the improved Broad-leaved Dandelion to the notice of gardeners generally as quite a superior thing in its way; and I would further impress on those who constitutionally require a diuretic to use this as a salad in a relishable form, grown and blanched as has been recommended by Mr. Record.—H. Knight, *Floors.*

POT-VINES.

In the following paper I will relate what has been my successful experience in growing pot-Vines with limited convenience in one place for several years, and although I may not describe anything uncommon, my remarks may prove of interest to some of your readers.

It is usual in many gardens during spring to have one, two, or, perhaps, even three, hotbed frames put up in the course of the season. In the first of these, then, among the other things a lot of Vine eyes are inserted in a pan in the usual manner. As they become nicely rooted, they are placed singly in small pots. They are still kept in a corner of the frame, and grown on. As they advance they are encouraged in similar quarters, and by-and-by, perhaps, shifted into a fresh frame where there is a greater heat.

They are kept as long as possible under such circumstances, and about the middle of May, or when the bedding plants are getting out of hand, they are transferred into ordinary-sized cold frames. In these a row of plants is set along the front of the frames, almost as close together as the pots will stand. A few pieces of strong cord are tacked tightly across the frame to act as a trellis to keep the canes off the ground, and at a regular distance from the glass. When placed in these quarters the Vines are encouraged as much as possible by good attendance, shutting-up early to husband sun heat, and I have often seen many canes with roots and tops "as sound as a bell," produced in this way by the end of the season.

Canes thus grown may not be nearly so good-looking nor so strong as those reared in bottom heat in houses by themselves, or in other hothouses, all through the season, but for their size they are often by far the best; for second-sized canes with good sound roots and well-ripened stems produce often better crops of Grapes than others twice the size and apparently sound enough. I could prove this by an instance under my own observation at the present time.

These canes in the cold frames in a good season can be ripened to perfection. The sashes, according to the weather, can be moved at convenience, and any amount of air can be given. When their full season of growth is over it is generally the plan to take them away to a back place and plunge the pots in coal ashes to insure the roots from being injured by too sudden changes of temperature, till the time arrived for their being put into the forcing-pit, which was generally in November. They have always done well, producing very good dishes of Grapes in May.

This plan of growing young canes would certainly not be resorted to if I had better conveniences, but in many cases we have to make the most of things as they are. In this instance there is a small stove for fruiting the Vines in, but not another for growing a young lot of Vines. I have known of other cases in which good fruiling pot-Vines could have been reared in a similar way, but the attempt was not made. —Robert Mackellar.

CUCUMBER FAILURES.

Cucumber plants well established, with healthy growth, large green foliage, and the soil filled "with fine, white, clean, healthy-looking roots," and yet without sufficient stamina to produce or rather to mature any fruit—what can one infer from such a statement but the presence of a faulty soil or temperature, or both? Will "D., *Deal,*" thin the vine, only retaining the strongest shoots, apply soil, and feed with liquid manure, as I have suggested, and tell us the result after the trial, for which there is still abundant time this season. I detest mysteries, and do not believe we have one in this instance. Is it possible that the soil used is of too light a nature? I have now four large plants clothed with huge green foliage, and laden with fruit in all stages of growth. They are in 10-inch pots, which were long ago concealed from view by the sods of turf packed around them, layer after layer of turf having been added as often as the roots became visible, and the plants are maintained in full vigour and fruitfulness by the constant use of sheep-dung water, as much as six gallons having been given to each plant daily during the late hot weather. The sods are completely laced together by the roots,

and it would be rather a difficult matter to thrust one's hand far into either of the heaps.—Edward Luckhurst.

I have lost many Cucumbers this year in the manner described by "D., *Deal*," and attribute the cause to woodlice eating the blossom and a little way into the end of the young fruit, and so making the latter decay at the end. I have since placed toads in my frames; they have diminished the numbers of these insects, and in the same proportion the number of spoiled fruit. In other respects my Cucumbers have done well, and I have cut more than the usual number of very fine fruit.—H. J.

[We are glad that you have found out the cause of failure in your case; but such failures as those referred to by "D., *Deal*," and others are not so easily cured, as they are more the result of a too vigorous or a too languid root-action, and without seeing the plants it is not easy to say which. This is supposing that the dread disease is not present. Of its cause and cure everybody is quite ignorant, at least every one feels so when his plants are attacked. In such a case, the young fruit will go off and nothing will make them swell.—R. F.]

ROYAL HORTICULTURAL SOCIETY.

August 16th.

The Show on this occasion was not large in any department. The Gladiolus and Hollyhock, however, which were the flowers to which the Show was mainly devoted, were good, though not numerous. In other seasons we have seen better spikes of Gladiolus, but never a better lot of seedlings.

In class 1, for the best twenty-four cut spikes of Gladiolus, three prizes were offered by the Duke of Buccleuch, the President of the Society. The first of these went to Messrs. Kelway, of Langport, Somerset, for excellent spikes, of which we noted Robert Fortune, Clarissa, Lacépède Araximenes (first-class certificate), Orphée, Legouvé, Virginia, Astrea (first-class certificate), orange scarlet, violet purple centre; Yellow King, cream ground, purple feather and flame, yellow-tinged throat (first-class certificate), Phidias (first-class certificate), fine violet purple cream throat, and white line upon each of the upper petals, Ophir, yellow, marked with purple; Lord Bridport (first-class certificate), pale lilac, purple feather; Madame Vilmorin, lilac rose, white centre, carmine markings; Rival, Miletus; Archelaus (first-class certificate), splendid white purple feather, and Adolphe Brongniart. Mr. Douglas, gardener to F. Whitbourn Esq., Loxford Hall, was second with one of the finest lots of seedlings we have ever seen, together with excellent spikes of established varieties. Mr. Wheeler, Warminster, took the third place with a good stand, and the Rev. H. H. Dombrain, Westwell Vicarage, Ashford, had also very good spikes, taking an extra prize.

In the next class, for twelve spikes, Mr. Douglas took a decided lead, exhibiting besides several well-known kinds, the following seedlings, all of which received first-class certificates—viz., Francis Whitbourn, rosy purple and white; William Earley, cream veined with rose; Mrs. Francis Whitbourn, large and very fine, white feathered with purple; and Talisman, magenta purple. Mr. Welch, gardener to J. Marshall, Esq., Belmont Park, Taunton, was second with good spikes; and Mr. Dombrain third.

For six, Mr. Douglas was again first with splendid spikes of Madame Desportes and several seedlings, Mr. Dombrain being second, Mr. Warren, Wellesley Road, Croydon, third; and Mr. Welch equal third. Messrs. Carter, Dunnett, & Beale exhibited a fine collection not for competition.

For six cut spikes of Hollyhocks, Mr. Chater, Saffron Walden, was first with excellent spikes of Fair Ellen, rose; Hercules, yellow, tinged with blush; Majestic, crimson; Peri, very fine, delicate pale yellow; Fascination, lilac; and Bullion, buff, tinted yellow. From the same exhibitor came Cygnet, a fine white; Queen of Yellows, one of the finest of that colour; and Othello, fine dark maroon.

Mr. W. Chater, of Saffron Walden, was first, for twenty-four blooms, with Nonpareil, Invincible, Incomparable, Walden Primrose, Carns Chater, Fred Chater, Majestic, Enchantress, cream, beautifully tipped with purple, Competitor, Splendidum, Eclipse, Hercules, Alfred Chater, Marvellous, Champion, rich ruby, Bullion, Conquest, Constance, William Brand, Joy, Leviathan, Prince Albert, Marion, and Mochanna. Messrs. Paul & Son and Mr. Wheeler, Warminster, were respectively second and third. The latter set up his bloome with laced paper, which was certainly a disadvantage as compared with a plain white card gnard. Of twelve, Mr. Porter, gardener to Mrs. Benham, Sion Lodge, Isleworth, was the only exhibitor, and was first with fair blooms, but not remarkable.

Phloxes were not numerously shown. The best twelve cut spikes came from Messrs. Downie, Laird, & Laing, of Stanstead Park Nurseries, Forest Hill. It is to be regretted that the Phloxes were not required to be shown in pots, as cut spikes in this warm weather so soon fade. Among the best varieties we noticed Madame Pepin, rich rosy crimson; Amabilis, salmon; M. H. Low, splendid spike, magenta crimson; Joseph Heine, fine spike, salmon rose; Madame Billy, large flowers, lilac rose, crimson eye; Monsieur C. Turner, splendid spike, rose, crimson eye. Messrs. Paul & Son were the only other exhibitors; Madame Domage, white, purple eye; Princess Ghika, rosy purple; and Sultan, white crimson eye, were very fine.

Of miscellaneous subjects, Messrs. Lee, of Hammersmith, had specimens of about 150 sorts of hardy ornamental trees and shrubs. To do these justice they would require a special report, so numerous, so varied, and so good were they. We can only here signalise as a few of the most noteworthy. Alnus cordata, A. glutinosa laciniata, handsome leaves; Catalpa syringæfolia aurea; Cercis Siliquastrum variegatum; Cornus sanguinea elegantissima and sibirica variegata; Fraxinus aucubæfolia, F. nigra; Negundo fraxinifolium variegatum; Robinia hispida, with beautiful rose-colored flowers; a pretty Golden Elm, and Ulmus viminalis superba. These would be a great ornament in any garden. Messrs. Carter & Co. exhibited some very fine examples of French Marigolds. The only other object worthy of notice was Mr. Shenton's Flower of Eden Pink, which has been several times exhibited before, and on this occasion did not show off to much advantage.

Fruit Committee.—G. F. Wilson, Esq., F.R.S., in the chair. After reading the minutes it was reported that the Peach called Markly Admirable, which received a first-class certificate at last meeting as a superior early Peach, had been exhibited under a misapprehension as to the season of its ripening. The house in which it had been grown was not in reality a cool house in the true acceptation of the term, and the crop when ripened would not in a cool house be ripe till the middle or end of September. Mr. Pearson, of Chilwell, reported that the seedling Grape Chilwell White, which he exhibited last year, and to which a first-class certificate was awarded, had disappointed his expectations this year, and that, notwithstanding the great expense to which he had gone in cultivating it, he felt it was his duty to the public to withdraw it from sale and to destroy the stock. He therefore begged to be allowed to return to the Committee the certificate awarded to the Grape last year. The Committee thereupon passed a vote of thanks to Mr. Pearson for the highly honourable course he had taken. Mr. Thomas Thornton, Heatherside Nursery, Bagshot, sent a box of Heathereide Cucumber, a handsome variety, which the Committee desired to have in January, as it was of opinion that it would be valuable if in use at that season. Mr. J. Meakes, gardener to R. Fowler, Esq., Petersham, Surrey, sent a brace of large Cucumbers grown in a two-light box. The Rev. M. J. Berkeley exhibited the Early White Naples Onion and Giant White Tripoli, to show that they are distinct varieties, an opinion which was confirmed by the Committee. Messrs. Carter & Co. exhibited specimens of Trifolium cæruleum, a new forage plant.

Mr. Thomas, gardener to S. Chamberlayne, Esq., Cranbury Park, Winchester, exhibited a pair of very handsome Queen Pines, which received a special certificate. Mr. W. P. Roberts, gardener to Lady Derby, Holwood Park, Beckenham, sent bunches of Frankenthal Grape from Vines a hundred years old. Mr. William Earley, gardener at Valentines, sent bunches of a seedling black Grape, the berries of which are small, and have a slight Frontignan flavour. Mr. Pearson, of Chilwell, brought bunches of Ferdinand de Lesseps Grape, to which a first-class certificate was awarded last year. The Committee remarked that the flavour was much like that of fresh honey, and that the bunches were improved in size since last year. Mr. Pearson also exhibited a large bunch from a Vine raised from Duchess of Buccleuch, which has a distinct Frontignan flavour, but it was not quite ripe. Another seedling from Duchess of Buccleuch very much resembled Foster's White Seedling, with a thin delicate skin, and a sweet flavour and thin juice. He exhibited a seedling evidently raised from Black Morocco, not ripe, but very promising. It was requested that Mr. Pearson should exhibit it later in the season. A variety raised from Mrs. Pince, also unripe, promises to be a Grape of great excellence. The berries are large and oval, the flesh firm, and with a slight Frontignan flavour. A variety, also a seedling, with a large oval berry and a very thick blue bloom, was much admired. Its flavour is that of the Black Hamburgh. Mr. Donovan, gardener to J. Kettlewell, Esq., Upper Norwood, sent a dish of Morello Cherries. Mr. Foote, gardener to Sir A. H. Elton, Bart., Clevedon, Bristol, sent two dishes of Morello Cherries. Mr. Craddock, Compton Verney, sent fruit of a Red Currant, which appeared to be the variety called Raby Castle. Mr. Gardiner, gardener to E. P. Shirley, Esq., Lower Eatington Park, Stratford-on-Avon, sent a very meritorious dish of Peach Apricots. Mr. Tillery, of Welbeck, sent fruit of St. Ambroise Apricot, also a splendid dish of Barrington Peach, to which a special certificate was awarded, and a fine dish of Violette Hâtive Nectarine. Mr. J. Douglas, of Loxford Hall gardens, Ilford, exhibited fine dishes of Royal George and Grosse Mignonne Peaches and Washington Plum from trees grown in pots, to which a special certificate was awarded. A dish of Shanghai Peaches was sent under the name of Noblesse by Mr. Donovan, gardener to J. Kettlewell, Esq., Beanmont, Upper Norwood.

Prizes were offered for the best dishes of Apricots; the best came from Mr. Craddock, gardener to Lord Willoughby de Broke, Compton Verney; the second best from Mr. Smith, gardener to the Earl of Gainsborough, Exton Park. Both were Moorpark. Prizes were also offered by Messrs. Carter & Co., for the best collection of vegetables,

to include their Champion Runner Beans, Peas, &c., but no one came forward to claim them.

Mr. Young, Milford Nurseries, Godalming, sent a fasciated Cucumber vine, bearing fourteen fruit.

Floral Committee.—Dr. Denny in the chair. Mr. Williams, of Holloway, exhibited two good specimens of Erica Turnbullii, showing its late-blooming qualities. From Mr. Croucher, gardener to J. T. Peacock, Esq., Sudbury House, Hammersmith, came a small collection of Agaves, of which Mr. Peacock possesses a large and valuable selection. First-class certificates were given for A. Simsii, with very large leaves, and for A. imbricata. Mr. Lamb, gardener to G. T. Davey, Esq., Colston Bassett, exhibited an Amaranthus with yellow leaves, flushed with purple, but not so showy as Bicolor and other kinds at present cultivated. Mr. Wheeler, Warminster, sent Gladiolus Duke of Buccleuch, but the flowers and spike were small; also Hollyhock, Royal Prince, but though good, not sufficiently distinct in colour from many existing sorts. From Mr. Macintosh, nurseryman, Hammersmith, came a hybrid Cereus, with pretty rose-coloured flowers, but not nearly so large and showy as those of some of the genus.

Mr. Young, gardener to F. Marshall, Esq., 28, Avenue Road, St. John's Wood, exhibited several seedling Hollyhocks, small both in spike and flower. The Rev. E. Hawke, Willingham Rectory, Gainsborough, exhibited a fine stand of Hollyhocks. From Mr. Shenton, Biggleswade, came double scarlet Pelargonium Mrs. Fisher, a poor specimen; and from Mr. Trusler, Farnham, a nicely variegated Carnation called Sensation.

Mr. Wilson, gardener to W. Marshall, Esq., Enfield, sent Lælia elegans Marshallæ; Mr. Speed, Chatsworth, Viola Lavender Queen, paler than Viola cornuta; and Mr. Wills, Sussex Place, Brompton, Pelargonium Duke of Edinburgh, with white-variegated leaves, of excellent habit, apparently a hybrid Ivy-leaf.

Mr. Green, gardener to W. Wilson Saunders, Esq., had a first-class certificate for Anthurium ornatum from St. Martha, with a large pure white spathe and a singularly beautiful pale rose and white spadix over 4 inches in length. Mr. Green also exhibited several other plants, as a handsome Dracæna from South Africa, Griffinia multifida with a small head of bluish lilac flowers, and Jatropha multifida.

PLANTS ATTACKED BY RABBITS.

Rabbits are fonder of the blue Lobelia than any other plant which I know; but with regard to plants which they will not eat, I must observe that there is scarcely one of those mentioned in the published lists which I have not found barked by them when fresh planted and young. For instance, the evergreen Berberry has been recommended for covers, and when it is established rabbits will rarely touch it, but put out young plants of it, and if the rabbits are numerous, scarcely one will escape being gnawed over at the ground: hence the importance of securely fencing at first. In a contemporary, Roses are mentioned among the plants which rabbits will not touch; with me Roses in a small rosery are so much attacked that until a rabbit-proof fence be put up I shall trouble myself no more about them. With standards as yet the rabbits do not meddle, but the dwarfs are regularly cropped—buds, shoots, and leaves forming a most delicious pasture ground—though there is plenty of sweet grass all round. About two-thirds of each young leaf is eaten off, the base part being left. As for young shoots and buds, they seem to be cut through chiefly for amusement, as they are left on the ground. There is hardly a plant (including the Laburnum), which has been said to be exempt from the attacks of rabbits, that I have not seen barked and peeled, especially when fresh planted. There is no security but a wire net, small enough in its meshes not to permit a young rabbit to pass through, and high enough to prevent an old one jumping over it. One must also look out for burrowing underneath. The mode described some time ago of fixing the netting would to a great extent prevent that being done. I have found that young rabbits will make their way through openings of 1½ inch, and soon become too large to be able to return.—R. F.

Liliums.—How varied are the habits of the different species of Liliea! The old common white Lily (L. candidum), has already bloomed this season, and the stems and leaves have died, and the bulbs are now at rest; consequently, it is the proper time to take them up and transplant. If it is not done soon, it will be too late for this season, because in the course of three or four weeks the bulbs will again put forth leaves which remain fresh and green during the winter. A few other species like the Lilium umbellatum have also bloomed, but the flower stems retain their freshness, and will for weeks, while several species of the Japan Lilies have not, as yet, shown flowers. And still all were planted at the same time last fall, and in the same bed; but they are different species, coming from various parts of the world, and change of climate does not change their natural habits. One species may require transplanting in midsummer, like the L. candidum; another in the autumn, while still another class is seldom successfully removed except in spring; and all these variations in habit must be known to secure perfect success. Florists, and other dealers in bulbs, are compelled to bestow more care and skill in preserving them to an unreasonable time for planting, in consequence of the ignorance of their customers, than they do in cultivation and propagation.

DAVENHAM GOOSEBERRY SHOW.

This was held on July 31st at the Bull's Head Inn, Davenham.

HOP CULTIVATION FOR ORNAMENT AND USE.—No. 6.

Hop Poles.—Hop poles being so large an item of expenditure, attention is anxiously directed to them. As soon as possible after the Hops are picked, and very often immediately afterwards, the bine is stripped from the poles, and these are set up conical fashion in piles of about three hundred poles each, or as many as are wanted for a hundred hills; and these cones, being placed regularly over the ground, give a peculiar appearance to the landscape. The mode of setting them up is to tie four poles together at about a foot or so from their tops, and to spread them out at bottom, so as to present an angle of about 60°, and the rest of the poles are piled against them in four groups, which is necessary to save the hills being occupied by them. If the ground should be planted in triangles, six groups of poles will be required to a stack, as the pile is called, instead of four, as will be understood by the position of the plants, one plant being always immediately under the apex, and all the plants clear for dressing when the time arrives. The stacks of Hop poles resist the winds unless the weather is exceedingly stormy, and a wind which blows down the stacks of Hop poles is a hurricane to be remembered.

The great expenditure arising from the decay of poles has led of late years to the almost universal custom of charging their lower ends with creosote, which prolongs their durability. This is technically called dipping, and poles so treated are said to last about double the time which they otherwise would do. The mode is this. A strong iron tank, 6 or 7 feet long, by 4 or

4½ feet wide, and 2 feet deep, is fixed in brickwork, so as to allow of a fire beneath it; in this the poles are placed as thickly as possible, with their tops upwards, a sort of rough framework keeping them in position at the top; but previous to putting them into the tank creosote is poured into it in sufficient quantity to reach the top, or nearly so, when the poles are all put in. A fire is then applied underneath, and kept burning for about twelve hours, when the poles may be taken out and others put in. The creosote is said to enter the pole at the bottom, which, of course, is ready sharpened, and to ascend through the wood considerably above the point of immersion. A pole that would only last in an ordinary way five or six years will now last nine or ten. I believe nothing in Hop cultivation has become so universal a practice in so short a time as dipping the poles, and the apparatus for the purpose is to be met with everywhere.

The demand for Hop poles is so great that all kinds of coppice wood of sufficient size and straightness are used, but the most popular are Chestnut and Larch, many thousands of the latter being imported into Kent. They are certainly the straightest and neatest-looking poles of any, but it is questionable whether they will last so long as Sweet Chestnut. Next in order come Ash, Willow, and Maple; and Beech, Birch, Lime, and Alder are often met with, the dipping process rendering the last two almost as enduring as better poles, but they swallow up a large quantity of the dipping material. Hop poles, however, have always been costly, and plots of ground are frequently planted with Chestnut expressly for the purpose of producing them, and the trees being cut about once in ten years often realise from £40 to £50 per acre, the purchaser cutting and finding all the necessary labour, &c. Plantations of Larch are also occasionally made for the same purpose, the trees being planted about 18 inches or so apart, and the whole cut at the end of twelve years or so; the ground is then returned to tillage purposes. But the facility of obtaining poles from a distance having of late years so much increased, planting such ground is now not so much practised as formerly, but steep banks, and Willow and other pollards by the sides of ditches and other places, are made to yield poles of some kind. The demand for them is so great, that those a little crooked are not objected to. To increase their durability the bark of all kinds of poles is shaved off, excepting Ash, which, clinging so closely to the timber, seems almost a part of it. The poles are sharpened at the stout end, and every season, before being inserted in the ground, all old ones are tried, whether they are strong enough or not, by being struck sharply with the foot near the bottom while being held in a slanting position, and all not bearing this ordeal are sharpened afresh, and if too short for the place they are in are employed for another class of Hops, and if too short for these, are used for firewood. The annexed table gives the average prices of Hop poles per hundred.

	16-feet poles.	14-feet poles.	12-feet poles.	10-feet poles.
Chestnut	40s.	32s.	21s.	9s.
Larch	40s.	30s.	20s.	8s.
Ash	35s.	26s.	16s.	8s.
Oak, Birch, Beech, Willow, Alder, Lime, and others, mixed	24s.	16s.	12s.	7s.

It is almost unnecessary to remark that prices vary, but the above may be regarded as a fair average. I cannot say what the cost of dipping will be, but I expect from 6s. to 10s. per hundred may be set down.

New Mode of Training.—Although in general the poles for supporting the Hops are simply set upright in the ground, other modes have been tried. A few years ago a gentleman patented a plan for having only one stout pole standing about 7 feet high from each hill, stringa being stretched horizontally from the tops of these poles both at right angles and diagonally, and the Hops were trained to the strings, but the plan was little adopted, and did not seem to answer. A method invented by Mr. Coley, near Maidstone, promises better, and through the kindness of Mr. Coley I was shown his garden, and nothing could look better. I believe he, also, has patented his mode of training—not in more than one case in twenty, a prudent course as regards anything connected with cultural matters, but the perfection to which he has brought it deserves public recognition.

Mr. Coley's mode is this:—A plantation at 7 feet apart is recommended, and on each hill two poles are placed upright, about 20 inches apart at the bottom, and a few inches more perhaps at the top, for these poles are to be permanent in the ground. A cross piece of wood at 4 feet from the ground is nailed to each pole, keeping all together, and a wire loop at the side of each pole allows of the end of another slender pole being inserted, while the opposite end of the pole rests in a sort of fork, also made of stout wire, at the top of the pole on the adjoining hill. This rafter-pole, as it may be called, does not touch the ground anywhere, but is fixed between the upright poles at an angle of about 45°, and its top often goes past the top of the poles it rest on to the extent of a couple of feet. In training the Hops to poles so erected, four Vines are taken to each pole starting from the ground, and when these have grown high enough, two of them are trained to the rafter-pole where it is inserted, and the other two continue their course up the poles they started on. The advantages of this system are twofold. First, the whole plantation being united together in the way indicated when the Hops reach the tops of the poles, high winds have little effect—and the damage done by these is often very serious. Only last year a neighbour of mine estimated his loss by the wind on September 10th at £80 or £90, on a plantation of little more than five acres, and others were nearly as badly off. Now, Mr. Coley's system certainly does afford great protection from wind. A second advantage is, that instead of the strings of Hops being all clustered together and crowded round an upright pole, they hang downwards, free from each other, from the rafter-pole, like so many enormous bunches of Grapes. Mr. Coley has called this mode of growing them "The Vinery System." Assuredly nothing could look better than the Hops in his garden about the end of August, when I had the opportunity of seeing them. Many of the strings of Hops reached the ground, and great care having been taken to select straight Larch poles, and the workmanship being perfect, the appearance, looking down the alleys, was that of a perfect wall of Hops on each side, and the sky-line quite clear the whole length of the garden—200 or 300 yards. How far this system may receive public support remains to be seen, but Mr. Coley's attention has been directed to perfecting it in all its points—as in the preparation of the loops, fork-ends, &c., of strong wire, for which purpose he has provided suitable tools, leaving nothing to be desired, except that all Hop poles should grow straight. His own garden was a model in every way.

Hops have also been tried at greater distances apart than are generally allowed, and some years ago it was urged that a rather close row of Hop plants, but the rows 10 feet apart, was the best mode of planting. Only a few, however, adopted this system, and they soon departed from it. Other modes have been tried from time to time, and now and then with more or less success; but the bulk of the Hops grown in 1870, and that was one of the largest growths on record, were mostly on upright poles placed around plants 6 feet from each other, and that distance may be set down as the most common one at which Hops are planted.

Concluding Remarks.—The popular notion that for Hops the weather can never be too hot and dry, received a check in 1868, when the drought certainly told upon them, and for the first time red spider became a formidable enemy. This insect, however, did not appear in 1870, which was one of the most favourable seasons on record, and the crop, with the exception perhaps of that of 1859, the most abundant of any picked of late years, but that of 1826 was, perhaps, as good. These seasons will all be remembered as being very dry. Why the crop of 1868 should not have been better it is difficult to say; in fact, there seems to be something bordering on capriciousness in the Hop. Occasionally unexpected recoveries from blight have taken place late in the summer, and a fair crop has been the result; on the other hand, a promising crop has taken a turn the other way just at the same time, so that the occasional remark of the most experienced growers, that they know "nothing at all about them," is not altogether self-disparagement. The uncertainty that hangs over this crop prevents more growers embarking in Hop cultivation, and invests it with an amount of anxiety which no other crop causes, instances of great wealth and great losses being on record. Nothing deteriorates more by keeping than Hops, and old ones are often unsaleable, and when they paid an excise duty of some 18s. 8d. per cwt., great hardships were sometimes endured by the growers, for unless the Hops were exported the duty could not be refunded. Some growers have paid shippers a few shillings per bale to take the Hops out to sea and throw them overboard, in order to regain the remaining shillings of duty. On the other hand, fabulous prices have sometimes been made, and great crops secured. Even last year there was a gentleman who had a growth of upwards of 300 tons in one parish, on

somewhat more than that number of acres. But "all is not gold that glitters;" the expenses are enormous, and persons having old Hops on hand, will most likely be willing to part with them at less than the cost of picking.

Land having the reputation of being good for Hops is eagerly sought after, and commands high prices when in the market. Foreign competition, which it was feared would undersell the home grower, has not yet been able to do so, although there is little doubt but it will prevent in blighty seasons those fancy prices which were not unusual years ago. I may, however, mention as one item of home expense not yet alluded to, that Hop land pays a tithe of from 15*s.* to 20*s.* per acre more than the ordinary rent charge that may be affixed to it, and large as this sum is, it is, nevertheless, regarded as one of the small tithes, adding another to the peculiarities, if not anomalies, of this singular branch of culture.—J. ROBSON.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 21.

DRAWING PLANS.

To draw *fig.* 44. Draw the centre line *a* 6, and divide it into six equal parts, as 1, 2, 3, 4, 5, 6. Draw lines 7 7, 8 8, 9 9, and 10 10. From point *a*, with radius *a k*, draw arc *k*, meeting lines 7 7 and 10 10. From the same point, with radius *a h*, draw arc *h*, meeting lines 8 8 and 9 9. From point *a*, with radius *a c*, draw arc *c*, and also circle *b*. From points 1, 2, &c., draw arcs and circles corresponding to c and *b*. From points *f* and *d*, being the points where circles *a c*, 1 *c*, &c., cut each other, draw arcs *g* and *e*, and from corresponding points draw corresponding arcs.

To transfer *fig.* 44 to the ground. Take a line and insert stakes in the ground, as at points *a* and 6, the distance between being 48 feet. Divide the line *a* 6 into six equal parts, as 1, 2, 3, 4, 5, 6, and insert pegs at the points thus found. The distance between the pegs will be 8 feet. On each side of the centre line *a* 6 measure 7 feet 4 inches, and insert pegs as at points 7 7 and 10 10. From the same point measure 5 feet 4 inches on each side, and insert pegs as at points 8 8 and 9 9. Lay lines connecting points 7 7, 8 8, 9 9, and 10 10. From the stake at point *a*, with a string 7 feet 4 inches long, trace arc *k*, meeting lines 7 7 and 10 10. Reduce the string 2 feet and trace arc *h*, meeting lines 8 8 and 9 9. Reduce the string 1 foot and trace arc *c*. Again reduce the string 2 feet and trace circle *b*. From centres 1, 2, 3, 4, 5, 6, with radius *a c*, trace arcs corresponding to arc *c*; and with radius *a b*, which is 2 feet 4 inches, draw circles corresponding with circle *b*. Where the arcs meet each other insert pegs, as at points *f*, *d*. From the pegs at points *f*, *d*, with a string 3 feet 5 inches long, trace arcs *e* and *g*, and so on, until the border is traced. The lines and dotted parts indicate Box. B indicates beds; W, walks.

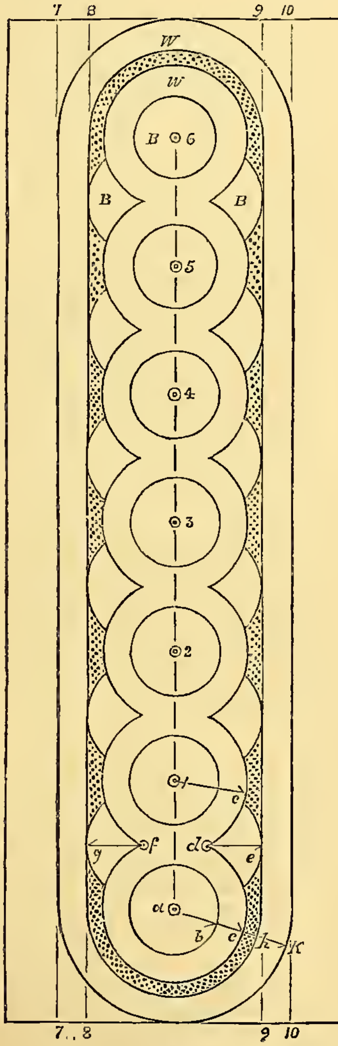

Fig. 44.
Scale 12 feet to the inch.

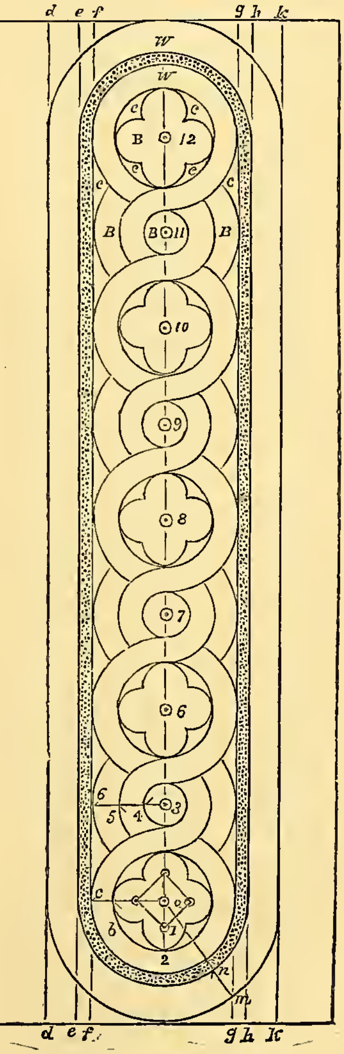

Fig. 45.
Scale 16 feet to the inch.

To draw *fig.* 45. Draw centre line *a* 12, and divide it into eight equal parts, as 3, 6, 7, 8, 9, 10, 11, 12. Draw lines *d d*, *e e*, *f f*, *g g*, *h h*, and *k k*. From point *a*, with radius *a m* draw arc *m*, meeting lines *d d* and *k k*. Draw arc *n*, meeting lines *e e* and *h h*; draw arc c, meeting lines *f f* and *g g*. From point 3 draw circle 4, uniting with arc c. From the same centre draw arcs 5 and 6. From points 6, 8, 10, 12 draw arcs and circles corresponding to those drawn from point *a*; and from points 7, 9, 11 draw arcs and circles corresponding to those drawn from point 3. To draw the quatrefoil inside the circle it is necessary to form a square, as shown inside the circle drawn from centre *a*. From the angles of the square draw the lobes, meeting each other on the sides of the square, and find the corresponding figures 6, 8, 10, 12 in the same manner.

To transfer *fig.* 45 to the ground. Take the line and insert stakes into the ground, as at points *a* and 12, the distance between being 64 feet. Divide the line into eight equal parts, as 3, 6, 7, 8, 9, 10, 11, 12, and insert a peg at each point. The length of each division thus found is 8 feet. On each side of line *a* 12 measure 9 feet 9 inches, and lay lines *d d* and *k k*. On each side of the same line measure 7 feet 3 inches, and lay lines, as *e e* and *h h*; again on each side of the same line measure 6 feet 3 inches, and lay lines, as *f f* and *g g*. From the peg at centre *a*, with a string 9 feet 9 inches long trace arc *m*, meeting lines *d d* and *k k*. Reduce the string 2 feet 6 inches, and trace arc *n*, meeting lines *e e* and *h h*. Again reduce the string 1 foot and trace arc c, meeting lines *f f* and *g g*. From the same peg, with a string 4 feet long, trace circle *b*. From the peg in centre 3, with a string 6 feet 3 inches long trace arc 6. Reduce the string 2 feet 6 inches and trace arc 5. Reduce the string 2 feet and trace circle 4. From the pegs in 6, 8, 10, 12 trace arcs and circles corresponding to *a b* and *a c*, and from pegs 7, 9, 11 trace arcs and circles corresponding to 3 4, 3 5, 3 6. To

trace the quatrefoil in the circle it is necessary to form a square, as shown at centre *a*, the side of which is 3 feet 6 inches, and insert a peg at each angle of the square, as shown at point 1. From the peg at point 1, with a string 2 feet long, trace arc 2. Trace corresponding lobes or arcs from the other three angles. Find beds 6, 8, 10, and 12 in the same manner. The lines are of Box; the dotted compartment stone kerb; w, walks; b, beds; *c*, coloured materials.—M. O'Donnell, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 15.

The genus Gracillaria contains a good many species, though pigmies in their dimensions. The moths, when resting in the day on palings or trees, may be unmistakeably identified by the posture in which they place themselves. "The head and the anterior part of the body is elevated, the first pair and the middle pair of legs stretched out a little sideways, and the third pair of legs are placed against the side of the abdomen." The antennæ, also, are generally laid back, and partially hidden by the wings. As long ago as 1736 Réaumur had observed with much interest the habits of two at least of the species of this genus. If the reader wishes to introduce himself to one of these, he has only to walk now to a spot where grow some Lilac bushes. On the leaves, or reposing close by in some nook screened from the wind, will be found small moths, owning to the name of G. Syringella, and showing to the unassisted eye a not very distinct tracing of yellow and brown. About London we find the species also haunts the Privet.

Mr. Stainton has given the life history of G. Syringella with great accuracy, commencing with the eggs, which he states are deposited in little clusters. The young caterpillars begin their proceedings by forming small mines in the leaves, which have the appearance of blotches, within one of these are found from four to a dozen feeding in company. As they grow they journey in company, making a new blotch in another part of the leaf, or passing to another leaf, when the colony, perhaps, may divide into two parties. At last they come out, and feed outside, rolling up the leaves in a seemingly clumsy manner to afford themselves concealment. The leaves are rolled laterally, and fastened sometimes, though not always, by cords of silk fixed outside as well as within. After a time the foliage begins to turn brown, and, gradually, should the caterpillars be numerous, many of the leaves fade and fall off. Cone-like structures, which are much neater than those made by G. Syringella, are manufactured by other caterpillars of the genus, as, by the rather singular G. phasianipennella, the caterpillar of which cuts strips from the sides of the leaf, and duly fastens them together, tailor-like. The young caterpillars of our Lilac-feeder are remarkable for the very transparent appearance they have; afterwards they become tinged with greenish brown, the dorsal vessel showing distinctly. When of their due size they spin cocoons, which are tolerably thick, and hide the small chrysalis from view. There are two successions of this insect annually, the caterpillars being found feeding in June, and again in August and September; and owing to the early fall of leaves in the vicinity of London, the second brood will be sometimes deprived of food ere they have completed their growth. One reads with some interest the statement that in Switzerland G. Syringella has been noticed to extend for some distance up the Alps, occurring there, I presume, upon the Ash.

Another Gracillaria, scientifically named stigmatella, occurs in gardens and shrubberies, and the moth is one of the visitants to the Sallow bloom in spring, mingling there with the crowd of bees and flies, and its moth brethren of a larger growth. The caterpillar begins its career rather late in the season, mining for a short time the leaves of Willow or Poplar, and then constructing cones on the top or edge of the leaf. It moves freely from place to place, so that when we are looking at a tree which has been attacked by it, we are sure to find a large proportion of empty cones. This caterpillar is of a greenish-white colour, with two brown spots on the sides. The moth has derived its name from a whitish, rather conspicuous triangular mark on the upper wings.

It is very seldom that we see any species amongst our larger beetles occurring on the wing in any quantity, except the common Cockchafer. Such species for instance, as the well-known Dor, the Stag, the Musk Beetle, the various Carabi, are seen singly, or, perhaps, two or three together, and this is also generally the case with the Rose Beetle (Cetonia aurata). Once, however, I witnessed a flight of these insects, which was truly astonishing. The date was some day about the middle of June, 1857, and the scene of it a winding narrow lane which intersected some market gardens at Fulham. The sun shone brightly at the time, and the attraction which had drawn them together was the Privet bloom. I should say, without exaggeration, that hundreds might easily have been secured, and the sight was a pleasing one, for their elytra reflected the sun's rays, while the air resounded with the sonorous hum they made. Doubtless they had recently emerged from the pupa, having bred close at hand in the fields. Latreille asserted that this beetle does scarcely any injury to vegetation, because it seeks the flowers for the honey they contain. On the contrary, the Rose Beetle does actually nibble the petals, especially those of the Rose, though it is in no respect scrupulous, and if these are not to be had, contents itself with other species. One gentleman reports that in 1870, where he had an opportunity of observing it, as early as May it had begun to attack the blossoms of the Weigela and Syringa; also, he says "it is particularly fond of the early white Pink, tearing the petals with its curved mandibles and hooked feet."

The Rose Beetle, or Rose Chafer, has also been called the Copper Beetle from the hue of the elytra or wing cases, and, without very good authority, it has been supposed to be the Golden Melolontha of Aristotle. A popular writer upon natural history comments upon the species in the following ludicrous manner. He believes that it has its name "because it is an insect of refined habits, and chiefly dwells in the bosom of white Roses. Yet it loves earth, too, and in pursuance of its mission falls from its Rose to earth, and there digs a receptacle for its future progeny. But though in earth, it is not of earth, and, burrow as it may, it returns to its Rose without a stain upon its burnished wings." Why the Rose Chafer should be supposed to affect white Roses in particular I cannot say, and as to its "dwelling in the bosom" of a Rose I feel rather incredulous. However, this much is true in the account, that whether it "digs a receptacle" or not, the eggs are usually laid on or near the earth. That the larva is sometimes found in decaying wood, as stated by some authors, or even in ants' nests, I would not deny, but it also, if not invariably, feeds on the roots of various plants. I regard this as proved to a demonstration by the occurrence of the imago in spots where neither rotten wood nor ants' nests afford a nidus for the larva. This I hope to confirm by a discovery of the larva engaged in its destructive work upon roots, in which, as yet, I have been disappointed, nor have others been more fortunate—at least, I have heard of instances where a larva, thought to be that of the Rose Chafer, has been unearthed, but not reared to maturity so that it might be identified with certainty. Like that of the Cockchafer, it probably passes two or three years in its earlier stages of life, and burrows at times to a considerable depth. We may assume, therefore, that the species is injurious to the gardener, both as larva and imago, and really the only satisfactory mode of keeping it in check seems to be the destruction of the beetle.—J. R. S. C.

Local Names of British Plants.—It is desired to collect as many of these as possible, and the assistance is requested of all who take an interest in the subject, or who may have the opportunity of ascertaining and recording them. Any lists sent to Mr. James Britten, the Royal Herbarium, Kew, or to Mr. Robert Holland, Mobberley, Knutsford, will be thankfully received and acknowledged.

A NEGLECTED PRETTY FLOWER—LINARIA VULGARIS.

In the following notes I wish to call attention to a very chaste and pretty Toadflax of our neighbouring hedgerows, Linaria vulgaris. Are we not so very apt to be led off by the many and very beautiful exotics of our gardens that we are naturally inclined to pass by all our native plants—some of them most beautiful, and of many and pleasing associations—as unworthy? This pretty Linaria has several features of interest that may demand and are worthy of the cultivator's attention. It has slender-looking yet wiry stems, with smooth, narrow, light green leaves. But more particularly I wish to remark its pretty erect head, about 3 inches in length, of beautiful orange and lemon spurred flowers, reminding one of some of the forms in the flowers of the much-prized Orchid family.

Many gardeners have to send off by rail large quantities of cut flowers to great distances several times a-week, and in so doing sometimes there is a difficulty in finding enough of those

flowers which will always be sure to prove satisfactory on arrival; for this purpose it happens that some of our very prettiest and most popular of garden flowers are not well adapted, Geraniums and Fuchsias for instance; but the flowers of this Linaria would, I venture to think, be well suited for such a work at this time of year. Few flowers would, I believe, be better adapted for arranging for variety in many glasses of cut flowers. It would be a better yellow than most of our Calceolarias, and the fact of its being but a species of our own native flora should not detract from its other great merits. I intend to grow a good quantity of it next year, and I hope others may inspect it for themselves, and, if they find it useful, give it also a place.—R. Mackellar.

[Why should not this beautiful plant be used as a bedder instead of Calceolaria? and, being a perennial, it would not require renewing every year.—Eds.]

A BIT OF SOUTH DEVON.—No. 4.

"You ought to have nightingales in such woods as those of Berry Pomeroy." "No, they are afraid to come among us 'Devonshire Sirens'—we are so called because we excel them in singing." I am quite willing to believe the adage, and shall not reveal who uttered it; but be it true or be it not true, the said Sirens—excepting only those who preside at the turnpikes, for they are elderly, and extort sixpences profusely—are such fair, rosy, round-faced, plump damsels, that they ought to have soft sweet voices to match. Even the little woman who for twenty years has been the portress of Berry Pomeroy Castle, whither I was about to wander when I closed a previous note, is so kindly that I think she must have been a Siren thirty years ago, at all events she is still pleasant, and led me winningly to "The Wishing Tree." She told me that if I walked thrice aronnd it "without a word, smile, or sigh," whatever I wished would and should occur, and sundry jolly girls proceeded to test the efficacy of the charm. I also clambered round it—walking is an impossibility, for it is on the edge of a declivity—but it was for the less mystical purpose of measuring its girth, which I ascertained is 22 feet at 4 feet from the surface, and the height of the tree must be 80; the branches overshadow a vast circle. It is a noble Beech tree. Many Beeches may have trunks larger, but they are hollow, and this is perfect—not a decayed spot is to be seen on it. Let me ask, Why does not the Ivy nsually climb up the stem of the Beech? Is it because the bark is so smooth that there are no crevices for the Ivy's fibriles to penetrate? I know of no chemical constituent in the bark that can be offensive. The day of credence in plant-antipathies is passed, or we might conclude that the Ivy hates the Beech, as the Romans believed the Vine hated the Onion. Is this freedom of the Beech observable elsewhere? I never remember noticing the subject until I saw here the Oak, Ash, Elm, Sycamore, and the Pines, clothed profusely with Ivy, but the Beech never. An Ivy plant now and then is seen trying to ascend one, but always weakly. Nowhere does Ivy grow more luxuriantly than over parts of Berry Pomeroy Castle, and the stems are gigantic. It completely envelopes the towers and chapel-room of the noble gateway, and fittingly hides from view the arms of the founders—the Norman Pomerais—men that should be blotted out of memory, for they are renowned only for deeds of murder and suicide. The old rnin, vast and noble, retains so much stability and entirety as if for a memorial, that not time but a retributive power had wrought its downfall; and so tradition tells, for the Protector Somerset sought to sustain and enlarge the edifice, but the lightning scathed and overthrew it.

Passing over a few miles of Devon lanes, skirted by cider orchards, a ruin of a very different kind is to be visited. It is at Watcombe, the ruin of a residence never erected. This is no paradox. About twenty and two years since, Brunel the younger saw here a coombe, from the high grounds around which most extensive views inland and seaward are commanded. He purchased that coombe and its surroundings, wisely commenced planting forthwith, that the trees might be growing whilst the house was erecting. In the valley he plotted out the flower garden; on the hills around he planted his arboretum; he built a gardener's house; he formed an Italian garden, and adjoining it laid the foundation of a residence. It is said that foundation cost him three thousand pounds, and then he proceeded no further. Why he stayed proceedings your penman knoweth not, but he does know that some one needing a mansion and grounds suitable to his wealth should become the purchaser, and complete the work. When Mr. Brunel died the estate was purchased by two brothers named Vickery, residing at Newton Abbot; but they only purchassd to sell it again for a fairer price.

The gardens and plantations are kept in excellent order by Mr. Helstone, the intelligent and obliging gardener, and those plantations are worth a journey to wander among. The whole estate includes sixty acres, and of these the pinetum occupies twenty, and the Cratæguses nearly two acres. The Coniferæ are perfect specimens, so vigorous, so clothed with branches to the very soil's surface, and so well apart, that on every side they are symmetrical.

Mr. Helstone obligingly furnished me with a list of the three chief collections of trees. Those of the Coniferæ to which an asterisk (*) is prefixed are all well furnished with cones this year, and he thinks several will perfect seeds for the first time. He has raised thousands of seedlings, from seeds ripened here, of Cupressus macrocarpa and Pinus insignis.

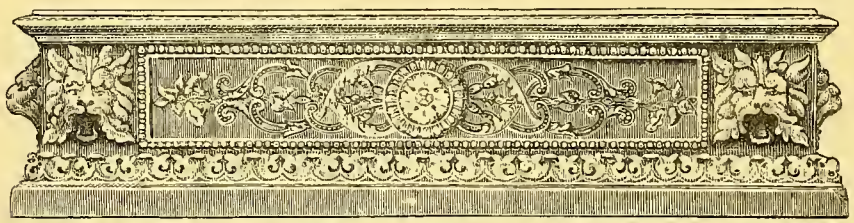
From those plantations I wended my way back towards Torquay, and one of my companions, had he known the per-

versity of human nature—at least of my human nature—would have said as we reached a certain gate about which were arranged busts and vases—"It's no use going in there, it's only a pottery," but he uncunningly said, "Let us go in there." So I, of course, said, "Oh! no—it's only a pottery!" Others of my companions being of the more pliant and inquisitive sex thought otherwise; so "the Ayes had it," and in we went, and glad I was, and glad I am, that I was outvoted, if it were only for the satisfaction I had of conversing with a man so courteous, so calm, and so obliging as Mr. Brock. He is the very fitting manager of the works of "The Watcombe Terra Cotta Clay Company."

Never did I expect to see such fictile work of English manufacture. I had been disgusted with the vulgar red figures in the arcades of the Royal Horticultural Society's Garden at Kensington, and thought that all home-made must be similar. The earth used at the Watcombe Pottery produces a ware of the pure, soft, classic terra-cotta colour, and the statuettes, busts, and vases constructed from it are worthy to stand by the side of the genuine Etruscan. The manufactory is not common pottery, but within its rooms are skilled artists. I saw the entire details of the manufacture from the washing of the earth—a red sandstone-tinted clay—the puddling of the dough, the turning of the vases, the baking; the artists (all women) with camel-hair brushes, adding the Etruscan patterns, and the sculptor designing forms and ornaments.

It is not a manufactory of the ornamental only, tiles, flower-pots, flower vases, window or Mignonette boxes, are among the utilities produced. The plain yet tasteful flower-pots are as

superior to the vulgar-shaped heavy pots commonly in use as



Hyperion was in grace the superior of a Satyr. Of the more ornamental flower-pots, vases, and boxes, the accompanying are specimens, but there are many others.—G.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Stir the surface of the soil among all growing crops where practicable. Trench or dig every spare piece of ground. Earth-up all the Cabbage tribe that are sufficiently advanced, and make succession plantations of *Brussels Sprouts*, *Buda Kale*, and *Broccoli*. Plant a considerable breadth of *Endive* and *Lettuces*. Prick out in nursery beds the *Cabbage* plants intended for spring use, that they may become stocky previous to their final planting. See that the *Celery* as it advances has every attention to weeding, the removal of offsets, and earthing-up, but in no case let the earth be raised so high as to injure or choke the heart of the plant. Collect and dry horse droppings for making a bed for *Mushrooms*. Keep the droppings spread thinly in a dry airy shed, and turn them frequently, for unless they are well dried it is difficult at this season to prevent the bed heating excessively, and this should be guarded against, as it exhausts the manure, and then there is only a poor chance of a good crop. Should a failure of the *Potato crop* occur, there will be an unusual demand for other vegetables in the spring. Let Stone and Dutch *Turnips* be sown on spare plots, and let all other vacant ground be planted with Coleworts, Brussels Sprouts, Cabbages, Savoys, &c. Ash-leaved Kidney *Potatoes* intended for seed may now be taken up and exposed to the sun till they are green. Should the disease attack the other sorts, let them be taken up at once, dried, sorted, and packed in dry earth or charcoal.

FRUIT GARDEN.

The prevalence of damp cloudy weather has caused free growth in fruit trees, and, excepting such as are bearing a good crop of fruit, they have in most cases already made as much or more young wood than there is much chance of their ripening in the course of the autumn. It will, therefore, be advisable to go over the trees and stop about half the shoots, beginning of course with the strongest, for a general stopping at this time would probably induce the production of a mass of useless spray, whereas stopping the stronger shoots, or those which incline to grossness, will divert the sap into the weaker ones, which will be strengthened, while the buds on the shoots that have been stopped will become full and plump without starting into growth. The only effectual method, however, of curing a gross habit of growth, when this is the case in ordinary seasons, is root-pruning, or keeping the roots within proper limits by means of shallow, well-drained borders. Should it be found that the shoots after stopping incline to start into growth, it will be advisable, as soon as the fruit is gathered, to open a trench at a moderate distance from the stem of the tree, cutting the strongest shoots. This will be of the greatest service in checking growth, and will probably do more towards securing ripe wood than anything else that could be adopted. Let the Strawberry plantations intended to stand for next season be trimmed as soon as convenient, cutting off and clearing away the runners, &c., so as to afford the leaves plenty of room.

FLOWER GARDEN.

In many neighbourhoods green fly is very troublesome on the Verbenas, &c. Tobacco water and soapsuds have been used with success. Nothing cheaper or more efficient can be used by those whose plants are infested. The strength of the mixture should be tested by dipping into it some of the shoots most affected; use it sufficiently strong to kill the insects, but not so strong as to injure the leaves. It should be applied in the evening, when there is a prospect of a dry night, using a

fine syringe or a fine-rosed watering-pot, and giving enough to moisten the whole of the foliage. Go over the beds frequently and remedy any defect that may be perceptible without loss of time, for the bedding-out plants are enjoyed but for a comparatively short season, and now that they are in full beauty every means should be used to render them as enjoyable as possible, by maintaining the most perfect order and neatness. When the stock is clean and growing vigorously this will involve considerable labour, as it will be necessary to go over the beds frequently, pegging down when necessary, removing decayed flowers, and cutting back such of the shoots as may incline to encroach upon the edgings of the beds. Keep herbaceous plants neatly tied up, and cut off the flower stems of any that are becoming unsightly. Take advantage of every spare hour to put in cuttings, and use all possible dispatch with this work until there is in a fair way of rooting a good stock of such plants as are known to be difficult to winter, except when well established. Keep climbers on walls within due limits. Propagate Hollyhocks by cuttings. Mark good seedlings, digging up all single and semi-double varieties. Take off the tops of seedling spikes if not already done; it throws strength into the remaining flowers, and encourages the formation and growth of the seed. Should hot weather continue, take care that newly-formed beds of Pinks and Pansies do not suffer from drought. Prick out seedling Pansies on well-prepared beds. Carnations and Picotees should be layered. Gentle waterings will be required, and the pots must be kept free from weeds; pull out decayed petals from those calyxes where seed-pods are forming, otherwise wet will lodge and the seed perish. Prepare the Tulip bed by frequent turnings; add, if required, fresh compost; avoid dung.

GREENHOUSE AND CONSERVATORY.

Repairs, painting, the examination of all flues, furnaces, pipes, and hot-water apparatus, should at once take place; the interior of the glass and woodwork should also be well washed and cleaned with hot water and soft soap; and the walls, &c., should have a couple of good coats of lime whitewash, made from strong newly-burned lime, with a good supply of sulphur vivum added, and every corner and crevice should be well washed with the above mixture. A wholesome structure for the reception of the plants will be thus secured. What is there that has a more negligent unwholesome appearance than dust and cobwebs, green walls, and dirty woodwork and glass? Let these matters be at once looked to, and thorough cleanliness be secured at this the most convenient season. The usual quantity for a season's supply of the kinds of soil used in potting should be laid-in as soon as convenient, and before the ground becomes sodden with the autumn rains, for even turfy soil should not be carted and stacked-up when saturated with water. The soil should be neatly put up in narrow ridges so as to be safe from wet, and exposed as much as possible to the action of the air. As success in plant-growing very much depends upon having suitable soil for potting, no trouble nor expense that may be necessary to procure this should be spared when well-grown specimens are expected. Loam of a moderately good quality may be secured in most neighbourhoods, but good peat is not to be obtained in many localities. This is absolutely necessary, however, for the growth of choice hard-wooded plants, and should be procured at the proper season, so as to have it in a fit state for use when wanted; for nothing is more disheartening to gardeners, nor worse economy on the part of employers, than being without suitable soil in a fit state to use for potting plants at the proper time. Plants intended to flower under glass during autumn and winter must now be looked to. Let the stock of Begonias have another shift if not already in pots sufficiently large. Keep the plants thin, that their foliage may be kept from injury. Attend to Chrysanthemums; water freely with liquid manure. Good specimens should be aimed at rather than a few fine blooms. The potting of the Hyacinths, Narcissus, &c., for forcing must soon occupy attention; about equal portions of good fibrous loam and decayed leaf mould, with silver sand, will be the best soil for them if for forcing, but well-decomposed cow dung must be substituted for the leaf mould when the bulbs are intended for late blooming. After potting place them on a dry bottom and cover the pots 2 or 3 inches deep with old tan or ashes, preserving them at the same time as much as possible from heavy rains. Under this treatment they will fill their pots with roots, and will be in readiness for forcing when wanted.

STOVE.

Plants flowering in the conservatory will require attention to prevent their being injured by damp, especially Achimenes and Clerodendrons, which should be gone over every day in cloudy weather, carefully picking off decayed flowers, &c. Any of the twiners on the roof which have done flowering may be thinned out so as to prevent shading the house too much, for after this season permanent shade should be avoided as much as possible. Apply fires but moderately, and that, too, principally in the morning, at the same time taking the advantage of admitting abundance of air.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

At last, and rather suddenly, we have something like a tropical climate, which has produced wonders after a rather cold, dripping summer. The vast yield of hay will make up in some measure for the way in which much of it was drenched and washed before being housed. The few days of bright sun have made a wonderful change in our corn fields and Turnip crops. The fields are whitening beautifully, and now, we should say, the Turnips have escaped the bane of mildew. On the whole we never recollect such a promising appearance of corn and root crops.

Celery.—With all the rains ours on the whole is stouter, but hardly so long as usual. We have just given it a good watering with sewage, and then followed overhead with clean water from the rose, as the leaves are rather sensitive to sewage. We earthed up a piece for early use, as we find we could not go on from July as we used to do, and therefore send it in later. The watered part we will examine for suckers, on the first fine day tie up the most forward plants, and scatter some fine soil from the sides to encourage rooting and to keep the moisture in. We mention this watering chiefly for the purpose of putting the less experienced on their guard. When Celery is grown, as ours is, in beds, the rains have a much better chance to tell on the roots; but even ours were much drier than we expected when we tried the soil with our fingers and dug down with a knife and stick. When Celery is grown in single rows the rains are very apt to be thrown off by the large leaves, and the roots do not receive their fair proportion. We have several complaints before us of Celery running and bolting, and the wonder is expressed that such should take place in a moist season. We should say that the bolting is greatly owing to the dripping season, and chiefly because it is so apt to beget in us a confidence and security which otherwise we should not feel. For such a ditch plant we should never disdain to try the ground about the roots with our fingers. Many a fine pot plant might have escaped bad health and shortened existence if it were ascertained that the soil was damp throughout instead of for an inch or so at the surface. We have known fine broad Cauliflower plants flagging in bright sun after a heavy rain, because the large slate-sized foliage carried the bulk of the rain away from the chief mass of roots, and that which was thus thrown off had sunk into the ground without reaching them. We noticed lately that some Cauliflowers were dry at the roots notwithstanding the rains; and so with the Celery. We have for years had scarcely a single bolted head. We see no appearance of any as yet, and if any do come we shall blame some time when the roots were extra dry independently of the rains.

Watering.—The change in the weather has rendered this necessary in many cases, as it is amazing how quickly a few days' powerful sun dry up the ground. The farmer can take his ease, whilst the gardener suffers, and must exercise care and anxiety every day. In the one case the crops have been committed to the soil, and have taken hold of it so as to sustain themselves in any weather; in the other case, constant succulent successions are wanted, and therefore there is need of shading, of sprinkling, and of good waterings to keep all going on, so as to have no breaks in the supply. In watering growing crops, as Celery, &c., it is best to water thoroughly, and shortly afterwards to spread a scattering of dry soil over the surface to keep the moisture in. In sowing in such burning weather seeds of Lettuces, Cabbages, Onions, &c., if thickly broadcast, it is best to dig, tread, and rake the ground ready for the seeds, then level, sow, and slightly pat them down with the back of a clean spade, covering all over with a sprinkling, say from one-eighth to one-quarter of an inch, of dry riddled soil. The dry covering will keep the moisture in, and the seedlings will come through healthy and strong.

FRUIT DEPARTMENT.

Besides attending to trees, washing late Cherry and Plum trees, potting Strawberry plants for forcing—all of which

matters have been lately alluded to in detail, one of our chief items of work has been

Clearing the Covering from a Vine Border, that the strong sun might heat the soil well. A thin covering of leaves and litter had been put on in the autumn, and a little more was added in April, when we made the whole border a receptacle of bedding plants, to receive less or more protection before being turned out. In general seasons this covering would have been removed at latest early in July, but the season was so wet and cold that we thought it was better to let it remain, as it so far defended the border from the cold heavy rains, and the weather was too cold to heat the soil of the border to any great extent. With a very porous, well-drained border, we question if all the rain that fell, if passing freely, would do harm. But in other cases, where the border was at all different, we feel certain that many of the stoppages of swelling and colouring recently referred to have been chiefly owing to too much cool moisture stagnating about the roots. Be this as it may, it operated with us as a reason for allowing most of the covering on the Vine border to remain, and more especially as the rains that would pass through it would be rather enriched before getting into the soil. We are also able to serve two purposes in the moving—exposing the surface of the ground to the sun, as stated above, and mulching many things in the kitchen and flower garden that needed that help to save frequent watering. Mulching is best applied after the ground is sufficiently heated. Applied too soon it keeps heat out. A little fresh surfacing placed over the border will cause all to look clean and neat, and prevent cracking, and in extreme cases of heat we shall be tempted to mulch slightly, and very likely water the late Vines. Above all things, however, extra watering should ever be avoided, unless the drainage is very good, and no mere surface inspection should be deemed satisfactory, but the soil should be carefully examined for several inches in depth. We have known Vines planted inside houses that seemed at a standstill, merely because the soil was watered once or twice a-week, and the moisture had never penetrated to the bulk of the roots, but was confined within 3 inches of the surface.

ORNAMENTAL DEPARTMENT.

We have had a very busy week in fresh regulating, cleaning, nipping-out decayed bloom, and, above all, in *watering*, especially the outsides of beds, from which all traces of moisture seem to depart at once. Before the bright weather came we had to soak several times vases filled with Scarlet Geraniums. Rains must not be depended on in such cases. The plants when thick and the leaves filling the space, throw the rains over the vase instead of into it, and, therefore, even after a heavy shower, it will often be found that the soil at the roots is very dry. The fingers or a stick should often be used to see in what state the under soil is. For plants in beds a minimum of water has been needed this season before the hot weather came. To make safe we watered most things except those that were growing quite as strongly as we wished, having previously stirred and loosened the soil where we could get at it, as it was hard on the surface from the rains. Then, wherever it could be done, we followed with a *mulching* from the Vine border. This in many cases had to be confined to the sides, as the centres were too close and full to permit of much in this way being done. Calceolarias had been thus treated some time before, so that helped to keep the ground cool and moist about them, the very thing to enable them to thrive in a bright sun. The material on the border, from being turned several times, was pretty well decomposed, and when thrown into a heap was broken small rather easily with the points of a fork, and this did well for the central parts of beds. The looser this is so as to be neat, the more effective it will be as mulching for keeping moisture in and heat out, as the ground is now warm enough. For placing near the outsides of beds, the most important part of all, we pass the material through an inch sieve so as to secure more neatness. The rains will pass through such surfacing easily, and carry much nourishment with them, and the open texture of the mulching soon drying on the surface, will help to prevent the moisture evaporating. Before mulching, the beds and rows that needed it most received a good watering of sewage water not over-strong. Readers are aware that we have more faith in one good watering than in many paltry applications. It should also be remembered that this enriching, even by surface mulching, has a very different effect as respects free blooming than digging manure in the soil, which too often encourages great luxuriance of growth. Some people keep their bedding plants in such a miniature state, that we should not be able to know them. Now, we like to see something of healthy luxuriant growth, strong plants meeting each other, and keeping the earth out of sight, but this free growth is of little advantage unless accompanied with density of blooming. Nothing tends more to secure these desiderata than a little surface manuring. The Polemonium cæruleum variegatum alluded to last week, is now putting on a brighter livery, and Geranium beds, lately scarcely so full and bright as desirable, are brilliant under the bright sun.

We pass over what would be a good deal of repetition, about potting, propagating, &c., to say a few words on

Burning Sulphur and Sulphur Fumes.—Like fire and water, sulphur is a good servant but a fearful devastating master. A keen amateur lately accosted us in great trouble about his Grapes just taking their second swelling nicely, but he thought there was red spider on them, and he used an iron stove in the house, put a small fire in the stove, and painted the outside of it with sulphur. We can well judge his consternation on seeing the leaves of his Vines, especially all along the top of the house, flaccid and drooping. We could only advise palliatives, such as to return at once and give air all along the top of the house, and as the sun threatened to be powerful, to make some whitening water in a pail, and throw it on the glass roof outside, thickly with a syringe, so as to shade the house; to moisten the floor inside, and to encourage fresh growth from laterals where the leaves were totally injured, and would require to be removed. As the gentleman said he used only a very little sulphur, there might be hope of saving most of the crop and tolerably good wood for next year. This is anything but the only instance of misconception as to burning sulphur this season. Our readers must bear in mind that no growing plant will stand the fumes of burning sulphur—no evergreen plant will stand them at any time. When deciduous plants have lost their leaves, and the wood is perfectly matured and hard, the fumes of burning sulphur for a short time will not injure the wood, but if the wood is at all green and unripened it will kill these parts to a certainty. Hence the care with which it should be used. We shall never forget the self-accusations of a patriarch in gardening when, after smoking his Cinerarias, and the fly not dying soon enough for him, he put a bit of sulphur in the pot with the tobacco, determined to do for the fly; and so he did, and for the plants too. Hardly one survived the ordeal. We often use burning sulphur in a pit or frame as a cleanser, destroyer, and purifier on finishing, say, a crop of Melons or Kidney Beans, before putting another crop in. A handful of sulphur placed on a few lighted cinders on a tile is generally sufficient, shutting the place, and shading and covering; but in doing this the greatest care must be taken that none of these fumes can reach by any mode the plants that are growing in neighbouring pits or frames. If there is the smallest opening between a smoked pit and one in which plants are growing, every leaf touched by the fumes will be killed or much injured. Even after such smoking it is well to expose the pit or frame for a day before preparing for another crop. We generally use that day for syringing walls, woodwork, &c., with hot water as near to the boiling point as possible, and we do all this on the principle that it is better to guard against insects than have recourse to means of killing them when they come. In all such cases prevention is better than cure, a fact that people seem slow to learn, or many advertisements would be rather an unremunerative affair.

So much for sulphur. When there is heat enough to burn it, it will kill, or nearly kill, every plant that is growing. It must be used with great care and judgment in the case of deciduous plants in a state of rest. Every soft, green, unmatured spot will suffer. For helping to keep red spider under, the fumes thrown off by a wall heated by the sun, from hot-water plates, or even warmed bricks will be useful; but if ever the body on which the sulphur is placed rises higher than from 160° to 170°, you get to danger-point. Hot-water pipes, even, may easily be made too hot for the sulphur placed on them to be safe.—R. F.

TRADE CATALOGUE RECEIVED.

B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N.—*General Bulb Catalogue.*—*Catalogue of Fruit Trees, Roses, &c.*

TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

Books (*Joseph Millward*).—Keane's "In-door Gardening" will suit you. It may be had from our office for 1s. 7½*d.*

Royal Horticultural Society's Floral Committee (*G. Brooke*).—The next meeting is on September 6th. Address to the Secretary of the Floral Committee, Royal Horticultural Society, South Kensington, London. They must be delivered there not later than 10 A.M. on the day of meeting.

Tenant Removing Plants (*Tom Jones*).—Unless you are a nurseryman or florist, or have an agreement to the contrary, you cannot legally remove Rose trees and other shrubs and plants; you cannot dig up a Strawberry bed; but you may take up Tulips and other bulbs.

Collection of Fruit (*H.*).—Black and White Grapes must decidedly be "different kinds," and therefore within the latter of the schedule, and we believe its intention also. They are always admitted as such at the London shows.

Dracocephalum canariense Seedlings (*T. S.*).—The seedlings of this (the Balm of Gilead), planted in the open ground, will require to be lifted in autumn before frost, potted in light sandy loam enriched with leaf soil, and wintered in a greenhouse, giving no more water than enough to keep them fresh.

Cropping between Strawberries (*Idem*).—We do not think it would pay to plant Asters or have Onions between the Strawberry rows; indeed it would spoil the plants' bearing another year. As you cannot plant until March, why not take a crop of some early Potato, as Myatt's Prolific Ashleaf, which would be cleared by the early part of July? Then you could at once plant with Strawberries, and take pains so as to have the runners rooted early by layering. You would from a July planting have a good crop the following year, quite equal to a planting made in March; and the Potatoes would be profitable, and cause no injury to the coming crop of Strawberries.

Strawberries Dying Off (*W. P.*).—We could find no insect. Send us a specimen, and we will endeavour to help you. The gardeners are probably right.

Early Prolific Strawberry (*D. G. Goddard*).—Write to "The Gardener," Morningside, Kidderminster.

Chasselas Musqué and Golden Champion Grapes (*C. R. R.*).—Chasselas Musqué requires exceptional treatment to prevent the berries from cracking. It requires the same treatment as Black Hamburgh until the process of stoning is finished, then the atmosphere must be kept dry. A night temperature of from 65° to 70° must be maintained, with as much ventilation as possible both by night and day; and, as a further preventive, cut a notch in the branch quite in to the pith, just underneath the bunch. This checks the flow of sap to the berries, and will most likely prevent cracking. Golden Champion succeeds best when grafted on the Black Hamburgh. We then obtain plenty of bunches and the wood ripens well; but we have never had a bunch ripening off to a fine golden colour without a number of the berries being disfigured with dark-coloured spots just under the skin, nor have we seen any thoroughly ripe without this fault. Being a very thin-skinned variety it is more liable to rust than most other sorts. We have it grafted on Trentham Black; the berries are of immense size and nearly round, but they did not set well, and few of them are perfect.

Vines in Cool House (*C. R.*).—Your list will do very well, but you ought to leave out Mrs. Pince and Gros Colman, which require heat, the latter especially.

Grapes Scalded (*Staff Surgeon Major*).—The berries were quite shrivelled. But for your giving air all night we should have said that the Grapes were blotched and scalded by hot water. We fear, if the roots are near the surface, that the excess of rain on the outside border, with want of sun, has been the chief cause. Meanwhile we would let the sun play on the border, and give more air, even if you gave a little fire heat on a dull cold day. We regret we cannot give more definite advice. The great thing is to use preventives; when once scalded or failing little can be done. One of our best gardeners, finding his Vine borders getting too wet, had a lot of dry litter put next the earth, and turned other covering material over that, so as to keep the soil drier.

Grapes not Colouring (*A. W.*).—Too much water is as injurious as too little; retention of moisture is a fruitful source of shanking. If watered so frequently before, it would be well to see if the roots are damp enough at the colouring period. We would thin out, but not quite remove all laterals, those left encouraging healthy root-action.

Vine Leaves Withering (*Blue*).—See what has been said in answer to other correspondents. A great fall of rain on a badly-drained border in such a sunless season, would help to cause the withering of the leaves, and arrest the swelling of the fruit. That may be partly the cause, but in the case of Vine and Geranium leaves, we believe the chief cause is scalding or scorching, from want of air given early enough in a sunny morning.

Vine Roots Decaying (*A. W.*).—It is rather singular that the Vine roots should decay in an inside border in the manner stated. The wireworm, of course, would injure them, and should have been trapped and rendered uncomfortable with lime waterings, but they would not be sufficient to account for the decay. We fear that your watering once a-week has been too frequent, and we should not be surprised if fungus has been formed from the fowl dung, &c., supplied. The wireworm, however, had better be eradicated by trapping with sliced carrots, &c. Watering should ever be proportioned to the evaporation, and in such a dull season as this it would be easy to over-water Vines, and thus so far injure the roots.

Mushrooms (*C. W.*).—So far as the preparation and management of the bed have been conducted it appears to us that you have been most successful, and there can be little doubt that the spawn you have used has been spurious.

Chrysanthemums Growing against a Wall (*St. Bridget*).—Apply a mulching of well-decomposed farmyard manure to your Chrysanthemums at once. They will require a copious watering about twice a-week. If the ground is poor an occasional watering with weak manure water will be beneficial, but if rich we would not use it, or at least not before the flower buds could be seen; even then we have more faith in surface-dressings, allowing the water to wash the nutriment down to the roots. Decayed stable manure is most suitable.

American Blight (*G. M. F.*).—Slake some quicklime and add some salt; make a paint of it, and apply it with a brush in winter. If lichens or moss are on the trees it will cure that also. At Rushton I had several Rihston Pippin trees much affected by American blight. The above recipe cured them entirely.—W. F. Radclyffe.

Covering a North Wall of a House (*J. J. S.*).—Try Rægner's Ivy; it has heart-shaped polished leaves, and is very handsome. If you want flowers, put up a wire fence against the wall, and plant behind the wire Cotoneaster buxifolia; it has pretty white flowers and evergreen leaves; the fruit is coral red. It is always cheerful-looking. At Rushton I covered with it a north wall that was unsightly when seen from my dining-room. It is a strong grower, and will reach 8 or 9 feet high. Ivy is an excellent covering for a damp wall.—W. F. Radclyffe.

Wintering Castor Oil Plants in the Open Ground (*D. M.*).—This plant cannot be wintered out of doors even with protection, for it is destroyed by a few degrees of frost. Take up your plants on the first approach of frost, place them in a house from which frost is excluded, and keep them dry. If the plant has flowered throw it away. Perhaps the best plan to secure strong plants for planting out is to sow now, and have the plants established before winter in small pots in sandy soil, keeping them dry and near the glass during the winter.

Fern Fronds Losing Colour (*Idem*).—It is probably due to the plants being much shaded, and not having a sufficiently high temperature. It is usual, however, for the kinds you name, and, indeed, all those having pink fronds whilst young, to show less colour in the late summer and autumn months than in the spring and early summer months. We attribute the difference to the greater amount of light, the plants not being shaded until the sun's rays become powerful. The remedy will be more light.

Two-acre Garden (*Constant Reader*).—You and your one man have enough to do with this, the houses, frames, &c., if all is kept well; but much will depend on the style of keeping. Where fruit and vegetables are sold there is more labour involved than when all is consumed by the family. Early forcing, too, makes all the difference.

Melon Ripening (*An Irish Reader*).—To know when a Melon is ripe is no difficult matter. You may know when it begins to ripen by the perfume or aroma given off, and then you will notice a change in the colour. When it changes to one colour throughout—it may be white, yellow, or yellow tinged with red according to the kind—it is fit for cutting; and another good criterion is when the fruit commences to leave the vine by cracking or parting from the footstalk; it should then be cut. We consider it better to cut Melons under rather than over-ripe, and to keep them for a few days in a dry airy room before sending them to table.

Heating a Span-roofed Cucumber House (*Signature illegible*).—There need be no difficulty in taking your main flow-pipes at the sides of the house to join the return beneath the bed. Such things are done every day. You might thus, with the exception of the return, have your top and bottom heat independent of each other. A very simple mode of heating such a house would be to take the side and end pipes as flows, and make all returns in the chamber beneath the bed, but by this mode you must heat the sides before you could heat the chamber. The more flows and the fewer return-pipes, the more regularly will the pipes be heated. Assuming that the boiler is at one end of the house, and you can have only one pipe at the side, we would take that right round and drop at once to the return-pipe near the boiler; then, so far as this pipe is concerned, that would be quite under separate control by means of a throttle valve. That would not in early forcing be enough for top heat, and you would still have to borrow from the chamber for that purpose. With four or five pipes in the chamber, and the slides spoken of, you might dispense with side pipes.

Breakage of Glass (*C. Z.*).—With ordinary 15-oz. glass, we have lost few squares, size 20 inches by 12. We are sorry you have lost so much; the glazing must have been too tight. We would in respect to the large house leave well alone, and reglaze with 21-oz., say 20 by 12, or 20 by 15, not larger.

Second Early Potatoes (*Cottage Gardener*).—The Lapstone is the best second early Kidney Potato, and Early Oxford the best second early round kind. Neither has large haulm, though in both it is larger than in Myatt's Prolific. Large haulm is in a great measure due to the richness of the ground, and to giving manure at planting, or just before. We do not know of a second early having shorter haulm than those named. They are unequalled for quality and yield.

Transplanting Heather (*J. P., York*).—Transplanting pieces of young Heather over the burnt moor at a few yards apart should be done in autumn after the growth is complete, or between September and March in mild weather. The younger the Heather the better it will grow; but we are informed that the large pieces moved in October sooner cover the ground with Heather, for though they may not grow so well as young tufts, they seed much more freely. We should try both, and also cut off the Heather in full seed and strew it over the burnt portion.

Select Tall Phloxes (*Mrs. C.*).—Aurantiaca superba, vermilion orange; Madame Marie Saison, white, shaded red; Duke of Sutherland, dark rosy crimson; Etoile de Neuilly, white, with purple eye; Madame Andry, deep crimson; John Laing, rose, tinged with purple; Vierge Marie, white, purple eye; Miss Melville, light rosy crimson. They can be planted in autumn.

Insects (*J. W.*).—Your Willow branch is infested with numerous specimens of a species of aphis, just in the same way as Roses or Beans may be observed every day.—I. O. W.

Names of Plants (*A Lover of Flowers*).—You seem to have chosen your pseudonym very well; but if you do love your flowers we must ask you, when you next request us to name "the enclosed flowers," to send us a few more than you do now, or we shall think you selfish. Two flowers only did we find—one, a Campanula, No. 3 of list, not in a state in which we could name it; the other (No. 1), being that of Agapanthus umbellatus. No. 4 was Sedum Sieboldii; and as for No. 2, we can only say it is the leaf of a monocotyledon, probably a Lilywort, and possibly that of Solomon's Seal, Polygonatum racemosum, but this last is a mere guess. (*H. T.*).—The long leaf is that of Goldfussia isophylla, the other of Fittonia argyroneura. Both are stove plants. (*F. W. C.*).—1, Drynaria propinqua; 2, Phymatodes vulgaris; 3, Gymnogramma tartarea; 4, Adiantum hispidulum; 5, A. diaphanum; 6, A. Capillus-Veneris. (*Oswell*).—1, Selaginella Martensii; 2, S. Braunii (S. pubescens of gardens); 3, Chloris verticillata, an American Grass. (*Ben Bridges*).—1, Prunella vulgaris, Self-heal; 2, Listera ovata, Twayblade; 3, Phalaris arundinacea fol. va-

riegatis, common Ribbon Grass; 4, Lysimachia ciliata—at least it would appear to be that species. But you say "It grows wild here." Are you sure you are right in this? If so, be good enough to communicate your name and address to us, enclosing us a better specimen, and telling us what quantity of it you find, and where the locality is. (*Chesham*).—1, Linaria Cymbalaria; 2, Artemisia Dracunculus; 3, Corydalis lutea; 4, Euphorbia Lathyris; 5, Polypodium vulgare. (*Constant Reader*).—There can be no doubt this is the Stinking Morel (Phallus impudicus). It is common on the north of London. Strange to say, a short time ago we heard of a very similar case. The inspector of nuisances told us of a house infected with a frightful stench in the basement as if from putrid corpses, that could not be accounted for. On the boarding being taken up there was found a plentiful crop of this stinking fungus. It is difficult to say how it could be destroyed, unless taken up one at a time and burnt. (*E. K. L.*).—We cannot undertake to name florists' flowers. We had to pay 4*d.* for your parcel. (*E. T.*).—Samphire, Crithmum maritimum, red from the sun. (*Moulsham*).—The common Loosestrife, Lysimachia vulgaris. (*A. C.*).—The white Lily is L. longiflorum of Thunberg, native of Japan; the orange one is L. davuricum of Gawler, native of Siberia. (*Inceptor*).—Achillea filipendulina, one of the Milfoils, a well-known garden plant, and native of the East. (*E. G.*).—The plant you send is Lythrum Salicaria itself, true and proper. You must be magnifying differences. (*W. B. Ford*).—Your fronds are quite the same, and are extremely young fronds of Polypodium vulgare, the common Polypody. (*G. W. J.*).—Honckenya (or Honkeneya) peploides, the Sea Purslane.

POULTRY, BEE, AND PIGEON CHRONICLE.

POULTRY-KEEPING UNDER DIFFICULTIES.

No. 3.

Returning now more in detail to my limited space, and what may be done with it, I will first repeat that it measures exactly 67 feet long by 35 feet wide; and that as I, for reasons already given, find it best to make exhibition a secondary object, and rather to devote my small piece of ground to producing the greatest possible result, the problem to be solved every year is the breeding from four different pens of adult fowls, the hatching of between forty and fifty chickens, and the rearing about thirty of them to maturity. With some varieties more than this might be done; but my breed is Dark Brahmas, and it will readily be believed that very careful management is needed to preserve health in a space so crowded.

First, with regard to the permanent arrangements. These are not quite so good as might be, owing partly to the plan of the garden, and partly to the houses, &c., having been built piecemeal instead of on one regular plan. A gravel walk 4 feet wide runs up the garden, leaving a border 7 feet wide on one side. This being a few yards longer than the rest, is nearly 80 feet, and has a rude, quite open shed at each end, and a wire division in the middle, making thus two runs about 40 feet by 7 feet. The other side of the path, of course, measures 24 feet in width by 67 feet in length. The whole length, against the wall runs a shed 6 feet wide, part being only fenced with wire for dry rubbish, and part entirely enclosed for roosting-houses, and the whole is divided into four runs or yards, measuring in width 17 feet, 13 feet, 26 feet, and 11 feet respectively. Had I made the whole at once, I would have made the 17-feet pen narrower in order to have made the 11-feet pen wider. The first two pens have houses 5 feet wide, the rest of the shed being open. The large 26-feet pen has two houses 4 feet wide, and two sheds 9 feet, and the last pen a house 4 feet, and shed 7 feet wide. All the sheds on this side of the path have wire doors, and are wired up the front, so that the fowls can be confined at pleasure; but the sheds on the border are quite rough and entirely open. The divisions between the pens are boarded nearly 3 feet high, so that the birds cannot see each other, and wired above.

I put the whole up, as far as I remember, with my own hands, except a little help from a brother, and do not think the total expense was more than about £15. I had a pretty good wall to build against, and under such circumstances putting up houses is a very simple affair. The first thing is, by means of strong holdfasts, to fix pieces of scantling 3 inches by 4 all along the wall horizontally, at the height you have fixed for the roof, to nail the rafters on, and to fix uprights of the same at every partition you want, letting them about 2 feet into the ground. Opposite these you dig holes for and plant your front uprights, taking care that they are an equal height all along, and when you have spiked upon these another horizontal piece for the lower edge of the roof, and nailed two or three rafters to keep the whole in position, you have the rough frame complete, and can spike down the other rafters, and "timber-up" at leisure. It is quite unnecessary to spend large sums on even an extensive range of houses; and if every man would accustom himself to use tools, it would be better both for his health and his pocket, for he will never find a workman who will do in a given time half the work that he can do himself. I am sorry to say this, but I have always found it so.

All these pens are generally filled up to about the beginning of December, by which time I endeavour to sell all birds which I do not require, and clear, at least, the largest pen, which remains then entirely empty till the end of February. This run being devoted to the young chickens, it is thus tolerably fresh and pure for them, as I never set hens, from want of room, till the end of February or early in March. The border, also, I clear as soon afterwards as possible, and endeavour to give half of it at least a month's rest. When my four breeding pens are made up, one goes on half of the border, the other three in the smallest three pens on the other side. I have, of course, no trouble with my first two sitting hens, having the two houses and sheds in the chicken run at their disposal, and the ground there being fresh and clean, I go on hatching till I have often nearly forty chickens in the run. In order to do with such a number, the manure is, as far as possible, swept up off the ground (which they tread hard), two or three times a-week with a soft brush, and some disinfectant (lately I always use carbolate of lime), scattered in the houses. By the time the first chickens are six or seven weeks old, however, it is necessary to thin the numbers in the large pen, and fifteen to eighteen are drafted off to the unoccupied end of the border, which has been in its turn getting fresh for them. At the end of May, again, when the season for selling or setting eggs terminates, I sell at least one cock and a hen or two, thus bringing my four families into three, and emptying another pen, and as soon as possible, at leisure, I generally dispose of a few more birds so as finally to reduce my old stock to two pens. By the time this is done the last-hatched chickens are getting on, and room is thus made for separating the cockerels. I, finally, after eating two or three of the worst cockerels, generally divide the chickens into two pens of cockerels and two of pullets, retaining the best of the pullets in the largest run, as I find by experience that they need more space than the cockerels to keep in health.

Once or twice each year every pen in my yard is thoroughly dug up about 6 inches deep. I used to do it myself with a heavy Dutch hoe—a plan I can conscientiously recommend to stout gentlemen in want of exercise—but I soon got tired of it, and now have it dug over with a spade. The houses and shed are whitewashed at the same time with a mixture of lime and sulphate of iron, and all the nests, which are separate, are also washed with the same.

It is by thus giving each pen devoted to the chickens a few months' rest every year, and by digging over the whole, taking up always as much of the manure as possible, that I am able to do so much in the space I have. My two finest pullets this year weighed nearly 5 lbs. each at four months old; and though that is not equal to what I could obtain had I a grass run, I am certain few breeders can beat it. The number of pens is necessary to proper classification; for before I had so many divisions I could not do so much; but people who do not wish to sell eggs would require fewer breeding birds, and would have the more room for chickens. Such might be able, by sowing, to get a little grass each year in their chicken runs, but I have never myself been able to do any good in this way, though I have often tried, the short time I can give not being enough for it to grow.

The floors of all my houses are of concrete, or rather hard mortar, and much as it is condemned in this Journal, I prefer it for a floor, if sprinkled freely with earth or ashes. I have never had more than a few single deaths, which every breeder is subject to, and believe my yard is as healthy now as six years ago. The one difficulty I find is in getting that bright and clear white in the plumage which is so much admired, and for which nothing seems to equal the shade of living trees. I have heard that there are means known to some of bleaching birds tanned with the sun and acid atmosphere of a city; and I have tried chloride of lime with a little improvement, but I cannot say with success. If any breeder can enlighten us on this point he will remove one of the "difficulties" under which I labour, in common with many others who have to follow their "fancy" amid the smoke and glare of a town.—L. Wright.

GOLDEN-PENCILLED HAMBURGH HEN INCUBATING.

Mr. Hewitt tells us in the "Poultry Book" of two instances which he has known of hens of this breed incubating steadily,

but in each case the hen had stolen her nest in some out-of-the-way place where the eggs, of course, were left undisturbed until the number was completed and the hen had begun to sit. As the following differs from those cases, I think some may care to hear it. A Golden-pencilled hen, three years old last May, began to lay in 1871 on January 19th; she laid from that date till July 16th, never missing more than four days at a time, laying generally on two days and then missing one; but on the 16th of last month she remained on her nest all night, and being in it on the next morning, I placed seven eggs under her on the chance of her sitting out her whole time. She not only was most steady during her three weeks of incubation, but at the end of the time (August 6th) hatched out her chickens, and is now proving a most exemplary mother. I may add, the hen laid all her eggs from January 19th till she began to incubate, in the same nest, the egg being removed on the evening of the day on which it was laid. She is also perfectly well bred, herself a prize-winner, and the mother of many other winners. She has never shown the smallest desire to sit before, and now seems quite in her glory with her young family. —Reginald S. S. Woodgate, *Pembury, Tonbridge Wells.*

WARRINGTON POULTRY SHOW.

As this Show was instituted only a year ago, it is perfectly astonishing that so complete and varied a collection of both poultry and Pigeons could be brought together as there was on the 8th and 9th inst. The public support was freely given, and it was well deserved by the managing Committee, who did everything necessary to place the Show in the most favourable position. Colonel Wilson Patten, M.P., kindly allowed the use of his grounds, and between six and seven thousand persons were admitted on the first day, a result that was probably much aided by the day being observed in Warrington as a general holiday. The entries amounted to 438 pens, last year's entry being 383, showing not only an increase in numbers, but a wonderful improvement in the whole of the specimens exhibited. Large and most commodious tents were provided, and the pens were supplied by the well-known firm of Messrs. Turner, of Sheffield.

There was a grand display of *Dorkings*, but the adult birds were unfortunately deeply moulting, which caused the silver cup to fall to the chickens. In the *Spanish* classes there was an unusually good entry, the birds being excellent throughout; the adults secured the cup. Of *Cochins*, every variety was well shown. Mr. A. Taylor, of Manchester, was a very extensive winner in this division. The silver cup for Cochins was taken by this gentleman in a very severe competition, principally with first-prize pens. *Brahmas*, though mostly moulting, so far as the Dark-feathered were concerned were a very fair lot, and some of the Light-feathered were sent in unexceptionable condition. In *Game* most of our noted breeders competed; the birds were, as a whole, wonderfully good, and the cup was eventually awarded to a very fine pen of Brown Reds, the property of Mr. Brierley, of Middleton. *Hamburghs* were first-class throughout, Golden-spangled being successful for the Hamburgh silver cup. The silver cup for *Polands* was also taken by the Golden-spangled variety. The class for *French Fowls*, and the Variety class, were exceedingly well filled. Game *Bantams* are often better shown, but some very superior Silver-laced Bantams were competing. The classes for Waterfowl proved a very strong feature in the Warrington Show, and excited much interest among the sight-seers.

In *Pigeons* we were agreeably surprised to find that the liberal offer of numerous cups by the Committee induced many exhibitors of note to send their best birds to compete, although it must have given many of them trouble to find foster-parents for their produce at this the close of the breeding season.

In Ponters Mr. Fulton won the cup with a magnificent White hen, that for Carriers he also won with a Dun hen. In the Carriers under one year the prize given by the Secretary for the best bird under one year (which we would suggest another year ought to be given for the best bird bred in the year of the show), was also taken by Mr. Fulton with a bird of this season, but we were not struck with it. In Short-faced Tumblers he took the cup with a beautiful pair of Almonds; but the cup for the best pair of Barbs, Turbits, or Owls went to the first-named variety. In the next classes, for the best in Jacobins, Fantails, Trumpeters, Magpies, or Nuns, Mr. Fulton won with Jacobins, making five cups altogether. In that for Dragoons Mr. Holland won with a pair of Reds, also first honours in Blues and Silvers, and divided the remaining honours with Messrs. Graham and Mitchell. In a strong class of Antwerps the cup went to Birmingham, also second honours. In the class for Any new variety plumaged birds shown in beautiful condition took the cup. In the Selling class there were many good and cheap pens. Commendations were not bestowed by the Judge, not from want of merit, but we presume from want of time, as a better collection of all varieties it has not been often our lot to see. Many were the birds not noticed here we have seen decorated at other shows with high honours.

Dorkings.—1 and 2, J. Martin. 3, Mrs. Arkwright. *hc*, T. Briden. *Chickens.*—1 and Cup, Mrs. F. S. Arkwright. 2, J. Martin. 3, W. H. King. *hc*, R. H. Richardson; F. Parlett; E. Leech.

Spanish.—1, Cup, and 2, C. W. Brierley. 3, Mrs. Allsopp. *hc*, W. Woolley; J. Walker; H. Beldon. *Chickens.*—1, J. Walker. Equal 1, Mrs. Allsopp. 2, H. Brown. 3, N. Cook. *hc*, W. R. Bull; Clowa & Adkins.

Cochins.—*Buff or Cinnamon.*—1, Cup, and 2, W. A. Taylor. 3, Henry Lingwood. *hc*, H. Lacy; Mrs. Allsopp; W. Sanday. *Chickens.*—1 and 2, W. A. Taylor. 3, W. P. Rylands. *hc*, J. Sichel.

Cochins.—*Partridge.*—1, W. A. Taylor. 2 and 3, E. Tudman. *Chickens.*—1 and 2, C. Sidgwick. 3, W. A. Taylor. *hc*, Horace Lingwood; E. Leech. *Subscribers' Cup.*—Cup, E. Leech. *hc*, Horace Lingwood. *c*, E. Tudman.

Cochins.—*White.*—Cup, J. Sichel. 2, Mrs. A. Williamson. 3, A. D. Cochrane. *hc*, E. Fearon.

Brahmas.—*Dark.*—1 and 3, H. Lacy. 2, T. F. Ansdell. *hc*, Rev. J. Richardson; T. Raines; H. Beldon; G. A. Stephens. *Chickens.*—1 and Cup, W. A. Taylor. 2, J. Ashworth. 3, T. F. Ansdell. *hc*, T. F. Ansdell; Horace Lingwood. *c*, J. Thomson.

Brahmas.—*Light.*—1 and Cup, H. M. Maynard. 2, Mrs. A. Williamson. 3, Rev. N. V. Ridley. *Chickens.*—1, T. A. Dean. 2 and 3, J. Pares. *hc*, H. M. Maynard.

Game.—*Any Variety.*—*Cock.*—1, R. Ashley. 2, C. Chaloner. 3, C. W. Brierley. *hc*, G. F. Ward.

Game.—*Black-breasted Reds.*—1, C. Chaloner. 2, E. Bell. 3, T. P. Lyon. *Chickens.*—1 and *hc*, C. Chaloner. 2, B. Jarvis. 3, S. Matthew.

Game.—*Brown and other Reds, except Black-breasted.*—1 and Cup, C. W. Brierley. 2, H. M. Julian. 3, R. Ashley. *Chickens.*—1, C. W. Laxton. 2, J. Carlisle. 3, J. Fletcher. *hc*, B. Jarvis; J. Carlisle (2).

Game.—*Any other Variety.*—1, C. W. Brierley. 2, C. Chaloner. 3, S. Matthew. *hc*, F. Sales. *c*, H. M. Julian. *Chickens.*—1, C. Chaloner. 2, Barker & Charnock. 3, W. H. L. Clare.

Hamburgs.—*Golden-spangled.*—1 and Cup, J. Rollinson. 2, H. Pickles, jun. *hc*, H. Beldon. *c*, J. Rollinson; J. Statter. *Silver-spangled.*—1, H. Beldon. 2 and *hc*, H. Pickles, jun. *Golden-pencilled.*—1, J. Rollinson. 2, Rev. J. Richardson. *hc*, H. Pickles, jun.; H. Beldon; T. Wrigley, jun. *Silver-pencilled.*—1, H. Beldon. 2 and *c*, H. Pickles, jun. *Black.*—1, C. Sidgwick. 2, W. A. Taylor. *Chickens* (any variety).—1, H. Pickles, jun. 2, G. Brown. *hc*, H. Beldon.

Polands.—*Silver-spangled.*—1, H. Pickles, jun. 2, H. Beldon. *c*, Mrs. J. M. Procter. *Golden-spangled.*—1, Cup, and *hc*, H. Beldon. 2, W. Harvey. *Any other Variety.*—1, T. Dean. 2, J. Battye. *hc*, T. Wakefield.

French Fowls.—*Houdans.*—1 and 3, R. B. Wood. 2, J. Weeks. *hc*, G. W. Hibbert. *Any other Variety.*—1 and Cup, R. B. Wood (Crêve-Cœurs). 2, H. Beldon. 3, E. Williams. *hc*, Rev. N. V. Ridley; J. Sichel; C. H. Smith.

Any other Variety.—1 and Cup, F. Wilton (Black Cochins). 2, S. R. Harris (Minorcas). 3, Rev. N. V. Ridley (White Leghorns). *hc*, W. G. Mulligan. (Scotch Greys); Rev. A. G. Brooke (Malays); G. Anderton (Sultans); —Johnson (Anconas). *c*, Mrs. F. Teale (Japanese Silkies).

Game Bantams.—*Cock.*—1, T. Sharples. 2, Ellis & Buckley. 3, W. Adams. *hc*, J. R. Robinson.

Game Bantams.—*Black-breasted Reds.*—1, G. Hall. 2 and 3, T. Sharples. *Chickens.*—1, J. Eaton. 2, T. C. & E. Newhitt. 3, T. Sharples. *hc*, Rev. C. J. P. Keene; J. W. Morris.

Game Bantams.—*Any other Variety.*—1, J. Eaton. 2 and 3, T. C. & E. Newbitt. *hc*, Bellingham & Gill. *Chickens.*—1, T. Dyson. 2, J. Eaton. 3 and *hc*, Rev. C. J. P. Keene.

Bantams.—*Any variety except Game.*—1 and Cup, M. Leno. 2, H. Beldon. 3, S. & R. Ashton. *hc*, M. Leno; H. Draycott; T. Waddington; J. Sichel.

Ducks.—*Aylesbury.*—1 and Cup, W. G. Mulligan. 2, E. Leech. *hc*, H. S. Stott; J. K. Fowler (2). *Rouen.*—1, R. Gladstone, jun. 2, J. Scotson. *hc*, T. Wakefield (2); E. Leech; H. S. Stott. *Black East Indian.*—1 and 2, S. Burn. *hc*, H. B. Smith. *Any other Variety.*—1 and Cup, C. W. Brierley. 2, H. B. Smith. *hc*, W. Binns; C. W. Brierley.

Geese.—1, J. K. Fowler. 2, E. Leech. *hc*, H. S. Stott. *c*, R. Gladstone, jun.

Selling Class.—*Single Cock.*—1, B. Jarvis. 2, W. R. Park. 3, N. Cook. 4, W. T. Storer. *hc*, F. Bennett; C. W. Brierley; J. Mansell. *c*, H. M. Julian. *Pair of Hens.*—1, Birch & Boulter. 2, Mrs. G. Granville. 3, W. Whittaker. 4, T. Bellman. *hc*, W. Whittaker; F. Steel; H. Beldon; C. W. Brierley; E. F. Gardom; W. T. Storer; H. Wilkinson. *c*, W. G. Mulligan. *Cock and Hen.*—1, J. Mansell. 2, Birch & Boulton. 3, A. Bamford. 4, W. Speakman. *hc*, W. G. Mulligan. *c*, F. Cooper.

PIGEONS.

Pouters.—*Cock.*—1, F. Gresham. 2 and 3, R. Fulton. *Hen.*—1, Cup, and 3, R. Fulton. 2, F. Gresham.

Carriers.—*Cock.*—1, G. J. Taylor. 2 and 3, R. Fulton. *Hen.*—1, Cup, and 3, R. Fulton. 2, G. J. Taylor. *Cock or Hen under One Year.*—Medal and 2, R. Fulton. 3, W. Walton.

Tumblers.—*Almond.*—1, Cup, 2, and 3, R. Fulton. *Short-faced.*—1, F. Moore. 2 and 3, R. Fulton. *Long-faced.*—1, W. Harvey. 2, J. M. Braid (Baldheads). 3, F. Moore.

Barbs.—1 and Cup, for the best pair in Barb, Turbit, and Owl classes, G. J. Taylor. 2 and 3, R. Fulton.

Spanish.—*Black.*—1, H. Beldon. 2, J. Thresh. *Chickens.*—1 and 2, J. Thresh.

Cochin-China.—1, H. Beldon. 2, T. H. Readman, Whithy. *Chickens.*—1, C. Sidgwick. 2, Baxter & Dawson. 3, O. Stansfield.

Hamburgh.—*Silver-spangled.*—1, H. Beldon. 2, N. Pickles, jun., Earby. 3, T. Fawcett, Baildon. *Chickens.*—1, J. Wright. 2, T. Fawcett. 3, N. Pickles, jun. *Gold-spangled.*—1 and 3, H. Beldon. 2, N. Pickles, jun. *Chickens.*—1, N. Pickles, jun. *Silver-pencilled.*—1, N. Pickles, jun. 2, H. Beldon. *Chickens.*—1, H & J. Garnett. *Gold-pencilled.*—1, H. Beldon. 2, N. Pickles, jun. 3, J. Crabtree, Shipley. *Chickens.*—1, T. Garnett. 2, N. Pickles, jun. *Black.*—1, H. Beldon. 2, C. Sidgwick. 3, H. W. Illingworth. *Chickens.*—1, C. Sidgwick. 2, W. Fawcett. 3, H. W. Illingworth.

Brahma Pootra.—1, H. Beldon.

POLAND.—1 and 2, H. Beldon. 3, N. Pickles, jun.
FRENCH.—1, H. Beldon.
BANTAMS.—*Game.*—Cup, 1, and 2, W. F. Entwisle (Black Red and Poles). 3, E. Ibbetson, Idle. *Chickens.*—1, W. F. Entwisle. 2, E. Riley. 3, J. W. Thornton, Bradford. *Any other Variety.*—1, S. & R. Ashton. 2, H. Beldon. 3, N. Pickles, jun.
DUCKS.—*Rouen.*—1, H. Jowett. 2, T. Garnett, Idle. 3, M. Scott. *Any other Variety.*—1, S. & R. Ashton. *Ducklings.*—1, N. Pickles, jun. 2. M. Scott. 3, H. Jowett.
ANY OTHER VARIETY.—*Chickens.*—1, M. Sutcliffe. 2, W. Johnson. 3, J. W. Thornton.

PIGEONS.—*Carriers.*—1 and 2, E. Horner, Harewood. 3, H. Yardley, Birmingham. *Dragoons.*—1, H. Stanhope, Eccleshill. 2 and 3, F. Graham, Birkenhead. *Pouters.*—Cup and 1, J. W. Cannan, Bradford. 2, E. Horner. 3, H. Yardley. *Trumpeters.*—1 and 2, E. Horner. *Tumblers* (Short-faced).—1 and 3, E. Horner. 2, H. Yardley. (Long-faced).—1, E. Horner. 2, W. Lund, Shipley. 3, H. Yardley. *Owls.*—1, H. Yardley. 2, J. Thresh. 3, E. Horner. *Turbits.*—1 and 3, E. Horner. 2, W. Lund, Shipley. *Antwerps.*—1, H. Stanhope. 2, B. Lancaster, Baildon. 3, C. Smith, Idle. *Fantails.*—1, H. Yardley. 2, E. Horner. *Any other Variety.*—1, E. Horner. 2, W. Lund. 3, W. Ellis.

LITTLEBOROUGH AGRICULTURAL SOCIETY'S POULTRY SHOW.

THE following are the awards made at this Show, which took place on the 12th inst. :—

GAME.—1 and 2, C. W. Brierley, Middleton. *Cock.*—1 and 2, C. W. Brierley. 3, J. Oldfield, Shibden. *Hen.*—1, C. W. Brierley. 2 and 3, T. Dyson, Halifax. *hc*, C. W. Brierley; W. Ormerod, Pexhouse, Todmorden.
BRAHMA POOTRAS.—1, J. Ashworth, Rochdale. 2, H. Lacey, Hebden Bridge. *c*, J. Ashworth; H. Lacey. *c*, J. Watts, King's Heath, Birmingham.
COCHIN-CHINA.—*Cinnamon and Buff.*—1. H. Lacey. 2, E. Leech, Rochdale. *hc*, A. Bamford, Middleton. *Any other Variety.*—1, E. Leech. 2, A. Bamford.
BANTAMS.—*Game.*—1, J. W. Morris. 2, G. Haworth. *Cock.*—1, S. Smith, Northowram. 2, G. Haworth, Holden Wood. *Any other Variety.*—1, G. W. Robinson, Halifax. 2, J. Watts. *hc*, S. & R. Ashton, Motram; J. Watts.
DORKINGS.—1, W. H. King, Rochdale. 2, J. Stott, Healey, Rochdale. *hc*, S. H. Stott; W. H. King.
SPANISH.—Cup, 1, and 2, C. W. Brierley. *hc*, J. Stott, jun., Bank, Wardle.
HAMBURGHS.—*Golden-pencilled.*—1, S. Smith. 2, T. Wrigley, jun., Middleton. *hc*, H. Pickles, jun., Earby, Skipton; T. Wrigley, jun. *Silver-pencilled.*—1 and 2, H. Pickles, jun. *Golden-spangled.*—1, J. Rollinson, Lindley. 2, J. Statter, New Brighton. *Silver-spangled.*—1, E. Vickup, Lumb, Newchurch. 2, H. Pickles, jun. *Black.*—1, C. W. Brierley. 2, J. Buxton, Rochdale.
POLANDS.—1 and 2, H. Pickles, jun. *hc*, P. Unsworth, Newton-le-Willows.
ANY OTHER VARIETY.—1, G. Anderton, Accrington.
SELLING CLASS.—1, J. T. Travis, Rochdale. 2, A. Bamford, Middleton, Manchester. *hc*, S. Buckley, Ending.
LOCAL CLASS.—*Any Variety.*—Cup and 1, J. T. Travis. 2, C. Whitehead, Ealees, Littleborough. 3, B. Hutchinson, Shaw Moss, Littleborough. *hc*, S. Renshaw, Gale, Littleborough; W. Butterworth, Light Alders, Littleborough; B. Hutchinson (2).
GEESE.—1, S. H. Stott. 2, E. Leech. *hc*, E. Lord, Littleborough.
DUCKS.—*Aylesbury.*—1, E. Leech. 2, S. H. Stott. *Rouen.*—1 and 2, T. Wakefield, Newton-le-Willows. *hc*, S. H. Stott, E. Leech; P. Unsworth; R. Hurst, Rochdale. *Any other Variety.*—1 and 2, C. W. Brierley.
TURKEYS.—1, Leech. 2, R. Hurst.

PIGEONS.

POUTERS.—*Cock.*—1 and 2, E. Horner, Harewood, Leeds. *Hen.*—1 and 2, E Horner.
CARRIERS.—*Cock.*—1, E. Horner. 2, J. Stanley, Salford, Blackburn. *Hen.*—1 and 2, E. Horner.
TUMBLERS.—*Almond.*—1, F. Moore, Burnley. 2, J. Fielding, jun., Rochdale. *Any other Variety.*—1, J. Fielding, jun. 2, E. Horner.
DRAGOONS.—1, E. Horner. 2, P. Unsworth.
FANTAILS.—1, H. Yardley, Birmingham. 2, J. S. Leversidge, Newark-on-Trent.
BARBS.—1, J. Fielding, jun. 2, J. Stanley.
JACOBINS.—1, E. Horner. 2, J. Taylor, Rochdale.
ANTWERPS.—1, J. Stanley. 2, P. Unsworth.
TURBITS.—1, A. Mangnall, Bronghton, Manchester. 2, W. Kitchen, Blackburn.
TRUMPETERS.—1, E. Horner. 2, W. Kitchen.
OWLS.—*Foreign.*—1 and 2, J. Fielding, jun. *English.*—1 and 2, A. Mangnall.
NUNS.—1, J. B. Bowdon, Blackburn. 2, H. Yardley.
BALDS OR BEARDS.—1 and 2, J. Fielding, jun.
ANY OTHER VARIETY.—1, W. Kitchen. 2, T. Waddington.
Cup for most points.—E. Horner.

RABBITS.

LOPS.—1, A. H. Easten, Hull. 2, J. Boyle, jun., Blackburn. *hc*, S. Greenwood.
ANGORA.—1, J. Baron, Rochdale. 2, J. Boyle, jun. *hc*, A. H. Easten.
HIMALAYAN.—1 and *hc*, J. Boyle, jun. 2, J. Butterworth.
SILVER-GREY.—1 and *hc*, S. G. Hudson, Hull, 2, S. Greenwood.
ANY OTHER VARIETY.—1, S. G. Hudson (Dutch). 2 and *hc*, J. Boyle, jun. (Grey and White Dutch and Belgian Buck.
SELLING CLASS.—1, J. Boyle (Silver-Grey). 2, A. H. Easten (Angora). *hc*, J. Butterworth (Yellow and White Lop).

JUDGES.—*Poultry:* Mr. R. Teebay, Fulwood, Preston. *Pigeons:* Mr. Ridpeth, Outwood Hall, Handforth, Manchester. *Rabbits:* Mr. C. Rayson.

GREETLAND AND WEST VALE POULTRY SHOW.

THIS was held on August 12th. The awards were as follow :—

BRAHMA POOTRA.—1, D. Spencer, Copley. 2, Dr. Holmes, Whitecoats, Chesterfield. *Chickens.*—1, Dr. Holmes. 2, J. Bailey, Earby.
COCHIN-CHINA.—1, J. E. Eastwood, West Vale. 2, J. Baldwin, Greetland. *Chickens.*—1, E. Day, Wakefield. 2, J. Greenwood, Copley.
SPANISH.—2, (no competition) R. Holroyd, Barkisland. *Chickens.*—2, G. Bettison, Scholes, Greetland.
HAMBURGHS.—1, S. Smith, Northowram. 2, W. Waterhouse, Upper Exley, Southowram. *Chickens.*—1, S. Hirst, Stainland. 2, S. Smith.
GAME.—1 and 2, R. Hemingway, Shelf. *Chickens.*—1, 2, and Timepiece for best pen in the Show, T. Dyson, Halifax. *hc*, R. Hemingway.
GAME BANTAMS.—1, W. Hansen, Greetland. 2, A. Bailey. *Chickens.*—1, T. Dyson.
ANY OTHER BREED.—2, T. Briden, Earby, Skipton. *Chickens.*—1, S. Hirst, Stainland. 2, T. Briden.
EXTRA PRIZES.—*Game.*—*Hen.*—1, W. Sugden, Rastrick. 2, T. Dyson. *Cock* (Local).—1, S. Farwell, Elland. 2, V. Barton, Greetland. *Any Breed.*—2, W. Hirst.
DUCKS.—1, J. Holroyd, Barkisland. 2, J. Fielding, Greetland. *ucklings.*—1, R. Sykes, Stainland. 2, J. W. Parr, Greetland.
GEESE.—1. C. E. Parr. 2, G. Bettison, Scholes, Greetland. *Gos ings.*—1, G. Bettison, Scholes, Greetland. 2, J. Maude, West Vale.
TURKEYS.—1 and 2, J. Sykes, Skircoat. *Poults.*—1, A. Smith, Old Lindley Edge. 2, J. Jackson, Old Lindley Edge.

OKMSKIRK AND SOUTHPORT POULTRY SHOW.

THIS was held on the 10th and 11th inst., and was on the whole good. The adult *Dorkings*, as a class, were rather weak, but the Dorking chickens remarkably good, and the competition keen. *Cochins*, both Buff and Partridge-feathered, were fully equal to, if not better, than anything we have seen in Ormskirk. *Brahma Pootras* were not so numerous as on previous occasions. *Game* were only poorly represented, with the exception of a few pens of good chickens. The Golden-spangled and Pencilled *Hamburghs* were few but excellent. Aylesbury *Ducks* were few, but remarkably good. Ronen Ducks formed a very strong and snperior class. Only two pens of *Turkeys* were exhibited. *Pigeons* were perhaps better than on previons occasions. The following is a list of the prizes :—

DORKINGS.—*White.*—1 and 2, J. Robinson. 3, M. Fairhurst, Ormskirk. *Chickens.*—1, E. Williams, Henllys Berriew. 2 and 3, J. Robinson. *Coloured.*—1, T. Brid n, Earby, Skipton. 2, W. H. King, Rochdale. 3, J. Robinson. *hc*, T. Hornby, Lsthom. *Chickens.*—1, R. W. Richardson, Beverley. 2, E. Leech, Rochdale. 3, W. H. King.
COCHIN-CHINA.—*Buff.*—1, H. Beldon, Bingley. 2, W. A. Taylor, Manchester. 3, T. Stretch, Ormskirk. *Chickens.*—1, T. Stretch. 2, W. A. Taylor. 3, C. Sidgwick, Keighley.
PARTRIDGE OR GROUSE.—1 and 2, T. Stretch. 3, W. H. Fowler, Southport. *Chickens.*—1, C. Sidgwick. 2, E. Leech. 3, P. Woods, jun., Ormskirk.
BRAHMA POOTRA.—1, H. Beldon, Bingley. 2, J. Sichel, Timperley. *Chickens.*—1, W. A. Taylor.
SPANISH.—1, H. Beldon. 2, H. Wilkinson, Earby, Skipton. 3, J. Sichel, Timperley. *Chickens.*—1, H. Beldon. 2, H. Wilkinson.
GAME.—1, M. A. Forde, Maghull. *Chickens.*—1 and 2, J. Carlisle, Earby. 3, M. A. Forde. *Any variety.*—*Cock.*—1, G. F. Ward, Wrenbury. 2, T. P. Lyon, Liverpool.
HAMBURGHS.—*Golden-spangled.*—1 and 3, H. Pickles, jun., Earby, Skipton. 2, H. Beldon. *Silver-spangled.*—1 and 3, H. Pickles, jun. 2, H. Beldon. *Golden-pencilled.*—1, H. Beldon, 2, H. Pickles, jun. *Silver-pencilled.*—1 and 2, H. Pickles. 3, H. Beldon.
BANTAMS (Any variety).—1, J. W. Morris, Rochdale. 2, J. Sumner, Holland Moor. 3, H. Beldon.
GAME BANTAM (Any variety).—*Cock.*—1 and 2, J. Sumner. 3, C. J. P. Keene, Halsall.
ANY OTHER VARIETY.—1 and 2, H. Beldon. 3, J. Sichel, Timperley. *hc*, C. Morris, Grassendale.
DUCKS.—*Aylesbury.*—1 and 3, J. K. Fewler, Aylesbury. 2, E. Leech, Rochdale. *Rouen.*—1, 2, and *hc*, R. Gladstone, jun., Court Hey. 3, J. K. Fowler.
GEESE.—*Any Variety.*—1, J. T. E. Fowler. 2, J. Bryers, Ormskirk. 3, R. Parr, Aughton. *Goslings.*—1, J. K. Fewler. 2, R. Parr. 3, J. Bryers. *hc*, E. Leech.
TURKEYS.—*Any Variety.*—1, E. Leech. 2, C. Morris, Grassendale.

PIGEONS.

CARRIERS.—*Cock.*—1, T. Waddington, Feniscowles, Blackburn. 2, T. Stretch, Ormskirk. *Hen.*—1, H. Yardley, Birmingham. 2, T. Waddington. POUTERS.—1 and 2, T. Waddington. *hc*, T. Stretch; J. Philips, Anfield. JACOBINS.—1, H. Yardley. 2, T. Waddington. BARBS.—1, H. Yardley 2, J. Philips. *hc*, M. Hatchforth, Croston. TUMBLERS.—1, H. Yardley. 2, T. Waddington. ANY OTHER DISTINCT VARIETY.—1 and 2, T. Waddington. *hc*, J. Philips; H. Yardley.

JUDGES.—Mr. E. C. Stretch and Mr. Hutton.

ALDBOROUGH AND BOROUGHBRIDGE POULTRY SHOW.

THE eleventh annual Exhibition was held in the park of Aldborough Manor, on the 1st inst.

DORKINGS.—1, R. Petter, Whixley. 2, Miss E. A. Dalton, Slenningford, Ripon. *hc*, R. F. Farrar, Greenhammerton Hall. *Chickens.*—1, Mrs. B. Pierse. 2, F. Parfitt, Londonderry, Bedale. *hc*, Miss E. A. Dalton. *c*, H. R. Farrar; H. S. Thompson, Kirby Hall.
SPANISH.—1, J. Robson, Thornton-le-Moor. 2, H. R. Farrar. *Chickens.*—1, H. R. Farrar. 2, J. Robson.
GAME.—1, J. Watson, Knareshorough. 2, J. Watson, jun., Knareshorough. *Chickens.*—1, G. Carver, Sandhill, Bedale. 2, J. Robson.
COCHIN-CHINA.—1, T. S. Turner, Boroughbridge. 2, W. Barnes, Thirsk. *Chickens.*—1 and 2, H. R. Farrar.
BRAHMA POOTRA.—1, Miss B. Pierse. 2, F. Horsman, Boroughbridge. *hc*, H. S. Thompson. *c*, F. Carver, Langthorpe, Boroughbridge. *Chickens.*—1 and *hc*, Miss B. Pierse. 2, H. S. Thompson. *c*, J. King, Boroughbridge.
HAMBURGHS.—*Golden-spangled.*—1, J. Watson. 2, R. P. Moon, Driffield.
HAMBURGHS.—*Golden-pencilled.*—1, W. Bearpark, Ainderby Steeple. 2, J. Watson. *Chickens.*—1, Miss E. M. Ellerby, Easingweld.
HAMBURGHS.—*Silver-spangled.*—1, J. Walker, Great Ouseburn. 2, G. Slater, Ripon. *Chickens.*—1, J. Robshaw. 2, J. Walker.
HAMBURGHS.—*Silver-pencilled.*—1, W. Bearpark. 2, Miss B. Pierse. *Chickens.* 1, J. Watson. 2, Miss B. Pierse.
POLANDS.—1, W. Bearpark. 2, C. Walker. *hc*, T. S. Turner. *Chickens.*—1, T. S. Turner. 2, C. Walker.
BANTAMS.—*Game.*—1, G. H. Pickering, Driffield. 2, W. P. Garrett, Dunsforth, York. *Any other Variety.*—1, E. R. Turner. 2, J. Watson.
FARMYARD CROSS.—1, R. P. Moon. 2, Miss Woodward, Minskip. *hc*, W. Bickerdike, Brampton Hall. *Chickens.*—1, H. S. Thompson. 2, H. J. Farish.
ANY OTHER VARIETY.—1, W. Bearpark. 2, Miss Barclay, Aske. *hc*, Miss B. Pierse (2); H. R. Farrar. *c*, J. Watson; E. H. W. Dickson, Little Ouseburn.
TURKEYS.—1, I. Moorey. 2, T. Smith. *Poults.*—1, W. W. Garwood. 2, I. Moorey.
GEESE.—1 and 2, J. T. Renton, Ripon. *Goslings.*—1, W. Bickerdike. 2, J. T. Renton.
DUCKS.—*Aylesbury.*—1, T. Carver. 2, H. S. Thompson. *Ducklings.*—1, H. S. Thompson. 2, H. R. Farrar. *hc*, T. Carver; H. R. Farrar.
DUCKS.—*Rouen.*—1 and 2, C. Graham, Aldborough. *Ducklings.*—1, C. Graham. 2, G. Sadler.
DUCKS.—*Any other Variety.*—1, G. Sadler, Boroughbridge. 2, F. Parfitt.
GUINEA FOWLS.—1, Miss B. Pierse. 2, I. Moorey. *hc*, J. Renton; W. Bickerdike.
SELLING CLASS.—1, Mrs. T. S. Turner. 2, J. Watson, jun.

PIGEONS.

POUTERS.—1, E. Horner, Harewood. 2, G. Sadler. *hc*, E. Horner; R. P. Moon.
CARRIERS.—1 and 2, E. Horner.

Trumpeters.—1, E. Horner. 2, J. Cundale, Copt Hewick, Ripon.
Jacobins.—1 and 2, E. Horner. *hc*, J. Watson, jun.; G. Sadler.
Fantails.—1, E. Horner. 2, G. Sadler. *hc*, J. Watson, jun.; C. Auton, York; G. H. Pickering.
Tumblers.—1, E. Horner. 2, C. Anton. *hc*, G. Sadler.
Barbs.—1, 2, and Cup for the best pen of Pigeons in the Show, E. Horner.
Nuns.—1, G. Sadler. 2, G. H. Pickering.
Turbits.—1, E. Horner. 2, G. Sadler. *hc*, C. Auton.
Antwerps.—1, J. Cundale. 2, C. Auton. *hc*, G. Sadler; E. Horner.
Owls (English).—1, G. Sadler. 2, J. Cundale.
Any other Variety.—1, E. Horner. 2, C. Auton. *hc*, R. P. Moon.
Selling Class.—1, G. Sadler. 2, J. Hardcastle, jun., Skelton, Ripon (Balds).

Rabbits.—*Any Breed.—Buck.*—1, C. Anton. 2, C. Taylor, Minskip. *hc*, I. Slade, Boroughbridge; G. Umpleby, Boroughbridge; T. Gargrave. *Doe.*—1, C. Anton. 2, T. Taylor, York. *hc*, J. Benson; C. Russell, Aldborough; T. Taylor: Master Dawson, Aldborough Manor. *Extra Class.*—1, W. Bickerdike (Peacock and Peahen). 2, T. S. Turner, Boroughbridge (Japanese). 3, — Brooks, Aldborough (Owl).

Judge.—Mr. Beldon.

[We publish this prize-list with great reluctance, seeing that so long a time has elapsed since the Show; and we must beg secretaries to send us prize-lists as soon as possible after the awards have been made.—Eds.]

ALLERTON POULTRY SHOW.

The seventh annual Show of the Allerton Society was held on the 12th inst., and was well attended by visitors, but owing to the reduction of the prize list and another Show being held on the same day, the number of entries was not equal to that of last year. There was, however, scarcely a class that did not contain some excellent birds.

In single *Game* cocks Brown Reds were first and third and Black Red second, and in pairs of birds Brown Reds won all the prizes. *Spanish* were good and well placed; and in *Cochins* Whites of great excellence and in the highest condition were first, Buffs second and third. The *Brahmas* were of moderate quality. *French fowls* were good, the first and third prizes going to Crêve-Cœurs, and the second to La Flèche. *Hamburghs* are seldom seen in such good feather at this time of year as they were at Allerton, and with the exception of the Golden-pencilled, which were faded in colour, the classes were of uniformly high quality. The *Bantam* classes were badly distributed, Game being allowed a class of their own, and also to compete with the other varieties, and in consequence the entries were unusually small.

In chickens, the *Game* classes contained some good birds, and in *Cochins* all three prizes were taken by one exhibitor, showing excellent specimens. The entries of *Hamburghs* were more numerous in the young than in the old classes. The first-prize Golden-spangled were a handsome pair, as also the Silvers; the cockerel of the latter pen was one of the best we have ever seen. The Golden-pencilled pullets were rather light in ground colour, but the Silver-pencilled were very good in colour and markings, and the Black Hamburghs were also a nice lot. The Red Game *Bantams* were shown in splendid order and full feather, and in the Variety class Blacks were first, Duckwings second, and Pekins third. Of *Ducks* there were some good Rouens, and also Bahamas in the Variety class.

A cup was offered to the most successful exhibitor of *Pigeons*, and this was easily won by Mr. W. Cannan with a fine stud of birds. Ponters stood first, Blues taking the place of honour, the cock bird measuring 20 inches in feather, and 7⅞ in limb, and the hen 18½ and 7 inches in limb. The Whites were second, measuring 19½ and 6½ inches, and 18½ and 6½ inches; third were Blues, 18¾ and 7 inches, and 18½ and 7½ inches; the latter were, however, a little foul-thighed and out of feather. In Carriers, Duns of extraordinary merit were first, although somewhat out of condition, and Blacks second and third. In Short-faced Tumblers, Almonds were first and third, and Yellow second. The first-prize pair were all that could be desired. A pair of perfectly-marked Red Mottles stood first in Long-faced Tumblers, closely pressed by Black Baldpates; and Black Mottles were third. The Owls were a mixed class, both Foreign and English competing together, and the first award was made to Foreign Blues, the second to Whites, and the third to Blue English, the whole being perfect of their kind, although the last-named were not clean. Turbits find their home in the immediate vicinity of Allerton, and scarcely a pen was shown which was not deserving of a prize. Yellows were first, Reds second, and Blues third. Jacobins were good, Reds being first and Yellows second and third. Fantails were good. The first-prize pair was very small. In Barbs, Duns were first, Blacks second, and Reds third. In Dragoons, Blues were first, although considerable doubt was felt by the Judge as to the sexes of the birds; but if these be a correct pair, we may congratulate the owner upon the possession of the best pen we have ever seen. Trumpeters were very good; a handsome pair of Black Mottles were first, Blacks second, and broken-coloured Black and White third. Of Nuns, Blacks were first and second, and Reds third. The most striking pair of birds, however, was left out on account of the severity of trimming. The heads and throats of both birds were denuded of every foul feather, and we would advise Mr. Yardley to give them a long rest before they again appear in the show pen. Antwerps were a good class, Duns being first, Red Chequers second, and Blues third. Magpies were good, with Reds first and third, and Yellows second. In the Variety class were some good birds. Porcelain Swallows were first, Porcelain Ice second, and Ural Ice Pigeons third. There were some cheap birds in the Selling class, notably the first-prize Black Magpies, which were perfect.

Game.—*Any Variety.*—1, J. Hodgson, Bowling, Bradford. 2, W. Johnson, Idle. 3, H. Jenninga, Allerton. *Cock.*—1, Miss Aykroyd, Eccleshill. 2, W. Fell, Adwalton. 3, J. Preston, Allerton. *Hen.*—1, J. Smith, Allerton. 2, W. Spencer, Haworth. 3, Miss Aykroyd. *c*, E. Redman, Northowram; W. Fell.
Spanish.—*Black.*—1, H. Beldon, Goitstock, Bingley. 2, J. Powell, Bradford. 3, J. Thresh, Bradford.
Cochin-Chinas.—1, J. Sichel, Timperley. 2, H. Beldon. 3 and *c*, W. A Taylor, Manchester.
Brahma Pootras.—1, H. Beldon. 2, J. Sichel. 3, J. Preston.
French Fowls.—1, H. Beldon. 2, Hon. C. W. Fitzwilliam, Wentworth Woodhouse. 3, J. Sichel. *c*, Hon. H. W. Fitzwilliam, Wentworth Woodhouse (Crêve-Cœurs).
Hamburghs.—*Golden-spangled.*—1 and 2, H. Beldon. 3, H. Pickles, jun., Earby, Skipton. *c*, J. Rollinson, Lindley, Otley. *Silver-spangled.*—1 and *c*, H. Beldon. 2 and 3, H. Pickles, jun. *Golden-pencilled.*—1, H. Beldon. 2, H. Pickles, jun. 3, J. Rollinson. *Silver-pencilled.*—1 and 3, H. Beldon. 2, H. Pickles, jun. *Black.*—1, C. Sedgwick, Keighley. 2, H. Beldon. 3, J. Smith, Gilstead. *c*, J. Preston.
Game Bantams.—*Red.*—1, G. Noble, Staincliffe, Dewsbury. 2, W. F. Entwisle, Cleckheaton. 3, F. Steel, Burnley. *Any other Variety.*—1, W. F. Entwisle. 2, H. Beldon. 3, J. Sichel.

CHICKENS.

Game.—*Red.*—1, J. Spencer, Clayton. 2, Miss Spencer, Clayton. 3, Miss Aykroyd. *Any other Variety.*—1 and 2, Barker & Charnock, Illingworth. 3, Brentnall & Kyte, Nottingham. *Pullet.*—1, J. Hird, Bingley. 2, J. Robertshaw, Thornton. 3, Miss Aykroyd. *c*, T. Briggs, Fearncliffe, Bingley.
Cochin-Chinas.—1, 2, and 3, C. Sedgwick.
Hamburghs.—*Golden-spangled.*—1, H. Pickles, jun. 2, H. Beldon. 3, T. Dean, Keighley. *Silver-spangled.*—1 and 3, H. Beldon. 2, T. Fawcett, Baildon. *Golden-pencilled.*—1, J. Smith. 2, H. Pickles, jun. 3, J. Preston. *Silver-pencilled.*—1, J. Preston. 2, H. Smith, Morton Banks. 3, H. Beldon. *c*, H. Pickles, jun.; H. Beldon. *Black.*—1 and 2, C. Sedgwick. 3, W. A. Taylor.
Game Bantams.—*Red.*—1 and 2, W. F. Entwisle. 3, G. Noble. *Any other Variety.*—1, H. Beldon. 2, T. Dyson, Halifax. 3, J. Sichel.
Selling Class.—1, J. J. Booth, Silsden. 2, J. W. Thornton, Bradford. 3, J. Berry, Silsden.
Ducks.—*Rouen.*—1, J. Newton. 2, A. West, Worsthorn, Burnley. 3, J. J. Booth. *Aylesbury.*—1, J. Preston. *Any other Variety*,—1 and 2, W. Binns, Pudsey.

PIGEONS.

Pouters.—1, 2, and 3, W. Cannan, Bradford. *c*, H. Yardley, Birmingham; E. Horner, Harewood, Leeds.
Carriers.—1, W. Cannan. 2 and 3, E. Horner. *c*, H. Yardley.
Tumblers.—*Short faced.*—1, E. Horner. 2, W. Cannan. 3, H. Yardley. *c*, J. T. Lishman, Girlington. *Any other Variety.*—1 and 3, W. Cannan. 2, J. T. Lishman. *hc*, H. Yardley. *c*, E. Horner.
Owls.—1 and 3, W. Cannan. 2, R. Wilson, Thirsk. *hc*, E. Horner.
Turbits.—1, J. W. Cannan. 2, J. T. Lishman. 3, T. Foster, Denholmegate. *c*, R. Wilson; W. Cannan; J. T. Lishman.
Jacobins.—1, W. Cannan. 2, E. Horner. 3, R. Wilson.
Fantails.—1, J. F. Loversidge, Newark-on-Trent. 2, H. Yardley. 3, J. T. Lishman.
Barbs.—1 and 3, E. Horner. 2, H. Yardley.
Dragoons.—1, H. Yardley. 2, W. Cannan. 3, J. W. Cannan. *c*, E. Horner.
Trumpeters.—1, J. Cundall, Ripon. 2 and *c*, W. Cannan. 3, E. Horner.
Nuns.—1, R. Wilson. 2, H. Yardley. 3, J. T. Lishman.
Antwerps.—1, J. W. Collinson, Halifax. 2, J. T. Lishman. 3, W. Cannan. 4, E. Horner. *hc*, J. W. Collinson; W. Cannan.
Magpies.—1, J. T. Lishman. 2 and 3, E. Horner.
Archangels.—1 and 2, H. Yardley. 3, W. Binns.
Any other Variety.—1 and 2, J. T. Lishman. 3, W. Lund, Shipley.
Selling Class.—1, A. Preston, Allerton. 2, J. W. Cannan. 3, W. Lund.

Rabbits.—*Common.*—1, J. Knight, Allerton. 2, E. Fairbank, Allerton. 3, F. Moore, Allerton.

Judges.—*Poultry:* Mr. J. Dixon, Bradford. *Pigeons:* Mr. E. Hutton, Pudsey, near Leeds.

LEICESTER AGRICULTURAL SOCIETY'S POULTRY SHOW.

The weather has been singularly favourable of late to the success of poultry exhibitions, and in no case more so than at Leicester; hence the financial success of this year's meeting will stand high in the records of this Society. Messrs. Turner's show pens, and capital roomy tents left nothing to be desired, and the courtesy of the Committee, with the care they gave to the birds, could not be excelled. In a general class for *Dorkings*, a pen of White took the first prize, a circumstance attributable to great want of condition in the Grey Dorkings generally. A very strong feature was the early chickens of almost every variety, while other shows have been remarkable for the scarcity of anything like really early chickens. *Cochins* throughout were such as had never previously appeared before the Leicester public, though a few pens were sadly amiss from being overshown. Whilst speaking of Cochins, we cannot but remark that some especially good Partridge hens were exhibited by the Honorary Secretary, Mr. Sheppard, at the low price of a guinea a-couple, in the sale class! Of these, of course, there was a speedy disposal. Many well-known *Game* cocks were shown that in bygone years were frequent winners, but which by age and accidents have become so faulty in the feet as to be only useful in future for stock purposes. Some fine young Game pullets, fully grown and close on laying, were to be met with in considerable numbers. A few very perfect *Hamburghs* were present, but the entries were limited. Game *Bantams* were a failure. The Selling classes contained generally a very cheap entry of good birds, and we are told the sales effected were considerable. Mr. Yardley had it pretty well his own way with a carefully-sent selection of *Pigeons*, and of *Water fowls* there was a good and large entry.

Dorkings.—1, J. Choyce, Atherstone. 2, W. H. Salt, Leicester. *Pullets.*—1, J. Watts, King's Heath. *Cockerels.*—1, J. Watts.
Spanish.—1, J. Stephens, Walsall. 2, M. Brown, Melton Mowbray. *hc*, H. Marshall, Cropwell Butler; J. Watts. *Pullets.*—1, M. Brown. *hc*, J. Stephens. *Cockerels.*—1, J. Stephens.
Cochins.—*Cinnamon and Buff.*—1, H. Yardley. 2, H. C. Woodcock, Rearsby House, Leicester. *hc*, J. Watts; H. C. Woodcock. *c*, J. Hassal, Leicester.

Pullets.—1, H. C. Woodcock. *hc*, J. Hassel. *Cockerels.*—1. J. Watts. *White.*—1, Mrs. Williamson, Queeniborough Hall, Leicester 2, H. E. Emblin, Oadby, Leicester. *Pullets.*—1, Mrs. Williamson. *c*, H. E. Emblin. *Cockerels.*—1, Mrs. Wiliamson. *hc*, H. E. Emb'in. *Any other Variety.*—1, J. Stephens. *Pullets.*—1, J. Stephens. *Cockerel.*—1, J. Stephens.

Brahmas.—1, W. Stevens, Northampton. 2. Mrs. Williamson. *c*, J. Allen; J. Watts. *Pullets.*—1. H. C. Woodcock. *hc*, J. Watts; Mrs. Williamson. *Cockerel.*—1, J. Watts. *hc*, W. Stevens.

Game.—1, H. Marshall. 2, W. E. Oakeley, Atherstone. *Pullets.*—1, W. H. Clare. 2, W. E. Oakeley. *hc*, W. T. Everard; W. E. Oakeley. *Cockerel.*—1, W. T. Everard. *hc*, Lord Manchline, Derby; W. E. Oakeley. *c*, W. H. Clare. *Cock.*—1, W. E. Oakeley.

Hamburghs.—*Golden-spangled.*—1, J. Stenhens. 2, J. W. Swallow, Northampton. *hc*, H. E. Emberlin. *Silver-spangled.*—1, J. Choyce. 2, No competition.

Game Bantams.—1, H. Yardley. 2, W. Brown, Cliff, Atherstone.

Bantams.—*Clean-legged, any other variety.*—1, W. H. Johnson, Braunstone, Leicester. 2, H. Draycott, Hunnberstone, Leicester.

Selling Class.—*Cock.*—1, H. Yardley. 2, W. E. Oakeley. *Hens or Pullets.*—1, T. Sheppard, Humberstone (Partridge Cochins). 2, J. Choyce (White Dorkings). *hc*, A. J. Hamel; C. M. Grundy; J. Watts; W. E. Oakeley; T. Sheppard (2). *c*, H. Yardley; H. Draycott; W. Nottage, Northampton.

Ducks.—*Aylesbury.*—1 and 2, J. J. Sharp, Broughton, Kettering. *hc*, H. E. Emberlin. *c*, J. Choyce. *Rouen.*—1, J. Wright, Melton Mowbray. 2, J. Choyce. *hc*, T. Burnaby, Pipewell, Kettering; H. Marshall.

Turkeys.—1, J. Watts. 2 and *hc*, W. H. Johnson.

Geese.—1, J. Watts. 2, J. Choyce.

PIGEONS.

Carriers.—1 and *hc*, H. Yardley. 2, J. Watts.

Pouters.—1. H. Yardley. 2, G. Sturgess, Leicester. *hc*, H. E. Emberlin; H. Draycott; J. Watts; G. Sturgess.

Fantails.—1. H. Yardley. 2. W. Choyce. *hc*, H. Yardley; J. F. Loveridge, Newark; H. Draycott. *c*, W. Choyce.

Turbits.—1, H. Yardley. 2, F. H. Paget, Birstall, Leicester. *c*, J. Watts; F. H. Paget.

Magpies.—1, H. Draycott. 2. H. Yardley.

Any other Variety.—1 and 2, H. Yardley. *hc*, H. Draycott; J. Watts (3); W. Nottage. *c*, H. Draycott.

Selling Class.—1, J. Watts (White Horsemen). 2, H. Yardley (Blue Horsemen). *hc*, H. Yardley; H. Draycott.

Rabbits.—*Lop-eared* (Any variety).—1 and 2. W. Cannan, Leicester. *hc*, J Smith, Leicester. *c*, G. W. Sturgess; Hon. P. Hastings. *Any other Variety.*—1, S. C. Pilgrim, Hinckley (Himalayan). 2, F. Sabbage, Northampton (Dutch).

Extra Stock.—*hc*, W. H. Johnson (Guinea Fowls).

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

CROYDON POULTRY SHOW.

I am sorry to find such unjust remarks in last week's number concerning the above Show. Although living at Croydon, I have nothing to do with the management of this Show, which is connected with the Agricultural Society, and therefore I can speak as an independent exhibitor. In my opinion the arrangements were as good as they could be where an exhibition takes place under canvas. I agree with Mr. Cresswell, that the passages might have been wider, but as the day was unfortunately very wet, they were not unduly crowded, nor were the birds In two instances the pens were placed on the ground under the bottom tier, but in each of these cases the birds were evidently unexpected arrivals, as they were numbered 96a and 105a. I may add that in many shows that I have attended the arrangements have not nearly equalled Croydon, and that in old-established societies and fine weather.

The same correspondent also finds great fault with the police in attendance. My own experience was, that on presenting myself about 1 p.m., I was politely informed that the Judge had not quite finished his awards, and requested to wait a short time before entering. At that time the only persons in the tent were the Secretary with the Judge, also Mr. Billett, who was employed to pen the birds, and two or three local Pigeon fanciers, who exhibited their birds, but not for competition. Certainly the Judge had more to do than was anticipated, and it would have been very much better if the Secretary, when he found that the entries were three times as numerous this year as they were last, had appointed a second Judge. But is there one show in twenty which attains perfection in its second year? As to your correspondent's last remarks, I can only look on them as great exaggerations, for with a good canvas tent, as the tent in question was, it is perfectly impossible that any bird could leave it in such a state that it could reach home in a condition fairly described by saying it appeared to have just come from a washtub. How much fairer to have imagined that in such a wet time it had become in that state in transit home.

"Observer" speaks in very disparaging terms as to the judging. For my own part I thought the judging quite as good as usual, and I met there more than one good judge who did so likewise. As regards the Brahmas, with the judging of which he finds particular fault, there was hardly a bird in the Light class that was fit to be placed in an exhibition pen. They were nearly all in heavy moult, out of condition, and as yellow as Canaries—very good birds many, but not fit to show until over their moult. The first and second prizes went to those which had the best got over their moult, and were, therefore, in the best condition for exhibiting. "Observer" should also remember that July is the very worst of all months in the year for a poultry show, on account of the birds being in such deep moult, which also adds very much to the Judge's difficulty in awarding the prizes in such a manner as to give general satisfaction.

In conclusion, I do maintain that it is too bad to find such—I must say undeserved—fault with a show which has only once before been held, and this year obtains three times as many entries as on the former occasion. I must also add, that in my opinion the show was a great success in every way, except that on account of the soaking wet day I fear, from the Secretary's remarks, both ends will hardly meet. —Philip Crowley, *Waddon House, Croydon.*

QUEENS LEAVING THEIR HIVES.

It is difficult to prove a negative, but I agree with Mr. Lowe in thinking that fertile queens, which have entered fairly on their duties as mothers, do not leave their hives for an aërial excursion. At all events I have never had any proof of the fact, and if the circumstances mentioned by "B. & W." had happened in my apiary, it would not have occurred to me to explain them in the way that your highly-esteemed correspondent has done. Although Mr. Lowe sometimes steers his course alone, it is his fortune, or misfortune, to have me for a companion on the present occasion.

In regard, then, to the experience of "B. & W.," my conjecture is that the bees of the strong hybrid hive removed 40 yards off swarmed unseen, and that the swarm entered his Italian hive in which royal cells were commenced shortly after it was driven. Finding matters in this condition, this swarm made a second exodus on the 24th of May.

But it will be obvious that if there were other hives in the neighbourhood, it is not necessary to suppose that the swarm issuing on May 24th came originally from the strong hybrid Italian hive; it might have come from some other hybrid stock.

It is quite common for bees to swarm out of one skep into another, and the novelty of an instance which came under my observation many years ago caused it to be well remembered. Three hives were sited a few yards from each other—thus: A, B, C. First A threw a swarm, which was housed in a common skep; then B threw a swarm, which entered A without opposition. Immediately thereafter C threw a swarm, which entered B. I was an eye-witness of these doings, and I have an impression that the time occupied by them did not exceed half an hour. These hives, A and B, into which swarms had entered threw swarms on the third day following; and now when a swarm leaves a hive I do not conclude that the queen and followers properly belong to it on the mere evidence of having witnessed their exodus.—R. S.

[This would have appeared earlier had it not been among Mr. Woodbury's papers, and not found until some days after our friend's death.—Eds.]

UNITING BEES—SAVING THE BEES OF CONDEMNED STOCKS.

I have lately come into possession of three stocks of bees in rotten old straw hives, and of three or four swarms of June and July of this year, which were hived in common boxes of different sizes. I am desirous of establishing at least three good stocks to stand the winter, and also of taking some honey. The people about here have no idea in bee-keeping beyond stifling the bees with brimstone. I have picked up a little theoretical knowledge in your Journal, but being a lady cannot put it in practice myself. My man is evidently indisposed to try experiments.

Please tell me if—1st, I should drive the bees into new and improved hives? 2nd, When uniting two or three weak colonies should all the queens but one be destroyed? 3rd, If set about this month, will the bees have enough honey to live on through the winter? 4th, Would you recommend me to buy a Ligurian queen or swarm, or wait until I have had some little experience?

By answering these questions you will save the lives of many colonies which would otherwise be destroyed by the country folk, for when I have myself learnt, I intend to teach them the proper method of managing.—A Subscriber's Sister.

[1st, We should advise you not to attempt to establish stocks of driven bees in new boxes at this season of the year. You had better wait until next summer, and then hive the swarms into them, when you can break up the old hives twenty-one days after the issue of the swarms.

2nd. It is not necessary, when uniting two or three colonies, to destroy all the queens but one. If possible, drive the bees of both or more hives successively into one empty receptacle, knocking them out subsequently into the hive they are intended to occupy.

3rd, Without very liberal feeding, say from 30 lbs. to 40 lbs.

of sugar syrup, your expelled bees would fail in building comb or storing food sufficient for their winter requirements. If you take up any of your stocks, and desire to preserve the lives of the bees, you must unite them to stocks tolerably well supplied in every respect, making up any deficiency there may be in stores by feeding each stock until it weighs, exclusive of hive and bees, at least 15 lbs.

4th, You had better wait until you have had more experience, and have become an expert manipulator before you attempt ligurianising your apiary. We know many ladies who, with the protection of a proper bee dress, are clever and fearless operators.

Lastly, Do not trouble yourself about trying to indoctrinate the country folk with your improved methods of bee management. The attempt will end only in utter failure; besides which, it is very doubtful if, with their means and capabilities, their own plans are not the best for them.]

HINGES TO BAR-AND-FRAME HIVES.

The writer of the review of Major Munn's edition of Dr. Bevan's "Honey Bee" does not appear to understand this "cranky hive," and although a large number have been distributed over the country from my establishment, I venture to think your correspondent has never seen one of them.

I know nothing whatever of the hive which Major Munn presented to the Apiarian Society, and the hive might have been made by the "cheap country carpenter" at a cost to the Major of £7 or £8, and yet have merited the appellation of "a cranky hive," but I am unable to say whether its bar-frames were hinged or not; yet I may say that the bar-frames, as I make them, are not hinged to the hive. If they are hinged at all they are hinged to the glass observation-frame, into which any one of the combs can be lifted by a brass lifting-rod and made fast by a thumb-screw, and which can be removed anywhere for observation and returned to the hive without a single bee making its escape. The frames which I made in 1851 are interchangeable with those made in 1871.

Again, the frames of Major Munn's are not "triangular frames," the outer case or box being a semi-hexagon, or half a hexagon, into which the frames are made to fit, leaving a space of about three-eighths of an inch all round the frames, which must be of half-hexagon shape, and not triangular; and "every bar-frame on being raised into the observation-frame," requires to be held in a position by the brass lifting-rod until it is firmly fixed into it by a brass thumb-screw. Two broad zinc slides are then inserted, the one into the observation-frame, the other into the hive; these effectually close the aperture in the hive whence the comb has been raised.

"Sudbury" is quite correct in stating that the Major Munn hive in the Edinburgh Museum has its frames hinged to the hive, and, as the maker of this hive, I had nothing to guide me in its construction but Major Munn's pamphlet of 1851. I attached brass hinges to this hive (the first I ever made), for which I alone am responsible; but even this did not prevent the combs from being interchangeable.

Mr. H. A. King, that practical apiculturist of New York, has lately honoured me with a personal visit, and was so much pleased with the construction and arrangement of this "cranky hive," that he purchased one to take home to the New World, where I have not the least doubt but it will prove itself to be worthy of the patronage of the American people.

Major Munn's bar-and-frame hive was first made in England in 1834, patented in France in 1843, and (from a description in Major Munn's pamphlet of 1851), was first made at Dover in or about that year by—Wyatt J. Pettitt.

[We sent the above communication to Mr. Woodbury just previously to his death, and the following comment has the additional interest of being the last he wrote upon any subject connected with bee-culture.—Eds.

"Major Munn's bar-and-frame hive appears capable of assuming as many shapes as Proteus himself. We have ourselves seen and examined it whenever opportunity offered, and certainly always believed that the frames were hinged to the hive, whilst Mr. Pettitt himself declares that they are so in the case of the one first made by him and deposited in the Edinburgh Museum. Of one thing, however, we are quite certain—that they were always triangular, and that they are so represented in Major Munn's pamphlet as well as in every engraving of his bar-and-frame hive which we have met with, and which were all, or nearly all, issued by Mr. Pettitt. Mr. H. A. King is an American hive-maker who has been prosecuted by Mr. Langstroth for infringing his patent, and who, having made the journey to Europe for the avowed purpose of collecting evidence which may enable him to defeat that gentleman's claims, is, of course, but too happy both to praise and to purchase a hive which he hopes will aid him in accomplishing his object. Our reviewer spoke only of the bar-and-frame hive as described and promulgated by Major Munn, not as it may since have been altered either by him or by Mr. Pettitt, whose letter is therefore beside the mark. As the actual facts of the case seem to be perfectly understood on both sides, the correspondence may very well end here."]

COOKING VEGETABLES.

In reply to Mr. Fish's suggestion that some lady would give a few directions on the best way of cooking vegetables, I have ventured to send you the following:—

How to Boil Peas to Taste well and Look well.—Put two quarts of hard spring water into a pan that will hold three quarts; when the water boils put into it as much bi-carbonate of soda as will lie in a saltspoon, and a good teaspoonful of common salt. Then remove the pan from the fire until the water ceases boiling, pour in the peas, just shelled, from about half peck when in the pod, not more; put the pan on the fire again until it just begins to simmer, then remove it to the hob or cooler part of the stove, where it will remain at scalding heat, but not boiling; there let it remain until the peas are quite tender, which the very hardest will become if allowed to remain long enough. The length of time varies from a few minutes to half an hour or more, according to the age of the peas or the length of time they have been gathered.

Some little care should be bestowed on the shelling of peas, for it is impossible for any gardener to be quite sure that every pea is the same age, and a little careful judgment will easily detect what will not boil together; if there is but a single pea too old it is better left out, as the one pea would spoil the whole dish.

The cooking of vegetables is almost always considered of small importance, and few persons will give themselves the trouble to do it properly, even when they know how; and, strange to say, very few of those who do not know how will follow even written directions. They cannot imagine there can be any way but one, and that the way they have been used to. One great cause of failure is from the small quantity of water used; it is almost impossible to use too much. I have seen cabbage boiled, or rather cooked, and when done there was no water to pour from it; all that had been put in the pan was gone in absorption and evaporation. Of course it tasted more like cabbage water than cabbage.—Anna.

OUR LETTER BOX.

Liskeard Poultry Show.—We are informed that the remarks of "J. L." on this Show at page 93 are not altogether correct. The Judge on the occasion is well known to be thoroughly competent to undertake that office, and on being solicited to do so declined, because he knew that his son had entered the Game Bantams with which he took first prize at Truro. The Committee, however, importuned him till he did act; and we certainly do not see any great crime he committed in awarding the prize to his son's birds, especially as it is not contended that they were not the best in the competition.

Fowls Roupy (*J. R., Birmingham*).—Your fowls have the roup. Wash their heads once or twice daily with tepid water. Give them every day 1 grain of sulphate of copper mixed in oatmeal mashed in ale; also plenty of green food. Separate those affected from all others.

Treatment of Fowls while Moulting (*J. G.*).—It is not the first time doctors have differed, and we are happy for your sake that in this instance the patient did not die. We are, however, bound to say we believe the bird recovered in spite of your treatment rather than because of it. The writer of the article has, we believe, tried everything mentioned in it on a large scale.

Points of Light Brahmas (*Brahma Novice*).—You have omitted one point which may, and should be black even in a Light Brahma. The plumage should be white, save the flight hackle and tail. It is a very common thing for these birds to have spotted backs. Such spots must be called blemishes, but they will moult out as the birds become older, if they are few in number. If you intend to breed for exhibition you can, we think, safely do so, or you may show the birds themselves. If, however, the backs are so spotted as to make them deserve to be called mottled, we should advise you to change the strain, at any rate on one side. The weight you quote is a large one for a bird of the age. We repeat for your comfort, that being chickens it is probable the spots will be moulted out.

Soft Eggs—Fowls out of Health (*W. P. B.*).—Your fowls are evidently out of health. To make even a guess at the number of eggs you should have, it would be necessary to know the ages of all your hens. According to your description you have none of them so aged as to be

the most favourable layers. The one-year birds laid their early eggs as pullets last autumn. Those of two years old are in their best but not earliest laying, and the three-years-old are falling off. It is evident they either lack material for shell, or their secretions are at fault. They have lime, &c., in its mature state. We advise you to feed for a few days on whole corn entirely, and to do so very moderately. We think it likely it may succeed. Castor oil is very good treatment, given in doses of a tablespoonful every other day, but it would be necessary then to find out the delinquents. The hundred soft eggs are probably laid by three or four birds.

Fowls Making a Sneezing Noise (*J. C. S. R.*).—Alter your treatment, or you will lose all your Bantams. The turpentine down the throat is worse than useless; to be of any use it should be put down the trachæa. Let them have nothing but camphor julep to drink, and give them daily a pill of camphor the size of a small garden pea, to be continued till cured. The first dose often makes another unnecessary. Feed on ground oats, bread and milk, chopped egg, and meat scraps till they are cured, which will not be long.

Wen on Pigeon's Neck, and Antwerp Points (*A. C. E.*).—If we read your letter aright your bird has a wen outside its throat. Let it alone, or, if it be moveable under the fingers, you can cut the skin across and remove it. For points and full information, with accurate engraving of the Antwerp Pigeon, see our number for February 17, 1870.

Various (*H. H. B.*).—You can show a young and old bird together unless the schedule says to the contrary. Always read a schedule carefully; there are often some classes for old birds, some for birds of the present season. The Antwerp's wings should not droop. As to showing a single bird, read the schedule of the Birmingham Show and you will know. A schedule of a show is your guide in such matters, we cannot be.

Pigeon Stolen at Snaith.—Mr. O. A. Young, Middle Street, Driffield, had a White Pouter stolen at the Snaith Show. He tells us that if Pigeon fanciers will subscribe and enable him to try the liability of the Committee, then if he recovers from the Committee the value of the Pigeon, eight guineas, he will give that sum as a prize at some future show. He asks our opinion; therefore we add, that unless he could prove the Committee's negligence, we think that they are not liable for the loss.

Missing Pigeons.—"Seeing so many inquiries about lost birds at shows, I must state that I have a pair which came astray on the day of the Romford Poultry Show before the prize cock was lost. I cannot hear of anyone near here who has lost any Pigeons, but they seem to have private marks, so that the owner could describe them by letter only to Miss Julia Mashiter, *Priests, Romford.*" [This letter would have appeared before, but from having been improperly directed it has been travelling about London for several days.—Eds.]

Works on Fancy Pigeons (*John Grundy*).—The books that have been written on fancy Pigeons have not been many. First, Moore's "Columbarium," published in 1735. This book, scarce'ly more than a pamphlet is now very scarce and valuable; it is excellent, and the foundation of all our correct knowledge. Then followed the "Treatise on Domestic Pigeons," published in 1765. This is Moore's work enlarged, with illustrations of each bird. There is an edition of this work on larger paper and superior engravings, a copy of which I have seen. Next, in about 1800, came "The Complete Pigeon Fancier," by Daniel Girton, in substance like the two former, but enlarged. This book has illustrations. It may sometimes be bought for 1s. at a bookstall, being much more common than the two former. In 1802 was published a "Treatise on the Almond Tumbler" only. This was the next book in value after Moore's. It has a picture of a standard Almond of that date. Dixon's "Dovecote and Aviary," saw the light in 1851. It is prettily written, but no authority on high fancy matters; it is now out of print; its substance, with illustrations by Harrison Weir, may be bought for 1s., under the name of "Pigeons and Rabbits," being one of Routledge's "Books for the Country." Eaton's "Treatise on the Almond Tumbler," came out in 1851. It is now incorporated in his "Treatise on Pigeons," and since the death of Mr. Eaton is to be bought of its able illustrator, Mr. Dean Wolstenholme, Elizabeth Cottage, Archway Road, Highgate, price 10s. The "Pigeon Book," by Brent, with many illustrations, published at the office of this Journal, is a practical and able work. Tegetmeier's "Pigeons," with coloured illustrations, was sent out in 1868, price, I think, 10s. 6d. More recently the same author has published a shilling book on "The Homing or Carrier Pigeon."—Wiltshire Rector.

Mending Cracked Eggs (*Marian*).—I have not tried adhesive postage-stamp paper, but I mended an injured egg with goldbeater's skin, and succeeded in hatching a young one from it. The injury, however, must not be severe, and the application must be prompt.—W. A. Blakston.

Goldfinch and Canary Mules (*G. G.*).—You are to be congratulated and envied. A lady lately complained to me of having been bored by a *savant*, who talked her out of her depth into deep waters, where she floundered about in great tribulation. She said she regretted so much not being able to ask him a question which would puzzle him, and I ventured to suggest she might have inquired if he had ever bred a clean Mule. There can be no doubt whatever as to the bird in question being a Mule if, as you say, you have had the hen several months, during which time it has never been near a cock Canary, but always with a Goldfinch, and further, had one nest of empty eggs previous to this bird being hatched. But are you quite sure of all this? Do you attend to your birds entirely yourself? or do you ever have that duty performed by deputy? Do you keep a stock book, in which you enter all particulars concerning your birds? Do you ever change the eggs from one nest to another without making a memorandum, to show that B has a nest of five, made up of two from A, two from C, and one from G, and so on, or do you trust to your memory? And then you know that chubby little fellow with the wings, who is always going about with his bow and arrow, is not particular where he fires, and it is proverbial that he laughs at locksmiths. Are you quite sure there have been no clandestine meetings? I am only suggesting possibilities, not probabilities. Mistakes will occur in the best regulated families. I presume the bird is still in its nest feathers, and, if from a late nest, has not begun to moult. It ought to show more Goldfinch than Canary conformation about the beak. If a buff bird, the plumage will be very much whiter than in a Canary, and, whether buff or yellow, will be of a different texture. The difference will be patent enough when it moults. If a cock, it will have the Goldfinch "flourish" on the face, and more or less of the yellow of the Goldfinch wing. If you are disposed to send it to me for inspection you can do so with perfect safety, and I will empanel a jury of Mule-breeders to sit on the subject; indeed, I should much like to see it.—W. A. Blakston.

Gold Fish (*J. M. S.*).—Ordinary fish cannot be converted into gold fish by warm water. Their increase, and the disappearance of the other fish, are doubtless due to the high temperature. The gold fish and common carp are distinct species.

REMARKS.

9th.—Very fine all day, and very warm, but with a little breeze, especially in the evening.

10th.—Another fine day, aurora-like clouds at sunset, reaching to the zenith, but colourless and motionless.

11th.—Hazy in early morning, warm day, looking storm-like between 8 and 9 P.M.

12th.—Very fine all day, slight breeze in evening.

13th.—Fine, but very warm till the evening, then a nice breeze.

14th.—Splendid clouds soon after sunrise, beautiful day, and rather cooler.

15th.—Very fine and much more pleasant from its being cooler.

A most splendid week, scarce a cloud to be seen, except those beautiful ones above mentioned, hot sun, but copious dews, and cool breezes in the evening.—G. J. Symons.

COVENT GARDEN MARKET.—August 16.

Supply moderate, and a steady demand. French consignments are heavy, comprising Pears, Apples, Melons, Figs, Peaches, Nectarines, and Plums, a large quantity of which are forwarded to the northern and midland markets daily. Cherries are nearly over, the Morello being the only variety now in any bulk. The Potato trade is heavy with large stocks.

POULTRY MARKET.—August 16.

Poultry quotations will amount to very little during the next few weeks. The great heat will render them very difficult, because all the best prices will go to the neighbourhood of London, whence poultry can be had much fresher than from greater distances. It was too early when we went to press to give any notice to Grouse beyond saying the birds are forward, and in good condition.

From observations taken near London during forty-three years, the average day temperature of the week is 72.8°, and its night temperature 48.7°. The greatest heat was 89°, on the 25th, 1859; and the lowest cold 31°, on the 26th, 1861. The greatest fall of rain was 1.92 inch.

ROAD-MAKING UNDER DIFFICULTIES.—No. 1.

IF making a road were to consist of simply cutting a trackway and filling it with broken stones, it would be hardly worth while to devote a paper specially to the subject; and really, to glance casually at the matter, there does not appear to be very much more to be done. But this, like other work, when taken seriously in hand, resolves itself into numerous important details, all requiring careful attention, and which, if the work is to be brought to a successful issue, must be well studied and clearly arranged into a regular plan, so that each part of the process may be done in regular order, without one operation clashing with another; for, in such work, confusion invariably implies waste both of money and time.

When a road is to be made, the first thing to be done is to survey the land through which it is required to pass, in order to select the most favourable line. On an open plain, or a flat or tolerably level district, this is an easy matter, but in a hilly wooded country there are many difficulties to contend with in order to secure as short and direct a line as the gradients will admit of. Supposing the road is to run along a steep hillside down into a valley, to pass over a stream or river, and thence up and along the opposite side of the valley — if both hillsides are thickly clothed with underwood, interspersed with timber trees, with numerous springs of water bursting forth and forming tributaries to the main stream in the valley, and with the surface of the slopes broken up into a variety of inequalities, we shall have enough of difficulties to contend with to afford subjects for a very useful and instructive lesson. Let us proceed, then, to grapple with these difficulties, and see how we can overcome them.

It is best at starting to tiy from some commanding point to obtain a general view of both sides of the valley, in order to note all its most prominent features, of which a rough outline should be sketched in one's note-book for reference. It is also advisable to ascertain if any of these features are eventually to be brought more fully into view, or if there are to be any ponds, waterfalls, or a lake in the valley, because if parts of the road can be made to command fine or picturesque views of pleasing objects, without going far out of the most direct line, it is highly important they should do so. The land through which the road is required to pass must then be gone over and thoroughly examined, notes taken of all important undulations, such as abrupt ascents and deep dells; streams and bogs should also be noted, as they must be dealt with in due course. This is an arduous undertaking, it being very difficult to obtain a clear idea of the character of land covered with a dense growth of underwood; my own practice is to go over the land two or three times in order to make quite sure nothing of importance has been overlooked.

Next comes the important work of selecting and marking the line of road; in doing this all unmeaning curves should be avoided, and the road should proceed in as direct a line from one end to the other as the nature of the ground will admit of. For this work there should be six or eight men with ranging rods—that is, poles long enough to reach above the tops of the underwood, and with a small flag of white calico fastened to the top—also two men with hand-bills, a short ladder, or, if there are not many tall trees, a pair of high steps. Starting from one end of the line, the surveyor either mounts a tree or the steps at a suitable point for overlooking the whole of the first part of the line, he then arranges the men with flags in single file, and when this is done, one man starts from the surveyor's post and another from the flag farthest from him, each man cutting a slight track from flag to flag till they meet. This process is repeated piece by piece till the entire line is marked out.

The narrow track being made sufficiently clear, now comes the most important part of the survey. The natural levels are all taken with a theodolite or dumpy level, the last-named instrument answering quite as well for this work as the more expensive one, yet for general purposes the theodolite is, of course, to be preferred. A sketch or map of the road should be made showing all the inequalities of the line, with the streams or springs, below each of which a note should be appended, showing how the water is to be disposed of; if through pipes, state size and number, or if through a culvert, give its size, length, and form. The road must also be measured, and divided into as many lengths as there are to be gradients. The number of gradients will depend upon the natural levels and the manner in which they can best be reduced sufficiently. This part of the work demands much careful thought and a thorough knowledge of the dimensions of every mound to be levelled or hollow to be filled. As a general rule no gradients should have a greater rise than 1 foot in 18; in some instances 1 in 12 may be ventured upon to avoid or lighten heavy cuttings, but this rise should only be for short distances; for while aiming at economy of execution real efficiency must not be forgotten.

I should have said that the narrow track ought to mark the upper side of the intended road, as then it is an easy matter to measure off the real track. The eventual width of the road will, of course, be our guide in deciding what width is to be cleared of wood. For a grand avenue the road may be 20 or even 30 feet wide, and the front, or principal row of trees along each side, should stand back upon turf quite 50 feet from the centre of the road. For ordinary drives a space of 15 feet makes a wide handsome road; but when the line is beset with so many difficulties as to render the preparation of the levels a costly undertaking, the width of the hard road may be reduced to 9 feet; this width is not enough for two carriages to pass, but that difficulty is easily overcome by making the level space 15 feet wide, or 20 feet where the slope is very steep. Such a narrow road, although not suitable for a busy or public thoroughfare, yet answers very well for an ordinary private drive.

The levelling of the road, and grubbing of the underwood and timber, should be done altogether, and by the piece or yard. In deciding upon the price of the work all the inequalities of the entire line should once more be

passed in review, and one general price decided upon for the side cuttings, cuttings, and embankments, including the correct dressing of all slopes (batters) at a given angle; the outline of every curve being distinctly marked with stakes, and the depth and contents of every cutting given so clearly that no mistake can occur. The angle of the slopes must depend entirely upon the nature of the soil, which is sometimes so compact, or contains so much rock, that an angle of only a few degrees out of the perpendicular may be safely adopted; but where the soil is not very firm it is best to make all slopes of an angle of 30°—that is to say, at a gradient of 1 in 2, sharper angles being unsafe, as the soil is very subject to detrition from heavy rains or shattering frosts. When these slopes are made, as in this case, by cutting the solid earth away, they are done with the greatest ease and accuracy by first of all removing the soil only in a perpendicular line to the foot of the slope, and afterwards the face of the slope can be dressed to the required angle; but if this is attempted to be done as the bulk of earth is removed, a faulty batter is almost certain to be the result. This is important, because handsome slopes contribute materially to the appearance of a new road.—Edward Luckhurst.

NEGLECTED VARIETIES OF THE ROSE.

I am glad "D." has again called attention to the subject of neglected garden Roses. With nearly all that he says I can agree, but I think, with some few exceptions, the best exhibition Roses are also the best garden Roses. Of course it would not do for an amateur, book in hand, to note down every fine flower he saw exhibited, as there are many Roses that occasionally throw up a very good bloom, which, with shading and attention, form a great addition to a stand of Roses, and yet in an ordinary way will do no good at all. Alpaïde de Rotalier has with me been one of these. I saw it exhibited several times very finely the year it came out, but I have never cut a bloom of it in my own garden that gave me the least pleasure, and nine blooms out of ten have been worth nothing at all. But I believe, as a general rule, the Rose that is shown oftenest and in best condition at exhibitions is also the best for garden purposes. Take, for instance, Charles Lefebvre, John Hopper, La France, Baroness Rothschild, Alfred Colomb, &c.; these will give infinitely more pleasure to a Rose-grower than any number of Baronne Prévost or Duchess of Norfolk. I cannot, either, quite agree with my friend "D." in thinking Cécile de Chabrillant the model as to shape. It is, undoubtedly, of a beautiful shape, but I prefer both Marie Baumann and Alfred Colomb. Comtesse C. de Chabrillant does not show enough of the inner colour of the petals, which in nine Roses out of ten is the finest colour. It is in this point that such Roses as Alfred Colomb, Marie Baumann, Madame Caillat, and Charles Lefebvre have to my mind the advantage, that in unfolding the outer petals, while there are still a high centre and circular outline left, they show the full depth of colour of the inner petals. I remember, when at Manchester, a great Rose-grower admiring a three-parts-open Centifolia rosea, on account of its circular and shell-shaped petals, more than a grand bloom of Baroness Rothschild in the same box, which showed the full satiny depths of its petals, and yet was still a model of form. Opinions, consequently, will always differ as to the best models of form, and I have ventured to question "D.'s" opinion in order to elicit the opinions of others. Is not Madame Vidot quite as fine in its way as Cécile de Chabrillant?

Eugène Appert is decidedly a fine-coloured Rose, with very healthy foliage, but with me Duke of Wellington is even finer in that shade of colour. Colonel de Rougemont is a better flower than Baronne Prévost, but a bad grower, and in this respect the Baronne has much the advantage. I quite agree in all he says in praise of Fisher Holmes; it is very fine in point of colour, and a healthy grower, and, if disbudded, an exhibition Rose. Prince Léon is certainly an exquisite-shaped Rose, but so seldom caught, and so weak a grower that it is hardly worth retaining in an amateur's garden; it is, in fact, only a Rose for exhibitors to bud for the sake of getting an occasional bloom to help out a stand. Comte de Nanteuil and M. de Montigny are two Roses as fine as any grown, and ought never to be discarded from the garden. Jean Cherpin is fine in colour, but with me burns with the least approach to sun, so that, as in the case of Monsieur Bonceune, I hardly get a bloom fit to gather. "D." has omitted a few I should like to add, as La Brillante, good habit, free-blooming, a very smooth-petalled Rose; Madame Knorr, also a very free-blooming Rose, deep rose in the centre, blush outside petals; Duchess of Sutherland; and a few others.

I am rather amused at what "D." says with regard to Général Jacqueminot and the Rev. W. F. Radclyffe, as it accounts for his recommending the Général a few weeks ago, which I was otherwise rather at a loss to understand, as I never knew a Rose (at all events in these parts) that was such a universal favourite, so that it could not in my mind be considered a neglected Rose. I suppose Mr. Radclyffe was making up now, by his present recommendation, for his having given him away before as a loose fellow. It has been, as "D." says, a remarkably good year for the Général, and almost the best bloom I ever saw of it was exhibited by Messrs. Paul at York, and worthy of any stand of Roses.—C. P. P.

ERYTHRINA CRISTA-GALLI CULTURE.

I wish to call attention to the above-named plant as being very worthy of cultivation by gardeners generally. It is very probable that, as the plant has been in this country nearly a hundred years, it was at one time thought much of, and cultivated to a much greater extent than it now is. It is not the beauty of the plant alone that entitles it to more extensive cultivation, but its hardiness and ease of culture are qualifications sufficient, I should think, to induce all who have not grown it to give it a trial. I am particularly partial to it for conservatory decoration; it is a noble-looking object for either in-doors or out of doors in any part of the garden—just the plant, too, that amateurs can grow successfully, because it thrives with little attention. It is a species of Coral Tree, has very handsome foliage, and scarlet flowers, and with ordinary cultivation it blooms in August. It is a very good and suitable associate for Liliums at that time.

In some parts of England the Erythrina is to be met with as a border plant growing in common garden soil, and after flowering, and when the wood is ripened off, which is in autumn, the shoots are cut down to the ground, and the old stool or roots slightly protected during winter. This, however, is not the wisest treatment to adopt, for if the winter prove very wet, or severe frost occur, the roots are considerably injured, and the plant throws up weak and unhealthy shoots in consequence. My plan is to grow the plants in pots, and give them the protection of a pit from which the winter's frost is excluded, and after they start into growth, and fine spring weather sets in, the pots may be plunged along the south side of a wall. Afterwards, when suitable weather arrives, the plants may stand in the open ground, at all times to be well supplied with water. They require a considerable amount of room; a moderate-sized stool will throw up shoots sufficient to produce a plant 5 feet high and as much in diameter. Staking must not be neglected.

I have tried several mixtures of soils in which to grow the plant, but find none so suitable as rich turfy loam and very rotten farmyard manure in equal proportions. I usually pull the loam to pieces with the hand, and mix sand with it if it is a heavy loam. I then take the manure and rub it to pieces, sifting a little quicklime and soot over it, and well mix that with the hand. I finally well incorporate the two. Such a mixture will produce a vigorous growth, handsome and healthy foliage, and highly-coloured flowers.

Plants are raised from cuttings of the young shoots when about 2 inches long, or the flowering shoots may be made into cuttings. In either case bottom heat will assist them, with a bell-glass or hand-light over them. I once saw a grand display of this Erythrina, about four dozen large plants being arranged along the front of a range of vineries. The pots were plunged in the border by the side of the walk. The plants were uniform in height and size, and really looked very fine. These gave me a lasting remembrance of this really handsome and beautiful plant.—Thomas Record.

CUCUMBER DISEASE.

I have grown Cucumbers for the last six years, but not till this year have I had what I call full success. I have always grown them in peat, turf, and other light soils, and have been troubled with disease in the fruit, but this year I determined to try another soil, and composed it as follows:—Part of an old Cucumber bed, pig manure, fresh horse dung, and manure from a sewage well, the latter being the principal part. The variety which I grew was Telegraph. The plants began to bear at the beginning of March, I have cut an abundance of

fruit, and they are still bearing, though not so freely. The fruit has been from 18 to 26 inches in length, and has not exhibited a vestige of any kind of disease. I only water once a-day, and that about 7 P.M.

I leave it in abler hands than mine to find whether light soils have anything to do with the disease, but I intend to grow my plants in stiff soil for the future.—Learner.

BRASSICA OLERACEA.

No wonder the Romans and Greeks held the Cabbage in high esteem; it is a dainty dish, fit to please the palate of queen, emperor, or peasant, and no person seems ever to tire of it. This is the case with but few other garden vegetables. Reader, you may smile and say I am too lavish in my praises, but hold until you have made a voyage or two across the salt ocean. If you have made such voyages it will be easy to convince you that there is not a vegetable grown so fondly longed for. No matter what port a vessel may cast anchor in, Cabbage is the only vegetable inquired for by all on board, and by the passenger class specially.

Who that has ever seen the parent Brassica oleracea could imagine it would ever assume so many forms and variations? The last time I saw it was in the Isle of Sheppey. I had been planting some trees around the fortifications at Sheerness, and took an evening walk by the banks of the Medway. I found this Brassica growing in a corn field close to the banks of the river, and I found wild Celery growing very abundantly in a trench quite convenient.

Let us now take a glance at the sorts the farmer and cottager chiefly plant—viz., York and Drumhead. I would advise the cottager never to plant Drumhead; it exhausts the soil so much, that where a crop of it is grown, no matter how you may manure, you cannot get a moderate-sized crop of Potatoes off the same plot for two seasons afterwards, and as an article of food I hold it to be far inferior to the York Cabbage. It cannot have nearly the muscle-producing properties, nor contain the gum, sugar, and gluten that the York does, but the Drumhead contains more water, as is evident to any person who has seen it cooked. It is quite a mistake for either the cottager or the gentleman's gardener to plant such a robber of the soil, for you can have two crops of York to one of Drumhead; two lines to the one, and two plants to the one.

Then look to the sprouting properties of the York. We have just seen (supposing we do not allow sprouting) that we can grow about one dozen heads of the York Cabbage to the one of Drumhead. Theory says it exhausts the soil very much to allow sprouting to take place. Have the theorists who have written so taken into consideration the amount of food and nourishment one sort of Cabbage derives from the air as compared to another? I think they have not; and it is a subject that would be well worth testing. I hold, and many practical humble gardeners like me affirm, that the Cabbage which produces no sprouts is the sort that robs the soil much more than the sprouting kinds do, particularly the York. You will often find a plot from which a crop of the York Cabbage has been taken, but the stocks left sprouting; you will find them loaded with the most delicious sprouts, and when you pull up the stock you will actually find it in a state of decay, without the slightest particle of clay attached to any fibre. Well, let us take up and examine the roots of the Drumhead or non-sprouting kinds, and what do we see? a large ball of earth attached to the roots—enough for a man to lift. To bring the soil into condition again is almost like reclaiming that of a forest of Ash trees, so exhausted is it. Vegetable physiologists would enlighten gardeners very much by stating the number of stomates in a square inch of each of the foregoing varieties, to let the gardening world see their action as regards the atmosphere and soil; and chemists the properties of different varieties as muscle or fat-producing food; for in the midst of our cordon training, our restrictive and extension systems of Vine culture, and our blaze of bedding, Cabbage, the chief of the vegetables, should not be neglected nor forgotten.—J. McD.

LILIUM AURATUM.

Notwithstanding the great success we now and then hear of in the flowering of this capricious plant, certain it is there are many failures, and instead of the bulbs multiplying in the grower's hands, they often do exactly the reverse. There is one way in which I think Lilium auratum may be more safely depended on for doing well, and that is when it is planted out of doors in suitable soil. In such a place it succeeds well, and as far as my experience goes it is quite hardy. Some years ago I planted some out, and one of them showed upwards of twenty fully-expanded blooms at one time during the past season, with some others in bud and some going off. The stem, being stout and thick, did not require a stake, although it was fully 6 feet high. The site was an old Rhododendron bed, which must have been full of the roots of these plants, as well as of those of a large Elm tree growing near, which occupy the whole length of the bed; yet the plant has shown the robust health necessary to perfect the above number of fully-grown flowers. I would, therefore, say to those who often have to complain of losing their bulbs when kept in pots, Plant a quantity out of doors; they are less liable to mishaps then, and in general bloom much more strongly.—J. Robson.

A BIT OF SOUTH DEVON.—No. 5.

"You find it very hot at Torquay," is a sentence, half query half assertion, made in a letter received a few days since. I replied, "Yes, it *is* very hot." "Ah! you are finding it out," was the rejoinder. And my sur-rejoinder was, "It is found out elsewhere. A letter from Brighton tells, 'We sha'n't bear it many days longer.' A letter from Chippenham says, 'We are melting.' (I hope the writer will not become a large grease spot and heap of bones). A letter from Scarborough says, 'It is at midday like a furnace;' and a letter from the metropolis concludes my bulletins of temperature—the writer, evidently *in extremis*, concluding his very brief note with this sentence, 'London is stewing hot; the Venetians are down, yet I sit oozing at every pore.'" I adopted another course—proceeded to Totness, that quaint old town, so old that the stone is shown on which Brutus of Troy sat and uttered the rhyme—

> "Here I stand and here I rest,
> And this town shall be called Totness."

I did not stay—probably your readers will not either—to inquire as to the credibility of the legend, but I placed myself under the awning of the steamer Newcomen about to thread its way down the stream thus apostrophised—

> "River Dart! oh! river Dart!
> Every year thou claim'st a heart."

The rhyme is said by some to allude to the numerous drownings, and by others to its captivating beauty. Parts of it certainly are very beautiful, and it has been called "the English Rhine," which in my opinion is no praise. The Wye is far more beautiful, and more continuously beautiful, deserving the highest praise-name of "the British Moselle."

I should have liked to wander for hours in the woods of Sharpham, which have their lowest branches dipping in the Dart, and densely clothe the steep hillside. One of those trees is a Wych Elm, said to be the largest in England. Mr. Pender, gardener at this residence of T. Durant, Esq., says, "The tree stands on an area of 400 feet in circumference; some of its branches, in a horizontal line from the stock of the tree, are 80 feet; circumference of the stock of the tree, 16 feet; and some of the large branches measure 9 feet in circumference. Some of the branches which hang over the carriage drive through the park are supported with huge props, while others on the opposite side are lying on the ground."

A Plum abounds in the fruiterers and market here, known as the "Disham." I spell it as the Devonians pronounce it, and might have accepted the alleged derivation of the name to be "cause it's only good in the pie-dish." I was exasperated by a fat old woman on the steamer who would stand between me and the landscape, but forgave her so soon as she said "That's Dittisham; that's whence our pie and preserving Plum comes from. All those trees you see, and in every cottage garden there are some, are Plum trees." So I inquired further, and find that the oldest man living remembers trees that were very old when he was a boy; and on obtaining specimens of the Plum I think that it is now known as the Victoria, a name which ought not to have been applied, for it has been known for centuries in Sussex as the "Alderton Plum." Why with Devonians is "Plum" synonymous with "soft?" "A soft bed" with them is "a Plum bed."

On we glided to our voyage's conclusion—Dartmouth, native town of the inventor of the steam engine, after whom our vessel is appropriately named. I had been at Dartmouth previously, and in strolls noticed standard Fig trees in the gardens and hedgerows, where in the first-named they ripen fruit annually, and in the hedgerows occasionally. The peculiarity is that in

South Devon this is so general, not that it is peculiar, for there is an orchard of Fig trees at Tarring, near Arundel, in Sussex. It is peculiar, however, to Devonians that they call Raisins Figs. With them a Plum pudding is "a figgy pudding," and they have this nursery rhyme—

"When I brew and when I bake
I'll give you a figgy cake."

This application of the name of one of their own fruits to one of foreign growth, merely because they are alike sweet and have their seeds inside, is only a single instance out of many instances of their adoption of terms from their favourite pursuit, gardening. One more only will I quote, told me in reply to a query why a sailor no longer escorted a Torquay damsel, "Oh! she 's given him Turnips." Let me tell a tale of warning to others who may write "Bits" about Devon. Mr. Saunders, host of the Devon Arms in this city of villas, has harvested this season a noble crop of White Spanish Onions, averaging 17 inches in circumference. "He grew 350 lbs. in weight on two-thirds of a yard of ground," said our informant. "Dear me!" said an old gentleman from Cheapside, "they must have grown a-top of one another!" By "a yard of land" our informant meant what is elsewhere called a pole or perch, and Mr. Saunders's Onions were grown on a bed 35 feet long and 5 feet wide.

I have spoken of gardening as a favourite pursuit of the Devonians, and the evidence is everywhere. Each villa is set like a jewel in a garniture of gardening. Every cottage in every lane has flowers on and around it—and what lanes are they! banks 6 feet high, not 8 feet apart, clothed densely with Ferns and wild flowers, crested with Nut trees, and thickly overarched with the noblest of Beeches, Elms, and Oaks. A fine summer evening's wandering in the Cockington lanes is a luxury never to be forgotten—so beautiful, so refreshing, so cool, though not so cool as Kent's Hole, that storeplace of records for the anthropologists. The temperature there never varies, it is 52° day and night all the year round. Let that vagrant bit remain, for I will at once return to the love-of-gardening evidence by adding that little market gardens and vast orchards crop out everywhere—market gardens, the owners of which are unknown beyond their immediate vicinities. I travelled on to Berry Head; and there at some 300 feet above the sea's level, and on that furthest narrow promontory of Devon, I was brought to a pause by a board inscribed, "Cann, Nurseryman and Florist," and there within walled enclosures were acres of fruits, flowers, and kitchen-garden stuff.

Berry Head will be associated in my memory with the Helianthemum polifolium, for there for the first time I found that rare white Rock Rose; there grows also the Trinia vulgaris, Honewort. Of other not-common plants I noticed but few. Crambe maritima, Sea-kale, on Shapton Sands, I notice chiefly because it was thence Mr. Curtis obtained the plants from which he introduced it into our kitchen gardens in 1795. On the Paignton Sands is Erodium maritimum, Sea Storksbill, and on the banks near is Tamarix anglica, English Tamarisk, the sprays of which add such grace to bouquets. I know of no other places than Babbicome Downs and Daddyhole Plain near here where the Bupleurum aristatum, Narrow-leaved Hare's-ear, is found in England. Of Ferns, Stewart states that the Maidenhair, Adiantum Capillus-Veneris, is to be found in some crevices of wet rocks at Mudstone Bay, near Brixham; the Tunbridge Filmy Fern, Hymenophyllum tunbridgense, at Bickleigh Vale and Beckey Fall, and at the place last named the Hymenophyllum unilaterale. At Holne Chase, about twelve miles from Torquay, Mr. Stewart says, "I have gathered fronds of Osmunda regalis which measured 10, 12, and 13 feet." The Adder's-tongue, Ophioglossum vulgatum, is found about the Torre Abbey pastures.

I have just alluded to the orchards, and I will add that they would puzzle, astonish, and horrify even the "hairy" of you two "old Gooseberries." They would puzzle, because he would see thousands of trees in thousands of orchards, all differing and all nameless, because seedlings. The pips were and are sown wholesale, and the products are ungrafted. He would be astonished because of the numbers and size of orchards, all of Apple trees, that occur on each side of each lane for miles around Torquay. I regret to hear that they bear on the average this year less than half a crop, for this is the birth-district of the best cider. He would be horrified by the total defiance or ignorance of all fruit-culture evinced. Trees with crowded branches and crowded together are everywhere, and I have not seen one orchard so cared for that I could justly say, "That orchardist deserves a crop."

Now for "a few" breakfast, and then off for Coombe Royal, but before closing I need add that "few" is the Devonian for "little."—G.

DOUBLE LILIUM TIGRINUM—LARGE ANTHURIUM SCHERZERIANUM.

I HAVE sent you a flower of Lilium tigrinum flore-pleno, which is really uncommon as yet, and from its value and beauty deserves attention as a very fine addition to our Lilies. The flower sent is from a small bulb in a pot, which under this condition is most beautiful, and I expect when cultivated out of doors it will prove itself still more so. We have several pots of this Lily in flower just now, and some of them have been open three weeks, and are still beautiful.

I have also sent you a flower of our variety of Anthurium Scherzerianum, the spathe of which is 6 inches long; but this is not the longest, one of recent formation is nearly 7 inches long. The flower sent opened up last April, which shows the value of this splendid plant in all its varieties. The remainder of the flower-stem of the variety sent, which I have not put in the box, from want of space, is 17 inches long.—H. K.

[Both of these are very beautiful indeed, the Anthurium marvellously so; this is the finest spathe of Anthurium, and the Lilium is the most double, we have ever seen.—EDS.]

THE SOIL SUPPLY OF GARDENS.

WE recently commented on the water supply of gardens, and now we propose to offer a few remarks on the very important question of the soil supply of gardens. It need not be said that these twin elements rank of the very first and highest importance in nearly all the operations of the horticulturist. Destitute of them, he might give up his occupation; inadequately supplied with them, he is almost as badly off as the Egyptians when called up to render their tale of bricks without a supply of straw. It is on the plentiful supply of water, and soil of certain qualities, more than anything else, that the character of garden produce depends. At least all other appliances, however correctly handled, cannot insure success in the absence of good water and soils.

Gardeners have in numerous instances to put up with much that is most trying and unreasonable connected with their supply of soils for potting and other purposes. It would be as reasonable to expect the farm steward to send prime sirloins to the larder or fat oxen to a cattle show without supplying him with plenty of proper food to feed them with, as it is to expect the gardener to produce first-rate plants and fruits without a proper supply of soil. Fortunately for the farmer, he can manufacture or grow the greater portion of what his oxen require, but gardeners cannot manufacture "turfy loam" and "fibry peat." No nobleman or gentleman ever expects the farm to produce prize animals on dry bents or chaff, and yet such an expectation would only equal in absurdity the expectation that fine Pine Apples and other pot plants can be reared on road scrapings, or clay, or any other composts equally unsuitable to the best cultural results. That policy which compels gardeners just to take any sort of soil that they can get, and prohibits them from taking a supply of that which is proper, is not only an unreasonable but a short-sighted policy on the part of the employers. We have known gardeners connected with large landed estates obliged to take road scrapings to pot with, and to pot their Pines in clay mixed with chopped straw and leaves, while plenty of good loam could be had in the nearest meadows. Not only is this a stupid policy, but the apprehensions which lead proprietors thus to refuse proper soil are entirely delusive and without foundation. They will not allow the gardener to break into the meadow, because they fear that by so doing their lands will be sadly and permanently deteriorated. Even if he offers to replace it with a richer and better grass-producing soil, the offer is seldom reassuring, and in some cases not entertained for a moment. We are not now supposing cases for the sake of a purpose. Indeed, we venture to assume that a large proportion of gardeners can endorse from their own experience what we are stating.

We once held a situation where we were driven, as the saying is, "to our wits' end" for want of soil to pot with. At last, after a sort of special pleading, and a controversion of the ideas of the proprietor—and always, in this battle, his lieutenant the farm bailiff—permission was obtained to test our statements in the corner of an old meadow. Of course, it was not expected

of us that we could substantiate the assertion that the produce, and consequently the value, of the patch would be increased instead of deteriorated. On the contrary, the performance was regarded as a piece of impudent robbery, more especially as gardeners are not expected to know anything of farming or meadows. How can they? However, our success was complete. The yield of hay was nearly doubled, and in the autumn the grass was green and sweet, resorted to by cattle and sheep in preference to any other part of the meadow. The issue was that a regular supply was granted so long as the bargain was implemented in the same way. And what was the process? Simply first to mow as closely as possible the grass, then to skin off the turf as thinly as it would hang together and bear handling. Then the 3 inches of soil lying immediately underneath the thin skin, and which contained the roots of the grass, was taken for the garden. The space was filled up with old rich soil, such as is not very difficult to procure about most garden establishments; at least most gardeners will be glad to provide such, by hook or by crook, to exchange for maiden loam. The surface was rolled down firmly, turfed over with the same turf, and well rolled again; the soil exchanged, being much richer than the loam, yielding not only better but earlier grass, while it was utterly unfit for the potting bench. The result was, a grant of as much soil yearly as was required. Of course, it would have been much better, and quite as harmless, to have taken the turf; but we ran no risk of committing ourselves; and every gardener knows what a boon it is to get even that which lies immediately below the thin skin of turf, instead of being compelled to work with any rubbish he could otherwise scrape together. By this method not even a season's sward is sacrificed; but if the turf be taken, and the ground properly laid down firmly, and sown thickly with permanent grasses, and fenced round for a few months, it is difficult at the close of the season, except by close inspection, to know where the turf has been removed, unless it be by the rich verdure of the spot.

This question is one of vast moment to successful culture; and we feel confident that if many who, under an absurd dream, deny such a supply, were to submit to one trial, there would not in the end be any objections to take the requisite amount each season. And we are certain that many a just complaint from the gardener would be avoided, and the produce of the garden vastly improved.

While we thus point out the groundlessness of the idea that gardeners would deteriorate the value of grass land by the process we have described, it is but right on the part of gardeners to be as sparing and economical with soil so obtained as possible, and not to break into fields more extensively than is absolutely necessary; for we admit the process does create an eyesore and disturbance for a short time. We have known the loam shaken from old Pine plants, French Bean pots, from Melon and Cucumber pits, made no further use of, but either wheeled into an open quarter of the garden or to the waste heap, while it might perfectly well have been made use of for many purposes—such as mixing up for potting and boxing flower garden plants. Heaps of good soil are often collected with other rubbish under potting benches, and then taken to the waste heap. All such ought to be sifted, and the good soil separated from the other matter, and a place set apart for forming all soils collected in this way into a heap that can be profitably used in many ways, with which all gardeners are conversant. Hundreds would be glad to use what some refuse, and in refusing, and drawing too greedily and injudiciously on fresh supplies, are to some extent perpetuating the tenacity with which so many owners of land refuse their gardeners fresh supplies.—(*The Gardener.*)

DECOMPOSITION versus COMBUSTION.

At this time there is to be seen in the kitchen garden a large heap, consisting of many cartloads of vegetable refuse, such as hedge and Laurel clippings, old Strawberry plants, and cuttings of fruit trees of various sorts, the whole of which will be shortly buried at a depth of 18 inches below the surface of the earth. This vegetable refuse will form a stratum 6 inches thick, and will be well trodden in before the 18 inches of earth are placed over it. From an experiment I made last year I have come to the conclusion that this is the most economical mode of disposing of all vegetable refuse. The product of the large heap in the garden, if burnt, might be a few bushels of ashes, worth 5*d.* the bushel, the effect of which would only last one season, whereas the effect of a well-trodden-in 6-inch stratum of vegetable matter would last several years. The decay being very gradual, there would be a continual supply of carbonic acid in solution with water to the plants above. As might be supposed, the superstratum of 18 inches of earth becomes thoroughly drained, and if examined will be found to be full of rootlets, and I have observed that Strawberries grown in ground cultivated in this manner not only acquire a large size and very fine flavour, but do not flag in hot and dry weather.

This operation costs rather more than trenching, it is infinitely better, and, as it lasts several years, the cost per annum would be very trifling. Probably this woody matter should not be thicker than the little finger, but I should think there would be no fear of mycelium. If it be necessary to hasten the decay of this vegetable layer, a little lime on the surface of the soil would soon form lime water, and finding its way downwards thus effect the object.—Observer.

SHRUB BEDDING versus FLOWER BEDDING.

As we have arrived at that period of the season when the effect, either good or otherwise, of present arrangements and combinations in the flower ground can be taken into account, and the propagation and preparation of next year's supply of bedding stuff are being cared for, we purpose saying a few words with regard to an aspect of the bedding system that we should like to see more attended to than it is. We allude to what may be provisionally termed, shrub bedding. Instead of the custom which at present almost generally prevails of filling every bed in the flower or dressed ground solely with their usual gay but tender and ephemeral occupants, we strongly advocate a fair proportion of the beds being made objects of perennial beauty, by filling them with happy combinations of hardwooded, hardy, low-growing, persistent-foliaged shrubs, by the judicious and tasteful use of which effects can be produced quite as pleasing and far more lasting than can be had from the present system of flower-bedding only.

In the different beautiful varieties of Ivy, which are now available, we have material for the most varied and effective beds. Of the common and variegated Hollies the same may be said. The many varieties of low-growing Coniferæ afford subjects admirably adapted and easily available for the purpose. We have seen very telling beds formed by such simple combinations as the variegated Savin for the centre mass of a bed, and its Tamarisk-leaved variety for a marginal belt.

A bed of the golden Thuja aurea edged with the Tamarisk Savin, or *vice versâ*, is very effective. For setting in a belt of contrasting colour, miniature plants of the golden Thuja would be admirably adapted. Cupressus Lawsoni, which is most patient of the use of the knife, would make a good central mass in a comparatively raised bed, which might be belted with a glaucous zone of Savin looped at intervals with Thuja aurea, or the common Heath-like little Juniperus ericoides. The mention of Heath reminds us of a spot where just now a belt of the common Ling or Broom Heath forms one of the greenest and most refreshing-looking margins possible to a shrub bed. Many of the lovely evergreen American peat shrubs are well suited for our purpose. The neat little Pernettyas, with their tidy foliage, pretty little white flowers, succeeded by rich trusses of beautifully-coloured berries, may be used with good effect. In the way of variegated foliage, the shrub-bedder has material that can fully rival the flower-beddere' Golden Chain, Mrs. Pollock, Flower of the Day, and other popular bedding Pelargoniums, in such never-dying, frost-defying, and persistently beautiful subjects as the golden and crimson, and other variously-tinted Ivies, Euonymus japonicus variegatus, the white creeping E. radicans, Rhamnus Alaternus variegatus, and though last, far from least, that most recent and perhaps greatest acquisition of any, the beautiful golden variegated Coprosma Baueri.—(*Irish Farmers' Gazette.*)

Mr. Rucker's Orchids.—At the sale of these, which was continued on the 9th, 22nd, and 23rd inst., Mr. Stevens realised the following amounts for some of the specimens—viz., for

Pleione maculata, £7; P. Wallichiana, £5 5*s.*; P. humilis, £6 6*s.*; Aërides affine, Loddiges' old variety, £8 10*s.*; A. virens, Kenrick's variety, fine specimen, £5 15*s.*; A. Larpentæ, £5; A. Lobbi, £5 10*s.*; A. Fieldingii, a very fine specimen, thirty leaves, £15; A. rubrum, £5; A. Schrœderi, fine plant, £6 10*s.*; Cattleya Reichenheimi, £17 10*s.*; C. exoniensis, £12; C. labiata var. AUTUMNAL-FLOWERING CROCUS.

The Crocus, as one of the earliest ornaments of the flower garden, is universally admired, and, indeed, for neat, dwarf, and compact growth, and varied shades of colour, Crocuses are unequalled for margins or edges of flower beds or borders. They are among the first flowers that remind us of spring, but the autumn-flowering kinds have no such reviving influence. They tell of coming gloom, wet, snow, frost, dreary winter with its storms and blasts. Should we value them less for that? They flower, it is true, at a time when flowers are plentiful, if indeed, we may so term blazes of scarlet, yellow, and blue, representing about half a dozen species of plants, which are all we want as regards their profusion of bloom. But there is pleasure in variety, a charm that no repetition can effect. I think there is something very refreshing in autumn-flowering plants. They seem to revive, to give life and hope in the declining year. Springing-up close to plants that have been a mass of beauty, they are enhanced in beauty—they give to Nature beauty even in her decay.

Autumn-flowering Crocuses differ from those which bloom early in the spring, for, like the autumn-flowering Cyclamen, the flowers appear before the leaves. These plants grow in the dull autumn and winter months; in fact, all their growth is made and matured in the dullest, coldest half of the year.

All that these Crocuses require is well-drained soil, thriving best in a rich light loam over gravel. They succeed in the sunniest situation, and thrive equally well in partially shaded positions, doing admirably on the margins of shrubberies, and they are gems by the margins of woodland walks, and at the foot of rockwork; in fact, everywhere. They do not interfere with the summer-flowering plants, which may be planted between them. They should be taken up every second or third year, and the roots divided. This is best done when the leaves begin to fade. Enrich the ground with some well-decayed manure or leaf soil, and replant at once.

The autumn-flowering species are not numerous. So far as I know they are confined to three, or at most four—viz.:

Crocus speciosus.—Flowers large, purplish-blue, beautifully striped. It is the finest species of Crocus, being very free-flowering and beautiful. It flowers from the middle of September.

C. sativus.—Flowers large, pale purple, with long orange styles. It flowers in September. It is synonymous with C. autumnalis.

C. serotinus.—Flowers violet purple, with a yellow throat. It flowers in October, and continues to bloom in November.

I should like to know if there are any others to be had, except in their native habitats, and should anyone wish to form a collection of Crocuses I know of no place where more information is to be gained than from the late Mr. Beston's excellent descriptions, Vol. iii., New Series, pages 114 and 135.—G. Abbey.

CLIANTHUS DAMPIERI AND PUNICEUS—THE GLORY PEA.

In your last number is a communication upon the culture of Clianthus Dampieri. I beg to say that this is not the Glory Pea and Parrot-beaked Plant of New Zealand. I have travelled over the greater part of the island, and have never seen it. It is, rather, a native of Australia. Clianthus puniceus is the true Glory Pea of New Zealand, and its native name is Kohai ngutukaka, or Parrot's Bill. Its magnificent festoons of blossom are to be seen north and south. As far back as 1845 I sent seed to England, and on my return had the satisfaction of seeing it in full bloom upon a south wall of a house, where it remained several years, proving it to be hardy, and certainly not an annual nor biennial. I consider that it requires merely the ordinary care needed by a Tea Rose to keep it through our winter.

Clianthus Dampieri is much given to red spider, and should be grown quickly. Its flower is similar in shape, but different in colour, to that of C. puniceus.—G. E.

TEA ROSES.

It is common to suppose that the Tea Rose is hard to grow. True that it may require a little extra care in winter, but yon may rest comparatively happy during the summer. Out of three hundred plants, during the past winter I did not lose one, although they were planted close to the water. I have been driven frantic all the summer with every form of disease among the Perpetuals—aphis, mildew, rust, and now they look most ghastly specimens without a leaf. My Teas, however, have not known "an ache or a pain." They are now, and have been all the season, in full health and vigour. I have been most successful in my showing this year, and I am sure I owe it all to having plenty of Teas to cut. I am convinced that it has been the fair face of Niphetos, the delicate shading of Rubens, Souvenir d'Elise, and Madame Bravy shining out amidst the glorious colours of Charles Lefebvre and Duke of Edinburgh that have won their way to the judicial heart, and caused the premier prize to rest on my twenty-four or twelve, in preference to much larger and perhaps more brilliant stands on my right and left.

I was present at a show at Glastonbury on the 8th inst., and there I saw the Tea Rose in its fullest glory. Mr. Pavitt, of Rose Cottage, Bathwick, Bath, displayed six stands containing one hundred blooms of Teas. A more lovely sight I never saw. The day was intensely hot, the cut-flower tent injudiciously placed in the full glare of the sun. The giants in Mr. Keynes's prize twenty-four threes looked hot and drooping, their colour could not stand such a roasting. "The Perpetual season was past," "The wrong time of year for showing Roses," were the apologetic words. True, no doubt; but yet that we could have Roses in perfection, even in the midst of a burning August, was proved by Mr. Pavitt's cases. There stood Souvenir d'un Ami, Catherine Mermet, Niphetos, Mesdames Bravy and Willermoz, every form and colour, in perfect beauty. Neither were they in size just fit for the button-hole, the general destination of Tea Roses, but fine imposing flowers, any one of which would have graced a stand of twelve Perpetuals. I was much amused at the remarks made by the many who lingered before these stands. It was a new light to many a Rose-loving heart, and many a vow was made that for the future their rosariums should not be without a full complement of Teas. I give it as my advice to all amateurs whom it may concern, Have some Teas. Order the strong growers this autumn on short Briars, the more delicate on the Manetti in pots, to plant out the first week in May.—Stiff Soil.

CHEMICAL POWERS OF THE SUNLIGHT.

[The following is extracted from a paper by General Pleasanton, read before the Philadelphia Society for promoting Agriculture.]

At the request of my old friend and your respected President, I have attended your meeting at this time to impart to you the results of certain experiments that I have made within the last ten years in attempts to utilise the blue colour of the sky in the development of vegetable and animal life.

I may premise that for a long time I have thought that the blue colour of the sky, so permanent and so all-pervading, and yet so varying in intensity of colour, according to season and latitude, must have some abiding relation and intimate connection with the living organisms on this planet.

In the autumn of the year 1860 I commenced the erection of a cold grapery on my farm in the western part of this city. I remembered that while a student of chemistry I was taught that in the analysis of the ray of the sun by the prism, in the year 1666, by Sir Isaac Newton, he had resolved it into the seven primary rays—viz., red, orange, yellow, green, blue,

indigo, and violet, and had discovered that these elementary rays had different indices of refraction; that for the red ray at one side of the solar spectrum being the least, while that of the violet at the opposite side thereof was the greatest, from which he deduced his celebrated doctrine of the different refrangibility of the rays of light; and further, that Sir John Herschel, in his subsequent investigation of the properties of light, had shown that the chemical power of the solar ray is greatest in the blue rays, which give the least light of any of the luminous prismatic radiations, but the largest quantity of solar heat, and that later experiments established the fact of the stimulating influence of the blue rays upon vegetation. Having concluded to make a practical application of the properties of the blue and violet rays of light just referred to in stimulating vegetable life, I began to inquire in every accessible direction if this stimulating quality of the blue or violet ray had ever received any practical useful application. My inquiries developed the facts that various experiments had been made in England and on the European continent, with glass coloured with each of the several primary rays, but that they were so unsatisfactory in their results, that nothing useful came of them so far as any improvement in the process of developing vegetation was concerned. Finding no beaten track, I was left to grope my way as best I could under the guidance of the violet ray alone.

My grapery was finished in March, 1861. Its dimensions were 84 feet long, 26 feet wide, 16 feet high at the ridge, with a double pitched roof. It was built at the foot of a terraced garden, in the direction of N.E. to E. to S.W. by W. On three sides there was a border 12 feet wide, and on the fourth or N.E. by E. side the border was only 5 feet wide, being a walk of the garden. The borders inside and outside were excavated 3 feet 6 inches deep, and were filled up with the usual nutritive matter, carefully prepared for growing Vines. I do not think they differed essentially from thousands of other borders which have been made in many parts of the world. The first question to be solved on the completion of the frame of the grapery, was the proportion of blue or violet glass to be used on the roof. Should too much be used, it would reduce the temperature too much, and cause a failure of the experiment; if too little it would not afford a fair test. At a venture I adopted every eighth row of glass on the roof to be violet-coloured, alternating the rows on opposite sides of the roof, so that the sun in its daily course should cast a beam of violet light on every leaf in the grapery. Cuttings of Vines of some twenty varieties of Grapes, each one year old, of the thickness of a pipe-stem, and cut close to the pots containing them, were planted in the borders inside and outside of the grapery, in the early part of April, 1861. Soon after being planted, the growth of the Vines began. Those on the outside were trained through earthen pipes in the wall to the inside, and as they grew they were tied up to the wires like those which had been planted within. Very soon the Vines began to attract great notice of all who saw them from the rapid growth they were making. Every day disclosed some new extension, and the gardener was kept busy in tying up the new wood which the day before he had not observed. In a few weeks after the Vines had been planted, the walls and inside of the roof were closely covered with the most luxuriant and healthy development of foliage and wood.

In the early part of September, 1861, Mr. Robert Buist, a noted seedsman and distinguished horticulturist, from whom I had procured the Vines, having heard of their wonderful growth, visited the grapery. On entering it he seemed to be lost in amazement at what he saw; after examining it very carefully, turning to me, he said: "General, I have been cultivating plants and Vines of various kinds for the last forty years; I have seen some of the best vineries and conservatories in England and Scotland; but I have never seen anything like this growth." He then measured some of the Vines and found them 45 feet in length, and an inch in diameter at a distance of 1 foot above the ground; and these dimensions were the growth of only five months! He then remarked: "I visited last week a new grapery near Darby, the Vines in which I furnished at the same time I did yours; they were of the same varieties, of like age and size when they were planted as yours; they were planted at the same time with yours. When I saw them last week they were puny, spindling plants, not more than 5 feet long, and scarcely increased in diameter since they were planted, and yet they have had the best possible care and attendance!"

The Vines continued healthy and to grow, making an abundance of young wood during the remainder of the season of 1861.

In March of 1862 they were started to grow, having been pruned and cleaned in January of that year. The growth in the second season was, if anything, more remarkable than it had been in the previous year. Besides the formation of new wood and the display of the most luxuriant foliage, there was a wonderful number of bunches of Grapes, which soon assumed the most remarkable proportions—the bunches being of extraordinary magnitude, and the Grapes of unusual size and development.

In September of 1862 the same gentleman, Mr. Robert H. Buist, sen., who had visited the grapery the year before, came again—this time accompanied by his foreman. The Grapes were then beginning to colour and to ripen rapidly. On entering the grapery, astonished at the wonderful display of foliage and fruit which it presented, he stood for a while in silent amazement; he then slowly walked around the grapery several times, critically examining its wonders; when, taking from his pocket paper and pencil, he noted on the paper each bunch of Grapes, and estimated its weight, after which aggregating the whole, he came to me and said, "General, do you know that you have 1200 lbs. of Grapes in this grapery?" On my saying that I had no idea of the quantity it contained, he continued, "You have indeed that weight of fruit, but I would not dare to publish it, for no one would believe me." We may well conceive of his astonishment at this product when we are reminded that in Grape-growing countries where Grapes have been grown for centuries, that a period of time of from five to six years will elapse before a single bunch of Grapes can be produced from a young Vine—while before him, in the second year of the growth of Vines, which he himself had furnished only seventeen months before, he saw this remarkable yield of the finest and choicest varieties of Grapes. He might well say that an account of it would be incredible.

During the next season (1863) the Vines again fruited and matured a crop of Grapes estimated by comparison with the yield of the previous year to weigh about two tons; the Vines were perfectly healthy and free from the usual maladies which affect the Grape. By this time the grapery and its products had become partially known among cultivators, who said that such excessive crops would exhaust the Vines, and that the following year there would be no fruit, as it was well known that all fruits required rest after yielding large crops; notwithstanding, new wood was formed this year for the next year's crop, which turned out to be quite as large as it had been in the season of 1863, and so on year by year the Vines have continued to bear large crops of fine fruit without intermission for the last nine years. They are now healthy and strong, and as yet show no signs of decrepitude or exhaustion.—(*American Gardener's Monthly.*)

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 16.

Really it would be asking almost too much of human nature to expect anyone to answer this question affirmatively: "Will you do a good turn to a Bluebottle-fly?" It is very easy, of course, to theorise about the utility of this and that species of Musca, considered as scavengers, or on the place which each living organism holds in Nature's system, wherein, despite of what may seem to us its unpleasant peculiarities, we admit that it forms a link which could not be dropped out without interfering with the whole. But one of the points in the character of the Bluebottle which offends us most of all is the determination it shows to wander everywhere in and out of doors, and apparently for the express purpose of inflicting annoyance upon the huge biped man, against whom, were you putting him into the scale, you would have to heap many thousands of Blow-flies to serve as counterpoise, yet, strange to say, when the two come into collision, the Bluebottle keeps his temper, and the man does not. Really, you feel inclined to pardon the insect offender who attacks you or your property in a systematic way. The caterpillar which devours your Cabbages and Lettuces, as a rule, does not touch anything else; nay, even the aphis, common as it is on a variety of plants, shrubs, and trees, does not enter your house, except by accident, and is then glad enough to escape again with life.

But the Bluebottle, what is he? A predatory insect of the garden? Yes. Of the conservatory and hothouse? Yes. And more than this, he visits also our houses, not one room only, but every room to which he can gain admission. He is here, there, and everywhere, and not satisfied with plaguing you by haunting you in your moments of relaxation, and vexing your

ears by his hum, which some people think melodious—if they really do, I wish I had their ears—he flies at you desperately, and settles upon you in order that he may regale himself upon the moisture exuded from your skin. Why, the other morning, reader, a friend of mine lying half awake, engaged in a philosophical meditation, had to lift himself up eight times to chase off a determined fellow, who settled thus repeatedly, though driven off again and again; and at last, the sufferer having got up in despair, no sooner did the Bluebottle ascertain this fact than he took himself off to the ceiling, and "pitched" there, looking down serenely as if to say, "Now I have made you move at last, and, what's more, I have got to a position of security." I believe the first impulse in my friend's breast was to send to the lower regions of his house for a ladder which would enable him to reach the ceiling, and destroy his malicious though paltry foe, but, on reflection, he calmed down and consoled himself in a philosophical manner, allowing the Bluebottle to escape with a seeming triumph.

Behold the Bluebottles in the garden. If they are at home in the house, they are quite as much at their ease when they rove from one spot to another, regaling themselves upon fruit, and buzzing also in swarms about the flower parterres. With the ripening of Gooseberries and Currants we find attendant Bluebottles prepared to take their share of the produce. Strawberries and Raspberries they also affect; not, as I have noticed, so frequently meddling with the first of these, but the grand harvest of these insects is at the time of the maturing of Plums, Cherries, and wall fruit generally. "There's always something to be got about a garden" is their motto; and when other supplies fail Apples and Pears still remain, and late-ripening Grapes, on the strength of which the Bluebottle prepares for its hybernation, or at least this seems to be the case with a moiety of the species. Individuals hide away in nooks and crannies when winter has fairly set in, and occasionally a party of Bluebottles will be found reposing in company. A gentleman, having climbed a disused telegraph pole, shook out from a cavity in the upper portion dozens of these in a state of torpidity.

Another name given to the species before us (Calliphora vomitoria)—namely, the Flesh or Blow-fly, reminds us that it is one out of many species of the Dipterous order, which deposit their ova on meat. It is certainly not an agreeable idea, yet it is one which will suggest itself when we see a swarm of these insects buzzing about and settling upon fruit, that it is almost certain they have recently paid visits to animal matter in a state of putridity or nearly so. Flies are tolerably particular in cleaning themselves, but still we might, did the choice rest with us, decidedly wish that they should not approach us, or our garden produce, too soon after they had been engaged in the work of preparing for the continuance of their species. And, indeed, it has been suggested by some, that it is possible such insects may be the means of propagating contagion by carrying poisonous matter on their limbs or jaws from one object to another—a theory which is clever, perhaps plausible, yet one which I can scarcely receive as true.

The number of eggs deposited by the common Bluebottle is about two hundred, and if the weather is tolerably warm, the young larvæ emerge the same day. Unlike the majority of larvæ, which seem to require occasional intervals of quietude to assist digestion, these meat-eating individuals proceed without interruption, unless from external causes, and are, it is said, adult within the week. From the experiments of Redi, their increase of weight appears to be sometimes as much as two hundred-fold in the course of twenty-four hours. According to the writings of some of our entomological authors, Bluebottle larvæ, when desirous of becoming pupæ, quit their food and seek a retreat in the ground. This must, however, depend upon circumstances, for it is evident that as their powers of locomotion are very moderate, getting to earth may prove a very troublesome job—at least, I have noticed places where, doubtless, such larvæ obtain their favourite conditions, but in which earth is not to be found, and from whence I have not seen them performing migrations in search of it. I assume, therefore, that the pupæ are attached to any convenient object, though, should the carcase on which the larvæ have preyed be resting on the ground, they would descend there.

Our microscopists, to illustrate the anatomy of this species, usually prepare a series of ten or a dozen slides, and the most interesting of these is one showing the proboscis and lancets. This proboscis is retractile, and composed of two parts, its opening having two thick lips, and in these are a number of channels. As the fly is seen to bring these lips into close contact with any matter which it wishes to draw into the proboscis, while at the same time the pliant part is moved in a variety of ways, there is no doubt it is by the principle of suction that the food is taken up. It is a frequent supposition that "flies bite" in warm weather, when they settle upon the human skin, the fact being, I suppose, that the exhaustion of the air by the application of the proboscis of the insect occasions an irritation for the moment, though it is possible Bluebottles may actually make at times an incision, for there is enclosed in a case a lancet which is used to pierce the skin of fruits, &c.

The practical man will ask, "How can these insects be destroyed, and their injurious attacks prevented?" This is not easily answered. Bluebottles are not to be frightened off, they spurn the enticements of "fly papers," and though they may be beguiled by some sweet and odoriferous compounds, and thus drowned or poisoned, it is doubtful whether we do not draw an additional number which would not otherwise visit us, almost equivalent to those we kill. The removal or the deep interment of any animal substances to which these flies would be likely to resort is an important particular often overlooked. In one or two summers, when engaged in "sugaring for moths," by applying a syrup to the trunks of trees in my garden, I had the satisfaction of feeling that though my captures were not extensive, I was doing indirectly an act of kindness to my neighbours. Throughout the day hosts of flies resorted to the sugared trees, to feast upon what the moths had left, and other gardens must have been thereby benefited. It is noticeable that the ordinary garden spiders very rarely succeed in capturing these boisterous insects, which soon disentangle themselves from their meshes.

One of the earliest moths which we see about, not on the wing, but more generally at rest, or slowly crawling up a tree, is the Brindled Beauty (Biston hirtarius), and putting in an appearance as they do, about our London parks and squares, just as the Cuckoo reaches our shores, we might style it a "harbinger of spring." Just now, however, we shall detect it without much difficulty in the larval stage. The species is a singular one altogether, for though the caterpillar is a decided "looper" (or ground-measurer), and belongs, therefore, to the Geometrine family, there is much in the structure of this moth and a few others allied to it, which seems to connect them with the family of the Bombyces, of which the Silkworm Moth (B. Mori) is a well-known example. The imago of the Brindled Beauty usually emerges from the pupa or chrysalis state between the hours of 10 and 12 A.M., and in the afternoon on mild April days some dozens may be taken off the trunk of a single tree, and the female individuals are then probably busily engaged in depositing clusters of their green eggs, which are small in proportion, in the clefts of the bark. So strongly is this habit implanted in them, that they can hardly be induced to part with them otherwise. To reduce the number of the caterpillars by anticipation, there can be no better way than to knock the moths off the trees. It is rather a mystery how the young caterpillars, hatched as they often are, at a time when cutting winds prevail, manage to climb from the bark to the twigs; but at least a good proportion survive the perils of early caterpillar life, judging from the abundance of the species where it occurs, though in some parts of England it is unknown. The small sooty-coloured caterpillar at first gives little indication of the size it is to attain, and the appearance it is to present, and frequently it grows but slowly until the July warmth hastens it on. The arrangement of colours is curious; the ground colour of two shades of brown is broken into regular portions by black lines, there is a yellow ring behind the head, and yellow spots on the back and sides. By the paved roadsides these caterpillars are often found feeding on the Lime and Elm, and the stones beneath are very observably discoloured for some distance by the copious excretions of the individuals resting on the overhanging boughs. In gardens and orchards they resort to the Plum and Pear, and the latter especially is defoliated by them in some seasons. The pupa may be destroyed in autumn or winter by digging round the trees, as they are easily detected.

Biston hirtarius.

Going into an outhouse or greenhouse at early morning the

observant gardener is likely to notice several moths which, after their night's performances, are about to settle themselves down for their sunlight repose. Should he attempt to start them he will probably be astonished at the curious gyrations of the species known as the Mouse (Amphipyra Tragopogonis), should that be amongst them, as might be expected in August. From its peculiar shuffling movements it has received its English name. This is occasionally a garden species, and though the caterpillars have been found on various low plants, they have a great liking for Larkspurs. There is only one brood in the year, the eggs laid in the summer hatching, as I suspect, in the autumn, and the caterpillars hybernating. At any rate they are to be found feeding in May, being full-fed in that month. There is nothing very particular in the appearance of the caterpillar, the colour being a dull green, sometimes a little lighter, and marked with white and black.—J. R. S. C.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 22.

DRAWING PLANS.

To draw *fig.* 46. Draw line 1 7 and divide it into six equal parts, as 2, 3, 4, 5, 6, 7; the points thus found being the centres from which to describe circles and arcs to be defined hereafter. Produce the line until it reach the points c c. Draw lines *a a*, *e e*, *b b*, and *d d* as shown. On line c c, from centre 1, with radius 1 8, draw arc 8, meeting lines *a a* and *e e*; also from the same point draw arc 9, meeting lines *b b* and *d d*. From the same point draw arc 10 and circle 11. In drawing arcs 9 and 10, and all corresponding arcs, it will be found to be better to draw the circles complete with the pencil, as shown by the thick and dotted lines. When repeating the work in ink it will be easily seen where the curves meet the straight lines drawn from the outside of circles 1, 2, &c., and the line parallel with it, as shown in points *p r*. From centre 2 draw arcs *f f* and *g g*, also circle 12. From points *p r*, on the right side, draw straight lines to circle 11, and on the other side to circle 12. In drawing straight lines of this description between two circles, the lines must be drawn so as to touch the extreme edges of the circles, otherwise they will cause an abrupt angle, and so spoil the effect of the drawing. From centres 3, 4, 5, 6, 7 draw circles and arcs corresponding to those drawn from points 1 and 2, also straight lines as described.

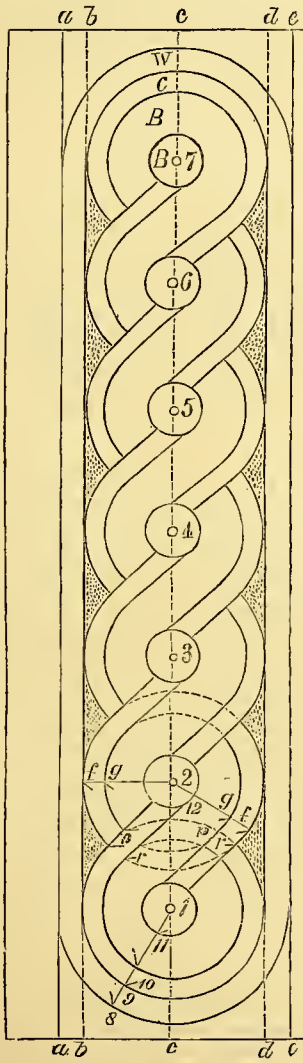

Fig. 46.
Scale 16 feet to the inch.

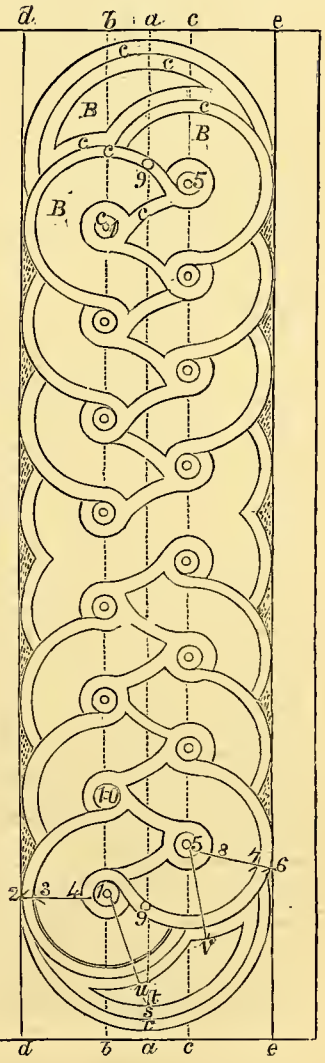

Fig. 47.
Scale 16 feet to the inch.

To transfer *fig.* 46 to the ground. Lay a line from centre 1 to centre 7, the distance between being 63 feet, and insert pegs. Divide the line into six equal parts, as 2, 3, 4, 5, 6, 7; insert a peg at each point. On each side of the centre line measure 9 feet 9 inches, and lay lines as in *a a* and *e e*; measure 7 feet 9 inches, and lay lines as shown in *b b* and *d d*. From the peg at point 1, with a string 9 feet 9 inches long, trace arc 8, meeting lines *a* and *e*; reduce the string 2 feet, and trace arc 9, meeting lines *b* and *d*; again reduce the string 18 inches, and trace arc 10. From the same peg, with a string 2 feet 2 inches long, trace circle 11. In tracing arcs 9 and 10 it is better to trace the circle as shown by the thick and dotted lines. From the peg at centre 2, with a string 7 feet 9 inches long, trace arcs *f*, *f*, meeting arc 9, as where the lines are cut in *p r*; reduce the string 18 inches and trace arcs *g*, *g*. From the same peg, with a string 2 feet 2 inches long, trace circle 12. From the point where arc 10 is cut in *r* lay a line to the extreme edge of circle 12, and lay a line parallel with it at a distance of 18 inches between, as shown, connecting arc 9 and circle 12. From where arcs *f* and *g* are cut lay a line to circle 11 in the same manner, and repeat the process from each point until the design is traced. W are walks. C indicates coloured materials or bulbs, and B beds.

To draw *fig.* 47. Draw centre line *a a*. On each side of line *a a* draw lines *b b* and *c c* at an equal distance, as shown; also draw lines *e e* and *d d*. Divide the lines *b b* and *c c* into seven equal parts, thus—divide line *b b* into seven equal parts, the first division being shown in 1 10; with radius 1 10, from points 1 and 10, describe arcs intersecting, as at point 5; with the same radius from point 5 set off seven equal parts on line *c c*. All the points thus found will form equilateral triangles with each other. From centre 1, on line *b b*, with radius 1 2, describe arc 2, touching line *d d*; from the same point describe arcs 3 and 4, also circle 1. From centre 5 describe arcs 6, 7, 8, and circle 5. Describe the remaining arcs and circles from their respective centres in the same manner. From centre 9, on line *a a*, describe arcs *r*, *s*, and *t*. From centre 1, with radius 1 *u*, draw arc *u*. From centre 5, with radius 5 *v*, draw arc *v*.

From corresponding points 1, 5, 9 describe corresponding arcs, and the design is complete.

To transfer *fig.* 47 to the ground. Lay a line connecting points 9, 9, the distance between being 63 feet; measure 10 feet 3 inches on each side, and lay lines *d d* and *e e* parallel to 9 9, and insert a peg at each point. Again on each side of line 9 9 measure 3 feet 6 inches, and lay lines *b b* and c c. With a line 4 feet in length describe an arc from centre 9; the point where the arc cuts line *b b* is centre 1. From centre 1, on line *b b*, set off 56 feet, and divide it into seven equal parts, as shown in points 1, 10; insert a peg at each point. With a line 8 feet in length (being one-seventh of 56 feet), from centres 1, 10, describe arcs intersecting on line *c c*, as at point 5. From point 5 set off 56 feet on line *c c*, and divide it into seven equal parts in the same manner as line *b b*, and insert pegs. From centre 1, on line *b b*, with a string 7 feet long, trace arc 2, touching line *d d*; reduce the string 1 foot and trace arc 3. With a string 2 feet long trace arc 4; reduce the string 1 foot and trace circle 1. From the peg at centre 5, with the same length of string, trace arcs 6, 7, 8, and circle 5. Trace similar arcs and circles from centre 10 and all corresponding points. From the peg at centre 9, on line *a a*, with a string 10 feet 3 inches long, trace arc *r*, meeting lines *d d* and *c c*; reduce the string 1 foot and trace arc *s*; again reduce the string 1 foot and trace arc *t*. From centre 1, on line *b b*, with a string 8 feet long, trace arc *u*. From centre 5, with a string 8 feet long, trace arc *v*, meeting arcs *u* and *t*. From corresponding centres 1, 5, 9 trace similar arcs, and the design is complete. c indicates coloured materials; B, beds.—M. O'Donnell, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

WORK FOR THE WEEK.

KITCHEN GARDEN.

Unless we get a good supply of moisture from the clouds, watering and surface-stirring must be followed-up amongst *Broccoli* and *Cauliflowers* for autumn use, otherwise they will be forced into premature flower. Some time ago I saw a piece of Cape Broccoli which had a thorough soaking of water all over the ground early in the morning, and about the middle of the day the soil was all forked-up to the depth of 6 or 8 inches. They had completely covered the ground with foliage, thus preventing rapid evaporation, and were likely to be very productive, whilst others of the same sowing and planting, but not so well treated, were buttoning fast. Wherever, therefore, there are available means at command, these operations are imperative. Let there be no delay in getting in the main sowing of *Cauliflowers, Red Cabbage*, and Bath Cos *Lettuce* to stand through the winter. General experience proves that after the 24th success is precarious. If *Celery* has been well supplied with stimulants, which are very necessary during the present season, some of the early crops will now be sufficiently advanced for earthing-up. This should be performed on a dry day. Remove all suckers and useless leaves, and tie each plant separately with a piece of matting to prevent the earth from getting into the hearts of the plants. The earthing-up may then be proceeded with in the usual way, taking care to loosen the earth well about the roots. If they have a thorough good soaking of liquid manure the day previous, it will be of great advantage. These remarks will, of course, apply to each crop as it becomes ready for earthing-up; but in the case of early and main crops they should be left until within three weeks of the time they are required for use. *Dwarf Kidney Beans* and *Scarlet Runners* should now be kept well gathered, as if allowed to perfect seed most of the later blossoms will prove abortive. Keep the main crop of *Onions* well turned about to have them as soon as possible in a condition for storing.

FRUIT GARDEN.

Apples and Pears require constant attention now; gather the various sorts as they ripen, and let the operation be performed with as much gentleness as if they were eggs, for wherever an Apple or Pear is bruised it lays the foundation of premature decay. Peaches and Nectarines must be looked over every day and gathered as they ripen, as a fall, even when nets are suspended to receive them, is fatal to their flavour and appearance, if they have to be kept a day.

FLOWER GARDEN.

If beauty in summer be a desideratum in this department, great activity should now prevail, and all possible speed be employed in propagating a sufficient quantity of Verbenas, Petunias, Salvias, Scarlet Geraniums, and other bedding-out plants, as the summer beauty of the flower garden next season depends entirely, or in a great measure at least, upon the supply of plants prepared at this time. I will not attempt to propound a system to be followed in their propagation; this has been frequently brought before the readers of the Journal. Use every available means to raise a sufficient stock to preserve during the winter. When there is comparatively small space for wintering these plants, I would recommend boxes and square pans for the purpose. It would be desirable to dip those cuttings of plants liable to be affected with aphis, overhead in tobacco water before planting them out into the boxes, this will save much trouble and anxiety afterwards. Mowing will not be so frequently required as heretofore, once in three weeks will be sufficient. Sweeping will now be in great requisition, as the "sere and yellow leaf" is beginning to fall from the trees and shrubs. The lawn and walks should be gone over every morning. The roller, too, should not be forgotten. Attend to the destruction of weeds, hoeing and hand-picking; tie-up climbers; dress the edges of beds by pegging, or tying if encircled with basketwork; pay the greatest attention to order and good keeping. Some of the earliest Carnation and Picotee layers will now be sufficiently rooted to take from the parent plant. It will be advisable to choose damp weather for the operation. They may be potted in pint pots, placing them in a frame for a few days, taking care only to water the soil, not over the foliage. Few hardy plants are more impatient of a damp and confined atmosphere than these. On removing the layers from the stool, or stock plant, if the sort is valuable or scarce, it will be advisable to cut the stumps back, they will often emit shoots and make very desirable plants to propagate or save seed from during the ensuing summer. Tulips and Ranunculuses need no remark at present, except that the beds for next year's planting should be turned and sweetened at least once a-month. Pansies and Pinks planted out for next year's blooming will require considerable attention during the hot weather. Watering, shading, weeding, &c., must be carefully followed up. Give Dahlias liquid manure, mulching the soil with decayed Melon-bed manure. Do not relax in using every means to entrap earwigs.

GREENHOUSE AND CONSERVATORY.

Any inmates of these structures which have not been placed out of doors, will still be much benefited by being out, even for two or three weeks, more especially all those which appear long-jointed or somewhat pale. When plants assume this character it is plain they have been ill-treated. We do not find them thus in a state of nature when growing under proper circumstances. If drenching rains occur, any tender plants which are likely to suffer damage should be taken in-doors again. There is no occasion to house the whole stock at once. Plants impatient of moisture should not be kept out too long; the nights are getting long, the solar heat will soon become much diminished, and, of course, evaporation will become slower. These houses should now be gay with Fuchsias, Hydrangeas of various tints of colour, the best varieties of Scarlet and Variegated Geraniums, Balsams, Cockscombs, and Amaranths. Keep them removed, and have a quantity of late-autumn and winter-flowering plants duly shifted on.

STOVE.

Shift in due season a good stock of the beautiful winter-flowering Gesnera zebrina, no soil seems to suit better in inducing a luxuriant healthy growth than light fibrous loam, heath soil, and rough sweet leaf mould in about equal proportions, with a portion of charcoal both as drainage and mixed with the soil, adding to it a small quantity of sharp sand. The plants should be potted rather lightly, that is to say, the soil should not be rammed together too firmly to prevent a free circulation of air and water. Then, if the plant be placed for a time on a gentle sweet bottom heat, shaded from the sun when it is clear and powerful, and syringed pretty freely with clean, tepid, soft water, and the application of clear liquid manure is occasionally made to the roots when well established, it is astonishing what beautiful and rapid growth they will make. Euphorbia jacquiniæflora, too, should now meet with every encouragement, as it is also one of our best and gayest winter-flowering plants, and is particularly useful for furnishing bouquets, plants for the stove and conservatory, or the most sheltered parts of the mixed greenhouse. Pay every attention to such superior stove plants as Allamandas, Dipladenias, Stephanotis, Echites, Luculias, &c.

COLD PITS.

Young stock intended to flower next season should be exposed

to the midday sun in order to ripen the wood, taking care not to do this so rashly as to injure the foliage. This, however, will only be proper in the case of such plants as have already made plenty of young wood, but it is advisable after this season to be anticipating the approach of winter, and to use every possible means to forward the growth of valuable hardwooded plants in order to get it somewhat firm and able to resist damp, &c., as soon as possible, and this is especially necessary when the plants have to be wintered in these structures.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

Sowing Seeds out of Doors in Dry Soil and Dry Weather in Summer.—At page 127, seventh line from bottom of second column, for "level" read water. Surface watering after sowing in all such cases is often worse than useless. We prefer, on the contrary, that the ground should be moistened for the seeds, so as to encourage them to germinate freely, and then the covering should be of dry earth to keep the moisture in whilst the dry weather lasts: hence, if we sow in drills we prefer soaking the drills before sowing, especially if we lead the seeds, pat these gently into the moist soil with the head of a rake, &c., and then cover with the dry soil. When we sow broadcast, as we are sometimes compelled to do from want of room, we prepare the ground as in the page alluded to, then give the whole a good watering, allow it to stand a little so that the surface may become friable; then scatter the seeds equally, gently pat them in with the back of a clean spade, and cover with dry soil to the depth, for such subjects as Cabbages, of one-fourth of an inch, most probably part of that depth being charred refuse. We are thus minute, because, by adopting this simple plan, hardly a seed fails in dry weather, and the young plants come up with a sturdiness which they rarely show when surface waterings have to be resorted to whilst the plants are very young. It will be found best in every way to secure moisture beneath them at first, and then the dry surface will be rather an advantage.

Even after this moist season, in sowing seeds after early Potatoes, &c., we found the ground very dry, and, therefore, the above precautions were all the more necessary. It reminded us how dry the ground must be in tropical latitudes, where little or no rain falls in the dry season; for less than a week of a high temperature turned our rather moist ground into something like baked earth, and but for the moving of the surface with the hoe, there would have been cracking and fissures in all directions, which in gardening ought, if possible, to be avoided, as besides the dry air thus entering freely, there is a great risk of roots being snapped and broken in the strain made by these open fissures.

In sowing seeds as above stated, the young seedlings generally grow at once, and you thus secure a more level crop of seedlings than by any surface watering. "But," said a friend the other day, "what about the rains wetting the surface of the seed-beds? Is not that much the same thing as watering on the surface?" No, we think it quite different, unless the conditions which attend the rain are always borne in mind, and such watering is always given in coolness and shade. We had a nice refreshing rain on the morning of the 17th, but there was no scorching air, no bright sunshine, and the effect, therefore, was very different from haphazard artificial surface watering. We would only here bring the same principle into operation, that we have recommended for years in the case of small valuable seeds sown in pots. It is best to prepare the pots, water well, and let the soil become rather dry on the surface before sowing, and then sow and shade a little until the seedlings appear. The shanking-off and damping-off of the young seedlings will to a great extent be prevented, as overhead watering is avoided. Many seedlings never appear, many go off at the surface of the ground because such simple precautions are neglected, and seedsmen are blamed when the blame should rest with ourselves.

Weeds.—The warm weather after the rains has brought up myriads of weeds, and the pulling-up of weeds is always, if it can be avoided, a great waste of time and labour. In nothing is the proverb more fully realised—"a stitch in time saves nine." A scuffle with a Dutch hoe when the weeds are 2 or 3 inches in height, will take little time, will leave a loose surface to prevent cracking, and the sun will soon shrivel the weeds out of sight, without giving any trouble in removing them.

To prevent the ground cracking we moved the surface among Broccoli, Greens, &c., where they were not too strong for us to get near them; though for Broccoli, besides this mere surface-stirring for young plants, we think the plants thrive better and stand the winter better when the ground about the roots is firm and solid instead of loose. A friend of ours generally plants with a crowbar in hard ground after Peas, and though his plants succumbed to a great extent to the frost of last winter, he generally has fine compact heads of Broccoli, and large sturdy plants in the spring.

Peas.—We have been clearing these off. A fortnight of tropical weather has brought in our Peas so fast that we fear our autumn supply will be less than usual. When mostly done with there is no beauty in looking at rows of withering Pea haulm, and yet frequently we let it stand longer than we ought to do for the shade which it affords. Thus, on the ridges between our Celery beds we have not removed the rows of Peas, which are of little use to us but for the shade they give from a bright afternoon sun. That little shade has saved us some waterings. There is nothing pleasing in the sight of the withering haulm; still we would rather keep it a little longer, as it is quite possible to overwater even Celery, and a little shade until the days shorten gives the plant one of its natural conditions of growth. We can recollect when young what a hurry-scurry there was in removing pea-haulm, weeds, &c., when the great Loudon was expected to take some gardens under his notice in a provincial tour. There can be no doubt that there is less care taken as respects neatness and high keeping in the autumn as compared with the early summer months, a fact too perceptible in most gardens; but still the great Loudon would not have looked upon such in a kitchen garden as a decided eyesore for which there was a seen and felt utility. With a continuance of such hot weather as we have lately had a flickering shade would be useful to the Celery beds. With little water to give ours last year we managed to obtain a good supply for the season, chiefly by shading.

We watered Cauliflowers, Lettuces, and late Peas, and mulched, using in some cases the short cuttings from the mowing machine.

Pickling Cucumbers and Vegetable Marrows have for some time been thriving well, but we have observed several leaves affected with red spider, and the last fortnight has been just the time to promote the activity of such an insect. We have syringed with clear soot and lime water, and most probably will follow with weak clear soft-soap water. Even these Gherkin Cucumbers when 4 inches long and young, are very sweet to those who like Cucumbers. Our first spring Cucumbers planted in a small bed in pots, and treated much in the same way as described by Mr. Luckhurst, and which we have adopted for years, are still bearing as profusely as ever. We think it but right to say, however, that even that system did not help us with the disease when it visited us; in fact, nothing helped or palliated, so as to enable us to have a moderate supply, except frequent sowing and planting. Hardy and tender kinds, in-doors and out of doors, in all conceivable soils and circumstances, in hot-water pits, in dung beds, on ridges, under hand-lights, in the open air, against walls and fences fully exposed—it was all the same, the disease would manifest itself after a few fruit were obtained, and the plants did little good afterwards. It never showed with us on Melons or Vegetable Marrows, but with pickling Cucumbers raised and transplanted, or sown at once in the open ground, it was all the same, and it is to us, though long free from it, as great a mystery as ever.

Let us add, that we wish to see the Vegetable Marrow generally grown by cottagers. It would thrive extremely well in any sunny spot, and especially in soil on a raised dung bed slowly decomposing. It will also succeed admirably against a paling or fence, and it will do so likewise in the open garden, and yield all the more quickly if a few barrowloads of hot dung, grass, and weeds, are placed in a hole, and then the earth returned in a sort of mound above it. The Vegetable Marrow is not so good for pies when ripe as some of the larger Gourds grown for this purpose by cottagers; but then used when young—say averaging 6 inches in length, it would yield a great amount of rich delicious food. Even in this state high and low spoil it in the cooking, by slicing and cutting before boiling. It is best to cut it with a good long stalk, and to boil it whole—when the points of a fork go into it easily, it is done; then cut the fruit in two lengthwise, remove the pulp, use pepper and salt, and if obtainable just a little butter, or better still meat gravy, and you have a dish that even a king might envy.

FRUIT DEPARTMENT.

The general work has been much the same as detailed in previous weeks' notices, finishing summer pruning, syringing

Plums and Apricots. The latter are not ripening so kindly as we would wish, but there is a heavy crop though the wood suffered considerably by the frost. We notice that the *ants* are beginning with them before they are so thoroughly ripe as to make first-rate jam. For bottling, &c., and keeping whole or in halves, it is well not to have them over-ripe. We wish we had a little guano from which to form a clear liquid, but in want of it we shall most likely very soon syringe or engine our Apricot trees heavily with clear soot water, beginning at the top and working down, and as soon as practicable repeat the dose, coming over the trees a second time. This will bring the most of the ants to the ground for safety, for next to guano they detest clear soot water, which can hardly be cleared without a little quicklime, and that, too, is such an abomination to the ants that we have made their colonies disperse by strewing quicklime in their runs. After the syringing to bring the ants down, it is well to run a brush with tar and oil along the bottom of the wall to prevent the ant going up again, for after once tasting the sunny side of a ripening Apricot, he will be anxious to get back again.

Orchard-house trees in pots have wanted a good deal of watering, and mulching has helped them and saved watering. The Grapes in the orchard house are doing tolerably well, but Peaches and everything else are later than usual, owing to the want of sun in the early part of the season, and we are doubtful if the later Grapes will ripen so well, though we shut up the house with sunshine when we can. It will be quite as serviceable to us if Peaches, &c., come in later. Out of doors, as previously stated, our Peach trees have suffered from frost; but for the wood giving way we should have had plenty of fruit notwithstanding, as the wood that stood is very fairly supplied.

Strawberries out of doors have been rather a short crop this season, and what was worse, the time of gathering was short. The heat of 85° and upwards in the shade seemed to dry and shrivel them up. Even the second crop from forced plants was considerably injured from the great heat, and declined to swell freely, when it could hardly have been suffering from dryness. But for having so many months of forced Strawberries that never did better with us on the whole, the glut of the Strawberry season would have been a short one. As opportunity offers we are clearing from runners and extra growth the beds and rows done bearing; then we run a hoe or merely the points of a fork along, just to loosen the surface soil, and we shall next mulch between with old hotbed and other dung. We have rarely been able to use horse droppings, but we should prefer that to all other manures for the strength and maturation to the buds for next year. The mulching, if raised a little in the middle of the interval between the rows, helps to protect the buds from drying frosty winds, and keeps the roots secure from the action of frost and dryness. Whatever care is bestowed now, even in watering in excessively dry weather, will be well repaid in general by the abundance of the crop next season. We do not recollect ever having the incipient bloom injured before the buds swelled, as no doubt was the case in the rapid changes of last winter.

We proceeded with potting Strawberry plants for forcing. The essential to success is drainage, not so much of it, as done well, with the convex or rounded side of the crock over the hole, which, with small crocks over it, will allow water to pass freely and yet not permit of worms passing in and upwards. A little sprinkling of bones in small pieces over the drainage is very good, and just a pinch of clean fresh moss over that, and a dusting of soot as much as can be raised between the thumb and finger for a pot. We use a little sweet rotten dung along with the soil, but not much, depending more for strength on clear weak manure waterings, as soon as the roots begin to meet the sides of the pot. Then much of the success will depend on fixing the bud but little lower than the rim of the pot, potting firmly, and placing the pot on a hard bottom as much exposed to the sun as possible.

ORNAMENTAL DEPARTMENT.

Before the rains of the 17th inst., with the help even of mulching, something like a score of our Calceolarias gave way to the dryness, but, on the whole, they have done very well. Coleuses in beds have also done well in rows. Owing to the long continuance of cold weather they have scarcely grown high enough for their neighbours, whilst in such a warm season as the last they would have needed stopping. For many purposes Iresine Lindeni will make a good substitute, as it is a close grower, of good habit and colour, bears pinching well, and is much hardier than the Coleus.

Scarlet Geraniums have been in their beauty after the hot weather, but the rains reminded us that they needed picking over, as a few spent blooms easily disfigure the rest when beaten by wind and rains.

We should hope that the *lawns* will now keep of a rich green for the season. We had heavy work in turfing and returfing in the spring, but the labour has been well repaid. The returfing consisted in taking-up an old lawn, levelling, and putting the same turf down again. When lawns have been made twenty or more years, and soil was added to make-up inequalities, heights and hollows will begin to show themselves, which are not so pleasant to the eye, the feet, the machine, or the scythe, as a uniform sweep or level. Much may be done in correcting these inequalities by relaying such bits by themselves; but we find it is best in every way to take off the turf entirely in autumn, winter, or early in spring, bring all such inequalities to a general level, and then replace the turf. Even then much will depend on taking-up the turf of a uniform thickness. This relaying helps to get rid of many rough weeds. Except in the case of turfing over large flower beds, where the grass has grown very strong, the relaid lawn does not retain any trace of the turfing, while the ease of managing it has almost made up for the trouble and labour.

We must make a commencement in propagating, but we are loath to meddle with the beds. We went on potting, tying, and hardening-off, as detailed in previous weeks' notices.—R. F.

TRADE CATALOGUES RECEIVED.

Kelway & Son, Langport, Somerset.—*Catalogue of Gladioli.*

J. Veitch & Sons, Royal Exotic Nursery, King's Road, Chelsea, S.W.—*Catalogue of Hyacinths and other Bulbous Roots.*

W. Catbush & Son, Highgate, London, N.—*Bulb Catalogue for* 1871.

Henry Curtis & Co., Devon Nursery, Torquay.—*Descriptive Catalogue of Selected Roses, &c.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (*A Novice*).—The "Cottage Gardeners' Dictionary," Thompson's "Gardener's Assistant," and Johnson's "Science and Practice of Gardening," will be a library for you.

THE FRUIT MANUAL (*J. E. B.*).—The new edition is not yet printed. We certainly would not rub a child with paraffin oil to keep from it "the harvest bug." We would try an infusion of Elder leaves.

MR. UNDERHILL (*F. L., Preston*).—His address is Sir Harry Road, Edgbaston, Birmingham.

PRIZE FOR THE BEST GERANIUM (*A. C.*).—The members of a committee cannot agree whether a Pelargonium should be allowed to be shown in this class or not. In our opinion, yes. If restricted to the botanist's genus Geranium, there would probably be no specimen admissible. In future we should recommend two classes. Accept the popular name "Geranium," and have a prize for Scarlet Geraniums and another for Geraniums of any other kind.

RIBBON BORDERS (*A. Y. Z.*).—In our "Garden Plans" you will find numerous plans for ribbon borders and how to plant them. You can have the volume if you enclose 5*s.* 2*d.* with your address.

KITCHEN GARDEN VEGETABLES FOR EXHIBITION (*A Constant Reader*).—Beet, Tomatoes, Celery, and Shallots are kitchen garden vegetables. To your query, "which are the best vegetables to exhibit?" we can only reply, those of which you have the finest specimens.

FANCY PANSIES (*C. Stuart*).—They are of an excellent strain, and many of them exceedingly pretty.

POPPIES AS A PROFITABLE CROP (*S. M.*).—We have made some inquiry amongst our correspondents, but cannot gain much information on the subject, but we believe that the bulk of the dried Poppies which chemists and others use are of foreign growth. We understand that although as fine-looking heads can be grown in this country as on the Continent, yet they lack the necessary properties which give the latter value, or rather the foreign-grown ones are of greater strength. In the absence of more correct information we are unwilling to advise their being sown; but if you are determined on a trial, and have a piece of fine sandy land ready for the purpose, we would say, Drop a few seeds on the surface of the ground, say half a dozen, in patches 18 inches apart, in rows the same distance from each other. Thin out the seedlings, and

treat them the same as other crops. The seed is probably cheap enough; certainly few plants furnish it in greater abundance; but we are strangers to the mode of harvesting the heads, and still more so to securing a market for them afterwards.

Various (*Horace Bell*).—1. The Campanula pyramidalis in 10-inch pots not flowering this year, would flower next season if afforded slight protection in severe weather, the pots being plunged to the rim in coal ashes; or you may plant them out in the borders. If you keep them in pots water well in dry weather, and next spring give 13-inch pots. 2. The specimen Geraniums for out-door decoration will need potting in March, at that time reducing the balls considerably, and returning them to the same or a smaller size of pot, and give their blooming-pots early in May. When the plants are housed in autumn you may turn them out of the pots, reduce the balls, and repot in a smaller size of pot so as to save room, and in that case you will not disroot in spring, but shift into larger pots in April, and at the close of May. 3 Maiden-hair Ferns are propagated by division of the roots or rhizomes, taken off with roots and fronds to each division, potting in small pots, or in a size proportionate to the size of the divisions. If the pots contain them comfortably they are large enough. March is the best time to divide the plants. 4. Pancratium illyricum bulbs just received may be at once planted out where they are to remain. It is necessary that the soil be freed of stagnant water, and be sandy loam enriched with cow dung and fibrous peat. The situation should be warm, and a slight protection given in severe weather.

Ivy for Covering a House (*C. H. M.*).—The quickest-growing is, we think, the Irish (Hedera canariensis), and that we should plant. We should procure good strong plants in pots, and we have had them with shoots 6 feet long, and otherwise well furnished. They may be planted at any time. The price varies with the size of the plants. For the size named we gave 30s. per dozen, for good well-rooted plants in pots 15s. per dozen, and for small but well-rooted 9s. to 12s. Plant at once. The plants will be well established for a good growth another season.

Privet for Hedge—Quick-growing Forest Tree (*Idem*).—The best Privet for a hedge is the Common Evergreen, but the Oval-leaved has much bolder foliage, and is equally good for hedges as for shrubberies. For an exposed situation no evergreen forest tree equals the Austrian Pine. If you want a deciduous tree, Sycamore will suit.

Transplanting Gooseberries and Currants (*Idem*).—You may safely transplant the bushes, four and five years old, in autumn, as soon as the leaves have fallen. If this be done carefully, as many fibres as possible being preserved, they will be more profitable than small young trees.

Pruning Wall Apple and Pear Trees (*J. Hamilton*).—You should now, if not already done, stop all the shoots of this year to within five or six leaves of their base, excepting always those at the extremities of the branches, which, being required for extension, should be left entire, and trained-in at their full length. If you have already stopped the shoots, do so again at the beginning of next month, stopping the shoots to two or at most three leaves above their origin. The final pruning should not be performed until the leaves have fallen, and the earlier after that the better.

Seedlings in Frame Eaten (*Idem*).—The seedling plants in a bed heated by dung are no doubt eaten off by woodlice. The remedy is to place a little dry hay all round against the inside of the frame, and to pour boiling water down by the sides of the frame every morning for a few days, wetting the hay thoroughly, and replacing it with fresh daily. The water will, of course, destroy any plants or roots it comes in contact with, therefore keep it from those, removing the pots from the sides of the frame. A barrel inverted over an Hydrangea in winter would be a sufficient protection, mulching round the plant with partially-decayed leaves or litter. Use the inverted barrel only in severe weather, removing it when mild. It will not answer to thus cover the other plants you name except in very severe weather. There is no work treating on what you name, nor, indeed, is one necessary, as flowers and vegetables are not differently grown for competition than for decoration and table. Superior examples are only aimed at, each only having a chance of a prize.

Leaves of Greenhouse Plants Turning Yellow (*A Subscriber*).—Had you sent us a specimen we could probably have given you a fuller reply. Without specimens or any particulars we can only conclude that the plants have not had proper supplies of water, or are infested with thrips or red spider.

Petunias Going Off (*Rather Puzzling*).—The plants being grown on a shelf in the Cucumber house is quite sufficient to account for their going off. They are living too fast, and their vital forces are exhausted. The supplies of water would need to be so copious as to cause them to go off at the collar or neck, and that we apprehend has destroyed them. They will not recover. Petunias do not require more than a greenhouse affording safety from frost, and in summer cannot have too light and airy a position in a cool house; indeed, they are better grown in summer in cold pits or frames, drawing off the lights, affording, however, protection from heavy rains, but then affording abundance of air.

Watcombe Terra-Cotta Company (*A Subscriber*).—There is a stand of specimens in the Arcade, next the Exhibition road, of the Royal Horticultural Society's Garden at South Kensington.

Preserving Dahlia Tubers.—A correspondent, "R. P. B.," says that dry cocoa-nut fibre refuse is most effectual for this purpose; the tubers to be packed in it.

Grapes Cracking while Colouring (*Amateur*).—A similar question to yours was answered in the number for August 17th. You do not say what variety is in fault in your case. Rust or mildew on the berries will cause them to crack; we also found the Gros Guillaume, and Trentham Black, had this fault when a rather moist atmosphere with little heat was maintained, while a high temperature and rather dry atmosphere prevented it.

Heating Ground Vinery (*T. W.*).—There is a difficulty in advising you how to heat a ground vinery 13 feet long, 4 feet in width, 30 inches high at back, and 24 inches in front, just because the place is so low and so small. Were gas handy, a small gas stove, with a pipe to take off the burned gas, would be best, or you might have an inch pipe from the stove to go along the front of the little house. A very small iron stove, with a smoke pipe through the roof, and a flat top to the stove to hold water, would also be sufficient, but then you would want an opening to feed and attend to it. A small furnace outside, and a row of earthenware pipes for a flue, would be more expensive, but would answer well if not made too hot. There is nothing so cheap as a little stove inside, but then it involves care and trouble. If your floor had not already been paved with Staffordshire tiles, and your place had been wider, we would have advised at once a small furnace at the east end, and a small flue beneath the floor, say a tile at the bottom, one row of brick-on-edge on each side of it, 4½ to 5 inches apart, which make the flue, a thin tile over it, and then the tiles of the floor laid in mortar. Three 4-inch pipes 2 feet in length, at the further end, would do for a chimney. You would thus lose no room, and you would have a nice mellow heat, and avoid all dust, &c., among your plants. In very severe weather it would be safer to put a little protection in the shape of a mat, &c., over the glass than use much fire heat. The plan you propose of taking the Vines out will answer well enough, but if you do not raise your little house higher in winter with fire heat than from 40° to 45°, the Vines will be safer inside. The very smallness of the place makes the heating and keeping the plants in winter more troublesome, as such a little place is easily heated and quickly cooled. If you did not heat it at all you could keep Lettuces, Endive, &c., over the winter. On the whole, were the place our own, we would put such a little flue beneath the floor and along its middle. The plants that stood over the flue we would place in saucers, as they would dry more than the others.

Soot and Guano for Roses (*Idem*).—Mr. Curtis informs us that at the Devon Rosery it is found best to supply soot and guano to the roots of the Roses in a liquid form in the proportion of half a pound of guano to half a peck of soot, mixed in about eight gallons of water, and applied twice a-week early in spring, giving one quart to a tree, more or less, according to the size of the tree. The young shoots and foliage may also be watered with the mixture, syringing it off the day following with clear water.

Sugar Beet (*E. R. P.*).—We cannot detail the mode of manufacturing sugar from it.

Stephanotis Losing its Leaves (*H. W.*).—No doubt the plant has lost its leaves owing to the cold. A cool greenhouse is unsuitable. It is a stove plant, and must have a temperature of 50° in winter, or that which it will have in your greenhouse in summer in dull weather.

Perennials for Beds (*Sunny*).—There are very few perennials that would serve your purpose in a satisfactory manner. The majority are too tall, or, if dwarf, are not continuous-flowering. You will find a detailed list of herbaceous plants in vol. i., New Series, page 274. It gives names, height, colour, and the usual time of flowering. "Flower Garden Plans" would suit you. It may be had free by post from our office for 5s. 2*d*.

Ivy for Border (*Idem*).—The cuttings recently put in will strike this autumn, and may be taken up next March and planted where they are to remain, but they would be better left until autumn. For speedily covering the ground they should be planted about 1½ foot apart every way. Peg the shoots down so as to keep them from twisting about with the wind.

Table Decorations at the Crystal Palace.—In page 105, first column, twenty-first line of third paragraph, for "Stocks" read *sticks*.

Blighted Apple Tree (*Probo*).—It is a very severe attack of American blight. See what was directed on page 109 of our number published on the 10th inst., and page 129 of the succeeding number.

Ribbon Border of Verbenas (*L. R. Elm*).—We have tried them both mixed and of the same variety, and are inclined to think that Verbenas judiciously mixed produce the best effect. Small beds of one kind, and edged, produce a fine effect. *Scarlets:* Brillante de Vaisse, Defiance, Géant des Batailles, Mrs. Woodroffe, and Lord Raglan; *Whites*, Smith's Queen and Mrs. Holford; *Rosy Purple*, Victory; *Pink*, Magnificent; and *Purples*, André and Purple King—the latter is by far the best. If you buy our "Garden Plans" you will see designs of ribbon borders, how to plant them, and how to cultivate this flower. You can have the volume post free from our office if you enclose 5*s*. 2*d*. with your address.

Various (*An Amateur*).—The Roses on the Manetti stock and their own roots should not be removed until the beginning of November, but you may lift them in a fortnight, if you do so carefully, covering the roots from the sun and air. Shade for a few days from bright sun, and water so as to keep the soil moist. We do not consider it good practice to remove any but the old leaves from bedding Geraniums. It no doubt causes weakness of growth, and increases the amount of bloom, but the flowers must be small as compared to those that are supported by good foliage. Dr. Hogg Strawberry, like many others, has been unusually pale this season from the dull useless weather, and the excessive growth of foliage that has kept the light from the fruit. The planting in February would not cause the fruit to become white. Of the Geraniums you name we should prefer Charlie Casbon, on account of its dwarf free habit, but the others have fine trusses of bloom, and are good.

Glazing without Outside Putty (*T. M. U.*).—As you are already glazing your orchard house we can hardly tell you how you can dispense with outside putty now. The best mode is that of Beard, where the glass rests on non-conducting material, as soft pasteboard, the same covering it, and a coping is then fixed over to hold the glass tightly, room being left for the glass to expand laterally. With rebates cut in the usual way we do not think it would be well to do without outside putty. The best way for common purposes is to fix the squares of glass in grooves deep enough to allow of the expansion of the glass, and pack the squares on the underside firmly with putty, or list, or india-rubber—anything that will keep the glass firm. In painting outside, the brush may also just come over the edge of the glass.

Arrangements of a Glazed House (*A Young Gardener*).—You may concrete or asphalt the walking space of your little house, but your chief remedies against damp will be to use the flue a little more in dull weather, to give more air, and to water carefully, especially in winter, so as not to spill a drop on the ground nor to run over the rims of the pots. Your proposed frame or small pit in front will do very well. In a 12-feet length we would have at least four openings with slides a foot long, and say from 6 inches deep. With only one small flue along the front of the house we do not think you could do any good with Cucumbers in winter. To grow them at that season you would require a rather large flue and a strong heat. You might bring on Strawberries with a mild heat, and fruit them in April, at the end of March, or earlier if the heat were sufficient. For cut flowers in winter, once you had the plants, the best paying would be Camellias, Epacrises, and a few Azaleas. For plants of your

own raising you could have Mignonette, Pinks, Perpetual Carnations and Picotees, Chinese Primulas, and Violets, especially The Czar. A little over 45° in cold weather would bring these in. Some annuals, as Collinsia bicolor, also come in well. As you are a young gardener, and you purpose doing all this where you live at a distance from the garden in which you work during the day, we would advise you to be careful to have everything you do straightforward and aboveboard. We say nothing of the principle involved; but some people would think that a man who worked so industriously for himself would not be the most suitable for them, and then they are apt to think about temptations.

Glass for Vinery and Orchard House (*H. B.*).—For a substantial house such as you speak of, we would not have it less than from 12 to 14 feet in width, and, taken altogether, no plan would suit you better than Mr. Beard's, and the glass we would use for such fruit purposes would be 21-oz. sheet. If wood is determined on for the roof, then you may either glaze in the old way or place the glass in grooves. We could not enter on the subject without more particulars. The best mode of ventilating would be by small sashes at the top and sashes in front, moved all at once less or more by wheel and racket or other means. The best mode of heating the three divisions would be by hot water; and if you made the central division the warmest you could place the boiler against that, and then by means of valves take the heat to either end-house as wanted. The cost of such a building will greatly depend on the material and the finish given to it. We could not help you better than by referring you to our advertising columns, where the prices of different kinds of buildings are given almost every week, but then you must make up your mind and avoid extras afterwards.

Heating with Hot Water (*Delta*).—There is no chance of your heating the house, if the sketch given is correct. However, it is less on the difference of 10 feet in level between B and A, than the difference between the level of the top of the boiler and the point A, that the difficulty will rest. If by taking the supply-pipe at once to the bottom of the boiler, taking the return-pipe also near the bottom of the boiler, and either sinking the boiler or elevating the pipes to the point A, so as to have that a foot or two above the top of the boiler, then the circulation will be secured. Under present arrangements we think you are sure to fail.

Red Spider (*S. R.*).—Syringing, keeping the air moist, and dusting with flowers of sulphur are the best treatment you can adopt. The "Garden Manual" will suit you. You can have it free by post from our office if you enclose twenty postage stamps with your address.

Tree Borer (*J. Green*).—The caterpillar that attacks your Apple trees is that of the Wood-Leopard Moth, Zeuzera æsculi.

Name of Plant (*Under-Gardener*).—Pilea muscosa.

POULTRY, BEE, AND PIGEON CHRONICLE.

DE OMNIBUS REBUS.—No. 2.

"Doctor, I am not well." "What have you been eating?" "Sir," said a friend of ours, "there is no doubt mine are among the best-bred chickens in England, and they are well fed, but they do not get on. Will you kindly look at them?" We did so, and found a large number with their care-worn faces, narrow bodies, large protuberant crops, long weakly legs sadly in-kneed, and preferring squatting to walking. "Very unsatisfactory," we said. "Get rid of all the cocks at once. May do something with the pullets. What is their food?" "Cabbage, sometimes raw and sometimes boiled; potatoes, always boiled; bran, Indian meal, rice, and some sharps." "Bad feeding," we said. "Well," replied our friend, who has only lately taken to poultry, "you must admit these are things they would not get in a state of nature." "Granted," said we; "but in a state of nature they would get a hundred things they cannot get here." "Well, then, please tell me what your idea of artificial poultry-feeding is."

It is very hard, say we, to consider poultry living in a natural state where their haunts are expected to be tidy. Clean dirt must be allowed. It is unpardonable to let the dirt of the birds lie about; but that for which we plead is the disturbance by scratching of heaps which have been swept up. We cannot ask that our feathered friends should be allowed the run of the garden, but if they can be permitted access to a shrubbery, or to a garden, or stableyard, where there are waste and dung heaps, they not only find food there, but they do much good. Their's is a searching inquiry. While the dark mass is turned over and over the busy beaks are at work every instant, picking food, invisible so far as we are concerned, not so to them; larvæ, embryos, grubs—all are devoured. Let us illustrate this. We once saw sixty-one grubs taken from the crop of a hen Pheasant. That was one morning's meal. How many thousands of similar pests had she destroyed? She had paid for the stray grains of corn she had picked up during her short life. It is the same with the fowls. The grubs, &c., are sent to feed them, and they are sent to eat the grubs. All things are thus equally balanced.

It is said the cause of the slow increase of lions is that the young lionesses die in teething, and so few survive, the males fight to the death over them; disabled young lions are frequently met with in the neighbourhood of water. Fancy musing over a wounded lion, after the fashion of Jaques and the stag! We prefer it should remain fancy. We have long thought it would be a pleasing mission if we, in "our Journal," tried to reconcile poultrymen and gardeners. A friend of ours, a clergyman, had an idea that food exercised a great influence on the nature and habits of birds. Game cocks were his hobby, but they would fight. He would try bread and milk diet. Twenty smart young Black Reds disported themselves together in a small paddock overlooked by his dressing-room. They were fed on bread and milk. They had the thew and sinew, the bright eye, the fearless demeanour, and all the properties of the Game cock; but the matutinal crowing ended in no disagreement, and all went well. Our friend thought their nature was altered. Every morning he rushed to his dressing-room window and threw a few crumbs to his friends. In his eyes they really seemed polite to each other, no chasing and scrambling after the food, almost making way for each other. Long success emboldened him, and he boasted of his experiment and the result. One morning on looking, "as was his custom," not a bird was visible. He rushed to the bell, but before he pulled it he heard a hurried knock at his door, and "Oh! sir, do come down," from his man. "What is the matter?" "Oh! sir." "Well, do tell me; what is the matter?" "The cocks, sir." "That's enough; I'm coming." Many lay dead, one only was trying a staggering walk in the middle of the pen, the others essayed to stand by leaning against the wall, and by using the ends of their tails and wings as additional supports. But what had caused this sudden change? A pullet had by some means or other got in, and—

"Like another Helen, fired another Troy."

The bread-and-milk diet broke down.

Under certain circumstances poultry and gardens agree. At the time of year when there are no chickens, when the days are about six hours long, and when the shrubberies and gardens are about as growing as a dining table, they agree; but as soon as one has some chickens, and the other a show of green meat, disagreements begin. "They plaguy chickin does more harm in a day than all the blights, frostasis, and grubs would in a week;" so says the gardener. The poultryman—"He'll be blowed if the garden aint a nuisance. There's as much row over a lettis as if it was gold, and as for dammidge, why look at the cottagers. They grows twice as much, twice as good, don't spend arf the money, and lets the chickin run anywhere. They believes, and they're right, as they does good." There is no doubt that in their examination of the rubbish heaps they devour much that would become injurious when developed, and that in the early spring they turn over the leaves and detect mischievous things as they approach the surface, cheered by returning light and warmth. We are disposed to think that, like the hen Pheasant we have mentioned, they pay well for that which they eat. One point, however, cannot be doubted; access to such places is, if not necessary, most beneficial to the health of fowls. A fowl will starve to death on the best corn that can be given if it be given under conditions of perfect cleanliness—*i.e.*, in a carefully swept paved yard or in a room, and if it be always of the same kind. They require change. We can learn much in the management of our fowls by consulting our own nature. If Fortune had been so kind, or so unkind, to us as to provide us with more than ample means, a sumptuous table, a large attendance, rendering it unnecessary for us to do anything for ourselves, we should not care for exercise, we should have little real appetite, we should be drowsy, and at last the doctor would declare we had an inactive liver. We do not, of course, mean this other than in the case of those who, without any vicious propensities, have sluggish minds and like to make themselves comfortable. So where fowls are over-fed they get fat and lazy, they loathe the good plain food given to them every day, and the man says, "Those fowls are not right, they don't feed." Change is tried till the whole list is exhausted, and eventually they die of "fat liver." If Fortune ceased her favours to the man, or the poultryman ceased to feed the fowls, a cure would be the result in both cases. In the first case labour and short commons would improve the appetite and restore the liver. Abernethy's prescription for gouty and dyspeptic men was a good one: "Live on two shillings per day and earn them." When the fowls won't feed, cease feeding. For a day or two the fat favourites will still sulk and squat about, but after that time they will begin to ask where the food is, and as it does not come to them they will seek it. Natural appetite returns, the liver begins to act, and they run

eagerly after food they loathed a day or two before. When they have reached it they devour it, and after that digest it. Keep them for some time on short commons. Half the fat fowls die of petting; they are unnaturally fat, and become diseased thereby. "MIRANDA" says she has made up her mind to give up poultry because they cost so much and lay so little. The two complaints are intimately connected. If the fowls had been fed less they would have cost less and would have laid more. To feed moderately is to save food in every sense of the word. You sow less, and you reap more; you spend less money in food, and you get four times as many eggs.

To feed poultry profitably for their health, beauty, and productiveness, choose an open spot for the process. Having mixed ground oats and water to such consistence that a piece will break and scatter when it is thrown on the ground, call your birds together and throw the food broadcast; they will wander in search of it. This should form the meal morning and evening. You must judge the quantity by ceasing to feed as soon as they cease to run after it, and observe this rigorously. One more meal, a mid-day one, will be necessary. This may consist of whole corn; barley is the best. If you have household scraps you may give them, but observe these must be in lieu of, not in addition to, the ordinary meal. This will keep your fowls as fowls should be kept.

POULTRY YARDS IN SUMMER.

WE have summer at last, and it has made a revolution in the poultry-yard. Two days after the hot weather set in, one of my Brahma hens had lost nearly every feather, and I was reminded of Sydney Smith's wish, that he could take off his skin and sit in his bones. The fowls do next door to it, and now look like "porkypines." I look at and envy them, and with the thermometer at 80° to 90° in the shade, am tempted to wish almost that the primitive British costume, consisting of a thin wash of indigo in lieu of clothing, might be restored. Thus lightly and elegantly attired the heat might be even enjoyable. Meantime we are all martyrs to our ridiculous summer costume, and the old fowls have the best of it.

The chickens are less fortunate, *their* plumage is getting daily closer and more perfect, and they suffer much, lying about even in the shade with their beaks open as if panting for air. My purpose is to suggest again (for I have done it before) a few little matters which add much to their comfort and well-being. A poultry-fancier, however hot he may be, has no business to lie down and cool himself till he has done all he can for his fowls.

Take a pot or garden engine, and give all the pens a good drenching once a-day. If some of the water goes on the chickens all the better; great drought is never good for them, and leads to bad feathering. See that the fountains, whether empty or not, are refilled with cold water at least once daily. Those big things that hold a week's supply are bad even in winter; in summer they are almost death to the chickens, and many a case of so-called "cholera," had no other cause. See also that the fountains are either kept, or if that cannot be done, regularly moved, so as to be in the shade all day. And last, but not least, let the house doors stand wide open all day, and all night too. Fresh air is very life to the fowls in this weather, and the most delicate will not be injured by it.

In small pens like my own abundance of green food must more than ever be now provided. For a few pence I get children to bring me fresh grass daily, which is cut into green chaff, and not only thrown down, but mixed plentifully with the soft food in the morning. I know of no better plan where a grass run cannot be had, and it keeps the birds' appetites up wonderfully. A little sulphur in the food now and then is also very beneficial, say once a-week or so.

Now, too, is the time for the purification, which ought to take place at least once a-year in every poultry-yard. If some sulphate of iron be mixed in the limewash it will be far more effective in the destruction of vermin. Wash the nests out with the same if of wood, and throw away all the old straw and hay every three or four weeks at least. Carbolate of lime sprinkled twice a-week will keep the smallest houses beautifully sweet and wholesome.

Now also is a good time to get fresh loads of road dust, sand, or dry ashes to replenish the dusting sheds. At this time of year they will be clean and dry. If possible, before doing this, the old material should be finely screened, which will remove both stones and manure which may by degrees have collected, and will add greatly to the comfort of the fowls.

All these things may not be much, but they make all the difference between a sickly or healthy summer in the poultry yard.—L. WRIGHT.

POULTRY EXHIBITIONS FOR THE WORKING CLASSES.

I OFTEN read in your Journal the notices of flower shows for the working classes, and the thought has struck me that the exhibition of poultry under the same rules would do much to encourage the keeping of poultry by the working class. I think it would surprise some of the prize-breeders to know the difficulties which attend the breeding and rearing of chickens in the back yards of London. It is no very easy matter to rear a brood of chickens in February, with no other accommodation than a house 5 feet long by 2 feet 6 inches wide, and have a long journey after a root of grass or a handful of leaves. Of course I do not pretend to say that we could show many pure-bred birds, but I think some cross-bred birds which I have seen really do great credit to the breeders when we take into consideration the means they have at hand. I think if some of the gentlemen who arrange the shows will try and make room for poultry, they will do a great favour to many working men. I think a medal, or some similar prize, would be tried after by very many, and I would especially encourage early breeding by a prize for chickens.—H. I. O.

INSURING EXHIBITED BIRDS.

IT occurs to me that if the safety of birds could be insured at so much per pen, or by a per-centage on the reserved prices put upon them, few if any would lose the opportunity held out to them. Were some such system adopted I am convinced it would induce many to send contributions which are now withheld, simply because they can get no guarantee for their valuable stock; and further, it would be an incentive to committees to see responsible persons appointed to look after contributions, and the result would doubtless be a profit, as with ordinary care few mishaps may be anticipated. I shall be glad to see this matter ventilated by such as are interested, and venture to assert that so long as poultry shows continue without a guarantee of some kind to exhibitors, they will inevitably retrograde so far as quality is concerned.—A. V. MEERSCH.

PRIZES FOR BLACK EAST INDIAN DUCKS.

LAST year I solicited subscriptions to provide a cup for Black East Indian Ducks to be competed for at the Crystal Palace Show. I again ask the same favour, and to be allowed to say that any person disposed to subscribe towards one to be offered at the same Show this year will greatly oblige by communicating at once with the undersigned, or with the Secretaries of the Crystal Palace Show. Remembering the great success this class was last year, I trust that admirers of this breed will subscribe even more generally than they did on that occasion.—GEORGE SAUNDERS SAINSBURY, *Belle Vue House, Devizes.*

KEIGHLEY POULTRY SHOW.

UNFORTUNATELY the weather proved as unfavourable as it could possibly be; for the rain fell constantly during the preceding night, and while the Show was open heavy thunder showers occurred at intervals. This is to be regretted, as the town on the day of the Show is decorated with evergreens and banners, the morning ushered in by the joyous clanging of the church bells, and from midday most of the places of business are closed for an almost general holiday. The preparations made this year were not less complete than heretofore, and it was appointed that in the evening a brilliant illumination should take place on all the triumphal arches on the way to the Show field, which is three-quarters of a mile from the centre of Keighley. To give any description of the poultry exhibited, even approximately correct in its details, would be a task we could not enter upon, but the opinion expressed by the Judges was, that throughout the Show the classes contained specimens of high merit, and fully equalled those of any show previously held in this district.

COCHIN-CHINAS.—*Buff.*—1, H. Lacey, Hebden Bridge. 2 and 3, W. A. Taylor, Manchester. *Chickens.*—1 and 3, W. A. Taylor. 2, C. Sidgwick, Keighley. *c*, J. Sichel, Timperley. *Any other Colour.*—1, J. Sichel. 2, E. Leech, Rochdale. 3, W. A. Taylor. *Chickens.*—1 and 3, C. Sidgwick. 2, W. A. Taylor.

SPANISH.—*Black.*—1 and 3, C. W. Brierley, Middleton. 2, J. Powell, Bradford. *hc*, H. Beldon, Goitstock, Bingley. *Chickens.*—1, J. J. Booth, Silsden. 2, H. Beldon. 3, W. Wilkinson, Earby. *hc*, Clews & Adkins.

HAMBURGHS.—*Silver-pencilled.*—1 and 3, H. Pickles, jun., Earby. 2 and *c*, H. Beldon. *Chickens.*—1, H. Pickles, jun. 2, H. Beldon. 3, H. Smith, Morton Banks.

HAMBURGHS.—*Silver-spangled.*—1 and 3, H. Pickles, jun. 2, H. Beldon. *Chickens.*—1, T. Mitchell, Keighley. 2, C. Smith, Silsden. 3, H. Beldon.

Walker, Halifax.

DUCKS.—*Rouen.*—1, E. Leech. 2, J. Newton. 3, A. West, Burnley. *hc*, J. J. Booth. *Aylesbury.*—1, E. Leech. 2, W. Wilson, Farnhill. 3, W. Clayton, Sutton. *Any other Variety.*—1, C. W. Brierley (Whistling Ducks). 2 and 3, No competition.

GEESE.—1, E. Leech. 2 and 3, No competition.

SELLING CLASS.—*Cock.*—1, J. Berry, Silsden. 2, A. Bowker, Keighley. 3, J. J. Booth. *hc*, J. Bowker; H. Wilkinson, Earby. *Hens.*—1, J. J. Booth 2, J. Newton. 3, G. Greaves, Poole, Otley. *hc*, J. Bowker; J. Powell, Bradford; H. Wilkinson.

Mr. E. Hewitt, of Birmingham, and Mr. R. Teebay, of Preston, judged the poultry; and Mr. Esquilant, of London, the Rabbits and Pigeons.

MALVERN POULTRY SHOW.

WHEN it is borne in mind how many shows are being held simultaneously, it ceases to be a matter of surprise that the entries at all are proportionably limited, and no doubt exists that but for this circumstance the entries at the Malvern Show would have fully equalled those of any of the eleven shows that have taken place previously. It is a matter for congratulation, however, that the quality of the birds entered, as a whole, showed no deterioration; and we may also speak favourably of the general arrangements of the poultry tent.

Game fowls stood first on the prize schedule; and here Mr. S. Matthew and the Rev. G. S. Cruwys pretty well divided the honours between them, Messrs. Moore, Mitchell, and Griffiths being the only other prize-winners. A really good-conditioned Duckwing pullet in this class, at first sight a remarkably clear hard-feathered bird, was thrown out entirely for being duckfooted—a fatal objection, and one that mostly proves itself hereditary. Three good pens of *Spanish* competed, the hens being decidedly better than the cocks of this variety. Of *Dorkings* there was a very poor entry. All the Buff *Cochins* were sadly out of condition, but the Partridge-coloured were capital, whilst the White ones were, as far as the winning birds were concerned, a good sample. In the *Brahmas*, good hens were plentiful, but the cocks were not up to the standard they should have been. Mr. Pickles showed a single pen of Silver-pencilled *Hamburghs* in a class open to Pencilled of both colours. They were a very good pen, but singular to say, it was the only entry. Golden were first, and Silvers second, in an open class. In the Spangled Hamburghs, the winners of the first prize were speedily claimed at a very low figure. By reference to the appended prize list, it will be seen that the Variety class was both excellent in quality and also very well filled. The second-prize pen of Andalusian chickens are birds of considerable promise.

Game *Bantams* showed below par, but the "Any other variety of Bantam" class was remarkable for the excellence of its Sebrights, a feature at the present hour somewhat unusual. Aylesbury and Rouen *Ducks* were quite equal to those seen at our largest shows, and in a variety Duck class, Miss Clifton and Mr. Sainsbury swept away the prizes with grand specimens of Buenos Ayreans. In this class some excellent Mandarins were also exhibited. The Selling class proved far better than anticipated; it embraced a great number of varieties all well shown, and no doubt many of them were entered at prices far below their actual value. Mrs. Blay, of Worcester, sent a large cage of Canaries, that proved a very attractive feature to visitors.

As the weather is fine, no doubt the Show will prove pecuniarily successful.

GAME.—*Black or Brown-breasted Reds.—Cock.*—1, S. Matthew. 2, Rev. G. S. Cruwys. *hc*, J. Moore. *c*, Osborne Bros. *Hen.*—1, S. Matthew. 2, Rev. G. S. Cruwys. *hc*, J. Moore; J. Mason; J. Mitchell. *c*, W. Jones (2). *Any other Variety.—Cock.*—1, J. Moore. 2, W. Griffiths. *Hen.*—1, J. Mitchell. 2, S. Matthew.

SPANISH.—1, J. Stephens. 2, E. Taylor. *hc*, Nicholas Bros.

DORKINGS.—1, H. Yardley. 2, Miss E. Williams.

COCHIN-CHINA.—*Cinnamon and Buff.* — 1, D. W. P. Thomas. 2, J. Watts. *c*, W. Griffiths. *Partridge and Grouse.*—1 and 2, J. Stephens. *c*, J. K. Fowler. *White.*—1, A. J. E. Swindell. 2, J. K. Fowler.

BRAHMA POOTRA.—*Dark.*—1, H. Yardley. 2, J. Watts. *c*, W. Sims. *Light.*—1, L. H. Ricketts. 2, J. Watts. *hc*, Rev. N. J. Ridley.

HAMBURGHS.—*Gold or Silver-pencilled.*—1, H. Pickles, jun. 2, No competition. *Gold or Silver-spangled.*—1, T. W. Swallow. 2, H. Pickles, jun. *hc*, T. May. *c*, J. Heppel.

GAME BANTAMS (Any variety).—1, E. Davis (Black Reds). 2, S. Stephens, jun. (Brown Reds). *hc*, A. Ashley. *c*, Lieut.-Col. Tickell.

BANTAMS (Any other variety).—1, M. Leno (Silver-laced). 2, Rev. G. S. Cruwys (Silver-laced). *hc*, Rev. G. F. Hodson (Gold-laced); H. Pickles, jun. (Blacks). *c*, J. Watts (Silver-laced).

DUCKS.—*Aylesbury.*—1 and *hc*, J. K. Fowler. 2, L. H. Ricketts. *Rouen.*—1, J. K. Fowler. 2, W. Stephens. *c*, W. Stephens; Rev. G. S. Hodson. *Any other Variety.*—1, G. S. Sainsbury (Buenos Ayrean). 2, Miss Clifton (Buenos Ayrean). *hc*, M. Leno (Mandarin).

ANY OTHER VARIETY.—1, H. Wyndham (Crêve-Cœur). 2, Mrs. Blay (Andalusian). *hc*, Rev. N. J. Ridley (Malay); H. Pickles (Silver-spangled Polands); H. Yardley (Cuckoo Polands); J. K. Fowler (Crêve-Cœur); C. Maggs (Black Hamburghs); J. Watts (Ptarmigan).

SELLING CLASS.—1, Mrs. G. Granville (Grey Dorking). 2, Rev. E. B. Rowland (Houdans). *hc*, Mrs. Blay (Silver-spangled Polands). *c*, S. Taylor (Grey Dorking); J. Masefield (Houdans); E. Taylor (Buff Cochins).

PIGEONS (Not for competition).—*c*, Capt. Dwarris, R N. (White Pouters) (3).

EXTRA CLASS.—*hc*, Mrs. Blay, Worcester (Two cages of Canaries).

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

WOODSOME POULTRY SHOW.

THIS was held on the 16th inst., in two large fields, which are beautifully situated in the basin of a thickly-wooded locality about four miles from Huddersfield. The weather was very favourable, and the attendance of visitors large, so large, in fact, as to cause surprise, for the locality is very thinly populated, and but few dwellings were visible from the Show field. Unfortunately the Show was very badly supported with entries, at which we are much surprised, for a better-regulated Society it is difficult to find, both exhibitors and visitors meeting with extreme courtesy, and the stock with the greatest care and attention. Pens of the most perfect kind are used. We may here state, that it is determined to remodel the schedule on a most liberal basis, in the hope that the Show will be better patronised.

Rabbits were first on the list, and both classes contained excellent specimens of Lop-ears good in style, size, colour, and measurement. Of bucks, the finest was a Blue and White, 21 inches and 4½ inches, and the second 19 inches and 4½ inches, but the does were far in advance of them, the finest being 23 inches and 4¾ inches in ears, and the second 21 inches by 4½ inches. The first-prize animal was remarkably fine.

In poultry, *Spanish* were good, and the honours were closely contested, as also in both classes of *Cochins*, but the *Game* were very poor. In *Hamburghs*, Mr. Beldon won all the first prizes with some capital birds. *Ducks* were very good, especially the Rouens; and in chickens Silver-spangled were first and Crêve-Cœurs second, the latter being very promising.

In *Pigeons*, Carriers were wretched, but Pouters noteworthy, as also the Tumblers and Fantails, and in Jacobins the first-prize pen was as good as could be desired. There was a class for the common Dovecote Pigeon, but we were surpoised to find this variety is not understood by the exhibitors, not a single correct specimen being shown.

DORKING.—1, W. H. King, Moss Mills, Rochdale.

SPANISH.—1, H. Beldon, Goitstock, Bingley. 2, J. Thresh, Bradford.

COCHIN-CHINA. — *Cinnamon or Buff.*—1, H. Beldon. 2, H. Lacy, Hebden Bridge. *Any other Variety.*—1, J. White, Whitley, Netherton, Wakefield. 2, H. Lacy.

GAME.—*Black-breasted or Brown Red.*—1, Miss J. A. Aykroyd, Eccleshill, Leeds. 2, W. J. Cope, Barnsley.

POLANDS.—1, H. Beldon.

BRAHMAS.—1, H. Beldon. 2, H. Lacy.

HAMBURGHS.—*Gold-pencilled.*—1, H. Beldon. 2, F. Brooke, Huddersfield. *Gold-spangled.*—1, H. Beldon. 2, J. White. *Silver-pencilled.*—1, H. Beldon. *Silver-spangled.*—1, H. Beldon. 2, J. Bradbury, Brackshaw, Austonley.

BANTAMS.—*Game.*—1 and 2, G. Noble, Staincliffe, Dewsbury. *Any other Variety.*—1, H. Beldon. 2, D. Stocks, Taylor Hill. *hc*, G. W. Robinson, Halifax.

DUCKS.—*Aylesbury.*—1, E. Leech, Rochdale. 2, H. Sugden, Woodsome Lees. *Rouen.*—1 and 2, J. Crosland, Royd's Mount, Huddersfield. *hc*, E. Leech; J. White.

TURKEYS.—1, E. Leech. 2, J. Crosland.

ANY BREED.—*Chickens.*—1, J. Bradbury. 2, J. White. *hc*, J. Thresh; J. White; J. F. Beaumont, Huddersfield; J. Haigh, Shelley, Woodhouse.

PIGEONS.

CARRIERS.—1, H. Yardley, Birmingham. 2, J. Crowther, Golcar.

POUTERS.—1, J. Thresh. 2, H. Yardley.

TUMBLERS.—1, J. Thresh. 2, H. Yardley.

FANTAILS.—1, J. Thresh. 2, H. Yardley. *hc*, J. Crosland.

JACOBINS.—1 and *hc*, J. Crosland. 2, H. Yardley.

TRUMPETERS.—1, J. Thresh. 2, T. Kaye, Honley.

BARBS.—1, H. Yardley. 2, J. Crosland. *hc*, T. Kaye; J. Thresh.

DOVECOTE (Common).—1, R. Armitage, Lepton. 2, A. Roberts, Lepton.

EXTRA STOCK.—1, G. Blackburn, Outland.

RABBITS.—*Buck.*—1, C. Gravel, Thorne, Doncaster. 2, J. A. Clough, Huddersfield. *hc*, T. Harrison, Moldgreen. *c*, R. Esam, Newark. *Doe.*—1, T. Taylor, York. 2, C. Gravil, jun., Thorne, Doncaster. *hc*, R. Esam, Newark.

JUDGES.—Mr. W. Cannan, Bradford, and Mr. E. Hutton, Padsey, near Leeds.

RABBITS AT LITTLEBOROUGH POULTRY SHOW.

I WAS very favourably impressed by the number of entries (forty-six), as well as by the high quality of the specimens, which, for a first exhibition, must have been to the Committee very gratifying; and I may add that the attention of the Committee to all specimens consigned to their care for the day was very great. Abundance of good food, and roomy pens, quite large enough for pairs, were provided, and special attention was paid to the comfort of the animals. As the prizes were detailed in last week's number I need only refer to them.

Of the Lops there were four entries, and Mr. A. H. Easten's splendid doe justly deserved the first position. She had a dignified yet graceful appearance; her ears were 21½ inches long by 4¾ inches wide, hanging in the true style of a good Lop. Her fortunate neighbour, a Yellow and White buck from Mr. J. Boyle, was by no means a discreditable

occupant of his temporary apartment, having ears 21½ inches long by 4¾ inches wide; and the highly commended pen of Mr. S. Greenwood was also good, perhaps rather heavily marked, yet a fit companion to his more fortunate neighbours. The showy Angora class contained ten entries, including several very fine specimens, some being rather small yet well woolled, and that with a fineness of texture which I prefer for a specimen of this variety. The first prize went to a doe of large size, clean, and well cared for; and if exhibitors would consider how much the appearance of their specimens is improved by the comb and a clean bed, I am sure the little time required for these important attentions would be willingly afforded. The second prize went to rather an exception as regards colour, being fawn, yet a well-formed Rabbit and worthy of its position. Mr. A. H. Easten's highly commended was a neat specimen—not, perhaps, as fine in fur as the others, yet worthy the third position it took in its class. I may here remark that amongst some of the specimens I found the ears troubled with that gum which tends so much to give the animal a dull and stupid appearance irrespective of the pain, and more especially when handled. A little attention in this particular would be advisable, especially when so effective a remedy is at hand. The Himalayans, eight in number, contained some good specimens, but not all, as some were far too light in the extremities; yet the first and second-prize animals I have seldom seen equalled in points of merit, and care was requisite to determine upon the superiority of one over the other, as both were almost equally good. Mr. J. Boyle's highly commended was by no means an inferior animal, and Mr. J. Butterworth exhibited another specimen which I doubt not will secure honours. The Silver-Greys (nine) were very good as a class, and the first-prize one was in my opinion of the true Silver type, even to the very nose; it was of large size and well formed, general in the silvering, and worthy of its position. The second-prize specimen was not quite so large, a little darker, yet in every respect a good specimen, and fit companion for her more fortunate sister (both were does). Mr. S. G. Hudson's highly commended doe was also no mean specimen. The Any other variety class contained as usual Belgian Hares and Dutch, and some to my mind almost the perfection of marking were found amongst them. First, with dignified yet placid look, was the Belgian buck of Mr. S. G. Hudson, a true specimen of what one of this variety should be—large, well-proportioned, and general in the shade of the hair, and offering an interesting contrast to the pretty little Dutch Grey and White specimen belonging to Mr. J. Boyle, jun., who also received a high commendation for a good specimen of the Belgian Hare. The Selling class contained by no means inferior specimens; and the first-prize Silver-Grey, and a very finely woolled yet young Angora as second, were both more than the average found in this class. An excellent Lop from Mr. J. Batterworth was highly commended and worthy of a passing remark. I hope she will be found as a prize-winner.—Charles Rayson, *Didsbury*.

SPANISH HEN INCUBATING.

I had three Black Spanish hens a few years ago, and one of them, a well-bred one, was baulked of sitting, but would not be done out of her nursing, for she took to a batch of Bantams that were several weeks old. I have now another Spanish hen which has been wanting to sit for nearly two months, but, being prevented, she tries her best to take possession of some half-grown chickens, which care nothing about her.—J. Gabb, *Bewdley*.

THE CUMULET, VOLANT, AND WHITE EYE PIGEON.

This Pigeon is of the Tumbler species, and imported from Brunswick into this country. It is a distinct breed, and bred true to its points in feather and flying propensity. It is of the Tumbler size, white or marble grey, sometimes lemon shaded in the neck, rather high on a clean coral leg, sharper-faced than the Tumbler, and has the invariable, prominent, glittering, pearl-white eye. The bird is called Cumulet in allusion to its cloud-climbing or sky-high-flying peculiarity; also called Volant in reference to its superlative flying powers, and known as White Eye from its bright white eye described. This Pigeon is as pure a species or sort, as the purest Carrier is of its kind of Pigeon.—Reader.

NEW BOOK.

The Homing or Carrier Pigeon. By W. B. Tegetmeier, F.Z.S., &c. London: Routledge & Sons.

War troubles and their accompaniments are in these days soon forgotten. Already the German siege of Paris is little thought of because another has succeeded; and so on, and so on, in this rapidly changing age. Then, too, newspapers are but things of a day, of them the proverb *litera scripta manet* is not true. But a book, a distinct book, is a permanent thing. It remains while the newspaper is torn up; it is placed on our shelves and referred to when one war has given place in men's minds to another.

For these reasons I am glad that Mr. Tegetmeier has published a book, and a cheap one too, on the deeds of Homing Pigeons, so that the interests aroused for a time in so many minds concerning these birds will be perpetuated, at least with some. Mr. Tegetmeier gives first a history of the Homing Pigeon, and chats pleasantly about Anacreon, Varro, Pliny, on to our first Pigeon writer, John Moore; then about English Pigeon races, then about Belgian races; then tells us of the longest race on record.

"But the longest Pigeon race on record was that flown from Rome to Belgium in 1868. Two hundred Pigeons, all of which had been flown from the south of France, but none beyond, were entered for the race. The distance is 900 miles. They were liberated on July 22nd, at half-past four in the morning, the weather being beautifully fine. The first arrival was on Monday, August 3rd, at five minutes to two in the afternoon, the bird belonging to M. Keyne, of D'Ougree, near Liége. The second reached home on the same day, the third on August 4th, the fourth on August 6th, the fifth and sixth on August 10th, the seventh and eighth on August 11th and 12th, the ninth on August 18th, and the tenth on September 11th. This race was one of the most interesting character, as the birds had to fly over 500 miles of country entirely unknown to them. If they flew in a direct line, they must have crossed the Apennines, near Monte Cimone, where those mountains are between 6000 and 7000 feet high, and the Alps near the St. Gothard, where the lowest passes are almost 7000 feet, and continued their course across the whole of Switzerland. But it is most probable those that returned rounded the westward of these mountain chains, and, skirting the coast, came by way of Nice through France. Of the two hundred liberated, not more than twenty ever returned."

The rate of flight of these wonderful Belgian birds is, it seems, in the best races "more than one mile per minute during a flight that lasts for four hours and three-quarters. Upwards of sixty miles an hour for nearly five hours in succession. Truly, this is a wonderful performance; and good as it is, it is greatly exceeded in short-distance flights, in which the bird knows its route perfectly."

We have in chapter the second an account of the different breeds employed as Homing Pigeons. The author clears away the many mistakes as to name. Thus, the Carrier is not a homing bird, neither is the show Antwerp. I hope that in all future Pigeon-writing the term Homing Pigeon will be employed only. The Carrier must not lose his name, although it implies what he does not do, but after a reign of upwards of a hundred years King Carrier must not be dethroned.

Other chapters relate the management of Homing Pigeons, their training, whether the homing faculty is instinct or intelligence. With two more chapters on the Anglo-Belgian *concours*, and Pigeon-flying from balloons, this handy, pretty, and useful little book ends. I am glad to see it at all railway-stalls, and not only will it spread an accurate knowledge of the Homing Pigeon, but also, I think, may lead some of its many readers to wish for others of the "many varieties of fancy Pigeons."—Wiltshire Rector.

QUEENS LEAVING THEIR HIVES—MR. WOODBURY'S DEATH.

Notwithstanding the apparently corroborative evidence furnished by "B. & W.," in No. 538, that he was correct in his inference that the old queen of the hybrid hive had been taking aërial excursions before swarming, yet the facts narrated, strong though they seem, do not in reality prove anything of the kind. There are so many ways of accounting for the curious circumstances attending the case without violating what I believe to be an invariable rule—namely, that a mother queen never takes an aërial excursion, that, like "R. S." (who does not hesitate to endorse my view, though I assure him it is "no misfortune"), I should never think, if they occurred in my own apiary, of explaining them as "B. & W." has done, even though the proof were stronger.

My excuse for recurring to the subject is, that I am anxious that an error of this kind in the habits of the queen bee, promulgated by one of acknowledged authority in apiarian matters, should not pass without challenge. I know it is a popular belief among a certain class that queens take "airings" during fine days even in winter, as the common bees do, and a dead or invalided queen found before the hive, is taken as a proof

of this, but this also I need scarcely say is a complete fallacy. In the second notice, No. 538, "B. & W." says he is "quite certain that there could not have been within it (the driven Italian hive), any royal brood;" but he may have been mistaken, as in any other than a framed hive it is extremely difficult, with every care, to pronounce decidedly. Nor would I reckon it of any consequence that royal cells were seen being developed in the hybrid hive itself after swarming. One or two we are told were sealed two days after swarming. This was to be expected. The strongest evidence, no doubt, is the circumstance that the brood of the respective swarms corresponded to "B. & W.'s" surmise. In No. 537 I adverted to this as a test, but in reflecting over the whole matter, and the further details furnished, I can see how even this confirmatory evidence can be otherwise accounted for. "B. & W." does not inform us that the Italian hive was thoroughly pure; but, even though it was, he can easily see that its first "cast," if my explanation of the swarming be correct, might, according to the mating of the queen, be less pure than the second one. In a mixed apiary not much importance can be attached to questions about purity. On the whole I have no hesitation, considering the many possible ways the curious circumstances narrated by "B. & W.," in No. 535, could be otherwise explained, of discarding the idea that we have here any proof that mother-queens ever go forth on aërial excursions.

In taking up my pen for the first time after these pages have made known in a formal way the melancholy tidings of Mr. Woodbury's death, I cannot help recording my feelings of deep and heartfelt sorrow at the sad event, and I cordially coincide with Mr. S. Bevan Fox in believing, "that all the readers of this Journal, and all the contributors to its columns, whether interested as apiarians or otherwise, will experience deep feelings of sorrow for the loss of one who has for so many years contributed so largely to its columns." Though I have never had the pleasure of any personal acquaintance with Mr. Woodbury, yet for upwards of ten years I enjoyed a friendly correspondence with him. This dated from the introduction of the Ligurian bee, and though it was our "fortune," or "fate" rather, to engage in a long controversy in these pages on a subject regarding which there is much diversity of opinion, yet notwithstanding the vigour and spirit displayed by all who took part in it, I need scarcely say that no change was effected in our other relations or correspondence, which continued cordial throughout. I shall only add, that by the death of our lamented friend we have lost one of the most accomplished apiarians of the day. -J. Lowe.

BEES NOT WORKING.

I have an old stock in a straw skep that for six years has never failed to yield me a considerable quantity of honey; but this year the bees have done nothing. In April they were unusually strong, and plundered one of their neighbours. Since then they have remained idling about the mouth of the hive, amusing themselves occasionally by killing drones, but utterly declining to go into a super, and never showing any activity in their efforts on their own account.—H.

[Your hive may suffer from one of two or three causes. First, it may have a queen whose power of breeding may be very small, owing to age or accident; or secondly, the breeding cells of the combs may have become contracted and unfit for the purpose; or thirdly, they may be so filled with honey as to prevent the queen giving full scope to her natural fecundity. You do not say whether or not the bees have carried in pollen freely of late. If the hive were ours we should drive out the bees into an empty skep, and endeavour to catch a sight of the queen if any, and judge from her appearance as to her age and probable capabilities. If, from very ragged wings or dark shrunken appearance, she gave evident proof of being aged, we should, if it were desired to perpetuate an already somewhat aged hive, crush her between the fingers, and having obtained a lot of expatriated bees from a doomed cottager's hive, add them with their queen to the old stock. If, however, the bees are still very numerous, and pollen is carried in in moderate quantities, you may leave the hive as it is until next year, when perhaps a swarm may issue from it, at the end of twenty-one days from which time the stock may be broken up and the bees added to those of the swarm.]

OUR LETTER BOX.

Wakefield Show.—Mr. J. S. Booth states that he had a pen of Malay chickens highly commended.

Ormskirk and Southport Show.—We are informed that the names of the Judges sent to us were not correct. They ought to have been Mr. Hudson and Mr. Douglas.

Allerton Show.—Mr. Yardley writes to us giving a most unqualified denial to the statement by our reporter. He adds—"Not a foul feather was abstracted. The birds have been in my possession eight months, and have obtained first prizes at Torquay, Stroud, Colchester, and many other Shows. I am quite willing to submit the birds to any competent judge for examination, when I am sure the difference between trimming and moulting can be readily discerned, as well as the sexes of the pair of Dragoons which seem also to have caused Mr. Hutton some uneasiness."

Warrington Poultry Show.—Mr. J. Wright, Rochdale Road, Manchester, won the cup for Antwerp Pigeons.

Neath Poultry and Pigeon Show (*W. C. and Others*).—We always conclude if a committee do not consider their proposed show of sufficient importance to be advertised in our columns, that it cannot be deserving of a report.

Portraits of Pigeons (*Captain*).—They commenced in our No. 464.

Dyeing Feather Grass.—*A Constant Subscriber* wishes for recipes to dye this grass various colours to fit it for mixing with everlasting flowers.

REMARKS.

16th.—Fine but hazy in morning, cloudy in the evening.

17th.—Very hazy and heavy in morning, more or less cloudy all day, storm-like about 6 P.M., heavy rain at 10 P.M., and all through the night.

18th.—Rain in morning and occasional showers all day, splendid and long-continued rainbow between 6 and 7.

19th.—Cool but very bright, a most lovely day throughout.

20th.—Fair but cloudy all day, much cooler.

21st.—Fine morning, slight shower about noon, sun not hot but the air oppressive.

22nd.—Rather stormlike in morning, but passed over with only a few large drops of rain, fine afternoon.

The rain on the night of Thursday and morning of Friday (amounting to more than half an inch) tended to cool both the air and the ground, and thus make the past week much more pleasant, though not quite so bright as the preceding one.—G. J. Symons.

COVENT GARDEN MARKET.—August 23.

The markets are much quieter than they were, and sales can only be effected to any extent by a reduction of prices. To-day we have had but few buyers, the inquiry being chiefly for rough descriptions of produce. Hothouse Peaches and Nectarines are nearly over, those from the open walls just coming in. Imports heavy, at former prices.

From observations taken near London during forty-three years, the average day temperature of the week is 71.0°, and its night temperature 47.2°. The greatest heat was 85°, on the 1st, 1843; and the lowest cold 30°, on the 4th, 1850. The greatest fall of rain was 1.50 inch.

CULTIVATION OF THE HOLLYHOCK.

THIS has been an exceptional season, and in many respects an unfavourable one, for some flowers and fruits. It has been a good season for the Hollyhock, and some of the spikes which I have seen this year are truly grand. The Hollyhock and the Pansy are amongst the first flowers that I ardently cultivated before becoming a gardener, and now that I require to study the pleasure of my employer more than my own, I have not been able to devote so much attention to them, but I admire them still. They form striking contrasts to each other. The one lowly and modest, carpeting the ground beneath your feet, and studding it with soft velvety and beautiful colours like the "wee, modest, crimson-tipped flower;" the other noble and majestic, forming gorgeous pyramids of many colours, pure white and pale yellow to the deepest orange and buff, soft rose and pink, red, crimson, and deepest maroon.

This fine autumn flower seems to have been brought into very prominent notice for the first time as an exhibition flower in London about the year 1854, as Mr. W. Paul, in his excellent little practical work, "An Hour with the Hollyhock," alludes to a very successful exhibition specially got up for this flower in the Surrey Zoological Gardens that year. Previous to this there were many raisers of seedlings both in England and Scotland; there were also two distinct types. The English section had the largest and best-formed centres, but in many cases a scarcely-distinguishable guard petal, while the Scotch varieties were conspicuous by their immense guard petals; by crossing the two nationalities flowers with well-formed closely-compacted centres were produced, and much better-proportioned guards.

Those who intend to begin the culture of Hollyhocks would do well to obtain a selection of the very best sorts. Plants that are propagated in the spring generally make the strongest spikes; they should be planted-out on the first favourable opportunity after the middle of March; if the weather is unfavourable April would be as well. The soil should be deeply trenched and highly manured; if the subsoil will admit of it, the ground should be trenched 3 feet deep. The most suitable and effective position for Hollyhocks is to form backgrounds to wide borders, they also form a striking feature where the spikes can be seen at a distance rising above the foliage of evergreens in a dwarf or newly-planted shrubbery. For exhibition, or where the most perfectly-developed spikes or flowers are required, they should be planted by themselves in rows 4 feet apart, allowing 3 feet between the rows. The sticks intended to support the plants should be stout, and stand 6 feet out of the ground; these should be 7½ feet long, and put in before the plants, planting-out the Hollyhocks close to the sticks afterwards. The plants will require but little attention except tying the main shoots to the sticks, pinching-out the side shoots, and giving them copious supplies of water at the roots; in hot weather mulching the ground round the roots is very beneficial to them. If required for exhibition, the spikes must be shaded in some way.

When the flowers show signs of decay they must be removed, as if decayed flowers are allowed to remain they will injure the seed pods. It is very important to save seeds of the very best varieties in each colour, as the best and most regular spikes are obtained from plants which have been raised from seeds, and the chances are that varieties may be obtained having distinct features and of better quality than those already in commerce. There is also much interest in watching the development of the flowers, and in comparing them with those from which the seed was obtained.

As soon as the seeds are ripe, or when the flowers have faded, if it is not intended to save seeds, the plants should be cut over, and about the beginning of October they should be lifted out of the ground and potted, or planted in some light sandy loam and leaf mould in a cold frame; I prefer to pot them, as the plants can be moved into a warmer position if required. If they are wintered in a house where no artificial heat can be applied to them the pots must be plunged; if otherwise they may be placed on a shelf, or in any position where they can have a free circulation of air around them. The plants must not be huddled together in any out-of-the-way corner during winter and neglected. A number of shoots will be thrown up from the base of the main stem, these must all be taken off early in the season; any time in February will do. They will form plants in a short time if grafted on a piece of root in the way whip-grafting is performed; the cutting, with the small piece of root attached, should be potted in a 3-inch pot in some very sandy compost, and the pots plunged in a very gentle bottom heat in an ordinary dung frame; if the bottom heat is at all excessive every one of the plants will rot off. When the young plants show signs of being established they should be removed to a cold frame, keeping it close for a few days until they are inured to the change. It is also desirable to shift the plants into larger pots before finally planting them out.

I will now make a few remarks about raising seedlings. July is a good time; the seeds can be sown in the open ground, and the plants pricked out and protected during winter in a cold frame, or any of the cheap glass protectors now in use may be placed over them, planting them out in March where it is intended they should bloom.

The Hollyhock makes a grand feature at the autumn exhibitions if shown as cut spikes, which is by far the best way to show them. They are also exhibited in stands, similar to Dahlias, as single blooms. To obtain the greatest measure of success, and increase the size of the flowers, the spike should be cut over, allowing only from three to six flowers on a spike; shading them must also be attended to, as sun, rain, and wind soon damage the petals.

I had some conversation with the principal Hollyhock growers at the August meeting for this flower at South Kensington; contrary to my experience and that of others in this neighbourhood they all seemed agreed that this was a bad season for them. The "mysterious" disease which attacks the Hollyhock, like those from which the Potato,

Cucumber, and Gladiolus suffer, has been making sad havoc. I am glad to say I have not yet come in contact with it, but I am told that the plants decay close to the surface of the ground, and there is not as yet any known remedy for it. Red spider is the most insidious enemy I know of, but this can be kept in check by frequently syringing the plants. There is also a maggot which eats its way amongst the seeds exactly similar to, if not the same as that which burrows in Apples, causing them to drop before they are ripe; this can only be got rid of by hand-picking. Mr. W. Chater, of Saffron Walden, exhibited a fine lot of flowers, both spikes and cut blooms, at Kensington on the 16th, but I think the climate of Scotland is better adapted for Hollyhocks than that of England; at least they are exhibited much better in Edinburgh than they are in London. A list of the very best varieties will be found in your report of the exhibition at Kensington.—J. Douglas.

ROAD-MAKING UNDER DIFFICULTIES.—No. 2.

For a road to be really sound and durable, the drains immediately upon or in connection with it must be so arranged that water shall at no time lie in pools either upon or alongside the road, but at once pass away down the drains, for which common unglazed pipes answer quite well; but they should never be less than 6 inches in diameter, and be laid at a sufficiently sharp angle for the water to pass away so quickly that all sediment may be washed clear of the pipes. Drains are sometimes made with 3-inch pipes laid at a very flat angle, and with a well or trap under each grating continued several inches below the mouth of the drain, to prevent any sediment from passing into the pipes at all. But I do not like the plan, because, without constant supervision, the wells soon fill, and it follows as a matter of course that the pipes are in danger of being filled also, the water passing through so slowly that it deposits most of its sediment as it flows. It is therefore evident that drains made at an acute angle are altogether best, as they are self-cleansing.

Another important point to be remembered in making such drains is to avoid all abrupt curves or angles, or anything likely to have the slightest tendency to check the flow of the water. A drain should never proceed along one side of a road for a distance and then turn abruptly at right angles across to the other side; but wherever such crossings are necessary they should be at a very obtuse angle, forming a long diagonal line till the other side is reached, and thus the check given to the water will be hardly perceptible, and the flow will go on to the outlet with undiminished speed.

The gratings through which the water passes down into the drains should be proportionate in size to the width of the road. Thus, for a road only 9 feet wide, gratings 10 inches square, with stout bars three-quarters of an inch apart, are very suitable; but if the road is 12 or 15 feet wide, then the gratings should certainly be larger; and so upon a road having a gradient of 1 in 12 it is very evident that more gratings are necessary than upon easier levels. During very heavy showers the water runs down such steep inclines with a rapidity so violent that, if it were not checked by means of the numerous gratings placed in its course, there would be a risk of much of the material upon the surface of the road being washed away.

In addition to the covered drains in the road itself, open drains and ditches are often necessary to prevent water from flowing upon or over the road, of which there is much risk when it passes along the side of a bank or hill. In making a cutting for a road to pass more easily over a steep ascent, I found that the water oozed out of the upper side of the cutting so fast that the men were standing in water when at work, and were much hindered thereby. Moreover, as this side of the cutting for certain reasons was made at an unusually sharp angle, I feared that so much moisture passing through it would cause it to shatter very much with the first frost. To prevent all this, an open deep drain was made at about a perch from the side of the road, and carried parallel with it as far as was found necessary. This answered admirably, quite cutting off the great superabundance of moisture contained in the soil, and also preventing much water from flowing down the bank on to the road during heavy showers. In a few other isolated moist places occurring along the upper bank, the water was collected into one channel by cutting a "crow's-foot" open drain—that is, a central drain at right angles with the road, and having a branch on either side extending after the manner of the claws of a bird's foot.

In dealing with the main watercourse in the valley, local circumstances differ so materially, and have so much influence upon the work, that no particular process can safely be laid down to meet all cases. For producing a picturesque effect, and to form a striking and ornamental feature in the valley, a bridge is altogether preferable for crossing the water; but if the work is to be done as economically as possible, and the bulk of water be not too great, stout glazed socket drain pipes, or a culvert passing under an embankment, connecting the banks of the stream, may prove to be best. The size of the pipes or culvert should, of course, be in proportion to the body of water contained in the stream during the wettest period of the year. Circular pipes 2-feet in diameter afford passage for a large body of water, and such pipes are equally efficient, and much less expensive than a culvert.

The track to contain the stones for the road should be excavated to a depth of at least 9 inches, not only that it may contain sufficient "metal" to bind into a firm mass, and sustain the traffic for a considerable time without needing repair, but also that the layer of hard material may be deep enough to withstand the effects of heavy thunder showers, which I have seen act with such force upon shallow roads, especially upon steep gradients, that the sides have been furrowed with channels to such a serious extent as to wash the stones completely away, leaving the soil at the bottom of the track bare. Such paltry shallow roads constantly need repair, and are far more costly than if they had been properly made in the first instance.

In searching for rock beds from which to procure stone for the road, a knowledge of geology is useful, not altogether as regards a knowledge of the quality of the stone, but because stone is more easily discovered by those understanding the natural indications of its presence. When such indications are found, some trial holes should be made a few yards apart with a boring tool, for although there may be positive evidence of the presence of rock, it is not wise to commence excavating till it is ascertained by boring if the bed is large enough or sufficiently near the surface to be excavated at a reasonable rate. The cost of excavating depends entirely upon the depth of soil covering the rock, the rate of pay ranging from 9*d.* up to 1*s.* 8*d.* per cubic yard of stone. I believe, however, it is not often that the higher price is reached. As an example from which safe deductions may be made as to the necessity for higher or lower rates, it may be stated that for excavating the hardest kinds of sandstone in a quarry having a regular layer of 6 feet of earth over the stone, 1*s.* 1*d.* per cubic yard of stone is a fair price. This includes the removal of the soil, and the excavating and heaping of the stone in squared heaps a yard high on level ground close by the quarry; the labourers finding their own tools, but the master supplying planks and wheelbarrows. When a quarry is opened, if much stone is required, a quantity of 4-inch pipes should be supplied to the men upon condition that a drain be made and continued upon the lowest level as far as the work goes, to carry off water, as otherwise a few wet days may flood the quarry, and hinder the work for a considerable time.

The stone should not be broken fine at the quarry, but should be carted to the track and there broken, care being taken to place large pieces in the bottom of the track, and smaller ones upwards to the surface. The spaces among the large pieces at the bottom act as a drain, thus tending to maintain the road in a sound dry condition.—Edward Luckhurst.

AMERICAN POTATOES.

I procured in the spring of last year 1 lb. of Early Rose Potato which I cut into sixty sets, and the result was 60 lbs. of Potatoes. I took 1 lb. from them this spring, which I cut into forty sets, and the result this season is 72 lbs. of very fine Potatoes; 3 lbs. of these were diseased.

I had also this season 1 lb. each of Peerless and Climax, the results are as follows:—Peerless, fifty-seven sets produced 86 lbs.; of these 14 lbs. were diseased. Climax, sixty-two sets, produced 60 lbs.; of these 3 lbs. were diseased. The tubers of Peerless are very large and heavy, the Climax a fair average. I think the American Potatoes have proved less liable to disease than many others of our old sorts.

I have some Regents, Early Frame, and Paterson's Victoria not worth lifting, while the Early Rose has produced a fine crop—*i.e.*, from a peck of cut sets I lifted ten bushels, and found but very few diseased.—J. Harland, *Gardener, Writtle Park.*

Linaria vulgaris.—You are quite right when you say the above-mentioned plant, being a perennial, would not require

rsmoving. Some time ago, in an evil hour, I introduced it into a small garden of choice wild flowers, and in a short time it overrun the entire place.—J. G.

THE CULTURE OF THE CAMELLIA IN BELGIUM.

Much has been written of late in the journals devoted to horticulture on the subject of the culture of the Camellia, and many things have been insisted upon as absolutely necessary for success; but I am inclined to think that it is a plant which will accommodate itself to various circumstances and thrive in various soils. I remember when I was at Deal constantly seeing one which never seemed to leave the window of the sitting-room, was not I know for years repotted, and yet which was always vigorous and always flowered well. We know also that Mr. Pearson, of Chilwell, has long maintained that the proper soil for its successful culture is loam, and strongly deprecates the mixture of loam and peat, and, although I have never had the pleasnre of seeing his, I can well believe that they are pictures of health; but at the same time I have seen wondronsly fine examples of good culture in all peat, and in other cases in loam and peat mixed, while I have known many cases where each and all of these plans have been tried and without success. This I can only account for from the fact that there is a vast difference in the quality of both peat and loam; and when I read of the latter being pared off rocks and nearly all fibre, such as I have seen it from the Dublin mountains, I can at once see how different that is from the loam I am accustomed to use, which comes off some of the rich lowland pastures of Kent.

At the time that the discussion was going on, a good deal was said of the Belgian cultivation. It was acknowledged on all hands that this was good. We could judge this to be the case, for every year we have been accustomed to see the large importations which are brought over, too often, indeed, to wither and die in stifling London dining-rooms, but which are pictures of health and vigour; and having lately had the opportunity of running through some of the Belgian establishments, I give now the result of my observations and inquiries.

1, *Soil*, on which so much depends. The Belgians grow their Camellias entirely in leaf mould, but it is leaf mould of a peculiar character, most of it probably thirty or forty years old. It is obtained in a manner I think accessible to ourselves, from the woods and forests, in those ravines and undulations in the ground where the leaves have fallen year after year and have never been disturbed, and where they have formed a thick and dense bed of decayed matter. I rather fancy most people who live in a wooded country can get this. It approaches more nearly in appearance to peat than the leaf mould we generally use, while it differs very considerably from peat in its texture, and is also much lighter when wet, and gives more thorough drainage, a point on which the Camellia is very tenacious. In saying this I wish it to be distinctly understood that I do not pretend to say that the Camellia will not thrive in other soil; I am only giving the Belgian system, and I know nothing to hinder us from having the same success if we can use the same soil.

2, *Potting*.—This would seem to be a matter about which there can be no second question as to how and when it is to be done. But I find that the Belgian plan differs entirely from ours. I have always remarked the extreme smallness of the pots in which their plants reach us; but I have always considered this was simply a matter of economy of space, and that as they were grown for exportation they were kept in as small pots as possible for the convenience of packing: but this I found was a mistake. It is done advisedly, and they maintain that the Camellia does better and flowers more regularly with its roots restricted. They say that we judge our plants of all sorts by the size of the pots, they by the size of the plants. If a nurseryman with us advertises any it is that they are in 60's, 48's, 32's, while they say the plants are so many centimetres high. For the same reason they do not pot so frequently as we do—one nurseryman told me once every three years, others do it every two years. The first year they say the plant makes a long shoot, the second a shorter one, and, indeed, you can see it in the plants, while in most instances they set their bloom buds also.

3, *Summer Culture*.—As to this, I see with many it is insisted upon with us that they ought not to be turned out of doors. But the Belgian knows no such rule. They are invariably put outside in shaded alleys and remain there till late in the summer, and yet the climate of Ghent is not very different from that of the south of England. I notice corn is about equally forward, and that the Hops bear much the same bad aspect around them that they do in Kent; but I can quite understand that if the plants are overpotted, or if the soil is tenacious, that the heavy rains will sodden the soil, cause the bloom buds to fall off, and injure the general health of the plant.

Such are a few things I have noted amongst the Belgian cultivators, and I shall be glad if they be of any use to the admirers of this lovely flower at home.—D., *Deal*.

THE AMATUNGULA AND KEI APPLE.

Having a familiar and personal acquaintance with both the "Amatungula" and "Kei Apple" of South Africa in the fresh state, I venture to offer a few remarks concerning them in that condition, by way of supplement to Mr. Jackson's interesting paper in No. 16 of the "Food Journal," which draws attention to these fruits in their preserved state.

The Arduina grandiflora, which bears the Amatungula of the Zulu Kafire, is an apocynaceous plant, belonging to the same tribe as the Periwinkle (Vinca major and minor), of our hedges. It is a very beautiful stiff evergreen shrub, a few feet high, with dark glossy leaves, armed at the base with remarkable bifurcated thorns, which remain green until quite old. It grows in sandy and boggy places along the Natal coast in the close neighbourhood of the sea; the Ivory Nut Palm (Phytelephas), the wild Strelitzia, and the Aloe of various colours and forms being its ordinary companions. The fruit, which is correctly described as varying considerably in size, looks very much like a small Plum, and has thence acquired for itself the name of the Natal Plum. It is reddish at first, but becomes of a dark violet hue as it ripens. When ripe it has a white milky juice, of an agreeable sub-acid flavour, and is very acceptable and refreshing during the South African coast heat. The milkiness of the juice is obviously due to the presence of caoutchouc, which is yielded in abundance by some members of the tribe. There are other plants in the family that are favourably known on account of their fruits. The Carissa Carandas, which elsewhere furnishes a well-known substitute for Red Currant jelly, is closely allied to the Arduina of Linnæus.

But it must also be added that there are other members of this particular family which are by no means of so agreeable a repute. The Tanghinia veneniflua of Madagascar, which is a sort of first cousin of the Carissas and Arduinas, has a fruit with a kernel not larger than an Almond, which is so energetic a poison that one kernel is a deadly dose for twenty men. The Oleander, which is also of poisonous power, belongs too to this family. Indeed, this is one of the notable instances of the development of harmless fruit by some members of a very baneful tribe. From my own experience I should be inclined to doubt whether the ripe Amatungula would be found to be altogether wholesome if very freely indulged in, although, on the other hand, I have never heard of any actual mischief following upon its use; but that it would be very materially improved as a fruit by garden cultivation there can be no doubt. The wonder is rather that the fruit should be so good as it is in its rude state, than that it should have some questionable qualities. There are few wild fruits that have not a hair-oil-and-furniture-varnish essence of some sort to be extracted or dissipated by the refinements of horticulture, before they can be said to have become worthy of a place in the dessert as well as in the desert. In the case of the unrefined Amatungula the *soupçon* is certainly of the "waterproof" kind. If, however, this fruit ever have as much done for it by cultivation as the wild Crab had before it was turned into the Ribston or Newton Pippin, it will most probably prove a valuable addition to our gardens.

The flower of the Amatungula is formed like that of our common Periwinkle, but it is white, and very much smaller than the blue flower of the Vinca of our hedges, notwithstanding the specific appellation grandiflora, which for some reason has been conferred by the botanist upon the species. The flower is, nevertheless, very bright, star-like, and pretty when it appears among the dark glossy leaves. It is commonly seen upon the plant at the same time with the red and violet berries of the ripening fruit, and in some measure suggests the thought of the Jasmine, until the eye detects the very curious armament of green-forked spines.

The Amatungula is very commonly employed as a preserve by the Natal coast settlers, but this preserve is for the most

part very coarsely and rudely made, and, as it is ordinarily seen, does not do fair justice to its capacity. When skilfully prepared it has a pleasant acidity, delicately touched with the peculiar flavour of the fruit, which gives it a fair claim to colonial favour, although it must be admitted that even then it stands a long way behind the Raspberry, Gooseberry, and Green Gage of Old England.

The "Kei Apple" is the berry of a plant belonging to the interesting family which produces ebony and the iron woods. It is a large evergreen shrub with small thick-set leaves, and grows well in higher and colder districts than the Amatungula. It is, indeed, properly a member of the upland and inland bush. The shrub has hard wood, is of slow growth, and is of great value on account of the splendid thickset hedge which it forms, densely armed with strong dry spines three-quarters of an inch long, and as hard and sharp as a needle. The well-grown Kei Apple fence is a barrier which no living creature will face. It is simply impenetrable, and in addition to its proper bulwarks, it throws out outworks in the form of long straggling arms that are also bristling with sharp spines. It is a deciduous plant, having a tender light hue in the first spring, maturing in the advanced summer into the dark green of the Beech, and occasionally almost assuming the sombre tint of the Yew. The plant is also diœcious, some of the trees bearing only a stamen producing unconspicuous flowers and no fruit. When not trimmed and trained into a fence, the Kei Apple developes into a very large tree. The plant is either a Diospyros, or a near ally to that genus. In common with all the Ebenaceous plants it has some affinity with the Holly. Another species of the Diospyros genus, the Diospyros Kaki, furnishes a well-known Chinese sweetmeat.

The name Kei Apple has been conferred in consequence of the fruit having been originally noticed in the neighbourhood of the Great Kei River, the stream which divides the Old Cape of Good Hope settlements from Independent Kaffraria. The fruit is, however, quite as generally known in the Natal district as Dingaan's Apricot, the second part of this designation being suggested by the woolley Apricot-like aspect of the skin. Dingaan, who confers the other part of the name, was the brother and successor of the first great Zulu potentate, Chaka; and was also the chief adversary of the Dutch Boers, who occupied Natal before it became an English dependency. It is to be presumed that he was a patron of this fruit, as he has thus made it a present of his august name. But that he ever used it in any other sense than a medicinal one in those ante-saccharine days, when neither the cane not its sweet extract had yet put in an appearance in the Zulu Kafir district, is certainly very much to be questioned. Distilled vinegar is tame as an acid compared with the matured juice of the Kei Apple. The Dutch settlers, indeed, prepare it for their tables as a pickle without vinegar, and it is by no means contemptible in that form. It is also, on this very account, a good preserve of the Red Currant jelly class, when prepared with a liberal hand in the matter of sugar, and a thrifty and prudent one in the matter of fruit. From my own personal experiences I am able to offer Mr. Jackson my warm congratulations that fate has allowed him to be innocent of the Kei Apple in its fresh state. If he ever chanced to make an acquaintance with it in that condition, I venture to assure him that he will return to his first love, the Kei Apple preserve.

There are other fruits which are now most valued acquaintances in every garden of Natal; not, however, indigenous, but introduced and naturalised productions. First and foremost there is the most exquisite Loquat, an importation into South Africa from some of the islands of the Eastern Archipelago. The Loquat is a small apple, just of the right size for a tolerably well-developed human mouth, with a juicy pulp intermediate between the Gooseberry and the Peach, and with a malic flavour strongly inclined in the Gooseberry direction. It has two or three large central pips, almost arriving at the dignity of stones. In fact, the Loquat is very much a small apple, that you can squeeze like a Gooseberry, and that has a flavour more exquisite and delicate than the best Apple of England. It is one of the most agreeable and refreshing fruits that can be encountered in a hot climate; and it has the great advantage that it can be indulged in without any of those second thoughts that will come over the botanical mind when it contemplates the so-called harmless fruit proffered by some atrocious ally of Dogbane or Nightshade. The Loquat is the fruit of the Eriobotrya japonica, a true member of that honest Apple family, whose worst perpetration, under the most unfavourable circumstances, is malic acid and rough cider. And a perfect glory of the garden is the Eriobotrya japonica, with its whorls of pendant dark green leaves, glistening white underneath, and fashioned upon the mould of the Sweet Chestnut. The flower is an enlarged copy of the Hawthorn, with the true Hawthorn fragrance, comes out from the centre of the leaf-tuft, and there ripens into large bunches of luscious fruit, looking like small golden Pears, often of considerable size and weight. The tree is an evergreen, and has a curious habit of always keeping itself in the fashion of a trim standard.—R. J. Mann, M.D.—(*Food Journal.*)

DESTROYING THE MEALY BUG.

There are few who like to acknowledge the presence of this pest in their collections. I am bold, perhaps, in saying that I have been in summer in very many stoves and warm plant and fruit houses, and in most instances have seen unmistakeable evidence of its presence. I am sorry to say it, but it must be said, plants infested with mealy bug are not uncommon on the exhibition stage. Why, then, strive to keep in the background what will always show itself? I know its presence is considered solely due to want of cleanliness on the part of the cultivator. I have heard blame attached where no blame was due. It is one thing to find fault, another to have cause. It is a common failing for people to see the negligences of others, and utterly fail in seeing what is needed on their part to make cleanly cultivators. How frequently are slovens made by the little care and the indifference of those whom they serve in providing willingly the means requisite for cleanliness, which they often do grudgingly or altogether withhold? The importance of cleanliness cannot be over-estimated. A clean person and a clean healthy dwelling, are the highways to health; but a dirty person and a dirty unhealthy dwelling are where disease strikes in its greatest severity. So of plants; they need a clean house, properly constructed to afford the light, air, moisture, and temperature needed for their healthy development, and these conditions must not only be provided at first, but be maintained. The glass must be kept so that the light is not obstructed by a coating of moss, and ventilators must be workable. I have known more than one gardener not able to give air to vineries because their employers were slow in supplying the required cord, and in other cases the lights could not be moved because they were out of order. The masters were indifferent as to that, but not backward in complaining of the Grapes being all at the top of the house, and ripening there much earlier than elsewhere, and in grumbling at defective bunches and berries, failing to see that that indifference was the cause of red spider and perhaps mildew. Indifference on the part of employers tends to produce indifference in servants.

The most important agent in keeping down mealy bug is thorough cleanliness. Mealy bug is one of those pests which harbour in wood as well as on living plants; indeed, it will exist on everything used in the construction of plant houses, and in the culture of plants. The woodwork should be thoroughly cleaned at least twice a-year—October and March, using soft soap not less strong than 3 ozs. to the gallon, keeping it from the glass, and this should be cleaned with clear water. Every wall should be coated with limewash, adding 1 lb. flowers of sulphur and 4 ozs. of soft soap to every gallon, and the woodwork should be well painted every alternate year—better every year. The cleaning must be thorough. Mealy bug cannot endure paint; there is no insect, probably, that spirits of turpentine, especially its vapour, will not kill.

As regards cleaning the plants, I am a firm believer in water being the best thing to use. Mealy bug cannot withstand it, and, though it may shield itself from it in the cracks and crevices, on the plant which can be subjected to the force of water from a syringe its days are few. When a plant is infested (and all plants should be frequently examined to see that they are free of insect pests), I advise that it should be gone over where it stands, if this can be done, and if not, it should be removed with the least disturbance—not that the insects are likely to run, but they fall, and one dropped may soon cause a generation on other plants near which it falls; but if cleaned where it stood, if any drop, the insects will generally return to whence they came. I go over the plant leaf by leaf, scanning well every joint, and wherever a mealy bug is seen, or the cottony substance of the brood, it is taken between the finger and thumb, and this is after all the best cure; it is tedious, but sure. That done, remove the plant, and laying the pot on its side syringe the plant thoroughly,

turning it round so that it may have the force of the water directed against every part. The water should be heated to a temperature of 160°, and to every three gallons add a wineglassful of spirits of turpentine and 12 ozs. of soft soap. The solution should be applied at a temperature of 140°. This will destroy all the mealy bug escaping the hand-squeezing, but it is not applicable to all kinds of plants. Those with smooth hard leaves it will not injure, but those with soft hairy leaves it will destroy. Examples of plants which it will not injure are Gardenias, Ixoras, and Stephanotis, and those which it will injure are exemplified by the Gloxinias. In the case of soft hairy-leaved plants, the best method is to persist in the hand-cleaning, and syringing with water only at a temperature of 120°. Either persisted in will soon clear the plants of those pests—not that the insect may not return, which it assuredly will do if of long standing. It hides itself in the woodwork, plunging material, &c., and reappears when least expected.

This remedy may, perhaps, be known to everybody, but it is not applicable in every case, as it is impossible very often to remove the subjects, and the solution applied to them may drip on subjects it would injure. For individual plants it answers well, but for a house something different must be used. That something is guano, or the ammonia it gives off. The vapour of turpentine answers the same purpose, but it will destroy every leaf that has not ceased to inhale, and especially plants that do so largely, as Gloxinias, Achimenes, Gesneras, and all of their family, along with Vines, &c. The vapour arising from guano, on the other hand, is invigorating to all but a few, and to the latter, even, in less powerful doses. It is easy, however, to remove such subjects as Gloxinias, Achimenes, Gesneras, and Ferns, and with the house closed to scatter some of the best Peruvian guano on the floors, just covering every part; then sprinkle with water and keep moist. In about an hour the ammonia evolved will be sufficient to make it strongly apparent to the eye and nose. Let the guano remain on the walks as long as you please, keeping them moist, and in case of any mealy bug being found repeat the application; but I have not found it necessary to do so.

In addition to the guano on the floor, I put in each of the evaporation troughs (I have all the upper pipes troughed in all houses requiring a high temperature) a handful of guano, and stir well up, repeating the application every fortnight during the growing season, and this keeps off the mealy bug, and is useful against other insects, especially red spider, for which it is a remedy.

The value of ammonia to the cultivator is well known, and the greater benefit of natural watering as compared with artificial watering is in a great measure due to its presence in the one case, and absence in the other. I am persuaded that for sprinkling, for every three gallons used, 1 oz. of guano would be vastly superior, more beneficial than water only, which from its being drawn from a source deprived of its ammonia possesses no stimulating quality. Strained I consider it would be very beneficial for syringing plants. Having tried it but to a limited extent, I cannot say more than that it has a beneficial tendency similar to that of soot water, it is of an equally harmless nature as regards the foliage, and does not discolour paint, &c.—G. Abbey.

THE FOREST TREES OF HINDOSTAN.

Foremost amongst the crowd of leafy princes in ornamental beauty and commercial value stands the Ironwood tree of the Burrampooter valley, Mesua ferrea. Tall, straight, and symmetrical, it rears itself some 60 or 70 feet high, tapering upwards in its glossy green mass of waxlike foliage, beset with snowy, fragrant, golden-centred flowers of the Camellia character, its timber unmatched for weight and hardiness by any other in all the immense wildernesses of Ind, and its worth enhanced by its comparative rarity, for the axe has played sad havoc with the very partially-scattered groups to be met with at the present time. The dried flowers are sold as a perfume. There are certain conditions of soil, clime, and natural production which have hitherto baffled the zealous arboriculturist in his labours to propagate this beautiful wonder of the woods. I sent large quantities of seed to the Royal Botanic Gardens in Calcutta, and ill success appears to have attended all the attempts at introduction, besides the unavoidable catastrophe of those gardens being more than once utterly demolished by frequent hurricanes, known as "cyclones." When I was building a house in Assam, I succeeded in finding and felling some first-class ironwood timber, and when it was ready for use had to employ no less than three lusty elephants to drag each of the best specimens to my locality, a few miles distant, and they found it hard labour, too; the ground being soft and marshy, with no vestige of a roadway, all stumps, and bushes, and bogs, putting wheels or rollers quite out of consideration. Slowly and surely my mast-like logs found their way to my work! I will return to this little-known order of Garcinaceæ presently.

A rival in beauty and utility, though quite of another type, appears in profuse array, the gorgeous Lagerstrœmia reginæ—every spike of rose-red flowers enough to fill a market-basket. Grand in its regal bloom and stout in its growth, yielding durable though crooked logs, preferred by the Burmese for ship's "knees," and by the 'cute Anglo-Indian adventurer for the roof supports of his residence, this lovely tree attains a moderate size in cultivation, and flowers annually in the gardens of Lower Bengal.

On entering Central and Lower Assam, the European stranger is overpowered with admiration of the gigantic woodland scenery. As he ascends the noble Burrampooter, winding among ranges of little hills and grand mountains, he will with his telescope scan the interminable tracts of dark forest, and occasionally define its constituent "Sylva." Spreading over the lower country, his glass will, from the poop of the steamer, proclaim that here Shorea robusta is indigenous and paramount, its sombre and silent shade telling the well-known tale of death-dealing malaria, which has laid low many a bold hunter and brave botanist in the regions of heat and moisture, the combination so necessary to the life of this valuable timber tree, attaining its proudest dimensions here, and in the equally noxious atmosphere of the Nepaul Terai. The Government gun-carriages, the transport train, the military buildings, the warehouse of the merchant, the craft of the native boat-builder, all constructed of the heavy fibrous wood, supporting great strain and shock, while so heavy as to sink in water, and hence requiring rafts of bamboo and earthen pots to give it floatage in conveyance by river. Were it not for the annual conflagrations caused by the primitive custom of burning the old grass lands, India would at the present time have been indeed overstocked with this invaluable tree. Most of your readers may not be aware that dammar is the gum or resin of Shorea robusta, which is annually collected by woodmen, who pay a license for gathering forest produce—*i.e.*, charcoal, honey, beeswax, gums, and the flowers of Bassia latifolia for the distillation of spirits. I once visited a noble forest of this tree, the hereditary property of a Mahometan priest. It had evidently been tended and conserved by past generations, for the giants appeared as clean and regularly placed as in a recent plantation! I was allowed, as a special favour, to fell one of the monsters of the many hundreds standing in proud state, and found the timber very solid and mature. The grain of the wood is much like that of our English Elm. The railways have availed themselves largely of its comparative abundance and good qualities, and the Government conservators are keeping a strict eye upon the herdsmen and other incendiary tramps, to save the young seedlings (self-sown) from annihilation.

This is not the only precious individual in that remarkable order, Dipterocarpaceæ, for Vateria indica supplies that elegant resin known to commerce as East Indian Copal, closely resembling amber, and often containing flies and other minute natural objects. I have had beads and mouthpieces for pipes made of this substance, but it is too brittle for much handling. Combined with boiling linseed oil and a little pale dammar, it is in general use by carriage and house painters in the East as a varnish; while among the aborigines of Malabar it is manufactured into candles, which burn with a clear light, no smoke, and fragrant odour. This gum resin is highly electrical. Vateria lancifolia yields the incense used in Hindoo temples near the coast. Dipterocarpus lævis and angustifolius furnish the balsamic oil known as gurjun. An old tree will supply by tapping and charring 40 gallons in one season, but will soon perish; for this reason I presume the product is rapidly rising in price. I have found it a famous solvent for the most difficult soluble substances. The virgin forests of our north-east frontier and also Burmah are its localities, growing in the most dark and pestiferous jungles.

Cedrela species are superb timber producers, yielding the finest woods for cabinet work, the darker kinds being almost equal to mahogany, and taking an exquisite polish. The older the timber, the finer the grain and the darker the veins. This is the favourite wood of the cabinet-makers and house carpenters of the luxurious East. Such furniture as bedsteads, dining tables, chairs of every shape, sofas, cabinets, chests of drawers,

&c., are to be daily seen in all the splendour of French polish, and of the latest European designs; it is generally known as "Toon wood," and is very remarkable for its lightness, being only a little more heavy than deal, unless of the scarce mountain species, when its density increases, as its beauty also. This latter kind is rather rare in commerce, though so plentiful in the virgin forest of the upper Burrampooter districts; the reason being that no local saw-mills have yet been started, and the rapids are too heavy to raft such fragile logs; indeed, there are few woods can withstand the terrible grinding force of those vast cataracts, which not only smash gigantic trees into drift wood, but more frequently impound them for ever in some unapproachable cavern beneath the waves. In the vicinity of the great north-east rivers, the Upper Burrampooter, the Debong, and Dehong (the latter supposed to be the veritable Sampo of Tartary), the nomadic tribes have long ago felled and cut out into canoes all the specimens of this valuable tree, not only for their own use, but for barter with strangers and frontier traders in salt and cloth, their two chief desiderata. I obtained two or three of my own canoes in the rough after this fashion, the Toon wood boats being preferred by experienced hands for navigating the most dangerous waters, their elasticity and buoyancy rendering them more manageable than other timber. When on two expeditions into that remote highland country (N. latitude 26°) in 1858-59, I carried all my troops, and two mountain howitzers with their ammunition, and several days' commissariat, in these hollowed trees, the most primitive form of *cava trabes*, and by portage at the most difficult rapid of the Dehong, I reached my destination just fifteen miles beyond where the only European traveller, Lieut. Wilcox, had ever set foot. But few accidents occurred during the return voyage. Some arms and two or three canoe men were lost; in my own light and handy canoe I managed to rescue more than one man, and mine was the last boat to leave that inhospitable and treacherous country.

While traversing its wonderful forests I frequently came on some crumbling giant Cedrela, fallen and defunct from antiquity, and I well remember walking in at the base of the grand old relic of Nature and out at the upper trunk, with plenty of space overhead (I am nearly 6 feet high). I was always a canoe fancier, and possessed all the best that could be obtained. Two of these were fitted in "barbaric pomp," with ornamental roofs and screens of a particular leaf, combined with lattice of split bamboo and rattan, adjusted to form a sitting cabin and a sleeping berth; these were, of course, larger than usually met with. There was also a tiny cook boat, fitted with its clay hearth and the latest inventions of portable culinary utensils, from the sheet-iron stove for charcoal down to the newest toasting-fork, and the little craft had its store-boxes and bunks well freighted with commissariat. The most symmetrical of the lesser "dug-outs" I had selected for the fishing department; it was hollowed and fitted out under my own eye by two experienced "cutters," and then I added all manner of small angling dodges, and finally stowed away a spare steering paddle of tested Terminalia citrina (should this break all will certainly be ducked and bruised, perhaps drowned), with the best canoes and the best men money could procure. Not once in three years did I ever meet with a *contretemps*, though I dared anything and everything "in a hell of waters," which must be seen and encountered to be understood by the fireside Englishman. Now that the Forest Department has been thoroughly organised by Government, doubtless the Cedrelaceæ will be protected within our actual territory; but on the debateable hunting-grounds of the above nomadic savages poisoned arrows will ever be more plentiful than foresters!

In this valuable order of timber trees we have the satinwood of Southern India and Ceylon, yielding also a useful oil for painters; also Swietenia Mahageni, or mahogany tree, long introduced and partially acclimated; in fact, the first instance of this exotic seeding has just occurred at Madras. The cyclone in 1864 or 1865 destroyed one or more noble specimens in the Calcutta Botanic Gardens said to have been planted by the founder of the establishment, General Kidd, a century before. In a gale at Berhampoor, in Lower Bengal, a most promising beauty was blown down, and I was so lucky as to meet with a piece of the wood some time after. It had been sold by auction. Its grain was good, but colour so unusually pale that I had to employ very dark French polish in finishing my work, using plenty of dragon's blood.

There are still a few experimental trees at Berhampoor, planted in low alluvial ground, where they do not appear to make any growth. Then we have the fine Chickrassia tabularis in this family, scattered over the more rainy of our climates, for it is a moisture-loving tree, in large demand by the Calcutta upholsterers and cabinet-makers, being beautifully veined.

All this order contain a great amount of febrifugal property in their bark, their habitat being the most feverish localities, like the Cinchona and the Willow, both furnishing the potent alkalines quinine and salicine.—(*English Mechanic and World of Science.*)

THE PREPARATION AND PROPERTIES OF THE VARIOUS KINDS OF CHINESE TEA.

It is proposed to review the various stages and processes of growth and manufacture of Tea, as supplied by China to the civilised world, with reference to the medicinal and dietetic properties of the various forms of this "necessary of life." It is to the credit of the Celestials that, whilst they do not live under the strict rule of Islam, they have elected to confine themselves chiefly to the use of a drink which has commended itself to all sorts and conditions of men. In no other country is such a store of wealth drawn from the very leaves of trees as in China, where the Mulberry leaf furnishes silk for clothing, and the Tea leaf material for satisfying hunger and thirst.

The Tea plant of China, the Thea cantoniensis or Thea viridis of botanists, is not the same as that used in very remote periods by the people of the classical period. They probably used the leaf of the Chicory, as well as those of other plants still used in various parts of the country, such as the Willow, the Holly, the Sageretia theezans, and other plants.

Since the seventh century of the Christian era the growth of the Tea shrub has been sufficiently extensive to invite taxation by the Emperor, though to a much less extent than cereal crops, the chief dependence of the people of the "Middle Kingdom," the name by which China is known to its own people. The Tea shrub is met with in Hupeh province as a small, stunted evergreen bush, varying from 1 to 3 feet in height, and covered with a precarious growth of young shoots, bearing shining, ovate, pointed, and irregularly serrated leaves. It is grown on the hill-sides or terraces of such districts as have a red and rapidly disintegrating sandstone soil, where rice could not well be raised, from the difficulty of irrigation. The shrubs are renewed from young seedlings, after some ten years or so, according to the enterprise of the peasant grower. Formerly the bushes were renewed every five years, but the extraordinary and insatiable demand for Tea has led to the exhaustion of the plants, as anything in the shape of Tea is bought by the speculative and indiscreet foreign trader. The seeds are often abortive, from the damage done to the tree by the remorseless stripping of the leaves. The seeds require some peculiar treatment, such as the soaking in a prepared liquid, or in an artificial mould made of exhausted oilcake. Several seeds are placed together to insure the growth of a single seedling. The seeds yield a fixed oil, which is said to never turn rancid. The Tea oil known to foreign residents in China is the product of the seeds of the Camellia oleifera, a plant called by the same name (Ch'a) as the Tea shrub. The various kinds of Tea—namely, green, black, red, and brick Tea—are all produced by the same kind of shrub, which shows some slight tendency to variation in some such simple characteristics as the length of the leaf, &c. The leaves are picked at three or four periods of the year, commencing with the latter part of April. The bushes are finally clipped to make some of the brick Tea, and to encourage the growth of young shoots in the coming spring. The raw leaves are dried in the sun by spreading on mats, and the shrivelled product pressed and rolled by men, who stand in tubs, kneading the leaves into a ball with their naked feet. This operation gives the twist to the leaf, and removes superfluous watery juices. The Tea is seldom dried by fire by the small Tea growers, unless the weather be wet and the Tea liable to mould from the want of sun heat. It is stored in bags long enough to collect a quantity, and is then "fired" by placing it in thinnish layers on the convex diaphragm of a large hopper or basket, shaped like a dice box, with both ends open, which is put over a charcoal fire. The leaf is exposed to this heat (which never exceeds 212°, and is moderated by placing a thick layer of wood ashes over the fire) for about two hours, being stirred up several times, so as to heat the whole of it gradually and thoroughly. Processes of sifting, winnowing, mixing, and picking follow, and a final "firing," to get rid of moisture acquired during the manufacture, fit it for packing in chests. The stalks are usually rejected, as foreign Tea buyers do not like them. They contain all the properties of

the leaf, and are largely consumed by the Chinese. The Tea ought to undergo no change in the chests, which are carefully closed by soldering. The flowers of the Aglaia odorata, the Jasminum Sambac, the Chloranthus, and perhaps other plants, such as the Gardenia, are used to scent the Tea. Dried leaves of the Salix alba are used to adulterate Tea sometimes, but in the interior of the country such practices are commendably rare. Black Tea forms the bulk of the produce, and is preferred by the Chinese for ordinary drinking. Red Tea is made from the same kind of Tea shrub, and is of a brownish-black, rather than a red, colour. The infusion is certainly of a deep red colour, and this may be the origin of the name Hung-ch'a, or "red Tea," a name given to it by the Chinese. Green Tea is made in Hupeh to some extent by picking at the very beginning of the season the fine hairy summits of the youngest branches of the shrubs. Brick Tea is made from the clippings of the Tea bushes, the dust of black Tea, and from any other description of leaf. Odd stories about blood and other substances being mixed with the Tea leaf and dust are perfectly unfounded. There are "large green bricks" of the coarsest sort, "small green bricks" made of a better kind of Tea leaf, and "small black bricks" made from good Tea dust. The shape of the Tea which is used as a means of barter by the Mongol tribes is more like that of a tile than of a brick. In making brick Tea the leaves and dust are steamed, pressed in moulds of a uniform size, and carefully dried without access of the sun, or any other direct source of heat.

This Tea goes to the Siberian, Buriat, Tungous, Kirghis, and Mongol tribes, who chop it up with salt and butter, or koumiss, after exhaustion of the leaf in the ordinary way. The people of Thibet wisely add a little carbonate of soda to the water used in brewing their tea from slices of the bricks.

If two or three leaves be picked from a Tea shrub and chewed in the mouth, very little in the way of marked impression is made upon the sense of taste. A grassy, slightly bitter, but scarcely astringent flavour is brought out in the mouth. The peasants picking the leaf or passing through the Tea shrubberies are seldom seen to gather the leaf and partake of it, as schoolboys do of Bramble leaves in English lanes.

Prepared Tea leaf is, in fact, a very different thing from the raw, growing leaf of the shrub. Chinese Tea consumed in the country, and prepared by a single "firing," after drying in the sun, is also a very different article from the Congou Tea prepared for the English market. On this account, Chinese statements and experience are of no great use in determining the effects of Tea as consumed in western countries. Russian Tea, which undergoes no special preparation for the short overland journey which it has to make, is more like the Chinese native Tea in flavour. Foreign new Tea—that is, Tea prepared and still in China—is a very different article from the Tea when placed in the teapots of English villagers, after being conveyed in an iron ship through the tropics, in large quantities of some 90 lbs. or more. Tea is described in the Chinese pharmacology as cooling, peptic, exhilarating, rousing, both laxative and astringent, diuretic, emmenagogue, and in large concentrated doses as an emetic. It is used as a wash for sore eyes, ulcers, and wounds of all kinds. It is understood by Chinese physicians that the excessive use of Tea renders people thin, anæmic, and weak-sighted. Tea is taken by Chinese scholars and labourers to stave off the cravings of hunger until a convenient season arrives. Much of the so-called Tea taken by the common people in China is nothing but very warm water. Hot water is often taken by them in large quantities when threatened with colds, fevers, and other acute or chronic diseases, apart from considerations of economy. They regard it as antidotal, corrective, solvent, demulcent, dilnent, lenitive, stimulant, deobstruent, diaphoretic, diuretic, and lithontriptic in its effects. Such a dose is much more sensible than the inevitable "six-penn'orth of the best French brandy" which the English rustic gulps down in the emergency of pain or some other symptom. Experience has taught the Chinese that weak Tea is much better than cold and impure drinking-water. They are exceedingly particular as to the water used in Tea-making. They prefer the comparatively soft water of their large muddy rivers, so often swollen by rain and the melting of snow. They object to Tea made from lake water, as they consider it unwholesome and having a tendency to render the mind dull and slow.

It will be remembered that the leaf used in the making of Congou Tea (black) is first dried in the sun, and then compressed, so as to part with any superfluous moisture. This must lead to a concentration of the principles contained in the leaf. The Tea leaf is stored in bags, and generally subjected to a preliminary "firing" in addition to the formal "firing" previously described, in view of any delay which may occur during the collection of such large quantities as are necessarily prepared at one time for the foreign market. Certain chemical changes tending to the oxidation of the chemical constituents of the natural leaf must take place in the repeated exposure to a moderate heat, and during the storing together in loose heaps of the half-dried leaf freely exposed to the atmosphere. Nothing like fermentation ever takes place, as this would issue in the destruction of the leaf, which is carefully kept from becoming heated or mouldy during the process of making up the whole "chop." A kind of maturation occurs, issuing in the formation of more extractible matter, capable of solution and circulation. The final "firing" has something of the same effect upon the Tea leaf as the kiln-drying has upon the germinating Barley passing into malt—it fixes the composition of the Tea leaf, and renders any further change as unlikely as undesirable. The Tea leaf is then at its best, and any idea of ripening upon the voyage is simply absurd. It follows from the low temperature at which the Tea is dried that no empyreumatic products can be met with in properly prepared Tea. And yet there is a degree of austerity produced in the ordinary black Tea, which causes it to produce nausea, sickness, and diarrhœa when taken in the shape of a strong infusion prepared from the new spring Tea just ready for the voyage to Europe. This is especially the case with badly-secured leaf, which may be assumed to have been purposely exposed to a high temperature in order to fit it for the foreign market. All or most of those effects pass off by the time that the Tea reaches the foreign consumer. The more stable the Tea the better it will turn out. Any change on the voyage is for the worse, according to the experience of the most competent judges. Thirty pounds of the green leaf produce from 8 to 10 lbs. of the sun-dried leaf. One hundred pounds of the sun-dried leaf lose 8 lbs. of weight in "firing," and produce 10 lbs. of stalks, 15 lbs. of Tea dust, and the rest good marketable Congou Tea. New Tea produces in China laxative effects upon foreigners, as prepared for exportation. This effect is not permanent. As a rule, black Tea, under the same circumstances, has a decided diuretic effect, even in hot weather, when perspiration is abundant. It excites in many a strong craving for food, and causes a degree of sleeplessness. The narcotic effect of new Tea is asserted by Johnston in his "Chemistry of Common Things," but has never been noticed.

The large proportion of nitrogen in Tea, amounting to nearly 6 per cent., prepares us to find powerful properties in it. That Tea is a stimulant there can be no manner of doubt. This probably depends upon the presence of the theine, a soluble crystalline substance, which resists the moderate temperature at which the leaf is dried. The peculiar taste of green Tea falsely suggests the presence of more than the usual amount of that astringent principle which, in the shape of tannin, is present in about equal quantity in both the black and green Tea. The properties of Tea as an astringent are turned to account by the Chinese, who prescribe it in diarrhœa when acidulated with vinegar. Cold Tea, to which a small quantity of dilute sulphuric acid has been added, is an excellent diet-drink for use in hot weather when there is a tendency to diarrhœa. That the use of Tea to a large extent has a peculiar effect upon the nervous systems of both animal and organic life there can be no doubt. This is the reverse of a sedative influence. Some of the craving of the Chinese for opium is connected with their incessant drinking of Tea, especially upon an empty stomach. The effect of Tea is to excite, and this property may be turned to excellent effect in cases of opium-smoking and in uræmic poisoning. If good new Congou Tea be given in the latter disease, there is the additional advantage of the diuretic effects of the infusion. In all cases in which coffee is most to be prescribed, Tea is much more convenient, accessible, and powerful. It is obvious that the high temperature at which coffee berries are roasted must be fatal to the presence of much caffeine, a principle identical with theine. This latter substance has been recently proposed by Mr. Lewis Thompson (*Medical Times and Gazette* for February 10th, 1871) to be brought into use as a tonic remedy in typhoid diseases, neuralgic affections, and in senile gangrene. Large quantities of weak Tea, however, tend to the occurrence of sciatica and other forms of neuralgia. The experiments of Peligot seem to prove that, as might be assumed from the presence of so large a proportion of nitrogen, Tea is, as the Frenchman said of the coffee, both "meat and drink." Old women who boil their Tea leaves are right, for they thereby extract much more of

the theine. The antidotal power of Tea, so strongly insisted upon by the Chinese, is worth a trial, especially in cases of poisoning by tartar emetic or corrosive sublimate.

The use of Tea in certain forms of dyspepsia is a common Chinese practice. If taken as a plain drink between meals it seems to give tone to the stomach. It is obvious that the "Tea" of our domestic tables, a compound of milk, sugar, and much water, is not the article intended to be spoken of in these pages. The sooner *infusum theæ* is placed in the British Pharmacopœia as a recognised article of the Materia Medica, the more likely are we to place its employment upon a scientific basis, and thus to rescue a very important drug from the contempt of familiarity. A tincture of Tea is not a desirable preparation, as theine is only sparingly soluble in cold alcohol. An extract of Tea, carefully prepared, would be an excellent preparation for trying the effects of Tea in the delirium of fever and the stupor of intoxication.

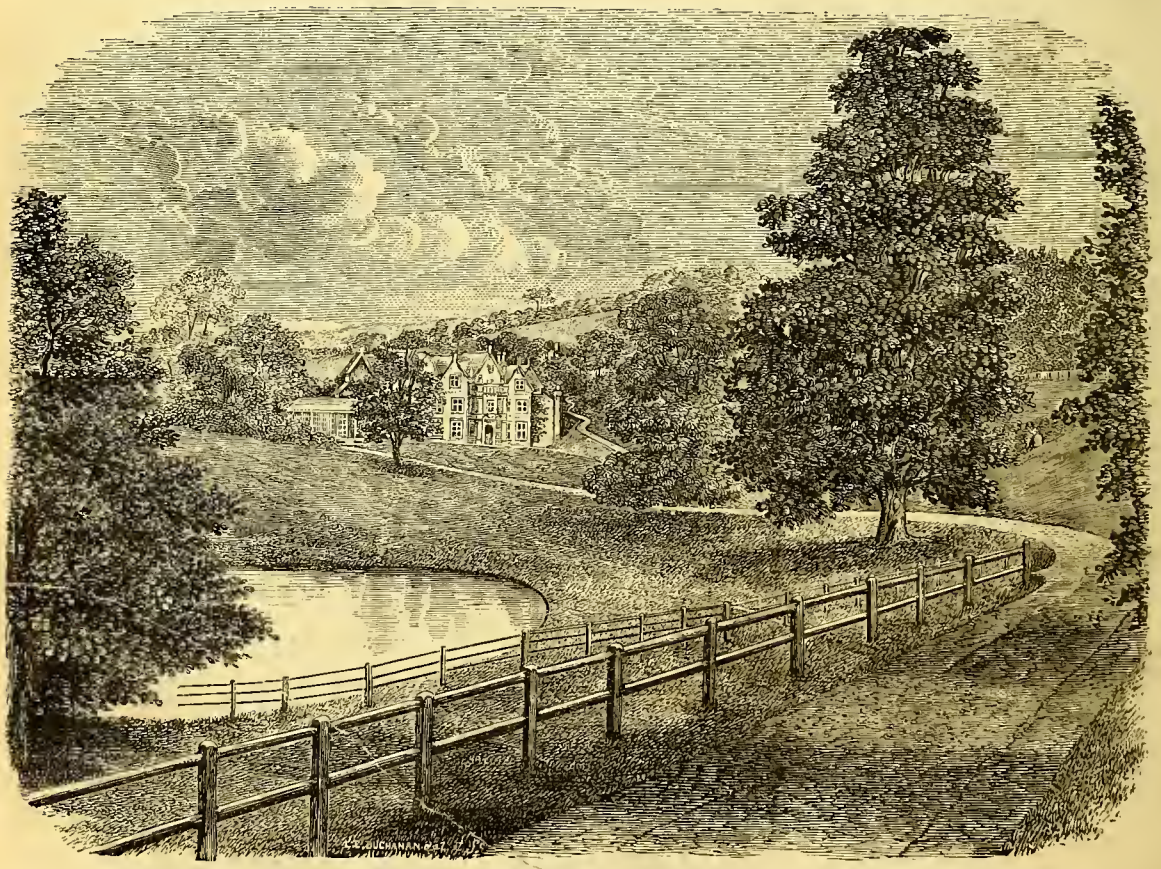
The Chinese are under the impression that foreigners are compelled by some instinctive necessity to send and buy the Tea of the land of "the Glory of Summer." Of the influence of Tea upon the sobriety of our countrymen and countrywomen there can be no doubt. When our poor people cease to waste their Tea leaves, and begin to eat them as a dish, like the people of Mongolia and Siberia, another important step will have been taken in the direction of completely utilising the properties of this most important article of diet and medicine.

Brick Tea might economically be introduced into use on board our ships of war, as it is cheap, portable, good, and much less perishable than ordinary Tea.—F. Porter Smith, M.B. (in *Medical Times*).

COMBE ROYAL.

"Who are you?" "Visitors to Combe Royal." "Ha! Ha!" Such was the query, reply, and final laugh which occurred at the door of the Maltsters' Arms, at Harbleton, where we pulled up on an 120°-in-the-sun day of this present month of August to give our horses a few mouthfuls of water. If our interrogator had been even a better authority than a parrot we should not have been deterred from proceeding to our destination, for we were assured by good judges that we should be well recompensed for enduring a drive of thirty miles under such a sunshine; those judges were right, without any reference to the specially excellent cider made in the parish.

That parish is West Allington, in Devonshire, about a mile from Kingsbridge. The manor was an ancient demesne of the Crown in the time of the Norman monarchs, if not even previously, and was given by King John to Alice de Rivers, Countess of Devon, but reverted to the Crown, and was subse-



quently granted by Henry III. to Matthew de Besils. Afterwards it was divided into various smaller estates, one of which was certainly "all that barton known as Combe Royal," for a barton was the demesne lands of a manor, and is named in an existing deed of the time of Edward III. This barton passed to various possessors until the Gilberts became its possessors, and one of the Gilberts of Holwell sold it in 1736 to an ancestor of the present proprietor, John Luscombe Luscombe, Esq. Luscombe is a truly Devonian name (and is Anglo-Saxon for "a valley of delight"), and the Luscombes of Luscombe, in the parish of Rattery, held there a knight's fee in the time of Henry IV., were residing there in 1630, and how much later we know not. The family were never ennobled, but they have always borne "the grand old name of gentleman," and we can add, from experience, that the Luscombe of the present fully sustains Westcote's character of the Devon gentry, "they are civil, affable, kind, and courteous to strangers."

Combe Royal undoubtedly was so named because part of the King's demesne, but it also merits the distinguishing epithet as one of the kings of the wooded valleys of the county.

The entrance-lodge is at one extremity of the valley, the house is at the other end, and the approach, as shown in our

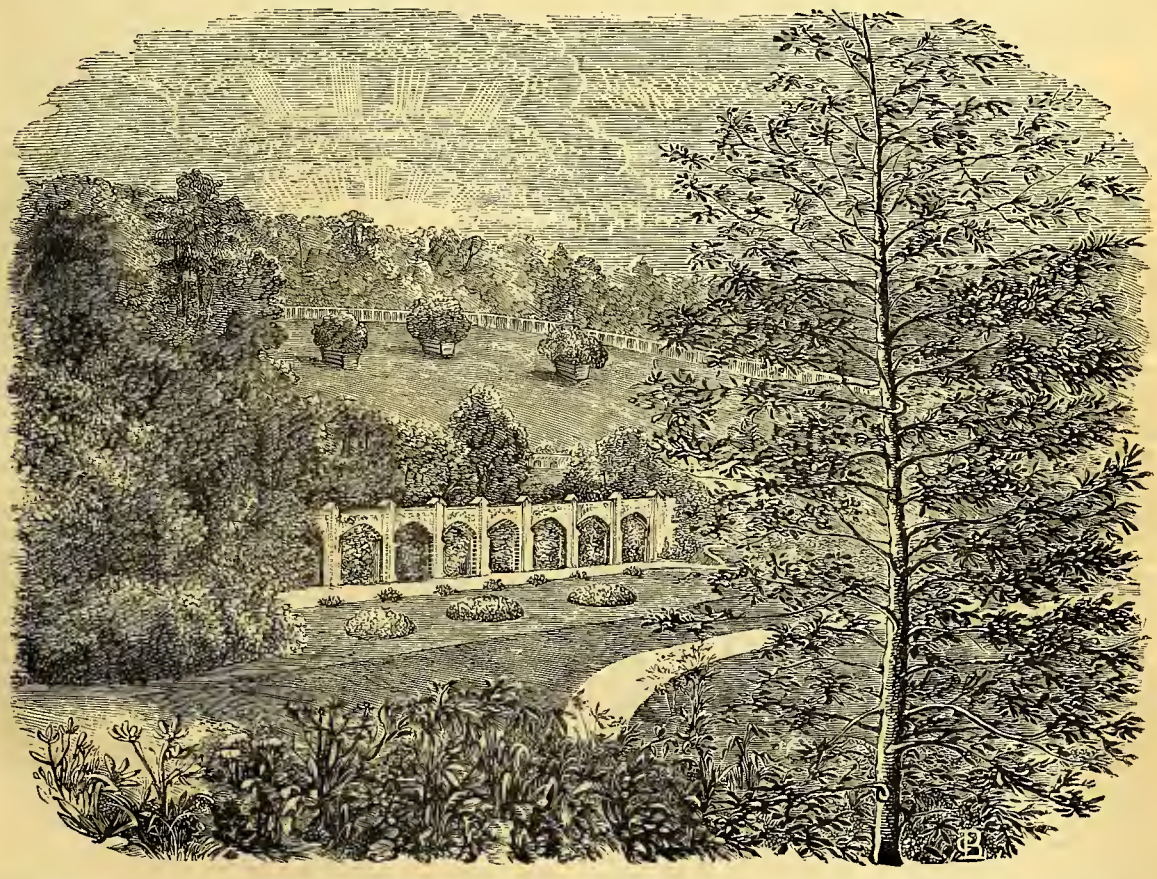
engraving, is by a road winding along the valley between the well-planted hills which border each side. Its situation is peculiarly adapted to the growth of exotic plants, as it is 280 feet above the sea level, and screened by hills from the prevailing south-west winds, and also from the north and east.

The successful culture of the trees of the Citrus family is a peculiarity of Combe Royal, as it is believed that the luxuriance and fruitfulness of the trees cannot be equalled in England, when it is remembered that no protection is afforded them beyond the walls on which they are trained, and the frames of wood or reed with which they are covered by night and partially by day, when needful, in the winter. One Seville Orange tree, from which vast quantities of fruit are annually gathered, is traditionally known to be 250 years old, from the fact that the grandmother of the present proprietor was told when a child by her grandfather, John Luscombe, Esq., that it was more than a century old when he became the possessor of the place. The Citron trees often produce enormous fruit, several having attained 17, 18, and even 19 inches in circumference. The Shaddocks, Lemons, and Limes are fine in proportion. No permanent injury has ever been done to the trees by the severest winters, except in 1859-60, when a vigorous Bergamot Lemon was killed, which at the time bore a fine crop of fruit, averaging 12 inches in circumference. A magnificent basket of Citrus fruit was in 1850 presented to the Queen, who, through Sir Charles Phipps, graciously expressed her surprise and admiration of their size and beauty, and sent Mr. Toward from Osborne to inspect the trees.

The orangery, or, as it might more justly be entitled, the citrusry, for it includes the best fruit-bearers of the genus, is on the side of the valley, has nearly a southern aspect, and is a recessed wall, as shown in our engraving. The recesses are all 11 feet high, but vary in width. That in which the Lemon is growing is 15 feet, that of the Citron 16 feet, and the six other recesses are 12 feet. All of them are 15 inches deep.

The occupants of these eight recesses are the Lemon, Bergamot, Citron, Seville Orange, Shaddock, Orange, Lime, and Mandarin Orange. Although the thermometer fell to zero last winter no injury was caused to any one of the trees, although their only protection was reed panels. When we saw them, ripening fruit was on all of them, and the healthy luxuriance of their foliage was most striking. Anyone about to erect such recesses for the culture of the Citrus genus would do well to have each 18 feet wide, for the need to prune back the branches in the Combe Royal recesses must increase the difficulty of securing the fruitfulness of the trees by avoiding over-luxuriance.

Perhaps one of the largest specimens of Acacia dealbata in England once ornamented the grounds. It was, unfortunately, broken down and uprooted by the weight of snow in an unusually heavy fall in December, 1859. It measured 54 feet in height, and the trunk was more than 5 feet in circumference. From the heart timber an ornamental drawing-room chair has



been manufactured. A very large species of Eucalyptus, a native of Tasmania, has stood the last winter well, and bloomed profusely in the spring of the present year, while Embothriums coccineum and lanceolatum have been gorgeous with their scarlet flowers, and Camellias prodigal of bloom. Desfontainea spinosa has done well, and Opuntia Rafinesquiana grows and blooms in the open air.

Many more plants, shrubs, and trees deserving notice must be omitted, but we will observe that the Datura arborea in the conservatory had four hundred of its noble flowers open simultaneously. In the open ground we saw specimens of Cycas, huge bushes of Camellias, species of Aralia, Bamboos from the Himalaya, Abutilon vitifolium, all of which endure the winter unprotected. We also noticed a deciduous Conifer, the name of which is doubtful. We think it is the Glyptostrobus pendulus, a native of China; at all events it is hardy at Combe Royal, and we should like to be certified of its name. We must note one bed of Phlox Drummondi in front of the conservatory. We never saw a bed of crimson, scarlet, purple, and pink flowers so brilliant. Beds of Verbenas on each side looked poor and paltry in comparison.

Almost equalling the orangery in interest is the American

garden, formed by the present proprietor in a branch of this "happy valley." Among a collection of other trees and shrubs it includes the Sikkim Rhododendrons received from Kew through the kindness of the late Sir William Hooker. Many of them are doing well. The strongest and most floriferous are Thomsoni, niveum, and Blandfordiæflorum; the latter produces its gay and peculiar blossoms in the greatest profusion, and the bushes of Thomsoni are gorgeous with their wax-like bells of the richest crimson. Being seedling plants they vary much, and several cannot be identified when compared with Dr. Hooker's exquisite drawings, or rather the plates from his drawings. This year the beautiful yellow Rhododendron Wightii flowered for the first time, but the blossoms were pure white; its foliage, however, is unmistakeable. Some of the more tender sorts—Dalhousiæ, Edgworthii, Aucklandii, Falconeri, and one or two others, will not endure the winter even at Combe Royal. The Japanese Rhododendron Metternichii has borne the severity of the two last winters well, as have five plants of the Himalayan R. cinnamomeum. The preceding winters have proved fatal to many large specimens of the true R. arboreum, two only having survived. The trunk of one of the defunct trees was measured recently, and found to be, a short distance above the earth, 3 feet 1 inch in circumference.

The recent proprietors of Combe Royal have been gardeners as well. As far back as 1812 a practice of J. L. Luscombe, Esq., for successfully raising cuttings of the Citrus genus was made known to the Royal Horticultural Society and approved by the then President, T. A. Knight, Esq. The same Society awarded him a Banksian medal for Oranges, Lemons, and Citrons exhibited in the April of 1827.

CHEMICAL POWERS OF THE SUNLIGHT.

The facts stated in an article under this heading, quoted in last week's Journal of Horticulture, if correct, must be erroneously attributed to the cause assigned. The author is obviously very imperfectly acquainted with the results of recent research into the constitution and effects of light, the influence of which upon vegetation has been the subject of many experiments, and the particular action of the different rays is now pretty well known. The various-coloured rays which compose white sunlight, as shown on analysis by the prism, are generally classed as the red (including the ultra red), the yellow, and the blue (including the violet and ultra violet) rays. The principal effect of the last, or blue rays, is chemical, actinic as it is termed, and chiefly influences the germination of seed; their illuminating and heating powers are smallest, instead of, as erroneously stated, their giving "the largest quantity of solar heat." The yellow rays, which have the greatest illuminating power, influence the growth of the plant, the decomposition of carbonic acid, and the formation of colouring matter. The red rays, the heating power of which is the greatest, influence fructification mainly.

As a ray of ordinary sunlight consists of rays of all the colours of the spectrum, the effect of blue glass is in reality to intercept the complementary rays—*i.e.*, the yellow, red, and ultra red, and it would consequently be more correct to say that the sun cast a diminished portion of yellow and red rays on every leaf in the grapery, instead of "cast a beam of violet light," as if the violet were an addition to instead of a component of the ordinary ray. If, therefore, the effect of violet-coloured glass should be to augment the growth of plants in the extraordinary manner stated, it necessarily follows that the influence of the other rays which are intercepted by the glass—*i.e.*, the yellow and red rays—is to diminish vegetation, which is quite inconsistent with all experiment.

These facts are perfectly well known to physicists and those conversant with vegetable physiology. The chief practical result in this direction of scientific investigation is the introduction for conservatories of a glass coloured greenish by the oxide of copper, which intercepts the excess of the red or heating rays.—Spectroscopist.

The Oldest Rose Tree.—The oldest of all Rose bushes is said to be one which is trained upon one side of the Cathedral of Hildesheim, in Germany. The root is buried under the crypt, below the choir. The stem is a foot thick, and half a dozen branches nearly cover the eastern side of the church, bearing countless flowers in summer. Its age is unknown, but documents exist which prove that the Bishop Hezilo, nearly a thousand years ago, protected it by a stone roof, which is still extant.

AUTUMNAL-FLOWERING CROCUSES.

Seeing the remarks of Mr. G. Abbey on these beautiful autumnal plants, I was surprised at the small list he gives of them. Among autumnal species I possess in addition to those named by him, C. Boryii, white, September and October; Pallasii, lilac, September and October; medius, violet, October; cancellatus, *var.* mazziaricus, white, October; pulchellus, pale blue, October and November; Scharajani, yellow, October and November. This last-named beautiful and scarce species is from Western Russia, and will be some years before it become plentiful. It is equal in beauty to the common large Dutch yellow. I possess about twenty-seven true species of Crocus.—Ebor.

NOTES AND GLEANINGS.

We have received from Messrs. Carter & Co. eleven sorts of African and French Marigolds grown at their seed farms in Essex. The Lemon and Orange African are remarkably fine both in size and colour, and their names are truly descriptive of their colours. Of the French Marigolds, Dunnett's Tall Orange is rich-coloured, and very double. The Double Gold-striped and Double Dark are also excellent varieties.

—— From a catalogue which we have received we find that the extensive horticultural collection of H. Laurentius, of Leipzic, is to come under the hammer. The sale is to commence on Monday, September 11th, and will be continued to October 1st. Herr Laurentius states that the cause of his parting with his plants is a seemingly incurable affliction which renders movement impossible, and after disposing of his new importations he intends to give up his business. There are 4125 lots, consisting of stove and greenhouse plants of all kinds, Ferns and other fine-foliaged plants, hardy ornamental trees and shrubs (including numerous Conifers), fruit trees, &c.

WORK FOR THE WEEK.

KITCHEN GARDEN.

Thanks to Mr. Mechi for proving on a large scale the advantages which vegetables derive from the application of manure in a liquid state. When once the sewage water of towns can be brought economically to the surrounding lands and market gardens, a great improvement both in the quantity and quality of vegetables will be insured. In the meantime I wish to point out that individual houses, however small, as well as towns, have a sewage which, if conveyed to a tank, or to a similar contrivance where a tank would be too costly, and into which the dung of poultry and the smaller animals, soot, &c., which can nearly always be obtained, could be thrown, a valuable liquid compound would be obtained from a substance usually thrown away, and which when applied (diluted, of course, when too strong) to growing crops in the kitchen garden, will produce a marked effect on the produce. As a matter of course, when the dung of pigs and other animals is added, the tank must be on a corresponding scale, but the first object should be to convert to a profitable end matters usually lost, leaving the bulkier manures to be used when the liquid substitute cannot be so well applied. I have noticed that liberal waterings of the above are the best preventive of mildew in Peas and some other crops, which at this season usually suffer from it, acting, as I presume, by inducing a vigorous and healthy growth, and thus enabling the plants successfully to resist the attacks of disease. Attend to seedling and newly planted crops with water, and look over former directions as to bringing up any arrears which, more or less, generally occur in busy seasons. Keep a sharp eye on the larva or grub of a species of cockchafer, which at this season does considerable injury to newly planted crops by eating off their roots. Slices of Carrots may be stuck in the ground, where the insects will attack them, and may be destroyed. Take advantage of a dry day to earth-up *Celery*, which operation must at all times be performed with care, holding the leaves well together with the hand, so as to prevent the earth getting into the centre of the plant. Sow the principal crop of *Cauliflowers* for keeping over the winter. Sow also largely the most approved sorts of *Cabbage* for standing over the winter in nursery beds. Tie up both *Endive* and *Lettuces* to blanch. Pay due attention to the crops of *Onions*. Let them be removed from the soil as soon as they have ceased to grow, if left longer

than this they frequently become mouldy and do not keep so well; let them be spread out in a dry shed till fit for tying in ropes. Earth-up all advancing crops of *Winter Greens* and *Broccoli*. Run the hoe between the rows of Winter *Spinach* as soon as it is aboveground.

FRUIT GARDEN.

Remove the runners from Strawberry plants in pots, and set them sufficiently far apart that sun and air may have free access to their foliage. Gather *Tomatoes* as they ripen, and when they are backward and at the same time much in demand gather a few of the most forward and hang them in the stove; or, where there is not this convenience, place them in a frame, where they will soon ripen.

FLOWER GARDEN.

Besides keeping every part of this department in the neatest order, the propagation of the stock for supplying next season's demand will engross all the time and attention that can be spared. In all cases the number of plants which it will be necessary to provide should be noted down, allowing a wide margin for contingencies, losses, &c. The earlier-struck cuttings must be potted-off, and after they have become established place them out of doors in an open situation, bearing in mind that all the more delicate bedding Geraniums should well fill their pots with roots before winter, otherwise many will be lost. While propagation is proceeding attention must be turned to the amount of winter accommodation for them, which, whether in the shape of frames, pits, or larger structures, should be got in readiness to receive them before bad weather sets in. Continue to plant out Pinks as they strike root, bearing in mind that those which are put out now in the places where they are to flower next season generally lace much better than those planted in the spring. I would advise the growers to gather Pink seed forthwith, allowing it to remain in the capsule or seed vessel till wanted. Plant offset Tulips, and commence arranging the best bed for planting. Of course all careful growers have made the necessary remarks as to the state of the flowers last season, whether too high for their position in the bed, whether stained or out of character, &c. The amateur who is commencing may now have an opportunity of procuring fine sorts at a moderate cost, many extensive growers disposing of their surplus stock at very reasonable rates. I will name a few that are fine and should be grown by everyone, and, though cheap, are indispensable. In Bizarres: Leonidas, Pilot, Charles the Tenth, Captain White, Polyphemus, and Duke of Devonshire. Byblœmens: Thalia, Musidora, Princess Royal, Queen Charlotte, Chellaston Beauty, and Maid of Orleans. Roses: Heroine, Aglaïa, Catherine, Lady Jane Grey, Lavinia, and La Vandicken. These are most of the fine sorts for exhibition, and when in good character gems in any bed. Give Dahlias liquid manure once or twice a-week, and attend to disbudding, &c.

GREENHOUSE AND CONSERVATORY.

Continue to look over climbers, borders, &c. Large specimens which have been placed out of doors to provide room for other things, will soon require housing. This, however, will depend greatly on the weather. The earth worm is a greater enemy to pot plants in general than low temperature; every precaution must be taken to avoid its depredations. Look well to late-flowering plants. Late Heliotropes, Scarlet Geraniums, Petunias, &c., will now be somewhat potbound, and in that state, with the application of weak liquid manure, they will produce an abundance of blossom on a light shelf until the beginning of December. Lachenalias should be potted, and Persian Cyclamens, if planted out, will now be fine bushy plants full of young leaves. They should be taken up forthwith with all the soil possible adhering to them, potted carefully, and placed in a close frame or propagating house; a bottom heat of 75° would be an advantage, with a very moderate atmospheric temperature. After three weeks of this treatment they may be introduced to the greenhouse, where they will produce blossom in abundance from November until April. Where Camellias, Chinese Azaleas, and the Hybrid Indian Rhododendrons were not potted in the spring, and require shifting, the present will be the most favourable time, as the young wood is now becoming somewhat firm, and the flower-buds are perceptible. As this class of plants require water very liberally during one period of their growth, drain the pots well, and use very turfy peat and sand, adding an equal portion of fibrous loam for the Camellias.

STOVE.

Little fresh can be added here at present. Take every means in due time to harden, or rather ripen, the growth already made. Give air very freely indeed at all times, more especially when the warmth of the natural atmosphere ensures safety. Nevertheless, shut up abundance of solar heat with a good amount of atmospheric moisture early in the afternoon. Many of the earliest growths of Orchids showing signs of ripeness in the leaf, and plump pseudo-bulbs, may be removed forthwith from the excitement of the growing house. Any situation where a temperature averaging 60° or 65° by night can be insured, will suit them well; a very moderate amount of atmospheric moisture will suffice.—W. Keane.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

The seeds lately sown have come up beautifully, and stand the weather well, as there is moisture beneath to keep the young plants growing. The last sowing of Cauliflower may be made at the beginning of September, as there will be no danger of that starting or buttoning too early. We have two sowings earlier. Lettuces, Cabbages, &c., rarely do much good if sown after the end of August, as they do not seem to have strength enough to stand the winter, though several times we have sown Lettuces on hard ground in the middle of September, and they have stood the winter well, and come in useful in spring. By hard ground we mean ground not dug, but merely loosened a little on the surface, and the seeds raked in or slightly covered. It is well to have the main sowings made from the 15th to the 25th of August. Between these days is a good time for sowing the main crop of Winter Spinach, as when up the plants grow rapidly in the warm autumn months. We watered Cauliflowers, late Peas, and some fine rows of Scarlet Runners, which, though yielding well, yet dropped more blooms than we wished to see fall. There was another reason for the dropping—a thick crop of fine Turnips between the rows, all wrong no doubt, but one hardly knows how to find room at times when the demand is large and a kitchen garden small. Let us remind those rather young in gardening that one pod on Scarlet Runners left to swell and ripen its seeds will exhaust the plant more than twenty pods gathered in a fresh young state.

FRUIT GARDEN.

We gathered a fine lot of Apricots, whilst many are still not ripe enough, and would not ripen kindly but for the fine weather. We also collected a good portion of a heavy crop of Morello Cherries for brandy, preserving, &c. We used to save these late on the trees for dessert. We question whether it is not better to gather them when ripe, and either brandy or bottle them at once. The Morello is no bad dessert fruit when the fruit is large and fully ripe, as some of ours have been. Grown under glass in an orchard house we have heard it pronounced delicious by good judges.

ORNAMENTAL DEPARTMENT.

Besides moving plants to make way for the changes and fresh arrangements to be effected in the conservatories, corridors, &c., of which, as well as fresh heating, we hope by-and-by to have something to say, we have been potting plants intended for autumn use, sowing Stocks, Mignonette, &c.; but the chief work has been an earnest commencing of *propagating* Verbenas, Heliotropes, Salvias, Geraniums, &c. Coleus should also be got in and established in small pots. Owing to want of room, we generally put in most of our cuttings in shallow wooden boxes, say from 1 to 1½ inch apart. The boxes are so open that they need no drainage. If we have a little very sweet, well-aired leaf mould without a trace of fungus, we scatter a little along the bottom, then we find nothing better than fresh sandy loam however poor. If too loamy we put a little drift road sand with the loam. This soil is passed through a half or three-quarter-inch sieve, the rough goes to the bottom of the box, and the finer, mixed with some fine charred refuse, is placed at the top, and a little road drift-sand covers the surface. We scarcely under such treatment have a gouty cutting, or any appearance of fungi, which make such havoc in boxes of cuttings when the spawn is introduced in half-rotten leaf mould and dung.

We are compelled to refer to previous numbers for many and minute definite particulars.—R. F.

TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Catalogue of Bulbous Flower Roots, Plants, Seeds, &c.*

William Paul, Waltham Cross, London, N.—*Bulb Catalogue*, 1871.

Edmonson, Brothers, 10, Dame Street, Dublin.—*Catalogue of Hyacinths, Tulips, and other Bulbs.*

F. & A. Dickson, 106, Eastgate Street, and Upton Nurseries, Chester.—*Catalogue of Dutch Flower Roots, &c.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Books (*A. Holden*).—"Johnston's Lectures on Agricultural Chemistry."

(*H. J. R. L.*).—The book was advertised in our last number.

Weigela (*Amateur, Cirencester*).—The correct pronunciation we believe to be Wi-gé-la. Your Rose seed may produce seedlings yet. It often remains dormant for a year.

Raspberries not Succeeding—Preserving Everlasting Flowers (*Probo*).—Your garden is probably too dry for the Raspberry. In its wild state it is found in woods in low moist situations. It succeeds best in deep, light, rich loam in a shady position. The best plantation of Raspberries we ever saw was in the south of Scotland, on the north side of a wall 14 feet high. Trench your ground 2 feet deep and manure it well. Cut the Everlasting flowers before they are over-blown, strip off all the leaves, tie the flowers up in bundles, and hang them up in a dry place.

Blotched Peaches (*A Subscriber*).—The blotches probably arise from a deficient supply of sap. Keep the roots well mulched during the summer, and water freely if the season be dry.

Slow-combustion Stove (*P. F. L.*).—The address is J. T. Mayell, 35, Litchfield Street, Soho, W.C.

Roses Among Ivy (*E. M. Rathgan*).—We can give you no encouragement in the attempt to grow Roses among Ivy. The roots of Ivy are such gross feeders they would deprive the Rose of every particle of food and moisture. The only Rose we ever saw hold a brief struggle for existence against Ivy was a Safrano. If a large and deep hole could be dug, and the sides slated, so as to prevent the Ivy roots getting into it, then, perhaps, Roses might do a little good for the time, and Gloire de Dijon, Jaune Desprez, Général Jacqueminot, and Maréchal Niel, all on the Manetti stock, would have as good a chance of succeeding as any other.

Swainsonia galegifolia (*Fair Play*).—It is a greenhouse evergreen.

Seedling Clematis (*J. Nelson*).—The Clematis is not superior to some of Messrs. Jackman's and Mr. C. Noble's flowers already in commerce.

Black Hamburgh Grapes not Setting (*J. T.*).—The probable reason of your Grapes not setting was a low temperature when they were in flower. Had you maintained a night temperature of 70°, with a proportionate rise by day, every berry would have set. At the date you mention, in many places the thermometer fell below the freezing point; we registered 35°. During the time the Vines are in flower do not allow too much moisture in the house; sprinkling the paths and surface of the border twice a-day is sufficient. After the Grapes are set, the night temperature of your house should be from 60° to 65°.

Vine Leaves Diseased (*C. Crofts*).—Unfortunately you have either red spider or thrips on your Cucumbers, we think both, though we do not see any, but we know the marks they leave. If you have only a few leaves affected, clear them off, and syringe strongly with clear soft-soap water of about 1 oz. to the gallon, follow next day with clear water at 100°, and then again, and again, with the soap water, varied by weak clear soot water. But if most of the leaves are affected, it might be better to clear out at once. On young strong plants the above remedy will generally be effectual.

Centaurea (*G. B.*).—You cannot do better than employ Centaurea ragusina candidissima.

Apple Trees under Glass Protectors (*Amateur*).—In addition to White Calville and Ribston Pippin, we would have Kerry Pippin and Cox's Orange Pippin, the Melon, American Mother, Newtown Pippin, Reinette du Canada, and Lord Burleigh. We have discontinued the culture of Apples under glass, as they were subject to mildew, and except the White Calville, and some of the American kinds, we thought they did quite as well out of doors.

Separating Strawberry Runners—Peach Trees Gumming (*Idem*).—As soon as the young Strawberry runners have firmly rooted into the soil they may be cut from the parent plant. If the shoots of your Peach and Nectarine trees have not been injured by tying too tightly to the wires, or by some other cause, we would look for the evil at the roots. Lift a portion of your trees this autumn, replanting them in turfy loam, and if this is successful you can remove one or more portions in the following year. Periodically lifting the trees if the subsoil is dry, at the same time keeping them free from aphis, red spider, and mildew, will prevent gumming, and the shoots from dying off suddenly.

Heating a Small Greenhouse (*Countryman*).—The neatest thing we saw for a small conservatory opening out of the drawing-room, was a tin kettle hollowed like a saddle-back boiler, the kettle holding three quarts of water, a tin flow-pipe from it, and a tin return-pipe into it of 1½ inch diameter, and two of these going round the floor of the house. The boiler was heated by a burner with six jets, and a frame like a lid of a saucepan fitted on the bottom of the boiler, with an opening for air, so as to confine the heat to the boiler. You would want more for your place. Could you not manage to have hot water easily from the kitchen boiler by making it with a fixed top and feeding it from the conservatory? One-inch pipes would do admirably for connecting the two places, and two 3-inch pipes would heat the place comfortably.

Erecting a Small Greenhouse (*A Reader, Leek*).—You will want a good consumption of gas for a place 12 feet by 10. The fumes from the gas must be carried outside. The tin boiler would do, but half the size you mention. Read an answer to another correspondent. The fumes of the oil lamp must be carried off as you say, and then we think you would be deficient in heat. Why not put up a small Rivers's brick stove with a flat top to it for a water-basin, and take the smoke-pipe into the wash-house chimney? and thus save all trouble about gas-burners and nil-lamps, for they will give trouble, and then you may defy frost and old Boreas besides.

Camellias Infested with Scale (*A. A.*).—The best mode of destroying the scale will be to pick off those not brown and hard with the point of a knife, and take those which are brown and hard between the finger and thumb and squeeze them; then wash the leaves and stems thoroughly on all sides with a solution of 4 ozs. of soft soap and a tablespoonful of spirits of turpentine in a gallon of water, and apply with a sponge at a temperature as hot as the hand can bear, or 120°.

Watering Peach Trees in an Inside Border (*Idem*).—It will not be necessary to water the border from the beginning of November up to February, or from the fall of the leaf to the swelling of the buds. When you want to force, the border should receive a copious watering, and should be kept in that condition throughout the growing season. At the commencement and close of this, not nearly so much water will be needed as when the trees are in active growth. For instance, a good watering being given when the buds begin to swell, another will not be required until the blossoms expand; then water when the fruit is fairly set, and about every three weeks up to the stoning, and every fortnight afterwards up to the swelling for ripening, and then every week until ripe. After the fruit is ripened off water every fortnight or three weeks, and when the leaves begin to fall discontinue watering. There is no good in dribblets; the supplies wanted are those which moisten the soil throughout. The Vine requires to have the soil moist when it begins to swell its eyes. We water inside Vine borders when we wish to start the Vines, when they are breaking, when in full leaf, when flowering, when the fruit is set and beginning to swell, and then every fortnight until the fruit change colour, and give the last watering ten days after that. There is no necessity to water Vines at rest. There is no book specially treating of the watering of Vines and Peach trees.

Colour of Greenhouse Inside—Wintering Caladiums (*A. D.*).—We presume you allude to the painting of the woodwork and the washing of the walls. The woodwork of the roof and all the sashed portion of the structure is best painted white, the stages stone colour, and all ironwork red. The walls are best limewashed, but they may be stone colour. Caladiums and Cannas should be kept dry in winter; they should not have any water, but it is well to stand the pots on a floor or other position whence they can derive slight moisture without being perceptibly moist. The tubers should be covered with soil, in which they may be stored. They will do in any place free from frost. We think the Caladium must be C. esculentum, for such as C. argyrites, Balleymei, Chantini, &c., require a stove, or not less than 60° in winter. A red Azalea is Mars, and a white one Fielder's.

Ivy against Painted Wall not Thriving (*A. C.*).—The nature of the Ivy is to cling. We do not see why it should not succeed against the trellis; but there can be no doubt that it would thrive much better if you were to remove the paint from the wall, and nail up the shoots as they advance, so as to cover the wall in every part. If the Ivy is on a south wall syringing in the evenings of hot days would do good, and a good watering in dry periods will do much to establish it. On a north, east, and west aspect the syringings will not be necessary.

Geranium Leaves Spotted (*G. K. P.*).—The leaves sent are badly spotted, in a great measure owing to the roots being inert in a sodden and too rich soil. Only water when the soil becomes dry, and then give a good supply. Use a compost of loam from rotted turves, light rather than heavy, and one-fourth of leaf soil, or old well-decomposed manure, with a sixth part of sharp sand. Afford good drainage, a position near the glass, and abundance of air. It will disappear.

Fruit of Cotoneaster microphylla (*Inquirer*).—We cannot say if it is either wholesome or poisonous. The smell of hydrocyanic acid is so strongly emitted by the plant that it raises a suspicion.

Roses for Growing near the Sea (*Idem*).—The Hybrid Perpetuals are the most suitable, and dwarfs either on their own roots or the Manetti are to be preferred. The following do well with us, and we are not beyond the influence of the sea breeze from the east:—Achilla Gonod, Alfred Colomb, Baronne Prévost, Beauty of Waltham, Camille Bernardin, Caroline de Sansal, Charles Lefebvre, Comte de Nanteuil, Duc de Rohan, Elie Moral, Eugène Appert, Gloire de Santenay, John Hopper, Lady Suffield, Louise Peyronny, Baroness Rothschild, Maréchal Vaillant, Paul Verdier, Pierre Notting, Princess Mary of Cambridge, Senateur Vaisse, Thorin, Victor Verdier, Xavier Olibo, and William Griffith.

Climbers for a South Wall (*Idem*).—Cloth of Gold, Lamarque, and Solfaterre, Noisette Roses; Climbing Devoniensis, and Gloire de Dijon, Tea-scented Roses; Clematis Jackmanni, C. Fortuni, Wistaria chinensis, Jasminum officinale grandiflorum, Ceanothus azureus, C. Veitchianus, Cydonia japonica, Escallonia macranthe, Garrya elliptica, and Embothrium coccineum.

Cotoneaster microphylla and C. buxifolia (*G. W. Briggs*).—We give you the description of both, which will enable you to determine each. C. microphylla, leaves oblong, blunt-ended, downy beneath, flowers usually solitary; C. buxifolia, leaves egg-shaped, woolly beneath, flowers two or three on each woolly stalk.

Lilium auratum Treatment (*Idem*).—The plant should be kept duly but not excessively supplied with water, and it may either have a warm position out of doors, or a light airy one in a cool house. When the stem turns yellow repot in a larger size of pot, and without disturbing the roots, merely removing all the soil that can be taken away without interfering with them. Afford good drainage, and a compost, rather rough, of light turfy loam two parts, well-rotted manure one part, and one part

sandy peat, with a free admixture of sharp sand. Pot so that the crown of the bulb may be from 1½ to 2 inches below the rim of the pot. Water gently, and place in a cold pit or house where protection can be given from frost. In spring remove it to a cool, airy, light house, and water so as to keep the soil moist, but do not deluge the soil with water, for nothing is so injurious. When the stalks are about 6 inches high top-dress with rich compost, and water copiously.

NADAL'S ENGINE (*W. M.*).—We do not know where you could obtain it. Refer to the advertisement.

PLANTING A BORDER WITH FRUIT TREES (*A Cottage Gardener*).—In the border 11 feet wide you will not have room for a row of Raspberries and two rows of pyramid Pear trees. The Pear trees would require all the space. You may plant them 2½ feet from the walk, and 6 feet asunder as you propose, omitting the Raspberries altogether, or you could have two rows of Raspberries alone, which should be put in at the same distance from the walk as the Pears, and 4 feet apart in the rows. Two strong or three moderately strong canes should be planted together. You will require thirty stools in each row, sixty for both, or 180 canes. The best Raspberries are Red Antwerp and Fastolf, size and quantity being the desiderata.

SOIL FOR BEDDING PLANTS (*Idem*).—The soil of your garden if a good light loam will make an excellent compost for potting bedding plants, adding one-fourth rotten manure, or, better, fresh horse droppings free of straw, one-fifth sandy peat, and one-sixth of silver sand and charcoal, the whole made into a heap and turned over frequently in frosty weather. It will be in good condition after it has been three months in the heap.

DESTROYING WASPS IN THEIR NESTS (*G. F.*).—You refer probably to the cyanide of potassium. Either that or carbolic acid poured into the nest at night, and the entrance then stopped up, would suffocate the whole of the inhabitants. A strong solution of the cyanide has usually a piece of lint 3 or 4 inches square dipped into it, and then placed inside the entrance.

POULTRY, BEE, AND PIGEON CHRONICLE.

DE OMNIBUS REBUS.—No. 3.

CROOKED breasts are among poultry torments. One cock among many has been noted on the chicken run, a little leggy it may be, but such a beauty; and at last he is to be handled. He is taken off the perch at night. Master and man are present: the former expects the latter to say, "He *is* a beauty, sir." Like our friend Lord Burleigh, he shakes his head and says nothing; but his silence is eloquent. The master takes the bird in his hand only to discover it has a very crooked breast. It is more than tiresome, and he says there must be mismanagement somewhere. The man says it is not his, and they part mutually dissatisfied. But there must be a cause for everything, and it should be the part of those who take an interest in the subject to go into it. We have nearly or quite half a century of poultry experience, and treat it as a question of perches.

Except in Turkeys, crooked breasts are not so common as they were some years ago, and that of a Turkey, far worse than that of a fowl, amounts to a real deformity. In a market it will take off a third of the value of a bird. Some people will not believe the perch has anything to do with it, and others say it is hereditary. We differ from both. To the first we say, Did they ever see a crooked-breasted Pheasant? To the second, Can they introduce us to a yard where the deformity is not a very small fraction of the number kept? The Pheasants choose their own perches, and good, kind, clever Dame Nature tells them what is good for them. While still poults they roost under or with their mother; then they jump on a small bough, but still close to the hen; as they grow older they perch higher, but on good-sized boughs, and near the trunk of the tree. They never perch on a small one, which requires them to hold it tight and to lean on it for support. A fowl never becomes crooked-breasted after it has arrived at maturity. The deformity is contracted in youth while the breastbone remains cartilaginous and impressionable, and takes the shape of the perch. Pheasants do not always perch. In many heath districts where they abound, and oak trees do not, they roost in the heath. In our poultry experience we have reared many thousands of chickens, hundreds annually. Many of our Brahmas and Cochins never perch; as long as they are chickens they roost in the rip with the hen. When they pass into the adult house, where perches are provided for them, they never use them, they perch on the ground in the corners.

A clever Game cock placed on the palm of the hand should balance; his legs put under him are spread out that he may stand when he wants to get up, but he does not want to clasp, and he rests on his feet. The Pheasant does the same on the perch. Nature tells him to have the trunk between himself and the wind, and instinct has taught him the broad arm of the bough close to it is the most natural and most secure roosting place. If he be disturbed he stands up, and takes his flight at once. Where birds are compelled to roost on improper perches they are seen to wobble; first they look as though they would fall down in front, then as if they would fall off backwards, at last they clasp with their feet, they gradually widen them till they rest on their breasts. Their feet prevent them from falling off, but they rest on their breastbones, which take the impress of the perch. It is not rest if the energies of the bird are to be taxed to maintain itself in security. That only is rest which is the entire cessation of all muscular action, when the feet are drawn up under the body and the toes are expanded, and they form, as it were, a layer so constituted as to supply a rest for the body in its natural position. Enough of perches; and there will be those who will say, "Enough of this paper." We forgive them; we are sorry for them; but if they will deign to follow Nature our occupation is gone. As they will not, we have to do it for them.

Moral. Follow Nature. Cochin-Chinas, and Brahmas, and Pheasants do just as well on the ground as on perches. Why do fowls seek the cross beams of barns, the eaves of out-houses, the mangers of an old cart-house, the calf pen that is not in use? Because there are old wide beams on which they can rest. Make your perches accordingly, and if your fowls prefer to remain on the ground, let them do so. See that their chosen rest is thoroughly cleansed every day. Hundreds of thousands of Pheasants are reared by hand every year; neither they nor their parents are ever provided with roosts.

Why did we choose our heading? Because we determined to treat of all our principal queries, and our next is the saving of food. When we are idly disposed we like to take down "Bewick." Who does not? Apart from the marvellous woodcuts and the correct description, the little tail illustrations are inimitable, and a fund of amusement and enjoyment. This morning we saw the representation of a very old man leaning against a wall to protect himself from the rain, while underneath was written—

> "Did youth but know what age would crave,
> How many a penny it would save."

All may not have, or may not read "Bewick," but we are not sure that the quotation will not bear a wider and better application than the feeding of poultry. At any rate, our limits this week afford no more space, and although we headed this "concluded," we think, seeing how closely we have kept to our text, we must, as Mr. Crummles says, have another "last night," and conclude in our next paper.

POULTRY-KEEPING UNDER DIFFICULTIES.

HOUSES AND YARDS.

I LABOUR under the same difficulties as Mr. Wright, but my arrangements are somewhat different; therefore, perhaps, a description may not be unacceptable to some of your readers. I keep only Buff Cochins; in fact, more than one breed in such a space is out of the question.

My space is 66 feet by 18 feet, and is enclosed by a 6-feet wall on one side, and 3-feet palings on the other, and across the ends. I have four houses and yards. The first stands in the bottom corner on the right-hand side, is built of brick, and measures 6 feet square, which I found built: to this I added a yard 15 feet by 13 feet. The next yard is 15 feet by 4 feet, and the next 8 feet by 3 feet, each having a house 3 feet square. The next and last is 13 feet by 8 feet, with a house 3½ feet square. These three houses are made of wood.

Each yard is enclosed by palings 3 feet high, 1¼ inch broad, and half an inch thick. Between the pales I have nailed a ceiling-lath to keep the birds from fighting and to make the yards warmer. One yard is entirely shaded; each of the other three has its shed, with the back to the sun, measuring 3 feet deep and 3 feet high. The width of two is 4 feet, the other 10 feet, and are covered with sacking gas-tarred, supported by pieces of wood an inch square. In the door of each house is a pane of glass 4 inches square, and a hole sufficiently large for the birds to go in and out. A flap covers each hole at night, which is raised to a horizontal position in the daytime by means of a piece of twine, to keep the rain from beating in. By means of gates two or three yards can be thrown into one. The floors of the houses and yards are composed of a layer of ashes 12 inches deep, and a layer of gravel of the same thickness from a lime pit. The gravel is turned up about six times a-year.

Outside the yard is a coop, 3 feet by 2 feet, into which I put broody hens, by which means they are always cured in three or

four days. Each house is furnished with moveable perches about 6 inches high and 4 inches broad. These are not introduced into the chicken houses till the birds are about six months old. The remaining space—47 feet by 18 feet—is grass, except the gravel walk, which is 3 feet wide. The droppings are removed from the houses, yards, and grass daily. This I find as little trouble as doing it once or twice a-week; besides, the droppings are not then trodden into the ground. By these means I keep my birds perfectly clean and healthy. I have lost but one adult bird in four years. I never lose more than one chicken or two in a season, and those have been weakly, and have died when they were a week or two old.

I keep six hens and a cock, and rear about thirty chickens, and I prefer this number to a greater. As proof of condition I may mention that I have never exhibited till the last two or three weeks, and my best birds have taken the first prize on each occasion (five); and I had not to wash a feather. The grass, which Mr. Wright mentions as a "difficulty," has been laid about three years, and is in excellent order. If the turf be laid in November and the birds be kept in their yards for a month or six weeks, using the besom freely in the meantime, it will have a good start. The chickens will not suffer much from their confinement at six months old. After this, if any particular spot be attacked, water it well and frequently, and drive a few pegs in, leaving the ends 3 or 4 inches out of the ground. The chickens are on the grass during the whole of the day, except an hour when the old birds take their turn. They do not require any other green food either in summer or winter, in fact they refuse it. This week I sent away a pullet four months old that weighed 5 lbs., and I have one or two which would weigh rather more, I think. I have reared some large birds in this space: one which I have, the cock, I bought when he was four months old, and he is fifteen months old now, and weighs about 13 lbs. The brick house, wall, and paling enclosing the space I did not pay for: the rest cost me under £5.—W. J. Peace, *Driffield.*

[We shall be obliged by the further notes you proffer.—Eds.]

PRIZES FOR POULTRY REARED BY THE WORKING CLASSES.

"H. J. O.'s" letter opens a new field for usefulness, by pointing a way to encourage those who rear poultry under great difficulties. Whatever is done under circumstances which preclude many from any attempt, and under which fair success is achieved only by very great trouble, is worthy of special notice, and if possible reward. It is a custom in some of our country shows to have prizes for poultry reared in the district, but I am not aware of any case where rewards are offered for the birds reared by the working classes resident in towns. "Expel Nature by a pitchfork, and yet it will return," said an old proverb in our school Latin Delectus, and here is a proof of its truth. A love of poultry must surely be expelled when an artisan or working man has been obliged to shift his quarters to London, or some large town; but no, it will not be expelled. It is a case not dissimilar to the love of flowers, still keeping its hold even up a London court. Fancy, as "H. J. O." writes, a man taking "a long journey after a root of grass, or a handful of leaves," and striving, and at last succeeding, by dint of industry and effort, in raising his chickens to maturity. Such a man does deserve a prize card or a medal to hang up in his house, a few shillings in his pocket.

There is another view in which this subject may be regarded. I hold strongly than any cause which brings different classes of the community into friendly intercourse, is a good cause. People frequently think ill of each other from no other reason than that they do not know each other. Class prejudices have often no other source. If the working men could but more frequently meet the gentlemen (often as laborious workers as themselves), both classes would be the better. The German bond is a love of Fatherland; and now in England I long to see a mutual esteem grow up among men in different spheres; such once felt would make men trust each other, and then love each other. I think with this in view as one motive, the suggestion in "H. J. O.'s" letter should at least have a careful consideration from the committees of our shows in large towns. I think, too, this foreshadowed plan would cause the working classes to frequent the shows in larger numbers. This would be well, as an extension of wholesome recreations for workmen is what we all desire; increase these and the temptations of the publichouse will be lessened. Nothing I should like better than to see pens filled with birds reared under the greatest difficulties, and the class who reared them looking on and enjoying themselves.—Wiltshire Rector.

POULTRY EXPERIENCE PURCHASED.

Some years ago I had a couple of fowls presented to me quite unexpectedly, when my knowledge of poultry consisted entirely of neatly dissected parts nicely roasted, as a leg, wing, or part of the breast, and in that benighted condition (we did not subscribe to a "Poultry Chronicle" in those days), I treated them very much the same as Mr. L. Wright describes in his very amusing letter last month. They lived in a small paved yard, had plenty of hot sun and cold water, with barley *ad lib.*, and I thought they were very ungrateful to pine and die in the face of such good treatment. Not so soon discouraged, I purchased some more—just to please the children, I said—studied attentively the poultry part of your Journal, while my liege lord carefully perused the gardening operations, and by that means I discovered that other means were requisite and necessary for their welfare. I allowed them half our small town garden, and for a time (spring time), all went on swimmingly, until I was afflicted with an unconquerable desire for White Cochins. Their snowy-white plumage and pretty intelligent faces so completely took my fancy that I did not rest until I was possessed of some of the best I could buy. I durst not tell what they had cost, for even I thought it an awful lot of money. But, alas! alas! before I had had them a fortnight they no longer deserved the title of White Cochins. They moped about, seemed lame, and troubled with perpetual diarrhœa, wasted to skeletons, and finally gave up the ghost, leaving the cock to mourn his untimely loss, and me, their mistress, to moralise upon the vanity and uncertainty of human pleasures in general, and the keeping of White Cochins in particular.

The cock I put in the run with the common hens by way of consolation, and then by selling the eggs laid by a sort of Silver-pencilled Hamburgh, I had a flock of black and yellow chicks slightly feathered in the legs, that commenced laying last January. I set the eggs, and was very successful with early birds; but as the summer advanced, one by one they have died. More than twenty have I lost in three months, and only those hatched from the cross of Cochin and Hamburgh. They first appear lame, and sit about, rising only to feed, which they do till the last greedily, although there is not a particle of flesh on their bones. On opening them the liver is soft and pulpy, and it, with the whole of the entrails, is covered with hard yellow lumps about the size of a large pea or nut. The heart and gizzard are always healthy. What am I do to prevent this vexatious disease? I feed them in the morning with the best barley mixed with good wheat, scraps from the kitchen, and barleymeal wetted with water from the swill tub in the evening. We have removed to the country, and they have a large yard with the run of the road and stables, though they do not get so much grass as I could wish.

This year I am "going in" for Dark Brahmas, so strongly recommended by your correspondents, and I have a few very promising birds, which I keep separate by shutting them in the large gardens (but they make dreadful raids on the young cabbage plants and neglect the lawn), and it is for their sakes I trouble you for your opinion. Is that disease peculiar to Cochins (and I suppose the Brahma is a kind of Cochin), or is it caused by any treatment of mine—such as overfeeding, &c.? I have searched through all the back numbers, and though I find something similar, I do not find the disease exactly as I describe it.—T. K. L.

[We are almost wicked enough to be glad that the Cochins died, since they are the cause of our receiving your clever and interesting letter. The disease you mention is not of common occurrence, nor is it peculiar to Cochins. Cocks are never attacked by it; hens are when they are improperly and overfed to force them to lay. We have never known it to be hereditary, and cannot conceive why your fowls have it. We do not quite understand the nature of their run—a large yard, with the run of the road and stables, but not much grass. We must therefore go to generalities. We have the highest opinion of the Brahmas. They are hardy in constitution, pleasing in appearance, good layers and sitters, and good mothers. They are not large eaters. Like all fowls, the more range they have the better, but they will bear confinement well. They will do even in a small pen. As our object should be to keep them as well as possible, we should try to provide them in confinement

with those things they would find at liberty. Let them have a supply of lettuces that have gone to seed, and of refuse vegetables. Let them have large sods of growing grass, cut with plenty of fresh earth; road grit if it can be had. Feed them morning and evening with ground oats or barleymeal, the former preferable, slaked with water or pot-liquor. In the middle of the day barley and house or table scraps. If you do this we will warrant you healthy birds, and such, if they are well seen to, are profitable, inasmuch as they afford nice food and healthy amusement at small cost.—Eds.]

BURNLEY POULTRY SHOW.

This was held on the 19th inst., and was confined to birds of this year.

Game.—*Black or Brown Reds.—Cockerel.*—1, Miss J. A. Aykroyd, Eccleshill. 2, T. Dyson, Halifax. *hc*, R. Payne, Brierfield, Burnley. *Chickens.*—1, R. Payne. 2, Miss J. A Aykroyd. *Any other Variety.—Cockerel.*—1, Miss J. A. Aykroyd. 2, Brentnall & Kyte, Nottingham. *Chickens.*—1 and 2, Brentnall & Kyte.

Spanish.—*Chickens.*—1, J. J. Booth, Silsden. 2, H. Wilkinson, Earby.

Dorkings.—*Chickens.*—1, E. Leech, Rochdale. 2, J. Watts, King's Heath, Birmingham.

Cochins.—*Chickens.*—1, C. Sidgwick, Keighley. 2, E. Leech.

Hamburgus.—*Golden-spangled.—Chickens.*—1 and 2, H. Pickles, jun. *Golden-pencilled.—Chickens.*—1, T. Wrigley, jun., Tonge, Middleton. 2, H. Pickles, jun. *Silver-spangled.—Chickens.*—1 and 2, G. & J. Duckworth, Church. *Silver-pencilled.—Chickens.*—1 and 2, H. Pickles, jun. *Black.—Chickens.*—1 and 2, C. Sidgwick.

Brahma Pootras.—*Chickens.*—1, T. F. Ansdell, St. Helen's. 2, H. Bell, Burnley.

Game Bantams.—*Any colour.—Cockerel.*—1, T. Sharples, Forest Bank, Rawtenstall. 2, Ellis & Buckley, Accrington. *Black or Brown Reds.—Chickens.*—1, T. Sharples. 2, T. Barker, Burnley. *Any other Variety.—Chickens.*—1, Bellingham & Gill, Woodfield, Burnley. 2, T. Dyson. *Any other Variety except Game.—Chickens.*—1, H. Pickles, jun. 2, C. Sidgwick, jun., Skipton.

Any other Variety.—*Chickens.*—1, H. Pickles, jun. 2, H. Bowker, Hill Top, Keighley (Silver Polands).

Ducks.—*Aylesbury.*—1, E. Leech. 2, J. West & Co., Worsthorne. *Rouen.*—1, Edmondson & Wright, Barnoldswick. 2, E. Leech. *Any other Variety.*—1, C. W. Brierley, Middleton. 2, N. Grimshaw, Burnley.

Geese.—1, J. Houlker, Revidge. 2, E. Leech.

Turkeys.—1, E. Leech. 2, J. Houlker.

PIGEONS.

Carriers.—*Cock.*—1, T. Waddington, Fenniscowles, Blackburn. 2, J. Stanley, Salford, Blackburn. *Hen.*—1, J. Stanley. 2, W. Cannan, Bradford.

Pouters.—1 and 2, E. Horner, Harewood.

Tumblers.—*Almond.*—1, F. Moore, Burnley. 2, E. Horner. *Mottled.*—1, F. Moore. 2, E. Horner. *Any other Variety.*—1, W. Cannan. 2, F. Moore.

Barbs.—1, E. Horner. 2, J. Stanley.

Owls.—*English.*—1, W. Cannan. 2, A. G. Wilding, Burnley.

Trumpeters.—1 and 2, E. Horner.

Jacobins.—1 and 2, T. Waddington. *hc*, H. Yardley, Birmingham; E. Horner.

Fantails.—1, E. Horner. 2, J. F. Loveridge, Newark.

Turbits.—1, W. Cannan. 2, E. Horner.

Antwerps.—1, H. Yardley. 2, J. W. Collinson, Halifax.

Dragoons.—1, L. Byron, Blackburn. 2, T. Waddington. *hc*, J. Watts, King's Heath, Birmingham.

Any other Variety.—1, E. Horner. 2, W. Kitchen.

Rabbits.—*Spanish.*—1, J. Boyle, jun., Blackburn. 2, J. Irving, Blackburn. *Silver-Grey.*—1 and 2, S. G. Hudson, Hull. *Himalayan.*—1 and 2, J. Boyle, jun. *Any other Variety.*—1, J. Baron, Castlemere, Rochdale (Angora). 2, A. S. Easten (Angora). 3, J. Boyle, jun. (Angora).

Judges.—Mr. H. Smith, Mr. Douglas, and Mr. Tate.

STANNINGLEY AND FARSLEY POULTRY SHOW.

The second Show of this Society took place on the 26th inst. Although the prizes had been enhanced in value since last year, the entries were not numerous, but the birds shown were good. The cup was awarded to a good pen of Buff Cochins. In Game *Bantams*, Duckwings of promising quality were first and Brown Reds second; and in the Variety class for Bantams, Black was first and White second. Both prizes in the Duckwing Game class went to chickens.

No part of the Show was better than the *Rabbit* classes, the animals both measuring well and showing high development in shape and style. The medal for Rabbits was won by a splendid Yellow doe 22 inches by 4¼ in ear, large, well-shaped, and in the highest condition and fur.

In *Pigeons* Pouters won the cup, and the entries in all classes were good, the prizes being closely contested. The first-prize Black Carriers were a promising pair of young, and the second prize went to Duns. For Turbits the first were Yellows with spike heads, and the second Blues with shell crowns, and Blues won both prizes in Dragoons. Antwerps were a large class, and many more prizes might have been dispensed most deservedly. The Fantails and Owls were of great merit. In the Variety class Mottled Trumpeters were first and Swallows second. A pen of White Barbs containing the most extraordinary cock bird of that kind we ever saw, was very highly commended.

Spanish.—1, H. Beldon, Bingley. 2, J. Powell, Bradford. *hc*, W. Pickard. Thorner; J. Thresh, Bradford.

Cochins.—1, and Prize for best pen of poultry, H. Beldon. 2, H. C. & W. J. Mason, Drihglington. *hc*, T. Waddington, Blackburn.

Brahma Pootra.—1, H. Beldon.

Dorkings.—1 and 2, T. Briden, Earby. *hc*, W. Malton, Bowling.

Hamburghs.—*Silver-spangled.*—1 and 2, H. Beldon. *Golden-spangled.*—1 and 2, H. Beldon. *Silver-pencilled.*—1 and 2, H. Beldon. *Golden-pencilled.*—1, A. Smith, Northowram. 2, J. Smith, Bingley. *Any other Variety.*—1, H. Beldon. 2, J. Smith.

Bantams.—*Game.*—1, W. F. Entwisle, Cleckheaton. 2, J. Oldfield, Shibden. *hc*, A. Smith. *Any other Variety.*—1, S. & R. Ashton, Roe Cross. 2, H. Beldon. *hc*, J. Walker, Halifax; T. Waddington, Fenniscowles.

Any other Variety.—1, H. Beldon. 2, T. Waddington. *hc*, T. Waddington; W. Binns; W. Johnson.

Ducks.—*Rouen or Aylesbury.*—1, G. Wood, Stanningley. 2, J. Ward, Drighlington. *Any other Variety.*—1 and 2, W. Binns, Pudsey.

SINGLE COCKS.

Game, or Game Bantam.—1, W. Johnson, Idle. 2, W. Fell.

Game.—*Red.*—1, Miss Aykroyd, Eccleshill. 2, W. Johnson. *hc*, W. Adams, Ipswich; W. Fell. *Any other Variety.*—1, Miss Aykroyd. 2, J. Fell, Adwalton.

PIGEONS.

Carriers.—1, T. Waddington. 2, W. Cannan, Bradford. *hc*, W. Lund, Shipley.

Pouters.—1 and cup, for the best pen of Pigeons in Show, W. Cannan. 2, H. Yardley, Birmingham. *hc*, W. Cannan.

Tumblers.—*Short-faced.*—1, J. Braid, Cambridge. 2, W. Cannan. *hc*, H. Yardley. *Long-faced.*—1, W. Cannan. 2, J. Lishman, Bradford. *hc*, H. Yardley; W. Cannan.

Turbits.—1, W. Cannan. 2, W. F. Pickard. *hc*, W. Cannan; W. Lund; J. T. Lishman; J. G. Dunn, Newcastle.

Dragoons.—1, J. Lancaster, Baildon. 2, W. H. Mitchell, Birmingham. *hc*, J. W. Ward, Stanningley; J. Cundle, Copt Hewick.

Antwerps.—1, J. W. Collinson, Halifax. 2, H. G. Poole, Bradford. *hc*, J. W. Collinson.

Jacobins.—1, J. G. Dunn. 2, W. Cannan. *hc*, H. Yardley; T. Waddington; H. G. Poole.

Fantails.—1 and 2, J. F. Loversidge, Newark. *hc*, H. Yardley; J. Walker, Newark; T. Waddington; W. Cannan.

Owls.—1, W. Cannan. 2, J. Hawley, Bingley. *hc*, H. Yardley; R. Esam, Newark.

Any other Variety.—1, J. Cundle. 2, J. T. Lishman. *hc*, T. Waddington; W. Cannan; W. Lund; H. G. Poole; J. Hawley.

RABBITS.

Yellow, White, and Tortoiseshell.—1, H. Cawood, Thorne. 2, R. Esam. *hc*, S. Greenwood.

Black and White.—1 and 2, J. Springthorp, Stanningley. *hc*, J. Page, Headingley.

Self-coloured.—1 and Medal for best Rabbit exhibited, H. Cawood. 2, R. Esam. *hc*, W. Rudd, Undercliffe; H. Beanland, Bradford.

Grey and White.—1, W. Rudd. 2, H. Beanland.

Doe and Young Ones.—1, J. Pennington, Stanningley. 2, A. Tankard, Bradford.

Judges.—Mr. E. Hutton, Pudsey, and Mr. Dixon, Bradford.

RYHOPE POULTRY SHOW.

This was held on the 28th inst. in a large field in the suburbs of Sunderland, and although a small exhibition took place last year, this may be fairly stated to be the first real Show. Considering this fact, it is surprising that the arrangements were so complete, and young as the Society is, we are glad to be able to record an innovation which might be copied with advantage by older societies. In front of the pens—on Turner's principle, which were obtained from Sunderland—and at the distance of about a yard, a line of posts and railings were erected about breast high. No one was allowed within this enclosure, and the crowding in front of the pens, which in some cases becomes positively unpleasant, was altogether prevented.

Dorkings were first on the list, and the winners were large-framed birds; but the *Cochins*, with the exception of a pen that arrived too late for competition, were not in good bloom. Some fair *Brahmas* were shown, as also *Spanish*, but the cup for the first section fell to the lot of an excellent pen of Silver *Polands*. *Game* were shown in the largest numbers, but many of them were out of feather, although the classes presented plenty of quality, and the cup for this section was awarded to a sturdy-looking Brown Red cock. With the exception of the Red Game *Bantams*, no other class called for special notice, bnt this was the best class in the Show, many of the birds being very fine, and the cup, which was won by adult Black Reds, was very keenly contested, and two extra prizes were awarded.

Dorkings.—1, Buglass & Williamson, Durham. 2, Miss S. Storey, Dudley. *hc*, J. White, Warlaby, Northallerton.

Cochins.—1 and 2, G. H. Proctor, Durham. *hc*, J. H. Redman, Whithy.

Brahmas.—1, J. Nesam, West Sleekburn Colliery. 2, Dowell & Simpson, Bishopwearmouth. *hc*, A. H. Banbery, Langton, Northallerton; R. Moore, East Rainton.

Spanish.—1, W. Bearpark, Northallerton. 2, W. Atkinson, Bishop Auckland. *hc*, W. Maddison, Gateshead; J. G. Milner, Bellerby; W. Jaggs, Blyth; H. Wilkinson, Earby.

Polish.—1, W. Bearpark. 2, Buglass & Williamson. *c*, Buglass & Williamson; Miss Stephenson, Wolviston.

Barndoor Fowls.—1, O. A. Young, Driffield. 2, J. B. Bowman, Ryhope. *Any Variety.*—1, W. Bearpark.

Game.—*Any variety.*—Cup, T. Robson, Bishop Auckland. 2, Miss M. Aykroyd, Eccleshill. *hc*, J. Brough, Carliele; J. Hardy, Bishopwearmouth; W. Rodgers, Sunderland; W. Bearpark. *c*, J. W. Corbett, Seaham Harbour. *Black-breasted and other Reds.*—1, J. Brough. 2, W. Bearpark. *hc*, T. Robson. *Any other Variety.*—1, W. Bearpark. 2, J. Brough. *hc*, J. Robson; — Mulley, Sunderland.

Hamburghs.—*Golden-spangled.*—1, W. Bearpark. *Silver-spangled.*—1, W. Whitfield, Hetton-le-Hele. *hc*, Buglass & Williamson. *Golden-pencilled.*—1, R. Moore. *hc*, W. Whitfield. *Silver-pencilled.*—1, W. Bearpark. 2, R. Moore. *hc*, W. Whitfield.

Bantams.—*Any Variety.*—1, J. Ferry, Cowpen, Morpeth. *Any other Variety except Game.*—1, J. Ferry. 2, H. H. Thompson. *hc*, O. A. Young; J. Cartwright, Bishop Auckland; H. H. Thompson.

Game Bantams.—*Black breasted and other Reds.*—1 and Cup, G. Hall, Kendal. 2, W. Atkinson. 3, T. Mallen, Sunderland. 4, W. Rodgers, Sunderland. *hc*, G. Todd, Sunderland; R. Youll, Sunderland. *c*, Bellingham & Gill, Burnley, Leeds. *Any other Variety.*—1, Bellingham & Gill. 2, D. Hunter, Sunderland. *hc*, J. Ferry; G. Todd; G. Hall, Kendal.

Ducks.—*Aylesbury.*—1 and 2, T. Wood. *Rouen.*—1, Buglass & Williamson. 2, J. G. Milner. *Any other Variety.*—1, J. G. Milner. *hc*, Mrs. T. S. Bramwell, Newcastle; O. A. Young.

Guinea Fowls.—1, O. A. Young. *hc*, W. Bell, Hetton-le-Hole.

Selling Class.—1, W. Whitfield. *hc*, J. G. Milner; J. N. Lawson, Ryhope.

Judges.—Mr. E. Hutton, Pudsey, and Mr. J. Simm, Cramlington.

Golden-pencilled Hamburgh Hen Incubating.—I sold a nest of eggs to a friend of mine. He sold a pullet from the brood to Mr. H. Colman, of this town, which began to lay the first week in January last, and continued laying until about five weeks since, when for a day or two she kept her nest and

appeared broody. Eight of her own eggs were put under her. She sat as closely as could be desired during the three weeks of incubation and has hatched seven chickens, and now bids fair to be a good mother. She sat in the same nest in which she always laid. I may add that she is quite pure, having been bred directly from prize birds.—H. Welch, *Camelford, Cornwall.*

ROCHDALE POULTRY SHOW.

This was held in the grounds of C. M. Royds, Esq., Greenhill, Rochdale, on the 23rd inst. There were upwards of five hundred pens of poultry, Pigeons, and Rabbits.

Spanish headed the list, the entries being few and the quality moderate. Of *Cochins*, Buffs, Whites, and Partridge were very good, all the most noted exhibitors competing. *Brahmas* were also good, noticeably the first-prize pen and Mr. Taylor's chickens. *Game* were few, but very choice. We do not remember ever having seen a better Pile than the first-prize cock. Of *Polands*, both the adult and young birds were good. In adults Silvers were first, Golden second; in chickens a fine pen of Silvers stood first, Golden second, and a very handsome pen of White-crested Blacks received a high commendation. The *Hamburgh* classes contained most of the well-known winners, the entries were, however, smaller than we had anticipated for Lancashire; the quality, nevertheless, was very good. The Golden-spangled was, perhaps, the best chicken class; in fact, we have seldom seen better at this season. The first-prize pen contained a very handsome cockerel, and the second an unusually good pullet. Mr. Pickles' highly-commended pair were first-class, and were well worthy of a prize. In Silver chickens the first-prize birds stood clearly out in a good competition. In Black chickens the first prize went to a fine well-grown pen. Adult *Dorkings* were sadly out of feather. The chicken class contained some well-developed birds, the first-prize one especially so, but the pullet was scarcely to our liking in colour; the second-prize hen was better in colour, but not so large. For Any other distinct breed, the first prize went to good Crève-Cœurs, the second to Sultans. In chickens, Crève-Cœurs and Houdans were the recipients of the prizes. Game *Bantams*, if we except the winners, were a very moderate lot. We are afraid this breed is at present making little progress. The class for Any other variety of Bantams was about the best in the Show, containing Sebrights, Blacks, Whites, Pekins, and Japanese, the first prize being taken by Silver-laced (local), and the second going to a magnificent pen of Whites.

Ducks were very good, especially the winning Rouens. *Geese* and *Turkeys* were also well represented.

The *Pigeon* department was peculiarly attractive, many of the most successful English exhibitors having sent their best birds. Pouters were shown as single birds, with four classes allotted to them. Mr. Fulton was the principal prizetaker with very fine specimens. Carriers had six classes, with a very keen competition, Mr. Fulton's prize Blacks and Duns being particularly noticeable. Almond Tumblers were a good class. In the class for any other variety of Tumblers, the first prize went to very pretty Black Mottles, the second to a beautiful pen of Black Kites. Dragoons had two classes, each being well filled. In the class for Blues, a grand pair, good in all points, was first. The other first prize was taken by capital Yellows. In the competition for the medal presented by Messrs. Ottley, of Birmingham, for the best pair, Mr. Yardley's first-prize Blues well merited the honour they obtained. Antwerps were well represented and good. In foreign Owls both prizes went to Whites. Mr. Fulton exhibited a fine pair of Blues deserving a position. In the class for Red or Yellow Turbits, good Reds took both prizes; while for Any other colour Blacks were first, and very good Blues second.

The other classes do not require particular description.

The Rabbits were well represented by valuable specimens in the six classes, exclusive of the Selling class, and numbered about fifty-five entries—Lop-eared bucks, six entries; Lop-eared does, four; Angoras, ten; Himalayan, eight; Silver-Greys, eight; Any other variety, twelve; and the Selling class, seven. The first-prize Lop was a valuable specimen, well marked, and possessing points of excellence to entitle him to the creditable position he took. Ears 21⅜ inches by 4⅞ wide. The second prize went to a broad heavy Rabbit evidently not quite through his "moult." Ears 21½ by 4⅞ inches. The highly commended pen appeared in no unworthy position as compared with his two neighbours, and was well formed and of good carriage. Ears 21 inches by 4⅜. The first-prize tortoiseshell doe claims notice, as her general formation and appearance were good, and the outline of the back was to my mind in true proportion and of graceful appearance. Ears 20⅞ inches by 4½. The second prize was taken by a young Black of great promise with ears 20⅝ inches long by 4¼ wide. Mr. C. Gravil's highly commended doe has ears 20¼ inches long by 4½ wide, and is a neat well-formed animal. The Lops as a whole I decidedly pronounce good, not so much as to length of ears, but in other points essential to a good Lop. I would suggest that the pens in future for these animals be some 3 or 4 inches larger, as large Rabbits like to stretch out, especially in warm weather, and then their large proportions are very evident, and form a contrast to their more diminutive neighbours.

The Angoras were tolerably large, well-woolled, and of a fineness of quality which I prefer to size. Some specimens appeared to be the result of in-and-in breeding rather more than I think is desirable to insure large and healthy stock. The first prize went to a large specimen, wool fine, and with care in the dressing it would present even a more attractive and showy appearance. The second-prize Angora was large, rather shorter in the wool, evidently in a state of "moult," yet with a fine head and eye of the right form, and worthy her position. Both these two were does.

The Himalayan class was good, and required consideration to decide as to the one possessing the most merit. The first of Mr. B. S. Rothwell to my mind was almost perfection, as all the extremities were so uniformly shaded of the dark hue which I prefer. The second-prize specimen was probably equal in this respect, except in one point.

The Silver-Greys were very good, and almost all presented the true Chinchilla shade in the fur, and that general in its appearance; and the large valuable first-prize doe was a good specimen. The second-prize one was by no means a discreditable neighbour, and fully deserved its position.

The Any other variety class presented some excellent Belgian Hare and Dutch Rabbits. The first-prize large Belgian is well marked, and of a shade which I prefer for this variety; it presented an agreeable contrast to the wee Dutch Grey and White second-prize Rabbit. Some Belgians belonging to Mr. S. G. Hudson were fine and large. In the Selling class the fine Yellow and White first-prize Lop doe claims commendation as a specimen of what a Lop should be. She was not in very good order, yet the points of excellence were too evident to be overlooked. The second-prize buck gives promise of value, though rather dark.

I regret to have to find fault with the owners of such valuable pets for not bestowing upon some of the animals noticed a little more care and close examination, so as to insure their comfort at least, if not their health, and would suggest that every specimen forwarded for exhibition should be carefully inspected. This, I regret to say, had not been the case, at least not with the scrupulous care which I think requisite, especially the ears; for the same complaint I made in my last report must be reiterated. I look upon the Judge as not only the awarder of prizes, but an authority as to the state in which each occupant of the pen is presented to his notice as regards health, &c. I by no means wish to be misunderstood, and here state that no unhealthy Rabbit was found at Rochdale, but one or two would have been none the worse of a more minute inspection previous to leaving their homes.—Charles Rayson, *Didsbury, near Manchester.*

Spanish.—1 and 2, C. W. Brierley, Middleton. *Chickens.*—1, A. Mollins, Standeford, Wolverhampton. 2, Clews & Adkins, Walsall.

Cochins.—*Cinnamon and Buff.*—1 and *hc*, W. A. Taylor, Manchester. 2, H. Lacy, Hebden Bridge. *Chickens.*—1, E. Leech, Rochdale. 2, C. Sidgwick, Ryddlesden Hall, Keighley. *hc*, W. A. Taylor; H. MAGPIES.—1, W. Kitchen. 2, H. Yardley. *hc*, E. Horner.
ANY OTHER VARIETY.—1, H. Yardley. 2, W. Kitchen. 3, O. E. Cresswell, Hanworth Rectory.
SELLING CLASS.—1, J. Fielding, jun. (Owle). 2, I. Bush, Bowden (Yellow Barbs). *hc*, E. Horner; A. M. Yetts (Carriers); J. Walker.

RABBITS.—*Lop-eared.*—*Buck.*—1, A. H. Easten, Hull. 2, J. Boyle, jun., Blackburn. *hc*, Lewin & Robinson, Kettering. *Doe.*—1 and 2, J. Irving (Blue Tortoiseshell and Grey and White). *hc*, E. Gravil, jun., Thorne. *Silver-Grey.*—1 and *hc*, S. G. Hudson, Hull. 2, S. Greenwood, Hebden Bridge. *Himalayan.*—1, B. S. Rothwell, Rochdale. 2, J. Butterworth, Broadley, Rochdale. *hc*, J. Boyle, jun. *Angora.*—1, A. H. Easten. 2, J. Baron, Castlemere, Rochdale. *hc*, J. Taylor. *Any other Variety.*—1 and 2, J. Boyle, jun. (Belgian Hare and Dutch). *hc*, R. Leach. *Selling Class.*—1, J. Butterworth. 2, J. Boyle, jun. *hc*, A. H. Easten.

JUDGES.—*Poultry:* Mr. R. Teebay, Fulwood, Preston, and Mr. N. Cook, Chowbent. *Pigeons:* Mr. F. Esquilant, Brixton, London, and Mr. T. J. Charlton, Bradford. *Rabbits:* Mr. C. Rayson, Didsbury.

PIGEON TRIMMING AT ALLERTON SHOW.

As Mr. Yardley replies equivocally to the charge of trimming, and consequent disqualification of one of his pairs of Nuns at the above-named show, allow me to remark that he says correctly the feathers were not "abstracted," but, then, they were cut off close to the stump, most artistically, and in an unmistakeable manner; and had it not been my rule to handle and examine minutely all the varieties that are likely to be improved by trimming, I should also have awarded them a first position. With the exception of the throats and crests, the birds were in perfect feather, showing no signs of moult whatever. This was all seen by the Stewards of the department, and those gentlemen commented upon it in no measured terms.

As to the pair of Dragoons referred to, Mr. Yardley does nothing to allay the "uneasiness" which he thinks was created in my mind, and although the birds were young, the sex consequently difficult to determine at first sight (and he can see I gave them the benefit of the doubt), yet he is very careful not to declare them to be of the proper sexes.—E. HUTTON.

THE OPENING OF THE SEASON—WHITBY CANARY SHOW.

WHEN is Whitby Show? I am often asked. It's always held on the Tuesday before the St. Ledger. Not that there is any connection between the two, only I have known instances where it was thought that *viâ* Doncaster was the most direct route from Whitby to the north, and that Epsom lay somewhere between Sunderland and Edinburgh. Be that as it may, and far be it from me to dispute the fact, the two events always come together; and as the great Yorkshire carnival, big with so many hopes, falls on Wednesday week, "would it surprise you to know" that the Canary exhibition season opens at Whitby on Tuesday, September 12th? I admit that it is early, almost too early, but being held in conjunction with the Horticultural Show, there is no alternative but to hold it at the time mentioned. Still, those who made an early start will have plenty of birds ready, and the recent summer weather will have done much to forward the moulting of all ages—those with many a prize attached to their names, and younger aspirants for fame also. The Show deserves well of all, having a liberal prize list and a low entry fee, and is under the most experienced management. The town itself is one of the prettiest watering-places in England, and the surrounding views simply charming. There will be abundance of time between delivering the birds and the opening for a peep at the quaint little place, and my advice is, make large entries, bring your birds yourselves, and make an "outing" of the first Canary show of the season.—W. A. BLAKSTON.

QUEENS LEAVING THEIR HIVES.

I THINK the controversy may rest with regard to queen mothers taking aërial excursions. The question is certainly not "proved" one way or the other, and if your readers will refer to my original notes on the subject, they will see that I did not state the fact as proven, even by the remarkable case which I detailed. All I said was, it would "go to prove," by which I meant no more than that in a case of uncertainty such an incident in apiculture is worthy of note, an incident apparently so clearly making in favour of the disputed but still not disproved theory that mother queens do sometimes take aërial excursions.

Perhaps "R. S.'s" view is correct, although no such instance of swarming into other hives has come under my notice. That it is an "error" to put forth a suggestion like the one I made, I must deny. Rather I maintain it to be an overbold assertion to say that mother queens never take aërial excursions. It may be of rare occurrence; I believe it is, but the fact itself can never be placed beyond doubt.

With regard to the circumstances I have detailed, I repeat again they are absolutely correct. The stock contained a pure imported Italian queen; nor was there any royal cell in it. The box was entirely denuded of bees after repeated drivings, and every comb clearly exposed to view. But it is useless to argue the subject further. Let what has been written on either side go for what it is worth.

Mr. Lowe has touched upon a subject of great interest in referring to the departure of Mr. Woodbury. It needs no words of mine to express the sense of loss which all your readers in common experience. I had the pleasure of a personal acquaintance with him for some ten or twelve years, and can testify to the wonderful accuracy of all his knowledge. Whatever he aimed or pretended to know, he knew thoroughly, and his knowledge was only equalled by his courtesy and self-control.—B. & W.

A BEE-KEEPER'S DIFFICULTIES.

DURING the latter half of June and the whole of July the weather here was uncessingly wet. As a consequence, the bees harvested little or nothing, but I believe increased in numbers to an unusual extent. One of my hives is an improved "cottage." Early in the season I put a box on to prevent swarming. This box is 14 inches by 8, and 6 inches deep. Owing to bad weather the bees did not work in it, nor did they swarm. On the return of fine weather at the beginning of this month they clustered outside, mostly in a lump, under the floor-board. Here they have made a comb (in the open air) of the shape of a mitre inverted, about 10 inches long, and about 5 inches wide at the base, where alone it is attached to anything. A neighbouring bee-keeper has the same story to tell—nay, more; his bees made two combs hanging down from the floor-board, and he cut away one last week full of honey, and with nearly all the cells sealed. By procuring a Ligurian queen, and having hived this cluster of bees (as large as an ordinary swarm), by uniting her to the gentlemen of the open-air movement, would it be very difficult to establish them and keep them through the winter by plenty of food, &c.? If so, will you give suggestions for joining her majesty to her future subjects?—A GALWAY BEE-KEEPER.

[We should advise you, particularly at this advanced period of the season, not to attempt making an artificial swarm of the bees hanging underneath the floor-board of your hive, either by the addition of a Ligurian queen or otherwise. You may now, as soon as you please, cut away the comb, and as the weather becomes cooler the bees will all be able to find room within the hive. The building of combs in this manner is not an uncommon occurrence, especially in bad honey years. It is probable that if you had furnished your super with some nice bits of some clean empty worker comb your bees would have ascended, and have accomplished considerably more work, even although they might not have succeeded in nearly filling it. As you cannot obtain Langstroth's book through your local bookseller, write to Messrs. Neighbour, 149, Regent Street, London. The price is 10*s*.—EDS.]

BEE INCIDENTS.

AN occurrence which took place lately in my father's apiary I think may be of interest to your readers. A swarm issued from one of his hives on or about the 27th of June, and was hived in the usual manner. A few minutes after a queen rushed out of the entrance with some bees in hot pursuit. She was captured and replaced under the hive, but she ran out immediately, the bees apparently forcing her to do so. Concluding there must be two queens in the swarm, he caught and confined her under a glass in the house. At the same time there was a hive which had been clustering out for five or six

days. It occurred to my father that the bees wanted to swarm, but had no queen ready to lead them off, so the following day he placed the queen on the floor-board near the entrance; the manner of the bees changed at once, and in less than ten minutes a strong swarm came off, which has done remarkably well. As I have never heard or read of this being done, I thought I should like to communicate the circumstance.

Another incident occurred about a fortnight ago, which may not be an uncommon one, but has not hitherto come under my notice. A swarm was driven out of their home into an empty hive for the purpose of taking the honey, and after killing their queen my father placed the bees next to a hive to which he intended to join them in the evening, but they saved him all further trouble by leaving their empty temporary quarters and peaceably uniting with their neighbours exactly as he desired.—G. G.

[In the first case mentioned it is probable that the hive from which the bees were clustering out was on the very point of swarming, and the addition of the queen at the entrance supplied a little premature excitement just sufficient to cause the bees to rush forth. Such a practice, however, is not to be recommended, as in all probability the old queen in the hive would also join the swarm, thus there would be two queens, involving some amount of risk from fighting, or in causing the bees to separate in two clusters more or less apart from each other. The second incident you mention is by no means of uncommon occurrence, though not always attended with such peaceable results.—Eds.]

OUR LETTER BOX.

Warrington Poultry Show (*S. A. W.*).—As you intend to take legal proceedings, it would not be fair for us to publish any comment.

Craven, Perth, and Gainsborough Poultry Shows (*H. and Others*).—If a committee does not advertise the show in our columns, we conclude it is not of sufficient importance to deserve a report.

Dorking Hen Broody (*A. S.*).—Let her sit. You will have some good chickens to eat next February and March, or if you choose to sell them they will make a good price. The hen has laid well.

Black Red Bantams—Mosses (*Hamburgh*).—Black Red Bantams may have been bred from Duckwings, and may have been good enough to take prizes. Duckwings have been helped by all sorts of crosses, and the birds may have thrown back, but it is not a common result, and will scarcely be repeated. In many parts of the north Spangled Hamburghs are called Mosses, but we do not recollect seeing them so called in any prize list.

Crossing Brahmas with Spanish (*Anxious Amateur*).—We do not think the cross a good one. If we wanted eggs only we should keep pure Spanish, as their eggs are much larger than those of the Brahmas. We are not great admirers of crosses, but if they are made we should be careful to avoid contradictions. We should not, then, put sitters and non-sitters together; such are Brahmas and Spanish. Chickens of the latter hatched in March will lay in the winter. The pullets' eggs come at a certain age, independently of season. We do not approve of heated houses, and do not believe they help in any way to a satisfactory result. All that is necessary is to have a roosting place protected from draught and wet, and where the fowls can, if necessary, in wet and snowy weather find dust for their essential dust-bath.

Game Fowls (*C. L.*).—It is not at all an important point, nor is it a blemish.

Cochins with Discharge from Nostrils (*J. W. M.*).—The symptoms you complain of are very common at this time of year; they arise from slight cold consequent on the change of the early morning temperature. It is often cured by giving some bread and ale morning and evening. A camphor pill the size of a garden pea is a very good thing. If these fail give them Baily's pills. It is not at all dangerous in Cochins.

Hamburgh Bantams (*Tetley*).—We agree with you. Golden-pencilled Bantams would form a beautiful variety. We are disposed to think a Brown Red Game Bantam cock would be the best bird to put to the small Pencilled hens you name. You should get one with a thoroughly red breast, and you would have little to breed out in the way of colour. Having bred from such a bird and the Pencilled hens, you would from the progeny select the two cocks that favoured the Hamburghs most. You would put them to their mothers, and again choose the birds most like Hamburghs, and put them to the hens again. While these experiments are going on you can allow brothers and sisters to run together, and it is quite possible they may produce some good birds that will prove a great help to you. You are sure to succeed, but to do so perfectly is a matter of time and patience. In the materials with which you start you have faults to get rid of. The cock brings you diminutive size, but he offends in colour and comb; the hens bring plumage, but they offend in size. You must not use the cock in the manufacture after the first hatches. You must discard the hens as soon as you can. In choosing chickens to run together, strive to find them faultless. Above all, overlook no capital fault—use no single-comb cock, no yellow-legged or five-toed pullet, no pullet with patchy plumage. You must not put all your eggs in one basket, and therefore you must have several runs, from which you must select the best birds to breed from. We think the white ear and double comb of the Black would be more than counterbalanced by the dark plumage. Sebright-breeders are obliged sometimes to use Black birds to restore and deepen lacing. They can tell you what a tedious process it is to get rid of the black.

Brahmas' Feathers (*W. T.*).—We see nothing in your description to lead us to suppose there is anything impure in your Brahmas. They are very dark, and many are. Some become lighter as they grow older. The Brahma cocks do not furnish so early as the Cochins. We are always content to wait for late maturity in cocks and pullets. The precocious are never large. The feathering of the middle toe is not by any means, an important point.

German and Ural Ice Pigeons (*A. Z.*).—We are only familiar with the former of these birds.

Wing Disease (*L. G.*).—If we rightly understand you, your Pigeon has wing disease. Draw out the flight feathers of that wing, and by the time they have grown again the bird will most probably be quite well.

What Pigeons to Keep (*E. B.*).—We are at a loss to recommend you birds, and never name dealers. A prize is not to be won easily by any variety. We do not see how possibly we can say what are best for you to keep. Make your own choice, and purchase of those who advertise in our columns, and most likely you will be well treated.

Homing Pigeons.—*Far West*, and other correspondents, require these. Anyone having these to sell had better advertise them.

Dark Green Honey—Chloroform (*Grassendale*).—It is not easy always to account for the variation in colour in honey, as the honey taken from hives closely adjoining in the same garden will frequently be totally different both in quality and appearance. The dark green colour of yours was, doubtless, caused by the pasturage from which the bees obtained it, and not in consequence of the chloroform. We suppose you have not long been a reader of the Journal, or you would have known that the use of chloroform for depriving bees of their honey has been for many years condemned in the most unqualified manner.

REMARKS.

23rd.—Dull, with occasional very slight showers; fine at night, though quite cool and rather damp.

24th.—Rain in morning, cloudy and cold till 6 P.M., then windy and wet during the evening and the night; wind at times very strong.

25th.—Very fine till 1 P.M., then cloudy, sharp but very short shower at 2 P.M., afterwards fine, with very beautiful clouds just before sunset.

26th.—A most beautiful day, bright, clear, and refreshingly cool.

27th.—Rather warmer in the sun than lately, but not at all oppressive.

28th.—Fine clear day, and most splendid moonlight night.

29th.—Very fine all day, with refreshing breezes all day, and beautiful night.

A most charming week, cooler than the last, though more free from clouds, not any day on which it either looked or felt stormlike or oppressive.—G. J. Symons.

COVENT GARDEN MARKET.—August 30.

We have no alteration worth quoting. Supplies are about equal to the demand, and trade remains steady. Out-door Peaches and Nectarines are not very plentiful this season round London, but promise to be of fair average quality. Our first consignments of Grapes from Spain and Portugal have come to hand, but realise very low prices. Potatoes are largely supplied both by rail and coastwise.

From observations taken near London during forty-three years, the average day temperature of the week ie 69.2°, and its night temperature 46.7°. The greatest heat was 91°, on the 7th, 1868; and the lowest cold 28°, on the 7th, 1868. The greatest fall of rain was 1.50 inch.

COCHLIOSTEMA JACOBIANUM.

MANY amateurs and gardeners set themselves entirely against new plants, exclaiming that all these new species are rubbish, and they will confine themselves entirely to the good old plants. Another class, again, fly into the opposite extreme, and will have nothing but new plants, and are always eagerly and anxiously watching the market to enable them to be the first to catch any novelty that may appear. Now, in some respects both these are wrong; for, without wishing in any way to depreciate good old plants, there are many really splendid subjects of recent introduction which no garden should lack; on the other hand, there are many new plants which are inferior in merit to kinds already in our possession; so that by adopting the extremes both parties are losers in the end. The happy course to pursue is, therefore, a medium one, carefully selecting plants which appear distinct, and which seem to merit attention for their superior excellence.

It is an undoubted fact that many grand plants have been introduced into cultivation during the last ten years, and amongst the best of them is that called Cochliostema Jacobianum; it belongs to the order Commelynaceæ, and derives its generic name from the peculiar spiral appearance of its stamens. Being a native of Ecuador, it must be grown in the moist stove, and whether grown for the beauty of its foliage or its flowers, it is equally grand. The leaves are strap-shaped, sheathing at the base, from 1 to 3 feet long, and about 8 inches broad, rich vivid green in colour, and having a narrow margin of mauve. The flowers are produced from the axils of the leaves, and that, too, in the greatest profusion, as it commences flowering usually in March and April, and continues without intermission until Christmas. The flowers are produced in large branching panicles, and in colour are light blue and intense violet. Independently of the flowers, the stem is furnished with large and conspicuous bracts, which are as persistent as the flowers, and in colour are of a delicate mauve.

This plant should have liberal treatment, and should by no means be allowed to become potbound in small pots. The soil ought to be peat, loam, leaf mould, and good well-decomposed manure in equal parts, with silver or river sand added liberally. The drainage should be good, as it enjoys copious waterings; the water collects in the base of the sheathing leaves, and this should by no means be poured out, as it is a great source of nourishment to the plant, and not injurious as some frequently think.

Cochliostema Jacobianum is so extremely ornamental both in foliage and in flower, and so easily grown, that no stove, however small, should be without it.—Experto Crede.

VARIETIES OF PEAS.

There is, probably, no vegetable held in so much esteem as a dish of nice green Peas. In many establishments it is positively necessary to maintain a constant supply from May to November. In order to do this, a certain amount of attention and forethought is indispensable. I have often heard the remark made that Peas will grow anywhere, and under any circumstances. Of course those who entertain such notions know but little of the matter.

The garden ground here is not well adapted for vegetable culture, being of a very light nature, resting on a gravel subsoil. I believe a rich deep loam is essential to the successful development of all kitchen-garden crops; without it they cannot resist the summer droughts. My earliest crops of Peas are generally good, and obtained without much extra trouble. It is during hot dry weather in July that our kitchen-garden difficulties commence. I find the only way to obtain crops is by trenching the ground as deeply as the subsoil will permit, at the same time adding a liberal portion of manure; this should be done in the previous season, if possible. During dry weather the hoe is kept at work amongst them, and during excessive drought they require to be watered. This is effected by drawing a drill on each side of the row, and filling it up with water, giving sufficient to saturate the ground to a good depth. A small quantity of water is worse than useless.

For the earliest crop I grow Taber's Perfection; it does not come in quite so early as Sutton's Ringleader, but it is a much better cropper, and can be recommended as a very useful variety. Dickson's Favourite and Harrison's Glory come in next, sown together they are ready to pick at about the same time; both varieties carry large crops. They are much grown in the fields in this neighbourhood to supply the London market, and succeed Sangster's No. 1. or Daniel O'Rourke. During the Pea-picking season a large number of extra hands, principally women and boys, are employed. The crop is seldom picked over more than twice. At the second picking the haulm is pulled up, and the ground is ploughed, and immediately planted with Coleworts. Laxton's Supreme I have grown since it was first sent out. This is a moderately tall variety, and carries a good crop of large well-filled pods. Champion of England and Veitch's Perfection are both grand Peas, too well known to require any recommendation from me. These, with British Queen, I have found sufficient for all purposes.

There are many new sorts which are highly recommended. If some of your readers or contributors have found any of them to be distinct or superior to existing varieties, perhaps they will kindly give us the benefit of their experience. I received one named Magnum Bonum on trial this season; it is equal in quality to Veitch's Perfection, but grows as tall as Champion of England, and carries a large crop of the best-filled pods I ever saw.—J. Douglas.

TEA-SCENTED ROSES.

I quite agree with your correspondent "Stiff-soil" that the Tea-scented Roses are by no means difficult of culture. Indeed, if treated properly, they are easier to deal with than some other groups of Roses. But we must not lose sight of

the well-known fact that they are more liable to suffer from the frost and freezing rain in winter and spring than any others, and hence we should not allow them to be fully exposed to those influences.

Two distinct methods of dealing with them are adopted here, which may be termed "in-door" and "out-door" culture.

A span-roofed house with a double row of 4-inch pipes (flow and return) has been provided for in-door culture. The plants, standards and dwarfs, are planted out in beds, the branches of the strong-growing kinds being trained under the roof, and treated much in the manner of Grape Vines, while the more moderate growers are fashioned into bushes and pyramids in front and underneath. Here there is an abundance of beautiful flowers in April, May, and June, before the Roses are in flower out of doors. One Maréchal Niel, a standard, trained under the roof, produced this year nearly a thousand magnificent flowers; and the Climbing Devoniensis, Gloire de Dijon, Madame Falcot, Madame Bravy, Madame Willermoz, President, Rubens, Safrano, Souvenir d'un Ami, Vicomtesse de Cazes, and others, although not so prolific, were abundant and equally beautiful. Many of these continued flowering throughout the summer and autumn, so that at no time, from April to December, was there any scarcity of flowers. This is in-door culture.

Out-of-door culture is followed on two different lines. In May young plants are put out in front of a brick wall, but not trained to it. Training to the wall stands condemned by my experience: probably the dry hot air from the wall creates too great a drain on the leaves; it is better to plant 9 inches or a foot away from the wall, so that the air may circulate all round the plants, and that they may be watered all over when required. More vigour of growth and less spider are obtained by this practice, and a goodly number of flowers, too, the first summer and autumn after planting. The second line of out-of-door culture followed is to bud on the Dog Rose standards or dwarfs in August, so late that the buds may not break till the following spring. If they break in autumn the probability is that they will be materially injured and perhaps destroyed in winter. But permit me to remark that both the wall plants and the budded plants must be protected during winter. The former may be surrounded with evergreen branches, and the buds of the latter may be covered with strips of canvas tied on with bast or string.

The Tea-scented Roses are improving rapidly just now; the last two years have given us at least a dozen desirable varieties. The following have bloomed here both in and out of doors, and are so varied and beautiful that they are not likely to be lost sight of for many years:—Belle Maconnaise, Coquette de Lyon, Hortensia, Madame Azélie Imbert, Madame Gaillard, Victor Pulliat, Annette Sœur, Belle Lyonnaise, Madame Ducher, Madame Levet, Madame Trifle, and Madame Hippolyte Jamain. —William Paul, *Paul's Nurseries, Waltham Cross, N.*

LA VERSAILLAISE RED CURRANT.

The singularly cold damp weather which so long prevailed during the spring and early summer months of the present year affected the Red Currant trees so much that in some instances it has proved fatal not only to the fruit crop, but to the trees themselves, many of them being completely killed, and others so infested with blight and insects as to require close and constant attention to prevent the speedy and premature decay, which at one time appeared to threaten the whole of the foliage.

Of a few dozen bushes planted last season in precisely the same soil, and consisting of Knight's Large Red, White Dutch, Raby Castle, and La Versaillaise, all have suffered severely, excepting the last-named kind, the plants of which have passed quite unscathed through the trying ordeal, and have produced an abundance of vigorous shoots, and fine, large, deep green foliage. The healthy flourishing appearance of these trees in comparison to the miserable condition of the whole of the other kinds is so remarkable as to induce me to send you a note of the fact; for if this hardy and robust variety is as prolific, and the fruit is as fine in size and quality as it is said to be, it will, doubtless, prove a great acquisition.—Edward Luckhurst.

Large Produce of Potatoes.—In the spring of the year I had 1 lb. of Bresee's Peerless (a new American Potato). I cut the 1 lb. into 46 pieces, and planted them February 16th and dug them up August 22nd, when they turned out the enormous quantity of 135 lbs. Some of the stalks had five or six large tubers under each of them, and many of them weighed 2 lbs. each.—Thomas Penner, *Gardener to R. Durant, Esq., Sharpham.*

POT CULTURE OF MIGNONETTE.

In May put six or eight seeds into a thumb pot, and place it in a Cucumber frame. After the young plants are well above ground remove them to the greenhouse, placing them as near the glass as possible. When they are an inch or so in height, with a sharp knife cut off all by the surface except two of the strongest; allow these to grow a few inches, then with a knife cut the weaker one away. In a few days shift each of the plants left to larger pots, and never allow it to get potbound. Put in a stake, but not too near the stem. Nip out every flower that makes its appearance with the point of your knife; do not do it with the finger and thumb, otherwise the tender leaves will be injured. In a word, keep shifting, and allow no flower until the plant is as large as is desired.

Mignonette is a most interesting plant. It can be trained into any form one may desire by attending to these directions. I have no doubt it could be grown 6 feet high and 6 feet in diameter at the base—just by the rim of the pot. Give plenty of room and headroom and there will be no fear. Never allow water to touch the leaves in winter, and give just enough at the roots to keep the plant alive. Set it out of doors in summer in some sheltered corner. Mignonette requires a large supply of water, and will be benefited occasionally by a little liquid manure. It is not until the second summer that I would place the plants out of doors; and as it is about Christmas that we want it to flower, discontinue nipping off the flowers in October, it will then flower throughout the winter months in a cool house. Of course it is well to have plants of various sizes and forms, respecting which the cultivator must use his own discretion. The form of training which I prefer is the pyramidal style.—C. M. M'Crow, *Nash Court, Faversham.*

HYACINTH CULTURE IN POTS AND GLASSES.

In Pots.—It is not necessary to employ large pots, or pots of a peculiar shape for Hyacinths. There is nothing better than common flowerpots, and in those of 60-size (3¼-inch) single bulbs may be flowered in a most satisfactory manner. The pots usually employed are 48-size (5-inch), and 32-size (6-inch); the last-named being required only for selected bulbs grown for exhibition. We advise the use of small pots, where Hyacinths are grown in pits and frames for decorative purposes, because they can be conveniently placed in ornamental stands, or packed close together in baskets of moss, when required for the embellishment of the drawing-room.

A rich light soil is indispensable, and it should consist of at least one-half of good rotten manure, and the remainder turfy loam, with a liberal allowance of sharp sand. The mixture should be in a moderately moist condition when ready for use. When small pots are employed, one hollow crock must suffice, but 48 and 32-size pots must be prepared in the usual way, with one large hollow crock and a little heap of smaller pot-sherds or nodules of charcoal over it. Fill the pots quite full of soil, and then press the bulb down into it, and press the soil down round the bulb to finish the operation. If potted loosely, they will not thrive; if potted too firmly, they will rise up as soon as they begin to grow and be one-sided. Finally, to quit this part of the subject, they should be nearly covered with soil, except when grown in small pots, and then they must be only half covered, in order to afford them the largest possible amount of root-room.

When potted, the coolest place should be found for them, and they should not have a drop of water, unless they go absolutely dry, until they begin to grow freely, and are in the enjoyment of full daylight. The pots may be roughly stored in a dark cool pit, or any out-of-the-way place, where neither sun, nor frost, nor heavy rains will affect them, but it is advisable to plunge them in coal ashes or tan, and cover them a few inches with the plunging material.

As to their removal, there are two matters to consider. They must be taken out as wanted for forcing, and they must be taken out when they push their flower spikes through the plunging material, as they will do if they remain in the bed until spring. The cultivator must be guided in respect of their removal from the bed by circumstances, but when they are removed, a distinct routine of treatment must be observed, or the flowering will be unsatisfactory. For a short time they

must be placed in a subdued daylight, that the blanched growth may acquire a healthy green hue slowly, and they must be kept cool in order that they shall grow very little until they have acquired a healthy colour. The floor of a cool greenhouse is a very good place for them, when first taken out of the bed, and cleaned up for forcing. Another matter of great importance is to place them as near the glass as possible as soon as their green colour is established, and to grow them as slowly as the requirements of the case will allow. If to be forced early, allow plenty of time to train them to bear a great heat, taking from bed to pit, and from pit to cool house, and deferring as long as possible placing them in the heat in which they are to flower.

Those to bloom at Christmas should be potted in September, those to follow may be potted a month later. If a long succession is required, a sufficient number should be potted every two or three weeks to the end of the year; the latest potted will, of course, flower in frames without the aid of heat. In any and every case the highest temperature of the forcing-pit should be 70°; to go beyond that point will cause an attenuated growth and a poverty of colour. If liquid manure is employed at all, it should be used constantly, and extremely weak, until the flowers begin to expand, and then pure soft water should be used instead. It matters not what is the particular constitution of the liquid manure, but it must be weak, or it will do more harm than good. The spikes should be carefully tied to neat stakes in good time, and a constant watch kept to see that they are not cut or bent as they rapidly develope beyond the range allowed them by their supports. When done flowering, remove the flower-stems, and keep the plants in frames supplied regularly with water until the leaves die down; then lay them on their sides in a dry sunny place, with their heads to the north, for about ten days; then shake them out, rub off the roots, clean them up, and store in a dry place.

In Glasses.—It is of little consequence whether rain, river, or spring water be employed in this mode of culture, but it should be clean, and of a kind not likely to become offensive. Fill the glasses sufficiently full that the bulbs will nearly, but not quite touch the water, and place them at once in a dark, cool place, that they may be encouraged to send their roots down into the water before they begin to expand their leaves. When the roots are growing freely, bring them from the dark to the light, in order that their leaves and flowers may be developed in a healthy manner without being attenuated. Provide supports in good time; let them have as much light as possible, with an equable temperature. They are often injured by being kept in rooms that are at times extremely cold, and at others heated to excess. Those who would grow Hyacinths to perfection in glasses must remove them occasionally as circumstances may require, to prevent the injury that must result from subjecting them to rapid and extreme alternations of temperature. It is not desirable to introduce to the water any stimulating substances, but the glasses must be kept nearly full of water by occasionally replenishing as it disappears. If the leaves become dusty, they may be cleansed with a soft brush or a sponge dipped in water, but particular care must be taken not to injure them in the process.—(*Suttons' Bulb Catalogue.*)

FIG TREES CASTING THEIR FRUIT.

One of your most experienced contributors suggested some time ago that Figs cast their fruit because the female florets had not been impregnated. Upon examining with a microscope the interior of the enclosed specimen, the seeds seem well formed, and the general character of the fruit normal. It came off a plant of Bourjasotte grise, the great merits of which variety are lessened by the frequency with which it casts its fruit. I have a good many plants of it, but have lost a large portion of the fruit both last year and this.—G. S.

ANTHURIUM SCHERZERIANUM.

I congratulate "H. K." on the length of the spathe of his Anthurium; it is the longest I have heard of, but he does not give us the width. [It was 3½ inches where broadest.—Eds.] We have several plants here, among which is one that is thought a splendid variety. The spathes which it has produced this summer average 5 inches in length and 3 in width; the spadix, or elongation at the top of the spathe, measuring between 7 and 8 inches in length. The stems were 20 inches in length, carrying their noble blooms well above the foliage. Among the others are one or two longer varieties, but they are narrow. The plant above referred to has fifty leaves averaging 20 inches in length and 2¾ in width, giving it a very graceful appearance even when out of bloom. We find this Anthurium very useful as a decorative plant, and when arranged with a mass of Orchids in flower the effect is charming, its lasting properties greatly enhancing its value for the purpose. It also forms an excellent plant for exhibition.—C. J. W.

RYHOPE HORTICULTURAL SHOW.

If, as the story goes, the clerks of the Admiralty did not know where Sunderland was, one could hardly be surprised if anyone asked, Where is Ryhope? It is one of those pretty little villages with which our coast line is dotted, not a fishing village, but a country village pure and simple, though seated little more than a stone's throw from the sea, about three miles to the south of us. When I was a boy, and that's—well, never mind how many years ago—it was a pretty little place; and it is so to this day, though time has somewhat altered its face, and pretentious three-storied bay-windowed houses occupy the site of one or two of the white-washed cottages of former days. To me, as a child, it seemed a model village; triangular in shape, its base towards the sea, and its apex pointing westward; approached from the old turnpike road at its north-east angle, the entrance flanked on either side by a cartwright's and a blacksmith's shop, where such carts as never were, were built and painted with that everlasting red and blue, in which wheelwrights revel, where such horses were shod as are never shod now, the very smoke from whose burning hoofs seems to float before one's memory as sweet incense; the village green, where the rustics used to have their games on the long summer's evenings; the large pond at the head of the village, where we used to sail our ships (there were no model yachts then, ours were substantial brigs and schooners, well rigged, and smelling strongly of paint which never used to dry thoroughly—the handiwork of some friendly shipwright); the farmhouses, the cow-byres, the milk carts, and the amiable milkboy, who used to give us a ride in the straw among the cans and milk barrels, and make the donkey kick for our special edification—was there ever such a village? There may be, and there doubtless are, many fairer spots, but the recollections of childhood clothe Ryhope with charms belonging to no other place. There were the beautiful seabanks, where grew such quaking grass ("dothering ducks" we called them), as grew nowhere else; the sea beach with a strip of golden sand, where we used to bathe, my mother performing her toilet, as was customary in that primitive place in those primitive times, under shelter of an umbrella arrangement; the seaweed-covered rocks, laid bare at low tide, with every pool a mine of treasures; no end of winkles, and limpets, and crabs, which, for some reasons best known to themselves, have since emigrated—I mean the crabs; for what with Sunderland on the one hand cribbing hundreds of acres from the sea for its docks, and gas and patent fuel and other stench-producing factories on the other, striving which can discharge the most offensive-smelling compounds into the ocean, I think the crabs have agreed to seek "fresh fields and pastures new," and leave their native rocks to the limpets, who, making a virtue of necessity, still stick to the place with a pertinacity very commendable, affording a supply of excellent bait for fishermen, whose children, barefooted, visit the rocks every tide, knife in hand, detaching the limpets from the rocks with a skill the result of long practice.

About a mile from the village, and as recently as fourteen or fifteen years ago entirely unconnected with it, is a pretty little valley, a romantic spot, situated between two limestone hills, and once a favourite resort of Sunderland and his wife at the picnicing season of the year. Here, only a very few years ago, science smelt coal, and with a wonderful effort of engineering skill soon obtained it, and one result is that to-day upwards of seven hundred cottages, substantial and commodious, each with its own garden and out-premises, tenanted by nearly four thousand people, stretch in long regular lines, broken only by churches, chapels, and schools, over the undulations of the intervening country till they reach our little village of Ryhope, and it and Ryhope colliery become virtually one little town. The sports and pastimes of a pit village are various. Its inhabitants are, perhaps, in part not the most civilised portion of the community, nor has their peculiar calling a very humanising tendency; but there are among them men made of good stuff, the object of whose lives is to raise the moral standard of those with whom they come in daily contact, and in these efforts they are ably seconded by the colliery owners, who are

ever foremost in assisting in every good work which has for its aim the elevation of the vast numbers who are to a great extent dependant upon them. Out of this desire originated the Ryhope Floral and Horticultural Society, with its Exhibition and its Poultry Show, which yesterday (August 28th) resulted in one of the most signal successes which has attended any similar effort in this district. The Show itself, considered as a Show, was an immense success; and, apart from the splendid display of plants from the conservatories of the surrounding upper ten, not the least interesting feature was the great quantity of "stuff" sent from the colliery itself, and exhibited in the various flower, fruit, and vegetable classes open to "cottagers or workmen at the colliery," the whole occupying four marquees, one 60 feet in diameter, another 90 feet by 60, and the other two 80 feet by 25. Not more interesting to those conversant with the higher walks of horticulture are the great exhibitions of the day than was the Show of yesterday to many a begrimed hewer, who had spent many an hour in cultivating his little estate, and who was as proud of being first with his six spring Onions as the winner of the first prize for six stove or greenhouse plants. There will not be room in your columns for the names of the winners, but I daresay some who read the Journal will see recorded—

"Something attempted, something done."

You noticed the poultry show last week.—W. A. Blakston.

METROPOLITAN FLORISTS' SOCIETY'S SHOW AT THE CRYSTAL PALACE.

August 30th and 31st.

There was an immense difference between this Show and that of last year, but there is an immense difference also in the season of 1871 as compared with that of 1870. A dry summer can to some extent be remedied by the liberal use of the watercan or hose, but such a season (summer we cannot call it) as this, no artificial means can remedy; and the cold and cheerless spring, the wet and cold of June and July, were elements nothing could combat; and hence it was that in vain we looked for that magnificent line of Dahlias which made the last Show so memorable, for the splendid Asters, for the glowing Roses of 1870. The only flowers which were at all comparable to those of last year were the Hollyhocks and the Gladioli; the former certainly surpassed last year, and the latter were far more numerous, while I was glad to see fresh exhibitors taking the field and occupying prominent places. As it was, it is not difficult to see why Dahlias should have so fallen short. Anything more ungenial for them than the weather which immediately succeeded their planting-out could not be imagined. They did not remain stationary, they went back; and although the fine weather in the latter part of August did much for them, yet not one-third of the plants were in bloom, and indeed now I hardly fancy they will be equal to the splendid flowers of last year. Hollyhocks were very fine; and the seedling of Mr. Kelway's that obtained Lord Hawke's first prize, and that of Mr. Oats which obtained Mr. Chater's prize, were really magnificent flowers. Mr. Kelway's Gladioli were as usual very fine, though hardly equal in finish to those of last season; while, on the other hand, Mr. Douglas, of Loxford Hall, has never shown such spikes as he has done this year. Both of these exhibitors exhibited some fine seedlings, to some of which certificates were awarded.

I may as well here mention that a change will be made in the Exhibition next year. An international fruit show will be added to it if the fruit-growers of the kingdom will give their aid. I am quite willing to take the additional labour provided they will come forward to aid it. I shall hope to consult them by-and-by, and in the meantime can say that the Crystal Palace Company will give £50 to start with. So, my friends, set to work, and let us have a Show which shall be worthy of English gardening and of the place where it will be held.—D., *Deal*.

Owing to the exceptional character of the season the Show on this occasion was by no means equal to our expectations, notwithstanding the fact that the Crystal Palace Company had liberally supplemented the prizes offered by the Metropolitan Florists' Society. Dahlias were on the whole small, but would no doubt have been much larger had the Exhibition been a week later, and had the hot sun of the week previous not destroyed the best. Hollyhocks, on the contrary, were very good. Among the Gladioli were some remarkably fine seedlings, while Asters were also good. The arrangements of the tables, as usual, were excellent, and the introduction of a variety of plants along the centre of the stages, and breaking these up in bays, gave a good general effect.

In the nurserymen's class for forty-eight Dahlias, Mr. May, of the Hope Nurseries, Bedale, and Mr. Keynes, of Salisbury, were the two most redoubtable competitors. The former took the first position, the latter the second place. In Mr. May's stands the following were well represented—viz., Sir Greville Smytho, Emperor, Miss Roberts, Mr. Dix, J. Dunnington, J. Bennett, Charles Backhouse, Miss Henshaw, Commander, Yellow Perfection, Julia Wyatt, Flag of Truce, Vice-President, Golden Gem, Juliana, Indian Chief and Mrs. Thornhill. Mr. Keynes had very good blooms of James Cocker, Queen of Primroses, Annie Neville, Golden Eagle, Artemus Ward, Royalty, Mr. Dix, Sir G. Smythe, Monarch, Mrs. Wyndham, Mary Keynes, small but beautiful in colour, Vice-President, Hugh Miller, Lothair, Leah, rather small, and Gazelle. The third prize was withheld, and the fourth went to Mr. Walker, of Thame.

In the class for thirty-six the positions were reversed; Mr. Keynes was first and Mr. May second, Mr. Walker being third. Mr. Keynes's best were J. Cocker, J. Hunter, Flag of Truce, Jenny Austin, J. Neville Keynes, Lothair, Hugh Miller, Caroline Tetterell, Victory, Monarch, Annie Neville, John Lambert, and Sir G. Smythe. Mr. May sent Lord Derby, Sir G. Smythe, Octoroon, Adonis, lovely colour, white washed with pale lilac, J. Kirby, and others already named.

For twenty-four Messrs. Draycott, Humberstone Nursery, Leicester, Mr. May, Mr. Seale, Sevenoaks, and Mr. Walker were prizetakers in the order in which they are named. Among the varieties best shown were Julia Wyatt, Criterion, Hugh Miller, J. Bennett, Queen of Primroses, Harriett Tetterell, Sir G. Smythe, Miss Henshaw, Lord Derby, Flag of Truce, Edward Spary, and Yellow Perfection.

In the amateurs' classes the leading prizes for twenty-four were taken by Mr. C. J. Perry, Castle Bromwich, and Mr. Burpitt, gardener to C. Lambert, Esq., Wandsworth Common; and for twelve by Mr. Glasscock, Bishop Stortford, and Mr. Fewkes, Birmingham; Mr. Martin, Mr. Steer, and Mr. Beach, gardener to C. J. Herries, Esq., Sevenoaks, being the other prizetakers.

Of Fancies, the best twenty-four came from Mr. Keynes, and comprised good examples of Grand Sultan, Fanny Sturt, Miss Annie, John Sealey, Sam Bartlett, Bessie Wyatt, Pauline, John Salter, Sparkler, and Miss Neilson. Mr. May was second with fine blooms of Pluto, Pope's Gem, Galatea, Leopard, Hero of York, Sparkler, and Chang. In the amateurs' class for twelve the prizes went to Mr. C. J. Perry, Mr. Burpitt, Mr. Beach, and Mr. Martin, Hurstpierpoint.

For the prizes offered by Mr. Keynes for seedling Dahlias sent out by him in 1870 and 1871, Mr. C. J. Perry stood first, his best being James Cocker, Thomas Hobbs, crimson; Victory, James Grieve, buff, edged with crimson; Gipsy King, and Mary Keynes. Mr. May was second with Charles Backhouse, rich scarlet, Victory, and Thomas Hobbs. The third prize went to Mr. Coppin, Shirley, Croydon.

Messrs. Carter & Co. sent several pretty Pompone Dahlias about 2 inches in diameter, among which we noticed Obelisk, Princess Alice, and Erlking. Mr. Rawlings, Romford, received a first-class certificate for Maid of Essex, cream tipped with purplish lilac. Mr. Turner, of Slough, had a like award for Mrs. Saunders, pale yellow tipped with white, also for John Standish, rich red; both fine-formed flowers.

Hollyhocks were not numerous, but they were very good. The best nine spikes came from Mr. Oats, gardener to the Rev. Lord Hawke, Willingham Rectory, Gainsborough, and consisted of splendid examples of Alba superba, Walden Primrose, Fair Ellen, Queen of Yellows, Midnight, and rose, blush, and rosy crimson seedlings. Mr. Chater, Saffron Walden, the only other exhibitor, had fine spikes of Cygnet, Willingham Defiance, and Carus Chater. For twenty-four cut blooms, Mr. W. Chater was first, and Mr. Wheeler, Warminster, second; and for twelve, the prizetakers were Messrs. Oats, Porter, and J. W. Silver. The most noticeable for quality were Purity, Prince Albert, Triumph, Sanspareil, Ruby Queen, Walden King, Leah, Goldfinder, and Leviathan. Mr. Oats was also first for the best seedling with one of a fine rose colour, with the spikes thickly set with blooms. The Rev. Lord Hawke's prizes for seedlings went to Messrs. Kelway, of Langport, Mr. Wheeler, Warminster, and Mr. Chater, Cambridge; to the first for Lord Hawke, with very large rose-coloured flowers, to the second for Royal Prince, rosy red, and to the third for Albert Memorial, rosy crimson.

Of the Gladiolus there were several fine stands, notably those from Messrs. Kelway, of Langport, and Mr. Douglas, gardener to F. Whitbourn, Esq., Loxford Hall, Ilford. The former were first for thirty-six and the latter for twenty-four and twelve. In Messrs. Kelway's group four seedlings had first-class certificates—namely, Magnificent, fiery scarlet; Felix, carmine, flaked with lake, and having a violet stripe in the lower divisions; Victory, carmine, with a violet feather and a white blotch in the lower divisions; and Glow, orange scarlet, with an ivory centre, flaked with carmine. Among the others in this collection were Distinction, soft rose, flaked with scarlet and feathered with purple; Vesuvius, Sir Thomas Symons, Meyerbeer, Madame Desportes, Norma, and Lacépède, all of which were fine. The second and third prizes for thirty-six went to Mr. Wheeler, Warminster, and the Rev. H. H. Dombrain, and the corresponding prizes for twenty-four to Messrs. Paul & Son and Mr. Walker, Thame, whilst for twelve the Rev. H. H. Dombrain was second. For six Mr. Hodgson, of Croydon, was first with Circe, Marie Dumortier, Racine, Madame Dombrain, Delicatissima, and Duc de Malokoff, the other prizetakers being Mr. Gold, Mr. Oats, and Mr. Glasscock. Mr. Douglas likewise took Chapman's patent show case, offered for the best six spikes of Gladiolus of 1870, showing Horace Vernet, Nestor, Sir John Franklin, Phidias, and Van Spandonck. In addition he had first-class certificates for Sylvia, scarlet, streaked with white, and feathered with purple at the base of the divisions, and for Fairy Bells, rose, edged with salmon and feathered with purple. Along with these were several other good seedlings, and fine spikes of Meyerbeer, Sir J. Franklin,

Legouvé, &c. The second position for six Gladiolus of 1870 was taken by the Rev. H. H. Dombrain.

Asters on the whole were good, and some of them quite as fine as in more favourable seasons. The principal prizetakers, were Mr. Wheeler, Messrs. Kelway, and Mr. Matthews, Hoxton, and Mr. Walker, Thame.

Roses could hardly be expected to be fine after so much hot sun. The best came from Messrs. Paul & Son, and Mr. C. J. Perry, Mr. Coppin and Mr. Fewkes also showing creditable trusses. The latter also sent Verbenas and French Marigolds, taking the second prize for the former, Mr. Perry being first with very fine trusses. Of other subjects, Mr. Edwards, florist, Upper Norwood, sent two very fine specimen Hydrangeas in tubs; Mr. Farndell, Wandsworth Common, fine examples of White and Red Tripoli and other Onions; Messrs. Downie, Laird, & Laing a group of fine-foliaged plants; Messrs. Dickson, of Edinburgh, a collection of hybrid bedding Violas, which were dwarf in habit, good in colour, and likely to be useful; and Mr. Eckford, Coleshill, seedling Verbenas.

In table decorations there was a marked improvement as compared with those shown on August 5th, more originality, and a great deal more elegance. The arrangements of Mr. Buster, St. Mary's Cray, and Miss Hassard, Upper Norwood, were very graceful. Mr. Buster, Goring, was third, and Miss E. Blair and the Rev. H. H. Dombrain were commended.

At the risk of being thought presumptuous, I have made up my mind to write a few notes of my impressions of the recent flower show of the Metropolitan Society at the Crystal Palace, and to trust to the tender mercies of the Editors for their insertion in "our Journal," hoping to repeat the attempt on another occasion if successful.

As the names of the prizewinners will be supplied by the usual authorities, I need not repeat a list of names, which, however well known, have but little interest for those who are not practical gardeners. I went to the flower show simply as one who is very fond of flowers and gardening—a description which will, I daresay, apply to four out of every five spectators, who generally pay very much more attention to the flowers than to the names of the exhibitors. I might take as my text "Flowers not Exhibitors."

I shall plunge at once *in medias res*, without reference to classes or arrangements, and commence with Roses. There were not many specimens of the queen of flowers, and those which were exhibited soon showed the effects of the heat, which was very great on each day. The best Rose in the Show to my mind was a Charles Lefebvre exhibited by Mr. Perry. Some of the specimens exhibited under the same name were of such very different shades, that it was almost impossible to believe that they could be the same. Alfred Colomb was a most conspicuous example of this, and were I to order it, I am sure I do not know what coloured Rose I should get. Judging from the specimens I saw I should select Charles Lefebvre, Alfred Colomb, Céline Forestier, Maréchal Niel, La France, Madame Alice Durean, Mdlle. Marie Rady, and Madame Willermoz as among the best Roses on the tables. The heat of the day and the lateness of the season were much against them.

Verbenas were not plentiful but very good. None beat my old favourite Géant des Batailles.

Asters were very good indeed, but the prizes were not awarded in every instance quite in accordance with my ideas. I was not the only person who considered the twelve flowers exhibited by Mr. Silver, gardener to J. P. Saunders, Esq., better than either of the collections which took the second and third prizes. All the prize collections of thirty-sixes were most excellent, and it must have been an unenviable task to try to distinguish between them. I shall for the future discard German Asters and stick to the French.

Hollyhocks were magnificent, particularly the collections of Mr. Oats, and of those exhibited by him notably his twelve cut blooms. It was necessary to see them in order to believe that this flower could be brought to such perfection. It was not the least satisfactory feature in this class that the amateur carried all before him.

Dahlias were a sight to see, though I must confess that it is not a favourite flower with me. Mr. Keynes had in one of his collections a magnificent Queen of Primroses, which was, I think, the best specimen among them all. It excited great admiration. Of the others I shall select Julia Wyatt, Monarch, Golden Gem, Lord Palmerston, and John Neville Keynes as among the best.

Gladioluses I have kept till last, as to my mind they formed the feature of the Exhibition. They were simply magnificent. I would use a stronger word if I had one at command. Oh! what a feast of glorious colours and delicate shades! I could not help asking myself why this splendid flower is not more generally grown. If the Metropolitan Society should succeed in bringing it into greater notice, and accomplish nothing else, it would still have done a great work. Messrs. Kelway's thirty-six were very grand, and presented a sight well worth a journey. Mr. J. Douglas exhibited some very beautiful spikes, and amongst others one of Meyerbeer, which was to my mind the finest in the Show. There was not a single collection exhibited which would not have been a splendid feature in any garden. There was scarcely a spike which was not "a thing of beauty." The fact that "D.," of Deal, was among the prizewinners gave an additional interest in my eyes to this part of the Exhibition.

Of table decorations I confess I have scarcely patience to write. I do not know what were the conditions of the competition, and I defy anyone to guess at them after an inspection of the awards. There were but few specimens which were fit to be placed on any well-dressed table. In many instances the receptacle for the flowers was of the very commonest shape, and dressed in the worst taste. The design of Mr. W. Dedman, jun., which appeared to me the most tasty and suitable, being light and capable of being prettily dressed, was passed over without even a commendation, while a second prize was awarded to a contrivance from Messrs Barnicott & Banfield, consisting of flower-glasses and candelabra combined, in which the top flowers must have caught fire if the candles had been lighted.

The same remarks will apply to vases and baskets. Most of the articles exhibited were of the very commonest description. The third-prize vase was preferable to either of those to which the first and second prizes were awarded. In one instance a commended was bestowed on a common unshapely vase, containing a bunch of unarranged flowers. This was, I think, the climax. I was, and still am, in doubt whether the whole thing was not a joke. If it were not, I can only say I think this part of the Exhibition was very humiliating. I should have left the building in a state of great disgust after an inspection of these so-called "decorations," but the sight of the Gladioluses and the sound of that grand Handel Festival organ restored my equanimity.

To sum up, I should say, speaking as an amateur and an ignoramus, that the Dahlias and Verbenas were good, Asters and Hollyhocks very fine, and Gladioluses magnificent; but that the table decorations showed a sad lack of invention in the designs, and in many instances great want of taste in the dressing, but, taken as a whole, the Show was a source of very great enjoyment.—W. H. B.

ROYAL HORTICULTURAL SOCIETY.

SEPTEMBER 6TH.

The Show on this occasion was held in the Council-room, which barely afforded space enough for the full display of the subjects sent, which were not, however, sufficiently numerous to have filled a tent, even had the appearances of the early morning been more inviting than they actually were. Still the day was fair, the Show was interesting, and the attendance of visitors much better than one could expect now that London is out of town.

The show of Dahlias, though not by any means so extensive as that at the Crystal Palace, was superior in quality; a week has made a great difference in the blooms, and it was generally admitted that the Metropolitan Society's Show was for this season fully a week too soon. For twenty-four Messrs. Kelway, of Langport, were first with splendid blooms of King of Primroses, Pandora, Julia Wyatt, King of Sweden, Master of Arts, Mr. Dix, Jenny Austin, Vice-President, Miss Henshaw, Lord Napier, Charlotte Dorling, Volunteer, Lord Shaftesbury, Flag of Truce, Lord Derby, Andrew Dodd, Ellen Potter, Sydney Herbert, Princess of Wales, Hugh Miller, Mrs. Boston, Lady G. Herbert, and good examples of some others. The second-prize twenty-four came from Mr. Turner, of Slough, and consisted entirely of seedlings, several of which were very fine in size, form, and colour. Mr. C. J. Perry, Castle Bromwich, was third, showing fine blooms of James Cocker, Mary Keynes, Gipsy King, Vice-President, Hebe, and Miss Roberts. Mr. Burpitt, gardener to C. Lambert, Esq., Wandsworth Common, and Mr. Walker, Thame, also exhibited in this class.

In the amateurs' class for twelve Mr. C. J. Perry took the lead with Vice-President, John Keynes, Flora Wyatt, Lord Derby, &c. The second prize went to Mr. R. Parsons, Waterstock, Oxon, and the third to Mr. Beach, gardener to C. J. Herries, Esq., Sevenoaks.

Of Asters not quilled there was an excellent show, many of the heads being very nearly 4 inches in diameter, and the colours fine and distinct. Mr. Wheeler, of Warminster, was first for twenty-four with a remarkably fine stand. The second prize went to Messrs. Kelway, of Langport, who had some very fine blooms both as regards size and colours, the latter in several of the varieties being very brilliant. Mr. Chater, Gonville Nurseries, Cambridge, was third. Mr. Walker, Thame, and Mr. Rowe, The Rookery, Roehampton, also competed.

In the open class for twelve Asters Mr. Chater and Mr. Wheeler were respectively first and second, both with excellent blooms.

In the amateurs' class for the same number of blooms the prizes went to Mr. Rowe, Mr. Farndell, Surrey County Asylum, Tooting, and to Mr. Porter, gardener to Mrs. Benham, Isleworth.

For six Asters in pots Mr. Rowe and Mr. Porter were the only exhibitors, showing very well-bloomed plants. Messrs. Veitch exhibited, not for competition, a splendid collection of Truffant's Pæony-flowered, Chrysanthemum-flowered, and other varieties.

Of Verbenas, stands of twenty-four were exhibited by Mr. C. J. Perry, and Mr. Chater, Gonville Nurseries, Cambridge; the former being first with splendid trusses of Edwin Day, scarlet, Charles Perry, Lilac King, &c. Mr. Chater's trusses were somewhat past.

Of six plants of Lilium speciosum in not fewer than three varieties only one collection was shown; that came from Mr. Bull, of Chelsea, and consisted of L. speciosum (lancifolium) album, sub-varieties of rubrum, also roseum and punctatum. The plants ranged from 2 to 3 feet in height, and were in splendid bloom.

In six distinct Liliums Mr. Bull again was the only exhibitor, showing L. auratum in magnificent bloom, a variety of it called pictum with the band in the centre of each division purple-tinged, L. specio-

sum album and L. tigrinum, both very fine, and a variety of speciosum with the anthers orange instead of brownish crimson.

FRUIT COMMITTEE.—G. E. Blenkins, Esq., in the chair. Rev. C. C. Ellison, of Bracebridge Vicarage, Lincoln, sent two very handsome heads of Veitch's Autumn Giant Cauliflower, to which a special certificate was awarded. Mr. Charles Turner, of Slough, sent a brace of Blue Gown Cucumber. He also sent a brace of one named Wizard, of the Sion House race, which were very good. Mr. Perkins, gardener to Lord Hartismere, Thornham Hall, Suffolk, sent a large fruit of Sooly Qua Cucumber 5 feet 2 inches long. Messrs. Watts & Son, Northampton, sent the Improved Giant King Potato; and Mr. James Barpitt, gardener to C. Lambert, Esq., Wandsworth Common, sent a seedling called Bountiful. The Committee decided that in future they would give no opinion upon any new Potatoes until they had been grown in the garden at Chiswick. Messrs. Carter & Co. sent a runner Bean called Canada Express. Mr. D. McKellar, gardener to Charles Magniac, Esq., Colworth, Bedford, sent some very good Onions of the White Spanish and Globe varieties. Messrs. Barr and Sugden exhibited a collection of Onions, and a vote of thanks was awarded, and special attention was directed to the variety called Trebons, with a desire that it may be exhibited again. Mr. C. Osman sent a collection of fifteen dishes of vegetables, all of a very meritorious character, to which a special certificate was awarded. Mr. William Armstrong, gardener to F. D'Eath, Esq., Hendon, sent a Queen Pine weighing 4 lbs. 3 ozs. from a sucker of fourteen-months growth.

Mr. Clarke, gardener to W. Vivian, Esq., Roehampton Lodge, sent a bunch of Black Hamburgh Grapes. Mr. Pearson, of Chilwell, sent a seedling Grape called Dr. Hogg, a large, long-shouldered Grape, with a large round berry, and a fine Frontignan flavour. This was highly appreciated by the Committee, and was awarded a first-class certificate. Mr. Pearson exhibited several other seedlings which were not sufficiently ripe, and which will be sent to a subsequent meeting. Messrs. E. G. Henderson & Son sent a seedling Grape ripening three weeks earlier than White Muscadine. The bunches were not quite ripe, but were well forward in ripeness; the flavour was deficient. Mr. W. G. Gaiger, The Gardens, Burton Closes, Bakewell, sent dishes of excellent fruit of Bellegarde and Royal George Peaches, and Hunt's Tawny Nectarine. Mr. Donovan, gardener to Mrs. Kettlewell, Norwood, sent two dishes of Nectarines. Mr. Porter, gardener to Mrs. Benham, Sion Lodge, Isleworth, sent a dish of Peaches from an open wall. Mr. Turner, of Slough, sent a basket of a new Plum raised by Mr. Ingram at Frogmore, called Bonne Bouche, which was awarded a first-class certificate three years ago. This is a large greenish fruit, a good deal like Washington, and with a fine Green Gage flavour. Mr. B. Porter, gardener to Mrs. Benham, sent a dish of Pond's Seedling Plum. Mr. J. Clarke, gardener to W. Vivian, Esq., sent a dish of Victoria Plums. Mr. William Paul, Waltham Cross, sent a collection of forty-six varieties of Apples, all correctly named, which was awarded a first-class certificate. Mr. Reid, gardener to the Earl of Crawford, Haigh Hall, Wigan, sent two large fruits of Passiflora quadrangularis, which had been grown in a Melon pit. They were well ripened and well flavoured, and the Committee awarded them a special certificate. Mr. D. Ross, gardener to Colonel McDonald, St. Martin's Abbey, Perth, sent a seedling Melon called Ross' Seedling, a large oval fruit with a pale green flesh, and of good but not superior flavour. Messrs. Kelway & Son, Langport, sent a small red-fleshed Melon called Eclipse. Mr. Cadger, The Gardens, Luton Hoo, sent four seedling Melons. Mr. Perkins, Thornham Hall, sent a fine fruit of Queen Emma Melon, which was in fine condition and much approved by the Committee. It was awarded a special certificate.

Mr. Pragnell, Castle Gardens, Sherborne, exhibited a collection of Onions, which for their fine growth and great size we have never seen surpassed. The New Giant White Tripoli, Giant Madeira, and Giant Rocca were quite extraordinary, and the Nuneham Park form of the White Spanish was equal to the best specimens we have seen. The names of the other kinds were James's Keeping, Italian Red Tripoli, Flat Tripoli, Globe Tripoli, Blood Red, Danvers' Yellow, White Lisbon, Reading, Bedfordshire Champion, White Spanish, Neapolitan Marzagole, Early White Naples, Brown Globe, Strasburg, White Nocera, and Silver-skinned. The Committee awarded a special certificate, and in addition recommended Mr. Pragnell to the Council as deserving a medal for his very meritorious exhibition.

Messrs. Carter & Co. offered prizes for the best collections of Onions, including the Giant Rocca, Giant White Tripoli, and Neapolitan Marzagole. Mr. Farndell, Surrey County Asylum, Tooting, was first with excellent examples of the kinds named, Trebons, White Spanish, White Lisbon, &c. Mr. Baverstock, gardener to W. Hope, Esq., was second, and Mr. Miles, gardener to Lord Carrington, third. It would be useless to give the names of the varieties, as certainly the same kind figured under different names in different collections. Mr. Garland, Killerton Gardens, Devon, exhibited a collection not for competition.

FLORAL COMMITTEE.—Dr. Denny in the chair. There was on this occasion a large number of novelties, seedling Dahlias, Hollyhocks, and Verbenas being present in great force, but the proportion that were considered of sufficient merit to receive certificates was small.

Foremost must be mentioned Amaranthus salicifolius from Manilla, exhibited by Messrs. Veitch, of Chelsea. Of this two sets of half a dozen plants were shown, and excited general admiration. They averaged about 3 feet high from the pot, and few plants could be more ornamental, having long, narrow, graceful weeping leaves, most of them purplish rose with an orange tinge, others bronzed metallic green. Their effect was extremely fine, and we believe, moreover, that the plants were lifted from the open ground, and therefore, probably, capable of being treated as half-hardy annuals. Whether that be so or no, it is quite certain that this Amaranthus will prove a great acquisition. Messrs. Veitch also received a first-class certificate for Masdevallia amabilis, with lovely magenta sepals. From the same firm came also the orange scarlet Begonia Veitchii, which has before been certificated.

M. Jean Verschaffelt, of Ghent, sent a fine collection of Agaves; Mr. Croucher, gardener to J. T. Peacock, Esq., Sudbury House, Hammersmith, a collection of very remarkable Echinocacti, Mammillarias, and Cereuses, for which he received a special certificate; and Mr. Bull, Chelsea, several Draceenas, of which D. splendens, with olive and red leaves edged with deep red, and with the young foliage rosy red, was awarded a first-class certificate. A special certificate was given to Mr. R. Parker, Tooting, for a fine basket of Ixora amatilie, with fine deep orange heads. Messrs. Carter & Co. sent a double Tiger Lily, much inferior, as shown, to that noticed at page 140, also Begonia carminata superba, with pale flesh flowers and white-veined dark velvety foliage. Messrs. E. G. Henderson sent a number of plants of the ornamental golden-leaved Thyme which they have so often exhibited, also of Thalictrum adiantoides, and the variegated Hydrangea japonica. Messrs. Ponsford & Son, Brixton, had a special certificate for cut specimens of Clerodendron Bungei.

From Mr. George, Potney Heath, came a seedling winter-flowering Picotee called Celestial; and from Messrs. Lee, Hammersmith, Bronze Zonal Geranium Disraeli and Tricolor Compactum, to show their value as bedding plants. Mr. Eckford, gardener to the Earl of Radnor, Coleshill, also sent a seedling Zonal called Crimson King, and Bronzes Countess of Radnor and Princess Louise, the latter with a broad zone. From the Society's garden, Chiswick, come Begonia Richardsiana, a neat white-flowered species, with small deeply-slashed leaves, and when grown as exhibited, forming very ornamental free-flowering specimens in small pots.

Of new Dahlias, Mr. Turner, Slough, exhibited some very fine varieties, several of which have been noticed in the report of the Show at the Crystal Palace. Mrs. Saunders; John Standish, the latter splendid; Souvenir d'Herbert Turner, large, white; and Kate Haslam, lilac peach, of fine form, had first-class certificates; and a second-class certificate was given for Mrs. Waite, pale peach, with a white centre, of fine form. Mr. G. Quilter, orange; and Mephistopheles, dark maroon, were also promising. Mr. Lidgard, of Hammersmith, had a second-class certificate for Model, maroon crimson, but small. Mr. Keynes, of Salisbury, had first-class certificates for Dolly Varden, a very pretty faint blush, lightly tipped with purple; and for William Keynes, rich reddish orange. From the same exhibitor came also William Laird, lilac; and Marchioness of Lorne, cream, tipped with purple, a showy flower. These received second-class certificates. Mr. Parker, Winkfield, sent several seedling Dahlias, of which Lady Herschel, with a light ground and tipped with purple, was awarded a first-class certificate, and a similar award was made to Mr. Rawlings, Romford, for Maid of Essex, which was also certificated at the Crystal Palace. The exhibitors above named, also Mr. Harris, Orpington, and Mr. Fewkes, Birmingham, sent numerous seedlings. That from Mr. Fewkes, called Crimson King, was of great size and fine colour; and Flower of Kent, from Mr. Harris, though too small, was a good yellow.

Of Gladiolus, Messrs. Kelway, Langport, sent a collection, as well as a number of new kinds, the best of which have been noticed in another page. Mr. Tillery, gardener to the Duke of Portland, Welbeck, a great raiser of this flower, sent Celestial, white edged with scarlet, with a white line in the upper divisions. This had a novel and attractive appearance, and received a certificate of the first class.

Several stands of seedling Hollyhocks were also shown. Mr. W. Chater, Gonville Nurseries, Cambridge, was awarded a first-class certificate for Peerless, pale buff; and Mr. McKellar, gardener to C. Magniac, Esq., Colworth Hall, had first-class certificates for Jeanie, primrose, and Rose of Sharon, crimson.

Of Verbenas Mr. Perry, Castle Bromwich, sent Emma Weaver, very fine, white with a large purplish rose eye; and Mr. Eckford, Plato, deep scarlet, with a very large truss, and Lady Edith, very beautiful, white with a crimson eye.

A special certificate was awarded to Messrs. Veitch for their fine collection of Asters.

Although not exhibited before the Committee, we must mention a remarkably fine Gladiolus called cruentus, with flowers more like those of Vallota purpurea than of a Gladiolus. They are of a splendid scarlet, the lower divisions barred with white at the base, and produced not more than four at a time, but in long succession. The plant is very vigorous, but we are informed by Mr. Standish, in whose interesting collection at South Kensington it is to be seen, that it flowers well in a 5-inch pot. Peter Barr, a hybrid crimson scarlet, with a white feather and stripes, is another vigorous-growing kind well deserving of attention.

CHISWICK TRIALS OF FLOWERS.—It has been suggested that the best plan of making up the collections at Chiswick would be for the

various growers to contribute at this (autumn) season of the year, when they can be so much more conveniently looked out and dispatched, such kinds as they can spare of those already sent out. To further this object it was also suggested that catalogues should be sent to Mr. Barron for him to mark in them the names of those kinds which the Society already possesses. Mr. Barron is quite prepared to carry out this suggestion with a view to making the next season's trials as complete as possible, and would be glad to receive at once any varieties of the under-named flowers which are not already at Chiswick. In addition to the bedding Pelargoniums, which always form the principal group of trial plants, it is proposed to form also as complete sets as possible of Phloxes, Pentstemons, bedding Lobelias, and bedding Violas for out-door culture, and of Fuchsias for culture in pots. Address, Mr. A. F. Barron, Superintendent, Royal Horticultural Society, Chiswick, W.

GRAVEL WALKS—INSECTS—SEASONS.

Owing to the wet summer my garden walks (Steevie says they are half a mile in length—facts are sometimes figures) have been very grassy and weedy. I have used boiling water with vitriol and salt, and at present the weeds look dead; at any rate, the walks look well. A weedy walk looks as if the owner is dead or bankrupt. It is only an experiment.

Insects are innumerable. The ants I have killed with boiling water and by hand. Bluebottle flies, moths, wasps, and hornets I have caught in glass jars, such as pickles are sold in. I use treacle, cider, and hot water. I have twenty-four jars down at the base of the trees. They are full of the above enemies. Had I not done this they would have ruined my capital crop of Peaches and Nectarines. The trees are in fine condition for another year, with plenty of triple buds. I have cut in half a good deal of foliage in order to let in sun and air.

We shall have, I think, an early and hyperborean winter. I like a hot summer, genial autumn, and hyperborean winter, to be followed by an early spring.—W. F. Radclyffe.

MEALY BUG IN A VINERY.

About seven years since one of my vineries became infested with mealy bug through the introduction of a new Grape containing the eggs of this vermin. In the course of two years the whole of this vinery, 110 feet by 20, had become attacked. All the common remedies with the exception of guano, lately recommended by Mr. Abbey, were made use of without effect; and I believe that when once this pest has fully established itself no remedy but one will eradicate it. We determined last year to try this remedy—*i.e.*, starvation. We cut down all the Vines, fifteen years old, to within a few inches of the ground, taking care to clean the stems. When the warm weather came the eggs of the insects left in the house hatched, but soon died from want of food. None have been observed since, and the Grapes this year are magnificent.—Observer.

RUBUS DELICIOSUS.

In a foreign catalogue I notice Rubus deliciosus. Upon referring to Don, vol. ii., page 539, I find it is a native of the Rocky Mountains, but he does not say a word about its fruit, though I presume its specific name must have been given in consequence of some real or supposed excellence. Do you know whether any English pomologist has endorsed its American reputation?—G. S.

[We know nothing of this beyond the description given by Don, and that it is stated in Loudon's "Encyclopædia of Trees and Shrubs" to have purple flowers, succeeded by a very delicious fruit, and to be a shrubby Bramble 5 or 6 feet high.—Eds.]

COMMON SALT A SOLVENT OF SILICA.

Common salt is a compound of chlorine and sodium. When mixed with the soil the sodium, by oxidation, becomes soda, and the chlorine, by combination with hydrogen—evolved from the decay of organic matter and from other sources—is converted into hydrochloric acid, which is one of the most powerful solvents of silica known in chemistry. This hydrochloric acid acting on the sand grains dissolves the silica, and insures the greater per-centage of this element, which analysis of the ash has shown to exist in the straw of grains grown on salted, sandy land, as compared with that from land with like character not manured with salt. A fine practical illustration of the solvent action of hydrochloric acid, which is obtained in immense quantities as an incidental product in the manufacture of soda ash from common salt, is furnished in the preparation of paper stock from East Indian cane. The cane, crushed between rollers, is steeped in the acid diluted with water, by which means the silicious outer coating is dissolved away. A more annoying example is frequently experienced in analyses in which hydrochloric acid is an agent, and in which, from the solvent properties of the acid, the process is hindered and the accuracy of the results made doubtful by the presence of gelatinous silica.—(*American Journal.*)

ANNUALS FOR AUTUMN SOWING.

We very rarely see the cause of hardy annuals advocated in our periodicals. Now and again we see a notice of one or two new introductions, with a few passing comments on their merits, but the tone of these comments unmistakeably shows that annuals are subjects of only second-rate importance in fashionable flower gardening. Their inexpensiveness, and the ease with which they may be cultivated generally, have prevented them from being so utterly neglected as hardy perennials have been; but for many years amateurs have been their chief patrons, and they have received very little favour, especially in the better class of gardens, from professionals generally. Now, however, that there are signs of a turn in the tide in favour of introducing more variety in form and colour, as well as subjects likely to prove attractive on other accounts than colour simply, we may fairly hope hardy annuals will come in for a fair share of attention. It would be superfluous to insist on their beauty; no one that has ever seen hardy annuals really well grown can have any other opinion than that in their ranks are to be found a goodly array of Flora's choicest gems. In general, light graceful beauty is their characteristic; they lack the boldness and sustained brilliancy of the favourite types of bedding plants; but this fact should be all in their favour in the view of those that desire to make some reform in their flower gardening. As a class they can never vie with bedding plants for the purpose of massing; a very few, perhaps, may be useful in that way, in cases where it is difficult or impossible with the available means to rear full complements of tender plants. They are only suitable for planting in the mixed style in which density of general effect must give place to individual attractions. They may be best employed in filling up blanks in herbaceous borders, and in ornamenting the edges of beds of shrubs, and some few are very beautiful rockwork plants. Many of them bloom very early, and may be had in flower a few weeks after sowing; and a very important group—the "Californian Annuals"—by means of autumn sowings, can be brought into flower so early in many of the favourable districts, that they may be made available in spring flower gardening; and even in the least mild parts, if a cold frame may be devoted to them during winter, they will serve, along with other hardy plants, to make beds and borders gay long before bedding plants can be turned out into summer quarters.

While the writer thinks it desirable that hardy annuals generally should receive a greater amount of attention, he has personally more favour for the Californians than for those other hardy annuals which, hailing from many countries superior in respect of climate to our own, can only be cultivated during summer with us; and it is to this group that the remainder of the present paper will be devoted. The different species comprised in the group are not all natives of California, but a large proportion of them are so. All submit to the same general treatment, and the term Californian annuals is therefore sufficiently applicable and convenient in a general sense. The beauty and profusion of the flowers of many of them are remarkable when they are well cultivated and attended to. The names of a few of the most popular among them, such as Limnanthes, Nemophila, Clarkia, Godetia, Eutoca, and Whitlavia need only be mentioned in proof of their first-rate ornamental qualities. These contain some of the most choice and brilliant of hardy annuals, but they by no means monopolise the beauty of either the group to which they belong, or the whole class of hardy annuals.

The Californians succeed best when sown in autumn in most parts of the country. I have often had splendid plants from self-sown stock of Limnanthes, Nemophila, Collinsia, and others in bloom in April in Scotland; and with careful attention to the removal of decaying flowers along with the seed vessels as they formed, they have lasted in ornamental condition till July and August, when late spring-sown plants come in to take their place, and keep up the display to the close of the

year. Many of them freely sow themselves, especially in light warm soils and early districts. Advantage may be taken of this in transplanting as many seedlings as may be required to a nursery-bed, in some sheltered corner, where they must be kept till the rigour of winter is spent. In less favourable districts, however, throughout the greater part of Scotland, and many parts of England also, although autumn-sown plants may scatter their seeds, and give rise to a number of plants, they are usually either too far advanced, or too late to winter well; in the one case being too gross, and in the other too small, to withstand the effects of long-continued frost and damp. It is better, perhaps, in every case, to sow regularly, so as to insure a prospect of ample stock to transplant the following spring.

The beginning of September is early enough to make the sowing; and the poorest piece of ground that can be chosen, if well sheltered and warm in aspect, is the best for the autumn seed-bed. If the ground is poor, sandy, and dry, so much the better; digging and sowing, either in drill or broadcast, is all that is necessary in this case. But if rich and retentive, it will be necessary to reduce the staple by the addition of sand, lime rubbish, or fine-sifted ashes; and further, in order to secure the best possible drainage for the young plants, it will be advisable to raise the bed in the centre ridge-fashion. If all this is needed, drill-sowing is the best in the circumstances; and the drills should be ranged across the ridge, not along it, because the plants will thereby enjoy greater variety of aspect, and will be also less liable to suffer from stagnation at all points of the drill, for the top of the ridge will always be in a tolerably well-drained condition in even the most unfavourable cases. Wherever a line can be sown along the base of a west or south wall the plants may be expected to do well, and to come very early into flower the following spring. In severe weather, long continued, they will require some kind of protection. A few saplings hooped over the bed, so as to support mats, or well-clothed spruce branches, will be found quite sufficient covering in ordinary winters in any locality; and these coverings should only be put on when the weather is so severe as to cause apprehension of destruction to the plants, and be removed again as soon as it improves. The plants will require to be thinned before winter sets in, so as to stand quite clear one of another; and some attention will be needed from time to time afterwards to keep them quite free from decaying leaves, and any other cause of damping that may find a place among them. Those that can devote hand-glasses or cold frames to the wintering of them will have their prospects of success increased, and will, besides, be rewarded by the earliest possible crop of flowers.

Under glass they will require similar treatment to Cauliflowers, Calceolarias, or Pentstemons. Give air at all times except during the most severe weather. Remove the lights wholly on bright mild days, and keep them on, but tilted, in wet ones. Give water sparingly, only enough to prevent flagging, till the days lengthen and the plants begin growing vigorously. In March they should undergo a process of hardening-off, so that they may be planted out in April as early as possible.

If they have been wintered in the open ground they will require no hardening-off preparatory to planting out, but any protection that may have been given to the seed bed should be removed a few days beforehand; and in the event of bad weather setting in after planting out, it will be advisable to stick a spray of spruce close to each plant so as to arch over it.

The first spring sowing will be early enough made in the end of April, and a second may be made the first week of June. The latter should be made on a west or east aspect, where the plants will come away more vigorously than if sown in full exposure to the sun. All that may be transplanted with safety may be sown in the ground either broadcast or in lines; and tap-rooted kinds that do not succeed well when transplanted, must be sown where they are to remain, or in pots, to be turned out with balls.

The following short list comprises a few of the best of the Californian annuals. Those marked with an asterisk are not in every case the most beautiful, but they are all worthy of being cultivated in any garden, and are specially marked as being the longest bloomers, some of them blooming for a very long period indeed, if a little care is bestowed in picking off the seed-pods, and on watering in periods of drought:—

Agrostemma Cœli-rosa, 1 to 2½ feet; rose-coloured.
Calandrinia speciosa, 6 to 9 inches; procumbent; violet-crimson.
  alba, same as species, but white-flowered.
Callichroa platyglossa, 1 foot; bright yellow.
Centaurea depressa, 1 foot; deep blue.
  rosea, same height as species; centre florets rose, outer ones blue.
*Clarkia pulchella, 1½ foot; in variety.
*Calliopsis tinctoria, 2 feet; yellow and dark crimson and brown, in variety.
Collinsia bicolor, 1 foot; lilac and white.
  bicolor candidissima, pure white; same height as species.
  multicolor, 1 foot; deep lilac and white.
  verna, 1 foot; blue and white—the best and earliest.
Eucharidium grandiflorum, 1 foot; deep rose-purple.
*Eschscholtzia compacta, 9 inches; bright yellow, with deep saffron base to petals.
* tenuifolia, 1 foot; sulphur.
Eutoca viscida, 1 foot; deep blue.
*Gilia tricolor, 1 foot; pale purple, shaded.
  alba; same as last, but with white margin to corolla.
Godetia lepida, 1 foot; pale lilac and deep purple, shaded.
  Lindleyana, 1½ foot; rosy purple.
  roseo-alba, 2 feet; rose in centre, dull white on margin of petals.
  rubicunda, 2 feet; lilac purple.
Koniga maritima, 9 inches; white.
Leptosiphon androsaceus, 6 to 9 inches; variously coloured from white to purple.
  aureus, 6 to 9 inches; golden yellow.
  luteus, 6 to 9 inches; pale yellow.
Limnanthes Douglasii, 6 to 9 inches; trailing petals, with yellow base and white margin.
  alba; same as species, but pure white.
*Lupinus nanus, 9 to 12 inches; purplish blue, white, and rose.
Malcolmia maritima, 6 inches; variously shaded with rose, purple, and white.
*Nemophila insignis, 6 to 9 inches; trailing; sky-blue, with white centre.
* insignis alba, 6 to 9 inches; pure white.
* maculata, 9 inches; white, with purplish-black spots.
Platystemon californicus, 9 inches; trailing; sulphur.
Oxyura chrysanthemoides, 9 inches; bright yellow.
*Silene vespertina, 1 foot; rose-coloured.
Specularia pentagonia, 1 foot; violet and white.
Viscaria oculata, 1½ foot; rosy purple.
Whitlavia grandiflora, 1 to 1½ foot; deep blue.

—W. Sutherland (in *The Gardener*).

NOTES AND GLEANINGS.

We are requested to announce that a Grand International Fruit Show will be held at South Kensington, in the Royal Horticultural Society's grounds on the 4th of October next, when numerous gold and silver medals will be awarded as prizes. Full particulars will be found in advertisements.

—— We have received from Mr. Begbie, gardener to Lady Rolle, at Bicton, half a dozen remarkably fine Brunswick Figs, grown in the open air. The lightest weighed 4¼ ozs., the heaviest 5¾ ozs., and the six within an ounce of 2 lbs., and all were perfectly ripe.

The Oldest Tree in Europe.—The oldest tree on record in Europe is asserted to be the Cypress of Somma, in Lombardy, Italy. This tree is believed to have been in existence at the time of Julius Cæsar, forty-two years before Christ, and is, therefore, 1912 years old. It is 106 feet in height, and 20 feet in circumference at 1 foot from the ground. Napoleon, when laying down his plan for the great road over the Simplon, diverged from a straight line to avoid injuring this tree.

SOME PREDATORY INSECTS OF OUR GARDENS.—No. 17.

Some insects there are of which you can only get a sight at certain seasons, at other times you might search for them in vain, supposing you had suddenly conceived a wish to make acquaintance with one of that particular species. Now, if it so happens that you are a lover of earwigs, you may derive some satisfaction from the thought that any month throughout the year by a very little trouble you can bring one of these gentlemen to light. Yes, and not in any preparatory condition, but in his full dignity as a mature earwig. "A very malignant insect," says one. "A very shy insect," says another writer. Most assuredly earwigs have few testimonials in their favour to produce, and if their determination to do all the mischief they can in the garden and conservatory is a proof of their

malignity, well, then, in that sense they are malignant. Shy, too! yes, indeed, the epithet seems to have been applied to them by some as if it constituted a sort of redeeming quality in their character, yet it will be thought by most that the shyness of an earwig makes it more detestable. A set of determined skulkers are they, sneaking into all sorts of hiding-places during the day, when they will occasionally eat, if they can do so unobserved, but their grand feeding-time is at night; then they pour forth to commit ravages which are sometimes charged upon any but the real culprits. In the summer, as we know, their retreats are various; one can hardly pick a curled-up leaf without the expectation that it may contain one of them. Especially do they resort to the deserted habitations of the Tortrices, and they cluster about leaves and shoots which have been contorted by aphides. This, I have thought, may have arisen from some liking on their part to the secretion to which ants are so partial, for earwigs have a penchant for anything sweet, as is the aphis honeydew. A garden insect, truly, but not at all exclusively so; the species is only too plentiful in hedgerows, meadows, and dry woods, as entomologists who beat shrubs and trees for insects know full well. Nor do they refuse to reside upon open and healthy places, selecting the driest spots, as the Volunteers have experienced to their annoyance when encamped upon Wimbledon Common, though some of us who regard these individuals as intruders there, and consider that they are spoiling one of our best habitats near London for natural history objects, feel a sort of "mischief-joy," as Carlyle calls it, in their being thus earwigged; for, it must be remarked, that earwigs, like fleas, know nothing about respect of persons. The fact that a Peach is about to be presented to a prince will not prevent an earwig from eating his fill of the pulp, though he would certainly withdraw in due time, having had warning, since it must be quite as disagreeable to be bitten in half by royal as by vulgar teeth. This reminds me that I was once asked what an earwig tasted like, and I fancied the querist was contemplating some scheme by which these insects might be utilised, and like the oriental locust, served-up in some culinary compound (not a bad plan that of eating-up a garden pest were it palateable); but I really could not state from recollection, and in such a case it is far better for anyone to try the experiment *in propriâ personâ*. I have since been informed that earwigs have an unpleasant peculiar taste—raw; possibly cooking might modify this.

The name applied to the species before us has been the subject of much speculation. It has long been a popular belief that earwigs have a predilection for entering the human ear, and hence, so some say, arose the designation. It is not merely an English idea, for in France it is the Ear-piercer (Perce-oreille), and in Germany, the Ear-worm (Ohr-wurm), so that if Britons take up foolish notions they are not singular in so doing. Yet others will have it that with us the name was originally 'Ear-wing," because the delicate membrane of this organ when fully expanded resembles the human ear in shape, though this explanation is doubtful, because at the time when it was first distinguished by an English name, people were not generally observant of peculiarities in the structure of what were deemed despicable creatures, and a century or two ago, probably, scarcely anybody knew that an earwig had wings, as it was never seen to use them. According to Dr. Johnson, the Saxon "rigga," a verb meaning to "bore," or "pierce," is the root of the second syllable, thus rendering our vernacular name an analogue of the others. Still the notion as to the earwig's hostile intentions towards our organs of hearing is baseless. Every schoolboy will shortly be aware, it is to be hoped, in these advancing days, that the drum of the ear affords no passage for an enemy—no, not for a mite, whereby it could enter the brain and cause death or insanity, as is said. That, considering the well-known propensity of these insects to seek concealment, it is quite likely when persons have lain down in places where they abound, that one might lodge in the folds of the ear or enter the passage, we can readily admit. Two instances have recently been recorded, and in each the insect was easily removed from the ear. One of the two persons suffered great pain for a short time, which extended down one side to the feet. The other individual was most annoyed by the tremendous noise produced by the motion of the creature in the ear. The location of the earwig, too, amongst other insects has been a matter of dispute. The wings, which are most beautiful, have the chief nervures arranged in the form of radii, which spread from a common point near the anterior margin, and the membrane is so delicate that very tender treatment is necessary when it is to be examined. These wings are packed-up most neatly, being folded transversely as well as longitudinally, and hence Westwood placed Forficula auricularia in an order called Euplexaptera (well-folded wings). But Newman thinks otherwise, and we find it ranked with the Orthoptera in his little book, the "Insect-Hunters," where he describes the earwigs as

> "Feeding on the lovely petals
> Of our best and choicest flowers,
> Hiding in all sorts of crannies
> From the sunshine in the day-time,
> Crawling, feeding in the night-time;
> Their antennæ many-jointed,
> Gently tapering to the summit;
> The fore-wings are square and shortened,
> Leaving all the body naked,
> But the hind-wings, quite transparent,
> Like a lady's fan are folded
> Neatly up beneath the fore-wings,
> Very beautiful to gaze on.
> All the legs are very simple,
> And the feet are all three-jointed;
> At the tail we find a weapon
> Very like a pair of pincers,
> And with this 'tis said earwigs
> Open and fold-up the hind-wings;
> You must watch them and observe it;
> I have never had that pleasure."

Nor have I, and if it is the habit of some of the earwigs to open and close their wings with the forceps, it seems a rather useless proceeding, since these insects never fly. A gentleman who made repeated observations upon them in a district where they were so numerous as to be denominated a "plague," never saw one actually on the wing, though he thinks that occasionally when an earwig makes a leap, he may use his wings to keep himself steady. He notes also—that is, this observer, not the earwig, that when crawling up a wall or a curtain, they will suddenly jump to the ground should they apprehend danger, and sometimes, as he suggests, this is done in sport! A comical earwig! Well, perhaps such a thing may be.

But the effects of the jaw-work of these creatures in our gardens does not make the horticulturist feel at all comic; if he laughs it must surely be according to the common expression, "on the other side of his mouth." They attack fruit, wall fruit particularly, and of wall fruit liking best the Peach and Apricot; but in some seasons Pears and Apples are devoured extensively by them. Earwigs visit also the kitchen garden, and have been noticed to swarm upon Celery. The flower beds receive no better treatment from them; in some instances the whole plant will be attacked and present a mere skeleton of fibres, as the result of an inroad of a few nights. When less numerous, or less ravenous, earwigs confine themselves more especially to the flowers, the Dahlia being so exceedingly prized by them that the "show" which the cultivator would gladly make and for which he has long prepared, is sadly marred through the earwigs. It is to diminish the number of these that the Londoner has for years past been celebrated for adorning (?) his garden with inverted lobsters' claws mounted upon sticks, and which a foreigner is said to have regarded as an indication of the peculiarities of cockney taste in the matter of ornamentation. Small flower-pots are now much more frequently used for the same purpose. One of the most effective modes of getting rid of them is certainly this plan of providing them with hiding-places, out of which they must be shaken in the morning. Yes, and killed, and there is a difficulty. Earwigs have very tough constitutions. Drowning them is not easy, for they can swim; cut them in half, and life remains in the two portions of the body for some hours; even crushing does not immediately kill unless done very thoroughly indeed; and then, too, if you have a number to deal with, while you are operating upon a part the rest are rapidly escaping. Scalding them by boiling water is the best mode of disposing of them. Poisoning earwigs has also been tried, but it is reported that though they eat greedily enough certain "vermin destroyers" when mixed with sugar, the compounds did not seem to disagree with their digestion. Professor Westwood recommends as excellent traps small pieces of elder-twigs with the pith scooped out, which may be laid upon flower beds or suspended against walls or trees. Traps are also made on the principle of those used to destroy cockroaches—that is, with a cone of glass in the centre, into which the insects can be snared by means of bread.

Throughout their larval and pupal stages earwigs are as active as when matured, but have only rudimentary wings and wing-cases. It is to be observed that they do not hesitate to act as cannibals, and the dead or even the sickly individuals fall a prey to their brethren. Let me quote, however, one re-

deeming particular in the character of this insect. The eggs, which are deposited in some dry spot in a bank, or dry mound, are attended with great assiduity by the mother earwig. As the young ones grow they walk forth with their parent, as chickens with a hen, a circumstance which is attested by Frisch, De Geir, and Kirby.—J. R. S. C.

GROUND LEVELLING AND PRACTICAL GARDEN PLOTTING.—No. 23.

DRAWING PLANS.

To draw *fig.* 48. Erect rectangle A B C D, and draw diameter lines E F and G H. Draw lines *u*, *v*, parallel to line A D, and find centres *a*, *b*, *e*, *f*, *g*, *h*, *i*, *k*. From centre *f*, with radius *f* 5, draw arc 5. From centre *e*, with radius *e* 4, draw arc 4, meeting arc 5. From centre *a*, with radius *a* 2, draw arc 2, meeting arc 4. From centre *h*, with radius *h* 10, draw arc 10. From centre *i*, with radius *i* 9, draw arc 9, meeting arc 10. From centre *b*, with radius *b* 15, draw arc 15, meeting arc 9. From centre *k*, on line E F, with radius *k* 12, draw arc 12. From centre *g*, with radius *g* 28, draw arcs 28, 28. From centre *m*, with radius *m* 16, draw arc 16, uniting with arc 28 and meeting arc 15. From centre *n*, with radius *n* 22, draw arc 22, uniting with arc 28 and meeting arc 2. The other arcs are drawn from their respective centres in the same manner. Arcs 27, 27 are drawn from centre *g*, and meet diameter line G H. Arcs 17 and 23 are drawn from centres *m* and *n*. Arcs 18 and 19 are drawn from centre *s* on diameter line G H. Arcs 24 and 25 are drawn from centre *r* on diameter line G H. Arc 20 and the three corresponding arcs are drawn from centre *o*, also circle 21. The other side of the design is drawn in the same manner.

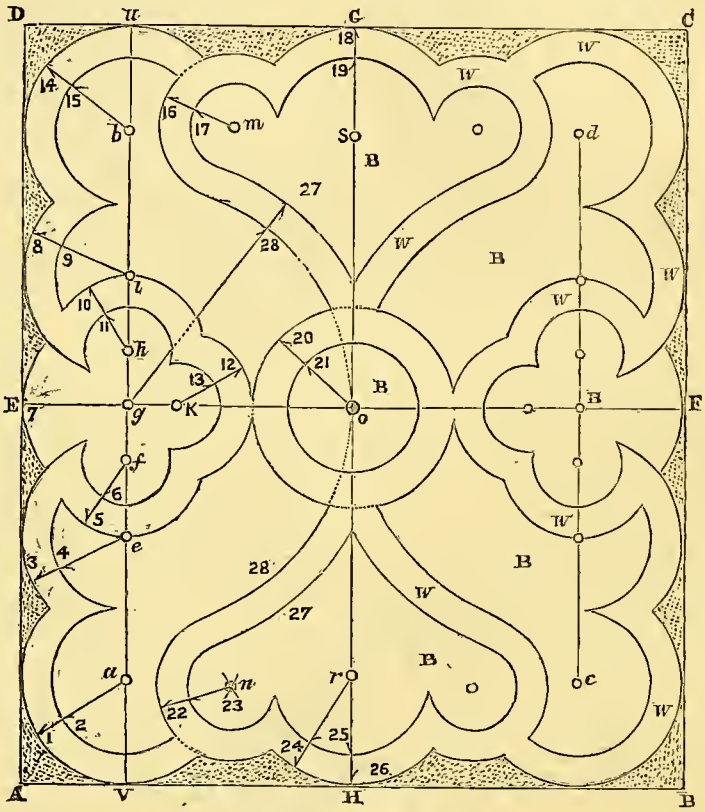

Fig. 48. Scale 12 feet to the inch.

To transfer *fig.* 48 to the ground. Lay the rectangle A B C D as before described. The distance between A B is 41 feet 7 inches, and between B C 48 feet. Insert stakes in angles in the usual manner, and lay the diameter lines E F and G H through centre o. From the stake at point A, on line A B, measure 6 feet 9 inches, and insert a peg, as at point *v*. From the stake at point D, on line D C, measure 6 feet 9 inches, and insert a peg, as at point *u*. Lay a line connecting points *u*, *v*. Where line *u v* crosses diameter line E F insert a peg, as at point *g*. On each side of the peg at point *g*, on line *u v*, measure 3 feet 6 inches, and insert pege, as at points *f* and *h*. On each side of the same point measure 8 feet and insert pege, as at points *e* and *i*; again on each side of the same point measure 17 feet 4 inches and insert pegs, as at points *a* and *b*. From the peg at centre *g* measure 3 feet on diameter line E F, and insert a peg, as at point *k*. From the peg at centre *f*, with a string 4 feet 6 inches long, trace arc 5, as shown by radius *f* 5; reduce the string 2 feet and trace arc 6. From the peg in centre *e*, with a string 6 feet 6 inches long, trace arc 3; reduce the string 2 feet and trace arc 4. From the peg in centre *a*, with a string 6 feet 6 inches in length, trace arc 1; reduce the string 2 feet and trace arc 2. From the pegs at centres *h*, *i*, *b* trace corresponding arcs. From the peg in centre *g*, with a string 16 feet long, trace arcs 27, 27; reduce the string 2 feet and trace arcs 28, 28, touching diameter line G H, as shown by the dotted line. Find centres *m* and *n* in the following manner:—From the stake at point A, with a string 14 feet 6 inches long, trace an arc, as in *n*. From the stake at point H, with a string 10 feet long, trace another arc, cutting the former one; where the two arcs cut each other is the centre required. Insert a peg at that point, as at *n*. Find centre *m* in the same manner. From centre *m*, with a string 4 feet 9 inches in length, trace arc 16, which will unite with arc 28 and meet arc 15; reduce the string 2 feet and trace arc 17, which will unite with arc 27. From the peg at centre *n* trace arcs 22 and 23 in the same manner. Trace the corresponding side in the same manner. Measure 17 feet on each side of centre o, on diameter line o H, insert a peg at each point, as at points *r* and *s*. From the peg at point *r*, with a string 7 feet long, trace arc 24; reduce the string 2 feet and trace arc 25. From the peg at centre *s* trace arcs 18 and 19. From the peg at centre o, with a string 6 feet 6 inches long, trace arc 20 and the three corresponding arcs; reduce the string 2 feet and trace circle 21, then the design is complete. All the lines and dotted parts are Box; D indicates beds, and W, walks.—M. O'Donnell, *Gardener to E. Leeming, Esq., Spring Grove, Richmond.*

WORK FOR THE WEEK.

KITCHEN GARDEN.

Where *Broccoli* and autumn *Cauliflowers* have been planted in shallow trenches these should now be filled up, for except in very dry situations the natural rains will keep them moist. The advancing winter crops of *Broccoli*, *Borecole*, &c., should be kept frequently hoed, and vacant ground may yet be filled up with the later kinds. In earthing-up *Celery*, the greatest care is necessary to prevent any portion of the earth from falling into the heart of the plant, which would prevent the upright growth of the inside leaves, and spoil its appearance for the table, nor should the earth be pressed too closely round the upper part of the plant, as frequently, when such is the case, it bulges out below. The best practice is to tie each plant up loosely with matting, having previously removed the suckers and small leaves, and then a little earth can be added every week as the plant increases in size. Another common

error arises from earthing-up Celery too soon. It should be allowed to grow to a considerable size before earthing-up is attempted, and be frequently soaked with water, as but little rain will reach the roots afterwards. It should likewise never be touched when the plants are at all damp. *Cardoons* will require similar treatment. *Leeks* in drills may have earth drawn up to them by the hoe. Late *Peas* and *Beans* will require close attention to prevent mildew; well supply the former with liquid manure. *Tomatoes* are likely to be late, and the leaves shading the fruit should be removed; prevent the plants making any further growth by constant stopping.

FRUIT GARDEN.

Any of the Peach and Nectarine trees which are observed to be growing too freely should be gone over, stopping all the stronger shoots, and those which were treated in this way a few weeks ago should also be looked over again, stopping a further portion of the shoots, if this appears necessary to prevent the formation of gross strong wood. Pears, and, indeed, all trained fruit trees, should also be gone over, removing all superfluous wood so as to expose the trees to sun and air as fully as possible. This will be of service in properly maturing the fruit spurs and bearing wood before winter. Where mulching has been used for Peach and Nectarine trees, it should be removed at once, if not already done, for the fruit is seldom well flavoured if the roots are excluded from the action of the sun and air during the period of ripening. See that Strawberries in pots for forcing next season are well cared for, placing them in an open sunny situation where they will have all the light possible, and do not allow them to suffer from want of water at the root.

FLOWER GARDEN.

Unless some precautions be taken to keep the taller plants in the beds of geometric flower gardens within proper limits, they will be likely, towards the end of the season, to become too high, and will destroy the uniform appearance essential to this style of gardening. A constant watch should therefore be kept on plants likely to exceed the standard height, and by frequently pinching-back or pegging-down endeavour to keep beds of the same pattern at the same height. At this season, with beds of flowering plants, frequent cutting-back and trimming will be required to prevent a straggling habit in free-growing plants; at the same time allow no dead flowers and seed-pods to remain on the plants. By careful attention to these little matters the season of blooming may be prolonged till the plants are destroyed by frost. Lawns should be well swept in dry weather to remove worm casts, and afterwards be well rolled. Where worms are very troublesome, water with clear lime water of full strength; this will bring them to the surface, when they should be removed. Cuttings of various evergreens should now be planted to keep up the reserve garden. Directly the early cuttings of bedding plants have taken root, remove them to an open situation, or place them out of doors, to ensure a hardy habit. If any beds under trees appear to be suffering owing to want of water, give them a good soaking at once, and see that late Hollyhocks are afforded a liberal supply, which will greatly assist in prolonging their beauty. We may soon have indications of the near approach of frosty nights, and it will be well to be prepared with something with which to cover any beds liable to be injured by slight frost, such as those of Heliotropes, and the variegated Geraniums, the foliage of which is very easily injured. Mignonette for winter and spring flowering may now be sown. Phloxes and other herbaceous plants will now be making a tolerably good show. If Auriculas are not already potted for the winter they should be potted without delay. Remove suckers or offsets, and place them round the sides of the pot, which should be 6 inches across. Auriculas are impatient of rich compost during winter—turfy loam, river sand, and very rotten horse dung, a small portion of the two latter, will make a suitable compost. It is far better to give them a strong top-dressing in the spring than to have it of too forcing a nature for their winter food. As regard Tulips, in consequence of the weakness of some of the bulbs, it will be advisable to put a small portion of decayed manure and leaf soil about 2 or 3 inches beneath the offsets. It is argued that manure fouls the cups, and with some show of propriety; but as there are always exceptions to every rule, I would recommend a stronger diet, at all events for the offsets in the coming season. The layers of Carnations and Picotees may be taken off and potted without delay, using compost as before directed. Many seedlings have missed blooming; and if not convenient to let them stand over the winter in their present situation, in consequence of the large spaces in the beds from whence the single ones have been removed, it will be advisable to prepare another bed of suitable compost, and carefully remove them with balls of soil into regular rows. Here they may stand the winter, and will bloom profusely next season. Look well to your composts, especially that for the blooming bed of Tulips, frequently turning it, and picking out wireworms and other insects.

GREENHOUSE AND CONSERVATORY.

Keep Begonias for winter display thin, that their foliage may be kept as much as possible from injury. Plumbago capensis, being almost indispensable for supplying cut flowers for autumn use, must not be overlooked. Attend also to Chrysanthemums; water them freely with liquid manure. The earliest winter-flowering Heaths and Epacrises should now or soon be placed under cover, as it will forward their blooming; give air, however, freely. The potting of Hyacinths for forcing must occupy attention; in doing this, do not forget to pot a few miniature ones, which are stated to bloom beautifully in proportion to their size; they form good outside rows to vasefuls of large-flowered varieties, which should, of course, occupy the centre. About equal portions of good fibrous loam and decayed leaf mould, with silver sand, will be the best soil for them if for forcing; but well-decomposed cow dung must be substituted for the leaf mould when the bulbs are intended for late flowering. After potting place them on a dry bottom, and cover the pots 2 or 3 inches deep with old tan or ashes, preserving them at the same time as much as possible from heavy rains. Shake out and repot Pelargoniums that are sufficiently advanced, after being cut back, keeping them rather close and moist until they strike into the new soil. Plants, however, that are fairly established after repotting can hardly be too freely exposed to air, or kept too cool. Let Cinerarias, also, be kept cool and moist, attending to repotting such as require it, and fumigating whenever green fly appears on any of the plants. Primulas must also be carefully attended to, in order to encourage them to make rapid growth, particularly the double varieties, which are invaluable for winter. Keep Tree Violets free of their great enemy, red spider, by a liberal use of the syringe, and give them plenty of manure water, which will help to keep them in vigorous health. Pot Intermediate Stocks for early blooming, and also a few annuals for the same purpose. Tropæolums of kinds must also be started. Azaleas which have ceased growing, and which have set well for bloom, should now be kept as cool and hardy as possible. Whatever watering may be necessary should now be done early in the morning, so as to allow of getting the superfluous moisture dried up before night.—W. KEANE.

DOINGS OF THE LAST WEEK.

KITCHEN GARDEN.

THE bright weather, so cheering to the farmer, brought up multitudes of small weeds in the garden, some pieces not long planted looking as if seeds had been sown on purpose. We believe that the soil of every kitchen garden of some years' standing is a storehouse of seeds of *weeds* for many succeeding years. A scuffle with the hoe soon sends them all out of sight in these sunny days, and one or other modification of the Dutch hoe is the tool for all such work, as it leaves no traces of the workman's feet behind it.

In the case of all new labourers and inexperienced hoers care must be taken that they cut up the weeds, and do not shove instead a little earth over the seedlings. It is well to run the foot along the ground of the hoers, to see that the weeds are really cut up when so small, and not merely covered over. With weeds averaging only an inch in height a 6-inch hoe with a fair pair of arms will soon go over a large extent of surface, and more especially if the man knows how to use the hoe; he need never stoop much at his work. There is plenty of back-stooping in gardening without making more of it than is absolutely necessary. Some men cannot mow without their body leaning uncomfortably over the scythe. By setting the scythe right for short grass there is no necessity for this doubling-up. We have known people complain because the man who mowed their lawn did not have his head near enough the ground. Like a man bending double over a Dutch hoe, it is all a mistake—a mere waste of energy and muscle over work which could be done just as well without such a strain on the muscles of the back.

We have no doubt that one of the most valuable things in a garden, the *rubbish heap*, a general omnium gatherum of all odds and ends, is one of the most fruitful sources of seeds of

weeds being taken back again to the garden. Such heaps if well managed are as valuable for general crops as hotbed or other dung, but carelessly used they become too often receptacles of seeds when weeds in a seeding state are placed there along with potting earth that has done its work, sweepings from lawns, &c. A little salt and lime will often greatly improve the quality of such heaps; but the best way to increase their value and to destroy the seeds that find their way to them, is to place grass mowings, rakings, all and everything that will heat violently in lower layers, with the more earthy matter over them, so that all may be heated through and through, and still the fertilising gases will be arrested instead of being permitted to contaminate the air. Even the humblest, if they do not use soapsuds, dish-washings, &c., as liquid manure, would greatly enrich their rubbish heaps by pouring all such water on them, and every now and then scattering a little dry soil over the places that receive the rich waterings. This will preserve the virtues of the decomposing materials, and the dry earth is the best and cheapest of all deodorisers.

Watering.—As far as this neighbourhood is concerned, with a low barometer we have still had no rain, though we have heard of heavy showers not far off. A fine rain would benefit the garden, do great good to the luxuriant crops of Turnips in the fields, and do little or no harm, if not continuous, to the later corn, as it would help to swell the ears of grain. Never could there have been better or more propitious weather for carting home the valuable corn produce. In the garden, however, many things were getting too dry, and we watered liberally Roses, Peas, Beans, Cauliflower, and Celery. We wish some of our learned friends would tell the quantity of moisture in the form of vapour a strong Celery plant would throw off in a bright sunny day. About eight days ago we gave our Celery beds a good drenching—sailing them, in fact, with sewage, and as some are apt to be careless with the spout of the water-pot, and as the stems of Celery are rather sensitive to strong manures, we followed with a watering overhead with clear water, or clear weak soot water, so that none of the sewage should rest on the stems, and then when the tops were somewhat dry we threw over the bed about an inch of finely-pulverised dry soil from the sides to help to keep the moisture in. With all this, however, we found the soil of the beds much drier than we expected, and there was no alternative but to give water even from our limited supply. We believe three or four days more of such weather would have given us, without water, bolted heads, which we do not want, and which hitherto we have not had for many years. We mention this simple circumstance that young enthusiastic amateurs may be induced to take nothing on trust, but examine and test for themselves, for if we had not taken a pointed stick and turned up the soil among the Celery, we could not have believed that with our dewy nights the Celery plants had managed to throw so much more moisture into the atmosphere than they had received from it. Fine rows of Scarlet Runners, too, with massive rich foliage, were inclined to drop a good many flowers without setting and swelling the pods until they had had a watering at the roots. For Peas and Beans, &c., we find it is a good method to sow in a shallow wide trench; it gives a better chance for watering effectually if needful.

Earthing-up Celery.—We have dwelt so much on this that to avoid repetition we would prefer referring to articles where the whole is fully described. Suffice it to say, that we have earthed-up our second piece in a bed, the plants having been tied loosely some time previously so as to encourage the centre of the plant to rise a little. These plants were well watered the day previously, and then were earthed-up at once in order to be ready in three weeks or so. We seldom earth-up more in summer than two or three dozen at a time. By following in small successions, we take the Celery up for use before the soil about the roots becomes exhausted of its moisture. When earthed-up there is less evaporation, but still it is considerable, and the part, bit-by-bit earthing-up, leaves the evaporation from the foliage full play, whilst the roots receive no added moisture, and then up comes the flower-stalk rendering the plant unfit for anything but the roughest kinds of soups, if even for that purpose.

If Celery is of a good size before planting out, the most if not all of the suckers that come in the axils of the outer leaves can be removed, but in general the plants should be examined carefully before tying, and every sucker or young side shoot carefully removed. Each head or stick will be more symmetrical in consequence. We generally use a sharp-pointed knife for the purpose. Some friends of ours, however, never remove any suckers, and they contend they obtain more useful produce in consequence. We mention this though we do not recommend it, and yet, as they contend, the plan has some recommendations. We saw some huge heads of dwarf Celery taken up last October, and though the main central head was not so good as ours, yet round the sides there were three, four, or more nice little blanched heads—suckers; and whilst the main head went to the cheese and salad-bowl, the side pieces went for kitchen purposes, or the best was cut up small for salad. A great amount of useful Celery may thus be obtained, though we should prefer growing some small Celery separately, and having the main heads more perfect.

The tying-up of Celery needs some care, so as to tie it loosely. It is easy to tighten before earthing-up if not tight enough. If at all tight the heart of the plant does not rise freely, and is apt to find a way for itself between the leafstalks below the tying. Shreds of matting are as good as anything for tying. Even single rows are worth the labour and trouble of tying. When grown in beds, the most economical way, tying is indispensable. People to whom Celery beds are something new, are anxious in their inquiries as to the earthing-up, but when the plants are well cleaned and tied, it is just as easy to earth-up a bed with from three to five plants across, as it would be to earth-up a single row. For late crops we prefer that each head should have a few furnace ashes round it, and that is easily done by placing two pieces of semicircular spouting-pipes round the plant, turning-in the sifted ashes from a barrow, and banking all round with earth as you go on, moving the pipes from row to row. In earthing-up, too, the earth should be broken fine with the spade before being applied. The throwing in large rough lumps among the Celery plants is doing them anything but justice.

Collecting Soil.—Now, when the ground is rather dry, there can be no better time for collecting whatever soil may be necessary for potting and the many other purposes for which it is required in a garden. If it can be obtained with the turf all the better; if not with the turf, still as little below it as possible, and the more fibre it has in it the better. When you have a choice, pass the rich meadow with its soft broad-leaved grass—that will generally be too rich and too adhesive even for general purposes. Choose rather the soil beneath grass that is small, hard, and pointed, more like so many stocking needles, than the large-leaved grass of the meadows. This you will most readily find in upland commons and sheep walks. If you cut such a piece of turf up with your knife, if it is only 1½ inch in thickness, you will find you can hardly tear it to pieces with your hands, it is so full of fibres. We have looked on such with longing eyes for years, without ever being able to get a load of it. After lying and sweetening for a few months, such soil would grow to perfection everything that did not absolutely require heath soil, not peat soil in the general acceptation of the term. Peat soil that has been taken from where water has passed or stood over it, however useful for fuel, is of no use for gardening potting purposes. The heath soil we want is that obtained from uplands, where the herbage gradually decaying has left a layer of vegetable matter mixed with disintegrated rock, sand, &c., the whole process taking place in a dry exposure, and not under water. Such heath soil can now only be obtained in many districts by the rich, as the price is getting higher every year. Such fibrous loamy soil as we have alluded to will grow almost all plants except Heaths, and even it may form a good part of the compost of the stronger-growing of them, and will do for all the Rhododendron tribe, provided there is no chalk nor lime in it—no amount of calcareous matter worth speaking of, as whenever that is present Rhododendrons will refuse to flourish.

With the above as a sort of guide in choosing, except where road surveyors are disposed to be extra troublesome, a fine lot of fresh compost may be obtained from the sides of most highways, and that for a small consideration, as in most cases the removal of the piled-up banks would greatly benefit the highway. For many years this has been our chief source of supply, though, as hinted above, we knew where we could have procured better. Sometimes the doing away with a hedgerow in a field has enabled us to obtain a lot of rough turf before levelling for the plough, and that, the rougher the better, makes rare soil after sweetening for six to twelve months. Provided we can get it fresh with less or more of fibre in it, all is pretty well fish that we can catch in this fresh loam net.

The great object is to have such soil well exposed to the air and sweetened, without greatly decomposing its fibre before using it. Many of our readers have little room for such a pur-

pose, but after all there is no better mode than building up the soil in little stacks of from 3 to 3½ feet wide, and then drawing them into a sharp-hipped roof which will throw off the rains. If you wish to be very particular, lay some turves over the hipped or span-roof, and drive some little sticks through the turf. If you can have strongish grass with the soil you want nothing else to keep the heap open; but if not, then every foot or so we would place a layer of pruninge, long litter, or some drain tiles rather open, so that the air should pass through the heap. Mark, the air makes ere long even sourish lumpy soil as sweet as a nut, and the wet being excluded you obtain a sweet compost, with the great mass of fibre not exhausted or greatly decayed—altogether a very different thing to go to, from what even the same soil would be if tumbled down from a cart and left to the vicissitudes of the weather. Such a heap well put up (and a few barrowloads may be cared for in the same way as a score of cartloads) may become rather dry in a hot summer, as you chop it down; but it is easier to damp it with the rose of a watering-pot than to dry what has been exposed when you want to use it. We prefer that all such heaps should be pure and unmixed. We would rather mix as we use it, when other things are necessary. As to mixtures, more another time, as they often do great mischief, especially when manurial matters containing fungi are used.

As we alluded to dryness above, allow us to repeat that much injury is done from using too dry soil and too wet soil in *potting*. Take the following simple rule and you will rarely go wrong. Take a handful of the soil for potting and squeeze it tightly. If it retains the traces of the fingers but falls to pieces as you lay it down on the board, it is all right as respects moisture. If it is so damp as to retain the deep impress of your fingers, and when you lay it on the board it retains its shape like a lump of dough, then the soil is too wet to be used for general potting.

As an excuse for these details we may say in conclusion that two simple causes ruin more pot plants than is generally supposed. The first is shifting a plant from one pot to another whilst the ball of earth and roots are dry. No watering will soak that ball afterwards. The less evil is using very dry soil when fresh potting. It is long, very long, before ordinary waterings will go through it, and before that takes place the outside fibres are starved. These two little matters attended to, thousands of plants would be saved from bad health and premature decay.—R. F.

TRADE CATALOGUES RECEIVED.

J. Carter, Dunnett, & Beale, 237 and 238, High Holborn, London, W.C.—*Catalogue of Flower Roots, Fruit Trees, and Roses.*

Hooper & Co., Central Avenue, Covent Garden Market, London, W. —*Autumn Supplement to Gardening Guide and General Catalogue for* 1871, *containing lists of Dutch Bulbs, &c.*

P. Lawson & Son, 20, Budge Row, Cannon Street, London, and George IV. Bridge, Edinburgh.—*Catalogue of Dutch Flower Roots, &c.*

Robert Parker, Exotic Nursery, Tooting.—*Catalogue of Hyacinths and other Bulbous Roots, Fruit Trees, &c.*

T. Bunyard & Sons, Maidstone.—*Descriptive Catalogue of Ornamental Trees and Shrubs.—List of New Roses and Gladioli.*

G. M. Kemp-Welch, Cotham, Bristol.—*Catalogue of Dutch Flower Roots.*

TO CORRESPONDENTS.

*** We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By doing so they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely to The Editors of the Journal of Horticulture, &c.*, 171, *Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

Planting Russian Violets (*Reader*). — They and all Violets flower from the old plants or parts, and also from the runners of the current year. The runners taken off now, watered, and mulched with leaf soil or old manure will flower in the spring, but not so well as those taken from the plants early in summer. The roots may be taken up in autumn, divided, and replanted, and the plants will flower in the following spring, but not so well as those not disturbed.

Loosening Budding Ties (*S. R.*).—Loosen them at once. They may usually be loosened in five weeks after the bud has been inserted. To leave them until the bark above and below the ties, as in your case, has swollen, is injurious.

Zonal Geraniums in Pots (*Devoniensis*).—We should now cut in the plants, indeed prune them well back, and keep them rather dry for about a fortnight, shake them out of the pots, and place them in 6-inch pots. They will have good foliage before winter, and can be wintered in considerably less room. Shift them into larger pots in March, and again in May, and stop as required up to that time; you will thus have fine plants from May. The double kinds succeed in the same compost as the others. If you can accommodate the plants and wish for a late bloom, we would not cut them back, but merely remove any irregularities of growth, and top-dress with rich compost, keeping the plants in the same-sized pots, and you will have a good bloom until winter. In this case prune in March, keep the soil dry for a few days, and when the young shoots are about an inch long disroot, potting the plants in 6-inch pots, and when these are filled with fresh roots, or about the middle of April, shift to 8-inch pots, the plants being pruned in the first week of March. You may shift again into larger pots at the end of May, and the plants will bloom finely throughout the summer. The shoots cut off now or in spring will make good cuttings. Those taken off now strike freely out of doors, those removed in spring require gentle heat The lanky cuttings out of doors we would cut back to two joints, and put in the tops at once.

Frogs in a Fernery (*Connemara*).—They are not injurious to anything, but are great insect-devourers. We have had frogs and toads in a fernery many years, and they have done no injury, but have, we think, been of great benefit.

Soil for Gloxinias, Achimenes, and Allamandas (*Idem*).—For the Gloxinias and Achimenes two parts light turfy loam, one part sandy peat, one part leaf soil, and half a part each of charcoal and silver sand, the whole well mixed and made moderately fine, but not sifted. The Allamandas will thrive in the same compost, but it is desirable not to make it so fine as for the Gloxinias. Good drainage must be provided.

Repotting Cycas revoluta (*Amateur, G. B.*).—The plant being now in a very small pot and potbound, repot at once, loosening the sides of the ball, and give a moderate shift, and a larger one in March. A compost of two parts turfy loam, one part sandy peat, and one part leaf soil or well-rotted manure, with half a part each of charcoal and silver sand, using good drainage, will grow it well.

Melon Plants Going off at the Collar (*J. T. S.*).—The cause of this is difficult to explain, indeed it is not satisfactorily understood. Some attribute it to one thing and others to another; but the chief reason in our opinion is the watering overhead and shutting up closely at night, which cause the vapour to condense, and this so charges the parts with moisture that ulceration of the stem takes place. It not unfrequently happens that the canker or ulceration of the stem follows a close pruning, or the removal of a considerable quantity of foliage, accompanied as it very often is with watering. This so gorges the plant with sap that it oozes from the cut parts, and this exudation is followed by the decay of the stems and ulceration at the collar. The only effectual remedy is to keep it dry, giving a little air at night so as to prevent moisture condensing and dripping on the stems. We have now Heckfield Hybrid, Oulton Park Hybrid, Moreton Hall, and others perfecting the second crop, and they are not watered oftener than once a-week. In and after August Melons in dung frames do not require frequent supplies of water, and at no time should large removals of the foliage be practised, but stop frequently so as to render them unnecessary.

Camellia Leaves Spotted (*Idem*).—We consider the spotting of the leaves arises from their being wet when the sun shines powerfully on them. The remedy is to afford a slight shade, either by washing the lights over with a size of milk and whitening or by using some shading material; or Vines and other climbers answer well.

Growing Ferns in a Vinery (*M. H.*).—Ferns may be grown well in a vinery, the shade afforded by the Vines being beneficial to the Ferns in summer. The only drawback is the dryness of the atmosphere when the Grapes are ripening, but with a good supply of water at the roots the Ferns do not suffer considerably; in fact we have two vineries, which are now filled with Ferns and Lycopods grown principally for decorative purposes, and when the kinds are greenhouse they succeed throughout the year, frost being excluded. If the Grapes are expected to hang for any length of time after they are ripe it will be necessary to remove the Ferns.

Line of Trees (*K. M. H.*).—You do not say whether you wish for evergreen or deciduous trees, but we presume the latter. The following would all succeed—viz., common Horse Chestnut, scarlet Horse Chestnut, Lime; English, Wych, and Exeter Elm; Spanish Chestnut, Sycamore, Scarlet and Norway Maple, Scarlet Oak, and Purple Beech. If you plant more than one line, trench the ground and employ Austrian Pine, Corsican Pine, and Scotch Fir as nurses.

Fruit Trees for Garden (*Idem*).—For the south wall we would advise *Apricots*—Moorpark, Kaisha, and Hemskerk. *Peaches*—Royal George, Noblesse, Early York, Grosse Mignonne, and Barrington. *Nectarines*—Elrnge and Violette Hâtive. *Plums*—Green Gage, Belgian Purple, and Coe's Golden Drop. *Pears*—Marie Louise and General Todtleben. For the north wall we fear culinary Plums and Pears will not suit, but the Morello Cherries succeed admirably. Of *Plums*—Pond's Seedling, Magnum Bonum, and Winesour; and of *Pears*, Catillac. *Pyramid Pears*—Bergamotte Esperen, Beurré d'Amanlis, Beurré Giffard, Beurré Hardy, Beurré Diel, Comte de Lamy, Jean de Witte, Louise Bonne of Jersey, Marie Louise, Seckle, Williams's Bon Chrêtien, Zéphirin Grégoire, and Ne Plus Meuris. Of *Apples*—Dessert: Early Harvest, Red Margaret, Kerry Pippin, Adams's Pearmain, Cellini, Margil, Cox's Orange Pippin, Scarlet Nonpareil, and Keddleston Pippin. Kitchen: Cox's Pomona, Keswick Codlin, Lord Suffield, Alfriston, Bedfordshire Foundling, Dumelow's Seedling, Northern Greening, and Winter Majeting. For cordons have Reinette du Canada, Blenheim Pippin, and Dutch Mignonne Apples. *Strawberries*—Sir Joseph Paxton, Rivers's Elize, Dr. Hogg, President, and Frogmore Late Pine. *Raspberries*—Antwerp and Fastolf. *Gooseberries*—Dessert: Whitesmith, Yellowsmith, Pitmaston Green Gage, Red Champagne, Early Red Hairy, and Warrington. For general purposes: Crown Bob, Roaring Lion, Rifleman, Overall, Hepburn's Prolific, Victory, Warrington, and Ironmonger. *Currants*—Black Naples; White Dutch and White Dutch Cut-leaved; and Red Dutch and Raby Castle.

PRUNING APPLE AND PEAR TREES (*E. Chapman*).—The mode of pruning Apple and Pear trees to render them fruitful, is to attend to summer pruning or pinching. All the shoots except those required for extension should be pinched back to three leaves in July, or when they have made about a foot of growth, and pinching should be repeated every month or six weeks up to the third week in September. The shoots required for extension should be trained in at their full length, but if they are as long as required treat them the same as the other shoots. The spurs must not be interfered with, but by stopping the shoots they will attain fuller development, and light and air being admitted to them they will form fruit-buds. The shoots pinched back should, as soon as the leaves have fallen, be cut back to within half an inch of their origin. We fear your trees are in a wet soil; if they are drain it well, and to check their luxuriance we would take out all round a trench 3 feet from the stem, cutting through all roots thicker than whipcord, and working under the ball towards the centre and below the bulk of the roots. Cut through any that have a dowoward tendency. Fill up the trench with a compost of two parts strong loam, one part brick and old lime rubbish, and ram firmly. Take care that the trees are not lowered by the process, but, making an opening under one side, fill that before the other is commenced. Immediately after the leaves have fallen is the proper time to do this. Mulch round the stem with littery manure over a circle of about 8 feet in diameter. If the trees are already planted low lift them, and plant so that the setting-on of the roots may be about a foot above the general level. Cover them with about 3 inches of soil, and form a cone highest at the stem of the tree. It may be necessary to water in the early part of summer. Summer pruning being attended to, we think your trees will fruit a year afterwards.

VINES INFESTED WITH SCALE (*A Constant Reader*).—The leaves sent have the upper surface blackened by the secretions of the Vine scale (Coccus vitis), and those insects are in abundance on the leaves. It is the worst case we have seen, and the fruit we should consider spoilt. Your only remedy now is to syringe the Vines thoroughly with water at a temperature of 160°, adding a wineglassful of spirits of turpentine to every three gallons. This will destroy all it comes in contact with; but as there will be parts that will not become wetted, repeat the application every second night for a week. After the leaves have fallen (and as they fall clear them up daily and burn them), and when the Vines are pruned, strip off all the loose bark, scraping well the angles and crevices, but not damaging the live bark, burning the bark removed as well as the pruninge; then with a brush wash the Vines thoroughly with water at a temperatnre of 146°, adding a wineglassful of spirits of turpentine to every gallon. Have the house thoroughly cleaned, the glass washed with clean water, the woodwork with soap and water, the walls limewashed, and finally all the woodwork of the house inside well painted. As soon as that is done dress the Vines with 4 ozs. of soft soap and sufficient sulphur vivum to bring a gallon of tobacco water to the consistency of paint, heating it to 140°, and applying it with a brush thoroughly. Do this early in winter, and again late in winter, just before the eyes begin to swell, taking care not to rub off or dislocate the eyes. We cannot reply privately.

PLANTING A VINERY TO PRODUCE FRUIT NEXT YEAR (*Vexed Gardener*) —There is hardly anything impossible where the purse is big enough. Were we in your case we would have from fourteen to twenty good Vines well established in say 15-inch pots, the Vines being two years old and well ripened, or if ripening now all the better. These we would not prune so very much back, but keep them for fruiting next year, and a little the year afterwards. We would not plant them in the usual way, but make a large hole in the inside prepared border to let the pot down, so as to have the rim covered 2 or 3 inches. Before setting the pot down we would widen the hole at bottom, and break the pot, so that whilst the pot clung to the ball the fibres could get out all round as the Vine grew. These you will observe are temporary Vines. The others should be good plants—say fourteen or so in all, and we would plant them in the usual manner, cut them well back, and take nothing except a few berries from each the first year, and crop lightly until the third season. For Vines to bear in pots, but the roots allowed to extend, for the early house have one Dutch Sweetwater, one Royal Muscadine, one Muscat Hamburgh, one White Frontignan, and the rest Black Hamburgh. For the later house have Black Hamburgh, Trentham Black, Canon Hall Muscat, Muscat of Alexandria, Lady Dowoe's, and Trebbiano. For permanent Vines you could scarcely have better or more productive kinds, only if you keep a good heat in the late house you may add Kempsey Alicante and West's St. Peter's, or even Groe Guillaume, all of which like a Muscat temperature.

HOUSE FOR FORCING STRAWBERRIES (*Salop*).—The simplest and most economical plan in your case, would be a lean-to house in the orchard-house style, with ventilators at the top, and in front louvre boards moveable all the way. Have the flue where most convenient, not far from the front; then have a fixed or temporary stage—say 16 to 18 inches from the glass, to receive the Strawberry pots. These you can place and water from behind the stage. The same stage would do for dwarf plants of any kind. Vines, too, might be planted and kept outside until the forced Strawberries were over; or Cucumbers and Melons might be grown and be trained with little trouble over the stage.

FORCING STRAWBERRIES (*H. R. Du Pré*).—If you did not mean to take up these large vigorous plants until April, you might lift them with large balls, place them in your frames and pits, and pack the balls firmly with earth. For early work the lifting and replanting will not do. You must have the plants established in the pots. We have no recollection of the previous directions, but if the plants are so very strong we question much if they would not be better potted, and fresh rooted and established in the pots before winter, as the mere check would diminish growth and help to the thorough maturation of the wood; and if the pits and frames are empty, you could plunge the pots in them during the winter. You will have earlier, and in most cases heavier crops of fruit by these means.

PEACH BORDER ON GRAVEL SUBSOIL—UNDERGROUND MUSHROOM HOUSE (*X. Y.*).—We should not think of adding clay to the bottom of an open gravel subsoil for a Peach border. We would sooner make part of the gravel into concrete; but, on the whole, if the gravel is at all open, we would make the border on it, and entice the roots to keep near the surface by surface-mulching. We would under the circumstances have a ventilator from the top of the stokehole Mushroom house. We would just as soon make the Mushroom bed on the natural sandy bottom as on one of bricks or flags, only the latter will be a somewhat better safeguard against woodlice. There is little to choose between them, but bricks look better and more finished.

MUSHROOMS GRUB-EATEN (*W. Yateman*).—The grub is apt to assail Mushrooms in houses in summer, from being too close and hot. Sweep the beds clean over, water eepecially at the back and front, syrioge the walls and pathway, give a little air, not a keen draught, and put no covering on the bed. A shady place out of doors, or a cool cellar, is the best for Mushrooms in eummer.

PROPAGATING THE BANKSIAN ROSE AND WEIGELA ROSEA (*Idem*).—The Banksian Rose and Weigela roses are easily propagated by using stiff side shoots as cuttings, placing the cuttings in eandy soil with sand on the surface, and tben putting them under a shaded cold frame or hand-light. They will strike on a border on the shady side of a fence, but not so soon as by the above mode.

WATER CONTAINING IRON (*J. N. N.*).—Unless the water is greatly contaminated by the oxide of iron coming through iron pipes, we should not be afraid to use it. If there is much redness from excess of rust or oxide of iron, we would let the water stand some time io cisterns or barrels after throwing, say, half a pound of quicklime into each receptacle of forty gallons or so. This, well stirred, will cauee the iron to be precipitated and fall to the bottom.

SEEDLING AGERATUM (*N.*).—Your Blue Bob Ageratum seems very pretty, but we cannot speak definitely as to a head of bloom, as the habit and vigour of the plant as well as its general height must be considered. We find Imperial Dwarf excellent for the centres of dwarf beds, but for an outside edging where water is scarce it does not answer so well. A variety which will stand dryness will be an acquisition.

BLUE LOBELIAS (*J. F. C.*).—Trentham Blue is a pretty dark kind, not quite so compact as compacta. We would advise you to go to some of the nurseries, and pick out a few pote of the colour you most favour, and carefully save seed from the plants. Even with seed carefully saved there is often a disposition to revert to euch original types as gracilis, light and grasey in comparison with many others, but still fine for hanging baskets, &c. Pumila grandiflora is also very fair. Trentham Blue is more vigorous, and in general the colour is a rich dark blue.

WINTERING VERBENA VENOSA (*A. P. S.*).—We have no doubt you can keep the straggling roots packed in cocoa-nut fibre during the winter. We should prefer dry soil, and any place where no great amount of water nor frost could reach them. If, however, you can command a hotbed from January or February, we would trouble ourselves nothing about the roots, but sow thickly in a pot, prick off the seedlings as soon as they could be handled, and harden them off by the middle of May. Such nice healthy seedlings will generally far transcend io free blooming the old roots, which must generally be cut and trimmed to make the most of them before planting.

ALTERNANTHERAS AND OTHER BEDDING PLANTS AT WIESBADEN (*Wiesbaden*).—In a recent number you would see that Mr. Sheppard, of Bedford, used various Alternantheras for edgings, belts, &c. You will find a good variety of these pretty little plants in most of the London and large country nurseries. They are easily raised from cuttings. We do not know the "Soubellaria," was it also an Alternanthera? The brown-leaved plant with small yellow flowers like a Wood Sorrel, we have no doubt was Oxalis corniculata rubra, which grows freely from seeds or divisions; in fact, often holds its own in many gardens. It succeeds well if treated as recommended to another correspondent for Verbena venosa, but just now we have some beautiful edgiogs made by taking up in May the little plants which have stood the winter, and planting them regularly. As being so hardy, and making a fine regular wreath ronnd pink or yellow, we prefer it for some purposes to the Alternantheras.

SEEDS FOR BARBADOES.—*Celia* would be much obliged by anyone stating which are the best and most suitable seeds to send to Barbadoes.

SMOKELESS STOVE (*H. K.*).—We know of none that can be admitted among plants without injuring them, nor did we ever know a plant-house in which a flue could not be added to the stove without being an eyesore. You enclosed 3*s* 3*d*. in stamps. What for?

SEA-WEED AS A MANURE (*H. A.*).—We know of no crop or plant to which it may not be applied beneficially. It should be applied quite fresh, and whilst the plants are growing. It is especially beneficial when applied to Asparagus, Sea-kale, Beet, and all the Cabbageworts, which, of course, include the Cauliflower and Broccoli.

PROPAGATING AGERATUMS TOM THUMB AND IMPERIAL DWARF (*An Amateur*).—Both may be raised from cuttings put in now in sandy loam and leaf soil, two parts of the former to one of the latter, and one part silver sand. They strike freely in a frame over a gentle hotbed. When they are struck pot them off singly in 3-inch pots, and winter in a light airy structure, keeping them dry, yet giving enough water to keep the foliage fresh. Seed may be sown in March in a gentle hotbed, the young plants pricked off when large enough to handle, and forwarded in heat. They will be good plants by May; but unless you secure seed which will germioate better than that which we have had, your stock of plants will be small.

WINTERING BEDDING PLANTS IN A ROOM (*Idem*).—The room being well lighted we see no reason why you should not winter the plants safely. The main point is to keep them dry, and yet give sufficient water to maintain vitality. Having a fireplace in the room there is no necessity for a stove. A fire should be lighted in very damp and in severe weather, so as to maintain a temperature above freezing point. Admit all the air practicable, but only in mild weather. The Abutilon will live if kept dry. When you take up the Geraniums remove most of the leaves, and be careful in winter to take off all decayed leaves and parts. The Primulas would succeed in the room if you gave them a position near the window and watered carefully. They would not, however, flower before spring.

SOIL FOR ECHEVERIA METALLICA (*Idem*).—Two parts light sandy loam one part leaf soil, one part crocks, and one part sharp sand. The drainage muet be efficient, and if you water sparingly the plants will winter safely.

AMARYLLIS CULTURE (*C. H.*).—They succeed admirably in a compost of turfy loam two parts, one part sandy peat, and one part leaf eoil or old cow dung, with a free admixture of sand. Drain well. Pots twice the diameter of the bulbs will be sufficiently large. Repot early in February, removing no more of the old soil than will comb away freely,

and the soil being in a moist state no water will be required for about a fortnight, otherwise the soil must be made moist. Place the bulbs in a bottom heat of from 70° to 75°, if convenient, and continue them there until the pots are full of roots; then gradually withdraw them from bottom heat and give the plants a position near the glass; indeed, in all their stages they cannot be too near it if room be allowed for their development. When growing freely water copiously, and continue to do so until the growth is complete and begins to turn yellow; then withhold water by degrees, and keep them dry in winter on shelves. They require the temperature of a stove.

Seedling Picotees (*Maria*).—The seedlings which have had single flowers this year will not be double in the next, though sometimes semi-double flowers of the first year are on the same plants double in the following year. We have, however, no hope of single-flowering plants becoming double in future seasons. We are unable to tell what caterpillar it is that is committing ravages amongst your Roses and Geraniums. The best remedy would probably be to syringe the plants with 1 oz. of white hellebore powder to a gallon of water; let it stand in an earthenware jar closely covered for twenty-four hours, then shake it up well and apply it with a syringe on a mild evening, or sprinkle it over the plants with an old whitewash brush.

Plants for a Stove (*Young Beginner*).—Your list is upon the whole good, but the twelve most select stove plants in our opinion are:—Allamanda grandiflora, Anthurium Scherzerianum, Clerodendron Balfourianum, Dalechampia Roezliana rosea, Dipladenia amabilis, Franciscea calycina major, Gardenia radicans major, Hoya imperialis, Ixora acuminata, I. coccinea superba, Medinilla magnifica, Rondeletia speciosa major, and Stephanotis floribunda. If you are restricted to twelve omit Clerodendron Balfourianum. Of Orchids for a stove, twelve are:—Aërides odoratum majus, Cattleya crispa superba, C. Mossiæ superba, Dendrobium fimbriatum oculatum, D. nobile majus, Epidendrum macrochilum roseum, Cypripedium barbatum majus, Lælia purpurata superba, Odontoglossum Alexandræ, Phalænopsis grandiflora, Vanda suavis, and Oncidium splendidum. Three greenhouse climbers are Tacsonia Van-Volxemi, Rhynchospermum jasminoides, and Lapageria rosea. The "Orchid Manual" would suit you. It may be had free by post from our office if you enclose 2s. 7½d. with your address.

Sowing Early Spring-flowering Plants (*Mrs. B.*).—It is now too late to sow any but annuals, and those should be sown from the middle to the close of this month. Full instructions are given in "Winter and Spring Flower Gardening," which you have.

Heating a Workroom with Greenhouse Overhead (*F.*).—From what we can make out, hardly anything in the way of heating could have been done worse. You are quite right; you would heat the greenhouse much better by taking the flow-pipe at once to the lowest part, and then allowing the pipes to rise a little to the extreme end, where fix an air-pipe, and take the return-pipe at once to the bottom of the boiler. You can have nothing worthy of the name of circulation in the low pipes G, in your workroom; in such a position they are practically useless. Any heat they may have is more from absorption from the heated chamber round the boiler than from any proper circulation. That chamber round the boiler heated by gas will heat your workroom just as an iron stove would do. Do you heat the boiler by gas also, or have you a fire besides? Be that as it may, from the present position of the boiler you will never heat the pipes G. You may go as high as you like, but not below the boiler.

Heating a Small Range of Houses (*F. S. Worthington*).—We would alter the arrangement of the houses to pit, stove, vinery, orchard house. We would put the boiler then between the stove and vinery, and heat right and left as desirable. It matters little where the boiler is placed, as if it is at one end, you could take a small flow and return-pipe from end to end, having a complete circulation in themselves, and then by a valve or tap take what you want for each house. For instance: for your early vinery you need from 70 to 80 feet of 4-inch piping. For Cucumbers alone we find 1 and 1½-inch piping very good. As to boilers, we can only say, that after seeing and trying many, we have carried out what we advise—simplicity, and put in two saddle-backs, and from one we shall secure at least four different temperatures in winter. We have no fault with other boilers, only we prefer the simple saddle-back. In glazing the roof, the closer the one-eighth-inch laps touch each other the better. All glass, especially if the squares are large, will be found to be a little rounded, and there is a little tact necessary to place the rounds together, otherwise there would be some open spaces between square and square, the less the better.

Geothermal Heating (*C. Adams*).—All that we know upon the subject is contained in two of our back numbers—Nos. 143, new series, and 649, old series. You can have them free by post if you enclose seven postage stamps with your address.

Blue Marl (*New Subscriber*).—Without a chemical analysis, which we cannot undertake to effect, we could not tell you with any degree of confidence its worth as a manure. We believe it to be what is usually called gault or blue chalk marl. If it be that it is not siliceous.

Names of Fruits (*S. O. R.*).—Nectarine, Violette Hâtive. Apple, Lord Suffield.

Names of Plants (*D. M. G.*).—Vallota purpurea, sometimes called the Scarborough Lily. (*Brisbane*).—Dolichos lignosus; certainly not the plant you mistook it for. (*A New Subscriber, Kilnwick*).—1, Æschynanthus longiflorus; 2, Begonia strigillosa, otherwise known as B. dædalia; 3, Æchmea discolor. (*R. B. L.*).—By no means trust to your Cucurbit as being fit for food. We have not yet recognised what species it is, but warn you at once that we recommend you by no means either to pickle or in any other way to eat the fruit till you know more of them, or have certain knowledge that they are not injurious. The general character of Cucurbits is deleterious. Some are very poisonous, and very few indeed are to be trusted. (*A. B. Y.*).—2, Doudia candata; 3, Selaginella Martensii; 4, Asplenium flabellifolium. The other specimens were too young and fragmentary to be determined, especially as they have no spores, and were not recognised off-hand. (*Acton Castle*).—The shrubby plant is Amelanchier Botryapium, with racemes of white flowers (*A. C.*).—2, Eryngium alpinum; 3, Spiræa Filipendula, Dropwort; 4, Lilium Martagon; 8, Alyssum saxatile; 9, Lonicera japonica, Japanese Honeysuckle. (*Alpha*).—1, Phymatodes vulgaris; 2, Selaginella Kraussiana; 4, S. Martensii; 5, Cyrtomium falcatum; 8, Platyloma cordata. (*W. F. R.*).—Oxalis articulata, native of Chili. (*Ignoramus*).—Cornus mas. (*George*).—Vallota purpurea, also known as the Scarborough Lily.

POULTRY, BEE, AND PIGEON CHRONICLE.

DE OMNIBUS REBUS.—No. 4 AND LAST.

We left off last week on the subject of food. We borrowed a "wise saw" in illustration, which is, we are afraid in many cases, a "modern instance." The love of overfeeding is general. It is more developed in servants than in masters. Perhaps it is, that while the former feed the latter pay. We would not be misunderstood; we do not speak of wilful waste, but the carrying out of the idea, "that they cannot bear to see anything short of food," and that putting food in front of them is feeding.

Good and proper feeding is first to get a proper description of food, next to give it regularly, and lastly in such moderate quantities as shall be entirely eaten with an appetite at each meal. Whether it be for fattening or for breeding stock, the rule applies equally. In the former case they consume more food, as they get only that which is given to them, but they must only have as much as they will eat at once. In our great poultry-feeding county, Sussex, not only is the trough changed and scalded every day, but the food is fresh mixed for each meal. These are the conditions of success. If the food is allowed to remain in the trough and acquire the least acidity the fowls take a dislike to it. No more thriving after that. Fowls will only fatten while they enjoy the food. The taste for luxuries soon fails unless they are moderately and judiciously given.

We recollect many years ago being asked by a lady of high rank to visit her poultry establishment, as the expenses increased daily and the results were less satisfactory every week. The poultry had been kept in till we came. Turkey house first. The doors were opened, and the poultry-woman stood with meal and barley ready to dispense it by the handful. We forbade anything of the sort. When the doors were opened nearly all the birds flew and scrambled away into the fields, spite of the attractions of some furtive handfuls that were thrown down. "There, my lady," said the old woman, "that's the way; they won't eat." Let us look in the house. There was the secret: the ground had been covered with food, and much still remained. "Poor things!" said the old woman; "no doubt they waked up hungry, same as other people." We found that on the ground outside their roosting house the food was trodden down more than an inch deep. The same in the Duck run; we dug up the barley inches deep, looking like a "nougat" made of very small almonds. But now for the fattening house. On entering, a most unpleasant odour met us. There was sufficient food mixed for six fowls to serve a dozen for three days. "Poor things!" said the woman, "they don't eat as they should; they wants their liberty. That food as aint touched has been before them ever since yesterday." "Yes," said we, "that is the cause. If it had been given properly, a little at a time, they would have eaten it and done well upon it. You," we continued, "would get sick of the sight, smell, and taste of turtle and venison if it were on the table every time you went into your house." The woman looked for a moment at us, and then took to audible muttering. "Turtle and venison, turtle venison, venison turtle, always ready and get tired of it! Well, I never heard the like of that! Wish my lady would try us, that's all. But he don't know much, and it's no use minding what he says." We never could command attention from her afterwards, but the result of our visit was to diminish the consumption of food two-thirds and to establish a healthy and profitable breed.

The contempt for order and common sense leads to more than half the disappointment and loss. When we are consulted why fowls will not feed, or why they cost so much to feed, we often think if fowls were gifted with speech they would answer as Master Adolphus did the day after Twelfth-night, when the doctor who was called in asked him what he had eaten: "Only supper as usual, and a sailor, and a windmill, and a nigger, and a ship, and an elephant, and the queen off the cake." The truth is, everybody likes to keep poultry, and to eat poultry and eggs. How many can look back to the small beginning of the fulfilment of the day-dream of many years, when the first egg laid by our own hens has appeared on table, or the first Ducks or chickens have contributed a meal. From the owner of thousands of broad acres and half a dozen castles, each

standing in its own park, who counts his deer by thousands and his six-year-old South-down wethers by tens of thousands, standing up to their bellies in grass (*O, si sic omnia!*), to the tradesman who hires a suburban cottage with a garden, and who gathers his first dish of peas or beans for the Sunday's dinner—from the noble who dines eighteen sumptuously and praises his venison, mutton, and dessert, to the tradesman with his Sunday dinner of veal, bacon, and peas, who declares that such vegetables as he gathers cannot be bought—there is a tendency throughout the race to enlarge on the merits of that which belongs to them and that which they have raised, and to eat with a double zest that which they have produced and which belonged to them.

Poultry should be more generally kept than it is; it fetches a better price for the table, eggs are much dearer than they used to be, and food for it is cheaper. Another advantage is, fowls' needs are better understood. In former days the roup was the plague of the poultry yard, and its victims were legion. We have often seen a yard in which those only that were not roupy were those that were approaching convalescence. This is now unknown. Little was known of the merits or the natures of the different breeds. Everything concerning them is known now. Rice and refuse of all kinds, including potato-peelings, were thought good enough for poultry, and no wonder it was given up in disgust when the poor "atrophies" were seen with crooked backs, thin legs, large heads and knees, and when the different broods were known, not by the different sizes, but by their senile appearance.

We have endeavoured in this paper to show how the cost of keeping them may be diminished by the proper management of their food; we will also tell when they will realise the best prices for the table. On the same principle that the grower in forcing fruits aims to bring them to maturity as much before or after the natural season as possible, the poultry-keeper for profit should aim to have good tender chickens ready for the higgler or the market from April 1st to June 14th. When this is accomplished profit will be discovered.

We will only add one word more. Poultry-keeping is a healthy and engrossing pursuit, but it should only be undertaken by those who can find pleasure in work.

SHARP PRACTICE—LOST TAILS.

Quite unexpectedly to myself, I found I was able to run up and spend exactly one hour and a half at the Cheltenham Show, when I was annoyed by a little arrangement which I think ought to be reprobated. I am quite aware it has been done elsewhere; but when a show aspires to the rank Cheltenham desires, things require notice which in smaller ones would only provoke a contemptuous grin.

The place itself is peculiar. Cab fares are higher than in almost any town I know; and even the railway station is not conducted like those of ordinary towns, but passengers are kept off the platform by an iron gate till the trains they are to depart by have arrived. I have often wondered at these things, but have had to conclude that the inhabitants of such a "swell" place could not behave as ordinary mortals. The peculiarity about the Show is, however, of another character. In the advertisements, on the bills, and on the catalogues and schedules the price of admission was stated to be "1*s*.," but when I presented myself at the gate I was told I must pay 2*s*. 6*d*., the price of the admission to the Agricultural Meeting. I did not grumble at that, but on reaching the entrance to the poultry tent found I had in addition to this to pay the shilling advertised. Remonstrating on the inconsistency, I was rather gratuitously told that for the 2*s*. 6*d*. I could see the agricultural and horticultural shows, with which they had nothing to do. Now, I confess I do not like this way of managing matters. If the poultry show was independent of the agricultural, why should visitors be compelled to pay for what they might not wish to see? A visitor to the horticultural show is not compelled to pay against his will for the poultry show; why should the poultry visitor alone be the sufferer? It is not the amount of money I complain of. Many shows charge high the first day, and had the admission been 3*s*. 6*d*. avowedly I should have gone just the same; but I do contend that to announce admission in a poultry journal as 1*s*., and then compel a visitor to pay 2*s*. 6*d*. additional, is not a course which commends itself to common sense or common honesty. I should remark that the poultry were in a separate enclosure; and the Committee must rest under one of two imputations; if any part of the 2*s*. 6*d*. goes to their coffers, then the admission to the poultry was so much more than 1*s*.; if not, they committed the incredible folly of consenting to be charged 2*s*. 6*d*. per head for nothing but the privilege of holding their show in the neighbourhood of the other.

With the Show itself I was pleased. The Spanish and Cochin classes were wonderful for the season, and also the Hamburghs. Brahmas, with a few exceptions, were poor. But I wish to note that I had ocular demonstration of the way in which tails may be lost, as I witnessed the actual process in two cases, and think it worth while recording the fact for the sake of some angry exhibitors who may blame individuals for malicious injury. The pens were the usual wire ones, and in rows, not back to back, but with a space between. In two cases during my hurried visit I saw cocks with their tails through turn round quickly, and in one case one, and in the other two feathers dropped with the motion. Doubtless at this season the injury is easily done, and fortunately easily repaired, but the occurrence is suggestive, and I venture to press the matter on the particular attention of Messrs. Turner. The evil would be easily remedied by substituting sheet-iron backs for the wire now used; or, if this cannot be done, the same purpose is easily effected in the simple manner always seen at Bristol—by putting the pens back to back, with a strip of calico or canvas of the same height between. Putting them apart and unguarded has other evils, which frequently lead to gross injustice in judging, but for which the Judges are in no way accountable. For instance, at the Crystal Palace Show the very best Spanish cockerel was unnoticed. The fact caused astonishment to many, but it was not the fault of the Judges; the simple fact being that the hens happening to be at the back of the row, and owing to the open pens in plain sight, the bird would keep his head that way, and was literally not seen. I have noticed the same thing often, and many a case of apparently unaccountable judging may be thus explained.—L. Wright.

HANDICAPPING POULTRY EXHIBITORS.

Could you or any of your numerous readers suggest a plan by which some of the poultry exhibitors could, in racing phraseology, be handicapped? I breed five or six different kinds of fowls, and have done so for some years, and up to the present time have very often exhibited, but it is very disheartening when I regularly find such names as Taylor, Leech, Brierley, Beldon, Sidgwick, and Lacy (who either breed or buy a pen or two of good birds, and exhibit them at every show, big or little, no matter how small the first prize), sweep all before them. If some method were arranged that previous winners should give so many points, it would give a fresh impetus to such as me, who, in the face of the prospect of sure defeat, must certainly retire from so expensive a fancy with, I think, the ultimate result of the great guns being left to exhibit amongst themselves, as I feel confident amateurs have but little chance.—F. Handicap.

[It would be difficult to find an Admiral Rous to arrange the handicapping as satisfactorily as the veteran of that name does on the turf.—Eds.]

PIGEON TRIMMING AT ALLERTON SHOW.

I am quite at a loss to comprehend how Mr. Hutton, being considered a judge of Pigeons, should vary so continually as to the quality and perfection of the same pen of Pigeons when he sees them at two different shows. This identical pen of Nuns were considered quite good enough to obtain the first prize at one show where Mr. Hutton officiated, yet at another exhibition, though sent in exactly the same condition, they are pronounced by Mr. Hutton himself as "trimmed most artistically and in an unmistakeable manner," consequently the same arbitrator at once disqualifies them. So far from "equivocally" denying the charge of "trimming," I deny it *in toto* and most unreservedly, whilst certainly the proof lies with Mr. Hutton, who casts the imputation.

I must here say no difficulty shall arise on my part as to a thorough ventilation of who is right and who is wrong in this matter, and the birds are ready at any time to be placed before two or more competent judges, to prove not only whether or not they have been "trimmed," but also the truth or otherwise of Mr. Hutton's statement, that "with the exception of the throats and crests the birds were in perfect feather, showing no signs of moult whatever," whereas, I contend, that anyone (save Mr. Hutton himself) is welcome to inspect them for

his own satisfaction, in proof that they are in pen-feather throughout the whole of the body plumage at the present time.

Now as to the sexes of the pair of young Dragoons which Mr. Hutton admits caused him "uneasiness," but states I "can see he gave me the benefit of the doubt," I distinctly assert they are cock and hen, which none but a novice could ever doubt. So recently as the 23rd of August, at Rochdale, under Messrs. Esquilant & Charlton, they stood first with the medal. But the most conflicting feature of the case to my own mind and that of other Pigeon breeders is this, that Mr. Hutton, whilst he states at Allerton Show, held on August 12th, "they were the best pair he ever saw," at Stanningley Show, held on August 26th, at both of which shows Mr. Hutton judged them, he not even so much as commended them. This want of anything like uniformity of opinion in the same judge, on the same birds, and shown in the same condition, is to my mind so complicated a mode of awarding prizes, that I have, in conjunction with several other large exhibitors of Pigeons, resolved never to show a single pen again at any show where I know Mr. Hutton will be the appointed judge.—HENRY YARDLEY, *Market Hall, Birmingham.*

WHITBY POULTRY AND PIGEON SHOW.

THIS Show was held on August 30th, and, the weather being extremely favourable, the success of this year's meeting was complete. The arrangement respecting the pens in which the birds were shown was a very great improvement on that of former years. The pens used were quite new, and of sufficient size to prevent any injury to the plumage of even the largest varieties of poultry. The top, back, and the divisions forming the sides of the pens were all of solid woodwork, the fronts alone being of galvanised wirework, and each pen was provided with a drinking fountain also galvanised. On the whole these pens were very easy to inspect, and the birds, from seeing open space only at the front, did not keep constantly striving to escape at the back on the approach of the visitors or Judge, and there were no continuous efforts to fight the birds situated immediately in the rear, as when open backs are the order of the day, with the result of frequently destroying the plumage until the next moulting time. Many of the exhibitors expressed themselves much pleased with these pens, and we hear that it is the intention of the Committee to let out on hire the wire fronts, wooden side divisions, and water fountains to the managers of any other local show who may desire to engage them. The only portion of the arrangements that proved defective was the penning of the poultry on their arrival, method and promptitude being altogether ignored; consequently irregularity prevailed in this matter, no master hand superintending, and thus a confusion ensued that might with a little forethought have been easily prevented.

The adult *Dorkings* were a very indifferent class, but the entry for chickens of this variety was equal to that at most of the largest shows of this season; in fact it proved one of the most commendable features of the Show. The same remarks are equally applicable to the *Spanish* fowls, Mr. Burn, of Whithy, showing some well-grown chickens. In *Game* the Brown Red chickens were shown in excellent feather and condition, and most probably, when carefully dubbed, we shall hear of further successes attending their exhibition. A few pens of good *Cochins* were shown, but the majority were indifferent. The Rev. R. A. White, of Whitby, with a finely developed pen of Dark *Brahma* chickens secured not only the silver cup in the district competition, but likewise first prize in the class for this breed open to all comers. Though the majority of the *Hamburghs* shown were not equal to the standard of the customary Yorkshire and Lancashire exhibits, some Golden-pencilled and Silver-spangled were on view that would be hard to beat at any show. Mr. J. K. Fowler, of Aylesbury, sent pens of Rouen and Aylesbury *Ducks* that completely astounded the local exhibitors, and the display of fancy Waterfowls was for the time of year remarkably good, the Black East Indian Ducks in particular.

DORKINGS.—1, J. White, Warlaby. 2, R. Smith, Malton. *Chickens.*—1, Rev. G. Hustler, Stillingfleet. 2, J. White. *hc*, J. Smith, Westerdale; S. Burn, Whitby; E. Corney, Whitby; D. White, Driffield; Mrs. B. Peirse.

SPANISH.—1, R. Smith. 2, G. Holmes, Driffield. *Chickens.*—1, S. Burn. 2, G. Pounder, Kirby *hc*, W. Harrison, Underpark; J. Booth, Lyth; W. Kidd, Lyth; H. Judson, Woolkmoll.

GAME.—*Black-breasted or other Reds.*—1, W. Bearpark, Northallerton. 2, W. Maynard, Ingleby, *Any other Variety.*—1, F. Sales, Crowle, 2, W. Bearpark. *Chickens.*—1 and 2, G. Carter, Bedale. *hc*, O A. Young. *c*, W. Bearpark.

COCHIN-CHINAS.—1, T. H. Readman, Whitby. 2, J. Booth. *Chickens.*—1, J. Booth. 2, G. Speedy, Whithy. *hc*, H. Elliott, Lyth; G. Trueman, Whithy. *c*, J. F. Loveridge, Newark.

BRAHMA POOTRAS.—1, Miss B. Peirse, Bedale. 2, E. Corney. *Chickens.*—1, Rev. R. A. White. 2, W. Whitely. *hc*, W. Stonehouse, Whitby; Rev. G. Hustler. *c*, E. Corney; Miss B. Peirse.

FRENCH.—1, J. K. Fowler, Aylesbury. 2 and *c*, T. Percival (Crêve-Cœurs).

HAMBURGHS.—*Golden-spangled.*—1, G. Holmes. 2, G. Garbutt, Sinnington. *Silver-spangled Chickens.*—1, G. Speedy. 2, W. Stonehouse (Silver-spangled). *Golden-pencilled.*—1, T. H. Readman. 2, G. Holmes. *Silver-pencilled.*—1, Miss B. Peirse. 2, G. Garbutt. *Gold or Silver-pencilled Chickens.*—1 and 2, J. Webster, Whithy. *hc*, J. Webster. *c*, J. Russell; Miss B. Peirse; T. H. Readman.

BANTAMS.—*Game.*—1, Pickering & Duggleby, Driffield. 2, W. Henderson. 3, E. Barker, Stokesley. *Any other Variety.*—1, R. Tinsley, Norton. 2, G. Holmes. 3, Dr. Tinley, Whitby.

ANY OTHER VARIETY.—1, J. P. Fawcett (Black Hamburgh). 2, Mrs. Storry, Stokesley (Sultans). 3, Lady D. Yeoman (Polands). *Chickens.*—1, J. P. Fawcett (Black Hamburghs). 2, Miss B. Peirse (Houdans). *hc*, J. Oxley, Whitby White Leghorns); T. H. Readman (Black Hamburghs).

DUCKS.—*Black East Indian.*—1, S. Burn. 2, Mrs. Hayne, Fordington. *Ayles bury.*—1, J. K. Fowler. 2, W. Stonehouse. *Ducklings.*—1, J. K. Fowler. 2, W. Stonehouse. *hc*, O. A. Young. *Rouens.*—1, J. K. Fowler. 2, J. P. Fawcett, Whithy. *c*, W. Pattison; G. Garbutt. *Ducklings.*—1, G. Garbutt. 2, J. P. Fawcett. *c*, T. Weathercill. *Any other Variety.*—1, G. Sadler, Boroughbridge (Carolinas). 2, S. Burn (Mandarins). *hc*, O. A. Young; S. Burn (Carolinas); W. English (Widgeon). *Ducklings.*—1, S. Burn (Buenos Ayreans). 2, O. A. Young.

GEESE.—1, O. A. Young. 2, Rev. G. Hustler. *hc*, Mrs. Storry, *Goslings.*—1, Mrs. Storry. 2, Rev. G. Hustler.

TURKEYS.—1, Rev. G. Hustler. 2, Mrs. Storry. *hc*, Mrs. Ward, Banniel Flat. *Poults.*—1 and *hc*, Mrs. Ward. 2, G. R. Pearson.

SELLING CLASS.—*Any Variety.*—1, J. Webster (Golden-pencilled Hamburgh). 2, G. Pounder (Spanish). 3, A. H. Banbury (Buff Cochins). *hc*, Lady D. Yeoman (Houdans). *c*, G. Speedy (La Flèche).

DISTRICT PRIZES.

DORKING, SPANISH, OR FRENCH.—*Chickens.*—Cup, S. Burn (Spanish). *hc*, J. Booth (Spanish).

GAME.—*Any other Variety not Specified.—Chickens.*—Cup, G. Speedy (Polands).

COCHIN-CHINAS.—*Chickens.*—Cup, G. Speedy.

BRAHMA POOTRA.—*Chickens.*—Cup, Rev. R. A. White. *c*, W. Stonehouse; E. Corney.

HAMBURGHS.—*Chickens.*—Cup, J. Webster (Golden-pencilled). *hc*, J. P. Fawcett (Black); G. Speedy (Silver-spangled); J. Webster (Golden-pencilled).

BANTAMS.—*Chickens.*—Cup, W. Henderson.

DUCKS, GEESE, OR TURKEYS.—*Ducklings, Goslings, or Poults.*—1, W. Stonehouse (Aylesbury). *hc*, J. P. Fawcett (Rouen).

PIGEONS.

POUTERS.—1, G. Sadler. 2, H. Yardley, Birmingham.

TUMBLERS.—1, H. Yardley. 2, G. Sadler. *hc*, C. Auton, York (2); I. Garbutt.

CARRIERS.—1, H. Yardley. 2, No competition.

FANTAILS.—1, H. Yardley. 2, J. F. Loversidge. *hc*, C. Auton.

JACOBINS.—1, F. Waitt, Birmingham. 2, H. Yardley. *hc*, C. Anton; F. Waitt; R. G. Sanders, Beverley.

TRUMPETERS.—1, R. Wilson. 2, C. Auton.

BARBS.—1, R. Wilson. 2, H. Yardley. *hc*, C. Anton.

ANY OTHER VARIETY.—1, H. Yardley. 2, R. Wilson. *hc*, T. C. Benson, Ford Hall (Blondinettes).

SELLING CLASS.—1, J. Cundale (Antwerps). 2, C. Auton. *hc*, W. Bearpark; C. Auton; R. Wilson; J. Cundale (Antwerps and Magpies). *c*, R. Wilson.

The Judge was Mr. Edward Hewitt, of Sparkbrook, near Birmingham.

TODMORDEN POULTRY SHOW.

THIS was held on the 2nd inst. in the fields at Roomfield, and although rain fell heavily during the night, the day was remarkably fine, and the Committee were amply rewarded by the large receipts at the gates, as some thousands visited the Show. In all the departments there was great merit, and everything was admirably arranged by Mr. Crossley, the Secretary.

The *Game* classes came first, and in single cocks the first prize went to a grand Brown Red, which was everything that could be wished for in a Game cock. The same exhibitor was also first with a single hen, also with a cock and hen, all of great merit. In *Brahmas* Mr. Lacy was first, and Mr. Ashworth was second with a splendid pen of chickens, the best in all respects we have seen this season. In *Dorkings* the first prize went to a grand pen of chickens, which we think are likely often to be in the prize list. The two pens of prize *Spanish* were in excellent plumage for the time of the year, and two better pens it would be difficult to find. The entries in the *Hamburgh* classes were not large, but some of the birds were very good. The first prize for Game *Bantams* went to a good pen of Piles, the second to Reds. The Rouen *Ducks* were an excellent class, and, besides the prizes, five pens were highly commended.

Among the *Pigeons* the Pouters and Carriers were mostly first-class birds, Mr. Horner winning both prizes for Carriers. The Tumblers were good, and three pens were highly commended. The Dragoons were a good class, and the Fantails were perfect, and four pens were highly commended. The Barbs and Jacobins were also good classes, and Antwerps were perfect. Turbits, Owls, and Trumpeters were very good classes, and the Blue Rocks were a beautiful class—a class we should be glad to see at every show. The Variety class contained some fine specimens of Toys, and four pens were highly commended.

GAME.—1, C. W. Brierley, Middleton. *Cock.*—1, C. W. Brierley. 2 and *hc*, W. Ormerod, Pexheuse, Todmorden. *Hen.*—1, C. W. Brierley. 2 and *hc*, W. Ormerod.

BRAHMAS.—1, H. Lacy. 2, J. Ashworth, Rochdale. *hc*, J. Ashworth, Rochdale; H. Lacy.

COCHINS.—1, H. Lacy. 2, A. Bamford, Middleton. *hc*, E. Leech, Rochdale; H. Lacy.

DORKINGS.—1 and *c*, W. H. King, Rochdale. 2, J. Stott, Henley, Rochdale.

SPANISH.—1 and 2, C. W. Brierley.

HAMBURGHS.—*Gold-pencilled.*—1, S. Smith, Northowram, Halifax. 2 and *hc*, T. Wrigley, Tonge, Middleton. *Gold-spangled.*—1 and 2, H. Pickles, jun., Earby, Skipton. *Silver-pencilled.*—1 and 2, H. Pickles, jun. *Silver-spangled.*—1 and *hc*, H. Pickles, jun. 2, H. Stanworth, Worathorne. *Black.*—1, H. Hoyle, Lumb, Newchurch. 2, T. Greenwood, Todmorden.

BANTAMS.—*Game.*—1, T. Barker, Burnley. 2, Bellingham & Gill, Burnley. *hc*, Bellingham & Gill, Burnley; T. Barker, Burnley; S. Smith. *Any other Variety.*—1, H. Pickles, jun. (Black). 2, G. W. Robinson, Halifax (Black).

ANY OTHER VARIETY.—1, H. Pickles, jun. (Silver Polands). 2, T. Waddington, Feniscowles. *hc*, S. Renshaw, Gale, Littleborough; T. Waddington.

SELLING CLASS.—1, T. Wakefield, Golborne, Newton-le-Willows (Black Polands). 2, — Buckley, Ending, Healey, Rochdale (Dark Brahma). *hc*, H. B. Smith, Broughton, Preston (East Indian); H. Pickles, jun. (Polands).

DUCKS.—*Aylesbury.*—1, E. Leech. 2, A. West, Worathorne, Burnley. *Rouen.*—1 and 2, T. Wakefield, Golborne, Newton-le-Willows. *hc*, H. B. Smith; E. Leech; S. H. Stott, Preston; A. West: R. Hutchinson, Littleborough. *Any other Variety.*—1, C. W. Brierley. 2 and *hc*, H. B. Smith.

GEESE (Any variety).—1, E. Leech. 2, S. H. Stott.

TURKEYS (Any variety).—1, E. Leech.

PIGEONS.

POUTERS.—1, T. Waddington. 2, E. Horner, Harewood, Leeds. *hc*, T. Waddington; E. Horner.

CARRIERS.—1 and 2, E. Horner. *hc*, H. Yardley, Birmingham; J. Stanley Blackburn.

TUMBLERS (Any variety).—1, F. Moore, Burnley (Almonds). 2, E. Horner. *hc*, H. Yardley; T. Waddington; J. Brown, Haslingden.
DRAGOONS.—1, T. Waddington. 2, H. Yardley. *hc*, J. Stanley.
FANTAILS.—1, J. F. Loversidge, Newark. 2, T. Waddington. *hc*, J. Walker, Newark (2); H. Yardley; E. Horner.
BARBS.—1, H. Yardley. 2, E. Horner. *hc*, J. Stanley; E. Horner.
JACOBINS.—1, E. Horner. 2, T. Waddington.
ANTWERPS.—1, E. Horner. 2, J. Stanley. *hc*, J. W. Collinson, Halifax; J. Stanley; T. Waddington.
TURBITS.—1, B. Consterdine, Littleborough. 2, T. Waddington. *hc*, F. Moore, Burnley; W. Kitchen, Feniscowles, Blackburn; H. Yardley; E. Horner (2).
TRUMPETERS.—1 and 2, E. Horner. *hc*, W. Kitchen; T. Waddington.
OWLS.—1, J. Stanley. 2, B. Consterdine. *hc*, E. Horner.
BLUE ROCKS.—1, J. Crabtree, Ewood, Mytholmroyd. 2, E. Horner. *hc*, J. Crahtree; W. Sutcliffe, jun., Todmorden; E. Horner.
ANY OTHER VARIETY.—1, B. Consterdine. 2, T. Waddington. *hc*, W. Kitchen; H. Yardley; T. Waddington; E. Horner.

Mr. James Dixon, of Bradford, and Mr. Robert Payne, of Burnley, were the Judges.

DRIGHLINGTON AND ADWALTON POULTRY SHOW.

THIS Show was held on the 2nd inst. The following is the prize list:—

SPANISH.—1 and Cup, T. C. & E. Newbitt, Epworth. 2, H. Beldon, Goitstock, Bingley. *hc*, J. Powell, Bradford.
DORKINGS.—1, T. Briden, Earby. 2, H. Beldon.
COCHINS.—1, H. Beldon. 2, W. J. Mason, Drighlington.
BRAHMAS.—1, C. Berry, Morley. 2, H. Beldon.
GAME.—*Black breasted or other Red.*—1, J. A. Aykroyd, Eccleshill. 2, J. Fell, Adwalton. *Duckwing.*—1 and Cup, J. A. Aykroyd. 2, W. Fell, Adwalton. *Any other Variety.*—1, H. Beanland, Tong. 2 and *hc*, R. & H. Walker, Wood Nook, Gomersal.
HAMBURGHS.—*Golden-spangled.*—1 and 2, H. Beldon. *Silver-spangled.*—1 and 2, H. Beldon. *Golden-pencilled.*—1 and 2, H. Beldon. *Silver-pencilled.*—1 and 2, H. Beldon. *Black.*—1 and 2, H. Beldon. *hc*, C. Berry; E. Hopkinson, Tong.
ANY OTHER VARIETY.—1 and 2, H. Beldon. *hc*, C. Berry.
SINGLE COCK (any variety).—1, W. H. Mason, Drighlington (Buff Cochin). 2, J. Fell, Adwalton (Black Red). 3, H. Beanland (Brown Red). *hc*, J. A. Aykroyd (Brown Red).
BANTAMS.—*Game*—1, G. Noble, Staincliffe. 2, J. Oldfield, Shibden, Halifax. *hc*, S. Ward, Birkenshaw; J. A. Chapman, Morley (2); T. C. & E. Newbitt (2). *Any other Variety.*—1 and 2, H. Beldon.
GEESE (Any breed).—1, J. Ward, Drighlington (White). 2, Miss C. Bland, Drighlington (Grey). *hc*, J. Pitts, Drighlington (White).
DUCKS.—*Aylesbury.*—1, H. Beldon. 2, S. Proctor, Pudsey. *hc*, T. E. Terry, Shawfield, Tong. *Rouen.*—1, T. E. Terry. 2, E. Crampton, Pudsey. *hc*, J. Ward.

PIGEONS.

CARRIERS.—1, W. Cannan, Bradford. 2, H. Yardley, Birmingham.
POUTERS.—Cup and 1, W. Cannan (Blue). 2 and extra 2, H. Yardley (White). *hc*, W. Cannan; S. Robson, Brotherton, Ferrybridge; R. Esam, Newark.
TUMBLERS.—*Almond.*—1, W. Cannan. 2, H. Yardley. *Any other Variety.*—1 and 2, W. Cannan.
BARBS.—1 and *hc*, W. Cannan. 2, H. Yardley.
ANTWERPS.—1, J. Speight, Bradford. 2, W. Firth, Birkenshaw. *hc*, W. Cannan; B. & M. Peel, Birkenshaw (2).
TURBITS.—1 and *hc*, W. Cannan. 2, H. Yardley.
FANTAILS.—1, W. Cannan. 2, H. Yardley.
JACOBINS.—1, H. Yardley. 2, W. Cannan.
TRUMPETERS.—1 and *hc*, W. Cannan. 2, S. Robson.
MAGPIE OR SWALLOW.—1, J. Annakin, Drighlington. 2, H. Yardley. *hc*, W. Cannan (2).
ANY OTHER VARIETY.—1 and 2, W. Cannan. *hc*, J. Speight; R. Esam.

JUDGE.—Mr. E. Hutton, Pudsey.

BINGLEY POULTRY SHOW.

THE annual Poultry Show in connection with the Airedale Agricultural Society, was held in the grounds of Gawthorp Hall, Bingley, on August 30th. The awards were as follow:—

GAME.—*Black or other Reds.*—1, Lund & Lambert, Silsden. 2, J. Robertshaw, Thornton, Bradford. 3, E. Aykroyd, Eccleshill. *hc*, E. Aykroyd; J. Hodgson, Bradford; T. Dyson, Halifax. *Any other Variety.*—Cup, E. Aykroyd. 2, J. Robertshaw.
SPANISH.—1 and 3, J. I. Booth, Silsden. 2, W. E. F. Pickard, Thorner, Leeds. *hc*, W. Schofield, Leeds.
DORKINGS.—1, T. E. Kell, Wetherby. 2, D. White, Great Driffield. 3, R. W. Richardson, Meaux Abbey, Beverley. *hc*, H. Beldon, Goitstock.
COCHINS.—Cup and 2, C. Sedgwick, Keighley.
BRAHMAS.—1, R. Hutchinson, Hollingworth. 2, Dr. Holmes, Chesterfield. 3, R. H. Hodgson, Micklethwaite.
HAMBURGHS.—*Gold-spangled.*—1, H. Beldon. 2, E. Gill, Fearneliffe, Bingley. 3, T. Dean, Keighley. *hc*, T. Dean; T. May, Wolverhampton. *Silver-spangled.*—Cup, G. Mitchell, Keighley. 2, H. Beldon. 3, C. Smith, Silsden. *hc*, G. & J. Duckworth, Church. *Black.*—1, W. Preston, Bingley. 2, C. Sedgwick. 3, J. Lund, Silsden. *hc*, C. Sedgwick; W. Moore, Keighley. *Gold-pencilled.*—Cup, H. Beldon. 2, J. Smith, Gilstead, Bingley. 3, T. Fawcett, Baildon. *hc*, J. Smith; T. Kinder, Micklethwaite, Bingley. *Silver-pencilled.*—1, R. Longbottom, jun., Bingley. 2, H. Smith, Morton Banks. 3, H. Beldon. *hc*, J. Garnett, Idle.
ANY OTHER VARIETY EXCEPT BANTAMS.—1, H. Beldon. 2, J. Bowker, Keighley. 3, J. J. Malden, Biggleswade (Crêve-Cœur). *hc*, T. Middleton, jun., Scarcroft (Silkies); H. Bowker, Keighley (Polands); T. Dean, Keighley.
BANTAMS.—*Game.*—Cup, G. Noble, Staincliffe, Dewsbury. 2, J. Oldfield, Shibden, Halifax. 3, W. F. Entwisle, Westfield, Cleckheaton. *hc*, W. F. Entwisle; R. Butterfield, Windhill Cragg, Shipley. *Any other Variety.*—1, C. Sedgwick, jun., Skipton. 2, H. Beldon. 3, S. & R. Ashton, Mottram.
SELLING CLASS.—1, C. Carr, Wilsden (Cochin-China). 2, J. Bowker (Polands). 3, H. Beldon. *hc*, J. Smith; G. Greaves, Pool, Otley (Dorkings); W. F. F. Pickard; J. J. Booth; Baxter & Dawson, Thackley, Idle; W. Johnson, Idle; A. Tidswell, Ovenden.
DUCKS.—*Aylesbury.*—1, A. West, Worsthorn, Burnley. 2, W. Wilson, Farnhill, Kildwick. *Rouen.*—1, S. H. Stott, Preston. 2, R. W. Richardson. *hc*, J. J. Booth; J. Newton, Silsden.

PIGEONS.

POUTERS.—*Cock.*—1 and 2, E. Horner, Harewood. 3, R. Harrison, Darlington. *Hen.*—1 and 2, E. Horner. 3, G. J. Taylor, Huddersfield.
CARRIERS.—*Cock.*—1 and 3, E. Horner. 2, T. Waddington, Feniscowles, Blackburn. *Hen.*—1 and 2, E. Horner. 3, T. Waddington.
TUMBLERS.—*Almond.*—1, T. Waddington. 2, E. Horner. 3, F. Moore, Burnley. *Any other Variety.*—1, G. J. Taylor. 2, W. Cannan, Bradford. 3, F. Moore.
BARBS.—Cup, J. Hawley, Girlington, Bradford. 2 and 3, E. Horner.
OWLS.—1, W. Cannan. 2, J. Hawley. 3, E. Horner.
JACOBINS.—Cup and 2, J. Thompson, Bingley. 3, G. Roper, Croydon.
TRUMPETERS.—1 and 3, E. Horner. 2, W. Harvey, Sheffield.
FANTAILS.—1, J. Walker, Newark. 2, T. Waddington. 3, E. Horner.
TURBITS.—1 and 2, E. Horner. 3, Clayton & Bairstow, Girlington.
DRAGOONS.—1, T. C. Benson, Sunderland. 2, B. Lancaster, Baildon. 3, J. Baxandall, Crosshills.
ANTWERPS.—1, W. Harvey. 2, M. Smith, Keighley. 3, Clayton & Bairstow.
ANY OTHER VARIETY.—1, W. Harvey. 2, E. Horner. 3, T. Waddington.
SELLING CLASS.—1, J. Lister, Keighley. 2, R. Petch, Moon, Driffield. 3, E. Horner.
BRED FOR FLYING PURPOSES.—1, J. Summer, Morton (Antwerps). 2, R. Sedgwick, Keighley.

RABBITS.—*Heaviest.*—1, W. Arkwright, Sutton Scarsdale, Chesterfield. 2, A. H. Easten, Beverley. *Lop-eared.*—1, H. Cawood, Thorne. 2, H. Ridley, York. 3, J. Boyle, jun., Blackburn. *Any other Variety.*—1, S. G. Hudson, Hull. 2, R. Pollard, Bingley. 3, W. H. Tomlinson, Newark.

JUDGES.—*Poultry:* Mr. R. Teebay, Fulwood, Preston. *Pigeons:* Mr. W. Smith, Beech Hill, Halifax. *Rabbits:* Mr. J. Douglas, Clumber.

WIRRAL AGRICULTURAL SOCIETY'S POULTRY SHOW.

THE annual Show in connection with the old-established Wirral Agricultural Society was held on August 30th near Birkenhead Park. The weather was all that could have been desired, and throughout the day a large number of persons visited the ground. The arrangements for the poultry were very good, all the pens being well protected from the weather; but as the day was very hot the canvas was only of use to protect the birds from the sun. The *Dorking* class was not up to the mark, and the birds were in bad plumage. The chickens were a fair class, but we have seen better at this season of the year. Some of the adult *Cochins* were very good. Mr. Stretch and Mr. Lacy had a hard pull for the first, the former only won by condition. In the chicken class Mr. Sidgwick was first with a really perfect pen of Partridge, and Mr. Stretch followed with a good pen of Buffs. Mr. Lacy took both prizes in *Brahmas* with capital birds; some of the chickens were also very good. The *Spanish* were very poor, and only one prize was awarded. The adult *Game* were much out of condition, but some good birds were amongst them. The first prize went to Black Reds, the second to Browns. The chickens were good, and both prizes went to Brown Reds. The Game *Bantams* were a small entry, Mr. Maples being the principal winner. There were only two classes of *Hamburghs*, and with the exception of the winners they were rather indifferent. The Variety class contained some excellent Crêve-Cœurs and Houdans.

In Rouen *Ducks* there were fourteen pens of excellent birds. Mr. Gladstone's prize pen was all that could be desired both as regards size and colour. In Aylesburys excellent birds were first and second. The *Geese* were very fine, and the Judges would have been glad if they had had more prizes to award.

There was a fine show of *Pigeons* in nearly all the classes. Mr. Yardley was a large winner with first-class birds. The Dragoon classes contained thirty-three pens of the best birds that were ever brought together. Mr. Byron took the cup for the best pen of Dragoons of any other colour than Blue. The second-prize pen was in all respects first-class, but suffering from the moult.

The *Pigeons* proved very attractive, as they generally do. In Carriers, Blacks were first and second, the first-prize birds being of capital carriage. In Pouters, both first and second prizes went to Whites, both pens being good. Tumblers had two classes. One was for Beards and Balds, in which Blue Beards were first and Blue Balds second; the other was for any other variety, and in this Almonds were first and a pretty pair of Yellow Mottles second. In Barbs, Yellows were first and Blacks second. In Turbits the first-prize birds were Whites, in deep moult, but good in head, Yellows in good feather being second. In Owls, Whites were first and second. A silver cup for the Dragoon classes produced a very good entry, both in the class for Blues and also in that for any other colour. Mr. Graham's birds were all in moult, otherwise he would have stood much higher in the prize list. The first and second-prize pens of Blues were both in very good feather. In the class for any other colour, Yellows took both prizes. The first-prize birds were too light in the thigh, the second-prize birds were grand, only in moult. Black Nuns were first and second in their class, and Trumpeters first and Porcelains second in the class for any other variety. Another year I should strongly recommend the Committee to offer prizes for single Carriers and Pouters instead of pairs.
—A FANCIER.

DORKINGS.—1, J. H. Stott, Preston. 2, T. Briden, Earby. *Chickens.*—1 and 2, R. Ravensbaw, Preston. *hc*, J. Watts, Kingsheath, Birmingham.
COCHIN-CHINAS.—1, T. Stretch, Ormskirk. 2, H. Lacy, Hebden Bridge. *hc*, J. Watts. *Chickens.*—1, C. Sidgwick, Ryddlesden, Keighley. 2, T. Stretch. *hc*, J. Willis.
BRAHMA POOTRA.—1 and 2, H. Lacy. *hc*, W. Gamon, Chester. *c*, J. Watts. *Chickens.*—1, G. Biddle, Moreton. 2, F. A. Dean, Moreton-on-Lugg. *hc*, W. W. Duncan, Moreton (2); J. Watts.
SPANISH.—1, H. Wilkinson, Earby. 2, Withheld. *Chickens.*—1, J. Walker, Standeford, Wolverhampton. 2, H. Wilkinson. *hc*, A. Mollons.
GAME.—1, T. P. Lyon, Knotty Ash, Liverpool. 2, G. F. Ward, Wrenbury, Nantwich. *hc*, G. C. Barnett, Birkenhead. *Chickens.*—1 and 2, J. Carlisle. *hc*, G. C. Barnett.
BANTAMS.—1, G. Maples, jun., Wavertree, Liverpool (Game). 2, J. Smith, Oxton. *Chickens.*—1 and 2, G. Maples, jun. (Game).
HAMBURGHS.—1, T. Bolton, Basford. 2, J. Statter, New Brighton. *Chickens.*—1, T. Bolton. 2 and *hc*, J. Statter (Golden-spangled and Silver-pencilled).
ANY OTHER VARIETY.—1, W. Gamon (Polish). 2, W. Dale, Neston (Crêve-Cœurs). *Chickens.*—1, J. J. Malden, Biggleswade (Crêve-Cœurs). 2, C. Morriss,

Holmleigh, Grassendale (French). *hc*, J. K. Fowler, Aylesbury (French); Rev. C. C. Ewbank, Longford Vicarage, Biggleswade (Crève-Coeur).

Ducks.—*Rouen.*—1, R. Gladstone, jun., Court Hey, Broad Green, Liverpool. 2, T. Wakefield, Golborne, Newton-le-Willows. *hc*, H. B. Smith, Broughton, Preston; S. H. Stott; R. Gladstone, jun. *Any other Variety.*—1, J. K. Fowler. 2, E. Leech, Rochdale. *hc*, H. B. Smith (2); S. H. Stott; J. K. Fowler.

Geese.—1, J. K. Fowler. 2, J. H. Stott. *hc*, E. Leech; G. F. Statter, Carliale; Rev. G. Hustler, Stillingfleet, Yorkshire.

Turkeys.—1, E. Leech. 2, Rev. N. J. Ridley, Newbury (Cambridge).

Extra Prize,—*For best Pen of Fowls of any Breed, the Property of a Wirral Farmer or Labourer.*—1, W. Dale (Brahmas).

PIGEONS.

Carriers.—1, L. Byron, Blackburn. 2, J. Stanley, Salford, Blackburn. *hc*, H. Yardley, Birmingham.

Pouters.—1, H. Yardley. 2, E. C. Stretch, Ormskirk. *hc*, J. Hodgson, Birkenhead.

Balds and Beards.—1 and 2, W. J. Woodhouse, King's Lynn. *Any other Variety of Tumblers.*—1, H. Yardley. 2 and *hc*, W. J. Woodhouse.

Fantails.—1, H. Yardley. 2, D. MacIver, Moor Lee, Bromborough.

Barbs.—1, J. Stanley. 2, H. Yardley. *hc*, J. W. Phillips, Anfield, Liverpool.

Turbits.—1, E. C. Stretch. 2, W. Gamon.

Owls.—1, H. Yardley. 2, J. Stanley. *hc*, Mrs. W. Sneyd, Keele Hall, Newcastle-on-Tyne (2).

Dragoons.—*Blue.*—1, H. Yardley. 2, L. Byron. *hc*, J. Watts; W. H. Mitchell, Moseley, Birmingham; H. P. Ryland, Erdington, Birmingham. *Any other Colour.*—1 and Cup, L. Byron, Blackburn. 2, F. Graham, Birkenhead. *hc*, F. Graham (4); W. H. Mitchell; J. Stevenson, jun., Chester; H. P. Rylands.

Nuns.—1, F. Graham. 2, G. A. Dean. *hc*, F. Graham.

Any other Variety.—1, W. Gamon. 2, H. Yardley. *hc*, J. Watts; J. W. Phillips (Yellow Magpies); J. Stanley.

Mr. Hindson, of Liverpool, and Mr. Dixon, of Bradford, were the Judges.

COTTINGHAM POULTRY SHOW.

The following awards were made at this Show, held on August 30th, at Cottingham, near Hull:—

Spanish.—1, T. C. & E. Newbitt, Epworth. 2, G. Holmes, Driffield. *Cock.*—1, G. Holmea.

Dorkings.—1 and piece of Plate, D. White, Driffield. 2, R. W. Richardson, Beverley. *Cock.*—1, G. Holmea.

Cochina.—1 and piece of Plate, R. Dawson, Beverley. 2, R. Fleming, Hull. *Cock.*—1, O. A. Young, Driffield.

Game.—*Black-breasted or other Reds.*—1 and 2, H. M. Julian, Hull. *Cock.*—1, H. M. Julian. *Any other Variety.*—1, Extra, and 2, H. M. Julian. *Cock.*—H. M. Julian.

Polands.—1 and 2, Mrs. J. M. Procter, Hull. *Cock.*—1, Mrs J. M. Procter.

Hamburghs.—*Golden-spangled.*—1, R. P. Moon, Driffield. 2, G. Holmes. *Cock.*—1, G. Holmea. *Golden-pencilled.*—1, G. Holmes. 2.—Biglin. *Cock.*—1, G. Holmea. *Silver-spangled.*—1, G. Holmes. *Cock.*—1, G. Holmes. *Silver-pencilled.*—1, G. Holmea. 2, W. G. Purdon, Driffield. *Cock.*—1, G. Holmea.

Farmyard Cross.—1, W. H. Young, Driffield. 2, G. Bromby, Cottingham. *Chickens.*—1 and 2, G. Bromby.

Any other Variety.—1, R. Loft, Beverley (Sultans). 2, D. Dunlin, Cottingham. *Cock.*—1, R. Loft.

Bantams.—*Gold*—1, Mrs. J. M. Procter. 2, O. A. Young. *Cock.*—1, Mrs. J. M. Procter. *Game.*—1, W. Adams, Ipswich. 2, J. Stabler, Driffield. *Cock.*—1, W. Adama. *Any other Variety.*—1, Mrs. J. M. Procter. 2, G. L. Davis, Hu'l. *Cock.*—1 and Plate, Mrs. J. M. Procter.

Geese.—1, O. A Young.

Ducks.—*Aylesbury.*—1, M. Duggleby, Cottingham. 2, H. Lawson, Hull. *Any other Variety.*—1 and 2, R. W. Richardson.

PIGEONS.

Pouters.—1, H. Adama, Beverley. 2, R. W. Richardson. *hc*, T. Statters.

Carriers.—1 and 2, W. Campey, Beverley.

Turbits.—1, Cup, and 2, C. N. Lythe, Cottingham. *hc*, H. Lawson.

Trumpeters.—1, D. McCollin, Hull. 2, C. N. Lythe.

Jacobins.—1, R. G. Sanders, Leven. 2, F. C. & E. Thompson, Hull.

Fantails.—1, H. Adams. 2, H. Taylor, Newland.

Dragoons.—1 and 2, H. Adams.

Tumblers.—1 and 2, H. Adams.

Barbs.—1, R. W. Richardson. 2, T. Statters.

Nuns.—1, R. W. Richardson. 2, J. Erskine, Hull.

Any other Variety.—1, Mrs. J. M. Procter (White Owls). 2, R. W. Richardson (Black Owls).

Rabbits.—*Lop-eared.*—*Buck.*—1, P. Ashton, Hull. 2, Miss Fletcher, Hull. *Doe.*—1 and 2, Miss Fletcher. *Any other Variety* (Pair).—1, E. Walker, Hesale. 2, P. Ashton.

Judges.—Mr. F. Ferguson, and Mr. J. Hodgkinson.

MANCHESTER AND LIVERPOOL POULTRY SHOW.

This Show was held on the 6th and 7th inst. We must defer our report till next week.

ALL BIRDS HATCHED IN 1871.

Dorkings.—*Coloured.*—1, E. Leech, Rochdale. 2, Miss Davies, Chester. 3, Gunson & Jefferson, Whitehaven. *hc*, T. E. Kell, Wetherby. *c*, T. E. Kell; A. Darby, Bridgenorth. *Silver-Grey.*—1 and 2, Withheld. 3, T. Statter, jun., Whitfield, Manchester.

Spanish.—1, F. Jamea, Peckham Rye. 2 and 3, E. Jones, Clifton. *hc*, J. Walker, Standiford. *c*, H. Beldon, Bingley.

Cochin-China.—*Buff or Cinnamon.*—1, W. A. Taylor, Manchester. 2, E. Leech. 3, C. Sidgwick, Keighley. *hc*, W. A. Taylor; C. Sidgwick. *c*, W. P. Rylands, Eddington; A. Darby, Bridgenorth. *Brown and Partridge-feathered.*—1 and 2, C. Sidgwick. 3, H. Lingwood, Needham Market. *hc*, W. A. Taylor; E. Leech; C. Sidgwick.

Brahma Pootras.—*Dark.*—1, W. A. Taylor. 2, H. Lingwood. 3, W. Gamon, Chester. *hc*, G. Maples, jun., Wavertree; R. B. Wood, Uttoxeter. *c*, T. F. Ansdell, St. Helena. *Light.*—1 and 2, J. Pares, Guildford. 3, R. B. Wood.

Game.—*Black-breasted Reds.*—1, C. Chaloner, Whitwell. 2, W. Harkes, Collingley. 3, H. M. Julian, Hull. *hc*, C. Chaloner. *Brown and other Reds except Black-breasted.*—1, E. Aykroyd, Eccleshill. 2, J. Wood, Wigan. 3, T. Dyson, Halifax. *hc*, J. Carlisle, Earby, Skipton (2). *c*, C. Chaloner; M. A. Forde, Liverpool. *Any Variety except Black-breasted and other Reds.*—1, C. Chaloner. 2, T. P. Lyon, Knotty Ash. 3, J. Halsall, Eccleston, Preacot. *c*, T. P. Lyon.

Hamburghs.—*Golden-pencilled.*—1, H. Pickles, jun., Earby, Skipton. 2, N. Barter, Plymouth. 3, J. Webster, Whitby. *hc*, J. Statter, New Brighton. *c*, H. Beldon, Goitstock, Bingley; J. Wrigley, Tenge, Middleton. *Silver-pencilled.*—1, H. Pickles, jun. 2, N. Barter. 3, W. M. Mann, Kendal. *hc*, H. Beldon; J. Platt, Dean, Bolton; H. Pickles, jun. *Golden-spangled.*—1, T. Walker, jun. Denton. 2, J. Statter. *hc*, J. Marsland, Hollinwood, Manchester; J. Chadderton, Hollinwood; J. W. Gardon, Newcastle. *c*, T. Dean, Keighley; W. A. Hyde, Ashton-under-Lyne. *Silver-spangled.*—1 and 2, H. Beldon. 3, J. Field ing, Newchurch, Manchester. *hc*, J. Preston, Allerton, Bradford; Ashton and Booth, Broadholtom, Mottram; J. Hodgson, Howe; G. Duckworth. *c*, D. Lord, Stacksteads; J. Duckworth. *Black.*—1 and 2, C. Sidgwick. 3, H. Beldon. *hc*, W. A. Taylor. *c*, C. Sidgwick; W. A. Taylor.

Polish.—1, P. Unsworth. 2, 3, and *hc*, H. Beldon. *c*, T. Dean.

French Fowl.—1, J. J. Walden, Biggleswade. 2, J. K. Fowler, Aylesbury. 3, R. B. Wood, Uttoxeter. *hc*, W. Dring, Faversham; E. Williams. *c*, J. Sichel, Timperley; C. Morris, Grassendale.

Any other Variety.—1, J. S. Booth (Malays). 2, E. Williams.

Game Bantams.—*Black-breasted Reds.*—1, T. Shurplea, Rawtenstall. 2, W. F. Entwisle. 3, G. Maples, jun., Wavertree. *hc*, W. F. Entwisle; Rev. C. J. P. Keene, Halsall. *c*, J. W. Morris. *Any other Variety.*—1 and 2, W. F. Entwisle. 3, Furniss & Sudall, Haslingden. *hc*, T. Dyson; J. W. Morris. *c*, Rev. C. J. P. Keene.

Bantams.—1, J. Walker, Hulifax. 2, J. W. Morris. 3, H. Beldon. *hc*, H. Beldon; S. & R. Ashton; J. Sichel; Miss R. C. Frew.

Ducks.—*Rouen.*—1 and 2, T. Wakefield, Golborne. 3, R. Robinson, Leeds. *hc*, J. K. Fowler; A. Haslam; T. Burns, Wigan; T. Wakefield; J. Scotson. *Aylesbury.*—1 and *hc*, J. K. Fowler. 2 and 3, E. Leech. *Any other Variety.*—1 and *hc*, H. B. Smith. 2, R. Gladstone, jun. 3, T. Wakefield. *c*, W. Binns.

Geese.—*Grey*—1 and *hc*, S. H. Stott. 2, G. F. Statter, Carlisle. 3, E. Leech. *c*, R. Beckett, Northwich; J. Wood. *White.*—1 and 2, E. Leech. 3, Sir H. P. de Bathe, Bart., Chicheater. *hc*, G. Hustler, Stillingfleet.

Turkeys.—1 and 3, E. Leech. 2, T. Rigby, Winsford. *hc*, F. Lythall; T. Rigby.

The Judges were Mr. E. Hewitt, of Sparkbrook, Birmingham, and Mr. Richard Teebay, of Fulwood, Preston.

TIMELY FEEDING BEES.

A timely word of warning will not come amiss just now to all who desire to save their bees during the coming winter. I do not think we have had so hard a season for honey as the present summer since the fatal year 1860. My own hives, with one or two exceptions, were all but pauperised when August came, nor did they mend much till the hot and thundery weather of the second and third weeks, and then only as bees can in August, when the earth seems nearly exhausted and the flowers, save in the lands of heather, produce but little honey. Nine out of ten of my hives are so poor, owing to their excessive swarming (quite into the middle of July), that I have already begun to feed some of them: and I advise apiarians generally to be on the alert ere it be too late. Great care should be taken, too, to avoid dropping any sweet syrup about, which would immediately attract robber bees and endanger a general and indiscriminate pillage of each other's hives. Use the bottle-feeder, and cover well over, taking care that the syrup be neither so liquid as to run too fast, nor so thick as to refuse to run at all. Feed towards evening when the apiary is at rest—a great deal of food will be carried safely down during warm nights.

The main feeding time should be in October; but see to it that the bees will survive till then. It is well to feed the hives continuously from first to last—I mean by this that the feeders should be filled as fast as they are emptied, so as to prolong the excitement as little as possible.—B. & W.

FEEDING BEES.

I have a quantity of dates offered me for my bees to extract the saccharine matter from them, as they are old and candied; do you think it safe to offer them as food? I fear my hives are scantily supplied with honey, and two swarms have still about a third of their hives to fill with comb. The stocks have no honey visible through the windows, but one out of two works well. I have no means of weighing the hives, so kindly give me advice as to when feeding should begin, if needful, and if the trough may remain on all night; also what is the best food to give, and will they form comb out of it?

I enclose also some lines from an old manuscript, which I thought might prove interesting, giving an early account of bee knowledge in England.—C. A. J.

"And ryght as *dranes doth nought but drynketh up the huny
Whan †been withe her busynasse have brought it to †hepe,
Right so farath ‖freres with folke upon erthe,
They §freten up the **furstefroyt and ††falaliche lyhbeth."

—*Piers Ploughman's Crede*, ll. 726-729. A D. 1394.

[We have had no experience respecting dates as an article of bee food. As your two swarms have not filled their hives with comb, you must make up your mind to give from 15 lbs. to 20 lbs., or perhaps even more, to each of sugar syrup, as a considerable portion of it will be used in extending the combs; the stocks also appear to require liberal feeding.

You may feed your bees any time during this month with advantage. Use the bottle feeder so often recommended by us, and give from 2 to 4 lbs. of food at a time to each stock. The proper time to put on the feeders is at dusk. Cover them well over, so that the bees from other stocks cannot get at even the outside of the bottle. The following morning remove all

* Drones. † Bee (in female sense). ‡ Skep (origin of ?). ‖ Friars. § Gather up. ** First fruit. †† Falsely liveth.

feeders, whether emptied or not, and continue the feeding nightly until the required quantity has been given. If necessary, contract the entrances of your hives to enable the inmates more effectually to repel robbers. Get all the feeding accomplished as rapidly, as completely, and with as little disturbance as possible. These directions are intended for autumn feeding only. Spring feeding must be carried on in a different manner.

If you do not care to give the large quantity of artificial food that all your weaker stocks or swarms may require, you may, if you please, unite two of them, making one good stock, which, with liberal feeding, may prove more profitable than keeping two weak hives. We do not advise this, however, as we do not know the strength of your respective colonies. The best food is in the proportion of 6 lbs. of loaf sugar to 4 lbs. of water, kept on the fire for two or three minutes after it has reached boiling point, and, of course, allowed to cool before being given to the bees. Wax can be secreted and combs built entirely from this syrup, but, as in the case of honey, it takes an enormous quantity of food to enable the bees to construct a very small quantity of comb, and this must always be taken into account when providing hives with sufficient stores for winter consumption.—Eds.]

MR. WOODBURY—FOUL BROOD.

Before entering on the subject of this communication, allow me to say that the death of Mr. Woodbury on the eve of expected recovery has occasioned the most profound sorrow. He was the prince of English apiarians; and those who, like myself, had the privilege of corresponding with him, will long mourn his loss while they affectionately cherish his memory. His early removal has not only overwhelmed his family and friends with deep grief, but it has made a blank in the apiarian circle which few, if any, are qualified to fill up; the deceased being, as one of the Editors of "our Journal" has well said, "our right hand, right head, and right heart in bee knowledge."

To the disease called foul-brood he was the first to direct the attention of bee-keepers in this country. He gave them all the information that could be obtained regarding it, and he minutely described the process by which he so successfully banished it from his apiary, and the method which he adopted eight years ago is the only one that has, in my experience, effectually eradicated the complaint. All other nostrums, whether English, German, or American, have signally failed. In the Journal of December 29th, 1870, Dr. Abbe stated that he had managed to bring the disease under control by the application of hyposulphite of soda. The account he gave of his doings made a strong impression, and I resolved to take an early opportunity of testing the value of his discovery.

My experiments were commenced in April. Having a well-stored Woodbury hive, I replaced two of the removed combs by two tainted ones. From these all foul cells were excised, and all the others thoroughly washed out with Dr. Abbe's solution. Not only so, all the other combs, with the box that contained them, were completely washed over with the solution, and subjected to its influence for a period of twelve hours. I then put one of my best swarms into the box and awaited the result, concluding that the fell disease would not be resuscitated and reappear if the remedy thus applied possessed the virtue ascribed to it. I am bound to confess that none of my expectations were realised. The solution had not the slightest influence in disinfecting the combs. The disease did not even receive a check; it broke out fresh as ever, and before the end of July had spread through the whole hive, and in a form as malignant as any I had ever witnessed. It was quite obvious that further attempts to effect a cure in the way recommended would be useless, so, not to waste more time over it, I at once drove the bees into an empty hive, and buried every comb. The box having been purified with chloride of lime, was, after a few days, tenanted by its former occupants, and now, whilst I write, not a vestige of disease can be observed in the well-brooded new combs. To the late Mr. Woodbury, whose loss we lament, we are indebted for making known, or perhaps I should say discovering, a method whereby wooden hives can be purged of their evil virus in a few days, and it is doubtful whether any better plan than the one he adopted will ever be found out for eliminating the plague of foul brood.—R. S.

OUR LETTER BOX.

Ryhope Poultry Show.—The second prize for Brahmas was awarded to Mr. A. H. Banbury, Langton, Northallerton.

Long Sutton Poultry Show.—Mr. Tegetmeier requests us to contradict the statement in our list of Poultry Shows, that he is to be one of the Judges at Long Sutton. The statement in question was founded on an advertisement by the Long Sutton Committee, which appeared in our columns on August 17th, and in those of *The Field* two days afterwards. Since the above was in type we have received a corrected list of the Judges, which we now insert.

Brahmas with Diseased Livers (*D. J.*).—You should describe the yard in which the fowls are kept. Is it paved? If it is not, what is the nature of the bottom? Do they get any sun? As much in the dark as we are, we must confine ourselves to generalities. Fowls kept in paved yards are subject to diarrhœa, and when they die from it the livers are generally in the condition you describe. We do not like your dietary. Give ground oats or barley meal slaked, in the morning and evening. Indian corn or barley on alternate days for the midday meal. Continue the lettuces by all means. If any are seized, give them at once two pills of camphor the size of a garden pea, and continue this if necessary. When the livers are affected the birds seem to suffer from inordinate thirst. It is well in that case to remove the water, and to allow them to drink only three times per diem.

Ligurian Queens (*D. N.*).—They are advertised in our columns.

Dormice (*S. M. W.*).—They can be obtained at some of the bird shops in Seven Dials, London, but we do not know of anyone who sells them in Liverpool, but such there are, no doubt.

METEOROLOGICAL OBSERVATIONS.

REMARKS.

30th.—Hazy and very warm in the morning, getting more and more cloudy all the afternoon and evening.

31st.—A most lovely day, a little cloudy about 5 P.M.

September 1st.—Occasionally cloudy and storm-like, oppressively warm, there being no motion in the air.

2nd.—Very slight shower at 9.10 A.M.; thunder at 12 40 and 2.10 P.M., cooler afterwards.

3rd.—Fine morning; rather cloudy in early afternoon, with very slight showers between 3 and 4 P.M.; and rain at 10.50 P.M.

4th.—Fine in morning, rain commenced soon after noon, and continued till the evening.

5th.—A very fine day throughout, bright sun, but a pleasant breeze.

Notwithstanding the rain of Monday and pleasant breezes, the temperature has been 4° above that of last week, and nearly 8° above the average. —G. J. Symons.

COVENT GARDEN MARKET.—September 6.

Trade quiet; there is a fair demand for the best descriptions of fruit and vegetables, but common goods only command low prices. Large foreign supplies are coming in just now.

From observations taken near London during forty-three years, the average day temperature of the week is 67.9°, and its night temperature 45.6°. The greatest heat was 87°, on the 15th, 1865; and the lowest cold 29°, on the 17th, 1840. The greatest fall of rain wae 0.90 inch.

HORTICULTURAL PARIS IN 1871.—No. 1.

"AND did you find Paris very much altered?" is the invariable question one is met with when you confess to having been there. To this question there must be various replies; in some respects one would say, Not in the least. You see the same *flâneurs* on the boulevards, the men who seem to have nothing to do but stroll about, or sit down and sip café or orgeat, &c. Go into the restaurants, and there is the veritable Adolphe or Jean who served you a year ago; the cocher of the fiacre hands you the ticket which might be the fellow of that he gave you in 1870; the same grey horses (we thought they were all eaten) draw along the omnibus; you receive your *billet de correspondance* as before; you go to your hotel, the very same *concierge* greets you as determined as ever to cheat you if possible, Antoine lights you to your chamber with hopes of "pourboire" dancing before his eyes, and you rub your eyes and begin to think that the war of 1870 and the Commune of 1871 were all a dream. But you go out again; you stroll into the Place de la Concorde, and thence up the Tuileries gardens; you see that the whole façade of the Palace is gone; that the barracks that faced the Rue Rivoli are shattered; that the Palais Royal (the Palace itself) is a ruin—the shops and restaurants and gardens remain as ever—that you can dine at Vessens or the Trois-frères if you like and if your pocket will afford it, as of yore. On further still, you come on the blackened mass of the Hotel de Ville, the theatre of the Opéra Lyrique, and the Palais de Justice, and you are now aware that all that you have heard of the wretched atrocities of Ferré, Lullier, Felix Pyat, and others was *not* a dream, and the wonder is that all Paris did not fall.

But that point of view which will suggest itself to the readers of the Journal is, Is Paris very much changed in a horticultural point of view? how have fared the gardens, *places*, promanades, and parks? I think it is impossible not to admire the energy with which Paris has endeavoured to repair her disasters. When one recollects that some of these places—as, for example, the Parc de Monceaux—were converted for a time into huge burial-places, and that now they are fresh and green with early-sown grass, it does argue a good deal for the love of beauty that certainly marks the French as a people. Again, I think that all who have visited Paris, and who hope to do so again, will rejoice to know that the trees which gave such a peculiar charm to the boulevards remain untouched, and do not seem to have suffered at all by the disasters of the war when fuel was so scarce; and the deliberately-planned and solidly-executed barricades of the Commune despised the use of such frail materials, employed so often in former revolutions.

It is the same with that wonderful promenade the Champs Elysées, so unlike anything anywhere else. The trees remain as before, the cafés chantants, the concerts, the merry-go-round, the marionnettes are all there as before, and but few of the trees are injured. But withal this you at once see that there is a change; you miss the beautiful beds of flowering and foliage plants, the subtropical gems that used to adorn the Parc de Monceaux and other places, and find that annuals, Petunias, and plants which can be easily raised from seed have been obliged to take their place. The scarcity of fuel and the fire of the batteries had almost destroyed La Muette, whence the gardens of Paris received their supplies, and as the Versailles troops only entered Paris on the 18th of May, before which time nothing had been done, the change which has been made is marvellous. A friend of mine told me that when he entered Paris after the Commune there was not a blade of grass to be seen in the Parc de Monceaux. It is the same with other and smaller places. As to the Jardin d'Acclimatation and the Jardin des Plantes, the former is literally a desert, and the latter filled with tents and soldiers, so that a passage through them is impracticable. The greenhouses, too, are nearly empty. M. Decaisne, the able and accomplished Director, has appealed for help to rehabilitate his houses, and I doubt not his appeal will meet with a ready response. The garden of the Luxembourg seemed to have fared the best, and was the gayest I saw, but this was dependant on its own resources, and although the losses were great, yet a goodly number of plants must have been preserved to enable M. Rivière to make the display he did.

It speaks well for the recuperative powers of France that the Paris markets seem to be supplied as heretofore. All who are interested in seeing what the Parisians aim at in fruit and vegetables must go the Halles Centrales, and there I find no lack of either. There were plenty of the rich luscious Peaches of Montreuil selling at 2*d.* and 3*d.* each, smaller ones at 1*d*, ripe Chasselas Grapes at 60 centimes per pound; while the bouquet-makers were as busy as ever, chatting over their work, and looking as merry as if they had never had two sieges to go through. It was the same in the flower market at the Madeleine and on the Quais. There was an abundant supply of plants all neatly arranged in their clean white paper envelopes, and apparently abundance of purchasers, while the well-known establishments of Filleul, Bourjon, Prévost, &c., had, as usual, their dainty-looking bouquets and bright and brilliant-looking plants in their windows.

I have thus given one side of the medal; alas! there is an obverse, and of this I shall write when I come to describe "outside Paris." There are scenes of desolation that make the heart sick to look at when one contemplates the destruction, and thinks of the awful histories connected with these ruins. But more of this anon.—D., *Deal*.

THE PHLOX AND ITS CULTURE.

This is certainly the most beautiful of hardy autumn flowers; it is easily cultivated, and a succession of flowers can be obtained from it in the latter part of summer and throughout the autumn. It is extremely valuable for planting in mixed borders, and for the flower garden; also for growing in pots for the decoration of the greenhouse and conservatory. Although the Phlox is worthy of cultivation

in any garden, it is just the flower for the cottager or the owner of a small garden, as it yields its flowers in rich and luxuriant profusion without the aid of glass houses, frames, or coddling of any sort.

There are two sections of the Phlox, divided into early and late-flowering. The early-flowering section (suffruticosa) contains some very beautiful varieties, but they are wanting in the rich orange-red, crimson, and purple shades of the late varieties. I find they do not thrive in the neighbourhood of London so well as the late sorts. It seems to me that they require a cool and moist atmosphere, as in Scotland the early varieties are preferred, and most of the new varieties are raised there. In the south of England it is best to grow the Decussata, or late-flowering section, although it is as well to have a few of the others in order to prolong the season of flowering. They require the same treatment, and both sections will well repay the amount of care required to keep them in good order. The culture is very simple, but their wants must be attended to at the proper time, otherwise success will not be attained.

I shall begin with established plants, such as may be obtained from the nurseries. A plant in a small pot which has been struck in the spring, and sent out in the autumn, will throw up from the base of the stem a number of shoots. When these have grown 3 or 4 inches in length all except three should be taken off to make cuttings. Some light sandy mould should be prepared, and one cutting inserted in the centre of a 3-inch pot; they strike root freely, especially if the pots can be plunged in a gentle bottom heat in a dung frame. When the cuttings are rooted, the plants should be removed to a cold frame, and gradually inured to the cold; for although the plant is quite hardy, it dislikes sudden changes of temperature. Some of the plants should be reserved for pot-culture, and others for planting-out.

The plants intended for pot culture should, as soon as the pots are well filled with roots, be repotted in 6-inch pots, shifting them afterwards into 8-inch pots, in which they should be allowed to flower. This size I find to be the best for flowering strong, early, spring-struck cuttings, and noble spikes of flowers are obtained in this way, when the plants receive careful attention. If the plants intended to be grown and flowered in pots are from cuttings struck in the previous season, three shoots may be allowed from each plant, and they should be flowered in 10-inch pots. The best compost to use is three parts sandy loam, one part leaf mould, and one part rotted manure. During the growing period the pots should be plunged in cocoa-nut fibre refuse, in the full blaze of the sun, but sheltered from cutting winds, and be abundantly supplied with water both at the roots and overhead. Occasional waterings with weak manure water will be beneficial. At an early stage of their growth sticks should be put in; these should stand 2 feet out of the ground and be rather stout, as a well-grown spike offers considerable resistance to the wind.

For culture in the open ground, the Phlox should be planted in beds if the finest possible spikes be desired. A few plants in a mixed border are a pleasing feature, and contrast well with Delphiniums and other herbaceous plants, but it is not easy to pay proper attention to them in such a position. Four rows should be planted in each bed, with an alley between wide enough to allow a man to pass along with a watering-pot without damaging the spikes. If one spike only is allowed to each plant, 16 inches apart in the beds will be sufficient; if three spikes, 24 inches should be allowed. Early in March is the best time to plant them, and the ground should be deeply trenched and highly manured. The plants will also require copious supplies of water during the growing season, and the beds should also be mulched with short manure to prevent evaporation.

The Phlox is not so well adapted for exhibition as the Hollyhock and Gladiolus, as the flowers are apt to fade before night, although when due precautions are taken I have seen them stand pretty well. The best way to stage the cut spikes for exhibition is to fill a small pot with sand, in the centre insert a small tube full of water, in this tube place the cut end of the spike, and surface over neatly with green moss. A pot is required for each spike.

Grown and flowered in pots Phloxes are a grand feature at the autumn exhibitions. A serious drawback to exhibiting them in this way is the expense attendant on moving them to long distances, so that to give all a chance it would be as well to show them in both ways. I will add a list of the best varieties in each section.

Early-flowering.—Duchess of Sutherland, Elvina, James Mitchell, James Neilson, John Watson, Miss Ainslie, Mrs. Murray, Mrs. Thorn, Mrs. Austin, Mrs. Hunter, Pladda, Robert Hannay, The Queen, William Linton, Waverley, William Blair, The Deacon, and W. W. Platt.

Late-flowering.—A. F. Barron, Amabilis, Aurantiaca superbs, Aurore Boréale, Comtesse de Chambord, Liervallii, Madame Barillet, Madame Guillotteaux, Madame La Comtesse de Fernandons, Madame Billy, Madame Domage, Mdlle. Hermine de Turenne, Mdlle. Marguerite de Turenne, Miss Macrae, Mons. Joseph Heim, Mdlle. Muret de Bort, Mons. W. Bull, Mons. Malet, Mons. Veitch, Madame Delamare, Mons. Marin Saison, Mons. Guillotteaux, Mrs. Laing, Princess Louise, Queen Victoria, Souvenir des Fernes, Triomphe du Parc de Neuilly, and Venus.—J. Douglas.

GRAFTED VINES IN AN IRON-STOVE-HEATED HOUSE.

Where the aid of hot-water pipes or flues is dispensed with, few seasons have been so unfavourable for the production of fine Vines and Grapes as the present; yet I am happy to state that my Vines and Grapes are finer than ever. During the cold sunless days the iron stove has done duty in place of sun heat. I must here remark to brother amateurs who may use a stove inside, that the draught should be perfectly good in rough and windy weather, otherwise, should any smoke or sulphur escape into the house it will damage the foliage, or possibly destroy it in a short space of time.

It must be remembered I have no costly border—simply the garden soil trenched about 2 feet deep, the top and bottom being well mixed together, adding a small quantity of bone dust and broken bones saved from time to time from kitchen scraps. Where the Vines are now growing there existed a plantation of Gooseberry trees for between seventeen and nineteen years. I send for your inspection some of the leaves, and I ask if they are not highly satisfactory in substance and size. I may add that the eyes for next year's fruiting project from the canes like nuts. A shoot of the black Lady Downe's is also sent. Of this I have several shoots showing fruit at two separate joints, the produce of green canes of this year's growth, the result of stopping.

Last year I wrote the Royal Ascot did not with me perform as stated in giving fruit from the green wood of the current year's growth; this, I now find, was owing to the Vines I had sent me being overstrained in forcing them to obtain a stock in the least possible time, and consequently the vigour and constitution of such plants was for a time destroyed. I have it this season fruiting nicely in No. 4 pots upon canes grown last year out of doors. Some of the canes cut down to the soil of the pot this spring are doing well, and I hope to ripen the fruit upon them in January next. I advise amateurs to adopt this Vine for pots. By forcing some early in the spring, keeping some back, and a third lot to fruit from the green wood, a good succession of Grapes may be had from one glass structure without much cost or trouble.

In growing the Vines to fruit from the green canes I subject them to the highest possible culture, using a soil very far richer than that employed to produce my pot Vines in general. Imagine the green canes of the Royal Ascot for this treatment to be gross-feeding softwooded plants, I treat them to old decayed night soil and light loam having a portion of lime in it. Poultry dung and bone dust I also find useful. Every third or fourth watering may be with manure water made from night soil, poultry, or sheep dung; old hotbed manure may also be used, and as a change guano water, for all plants thrive better with a change of food.

I also send a leaf of one of the American Vines. Is it not handsome in foliage? This Vine gives eatable or wine-making Grapes which will ripen out of doors in the early frosts of winter. The Grapes make a good preserve. The Vine is a rapid grower. When planted against a wall, fence, arbour, trelliswork, &c., it is very handsome. It is a singular fact that if well watered it thrives as well in sand as in common garden soil. I have two sorts of this Vine, the other having a plainer leaf and more robust; in fact the two together, with some other American Vines, are not yet in full vigour, as I only received the small cuttings last May, and then after they had been collected from various places, and had travelled in a tin case over four thousand miles to Sheffield.

In this cold sunless time (at all events in this locality), the use of fire heat usually helps to produce red spider. I have been so fortunate as to escape its visits. The following is my practice.

As soon as the Vines have broken, and until the leaves turn yellow, in a span house 40 feet by 20, and 12 feet to the ridge, I place near the centre an earthen glazed vessel holding about four or five gallons; in this I put about one gallon of night soil, and fill up three-quarters of the way with stale urine, the staler the better—slops as brought from the bedrooms will do. The whole is stirred up for a few minutes every afternoon when the house is closed. This not only prevents the spider, but adds greatly to the well-doing of the Vines; indeed it would be useful to plants in general. In the daytime upon entering the house nothing could be detected.—R. M. W., *Fir View, Walkley, Sheffield.*

P.S.—I send for your inspection some shoots of Vines showing miniature bunches of fruit. I must tell you the Vines they have been taken from have been stopped three and four times during the season; at each break they have produced shoots like that which I send. The Vines are loaded with fine Grapes. Canes from 2½ and 2⅞ inches in girth, and upwards of 20 feet long, this season's produce, will be the bearing rods next year. The leaves, I think, speak for themselves.—[They were large and most healthy.—Eds.]

I think it possible that black Lady Downe's and West's St. Peter's might have produced a second crop of bunches—*i.e.*, one lot of Grapes on last year's cane, and another lot of smaller bunches on the green wood of this year, if the breaks of the first stopping had been cherished, but I do not like to overtask a willing horse.

PLUMBAGO CAPENSIS CULTURE.

Occasionally one meets with an old favourite plant grown according to the requirements of the present time—that is, in a small, easily portable form, and yet decorative in the highest degree, so that one is induced to ask, Why let such a plant fall into the background, where it is forsaken and forgotten by most cultivators? I do not scruple to say, much as it is necessary for gardeners to keep pace with the times, and grow only those newly-introduced subjects which are suddenly and many times too highly extolled, and which, perhaps, fall into disuse as suddenly as they came in, through being worthless—that it is a mistake, and a very incredible one too, not to grow the above-named plant, and other old ones, in preference to many new introductions, which are said to, but do not, possess sufficient merit. I do not despise all newly-introduced plants, for the work of collecting and raising such is so progressive that it should be practised and encouraged; but those who possess the power of selection generally grow some of the most beautiful of our old plants.

When paying a visit to Chiswick two or three weeks ago, I had the pleasure to congratulate the superintendent, Mr. Barron, on his success in flowering the Plumbago capensis so abundantly in 32-sized pots. I think none of the plants exceeded 18 inches in height; they were as much or more than that in diameter, and with as many trusses of their lively blue blossom; they were perfect pictures, and admired by all present. I heard a gentleman ask another, What newly-introduced plant was there of that colour which could even approach these in decorative qualities? I for one came away with the intention of trying my hand at growing plants of this Plumbago in a similar way, and I hope others will do the same. It is easy enough to grow the plant, but flowering it is more difficult, and it requires some judgment to do so and at the same time have the plant in a compact form. Larger plants are equally desirable when there is room to grow them, and cannot fail to excite admiration. I think about three years ago at this season, when paying a visit to the gardens at Egerton House, then managed by my friend, Mr. E. Luckhurst, I saw in the greenhouse a large plant which to the best of my recollection was nearly 4 feet through, and not more than 3 feet high, well grown, and abundantly flowered, and I think I never saw a more beautiful plant. Now, as we are not in the habit of meeting with this plant in such a presentable and useful form as Mr. Barron and Mr. Luckhurst had it, perhaps they will be kind enough to favour the readers of this Journal with the mode of treatment they adopt to grow the Plumbago so successfully, and not one of them will be more thankful than—Thomas Record.

English Grapes.—Our own country is noted for producing some of the finest Grapes in the world, and the fame of the giant Vines at Hampton Court and Cumberland Lodge, Windsor, is great. On one occasion George III. was so pleased with a performance at Drury Lane Theatre that he gave orders for a hundred dozen bunches of Grapes to be cut off from the Hampton Court Vine, if so many could be found upon it, and sent to the actors. The gardener executed his commission, and informed his royal master that he could still cut off as many more without stripping the tree.—(*Food Journal.*)

TEA ROSES.

I can confirm all the good things said by "Stiff-soil" of Tea Roses. The following have been almost continuously covered with bloom, and perfectly healthy out of doors with me, from the middle of June to the present time:—Monsieur Furtado, Madame Margottin, Souvenir d'un Ami, Safrano, Madame Willermoz, Alba roses, Adrienne Christophle, Monplaisir, Vicomtesse de Cazes, and Canary. The first is the most vigorous grower, but not the most satisfactory bloomer; it has proved a bad opener with me. Nothing can be more satisfactory than the graceful habit of Safrano and Vicomtesse de Cazes. They have sent up rich-looking shoots from 12 to 18 inches high, and these formed heads of bloom with from eight to twelve sound Roses delicately drooping in a circle around these stems. Supported against a trellis in a south border they get the warmth and circulation of air, which, as Mr. Paul points out, they certainly need.

I should be glad if some one would give a list of twelve other Tea Roses, which from experience have been found suitable for out-door culture, to contain as many rose-coloured and kindred tints as possible, as my present little stock furnishes sufficient of the yellow and white class. Adrienne Christophle, however, one can hardly have too much of; it is difficult to define its colour—apricot, copper rose, peach, salmon all subtly mix with peculiar beauty, and it ought never to be left out of a group. What a tantalising picture Mr. Paul has drawn of in-door culture!—Cornubia.

AGRICULTURE—PAST AND PRESENT.

Mr. Cuthbert W. Johnson, in the *Mark Lane Express*, gives the following comparative view of the state of farming in England in the year 1870 and of five centuries previously:—In the fourteenth century (to give only one or two instances) the average produce of Wheat per acre in England could not have been more than ten or twelve bushels. In his history of the Suffolk parish of Hawstead, Sir John Cullum has given the report of its manor farm in the year 1387, from which we learn that the yield of grain from

66	acres of Wheat was then	69	qrs. 2 bushels.
26	,, Barley ,,	52	qrs. 2 bushels.
62	,, Oats ,,	40	qrs. 4 bushels.
25	,, Peas ,,	25	qrs. 3 bushels.

The farm of Hawstead contained 572 acres; of these 321 were in tillage, 30 were meadow, and the remainder wood and pasture. The live stock consisted of twenty-six cows and a bull, six heifers and six calves, ten working oxen, four cart horses and six colts, ninety-two muttons, and six score of hoggerills, or two-year-old sheep. The cows were fed during the winter upon rack-meat, all the hay was devoted to their support. The other stock were kept alive upon the straw and haulm, or on the pastures. The result of this wretched feeding was the production of a very poor stock of farmyard manure. Roots were then unknown as winter food; to oilcake the same remark applies. As winter approached the farmer of those days began to kill off his live stock. At Martinmas he killed his oxen to supply him with his winter's beef. Tusser, who wrote more than two centuries after the time of the Hawstead report, says in his November husbandry:—

> "(For Easter) at Martinmas hang up a beef,
> For stall-fed and pease-fed play Pick-purse the thief;
> With that and the like, ere grass-fed come in,
> Thy folk shall look cheerly when othere look thin."

It may appear strange that at the period to which I am referring root crops were unknown, at least as a field crop, for, as I have on a recent occasion remarked, it is very natural for us to suppose that our root crops were always field crops, but, in fact, they were long cultivated in our gardens before they were grown by the agriculturist. It was not till about A.D. 1500 that even gardening was introduced into England—when Catherine of Arragon required a salad we find that it was supplied from Holland; Cabbages came to us in 1510, Hops in 1524, Potatoes in 1563. Turnips were grown only in gardens till about the year 1669. In that year Worlidge, in his "Mystery of Hus-

bandry," observed, "Although Turnips be usually nourished in gardens, and be properly garden plants, yet are they, to the very great advantage of the husbandman, sown in his fields in several foreign places." In 1684 this root is first mentioned by Houghton as food for sheep. The Carrot is indigenous in our island, but its cultivation was long confined to our gardens. The same remark applies to the Beet. Worlidge describes it in his "Garden Tillage." The Mangold was first advocated as food for stock by Dr. Lettsom in the early years of the present century, and by General Beatson in 1811. It had been, however, tried in Lancashire successfully in 1790, and in Norfolk about 1797. We may then well feel interested in the researches of the horticulturist and the botanist in search of new plants, denizens of perhaps far distant climes. When, indeed, we remember that the Potato came to us from the New World, the Mangold from an equatorial climate, the Swede from far colder lands than our own, we may yet feel hopeful that other valuable plants will yet reward the discoverer—plants of which future agriculturists will reap abundant harvests.

THE POTATO.

It is popularly believed that we are indebted to Sir Walter Raleigh for this most important of esculent vegetable foods, the cultivation of which extends over a wider area than any other food plant; indeed, so universally is it diffused over the habitable globe, that it is found in almost every position where man can subsist; even in the Arctic regions it struggles for existence, producing stunted watery tubers in an imperfect state of development, whilst it flourishes in tropical as well as temperate climates, so easily does it adapt itself to circumstances. It ranks among the most useful of vegetable productions; it is highly prolific, and its value, which is incalculable, is hardly understood to its fullest extent.

The whole family of the Solanaceæ is suspicious—great numbers are narcotic, and many of them poisonous; though in the case of Solanum nigrum (one of the Potato family), the young and tender shoots, when cooked, are used as a vegetable in some countries. It is curious to note that the poisonous Bittersweet, the Tobacco plant, the Tomato, the Cape Gooseberry, the Capsicum, the deadly Nightshade, and the Henbane, the Thorn Apple, Mandrake, and Petunia, all belong to the same genus as the Potato; which most excellent vegetable was at first regarded with the eye of indifference by our forefathers, until it was imported by Sir Walter Raleigh in the seventeenth century, who endeavoured to attract public attention to it, and cultivated it himself on his estate in Ireland. So, although not actually the first to introduce it, he was, nevertheless, the means of first bringing it into public notice. He could not, of course, have been acquainted with one-half of its useful properties, and little did he dream that in after years it would radically revolutionise the diet of the country where it was first cultivated. It was known by the Indian name of the Sweet Potato, "Batatas," and under this name it continued to be spoken of and written about for some time after its introduction. We read that it was supposed that it would be found useful for feeding "swine and other cattle." The scientific analysis of the Potato is not within the province of this paper, and it will be sufficient to say that it is rich in starch, that it does not contain as much gluten as our cereals, and that it is wanting in nitrogenous matter. It is, however, more nutritious than any other of our succulent vegetables. To derive the necessary nourishment from a diet almost exclusively consisting of Potatoes, the stomach requires a considerable bulk of this kind of food; and it has been noticed that the Hindoo who lives on rice, the Negro who lives on plantain, and the Irishman who lives on Potatoes, are all, more or less, "pot-bellied," the Irishman, however, not so much so as the others; and this circumstance is attributable to their diet, which does not contain a sufficient proportion of gluten, and so necessitates the consumption of a large quantity of the food; for Potatoes are not nearly so nutritious as Wheat, and the constant employment of them as a chief article of diet is not favourable to the development of the physical powers; neither does it tend to enlarge the mental faculties. In fact, Professor Muelder, a celebrated Dutch chemist, has said, that "the Potato is the cause of the physical and moral degeneration of those nations who use it." Potatoes have been said to possess the advantage of solidity, like bread, and to have the healthful properties of many fresh vegetables, without their acidity. As an article of diet, when not used exclusively, they are of untold value; so universal has the use of them become, that they are almost an essential dish at dinner, for who ever thinks of dining without Potatoes? We have said that the Potato is wanting in mineral substances, and it is curious to note how, in Ireland, this deficiency is supplied by the water, which is almost universally strongly impregnated with mineral matter.

The use of Potatoes is a preventive against scurvy, if not an actual cure for it. Potatoes that have been exposed to the air, and have become green, are unwholesome; and new Potatoes—*i.e.*, unripe ones, have much to do with the prevalence of cholera and such like diseases during the summer months.

Humboldt has calculated that the quantity of ground which will grow 30 lbs. of Wheat will produce 1000 lbs. of Potatoes. In Ireland an adult will consume 10½ lbs. in one day. Potatoes are narcotic, and the water in which they are boiled is unwholesome, if not deleterious; but the process of boiling would seem to free them from all that is narcotic or noxious in their juices, imparting these objectionable properties to the water. As a staple article of food, the Potato has been the means of preventing famine; though, on the other hand, the lower classes of Ireland, being almost entirely dependant on this vegetable for subsistence, have experienced some years of misery in consequence of a universal failure in the Potato crops.

The varieties of the Potato that are cultivated are numerous; new ones are continually appearing; and the best sorts that are now sold in our markets are doubtless very superior in size and quality (the effect of judicious cultivation) to the tubers which Sir Walter Raleigh first introduced to notice.

The soil in which it is grown will be found to have considerable effect in determining the quality of the Potato; and almost every district has its peculiar varieties, their names being quite arbitrary or local. Most kinds are vastly improved by removal to a different locality; hence growers rarely use for many years in succession their own tubers for seed, but continually renew the stock by purchases from another district. One tuber will produce as many separate plants as it has eyes, but a piece of the Potato must be planted with each eye or shoot. The many varieties differ in form, size, colour, and in their time of ripening; some are more prolific than others, some are naturally waxy and watery, and some are mealy, which is an unfailing characteristic of the best varieties. A mealy Potato is more digestible and more wholesome than a waxy or watery one. Various methods of cultivation are pursued with more or less success in different localities. In France, the culture of the Potato to a great extent is mainly due to the exertions of Parmentier.

We will only allude to the Potato disease which some years ago attracted so much notice. Many persons do not know what it is, and it would be sufficient to say that it is the effect of a mould, or species of fungus, "whose spawn attacks the tissues of the plant in every direction, being present in the tubers and stems as well as in the leaves." The growth of this fungus is encouraged or retarded according as the season is favourable or unfavourable to its development. Since the ravages of this disease have become universally apparent, the rapidly increasing cultivation of the Potato has received a slight check. Potatoes are more important than any other vegetable as a variety of human food, and on the score of their economy are advantageously used in large quantities by the working classes, though their nutritive value is not great. They are, however, easily cultivated, easily kept, easily cooked, and easily digested; but, being wanting in fat and nitrogenous matter, they require to be eaten in conjunction with those kinds of food which will supply the deficiency; hence they are generally eaten with meat, or with milk as in Ireland, or with curds as abroad.—(*Food Journal.*)

CITRON GOURD FOR PRESERVING.

Nearly half a century ago I met on the shores of Asia an itinerant Persian, and, being then a student of his language, detained him some time in conversation. Our discourse was prolonged by the singular fact that he was a fellow townsman of the only Persian I had ever known. Talk being over, I asked him what he had to sell, and he opened his box, which contained sweetmeats. Among others was a dry preserve made of Gourd. It was simply luscious, without any particular flavour, but of a White Marseilles Fig one can say no more.

On returning to Europe in after years the remembrance of the Persian and his preserve induced me to try my hand with Vegetable Marrow and Ohio Squash, but without success. Having, however, seen an account of the Citron Gourd, it struck

me that this might be what I was seeking for, and accordingly I sowed some seeds in heat this spring. One came up, and on this one fruit set. It was gathered September 4th, and weighed about 3 lbs. Externally it was green, prettily marked with a snake-like pattern. Altogether it is a remarkable plant both in foliage and in fruit. Botanically it is the yellow hard-fleshed variety of the Cucumis Citrullus, called in French Pastéque, and very different from the other variety, which is the common Water Melon. Uncooked it is tasteless, cooked it is the same; but it boils beautifully clear and of a good consistence, ready to receive any flavour which you may wish to communicate. I followed Henderson's receipt and added lemon. The result is a very delicate lemon marmalade.

Henderson recommends the plant to be treated as a ridge Cucumber. I doubt whether under this treatment the fruit would ripen, but it may make an apple-green preserve such as he describes. However, the seasoning is all-in-all, and I have seen Carrots sliced thin and treated with lemon and sugar in the same way eaten with great applause; but no doubt "Citron Gourd" sounds more enticing than "Carrot."—G. S.

GREENHOUSE PLANTS.—No. 6.

PLANTS SUITABLE FOR WALLS.

It is desirable that the wall should be wired either horizontally with the wires not more than 6 inches apart, or with trellis wirework, in lozenges of not more than 6 inches on the side. The wirework is best fixed so as to be from one-half to three-quarters of an inch from the wall, and may either be galvanised or annealed wire painted. I prefer the latter. The walls should have east, west, or south aspects, and be but partially shaded. The borders ought to be prepared for planting, and be not less than 18 inches wide, nor need they exceed 3 feet in depth, 2 feet for compost, and besides that there should be from 9 inches to a foot of drainage, which should be good, and there must be an efficient outlet.

Camellias are, perhaps, the finest of all plants for a back wall—the foliage is so magnificent, and the flowers yield to no other of their season. Where Camellias are much in demand as cut flowers, the back wall of a lofty house is a good place for plants required to furnish them. Probably most, if not all, are suitable for covering walls, but it is well to choose those which have large foliage and are of free growth, and of that description are—

Monarch, bright scarlet, fine large flower, and splendid foliage.
Conspicua, bright scarlet, but only semi-double, nevertheless very fine.
Leeana superba (Beallii), bright crimson.
Mathotiana, bright crimson; large.
Leopold I., crimson; large.
Rubens, deep rose; large and fine.
Valtevaredo, rose; fine.
Reticulata flore-pleno, bright rose; large.
Mathotiana alba, white; large.
Mrs. Cope, white, striped crimson; large.
Duke of Lancaster, deep rose; large.
Giardino Franchetti, rose, slightly marbled; large.
Countess of Derby, with large white flowers distinctly marked.
Giovanni Santarelli, red, with large white blotch; large flower.

The border should be well drained, and the compost may consist of the top inch of moorland taken off with its short grass, and from high ground, where the soil is sandy. This kind of soil is in general half peat, half loam, and full of fine particles of sand. When this kind of soil cannot be had, then take off the top inch of a pasture where the soil is a good rich sandy loam. I chop up either kind of soil into pieces 1½ or 2 inches square, and if the latter kind be used add one-third sandy fibrous peat, and a like proportion of charcoal in pieces from the size of a pea to that of a hazel nut. No sand need be used if the soil contain enough of it, otherwise add one-sixth of silver sand. Cover the drsinage with a layer of turf, and then put in the compost, treading it firmly, and taking care to have it so dry that it will not clog.

The plants may be planted out at any season, but I consider the end of March best, turning them out with the ball entire, but loosening the sides of the ball with the end of a label or pointed piece of wood. The plants should be planted rather high, making quite a cone beneath them, for it must be borne in mind that the compost will sink considerably, and with it the plants, so that if planted level at first the collar of the plant is ultimately low, whereas it should always be raised somewhat above the general level. Water gently for a time, keeping the soil no more than moist, but taking care to keep the ball moistened through, and when the roots are pushing freely in the fresh soil, as may be known by the soil drying then water copiously, and that throughout the growing season. When the growth ceases, and the buds begin to form, still let the watering be liberal; and the buds being set and the wood firm, then water only as required to keep the soil moist, allowing it first to show symptoms of dryness before giving any water, then afford a good supply.

When the plants are growing they are much benefited by a sprinkling overhead with water morning and evening, but it need not be given at any other time; and if they are exposed to the direct rays of the sun, the morning syringing should be omitted, otherwise the sun falling upon their leaves whilst wet will cause them to spot.

The border should be top-dressed in March, and again in June, with the compost above named, placed in a heap for three months, in alternate layers of equal thicknesses of turf and cow dung, or better, sheeps' droppings. Previous to use it should be chopped up moderately small, and laid on 1 to 2 inches thick according to the settling of the border, and when that has settled as much as it will do, remove the surface soil down to the roots, and top-dress with the compost an inch thick.

In the matter of pruning none will be required for some years, but train the shoots from 4 to 6 inches apart. When they become too crowded in any part thin them out in spring before growth begins. Any irregular growths may be cut back at the same time to insure greater regularity of habit. On a 12-feet wall the trees should be 4 feet apart, 6 feet apart for a 9-feet wall, and 9 feet apart for a wall of 6 feet.

Oranges.—Next to the Camellia for covering a back wall are plants of the Citrus family. The flowers have so fine a scent, and are besides of such a pure white as to be much in request for bouquets, especially those for bridal occasions. The foliage, too, is beautiful, as well as the fruit.

The border should be prepared for the Orange tribe in the same manner as described for Camellias, but the compost ought to consist of the top 1½ inch of a pasture where the soil is a rich sandy loam; to two parts of this add one part of fresh horse droppings, one part cocoa-nut refuse, or failing that leaf soil, and one part each of lump charcoal and river sand. This, with good drainage, will grow them well. It should be used fresh, chopped up rather roughly, and put in firmly, having it in a nice condition as regards dryness, so that it may not adhere to the feet. The plants or trees should be turned out with the ball entire, only scratching the sides of the ball with a pointed piece of wood so as to loosen the roots. The distances should be the same as stated for Camellias. Plant high, for the Orange, like the Camellia, will not thrive when the collar is low, and the stem in time becomes buried. The best time to plant is probably September, but any time from then up to March will answer well. The watering must be moderate, no water being given so long as the soil is moist; indeed, too much watering is very injurious to Orange trees, not that they do not require plentiful supplies, but these should only be given when the soil becomes dry, then give a thorough watering. This treatment is required by the Orange in all stages of its growth. The soil should be top-dressed in spring, removing the surface after the plants are in possession of the border, but this will not be required for some time; therefore, add about an inch of fresh compost every spring, and remove the surface soil to the depth of about half an inch, not in any case going deeper than is advisable to keep clear of the roots. The top-dressing may consist of equal parts of fibrous loam and sheeps' droppings, or, failing these, horse droppings. The top-dressing may be repeated in June, and if the trees are carrying fruit, in September.

From the middle of February the trees should be syringed in the morning up to April, and after that, morning and evening throughout the summer until September, and from then to November once a-day in the morning, but this syringing in spring and autumn must only be practised in fine weather.

The pruning required should be done in February, and should be limited to thinning-out the wood where too thick, cutting out that which is old and weak. Nothing is gained by crowding the shoo

The Orange tree succeeds in what may be termed a warm greenhouse; indeed the temperature, if the fruit is to have any degree of perfection, must be ripened in a temperature of 50° to 55°. Orange trees, however, succeed well in a temperature of from 40° to 45° in winter by fire heat. They are impatient of the direct rays of the sun, and succeed admirably in a house

partially shaded by climbers. In most cases it is advisable to keep them rather dry in winter, especially if they are subjected to a low temperature. Throughout the summer liquid manure may be afforded every week, giving a good soaking of one peck of sheeps' droppings and a peck of soot to thirty gallons of water.

To keep down the black fungus, which forms so plentifully on the leaves, wash with a sponge and a solution of 2 ozs. of soft soap to a gallon of water; but it should be borne in mind that this fungus is only a result of the scale (Coccus), and if the trees are kept clear of that there will be no fungus on the foliage. The scale may be destroyed by a solution of 4 ozs. of soft soap to the gallon of water, applied as hot as the hand can bear with a sponge or brush. About twenty drops of spirits of turpentine may be added to every gallon.

The most suitable of this family are the Orange (Citrus Aurantium), and of it there are several varieties, and of them the Mandarin (Citrus nobilis) is good, and of free growth. The Lemon (Citrus Limonum acida) is also free in growth, and very suitable, and so is the Shaddock (Citrus decumana), or Forbidden Fruit, the fruit being very large and having a noble appearance. Although sometimes called Forbidden Fruit, the one bearing that name properly is Citrus paradisi, or Paradise Orange.

Luculia gratissima.—This plant has magnificent foliage when in good condition, which it rarely is, and the flowers are rosy lilac, produced in the autumn, winter, and spring months. In a pot it is probably the most miserable of all subjects cultivated in a greenhouse, but planted out in a conservatory border, and trained against a back wall, it is one of the finest and sweetest of the flowers afforded by the greenhouse in the dull period of the year.

The border should be prepared as described for Camellias, and the soil most suitable is turfy loam, with no more than about an inch of soil taken off where the ground is sandy, chopped up roughly. To two parts of this loam add one part of sandy peat chopped up roughly, and half a part of old cow dung, lump charcoal, and pieces of grit not larger than an egg nor less than a walnut. If the loam and peat are deficient in sand, add silver sand in the proportion of one-sixth of the whole. The compost should be well mixed and put together rather firmly. Plant out at any time, but March I think is the best. The sides of the ball should be loosened with a stick, otherwise the ball should be entire. Water gently, so as to settle the soil about the ball, and do not water again until the soil become dry, and then give a thorough supply. When growing it requires very copious supplies of water, but if the watering be regular—given whether it be required or not, the soil becomes so sodden that the leaves assume a dingy appearance and fall, the growth coming to a standstill. On the other hand, if no water be given until the soil becomes dry the plant grows luxuriantly. It is well to let the leaves slightly flag rather than water too soon. This treatment, as regards watering, is required throughout the year. The Luculia also prefers partial shade, and does well with syringing twice a-day; it is liable to attacks of thrips and green fly, which the syringing tends to keep down.

The pruning for some time will need to be confined to stopping the shoots, but, as the plant flowers at the points of the shoots, stopping should be resorted to as little as possible, and if the shoots have been started low enough it will hardly be necessary, as, after flowering, two or more shoots start from the end of each shoot of last year. When the plant has covered the trellis the pruning should be done in March, or before growth commences, and the plant may be cut-in rather closely, removing the old wood, and encouraging young wood, especially from the base of the plant.

Habrothamnus elegans, *H. aurantiacus*, and *H. fasciculatus* are also fine plants for a back wall, but require a position less shaded than either Camellias or the Luculia. The treatment of the Habrothamnuses has already been given at page 65 of the present volume.

Heliotropiums are so useful for cutting, and succeed so well against a greenhouse back wall not very much shaded, that they merit a place. The best kinds are Monsieur Hamaitre, a large purple variety, one of the best for winter flowering; Voltaireanum, a fine dark purple; and Miss Nightingale. It is well to plant them out, for I confess that with me in pots they do no good. The border should be well drained, and be composed of light turfy loam two parts, one part sandy peat, and one part leaf soil, with a free admixture of sharp sand. If the loam be poor, one-fourth of cow dung or well-rotted manure may be added advantageously, and, to keep the compost open, a sixth part of lump charcoal. The compost should be used rather rough, and be put in rather firmly.

Plant in March, and water as often as the soil becomes dry, but not till then, giving good supplies. In winter, or from November to March, keep dry, but not so as to cause the wood to dry. In March cut in the plant hard, each shoot being shortened to within half an inch of its base, for it is presumed that the shoots are trained at 9 inches apart, so as to cover the trellis in every part with shoots. After pruning keep the plants dry for about a fortnight, then water moderately, and when growing freely water copiously. The shoots should be regulated as they grow, thinning out where they are too crowded, and encouraging them where they are too few in number by training-in young shoots. From July to late in autumn there will be an abundance of bloom. In the early stages of growth the shoots should be trained-in at 9 inches apart, and they must be stopped as required, so as to furnish the shoots where desired.

If the plants are intended to flower in winter shorten the shoots in July to about half their length, or to 3 or 4 inches, and the plant will put out fresh shoots and flower in autumn and winter, the watering being liberal.

At the time of pruning the surface soil should be removed down to the roots, and a top-dressing given of loam and well-rotted manure in equal parts, and it may be repeated in July.

The plants noticed are all that I have found succeed on the back wall of a greenhouse, and if the wall be very much shaded by plants in front, or climbers closely trained on the rafters, none of the plants named will thrive, though the position may answer for Ferns, none of these being finer than Lygodium scandens. It answers admirably for trellises in the most shaded part of the greenhouse, and walls and other positions not receiving any sun, making growths from the roots 20 feet long in a season, at least it has done so with me this season. It requires two parts peat and one part loam. For a shaded wall or north aspect Ficus repens is, perhaps, the best plant. It clings to the wall with the tenacity of Ivy, and covers it closely with bright green leaves, having a fine effect. With good light loam and free drainage it will grow well. The Ivies are also good for a wall of this description. The most desirable are the new silver, Hedera Helix rhomboidea variegata, H. Helix minor marmorata, marginata elegans, marginata Cullisii, marginata argentea, digitata, minor Donerailensis, lobata, and pulchella. They should have moderately rich soil, good drainage, and one-third of pieces of brick, sandstone, or old lime rubbish mixed with the soil.—G. Abbey.

BEDDING GERANIUMS.

The gorgeous brilliancy of colouring obtained in the flowers of the Pelargonium, combined with their remontant property, may justly be considered one of the greatest triumphs of modern floriculture. Like many other really good things, the triumph itself has brought in its train an excess of aspirants to share in the fame, not unaccompanied with unmixed good, nor without some abuse. The Pelargonium must and will retain its proper place in the estimation of florists, but more than that it ought not to have, especially when it leads to the exclusion or thrusting aside of many other beautiful productions, which has unhappily been too often the case. Unmistakable signs of a return to a better state of things become more manifest every year. We shall all rejoice when this shall have been effected.

Last year about this time, or a little earlier, I propagated about two hundred plants of a few varieties of bedding Pelargoniums in 6-inch pots, the most convenient form at hand. Being uncertain of giving them sufficient attention throughout the winter so as to keep them alive, a neighbouring gardener very kindly allowed them to be placed for a few months in a vacant corner of his vinery. The plants being well rooted, strong, and healthy when removed there about the end of October, my friend at my special request bestowed scarcely a moment of time over them, but only allowed them to live till I could remove them in the spring. They were brought home about the second week in April, and without being repotted or any other trouble taken with them, they were at once planted out in a few small beds which have been for some years past devoted to a similar purpose. They made but little progress at that early period, and after that little soon retrograded. By the first week in June they were apparently about the size of the cuttings when first inserted in the propagating-pots. Taking up two or three I found, however, that they had made fibrous roots, and I did not despair. With a change of weather for

the better, my Pelargoniums began to grow rapidly and completely covered the beds. During the last six or eight weeks they have produced a mass of colour so brilliant and uninterrupted as to attract notice from all who have seen them. I have not to record a single failure.

A few simple facts may thus be deduced from the foregoing statement. 1, The smallest possible amount of care has been bestowed upon them. 2, Early planting is favourable to development of bloom. 3, The stinted space allowed to each plant during its early life does not deteriorate its after-existence.

There were from twelve to fifteen Geraniums in a pot when planted out. The soil here is light, but poor, and at an elevation of about 430 feet above the sea level; the severity of spring frosts is thus much mitigated.

I have only now to state the varieties in the beds, which contain from twenty to thirty plants each. It will be seen that they are well-known kinds, and would be considered as "old sorts." Arranging them in the order of merit as regards abundance of bloom, they will stand thus.

First.—Stella, Amy Hogg, Indian Yellow, Glow-worm.

Second.—Cybister, Tom Thumb (or a dwarf variety from it), Mrs. W. Paul, Trentham Rose, Magenta.

Third (inferior and apparently unsuitable for bedding).—Madame Vaucher, Lord Palmerston, the former a delicate white, the latter remarkable for its large trusses.

The Rose season here has been abnormal; many choice and favourite kinds have failed to show their usual beauty. The number of deformed and imperfect flowers has been greatly in excess of any previous season in remembrance. Would some of our Rose friends kindly send their experience for the sake of comparing notes? I shall be happy to furnish my little quota. —A. H. Kent.

AMMONIA versus RED SPIDER AND MEALY BUG.

In one of Mr. Abbey's papers in a recent number of the Journal he records some valuable experience in keeping at bay that little insect, but great pest, the red spider. My own experience of impregnating the air with ammonia exactly coincides with Mr. Abbey's. It is in my opinion the most simple, safe, and effectual means which can be adopted for keeping the foliage in the vinery free of this insidious pest. In damping and closing the vineries in the afternoon I always use guano water. I employ no other preventives, as sulphur, &c., good though they may be, and while I never syringe the Vines at any time or under any circumstances, I feel quite certain a single red spider has not ventured under the roof and lived for the past half dozen years

Besides the ammonia being a natural and effectual antidote to spider life, it has another value, as being an element of food for the Vines, which seem to luxuriate in its presence and by its influence. In the vinery is an Arnott stove, almost the only means of heating, and the evaporating-pan contains a strong solution of guano, and the foliage above and around this stove is always the finest by the extra dose of ammonia provided. The leaves are not much larger, but are stouter and more robust, and show by their healthy aspect how much they enjoy their atmospheric food.

A much stronger volume of ammonia is necessary to kill mealy bug than is required for red spider, and it must be stronger still to kill thrips. I have tried this by placing infested plants on an inverted pot in the evaporating-pan, and noting results. There need be no fear of using guano in this way in the vinery in a liberal manner. I have many times mixed a pound in the evaporating-pan when the water was quite hot, and seen nothing but good result from it

The air of the house when it is so used is quite pungent, yet by no means disagreeably so. In an atmosphere of this kind I am satisfied that spider could not exist, and mealy bug and thrips would turn up their noses in disgust. I am careful not to use it nearly so strong when the Grapes are setting and for some time afterwards, although even at this time I never entirely withhold the use of guano. When stoning is effected I use it freely, and have never yet seen any injurious results or signs of such arise from it. I only regret that I cannot employ it so freely in the plant stove, or I believe I should have no mealy bug nor thrips to trouble me. Begonias, Caladiums, and free-growing plants of this kind relish ammonia highly, but some other things, notably Ferns, may easily be overdosed. I tried it in a house containing several Ferns, but finding they did not approve of it relinquished the practice. I am not so sanguine as to suppose that the mere removal of the Ferns for a single night, and giving the rest of the plants a strong dose of ammonia, would have been satisfactorily effective. I prefer a steady continued use of guano over a long period to keep the pests at bay. The removal of Ferns, too, in spring is in many places no easy matter, from the simple reason of having nowhere to remove them to. In such places it is the other plants which must be removed and separately picked and doctored.

All sorts of panaceas are now offered for mealy-bug extermination, and one would think, when we read of their wonderful efficacy, that it was a gardener's fault if he allowed such an insect to remain on the premises. All these preparations may be good in their way, but it is a question of watching, and picking, and catching, work and perseverance to eradicate the ubiquitous and tenacious nuisance. But it is well known that many gardeners really have not time to examine and turn up every leaf, and peer into the numerous axils, and pick out separately. To such, a rainy day is a true friend. I recollect calling one day on a sadly overworked gardener, a most able and estimable man. It was a dripping day in summer. All his infested stove plants were out of doors, and had been there for three days. Most of them, he told me, would have three days more, and there would be little bug left. The rain, or the air, or the rather cold nights caused the bug to quite disappear. Turning a plant out of doors for a week under such circumstances has certainly a wonderfully good effect in destroying the insect, and the plants receive little or no sensible injury in other ways by the change, providing they are under a watchful eye and properly tended. "Mealy bug cannot withstand water," Mr. Abbey says. A rainy day is proof of the correctness of his remark. No water is so effectual as the water from the clouds, and no syringe can equal the steady continued distribution of the showers, either in checking the mealy bug or in nourishing the plants.—J. W.

[In support of the statements relative to ammonia being a vanquisher of red spider, we recently were informed by A. A. Croll, Esq., Roehampton, that the ammoniacal liquor of the gas works placed in saucers where red spider occurs overcomes the pest. That liquor emits fumes of cyanate of ammonia, an effective poison.—Eds.]

WHAT IS A HARDY FERN?

At the summer show of the Preston Floral Society, a prize was given for twelve hardy Ferns. I competed for it, and I staged amongst the number—Onychium japonicum, Lastrea intermedia, Cyrtomium falcatum, Adiantum Capillus-Veneris, and Pteris scaberula. Imagine my surprise, when the judging was over and I obtained admission, to find my twelve disqualified, a card being affixed to my plant of Pteris scaberula, on which was written by Mr. Petch, the Judge, "not hardy." Now, I believe that my name as a most enthusiastic devotee to all Ferns is well known. I carried off first honours at Nottingham this year for twelve exotic Ferns, for twelve Adiantums, and I was second for six hardy exotic Ferns, among which was the identical pan of Pteris scaberula which fell into disgrace at Preston. If it was properly disqualified, Onychium japonicum, the Lastrea, and Cyrtomium should have shared the same fate. They were spared. I shall feel much obliged if you will admit these few lines into your Journal, and at the same time give your views on the subject. Mr. Petch's judging was from first to last really faultless. and it gave the greatest satisfaction to everybody, an occurrence by no means usual.—T. M. Shuttleworth.

[We believe Mr. Petch was right. Pteris scaberula is included among "stove and greenhouse Ferns" in all catalogues, and the good authority we relied upon when preparing our "Fern Manual," not only stated it to be a greenhouse Fern but added, "It should be grown near the glass in the greenhouse, but by no means exposed to cutting draughts of air." Have you ever succeeded in wintering it without protection? Any plant that will not usually endure our winters without protection in considerable portions of the British Islands, we do not consider entitled to be classed as hardy.—Eds.]

Cinchona Culture at Réunion, Bourbon.—A paper communicated to the Academy of Sciences, and recently published in the "Comptes Rendus," gives an account of the progress of Cinchona culture in the French colony of Réunion. The first seeds were introduced in the island in 1866, at the suggestion

of General Morin. They came, we believe, from Kew, but, through mismanagement, most of the young plants perished. Fresh supplies of seed were subsequently procured from Ceylon and Batavia, and a report, dated in January last, furnishes the annexed details:—At Salazie, at an elevation of 4000 feet above the sea, two plants of Cinchona officinalis, saved by Dr. Vinson out of the produce of the seeds sown in 1866, were thriving splendidly. They were four years and a half old, and 15 feet in height. Their perfect acclimatisation was attested by the fact that in January, 1871, they were covered with flowers for the first time. It was hoped that the flowers would become fertilised this season, and that it would be possible to save seed from them.—(*Food Journal.*)

THE HEATH AND THE FERN.

"There, how do you feel now?" said a purple Heath, growing on a sunny roadside among Furze and Bramble bushes, to a small Fern that had taken root under the shade of a thick old Elm tree. "A short time ago how you pitied me, because my days had to be spent working and growing out in the summer heat; pity yourself now. See how the soft warm rain is falling, and never a drop can reach you."

"All the air is full of moisture," replied the Fern; "I felt it coming long before you did. I could not live half my time exposed to the dry fever heat in which you seem to revel."

"You are not going to live long," replied the Heath, "if there is any truth in your looks. How grey, and dusty, and parched you are. Your withered fronds go crack, crack, as the wind passes through them; you are as dry as the soil you vainly endeavour to thrust your roots into, and see how the rain comes down not unmindful of the smallest blade of withered grass; it would reach you if it could; gently, timidly it comes like a too-long-absent friend, and there is a rumbling noise afar off, and bright lights come and go in the sky, not caused by sun or moon, yet you are as thirsty as ever. Your great friend the Elm gathers it all to himself, not a drop escapes through his wide-spreading greedy arms. Poor Fern! you are dying of thirst—dying within sight and sound of running water."

"My turn will come," answered the Fern in a feeble voice, which sounded as though it came from a long distance; "when the good Elm is satisfied, my few wants will be supplied."

"It has been raining for hours," said the Heath, with a great laugh, "and it may cease before he is satisfied, and there be nothing left for you but a few dirty leaf-droppings. If you had taken my advice you could have drunk your fill now; what a good time you would have had."

"It would have been all over with me now, Mr. Heath, if I had ventured to live with you out there, exposed to the burning sun through all the long cloudless summer; the shade of this thick tree is welcome to me. I do not care for a blue sky; and a hard, dry, unmoistened atmosphere is a pain to me; it weakens my strength and injures my beauty."

"You do not know what is good," replied the Heath. "Oh how I love it." And in merry mood the gay Heath caught up the passing breeze, and shook out its thousand purple bells; and as though moved by the same impulse the giant Elm lifted up and down his heavy arms, thickly clothed with summer leaves, and warm showers fell and moistened the dusty soil, and down his rough dark trunk little rivulets softly stole and tracked their way to the hollow where the Fern waited in patience.

"I am more than content," whispered the Fern; "I can grow green again, and ripen my rich brown spores;" and full of hope the Fern stretched out its faded fronds, uncurling each tender joint, and all the cool air was full of sweet perfume; the very soil sent up a thank-offering.—Maud.

NOTES AND GLEANINGS.

On the 26th of August, at St. George's Road, Kilburn, in the eighty-fifth year of his age, died Mr. James de Carle Sowerby. He was the eldest son of the late eminent naturalist, Mr. James Sowerby, and he received much of his education through assisting his father in his literary and scientific labours. He was a Fellow of the Linnean Society, of the Zoological Society, and the Ray Society, and was Secretary of the Royal Botanic Society, in the first establishment of which, in 1839, he took an active part. He retained the secretaryship until about a year since, when he retired, the Society allowing him a small pension. He published many Lists of Fossil Shells, &c., in the Transactions of the Geological Society, and was author of "The British Mineralogy," and "Mineral Conchology." He was a skilful artist, and engraved many plates of fossil shells and English plants, and drew the figures for Loudon's "Encyclopædia of Plants," &c.

MUSHROOMS IN CANTERBURY, NEW ZEALAND.

Here, in a plentiful season like the present, many hundreds of gallons of what I will term field Mushrooms are gathered and hawked about the streets of Christchurch during the fine autumn weather which we usually have in this very variable and, as regards climate, treacherous part of New Zealand. I read that in the other colonies occasionally hundreds of bushels are gathered in spring and autumn. It is generally every second autumn that we have them in such great abundance here. This autumn we have had the old saying, "as plentiful as Mushrooms," fully realised amongst us. I think the yield of this fungus has in the present year far exceeded that known in any previous season in Canterbury. Two very large specimens of dunghill Mushrooms have come under my notice this season. Both were of the dimensions of an ordinary cheese-plate, weighing respectively 1 lb. 11¾ ozs. and 1 lb. 11½ ozs.

In our autumn months of 1869 I saw a parcel of Mushrooms of extraordinary size. The largest was 12 inches in diameter, and the remainder averaged about 6 inches. These were grown on a farm near my residence, in the "stockyard," or rendezvous for the cattle belonging to the farm. In addition to this, a monster dunghill Mushroom was found in March, 1866, in the neighbourhood of Christchurch, and it had attained the size of 33 inches round by 11 inches across the cap, stalk 13 inches round; and in another instance I recollect making notes of a dunghill Mushroom 12 inches round, and weighing 1 lb.

I attribute the growth of small as well as large specimens of this delicate fungus in such amazing profusion every alternate autumn solely to our genial rains, succeeded generally by warm sunny weather. I recollect on one occasion Mushrooms were collected by drayloads in the country and brought into town for sale. The same season some persons went down the river Avon in a boat, landing occasionally, and they obtained nearly a boatload. We find from experience that if we want our catsup to keep a long time we must not pick up Mushrooms in the paddocks on a wet morning, and I think I can safely state that there are few families without a good bottle of catsup in store. At the time of picking them it is quite a pastime amongst all classes to go out, "Maori-kit" in hand. This is a kind of boat-shaped basket, made of New Zealand Flax by the Maories. The Mushrooms are usually sold at 1*s.* the American bucketful.

In conclusion, I do not think we shall ever require "Mushroom caves" here for the culture of the Mushroom.—William Swale, *Avonside Botanic Garden, Canterbury, New Zealand.*

NEW EDIBLES.

In this paper we shall refer more to the produce of British plants than to those of foreign origin, and our aim will be chiefly to draw attention to the utilisation of those which abound on roadsides and waste places in English rural districts; and, as many of these have at some time or other been cooked and eaten, either experimentally or to satisfy the cravings of hunger, our remarks will seem to apply rather to a revival of old edibles than to the introduction of new ones. Few people who pass their days in towns have any idea of the utility of wild plants, and we fear that fewer still are thoroughly acquainted with the source or origin of most of our cultivated vegetables. Many of those which we now prize very highly, and which are recognised articles of food, are cultivated forms of wild plants which any of us may still see growing in their natural state in certain districts. The Celery (Apium graveolens), and the Sea-kale (Crambe maritima), may be taken as examples, the first of which may be found in marshy places and ditches on different parts of the seacoast, and the second, also a coast plant, grows wild amongst sand and shingle. The Asparagus likewise grows wild in several places on the British coast. If the culture and development of these and many similar plants have been found not only successful but remunerative in a high degree, it seems to be a matter beyond dispute that others might be similarly changed by persevering efforts in cultivation.

The Hop (Humulus Lupulus), which is extensively cultivated for brewing purposes, is an example: in its wild state it grows

in hedges and thickets, and in some districts is very abundant, so that the country people often collect the young shoots for use as a green vegetable. Hop tops, as they are called, are by no means an uncommon dish in some rural districts; indeed the young shoots, which are frequently removed from the cultivated plants to enable the remaining ones to grow stronger, are often collected as food; they have been said to form a good substitute for Asparagus; our own experience, however, teaches us that the latter is many times preferable, though Hop tops, when blanched by covering them with earth, and when properly cooked, make a really good dish. A much better vegetable, however, is afforded by the young shoots of Ornithogalum pyrenaicum, a plant belonging to the same natural family as the true Asparagus—namely, the Liliaceæ, and growing in woods and copses in Somerset, Wilts, Gloucester, Bedford, and Sussex. In the neighbourhood of Bath these young shoots are regularly collected in spring, tied in bundles, and taken into the markets, where they are sold under the name of French Asparagus; they are almost equal in flavour to Asparagus proper, and are somewhat equal in appearance, with the exception that the individual shoots are much more slender, seldom or never exceeding the thickness of a cedar pencil; this is, no doubt, the principal drawback to their more general use, but under a system of cultivation the flavour might be improved and the size enlarged. The bulbs of another species, O. umbellatum, the Star of Bethlehem, are, when boiled, very nutritious and wholesome, and are eaten as food in Palestine. The Onion (Allium Cepa) is another well-known representative of the same family to which the above belong, but the Chives (A. Schœnoprasum) is a comparatively rare plant in England, and is consequently but little known; the leaves, however, form an excellent addition to salads, and are used in France for flavouring soups. The Black Bryony (Tamus communis), the only British representative of the Dioscoreaceæ, the family to which the edible Yams of the tropics belong, has tubers similar to the Yam, but they are too acrid for use as food. The young shoots, however, after soaking in hot water, and then boiling them for some time, are said to taste like Asparagus, and are used in Greece as a vegetable. One of the most neglected, and certainly one of the most common of our British plants, is the Stinging Nettle (Urtica dioica); three species are known in this country, but the one mentioned is perhaps the most common. Many country people believe in Nettle-tea as a useful spring medicine, and not a few boil and eat them as a green vegetable; they were, in former times, grown in Scotland as a potherb, and if forced and blanched by earthing-up in a similar manner to Asparagus and Sea-kale, the young tops make a very good dish. In Belgium, Germany, and other parts of Continental Europe, Nettles are much more generally used as food than they are with us.

The Sea Beet (Beta maritima) is a plant growing on many parts of our coast. It belongs to the same natural family as the Spinach—namely, the Chenopodiaceæ, and is probably the original form of the cultivated Beet and Mangold Wurzel. The leaves are large, and when boiled resemble Spinach in flavour; the plant grows naturally on chalk, but is much improved by being grown in garden ground; and, if planted in rich soil, the leaves are finer, and the flavour is scarcely distinguishable from that of Spinach. A regular supply can also be obtained until late in the season, by gathering the leaves in succession as they grow. In many parts of Ireland they are collected by the poor and eaten as food. Now that the cultivated Beet is being grown in this country to some extent for sugar-making, it is well worth consideration whether the leaves might not be made a really useful and marketable green vegetable. Many other useful plants belonging to the Chenopodiaceæ, and growing wild in Britain, have been used at different times for food. The Good King Henry (Chenopodium Bonus-Henricus), for instance, was at one time very generally cultivated in gardens as a potherb, and is still, we believe, grown for this purpose in Lincolnshire under the name of "Mercury." It forms a wholesome green vegetable of the character of Spinach, and the young shoots are said to make an excellent addition to soups, stews, &c.

While writing, my attention has been drawn to a note in a contemporary on the value of the Charlock (Sinapis arvensis) as a green vegetable. One correspondent says that he partook of it with roast veal, and that it came to table as a fine-coloured and most tender green, and he feels certain that numbers would prefer it from its appearance and flavour, and consider it a delicate vegetable, if they were not aware of its origin. It is a most common plant, and if cultivated in gardens, there is no doubt it would be greatly improved.

The plants mentioned in this article are only a few out of the many British species that might be made available for culinary purposes—some as really marketable articles, and others for use in times of scarcity. Space will not admit of our referring in detail to any more than we have done; but we will conclude by simply mentioning the names of a few belonging to different natural families as indications that there is a wide field for experiments, and that our subject is far from being exhausted—viz., leaves of Borage (Borago officinalis), young shoots of Rampion (Campanula Rapunculus), young shoots of Cow Parsnip (Heracleum Sphondylium), Dead Nettle (Lamium album).

The natural order Compositæ, to which the Jerusalem Artichoke (Helianthus tuberosus), the common Artichoke (Cynara Scolymus), and the Cardoon (C. Cardunculus) belong, includes many other plants which ought to be used; for instance, the peeled stalks of the Burdock (Arctium Lappa), leaves of Chicory (Cichorium Intybus), blanched leaves of Dandelion (Taraxacum officinale), young stalks of Salsafy (Tragopogon porrifolius), &c. —John R. Jackson, A.L S.—(*Food Journal*)
