obviously was not in accordance with the rules of the schedule. Such an exhibit should have been made a non-competitive one, and I know well that the merits of the same would have been duly recognised by the judges and council by the highest award they are empowered to give, viz., a Gold Medal. The fact that the excellence of the exhibit merited recognition to such an extent that no protest was entered by the nurserymen competing in that class, speaks well for their generosity, for had such been put in, the Jersey Society would not have had a "leg to stand on," and the Jersey exhibit would therefore have been a fiasco, which would have been deplored. By all means, I say, encourage these Channel Islands exhibits; at present, growers from these islands cannot compete in the strictly competitive classes, hence classes should be provided for them, both for collections and single dishes, and I know well that private growers would take the matter up, and a truly representative gathering of Jersey or Guernsey fruit would be the outcome. Moreover, owing to Potato culture not proving so remunerative as in the days gone by, the cultivation of fruit and glasshouse gardening is largely on the increase, and Jersey is, so to speak, following in the wake of their Guernsey neighbours, and ere long will become an important market-growing centre. This island has been far too long devoted to the cultivation of the risky Potato crop; and fruit cultivation, for which, by reason of the natural fertility of its soil, climatic conditions, not to mention sunshine, it is so eminently adapted, will be the staple production in the near future. *P. F. L. S.*

A HEAVY RAINFALL.—We have just experienced the heaviest rainfall that I have ever measured—dating back to 1875. The rainfall was incessant throughout the whole of November 2, 4, and 5, during which time 3.06 inches fell. In fact, the past eleven days have given us 4.55 inches of rain. We may therefore consider that the great drought which has afflicted the London district since April, 1897, is now at an end, and that the drought-stricken and desiccated sub-soil has at last had a good soaking. *A. Worsley, Isleworth.*

Obituary.

F. CANHAM.—We regret to announce the death of Mr. F. Canham, for some years gardener to C. H. Feiling, Esq., Southgate House, Southgate, which took place somewhat suddenly on October 30. Mr. Canham, who was brother to Mr. Chas. Canham, for many years Orchid grower to Messrs. Jas. Veitch & Sons, was an excellent all-round gardener, carrying out the duties of the extensive gardens under his care to the entire satisfaction of his employer. Although not formerly a professional Orchid grower, when Mr. Feiling wished to include a good collection of Orchids among the subjects in his gardens, Mr. Canham undertook their management, and with the same good results which followed his endeavours in other branches of his art. He was much liked by those employed under him, and by all in the neighbourhood where he lived.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

November 7, 8, and 9.

CHRYSANTHEMUMS were splendidly shown at the Royal Aquarium, Westminster, on Tuesday, Wednesday, and Thursday last, when the National Chrysanthemum Society held its fifty-second annual exhibition and fête. There was a prodigious display of large, handsome, well-coloured blooms of the one great useful autumn flower, and the event was a success as an exhibition. At the same time, whilst the general quality was high, we think we have seen rather better Japanese blooms at the Aquarium than were shown on this occasion. The St. Stephen's Hall was utilised for the accommodation principally of the specimen plants, and of the flowers shown in the special "Vase" Class, which is noticed on p. 360. The galleries were also sufficiently full of exhibits, and efforts were made not to unduly crowd the ground-floor, where so much space is needed for the passage of visitors. Mr. R. DEAN, secretary, was responsible for the arrangements.

FIVE SOCIETIES ENGAGE.

The first class was that arranged for Horticultural and Chrysanthemum Societies to engage with each other in competition for prizes for the best collection of forty-eight blooms, twenty-four incurved and twenty-four Japanese. The 1st prize of £10 and the Challenge Trophy was won by the Portsmouth and District Horticultural Society, and the flowers were contributed by two members only, Mr. JAS. AGATE, and Mr. C. PENFORD. The exhibit was a very commendable one, and the Japanese varieties included magnificent specimens of Mrs. Mease, Florence Molyneux, the new white Japanese incurved; Mrs. J. Lewis, Miss E. Pilkington, Florence Penford, and others. The incurveds were by no means of poor quality.

For 2nd prize, the successful society was the Sevenoaks and West Kent Gardeners and Amateurs, the flowers being contributed by Mr. W. Tebay, gr. to Mrs. RYCROFT, Everlands, Sevenoaks. Some of the Japanese blooms in this stand were of great size, as Mrs. W. Mease, Phœbus, Mons. Hoste, Australie, &c.

The other societies competing in the class were the Ipswich and East of England Horticultural, The Bromley and District Chrysanthemum (3rd prize), and the Forest Gate and Stratford Amateurs' Chrysanthemum.

PLANTS IN POTS.

GROUPS.

The groups exhibited upon this occasion were arranged on the floor of the building instead of in the gallery, where they have been staged for some years. There were four exhibits, and the space allotted being a circular one, and of the same size, the arrangement of all of them was similar. They varied, however, in the degree of perfection in arrangement, and in the quality of the plants of which the groups were composed. The 1st prize was won by Mr. J. SPINK, Summit Road Nursery, Walthamstow; his Chrysanthemum blooms were larger than the others shown, and the Chrysanthemums were interspersed with Eulalia plants, the light and variegated foliage of which relieved the conical outline of the exhibit. The top, like that of all the other groups, was crowned by a Palm, but the several exhibitors used various species. The 2nd prize was won by Mr. W. Howe, gr. to Sir H. TATE, Bart., Park Hill, Streatham Common, for an exceedingly bright group, in which the plants were arranged to some degree in panels, according to colour. It was a prettier and brighter group, the flowers being fresher than the one from Mr. Spink, but the flowers were less large. 3rd, Mr. A. HATTON, gr. to Mrs. E. SWANZY, The Quarry, Sevenoaks; and 4th, Mr. E. DOVE, gr. to H. E. FAY, Esq., Bickley Hall, Kent.

TRAINED SPECIMENS.

The trained plants were arranged as usual in St. Stephen's Hall, and were of satisfactory quality. For a collection of six specimens of large-flowered varieties, including Japanese, the 1st prize was won by a glorious collection from Mr. J. BROOKS, gr. to W. REYNOLDS, Esq., J.P., The Grove, Highgate, London, N. His varieties were Colonel W. B. Smith, Miss Watson (pale yellow, a marvellous plant), Maiden's Blush, Mrs. Mease, John Shrimpton, and Phœbus. 2nd, Mr. F. E. WRIGHT, gr. to J. TROUP, Esq., Essex Lodge, Upper Clapton, who had Viviani Morel and Chas. Davis—very nice; and 3rd, Mr. G. WESTON, gr. to D. MARTINEAU, Esq., 4, South Road, Clapham Park. His *l'Isle de Raicis*, a brilliant red variety, was very beautiful.

The best exhibit of four specimens of any varieties was from Mr. Geo. Whitehorn, gr. to S. NICHOLLS, Esq., Forest Lodge, Whipp's Cross, Walthamstow. The varieties shown—President Nonin, John Shrimpton, Col. W. B. Smith, and Viviani Morel. Mr. Tom Stone was 2nd; his W. Tricker and Margot were especially good. 3rd, Mr. F. GILKE.

There was only one exhibit of six standard trained specimens, and this was shown by Mr. F. E. WRIGHT. The standards are the least attractive of these skilfully-trained exhibits.

Of four standards specimens, there were three exhibitors and the 1st prize was won by Mr. Geo. WHITEHORNE, who had Sunflower, Cleopatra, Eva Knowles, and William Tricker.

One of the prettiest sections is that of the neat little Pompons. They bloom so freely, and studding the large surfaces of these sphere-shaped plants like so many brilliant the effect is certainly a striking one. The 1st prize for six specimens was won by Mr. Tom Stone, gr. to R. A. COCHRANE, Esq., The Downs, St. Neots, Hunts. His prettiest plants were those of the old Cedo Nulli, white, golden and lilac. The others were *Sour Melaine*, *White Martha*, and Francis Boyce, a salmon-pink coloured Anemone. 2nd, Mr. F. Gilke, gr. to A. MORRIS, Esq., Court Green, Streatham.

The best specimen of an incurved variety, was one of Chas. H. Curtis, shown by Mr. J. Brooks, gr. to W. REYNOLDS, Esq., The Grove, Highgate; and Mons. Desblanc, from Mr. E. EASEY, gr. to F. BISHOP, Esq., 23, Highbury New Park, N., was 2nd.

CUT BLOOMS (OPEN).

JAPANESE VARIETIES.

The most important class for Japanese blooms was that for forty-eight specimens, distinct, and the 1st prize was £10 and a Challenge Cup. This was won by Mr. F. VALLIS, Bromham Fruit Farm, Bromham, Chippenham. The following were the varieties: Mrs. Mease, Mr. A. Barrett, Graphic, Soleil d'Octobre, G. W. Palmer, Suzie, Phœbus, Mrs. Coombes (the new pink, smooth-petalled Japanese, raised by Mr. Weeks), Calvat 1899 (a Japanese incurved, white, with faint blush)

Chas. Davis, Gustave Henri, L. Seward, E. Towers, Le Grand Dragon, Simplicity, M. Hoste, G. Ridgway, Surpasse Admiral, W. Bardeney, M. Ricoud, M. A. Brun, Lady E. Clark, Eva Knowles, Madame G. Brunt, Mr. J. Beissant, M. Louis Rémy, Mrs. Barclay, Pride of Madford, J. W. Barks, Madame P. Rivoire, Edith Tabor (very fine), Souvenir de Madame F. Rosette, N.C.S. Jubilee (rather pale in colour), Madame Carnot, Marie Calvat, Mutual Friend, Australie, E. Teichmann, Viviani Morel, Pride of Exmouth, Lady Hanham, Oceana, E. Molyneux (very good), Swanley Giant, Mrs. J. Lewis, G. J. Warren, Nellie Pockett (white, or palest lemon, Australian variety), and M. Chénou de Leché (very good). The 2nd prize was well won by Mr. J. W. McHattie, gr. to the Duke of WELLINGTON, Strathfieldsaye, Mortimer, Berks, who had a collection of which any grower might be proud. The varieties Mrs. Hugh Crawford, Matthew Hodgson, Le Grand Dragon, Edith Tabor, Australie, Mr. Jas. Bidencope, G. J. Warren, Mrs. J. W. Barks, and Mrs. White Popham were especially noteworthy in this exhibit. Mr. W. H. Lees, gr. to F. A. BEVAN, Esq., Trent Park, Barnet, was 3rd, with an exhibit of blooms rather less heavy, but of wonderfully bright colours. The varieties Lionel Humphrey, Miss Dorothy, Shea, R. Hooper Pearson, Dorothy Seward, and a purple-crimson unnamed seedling were especially remarkable for high colour. There were six exhibitors in this class, the others being Mr. M. GLEESON, gr. to A. VON ANDRE, Esq., The Warren House, Stanmore; Mr. W. RUSHTON, gr. to A. WHITELAW, Esq., Cowdray Park, Midhurst, Sussex; and Mr. R. Kenyon, gr. to A. F. HILLS, Esq., Moukham, Woodford Green.

Twenty-four blooms, distinct.—This class is always a popular one, and on the present occasion there were five exhibitors. Mr. J. W. McHATTIE was the most successful, and had a collection of very fine flowers. The varieties that figured to best advantage were Mrs. W. Mease, Edith Tabor, Ed. Molyneux, Mrs. H. Weeks, M. Hoste, Soleil d'Octobre, G. J. Warren, Le Grand Dragon, Mrs. Barks, James Bidencope, Mrs. G. W. Palmer, and Chatsworth. Very appropriately, a bloom of the Duke of Wellington was included in this splendid exhibit from Strathfieldsaye.

The next collection in merit was one from Mr. W. Meredith, gr. to GEO. WILDER, Esq., Stanstead Park, Emsworth, Sussex. There were remarkable blooms of Mr. T. Carrington, Madame Carnot, M. Hoste, M. Pankoucke, Master H. Tucker (a new one, that we have not seen better than the specimen in this class), and Ed. Molyneux; 3rd, Mr. H. PERKINS, gr. to the Hon. W. F. D. SMITH, M.P., Greenlands, Henley-on-Thames.

The following three classes of six blooms, of various colours, were exhibited in vases:

Any White Variety.—There were four exhibits in the class for six blooms, and three of them were of the variety Madame Carnot. Mr. McHATTIE, however, gained 1st prize for six marvellous blooms of the superb white Mrs. J. Lewis. Mr. W. HIGGS was 2nd.

Best Yellow Variety.—The 1st prize in this class was awarded to six magnificent and huge specimens of Mrs. W. Mease, from Mr. W. HIGGS; 2nd to Phœbus, shown by Mr. W. Allan, gr. to Lord SUFFIELD, Guntton Park, Norwich; and 3rd to Mrs. Mease, again shown by Mr. J. Sandford, gr. to G. W. WRIGHT INGLE, Esq., Woodhouse, North Finchley. Mrs. Mease is a charming variety, but not a good representative yellow, being too pale.

Any other Colour than the two preceding.—There were eight exhibits, and the 1st prize went to Australie, shown by Mr. McHATTIE (very fine); 2nd prize to the same variety, from Mr. H. PERKINS; and the 3rd also to Australie, from Mr. S. FOSTER, gr. to R. NIVISON, Esq., Tenterden Hall, Hendon.

The best six hairy petalled blooms, in not fewer than three varieties, proved to be *Hairy Wonder*, Louis Kœhmer, both of which are very well known; *Leocadie Gentils*, an exceedingly hirsute, narrow-petalled, pale yellow variety; and *White Swan*; *L. Gentile* is a most attractive flower. The exhibit was one from Mr. John Justice, gr. to the Right Hon. Sir R. TEMPLE, Bart., The Nash, Kempsey, Worcester; the 2nd prize went to Mr. HENRY LOVE, 1, Melville Terrace, Sandown, Isle of Wight.

INCURVED VARIETIES.

Thirty-six blooms, distinct.—There were four exhibitors in the largest class for the incurveds, or formal Chinese type of flower. The best collection was one from Mr. W. HIGGS, gr. to J. B. HANKEY, Esq., Fetcham Park, Leatherhead. Varieties of this type do not vary in the exhibits from year to year to the degree that the Japanese do, and it is not necessary to trouble the reader with a list of the thirty-six blooms in this case. It may be pointed out that Madame Edmond Rogers, the green-tinted new one, was included. The exhibit contained no specimen of Chas. H. Curtis, but a moderate bloom of Major Bonaffon; Bonnie Dundee was a very well-coloured, neat bloom of moderate size; Duchess of Fife was the largest bloom in the stand. The best yellow so far as colour was concerned was King of the Yellows, but it is too loose in petal. Madame Ferlat was shown well; as was Hanwell Glory, and D. B. Crane. An exceedingly close 2nd was Mr. G. Hunt, gr. to PANTIA RALLI, Esq., Ashted Park, Epsom, who had a very deep-coloured yellow, named Miss Louise D. Black; C. H. Curtis, and Golden Empress were good. The 3rd prize went to Mr. W. H. LEES, who had a collection little inferior to the one just noticed.

Twenty-four blooms, distinct.—There were only two exhibits in this class, and the 1st prize was won by Mr. W. HIGGS, gr. to J. B. HANKEY, Esq., Fetcham Park, Leatherhead; particular varieties in this exhibit were Madame E. Rogers, the new green-tinted continental variety; Chas. H. Curtis, of

which an enormously-deep bloom was shown; S. M. de la Drome, a moderately broad-petalled yellow bloom; Islene, pretty lilac-mauve, the florets incurved in a twisted manner; King of the Yellows, good in colour, but too flat in shape; and D. B. Crane, which was shown very well. The rest were well-known varieties, shown in generally good condition. The 2nd prize went to Mr. G. J. Hunt.

Twelve blooms, distinct.—The best collection of twelve blooms was one from Mr. Silas Cole, gr. to Earl Spencer, Althorp Park, Northampton, out of five exhibits; his varieties were Perle Dauphinoise, Ma Perfection, Topaze Oriental, Madame Ferlat, Lady Isabel, Mrs. N. Molyneux, Chas. H. Curtis, Mrs. Kingston, Lord Alcester, Countess of Warwick, Violet Tomlin, and Princess of Wales. The best blooms were Chas. H. Curtis, Topaze Oriental, and Princess of Wales. 2nd, was Mr. F. G. Foster, Brockhampton Nurseries, Havant, whose blooms lacked depth and finish.

There were five exhibits in the class for six incurved of one variety, and a collection of six very large specimens of Duchess of Fife, shown by Mr. W. Higgs, was awarded 1st prize. The same variety, from Mr. G. J. Hunt, was 2nd; and a very different flower, Globe d'Or, from Mr. Thos. Parkins, gr. to F. W. F. Ward, Esq., 34, Bisham Gardens, Highgate, 3rd.

OTHER TYPES.

Japanese blooms, incurved.—Mr. McHattie won 1st prize in a class for six blooms, distinct, of Japanese varieties with incurving florets, showing Duke of Wellington, Swanley Giant, N.C.S. Jubilee, Prefect Robert, President Bevan, and Madame Desblanc; the exhibit lacked a high-coloured variety. Of six other competitors, Mr. H. Parkins won 2nd prize; his best blooms were Australia and Australian Gold.

Reflexed varieties.—There is very little interest shown in the exhibition of the old reflexed type, and the varieties shown are all of them well known. The best collection of twelve large-flowered reflexed blooms, in not fewer than nine varieties, was shown by Mr. T. Caryer, gr. to A. G. Meissner, Esq., Alderholme, Weybridge; Cloth of Gold was the best yellow, Collingfordi the most effective crimson, and Mrs. Forsyth the best white variety.

Anemone blooms.—There were four or five collections exhibited in most of the classes for Anemone-like blooms. The best collection of twenty-four large-flowered varieties, excluding Japanese, was shown by Mr. W. Ring, gr. to James Warren, Esq., Capel House, Waltham Cross; John Bunyan was the best yellow, Mrs. P. R. Dunn and Mrs. Caterer good whites, and Descartes the best flower of high colour. 2nd, Mr. A. Ives, gr. to E. C. Jukes, Esq., Hadley Lodge, Barnet. Mr. Rino had also the best collection of twelve blooms, distinct, of the same type; and Mr. Ives was the best of four other exhibitors. The same exhibitors won similar prizes in a class for twelve Japanese Anemone blooms; but for Anemone Pompons Mr. C. Brown, gr. to R. Henry, Esq., Langley House, Abbots Langley, won 1st place for twelve trebles, distinct.

Pompons.—The pretty little Pompons were shown well by Mr. T. Caryer, in a class for twelve trebles, distinct. He had a very commendable exhibit, in which Toussaint Marizot, a singular little flower with quilled petals, was remarked.

Single-flowered varieties.—Mr. G. W. Forbes won 1st prize in a class for six varieties, to be shown in bunches or in sprays, six blooms in each spray. The charming varieties, were Purty, Earlswood Glory, Alphonso, and Victoria, all white, or nearly so; Mrs. Walton, mauve with white band around disc; and Rose Pink, a very similar variety. Mr. Aloridge was 2nd.

SPECIAL PRIZES.

SIXTY BLOOMS IN VASES.

By far the most important of the special classes, was one for twelve vases of specimen blooms of Japanese Chrysanthemums, distinct, each vase to contain five blooms of one variety. The vases were lent by Messrs. James Green & Nephew, Queen Victoria Street, London, and were 18 inches in height. Not less than 6 inches of Chrysanthemum-stem had to be seen above the top of vase. The 1st prize of £20, was given by Mr. H. J. Jones, and to this, the Society added a large Gold Medal. The 2nd prize was £15 and Gold Medal. 3rd, £10 and Silver-gilt Medal, and 4th, large Silver Medal and £5. Nine competitors entered, and this extraordinary class brought therefore an aggregate of 540 large exhibition blooms, and constituted quite a Flower Show in itself. They were staged upon tables in the St. Stephen's Hall, and excited considerably greater interest than those staged upon the usual flat boards. It is an innovation that deserves to be encouraged, as the arrangement is one that destroys the feeling of monotony that visiting a number of Chrysanthemum Shows is apt to create. The 1st prize was narrowly won from Mr. W. H. Lees, by Mr. J. W. McHattie. The varieties were Australia, Mrs. J. Lewis, Milano, a light-red wide-petalled Japanese, big globular flower; Oceana, Madame Carnot, Mrs. Coombs (one of the best of Mr. Week's new ones, very pretty pink), Phœbus, Mons. Chenon de Leché (very fine), Mrs. W. Mease, Charles Davis (splendidly coloured), Simplicity, and Mrs. White Popham. 2nd, Mr. W. H. Lees, whose best bouquets were of the varieties Jas. Bidencope, Mrs. Coombs, Mrs. G. W. Palmer, Mutual Friend, Lady Ridgway, and the highest-coloured and best-developed blooms of the variety

Pride of Madford, that we have seen. 3rd, Mr. J. Spinks, Summit Road Nursery, Walthamstow. 4th, Mr. Wm. Rushton, gr. to Alexander Whitelaw, Esq., Cowdray Park, Midhurst.

Twelve Japanese blooms, distinct.—In a class for twelve Japanese blooms, distinct, liberal prizes for which were given by Messrs. J. Peeg & Son, West Norwood, there were eighteen fine exhibits. The 1st prize was awarded to a collection from Mr. Geo. Neville, gr. to Lord Chesham, Latimer, Chesham, Beds. His varieties were Mrs. Mease, President Nonin, Mrs. H. Weeka, Edith Tabor, Chas. Davis, Mme. Hoste, Lady Biron, Ethel Addison, Eva Knowles, Phœbus, Joseph Chamberlain, and Madame Carnot. The next best lot was from Mr. J. W. Roberts, gr. to J. T. Skilbeck, Esq., Clonard, Harrow Weald, Stanmore. He had M. Chenon de Leché, Lady Hanham, Simplicity, and Mons. E. André, very fine. 3rd, Mr. H. Brown, gr. to H. W. Sillen, Esq., The Pines, Horsell, Surrey. There were 4th and 5th prizes awarded.

BEST SPECIMEN BLOOMS OF JAPANESE VARIETIES.

With the object of bringing to the fore varieties of clear, decided colours, Mr. Norman Davis, Framfield Nurseries, Sussex, offered 1st, 2nd, and 3rd prizes, in each of the following six classes. One bloom only was required in each class. The best white variety was Mrs. J. Lewis, shown by Mr. Geo. Higgs; and Madame Carnot, from Mr. O. Penford, was placed 2nd. Phœbus took leading place for the best yellow, and was shown by Mr. J. Brooke, gr. to W. J. Newman, Esq., Totteridge.

Of pink or mauve-coloured varieties, Vivand Morel, from Mr. Geo. Hagon, gr. to E. Arthur Lee, Esq., Fowley Park, Liphook, Hants, was best; and Emily Towers, from Mr. W. H. Lees, being 2nd.

Of crimson selfs, Ed. Molyneux, from Mr. J. Sandford, was only given a 2nd prize.

Pride of Madford won the 1st place for a purple self, and Mr. Geo. W. Palmer 1st for a bronze-coloured flower. These classes would have been of extreme interest had they been supported better by exhibitors.

SINGLE-FLOWERED VARIETIES IN VASES.

A Silver Cup was offered by Cannon's Restaurant Company, Ltd., Westminster, for the best twelve vases of single-flowered Chrysanthemums, six varieties to be large-flowered, and six small-flowered, six blooms of one variety in each vase.

Mr. G. W. Forbes, gr. to Madame Nicols, Regent House, Surbiton, won the Silver Cup. The prettiest varieties were Earlswood Glory, a fine large white; Miss Anderson, a smaller white flower of better form; Sir T. Symonds, large yellow; Annie Tweed, small crimson; and Mrs. Walton, large mauve, with white band round disc.

PREMIER BLOOM IN THE SHOW.

The finest bloom in the exhibition was a superb example of the variety Mrs. Mease, shown in Mr. Davis's special classes by Mr. W. G. B. Clarke, Hitchin, Herts. A prize of one guinea was offered for this by Mr. J. T. Simpson, to be subsequently supplemented by an oil-painting of the flower.

AMATEURS'—DIVISION A.

The classes reserved exclusively for amateurs were well competed for, though perhaps exhibits were slightly less numerous than on some former occasions.

Japanese Blooms.—The class for eighteen specimens, distinct, was won by Mr. A. Page, gr. to A. L. Reynolds, Esq., Moss Hall Grove, N. Finchley. He had a nice lot of moderate-sized specimens, and included many of the novelties that were to be seen in the open classes. 2nd, Mr. Joseph Acock, gr. to Mrs. Bacon, Stoneleigh, Sutton, Surrey. There was very little difference in quality between these two collections. Four additional exhibitors competed.

The best collection of twelve blooms was shown by Mr. D. Ager, gr. to Milton Bode, Esq., Down House, Bath Road, Reading. He had very creditable specimens of M. Pankoucke, Madame Carnot, and Phœbus. 2nd, Mr. A. Page, gr., Moss Hall Grove, N. Finchley.

There were ten collections of six varieties, and the best was from Mr. E. Rymian, gr. to O. Soffer, Esq., South Park, Reigate. The blooms were good, and represented the varieties Mrs. White Popham, Madame Carnot, President Nonin, Fen du Champ, Mr. T. Carrington, and Mrs. Mease.

The best exhibit of six Japanese blooms of one variety, was one from Mr. J. Denyer, gr. to Ed. Smith, Esq., Ingleside, Chatham, who had six very nice blooms of Mrs. Mease.

Incurved.—It is in the incurved flowers that the amateurs find the greatest difficulty in obtaining properly finished specimens. The best lot of twelve blooms, distinct, was from Mr. C. E. Wilkins, Wellington, Swanley Junction, and they were much the best shown in these classes, being moderate-sized, even specimens. 2nd, Mr. A. Hooney, gr. to G. H. Cox, Esq., The Grange, East Barnet.

For six blooms, incurved, Mr. Wilkins again secured the 1st place; but in the class for six specimens of one variety, the best exhibit was from Mr. A. Hooney, who showed the variety C. H. Curtis, beating four other competitors.

Pompons.—The best six bunches of Pompons, distinct varieties, were shown by Mr. Aldridge, gr. to G. Lacy, Esq., Springfield House, Palmer's Green. The varieties, Mdlle. Elsie Dordan, Wm. Westlake (yellow), and Prince of Orange, were very pretty. Mr. Aldridge beat four other exhibitors.

AMATEURS'—DIVISION B.

Exhibitors in the preceding classes could not enter the following eight, which are duplicates.

Mr. Martin Silsbury, Providence, Shanklin, Isle of Wight, had the best collection of eighteen Japanese blooms, distinct. His best varieties were Surpassé Amiral, Mrs. J. Lewis, Mutual Friend, Mrs. Barkley (pink), and President Bevan.

For twelve Japanese blooms, distinct, there were as many as twelve collections in competition. The best came from Mr. A. R. Knight, 63, Hardinge Road, Ashford, Kent. The most noticeable blooms in a very satisfactory collection were Madame Carnot, Mrs. Mease, Mrs. Weeks, and M. Chenon de Leché; the 2nd and 3rd prizes went to W. E. Reeve, Esq., Maybury Road, Woking; and Mr. Jas. Falconer, Woodham Walter, Maldon, Essex.

The winner of 1st place for six Japanese blooms, distinct, was Mr. E. Brown, jun., 3, New Alma Road, Southampton. The varieties Modestum and Mrs. G. W. Palmer were very good; 2nd, Mr. W. E. Reeve.

The best Japanese variety exhibited in collections of six blooms was that of Mrs. White Popham, shown by Mr. Henry Love, Melville Terrace, Sandown, I.W. Charles Davis, from Mr. E. Brown, jun., won the 2nd prize.

The 1st prize for a collection of twelve incurved was awarded to an exhibit from Mr. Jas. Falconer, Maldon, Essex; and the following class for six blooms, distinct, was won by Mr. W. G. Prudden Clark, York Road, Hitchin, Herts.

"MAIDEN" EXHIBITORS.

In the few classes reserved for growers who had not previously won a prize at any exhibition of the N.C.S., Mr. F. Meares, Holwood Stables, Walton-on-Thames, won 1st prize for six Japanese blooms, distinct; Mr. J. A. Humphries, gr. to J. L. Burgess, Esq., Marsey Hampton, near Fairford, Gloucester, had the best exhibit of three blooms, distinct the best collection of six incurved, distinct, and of three incurved.

TABLE DECORATIONS, EPERGNES, VASES, &c.

There were seven classes in which the extreme suitability of the Chrysanthemum for decorating the dinner-table, furnishing vases, baskets, epergnes, &c. They were very pretty, and some of them specially well done; but these decorative classes form a feature that changes very little from year to year, and it is to the public that they serve as object-lessons in the tasteful arrangement of flowers.

The most important class is for a table of bouquets, wreaths, sprays, &c., and with a very commendable exhibit Mr. L. H. Alcorn, Fern Bank Nursery, Stoke Newington, N., secured 1st prize. Large floral arches made of wire, and supporting elegant glasses for blooms, were used in this exhibit to good effect.

Miss E. B. Cole, The Vineyard, Feltham, had the best collection of three epergnes of Chrysanthemum blooms. Mostly single-flowered varieties were used, and the prevailing colour was mauve; the arrangement was perfect. 2nd, Mr. A. Merdew, 308, Southampton Street, Camberwell, S.E.

Mr. Mark Webster, gr. to E. J. Preston, Esq., Kelsey Park, Beckenham, won the 1st prize for two vases of Chrysanthemums, Pompons, or Anemone Pompons, arranged with any foliage for decorative effect. We thought the exhibit rather dull, being overdone with foliage.

The best pair of hand-bouquets was shown by Mr. Mark Webster; and the best decorated hand-basket by Mrs. Stronell, 213, Brixton Hill, Brixton.

Vases of six blooms were shown numerously in Class 69, and the best was from Mr. E. Jones, 51, Bower Street, Bedford.

Mr. W. Howe had the best vase (amateurs) of six blooms of one variety, showing a white Japanese incurved; 2nd, Mr. J. Denyer, gr. to E. O. Smith, Esq., Ingleside, Chatham.

The best hand-basket of natural autumn foliage and berries, arranged for effect, was from Miss Easterbrook, The Briars, Fawkham, Kent. The Pernettyas were used to advantage.

FRUITS AND VEGETABLES.

There were a few classes for Grapes, Apples, and Pears, which are out of place at a Chrysanthemum show. The best three bunches of white Grapes were of Muscat of Alexandria, from Mr. A. R. Allan, gr. to Lord Hillingdon, Hillingdon Court, Uxbridge; and the best black Grapes, of Black Alicante, from Mr. W. Taylor, gr. to C. Bayer, Esq., Tewkesbury Lodge, Forest Hill, S.E. The premier exhibit of Gros Colmar was one of three bunches from Mr. W. Cluck, gr. to Herbert Truellusson, Esq., Brodsworth Hall, Doncaster.

There was exceptionally good competition in the classes for Apples. The best collection of six dishes of culinary varieties, out of thirteen lots, was one from Mr. W. T. Stowers, gr. to G. H. Dean, Esq., 70, Harold Road, Sittingbourne; 2nd, Mr. W. Camm, gr. to the Duchess of Cleveland, Battle Abbey, Sussex.

In the class for an equal number of dishes of dessert varieties, the 1st prize was won by Mr. R. Chamberlain, gr. to F. M. Loneroun, Esq., Cressingham Park, Reading; and for six dishes of ripe Pears, the best exhibitor was Mr. W. Allan, gr. to Lord Suffield, Ganton Park, Norwich.

MESSRS. WEBB & SON'S AND OTHER SPECIAL PRIZES.

The best collection of nine dishes of vegetables in competition for prizes offered by Messrs. Webb & Son, was shown by Mr. Ed. Beckett, gr. to Lord Aldenham, Aldenham

House, Elstree, Herts; the 2nd going to Mr. A. Basile, gr. to Rev. O. L. POWELL, Woburn Park, Weybridge.

Messrs. HURST & SON, Messrs. DANIELS BROS., and Messrs. FIDLER & SONS, Reading, also offered special prizes for Potatoes. In a class for the best dish of a new seedling Potato, prizes for which were offered by the last-named firm, the 1st prize was won by Mr. E. S. Wiles, gr. to the Hon. EVELYN HUBBARD, M.P., The Rookery, Down, Kent, who showed good-looking tubers of a seedling named Duke of Marlborough, obtained from crossing Chancellor with Abundance.

Mr. R. SYDENHAM offered prizes in thirteen classes for vegetables. The 1st prize for Celery, was taken by Mr. JAS. GIBSON, gr. to R. N. HUDSON, Esq., Daneshield, Marlow; for Cauliflowers, by Mr. W. J. EMPSON, gr. to Mrs. WINGFIELD, Amptill House, Amptill; for Savoy, by Mr. GIBSON; Red Cabbage and Brussels Sprouts, by Mr. C. BROWN, gr. to R. HENTY, Esq., Langley House, Abbot's Langley; Onions, Mr. BECKETT; Carrots, Mr. A. G. GENTLE, gr. to Mrs. DENNIS, Little Gaddesden, Berkhamsted; Parsnips and Leeks, Mr. BECKETT; Beet, M. BASILE; &c. Mr. BECKETT, who won the greatest number of points in these classes, has won the Silver Cup for the 2nd time, and it now becomes his property.

MISCELLANEOUS AND TRADE DISPLAYS.

Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, had a magnificent display of cut blooms, set up in a most effective style in large, handsome vases, in bamboo stands, fanciful baskets, and other receptacles. Ferns and other decorative plants were interspersed amidst these. Mr. DAVIS always grows Madame Carnot well, and this variety and its two sports were shown grandly on this occasion. A bamboo stand was decorated with the curious variety Golden Shower, fig. 115, in *Gardeners' Chronicle*, December 3, 1898. Most of the types of Chrysanthemum were represented in this exhibit, and a few good Japanese novelties were included, such as Lady Francis Osborne (pink), Mrs. Carsham, a very wide petalled, incurved Japanese, the reverse silver-coloured, &c. (Large Gold Medal).

Adjoining the above exhibit was a similar one from Mr. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham. Large vases and other handsome receptacles for the display of blooms, and decorative plants for relief were also used by Mr. JONES. Many of the novelties in this exhibit will be found described in a note on p. 357. (Large Gold Medal)

Messrs. H. CANNELL & SONS, Swanley, Kent, made an exhibit of cut blooms, in which the arrangement of the flowers was in rows, each flower being surrounded with fronds of *Adiantum cuneatum*. Messrs. CANNELL had excellent blooms of Mrs. White Popham, Mme. Carnot, and other varieties, most of which will be found described in a note on p. 356. Two groups of *Cannas* in pots were very bright, as were also the numerous sprays of bloom of varieties of zonal *Pelargoniums* (Large Gold Medal).

Mr. ROBT. OWEN, Floral Nurseries, Maidenhead, had a large exhibit, including a group of plants in flower, carrying fine large blooms, and a splendid lot of cut flowers. Among the cut flowers were brilliantly-coloured large specimens of a number of more or less recently-introduced varieties, and of English seedlings raised at the floral nurseries. Mrs. W. SMITH (yellow Japanese), Hon. W. F. D. SMITH, Lord Ludlow (crimson Japanese), M. FATER, Owen's Memorial Orange Red, with gold reverse, were conspicuously pretty. Of incurved flowers, the variety Miss Godsmark, recently Certified, and a seedling raised at Maidenhead, also other seedlings, were remarked (Silver Medal).

Messrs. J. PEED & SONS, Rouppel Park Nurseries, Norwood Road, London, showed a group of Chrysanthemums in pots (Silver Medal).

Mr. JOHN GREEN, Norfolk Nurseries, Dereham, had an exhibit of Chrysanthemum-blooms (Silver Medal).

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N., were awarded a Gold Medal for a very nice exhibit of miscellaneous plants, including *Ericas*, *Palms*, *Ferns*, *Carnations*, *Orchids*, *Begonia Gloire de Lorraine*, &c.

Messrs. I. HOUSE & SON, Coombe Nurseries, Westbury-on-Trym, were awarded a Bronze Medal for a collection of blooms of varieties of Violets.

Mr. THOS. J. WARE, Hale Farm Nurseries, near Tottenham, showed a group of cut Chrysanthemums (Bronze Medal).

Messrs. W. CUTBUSH & SON, Highgate, London, N., had a very large table in the gallery of miscellaneous plants, for which they obtained a Small Gold Medal.

Other stands and exhibits represented Mr. SAN DEARD'S "Little Samson" boiler, Mr. J. HAW'S improved watering cans, Mr. HAYDON'S patent broom-holder, the "ONE AND ALL" garden manures, Messrs. FENLON & SON'S hot-water circulating condensing stove; "ICHTHEMIC" guano; horticultural sundries from Mr. J. GEORGE, Putney; Messrs. WOOD & SONS, Wood-Green, London; and D. DOWEL & SON, Hammersmith; Bedfordshire peat from Mr. JOS. ARNOLD; and nitrate of soda and other artificial manures from the PERMANENT NITRATE COMMITTEE, 3, Gracechurch Street, London, E.C.; &c.

ROYAL HORTICULTURAL.

NOVEMBER 7.—Owing to the comparative paucity of exhibits, the Drill Hall on this occasion had a rather bare appearance. These consisted chiefly of a long table, filled partially with *Begonia Gloire de Lorraine* in fine blossom, a small collection of *Orchids*, some very interesting; and several stands of Chrysanthemums, some *Statice*s, *Nerines*, and collections of Apples and Pears.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. C. T. DIUERY, J. H. FITT, J. JENNINGS, J. F. McLEOD, G. GORDON, W. BAIN, E. H. JENKINS, J. D. PAWLE, C. E. SHEA, H. TURNER, D. B. CRANE, E. T. COOKE, G. PAUL, C. JEFFRIES, and E. MAWLEY.

CHRYSANTHEMUMS.

Show blooms of incurved and Japanese varieties to the number of forty-eight were shown by C. E. SHEA, Esq., The Elms, Foots Cray, the blooms being fair specimens of popular varieties. Striking varieties and flowers were noted in Elsie Teichmann, Mathew Hodgson, Lady Ridgway, Jas. Myres, M. Chenon de Leché, Mrs. Mease, Oceana, Jubilee, and Lady Hanham (Silver Flora Medal).

Messrs. W. WELLS & CO., LTD., Earlwood Nurseries, Redhill, exhibited twenty-four cut blooms in eight varieties, all of which were of more than the average size, besides being fresh-looking. We may mention Miss Lucy Cheeseman, a rich yellow, confused-petalled, Japanese; Lord Salisbury, a big flat flower, with tints ranging from deep yellow to orange; Mr. Louis Rémy, light yellow; Silver Queen, a bright lilac-coloured flower, with simple reflexed florets; Margaret Silhot, a bloom with erect, stiff florets of the purest white; Sir Herbert Kitchener, a rich-looking, reflexed Japanese, very full, and quite globular in shape; and Sir T. W. Clarke, a graceful white bloom, with narrow florets. The firm showed a number of blooms of a brilliant-coloured variety in *Etoile de Feu*, in tint a reddish chestnut, with an orange reverse to the florets (a beautiful flower for cutting purposes). Mr. J. CORBETT, gr. to Lord HILLINGDON, at Mulgrave Castle, Whitby, showed Chrysanthemums, Jessie Corbett, a bright yellow Japanese, broad, reflexed petalled variety; General Symons, a rich crimson Japanese, not very full, as shown; Lady Laura Hampton, and some others. No award was made.

Hon. W. F. D. SMITH, Greenlands, Henley (gr., Mr. Perkins), showed three beautiful blooms of a yellow incurved Chrysanthemum Henry Perkins, a very full, symmetrical flower. He also showed three flowers of Chrysanthemum W. F. D. Smith, a Japanese variety of a brilliant crimson tint, and of large size, with florets that reflex somewhat.

Mr. W. SEWARD, The Firs, Hanwell, exhibited Japanese Chrysanthemums—Thos. Stephenson, May Nevill, and W. H. Whitehouse—but no award was made.

MISCELLANEOUS.

Mr. H. ROGERS, gr. to Lord RENDLESHAM, Rendlesham Hall, Woodbridge, showed Violets Marie Louise and De Parne, examples of excellent culture, the flowers large and good.

Messrs. SANDER & CO., St. Albans, exhibited a group of plants, including *Acalypha Godsefiana*, *Kentia Sanderiana*, a very graceful species; *Cirriophyllum refractum*, with greenish-coloured flowers; *Dracena thaloides*, pretty in the caulescent stage; *Stenoglossis longifolia*, &c.

L. DE ROTHSCHILD, Esq., Acton (gr., Mr. J. Hudson), had an extensive display of *Begonia Gloire de Lorraine*. The plants were in pots of $1\frac{1}{2}$ inches in diameter, and were capital, decorative objects, $1\frac{1}{2}$ to 2 feet high, and covered with flowers from base to summit. The variety, Mrs. Leopold de Rothschild, has a rather different habit, it is a sport with more pendulous habit, and flowers slightly different in tint; the blooms are not affected by fog like the other.

Messrs. H. LOW & CO., Bush Hill Park, Enfield, showed a pretty *Aralia*, named Lowe, a plant of a stiff habit, and with pinnate, dark green leaves, a useful, distinct, decorative subject.

H. J. ELWES, Esq., Colesbourne Park, Gloucestershire (gr. Mr. Lane), showed, as is his wont at this season, a considerable number of *Nerines* raised by him; they showed much variety in colour, slight variations in form, and a manifest tendency to produce leaves at the same time as the flowers. Awards of Merit were bestowed upon N. Mrs. Godman, a flower of a deep purplish-rose, and a corymb of good size; N. Mrs. Berkeley, light orange-red, flowering before the leaves show; and N. Miss Willmott, deep scarlet, fair-sized corymb, one of the showiest known. It possesses a very dense corymb.

The Duke of MARLBOROUGH, Blenheim Palace, Woodstock (gr., Mr. T. Whillans), showed three plants of *Carnation Oxford Yeoman*, a fine double bloom of a deep crimson colour and regular build.

Messrs. FORBES, nurserymen, Hawick, N.B., showed a white-flowered *Begonia Gloire de Lorraine*, named Caledonia, not presenting any specially good features, but which may improve.

Sir T. LAWRENCE, Bart., Burford Lodge, Dorking (gr., Mr. Bain), showed a new Violet, Miss J. J. Astor, a variety resembling De Parne in form, but of a reddish-purple tint.

Messrs. J. VEITCH & SONS, LTD., the Royal Exotic Nursery, King's Road, Chelsea, exhibited eighteen varieties of warm-house *Rhododendrons*, in fine condition. We wonder that no gardener ever exhibits flowers, or plants in flower, of these charming winter flowering subjects. It would appear as if gardeners scarcely, as yet, understand the cultivation of the plants, which is, however, of the simplest character.

Antholyza aethiopica var. *vittigera* was shown by J. T. BENNETT-POE, Esq., Holmewood, Cheshunt (gr., Mr. Downes), the flowers coloured scarlet and orange, and the height of the plants about $2\frac{1}{2}$ feet.

JOHN WATERER & SONS, LTD., American Nurseries, Bagshot, showed an interesting group of *Conifers*, in much variety, including many variegated forms of *Retinospora*, *Cupressus*, *Thuja*, *Juniperus*, and *Yew*.

Awards.

Awards of Merit.

Begonia Caledonia, from Mr. J. FORBES, Hawick, N.B.
Antholyza aethiopica var. *vittigera*, from J. T. BENNETT-POE, Esq., Cheshunt.
Violet Mrs. J. J. Astor, from Sir TREVOR LAWRENCE Burford, Dorking.
Nerine Mrs. Godman, from H. J. ELWES, Esq., Colesbourne Park, Glos.
Nerine Mrs. Berkeley, from H. J. ELWES, Esq., Colesbourne Park, Glos.
Nerine Miss Willmott, from H. J. ELWES, Esq., Colesbourne Park, Glos.

Medals.

Group of fibrous *Begonias*, from L. DE ROTHSCHILD, Esq., Acton (Silver-gilt Flora).
Group of *Conifers*, from Messrs. J. WATERER & SONS, Bagshot (Silver Flora).
Group of forty-eight cut Chrysanthemums, from C. E. SHEA, Esq., The Elms, Foots Cray (Silver Flora).
Group of *Nerines*, from H. J. ELWES, Esq., Colesbourne Park, Glos. (Silver Banksian).
Group of Violets, from Mr. H. ROGERS, Rendlesham Hall, Woodbridge (Bronze Banksian).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), J. Gurney Fowler, T. B. Haywood, J. Colman, J. Douglas, E. Hill, F. J. Thorne, W. H. Young, H. J. Chapman, J. Gabriel, E. Ashworth, A. H. Smee, C. J. Lucas, R. B. White, H. Ballantine, and J. Jaques.

The varieties of *Cattleya labiata* again formed a prominent feature of the show, a bright group of them being arranged by LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr., Mr. J. Hudson), and exhibited great variety of form, and some were unusually richly coloured, resembling in this respect *C. labiata* Warneri.

Mr. ED. KROMER, Bandon Hill, West Croydon, also showed a collection of fifteen distinct forms of his importation of *Cattleya labiata*, all of good quality, the slate-blue tinted *C. l. Kromeri* being a singular novelty. Mr. KROMER also showed *Cattleya granulosa gigantea*, a very large form, with flowers 6 inches across, and petals $1\frac{1}{2}$ in. wide, of a clear bronzy yellow tint; lip rich purple (Bronze Medal).

Mr. JAS. DOUGLAS, Edenside, Great Bookham, showed a collection of cut spikes of *Cattleya labiata* of much merit, together with several *Cattleya Loddigesii*, *Cologyne Massangeana*, and *Aerides suavisimum* (Bronze Medal).

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, staged a group in which fine forms of *Cattleya labiata* predominated. In the centre of the group, a plant of the beautiful yellow *Cypripedium insigne* Laura Kimball was observed, and other noteworthy subjects were a grand specimen of the singular *Dendrobium Cologyne* with many curious purplish flowers; good forms of *Oncidium Forbesii*, *Catasetum callosum*, *Sobralia Lindenii*, *Laelio-Cattleya* x *Novelty*, &c. (Silver Banksian Medal).

R. BROOMAN-WHITE, Esq., Ardlarroch, Garelloch, showed about two dozen spikes of remarkably fine forms of *Odontoglossum crispum*, samples of over 200 plants in flower at Ardlarroch. The type is a very fine one, varying from the large unspotted forms to those more or less blotched with red-brown. Two of the finest were *O. crispum* "Geraldine," a variety with handsome flowers, shaded with rose-pink, and blotched with reddish-brown, and *O. crispum* xanthotes, "White's" variety, nearly identical with the original in Baron Schroder's collection. The fine white flowers had a few light orange spots on the sepals, and the lip more profusely marked with blotches of dark yellow, but none of the brown markings usually seen on the species. The collection was awarded a Silver Banksian Medal.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow (gr., Mr. H. Holbrook), showed an interesting collection of hybrid *Cypripediums*, including *C. x Wilmslowianum* (*insigne* Chautini x *Harrisianum* superbum); *C. x*, said to be between *Harrisianum* superbum and *Druryi*, but with more resemblance to *C. x Madame Jules Hye* (*Spicerianum* x *Sallieri* Hyeannum), with a fine white dorsal sepal, having a heavy purple band up the centre, and a slight rose-coloured tint; *C. x* Jo grande Charlesworthi, with rose-lined upper sepal; and *C. x* Louisa Fowler, Harefield variety (*insigne* var. x *Chamberlainianum*), the cross in both directions being shown. Mr. ASHWORTH also showed *Cypripedium* *insigne* var. "Geo. Ashworth," a very large flower of the ordinary type, and *Laelia pumila* *Ashworthiae*, with white flowers slightly tinged with lavender, the front of the lip being slaty-blue, a near ally of *L. p. Low's* var.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed *Cattleya Bowringiana* concolor, of an uniform pale-rose colour; a pretty light rose *Cattleya labiata*, and *Laelia pumila*, "Low's variety," with peculiar blue-tinted lip.

NORMAN C. COOKSON, Esq., Oakwood, Wylam, Northumberland (gr., Mr. Wm. Murray), showed a pretty hybrid *Laelio-Cattleya*, of unrec'd parentage, resembling *L. C. x Decia* (L. Perrini x *C. aurea*). The fragrant flowers were pale rose, the front of the lip rose-purple from the base, running into very fine purple lines.

A. S. HITCHINS, Esq., St. Austell, Cornwall, showed *Cypripedium* x *Hitchinsiae* (*insigne* x *Charlesworthi* ♂), a pretty flower, in general characters resembling a small *C. x leeanum*, but with plain indications of *C. Charlesworthi* in it.

General GILLESPIE, Brynderwen, Usk, Monmouthshire, sent a fine spike of a good form of *Odontoglossum* x *Anderson-*

ianum, with cream-white flowers, flushed with yellow and spotted with chocolate colour.

A. H. SMEE, Esq., The Grange, Hackbridge, showed a magnificent form of *Cattleya labiata*, resembling the darkest-coloured C. L. Warneri; and a little green-flowered Orchid from the Amazon.

Awards.

Cattleya labiata.—Sent by LEOPOLD DE ROTHSCHILD, Esq., A. H. SMEE, Esq., and R. I. MEASURES, Esq. Many fine forms of this useful winter-flowering Orchid have been certificated, but not until the present meeting was the type so honoured (First-Class Certificate).

Cattleya labiata Gilmourii.—From Mrs. BRIGGS-BURY, Bank House, Accrington (gr., Mr. Wilkinson). A charming variety, of excellent form and substance, with pure white sepals and petals. The front lobe of the lip bore a velvety violet-purple blotch, surrounded by a broad, crimped, pure white margin, the tube being tinged with bright yellow. A very striking and attractive variety (First-class Certificate).

Cattleya labiata Alaba Princess of Wales.—From Messrs. JAS. VEITCH & SONS, Chelsea. A most beautiful form, with broad segments, the flower being wholly pure white, with a slight yellow tinge in the tube, and a scarcely perceptible tinge of pink in the centre of the front lobe (First-class Certificate).

Dendrobium Cologynae.—From Messrs. HUGH LOW & CO., Enfield. A fine plant of the species, often called *Bulbophyllum Cologynae* in gardens, was shown. It bore many large flowers of a whitish line, heavily marked with purple, the front lobe of the lip being wholly purple (Award of Merit).

Fruit and Vegetable Committee.

Present: P. Crowley, Esq., J. Cheal, E. Shaw Blacker, W. Wilks, J. J. Veitch, W. Poupert, A. F. Barron, A. H. Pearson, A. Dean, S. Mortimer, W. Farr, C. Herrin, G. Woodward, G. Wythes, F. Q. Lane, W. Balderson, E. G. Norman, W. J. Simpson, and W. H. Divers.

Mr. A. J. THOMAS, The Nurseries, Rodmersham, Sittingbourne, made a capital exhibition of Pears and Apples, the latter being of unusually large size generally, and glowing with brilliant tints. The Pears were likewise extremely fine specimens, especially those of Madame André Leroy, Beurré Luizet, Doyenné du Comice, Belle de Thon ars, and Beurré de Fougerey. The dishes and varieties numbered 120.

The Duke of RUTLAND, Belvoir Castle, Grantham (gr., Mr. Divers), showed eighty-two dishes of Apples and Pears, mostly of good size and colour for that district, and remarkably free from blemishes. The collection contained some uncommon varieties, of large size and attractive exterior, namely Dewdney's Seedling, Bascombe Mystery, Castle Mayo, and Jenkinson's Seedling. Good examples of Prince Bismarck and Round Nonsuch were included. A fine looking Pear Jean Van Geert was observed.

Messrs. J. VEITCH & SONS, LTD., showed a cross between John Dowie Crab and Cox's Orange Pippin, named Mr. Leopold de Rothschild. To all intents and purposes it resembles a Crab, but a pleasant-eating Crab. The tree is a prolific bearer, and the fruit small, and of a yellow tint.

Mr. W. ALLAN, gr. to Lord SUFFIELD, Gunton Park, Norwich, showed some General Todleben Pears, of enormous size.

Messrs. GEO. BUNYARD & CO., nurserymen, Maidstone, showed a new variety of Apple, under the name of Miss Phillimore, a flat, angular fruit, of a bright crimson colour on the sunny side, and yellowish-green on the opposite side.

Some excellent Cabbages came from the Society's gardens, but nothing which calls for special mention.

Miss BRETON, Forest End, Sandhurst (gr., Mr. Handley), showed some capital, well-blanching Cauliflowers.

Awards.

Mr. A. J. THOMAS, nurseryman, Rodmersham, Sittingbourne, for forty dishes of Pears, and eighty dishes of Apples (Silver-gilt Knightian Medal).

ROYAL HORTICULTURAL SOCIETY'S GARDENS, Chiswick, Cabbages Early October, Early Eclipse, St. Martin's, Perfection, and Jubilant (Award of Merit).

His Grace the Duke of RUTLAND, Belvoir Castle, Grantham (gr., Mr. H. W. Divers), thirty-six dishes of Pears, and forty-six dishes of Apples (Silver-gilt Knightian Medal).

Messrs. G. BUNYARD & CO., Maidstone, Apple Mrs. Phillimore, raised from Cox's Pomona and Northern Greening (Award of Merit).

Mr. ALLAN, Gunton Park, for General Todleben Pears (a Cultural Certificate).

Miss BRETON, Forest End, Sandhurst, Berkshire (gr., Mr. Handley), Cauliflowers (Cultural Certificate).

ROGER LEIGH, Esq., Barham Court (gr., G. Woodward), Pears Emile d'Heyst (First-class Certificate).

WOLVERHAMPTON CHRYSANTHEMUM.

OCTOBER 31 and NOVEMBER 1, 2.—This Society held its annual exhibition on the above dates, being the first time that the exhibition has been extended for three days. The exhibition upon the whole was one of the best that the Society has yet held. The Chrysanthemum blooms were of large size, and good in colour. Fruit was plentiful and of good quality, and there was considerable competition in the classes for Vegetables.

For a group of Chrysanthemums, the 1st prize was awarded to Mr. G. Bradley, gr. to Miss PERRY, Wergs Hall, Wolver-

hampton; Mr. W. SHINGLER, taking 2nd prize. These were good groups, but the one awarded 1st prize was remarkable for the heaviest blooms, and the group was the better arranged.

The class for groups of Chrysanthemums and foliage plants arranged for effect, brought four competitors: Mr. G. BRADLEY again taking 1st prize; the 2nd prize going to Mr. J. T. Simpson, gr. to C. T. MANDA, Esq., The Mount, Compton.

CUT BLOOMS.

For thirty-six incurved blooms, in not fewer than eighteen varieties, Mr. J. C. HUNT, gr. to PANTIA RALLI, Esq., Ashted Park, Leatherhead, Surrey, was awarded 1st prize; his flowers being of first-class quality throughout; Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, being a very close 2nd.

For thirty-six blooms of Japanese, distinct, the competition was very keen, Mr. T. S. VALLIS, Brouham, Chippingham, securing the 1st prize with blooms of Madame Carnot, E. Molyneux, J. Pockett, Phoebus, Mrs. Coombs, Mrs. Mease, T. Carrington, Jane Molyneux, Emily Towers, Graphic, E. Tabor, Mrs. J. Belsant, Mutual Friede, Fair Maid, Mons. Chenon de Leche, Pride of Madford, C. B. Haywood, Miss M. Underhay, Australian Gold, Mons. Hostie, Mrs. J. Lewis, Pride of Exmouth, Colonel Smith, Sov. D. F. Rosette, Lady Ridgway, E. Teichman, Louise, Madame Rivoire, Le Grand Dragon, Robert Powell, Madame Gustave Henri, Madame J. Bruant, Soleil d'Octobre, Mr. A. Barratt, and Mrs. W. Popham; Mr. GOODACRE again running a very close 2nd.

In the classes for twelve incurved distinct, and twelve Japanese distinct, Mr. GOODACRE was well to the fore in each case.

The prizes offered for the premier incurved and Japanese blooms went to Mr. J. C. HUNT, who showed a grand bloom of Duchess of Fife in the former, and a well-developed flower of Mrs. Mease in the latter class.

FRUIT AND VEGETABLES.

The fruit classes were well filled. For two bunches of Black Grapes, Mr. S. BREWELL, gr. to H. H. FRANCE HAYHURST, Esq., Everley, Wellington, Salop, was 1st; while Mr. W. Ashwood, gr. to R. A. NEWELL, Esq., Admanton, Wellington, was 1st for two bunches of White Grapes.

Mr. C. Kingscote, gr. to F. W. BRAMPTON, Esq., Brocken-cote Hall, Kidderminster, was 1st in the classes for three dishes of dessert and three dishes of kitchen Apples; while Mr. R. Jones, gr. to C. A. SMITH RYLANDS, Barford Hill, Warwick, was 1st for three dishes of Pears.

Vegetables were well shown, and in quantity.

MISCELLANEOUS.

Floral sprays, epergnes, and floral arrangements generally added greatly to the attractiveness of the show. Two of the local nurserymen put up a stand each of floral arrangements, the prizes for the same going to Mr. J. E. KNOTT, of Tottenham Nurseries, and Mr. R. LOWE, florist, of Wolverhampton, respectively.

NON-COMPETITIVE EXHIBITS.

Among these, Apples and Pears, from Messrs. T. RIVERS & SONS, Sawbridgeworth; twelve bunches of Grapes, from Mr. POOLE, Hill Grove, Kidderminster; baskets and bouquets of Chrysanthemums, from JONES & SONS, Shrewsbury; and a white sport from Begonia Gloire de Lorraine, from Mr. J. FORBES, of Hawick, G. W.

TORQUAY & DISTRICT GARDENERS.

OCTOBER 31 & NOVEMBER 1.—The above Society held their fifth annual Chrysanthemum and Fruit Exhibition on the above dates.

The groups of plants were very good, and the chief prize was secured by Mr. E. Pople, gr. to the Rev. A. B. WREX.

Mr. C. R. Prowse, gr. to W. FORD, Esq., Edgelow, secured the Silver Medal of the National Chrysanthemum Society with thirty-six Japanese blooms.

Vegetables were extremely well shown, Mr. F. E. Peacock, gr. to P. W. BUSHBY, Esq., being 1st in a keen competition for collections.

Fruit was also well represented, and the chief honours were secured by Mr. T. Warren, gr. to the Dowager Lady HALDON.

Messrs. J. HOUSE, of Westbury-on-Trym, exhibited Violets.

Messrs. CURTIS, SANFORD & CO., LTD., showed a splendid collection of fruit and Chrysanthemums; and Messrs. W. ALLWARD, W. BURRIDGE & SONS, G. H. PEARCE, and BROOKING BROS. were well represented. The local TECHNICAL GARDENING CLASS (Instructor, Mr. A. Pidgeon), exhibited vegetables; and Mr. W. B. SNALE had an attractive stand of Chrysanthemums and other plants, as well as fruit. Messrs. R. VEITCH & SONS, of Exeter, exhibited fruit and plants.

DEVON AND EXETER HORTICULTURAL.

NOVEMBER 2, 3.—The Fruit and Chrysanthemum Show, held on the above dates, was the 190th exhibition of the Society. The total number of entries compared favourably with those of former years, but the groups were fewer, and cut blooms more numerous. There were not so many honorary exhibitors as usual.

By reducing the groups from circles to half-circles, and placing these against the walls of the Victoria Hall, much space was gained. This was an advantage, for it is a noticeable feature in recent flower-shows that music is an important

factor in securing a good attendance, and where a good band is employed room for promenading must be found.

PLANTS IN GROUPS.

Chrysanthemums in pots, not fewer than eighteen varieties, arranged in semi-circular form, 14 feet by 8 feet, the back not to exceed 6 feet in height, quality of bloom to be the first consideration, effect also to be considered, Ferns and other small plants to be used as a border, W. BROCK, Esq., Parkerswell (gr., W. Rowland), was 1st with a fine lot of plants in fresh condition, and well balanced in colour. The arrangement might have been improved upon, and there were few dwarf Chrysanthemums in the group. Lady DUCKWORTH, Knightleys (gr., W. R. Baker), was 2nd.

For a similar group, 10 feet by 6 feet, including fifteen varieties, Mr. T. KEKEWICK, Peamore (gr., J. Abrams), was 1st; MARK FAURANT, St. Thomas (gr., T. Stark), was 2nd. To Mr. KEKEWICK's group was awarded the N. C. S. Certificate many fine blooms being included in it.

For a miscellaneous group, 10 feet by 6 feet, with not more than twelve Chrysanthemums in it, Mr. BROCK was 1st, and Lady DUCKWORTH 2nd. Mr. BROCK's was nicely and lightly arranged.

CUT BLOOMS.

Thirty-six Japanese, distinct (open competition), Silver Cup and £3 as 1st prize. This was stoutly contested, and some very fine blooms were shown. The Cup went to H. HAMMOND SPENCER, Teignmouth (gr., Geo. Foster). Amongst his best blooms, were Werther, Madame G. Bruant, Souvenir de Molin, Le Grand Dragon, Jane Molyneux, Marie Calvat, Madame (Philip) Rivoire, Mrs. J. W. Barks, N. C. S. Jubilee. The N. C. S. Certificate was awarded to this exhibit, and it was well worthy of the distinction. Mrs. DENNIS, Pilton, was 2nd.

For eighteen Japanese blooms, distinct, VINCENT STROCKEY, Langport (gr., J. Lloyd), was 1st; Mr. DENNIS was again 2nd; and for twelve Japanese, Mr. R. B. JAMES, Bideford (gr., R. Yeo), was 1st.

For six white blooms of one variety, Rev. E. E. HEATHCOTE, Rewe (gr., T. Tucker), was 1st with Madame Carnot; while for six yellow, one variety, Mr. HAMMOND SPENCER was 1st with Australian Gold.

The same exhibitor took premier place for six blooms of any other colour, with perfect specimens of Australia.

The 1st prizes for twelve incurveds and six incurveds were also secured by Mr. FOSTER.

CUT BLOOMS IN VASES.

Prizes of £2 and £1 were offered for the best three vases of cut Chrysanthemums, suitable for placing on a dinner-table. There were three competitors, but the judges withheld the 1st prize.

FRUIT.

Fruit was very well shown, and a notable feature in the exhibits was that, while many of the leading varieties of Apples and Pears were staged, few of the older varieties were found in the collections.

For three bunches of Black Alicante Grapes, Rev. H. CLERK, Exmouth, was 1st, with good bunches, carrying a fine bloom.

In Muscat of Alexandria (three bunches), 1st prize went to Rev. HAMILTON-GELL, Winslade (gr., G. J. Barnes); while 1st for bunches of any other sort went to Sir JOHN DAVIE, Bart. Creedy Park (gr., W. Seward), for fine fruits of Gros Maroc.

Mr. SEWARD also took Mr. Jones' special prize for three bunches, distinct varieties, with Gros Maroc, Black Alicante, and Lady Downe's Seedling.

APPLES.

Premier honours for a collection of thirty dishes of Apples, distinct, fifteen dessert and fifteen culinary, went to Sir JOHN SHELLEY, Bart., Shobrooke (gr., R. Mairs), but he was hard-pressed by Sir JOHN DAVIE. Size and colour were the predominant features in the first and second collections.

For the twelve varieties, Rev. E. G. HEATHCOTE was 1st, with fine Mere de Menage, Peasgood's Nonsuch, Bramley's Seedling, Cox's Orange Pippin, Mannington Pearmain, and King of the Pippins.

Sir THOS. ACLAND, Bart., Killerton (gr., J. Garland), was 1st for six varieties, dessert, with exceptionally fine fruit of Mother, Red-bibbed Greening, Adams' Pearmain, Cox's Orange, Cornish Gillyflower, and Blenheim Orange Pippin; and he also took 1st for six culinary varieties, with Bramley's Seedling, Peasgood's Nonsuch, Lady Henniker, Waltham Abbey Seedling, Mere de Menage, and Blenheim Orange Pippin. The Mere de Menage staged by Mr. R. B. JAMES, showed wonderful colour; and the fruit of the same variety, staged for the best single specimen, won by Mr. W. SANFORD, Wellington (gr., S. Kidley), weighed 21 ounces. Cox's Orange Pippin, Cornish Gillyflower, King of the Pippins, Lane's Prince Albert, Court Pendu Plat, and Newton Wonder, were well shown in the single dishes. The prize for the best culinary variety went to Rev. HAMILTON-GELL, for Alfriston; and for the best dessert variety to Admiral PARKER, Delamere (gr., Mr. Selley), for King of Tomkins County. The best flavoured went, as usual, to Cox's Orange Pippin, staged by MARK FAURANT, St. Thomas.

PEARS.

Sir THOS. ACLAND was 1st for six dishes dessert and three culinary. Mr. Garland also took 1st for six varieties dessert, showing Beurré Bosc and Doyenné du Comice in fine form.

Mr. SLADE, Poltimore, in the single dishes, showed grand fruit of Doyenné du Comice; Mr. GARLAND, of Josephine du Malines; Mr. MAIRS, of Beurré Bachelier; and Mr. BARNES, of Beurré Diel. The any other variety (dessert) was won with

Beurré Bachelier, and the culinary with Vicar of Winkfield; the best-flavoured going, as formerly, to Doyenné du Comice, shown by Mr. ABRAMS.

MISCELLANEOUS.

Dinner-table plants were unusually well shown, and the 1st prize was won by MARK FARRANT, and the 2nd by Lady DUCKWORTH.

TRADE EXHIBITS.

Messrs. ROBERT VEITCH & SON, Exeter, occupied the chief position, with a large collection of fruit, Chrysanthemums, and house plants, also showing La France, Amiral Avelon, Mrs. J. J. Astor, and St. Helena Violets. The FELDON NURSERY COMPANY, Sowton, had a collection of greenhouse plants and cut flowers; Messrs. HOUSE & SON, of Westbury-on-Trym, a good representative collection of Violets; and Mr. JOHN FORBES, Hawick, showed his white sport of Begonia—Gloire de Lorraine. Messrs. BUNYARD & SON, Maldstone, staged a fine collection of fruit.

BIRMINGHAM GARDENERS.

OCTOBER 30.—At a meeting held in the Athletic Institute, John Bright Street, Mr. W. B. Latham in the chair, Mr H. T. MARTIN read a practical paper on "The Forcing of Vegetables."

There was a fair display of Perennial Asters in variety shown by Mr. W. B. CHILDS, florist, Acocks Green.

KINGSTON AND SURBITON.

NOVEMBER 9.—Held as usual in the large Drill Hall, Kingston-on-Thames, the present show looked small as compared with so many others held in smaller halls, where the exhibits are crowded. That much of the Society's former prestige has been lost there can be no doubt, the chief cause, doubtless, being found in the swarms of competing societies of a similar nature that have grown up all over the kingdom, and attracting exhibitors in every direction. There were but two miscellaneous plant groups, the President's 1st prize of £5 being taken by Mr. J. Locke, gr. to SWINFEN EADY, Esq., Weybridge. Table and herried plants were, as usual, plentiful; but specimen Chrysanthemum plants were notably absent.

The premier class for cut blooms was the new one for thirty-six Japanese. This has replaced the old cut bloom class. It brought five entries—all excellent flowers, the best, however, coming from Mr. W. Jinks, gr. to E. BRUCE, Esq., Walton; a superb lot of blooms, hard to beat anywhere. Mr. J. Hunt, gr. to PANTIA RALLI, Esq., Ashted Park, was a good 2nd; and Mr. F. King, gr. to A. F. PERKINS, Esq., Holmwood, was 3rd. Mr. King was, however, a good 1st with twenty-four incurved blooms, having both fine flowers and the best known varieties; Mr. Hunt was 2nd, with six incurved (one variety).

Mr. Bolton, gr. to Mrs. BLAKE, Coombe Edd, was 1st with good C. H. Curtis, the same variety and Lady Isabel coming 2nd and 3rd.

Mr. Mileham, gr. to A. T. SMITH, Esq., Leatherhead, had the best twelve Japanese. Mr. King the best twelve incurved Japanese, very fine flowers; and also was 1st with twelve reflexed or tasselled Japanese. Mr. Peard, gr. to W. S. BOND, Esq., Surbiton, being 2nd in both cases.

Mr. Jinks had a very fine dozen anemone Japanese; and Mr. Fisher, gr. to Madame NICHOLS, Surbiton, the best twelve trebles of single-flowered varieties, very fine flowers, rather too flatly shown.

There were numerous local classes, inclusive of table-decorations, baskets, bouquets, and similar decorative material.

The best four dishes of fruit came from Mr. LOCKE. Mr. W. Taylor, gr. to C. BAYER, Esq., Forest Hill, had the best Black Grapes in good Alicante, and excellent white in Muscat of Alexandria. Mr. J. LOCKE had the best six dishes of Apples in a large competition, and Mr. FORBES the best four dishes of Pears.

Large collections of Apples were shown by Mr. A. DEAN (fifty dishes), prettily decorated with small plants and foliage; and by Mr. COOPER, gr. to Col. EMBERTON, Stead House, Hampton Court; and Mr. WILL TAYLER, of Hampton, had excellent examples of his outdoor Grape, Reine Olga.

Mr. HAYWARD, florist, of Kingston, filled a large table with handsome decorative material very attractively.

WARGRAVE AND DISTRICT GARDENERS.

NOVEMBER 1.—At a fortnightly meeting of the above Society, held on the 1st inst., the President, H. F. Nicholl, Esq., being in the chair, a most interesting lecture was delivered by Mr. L. Treacher, F.G.S., of Twyford, on "The Story of a piece of Chalk."

The country for some miles round rests on a bed of chalk, and the lecturer repeatedly showed how gardeners and horticulturalists were affected by the presence of the chalk formation underlying their gardens, &c. The lecture was illustrated by means of a number of lantern views of maps and sections of the district, photographs of noted chalk hills, cliffs, and rocks, drawings and photos of the fossils found in the chalk, diatoms, foraminifera, radiolaria, &c.

NOTICE.—Owing to the great pressure on our space, many reports of Societies are being held over till next week.

BOOKS: *L. M.* You will find something of what you want in the supplement to Nicholson's *Dictionary of Gardening* (Upcott Gill), which may be had separately. Mr. B. Dayden Jackson has in the press just the book you want. We believe it will be issued before the end of the year.

CAPE PLUMS: *C. J. W. G.* Probably a *Diospyros*; the fruit must be bletted like a Medlar before eating.

CATTLEYA LABIATA: *E. C. H. P.* A very fine variety.

FUNGUS ON LARGE BEECH TREE: *R. P.* Washing with the Bordeaux Mixture might be efficacious if you possess a fire engine with which to spray it all over the tree twice or thrice whilst the tree is bare of leaves.

GERMINATION OF MUMMY WHEAT AND PEAS: *S. W.* Not supported by trustworthy evidence.

INSECTS, &c.: *R. P.* 1, There are two different things, the red fungus is a *Nectria*; 2, an insect, *Chermes fagi*, allied to the American blight of Apples (see answer to *R. P.*); 3, scale insect on Pear, cut out and burn all the affected wood.—*J. W., Scotsman.* *Pulvinaria* (Coccus) *flocciferus*, Westwood, ♀. Your plant is in a hopeless condition. Cut down close, and carefully sponge the remaining wood with soap-and-water. Burn infested leaves and branches which have been removed. *R.*

INSECTS ON BEECH: *R. P.* Pump Paris Green or Petroleum emulsion over the tree, using a spray pump. You should place some absorbent material round the base of the tree, and for some distance around, so that but little of the dressing gets to the roots. The smoke from large smoulder heaps of rubbish if kept burning for a day or two would extinguish a great deal of insect life.

LIME RUBBISH: *J. Bean.* Excellent for incorporating with the soil of the fruit-tree borders everywhere, especially those which will be planted with stone fruits. It may be stored for future use with Vines in borders and pots, orchard-house trees, and various species of pot plants.

MUSHROOMS GROWING IN THE WINTER: *C. B.* Cannot be done without stable-manure.

NAMES OF FRUITS: We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. They should be just approaching ripeness, and they should be properly numbered, and carefully packed. A leaf or shoot of each variety is helpful, and in the case of Plums, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.—*G. P.* 1, Fig is the variety D'Agen; 2, Brunswick. The D'Agen is one of the finest late varieties.—*A Subscriber.* 1, Melrose. The spots are the indication of a disease termed Apple scab, which is caused by the attacks of a fungoid parasite known as *Fusicladium dendriticum*, which usually also attacks the leaves. The best method of dealing with it is to spray with diluted Bordeaux Mixture two or three times, once before the flowers open, after they have fallen, and while the fruits are quite small; 2 is Winter Greening.—*A. M.* 1, Golden Spire; 2, Holland Pippin.—*A. B.* 1, Tower of Glamis; 2, Hawthornden.—*Old Subscriber.* 1, Cockle Pippin; 2, Royal Russet; 3, Isleworth Crab; 4, Pomme Grise; 5, Winter Greening; 6, specimen quite unfit for identification.—*C. W. S.* We cannot identify your Apple; possibly it is a local variety. Certainly it is not Lemon Pippin, which you will find accurately illustrated in outline in the late Dr. Hegg's monograph of the Apple.—*J. E. W.* 1, Irish Reinette; 2, Manks' Codlin; 3, De Neige; 4, Calville Blanche d'Hiver; 5, Pomeroy (Lancashire); 6, Hollandbury.—*G. H.* 1 and 4, quite rotten; 2, Socré Verte; 3, Belle Julie; 5, Cobham.—*G. S.* Apple Harvey's Wiltshire Defiance; 1, Doctor Nelis; 2, a bad specimen, not recognisable.—*W. R. Preston.* 1, Fall Pippin; 2, Early Nonpareil; 3, Comte d'Egmont.—*R. G. J.* 1, Scarlet Nonpareil; 2, Chester Pearmain. The Pear was marked through being

over-ripe.—*C. G. N.* 1, Adams' Pearmain; 2, Scarlet Pearmain; 3, not known; 4, Pigeonnette; 5, Rymer; 6, Golden Winter Pearmain.—*B. C.* 1, Smart's Prince Arthur; 2, Lord Derby; 3, Cobham; 4, Loddington; 5, Scarlet Crofton; 6, Reinette Grise.—*W. J. W.* Only one fruit was received, and that was in a partly-decayed condition, and consequently quite unrecognisable.—*Oakdale.* 1, New Hawthornden; 2, Northern Greening; 3, Lemon Pippin; 4, unknown, probably local; 5, decayed and smashed; 6, Flushing Spitzenburgh.—*T. S., Wills.* 1, Hallowell Seuring; 2, Piles' Russet.—*W. S.* The fruits were so much damaged in transit, owing to the breakage of the package, that we could not identify them.—*J. T.* 1, Golden Spire; 2, Greenup's Pippin; 3, Green Tiffing; 4, Yes, it is Lord Suffield. We have seen many similar twin fruits this year in various stages of union. *H. F.* They have been previously dealt with.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*Heinrich Henkel.* *Aster grandiflorus*, L.—*J. V. S.* *Vitis Thunbergii*.—*T. H.* *Acer dasycarpum*; sometimes called *A. eriocarpum*.—*W. W.* *Crataegus coccinea*; not *Pyrus serbus*. *Bulbophyllum crassipes*, Hook. f., *Bot. Mag.* t. 4166 (as *B. Careyana* which it is not).—*Mac.* 1, not found; 2, *Dracena Sanderiana*; 3, *Codiaeum* (Croton) *cornutum*; 4, *C. Evansianum*; 5, *C. Mortii*; 6, *Chimonanthus fragrans*, so far as we can tell by the leaf only.—*R. N. H.* *Dendrobium Coelogyne*, often called *Bulbophyllum Coelogyne* in gardens.—*S. H., Suffolk.* 1, *Codiaeum* (Croton) *Nester*; 2, *Lady Zetland*; 3, *Etna*; 4, *Anitiminensis*; 5, *Hammendi*; 6, *Queen Victoria*.—*H. F.* 1, *Agrostis alba*; 2, *Bromus sterilis*; 3, *Bromus arvensis*; 4, *Centaurea nigra*; 5, Not recognised; 6, *Bromus* sps.—*C. W.* 1, *Pyrus terminalis*; 2, *Spiraea* sps.—*E. Y.* and *Cestrian.* *Euonymus europæus*, Spindle-tree.

POTATOS: *H. T. C.* The tubers sent exhibit a stage of the true Potato disease, described and figured in these columns in 1891 (vol. ix., pp. 361, 362, and 363) as *Phytophthora infestans*.

SCALE INSECTS ON PEAR TREE: *R. P.* You will find that a smothering mixture of adhesive clay, lime, cowdung, and sulphur, made of the consistency of thick paint, better than all the washes recommended. The work of painting the tree with this mixture must be thoroughly done, and may need repeating before the spring.

STEPHANOTIS GRANDIFLORA: *T.* Let the plant rest for, at the least, a period of three months. We will give fuller directions in our next.

TREATISE ON FERN PROTHALLI: *F. T. G.* Apply to the secretary of the Royal Society, Burlington House, Piccadilly.

VARIETIES OF CHRYSANTHEMUMS: *J. A.* We have no exact knowledge, but there must be many hundreds all told, although the first favourites in all sections may not number 200 varieties. Old ones are being constantly superseded by improved forms, and cease to be grown.

COMMUNICATIONS RECEIVED.—*W.*, Colchester.—*J. H. W.*—*J. W.*—*W. K.*—*D. T. F.*—*A. O'N.*—*S. A.*—*H. A. P.*—*H. W.*—*H. T. M.*—*H. T.*—*E. C.*—*Dr. U. D.*, Berlin.—*J. H.*—*R. Y. S.*—*A. D. H.*—*J. Continued Increase in the Circulation of the
"GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

(For Markets and Weather, see p. xii.)

THE

Gardeners' Chronicle

No. 673.—SATURDAY, NOV. 18, 1899.

THE ENGLISH TULIP.

THE advent of Lord Mayor's Day brings round once more the time when the orthodox florist of the old school planted his show Tulips, always in rows of seven, making the three colours, bizarres, roses, and byblœmens, run in a sort of herring-bone pattern across his bed. It is to be hoped that this delightful fancy will soon receive some new recruits. The Rose and the Carnation never had more adherents than they now possess; the Auricle keeps its position well, but the Tulip, once the very height of the florist's aspirations, is still in the "winter of its discontent," and has only a few devotees still engaged in handing on the treasures they received from their forbears to a new generation.

The causes of this decline are not far to seek; florists generally have been rather under a cloud for the last few years. A race of gardeners has arisen who regard flowers as a more or less untrustworthy means of decorating gardens, instead of gardens as a place in which to grow flowers. Then there are very few indeed among ordinary working gardeners who have the patience or the carefulness required to keep a Tulip collection in order—the best of the work must be done by the amateur himself. The difficulties of purchasing completed (if they did not begin) the disfavour that fell upon the show Tulip—an uncertain flower at the best, this very unsteadiness enabling the unscrupulous seller to palm off worthless strains with big names, or even to introduce old sorts under high-sounding aliases.

What the Rose-grower admires at a show he can be sure of buying, but the Tulip-fancier might give a long price for something that had been magnificently exhibited, and never get a bloom fit to be seen.

Tulips are unstable enough yet, but there are now a good many sorts that may be trusted to do their duty year by year; nor are they dear or difficult to obtain since Messrs. Barr have formed their great collection at Long Ditton. The amateur who wants to try his hand at Tulip-growing should confine his attention to a few sorts, and pay a little extra to get the best strains; in a few years he will have plenty of increase, and if his keenness grows, he will not then have to throw away a lot of wasters.

There are three main classes of Tulips—bizarres: yellow grounds, marked with red, brown, or black; byblœmens: white grounds, marked with purple or black; and roses: white grounds, marked with various shades of red or scarlet; and in each class are several sturdy, vigorous kinds, which furnish most of the prize-winners every year.

Such are among bizarres: Samuel Barlow, still rather dear, but the most superb of all Tulips; Sir Joseph Paxton (get the good strain), and Dr. Hardy; among byblœmens, Adonis, Chancellor, and Talisman; and among roses, Annie McGregor, Aglaia, and Mabel.

With these alone a young grower would be able to show and win.

There must be a future yet for the Show Tulip; it is essentially the hobby for the man with a small garden, who likes to do most of the work himself. Two beds, 12 yards long by 4 feet wide, will hold 1000 Tulips. Even if a man has to dig the whole of this over himself, it is no very big job; and once planted, though plenty of attention is wanted, the work is light. Again, the Tulip is perfectly hardy, and wants no coddling against cold or rain; it will do well on most soils, and will stand the smoky atmosphere of a town. One of the best collections in England is grown on a hillside in south-east Lancashire, where every tree has long since given place to a factory chimney—a very inferno—where the grass grows wearily, and even the wayside nettle has succumbed. Of course, the Tulip wants care and protection when in flower, but so does any flower that is to be perfect for showing; and the large cup of the Tulip in bloom at the end of May is particularly open to attack by hail or driving rain, though even then it is not one tithe so tender as a Rose.

But the show-table is not the be-all and end-all of Tulip-growing, though showing gives the stimulus that keeps the florist up to his best. The charm of the Tulip is in the flower itself, a charm that is not flung at you, that wants learning; but, once possessed, a charm that makes other beauties common.

The casual gazer prefers the glow of a Gesneriana, or the curious splendour of a parrot Tulip, especially if his æsthetic development has passed from primitive formalism to the picturesque stage—the one is " quaint," the other " intense;" he will appreciate the grace of the show Tulip when he reaches the ultimate haven of pure "form." Then he will feel its suave curves and subtle markings, the exquisite sympathy of contour and colour that marks Nature's intentions fully wrought out. The whole art of the florist is to bring to their highest term the natural inclinations of a flower towards symmetry and form.

The Tulip has had its palmy days, but the best have yet to come; few as are its lovers, there are some of us raising seedlings year by year, determined that the next generation shall see the perfection, that comes and goes from our present-day flowers, a settled inheritance of the new races. A. D. H.

NEW OR NOTEWORTHY PLANTS.

LÆLIO-CATTLEYA × SANTIAGO.

THIS is the name of what appears to be a new hybrid raised by Henry A. Clinkaherry, gardener to C. G. Roebing, Esq., of Trenton, New Jersey, U.S.A. The recorded parentage is as follows:—L.-C. × Hippolyta var. Phoebe × Cattleya intermedia var. Parthenia. The flowers bear a striking resemblance to those of L.-C. × intermedia flava. In the latter the perianth organs are a trifle more slender, tinted with pale yellow. However regarded, the new hybrid shows the strong influence of C. intermedia. Oakes Ames, in "American Gardening," October 14, p. 700.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM HARRYANUM.

THIS pretty and fragrant Odontoglossum, so distinct in form from all others, first flowered with Messrs. Jas. Veitch & Sons, in August, 1886, but seems to have never been so well represented in

collections as it deserves to be. It is one of the easiest to cultivate, and most free to flower of any of the genus. A flower of a very fine form of the plant is sent by Mr. W. T. Gould, Rose Mount, Hayfield, near Stockport. The bloom in question is large, well formed, and richly coloured, the yellowish sepals and petals being heavily marked with a dark purple tint, and the broad, white lip, with its singular-looking crest is prettily marked in the centre with violet colour. J. O'B.

THE THRUSH, BLACKBIRDS, &c.

WHY these two are classed together on the same level as garden friends or foes I know not, for they are very distinct in their habits, one also being much more serviceable than the other. The blackbird is one of the most destructive birds in the fruit-garden, which it frequents in considerable numbers, while the thrush is a more solitary bird, very seldom more than two being seen together. Generally only one pair occupies a certain radius, and any thrush intruder is at once fought, and mostly soon driven away. The blackbird will eat Apples, Plums, Pears, Figs, Gooseberries, and Strawberries in quantity; while the thrush seldom touches Apples, Pears, and not often Plums. And so little harm do they, and so much, so very much good, that I for one most devoutly wish that more than a pair would visit my garden. I know that young blackbirds, being light-coloured, and spotted on the breast, are often mistaken by casual observers for the song-thrush, and have had them sent to me as such. Early and late, for more than sixty years, I have watched the habits of the thrush, and can safely say that few birds render so much good service. Not so with the blackbird; he is a most voracious fruit-eater. I have had this year nearly the whole of my crop of Plums eaten, or damaged by them. Not like the thrush, they are so plentiful, that one week at my old garden my gardener caught over forty under the nettings, &c.; and here I have counted six or eight together at early morn—rather more, than fewer—tasting my Apples, &c. Nor does the blackbird eat snails as the thrush does, nor slugs, but, like it, he loves a worm. I have watched the blackbirds busy among my Gooseberry-bushes, rapidly lessening the quantity of fruit, and this while a thrush near-by was cracking the shell of a snail. I quite agree with Mr. Hart, that the thrush is a gentle, innocent bird, and that he does not attack large fruit—at least, such is my experience. Of course, there is no rule without an exception; birds feed differently in very dry and hot weather, but as regards the thrush, I have never had enough in my garden, while of the blackbird there have always been far too many. Again, the thrush will sing eight months of the year, and the blackbird only three. Harrison Weir, Sevenoaks.

TOMATOS AS A FIELD CROP.

HAVING devoted much time, study, and practice to the cultivation of the Tomato in the open-air for some years past, I may, perhaps, be allowed to add a few remarks to your article on the subject on p. 257.

There is no doubt whatever that in fine, warm, and comparatively dry summers, such as we have experienced for the last four or five years, Tomatoes may be successfully cultivated in the open air, with little or no shelter or protection of any kind, and that under such conditions the plants produce their fruit in abundance, and will even ripen the greater part of it, with much less care and trouble (and consequently less expense) than in the case of plants grown under glass. Moreover, when good results are thus obtained from plants in the open air, and these are grown on a considerable scale, the venture becomes an exceedingly profitable one, as will be readily seen from reckoning the returns from, say, a single acre of land under this crop. Supposing the plants to be set out in rows 3 feet apart, with a distance of 18 inches between them, which I cou-

sider a very suitable distance, the acre will accommodate nearly 10,000 plants; but, allowing for failures, &c., we will say 9,000. Supposing these to produce an average crop of 5 lb. of fruit apiece, this being a very safe estimate, and the entire crop to be disposed of at the low price of 2d. per lb., the total receipts would amount to no less a sum than £375! But, as every practical man knows, the actual returns never amount to as much as they work out on paper, and yet even half or two-thirds of this sum ought to leave a very respectable margin of profit.

But to descend from the theoretical to the more practical side of the question. As a matter of fact, the whole thing hinges upon the character of the summer experienced, and this, unfortunately, can not be ascertained beforehand. If fine and dry, all will probably go well, and the venture will prove amply remunerative; but when cold and wet weather prevails, especially during the latter half of the summer, when the fruit should be ripening, it is most vexatious and disheartening to see all one's labour and expense wasted, with scarcely a possibility of preventing the loss. Intending growers should be prepared for such an emergency, which may occur again at any time.

About ten years ago, I described, and within certain limits recommended, in somewhat similar terms to those in your article, the adoption of the Tomato as a field crop in an issue of the *Mark Lane Express Annual*. But one or two wet summers followed, and wrecked the hopes of those who had given the system a trial; and when, a few years subsequently, I had the opportunity of putting out a considerable number of plants under fairly favourable conditions, another showery summer and wet autumn destroyed the crop almost entirely, and resulted in a loss instead of a gain. Last season, again, I planted out some hundreds of good forward plants (chiefly Early Evesham), and secured a really enormous crop of fruit, though the soil here is very unfavourable for the growth of Tomatoes generally, many plants carrying 10 lb. or 12 lb. a-piece, and some, more; but a sudden change to cold and wet weather towards the end of September, when the crop was at its best, induced a bad attack of disease, and spoiled nearly half the total yield. Could the plants have been protected by some means at that time the result would have been something extraordinary; but failing this, the only thing to be done in such cases is to cut the whole of the trusses entire, and finish them in a fairly warm greenhouse, or else to pull up the plants bodily, and hang them up in any warm, dry place until all the fruit that can ripen has done so.

The importance of getting strong, forward plants ready to be put out at the earliest possible date is of the utmost importance. Late or backward plants, though they may do well up to a certain point, and the summer may prove fine, are almost sure to get caught by the wet weather that usually arrives in August or September, and then the bulk of the fruit is spoiled. Even if it does not become diseased, the fruits decay round the stalk and drop off. I employ whenever possible good, stout plants in 5-inch pots, singly, with one truss set or setting, and one or two more expanding, and they ought to be ready to plant out in fairly warm and sheltered spots, on an early opportunity after the first week in May. Such plants soon get to work, and afford an early as well as an abundant crop, but to produce, say, 10,000 of such plants, requires an area of glass of something like 5000 sq. feet, exclusive of pathways, &c., or half-a-dozen houses of 100 feet by 12 feet each. These, however, could of course be utilised for growing another crop within them subsequently.

The plants must be supported by some means, for any fruit that touches the soil is sure to become decayed, diseased, or eaten by slugs, &c. On light, dry soils, and in a warm season, water will probably be required to some extent, and, as a rule, more so during the early part of the season while the plants are growing, than later on. A mulch of littery-manure laid over the roots, however, saves

a lot of labour in this direction, and benefits the plants greatly in other ways also.

Of all the varieties I have tried in the open air (and this comprises nearly the whole of the leading kinds), I have found nothing to equal, much less surpass, the Early Evesham. It is at once the hardiest, dwarfest, most prolific, and the surest setting variety in cultivation, and the only one of which I can say that I have never known a healthy plant to fail to set a single blossom naturally. I

The fruit is rough, certainly, but by carefully selecting the best plants for a few years, I have secured a type of which the bulk of the fruit is nearly as smooth as that of E. Ruby, and averages 3 or 4 ounces apiece. Trusses of 2 to 3 lb. apiece are quite common in this variety, and plants only 3 feet high will carry on an average five trusses each. Next to this variety, I find the old Large Red (selected), Ifield Gem, and Chemin Rouge, to afford the best results. B. C. R.

FIG. 120.—PITTOSPORUM COLENZOI, IN LORD ANNESLEY'S GARDEN, CASTLEWEILAN, CO. DOWN.

had a batch of it under glass a few years ago, and though the crop was very heavy, the fruit was too much corrugated, sutured, or "rough" for this purpose, but believing it to be admirably adapted for outside work I tried it in this way the following year, and with such excellent results that I have sworn by it ever since. One year I was tempted by some remarkably fine weather in April, to put out a few plants on a rather sheltered south border the last week in that month, but colder weather following, the plants were white with frost several times in the early mornings, but I sprinkled them with cold water, and they seemed none the worse, and fruited abundantly.

PITTOSPORUMS.

I OFTEN wonder why it is that these lovely shrubs are not more usually grown by lovers of plants. In a recent number Mr. Burbidge referred to the specimens in these gardens, where we have grown them in quantity for many years. I venture to send two photos, one of P. Mayi (fig. 121), which is the most common, and which we find perfectly hardy—in fact, we generally choose it for the most exposed situations; and one of P. Colensoi (fig. 120), not named after the Bishop, but after a forest conservator in New Zealand, and which is considered here one of the most beautiful plants in the garden. In

the month of May, when *P. Mayi* is covered with its purple flowers, on a still evening the scent is so powerful that you can detect it fully 30 yards away from the plant, and the bees come to it in thousands.

Nearly all of the *Pittosporums* are natives of the southern hemisphere, and they grow here with great luxuriance. In the terrible winter of 1895 we certainly lost a large plant of *P. eugenioides*, about 6 feet high, which the frost killed to the ground, but all the others were uninjured. The following are the varieties grown in the gardens here: *Pittosporum Buchananii*, *Colensoi*, *coriaceum*, *crassifolium*, *erioloma*, *eugenioides*, *P. e. variegata*, *floribundum*, *lucidum*, *macrophyllum*, *variegatum*, *Mayi*,

P. Balfouriana is kept up as a distinct species from *P. aristata*, the differential characters assigned to *P. Balfouriana* being the subcylindrical cones, $3\frac{1}{2}$ to 5 inches long, with scales furnished with minute incurved persistent spines. In *P. aristata* the cones are described as ovate, from 3 to $3\frac{1}{4}$ inches long, their scales furnished with long, slender, horn-like prickles. We have not seen any cones which could be fairly called intermediate, but the resemblance is so close, that it is a matter of opinion whether the two should be kept separate or united. The cone scales of *P. Balfouriana*, as represented in Sargent's figure, are broadly ovate acuminate, whilst in *P. aristata* they are represented as sub-orbicular, with a long, slender horn.

(SEE P. 370.)

nigrescens, *Ralphii*, *rhombifolium*, *rigidum*, *tenuifolium*, *Tobira*, *P. T. variegatum*, *undulatum*, *phylloræoides*. *T. Ryan*, *The Gardens, Castlewellan*.

TREES AND SHRUBS.

PINUS BALFOURIANA VAR. ARISTATA.

We are indebted to Mr. Croucher, of the Ochtertyre Gardens, near Crieff, for specimens of the cones of this tree. We have already given an illustration of the cones, which we have taken to be a variety of *Balfouriana*. But since that time, Professor Sargent has enriched the literature of the subject by his superb work on the *Silva of North America*. The eleventh volume of that publication (published in 1897) is devoted exclusively to the American species of *Pinus*. We note that in it

P. Balfouriana grows on rocky slopes and ridges on Scott Mountain, California; in similar situations near the head of the Sacramento river, and on the southern slopes of the Sierra Nevada, growing with *Pinus contorta* or *Pinus monticola*. *P. aristata* is said to occur on the Rocky mountains of Colorado, southern Utah, central and southern Nevada, southwest California, and north Arizona, mixed with *Pinus flexilis* and *Picea Engelmanni*.

P. aristata, as grown in British gardens, is remarkable for its short, curved, brightly-coloured leaves, in fascicles of five; the fascicles being themselves densely clustered in rounded masses, with intervals between the clusters, thus producing a beaded appearance.

We are not sure that we have ever seen the true *Pinus Balfouriana* in British gardens; the specimens we have under that name might well be those of *P. aristata*. There are some differences in the

number and position of the resin canals; thus in most of the specimens named *aristata*, there is but a single resin canal in the centre of the dorsal surface, whilst in specimens called *Balfouriana* the number of resin canals is variable. Until cones are produced, it is not possible to give a satisfactory opinion upon specimens sent. *M. T. M.*

THE HERBACEOUS BORDER.

HYPERICUM HUMIFUSUM.

THIS is the name of a little native St. John's-wort, which those who observe flowers in their country walks have often seen growing by the roadside, on rather bare, grassy banks. It is a prostrate evergreen perennial, botanically speaking, a shrub, that is to say it never dies back or loses any of its growths, and having only one root-stem, it covers a larger area every year with its leaves and branches. It also multiplies rapidly by self-sown seedlings. I have given this description because I have found it the best out of many plants I have tried for covering the surface of the soil where delicate and weak bulbs are grown, as it both prevents caking and anticipates the growth of that bane of wet soils, the *Marchantia*. The veil it makes is so thin, and so easily pierced, that anything can grow up through it, though the soil below continues clean and free from moss and lichen. The Himalayan St. John's-wort, *H. reptans*, might be used in the same way if sufficiently hardy to resist cold winters in the open border, but it is not so in my garden. At least a dozen dwarf carpeting plants might be named as apparently suitable, amongst them *Erinus alpinus*, *Mentha Requienii*, *Arenaria balearica*, *Veronica repens*, but there are objections to all of them. Some of the dwarf mossy *Saxifrages* have been recommended, with the suggestion that they support the flowers of those bulbs which come out before their leaves; but where slugs are as common as they are at Edge, these plants afford them a nice shelter, under which they feed upon the flower-buds of the bulbs as fast as they rise through the soil. The next best covering to the *Hypericum*, especially where a larger surface has to be covered quickly, is *Acena microphylla*, or another species of similar habit, but prettier in its colouring, *A. Buchanani*. These do not seem to shelter slugs much, and cover large spaces on some of my borders without doing any harm. *C. Wolley Dod*, *Edge Hall, Malpas, Oct. 29.*

THE CHEMICAL COMPOSITION OF MEADOW-GRASS.

THE experiments were commenced in 1856, and are still in progress, so that the present is the forty-fourth year of their continuance. There are about twenty plots, two of which have been continuously unmanured, and the remainder have respectively received different descriptions or quantities of manure of known composition. A report on the "Agricultural Results" was published in the *Phil. Trans.*, Part I., 1880; and a second on the "Botanical Results in the *Phil. Trans.*, Part IV., 1882. The present paper deals with a portion of the "Chemical results."

In all cases, of both first and second crops, the dry matter and the ash, and in most the nitrogen, have been determined. In selected cases determinations have been made of the amount of nitrogen existing as albuminoids, and in some of the amount of "crude woody fibre," and of crude fatty matter. More than 200 complete ash analyses have also been executed.

It was found that the chemical composition of the mixed herbage was very directly dependent, not only on the seasons and on the supplies within the soil, but very prominently also on the description of plants encouraged, and on the character of their development; so that it was essential to a proper interpretation of the variations in the chemical composition, to bear in mind the differences in the botanical composition. Hence a summary table was given showing the characteristic differences in the botanical composition under the different conditions as to manuring, the influence of which on the chemical composition it was sought to illustrate.

As the investigation involved the consideration of the chemical composition of the mixed produce of about twenty plots over forty or more seasons, including the discussion of the results of more than 200 complete analyses of the ashes of the separated or the mixed herbage, attention was called to the state of existing knowledge as to the rôle or function in vegetation of the individual constituents found in the

ashes of plants; and this was seen to be very imperfect. Further, in calculating the percentage composition of the "pure ash," the plan usually adopted was to exclude not only the sand and charcoal, but also the carbonic acid. The authors considered, however, that the presence and the amount of carbonic acid associated with the fixed constituents in plant-ashes was a point of considerable significance, and they entered into some detail as to the methods of determining the carbonic acid in ashes, and as to the results obtained.

In order to throw some light on the connection between the growth of the crops and their mineral composition, results relating to the separated gramineous, the separated leguminous, and the separated "miscellaneous" herbage of the mixed produce, grown without manure and by different manures, were first discussed. To obtain more definite evidence illustrating the connection between character and stage of growth, and the composition of the products—especially the ash-composition—results relating to the Bean-plant, taken at successive periods of growth, and also to the first, second, and third crops of Clover, were next considered. Lastly, in further illustration, results as to the nitrogen and the ash-composition of crops of three different natural orders—Wheat representing the Gramineæ, Swedish Turnips the Crucifere, and Beans and Clover the Leguminosæ—were given.

The general result was, that there were very characteristic differences in the composition of the ashes of different crops according to the amounts of nitrogen they assimilated. Red Clover, for example, yields large amounts of nitrogen over a given area, part of which is due to fixation, but much is certainly taken up as nitrates from the soil; and the results show, that the greater the amount of nitrogen assimilated, the more is the ash characterised by containing fixed base in combination with carbonic acid; presumably representing organic acid in the vegetable substance before incineration. The conclusion was that, independently of any specially physiological function of the bases, such as that of potash in connection with the formation of carbohydrates, for example, their office was prominently also that of carriers of nitric acid, and that when the nitrogen had been assimilated, the base was left as a residue in combination with organic acid—which was represented by carbonic acid in the ash. Further, existing knowledge—as to the condition in which combined nitrogen is found in soil waters, as to the action of nitrates used as manures, as to the presence of nitrates in still-growing plants, and as to the connection between the nitrogen assimilated, and the composition of the ash as had been illustrated—pointed to the conclusion that, at any rate a large amount of the nitrogen of the chlorophyllous vegetation on the earth's surface was derived from nitrates; whilst, so far as this was the case, the *raison d'être* of much of the fixed base found in the ashes of plants would seem to be clearly indicated.

The various results and conclusions above referred to were found to afford material aid in the interpretation of the differences in the chemical composition of the mixed herbage of the different plots which was next considered, so far as the first crops over the first twenty years were concerned.

For the purposes of the illustrations the differently manured plots were arranged in four groups as follows:—1. Plots without manure or with farmyard manure. 2. Plots with nitrogenous manures alone. 3. Plots with mineral manures alone. 4. Plots with nitrogenous and mineral manures together. Average results for each plot, generally for a period of eighteen years, 1856-1873, and including the percentages of nitrogen, crude ash, and pure ash, in the dry substance of the produce; also the percentage composition of the pure ash were brought together in a table, and are discussed in detail. The close dependence of the chemical composition of the mixed herbage on its botanical composition, and on the character of development of the plants, was throughout illustrated. It was further shown, that the mineral composition of the mixed herbage was very directly dependent on the supplies available to the plant within the soil. Indeed, when it was considered that the mixed herbage of permanent grass-land includes plants of very various root-range and root-habit, and that some of them vegetate more or less almost the year round, it was not surprising to find that the composition of the produce was, upon the whole, a somewhat close reflection of the available supplies within the range of the roots. It was, in fact, much more so than in the case of individual crops grown separately. Within certain limits, this was the case even with the constituents of, so to speak, less functional importance than those which more obviously determined the description of plants encouraged and the character of their development. It was at the same time obvious, that when the more functionally important constituents are available in relative abundance, those which are of less importance in this respect were taken up and retained in less amount than they otherwise would be; the result being determined in great measure by the character of growth induced.

For example, if potash be liberally available the produce is much more stemmy, and the amount of soda, of lime, and to some extent of magnesia also, will be less relatively to the potash. In defect of sufficient potash, on the other hand, more of soda, or of lime, or of both, will be taken up and retained; but the herbage will at the same time be more leafy and immature. That is to say, the constituents are not mutually replaceable in the processes of growth, but accordingly as the one or the other predominates, so will the product of growth be different.

There can be no doubt, that luxuriance or vegetative activity is intimately associated with the amount of nitrogen available and taken up. Further, it may be stated that chlorophyll formation to a great extent follows nitrogen assimilation. But the results relating to the increased amount of non-nitrogenous substance yielded in the mixed herbage under the

influence of the various manures clearly indicated that the nitrogen being taken up, and the chlorophyll formed, the carbon assimilation, and the carbohydrate formation, depended essentially on the amounts of potash available. It may be stated as a matter of fact that, in practical agriculture, artificial nitrogenous manures are chiefly used for crops containing a comparatively low percentage of nitrogen in their dry substance, and yielding comparatively low amounts of nitrogen per acre. Indeed, they are mainly used for the increased production of the non-nitrogenous bodies—the carbohydrates—starch and cellulose in the cereals, starch in Potatoes, and Sugar in the Sugar-cane and in root crops, for example. And now, in the case of the mixed herbage of grass land, it was seen that, provided the mineral constituents, and especially potash, were abundantly available, a characteristic effect of nitrogenous manures was to increase the production of the non-nitrogenous bodies. Sir J. B. Lawes and Sir J. H. Gilbert in "*Proceedings of Royal Society, 1899*,"

CARDIFF CASTLE GARDENS.

THE following remarks refer to a few features in these gardens that impressed me during a recent visit there:—

The Apple-trees, which have been planted twenty years, and are upon the Crab stock, may best be described as large bushes; they are chiefly planted by the sides of walks, enclosing the vegetable quarters, and are about 15 feet in height, whilst their lower branches have a spread of about 22 feet in diameter. A remarkable feature of these trees is that their branches are clothed, almost the whole length, with fruit-bearing spurs. The lower spurs have been retained in vigour by keeping the branches sufficiently thin to allow the sun and light to penetrate into the centre of the trees. I was not surprised that Mr. Pettigrew was unable to conceal his pride in these grand trees. The fruit at the time of my visit had been gathered, but I saw it in the fruit-room, and its quality was excellent. The following varieties were most prominent:—Cox's King, Ribstoo, and Blenheim Orange Pippins, Warner's King, Reinette du Canada, Rymer, Alfriston, Wellington, Beauty of Kent, and Bramley's Seedling.

The fruit in the earlier vineries had been exhausted, but amongst the later Vines the Alicantes were very noticeable. The house is span-roofed, 60 feet long by 24 feet wide, and 20 feet high. The Vines, which were planted sixteen years ago, differ from each other to the extent that some are confined to one rod, and others have as many as seven. But this circumstance has no apparent effect upon the crop, which is a remarkably good and even one throughout the house. The bunches were symmetrical in shape, and were composed of large berries, well finished in point of colour and bloom. The weight of the bunches averaged about 2 lb. each, some of them reaching 3 lb., and there were about eighteen bunches to each rod. They are produced upon short-jointed wood, and rather small in size compared with that of the bunches. The roots of the Vines have the run of both outside and inside borders, and the stimulants employed are liquid cow-manure and concentrated artificial manure. Mr. Pettigrew has a firm conviction of the efficacy of the former, and of top-dressings composed of maiden soil, and an addition of crushed old mortar or lime.

Having heard of Mr. Pettigrew's success with pot-Vines, I was quite prepared to see good canes in readiness for next year, but not such as were shown to me, standing upon a bed of ashes, situated so that the canes might get all the sun possible. The canes are about 12 feet in length, short jointed, and have stout leaves and prominent buds, while the largest canes measure 2 inches in circumference at a foot from their base. They were grown from eyes started early last February. The vinery in which they will be fruited is a span 12 feet wide and 10 feet high, with a centre walk, and raised narrow borders on either side, in which the Vines, after being turned out of their pots, will be planted early in February, and trained upon an arched trellis, so that the points of the rods reach some distance down the opposite side to that where they are planted. This arrangement has the effect of checking the flow of sap, and consequently also the buds near the points of the Vines from

taking the lead at the expense of the lower ones. The varieties grown in this way are Alicante, Alnwick Seedling, Gros Maroc, Foster's Seedling, Buckland Sweetwater, Black Hamburg, Muscat of Alexandria, and Madresfield Court. Each cane is allowed to carry sixteen bunches of Grapes.

Cucumbers and Melons were in evidence, and the varieties Cucumber Cardiff Castle, and Melon Holborn Favourite, were both raised by Mr. Pettigrew; the former being generally known and especially valued by market growers, needs no further comment. The Melon is above medium size, beautifully netted, white fleshed, and of delicious flavour.

A plant-stove of the same dimensions as the Alicante vinery contains a collection of well cultivated plants, and nearly the whole length of one of the side stages was occupied by a healthy lot of Calanthes, chiefly C. Veitchi, in 6-inch pots. The most conspicuous feature in the house at the moment were three plants of Allamanda Hendersoni, growing in pots, placed at equal distances beneath the apex of the house. They had long, bare stems, reaching a trellis some 5 feet in width, fixed near the top of the house throughout its length. From end to end the trellis was covered with shoots furnished with bright foliage, and abundance of large flowers, affording a gorgeous display.

A long row of Belladonna Lilies planted near the front wall of a range of glass-houses was flowering splendidly, and a great many spikes had been cut. They are treated in a like manner to those described by Mr. H. J. Clayton in the *Gardeners' Chronicle* for October 7. *Thos. Coomber*. [A descriptive and illustrated article upon the Marquis of Bute's gardens at Cardiff Castle was published in the *Gardeners' Chronicle*, September 9, 1893. Ed.]

ALLAMANDA HENDERSONI.

OUR illustration (fig. 122), taken in the garden of W. Long, Esq., Thelwall Heys, Warrington, exhibits a plant of Allamanda Hendersoni, growing in the best position for the plant; namely, on the roof of a stove, where it would be exposed to the most ardent rays of the sun. The plant has evidently benefited by its position, judging by the number and size of its blossoms. The view gives only a portion of the plant, which extended doubtless up the roof to the apex; and was obligingly forwarded to us in September last by Mr. R. Poulton, the gardener at Thelwall Heys.

SCOTLAND.

AMONG THE APPLE-TREES.

LATE autumn is always a busy time for those gardeners who to their other duties add the study of pomology, and treat the fruit-trees under their charge with that amount of care which is so essential to continued success. It is surely taking a not too optimistic view of the situation to believe that the number of those who continue to limit their attention to an annual pruning during the season of rest is decreasing, and that the practice is now confined very largely to those who are content to follow leisurely in the rear. All who pursue hardy fruit-culture intelligently, must naturally have their attention directed at this season to the condition of the trees. It is the period when a revision of the arrangement and disposition of the branches and shoots alike of standard and of dwarf trees can be made with the greatest certainty; when over-luxuriant growth may be checked by root-pruning with the least risk of the operation having a bad effect on the trees; when worn-out subjects may be removed, and their places filled with young ones.

I wish to confine the remarks which follow solely to Apples, as being the most important of all hardy fruits, and also because what may be enunciated concerning these, will apply to a great

extent as well to other hardy fruits cultivated in the open garden.

The elimination of whole branches or of shoots, which, from whatever reason, have become too crowded, is a practice which requires annual attention. The same trees may not every year call for thinning, but there will always be some, and the time best suited for the work is after fruit has been gathered and before the foliage has fallen. It is then possible to determine to a nicety the position each branch ought to occupy, in order to allow the foliage on all parts of the trees to have access of direct sunshine. And it is well to remember that

quality can only be obtained from trees which do not possess a multiplicity of branches, and their numerous shoots and mass of foliage.

The sum of the above remarks is, naturally, that there is slight danger of anyone thinning branches too severely, and that an open arrangement of the shoots is to be recommended. It may also be noted that large spurs, which are frequently unfruitful or else produce small fruits only, are best cut off at the present time.

But even when due attention has been afforded trees in the above respect, there will generally be some individuals which still fail to fruit with regu-

generally is effective, is to cut a trench from 3 to 6 feet distant from the bole of the tree, and one-third or one-half round its circumference, according to the size of the tree, and then to sever every root met with; moreover, all roots passing downwards, from near the middle of the ball, must be sought for and cut. The remainder of the circumference should be treated in like manner the next year, or two years later. At least a portion of the soil employed to replace that discharged in cutting the trench should be good loam, and in any case it ought to be new soil. Trees which have been properly prepared in their earlier years at once

FIG. 122.—INTERIOR OF A HOthouse IN MR. W. LONG'S GARDEN, THELWALL HEYS, WARRINGTON, SHOWING A PLANT OF ALLAMANDA HENDERSONI IN FLOWER. (SEE P. 372.)

the removal of branches or of shoots which are a bar to others enjoying that necessary element to the full, is not a wasteful practice, because setting aside for the moment the fact that a tree cannot be fruitful in portions where light is excluded, the lesser quantity of fruit borne by the tree will exceed in weight and quality that borne by a greater number of such shoots, because in this instance the individual fruits will be greatly increased in size. There is yet another reason why branches should be very thinly disposed, and it is one which has perhaps received less attention than its importance demands. It is, that a tree is capable of bringing to the fullest development only a limited number of branches; or in other words, that an annual supply of fruit of full size and good

quality, or which, if fruitful, produce it of a quality not so good as desired. The only remedy for these defects is either lifting and transplanting, which is the best method to pursue with trees still young and easy to handle; or, in the case of older subjects, to prune the roots of the trees where they stand. In every instance where the former method can be safely carried out, it is preferable, as conducing to the production of fruits of the best quality, hence it is a practice that compensates the trouble of occasionally transplanting all trees while yet young. These, however, which have not been so treated, or which have grown out of the early condition thus imposed upon them, can by no other means than that of root-pruning be induced to assume a fruitful habit. The simplest form of root-pruning, and one that

respond to this kind of treatment, whilst these not so prepared may take a year or two ere they begin to bear fruit with regularity.

In addition to these, there are, in many gardens, trees so old that digging round them as a means of rejuvenation exerts no influence for good, and it is a waste of time and of ground to permit them to remain, and the only sensible method of proceeding is to grub them up and plant young trees in their places. For this and other purposes a small nursery, or, at least, a corner of the garden, should be devoted to the production of young fruiting trees to be ready on any occasion to transplant. These are, by annual transplantation, kept in a healthy and fruitful state, and the roots always so close at home, so that a removal to a permanent

position gives no check either to their progress or vigour.

It needs hardly to be urged that the staple, previous to planting the young tree, should have been removed, and new soil, &c., brought in, and that this material should be of as simple a nature as possible, avoiding animal dung above all things. In the process of planting, it may be indicated not only that the practice of planting deeply cripples the energies of the tree, but the opposite practice, even to the extent of raising the bole a few inches above the general ground-level, while in no degree inimical to vigorous growth, tends also to a fruitful habit. There are cases, such as in gardens, the soil of which is composed of inert material, where surface-planting is undoubtedly beneficial, and is not an uncommon practice. It is not, however, so generally recognised that very poor peaty soil, or that superimposed thinly on a bed of gravel or sand, is equally hurtful to Apples, and in these cases really wonderful results are effected by planting the trees almost on the surface, and covering the roots with a layer of the best procurable soil. It is also noteworthy that in northern districts, where under ordinary conditions fruit of such fine varieties as Ribston Pippin and King of the Pippins can be produced of good size and colour only when trained against a wall, the mere raising the soil a foot or so above the general level in open quarters, and planting the trees therein, exercises a very beneficial effect—not indeed so great as that derived from a wall, but still greatly superior to planting on the ground-level.

There are other points connected with this subject which I would like to touch upon at the present moment; but one only needs mention the question of variety. It is a universal failing among gardeners to cultivate too many varieties. At the same time it is a failing that leans to the side of virtue; but when one continues to shuffle along with varieties which on an average of years indicate their unsuitability to the soil or the climate, then it is time to make a clearance of them. Young gardeners need to be warned not too hurriedly to replace varieties which are found generally to succeed in the district by others that are more popular, until they have determined by actual trial the value of these. Indisputably valuable sorts, such as Wellington, Alfriston, Lord Suffield, Hawthornden, Stirling Castle, and Cellini, cannot be unreservedly relied on everywhere, and what is true of these, may be true of others. The writer may be allowed to illustrate his advice by a case in point. A few years ago, several hundred trees were required for a certain purpose, and they were ordered from a leading firm of nurserymen, who on their part most kindly advised the substitution of a more popular variety, which, however, had proved unsuitable, and had to be refused. The selection made by the gardener has proved eminently successful; how it might have turned out if experience had not taught him to reject the *bona fide* offer of what most people would have considered a better, cannot of course be determined; but in the circumstances, he certainly acted not injudiciously. B., East Lothian.

FRUIT REGISTER.

TREE-STRAWBERRIES.

THESE have been obtained by Mr. L. Baltet by tying up the runners so as to make them assume a vertical direction, and by removing all the lateral buds which are produced on this shoot. Tree Violets are produced in the same way.

DIAMOND JUBILEE GRAPE.

A figure of this new Grape is given in the number of the *Gardener* for November 4. It was raised by Messrs. D. and W. Buchanan, as a cross between Cooper's Black and Gros Colmar. The berries are oval, deep black, and of excellent quality.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener, North Mymms Park, Hatfield.

Phyllocactus.—As soon as these plants have completed their growth for the season, they should be rested by withholding water at the root to a great extent; all that is required being as much as will keep the cladodes plump until flower-buds appear in the spring. Much root-moisture afforded regardless of the needs of the plant, is always injurious to the *Phyllocacti*, and the sure result of over-watering during the winter is loss of roots, and, as a consequence, an unhealthy appearance. It is, however, not an easy matter to kill them outright by neglect. The beauty of the blossoms of the newer crosses is so striking that no amount of attention to their simple requirements ought to be lacking. The plant may be safely wintered in a house having a night temperature of 50° to 55°, and it is possible to winter them in one with a minimum temperature of from 45° to 50°. It is very necessary that the pots in which they are grown should be well drained, the plants suffering greatly from a water-logged soil; and even at the present season, every pot should be examined, and if the drainage be found defective, it should be put into good order.

Richardia Elliottiana.—The foliage of the latest of these plants is now dying off, which is an indication that no more water should be afforded till growth has recommenced, either naturally in the early spring, or sooner, by moderate forcing. When the soil in the pots has become dry, lay them on their sides under the stage in an intermediate-house for two months, taking care that they are placed out of the way of drip. Upon the first signs of new growth, place the plants in the light, and afford water. If spathes are required in the winter, roots of a flowering size, which have been resting for two months at the least, should be selected. Let them be put into 6-inch pots with silver-sand immediately around them, and the top of the root kept at about 1½ in. below the surface of the soil. The potting-compost may consist of loam two parts, peat or leaf-mould one part, and a considerable quantity of silver-sand. The pots should be drained with large crocks in order that there may be no need to afford water directly after potting the roots; the soil should be used in a fairly moist state, and water sparingly applied till the roots begin to push into the soil. A place on a shelf in the stove will suit them for the present.

Cannas.—These plants must receive no more water after this date, but be dried off, and then stored for the winter in a late Peach-house or other cool, dry structure, from which frost can be excluded.

FRUITS UNDER GLASS.

By W. STRAUNKELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

The Orchard House.—Where several succession Peach-houses exist, it is a good practice to get forward with the winter work in the orchard-house before the very cold weather sets in: pruning, washing, tying the trees, and cleansing the glass. The foliage of Peach and Nectarine-trees may now be easily removed with a new birch-broom, and that of other fruit-trees in this house comes off equally early. Where the cleansing of the fruit-houses is made a kind of reserve work for the young gardeners and labourers in bad weather, the cold houses should be the first dealt with. It is not necessary to put the borders in good order at the present time unless the weather being very cold, a set-to at such hard labour is a welcome change to tying and pruning the trees. The present time affords a suitable opportunity to re-arrange the trees. Replace worn-out ones with others obtained from the nursery, or from the walls in the home garden. If such trees in the home garden and nursery are periodically root-pruned, as they may require it, they are removable without much, if any, check being inflicted, and carry a crop of fruit next year as good as an undisturbed tree. In pruning and training, the aim of the operator should be the preservation of as much fruiting-wood as is necessary for the obtaining of a good crop, without any crowding of the summer shoots ensuing. In many

gardens the head-gardener prunes all the indoor trees, but the men are entrusted with the tying, and they should be instructed to remove any branches which, if left, would tend to crowding.

Pot-trees now standing out-of-doors should be sunk in the soil, or on beds of coal-ashes, or the pots and roots protected by leaves and litter against frost. The pruning of such trees may be performed at any period before March. In gardens where the bullfinches are apt to take the buds, pot-trees, especially Plums and Pears, should be frequently examined, and measures taken to protect them if it is seen that there is a loss of buds. During the next few weeks, especially in mild weather, all cold fruit-houses should be well ventilated day and night.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Berry-bearing Trees and Shrubs.—When the frosts have destroyed the flowers, and the deciduous trees and shrubs have lost their leaves, berry-bearing trees and shrubs, if planted in quantity, help to brighten up shrubberies, lawns, and the walls about a garden. Amongst plants effective when grown against a wall, or creeping over bold masses of rockwork, or forming a rugged outline to shrubberies, are the *Cotoneasters*, of which *C. congesta*, *microphylla*, *rotundifolia*, *thymifolia*, are distinct in the form of the foliage and size of the berries. The evergreen bush, *C. Simonsii rupestris*, and the deciduous varieties of *C. frugida*, *affinis*, and *lævis*, all produce pretty red and coral-coloured berries, which remain a long time in beauty. *Crataegus pyracantha*, *fructea lutea*, and *C. p. Lelandi*, clothe a wall with dark green foliage the whole of the year, and afford masses of orange-scarlet coloured berries on growth of the previous year; and by a course of judicious pruning, the plants may be made to fruit over the whole plant. The plants which I have mentioned are in every instance hardy, and capable of thriving in most soils, and cool or warm aspects. *Euonymus europæus* and *C. latifolius*, with their red fruits, afford nice contrast when planted amongst dull-looking shrubs. *Hippophae rhamnoides* (Sea Buckthorn), with its glaucous foliage, and clusters of orange-coloured berries, has a good effect when planted on the edge of the shrubbery, or as a group by themselves, but being dioecious, male and female plants should be planted in close proximity to each other, and in light or sandy soil they will grow and produce suckers freely. *Arbutus Unedo*, with its Strawberry-like fruit, and *A. Andrachne*, both of which possess greenish-white flowers, which are borne in clusters, are very pleasing, and being rather tender, should only be planted in warm and sheltered positions. The variegated and green-leaved *Aucubas* berry freely since the male variety has been introduced from Japan. Hollies of all kinds, green and variegated-leaved, are all beautiful when laden with fruits. *Berberis vulgaris*, with coral-red fruits; *B. atropurpurea*, with purple; and *B. aristata*, with black fruits, succeed well anywhere, even in the most exposed situations. *Pernettya mucronata*, and its many seedling varieties, bearing pink, rose, red, and crimson-coloured, also white berries, are exceedingly handsome plants to serve as edgings and small beds; *Skimmia oblata*, with bright vermilion-tinted berries; *S. o. var. Veitchii*, coral-red; *S. japonica*, red-coloured berries. *Pernettyas* and *Skimmias* succeed in a mixture of peat and loam, or in loam which does not contain lime.

Gladiolus.—Though the hybrid varieties of *G. Lemoinei* and *G. Nanceianus* are considered hardy in warm, light soils, it is much safer to treat them in the same manner as is done with the *G. Brechleyensis*, *G. gandavensis*, and *G. Childsii* sections, that is, to lift the corms and store them in a cool, dry place till the spring. It is noticeable this year that the stems of these plants have remained green till a much later date than usual, owing to the autumnal rain and absence of sharp frosts. In lifting the corms, cut off the flower-shaft, but leave the stem and leaves, and tie several together in bundles, hang them up in a cool shed or house till dried, and when the stems part readily from the corms, lay out the latter on trays or in drawers. The brood attached to the parent corms should be separated and kept by itself in dry sand, to be sown thinly in drills next year to grow larger.

Lobelia splendens and its varieties may be raised by seed sown in the spring, but where plants already exist, stronger plants may be obtained by division. At this season the plants should be lifted entire, and stood in a coolinery till the soil becomes dry, when the stems should be cut down and the plants potted or boxed, using leaf-mould or light soil to fill in around them. Let the roots be kept in a cool, well ventilated pit or frame, affording only as much water as will preserve them in a healthy state without inducing growth during the winter.

Salvia splendens and *S. patens*.—The first-named plant will succeed in the open ground, and may be raised from seed sown early in January. *S. patens*, on the contrary, should be raised from cuttings taken in the spring, and its roots protected from frost similarly to those of the Dahlia, by lifting and drying, and afterwards storing them in dry earth or fine coal-ashes.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

The Globe Artichoke.—The stools should be cleared of the flower-stems and decayed leaves, and be afterwards protected with a thick layer of tree-leaves and litter against frost. All seedlings which produced inferior heads should be discarded, and the stock of good varieties increased by division for the making of new plantations in the months of March and April.

Cabbages.—The mild, moist weather has favoured the growth of the early varieties rather more than is desirable, and it will be advisable to lift the plants with a spade, and then make the soil about them firm by tramping it. Let this be followed by moulding up the stems as far as the leaves.

Tripoli Onions.—The beds should be freed of weeds by the hand, and a liberal dressing of sifted soil or wood-ashes afforded, and the soil made firm on either side of the lines with the feet, the foot-marks being removed with the Dutch-hoe. It is always desirable to make two sowings of Tripoli Onions, for should the first get too forward, the plants may be drawn for salads, &c., and the second allowed to make bulbs.

Celery.—The final earthing-up of all late Celery should now be performed, taking advantage of fine days in doing this job. Let the plants be held so that but little soil gets into the heart, and squeeze it firmly round them; then bank up firmly, affording a sharp slope to the top of the ridge on either side. When sharp frost threatens, afford protection with bracken or light litter, removing this when the frost lessens.

Lettuce.—The leaves of Lettuce, after a spell of moist, mild weather, become tender, and in that state liable to injury from very slight frosts; and it is well to be prepared with litter, &c., for covering the plants lightly. The stock of available garden frames should be filled with Lettuces taken up from the beds, being careful in doing so not to break or bruise the leaves. Air should be freely admitted to the frames whenever there is no frost, and the leaves kept dry; therefore, there should be no drippy lights. Should the Lettuce-plants be inclined to run to flower, seeds of Cos varieties may be sown occasionally in boxes or seed-pans, in a heat of 55° to 60°, and such plants will be found very useful as salad during the winter.

Endive is liable to injury by even slight frost, especially the moss-curl varieties, and means of protection should be kept in readiness close by the beds.

Chicory.—A number of the plants may be lifted, and put in large pots or boxes, to be forced in a dark place—such as a mushroom-house or cellar, or under the stages of a greenhouse.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart. Clare Lawn, East Sheen.

Dendrobium Phalaenopsis Schroderianum, a plant imported in recent years in great numbers, and distributed in many instances at auction sales, will, in some cases, have been acquired by gardeners who had no experience with imported plants of this fine autumn-flowering Orchid. As soon as a consignment or a plant is received, every part should be carefully examined for the now well known *Dendrobium-beetle* that is apt to infest

these plants in their native country. I do not advise the washing of the pseudo-bulbs unless there are evidences of the insect, as injury to the dormant eyes may occur, and I should suppose that if a close watch be kept for them, and when observed, effective means are adopted against them, but little harm will be done. The plants having no leaves to preserve, it is unnecessary to protect them from strong sunlight; and they may be stood upright on a stage where light and heat in a heated house and no water afforded, the moisture contained in the air being sufficient for their present needs and for a long time to come. Some of the pieces will shortly push forth roots, when potting must be undertaken. Small pans, with perforated sides, and provided with wire loops by which to suspend them are the best. Let these be three-parts filled with crocks, over which place a compost consisting of two-parts peat and one of sphagnum-moss. The long pseudo-bulbs should be secured to the wire suspenders in order to prevent swaying about. A position near the roof of an East Indian-house is a suitable one. Do not immerse the plants or otherwise afford water during the winter, excepting on a few fine mornings, when they may be placed on the floor and gently sprayed.

Dendrobium atrovioletaceum.—Plants of this species which may have been imported about this date last year, having now become established, will probably be showing their flower-scapes. My experience with this plant is, that early in the year strong sunlight will give the young leaves a yellow tinge, but on heavy shading being afforded the plants, this discoloration was stayed. In most instances, two pseudo-bulbs have been produced in succession, though in all probability the later ones will not flower until next season. It appears to be a plant that is injured by severe drying-off, the pseudo-bulbs shrivelling very much if the compost remains dry for even a few days. It is, however, necessary, in order that the plants remain dormant during our winters, as little water as possible be afforded.

Dendrobium Wardianum and *D. crassinode*.—The flowering nodes of these two species are showing signs of enlargement, the leaves have fallen, and new growth is visible, which, to some cultivators, would suggest that more heat and moisture should be afforded the plants; this, however, is not advisable. Our plants were placed with the Mexican *Laelias*, and they are at present in a well-ventilatedinery, in which they will abide till I can distinguish the flower-buds, which is the right time to remove them to the Mexican-house. At the present time, and until root activity commences, water should be afforded only when the young pseudo-bulbs begin to shrivel. It is my practice to cut off the pseudo-bulbs below the flowering-nodes when flowers are required for decorative purposes in the dwelling, and plants thus treated for several years in succession show no ill effects from the practice.

Dendrobium Brymerianum and *Harveyanum*.—The Cattleya-house is the better one for these two species, and much less water should be afforded now that the growth of the pseudo-bulbs is completed, although these being thin, it is not advisable to keep the material in a dry state for any length of time.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Pruning Wall Trees.—Where pruning of the Pear-trees has not been commenced, there should be no further delay in commencing, so as to run no risk of delay from inability to carry on the work owing to hard weather. Early pruning is recommended as being conducive to the well-being of the trees. In the case of wall trees pruned in late summer, the necessary operations will be light. Aged trees may need the removal of a few of the long spurs, which ought to be done annually, sawing them off at about 2 inches of their junction with the branch, and smoothing the wound with a knife. It is found that the early removal of these spurs induces growth to start readily from them in the spring. If growth was renewed after the summer pruning, there will be shoots to be cut back below the break to a couple of dormant buds on the branch. The rest of the pruning will consist of shortening the leading shoots of the current year's growth to 1 or 2 feet in length, according to their strength, and cutting back weakly shoots still more, say to two

or three eyes. Young trees that are trained in the horizontal or the fan shape, must be so pruned that the branches will be regularly distributed, the past season's growth being shortened to ensure its breaking at the required points, in order to produce a symmetrical tree. Strong shoots may be left 2 or more feet in length, and weaker ones proportionately shorter. The centre leader should be pruned according to the distance apart which next year's shoots are intended to come, leaving one bud on either side, and a terminal bud, which, when it grows, will carry on the leader still higher. Cordons require to be pruned in a similar manner to a tree on a wall, and the spurs thinned out and shortened where unduly long. Providing Pear-trees are free from scale and other insect-pests, the training of the branches may immediately follow the pruning. Large branches will need tying to wall-nails, studs, or holdfasts driven into the wall, with tarred string, which will last a couple of years, and all doubtful ties should be renewed, so as to avert disasters occurring when the trees are laden with a crop of fruit. Shreds or bast do for fastening the current season's shoots. Mossy trees, and those infested with the white-scale, should be unfasted from the wall partially or wholly, and the moss removed by dry scrubbing with a stiff brush; whilst against scale insects a solution of Gishurst Compound-soap, used warm, at the full strength advised in the directions, should be applied with a new scrubbing-brush. It is very necessary that the crevices of the bark be well cleansed of scale, both young and old. In about three weeks the trees may be syringed with the soda and potash mixture, which will destroy any parasites that may remain, and give the trees a healthy appearance. To make this wash, dissolve 1 lb. of caustic soda and 1 lb. of crude commercial potash in 10 gallons of hot rain-water, and use at a temperature of 120°. Old walls, the pointing of which has been much damaged by driving nails into the joints of the brickwork should be "re-pointed," after loosening the trees from the wall. If a small quantity of cement be mixed with the mortar, the pointing will last a long time. The holes and crevices in old walls should be filled up every few years, as they form lurking-places for earwigs and other insects, which devour and spoil the fruit.

Miscellaneous.—The Apples in the fruit room should now be examined, and all fruits in the least degree decayed removed. There are always a few fruits which, from various reasons, do not keep, and these usually begin to decay during the first few weeks after being stored, and to neglect to throw them out is to invite wholesale loss. A fruit-room should be afforded air occasionally, when the outside temperature nearly corresponds with that of the room. Where fruit-trees were grease-handed early last month as a safeguard against the winter-moth, it is now advisable to examine the same, and re-dress with the adhesive substance any that are found to be dry.

A USE FOR MALT COMBINGS.—Few persons are acquainted with the fact that the sprouts from malted Barley, the so-called malt-combings, possess high manurial value, especially for plants which are grown in pots and tubs. The manure is better made in a cask or cistern, in the proportion of 40 lb. of comb to 60 gallons of water, the whole if possible being stood in the sun, in order to ferment. When the fermentation is passed, the water is fit for use, either diluted slightly with clean water or at its full strength. Many householders in towns, who frequently find a difficulty in obtaining manure-water, and which, when obtained, is evil-smelling and unfit for application to plants in and about the dwelling, would do well to make a note of this. It is a capital manure for Myrtles, Pelargoniums, Nerium Oleander, Fuchsias, Cannas, Aralias, Ficus (India Rubber-plant), Ampelopsis, Ivy, Periwinkle, Roses, &c. When the first filling of water is exhausted, a little more malt-combing may be added, and the vessel re-filled and fermented. Unsoaked malt-combings make an admirable manurial mulch for Roses, a surfacing of soil being put over all, and the whole afforded water during the season of growth. The use of this waste substance as a manure has long been recognised in this country, but we are all of us apt to forget, and fly to the dealer in manures.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, Nov. 21	Royal Horticultural Society's Committee.
	National Rose Society's Committee Meeting.
WEDNESDAY, Nov. 23	National Chrysanthemum, Floral and Executive Committees Meet.
THURSDAY, Nov. 23	Dundee Chrysanthemum Show (3 days).

SALES.

MONDAY, Nov. 20, and the following Tuesday, Wednesday, Thursday, and Friday, Dutch Bulbs, at Protheroe & Morris' Rooms.
MONDAY, Nov. 20.—Sale of Nursery Stock, at the Cooks-bridge Nursery, near Lewes, by order of Mr. W. J. Woolard, by Messrs. Protheroe & Morris, at 12.30 o'clock.
MONDAY, Nov. 20.—Bulbs, at Mr. Stevens' Rooms, King Street, Covent Garden, at 12.30 P.M.
TUESDAY, Nov. 21.—Clearance Sale of Glass Erections, Greenhouse Plants, &c., at the Mill Hill Nursery, Mill Hill Road, Acton, by order of Mr. J. Humby, by Messrs. Protheroe & Morris, at 1 o'clock.
WEDNESDAY, Nov. 22.—Great Clearance Sale of 120,000 Fruit Trees, at Perry Hill, Cliffe, near Rochester, by order of Mr. W. Home, by Messrs. Protheroe & Morris, at 11.30 o'clock.
WEDNESDAY, Nov. 22.—Great Sale of Japanese Lilies, Palm Seeds, &c., at Protheroe & Morris' Rooms, at 4 o'clock.
WEDNESDAY, Nov. 22.—Roses, Shrubs, Plants, Orchids, &c., at Mr. Stevens' Rooms.
THURSDAY, Nov. 23.—Bulbs and Roots, &c., at Mr. Stevens' Rooms.
FRIDAY, Nov. 24.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period November 5 to November 11, 1899. Height above sea-level 24 feet.

Remarks.—The first part of the week was mild and wet, the latter part being remarkable for strong south-westerly gales.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41.6°.

ACTUAL TEMPERATURES:—

LONDON.—November 15 (6 P.M.): Max. 52°; Min. 39°.

Fine—dull—foggy—no meteors seen on night of 15th.

PROVINCES.—November 15 (6 P.M.): Max. 54°; Scilly: Min. 37°, north-east Scotland.

The Wheat Problem.

SIR WILLIAM CROOKES has published, through MURRAY, Albemarle Street, his remarks on the production of Wheat in this and other countries, and the probable scarcity of this food at no remote period. Sir WILLIAM'S remarks were originally included in his address as President of the British Association at Bristol, in 1898, and they have now been revised in the light of the numerous criticisms and comments elicited by the address. Sir WILLIAM'S conclusions are, "that under the present conditions of heedless culture, a scarcity of Wheat is within appreciable distance; that Wheat-growing land all over the world is becoming exhausted, and that at some future time—in my opinion not far distant—no available Wheat-land will be left." Sir WILLIAM knows how to meet the emergency. "But I also pointed out that Nature's resources, properly utilised, are ample. I urged that instead of being satisfied with an average world-yield of 12.7 bushels an acre, a moderate dressing of chemical manure would pull up the average to 20 bushels, thus postponing the day of dearth to so distant a period that we and our sons and grandsons may legitimately live without undue solicitude for the future." No doubt Sir WILLIAM has some justification alike for his pessimism and for his optimism. Taking his figures as correct, there is no question that the yield is far less than it might be—than it is, in fact, under favourable conditions of season and manuring. Climatal drawbacks we cannot withstand, but by improvements in tillage, more frequent rotation, the more careful selection of sites, soils, and varieties, and specially by the use of nitrogenous manures in judicious combination with mineral manures, much, very much, may be done to increase the quantity and improve the quality of the product.

At present the cost of nitrogenous manures is a great drawback to the development of Wheat-culture, but we can surely trust the chemists of the future to find some means to enable us to utilise the enormous stores of atmospheric nitrogen at present allowed to remain inert. Omnipresent bacteria may be pressed into the service, as, to some extent, they are already in the case of the leguminous plants.

Whilst we must mainly look to the chemists, the botanists and physiologists will do their share. Out of the many thousands of starch and gluten-producing plants, why is it that we are practically confined to the culture of so very few? Hereditary endowments and cultivation from prehistoric times no doubt supply at present overwhelming reasons for the cultivation of cereals; but these reasons, powerful as they are now, are becoming less, as Sir WILLIAM CROOKES tells us, and they by no means preclude us from making trial of other plants. The various species of *Rumex* or Dock, to take one illustration, yield farinaceous seed in vast abundance. At present it fills no other purpose than to feed the sparrows, who, wiser in their generation than we, avail themselves of it freely. The Great Water Dock (*Rumex hydro-lapathum*) may be indicated among other species as amply worth experimental culture for this purpose. Its seeds are large (relatively), very abundant, and should present no special milling difficulties. Even supposing that the possible presence of tannin and the quality of the flour rendered it unsuitable for some purposes, it might be utilised for others, and so set free some of the Wheat now employed. There are thousands of plants awaiting trial and experiment, but no doubt much time would be needed; whilst the experimenter would, as

usual, have to encounter obstinate prejudice or listless apathy. These would be surely, if slowly, overcome, especially if Sir WILLIAM CROOKES' prophetic warning showed signs of fulfilment, and especially if some enterprising man could show that "there was money in it."

There is one thing which Sir WILLIAM CROOKES seems to have overlooked, and that is the power which is in the hands of the selector and the cross-breeder. Those who have witnessed the experimental cross-breeding of Wheat as practised, for instance, by Messrs. CARTER & Co., must have been struck with the results of cross-breeding and selection in materially increasing the yield, in developing forms suitable for special localities, as well as others which, relatively at least, are free from the attacks of mildew. We are not able to give statistical details, but no one who has had his attention drawn to the subject can have any doubt as to the vast increase in produce over practically the same area of Potatoes, Sugar-beet, fruit, and other crops during the last few years. This has been effected by careful selection and judicious cross-breeding. What has been done for the crops we have mentioned can be done for the cereals—indeed, to some extent it has been done—matters which at present attract too little attention; but when Sir WILLIAM'S gloomy vaticinations show signs of approaching fulfilment, the pace will be accelerated, and the public will call on the chemists and on the botanists to do their part in averting the calamity. They will not be found wanting, and they will probably be able to show that there is still a sufficiency of available Wheat-growing land in the world, even in the presence of a steadily increasing population.

"The Gooseberry Growers' Register."

We have alluded to this untended little publication issued year by year by E.O. FOULD, Bingley, because it contains a careful record of the weights obtained in certain varieties of Gooseberry. The value of such a register is probably greater than is contemplated by the enthusiasts, who exhibit their productions in friendly rivalry in the various towns and villages, chiefly in the north of England. On p. 78 is a table showing the heaviest berry in each year from 1809 to 1899. The arrangement of the other tables on pp. 80 to 86 is not quite clear to outsiders, though the preparation of the little volume shows an improvement over some of its predecessors. The heaviest red berry (shown, we presume, in 1899), was "Bobby," which weighed 25 dwts. 10 grs.; the heaviest white berry was "Transparent," which weighed 25 dwts. 18 grs.; "Ringer" headed the list of yellow berries with 20 dwts. "Stockwell" was the heaviest green berry, weighing 22 dwts. 9 grs.

In the table at p. 80, it is not clear whether the prize list given refers to 1899 exclusively. We do not make out what the figures 1 to 9, arranged horizontally at the top of the columns, refer to. "M.P." and "S.P." are mysterious, though we can conjecture their meaning. The column headed "totals" needs explanation as to how the totals are made up. Similarly, the column referring to weights probably refers to the heaviest weight of a particular variety for this year 1899. No doubt all this is as plain as a pikestaff to the competitors, but, as we have indicated, the interest of this Register is not merely local, so that it is most desirable that "outlanders" should be able to avail themselves of the statistical details here given.

To students of variation, the varieties of

Gooseberry are specially interesting, as the forms that are cultivated are all examples of pure variation, unaffected by any cross with other species. The history of these varieties as recorded year after year becomes thus one of importance, even though it is confined to one feature only—weight. We earnestly hope that these records will continue to be kept with accuracy.

THE FORTHCOMING CHRYSANTHEMUM SHOW AT DUNDEE, ON NOVEMBER 23 TO 25.—This important event promises to be a great success, and only second in Scotland to that of the Royal Scottish Horticultural Association, held on Thursday last in Edinburgh. The show will not consist of Chrysanthemums, but will include plants, fruit, and vegetables. Herr Iff's celebrated orchestral band from Glasgow will perform on each of the three days that the show lasts.

fruit is globular or somewhat flattened, of the size of a Crab-apple, deep red, streaked with violet. As it produces abundance of seed, it will not be long before this interesting species finds its way into our gardens.

OUTDOOR PEACHES IN CROMARTY.—Mr. HENDERSON, The Gardens, Cromarty House, Cromarty, N.B., sends us a photograph of a dish of Peaches grown outside. The variety is Waterloo, and proves in that northern locality to be a fine cropper, with fruit of good size.

BUTTERFLY CYCLAMEN.—Mr. ERNST BENARY, Erfurt, sends us a good coloured plate, showing numerous variations of this curious race, which was introduced by M. DE LANGHE-VERVAENE, of St. Gilles, Brussels, and figured in these columns, January 30, 1897. The petals are reflexed, broad, undulate, and fringed at the margin. The colours range from white, cream-coloured, violet, to deep rosy-lilac. In some cases the edge is marked with a thin coloured edge on a light ground, as in a Picotee.

PRESENTATION.—Mr. PIRIE, who for the past twelve years has been head gardener to H. CALLANDER, Esq., Preston Hall, Midlothian, was waited on by a number of friends on Thursday evening, November 9, and presented with a purse of sovereigns, on the occasion of his retirement from the management of the gardens at Preston Hall. Mr. SMITH, Oxenford, in a few well-chosen remarks, made the presentation, and Mr. PIRIE very feelingly replied.

CEDAR CATKINS.—From more than one correspondent we have this week received specimens of the male flowers presumably of some Cedar. They have been found abundantly on the ground, and attracted attention as resembling caterpillars of a hawk-moth. A tree of the Lebanon Cedar at Kew is laden with catkins just now. It would seem, therefore, that the pollination of the female flower takes place at this season also. We do not know whether it is the case with Cedars, but in some Conifers there is a cavity at the top of the ovule in which the pollen remains for a long time before it germinates, and impregnates the ovum in the archegonium.

THE BOTANY OF ANCIENT EGYPT.—Among the plants discovered by MM. LORET and POISSON in the Egyptian museum at the Louvre, Paris, are the remains of the White Lily (*Lilium candidum*), the Cedar of Lebanon (*Cedrus Libani*), *Populus euphratica*, *Trapa natans*, *Abrus precatorius*, *Citrus Limonum*, and *Adansonia digitata*—truly, a remarkably interesting addition to our knowledge of the botany of ancient Egypt.

BOTANICAL GARDENS, NILGIRIS.—From the Annual Report, dated August, 1899, submitted by Mr. PROUDLOCK, we learn that there was a prolonged drought of about fifty days in the months of February and March last, and the young plants had consequently to be watered during that period. With this exception, the year was, on the whole, favourable for gardening purposes. Mr. PROUDLOCK has considerably improved the condition of the gardens. His experiments upon the juice of the Papaya-tree at the Barliyar Gardens, are likely, if conducted on a large scale, to prove a source of income to the gardens. The question of the possibility of creating rubber-producing forests in this district seems to have been settled for the present. While the cultivation of the Ceara rubber-trees has been fully established in Southern India, the climatic conditions or soil are not suitable for encouraging the secretion of rubber in the trees to such an amount as to make their introduction a commercial success.

"THE NEW FORESTRY."—Under this title Mr. SIMPSON is about to publish a book relating to the Continental system of forestry as adapted to British woodlands and game preservation. It consists of a review of British forestry practice down to the present time, contrasted with continental, and particularly the German forestry

FIG. 123.—THE MONUMENT ERECTED TO THE MEMORY OF JEAN LINDEN, AT BRUSSELS.
(SEE LAST WEEK'S ISSUE, P. 360.)

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Society's Fruit and Floral Committees will take place on Tuesday, November 21, in the Drill Hall, James Street, Westminster, from 1 to 4 P.M. A lecture on "Fruit-growing in South Wales" will be given by Mr. J. BASHAM, F.R.H.S., at 3 o'clock.

—**ROYAL HORTICULTURAL SOCIETY'S EXAMINATION, 1900.**—The day suggested for these examinations, April 17, being Easter Tuesday, they will be held on Wednesday, April 25. W. WILKS, Sec.

DEVON AND EXETER GARDENERS' ASSOCIATION.—An instructive lecture was given by Mr. W. CHARLEY, gardener at Wonford House, Exeter, at the last meeting, entitled "Garden Walks and Drives," which treated the matter at some length. The superintendent of the Exeter Public Grounds presided, and introduced a useful and interesting discussion.

SOLANUM PIERREANUM.—Thanks to the kindness of Mr. GUMBLETON, we have had the opportunity of seeing a fruit of this remarkable species, described by him in our last issue. The

methods, which are fully illustrated and described by the author. Mr. SIMPSON visited some of the best German forests in 1897, with the special object of ascertaining in what manner the system there adopted, in the extensive State forests of Prussia and elsewhere, could be adapted to the smaller-wooded areas and existing conditions on private estates in Britain, so as to enable proprietors and their foresters, where so disposed, to adopt the newer methods now so strongly recommended by all competent authorities, with such assistance as a handy book may afford. The work will be published by Messrs. PAWSON & BRAILSFORD, Sheffield.

THE FIXATION OF CARBON.—The following extracts, showing the importance of the stomata in leaves, are taken from Dr. HORACE BROWN'S address to the Chemical Section of the British Association at Dover:—

"There can, of course, be no doubt that the primary source of the organic carbon of the soil, and of the plants growing on it, is the atmosphere; but of late years there has been such an accumulation of evidence tending to show that the higher plants are capable of being nourished by the direct application of a great variety of ready-formed organic compounds, that we are justified in demanding further proof that the stores of organic substance in the soil must necessarily be oxidised down to the lowest possible point before their carbon is once more in a fit state to be assimilated.

"The conclusions drawn are that respiratory egress, and assimilatory ingress of carbon dioxide, do not occur in the upper side of a leaf if this is devoid of stomatic openings, and that when these openings exist on both the upper and under sides, the gaseous exchanges of both physiological processes are directly proportional to the number of stomata on equal areas, hence, in all probability, the exchanges take place only through the stomata."

"Our results, on the whole, are decidedly confirmatory of Mr. BLACKMAN'S observations. The side of a leaf which is devoid of stomatic openings certainly neither allows any carbon dioxide to escape during respiration, nor does it permit the ingress of that gas when the conditions are favourable for assimilation. On the other hand, when stomata exist on both the upper and under sides of a leaf, gaseous exchanges take place through both surfaces, and, as a rule, in some sort of rough proportion to the distribution of the openings. There is, however, under strong illumination, a greater intake of carbon dioxide through the upper surface than would be expected from a mere consideration of the ratio of distribution of the stomata."

"Nevertheless, the general connection between gaseous exchange and distribution of stomata is so well brought out, that we must regard it as highly probable that these minute openings are the true paths by which the carbon dioxide enters and leaves the leaf."

HYBRID BETWEEN DAHLIA AND HELIANTHUS.—It is not to be surprised if some gardeners have doubts as to the possibility of securing hybrids between two such distinct genera. The records of hybridisation, however, should induce botanists to keep an open mind on such matters, and to await practical demonstration before pronouncing an

* There is one important fact to be borne in mind when considering how far these observations exclude the possibility of cuticular osmosis. In the many leaves we have examined, Mr. Escombe and I have found that the occurrence of stomata on the upper surface of the leaf is always correlated with a much less dense palisade parenchyma. The cuticle and epidermis under these conditions are in a much more favourable state to allow carbon dioxide to pass into the leaf by osmosis than when the closely-packed palisade cells abut against the epidermis, as they do when this is impermeable.

+ Granted that the stomata constitute the paths of gaseous exchange, it is clear that the amount of diffusion through them, other things being equal, must depend very largely on the extent to which they are opened. The delicate self-regulating apparatus which governs the size of the openings is so readily influenced, amongst other things by differences of illumination, that *a priori* we should not expect the stomata on the upper surface of an isolated leaf to be in the same condition as those of the more shaded lower surface. This may very well account for the stomatic ratio of the two sides not being in closer correspondence with the assimilatory ratios, as found in most of our experiments carried out in bright sunshine. In light of lesser intensity there is always a closer correspondence of the two ratios. There is also another possible explanation of the facts. Since we have good reason to believe that the principal part of the assimilatory work is carried on by the palisade parenchyma, which occurs in the upper part of the leaf, the tension of the carbon dioxide in the air spaces of that part of the mesophyll is probably less than it is in the spongy parenchyma. There will, therefore, be a higher "diffusion gradient" between the carbon dioxide of the outer and inner air in the former case than in the latter, and this would certainly tend to a more rapid diffusion through the openings in the upper side of the leaf.

opinion. Specimens of a Dahlia have been lately submitted to us by Mr. E. J. LOWE, which undoubtedly show some disturbing influence as a consequence of pollination with the pollen of *Helianthus*. This is manifest in the greater thickness of the leaf, which has much of the coriaceous texture of the *Helianthus*, and traces of the stiff, rigid hairs characteristic of *Sunflowers*. In another case evidence of disturbance, if not of intercrossing, is seen in a Dahlia, the flower-stalk of which, instead of being devoid of leaf-structures as it is usually, bears in spiral series a large number of oblong leaves like the bracts of the inflorescence. We have frequently observed morphological changes resulting, as it would seem, from the irritation or disturbance set up by cross-pollination without any actual blending of parental characters, but in these instances distinct traces of a real cross are observable.

STOCK-TAKING: OCTOBER.—It is gratifying to find, from the Trade and Navigation Returns for October, that the improvement in both imports and exports continues. As to imports, the increase foots up at £5,531,616—the value for the month being £44,130,818; and for the same month in 1898, £38,599,202. This certainly looks like good business, and the supply of food shows such an increase as to warrant the assertion that trade all round, war notwithstanding, is in an excellent condition. Here is our usual excerpt from the "Summary" table of imports:—

IMPORTS.	1898.	1899.	Difference.
	£	£	£
Total value ...	38,599,202	44,130,818	+5,531,616
(A.) Articles of food and drink—duty free ...	13,572,295	15,621,108	+2,048,813
(B.) Articles of food & drink—dutiable	3,182,481	3,300,474	+117,993
Raw materials for textile manufactures ...	3,729,088	4,768,535	+1,039,447
Raw materials for sundry industries and manufactures	5,445,853	5,770,023	+324,670
(A.) Miscellaneous articles ...	1,179,478	1,439,971	+260,493
(B.) Parcel Post ...	110,556	80,251	—30,305

The increase in food supplies is a very large one, and is followed by accessions to the values of raw materials for textiles, metals, manufactured articles, &c. In one department of imports there is a decrease, viz., in fruit, roots, and vegetables, as will be seen from the following table:—

IMPORTS.	1898.	1899.	Difference.
Fruits, raw:—			
Almonds ... cwt.	37,850	39,736	+1,886
Apples ... bush.	694,027	840,744	+146,717
Cherries...
Grapes	346,049	284,666	—61,383
Lemons... ..	96,830	95,416	—1,414
Oranges... ..	91,731	87,879	—3,852
Pears	109,217	74,152	—29,065
Plums	93,307	46,735	—46,572
Unenumerated... ..	228,177	195,968	—26,209
Roots and Vegetables:—			
Onions ... bush.	748,348	970,127	+221,779
Potatoes ... cwt.	105,112	325,595	+220,483
Vegetables, raw, unenumerated ... value	£119,373	£100,643	—£18,730

It is some time since we had such a long list of minus entries, so matters seem to be favourable to home producers. By the way, London barrows and street stalls are rather a pretty sight just now, and the poor folks' pence are purchasing good value. There are Bananas and Pomegranates at two a penny; oranges, of a sort, at three a penny; Apples and Pears at from 2d. a pound; good foreign Grapes at from 3d. a pound; even Pine-apples have got the length of the stalls, but, lacking the means, they are passed by. It is also

interesting to note the higher prices current for Canadian Apples, &c.—evidence of the care now exercised in selecting, packing, &c. The returns for the ten months show a total value of £400,134,971, as against £383,248,614, for the same period in 1898; or an increase of £16,886,357. A few lines may now be given to—

EXPORTS.

The figures representing the exports of British and Irish produce and manufactures for the past month are £23,699,021, compared with £19,863,019 for October, 1898; or an increase of £3,836,002. There is no decrease reported in the sectional columns, and the greatest increases are in metals and articles manufactured therefrom, also in machinery; yarns and textile fabrics look up well. It is noteworthy that cotton goods keep well up in the East, whilst linens keep their position in the West. The gain on the ten months is £25,458,041. The figures for the ten months just ended is £218,050,218; for the same period last year, £192,592,177. All comment is spared by reason of these eloquent figures.

TOBACCO-JUICE IN FRANCE.—All Tobacco-shops in France, says the *Society of Arts Journal*, must keep a stock of tobacco-juice, rich in nicotine, and of guaranteed quality. For spraying purposes, one part is mixed with 100 parts of water. The spraying of plants should be done after sunset, and they should be sprinkled with clean water on the following day. For fumigating hot-houses the proportion is one part of juice to five of water. The mixture is sprayed upon bricks or iron sheets heated to a temperature sufficiently high to produce rapid evaporation. It is claimed that insects and fungous parasites are absolutely destroyed by this process. Regarding the use of this product in the Alpes Maritimes, the United States Consul at Nice says that it is rapidly coming into general favour for all the purposes mentioned above. He has seen it used with complete success in curing what is popularly called "le noir." This parasitic affliction is not confined to Oranges, Lemons, Olive, and other trees, but has been most disastrous to such vegetables as Potatoes, Beans, Peas, Tomatoes, &c. He has also seen whole rows of Orange-trees so thickly covered with parasites that every leaf appeared coated with soot (hence the popular appellation, "le noir"), and he has been enabled to verify the fact that three or four applications of the lotion have prevented the disease from attacking new leaves, and have caused the disappearance of the black deposit upon those attacked. A proprietor of an Olive-grove in Nice has recently stated that the use of the juice in combating "le noir," which has destroyed many thousands of Olive trees in the department, is most costly, but at the same time very efficacious. The spraying machines used to spread the mixture are the same as those employed in applying sulphate of copper to vineyards. Efforts have been made to ascertain whether the use of tobacco-juice would not be more desirable in treating Vines for the cure of oidium—a parasitic disease of the Vine-leaves [and berries]—than sulphate of copper, but it appears impossible to discover anyone who has experimented with the two treatments. It would appear, at first sight, that tobacco-juice would be preferable, as sulphate has always been considered a preventive of attacks upon the Grapes themselves, especially after the bunches are completely developed, whereas the oidium attacks only the leaves, and indirectly the vitality of the plant.

MR. MALCOLM DUNN'S LIBRARY.—The sale of the late Mr. MALCOLM DUNN'S library was effected on the 9th inst., in DOWELL'S Rooms, Edinburgh. In addition to the ordinary trade purchasers, there was also present a strong contingent of the gardening fraternity, who, to a large extent, controlled the bidding, with the result that not only good prices ruled, but in some instances, books sold at higher rates than it is possible to obtain them through the ordinary channels. The best prices were obtained for the *Transactions of*

the *Botanical Society of Edinburgh*, 110s.; *Botanical Register*, 32 vols. £19; HARVIE-BROWN'S *Fauna*, small octavos, 50s., 52s., and 90s.; one volume of PLATTE'S *Jewell House*, 31s.; the 1863 edition of REID'S *Scots Gardener*, an imperfect copy, lately bound, 52s. 6d.; HILL'S *Profitable Art of Gardening* (1574), 95s.; a nice copy of LOUDON'S *Arboretum et Fruticetum Britannicum* (1844 imprint), 50s. Works other than those devoted to gardening and kindred pursuits, brought also good prices.

THE GERMINATION OF SEEDS.—The last number (420) of the *Proceedings of the Royal Society* contains an account of some experiments on the influence of liquid hydrogen on the germinative power of seeds, by Sir WILLIAM THISELTON DYER and Prof. DEWAR, which are of a very remarkable character. Sir WILLIAM DYER took seeds of *Brassica alba*, *Pisum sativum*, *Cucurbita pepo* (Vegetable-marrow), *Mimulus moschatus*, *Triticum sativum*, and *Hordeum vulgare*. The germinating power of the seeds from which these samples were taken was tested previously by Messrs. SUTTON & SONS. These seeds were entrusted to Professor DEWAR, who exposed them for half an hour to a temperature of -250°C . All these seeds germinated at Kew. A second set of seeds were subjected by Professor DEWAR to actual immersion in liquid hydrogen for six hours: whereas the first set were cooled in a vacuum, being sealed in a glass tube. The second set of seeds germinated as well as the first, although they had been subjected by Professor DEWAR to the almost inconceivably low temperature of -453°Fahr . below the temperature of melting ice. On the contrary, protoplasm is known to be disintegrated by a temperature of 75°C . (167°F .); and if seeds have germinated after exposure to a higher temperature than this, it must be because the investments of the embryo are non-conductors, and the extreme heat mentioned has never reached the embryo.

NITRAGIN.—Miss MARIA DAWSON, B.Sc., London and Wales, has a paper in the *Philosophical Transactions*, B. vol. 192, in which she records her experiments with nitragin. The author first of all, gives an acceptable summary of our knowledge of the tubercles found on the roots of Leguminosæ, and of the part they play in the life of the plant. The bibliographical references are very full and useful. In the next place, the lady-bachelor narrates her own observations and experiments on the tubercles and their contents, and then details her experiments with "nitragin." She concludes that nitragin really does contain the organism which is involved in the formation of the tubercles, and that it does, when artificially applied, produce the outgrowths in question.

KEW SEED LIST.—As an appendix to the *Bulletin of Miscellaneous Information*, is issued a list of seeds of hardy herbaceous plants and of trees and shrubs. These seeds are not sold to the public, but are available for exchange with other botanic gardens, foreign or colonial, and with regular correspondents of the garden. The list is alphabetical.

DUTCH BULBS.—The high price of these articles is due, it appears, to the spring-frosts that occurred in Holland after the bulbs had begun to grow. Fungoid attacks completed the stock of adversities.

TEA BLIGHTS.—Tea-planters in Ceylon have till lately enjoyed a considerable immunity from insect or fungus visitation, but, as inevitably happens when large numbers of any particular plant are grown in close approximation, pests are now beginning to spread. Mr. J. C. WILLIS, the Director of the Peradeniya Botanic Garden, has therefore called the attention of planters to the subject in a circular. The two principal blights are fungi *Pestalozzia Gulpinii*, or grey blight, and *Colletotrichum Camelliae*, or brown blight. The nature and characteristics of these fungi are explained, and the best methods of treatment detailed.

MORÆA IRIDIODES, VAR. MACLEAIL.—This lovely Irid is well known to our cultivators. It is a native of the Cape Colony and of Natal. The variety above-mentioned is even more beautiful than the type, as is evidenced by a flower shown to us by Mr. Gumbleton. The flower is flattish or slightly cupped, more than three inches across, with white, oblong lanceolate spreading sepals, oblong obovate petals, white, with a large club-shaped orange blotch on the narrow claw-like part of the petal, and extending to the middle. The three petaloid styles are erect, broadly lanceolate, rich violet, with a narrow white edge. Mr. Baker, in his *Handbook of the Iridæ* (1892), p. 62, mentions the plant under the garden-name of *Diets Macleail*.

MAGNOLIA LENNÉ.—From Straffan, Kildare, Mr. BEDFORD obligingly sends us fruits of this lovely Magnolia. The plant is against a west wall, and has not fruited since 1893. The fruit is oblong, about 4 inches long (10 to 11 cent.), 2 inches wide, consisting of a closely-packed spike of fleshy follicles; each follicle is about 1 inch (25 mill.) long, leathery, and of a deep rose-pink colour, containing a single seed attached to the carpel or follicle by a slender funicle or thread. The seed is oblong-obtuse at both ends, rather more than half-an-inch long (15 mill.), and of a brilliant orange-pink colour. The vivid coloration of the carpels and seeds seems to be intended as an attraction for birds, by whose agency the seeds are dispersed. *Magnolia Lenné* is supposed to be a form of the Chinese *M. obovata*, and by some, as by FOCKE, is considered a hybrid, but there is no direct evidence that we know of in support of this conclusion. It is said to have originated in a garden at Vicenza, but was brought to Erfurt in 1850. It was figured in 1866 in the *Revue Horticole*. Mr. BEDFORD would do well to raise some seedling plants, and note the results.

SYSTEMATIC BOTANY.—Anatomists and students of development are beginning to find out that no one set of characters is sufficient for classificatory purposes, but that all must, so far as circumstances allow, be taken into consideration. M. PARMENTIER, a distinguished anatomist, on concluding a paper on the utility of anatomy for classificatory purposes, says: "We cannot too highly admire the genius of the illustrious botanists who, guided by morphological details only, have established the classification of the species of the vegetable kingdom with such insight, that the classification may be considered natural, being almost always confirmed by anatomy." M. PARMENTIER's paper is in the *Bulletin of the Royal Botanical Society of Belgium*, xxxv., p. 37, 1896.

"NATURAL AND ARTIFICIAL METHODS OF VENTILATION." (London: ROBERT BOYLE & SON, 64, Holborn Viaduct).—This is a "compilation published with the view of demonstrating the comparative values of so-called natural and artificial methods of ventilation when the former is scientifically applied; and how ventilation may be successfully achieved with the simplest means by an intelligent comprehension of the laws which govern the movements of air and the utilisation of the powerful natural forces which are unceasingly in operation." The work is carefully done, the information being on the authority of specialists, and relating the results of practical experience.

THE NERVE-WAVE (LA VIBRATION NERVEUSE).—The subjoined extract is taken from the evening address, delivered by Professor CHARLES RICHTER, on September 15, at the Dover Meeting of the British Association, as translated by Professor MARCUS HARTOG, in *Nature*:—

"Thus, the nerve-wave in its form and period, and in the mode of its 'damping,' is comparable with the various waves of the unbounded universe in which we live, move, and have our being. But this resemblance must not lead us away from the recognition of the abyss that separates the nerve-wave from all the other phenomena within our reach. The vibrations of the forces scattered about us are—at least with the greatest probability—blind phenomena, which know not themselves, which are the slaves of irresistible fatality. The nerve-wave,

on the contrary, knows and judges itself; it is self-knowing or self-conscious; it can distinguish itself from the world which surrounds it, and shakes it. Since it possesses intelligence—for intelligence and consciousness are synonymous terms—it is susceptible of perfectibility; it is capable of right reasoning, and of wrong reasoning; it can attain a moral ideal forbidden to those brute forces which follow their fated course; it can conceive the idea of truth and justice when it is a question of defending the innocent, of establishing brotherhood among men. Consciousness, intelligence, the making for higher perfection—these are characters that have nothing in common with the characters of other waves; they seem to be phenomena of another, a higher order. This vibration, whose physical conditions we have studied, enters into the domain of morals; and this fact establishes its essential difference from all other vibrations.

"Assuredly the prodigiously rapid and regular undulations of light, and of electricity, appeal right justly to our admiration; but nothing is so admirable as this disturbance of the nerve-cell, which is self-knowing, self-judging, self-transforming, which strives to amend itself, and which from the stimuli which strike it, can deduce some of the laws ruling the vast universe distinct from it. The nerve-wave of man—himself the last result of evolution—is the most perfect term of the things and of the beings which it is given to us to know.

"Vast as is the world, mighty as are the fires of the infinite stars, the intelligence of man is of a higher order than these; and I would fain exclaim with the great philosopher, Immanuel Kant: 'More than the starry Heaven above my head, one thing fills me with admiration—the moral law in the heart of man.'"

SOLANUM INTEGRIFOLIUM.—One of the most ornamental plants in the show-house at Kew just now is the plant under the above name. The plants are 18 to 24 inches high, with leaves that belie the name given to the plant in their sinuous, almost lobed margins. The midrib bears vicious-looking spines on the upper surface, but the chief features are the scarlet fruits of the size of a small Apple, deeply furrowed, and of a brilliant red colour. They make very effective decorative plants at this season.

LATE-FLOWERING LINO.—A correspondent from Woking sends us a spray of the common Heather in full bloom. The plants begin to bloom every year in October after the others are over, and look gay throughout November. The variation is a desirable one, but how or why it originated it is hard to understand, as the external conditions are presumably identical.

PUBLICATIONS RECEIVED.—*Anne Pratt's Flowering-plants*, vols. ii. and iii., Nos. 15 to 20.—*The Photogram* (London and New York), October. This includes a short paper on arranging flowers to be photographed. The results aimed at and attained is the production of a pretty picture: from a botanical standpoint the illustrations are of little value.—*Prospectus and Time tables, County School of Horticulture, Chelmsford*, for the Session 1899-1900.—*Tropical Agriculturist*, September and October.—*Bulletin of the Botanical Department Jamaica*, August. This contains notes on collecting Rubber; and scale insects, remedial measures and insecticides.—*Bulletin of Miscellaneous Information, Trinidad*, July, including papers: "The Nicaraguan Coffee Disease," "Cacao Pod Disease (Phytophthora omnivora)," "Amherstia nobilis," "Trinidad Palm," "Cane Seedlings," and "The Mango" (with figures).—*Bulletin de l'Institut Botanique de Buitenzorg*, No. 1.—*Annual Report of the Department of Parks, City of Boston*, 1898, illustrated.—*Syllabus of Horticultural Classes*, by T. H. Smith, 4, New Street, Kenilworth.

PLANT PORTRAITS.

PEAR, Belle de Juillet. An early Pear, as its name implies. M. Burvenich gives it a good character in the September number of the *Bulletin d'Arboriculture*.

PURA THOMASIANA, Revue Horticole, October 1. Canescent, with linear, recurved leaves, each about 1 yard long, and a terminal panicle 6 to 7 feet in height, of metallic-green flowers.

RHODODENDRON SMIRNOWI, Revue Horticole, November 1. A Caucasian species, with white down on the under surface of the leaves, and trusses of pale lilac flowers. The description is furnished by M. Marc Micheli.

ROSE DUCHESSE D'AUERSTADT, Revue de l'Horticulture Belge, October.

ROSE MADAME WAGRAM, and CONTESSA DE TURENNE. Le Moniteur d'Horticulture, September 10.

IRELAND.

STORM IN DUBLIN.

A STORM of great violence visited this metropolis on Friday morning, the 3rd inst., lasting up to mid-day; it caused a great amount of destruction. Many of the parks were heavy sufferers, notably

the one attached to Trinity College. Several fine trees were blown down in the suburbs; private gardens had their trees uprooted. Fortunately, there was no fatality occurred from this brief tempest.

GLASNEVIN BOTANIC GARDENS.

An unusual feature in the above Gardens is the flowering of a plant of *Arachnanthe Lowi*, a Bornean Orchid, which has been in the garden for sixteen years, and this is the first time it has produced blooms. The plant carries six racemes, five of which are more than 7 feet, and one about 6 feet in length, and each raceme possesses thirty-three blooms on the average. The collection of *Cattleya labiata* is finely in bloom. *A. O'Neill*.

HOME CORRESPONDENCE.

WEBB'S VICEROY TOMATO.—I have grown this Tomato with many other varieties, but have not had one to equal it among the others. It is a splendid out-of-doors variety. I have had about fifty plants of this Tomato planted on a south border, and have been gathering fruits of a large size since the first week in August. Each plant has borne on an average 16 lb. of fruit. I like to try all the varieties of new Tomatoes, and in Webb's Viceroy I find one that will have my best attention. It is a splendid market variety, the fruits coming up to a weight of 13 ozs. each. It is as good under glass as in the open; my plants are still producing 6 to 10 lb. of nice ripe fruit each week. Should sharp frost set in, I shall place them in pots under glass for furnishing a late supply. *Wright, Oakfields, Kingswinford, Dudley.*

POTATO EARLY BIRD.—Mr. Baylor Hartland tells at p. 332 an interesting story of the securing of two crops from the above-named variety in one season. The name of the Potato is, perhaps, a little confusing, as a good many years ago the late Mr. Charles Turner put into commerce a selection from the Ashleaf Kidney under this title, and sometime after that had disappeared from lists. I raised an early white kidney by crossing Duke of Albany or White Beauty of Hebron with pollen of the Ashleaf Kidney, and that was put into commerce under the same appellation. Does Mr. Hartland refer to either of these varieties when he says that the one he mentions was his own "introduction," or does he mean by that term it is his own "raising," which is a different thing? But there is no novelty after all in what he details with respect to the getting of two crops in one year in that way. Only last year I purchased seed-tubers from the Canary Islands, and in April exposed them to "green," planted them a week later, and obtained a capital crop in that way. I have seen it done also by the aid of tubers from a very early planting on a warm border, or under a frame, the tubers being lifted before ripe, exposed for a week, then planted, and giving a good crop in September. There are few practices or experiments in connection with Potatoes that have not been tested in this country many times over. One of the remarkable features of the late Potatoes this season is the way they kept up green vigorous tops without having on them the least evidence of fungus, even into October. That is very unusual in the south. The best croppers this year, and therefore the best friends to the growers, have been the strong late croppers. These have produced four times the crop earlier ones have. *A. D.*

THE BEST CROPPING POTATOS.—May I ask some of your readers who have had much experience in the cultivation of Potatoes, to inform me which out of the following varieties they have found to be the best in every point, viz., Magnum Bonum, Maincrop (Clarke's), and Up-to-date, giving the quantity harvested per acre; also the best price per ton obtained, and to state which variety proved to be the best disease-resister. There have appeared in a local daily paper several letters written, I should say, by men with very limited experience, condemning "Up-to-date" all round. One gentleman told me he had seen Up-to-date and Maincrop growing side by side, and the latter gave a crop twelve times larger than Up-to-date, but this I know is absurd. Another says Up-to-date will not keep when pitted. The next letter says that Maincrop will command a price two-thirds larger

than Up-to-date, and that the former is far superior to the latter. I have grown several hundred tons of Magnum Bonum and Up-to-date, and have found both to be wonderful croppers, and to withstand the assaults of the fungus as well as any Potatoes that I have grown. I doubt if this Maincrop can be such a wonderful Potato as these letters would make it out to be, and before getting in my fresh stock of seed Potatoes for next year I shall be glad to have the opinion of some of your readers, knowing that your valuable paper comes in touch with the most experienced men in England. *Joseph Loader, F.R.H.S.*

RAGGED-SCHOOL CHILDREN.—The Corporation has again granted the use of the Guildhall for the Annual Banquet to the Ragged-School Children of London, and the Prince of Wales has once more sent me a donation to, if I may quote the words of His Royal Highness, "the excellent fund which you are again kindly raising for providing dinners and hampers for the poor and crippled children of the metropolis at Christmas." Last year, after providing a banquet at Guildhall for about 1,400 poor children, I was enabled to send 4,324 hampers to deserving little cripples, whose affliction very often keeps them prisoners in one room from year's end to year's end. I trust that with the renewal of your valued sympathy and assistance, we shall do better still this year, by increasing the number of hampers to 5,000. May I ask your readers to help me again this winter to brighten the lives of some of London's little cripples. Subscriptions should be sent to me here, marked "Children's Fund." *W. P. Treloar, Alderman and Sheriff, Ludgate Hill, London, E.C.*

BEGONIA FUCHSIODES FOR SUMMER BEDDING.—Having this year a dozen plants to spare of this handsome old scarlet-flowered Begonia, I planted them for experiment in a mixed bedding arrangement. The result exceeded my expectations. The plants when put out early in June were about 3 feet high, and they began to grow and flower forthwith, and have continued flowering freely up to the present time. The plants with their bright scarlet-tinted flowers are very effective planted in this manner. I used them in connection with variegated-leaved Abutilons and variegated *Daelytis glomerata*, the soil being covered with the latter. The plant withstands dry weather as well or even better than other fibrous-rooted species of the semperdorens type, and may be employed in dry gardens where the tuberous-rooted Begonias do not succeed. Cuttings of the plant root readily in a mild bottom-heat; and if these are rooted at this season, they make nice plants by May next. *C. Herrin, Dropmore, Bucks.*

PLUM COE'S GOLDEN DROP.—I was glad to see "H. T. M.'s" note on the long-keeping qualities of this superb dessert Plum. Were anyone restricted to one table Plum, few would hesitate to elect Coe's Golden Drop. A few might prefer the Green, Golden, or Transparent Gage, or the Jefferson, Woolston Black, Kirke's, or Imperatrice; but for constant fertility, hardiness, and vigorous constitution, none can approach Golden Drop. Trained on west or east walls, and in the open quarter in all forms, and under varied conditions of culture, this variety seldom fails to succeed from one end of the country to the other. In thousands of gardens where most of the Gages and other choice Plums are uncertain croppers, the Golden Drop is sure and reliable; and I have noted of late that it seems to be more grown north than south of the Tweed. I wish to cordially endorse all your correspondent has so well said in these columns at p. 330. He says his fruits were grown on a west wall. I have also found that flies and wasps give less trouble on west walls, and on dwarfs and cordons than on south walls. On west, east, and north walls, the usual season of ripening is from the middle to the end of September, and the season may be extended to similar dates in October. And I have also found that Golden Drop Plums grown on eastern and northern aspects escape spring frosts better, and the fruit keeps longer after they are ripe from cool sites than warm ones. To keep Golden Drop or Blue Imperatrice or other Clingstone Plums sweet and sound for weeks or months after gathering, they must be unbruised and unbiten by insects, as well as being dry when gathered. Neither must the fruits be roughly handled in the gathering and storing; this should always be done with extreme care. "H. T. M." does well to caution growers against removing the

stalks from the fruits; and for that matter all Plums for dessert are best gathered with their stalks. A sharp knife is better than scissors for gathering Golden Drops for long keeping. With an expert touch of a sharp knife, the base of the Plum-stalk is healed out. I do not agree with wrapping the Plums in tissue paper, wadding, wood-shavings, or storing away in air-tight jars or boxes in cool chambers. Any well-ventilated loft or empty chamber, the average temperature of which is 40° to 45°, will keep these Plums for six weeks to six months [!]. A room for storing these long-keeping Plums might be wired over near the ceiling, or splits of wood or thin bamboo rods stretched across from side to side at 6 in. apart; from these supports the Plums might be suspended with bouquet-wire, almost touching each other. Hung thus the fruits are doubly safe through the ties, and the small heel left on the top of the Plum-stems in gathering. In all the manipulation of this fruit, such as the suspension after gathering and storing, the stalk and not the fruit should be handled. Golden Drop Plums thus stored may be kept for a year or more, though this is seldom necessary. But it is often of great use and special value to have a good supply through the Easter holidays, and with cool quarters and thorough ventilation, and careful inspection, there is little or no difficulty in keeping Golden Drop Plums in serviceable quantities till midsummer. "Not without shrivelling," I fancy I hear some of my practical friends saying. Well, perhaps not. But the amount of that, and the time of it, will largely depend on where the Plums were grown, how they were gathered, and where they were stored, how, and when. *D. T. F.*

DAHLIA BLOOMS.—I send a few Dahlia blooms cut in the open garden this afternoon. We have at the present time some hundreds of really good flowers. The Cactus and the decorative varieties are by far the best. The Show Dahlias, of which we grow but very few, hold the wet, become too heavy for their stalks, and hang down their heads. *George Stanton, Park Place Gardens, Henley-on-Thames, November 13.* [Delightfully fresh. On the same date Dahlia blooms were on sale in Covent Garden. Ed.]

BOOKS FOR UNDER-GARDENERS.—Now that the days are shortening, and the long evenings are again with us, the more studious class of under-gardeners will begin to consider which "out of the vast number of books to be had at the present day," they are going to read to occupy their spare time; and as under-gardeners as a rule have but very little spare time, they do not wish to waste it in perusing volumes from which they are likely to reap little or no benefit. To all those of the above class who require a thoroughly good instructive book, I strongly recommend the works of Charles Darwin, especially to those interested in the remarkable family of Orchids. To these, this book entitled *The Various Contrivances by which Orchids are Fertilised by Insects*, is particularly suitable. How frequently one hears the remark from people looking through Orchid-houses, "What a singularly shaped flower, &c." In fact, they often seem to regard Orchids as freaks of Nature, and when looking at a *Catasetum* flower, they say "I don't see much beauty in that." Yet comparatively few under-gardeners can explain in a satisfactory manner the reason of all these peculiar structures, and what purposes they serve. Whereas, if it were only explained to the people passing the above remarks of the remarkable contrivance possessed by the *Catasetum* for ejecting its pollen masses when bees or other insects, visiting the flowers for the purpose of gnawing the fleshy substance found upon the labellum, touch a long, tapering, sensitive projection, called the antenna. This antenna, when touched, conveys a stimulus or vibration to a certain membrane, which is instantly ruptured. This sets free a spring by which the pollen masses are shot forth like an arrow in the right direction, and adheres by its viscid extremity to the back of the bee; it is thus carried to the flower of the female plants, and fertilisation is effected in a similar manner to all other members of the Orchid family. They would then cease to look upon them as ugly, ill-formed flowers, or "Freaks of Nature," and consider them the most interesting species of an interesting family. The same author also explains the marvellous construction of the *Cypripedium*, *Coryanthes*, *Masdevallias*, and other things too numerous to mention. It is not necessary, as some people think, to be a botanist, or well up in all

LAW NOTES.

BULBS BADLY PACKED.

A case of considerable interest to bulb importers occupied His Honour Judge Whitehorne at the Birmingham County Court recently for nearly six hours. It was an action brought by Adrian Klinkenberg, a bulb-grower of Lisse, near Haarlem, against Messrs. Thomson & Co., nurserymen, of High Street, Birmingham, to recover £67 4s. 3d. for bulbs supplied. Defendants paid £23 12s. 3d. into court, and pleaded as to the remainder of the claim that the bulbs were unsaleable by reason of their being badly packed. The plaintiff's case was, that on June 28 the defendants gave him an order for bulbs to the amount claimed, and in accordance with their instructions he delivered them to agents at Rotterdam, who transferred them to England, per the steamer *Winslow*. Upon

time head-gardener to the Dowager Countess of Jersey on the Osterly Park Estate, Heston. On Mr. Welch leaving, John Shrimpton took his position as head-gardener, and served under the Dowager Countess of Jersey and the Duchess of Cleveland for the space of twenty-one years. During the late years of his service, the raising of seedling Chrysanthemums under Mr. Seward engaged much of his attention. The earliest to be produced were Japanese William Seward and John Shrimpton, followed by Dorothy Seward, Mrs. John Shrimpton, John Seward, Charles Shrimpton, John Neville, Joseph Brooke, Elsie Neville, incurveds Hanwell Glory, and others. Most of those named were awarded Certificates of Merit. His loss is greatly deplored by his employer; for, to use Mr. Seward's words, "he was a painstaking, conscientious, honest man." As a cultivator he possessed excellent abilities, and displayed them in his work. John Shrimpton died of cancer after a long and painful illness, and was buried in St. George's Cemetery, Hanwell.

ENQUIRIES.

We have received the following letter from Mr. J. A. Warren, of Springhurst, Hartburn, Stockton-on-Tees:—"About eighteen months ago we made a small ornamental pond at the lower end of our garden, which is fed by a small, natural spring. The pond is dug out of the clay, and we covered the bottom with gravel taken from the river, and have planted Water Lilies, which are now well established, and other aquatics around the sides, and also introduced fish. After a few months the bottom was thickly covered with a moss (the botanical name of which I learn is *Mesocarpus* (?), one of the thread pond-weeds). [Please send a specimen. Ed.] At first no notice was taken of it; but, as it grew so rapidly, an endeavour was made to rake it out; but this has not proved successful, for it still continues to grow, regardless of the constant raking, and has now risen to the surface, making the pond very unsightly. If that which floats is scooped up in the morning, in the course of the day more of it rises, and the state of the pond is as bad as ever by night-fall. It is impossible to rake it out in its present stage, as it lies at the bottom as a thick, dark green substance, which flows through the rake on being touched. I should be very pleased if any of your readers who have had the same sort of trouble would kindly give me their experience, and inform me whether they were successful in ridding the water of this pernicious weed without injury to the fish, &c."

ROMAN HYACINTHS. — "Perplexed" would be glad if any of our correspondents would kindly indicate the cause of Roman Hyacinths failing to grow. The bulbs in question were bought at the usual time, potted, and afforded water, and after being allowed to drain, they were plunged in Cocoanut-fibre refuse in a frame. They seemed to make roots all right for a time, but when top-growth had made a little progress, and just before they were taken out of the fibre, the roots began to decay. He says that the bulbs were potted in the usual compost for such plants, and is certain there is nothing in the soil to cause the roots to decay, as a large batch of Freesias, potted at the same time in the same kind of soil, are doing remarkably well. The same thing happened twelve months ago, but as he then plunged them in coal-ashes outdoors, it was put down to something deleterious in the ashes. He has grown Roman Hyacinths for more than twenty years, and never knew them to behave so at such an early stage.

MOSS LITTER AS PACKING FOR FRUIT. — It is said that Apples placed in this substance keep for a much longer period in the fruit-room than is the case with the usual method of merely placing the fruits in one or two layers on the shelves. Can any of our correspondents say if this is really the case?

FIG. 124.—A FIELD OF MADAME DESGRANGES CHRYSANTHEMUMS.

from birds and insects, which the device effectually secures, this may also be accomplished by other more readily-applied means; but if by its use flavour in fruits is improved—as at Belvoir—an additional advantage is obtained. I have not tried the protector on the Apple. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

A FIELD OF CHRYSANTHEMUMS.

As affording our readers an idea of the great developments in recent years of the trade in cut flowers little suspected by the public, or indeed by gardeners in general, we illustrate in the present issue (fig. 124), a field in full bloom of the favourite, early-flowering, Japanese variety, Madame Desgranges. The flower is large, pure white, with florets of medium width, and is at its best in the month of September. The plant is of dwarf growth, and therefore very suitable for field culture. We are indebted to the kindness of the Brighton and South Coast Horticultural Co., Ltd., Exotic Nurseries, Worthing, for the opportunity of figuring this field of thirty-seven thousand Chrysanthemum plants,

delivery at Birmingham, the defendants at once wrote to complain that they had arrived for the most part in a rotten condition, owing to the fact that they had been badly packed, having been sent loose in cases instead of in bags. Plaintiff replied that he had packed the bulbs in accordance with his usual custom. Expert opinion was given by both sides upon the method of packing that had been employed, and the jury being unable to agree upon a verdict were discharged.

Obituary.

JOHN SHRIMPTON.—This well-known Chrysanthemum-raiser died on October 23 at Hanwell, where he had lived for the space of fifteen years as working-foreman to Mr. William Seward at The Firs. John Shrimpton was born at Norwood, in the year 1840, and started his gardening career under a Mr. Lamb, head-gardener to Miss Thackwaite of Norwood-green, who was a cultivator and exhibitor of Pelargoniums and Cinerarias. Leaving here on the occasion of the death of Mr. Lamb, he went under Mr. Welch, at that

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 7.—*Present:* Dr. M. T. Masters (in the Chair); Mr. Michael, Dr. Russell, Mr. E. F. in Thurn, Mr. E. Massey, Professor A. H. Church, and Rev. G. Henslow, Hon. Sec.

Effects of Fog.—Mr. Wright sent some Vine leaves from Chiswick to show the injurious effects of the recent fogs in the gardens of the Royal Horticultural Society. All Grapes of the Muscat class were by far the most severely injured, the foliage being scorched, and the fruit more or less covered with a deposit. It was observed that the fog occurred remarkably early in the season. Prof. Church noticed that it was peculiarly pungent, causing in one instance a hundred buds of a Camellia to fall in a single day. Injury was also done to Orchids at Chelsea and Gunnersbury. The real cause of the injuries is the presence of sulphurous acid and the mechanical accumulation of sooty matter.

Amaryllis reversion.—Rev. W. Wilks brought an Amaryllis, the flowers of which apparently had more or less reverted to the primitive form of Hippeastrum, from which the modern types have descended through hybridisation.

Foxglove, hybrid.—A flowering spike of a hybrid between a white-flowered Foxglove and Digitalis lutea was sent by Dr. Wilson, of St. Andrews. It was remarkable in having much smaller flowers than those of the usual form of D. purpurea × D. lutea; and though possessing perfect pistils, there were no stamens. Moreover, the flowers were white, but slightly variegated. The white Foxglove was the pollen parent.

French Vineyards Injured.—Dr. Masters observed that having lately seen the vineyards of the Champagne country, also those near Neuchâtel and the lake of Geneva, he did not observe a single perfect bunch of Grapes. They appeared to have rotted through frosts prevailing at the time fertilisation was taking place.

Pinus aristata.—He also exhibited cones of this rare Californian Pine. They are remarkable for bearing a needle-like spine at the back of the thickened end of scales, the so-called apophysis. It was a question whether this be not a variety of P. Balfouriana, which grows in the same country and only differs in the smaller spines. It is a good maritime species, bearing dense foliage. They were received from Mr. Croucher of Chief.

Pelorian Mentha.—Mr. Henslow showed a drawing of a regular flower of Mentha rotundifolia found wild by the river Wye, near Ross.

LINNEAN SOCIETY OF LONDON.

NOVEMBER 2.—Dr. A. GUNTHER, F.R.S., President, in the chair.

Professor STEWART, F.R.S., F.L.S., exhibited and made remarks on a preparation of the leaves of Mimosa pudica, showing the diurnal and nocturnal positions. He also exhibited the embryo and egg-cases of Cestacion Philippi.

Rev. G. HENSLOW, F.L.S., read a paper on the Proliferous state of the Awn of Nepal Barley. After describing the two varieties, Hordeum coeleste, vars. Egiceras and tricutum, he showed that the inverted flower-buds (which constitute the peculiarity of the monstrosity) were different in the two varieties. In H. Egiceras it commenced at a bend in the flattened awn, with an axial protuberance arising from the middle point; in H. tricutum the hastate form began with two protuberances, one on each side. In Prof. J. S. Henslow's figures (Hooker's Kew Journ. Bot., i., 1819, pp. 33–40, pls. 2–3), the arrested awn widens, the edges folding over until it forms a "cucullus," while the lateral processes of various shapes grow out at the base (really inverted summits) into what he termed "wings." His material, however, was not sufficient to enable him to interpret either the cucullus or the wings. The Rev. G. Henslow's specimens showed that the former often assume the form of two glumes more or less coherent by their edges, while the wings became their awns.

Dr. O. SPAFF, in criticising the paper, entered very fully into the structure and development of different species of the genus Hordeum.

Dr. W. G. RIDEWOOD, F.L.S., read a paper on the Hyobranchial Skeleton of the new aglossal Toad, Hymenochirus Boettgeri.

Mr. HAROLD WAGER, F.L.S., read a paper on the Eye-spot and Flagellum in Fugena viridis.

MAIDENHEAD HORTICULTURAL.

NOVEMBER 2 AND 3.—The autumn show of this society was held in the Grand Hall on the above dates, the exhibits being generally of great merit, especially those of Mr. Perkins, gr. to the Hon. F. D. SMITH, Greenlands, Henley-on-Thames. His cut-flowers and group of plants formed a feature of the exhibition. Groups of miscellaneous plants from several exhibitors were also very attractive, while fruit was shown of excellent quality. The arrangements generally were good, although in one instance, where a quantity of table plants were huddled together on a back stage instead of being disposed in a single line among the fruit dishes, where the effect would have been good and space economised, was one notable exception.

Groups.—For a semi-circular group of Chrysanthemums, "with foliage plants at the discretion of exhibitor," four good prizes were offered, and here Mr. Perkins was well ahead of other exhibitors, with a beautiful group, well arranged, and the plants carrying large flowers; 2nd, Mr. Daus, gr. to Colonel Grey, Bray.

Groups of miscellaneous plants were a pleasing feature, six exhibitors competing for half that number of prizes. Mr. Gibson, gr. to R. W. HUDSON, Esq., Danesfield, Marlow, was awarded the 1st position.

Cut Blooms.—The greatest interest was centred in the open class for thirty-six Japanese blooms in not fewer than twenty-four varieties, and not more than two of one variety. Mr. PERKINS was a good 1st, with the following, among others:—Mrs. White Popham, Australian Gold, Mutual Friend, Mrs. J. W. Burks, Australia, Mrs. Mease, the premier bloom and a magnificent flower; Madame Carnot, Mrs. H. Weeks, Pride of Madford, Le Grand Dragon, Lord Ludlow, and Nellie Pockett. Mr. Fulford, gr. to F. D. LAMBERT, Esq., Moor Hall, Cookham, was 2nd, also having good flowers, a fine Oceana being noticeable.

An interesting class was that for eight ways of Japanese blooms, each to contain three blooms of one variety, and only Chrysanthemum foliage to be used, a £5 Silver Cup being offered as 1st prize. Here Mr. PERKINS was 1st; 2nd, Mr. D. Hayler, gr. to Mrs. LANGWORTHY, Holyport, Maidenhead.

A somewhat similar class for eighteen Japanese blooms, arranged on a space 5 feet by 3 feet, with the addition of any foliage plants or foliage. Mr. Wood, gr. to Lord Boston, Hedsor, Maidenhead, was 1st with an arrangement of small decorative plants, above which the blooms were arranged.

For twelve Japanese blooms, Mr. Wood was 1st, followed closely by Mr. FULFORD; and for a similar number of incurved blooms, the last-named exhibitor was a good 1st, with a stand of large flowers of excellent quality.

For six Japanese of one variety, Mr. PERKINS was 1st with fine flowers of Mutual Friend. For a similar number of incurved blooms, Mr. FULFORD was 1st with D. B. Crane.

FRUIT AND VEGETABLES.—For a collection of vegetables, Mr. GRASON was a good 1st. Mr. Hutt, gr. to Captain FARWELL, The Priory, Burnham, was 1st for a collection of Pears, including a fine dish of Pitmaston Duchess; and Mr. Jordan, gr. to RILEY, Esq., Bohemia, Marlow, had a similar position for Black Grapes.

Non-competitive Groups were numerous; Mr. R. OWEN, Castle Hill Nursery, contributed a fine group of Chrysanthemums, consisting of incurved and Japanese varieties of his own raising, Lord Cromer being conspicuous. Mr. R. BROUGHTON and Mr. E. F. SUCH also contributed groups and floral decorations; and Messrs. J. HOUSE & SON, Westbury-on-Trym, Bristol, a collection of double and single Violets.

PORTSMOUTH CHRYSANTHEMUM.

NOVEMBER 1, 2.—A first-class display was that held in the Town Hall by the Portsmouth Chrysanthemum Society on the above dates.

Cut blooms were especially good and numerous. The incurved section displayed more than average merit. The leading class was that for forty-eight blooms, half to be incurved, and half Japanese varieties. Mr. C. PENFORD, gr. to Sir F. FITZGERALD, Bart., M.P., Leigh Park, Havant, won the premier award. Good specimens of Mrs. J. Lewis, Mrs. W. Mease, Soleil d'Octobre, Australia, Vivand Morel, and Mrs. Hoste, in the Japanese; while in the incurved section, Duchess of Fife, Globe d'Or, C. H. Curtis, and Mrs. R. C. Kingston, were noteworthy. Mr. E. J. Hunt, gr. to PANTY RAIL, Esq., Ashted Park, Epsom, was a good 2nd.

For twenty-four Japanese blooms, there was spirited competition. Mr. J. AGATE, The Nurseries, Havant, winning with an even stand of heavy blooms. The new Florence Molyneux, Miss Ethel Pilkington, Mrs. Mease, Phoebe, and M. Chenon de Leche, were conspicuous examples. Mr. C. PENFORD was a close 2nd.

For an equal number of incurved flowers, there was again brisk competition. Mr. PENFORD, with a stand of medium-sized blooms, winning premier honours from Mr. HUNT.

LOCAL CLASSES.

Numerous classes were devoted to growers in the Portsmouth Island. In the class for twenty-four Japanese, Mr. F. T. Steptoe, gr. to T. WILLIAMS, Esq., St. Andrews, was an easy winner of 1st prize. Mr. NEWELL, gr. to J. SEADON, Esq., Dorset House, won 1st prize for twelve Japanese, with heavy blooms. The best incurved blooms in this division, came from Mr. G. ADAMS, Clarendon Road, Southsea, in the class for twenty-four blooms.

AMATEURS.

The exhibits in these classes made a great display, so numerous and good were they. For twelve Japanese, Mr. H. H. LEES, 54, Cedar Road, Southampton, easily gained the leading award, for an exhibit that would have secured a higher position in an open class at most shows. The blooms were large, fresh, fine in colour, and well-staged. Mr. T. LLOYD, Drayton Road, North End, Portsmouth, was 2nd.

PLANTS, FRUIT, &c.

Plants were not remarkable. The best group of Chrysanthemums, interspersed with foliage plants, came from Mr. FOSTER, Brockhampton Nurseries, Havant.

Fruits and vegetables were well shown. Mr. E. HILLIER, nurseryman, Winchester, staged five dozen dishes Apples in splendid condition; and Mr. COUSINS, Swanwick, a smaller collection.

HEREFORDSHIRE FRUIT AND CHRYSANTHEMUM.

NOVEMBER 1, 2.—This Society held its eighth annual show in the Shire Hall, Hereford, and there was a magnificent display of Apples, which, if not remarkable for great size, were nevertheless of extraordinary colour. Pears were likewise exhibited in quantity, and were of excellent quality. The groups of Chrysanthemums and miscellaneous plants were of considerable merit, but with few exceptions the stands of cut blooms were not of high quality. Collections of vegetables were excellent.

APPLES.

In the class for fifty dishes, Mr. WATKINS, Pomona Farm, Hereford, was, as usual, placed 1st, with a grand lot of clean, highly-coloured fruits—Wadhurst Pippin, Smart's Prince Arthur, Wealthy, Lady Waldron, Peasgood's Nonsuch, Twenty Ounce, Livesey's Imperial, Newton Wonder, and Cox's Orange Pippin, were observed amongst the best dishes. Messrs. FEWTESS BROS., The Gild Nursery, Hereford, were a good 2nd.

For thirty dishes, Mr. R. GRINDROD, gr. to G. J. BATES, Esq., Whitfield, Hereford, took the lead with some of the best fruit exhibited, including splendid dishes of Emperor Alexander, Allington, Ribston, Cox's Pippin, Lord Derby, Gascoigne's Seedling, Bismarck, Rymer, &c.; Mr. Ward, gr. to Lady E. FOLEY, Stoke Edith Park, was a close 2nd.

For twenty-four dishes, including twelve dessert and twelve kitchen varieties, Mr. WOOLTON, Byford, Hereford, was 1st, with a choice collection of well-coloured fruits, Royal Jubilee, Byford Wonder, May Queen, Emperor Alexander, Warner's King, King of the Pippins, and Ribston Pippin being conspicuous. Mr. DAVIS, gr. to W. E. KING, Esq., Bodenham Manor, was 2nd.

Champion dishes.—Mr. GRINDROD secured the prize for the best dish of culinary Apples, with a grand dish of Emperor Alexander; Mr. FOX, gr. to Captain T. G. COTTERELL, Garmons, Hereford, that for dessert varieties, with large highly-coloured Cox's Orange Pippin; and Mr. DUNN, gr. to Mrs. WOODHOUSE, Burghill Court, for Pears, with a fine, clean dish of Easter Beurre.

PEARS.

The best collection of twenty-four dishes of Pears was shown by Mr. SPENCER, gr. to G. MOFFATT, Esq., Goodrich Court, Ross, who had fruit of very high quality; his best dishes being Beurre d'Avalon, Doyenné du Commerce, Durrandean, Beurré Superfin, Forelle, Bauré Balle Père, Beurré Berkman, Beurré Perrin, and Duchesse d'Angoulême; Mr. SMITH, gr. to L. J. C. MITCHELL, Esq., following with good, clean fruit.

Mr. GRINDROD was also first for twelve dishes.

There was spirited competition in some twenty classes for Apples and Pears, including collections of Cider Fruit, open only to tenant-farmers; as there was likewise for special prizes offered for Apples as packed for market; and for preserved fruits.

GROUPE OF PLANTS.

Amongst three competitors, Mr. FOX was placed 1st for a group of miscellaneous plants; and Mr. MUIARD, gr. to Sir J. RANKIN, Bryngwyn Park, was a close 2nd.

For a group of Chrysanthemums, 12 feet by 7 feet, Mr. SMITH, gr. to R. J. C. MITCHELL, Esq., was 1st with a beautifully arranged lot of plants possessing large flowers, but was very closely followed by Mr. WILLIAMS, gr. to Sir J. PULLEY, Lower Eaton.

CUT BLOOMS.

For twenty-four Japanese, Mr. RICH, gr. to G. HADFIELD, Esq., Moriston House, Ross, was 1st with the best stand exhibited; 2nd, Mr. W. DAVIES, gr. to A. W. G. WRIGHT, Esq., Quarry House. Mr. SPENCER was 1st for twelve blooms.

For twelve blooms of incurved varieties, Mr. GRINDROD was 1st; and Mr. C. SMITH, 2nd.

NON-COMPETITIVE EXHIBITS.

Mr. WATKINS staged 130 splendid dishes of Apples. The ENGLISH FRUIT & ROSE COMPANY, LTD., King's Acre, Hereford, staged a fine collection of sixty dishes of highly-coloured Apples. Mr. WILSON, Commercial Street, Hereford, exhibited a large collection of sprays of decorative Chrysanthemums, cut from the open, &c.

FRENCH NATIONAL CHRYSANTHEMUM.

NOVEMBER 3.—The fourth annual exhibition of the above Society, which was held in conjunction with the autumn show of the Practical Horticultural Society of the Rhone, was opened on the above date. The weather was all that could be desired, and about 5000 people visited the show on the first day. The display of plants in pots and cut blooms was a very extensive one, and the arrangements made for the convenience of visitors were exceptionally good. Instead of the usual method of staging the cut flowers on tables as in England, the flowers were shown in glass bottles, and then arranged in beds in the level ground with a raised wooden border; the whole of the bottles being covered with green moss.

A similar plan was adopted for the pot plants, nearly all of which were exceptionally dwarf, a system being practised at Lyons, which is known as "culture Lyonnaise," and consisting of striking the cuttings late in the spring, and then severely disbudding, so that the growers obtain very dwarf plants, with from three to seven large-sized blooms.

A large number of special prizes was offered consisting of works of art and medals. Among the donors were the President of the Republic, the Minister of Agriculture, the County Council, the town of Lyons, several French societies, the English National Chrysanthemum Society, and the Italian National Chrysanthemum Society, both of which were represented in the persons of Mr. Harman Payne and Mr. Paolo Radelli.

The Exhibition was laid out in the usual Continental style, the beds being formed in geometrical forms, with numerous paths between. New seedlings were shown in splendid form by M. ERNEST CALVAT, who had seventeen varieties, out of which the Floral Committee selected eight for First-class Certificates. These will not be sent out till next year, but it may be useful to mention them by name, for as shown there was certainly no sign of this grower's ability being on the wane, as some of the English cultivators are apt to think. They were Madame Adèle Cordonnier, Wibaux, M. O. de Meulenaere, Madame Alice Capitain, Madame L. Druz, Salomé, Madame de Tranqueville, Marquis Visconti Venosta, and Madame V. Delavrie.

Seedlings were also shown in very large numbers by M. BONNEFONS, EYND. DE REYVELLET, MESSRS. VILMORIN ANDRIEUX & Co., and M. HERAUD, a comparatively new raiser.

Mr. W. WELLS, of Earlswood, also showed Lord Salisbury. Lord Ludlow, Silver Queen, Janet, Lady Clark, and others, under numbers.

Another English exhibitor was Mr. J. BROOKS, of Totteridge, who had a nice exhibit of six cut blooms.

Pot plants were well shown by MESSRS. CHAMMET, ROZAIN, BOUCHARLAT, RIVOIRE ET FILS, BRESSY & COMBET, VILMORIN-ANDRIEUX & Co., and others.

The English reader will have but little interest in details of the various awards, and we shall therefore content ourselves with saying that in the groups there was a very good one contributed by the Municipal Gardens, where M. CROUET, the originator of the culture Lyonnaise, presides over the Chrysanthemums, and that the best varieties we noticed consisted of the following well-known sorts:—President Nonin, Madame Deis, G. J. Warren, Marié Calvat, Australian Gold, Madame Ferlat, Oceana, Mrs. C. Harman Payne. Others of equal merit were Madame H. Brun, a fine large white Japanese; Le Colosse Grenoblois, immense in size, but which is seldom seen now in England; Secrétaire Rivoire, yellow; Madame Carnot, all good, and large in size; M. Louis Rémy, a fine pure yellow sport from Mrs. C. Harman Payne, N. C. S. Jubilee, Rayonnant, Madame Rozai, a fine, delicate, pale, silvery-pink, somewhat old, but a very effective flower; Mon Petit Jean, and several others. There were also many other varieties, a large number of which are almost unknown in England, but which in no case could be compared with the varieties mentioned.

A curious exhibit came from M. DELVERT, who set up a collection of dwarf Chrysanthemums, rooted and grown in moss only, but which had their nutriment supplied by waterings with a special liquid-manure, prepared under the direction of M. Truffaut, jun., who is well known for his researches on the subject of chemistry as applied to horticulture.

MISCELLANEOUS GROUPS were very well arranged, and consisted of Palms, Ferns, and the usual ornamental and foliage plants. These were contributed chiefly by MESSRS. REVOT, DEVERS, and A. NOBEL. Carnations, Canas, Dahlias, Abutilons, Cyclamen, Roses, and many other products were staged.

There were also exhibits of fruit, the finest one being a display of Grapes by Mr. H. FATZER, who was deservedly awarded a work of art in bronze for his Gros Colmar and Black Alicante, and Canon Hall Muscat, and Muscat of Alexandria. In the grounds adjoining the exhibition-hall, which was a large temporary wooden structure, there were numerous Conifers, Magnolias, Palms, Bamboos, and ornamental shrubs, &c. Various implements and garden-tools were also shown.

A LUNCHEON to the jury was presided over by M. GERARD, the President of the Society; and at 8 o'clock in the afternoon M. VIGEN took the chair at a meeting of the Conference. A fine room in the Palais du Commerce was engaged for the purpose, and there was a good attendance to hear M. Gerard, who discoursed upon the subject of cross-fertilisation. M. Chiffot, who dealt with malaria and parasites, illustrated with coloured drawings. M. Ernest was awarded the Gold Medal of the Society for his services in the cause of the Chrysanthemum; and it was arranged that next year's show and Conference be held in Paris.

There was a grand banquet in the evening, presided over by M. VIGEN, the Minister of Agriculture, at which there were present the Prefect of the Rhone, The Rector of the University, General de Gefrier, MESSRS. Maxime de la Rochetier, Gérard, Philippe Rivoire, Secretary French N. C. S., Harman Payne, P. Radaelli, Secretary Italian N. C. S., H. Martinet, G. Chabanne, Lucien Chauré, Dauthenay, Marc Nicheli, T. Bevan, W. Wells, Fatzer, Félix Sabut, and many others. This festive gathering was the occasion for the bestowal of several decorations upon members of the Society, who had distinguished themselves in the work of the Society.

On the second day, there was another sitting of the Conference, which was presided over by M. Maxime de la Rochetier. A visit was subsequently made to the Park Tête d'Or, where the municipal greenhouses are situated; and in the evening, the Syndicate of Lyons nurserymen organised a smoking concert, to which the jury and others were invited. It is only fair to say that a most hearty welcome was offered to the foreign visitors, and especially to the deputation from the English National Chrysanthemum Society.

SCOTTISH HORTICULTURAL.

NOVEMBER 7.—At a monthly meeting held on the above date in the Society's Rooms, Edinburgh (Mr. James Greene presiding), and in the presence of an exceptional attendance, there were nominated 117 new members, the largest number ever proposed at one time.

Interesting exhibits of Chrysanthemums were made by MESSRS. JAMES GREENE & SONS and Mr. LAMONT.

TEA ROSES IN SCOTLAND.

The lecturer for the evening was Mr. SIMPSON, of the Dalhousie Nurseries, Broughty Ferry, Dundee, and he displayed a nice collection of Roses, chiefly Tea varieties—a fragrant and telling illustration of the subject of his lecture.

Mr. COMFORT exhibited a charming bouquet of Roses, and one of Mignonette, from the open-air, in a locality near Edinburgh.

In Mr. Simpson's exhibit from Broughty Ferry were fine, fresh samples of the following varieties, cut on November 7: Madame Lambard, Marie Van Houtte, White Lady, Lady Mary Fitzwilliam, Rainbow, Papa Gontier, Ulrich Brunner, Perle des Jardins, Mrs. John Laing, La France de '89, Dr. Grill, Duke of Edinburgh, &c.

Scotland is already famed for many things, and Mr. Simpson is anxious to add to her many crowns that of growing the finest Roses, especially Teas. One of her greatest advantages is her cool climate; this greatly extends the season of Scotch Tea and other Roses.

While the English and Irish growers often fail to get good blooms after July, the showy Northern growers can cut and come again through the summer and autumn. One seldom sees a good Tea or other Rose in France unless it be Gloire de Dijon, and these are poor against the Scotch Gloire de Dijon.

Mr. SIMPSON claims to be the first Scotch grower to bud Tea Roses freely in the open. He was led to do so by an incident that occurred in 1876 or 1877. On visiting the nurseries of MESSRS. MORRISON, Aberdeenshire, he was struck with the vigour and freshness of their Tea Roses in the open. Asking how they were produced, he was told that small Briars were potted-up in November, and placed in a cool greenhouse and grafted the succeeding March, planted out the following March, and sold to the trade readily the next November. Mr. SIMPSON had some of these Roses at the end of November, 1877. These small Teas were "soured," that is, laid in the nurseries at Broughty Ferry; and early in December a time of frost and snow, which lasted for a lengthened period, set in. In March, soon after the long frost broke, an English gentleman named PEARCE, called in search of hardy Tea Roses other than Gloire de Dijon. He was told the history of the Aberdeens plants, and agreed to examine them, and said that if any were alive, they must be hardy. All were found to be alive with the exception of two. "Then and there," says Mr. SIMPSON, "I formed a resolution to bud my Tea Roses in the open, which I have done ever since."

"For several years," said Mr. Simpson "we have sown annually some three miles of 4 feet beds of Briar-seeds to supply our own wants and that of our customers. As to the culture of Tea or other Roses, the great secret is to dig well and dung well; turn the top spit over 15 inches deep, and loosen the soil under that with a fork or pick 15 inches more. As to dunging, put some at the bottom of the first trench, then cover with earth with the Rose above it; cover the Rose with earth, then a layer of dung covered with 2 inches of soil to give freedom for the free use of the Dutch hoe through the summer, which is found to be better than watering. Plant in November at a distance of 15 inches square for dwarf trees, and they will then cover the ground well in summer. Prune either at the time of planting in November or in the spring, but not later than March, by which time all Roses in Scotland should be pruned. In pruning we simply shave our Roses over by the ground level, sometimes with shears. In spite of this close pruning, we have too many buds and shoots pushing in April and May. We thin these out to four on each plant, and keep them as far apart as possible. The buds are thinned to one on a shoot, and the shoots are rubbed out to 9 inches down from the bud, as that is found a nice length to cut with flowers; below that length they soon break again, and produce a second and then a third crop of flowers if the plants are strong and healthy. These growths are thinned and treated as the first, and prove harder than our forest trees, such as Spruce, Beech, Ash, Laurels, and Cedars.

Since 1893 the first blooming of cut-backs and maiden Roses at Broughty Ferry have been as follows:—

Cut-backs.	Maidens.
1893, May 30, Rubens.	1893, June 7, Distinction.
1894, June 6, Rubens.	1894, June 15, M. Van Houtte.
1895, June 10, Rubens.	1895, June 4, Grace Darling.
1896, May 26, Grace Darling.	1896, June 1, Gloire de Dijon.
1897, June 2, Bardon Job.	1897, June 23, Grace Darling.
1898, June 7, Bardon Job.	1898, June 15, Bardon Job.
1899, June 15, Bardon Job.	1899, June 22, Bladud.

Before the meeting closed, it was unanimously resolved that part of the profits of the great Chrysanthemum show of the Association, since held in the Waverley Market, should be given to aid the widows and orphans resulting from the South African War. D. T. F.

COVENTRY CHRYSANTHEMUM.

NOVEMBER 7, S.—The Corn Exchange, in which the above Society held its fifth annual show, is an ideal building for a Chrysanthemum exhibition; and, in spite of the falling off in the number of exhibits, the quality of those staged was excellent, and the effect produced was admirable.

In the group classes, the 1st prize was well won by Mr. J. Morris, gr. to Sir RICHARD MOON, Bart., Copsewood Grange, Coventry.

Two meritorious groups of miscellaneous plants were shown, the premier position being secured by Mr. W. FINCH, Coventry.

Cut Blooms.—For twenty-four Japanese, Mr. H. Blakeway, gr. to P. A. MUNTZ, Esq., Dunsmore, Rugby, was 1st; Mr. J. Blake, gr. to W. H. HERBERT, Esq., The Grange, Coventry, was a decidedly good 2nd.

The best collection of twenty-four incurveds was staged by Mr. A. Chandler, gr. to ARTHUR JAMES, Esq., Cotton House, Rugby.

Twelve Japanese blooms were shown best by P. A. MUNTZ, Esq., Rugby.

MISCELLANEOUS EXHIBITS.—There were large and representative collections of Apples and Grapes, interspersed with autumn-tinted foliage, &c., well set-up by Mr. H. T. Martin, gr. to the Right Hon. Lord LEIGH, Stoneleigh Abbey; and from the same establishment was a collection of Chrysanthemum blooms, exhibited with the natural foliage of the plants.

Mr. J. R. HARLEY sent a group of miscellaneous plants, and Sir B. MOON a collection of well-grown Apples and Pears. MESSRS. FINCH of Coventry had a fine show of wreaths, crosses, &c.

MESSRS. B. S. WILLIAMS & SON, of Holloway, London, had a fine display of miscellaneous flowering-plants.

ROYAL HORTICULTURAL OF IRELAND.

NOVEMBER 7, S.—The Royal Horticultural Society of Ireland held their annual display of Chrysanthemums and fruit in the spacious grounds of the Royal Dublin Society, the exhibits being staged in the central hall. During both days it rained almost incessantly. The Lord Lieutenant and party visited the show on the second day, and was received by several members of the Council.

The exhibits on the whole were as numerous as usual, but beyond a few they were not exceptional. Fruit was well shown; and deserving of special mention were the displays of the nurserymen, including MESSRS. DICKSONS of Newtownards, Hugh DICKSON of Belmont, and MESSRS. SAUNDERS of Cork. The latter stand was more of an educational nature, and from this point of view was worthy of recognition. MESSRS. J. HOUSE & SON, Bristol, staged single and double flowered Violets; Mr. J. FORBES, of Hawick, had Begonia Gloire de Lorraine, including the new white sport, Caledonia; MESSRS. RAMSAY & SON had a fine group of Palms, &c., also a display of floral designs.

PLANTS IN POTS.

For a group of Chrysanthemums, consisting of not more than thirty plants. A second prize only was awarded to JOHN MILLER, Esq., Bagginbath House (gr. P. Geoghegan), but the same exhibitor took premier honours; also Lord ARDLATH'S Cup, value £10, for a stand of thirty-six Chrysanthemums.

For twelve plants, WM. CARTY, Esq., Dunroo, Sandymount (gr. Mr. Lees), was 1st.

For a group of foliage and flowering plants, from which Chrysanthemums were not excluded, the premier exhibit, from Lord ARDLATH, included Cypripediums, Salvia, Cyclamens, Chrysanthemums, Palms, and Ferns, all tastefully interspersed; and reflected great credit on Mr. Campbell his Lordship's gardener. GEORGE DRIMMIE, Esq., Bootstown, was a close 2nd.

CUT BLOOMS.

In the class for a stand of forty-eight blooms, Japanese, in a similar number of varieties, for the Society's large Silver Medal and £10, Viscount ASHBROOK (gr. J. McKellar), was an easy 1st, with a magnificent group, in which the blooms were well developed; 2nd, GERTRUDE, Countess of PEMBROKE, Mount Merrion, Bootstown (gr. H. Crawford).

For the Gardeners' Cup, value £10 10s., and £3, for a stand of twenty-four Japanese, the best exhibit was one from Viscount ASHBROOK; 2nd, C. S. SPEAR, Esq., Springfield House, Glenageary (gr. Mr. Maher).

The best three varieties of Chrysanthemums, three blooms in each, own foliage, and stems to be 12 inches above top of vase, the Silver-gilt Medal (H. J. Jones), and added money prize by Society, was won by C. S. SPEAR, Esq., Glenageary; 2nd, Lord ASHTONS, Woodlawn, Galway (gr. A. Porter).

Incurveds.—Chrysanthemums, incurved, stand of twenty-four blooms, not fewer than twelve varieties, 1st prize a piece of plate value £3 3s., presented by the ICHTHYMUS GUANO CO., Ipswich, with money prizes added, was won by Viscount ASHBROOK (gr. J. McKellar); 2nd, GERTRUDE, Countess of PEMBROKE.

The best collection of twelve blooms was from CLIFFORD LLOYD, Esq., Victoria Castle, Killybeg (gr. J. Farrell).

The best Japanese bloom in the show was one of Mrs. J. Lewis, from Lord ASHBROOK; and the best incurved was C. H. Curtis, from the same exhibitor.

There were fine collections in competitive classes of Cyclamens, Carnations, and other autumn-flowering plants.

FRUITS AND VEGETABLES.

For a stand of four bunches of Grapes in two varieties, the 1st prize was won by Lord ASHTONS, Woodlawn, Galway, who had good bunches of well-finished black Alicante, Muscat of Alexandria, and Appley Towers; and the same exhibitor was 1st for two bunches of White Grapes.

The best pair of bunches of black Grapes was from the Right Hon. J. MEADE (gr. J. Colgan), who had superb black Alicantes.

The best collection of Apples in twelve varieties was from Lady EMILY BURY.

The best collection of dessert Apples in six varieties was shown by Wm. GOFF PIM, Esq., Summergrove, Mountmellick (gr., H. Hartley).

A collection of dessert Pears in twelve varieties was best from J. J. LOMBARD, Esq., J.P., Southill, Upper Rathmines (gr., J. Tobin).

Vegetables, upon the whole, were well displayed. The principal prize-winners were Lord CAREW, Lord ASHTOWN, Wm. GOFF PIM, Esq., Mrs. MOORE, and the Right Hon. J. MEADE.

TRADE EXHIBITS.

Messrs. HOON & ROBERTSON had a very pleasing collection of fruits and berried shrubs. Messrs. WATSON & SONS, Clontarf, had an exhibit of border varieties of Chrysanthemums.

Messrs. WELLS & Co., Earlswood, Surrey, had a neat display of Chrysanthemums. Messrs. TAIT & Co. staged a fine collection of Apples and Pears, including nearly 150 dishes.

Messrs. RAMSAY & SONS, Ballsbridge, displayed a group of foliage and flowering plants, measuring over 40 feet by 30 feet in height; it was a magnificent exhibit.

Messrs. SAUNDERS, of Cork, had a meritorious display of fruits. Messrs. ALEXANDER DICKSON, Newtownards, staged a collection of fruit.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 7, 8.—The annual show of the above Society was held in the Guildhall, Plymouth. The entries for groups and cut blooms compared favourably with those of previous years.

The leading class for cut blooms was one for forty-eight Japanese, for which a 1st prize of £10 was offered. This was won by Mr. G. FOSTER, gr. to H. HAMMOND SPENCER, Esq., Teignmouth, who had a fine lot of even and well-coloured blooms, including such leading novelties as Le Grand Dragon, Madame G. Debrie, Pres. Nonin, Jane Molyneux, Mrs. J. W. Barks, and Mrs. White Popham. Mr. G. W. DRAKE, Cardiff, was 2nd, with heavy blooms, that lacked freshness.

In the class for twenty-four Japanese blooms and twelve blooms, Mr. FOSTER was again to the front, and Mr. F. G. CLATWORTHY, gr. to F. BRADSHAW, Esq., Lifford Park, was 2nd in the larger class.

For six blooms of a white variety, Mr. CLATWORTHY was 1st, with Madame Carnot (good); and for six blooms of any coloured variety except white, Mr. FOSTER won with Australian Gold.

For twenty-four incurveds, Mr. FOSTER again took the leading place; 2nd, Mr. Stiles, gr. to the Rev. G. LYONS, Teignmouth.

Messrs. PERKINS & SONS, Coventry, had the best floral display, and made a very attractive one.

Groups, &c.—The best group of Chrysanthemums, arranged in a space of 100 square feet, was exhibited by Mr. H. BENNET, gr. to Lady JACKSON, The Pounds; and the 1st prize and a Silver Cup for the best group of Orchids was won by Mr. G. MATHEWS, gr. to Lord AUCKLAND, Kitley, West Plymouth, with a grand display.

Fruit was shown well, and Mr. PAOE had two grand bun bes of Muscat of Alexandria Grapes.

Vegetables were also a large feature. Mr. G. LOCK, gr. to B. H. HILL, Esq., Crediton, won the "Sydenham" Cup by one point.

Trade Exhibits.—Mr. W. J. GODFREY, Exmouth, showed several dozen blooms of new Chrysanthemums, and sprays of zonal Pelargoniums; Mr. SLATER, of the Devon Nurseries, a collection of Apples; Messrs. R. VEITCH & SONS, Exeter, Violets, &c.

BIRMINGHAM CHRYSANTHEMUM.

NOVEMBER 7, 8, 9.—The annual exhibition of Chrysanthemums was held in the Bingley Hall, and there was such a magnificent display as is rare at any autumn exhibition. Specimen plants, groups of Chrysanthemums in pots, arranged for effect; cut blooms, fruit, vegetables, and miscellaneous exhibits were all good alike. The management at the show in this busy centre leaves nothing to be desired. Mr. Hughes is a model Secretary, while Mr. Latham as Chairman of Committee is a host in himself.

SPECIMEN PLANTS.

Plants were well shown. The leading class was that for nine (Japanese excluded). Mr. C. BRASIER, gr. to Lady MARTINEAU, Edgbaston, was 1st, with freely-grown plants, not too formally trained, and well flowered, and representing popular varieties. Mr. J. WALDRON, gr. to G. CADBURY, Esq., was a good 2nd.

For six large-flowering varieties, Mr. BRASIER was again the most successful exhibitor, and for six Japanese, C. Blusset Charles Davis, and V. Morel were noteworthy in the latter class.

Mr. J. WALDRON won, for three plants of Pompon varieties, with well-blossomed examples of *Sour Mélanie*, W. Westlake, and *Rose Trevena*.

Single-flowered varieties were capitally shown by Mr. WALDRON and Mr. A. CRYER, gr. to J. A. KENRICK, Esq., Edgbaston, who secured the prizes in the order here given.

GROUPS.

Groups of Chrysanthemums and foliage plants were a feature of the show, so numerous and good were they. Two classes were provided. In that to occupy a space of 20 feet by 12 feet, there were six competitors. Mr. J. V. MACDONALD, gr. to E. H. KENRICK, Esq., won the leading award, with plants carrying good blooms, and not too thickly arranged—a fault possessed by some exhibits. Mr. BRASIER was 2nd, grandly-flowered plants, but somewhat flatly arranged.

In the smaller group, Mr. WALDRON occupied the post of honour with an exhibit that contained but few blemishes; Mr. E. J. MUSTIN 2nd.

CUT BLOOMS.

For twenty-four incurveds, distinct, Mr. C. CROOKS, gr. to the Dowager Lady HINDLEIGH, Droitwich, secured the premier award of £10 with blooms of large size, well set up; *Globe d'Or*, Duchess of Fife, C. H. CURTIS, Mrs. W. C. EGAN, P. PETFIELD, Bonnie Dundee, and J. AGATE, were conspicuous examples. Mr. GOODACRE, gr. to the Earl of HARRINGTON, Elvaston Castle, was 2nd, with large but somewhat rough examples.

Mr. CROOKS again won in the class for eighteen incurveds, as also for twelve blooms.

Japanese varieties were more numerous. Mr. GOODACRE scored an easy win for twenty-four blooms of distinct varieties, with heavy, fresh examples of leading varieties. Madame Carnot, Edith Tabor, M. Pankoucke, Madame Louis Rémy, Mrs. Weeks, Mrs. Mease, and Chenon de Leché were noteworthy. Mr. CROOKS was a good 2nd.

For eighteen blooms Mr. CROOKS won with a thoroughly good set.

The last-named exhibitor won for any one variety of white, in six blooms, with exceedingly fine examples of Madame Carnot. Mr. H. WESTBURY, gr. to C. SNOWELL, Esq., Edgbaston, was 2nd, with Mrs. Weeks, in good condition.

An interesting class was that for six blooms of any yellow Japanese, Mr. CROOKS winning with *Phoebe*.

Mr. F. VALLIS, Clippenhurst, secured the leading award for twelve Japanese incurved, staging typical examples of Modestum, Lady Ridgway, R. POWELL, Nellie Pockett, and T. Carrington.

Mr. J. JUSTICE, gr. to Sir P. TEMPLE, Bart., Worcester, won for twelve anemone-flowered varieties, staging these with typical centres.

DECORATIVE CLASSES.

Floral arrangements made a great display. For the best exhibit in a space of 20 feet by 5 feet, Messrs. POPE & SONS, King's Norton, occupied the leading position with baskets of choice flowers, bouquets, and designs of many kinds.

For a dinner-table, 8 feet by 4 feet, decorated with Chrysanthemums, Ferns, and other foliage, there were nine competitors, making a bold display. Mr. J. A. TIDMUS, Spark Hill, was 1st with an effective design carried out with *Source d'Or* Chrysanthemums and Ferns.

MISCELLANEOUS.

Primulas are always a feature at this show. Messrs. THOMSON & Co., Sparkhill Nurseries, won the premier award for twelve and six single-flowered varieties, as well as for six Fern-leaved kinds, staging their well-known named sorts. Fruit and vegetables made a grand display.

Non-competitive exhibits were numerous and good. Gold Medals were awarded to Mr. W. J. GODFREY, Exmouth, for Chrysanthemums; to Messrs. J. LAINO, Forest Hill, London, for Apples, Palms, and Begonias; and to Mr. DEACON, gr. to the Rt. Hon. JOSEPH CHAMBERLAIN, for a collection of flowering and foliage plants.

Silver Medals to Mr. WELLS, Earlswood, Redhill, for Chrysanthemums; to Messrs. CLIBBRAN for *Colosias*, Chrysanthemums, and *Salvias*; and to Messrs. WATKINS, Hereford, for Apples.

HANLEY CHRYSANTHEMUM.

NOVEMBER 8.—The seventeenth annual exhibition of the County Borough of Hanley Chrysanthemum Society was held in the Victoria Hall on the above date.

GROUPS (OPEN).

A very good group was put up by Mr. SMITH, gr. to JAS. MADDOCK, Esq., Alsager, in which were very fine blooms of the leading varieties, interspersed with Palms and fine foliage plants, to which 1st prize was awarded; and 2nd to Mr. G. LEWIS, gr. to R. G. HOWSON, Esq., Shetton. A nice group of stove-plants and Orchids was put up by the last-named exhibitor.

Cut Blooms.—Mr. GOODACRE, gr. to the Earl of HARRINGTON, Elvaston Castle, was 1st for twenty-four incurved and twenty-four Japanese varieties, having good blooms of the leading varieties in both classes; Mr. G. MADSON, gr. to F. A. BRACE, Esq., Doveridge Hall, 2nd, for twenty-four Japanese; Mr. MACPHAIL, Queen's Park, Longton, 3rd, for Japanese, and 2nd for twenty-four incurveds.

For twelve incurved, distinct varieties, no 1st prize was awarded; 2nd, Mr. MACPHAIL.

For twelve Japanese varieties Mr. MACPHAIL was 1st; 2nd, Mr. McKnight, gr. to T. BOLTON, Esq.

Vases of Chrysanthemums were very good indeed, and Messrs. JENKINSON, Newcastle-under-Lyne, were 1st, for a good exhibit, as they also were in the class for bouquets, wreaths, crosses, and button-holes, being awarded 1st in each of these sections. Mr. MADDOCK, of Hanley, was 2nd.

Amateurs.—The exhibits were strong in cut-blooms, and Mr. LOWE was 1st for twelve Japanese; Mr. LEWIS, 2nd, the same exhibitors being 1st and 2nd in the class for six varieties.

Mr. LEWIS was 1st for twelve incurved varieties; and Mr. LOWE 2nd. Mr. LEWIS was 1st for six varieties incurved; and Mr. LOWE 2nd.

The plants exhibited in pots were very fair specimens considering the murky atmosphere in which most of them are grown. A pleasing group of table plants and Ferns, not for competition, came from W. H. HARRISON, Esq. (gr., Mr. Bates). A group of *Begonia Gloire de Lorraine* was shown by R. G. HOWSON, Esq. (gr., Mr. Lewis), both groups being awarded Certificates of Merit.

Fruit was not largely shown, but was very good in quality.

CHESTERFIELD CHRYSANTHEMUM.

NOVEMBER 8.—The annual autumn exhibition was held in the Stephenson Memorial Hall, and was in every way a success. Groups of Chrysanthemums were a distinct feature.

Mr. E. MOSES, gr. to L. BRITT, Esq., Berry Hill, Chesterfield, won the premier award for a grand lot of dwarf plants, carrying excellent flowers. Mr. BLUXHAM, gr. to R. F. MILLS, Esq., Tapton Grove, Chesterfield, was 2nd.

Prizes were offered for a group of plants that had not been disbudded, to be arranged upon a space of 60 square feet, and a charming result was obtained. Mr. NELSON, gr. to A. BAINES, Esq., Ashgate Lodge, Chesterfield, was 1st, showing small-flowering Japanese varieties, as well as Pompons and single-flowered sorts. All of the plants were profusely flowered and arranged lightly, and in association with well-grown plants of *Cocos Weddelliana*. Mr. MONEY was an exceedingly good 2nd.

In the cut bloom section, Mr. J. EVANS, gr. to Sir H. WILMOT, Chadderton, Derby, won 1st place for twenty-four Japanese; Mr. NELSON securing a similar award for twelve Japanese.

In the "vase" class for four varieties, of three blooms each, Mr. PARKES, gr. to J. M. CLAYTON, Esq., Whittington Hall, Chesterfield, secured the leading award.

Mr. EVANS also won the 1st prize for incurveds in twelve varieties; and showed C. H. CURTIS in grand condition.

GARDENERS' ROYAL BENEVOLENT.

NOVEMBER 8.—In connection with the Bath Chrysanthemum Show, a smoking-concert under the auspices of the Bristol and Bath Auxiliary of this Institution was held in the Club-room, and more than a hundred persons were present.

Mr. G. J. INGRAM, Secretary to the Institution, made an interesting speech, explaining the objects of the Society, the work that was being done, and concluded by appealing to those present to become active supporters of the Fund.

Mr. INGRAM complimented Mr. MILBURN, who, as Secretary of the Auxiliary in Bath, had worked most energetically on behalf of the Institution. The Institution received upon an average £89 a year from this Auxiliary, and the Bath and Bristol district received from the Fund £144. After Mr. INGRAM's speech a considerable proportion of those present gave their names in as future subscribers.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 8, 9.—This Society held its thirty-sixth show in the Drill Hall, Bristol, and notwithstanding that exhibitions were held simultaneously at Bath, Cardiff, and Monmouth, the classes were well filled, and the quality of the exhibits generally good, the groups of Chrysanthemums, and of other plants, collections of vegetables and fruit, and Grapes, being particularly so.

Mr. TAYLOR, gr. to Ald. CAFFIN, Bath, was very successful with the latter, taking five 1st prizes, with splendid examples. He was also awarded a 1st prize for the best bunch of Grapes in the show, for a large and perfectly-finished one of Mrs. PINCE. Altogether, the show was a great success, but alas! the familiar faces of the late Messrs. DUMBLE, PRAGNELL, and SHINGLES were missing. They were all present last year.

CHRYSANTHEMUM BLOOMS.

For a collection of thirty-six Japanese, a Challenge Vase, value £12 12s., and £5 was offered as a 1st prize. Amongst six exhibitors, Mr. WILKINS, gr. to Lady THEODORA GUEST, Inwood House, Henstridge, was placed 1st, and having been successful twice previously, the Vase has now become the exhibitor's property. He staged fine, even, well-coloured blooms, including Mrs. W. MEASE, Mrs. W. POPHAM, Madame Carnot, Australia, J. SCARAMANGA, Swanley Giant, Lady Hanham, Madame G. HEURY, Mrs. H. WEEKS, Duke of York, Australian Gold, &c. 2nd, Mr. RUNNACLES, Leweston House Gardens, Sherborne.

There were eight entries in the class for twelve Japanese blooms, Mr. HACK, gr. to W. PETTICK, Esq., having the best; and THE FLOWER & FRUIT CO., Frome, closely following.

Mr. HACK was also 1st for twelve blooms of Japanese incurved varieties; and Mr. ROBINSON, gr. to Lord LUDLOW, was a close 2nd.

In a class (the 1st prize being a piece of Silver Plate) for twenty-four Japanese blooms, in eight or more varieties, three blooms of each, arranged with ornamental foliage, or small plants of Ferns, &c., in a space 4 feet by 3 feet, Mr. HACK was again 1st, with good blooms of leading varieties, relieved with foliage of *Crotons*, Fern-fronds, &c. Mr. SUTTON, gr. to W. A. TODD, Esq., was 2nd.

For twenty-four incurveds, Mr. RUNNACLES led with a stand of very fine blooms; 2nd, Mr. F. WILKINSON, gr. to Mrs. TALBOT GRAVES.

GROUPS.

A group of Chrysanthemums, to occupy a space 10 feet by 6 feet, was best from Mr. W. J. Bunker, gr. to A. SHIPLEY, Esq., who had a beautifully-arranged collection, in which the colours were tastefully disposed, and the flowers were large, fresh, and highly-coloured. J. C. GODWIN, Esq., who was 2nd, had many white and yellow varieties in the centre of his group.

A pretty feature were groups of Chrysanthemums arranged with Ferns and ornamental foliaged-plants, in a space not to exceed 60 square feet. Here Mr. Bannister, gr. to H. St. VINCENT AMES, Esq., was 1st, with exceedingly good plants, arranged in great taste. The Chrysanthemums had fine foliage and large blooms, and were interspersed with Asparagus, Crotons, Eulalias, and Palms. Mr. G. Newberry, gr. to J. SAUNDERS, Esq., also had an attractive group.

For a bank of miscellaneous plants, in a space 10 feet by 6 feet, Mr. NEWBERRY was a good 1st, with a very bright and fresh lot of plants. Mr. Knight, gr. to H. CARY BATTEN, Esq., was 2nd.

MISCELLANEOUS EXHIBITS.

Mr. BANNISTER was deservedly awarded a Gold Medal for a splendid collection of vegetables; and Mr. J. West, gr. to C. B. HARE, Esq., Clifton, a Silver Medal for the best Chrysanthemum plant, with a good trained and flowered specimen of the variety C. H. Curtis. Mr. Phillips, gr. to J. M. BANNERMAN, Esq., Wyastone Leys, Monmouth, took the prize for the best Chrysanthemum bloom, with a grand specimen of Duchess of Fife.

In the classes for Apples and Pears, Messrs. BANNISTER, FARMER, PHILLIPS, VIROO, RUNNACLES, COOPER, and THE FROLE FLOWER & FRUIT CO. were leading exhibitors.

THE BRISTOL AMATEUR HORTICULTURAL SOCIETY

held an exhibition in a wing of the Drill Hall, Bristol, on the same dates as the above, the classes being open only to members. There was a good lot of Chrysanthemum-blooms and miscellaneous subjects exhibited. T. C.

MONMOUTH CHRYSANTHEMUM AND HORTICULTURAL.

NOVEMBER 8, 9.—At the Rolls Hall, Monmouth, this Society held its ninth show, which was the best yet held in Monmouth. The groups and cut-blooms of Chrysanthemums were good, as also were Grapes and vegetables, while Apples and Pears were excellent.

For a group of Chrysanthemums in pots, in a space of 60 square feet, Mr. PITT, nurseryman, Abergavenny, was 1st, with had moderately dwarf plants, furnished with good foliage and fine flowers.

For a group of ornamental foliage and flowering plants, Mr. Phillips, gr. to J. M. BANNERMAN, Esq., Wyastone Leys, Monmouth, was well to the front, with a pretty group composed chiefly of Polioetias, Celosias, Salvias, Crotons, Eulalias, and Palms, fringed with Ferns.

CUT BLOOMS.

The class for twenty-four incurveds was won by Mr. PITT; and Mr. PHILLIPS was 2nd. The flowers were satisfactory.

The best collection of twelve incurveds was shown by Mr. Davies, gr. to A. W. S. WAIROU, Esq., Quarry House, Linton; and he was followed by Mr. Lockyer, gr. to J. HANBURY, Esq., Pontypool Park, who was a good 2nd.

In the class for twenty-four Japanese blooms Mr. PITT again took the lead; and the smaller class for twelve blooms was won by Mr. DAVIES, who had a very nice collection.

The Silver-gilt Medal, presented by Mr. H. J. JONES, Lewisham, for six Japanese, distinct, was won by Mr. Spencer, gr. to H. C. MOFFATT, Esq., Godrich Court, Ross, who had capital blooms of Madame Carnot, M. C. Payne, President Moren, Phebus, Madame G. Henry, and Cloth of Gold.

Non-competitive exhibits were staged by Mr. Coomber, gr. to Lord Llangattock, who had a collection of Apples and Pears; and by Mrs. WATKINS, florist, Monmouth, who had a good collection of Apples and decorative plants.

ASCOT CHRYSANTHEMUM.

NOVEMBER 8, 9.—A great improvement on last year's Show, was that held on the above dates. The open classes, which are usually the feature of this Show, were well contested.

There were five entries for a group of Chrysanthemums and foliage plants. H. P. LECHUELLAS, Esq., Windlesham (gr. Mr. W. L. Farmer), was 1st; and Miss DARRING SMITH (gr. Mr. W. Lane, King's Ride, Ascot), was 2nd.

For a semi-circular group of Chrysanthemums only, the Marchioness of CONYNGHAM, The Mount, Ascot, was 1st.

For a miscellaneous group of plants, Mr. LANE was an easy 1st. Mr. LANE was 1st for two collections of vegetables, consisting of nine and six dishes.

Cut blooms were well represented in the open classes. That for twenty-four Japanese, distinct, was won by T. B. HAYWOOD, Esq. (gr. Mr. J. C. SALTER), Woodhatch Lodge, Reigate. With heavy blooms, but rather pale in colour, Mr. WILSON was 2nd.

For twenty-four incurveds, Mr. W. WILSON was 1st with good heavy blooms; 2nd, Mr. SALTER.

For thirty-six blooms, distinct, eighteen Japanese and

eighteen incurveds, a Silver Cup and money prizes were offered. The only entry was from Mr. W. L. FARMER, who was awarded 1st prize for medium-sized flowers.

Mr. Perry, gr. to LOUIS SCHOTT, Esq., Penny Hill, Bagshot, took four 1st prizes for blooms in 6's, with much the largest and best blooms in the show. The varieties were, Madame Carnot and Australian Gold; six distinct Japanese; and six incurveds. Mr. PERRY was awarded the N. C. S. Certificate for the best Japanese bloom, for a Madame Carnot. Mr. WILSON had the best incurved, a Duchess of Fife.

CARDIFF CHRYSANTHEMUM.

NOVEMBER 8, 9.—The thirteenth annual show of the above society was held in the Park Hall, Cardiff, on which occasion much interest was evoked by the fine exhibits of fruit from the Royal Garden, Frogmore, sent by Mr. OWEN THOMAS. Prominent among the citizens present at the exhibition were Sir Thomas Morel (the Mayor) and S. A. Brain, Esq. (the Mayor-elect), and many members of the Corporation.

The Frogmore exhibit occupied a position in the centre of the Hall, covering an area of 24 feet by 6 feet, under a tastefully decorated canopy of gold and green, bedecked at each end with the Royal Arms, and surmounted by the Union Jack. Upon a raised disc, a beautifully-coloured plant of Codium formed the centre-piece, and against each of the four sides of this disc a bunch of Grapes was suspended, and framed by cordons of high-coloured Apples. Down the centre of the table, extending both ways from the disc, imposing arrangements of flowers were placed, effectively interspersed with light foliage, giving a graceful effect to the whole; further, smaller arrangements of Anthuriums, Orchids, Nepenthes, Bamboos, and Palms were cleverly used to relieve the dishes of fruit. An edging of the season's berries gave a pretty finish to the whole.

THE CHRYSANTHEMUMS.

As a show of these flowers the exhibition might be termed a mixed success. In the cut-bloom classes the competition was considerable, but the groups and specimen-plants were disappointing.

In the open classes for the best twenty-four Japanese blooms, for a prize of £5 and a Silver Cup, there were nine entries. Mr. GEORGE DRAKE, Cardiff, carried off the 1st prize, with blooms of Mrs. T. A. Compton, International, Madame Gustave Henry, G. J. Warren, Nellie Pockett, Edith Tabor, Australia, President Noinin, Madame P. Rivoire, Madame J. Bruant, Le Grand Dragon, Simplicity, John Seward, M. Hoste, G. W. Palmer, Madame Carnot, Edwin Molyneux, Pride of Exmouth, Mrs. C. H. Payne, Mrs. Mease, Madame B. Fray, Graphic, M. Chevon de Leche, and Madame G. Debrie. G. RUTHERFORD, Esq., Cardiff (r. J. Howe), was a good 2nd; and Mr. W. ADAMS, Southsea, 3rd.

For twenty-four incurved, distinct, Mr. W. ADAMS, was 1st with, among others, Madame Ferlet, Dorothy Foster, Madame Darrier, Globe d'Or, Nellie Triffel, John Miles, President Bevan, Madame C. Roger, Countess of Warwick, Dame d'Or, George Hough, Mdlle. Lucie Faure, Miss Annie Hills, Mrs. Nat. Molyneux, Topaz Orientale, and John Lambert. 2nd, V. STUCKEY, Esq., Langport (gr. James Lloyd), with perhaps larger, but coarser, blooms, including Globe d'Or, Mrs. N. Molyneux, and Madame Ferlet, particularly good. T. W. SWINBURNE, Esq., Winchcombe (gr. James Martin), took 3rd position.

For the best twelve Japanese, distinct, G. RUTHERFORD, Esq., Cardiff, was 1st, with good blooms of Mrs. Mease, G. J. Warren, Mrs. Remy, Le Grand Dragon, &c. Mr. RALPH CROSSLING, Penarth, was 2nd.

The best bloom in the show was a Mrs. Mease, in the prize stand.

In the Amateurs' Division for Cut Blooms, twenty-four distinct varieties, R. A. BOWRING, Esq., Cardiff (gr. H. A. Joy), was 1st. A. T. STEPHENS, Esq., Penarth (gr. J. Graham), was 1st for the best twelve Japanese blooms, not fewer than six varieties; and for twelve blooms, incurveds, S. A. BRAIN, Esq., Penarth, was 1st.

Twelve bunches of Cut Chrysanthemums, arranged with any foliage.—In this class Dr. THOMSON, Canton was 1st, with a nice arrangement of Chrysanthemums, coloured Ampelopsis, Salicigella, and Eulalia species.

The blooms of incurved varieties were undoubtedly inferior to what has been seen at Cardiff in previous years in size and freshness; and the Japanese varieties, though large, were in many instances very coarse, and it was apparent that the judges took note of this fact, for the prizes in all cases were given to the fresher and finer blooms.

PLANTS.

Groups of Chrysanthemums, Open.—Mr. W. TRESEDER, nurseryman, Cardiff, was the only exhibitor, and his exhibit was an excellent one.

S. DEAN, Esq., Cardiff, took 1st prize for four bushes with well-grown specimens of Amasse Amiral, Louise, Souvenir de Petite Amie, and President Noinin.

Amateurs.—S. P. Hacquard, Rumsey (gr. Mr. Pinches), took 1st prize for the best group of Chrysanthemums, his plants being well grown and dwarf.

Dr. WALLACE, Cardiff (gr. Mr. Bindon), took most of the 1st prizes in the single specimen class. His plant of the single-flowering Miss Rose was one of the most beautiful objects in the show.

MISCELLANEOUS.

The best arrangement of miscellaneous plants was an exhibit by Mr. G. RUTHERFORD, Llandaff.

Mr. A. E. PRICE, florist, Cardiff, was 1st with an arrangement of the varieties William Seward and Clinton Chaffon; and also took 1st prize for a hand-bouquet; while Mr. RALPH CROSSLING, Penarth, had an exquisitely-arranged bouquet of yellow Chrysanthemums, and was more than a good 2nd.

Mr. W. TRESEDER, Cardiff, was 1st for a wreath composed of Chrysanthemums; and Mr. PRICE took 1st prize for a wreath of mixed flowers.

Fruit was not abundantly shown, but it was fairly good; and the vegetables were excellent, especially Carrots, Onions, and Leeks.

TRADE EXHIBITS.

Mr. WILLIAM TRESEDER was much in evidence with blooms of Cactus Dahlias, and his stand of mixed cut flowers was particularly good.

Salvias and Celosias were exhibited by Messrs. CLIBBAN, of Altrincham, Cheshire; Mr. RALPH CROSSLING's exhibit of the best varieties of Chrysanthemums was showy. While a modest little stand, shown by Mr. JOHN FORBES, Hawick, N.B., was particularly interesting, inasmuch that the new white Begonia, Caledonia, a sport from Gloire de Lorraine, was exhibited in it.

J. GRAHAM showed a collection of dried table-plants, which attracted a great deal of attention, and was awarded a Silver Medal.

NORTHAMPTON CHRYSANTHEMUM.

NOVEMBER 8, 9.—The twenty-eight annual show of this Society was held on the above dates, and the exhibits were much superior to those observed last season, especially the cut blooms in the Japanese section. In one of the stands was an extremely fine bloom of Madame Carnot.

PLANTS AND GROUPS.

The best group of Chrysanthemum plants arranged for effect came from Mr. COULSON, Cliftonville, Northampton (gr. Mr. Isaac Reeve), who had a beautiful exhibit of leading varieties, the blooms being large, fresh, and of bright colours. The 1st prize won by Mr. Reeve included a Silver Cup, value 15 guineas. The 2nd place was taken by F. G. ADNITT, Esq., J.P., Northampton (gr. Mr. Owen Soden).

For six specimen plants (Japanese), Mr. REEVE and Mr. SODEN were 1st and 2nd respectively.

There were several other classes for plants, in which Messrs. REEVE and SODEN were the most successful competitors, and the varieties staged were chiefly W. Tricker, Madame Carnot, Souvenir de Petite Amie, Vivian Morel, Phebus, and Madame Ricord.

For six table plants, Mr. Silas Cole, gr. to the Earl SPENCER, Althorp Park, Northampton, was 1st; and Mr. J. Holland, gr. to Mr. BOSTOCK, Northampton, 2nd.

Primulas are generally shown very well at Northampton, but the chief exhibitor in former years (Mr. Bateman), for some reason not known, did not compete; and Mr. OWEN SODEN, Mr. A. Smith, gr. to Mr. A. TURNER, Northampton, and Mr. BURNOWS, nurseryman, Northampton, won all of the prizes.

CHRYSANTHEMUM BLOOMS.

In the section for eighteen incurved varieties, distinct, Mr. SILAS COLE was 1st, having staged some fine blooms. The stand contained a creditable collection, which was arranged beautifully; Mr. Wm. Pearce, gr. to S. LOBER, Esq., Flore House, Weedon, was 2nd. The same exhibitors obtained similar positions in the class for twelve blooms, and were followed by Mr. H. KEMPSTALL, gr. to Captain ISHAM, Lameport Hall, Northampton.

In the class for six blooms of one variety, Mr. COLES was 1st with good blooms of Topaz Orientale; and an amateur, Mr. TIPLER, was 2nd with Ma Perfection.

In the Japanese section for eighteen distinct varieties, Mr. PEARCE was 1st with some grand blooms of Simplicity, G. C. Schwabe, Madame P. Rivoire, Mrs. White Popham, Nellie Pockett, and several other varieties—this stand was well 1st; Mr. COLES was 2nd.

Mr. Woods, gr. to M. COOPER, Esq., Delapre Abbey, Northampton, who was 3rd in this class, had an enormous bloom of Madame Carnot, which caused quite a sensation.

For six Japanese varieties, introduced in 1898 and 1899, Mr. COLES was 1st, with blooms of Mrs. Barkly, Miss W. J. Barks, H. Weeks, Nellie Pockett, Mrs. Coombes, and Mr. Cursham.

Mr. Woods had the best collection of six Japanese, one variety, staging Miss Elsie Teichmann; and was also 1st for six Japanese blooms, distinct.

Mr. Woods also gained 1st prize for a table of blooms arranged with Ferns and foliage plants; Mr. KEMPSTALL was 2nd. The prizes in this class were not proportionate with the amount of work the method necessitates.

The Fruit classes were well contested. Mr. COLES was the chief prize-winner. Mr. Dymock, gr. to Wm. LEWIS VERNON, Esq., Stoke Brimmer Park, Towcester, took leading honours for vegetables.

In the amateur section, the contests were very keen, and in some cases the exhibits would have been creditably placed had they been opposed by the exhibitors in the open classes. Mr. KIRBY, Milton Street, Northampton, and Mr. BARKWAY, Lower Triffet Street, Northampton, were the chief winners.

Non-competitive exhibitors included Mr. ARTHUR BAILEY, Abington Street, Northampton, who had a variety of floral designs; and Mr. ALFRED COCKFILL, The Drapery, Northampton, who had a similar exhibit. H. K.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM.

NOVEMBER 9, 10.—The twenty-second annual exhibition of this ambitious Society was held in the Cromwell Hall, Putney.

The chief feature of interest was that afforded by the class known as the "Tradesmen's Prize" for twelve vases of Chrysanthemum blooms in twelve varieties and three blooms of each, for which prizes were offered of £10, £7, £5, and £3, being exactly similar to those offered at Edinburgh for the same exhibits, if we except a Silver Cup. Such prizes as these are offered by very few societies within a hundred miles of London, yet there were but two exhibitors who competed, which illustrates the lamentable disinclination there exists to exhibit in a more effective fashion than that of the usual flat stands, although the vases be provided by the Society.

The 1st prize collection was a very good one, however, and was staged by Mr. F. King, gr. to F. PERKINS, Esq., Oak Dene, Holmwood, Dorking. Varieties best represented in his exhibit were Mrs. Mease, Phœbus, Lady Hanham, Viviani Morel, and Chas. Davis. Mr. G. J. Hunt, gr. to PANTIA RALLI, Esq., Ashted Park, Epsom, who won the Silver Cup offered in this class last year, was not so successful on the more recent occasion, and was classed 2nd; he had heavy flowers, but they lacked freshness, a serious shortcoming, as exhibitions should be as bright as possible, and this can only be done by showing perfectly fresh flowers, and as well coloured as can be secured. Mr. Hunt is a Chrysanthemum cultivator who is rapidly coming to the front.

The rest of the classes for cut blooms, limited to subscribers within the Society's district, were generally well contested. In the incurved section the classes for twenty-four blooms, distinct, and that for twelve blooms, distinct, were won by Mr. Chas. Bentley, gr. to Major W. J. BOSWORTH, Cedar Court, Roehampton, who had much the best flowers.

Mr. J. Darr, gr. to J. HOOKER, Esq., Lombard House, Richmond Road, Putney, staged the best Japanese blooms, and had good specimens of Phœbus, Mrs. Palmer, Chenon de Lechê and Chas. Davis, winning 1st prize for the best collection of twenty-four distinct.

There were nice blooms also from Mr. A. Smith, gr. to the LADY SUPERIOR, The Convent, Roehampton, who won honours in the class for twelve blooms.

The 1st prize in a "Maiden" class for six Japanese blooms, distinct, fell to Mr. D. Anderson, gr. to the Dowager Countess of KINTORE, Oak Lee, Wimbledon Park.

There were not many exhibits of Pompons, singles, nor any Anemone-flowered varieties. The best Pompons and singles were from Mr. CHAS. BENTLEY.

The best group (semi-circular) of Chrysanthemums in pots was one from Mr. John French, gr. to Col. MITCHELL, Cannigare House, Wimbledon.

The competition in the classes for trained and specimen plants was weak. Mr. CHAS. BENTLEY, above mentioned, was by far the most successful exhibitor.

OTHER EXHIBITS.

Barried plants, Primulas, Ferns, and fine foliage plants, suitable for table decoration, added to the interest of the show.

A number of special prizes were offered for florists' exhibits of arranged flowers, in which the Chrysanthemum was used almost exclusively. Honours in these competitions were won by Mr. Newell, gr. to Sir E. SAUNDERS, President of the N.C.S.; Messrs. J. WALBORN & SONS, 13, High Street, Putney; Mr. GEO. STEVENS, &c.

There were grand Apples and Pears staged in competitive classes, and some good Grapes.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, exhibited a charming group of miscellaneous plants, comprising fine foliage and flowering species.

Messrs. J. FRED & SONS, Roupell Road Nurseries, Norwood, London, exhibited a collection of Apples.

BURTON AND SHOBNALL CHRYSAN- THEMUM.

NOVEMBER 11.—The fourteenth annual exhibition was held in St. George's Hall, Burton. The Society was originally started at Shobnall, where, up to two years ago, its annual shows were held.

There was about the same number of entries as usual, but a marked improvement in point of merit was noticeable in both classes compared with previous years. In the open class there were many flowers of perfect shape, tint, and size, the champion blooms, in form and colour, being magnificent. Mr. Sutton, gr. to Mr. H. H. JACKSON, of Moat Bank, cleared the deck in the class under notice, taking premier honours in each section, as well as the champion prizes for incurved and Japanese blooms, and the National Chrysanthemum Society's Certificate for twelve Japanese blooms of distinct varieties.

In regard to the members' class, the chief awards were obtained by Mr. UFTON, Gordon Street; Mr. CAUSER, Barton-under-Needwood; and Mr. GOSSELL, Uxbridge Street.

Mr. UFTON gained the 1st prize and the National Chrysanthemum Society's Certificate for a group of Chrysanthemums in pots, the awards in this section being given by Lord BURTON. He also took the champion award for incurved blooms, that for Japanese blooms going to Mr. CAUSER.

The groups, as well as cut flowers, were effectively arranged, and floral displays on the part of local professional nurserymen and florists added to the beauty of the show.

WELLINGBOROUGH CHRYSAN- THEMUM.

NOVEMBER 9.—The fifteenth annual show promoted by the above Society was the best that has been seen in the town. In the open competition for groups and plants, Mr. WARD, Wellingborough, Mr. HAYES, gr. Castle Ashby, and Messrs. H. & W. LACKE, nurserymen, Wellingborough, were the chief prize-winners.

For twenty-four cut blooms, Mr. Fulford, gr. to Mr. STOPFORD SACKVILLE, Drayton House, was 1st; and Mr. HAYES, 2nd.

Mr. KIRBY, Milton Street, Northampton, beat Mr. LATTIMORE, Wellingborough, in the class for twelve incurveds; and was also 1st for twelve Japanese blooms. Much credit is due to Mr. KIRBY, an amateur, for having defeated his professional contemporaries; but for twelve white Japanese blooms, Mr. HAYES had better specimens than Mr. KIRBY.

The vegetable classes were keenly contested; Mr. HAYES had the best collection.

The show has improved very much during the past few years, and promises to become one of the chief exhibitions in the county.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 13.—A meeting of the Floral Committee of this Society was held on Monday last. Nine members were present, and there were numerous varieties of the Japanese, in incurved, and single-flowered types, to be adjudicated. The tendency of the committee, whilst anxious to show its appreciation of the trouble incurred by exhibitors who send novel ties to these gatherings, is rightly against making the First-class Certificate of the Society too cheap, and several good varieties were therefore "passed," because they were too similar to existing varieties.

The only First-class Certificate awarded—and this was done unanimously—was to the variety Ralph Hatton, an incurved flower, raised by Mr. H. WEEKS, Thrumpton Hall Gardens, Derby. The blooms as shown were of large size, and the florets fairly wide, and of good substance. Their colour was that of silver, modified by a mauve blush, resulting from the colour upon the inside of the florets.

The following varieties were "Commended"—Mrs. F. B. Garrard, a very full-flowered, pretty Japanese, in the way of May Manser, from Mr. J. PRIEST, Cherry-tree Lane, Iwer Heath, Bucks, who had four other varieties; Mrs. Grogan, a decorative or market variety, of mauve or light purple colour in habit, suggestive of the variety Mrs. Wingfield, from THE BRIGHTON AND SOUTH COAST HORTICULTURAL SOCIETY, Worthing; Vicar of Leatherhead, a large yellow Japanese, most like G. J. Warren, from a cross between Lady Saunders and Edith Tabor, from Mr. H. J. JONES, Lewisham; General Symonds, an incurved flower of bright bronzy-buff; Geo. Towers, a light reddish-purple Japanese, commended for its colour, from Mr. WEEKS; Little Pet, a small-flowered single variety, light rosy-purple, from Mr. G. W. FORBES, gr. Regent House Surbiton, who had also a number of larger-flowered, single varieties that lacked form and substance in petal; and Mrs. Richard Clayton, a Japanese of promising colour, but not nearly in condition, from Mr. Jas. Bean, gr. to R. CLAYTON, Esq., Wylam Hall, Wylam, who sent a number of varieties.

Mr. ROHR. OWEN, Floral Nurseries, Maidenhead, submitted eight varieties, two of which the Committee desired to see again. These were true incurved or incurved Japanese varieties, white, with very delicate blush of flesh-colour, named Arthur King, and Capt. A. d'Albert.

Mr. THOS. GILES, Crossfield Nurseries, Surbiton, showed a yellow incurved from a cross between C. H. Curtis and Oceana, but the blooms, though lighter in shade, were too similar to the former variety.

ULSTER HORTICULTURAL.

CHRYSANTHEMUM EXHIBITION AT BELFAST.

NOVEMBER 14, 15.—The annual show of the above Society was held on the above dates in the St. George's covered Market, Belfast, which for comparison may be likened to the Waverley Market, Edinburgh, with the balance of light in favour of the former. In nearly every class, competition was keen.

Chrysanthemums, which were the leading feature, were shown in first-class condition. The 1st prize in the champion class went to Scotland, the 2nd remained in Ireland, and the 3rd was carried to England.

PLANTS.

For a group of, not to exceed twenty pots, with foliage plants, 1st prize to Mr. Joseph McIlveen, gr. to ROBERT TRUNNET, Esq., Rush Park, Whitehouse, with a splendidly-grown lot of plants, with from twenty to thirty blooms upon each specimen, the majority being fit for showing in a cut state; 2nd, Mr. P. McHaffie, gr. to Wm. ROBERTSON, Esq., Netherleigh, Strandtown, who followed very closely.

In a similar class, but for twelve plants only, Mr. Kirkpatrick, gr. to A. D. LEMON, Esq., Edgumbe, Strandtown, was easily 1st.

For a group of semi-circular form, with a radius of 7 feet 6 inches, Mr. KIRKPATRICK repeated his success, again standing well in advance of his opponents, depending upon medium-sized, well-flowered specimens, rather than upon tall

plants with a few large blooms. 2nd, to Mr. Richard Draper, gr. to J. D. BARBOUR, Esq., Conway, Dunmurry.

CUT BLOOMS.

Japanese.—The central point of interest in this section was the class for twenty varieties in triplets, to be arranged in vases, £53 being offered in four prizes. The 1st prize of £2 was worthily won by Mr. Lunt, gr. to Captain STIRLING, or Keir, Dunblane, N.B., who staged some grand examples, remarkably fresh, with much variety of colour; the best were N.C.S. Jubilee (extra), Mr. C. H. Payne, Lady Ridgway (very fine), Madame N. Ricord, Mary Molyneux, Phœbus, Mrs. Mease (extra good), Mutual Friend (large and clear), Pride of Madford, Mr. G. W. Palmer, Lady Byron (very fine), M. Chenon de Lechê, and Oceana. 2nd prize of £15 to Mr. McKellar, gr. to Lord ASHEROKE, Durrow Castle, Queens Co., who also had some grand flowers. The 3rd prize of £5 to Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby.

For forty-eight cut blooms, in at least thirty-six varieties, Mr. McKELLAR was 1st, staging fine flowers with much diversity of colour; 2nd, Mr. Thos. Bradshaw, gr. to the Marquis of DOWNSHIRE, Hillsborough Castle, who came very close to the winner.

For a similar class, open to Ulster only, Mr. BRADSHAW won with a fine selection, the blooms of first-class average throughout.

For twelve blooms of white varieties, Mr. BRADSHAW was 1st with Madame Gustave Henri and Madame Carnot, a very equal exhibit; 2nd, Mr. JAS. McKELLAR, who staged Madame Carnot better, but Baron A. de Rothschild not nearly good.

For twelve blooms of yellow varieties, Mr. BRADSHAW was again 1st, with a strong stand of Australian Gold and Phœbus, both in first-rate character.

For twelve blooms of any other two colours, 1st prize was awarded to the varieties Viviani Morel and Pride of Exmouth.

For six varieties in vases, three blooms of each, Mr. Reid, gr. to G. H. BROWN, Esq., Tordevia, Helen's Bay, had a strong exhibit, and won easily with Phœbus, Madame Carnot, Edwin Molyneux, Edith Tabor, Graphic, and Australia; Mr. Marshall, gr. to LANCELOT SHAW, Esq., Brooklyn, Knock, being 2nd.

Incurved.—For twenty-four blooms in not fewer than eighteen varieties, Mr. BRADSHAW staged a very even lot of flowers, fresh and fully-developed; 2nd, Mr. Robinson, gr. to THOS. H. TORRENS, Esq., Elenmore, Whiteabbey, in whose stand was found the premier incurved bloom in Lady Isabel, a deep, well-formed flower.

For twelve varieties, Mr. Hodgkins, gr. to JOHN TORRENS, Esq., Rosstulla, White Abbey, was 1st with a good stand, the best of which were Perle Dauphinoise, Duchess of Fife, and Jas. Agate. The incurved section, on the whole, was not strongly represented.

Anemone-flowered.—1st to Mr. JAS. ROBINSON, who staged his triplets in vases, the effect being excellent, the varieties being of the standard kinds, and the cushions being well developed; 2nd, Mr. HODGINS.

Single-flowered varieties.—1st to Mr. Mitchellson, gr. to Col. Hon. C. F. CRICHTON, Mullaboden, Ballymore, Enniscorthy; these also were set up in vases, but with other kinds of foliage in addition.

The best basket, tastefully arranged, came from Mr. Donald, gr. to JOHN SEPPER, Esq., Fairacre, Fort William Park.

MISCELLANEOUS GROUPS AND PLANTS.

These had no small share in the general effect. In the "open to the trade" class, Mr. HUGH DICKSON, Royal Nurseries, Belfast, whose group was composed of choice, well-grown plants tastefully put together, with no undue preponderance of colour, Orchids, Heaths, Bouvardias, Roman Hyacinths, and a few Chrysanthemums being chiefly relied upon. The group as a whole was well broken up and diversified in character. The 2nd prize went to Mr. WM. MAGEE, Knock Nursery, Strandtown, Belfast.

There were many classes for miscellaneous plants, and the exhibits in these were most satisfactory. The greater part of these were for plants in small pots. Mr. McILVEEN was 1st for four specimen Crotons, well-furnished and highly-coloured examples, and also for six plants in 6 inch pots, where he had a truly wonderful exhibit, the plants being well-furnished half-specimens, beautifully coloured.

Mr. P. McHAFFIE was the most successful exhibitor of Roman Hyacinths, Cyclamen, and double Primulas.

Mr. DRAPER was 1st for single Primulas, and Mr. BRADSHAW for Primula obconica, with plants very freely flowered.

Mr. McHAFFIE also had the best six Dracenas in small pots; it would, however, have been better had he not employed oil or its equivalent, in order to brighten up the foliage.

For a mixed group, open to gardeners only, Mr. Foster, gr. to JAS. YOUNG, Esq., Abbotsoft, White Abbey, was an easy 1st, with well-grown plants.

NON-COMPETITIVE EXHIBITS

of plants and fruits were contributed. From the Botanic Gardens Park, Mr. McKIMM, the Curator, sent and arranged a most tasteful group of foliage plants. From Mr. T. H. DICKSON, the Curator at another of the Belfast parks, a very bright group was arranged at the opposite end of the building. Messrs. ALEXANDER DICKSON & SONS, Newtownards, contributed a large quantity of Apples, Pears, and Grapes. Mr. HUGH DICKSON, Royal Nurseries, Belfast, staged a large group of Coniferous plants, Veronicas, Ivies, &c.

FRUIT EXHIBITS.

Prizes were offered for a table of dessert fruit, in twelve distinct varieties, separate prizes being offered in the same class for the most tasteful decorations of the same tables with flowers and foliage; thus, two distinct sets of prizes were open to competition. Mr. BRADSHAW was awarded the premier position; the fruit was of first-class quality, and the decorations most appropriate for the season of the year; the flowers used were *Source d'Or Chrysanthemums*, with tinted foliage, the fruit also being dished up with similarly-tinted Vite foliage.

Mr. BRADSHAW was the most successful with Black Grapes, with well-coloured bunches, and with Trebbiano in the "any other white" class. He was, however, beaten in the Muscat class by Mr. HARDING.

Mr. HARDING was first in the principal class for Apples in twenty-four varieties, showing highly-coloured fruits. Mr. BRADSHAW followed closely in this class.

Other and smaller classes for fruits were provided, and the competition was invariably good.

Vegetables, likewise, occupied a large space, classes for which—and for fruit—were reserved for farmers and others who grow for sale.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 9.—A. WARBURTON, Esq., Vine House, Haslingden (gr., Mr. Lofthouse), exhibited the magnificent *Odontoglossum crispum* var. *Lindenii*. The plant produces flowers of good size, and the segments are heavily blotched with rich crimson. The Committee awarded this plant a First-class Certificate, and the additional honour of a Silver-gilt Medal.

THOS. STATTER, Esq., Whitefield (gr., Mr. Johnson), exhibited a very beautiful Orchid in *Cattleya* "Countess of Derby." This variety, which in habit has traces of both *Cattleya gigas* and *C. aurea*, may be classed as one of *Cattleya Hardyana*, with pure white sepals and petals, the colouring in the labellum is gorgeous. A First-class Certificate and a Silver-gilt Medal was awarded. Also a Silver-gilt Medal for a fine group, including *Cattleya Bowringiana*, Statter's var. (First-class Certificate), and *L.-C. X Statteriana* (Award of Merit).

G. FIORLAND BALL, Esq., Wilmslow (gr., Mr. Gibbons), again showed his plant of *Cypripedium* *x Acteus* (*C. Leeanum superbum* *x C. insignis* *Sanderæ*), which was awarded a First-class Certificate. The plant being in much better form than when previously shown. Mr. BALL has a very nice group of Orchids (Silver Medal).

W. G. GROVES, Esq., Windermere (gr., Mr. Robertshaw), had a grand plant of *Cattleya* *x Martini nobilior*, the spike bearing ten flowers of fine colour and substance (First-class Certificate). Also from the same collection came a grand plant of *Cypripedium insignis Sanderæ*, with six flowers expanded (First-class Certificate).

Mrs. GRATRIX made her *début* at this meeting as an exhibitor, and was awarded a First-class Certificate for a nice plant of *Cypripedium insignis Sanderæ*.

S. GRATRIX, Esq., West Point, Whalley Range (gr., Mr. McLeod), received a First-class Certificate for *Cattleya labiata* var. *Cooksoni*, a very charming Orchid, having pure white sepals and petals, with a brightly-coloured lip.

J. LEEMANN, Esq., Heaton Mersey (gr., Mr. Edge), staged a very choice group of Orchids, the gem in which was *Cattleya labiata* "Sir George White," which is very similar in character to *C. l. var. Cooksoni*, but much larger. This plant received a First-class Certificate, and a Silver-gilt Medal was awarded for the group.

RICHARD ASHWORTH, Esq., Newchurch (gr., Mr. Pidsley), exhibited *Lælio* *x Cattleya* *x Pallas* var. *rubens*, a good form, and well coloured (Award of Merit).

ED. HOLT, Esq., Prestwich (gr., Mr. Murphy), exhibited a good plant of *Cypripedium insignis* var. *Sanderæ* (First-class Certificate).

T. BAXTER, Esq., Oakfield, Morecambe (gr., Mr. Roberts), received an Award of Merit for *Cattleya labiata* var. *crerulea*, a very distinct form, with a decided bluish tinge throughout the entire flower.

Mr. A. J. KEELING, Bingley, Yorks, staged a very nice group of Orchids, for which he received a Silver Medal. An Award of Merit was made to his *Cypripedium* *x magnificum* (*C. Pollettianum* *x insignis giganteum*), which is a good addition to the now numerous family of *Cypripedium* hybrids.

ALSAGER AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 15.—The ninth exhibition was held in the School Room, Alsager. The chief feature of this show are the groups, for which there are four classes, and each was well contested.

In the open class Mr. Smith, gr. to J. MADDOCK, Esq., was 1st, with a very fine group of good flowers, relieved with Palms and fine foliage plants; the National Chrysanthemum Society's Certificate was awarded to this group. Mr. Holland, gr. to F. RIGBY, Esq., 2nd.

In division two, Mr. J. Bailey, gr. to J. GIBBON, Esq., won with a very fine group; Mr. Groot, gr. to F. W. ELLERBY, Esq., 2nd.

In a class for a group of naturally-grown, or not disbudded plants, Mr. F. Higgins, gr. to F. C. MAOON, was 1st, with a group of well-grown plants.

Two groups were exhibited in the amateurs' section, and these were very creditable, being nearly equal to those in the open classes. 1st, Mr. J. ALLMAN, who was awarded the National Chrysanthemum Society's Certificate.

CUT FLOWERS, FRUIT, &c.

The best collection of twelve Japanese blooms was from Mr. B. Smith, gr. to J. MADDOCK, Esq., who had also the best collection of twelve incurved.

Mr. B. SMITH and Mr. J. ALLMAN were successful with specimen plants.

There was a moderate display of fruit. The best Grapes were shown by Mr. B. SMITH, and the best Apples by Mrs. W. ASHMORE.

SCOTTISH HORTICULTURAL.

CHRYSANTHEMUM EXHIBITION IN EDINBURGH.

(By Telegraph.)

NOVEMBER 16, 17, 18.—The annual Chrysanthemum Exhibition was opened on Thursday last in the Waverley Market, Edinburgh, and was a very brilliant event. Cut blooms were staged in abundance, and the plants were much better than any staged in previous years. There was a large show of Grapes and hardy fruits, and abundance of vegetables.

The competition that excited most interest was that for the best twenty vases of cut Chrysanthemum blooms in twenty varieties, three blooms of each. The prize included the City of Edinburgh's gift of £20 and £15 provided by the Society, making a total of £35; and the remaining four prizes were proportionately liberal. There was a very spirited competition, and on Wednesday there were nine entries, but only seven competitors came forward with exhibits.

There was, therefore, a total of 420 blooms, or 120 fewer than was staged at the National Chrysanthemum Society's exhibition in London last week, in the class for Twelve Vases containing five blooms in each. The coveted prize was awarded to Mr. THOS. LUNT, gr. to A. STIRLING, Esq., Keir House, Stirlingshire, who had very large blooms in the freshest condition. Mr. BEISANT, gr. to M. ARMISTEAD, Castle Huntley, was a very close 2nd, with blooms quite as heavy, but wanting in finish; 3rd, Mr. J. W. McHATTIE, gr. to the Duke of WELLINGTON, Strathfieldsaye, Hampshire; Mr. A. CHANDLER, Cotton House Gardens, Rugby, was 4th; and Mr. HAGGART, Moor Park Gardens, Ludlow, 5th.

A smaller class for Twelve Vases containing six blooms, which was reserved to Scottish gardeners and amateurs, was won by Mr. D. NICOLL, gr. to J. W. BELL, Esq., Rossie House, Forganally, who took the 1st prize of the Scottish Challenge Cup and £10. He had fine massive blooms. Mr. A. IRK, gr. to J. THOMPSON PATON, Esq., Norwood, Allea, was 2nd, with very fine examples; and Mr. BEISANT, 3rd.

The immense number of blooms staged in the important class for thirty-six Japanese, distinct (open), created a magnificent show. There were as many as twelve entries, and the 1st prize of £15 was won by Mr. T. LUNT, who repeated his success in the larger class; but two points only separate his exhibit from that shown by Mr. NICOLL, 2nd; 3rd, Mr. J. W. McHATTIE.

PLANTS.

The £10 prize for Chrysanthemums in pots was secured by Mr. CAVANAUGH, Murrayfield, with grand specimens, who had also the best four specimens.

The class for a semi-circular group of plants, for which £10 was offered as 1st prize, brought four competitors; Mr. WOOD, Dunmore Park, being accorded 1st prize for a somewhat formal arrangement. Mr. JARDINE, gardener, Ravelston Park, was a close 2nd.

FRUIT AND VEGETABLES.

Grapes were shown in large quantity, MESSRS. BUCHANAN obtaining 1st in the class for four bunches. MESSRS. THOMSON's prize for two bunches was secured by Mr. LESLIE, gardener, Pitcullen.

The class for a collection of eight varieties of fruit brought two competitors, Mr. D. CARRBERRY, Tower Gardens, Musselburgh, being 1st, with really fine examples.

For hardy fruits, Mr. JAS. DAY, gr. to the Earl of GALLOWAY, Galloway House, was the most successful exhibitor.

Apples were shown in very large numbers.

Of vegetables there were nine collections of ten sorts each. The 1st prize was awarded to Mr. CAMERON, gr., Birnrock, Dundee. Leeks, Tomatos, and Cucumbers were the chief features.

The total entries at this fine show numbered 1,125 this year, as against 1,014 last year; and the exhibitors 216 this year as against 204 on that occasion.

Our telegram was despatched from Edinburgh at 1.45 P.M., and the work of judging was then not nearly completed.

GARDENING APPOINTMENTS.

Mr. H. R. WOODCOCK, for eight years Foreman, and more than three years Head Gardener at The Beeches, Fleet, Hants, as Head Gardener to F. GOURLEY, Esq., Kempshott Park, Basingstoke.

Mr. WILLIAM NEWMAN, late General Foreman at Easton Lodge, Dunmow, Essex, as Gardener to Miss BROWNE, The Larches, East Grinstead, Sussex.

Mr. J. W. YOUNG, as Head Gardener to T. LILLEY, Esq., The Croft, Ealing, W.

Mr. ALEXANDER MUNRO, Foreman at Glamis Castle Gardens, as Gardener to E. CURRIE, Esq., Itton Court, Chesham, Monmouthshire.

Mr. ROBERT GREENLAW, Glenavon Gardens, Linlithgowshire, and formerly General Foreman at Scone Palace, Perth, as Gardener to HENRY J. YOUNGER, Esq., D.L., Beamore, Kilmarnock, Argyleshire.

Mr. E. SNELOVE, for the past three years Gardener at Woodlands Ridge, Hants, as Head Gardener to General Lord A. RUSSELL, Ewhurst Park, Basingstoke.

Mr. A. HAYNES, late Foreman and decorator under Mr. GILMAN at Alton Towers, as Gardener to F. H. COOK, Esq., The Grange, Walton-on-Thames.

Mr. F. TRIBBLE, late Head Gardener at Crosby Hill, Camberley, as Head Gardener to A. STRICKLAND, Esq., Apperley Court, near Tewkesbury, Gloucestershire.

Mr. ROBERT JONES, late of the Cliffe, Nantwich, has been engaged by the Right Hon. the Earl of Gosford to take charge of the gardens at Gosford Castle, Market Hill, and the Rich Hill Castle Gardens, co. Armagh.

Mr. H. D. PROSSER, late Head Gardener at Peover Hall, Cheshire, as Head Gardener to A. W. WILLIAMS-WYNN, Esq., Coely-Maen, Welshpool, Montgomeryshire.

Mr. JOHN BALFORTH, formerly Gardener at Bishops Court, Isle of Man, as Head Gardener to J. DEWRANCE, Esq., Cramore Place, Chislehurst, Kent.

Mr. W. MARSH, until recently Foreman in the Gardens, Sharston Hall, Cheshire, as Head Gardener to Mrs. L. JACKSON, Barley Lodge, Lillington, Leamington, Warwickshire.

Mr. WALTER HOLMES, for the past eight years, Foreman in the Gardens, Bayham Abbey, Lamberhurst, Kent, as Head Gardener to E. T. LAMBERT, Esq., Telham Court, Battle, Sussex.

Mr. A. J. MORRIS, for the past ten years Head Gardener at Kingston House, Abingdon, as Head Gardener to G. RANDELL HIGGINS, Esq., The Croft, Burcott, near Abingdon.

Mr. C. STOCKING, late of Marden Park, as Gardener and Bailiff to C. H. FEILING, Esq., Southgate House, Southgate, N.

Mr. ROBERT ADAMSON, late Gardener at Corner Hall, as Head Gardener to Mrs. EARLE, Farleigh Castle, Bath, Somerset.

Mr. J. LEE, for eight and a half years Foreman in the Gardens, Gosford, Longmiddy, N.B., as Head Gardener to the Earl of BUCHAN, Gog-Magog Hills, Cambridge.

MARKETS.

COVENT GARDEN, NOVEMBER 16.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.]

ANSWERS TO CORRESPONDENTS.

ARALIA VEITCHI: N. W. A. Guilfoylei, which is a free-rooting species easily raised from cuttings, is frequently employed as a stock for those Aralias that are natives of tropical countries. Graft on established stocks in a close case by the cleft, or whip method, leaving a leaf or two on the stock beyond the grafting point. A. Sieboldi and A. papyrifera are readily raised from seed in the case of the first, and root-cutting in that of the second; but they are not suitable stocks for Aralias from hot climates, hence your failures.

BOOKS FOR A GARDENERS' ASSOCIATION LIBRARY: H. T. Manual of Orchidaceous Plants, Veitch; published at the Royal Exotic Nursery, King's Road, Chelsea, London, S.W. *The Orchid Manual*, by B. S. Williams; published at the Victoria and Paradise Nurseries, Holloway, N. *Store and Greenhouse Plants*, by T. Baines; *The Book of the Vine*, by A. F. Barron; *The Orchard House*, by T. F. Rivers, Sawbridge-worth, Herts; *The Vegetable Garden*, by M. Villmorin, English edition; Murray. *Chrysanthemums*, by E. Molyneux; from the author, Swanmore Park, Bishop's Waltham; *Cactus Culture*, by W. Watson; published by Upcott Gill. *The Fruit Manual*, by R. Hogg; *Manual of Conifers*, by Veitch; *My Gardener*, by H. W. Ward; *Fruit Culture*, by Du Breuil; *Grafting and Budding*, by Baltet, English edition; Longmans. *Tree Pruning*, by A. de Cars, English edition; *Epitome of Gardening*, by Moore and Masters; *Plant Life*, by Masters; Vinton. *Origin of Cultivated Plants*, by De Candolle; Longmans. *Treasury of Botany*; Longmans. *System of Botany*, by Le Maout and Decaisne, English edition; Longmans. *Handbook of British Flora*, by Bentham and Hooker, and Illustrations to the same, 1 vol.; Lovell Reeve. *Student's British Flora*, by Hooker; *Structural and Physiological Botany*, by Asa Gray; Macmillan. *Plants of Shakspeare*, Ellacombe; Bille Plants, J. Smith; *Himalayan Journals*, Hooker; Darwin's Works; Murray. *Diseases of Plants induced by Cryptogamic Parasites*, Tubenif and Smith; Longmans & Co., London. *The Diseases of Trees*, by Hartig, English edition; Macmillan & Co. *Manual of Injurious Insects*, by Miss Ormerod, improved edition; *The Rose Garden*, by W. Paul, Waltham Cross.

BOOKS: WATERCRESS: J. C. A book by the late Shirley Hibberd, and published by Messrs. Colliogridge & Co., London, will afford the information that you require.

CARNATIONS DISEASED: C. D. The plant sent was badly affected by the fungus *Helminthosporium echinulatum*. It cannot be cured, and you should root up all infected plants and burn them. It spreads more rapidly in wet weather than dry, and on plants whose leaves have been denuded of their waxy coating.—*E. Semper*. The appearances point to eelworms at the root being the cause. The worms have probably been introduced with pasture-loom used in a fresh condition. You will find a figure and description of a plant attacked by eelworms in the *Gardeners' Chronicle*, December 3, 1881, p. 721. We fear there is no cure which would not be as injurious to the plants as the disease itself. Better to clear out every infected plant and burn it forthwith. The eelworms are not likely to go from one potted plant to another, as is the case with plants grown close together in beds.

CATKINS: Young Gardener. The catkins or male flowers of *Cedrus Deodara*.

DENDROMETER: A. C. B. You might enquire at some of the leading opticians or makers of mathematical instruments in London.

FLOWER-SPIKES APPEARING AT THE TOP OF THE PSEUDO-BULES OF ODONTOGLOSSUM CRISPUM AND PISCATOREI: F. E. H. The plants occasionally do this after some kind of check has occurred.

GENISTA CUTTINGS: J. C. Half-ripened cuttings, taken in June or July, with a thin heel of older wood, and $\frac{1}{2}$ to 3 inches in length, strike readily in pots filled with finely-sifted peat, mixed with a considerable proportion of silver-sand, and surfaced with a $\frac{1}{2}$ -inch layer of sand. Cover with a bell-glass, and place the pots in a temperature of 55° to 60°, shading the cuttings by a newspaper from strong sunshine. Water must be

afforded when necessary, and the glasses wiped out once a day. Plenty of finely-broken crocks should be placed in the pots, and no bottom heat afforded. Pot off into thumbs when rooted, and keep close and shaded from bright sunshine for ten days afterwards. At the expiration of that period, afford air, doing so very gradually. At the end of a fortnight the plants may be put into cold frames, being afforded no shade. On warm afternoons, at about five o'clock, sprinkle the foliage, and close the frames till eight o'clock, when air should be afforded and kept on during the night. The chief foe of *Genistas* (*Cytisus*) is red spider; but sprinkling the leaves late in the day, and a cool night temperature, will prevent any lodgment on the plants.

NAMES OF FRUITS: We are most desirous to oblige our correspondents as far as we can, but we must request that they will observe the rule that not more than six varieties be sent at any one time. The specimens must be good ones; if two of each variety are sent, identification will be easier. They should be just approaching ripeness, and they should be properly numbered, and carefully packed. A leaf or shoot of each variety is helpful, and in the case of Plums, absolutely essential. In all cases it is necessary to know the district from which the fruits are sent. We do not undertake to send answers through the post, or to return fruits. Fruits and plants must not be sent in the same box. Delay in any case is unavoidable.—*G. 1*, Crassane; *2*, Doyenné du Comice; *3*, Easter Beurré; *4*, Beurré Giffard; *5*, Beurré de l'Assomption; *6*, Autumn Nelis.—*W. R. 1*, Cox's Orange Pippin; *2*, Reinette Van Mons; *3*, Stirling Castle; *4*, Beurré d'Amanlis; *5*, Beurré Diel—*Enquirer*. *1*, Catillac; *2*, Emile d'Heyst.—*S.* Winter Pearmain.—*Reader*. *1*, Rambour Franc; *2*, Queen Caroline.—*G. R. 1*, Norfolk Beefing; *2*, Margil; *3*, Hornmead's Pearmain; *4*, Hoary Morning; *5*, Hollandbury; *6*, Grenadier.—*M. N. S.* Probably, a local variety, and evidently of little value.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—*F. W.* *Cattleya Dowiana aurea*.—*A. L.*, *Atherstone*. *Pteris cretica albolineata*.

"PEPPERHELLOES": Kylemore. We cannot find such a name, but from your description we guess it may be *Momordica charantia*, a warm greenhouse or stove climber.

RETROGRESSIVE SELECTION: American Correspondent. Mr. Galton's article appeared in vol. xxi., 1897, pp. 313, 336, and 348. Articles on similar subject by Mr. Drury will be found in 1895, vol. xvii., pp. 611, 645, and 692.

STEPHANOTIS GRANDIFLORA: T. The plant may be pruned from January to March, the plants then blooming from May till late in the summer. Do not crowd the young shoots, or let them grow into a tangle; let the plant have as much sunlight as possible, and it will then make short, floriferous lateral shoots and spurs, which should be allowed to stand free from the main shoots. The knife should be freely used in removing weak and apparently flowerless shoots, and hard pruning practised just previously to the plant being started. Repot or top-dress the plant as soon as growth is renewed. *Stephanotis*, in order to flower it satisfactorily, requires a rest-period of about three months, during which scarcely any water should be afforded, or only so much as will prevent much shrivelling of the wood. If a plant be portable, it should be rested in a dry house, having a temperature of not more than 50°, or lower than 45°.

WALNUTS: Maconday & Co. We do not know the varieties you name. They are mentioned in the French catalogues, but not in the English. Walnuts are budded or grafted, but they will grow from seed; and the seedlings generally come true.

THE

Gardeners' Chronicle

No. 674.—SATURDAY, NOV. 25, 1899.

ROADSIDE FRUIT IN EUROPE.

FRUIT-TREE planting by the roadsides does not make the progress in this country that might be expected. The area that could be thus utilised is in the aggregate very large, and the profit might be considerable. Not only the roadsides in the country districts, but many a mile of railway embankment should be so planted. Low hedges of Gooseberries would, in many places, answer the purpose of Quickset hedges, and yield a crop as well; and many and many a slope now left bare is well adapted for Strawberry culture. Cordon Apples might also be grown in places, though these would require more skilled attention than need be given to those just mentioned. Other suggestions will readily present themselves.

In some quarters we hear the objection raised that if fruit grew by the roadside it would offer a temptation to felonious boys. Perhaps it might; but if the planting were on a sufficiently extended scale, the amount lost by depredation would be relatively insignificant. Moreover, there are means of preventing the ascent of marauders by encircling the trunk of the tree with one or two coils of barbed-wire, which would as effectually stop the climber as the spikes in the post checked the vaulting ambition of the urchin in one of Leech's pictures. But there is a better plan even than this, and that is, to plant in such situations trees whose fruit once tasted, would leave no inducement to repeat the trial.

In some parts of Switzerland vast numbers of Pears are grown—some along the roadsides, some in the alpine meadows and valleys, even up to 4000 or 5000 feet. The fruit of these trees is not agreeable to the eye, still less is it pleasant to the palate in its crude state. Made into a "compote," it is, however, delicious, and vast quantities are so employed, whilst others are said to furnish a beverage corresponding to our perry. Cherries are grown in the same way, but the fruits are small, and only suitable for culinary purposes, or for use in the distillation of spirits. Great care is taken in the proper planting of the trees along the roadsides, the ground being well broken up, and each tree is secured to three stakes. These not only support the tree and prevent wind-waving, but they protect it from destruction by cattle, mules, or goats.

The following extract, which we take from the *Journal of the Society of Arts*, gives some details as to the extent to which this kind of fruit-culture is carried out in other countries, and affords one more illustration of the way in which we waste our opportunities:—

"The cultivation of fruit-trees along the high-ways of France is being extended each year. The Government having first set the example, the communes in certain departments adopted this practice as a source of revenue, so that now roadside fruit-cultivation has become an important branch of national industry. It is not, however, only in France that fruit-trees have been planted

along the roadside. The United States Consul at St. Etienne says that in Germany, Belgium, and the Duchy of Luxemburg, the system has been greatly developed, giving satisfaction to the State as well as to local interests. On the Würtemberg roads, for instance, the fruit harvest from this source produced in 1878 over £40,000, and last year the returns had more than trebled. The annual revenue derived from the national roads of Saxony planted with fruit-trees, rose from £1800 in 1880 to £8400 in 1892, furnishing a total sum of £68,000 for the thirteen years. In Belgium, according to the statistics of 1894, over 2875 miles of roads were planted with 741,571 fruit-trees, which furnished the large sum of £400,000. In France, the production of fruit-trees is estimated at £12,000,000. In Westphalia, in the Duchies of Baden and Saxo-Weimar, in Alsace-Lorraine, Switzerland, &c., the *employés* of the Administration of Roads and Bridges, and the road supervisors, are instructed in fruit culture. In some of the southern departments of France the roads are bordered with Cherry-trees, producing the small fruit called *Merise* (Wild Cherry), much appreciated for making wine *sui generis*, preserves, and even alcohol. In the Touraine, Plum-trees predominate; while in the Allier, the Walnut-trees transform the roads into shady walks. In Auvergne the Chestnut-tree flourishes; while in Normandy, place is naturally given to the Apple-tree. Some twenty years ago, the picturesque roads of the north-east of France were lined with stately Poplars; but although ornamental, their roots went far and wide, rendering the adjacent meadows sterile, and ploughs were continually stopped by off-shoots lying almost at the surface of the soil. The farmers appealed in such strong terms, that the communes decided upon the fall of the Poplar, and soon axes and saws were brought into requisition, and the roads cleared of these trees in favour of the humble but more useful *Mirabelle* (small Plum), to the great satisfaction of the villagers. Thousands of baskets of this fruit are sent to Paris daily. Some thirty years ago the distillation of the *Mirabelle* was unknown in the country districts, the people plucked it as food for their pigs, but to-day they have learned to make more profitable use of it. They distil it in large quantities, and find a ready market for it. A quart of this alcohol, slightly perfumed, sold five or six years ago for only about 10*d.* to 1*s.* 3*d.*; to-day it brings not less than 2*s.* or 2*s.* 6*d.*, while in Paris the best kind cannot be obtained under about 4*s.* 3*d.*

NEW OR NOTEWORTHY PLANTS.

IRIS SOFARANA, *n. sp.*

This new *Oncocyclus* Iris was collected for Messrs. Van Tubergen of Haarlem, on the Lebanon, near Ain Sofar, at a considerable altitude. A large single flower, with very long, narrow spathe-valves, is borne on a scape about 10 inches high. The nearly elliptical fall, convex laterally, is of a dark purple, almost black colour, brought about by very thick-set, reticulate, blotched veins of very dark purple colour on a creamy-white ground, very little of which, however, is visible. Over the claw, and running over the hinder part of the blade is a straggling beard of scattered, long, dark purple hairs; in front of these the netted veins are fused together into a very indistinct "signal." Standard almost orbicular, with a groundwork nearly white, marked with thin, dark purple veins, most conspicuous near the margin, interspersed all over with dark purple dots. The dots are scattered, and the veins thin, so that the whole surface is much lighter in colour than that of the fall. About a dozen dark purple, almost black, long hairs are scattered over the claw. The styles, placed horizontally, are large, broad, concave, dark purple, almost black, with large quadrate, crenate, not serrate crests, marked with branching blotched purple veins on a yellow ground. The ovary, with a short tube, is of the ordinary *Oncocyclus* type. The rhizome is large and compact, and the leaves relatively broad,

10 inches by nearly 1 inch, so broad as to seem, when young, those of an ordinary bearded Iris.

It was sent to Messrs. Van Tubergen as a variety of *I. Lorteti*, but from this it is widely different. It comes nearest to *I. Sari*, but differs from this in the form of the segments in their venation and colour. It is a handsome Iris, well worth cultivating. The illustration (fig. 125, p. 391) is a little smaller than the flower itself. *M. Foster, Shelford, November 11, 1899.*

CATTLEYA LABIATA ALBA "SIR GEORGE WHITE."

Several fine forms of the autumn-flowering *Cattleya labiata*, having pure white sepals and petals, have appeared among recent importations, and the desire to keep that section distinct from those with coloured segments, prompts the lucky possessors to give them the varietal name "alba," qualified by a garden name fixing the identity of each, and, like many of the garden methods, it answers the purpose for which it is intended. Perhaps the finest of its class which has yet appeared has just flowered with J. Leemann, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), who kindly sends a flower of it, with the request that it may be recorded under the name of the brave General who has won the admiration and sympathy of Great Britain and her colonies.

The sepals and petals are pure white, well displayed, and of fine substance. The extended petals measures $7\frac{1}{2}$ inches across, each being $2\frac{1}{2}$ inches wide. The lip is $2\frac{1}{2}$ inches broad, very finely crimped at the edge, pure white, with a chrome-yellow area at the base, streaked with diverging white lines. In the centre of the lip is a ruby-crimson blotch, over which is a purplish shade, the colour getting lighter towards the edge, which is marbled with white. The whole of the lip has a pure white margin nearly half an inch wide, and the flower is excellent in every respect.

It is, perhaps, nearest to *C. l. a. Cooksoni*. Another ally is the *C. l. a. Gilmonrie* of Mrs. Briggs-Bury, which, like the one now under notice, and other white forms, was imported by Messrs. John Cowan & Co., of Gateacre, Liverpool. It received a First-class Certificate at the Manchester and North of England Orchid Society, November 9.

CATTLEYA LABIATA PEETERSIANA SUPERBA.

The original form of *C. labiata* Peetersiana, when it was first flowered by M. Peeters, of St. Gilles, Brussels, was regarded as a very remarkable variation, its showy petals being heavily marbled with reddish rose-purple, the normal rose-coloured ground tint appearing between the darker blotches. That variety was eagerly sought after, and is still rare. But there came a rumour that a better thing in that direction had appeared under the above name, and all who have seen it agree that it will be impossible to get a more gorgeously-tinted *Cattleya*. Three plants, all divisions of the same, have flowered with J. Leemann, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), who kindly sends a flower of one of them, the darkest-coloured *C. labiata*, accompanied by the finest white form yet recorded—*C. l. a. Sir George White*. The whole of the flower is of an uniform dark rose-purple, the only other colour being a yellow tinge at the base of the lip, and a few white lines inside the tube where they do not meet the eye. The reverse of the flower is as bright as the surface. *James O'Brien.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUMS FROM MR. R. B. WHITE'S GARDEN AT ARDDARROCH.

A VERY interesting set of flowers of fine and varied forms of *Odontoglossum crispum* is kindly sent by R. Brooman White, Esq., Arddarroch, Garelochhead, N.B. (gr., Mr. Coles). The collection of *Odontoglossums* has already produced many very remarkable new forms. At present, and for some time past, an average of about two hundred spikes of *Odontoglossum crispum* have been open in the *Odontoglossum*-houses at Arddarroch; and

still there are spikes with buds in all stages—a very rare circumstance at this time of the year. One of the most remarkable is *O. crispum* xanthotes, Brooman White's variety, a fine white flower with some clear yellow spots on the segments, and without the brown markings usually seen in the species.

The other flowers may be divided into four classes, viz., the fine, broad-petalled white, which, when really at its best, is still the favourite; the white, tinged with rose or purple; and the spotted forms of both classes. Several of the varieties had one or more large blotches on each of the sepals, while others had smaller spots on all the segments, but no two were alike.

With the forms of *O. crispum*, of what is commonly called the Pachy type, was a spray of the elegant *O. c. Lehmanni*, which seems fairly intermediate between typical *O. crispum* and *O. Pescatorei*, its rounded, crimped labellum, much resembling some of the varieties of *O. Pescatorei*; also a very remarkable *O. x. Coradinei*, which Mr. Brooman White suggests may be a second crossing of *O. Coradinei* with *O. crispum*, which seems probable. The flowers are nearly as large as those of *O. crispum*, wax-like in substance, white, with nearly half of the area of each segment occupied by large chestnut-coloured blotches. *J. O'B.*

CATTELEYA LABIATA.

We have just received a very exceptional inflorescence of *Cattleya labiata* from Mr. Mason, gr. to Sir Edward Elton, Bart., of Clevedon Court, Somerset, and we think the size of the flowers and number on a spike, "establish a record." There are seven flowers on the spike, and each flower is nearly 7 inches across the petals. The colour is very rich on the sepals, petals, and front lobe of the lip, but in the throat is pale to the opposite extreme.

Altogether, we think the variety is well worthy of record, and we should have much liked to have sent the spike for your inspection, but that we wanted it, with others, for the Emperor of Germany.

Mr. Mason informs us he bought the plant at one of our sales, and there were two spikes on the plant, one with six, the other with seven flowers; and last year, the plant had two spikes with exactly the same number of blooms on. *F. Sander & Co.*

TREES AND SHRUBS.

SAMBUCUS GLAUCA.

At a meeting of the Société Nationale d'Horticulture de France, held on October 12, M. Maurice de Vilmorin exhibited *Sambucus glauca*, Nutt. (*S. californica*, C. Koch—*S. cerulea*, Raf., ?), with the following notice:—*S. glauca* is a tree of the third dimension, rather more developed than *S. racemosa*; it came originally from the north-east side of the United States, and the area over which it is dispersed extends as far north as British Columbia; it is, consequently, fairly hardy. This tree is particularly well adapted to bear the rather cold climates of the east and of the south-east. The abundant shining green foliage is very beautiful; in October the clusters of fruit are charming, and contrast magnificently with the red fruits of *S. racemosa*. The plant thrives in the same soils that suit the latter, those best suited appear to be sands, fresh, and fairly rich in humus. The specimens obtained by me were growing in good silico-argillaceous earth, moderately fertile.

TABLE FOR DISTINGUISHING THE SPECIES OF SYRINGA.

M. L. Henry has lately published in No. 293 of *Le Jardin*, p. 132, a table summing up very succinctly and clearly the marked distinctive characteristics of the species of Lilac properly so called, now known. Their determination can now be rapidly arrived at, and with certainty. Certain

peculiarities which appear not to have been previously noted, are indicated in this work, and deserve to be remembered. Thus, the facts that, of all the Lilacs, *Syringa pubescens*, Turcz., is the only one with violet anthers; that *S. Emodi* is the latest to come into leaf, and the only one with protruding stamens; that all *Syringas* may be divided into two very distinct groups, in one of which the inflorescences are borne directly on the wood of the preceding year (*S. pubescens*, *oblata*, *vulgaris*, *persica*, and *dubia*), while in the other they appear at the extremity of the shoots of the same year (*S. Emodi*, *Bretschneideri*, and *Josikæa*).

SICKLY FERNS.

IN Mr. Druery's interesting notes on the treatment of sickly British Ferns (p. 218), he suggests that exotics may be amenable to the same treatment; but I am afraid this is not the case, or, if any will reproduce in the manner described, the examples are very rare. It may, however, be of interest to call attention to the fact that exotics are equally liable to get into a sickly condition, and in some instances it is difficult to trace the cause. Yet in many cases the cause is easily discovered. There is one in particular, that it is as well to call attention to at this season of the year. It is keeping the plants in too much heat at a period when, like the British Ferns, they require rest. I have found that such as would, under natural conditions, rest during the winter, will, if kept in heat, continue in active growth well on through the winter, and although they make good fronds they do not store up strength and make the strong crowns necessary to start into growth at their natural period; they may go on, but the vigour gradually diminishes, until they die out entirely. I have found this to apply to some of the free-growing *Pteris*, &c.

Take a batch of the ordinary form of *Pteris serrulata*, keep some in heat, and some in a cool frame, from October until the middle of January; those in heat will have made some growth, while those in the cool will have remained quite dormant. But take these into heat, and give them a start, and in a very short time they throw up strong, vigorous fronds, and soon overtake those that have been growing through the winter, for these will make only weakly fronds, if they do not stop altogether.

Among the choicer Ferns may be mentioned the *Gleichenias*. A little warmth in the spring, while they are growing, will do no harm, but it is essential that they should be kept as cool as possible, without actually freezing them, from now until February. These beautiful Ferns love a cool, moist atmosphere, but should have plenty of light and sufficient air to prevent damp settling on the fronds. It is almost certain death to *Pteris scaberrula* to endeavour to keep it in heat through the winter; there are several of the *Adiantums* and *Davallias*—in fact, almost all Ferns are better for being kept on the cool side from now until after the turn of days.

Over-watering is another source of evil. So many people seem to think that Ferns must be continually watered; but although they do not like a dry atmosphere, too much moisture at the roots is sure to prove disastrous, more particularly so with newly-potted plants, or those that have large pots. Any that may have been potted on, and show signs of getting weaker, should be dealt with at once. When once a Fern does get into a sickly condition it is difficult to re-establish it again. As soon as it is seen that the new fronds do not develop to their full size, it is a sign of the plant not being quite healthy, and the sooner they are dealt with the better. It will be quite safe to reduce the balls where the roots have not taken hold of the soil, and they may often be potted back into smaller pots, but in this matter it will depend on the condition of the roots, &c. In re-potting sickly Ferns, good drainage is one of the most important considerations, and those which make their fronds

from a single crown (or caudex) should be potted down, so that the new roots which are produced from the upper part of the caudex as it advances may take hold of the new soil.

Under natural conditions, decayed leaves and other vegetable matter gather round the stems and furnish new material for the roots as the stem advances; but when grown in pots it often happens that, in watering, the soil is washed away, rather than any new being added. Sometimes top dressing may be preferable to disturbing the roots below; and later on, after they have made some new roots on the surface, they may have the lower portion removed when re-potting. I do not recommend disturbing the roots of Ferns at this season of the year, except where absolutely necessary. It will be better to top-dress, and be careful in watering, and then re-pot early in the year, when they have made a start into active growth again. Some growers recommend potting before active growth has commenced, but from careful observations I am quite convinced that to disturb Ferns at their roots while they are dormant will weaken them, while when growing freely they will not feel a check, but will take hold of the new soil at once, though, when much of the old soil is removed, or the plants divided, they require shade and a little extra care for a few days.

DECIDUOUS FERNS.

It not infrequently occurs that when these ripen off and lose their fronds in the autumn, they are mistaken for dead, or are lost through improper treatment during the winter. In the first place, though, they require to be kept on the dry side—they should not be quite dried up; and instead of being placed under a stage, a shelf, or some corner, where they get daylight will be more suitable. There is a considerable difference in the time that various Ferns remain dormant. I have known the beautiful *Adiantum lunulatum* to refuse to start until quite late in the spring; it will depend somewhat upon the time they are ripened off in the autumn. It is better that they should be rested early, for this ensures stronger crowns, which not only start early, but make much finer fronds than those which have been weakened by being kept in active growth too late in the autumn. The following are among the most beautiful of the deciduous exotic Ferns:—*A. palmatum*, *A. Henslovianum*, *A. speciosum*, *A. lunulatum* (referred to above), *Nephrolepis pluma*, *N. pluma* var. *Bausei*, *Leucostegia immersa*, *L. pulchra*, *Onoclea sensibilis*, *Dictyogramma japonica*, and the variegated variety; and some of the *Davallias* lose their fronds, but soon start again. *A. Hemsley*.

SCOTLAND.

TYNNINGHAME, EAST LOTHIAN.

It was with pleasurable anticipations, which were to be more than realised, that the writer entered the policies of Tynninghame, the East Lothian seat of the Right Honourable the Earl of Haddington, in September last. Those who have read with pleasure the articles upon gardening subjects by Mr. R. P. Brotherston, the gardener there, would expect to find many things worth seeing. The writer, on the occasion of this visit (his first), did so, and in the record of some of his impressions which follow, he desires to mention, imperfectly it may be, some of the beauties of Tynninghame from a gardening point of view.

One of the first things to attract the notice is the fine timber on the estate. Lying so close to the sea as it does, Tynninghame is much exposed to storms. Time after time have these played havoc with the trees, and but for the watchful care given, many of the fine specimens still in beauty would long ago have been destroyed. Some blown down have been raised, and many are weighted above the roots with stones to save them from being overturned. The trees have for long been the object of care on the part of the owners,

although in, and since, the time of the sixth Earl, who wrote *A Treatise on the manner of Raising Forest Trees*, there have been many alterations in the arrangements of the policies. An arboriculturist could detail with more skill than the writer could hope to do the sylvicultural features of Tynninghame.

The gardening at Tynninghame is varied in its style. There is no slavish adherence to the practice of any school, but a free use of the best ideas of all, together with many interesting examples of the systems of various eras in gardening practice.

The flower-garden at the mansion is very effective in every way. One cannot hope to do more than refer to some of the many enjoyable features. The garden is in keeping with the architecture of the building with its noble terraces. Effective, yet tasteful, display of colour is made in the beds, in

fusely planted with bulbs such as Daffodils, Tulipa sylvestris, and others. Primroses are in thousands, and the sight in their season must be a charming one.

From the flower-garden we wended our way to the kitchen-garden, where it may almost be said the flowers eclipse the more homely vegetables, and the other usual occupants of these quarters. What may be termed the main walk is flanked by long, broad borders filled with flowers. These are wonderfully fine; they form almost perfect examples of mixed borders. The variety they contain is very large, yet they do not appear at all bizarre. Hardy and half-hardy flowers are used, and these are composed of both perennials and annuals. Grouping is followed, and one may remark that in some of the bold masses of Montbretias one could observe the justice of the view ventilated

A walk through an arched way composed of iron-work covered with Apple Keswick Codlin, and with beds of Narcissi on either side, carries one in fancy to the days when the trees were covered with bloom, and the Daffodils nodding gently beside. The archway is 440 feet long, and one cannot but think it a happy thought which originated the idea of planting these Apples for their flowers in combination with those of the Narcissi. Near by, other borders flanking grassy paths show how pretty is this combination of grass and flowers.

Tynninghame is a place of surprises, and one of those is the quaint little old-fashioned garden which meet one's eye. Surrounded with a low hedge, its little beds edged with Box, and, planted with old herbs, it looks, what it is intended to be, a facsimile of some old dame's cottage garden of the olden time, when Rosemary and Rue, Vervain and Marigold, Thyme and Sage, and many other sweet-scented or useful herbs almost monopolised the space. This was a pretty feature, prettier than some may think, and bringing, as it were, before us a glimpse of the days when fewer plants were at the gardener's command than now.

Interesting, too, was a border of shrubs outside the kitchen-garden walls. Here were a number of the less well known shrubs, such as *Clerodendron trichotomum*, *Xanthoceras sorbifolia*, and several of the shrubby *Spiræas*. Two forms of *Vitis Coignetiae* are on the wall, and appear to be doing well; their handsome leaves were very fine indeed. Unfortunately, *Clerodendron trichotomum* does not bloom—a common experience in Scotland.

The vegetable quarters are largely hidden by the display of flowers in the kitchen-garden, and one might, from many points, imagine that no vegetables were near. They were, however, present in ample quantity for the requirements of the mansion, and one saw that they are as well grown as are the flowers. Fruit, which earlier in the year promised badly, had improved much in the later months, and there was a fair crop of almost all out-door fruits. Plums were, however, a very light crop.

The quantity of glass is not large, and several of the houses are of considerable age. The heavy timbers and small panes of glass are a drawback to successful work with many things, yet creditable are the results produced under careful and skilful management. There is nothing, perhaps, requiring special mention in this department, which is not made a leading feature of the establishment. It is evident that careful attention is given to supplying the family with their requirements in the way of fruit, vegetables, and flowers, of the highest quality. Mr. Brotherston, although of pronounced antiquarian tastes, is in his calling quite abreast of the times. A visit to the gardens under his charge will only help one to appreciate more highly his contributions to the horticultural press. He is fortunate in having the confidence of an employer who takes an interest in the gardens of his ancestral home. *S. Arnott.*

NOTES FROM A SCOTTISH MANSE.

Since last I wrote to the *Gardeners' Chronicle*, I have been in Edinburgh, visiting the Royal Botanic Gardens. There, I saw many fine tropical plants, many of them climbers, still in the full beauty of bloom; there, also, I saw a very famous Orchid, which, when newly introduced into this country by the Messrs. Sander, of St. Albans, created a veritable sensation. I mean *Dendrobium Phalaenopsis Schröderianum*, first discovered by their collector, M. Micholitz, in the island at New Guinea. This is undoubtedly a uniquely-coloured Orchid. In the artistically-arranged enclosures of the Botanic Gardens there are a number of majestic Palms in a spacious and lofty conservatory; outside, are many noble trees from California and Mexico, and a splendid collection of alpine and herbaceous flowers.

I also visited the nurseries of Messrs. Methven & Co., which are adjacent to the Botanic Gardens,

FIG. 125.—IRIS SOFARANA: NEW SPECIES.

(Two-thirds of the natural size.)

(SEE P. 389.)

the grass, and in the long borders on the terraces. Begonias are not as a rule satisfactory in dry soil, such as forms the staple at Tynninghame. Zonal Pelargoniums, however, more than take their place, and the brilliant display made by a long line of Vesuvius and Henri Jacoby, will not readily be forgotten. There were too many plants used for one to detail. One may, however, refer also to the bed of *Salvia patens* and blue *Lobelia*, to which reference has already been mentioned in these pages, to beds of *Fuchsias* with a groundwork of *Coxcombs* and other low-growing plants, to long lines of *Kniphofias* on one of the garden-terraces, to the plants in tubs under a balcony, and to the formal Laurels in boxes, which, however much one is wedded to a less formal style of gardening, one must confess, are quite in harmony with the mansion and its surroundings, and make one admit that their very formality gives attractions to the garden. In the neighbourhood, the grounds are prettily-wooded, adorned with shrubs, and the grass pro-

recently by Mr. Brotherston in the *Gardeners' Chronicle*, that these valuable flowers look better mixed than in groups of one colour only. Much of the effect of these truly grand borders was derived from the Hollyhocks they contained. These had, unfortunately, been affected by the disease, but they were, notwithstanding, very fine. It is in vain to attempt to describe this feature of the garden, with its *Asters*, *Pentstemons*, *Phloxes*, *Statice*s, *Sunflowers*, and the many other good border flowers which together made up the display.

There is also a Rose border which, in its season, must be of much interest to the owner. It contains many of the old and almost forgotten Roses, which have been collected from many sources. Some day these may again become fashionable, but even now they are full of interest to those who care for studying the flowers which were favourites with our predecessors. Modern Roses have also a worthy place.

where I saw a grand display of early Chrysanthemums, and very late-flowering Pansies and Violas; so that, even from a horticultural point of view, my visit to Edinburgh, though of extremely short duration [some weeks before the publication of this communication], was not in vain. There are other attractive nurseries in the vicinity of the modern Athens, that I must also visit on some future occasion, viz., those of the Messrs. Dickson, and that great Viola specialist, Mr. James Grieve.

On my return to Kirkmaiden I found that my own garden, which had suffered greatly before I left from the equinoctial gales, had like the weather (and in virtue of it), during my absence gradually improved. The voices of Nature for a period were silent; sunlight became triumphant, and growth was restored. The latent energies of the Dahlias and Chrysanthemums revived, though Sweet Peas branched and blossomed as if it were the beginning, and not the end of their season. The late Apples on the trees deepened their rich colours; the Violas revived, and became odorous once more. Even the Tropaeolums, scarlet and yellow (*T. speciosum* and *T. canariense*), though touched with the hoar-frosts, blossomed at intervals; while *Ampelopsis Veitchii*, the self-supporting Virginian Creeper took on, amid the encircling silence and brightness of Nature, most radiant hues. Everywhere throughout the green spaces of the garden Roses were reviving and bursting into bloom; here, Marie van Houtte was a primrose-coloured gem; there, A. K. Williams and Captain Hayward, rivals in beauty, were a lustrous crimson glow. No variety is more precious for autumnal productiveness than that much-loved native of China, the "brave old monthly Rose." It is familiar to the Rosarian from his earliest childhood, like its inevitable companion from fair Provence; both of these are exquisite links in the pure regions of memory between the present and the past. The Moss Roses, also, though their flowers have faded long ere we reach the confines of winter, have similar associations. In many old gardens, such as that at Traquair (whose picturesque environments have been immortalized in Scottish song), there are Roses of this uniquely interesting description hoary in years, and even in aspect, which flower as they did in the old days.

I have still—October—(wonderful to relate!) a stately specimen of *Lilium auratum* in bloom; also several varieties of *Lilium speciosum*, including *S. Kraetzeri*, the loveliest of them all. At this season last year I introduced into my garden (regarding them as valuable additions to my collection) two Lilies of considerable reputation, one hailing from oriental, the other from occidental regions—viz., *Lilium rubellum* and *Lilium Burbanki*—of which the former (though several seemingly-reliable bulbs were planted in places, where adequate drainage in winter and ample sunlight in summer were secured) did not produce a single bloom! It is possible that, like many other Lilies, it may take a considerable time to become established; but I greatly fear that like *Lilium Kramerii*, whose bulbs are equally diminutive and not more vigorous in constitution, it is extremely liable to premature decay. *Lilium Burbanki*, on the other hand, was successful beyond anticipation; and I cannot doubt that, like its beautiful parents, both of Californian origin, it will grow stronger and more floriferous year by year.

I cannot close this fragmentary contribution without making some reference to the death of Dr. Alexander Wallace, of Colchester, who was one of my kindest personal friends. Some years ago I made a pilgrimage to Colchester, for the special purpose of making his acquaintance and that of Mr. Benjamin R. Cant. On that occasion Dr. Wallace showed me his nurseries for the cultivation of Lilies, Calochorti, and Irises. To his book entitled *Notes on Lilies*, and which has long remained the leading work on the subject, I owed my first enthusiasm for Lily-cultivation. David R. Williamson, *Manse of Kirkmaiden*.

CHRYSANTHEMUMS.

TIMELY HINTS FOR NEXT SEASON.—Before the flowering period of one season is past, preparation must be commenced for the next. All who wish to have an up-to-date collection in all sections must effect an annual weeding-out of the varieties already possessed. It is just as easy to cultivate new and improved varieties as it is to stick to the older and inferior sorts. Where Chrysanthemums are grown purely for home enjoyment, the yearly addition of new and expensive sorts is not imperative; but in the case of exhibitors it is of the greatest importance that all such that are really improvements should be added, as all the difference may be made in the winning of a 1st prize by the inclusion of a novelty. Examine carefully your collection, and replace all that are inferior in size, form, or colour. The chief aim of the cultivator now is depth in his blooms, with solidity of petal, and pureness of colour. If a variety is of the reflexed section, the florets should tend in that direction. Those varieties that are neither incurved or reflexed, but distinctly of the hedgehog pattern, should be deprecated, as they do not possess the characteristics of one type or another. Take measures to secure that the whole collection is correctly named, or most annoying confusion will arise.

The propagation of next season's plants will need soon to engage attention. The middle of December is sufficiently early to insert cuttings; but it is not too early now to prepare the cuttings. Directly the plants are cut down, as they should be after the flowers have faded, place the pots in a cool, light, airy position in a vinery, Peach-house, or cold frame—any place where they will be protected from frost, and where they will obtain all available light and air. Seek to obtain "stocky" cuttings, about 3 inches long; they cannot be too stout, so long as they are firm, and not too sappy. Some varieties will throw up suckers from the base so freely as to overcrowd each other, thus rendering all weak and unsuitable. Thin out the weakly, to give space to others.

Examine the cuttings carefully for green or black aphid, and if either is present, dust with tobacco-powder, and afterwards vigorously syringe the plants with clear water. *E. Molyneux*.

HOLBECK GARDENS, SCARBOROUGH.

THESE gardens are situated at the extremity of what is known as the South Cliff. To my mind these gardens exemplify two facts—first, the great development of good taste observable in public gardens; and, secondly, an illustration of what may be accomplished in apparently very unsuitable positions, and with few materials, if only the work be set about in the right manner. To the first fact, it may be added that no doubt the *Gardeners' Chronicle* and its contemporaries have had much to do with this development. All well wishers of the uplifting of the public taste can but hope that we are as yet only on the threshold of the matter. Those who know Scarborough and its grand rocky cliffs rising from the sea at a steep angle for some 150 feet in height, will bear me out when I say that twenty years ago a more unlikely spot for a public garden could not well be imagined near the town; and much ingenuity and good taste in forming this cliff into natural terraces, with here and there walks, sloping grass-covered banks, has been displayed. Advantage was taken of forming beds and borders on the upper half of the cliff, away from the spray of the water, when tides are high. Groups and banks of Golden Elder and evergreens, Japanese Privet, are used for backgrounds and shelter to the flowering plants. Amongst hardy plants used were *Harpalum* in variety, white and red-flowered Japanese Anemones, varieties of *Carnation* of free growth, *Alyssum saxatile*, *Santolina incana*, China Roses, very fine; *Rosa rugosa*, covered with crimson haws at this season; scarlet-flowered Pentstemons, and Pansies in much variety. The beds and borders, as may be imagined, are of no

particular form, hence it is difficult to give examples.

I mentioned above that simple materials were used in forming the display. They were nearly all annuals, viz., Stocks, Ten-Week and East Lothian, Asters in variety, very fine; *Dianthus*, *Saponaria calabrica*, *Nasturtium*, self-coloured and of mixed colours; *Tagetes signata pumila*, *Phlox Drummondii*, and annual Chrysanthemums. The three latter were finer in growth and blossom than I have seen before. I ought to mention that *Mignonette* was here, there, and everywhere, covering what would have been otherwise bare spaces with a very free growth. Amongst the more tender bedding out plants were masses and borders of white *Marguerites* covered with flowers, and very vigorous in growth.

My visit was too late in the season to see the place at its best. Still, to me the picture was a very fine one, and well worthy a notice in your columns—hence this note. *H. J. C., Grimston Park, Tadcaster*.

PLANT NOTES.

CRINUM AMABILE.

THIS beautiful *Crinum*, presumably one of the finest of this large family of Amaryllidaceous plants, justly deserves to be included amongst choice stove-flowering plants. The crimson flowers are borne in umbels on a long scape, often as many as twenty to thirty flowers being produced in a single umbel. The leaves are broad, and from 3 to 4 feet long. It was introduced by Dr. Roxburgh in 1810 from the East Indies.

COSTUS IGNEUS.

The beautiful, bright, orange-coloured flowers of this desirable stove-plant are particularly striking, and although only lasting a short time in perfection, they are produced in quick succession for a considerable time, being borne in dense heads on the points of the shoots. It is a native of Bahia, and was introduced by M. Linden in 1882.

IMPATIENS ROYLEI.

Although a common plant in many cottage gardens, *Impatiens Roylei* does not find a place in the more aristocratic herbaceous borders so often as its good qualities entitle it to do. This hardy annual is a native of India, introduced in 1839, and figured in the *Botanical Magazine* and *Botanical Register* as *I. glandulifera*, which name is usually retained by seedsmen. When given generous treatment and a moist situation, this species attains a height of from 9 to 10 feet, commencing to flower at the end of July, and continuing to bear its curiously-shaped flowers of varying colour, sometimes very pale, and at others of a bright purple, till late in the year. Its propagation presents no difficulty; so freely does *I. Roylei* seed, that it has become naturalised in many parts of the country.

Early last August, while taking a stroll beside a stream which in summer slowly trickles its way, and in winter rushes along, a 6-feet deep torrent, through woods and pastures to the river Camel, I was surprised and delighted to see first a few stragglers, and then a whole company of *Impatiens Roylei* growing quite wild on a small island. Even then (August) the plants were well over 6 feet in height, and being shaded, the colour of the flowers was a beautiful soft shade of purple. On making enquiries, I found that for several miles this species grew annually in patches along the banks of this stream, frequently far from any garden. [A caution is necessary in the introduction of this plant. It is apt to be too obtrusive. *En.*]

Cross by this island was a delightful profusion of wild flowers, the most conspicuous being the purple Loosestrife (*Lythrum Salicaria*). A few days later, my employer expressing a wish to have some flowering plant growing near the water of a small lake, I took men and wheelbarrows, and we care-

fully lifted a nice batch of the Impatiens, and some good clumps of Loosestrife—this was on August 10, during that spell of exceedingly hot weather, and planted them close to the water's edge at the lake, taking advantage of the shade afforded by the overhanging trees. A thorough soaking and damping prevented flagging, and to all appearance the plants suffered in nowise from their removal; even now, towards the end of October, the Impatiens is still flowering. *A. C. B.*

FLOWER GARDEN AT ADARE MANOR.

WE are indebted to Mr. W. Bowles, head gardener at Adare Manor, for the following particulars

and usually, the best spikes grow on the younger plants, which carry but one. *Yucca recurva* is a better species than *Y. gloriosa* and *Y. filamentosa*, of which we have only a few."

FORESTRY.

PARK CLUMPS OF TREES.

THE park clump, in its usual form, is so intimately associated with the work of "Capability Brown" and his followers, that its existence alone is almost sufficient to justify one in assuming that the place in which it exists to any great extent was either laid out or "improved" by a landscape gardener of that school. In his *Essays*

siveness which proclaims their superiority as works rather of art than of Nature, and if intended as monuments of their creator's skill, answer the purpose wonderfully well.

I am not justified in assuming that every formal clump of trees is the result of Brown's teaching and practice, but it is very probable that this professor of landscape-gardening did more to perpetuate their use than anyone else. There may be a good deal of truth in the suggestion made by Repton in defence of his predecessor, that the objectionable character of these clumps arose quite as much from the treatment or neglect they received after Brown had done with them, as from any fault connected with the original design. But the fact remains, that the chief fault began with the choice of trees used, and the manner of planting them from the

FIG. 126.—THE FLOWER-GARDEN, ADARE MANOR, CO. LIMERICK.

concerning our illustration (fig. 126). "By permission of the Countess of Dunraven, I send for your acceptance a view of the south front flower-garden at Adare Manor, Co. Limerick, taken when numerous plants of *Yucca recurva* were in full flower last summer. The view, taken from the terrace, shows a number of Yuccas that were planted in various positions, with a view to fine effect. The flower-garden consists of four parterres of similar design, with a large clump of Pampas-grass in each. The view shows a portion of the Manor House and flower-beds, which were empty at the time, spring bedding being the only sort carried out. The Yuccas are growing in a strong loam, and they stand our winters without injury. Some idea is afforded of the height of the spikes of bloom, by the man who is standing in the middle distance, and who is 6 feet high. Some of the plants carried five and six spikes,

on the Picturesque, Sir Uvedale Price declares that if ever Brown's disciples were in need of a seal of incorporation for their calling, it need only take the form of a belt, a clump, or a single tree; these, with water, being the only materials with which they made their landscapes.

The chief characteristics of these clumps are their perfectly round or oval shape (as if geometry, rather than taste, determined their outline), their density, and the exclusive use of tall-growing forest-trees in their composition. Their boundaries are usually as sharp and clearly-defined to-day as at the time they were planted, and although the surrounding fences may have been removed for perhaps a century, the line they followed can be traced with the greatest ease. On flat or gently undulating ground, they stand out sharp and distinct from the surrounding trees with a kind of dignified exclu-

first, and to have rendered them picturesque features of a park or landscape, a method of managing them must have been inaugurated at a period when they were still under the eye and influence of the planter.

These clumps are probably least offensive to the eye when composed of deciduous trees such as Oak, Beech, Elm, or Spanish Chestnut, or such an evergreen as Scotch Fir, which assumes a flat or rounded crown in mature age, as the more or less irregular growth of the trees takes of some of the formality of their outline. But when composed, as they frequently are, of Larch, Spruce, and other conical-topped trees, they stand out as distinct from the remaining trees of a park or landscape, clothed chiefly with deciduous forest-trees, as is chalk from cheese, and totally fail to harmonise with their surroundings. Probably the

culminating point of ugliness is reached when small, circular clumps of this description are surrounded by a neatly-trimmed Thorn-hedge in place of the ordinary post and rail, or invisible iron fencing. Then they appear as if completely shut off from the surrounding ground, and as much out of place as a plot of Cabbages or Potatoes on the same spot, furnishing apt illustrations of the evils of rule-of-thumb when applied in ignorance of fundamental principles.

The objects of clumps in a park or landscape are several, the chief of which is the formation of a series of small back, or middle-grounds, which break up comparatively extensive but monotonous prospects, giving them variety and more or less intricacy. They are more essential on flat or gently undulating ground than where hills and eminences are of sufficient size to form in themselves important features in the landscape, as in the former case the view in any direction has an indefinite and gradually diminishing background, giving it a monotonous aspect which is only relieved by masses of trees.

Another use to which the clump can be put with advantage is in the neighbourhood of large woodlands where they can render the change from wood to open country more gradual and natural, and prevent abrupt terminations of either. Their presence in such instances may not always be practicable or desirable from an economic point of view, as, for example, when arable land runs up to the boundary of the wood; but in parks and grass-land under the immediate control of the owner, they can always be used with good effect if properly situated and naturally formed.

Another, though more temporary use of the clump, is in rearing individual trees in exposed situations, or on bad soils. The shelter afforded by close order usually produces taller and finer stems than can be grown in the open, and by careful attention to good and rightly situated trees, park timber may be more successfully and conveniently grown than by planting singly and enclosing each tree in a wooden or iron cage. *A. C. Forbes.*

(To be continued.)

SEASIDE PLANTING OF TREES AND SHRUBS.

[IN the spring of the present year we published some articles on the important subject of seaside planting, which, we believe, would be appreciated by those of our readers who might be engaged in or who contemplated this kind of work. The season having come round when planting can be re-commenced, we intend to print other articles dealing with planting, from the pen of one who has had considerable experience, and has an extensive acquaintance with suitable species of trees and shrubs.]

Bupleurum.—First, we have a singular narrow-leaved shrub, included in the large and very varied order of the Umbelliferae, which, to the superficial observer more nearly resembles an Ivy, both by its flowers and the strong odour of its foliage. It is known commonly by the name of Hare's Ear, both to the inhabitants of our maritime counties and also across the Channel. This plant (*Bupleurum fruticosum*), forms a large and neat hemispherical bush, which in winter is attractive by reason of its blue-green glaucous foliage, and in late summer is covered with small umbels of yellowish flowers, which are strongly scented, and very attractive to Haverflies and other insects, similarly to the Ivy. Planted on dry banks having a chalky or rocky substratum, it is a useful and effective plant. There are two distinct species, viz., *Bupleurum fruticosum*, and *B. arborescens*, the latter with broader foliage and smaller umbels than the former, and flowers which at a distance are pleasantly fragrant. There is likewise a golden-leaved variety, which, coming from Siberia, is very hardy, and desirable, and serves as a contrast to the green-leaved forms.

Of the *Escallonia*s, introduced from South America, *E. macrantha*, in 1847, is by far the finest. It flourishes on the south coast, and forms a compact dome-shaped shrub, with glossy, dark green foliage, and terminal growths flower for the greater part of the year. The flowers, which come in short spikes, are of a bright carmine colour, which, in common with a few other flowering plants, are brightest at the sea-coast. It is most at home when planted on dry, rocky slopes, and allowed to develop naturally, when it forms a very attractive shrub. It makes a beautiful garden hedge. Severe frost may, however, kill it back to the mature wood; but its recuperative energy is great, and it makes fresh shoots in abundance in the summer, which, when they have somewhat ripened, flower freely. There is a white-flowered form, of bushy erect habit of growth, which comes from Monte Video, the best form of which is known in nurseries as *M. floribunda*. *E. rubra* (Ingrami of the trade), is a free-flowering, erect-habited variety, but the individual flowers are much smaller, and not massed as in *E. macrantha*, neither has it proved so hardy as either of the two first-named. Lastly, a strong-scented kind, but very hardy, named "illinita," from the varnished appearance of the whole plant. The odour at a distance is that of the "Birdsfoot" Trefoil or Melilot, but closer this odour is markedly unpleasant. It bears numerous corymbs of white flowers, which turn creamy-tinted before falling. It forms a small, neat shrub, desirable as a contrast, and it would probably prove hardy further north than "macrantha," or any of the other species. One more recently introduced, called *Phillipiana*, see *Gardeners' Chronicle*, July 27, 1878, p. 109, promises to be a useful addition to the genus, but I have not used it yet. [Messrs. J. Veitch & Sons, Chelsea, have raised *E. La gl'yensis* ×, a variety between this white-flowered *Escallonia* and *E. macrantha*, which has pretty pink blooms. Ed.]

Berberis.—The common Barberry (*Berberis vulgaris*) and its purple-leaved variety, and the small box-leaved *Berberis dulcis*, have proved satisfactory at the sea-side; but the most attractive of the genus (*Berberis Darwini*) gets browed, its foliage becoming unsightly. Of the noble *Mahonias*, *M. Beali*, the *M. japonica* of some, have proved only partially satisfactory; while *Berberis aquifolia* Harveyi is an excellent sea-side plant. It differs from the type, in having large, round, entire foliage, which is without spines. The plant is of an erect habit, and flowers freely. All of the above-named thrive in partial shade, and should therefore be so used. They are all handsome in flower and fruit, while the berries are so acid, especially the first-named, that birds will leave them alone except in extraordinarily severe winters.

Rhododendrons.—It goes without saying that where these plants thrive there is nothing to surpass them in flowering shrubs. If they will succeed at the sea-side is a question that is frequently put to me professionally, and I grieve to be obliged to say "No! they will not." It is true that at Bournemouth, Boscombe, and the favoured coast-line of Devon, where plants in masses, sheltered from the sea breezes, they thrive and form grandly attractive masses, but if employed it should be cautiously, and only after plenty of shelter-belts have got up. *Rhododendron ponticum* and its varieties should be those chiefly relied upon, not omitting a variety I had from Mr. Chas. Noble, of Bagsshot, and named by him *R. californicum*, which, when planted in suitable soils, as peat, peaty-loam and light loam, grows freely and flowers abundantly. On the south coast, varieties of *R. arboreum*, so brilliant in colouring, may be tried; and also a few of the more hardy Sikkim species, as *ciliatum*, but on no account should these alone be planted, or failure will certainly occur. The dwarf-growing and smaller-growing members of the genus may be planted in the front or second row of the borders, the best of these being *R.*

ferrugineum, *R. præcox* or *davuricum*, and the pretty *myrtifolium*, and to these may be added some of the hardy heaths, especially the red and white-flowered *Erica mediterranea*. The yellow-flowered *Azalea pontica* may be tried in the same sort of soil for the sake of variety; and probably, though I have not yet used them, the brilliant-flowered varieties of *Azalea mollis*. *Experience.*

(To be continued.)

FOREIGN CORRESPONDENCE.

LODOICEA SEYCHELLARUM (THE DOUBLE-COCOA-NUT) AT BERLIN.

THE Royal Botanic Garden, Berlin, received September 25 this year four fresh seeds of *Lodoicea seychellarum*, one of which had germinated during the voyage from its native country to Germany. The seeds were brought to the steamer on August 1, so that they made a journey of fifty-six days. As there exist no data about the weight of the Coco de mer, I give the following ones, taken October 24, i.e., a month after receipt:—

I. 8,275 grammes, on arrival at Berlin; II. 10,315 grammes, began to germinate October 24; III. 11,895 grammes; and IV. 12,645 grammes. It is interesting to learn that the smallest seed germinated first, then the next larger size. The germination begins with a cleft about 2 inches long at the foramen of the seed on that side of the seed where is the carina—that is, the flatter-side. I do not find any remark about this in the literature of the plant. [It has been frequently figured in the *Gardeners' Chronicle*. Ed.]

RAPID GERMINATION OF SEEDS.

A fine specimen of *Myrmecodia echinata* in the Royal Botanic Garden at Berlin flowered and fruited last year very well. The seeds germinated the day after they were sown, i.e., within twenty-four hours. In the house where this plant is growing, there are numerous very minute ants, imported, as it seems to me, with the plants. These ants transport daily large quantities of earth upon plants of every kind, also upon the *Myrmecodia*, and it frequently happens that the seeds of this plant germinate in this earth.

INFLUENCE OF DRYING UPON THE GERMINATION OF PALM-SEEDS.

Seeds of *Oreodoxa regia* sent dry, packed in capsules of paper, did not germinate till after the lapse of one year and a-half; whilst seeds sent in moist wood-charcoal germinated in a few weeks after sowing. Comparing results, it was evident that out of about forty species of Palms, only three or four species germinated when the seeds were sent over here dry, and of these only a few seeds; whilst almost all the seeds of nearly all the species germinated when the seeds had been packed in a moist medium, and arrived in a moist state. *Dr. Udo Dammer, Gross Lichterfelde, near Berlin.*

CHRYSANTHEMUMS.

SOME little distance beyond the fortifications of Paris on the southern side, lies Chatillon-sous-Bagneux. Here in the Avenue de Paris, after passing many other establishments of a similar kind, the visitor will find a neat, little white house enclosed with railings and a high wall. The entrance is through a *porte cochère* in the wall, which leads to the courtyard of the dwelling-house. Beyond this, and extending for some distance right and left of the house is M. Nonin's nursery, where Chrysanthemums of all kinds are largely grown, and in a style that leaves the visitor with no doubt in his mind as to the capability of the cultivator. We pass first of all some beds of early-flowering varieties in full bloom, and being used to the ordinary arrangement of an English nurserymen's establishment, look about for a large glass structure in which to find the main body of the collection.

But in France, and especially beneath such a bright blue sky as we had on the day of our visit early in November, such precautions do not appear necessary, and presently we catch sight of a construction something similar to one we saw in Belgium three years ago. Posts 2 or 3 inches thick are driven into the ground at regular intervals covering many hundred square feet. On these are arranged portable lights forming a series

attention to the fact. A fine yellow Japanese we remember seeing in good form at the Paris show a few years since is Comtesse de Beaulaincourt. Mdlle. Louise Brossillon, white, is another. M. Frederic Daupias, sulphur-yellow, is large and promising; Son Altesse le Prince Hussein Kamil, is a fine chrome-yellow Japanese; President Lemaire is one of the Edwin Molyneux type; Jules Bernard, a good purple amaranth; M. Gatellier, rich golden-

Mazuger, a large globular Japanese, with pointed florets, terra-cotta; Frederic Baner, purple, with silvery reverse; M. Pueones, a fine golden-reddish carmine; Paul Harriot, Madame Laffroy, and several more.

CHRYSANTHEMUMS AT LYONS.

The Chrysanthemum shows in the public parks, although differing occasionally in mere matters of detail are essentially uniform in their arrangement. A large glass structure containing a single sloping bank, or else a central bank of plants in pots, is the prevailing idea. A journey abroad, however, occasionally helps us to find that, excellent as some of our ways are, there are at least other methods in vogue which might be of service to the organisers of English shows, one of the best lessons of the kind being the very artistic way in which the Ghent Chrysanthemum Show is designed and laid out, but which has never yet been imitated by any English society I know of.

The park Tête d'Or at Lyons is a park of which the Lyons people are evidently very proud. Its superficial area is of great extent, and in it are found the municipal greenhouses, a winter garden, Camellia-house, botanic and alpine gardens, the curator being M. R. Gérard, who is also the professor of botany at the Lyons University.

At this park a public display of Chrysanthemums is provided, but not in the way usually adopted here. In the winter garden, which is a beautifully arranged glass structure, containing Palms, Tree-ferns, and other things of the kind, several large groups of Chrysanthemums were set up, and by their colour in such a surrounding of greenery certainly looked most effective. The varieties comprised many not known in England, but among well-established sorts may be mentioned General Paquière, Souvenir de petite Amie, Mrs. C. Harman Payne, M. Chenon de Leché, Madame Carnot, Madame Ed. Roger, Vivian Morel, Madame Gustave Henri, Iserette, Phœbus, Louis Boehmer, Van den Heede, Commandant Blusset, &c.

In another house, interspersed among other Palms, Ferns, and Foliage plants were some very dwarf-grown varieties, of such popular Chrysanthemums as Wm. Seward, President Nonin, Lord Brooke, and those already mentioned, with others less well known, such as Le Drac, Madame Leblanc, Jules Chrétien, Ed. André, Mdlle. Philomène Claret, Madame Zurick, and others. C. H. P.

MR. LEOPOLD DE ROTHSCHILD APPLE.

IN this variety we have the result of a cross between one of our best late dessert Apples and one of the brightest coloured Crabs, viz., Cox's Orange Pippin and John Downie Crab. The fruit is small, yellow in colour, and pleasant eating, but still a Crab, scarcely any trace of the Pippin being discoverable, except, in so far as there is, an amelioration of the acidity of the Crab. The prepotency of the Crab itself, a variety and not a species, is very evident. The tree, as shown in the illustration (fig. 127), is an abundant bearer, and is worth growing as an object of ornament and usefulness. Fruits of the variety were shown by the raisers, Messrs. J. Veitch & Sons, Limited, Royal Exotic Nursery, Chelsea, at the meeting of the Royal Horticultural Society on November 7.

CONTINENTAL NOVELTIES.

HERR ERNST BENARY, of Erfurt, is sending out at this season seeds of the following novelties:—

- Antirrhinum majus Romeo.
- Aster, Dwarf Comet Bridesmaid.
- " " Mignon Aster, crimson.
- " " Carmine, rose-carmine.
- " (Lady section), Comet-flowered, white, with rose.
- Hellanthus cucumerifolius hybr. fl.-pl.
- Cineraria hybrida grandiflora (Fin de Siècle).
- Collinsia tinctoria purpurea.
- Dianthus Heddevi diadematus albus flore-pleno [or in plain English, double white].
- Pink, Diadem.
- Henckera sanguinea hybrida.
- Stock, Empress Elizabeth.
- Papaver levigatum compactum.
- Phlox Drummondii nana compacta, Surprise.

FIG. 127.—MR. LEOPOLD DE ROTHSCHILD APPLE, OBTAINED BY CROSSING COX'S ORANGE PIPPIN AND JOHN DOWNIE CRAB.

of span roofs, beneath which is the collection of large-flowered show plants in pots, all sunk up to their rims in the ground. The ground beneath the ridges is reserved for the path, the plants being arranged on each side in rows of five or six plants each.

M. Nonin, a genial, pleasant, chatty man, soon appears on the scene, and conducts us round in person. On the whole, the plants are very dwarf, the blooms are of large size, and the varieties comprise most of the best from all sources. We are, however, chiefly interested in his own seedlings, and having but little time at our disposal, draw

yellow; Madame Ragneneau, old rose; M. Raymond Desforest, reddish chestnut, with golden reverse; Princesse Alice de Monaco, large white; Paul Oudot, an immense rosy-pink, are all but a taste of others that are to follow.

We recognise Madame Gabrielle Debree as being one of the best of the season's novelties in England, but others are as yet not distributed, and of these a note is made of Georges Daupias, a fine Japanese, with long narrow florets, colour pure golden-yellow; Myrto, a silky-white, hairy novelty, with outer florets delicately tinted pink; M. Georges

Petunia, Double Lilliput, Rosa Bonheur.
 " hybr. grandifl. purpurea albo-maculata.
 Giant double Petunias.
 Yellow-throated fringed Petunias.
 Mammoth Verbenas, scarlet, rose, and carmine.
 Mammoth Verberna, Fire-fly, flowers red, with a white eye, said to come quite true from seed.
 Saintpaulia ionantha grandiflora violacea.
 Tagetes patula nana striata.

Mr. C. LORENTZ, Erfurt, offers the following novelties:—

Carnation, White Queen.
 Chrysanthemum carinatum Golden Feather.
 Mignonette, Excelsior.
 Mignonette, Golden Jewel.
 Snap Dragon, Black Prince.
 Lettuce Harbinger.
 Melon Cantaloup, Empress Augusta Victoria.

HAAGE & SCHMIDT, Erfurt, announce seeds of:—

Calendula officinalis Favourite.
 Dianthus laciniatus salmonensis.
 Eschscholtzia cespitosa.
 Helianthus cucumerifolius, Diadem.
 Linaria alpina rosea.
 Lychnis alpina alba.
 Papaver nudicaule striatum.
 Petunia hybrida grandiflora fimbriata fl.-pl. amabilis. [The reader will please note that we repudiate all responsibility for this more than sesquipedalian name.]
 Senecio elegans fl.-pl. pomponicus.
 Tagetes signata pumila sulphurea.
 Tropaeolum Lobbianum Princess Victoria Louise.
 Verbena Aubletia, candidissima.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart. Clare Lawn, East Sheen.

The effects of mild weather in November.—Mild weather in November is more trying to Orchids generally than a lower temperature would be, and greater care is thereby rendered necessary in respect to heating the structures, and affording water to the plants. The limited amount of fire-heat required to keep the temperature at the desired degree and the moisture-laden atmosphere outside, conduce to the retention of moisture in the plant receptacles. It also promotes root-action, which is not desirable at this season. The gardener is sometimes tempted also, in bright, mild weather, to promote a growing atmosphere in the houses; whereas, he ought at this season, to do all in his power to induce those species naturally disposed, to take their requisite degree of rest. Should such weather continue, by all means allow the plants to obtain the benefits of the genial atmosphere and health-giving light; but be sparing with water, both at the root and about the houses.

Ventilation.—Admit abundance of air to the houses by opening the wall-ventilators in the warm-houses, and those in the roof of the cool ones, whenever outside conditions will permit. A mild west wind should not be considered an objection to having the top ventilators of the cool-houses opened, let it blow ever so hard. Some cultivators have an objection to seeing the leaves of their plants swayed by the wind; though, how that can injure their health, providing it be caused by a soft, moisture-laden wind, is past my comprehension, seeing that such a number of our cool Orchids naturally inhabit the topmost branches of forest trees, which must often be oscillated by the wind. But cold, drying winds, should be excluded as much as possible by closing all ventilators, excepting those on the leeward side, and even these should only be opened slightly, as sufficient fresh air will gain admittance through the laps of the glass.

Watering and damping.—It is impossible to say when, or how often the houses should be damped, without actual experience of the particular houses, and the only true guide is the hygrometer, which must be used in conjunction with the teachings of experience and common sense. During dull, mild, and quiet weather, the houses and plants may be left for several days without any water being applied; especially where the floors and stages contain a large amount of moisture-holding material. During the prevalence of opposite conditions, the floors and stages should be damped in the morning, as soon as the day temperatures are reached, and again later in the day if occasion demands. Generally, the stages receive sufficient water at this season, during the process of applying water to the plants.

Lælia crispa, being an autumn and winter-growing species, every inducement to healthy leaf and bulb-development must now be afforded the plants. They will need all the light and heat obtainable in the Cattleya-house; but as root-action does not occur for some time yet, a limited supply of water will suffice.

Lælia elegans, will in most instances be at rest, and will need only as much water as will keep the pseudo-bulbs firm, but the plants should not be subjected to such a severe drying process as is enjoyed by the majority of Cattleyas and Lælias, or the pseudo-bulbs will shrivel beyond recovery.

Cattleyas Triana and Percivaliana.—Whilst in the process of developing the flower-buds in their sheaths, and until the flowers expand, should be afforded a slightly-larger quantity of water. Afterwards, the resting treatment should again be afforded.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

The Pinery.—Where a succession of fruits is required, the temperature of the fruiting-house by night should not fall below 65°, nor by day 75°, by artificial heat, although on bright days it may be allowed to rise to 80°, when fire-heat may be lessened, and air afforded for a few hours—say from 11 A.M. till 2 P.M. The bottom heat may be kept at from 80° to 85°.

The Succession Plants.—In this division a warmth of 60° by night and 65° to 75° by day will suffice, the lower degree on dull days or during sharp frosts. Bottom heat should be 5° to 6° lower than for fruiters. The amount of water required by the plants can only be indicated, as the frequency of the application will depend on the kind of bottom heat afforded, the nature of the soil, the size of the pots, &c. It may be said that the succession plants should be afforded a rest at this season, by lessening the bottom heat as indicated, and curtailing the amount of water at the root consistently with maintaining the plants in a healthy condition. Give an eye to drip, which in some Pine-stoves is apt to render the soil unduly wet if not checked, and directed into little tin troughs, and allow it to trickle away without doing harm. Air should be afforded the successions whenever it can be safely done, more or less in volume according to the weather. If the leaves of Oak, Beech, and Chestnut are used for making the hotbeds, a good store should be collected at this season, throwing them into a long heap or ridge, not less than 5 feet high and 7 feet wide. This heap should be protected from the weather. It is very necessary that the glass of a pit or house in which Pines are grown should be kept bright during the winter.

Young Stock.—The suckers which were taken from the plants late in the autumn and potted, must be afforded conditions of heat and moisture favourable to the formation of roots; and as soon as that has taken place to a satisfactory extent, they and the succession-plants may be allowed a season of rest of about two months in duration, i.e., the lower temperature given above should be observed. In all the divisions "damping-down" should take the place of syringing, excepting the surface of the bed of leaves or bark should become very dry, when a slight spraying between the pots would be beneficial.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Dwarf-growing Iris.—The so-called cushion Irises are beautiful plants for placing on warm, sheltered borders, and in well-drained nooks on a rockery. If some of the bulbs and rhizomes are held over till December, the flowers will appear later in the spring than others planted at an earlier date. A suitable compost is one consisting of good sandy loam, leaf-mould, and sharp grit in about equal proportions. Let each bulb be planted according to its size, 3 to 4 inches below the surface, and afford a protective layer of sifted coal-ashes 2 to 3 inches thick; or pieces of Saxifraga hypnoides may be planted between them to protect them, as well as to form a pleasing carpet wherewith to show off the blooms. *Iris atrofusca*, *I. iberica*, *I. Lorteti*, *I. Susiaua*, *I. alata*, *I. histrio*, *I. histrioides*, *I. persica*, *I. juncea*, *I. reticulata* (very hardy), *I. r. purpurata*, larger blooms, but not so delicate in

colour; *I. Vartneri* and *I. Regeli*, will succeed in the open air. Other varieties of this section flower during the winter months, and should have the protection of a cold frame.

The Planting of Deciduous Trees.—Although these may be planted in open weather during the winter, planting at the fall of the leaf is more desirable, the soil being then warmer, and more workable, and the trees will push forth roots sooner than when the operation is carried out at a later period. The mode of planting recommended in a previous calendar for evergreens is applicable to deciduous-trees, at the same time bearing in mind that the carefulness with which the work of lifting and planting is carried out will be well repaid by the progress the trees will make in the first year afterwards. Almost all trees and shrubs properly treated in a nursery have numerous fibrous-roots, and when an extensive planting job is contemplated, the plants should, immediately on arrival be laid-in, the roots being entirely covered with fine soil. Never lay them in a trench in bundles as they come from the nursery, or great risk will be run of the plants in the middle becoming dried. When a tree is planted, let a hole be made larger in diameter than the spread of the roots, and lay the latter out flat at a depth of 6 or 8 inches below the surface; and where the roots are matted together, fine soil should be washed in by water from the spout of a water-can. The weaker branches of a tree should be so arranged as to allow as much light as possible reaching the interior of the crown; and, although the effect of the pruning may not be pleasing at the first, a better-balanced head will be the result. In soils of a light nature, such trees as Sycamore, Ash, Lime, Birch, Plumes, Paulonia, and Liriodendron (Tulip-tree) will thrive; and on those consisting of heavy loams of a good depth, Poplars, Maples, Crataegus, Willows, Chestnuts, Cherries, Alders, Magnolias, Elm, Oak, and Walnuts.

Deciduous Weeping Trees.—These are not only beautiful in summer when clothed with leaves, but in the winter their pendulous habit form a pleasing contrast to other trees of an erect habit. I should advise their being planted singly in open spaces by the sides of streams and pools. Exposure to light encourages symmetrical growth; but when planted near water, the natural inclination is outwards towards the water. Among the more graceful species I may name the Birch, the Purple Beech, the White Mulberry, *Sophora japonica pendula*, and the weeping Cherries—*Cerasus Mahaleb*, *sinensis*, *rosea*, and *virginiana*. Of the coarser-growing trees there are *Ulmus montana*, *Aspen*, *Ash*, *Robinia inermis pendula*, and of *Salix*, the Kilmarnock, *S. babylonica*, *S. americana*, *S. purpurea*, are very suitable for woodland and waterside planting; and as each is budded or grafted on the common stock, no specially-prepared soil is required for them.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Drogheda, Maidenhead.

The Morello Cherry.—These trees being usually planted against walls having a north aspect, advantage should be taken of mild weather to get the pruning and nailing finished as soon as possible, if only for the comfort of the gardeners who have the work to do. Providing most of the surplus growth, and some of the old fruiting-wood were removed after the fruits were gathered, there will be but little pruning required at this season. If the young growths were fastened temporarily to the wall, they should now be unfastened, and where too close together, more of the old fruiting-growths removed, so as to give room. The shoots should be given a space of at least 3 inches, the object of the pruner being to keep the trees well furnished with bearing-wood of one-year old. After the nailing is completed, the trees should be syringed with an insecticide, such as petroleum emulsion, made by dissolving 4 oz. of soft-soap in 3 gallons of rain-water, and adding a wineglass of petroleum, keeping it well stirred while being applied. The soda-and-potash mixture mentioned in last Calendar is also a good one, but it should be used in a rather weaker state for the Cherry, 1 lb. of each ingredient to 12 gallons of water being of sufficient strength.

The Sweet Cherries require very similar treatment to the Morello, but being in all their varieties stronger growers, more space should be allowed

between the shoots. Care should be taken that no nail presses against the bark or rind anywhere, and that all ties and shreds are sufficiently large to allow for an increased diameter of the branch. As these varieties of the Cherry are usually planted on warmer aspects than Morellos, they may be taken during the colder parts of the day, and the north side when it is warmer. These should also be well syringed with one of the above mixtures.

Pruning Apple and Pear-bushes.—Where summer pruning was effectively carried out, little will remain to be done to these bushes, but the earlier that that is completed the better. The chief work now will be the shortening of the leading-shoots that would probably be left entire at the summer pruning. These should be cut back more or less severely according to their strength; if left too long the chances are against their breaking the whole length next season, and the symmetry of the tree is spoiled through loss of the fruiting-spurs. Strong growths, where extension is desired, may be left 18 inches to 2 feet in length, and cut so that the terminal-bud shall point in the direction the resulting shoot shall take. Weakly growths should be cut back to four eyes. Some kinds of Apples, of which Lady Sudeley is a type, produce their fruit-buds principally on the points of the shoots, and the pruning of such should be light, and root-pruning be practised on them if the growth is at all strong. Where large branches have been allowed to grow up too close together, they should be thinned out now by sawing some of them off almost close to the bole. Sufficient space should be given between the branches to allow direct sunlight to reach the inner parts of the tree when the foliage is full grown. Pears require similar treatment.

Various.—The mild weather has favoured the growth of weeds everywhere, and the beds of Strawberries and the bush quarters may stand in need of a hoeing on a day when the surface is dry, following this immediately by a light raking. If there are arrears of root-pruning, these should now be completed. The weather has been very favourable for planting and transplanting, and any work of this nature not yet completed should be pushed forward quickly.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener, North Mymms Park, Hatfield.

Show and Fancy Pelargoniums.—The plants intended for early spring blooming should at the present time be dwarf, bushy specimens, well established in 5 and 6-inch pots. They should now occupy a position as close to the glass as possible, a shelf being a very suitable place if a small house cannot be devoted to them. A night temperature of about 45° should be maintained, and this, as far as possible, without the aid of fire-heat, which, for the present, need only be applied occasionally during the day to expel damp should this be found to be necessary. No attempt should be made to push the plants into active growth, or the foliage will become drawn and weak, but for the next two months the aim should be by affording free ventilation on every suitable occasion to induce the plants to make slow, sturdy progress. Water must be carefully applied, as an excess of moisture at the root soon causes unhealthiness in the plant. The shoots of the batch required for early flowering should not be pinched, but should be allowed to grow unchecked, as the stopping of the shoots retards the flowering. This, of course, only applies to cut-back plants, as those which were raised from cuttings this summer must be stopped if they are not sufficiently bushy. Sometimes cut-back plants break so freely that disbudding is necessary. When this is the case, the strongest and best placed shoots should then be retained, and the weaker ones removed. Plants which are required to bloom very late may be stopped twice, but the plants should be afforded an extra potting late in the spring, shortly after the second stopping, otherwise the trusses of flower will be small.

Lapagerias.—As soon as these finish flowering, the opportunity should be taken, before the plants commence to make new growth, to thin out the shoots if unduly crowded, and to cleanse the glass and woodwork. When it is necessary to thin the shoots, some of the older growths may be cut clean away from the bottom, and the tips of the shoots which have flowered shortened back to the first wood-bud. While the plants are away from the

trellis they should be well examined, and syringed with an insecticide if the presence of thrips or mealy-bug be detected. In the case of the latter insect, it will be necessary to syringe the plants with strong soapsuds and paraffin, at the rate of a wineglassful of paraffin to three gallons of soapsuds, keeping the mixture thoroughly stirred while using it.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Preparations for Forcing.—Asparagus is probably one of the easiest of vegetables to force, and where large breadths of strong three-year or older roots have been suitably prepared, good heads of Asparagus can be obtained from the middle of December till produce is obtainable from the beds out-of-doors. Although Asparagus may be forced at an earlier date than that mentioned, there is usually an abundance of good vegetables for consumption up till Christmas which render Asparagus unnecessary. The forcing may be carried out on hot-beds made of tree-leaves and manure, or in pits heated by hot-water. When fermenting materials are employed, these should be turned over twice, or more often, as the state of the heap may show, and when it has been uniformly heated, the bed should be formed, bringing it up to within a distance of 12 inches from the glass, making it firm in the process. Over the bed a layer of light rich soil, 4 inches thick, should be spread, and the roots packed close together on this, filling in and covering the crowns with sifted soil. The depth of soil over the roots should not exceed 6 inches. Having finished the planting, put on the lights, which should be made clean and bright, in which state they must be maintained, and start with a temperature of 55° to 60°. Scarcely any ventilation will be required till after the young shoots begin to push through, unless the warmth rises, when air must be afforded in small amount day and night. The flavour of the heads is much improved when air can be admitted. More care is required when Asparagus is forced on hot-beds than when a proper forcing-house provided with top and bottom-heat is available, the right degree of warmth being more easily regulated in the latter. The bottom-heat should not be higher than 80°, and with an even temperature maintained, about twenty days are required to produce good heads fit for the table.

Seakale.—If this vegetable be forced in beds in the open, the first batch may now be covered with forcing pots or boxes. The preparation consists of clearing away the decayed leaves, and raking the beds so as to free them of all rubbish and weeds, then place some fine soil over each crown, put on the pots, &c., and pack a heated mass of tree-leaves and stable-litter around and over the same, making it fairly firm. A good deal of attention must be paid to the heat, for it may during spells of mild weather get too hot, in which case the produce would be weak, if means be not taken to reduce the heat by making holes in the mass, or removing the upper portion. Those crowns intended for forcing in boxes, pots, or in the Mushroom-house, should be taken up and laid in under a covering of litter, in readiness for use when required.

Rhubarb.—The roots should now be dug up, and some of them put into a warm place to force; or boxes and pots may be employed as in the case of Seakale.

Tarragon and Spearmint should be forced on a gentle bottom heat, planting the roots in wide pots or cutting-boxes. Let the supply of salading, such as Mustard, Cress, Chicory, Onions, be kept up by weekly sowing, &c.

THE APIARY

By EXPERT.

The Honey Harvest of 1899.—This was of a very jerky and uncertain order here this season. There were numerous spurts, but never a good flow. Frequent attacks of illness have prevented me from keeping a correct record of "takings," but the number of supers that have not been called into use make it evident that the quantity gathered is rather below the average. However, the whole of the season's produce is of good quality. We had no second crops of Clover within easy reach this year, and the small crops of

Sainfoin did not yield any honey through unsettled weather, so the season ended rather abruptly in this district; and even young queens are discontented with their maternal duties—the few I had came off at the usual time. I heard of quite a number of swarms in July; these issued from hives kept in districts where the Clover season failed, and while a considerable yield from the hives where the swarms issued was being stored. Regarding spring flowers, the White Thorn, Mustard, and Charlock, were so late that the bloom was on them when the flowers that produce honey of better quality opened in early June. The result of this blending of these honeys was that the early honey as usual with that from the White Thorn and Mustard is granulated in the comb very early after being gathered.

Wasps and Mice.—These pests are not quite so numerous as I expected them to be, a cold spring being favourable for them; but the humble-bees are more numerous than I ever remember having seen them before. There is a nest of hornets a mile from here. I had not, previous to this season, seen a hornet for twenty years. We have had quite a plague of mice for the last two months; I have not known them to be so numerous before, even in mid-winter. Quite early in August the mice were troublesome about the hives, making their nests among the coverings of temporary hives, and eating my Potatoes in the ground. Rats, too, are very troublesome here.

Winter Packing.—I have made it a rule for some years to get all my hives fed and packed for winter by the fourth week of September, with the best results; circumstances prevent me doing this now, but though the bees make the best of things as they find them, I am fully convinced that to get all preparations of winter completed early, helps the bees and reduces the amount of labour for them. When packed early, bees can propolise their coverings down, thus preventing draughts that any amount of packing later will not prevent. Of course, every reader has heard of the great results of early rest and early rising; the old and true saying is particularly applicable to bees minus any extension of wisdom. Good honey still on hand will increase in value. I know only too well how difficult it is to find store room for honey in small houses and cottages. Good run-honey in air-tight vessels will, if just placed in a frost-proof room, take care of itself. On the other hand, sections, and other comb-honey, require care all through. If no cupboard in the warmest room is available, a shelf may be fixed up in the warmest corner, the higher the better, and by doing the job neatly, the shelf may add to the nice appearance of the room. I have kept sections in fairly good condition on such a shelf for two or two-and-a-half years. Naphthaline, besides being useful in the hives as a preventive of foul brood, should be more generally used among the coverings, then we should not hear so much of the ravings of the wax-moth. I use naphthaline liberally when packing away surplus combs, and I like it among my clothing. By the way, I notice that naphthaline is being sold under another name in general shops and stores. We are told truly that the Rose if called by another name would smell just as sweet. Naphthaline, too, under another name will be useful.

CHRYSANTHEMUMS.—We do not anticipate that the Floral Committee or the National Chrysanthemum Society will be sufficiently advanced to place a high value upon certain Chrysanthemums sent us by Messrs. CANNELL & SONS. Nevertheless, there will be many who will prefer these oddities to the flaunting vulgarities of the exhibition-table, and will realise that for decorative purposes in small houses, they are likely to be more effective than the large-flowered varieties.

"Gold Faden," which being translated is Gold Thread, though not the same as our Gold thread. The flower-heads are 4 to 5 inches across; the ray florets yellow, thread-like, tubular; the disc florets almost normal.

Cannell's Favourite is a white seedling from Mrs. Filkin, a very pretty variety with flower-heads 3 to 4 inches across; florets snow-white, strap-shaped, narrow, lacinate at the tips.

White Thread.—Flower-heads 2½ to 3 inches across; florets strap-shaped, but so recurved at the margins as to be thread-like.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, Nov. 29. { National Chrysanthemum Society's Annual Dinner at Holborn Restaurant.

SALES.

MONDAY, Nov. 27, and the following Tuesday, Wednesday, Thursday, and Friday, Dutch Bulbs, at Protheroe & Morris' Rooms. Bulbs, &c., at Mr. Stevens' Rooms, King Street, Covent Garden, at 12.30 P.M.

WEDNESDAY, Nov. 29.—Sale of the Collection of Orchids, formed by S. Courtauld, Esq., deceased, at Bocking Place, Braintree, by order of the Executors, by Protheroe & Morris, at 12.30 P.M. (two days). Great Sale of Japanese Lilies, Continental Plants, &c., at Protheroe & Morris' Rooms. Roses, Shrubs, Plants, Roots, Bulbs, &c., at Mr. Stevens' Rooms.

FRIDAY, Dec. 1.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period November 12 to November 18, 1899. Height above sea-level 24 feet.

Remarks.—The weather has been dull and cold, with a dense, smoky fog on the 15th and 16th.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—41.4.

ACTUAL TEMPERATURES:—

LONDON.—November 22 (6 P.M.): Max. 51°; Min. 47°.

Dull—wind W.N.W., light.

PROVINCES.—November 22 (6 P.M.): Max. 50°, west Ireland; Min. 46°, north-east Scotland.

AT various intervals during the past four or five years reports have been published in these columns relating to a series of most interesting experiments conducted by M. LUCIEN DANIEL, who, with other workers on this subject, has shown that the old theories of the science of grafting contained many fallacies. On this occasion a short reference will be made to the successful graft of monocotyledonous plants; an operation which has hitherto been supposed to be an impossibility.

It is well known that in order to ensure the union of the scion and the stock, it is necessary that the living tissue of both parts should be intimately connected. By this means the nutrition of the grafted plant becomes possible through the process of osmosis, and perhaps by continuity of the protoplasm; and the stock which extracts nourishment from the soil through its roots passes it on to the scion. The reproduction of living cells, whereby the intimate union is effected, takes place in the cambium, and in the medullary rays, which, in certain cases, play a secondary part in this connection. The graft of dicotyledonous plants is, consequently, a comparatively easy matter, because their cambium layer is continuous and well defined, in contradistinction to monocotyledons, where the generative zone lies isolated in each fibro-vascular bundle. It is indeed owing to this peculiar anatomical structure, which affords only a slender chance for the agglutination of the dissected parts, that the union of monocotyledonous plants has hitherto been considered impossible.

The experiment now under consideration is the outcome of laborious and thoughtful work, extending over many years, but which has yielded definite results during the past summer. In the complete report which has recently been presented to the French Académie des Sciences, * M. DANIEL states that the graft of the class of plants in question was attempted at a very early period, and he refers to a system adopted by the ancient Greek gardeners, who appear to have considered that they had solved the problem. This method of THEOPHRASTUS was, however, what, in common parlance, would be called a "fraud," inasmuch as it bore no relation whatever to the graft, but consisted merely in placing seed, such as Wheat, within a tuber or root. Germination took place naturally, if there was a sufficient amount of moisture; but there was never a trace of physiological union between the plants. Reference is also made to somewhat vague results reported by YSABEAU as regards grafting the Rice plant in Italy; and to DE CANDOLLE, who, in his *Physiologie Végétale*, published in 1832, gives an account of experiments made with a species of *Dracæna*, which, however, gave no satisfactory results. If, therefore, the labours of M. DANIEL have not been made on virgin soil, he claims that no previous worker in this special field of enquiry has even raised a crop, although he would be the last person to infer that his researches do more than indicate a bountiful harvest.

During the last few years M. DANIEL has on various occasions obtained complete union of the two lips of a comparatively deep, longitudinal incision in the stem of the Lily, Iris, Canna, *Funkia cordata* in the pseudo-bulb of Orchids of the genus *Lælia*, and even in the very young stem of a *Cryptogam*—*Selaginella arborea*. The healing of the wound in these cases led M. DANIEL to attempt the cleft-grafting of various monocotyledonous plants; but in spite of a clear, though limited, reunion of the parts, the plants did not live beyond a period of six weeks. The system of inarching, or grafting by approach, was also tried, with somewhat more satisfactory—but still unsuccessful—results in the case of different varieties of *Caladium*. He therefore came to the conclusion that neither of the above-mentioned methods of grafting was likely to succeed, on account of the insufficient means of communication of the sap between the stock

and scion. In order, therefore, to increase the surface in contact, he tried the splice-graft, and cut the stem as obliquely as possible, and very nearly at its apex, where the scion from the same plant was replaced and ligatured very firmly. The experiment was tried, firstly, with a *Vanilla*, which is a small genus of climbing Orchids belonging to the order *Arethuseæ*, and the only one which possesses any economic value, the fruit of several species producing the "vanilla" which is largely employed to flavour confectionery. In the second instance, a *Philodendron* was selected, a genus of tropical American plants of the family *Aracææ*, which attach themselves to the trunks of trees, and hence their name.

The operation was made during the month of May last, and the union of the grafts in question is now quite complete, and not only have the internodes of the scion elongated, but new leaves have appeared, and in one case, aerial roots have been developed. The presence of these roots is interesting, and they are regarded as a confirmatory proof of success, inasmuch as the *Philodendron* bears two kinds of roots, viz: those which extract nourishment from the soil, and others which draw moisture from the atmosphere.

The graft in question, where the cut portion of the plant was replaced *in situ*, is a true graft since there has been complete re-union of the parts, and subsequent movement of sap therein, and M. DANIEL classifies it as a variety of the "mixed graft," which is the term applied to the system whereby curious physiological results are obtained when some of the leaves are allowed to remain on the scion and on the stock. This method has already been fully explained in this journal; * but in connection with monocotyledonous plants, which include so many flowers, it will be of interest to repeat in general terms that those phenomena which may be considered to be due to variation in the surrounding conditions, such as size and vigour of the plant, are less marked by the "mixed graft," which however should be employed when it is desired to obtain new varieties possessing certain characteristics, such as the shape of the fruit and the colour of the flowers.

M. DANIEL, therefore, concludes that the results obtained with *Vanilla* and *Philodendron* are an indication that the graft of monocotyledonous plants can no longer be considered impracticable, and that its success merely depends on the extent of the surfaces in contact, on the system of grafting which is employed, and on the nature of the plants.

We shall probably shortly refer at greater length to M. DANIEL's interesting experiments.

NERINE "MISS WILMOTT."—Mr. H. J. ELWES, Colesborne, Andoversford, Gloucestershire, is well qualified to be placed first among the hybridists who are now turning their attention to the improvement of that beautiful class of *Amaryllids*—the *Nerines*, fine groups of which he has been in the habit of staging at the winter shows of the Royal Horticultural Society for some years past; each successive year marking the improvement he has made, and especially in the matter of the flowers being produced at the same time as the leaves, a point which Mr. ELWES takes much pains to secure, and thus to avoid the one reproach of the earlier-flowering species of the *N. Sarniensis* class, which usually are leafless when the flowers are produced. Our illustration (fig. 128), represents one of the finest of the new hybrids in the group

* *Comptes Rendus*, vol. cxxix., p. 654.

* *Gardeners' Chronicle*, 1898, I., p. 84.

exhibited by Mr. ELWES at the Royal Horticultural Society on November 7 last. The flowers of N. "Miss Wilmott" were of a deep, soft scarlet. Others varied from pale pink to scarlet. N. Mrs. Godman being purplish-rose, and N. Mrs. Berkeley light orange-red.

INTERNATIONAL HORTICULTURAL CONGRESS IN PARIS.—An International Horticultural Congress will be held in Paris on May 25 and 26, 1900. The programme and rules can be obtained from the General Secretary of the Organisation Committee,

—nearly seventy years ago—the above-named journal says, that "few plants can, in autumn, compete with Chrysanthemums, whose belated flowers brave the first frosts, and form the last ornaments of our flower-beds."

REV. W. COLENSO.—This gentleman, mentioned in an article in our last issue on "Pittosporums" was not, as was stated, a forest officer, but he was a well known botanist, who, in the intervals of his work as a clergyman, made many valuable contributions to the botany of New Zea-

lating among country folk in Austria, Simon's Plum is at once an ornamental and a useful plant. The tree resembles a Peach or an Almond, and the fruit is large, red-coloured, with a pleasant aroma. It is ripe in September. If the plant will ripen its fruits in this country, as it might do in the south, it would form a nice addition to our autumnal fruits.]

"ICONES SELECTÆ HORTI THENENSIS."—Under this name the first of a series of descriptions and illustrations of plants that have flowered in the garden of M. VAN DEN BOSSCHE at Tirlemont,

FIG. 128.—NERINE "MISS WILMOTT"; FLOWERS ORANGE-SCARLET. (SEE P. 398.)

84, Rue de Grenelle, Paris, and they will later on be published also in the *Journal de la Société Nationale d'Horticulture de France*.

HOW TO DWARF CHRYSANTHEMUMS.—For some years pots of very dwarf Chrysanthemums have frequently been seen, the little plants having been obtained from making a cutting of the tips of branches already plentifully provided with buds. M. L. HENRY, who, at the Museum (Paris), began to apply this process fifteen years ago, has lately found in the *Journal de l'Académie d'Horticulture* (Le Jardin, p. 294), that in 1833 this way of taking cuttings was known, and even then considered old-fashioned. Even at that time

land, and contributed very largely to our knowledge of the flora of those islands. He acquired, moreover, a full acquaintance with the Maori language, and was the recognised authority on that subject. His death, at an advanced age, was recently announced.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, November 27, 1899, when a paper will be read by Mr. P. E. PILDITCH (Fellow), entitled "Party Walls under the London Building Act, 1894." The chair will be taken at 8 o'clock.

PRUNUS SIMONI.—According to the *Illustrirte Nützlicheblüthen*, a useful little publication circu-

in Belgium, has been published (Veuve MONNOM, Brussels). The work is in large 8vo, and the author has secured the assistance of DR. DE WILDEMAN, of the Brussels Botanic Garden, in the preparation of the work, and of J. M. D'APREVAL in the execution of the plates. The work will comprise not only species not previously described or figured, but also others imperfectly recorded at a more or less distant date. The plants illustrated in the present number are:—*Hakea suaveolens*, R. Brown, tab. 1, a species much cultivated in the south of France; *Trymalium Billardieri*, Fenzl, tab. 2, a Rhamnaceous plant; *Muraltia mixta*, D. C., tab. 3, the *Polygala mixta* of *Bot. Mag.*, tab. 1714; *Agathosma villosa*, Willdenow, tab. 4,

the *Diosma hirta* of the *Bot. Reg.*, tab. 369. It seems that the oldest generic name is *Hartogia*, of LINNÆUS, but if that appellation were adopted it would result in the debaptising of all the species, and the creation of an equal number of synonyms. Prof. ENGLER, following SONDER, has therefore very judiciously retained the generally accepted name to which all the literature refers, and Dr. DE WILDEMAN follows suit; and *Oxalis Ortgiesii*, Regel, tab. 5. The annotations are likely to be very serviceable, and the illustrations are not only excellent but useful also, two qualities which by no means always co-exist in so-called botanical plates. We note with pleasure that M. VAN DEN BOSSCHE has abundant materials in hand, and he may be assured that he will render great service to science by continuing their publication in the way he has begun.

THE DORPAT STOCK FOR THE ROSE.—The above variety, a cross between *Rosa Canina* and *R. cinnamomea*, is highly thought of as a stock for most varieties of the Rose. The plant grows of a regular strength from root to crown, erect, pliable, with a green, smooth, sappy rind; the thorns are weak, and come in pairs sparsely on the branches, either obliquely over or near each other. *Rosenzeitung* for October, 1899.

MESSRS. HARRISON'S VEGETABLE SHOW.—Messrs. Harrison & Sons, nurserymen, of Leicester, who hold an annual show of vegetables and roots at their Welford Road branch nursery, were enabled, by reason of the liberal prizes which they offer, to obtain a considerable number of competitors in the various classes, the quality of whose exhibits was excellent. The roots of all kinds were of especial good quality.

ROSES.—The National Rose Society has issued a fourth edition of their descriptive catalogue of exhibition and garden Roses. It is, for all practical purposes, an entirely new catalogue. About eighty-eight hybrid perpetuals are enumerated among the kinds suitable for the exhibition-table, together with fourteen hybrid Teas and forty-four Teas and Noisettes. In addition there are lists of so-called "garden" Roses, summer-flowering and other, some of which are quite equal in beauty to the exhibition varieties, and for the most part more interesting. Altogether there are upwards of 370 varieties brought under the notice of the rosarian for some reason or other—surely, an ample selection.

PLANTS RECEIVED.—*Anne Pratt's Flowering-plants* (F. Warne & Co., Bedford Street, Strand), vol. iii., Nos. 22 and 23.—*Banks and their Customers* (London: Elingham Wilson, Royal Exchange, E.C.) "A practical guide for all who keep banking accounts, from the customers' point of view." This contains some helpful hints for those to whom the management of a banking account is a mystery. Some of the information given is anything but complimentary to the banks, and not encouraging to timid customers.—*Nature Notes*, November.—*Nuovo Giornale Botanico Italiano*, Florence, vol. vi., No. 4, October, 1899.—*Bullettino della Società Botanica Italiana*, Florence, Nos. 7 and 8, September, October, 1899.—*The Agricultural Gazette of New South Wales*, October, 1899. By authority. Sydney, W. A. Gullick, Government Printer.—*Queensland Agricultural Journal*, vol. v., part iv., October, 1899. Brisbane, Edmund Gregory, Government Printer.—*Botanisches Centralblatt*, edited by Dr. Oscar Uhlworm, in Cassel, and Dr. F. G. Kohl, in Marburg.—*Gartenflora*, No. 22, edited by Dr. L. Wittmack; published at the Library zur Beförderung der Gartenbaues inden Preussischen Staaten, N., Invaliden Strasse, No. 41, Berlin; and by Paul Parey, Berlin.—*Botanische Zeitung*, edited by Graf zu Salm-Laubach, Frederick Oltmanns, No. xi., November, i. and ii. parts; Arthur Felix, Leipzig.—*The Case Law of the Workmen's Compensation Act, 1897*. Intended to supplement Part III. of *Accidents to Workmen*. By R. M. Minton-Senhouse. (London: Elingham Wilson, Royal Exchange, E.C.; Sweet & Maxwell, Ltd., Chancery Lane, W.C.)—*The Utility of Sulphate of Ammonia in Agriculture*, by James Muir, M.R.A.C. (Published by the Sulphate of Ammonia Committee, at No. 4, Fenchurch Avenue, London, E.C.) "Sulphate of ammonia is a nitrogenous manure, and must be considered as a source of nitrogen only. . . . Nitrogenous manures cause larger leaf growth, increased chlorophyll formation, slower maturity, and increased crops generally." Such is, in brief, the conclusion arrived at by the author of the Essay before us.—*Abrégé de la Petite Flore de Belgique*, par Alfred Cogniaux. (Bruxelles: Société Belge d'éditions; Ancienne Maison H. Manceaux, à Mons, 3, Rue des Minimes.) A valuable handbook; "destiné aux élèves des écoles primaires et moyennes,"

Fourth edition, with many illustrations.—*Algunos Casos de Teratología Vegetal, Fasciación, Proliferación y Sinantía*, por Angel Gallardo. (Buenos Aires: Reprinted from the *Anales del Museo Nacional*, vol. vi.)—From the U.S. Department of Agriculture, Division of Soils. Bulletin No. 9. *Soil Moisture: a record of the amount of water contained in soils during the crop season of 1898*. By Milton Whitney and Ralph S. Hosmer; and Bulletin No. 15. *Electrical Instruments for Determining the Moisture, Temperature, and Soluble Salt Contents of Soils*. By Lyman J. Briggs. Also Report No. 60. *Temperature Changes in Fermenting Piles of Cigar-leaf Tobacco*. By Milton Whitney and Thos. H. Means.

HOME CORRESPONDENCE.

THE SONG-THRUSH AND BLACKBIRD.—I was very pleased to read Mr. Harrison Weir's and Mr. Hart's good opinion of the song-thrush, which is one of the best friends the gardener has. I have watched them closely for over twenty years, and they are plentiful here, as are also blackbirds, and but for the latter we need not eat any fruits excepting Red Currants, of which the thrush is very partial; but I do not grudge them these fruits. The only other fruit I know them to be fond of, are Yew-tree berries, and I have often seen them among the Strawberries devouring slugs, but leaving the fruit untouched. The blackbird, on the contrary, will have nothing else but fruit while it is to be had, and even when hard pressed for food, I have not known it to take slugs, but it is partial to worms. I do not allow the thrushes to be destroyed, which may account for the large number of them at this place. In severe weather the thrush is one of the first birds to suffer simply for want of animal food. *Fredk. Bedford, Straffan House, Co. Kildare.*

EEL-WORMS.—These pests seem to baffle all remedies that have been brought to destroy them—for what will kill them will also injure any future crops for a time that may be put on to the land. Gas-lime will destroy eel-worms, but it must be used in such quantities that the after-crops suffer. Salt water and ammoniacal gas-water will do the same. When the late Mr. John Monro lived at the Potter's Bar Nursery, he bought a large quantity of soil, in which to grow Cucumbers, &c.; but he found it so full of the eel-worms, that he constructed a temporary furnace, with an iron tank over it, to char the soil, or, at least, to make it hot enough to destroy them. Of course it was an expensive job, but, as the soil had been carted there, it was cheaper to char it than to cart it back again. There is a field about four acres near where I reside, swarming with these pests; and the ground, which will be used as a market-garden, has been dug over, and thousands of these worms picked up [?]; but it seems a case of millions, and it would be a very expensive job to burn the whole of the soil. This appears the only way of exterminating them without injuring the ground for future crops. Can any reader of this journal suggest a better and more certain remedy? *Edward Bennett, Ash Vale, Farnborough.* [Deprive them of their food, i.e., the roots of living plants, by ploughing and fallowing the field for a year, after dressing it with quick or gas-lime, keeping it clean by the horse-hoe meanwhile. What our correspondent picked up cannot have been eel-worms, which are of microscopic dimensions. Ed.]

FRUIT-TREES ON GARDEN-WALLS.—In these days of enlightened fruit-culture we see many of the garden walls in the colder parts of the country occupied with varieties of Pears, not to mention Peaches, which seldom produce a fruit worth eating, either raw or cooked. The Pears are, as a rule, small and sometimes deformed, and if not small for the variety, at least they do not approach to anything like the flavour of the variety as grown in a suitable climate. It is only in very favourable districts in Scotland that the ordinary class of Pears is worth growing at all; and as for Peaches, it is remarkable that practical gardeners will try a tree or two, where it is a foregone conclusion that it is impossible to get a passable flavour in the fruits. Of course, gardeners are not always to blame; as some employers may infer, because they have seen or tasted fruit grown in some other place, and they imagine that their own garden fruit should be equally good as that which is grown in a more suitable locality. Many of the garden walls in Scotland and the colder districts of England now occupied by varieties of the Pear, needing more warmth than the climate affords,

could be more profitably planted with trees of certain varieties of the Apple, and of free-setting Plums. If Apples were planted on warm walls, they would be more acceptable than inferior Pears and Peaches. Of course, in cold situations and on north and east aspects, Morello Cherries, Gooseberries, and Red and White Currants succeed to perfection, and continue to hang for a long time after being ripe, if sufficiently protected from birds. But it is not of cold aspects particularly that I write this note, as they are, as a rule, very well cropped, but to draw attention at this season to the enormous waste of time and valuable space on south and west walls which we see in so many gardens in Scotland and the colder districts of England. *R. T. S.*

THE GROWING OF MUSHROOMS AT LEITH.—The *Scotsman* of Friday, November 15, reports as follows:—"The Public Committee of the Leith Town Council had under consideration yesterday afternoon a report by Dr. Mackenzie on three Mushroom-beds in old wine-cellars within the burgh, which he considered detrimental to the health of the community. The committee agreed to recommend the Council to order the owner to have the beds discontinued." This seems a pity. Those of us who know anything of the raising of Mushrooms artificially, are aware that the esculent can be grown almost anywhere without creating the slightest nuisance. [We quite agree with the Town Council in suppressing the growing of Mushrooms in cellars in the basement of houses, especially when the entrance to such places is inside the dwelling. Ed.] It seems a pity the Leith Town Council were not content with ordering the abatement of the nuisance, instead of putting a stop to a profitable home industry. And if Mushrooms may not be grown in cellars, why not also forbid the use of kitchens for growing them, or forbid the use of plants in apartments, window-gardens, or even in town gardens or other spaces within the precincts of the burgh? The Leith Town Council do not seem to be aware that the raw material for Mushrooms should be prepared and sweetened in the open air, or an open shed. [This very act of preparation is a nuisance in confined spaces in towns. Ed.] The spawn is clean and dry, with a faint odour of the Mushroom. Finally, the whole is "cased"—that is, it is firmly covered over with an inch or so of the purest earth or loam, which is virtually impervious to the passage from insanitary vapours from the beds to the cellar, and so to the other parts of the dwelling. Had the Leith Town Council called in experts before suppressing the rising home industry of Mushroom-growing in cellars, they might have learned that the dream of sanguine botanists is, that growers may soon dispense with their nucleus of decomposition, and the Mayor and Corporation each grow their own Mushrooms raised from spores on damp glass under their own tables. *D. T. F.*

PEACHES AND NECTARINES ON WEST WALLS.—Your correspondent, *H. T. M.*, on p. 330, in writing of that valuable Plum, Cox's Golden Drop, speaks somewhat despairingly of the Peach when grown on a west wall, telling us they rarely succeed. At what degree of N. latitude the Peach fails on that aspect I am unable to say, but I know that about London the Peach thrives and ripens its fruits on west and nearly due east aspects. From both of these aspects I have seen and had, in other gardens, regular annual crops of large, highly-flavoured fruits; and the leaves have been large, leathery, and free from insect-pests, more so than those growing on a south aspect. I am, this year, planting several trees on a west wall, of the following varieties: Waterloo, Hale's Early, Early Alfred, Grosse Mignonne, Dymond, Royal George, Bellegarde, Stirling Castle, Violette Hative, Sea Eagle, and Princess of Wales. The border will be thoroughly trenched, and a large quantity of fresh loam, mortar-rubbish, &c., added to the staple. *H. Markham, Wrotham Park Gardens, Barnet.*

THE PEOPLE'S PALACE.—As Treasurer of the People's Palace Horticultural Society, I venture to bring before you our work and necessities. The society has now been established for seven years, and has held, with unvarying success, exhibitions in the spring, summer, and autumn at the People's Palace, Mile End Road, London, E. We have recently established a children's section to interest the children of East London in the cultivation of flowers, by giving prizes for plants grown in their homes, and by lectures and practical demonstrations in the simplest elements of horticulture. The

gardens of members are visited (where such exist), and prizes are given for excellence in this department, in addition to those offered at the shows of the society. The additional expenses oblige the society to appeal for financial help. The subscriptions of the working-men and women members, which are very small, need to be supplemented by help from others, who have at heart the interest of spreading a love of flowers amongst the people of East London. I shall be glad to acknowledge the receipt of all subscriptions sent to me at the Anchor Brewery, Mile End Road. *Arthur F. Charrington, Hon. Treasurer.*

ABNORMAL GROWTH OF FLOWER-SPIKES OF ODONTOGLOSSUM CRISPUM.—It may interest your correspondent "F. E. H.," who enquires in your last issue about *Odontoglossum crispum* producing spikes on the top of the pseudo-bulb, to know that I have at least a dozen plants doing this at the

throughout, as although it may ripen near the stalk, it will be unripe at the apex. Planters would do well to remember that in our erratic climate the summer warmth is not always equal to or anything near that of the last few years. I would as soon think of planting Reine Claude de Bavay in the open, except in southern shires, as Golden Drop, and for the same reason. As regards the stalks of Plums gathered for keeping, of what consequence is it, if they are cut through with a pair of scissors or with a knife, except that in the case of Plums which have to be suspended by a thread, the swelling at the base of the stalk prevents the thread slipping off the dried-up stalk. I have kept Coe's Golden Drop for a period of three or four weeks, but never for six months; nor is it possible to keep that variety, or Ickworth, Imperatrice, or the Winesour Plums much longer, unless they are stoved—that is, converted into Prunes as we see them in the shops. *Greengage.*

FIG. 129.—ZYGOPETALUM GAIRIANUM.

(Shown by Frau Ida Brandt at the Royal Horticultural Society's Meeting, November 21, 1899.)

present time. In every case it is obviously the result of extra vigour in the plant, as they are produced on very large pseudo-bulbs, and in addition to a normal spike at the side; so that it is not always due to injury or a check to the plant. One bulb is producing no less than four spikes at the top of the bulb, besides a side spike. I have another plant of *Odontoglossum crispum* bearing a spike with six side branches, and an aggregate of thirty-seven buds. *R. W. Rickards, Usk.*

GOLDEN DROP PLUM.—Mr. Fish's statements (p. 380) concerning Coe's Golden Drop Plum are in some cases so remarkable that I, and doubtless others, would be glad if Mr. Fish would name some gardens where, for example, the variety is grown on a north or northerly aspect, and as a bush or other shape in the open quarter. My own experience has taught me that if you would have Coe's Golden Drop Plum in the finest condition, it must be afforded the warmth of a south, east, or west wall, according to the latitude of the place, and even on west and east walls in the colder parts of the country it takes a long time to ripen

WEEDS IN PONDS.—I think the weed to which Mr. Warren refers in his letter, which appeared in the *Gard. Chron.*, p. 381, is the same as that which gives some trouble in my small pond, but which has some compensating value. I find that, though unsightly unless kept in bounds, it serves the useful purpose of keeping the water pure, and in a suitable condition for the gold-fish in the pond. The weed is most troublesome in hot weather, when it grows rapidly and rises to the surface almost daily. I remove a part of what rises to the surface frequently, but do not think of taking it all away, or the water, which has no outlet, would not remain clear. When the little pond has to be emptied, it is apt to become a trifle stagnant before this pond-weed appears, and the gold-fish are placed elsewhere until the water becomes pure again. I think Mr. Warren will do well to confine himself to removing a portion of the weed only. *S. Arnott, Carsethorn, by Dumfries, N.B.* [The weed is a *Conferva*; and we do not think Mr. Warren will be able to remove more than a portion. *Ed.*]

ZYGOPETALUM GAIRIANUM.

THIS beautiful species was described by the late Professor Reichenbach as *Pescatorea Gairiana* in the *Gardeners' Chronicle*, 1879, i., p. 684, from a plant purchased by the late Mr. Gair of Falkirk in 1876 as *Bollea celestis*.

But little has been heard of the species since until now, when a flower and photo (fig. 129) of a plant received from Consul F. C. Lehmann, and which evidently is the same thing, is kindly sent by Frau Ida Brandt, Brummenhof, Riesbach, Zurich (gr., Mr. Schlecht), from whose interesting collection many pretty and rare species are often shown at the meetings of the Royal Horticultural Society.

The flower is violet-coloured, the outer halves of the sepals and petals being as described by Professor Reichenbach—deep black-purple! The lip, with its fifteen to seventeen keels, also exactly answers the description, the ground-colour being yellowish, the more conspicuous ridges and protuberances being reddish-rose; the column is violet-coloured; the area at the base, yellowish, with a few purple spots.

It is a very striking flower, and very distinct from any others. *J. O'B.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 21.—The usual fortnightly meeting of the Committees of this society was held on Tuesday last, in the Drill Hall, James Street, Westminster. The weather was not favourable, the light being very poor owing to the presence of fog. There was a very satisfactory display of exhibits, several of the collections were large, though the number of exhibitors was probably fewer than usual. The display of Orchids was better than the date of the season would have led one to expect, and this Committee recommended four Awards of Merit to the following:—*Cattleya vestalis*, *Cypripedium* × *Milo*, *Cattleya* × *Mrs. J. W. Whiteley*, and *Odontoglossum Leochristyense* "Canary Bird."

THE FLORAL COMMITTEE had before it some very bright collections of autumn and winter-flowering plants and of cut flowers. The winter-flowering Begonias of the *B. socotrana* strain, from Messrs. JAS. VEITCH & SONS, attracted much attention, and demonstrated the value of the plants at this period. Captain HOLFORD made a display of zonal Pelargoniums in pots, that were so abundantly flowered as to furnish an exceedingly gay and bright picture. Chrysanthemums which have constituted a feature at several preceding meetings were again exhibited in considerable quantity, and it is noteworthy that the three best collections of blooms were shown from private establishments. Mr. LEES' exhibit from the garden of F. A. BEVAN, Esq., that so well illustrated how to use the large flowers to secure the best decorative effect, was deservedly awarded a Gold Medal.

Cyclamens were shown by Messrs. HUGH LOW & CO., Clapton; Poinsettias by T. CRITES & SON, Tunbridge Wells; and Ferns by Messrs. HILL & SONS. Awards of Merit were recommended by the Floral Committee to *Begonia Sylvia*, and *Cordylone The Queen*, from Messrs. JAS. VEITCH & SONS; *Pelargonium Lilian* from Capt. HOLFORD, and *Chrysanthemum Mrs. Alfred Tate* from F. A. BEVAN, Esq.

The Fruit and Vegetable Committee recommended Awards of Merit to Apple Bassaleg Pippin, from Mr. J. BASHAM; and Siewing Pear Double de Guerre, from Mr. FRANK LLOYD. Mr. BASHAM, who delivered a lecture upon fruit cultivation in South Wales, showed a collection of about 200 dishes of Apples from Monmouthshire. Messrs. JOHN LAING & SONS also had a collection of fruits.

Floral Committee.

Present: W. Marshall, Esq. (in the Chair); and Messrs. Chas. O. Shea, Chas. T. Druery, H. B. May, W. Howe, R. Dean, Jas. Hudson, Jno. Jennings, J. F. McLeod, Thos. Peel, C. R. Fielder, J. Fraser, J. D. Pawle, Chas. E. Pearson, E. J. Jenkins, D. B. Crane, Harry Turner, Ed. Mawley, Chas. Jeffries, and E. T. Cook.

Winter-flowering Begonias were a fine feature from Messrs. JAS. VEITCH & SON, Royal Exotic Nurseries, King's Road, Chelsea, who had a collection of 300 plants in bloom, that filled more than one side of a large table running lengthways along the hall. The six varieties shown were all belonging to a strain that has resulted from crossing *B. socotrana* with varieties of the tuberous-rooted section. Mrs. HEAL, the best of the single-flowered varieties, was illustrated in *Gardeners' Chronicle*, Nov. 16, 1895, p. 585; Myra is also a good single variety with large flowers, and especially suitable for cultivating in baskets. John Heal, another single one, is better known; the flowers are small, very abundant, and the habit of the plants dwarfer and more

compact. Of semi-double varieties, Winter Cheer is a splendid winter-flowering plant, and the brightest of them all. Ensign is quite of a different shade of carmine, lighter, but very valuable. A new one named Sylvia is described under "Awards" (Gold Medal).

Messrs. J. HILL & SONS, Barrowfield Nurseries, Lower Edmonton, staged a group of Ferns, in which were fine examples of *Adiantum decorum magnificum*, A. Faulkneri, a most light and elegant variety, suggestive of A. gracillimum; A. elegantissimum, A. Williamsii; also several choice forms of *Gymnogramma*, including G. schizophylla gloriosa, G. Wettenthaliana, a silver-coloured form; G. calomelanos, G. Veitchii, &c. *Brainea insignis* was represented by a nice specimen, also *Davallia parvula*, *Lomaria gibba*, *Adiantum radiatum*, &c. A specimen in a basket of *Aglaomorpha Meyeriana*, with fertile pinnae at the end of the fronds, was most interesting (Silver Flora Medal).

A group of *Cyclamens* in pots came from Messrs. HUGH LOW & CO., Clapton, and Bush Hill Park Nurseries, Enfield. Several varieties with crested flowers were included. Bush Hill Pioneer, some with white and others with red flowers, more particularly showed the crest, and the type was figured in these pages Jan. 30, 1897, p. 70. The ordinary florists' varieties were exhibited in various colours, and a variety with flowers having ten petals was named Low's New Double (Silver Banksian Medal).

Zonal *Pelargoniums* in winter are always more appreciated than at any other season. A magnificent exhibit of plants in pots was made by Captain HOLFORD, Westonbirt, Tetbury, gr. Mr. A. Chapman. The plants were abundantly flowered, and gave a gay effect. Of varieties, the following scarlets were noticed:—Athlete, Hall Caine, Jno. Milton, Eleanor, and Millar's Favorite; the last named variety having paler, almost white, centre. *Crimsons*—Paul Campbell, and Mrs. E. Rowson. *Pinks*—Lady Chesterfield, Chaucer, Ian MacLaren, Lady Newton, Mrs. Simpson, and Golden Mrs. Lunzie. The following were good white, or nearly white varieties:—Dr. Nansen, H. de Percival, Madame Rozaine, and Agnes (Silver-gilt Floral Medal).

An excellent group of *Poinsettias* was shown by Messrs. THOS. CRIPPS & SON, Tunbridge Wells. The plants were about 3 feet high, clothed with splendid foliage to the base. There were forty-eight plants, and the developed bracts were large and brilliantly coloured (Silver Flora Medal).

Mr. J. T. BENNETT-POE, Homewood, Cheshunt, showed a spike containing six flowers of *Hippeastrum*, Mrs. Garfield. The flowers had rather long slender tubes and expanding segments, colour white, very prettily veined with red. Also some very fine specimens of *Pinguicula candata* in flower, for which the committee's Cultural Commendation was awarded.

A magnificent inflorescence of *Fatsia japonica* was brought by the superintendent, Mr. WRIGHT, from the society's gardens at Chiswick.

Messrs. F. SANDER & CO., St. Albans, again exhibited plants of *Dracæna Godsefiana*, D. Sanderiana, and of the two elegant Palms, *Kentia Sanderiana* and *Linosydis Patrickiana*. The last-named species carrying a lately-developed leaf, red-coloured, had a very pretty effect.

Fine branches of the exceedingly pretty and useful winter-flowering shrub *Arbutus Unedo* Croomi, in full flower, were shown by Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, Chelsea.

Beautiful plumes of *Gynurium argenteum* variety, Louis Carrière, were shown by Messrs. GEO. BUNYARD & CO., Maidstone. It is a pinkish-coloured variety.

CHRYSANTHEMUMS.

The premier award of a Gold Medal was awarded to an excellent exhibit of cut *Chrysanthemums* shown by Mr. W. H. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet. Mr. Lees has exhibited *Chrysanthemums* in show boxes on very many occasions with credit to himself, and on Tuesday he showed that he thoroughly understands by what system, the large blooms he and other cultivators obtain, can be best displayed. His exhibit would have compared favourably with those of Mr. Davis and Mr. Jones at the Royal Aquarium a fortnight earlier, and was in much the same style. Tall, trumpet-shaped vases, with a few huge blooms of one variety only in each have a splendid effect, and the exhibition *Chrysanthemum* always appears more or less of a monstrosity except when so arranged. But if the vase be not crowded with blooms, and these be disposed with taste, they afford an effect that is charming, as bold, and in the decoration of a large structure become indispensable at this season. Mr. LEES'S blooms were magnificent, and some of the best were Oceana, M. Chénod de Leché, Reine d'Angleterre, Chas. Davis, Mrs. Mease, Madame Carnot, Mutual Friend, E. Moynaux, Emily Towers, H. J. Jones (a magnificent crimson Japanese, that appears to be best from a late bud), R. Hooper Pearson; and of incurveds, Queen of England and Empress of India. There were fancy baskets tastefully arranged with Pompons, singles and other lighter flowers, and autumn-tinted foliage, Ferns, and such suitable relief—altogether the exhibit was a most attractive one.

Mr. W. NEVILLE, gr. to F. W. FLIGHT, Esq., Cornstiles, Twyford, showed a collection of *Chrysanthemums*, including forty-eight incurveds, and thirty-six Japanese blooms of exhibition size (Silver-gilt Banksian Medal).

An exceedingly interesting exhibit was made by Mr. E. BECKETT, gr. to Lord ALDENHAM, Aldenham House, Elstree. He showed none but Pompons and Anemone Pompons. These thirty-six vases each contained a few blooms of a variety, all of which were very pretty. Such exhibits as this are very welcome at a time when the large Japanese varieties threaten to oust most of the other sections from the exhibitions and from gardens. Of the Pompons we noticed Marabout, Midle,

Martha, and Snowdrop, all white; Golden Midle. Martha Dolly, William Westlake, and Nellie Rainford, yellow; and the following coloured ones: President, Helene, Sunset, Cendrillon, Chas. Dickens, Scapion, Eleanore, and Black Douglas; and of the Anemone Pompons there were Emily Rowbottom, Marguerite de Coi, Mr. Astie (yellow), Miss Nightingale, Bessie Flight, Montel, Marie Stuart, and Antonius (Silver Floral Medal).

Another collection of *Chrysanthemum* blooms but with no names attached, came from Mr. W. J. GODFREY, Exmouth Nurseries, Devon, who had about sixty good Japanese blooms, and a number of bunches of decorative sorts (Silver Banksian Medal).

Mr. J. H. WITTY, Nunhead Cemetery, London, staged a small group of *Chrysanthemum* "What Ho!" a curious variety, figured recently in these pages.

Messrs. J. PEED & SON, Roupell Park Nurseries, Norwood Road, London, S.E., exhibited a group of *Chrysanthemums* in pots, arranged in the usual style of a half-circle against the wall (Silver Banksian Medal).

Awards.

Begonia Sylvia.—A winter-flowering variety from crosses between the B. eocetrana, and a tuberous-rooted variety. The flowers are rosy-carmine, semi-double, opening quite flat, and measuring more than 3 inches across. Like the rest of these varieties, it is an abundant bloomer. From Messrs. J. VEITCH & SONS (Award of Merit).

Chrysanthemum Mrs. Alfred Tate.—A flat-petalled Japanese variety, being a sport from Etoile de Lyon. Florets rather short, but numerous; colour reddish-orange. From Mr. LEES, gr. to Mr. F. A. BEVAN, Trent Park, Barnet (Award of Merit).

Cordylone (Dracæna) The Queen.—A narrow-leaved, ornamental foliage plant; the widest part of leaf being about 3-in. wide. The leaves gracefully arch upwards and downwards, and in a young state are green in centre, with pale red margins. Later, the green becomes deep bronzy-green, and the margins more narrowly deep red. From Messrs. JAS. VEITCH & SONS, Ltd. (Award of Merit).

Pelargonium Lilian.—A zonal variety, with moderately-sized flowers of clear pink colour. From Captain HOLFORD, Westonbirt (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. JAS. O'BRIEN (Hon. Sec.), J. Gurney-Fowler, De B. Crawshaw, Chas. Winn, J. Douglas, J. Jaques, E. Hill, J. Colman, F. J. Thorne, W. H. Young, H. J. Chapman, H. Little, F. Sander, T. W. Bond, E. Ashworth, A. H. Smee, and T. B. Haywood.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, staged a very remarkable group of plants, in which their hybrids of L. Perrini were a strong feature, and for which the uncommon honour of a Silver-gilt Flora Medal was accorded. Six plants of *Lælio-Cattleya* × *Decia* (L. Perrini × C. aurea) displayed a good show of their large rosy-lilac flowers; two L.-C. Lady Rothschild (L. Perrini × C. Warszewiczii), bore fine flowers, similar in shape to L.-C. × *Decia*, but larger and more delicately tinted; two L.-C. × *Statteriana* (L. Perrini × C. labiata) were pretty varieties; and plants of L.-C. × *Semiramis* and varieties (L. Perrini × C. Gaskelliana) and *Lælia* × *juvenilis* (L. Perrini × *pumila*), completed a set which well illustrated the good results of judicious crossing in securing plants with showy flowers which appear in the winter, and for that reason very desirable. Of equal utility at that season are the varieties of *Cattleya* *Bowringiana* crosses, well shown in the group by the pretty C. × *Ariel* (*Bowringiana* × *Gaskelliana*), with showy purple flowers; C. × *Portia* (*Bowringiana* × *labiata*), and C. × *Mantini* (*Bowringiana* × *aurea*). Other fine hybrids were *Lælio-Cattleya* × *Atlanta* (C. Warszewiczii × L.-C. × *elegans*); the richly-coloured L.-C. × *Dominiana* Langleyensis, and *Epidendrum* × *Endrose-Wallisii*. One end of the group consisted of rare *Cypripediums*, the fine yellow-flowered C. insigne Sandera being represented by eight good plants. There were also present C. × *marmorophyllum*, C. × *Prospero*, C. × *Acteus*, C. × *Niobe*, C. × *Tityus*, C. × *Euryades*, C. × *Enone*, some varieties of C. × *Arthurianum*, and the quaint-looking, distinct C. × *Enid*.

Captain HOLFORD, Westonbirt Tetbury (gr., Mr. A. Chapman) was awarded a Silver Flora Medal for a fine group of grandly-grown *Cypripediums*, in which the forms of C. insigne were well shown; amongst them the noble C. i. Harefield Hall variety, the largest known. The yellow varieties included C. i. Sandera, C. i. Dorothy, C. i. Ballia, C. i. Laura Kimball, and C. i. citrinum, all beautiful and distinct. The other forms were represented by C. i. biceps, C. i. Dormani, C. i. punctatum violaceum, &c.; and among others noted were C. × *Ashburtonia*, C. Charlesworthi magnificum, C. × *Niobe* magnificum, C. × *Tityus*, C. × *Arthurianum*, C. × *Buchananium*, C. × *Barteti*, C. × *cananthum* superbum, C. × *Pitcherianum*, "Williams" var.; C. × *Morganie* Burfordense, C. × *Leeaeum* giganteum, and other varieties.

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whiffen), was awarded a Silver Banksian Medal for a pretty group made up of fine varieties of *Cattleya labiata*, of which C. i. Mrs. John Bradshaw, a grand white, with slight pink tint on lip; and C. i. Gem, a richly tinted dark form, were the best. With them were three fine plants of *Cattleya* × *Mantini*, a well-flowered *Cattleya maxima*, C. × *Mrs. Astor* (C. Gaskelliana × L. xanthina), pale yellow, with dark rose front to the lip; *Cymbidium Tracyanum*, *Lælia autumnalis* alba, &c.

W. A. BILNEY, Esq., Fir Grange, Weybridge, showed a

collection of cut spikes of good forms of *Cattleya labiata*; a fine spike of *Vanda Sanderiana*, and one of a good variety of *Vanda cœrulea*.

Mr. ED. KROMER, Roraima Nursery, West Croydon, also showed a good collection of *Cattleya labiata*, including plants of two remarkable forms, viz., C. i. Kaiser Wilhelm II., a very dark flower of the C. i. Peetersiana class. The petals of this flower were of a claret-red hue with a lighter band running through the middle, the greater proportion of the area of the petals was of a claret-red hue, and possessed broad, irregular rose-coloured margin; lip crimson-purple, with orange markings at the base. The other was C. i. "Brazil," with a very distinct ruby-red lip, having white disc.

Messrs. HUGH LOW & CO., Enfield, staged a group, in the centre of which was a plant of the *Cypripedium* insigne Laura Kimball. The remainder of the group consisted of *Lælio-Cattleya* × *Nysa*, L.-C. × *Decia*, L.-C. × *Exoniensis*, *Cypripedium* × *Milo*, *Oncidium varicosum*, with four strong spikes; O. tigrinum, and a plant of *Cycnches chlorochilon*, with three female flowers.

R. ASHWORTH, Esq., Ashlands, Newchurch (gr., Mr. Pidsley), showed *Cattleya labiata* White Empress, a noble variety with large, pure white flowers, having a violet-purple blotch on the lip, and very closely resembling that shown at the last meeting as C. i. Gilmouria; also *Oncidium Forbesii*, and a dark mahogany-brown form of it named Ashlands' variety.

HENRY LITTLE, Esq., Barons Halt, Twickenham, showed *Cattleya maxima*, Little's var., a fine bluish-white flower, with a remarkable purple reticulation in the lip.

W. THOMPSON, Esq., Walton Grange, Stone (gr., Mr. Stevens), showed *Odontoglossum crispum* Meteor, a large and finely-shaped bluish-white flower, with a singular rose-coloured marking.

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, showed a number of baskets of well-grown varieties of *Cypripedium* insigne, C. *Specterianum*, and two baskets of *Masdevallia tovarensis*, covered with white flowers.

Frau IDA BRANDT, Riesbach, Zurich (gr., Mr. Schlecht), sent flowers of *Zygopetalum Gairianum*, dark blue, tipped with blackish-purple, see fig. 129, p. 401; and a peculiar form of *Z. Dayanum splendens*.

Awards of Merit.

Cattleya × *vestalis* (*Bowlingiana aurea* ♂, *maxima* ♀), from Messrs. JAS. VEITCH & SONS. Flowers in outline resembling C. maxima, but larger in all the parts, and especially in the broad, rounded, crimped labellum. Flowers, bluish-white or pale-pink; the labellum having a beautiful purplish-rose-veining merging towards the base into orange-coloured.

Cattleya × *Mrs. J. W. Whiteley* (*Bowlingiana* × *Hardyana Massiana*), from Sir JAMES MILLER, Bart., Manderston, Duns, N.B. (gr., Mr. J. Hamilton). A pretty hybrid with a general resemblance to C. × *Mantini*. Flowers, bright-rose; front of lip, bright rose-crimson, with a purple band between the front portion and the yellow disc.

Cypripedium × *Milo*, *Westonbirt* var. from Captain HOLFORD, Westonbirt, Tetbury (gr., Mr. A. Chapman). A grand form of the type which was obtained between C. insigne Chantini and C. × *cananthum* superbum. The glossy flowers had a rich, bronzy-purple shade, the white dorsal sepal flaked with rose and purple.

Odontoglossum × *Loochristianum*, "Canary Bird" (*crispum* × *triumphans*), from W. THOMPSON, Esq., Walton Grange (gr., Mr. W. Stevens). An elegant hybrid, with some resemblance to a light-coloured O. × *excellens*. Flowers with the sepals and petals canary-yellow, spotted with brown. Lip ovate, crimped, white, with brown markings and yellow crest.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. W. Wilks, John Basham, W. Poupart, Jas. Cheal, M. Gleeson, A. F. Berron, A. H. Pearson, Alex. Dean, S. Mortimer, J. W. Bates, C. Herrin, Geo. Wythes, S. Reynolds, F. Q. Lane, James Smith, Robt. Fife, Geo. Bunyard, and Jas. H. Veitch.

Messrs. JOHN LAING & SONS, Forest Hill Nurseries, London, S.E., showed a collection of excellent Apples, including about eighty dishes, besides two pretty stands upon which fruits were also displayed.

Messrs. HARRISON & SONS, Leicester, were awarded a Silver Banksian Medal for a collection of vegetables. In this exhibit was noticed excellent Leicester Hero and Lyon Leeks, Globe Onions; Windsor Castle, Motor, and Up-to-Date Potatoes, Intermediate and Early Market Carrots, &c.

Mr. Geo. Wythes, gr. to the Duke of NORTHUMBERLAND, Syon House Gardens, Brentford, showed roots of a red Beet, described as Barkham's Dwarf.

Very fine fruits of the Persimmon (*Diospyros Kaki*, figured in *Gardeners' Chronicle*, Feb. 7, 1891, p. 171), grown on a south wall in the open, were shown by Mr. T. Edington, gr. to Earl DUCIE, Tortworth Court, Falfield.

There were several Apples submitted to the Committee, but excepting the variety described in "Awards," these were passed.

Mr. BASHAM, Fair Oak Nurseries, Bassaleg, Newport, Monmouthshire, showed a splendid collection of Apples; such as, perhaps, few growers have ever put up at any show. We noted many of the present popular varieties, as Sandringham, Warner's King, Bismarck, Wellington, Anne Elizabeth, Catshead Codlin, Wealthy, Frogmore Prolific, Lord Grosvenor, Blenheim Orange Pippin, The Queen, and Hornmead's Pearmain.

He showed 100 dishes of distinct varieties from his own grounds, and an equal number collected from Monmouthshire gardens, which, taken as a whole, were the finer produce.

We noted numerous varieties, local and little known or

grown elsewhere, in Mr. BASHAM's fruit, which might, we think, be discarded by the trade without loss to growers. Much the better part of Mr. BASHAM's fruit consisted of the finer varieties, these being clear in the skin and high of colour generally. The whole of the fruit was uncommonly free from blemishes caused by fungus, which goes to show that the beneficial effects of anti-fungus dressings are well understood by the exhibitors, and that in all other respects the cultivation of Apples is well understood.

Mr. Basham stated in the lecture which he gave at three o'clock that the manure made use of in his orchards was from the stable and farmyard. An award of a Silver-gilt Knightian Medal was made.

Awards.

Apple Bassaleg Pippin.—Described as a dessert variety, deep and round in form, yellow striped with red, eye closed and shallow, stalk short and thick, very deeply inserted. Flesh juicy and crisp. The fruits exhibited were either consumed by the Committee, or removed immediately subsequent to that Committee rising. This does not afford to representatives of the Press the opportunity that should be given them to inspect new fruits certificated by the Committee. From Mr. W. J. BASHAM, Bassaleg, near Newport, Mon. (Award of Merit).

Fear Double de Guerre.—A culinary variety, with fruits somewhat like mammoth specimens of *Beurré Hardy*. From FRANK LLOYD, Esq., Coombe House, Croydon (Award of Merit).

Lecture.

FRUIT-GROWING IN SOUTH WALES.

In the afternoon a lecture describing some interesting features of fruit-cultivation in South Wales and Monmouthshire, but more particularly the latter county, was delivered by Mr. J. BASHAM, Bassaleg, near Newport, Mon. Mr. Basham is a practical fruit-grower, and latterly we have seen excellent collections of hardy fruits at the Crystal Palace and at the Drill Hall from his nurseries and market-garden. These, and the Gold Medal collection from the Hendre Gardens, Monmouth, the residence of Lord LLANGATTOCK, have proved that parts of Monmouth, at any rate, and especially the fertile valley of the Usk, are quite capable under skilful cultivation of producing fruits of first-class quality. But of the 228,603 acres under orchard cultivation in Great Britain (exclusive of small fruits) there are but 6515 acres so planted in the whole district of South Wales and Monmouthshire. There has, however, been an increase in Monmouthshire during the past year of 26 acres.

Mr. Basham in his paper described the principal orchards in the county, and had evidently been at considerable trouble to acquire the details, that, when published in the Royal Horticultural Society's *Journal*, should prove to be very interesting.

ISLE OF WIGHT.

NOVEMBER 7, 8.—The Undercliff Chrysanthemum Society held their fourth annual exhibition, at Ventnor, on the above dates.

The exhibits were not so numerous as on previous occasions, but the quality of exhibits exceeded expectations.

The principal prize-winners were—Mr. W. W. Sheath, gr. to Miss MITCHELL, Ventnor; Mr. F. Attrill, gr. to Miss Cass, Ventnor; Mr. W. Russell, gr. to Mr. COMBE, Bonchurch; Mr. W. Gee, gr. to Mr. C. H. CLOOTS, Ventnor; Mr. S. Prissall, gr. to Hon. Mrs. CECIL, Ryde; Mr. F. Woods, gr. to Mr. C. MORTIMER, Steephill Castle; Mr. A. Richards, gr. to Mr. JESSOP, Bonchurch; and Messrs. H. DROVER & SON, W. KINGSWELL, M. SILSBURY, R. JOLLIFFE, D. DAV, and S. SAMUEL.

The show was a great success, and reflected credit upon the energy of the honorary secretary (Mr. Wavell Knight) and a hard-working Committee.

DEVIZES CHRYSANTHEMUM SHOW.

NOVEMBER 14.—This show, which is always an attractive feature in the town, is associated with the Devizes Benevolent Society, one-half of the Corn Exchange being devoted to Chrysanthemums, and the other half to a bazaar, the proceeds of which are applied to benevolent purposes. Mr. THOMAS KINO, gr., Devizes Castle, carries out the arrangements in an admirable manner, and, given a fine day, the results are always very satisfactory.

There were but eight competitive classes in all, and the best exhibits came from Mr. H. Clack, gr. to C. E. COLSTON, Esq., Roundway Park, Devizes, who grows good plants, and arranges them with skill; Mr. T. Rumble, gr. to E. C. SCHOMBURG, Esq., Cliffe Hall, Market Lavington, was placed 2nd.

One of the leading classes for cut blooms was that for twenty-four incurved varieties, in which Mr. W. Higgs, gr. to J. B. HANKEY, Esq., Fetcham Park, Leatherhead, was 1st with well-developed examples, among others C. H. Curtis, Handwell Glory (a very useful variety with a future before it), Princess of Wales, Topaze Orientale, &c.; and Mr. F. G. FOSTER, nurseryman, Havant, was 2nd.

The 1st prize for twenty-four Japanese was a handsome Silver Cup, given by the ex-Mayor, and this was won by Mr. F. VALLIS, gr., Bromham Fruit Farm, Chippenhain, with a superb lot of blooms, chief among them Mrs. Mease, Le Grand Dragon, Mrs. Barkley, Mrs. Coombes, Mutual Friend, Phœbus, Madame Carnot, Edwin Molyneux, Chenon de Leche &c. Mr. C. J. SALTER was 2nd with similar varieties. Two

extra prizes were awarded, in addition to a 3rd, so good was the competition.

With twelve blooms of incurved Japanese, Messrs. VALLIS and SALTER were severally 1st and 2nd.

With twelve blooms of the old incurved type, Mr. SALTER came 1st; and Mr. W. Robinson, gr. to Lord LUDLOW, West, bury, was 2nd.

With twelve blooms of Japanese, in six varieties, open to exhibitors residing in Wiltshire, Mr. VALLIS took the 1st prize, Mr. ROBINSON coming 2nd.

Mr. C. J. SALTER, who is in the front rank of growers of Anemone-flowered Chrysanthemums, was 1st with twelve good blooms; and Mr. ROBINSON 2nd.

BASKETS of hardy annual flowers, with or without foliage, were, as usual, very numerous, and the display generally was in excellent taste. Ladies competed in this class. Miss BELL, Melksham, was 1st; and Miss BOOKER, Devizes, 2nd.

A Challenge Bowl, held for a year by the exhibitor gaining the greatest number of points, was awarded to Mr. C. J. SALTER.

BECCLES CHRYSANTHEMUM AND FLORICULTURAL.

NOVEMBER 14, 15.—The tenth annual show of the Beccles Chrysanthemum and Floricultural Society was held in the Town Hall on the above dates. The exhibition was throughout an excellent one, and the competition in most of the classes very close.

For plants in pots, E. MASTERS, Esq., secured premier honours in the classes for Japanese, incurved, reflexed, and Pompons. This is the tenth consecutive year in which Mr. Masters has taken first honours in the above classes. A. WOODS, Esq., took the 2nd prizes in the same classes. Mr. MASTERS was also awarded the 1st prize for a single plant—a fine Vivid Morel.

The cut-blooms in the open classes were a choice lot. For twenty-four Japanese, Sir R. BEAUCHAMP, Langley Park (gr., Mr. Jeffreys), took the 1st prize; H. SMITH, Esq., Ellingham Hall, a close 2nd; Miss FOWLER, Lowestoft, 3rd.

The best twelve Japanese blooms were shown by Colonel EASTON, Holton Hall; and E. MASTERS, Esq., was 2nd. Mr. J. C. SHARPIN, an enthusiastic local amateur, took the 1st prize for half-a-dozen fine blooms.

The best twelve incurved varieties came from Miss FOWLER; and Mr. SHARPIN had the 2nd best.

Prizes were also offered for groups of plants in spaces 6 feet by 4½ feet, which brought together three exhibitors, but that from Sir R. BEAUCHAMP was the choicest and most tastefully arranged, and deservedly gained the 1st prize.

Fruit was sparingly shown. The best came from Sir R. BEAUCHAMP, who likewise staged the best collections of vegetables and salading.

Mr. BATTERS, Gillingham Hall Gardens, staged (not for competition) a most meritorious collection of garden produce which was an attractive feature of the show. H. F.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 14, 15.—The annual show, which was held in the Guildhall, was a great success. Cut blooms were numerous, groups of Chrysanthemums splendid, and specimen plants a feature. The management here is all that could be desired.

For the best group of Chrysanthemums, Mr. G. H. STREET, gr. to the Rev. Dr. FEARON, The College, Winchester, was most successful, with plants ranging from 2 feet to 4 feet in height, well clothed with foliage and carrying fine blooms; Mr. E. NEWMAN, gr. to Captain GAUSSEN, Twyford, Winchester, being 2nd.

Plants suitable for conservatory decoration, in 9-inch pots were excellent. Mr. G. ADAMS, gr. to Colonel F. A. DICKINS, Edge Hill, Winchester, won the premier award with dwarf, well-flowered examples.

For six plants (white-flowered varieties), there was a brisk competition. Mr. G. COUSINS, gr. to E. H. BUCKLAND, Esq., Kingsmead, Winchester, secured the leading award.

In a similar class, devoted to yellow-flowered varieties, Mr. COUSINS was again successful.

CUT BLOOMS

were numerous and good. The principal class was that for forty-eight specimens, half to be incurved, and the remainder Japanese varieties. Mr. NEVILLE, gr. to F. W. FLIGHT, Esq., Twyford, Winchester, was an easy winner, with full-sized examples of popular varieties in both sections; Mr. J. AGATE, Havant, 2nd.

For twenty-four Japanese blooms, six competed. Mr. J. WASLEY, gr. to J. B. TAYLOR, Esq., Sherfield Manor, Basingstoke, staged a grand lot of blooms, and easily secured the leading award.

Twelve Japanese (local) were best staged by Mr. Dawes, gr. to Mrs. OGILVIE, Rosecroft, Hambledon, being full, heavy, bright blooms.

White and yellow-flowered varieties were shown by Mr. WASLEY in four sorts, three of each in really good condition.

Mr. NEVILLE had the best twelve incurved, and a similar number of this section in four varieties.

Miscellaneous plants arranged for effect were a distinct feature of the show. Mr. E. Long, gr. to F. C. BINCH, Esq., Christchurch Road, Winchester, won the premier award with a commendable exhibit.

Fruit and vegetables were of high quality.

CHESTER PAXTON.

NOVEMBER 14, 15.—The annual Fruit and Chrysanthemum Show of the Chester Paxton Society was held on the above dates in the large Assembly Room and vestibule of the Town Hall, when one of the most attractive exhibitions ever seen in Chester was opened to the public by the Mayor of the city, Colonel H. T. BROWN.

The most attractive exhibits were the groups of Chrysanthemums, the average quality of which was superior. The chief honours fell to Mrs. HUDSON, Bache Hall (gr., Mr. E. Stubbs), who also carried off the much-coveted prize last year; EDWD. DIXON, Esq., Littleton Hall (gr., Mr. John Dutton); Mrs. McLAREN, Curzon Park (gr., Mr. S. Garner); and Mrs. ARTHUR PORTS, Hoole Hall (gr., Mr. John Taylor), in the order given.

In the cut bloom classes some excellent exhibits were made of Japanese and incurved varieties, and the entries for the single varieties showed a considerable increase over any previous exhibition. A very fine stand of naturally-grown cut blooms exhibited by Mrs. TOWNSEND INCE, Christleton Hall (gr., Mr. Thomas Weaver), easily carried off 1st honours.

FRUIT, &c.

In the nurserymen's class for the best fifty dishes of Apples, Mr. JOHN WATKINS, Hereford, and Messrs. PEWTERER BROTHERS, Hereford, were awarded 1st and 2nd honours respectively.

In the gardeners' class for kitchen Apples, the chief honours fell to Lord COMBERMERE, of Combermere Abbey (gr., Mr. E. Severn). Mrs. POCHIN, Bodnant Hall (gr., Mr. J. Sanderson); the Rev. L. GARNETT, Christleton Rectory; and H. LYLE SMYTH, Esq., Barrowmore Hall (gr., Mr. E. Morris).

In the classes for Pears, although the entries were not so numerous as usual, the quality was very high, and here the principal prizes were won by Rev. L. GARNETT, Christleton; Miss HOMBERSTON, Newton Hall (gr., Mr. Wakefield); EDWD. DIXON, Esq., Littleton (gr., Mr. Dutton); and Lord COMBERMERE (gr., Mr. E. Severn).

Honorary exhibits included a most attractive one from Mr. N. F. BARNES, gr. to His Grace the DUKE OF WESTMINSTER, Eaton (Gold Medal).

Messrs. DICKSONS, LTD., staged an exhibit of fruit and flowers; as also did Messrs. McHATTIE & Co., and Mr. J. W. DUTTON, all nurserymen of Chester.

READING CHRYSANTHEMUM.

NOVEMBER 15.—This was held on the present occasion in the two Town Halls, the old and the new; it means a division of the exhibits, but that is unavoidable. The large hall, when empty, looks a very spacious one, but a few exhibits, with provision for locomotion, soon fill it, so that when the show was opened to the public it was difficult to catch a sight of the exhibits, so large was the company.

In the large hall were the circular groups of Chrysanthemums, and the large and handsome Silver Challenge Cup was won by Mr. H. PERKINS, gr. to the Hon. W. F. D. SMITH, M.P., Greenlands, Henley-on-Thames, high quality characterising the blooms, and skill the arrangement; Mr. GALT, gr. to C. E. KEYSER, Esq., Aldermaston Court, was a very good 2nd.

In the small hall were other groups; those of plants not disbudded were very effective. Mr. BOOKER, gr. to W. B. MONCK, Esq., Coley Park, was 1st, run very close by Mr. Woolford, gr. to A. PALMER, Esq., East Thorpe. Groups were also shown in another division, and there were classes for trained plants, which were generally in bush form. Other plants were asked for in several classes, and they served the purpose of varying the show. One class was for a table of zonal Pelargoniums, in which two competed, the 1st prize going to Mr. Chamberlain, gr. to F. M. LONERGAN, Esq., Cressingham Park; the 2nd to Mr. WOOLFORD; the latter had rather the finer trusses, but the former had worked out the most effective arrangement.

Orchids were shown in good character, Mr. H. PERKINS taking the 1st prize.

Very finely-grown specimens of Poinsettias were shown by Mr. WOOLFORD, who also had some excellent Bouvardias, and a very fine lot of Cyclamen latifolium.

Palms were shown in pairs, and Richardias in threes.

The Cut Flower Classes for Chrysanthemums had the greatest interest. The best twenty-four Japanese came from Mr. COLLEGE, gr. to T. CARRUTHERS, Esq., Reigate, who had fine examples of *Secretaire Fierens*, *Le Grand Dragon*, *N.C.S. Jubilee*, *Graphic*, *Lady Hanham*, *Lord Ludlow*, *Phœbus*, *Mrs. Barkley*, *Mrs. Mease*, *Chenon de Leche*, &c.; Mr. FOSTER, gr. to L. PHILLIPS, Esq., Winfield, was a close 2nd.

With twelve incurved, Mr. G. LANE, gr. to Miss RIDGE, Englefield Green, was 1st, having finely-developed blooms of *Duchess of Fife*, *Miss V. Tomlin*, *Mrs. H. J. Jones*, *Chrysanthemiste Brunt*, *Topaze Orientale*, *Empress of India*, *Ma Perfection*, *C. H. Curtis*, &c.; Mr. PRICE, gr. to T. P. BULEY, Esq., Fairford, was a good 2nd.

Mr. GALT came in 1st with twelve Japanese, having, in fine character, some of the leading varieties; Mr. PERRY, gr. to L. SCHOTT, Esq., Penny Hill Park, was a good 2nd.

A class for six vases of blooms, three of each variety, brought several exhibits, Mr. WOOLFORD taking the 1st prize with admirable blooms, well arranged; Mr. PERRY was 2nd.

Single varieties in twelve bunches, five sprays of each being generally shown, made a charming feature, the 1st prize going to Mr. WILSON, gr. to Mr. BLAND GARLAND.

In the class for six Japanese, one variety, Mr. PERRY was

1st with very fine blooms of Madame Carnot; Mr. COLLEGE came 2nd with Miss Nellie Pockett.

The best six incurred were very fine blooms of Duchess of Fife from Mr. GALT; Mr. PERRY coming 2nd, with C. H. Curtis.

The best vase of *Chrysanthemums*, one variety, were those of Madame Carnot, from Mr. WOOLFORD. Groups of cut *Chrysanthemums*, arranged on a table space of given size, was a pleasing feature also. Epergnes of *Chrysanthemums* were also shown; and there were baskets of autumn foliage.

FRUIT.

There were several classes for fruit. Mr. Cole, gr. to Sir CHARLES RUSSELL, Bt., Swallowfield Park, was 1st with two bunches of Alicante Grapes, medium-sized, and highly coloured; Mr. PRICE came 2nd.

Mr. WOOLFORD had the two best bunches of Lady Downes, well finished; Mr. LANE was 2nd.

With any other black, Mr. COLE took the 1st prize, having well-coloured Gros Maroc; Mr. PRICE came 2nd with Mrs. PINE—good bunches, but not well finished.

Mr. COLE had the two best bunches of White Muscats, the bunches large, well coloured, and extra-good; Mr. BASIL gr. to D. H. EVANS, Esq., was 2nd.

With any other white, Mr. COLE came in 1st with Foster's Seedling; Mr. LANE taking the 2nd prize with large bunches of Mrs. Pearson, lacking finish.

Apples were numerous and in fine character. Mr. R. WEBB, Becham, had the best twelve dishes, six culinary and six dessert; Mr. EXLER, gr. to J. SIMONDS, Reading, was 2nd.

Mr. CHAMBERLAIN had the best six dishes of dessert Apples; and they were extra fine, especially Ribston, Cox's Orange, and Gasconne's Scarlet; Mr. E. DOWDING, Stoke Row, Henley, was 2nd.

Mr. R. WEBB had the best dish of Cox's Orange Pippin.

Mr. CHAMBERLAIN was 1st, for six dishes of culinary Apples; Mr. WADE PALMER was 2nd.

Mr. WOOLFORD had the best dish of Blenheim Orange.

Pears were also well shown. Mr. CHAMBERLAIN had the best eight dishes, and Mr. WOOLFORD the best four dishes; and there were single dishes also in the classes for Cucumbers, Mushrooms, and Tomatoes.

A large stand of floral decorations in various designs, was furnished by Mrs. PHIPPEN, of Reading, which was highly commended.

HULL CHRYSANTHEMUM.

NOVEMBER 15, 16.—The annual show was held in the Artillery Barracks, and if not quite so large as in some previous years, was nevertheless a success. Nowhere is there better management than here. Messrs. Harland and Dixon, the honorary secretaries, control the details perfectly.

CUT BLOOMS

were numerous and good. For twenty-four Japanese, Mr. C. CROOKS, gr. to the Dowager Lady HINDLIFF, Hedsor House, Droitwich, won 1st prize with a grand collection, in which the following were specially noteworthy:—Mons. Pankoucke, Mrs. W. Mease, Oceana, Elthorne Beauty, G. J. Warren, and Duke of York. Mr. WILLIAMS, gr. to the Earl of FEVERSHAM, was 2nd.

For a similar number of incurved varieties, Mr. CROOKS was again successful with large blooms, which were well staged; Mr. W. MEASE, gr. to A. TATE, Esq., Downside, Leatherhead, Surrey, 2nd.

For six Japanese blooms of any one variety, Mr. R. WALKER gr. to Col. STRACEY-CLITHEROW, Hotham Hall, Brough, won with *Chenon de Leche* in faultless style.

Anemone-flowered varieties were grandly represented. For twelve, Mr. F. MASON, gr. to ALEXANDER SMITH, Esq., Woodleigh, Hessele, won 1st prize.

Pompons were best shown by Mr. A. DREWERY, gr. to Mrs. F. B. MOORE, Harland Rise, Cotingham.

Single-flowered varieties, by Mr. V. WATERHOUSE, gr. to W. T. OWBAINCE, Esq.

For eighteen incurved (local), Mr. J. DOWN, gr. to H. G. CONSTABLE, Wassand, Hull, was 1st.

In the class for Japanese, Mr. H. THOMPSON, gr. to C. J. RINGROSE, Esq., Cotingham Grange, Hull, was the most successful, with a set of heavy blooms.

GROUPS OF CHRYSANTHEMUMS

arranged with foliage plants were less numerous than in preceding years. Mr. G. WILSON, gr. to Sir JAMES RECKITT, Swanland Manor, Brough, was the most successful, with a light arrangement of heavy blooms, Palms, Crotons, and other suitable plants, lightly dispersed; Mr. H. P. DARLING, Holderness Road Nursery, Hull, 2nd.

Specimen plants were, as usual, numerous and good.

A special feature is here made with table decorations in a properly lamp-lighted room. For a dessert-table, 8 feet long by 4 feet, properly laid for six persons, there was a fine display. Miss FANNY KIRK, Owstwick Hall, Benstwick, won the premier award with an almost faultless arrangement.

ROYAL BOTANICAL OF MANCHESTER.

NOVEMBER 16.—The annual Chrysanthemum Show of the Royal Botanical and Horticultural Society of Manchester was held on the 16th inst.

In the class for groups of *Chrysanthemums* in pots, arranged with foliage-plants for effect, in a space of 80 square feet,

there were only two exhibits—1st, J. WALTON, Esq., Newton Heath; 2nd A. BUCKLEY, Esq.

Plants in pots were very fine indeed, well grown, and, beautifully flowered. Nine large-flowered varieties were best shown by G. H. GADDUM, Esq., Didsbury; 2nd, T. HARKER, Esq., Withington.

For six Pompons in pots, J. BROWN, Esq., Heaton Mersey, was 1st; 2nd, J. WALTON, Esq. And for six Japanese varieties—G. H. GADDUM, Esq. was 1st; and T. HARKER, Esq., 2nd.

There were classes also for Primulas, Roman Hyacinths, plants suitable for the adornment of the dinner-table, Cyclamens, &c.

CUT BLOOMS.

The principal class in this section was that for the Derby Challenge Cup, given by the Earl of DERBY, the President of the Society, for forty-eight blooms, twenty-four Japanese, and twenty-four incurved, distinct varieties. This was well won by Mr. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet; 2nd, Mr. H. WEST, gr. to E. BENAENS, Esq., Bettisfield Park.

For twenty-four incurveds, not fewer than twelve varieties, Mr. H. WEST was 1st; and Mr. HEATON, gr. to R. P. HOUTEN, Esq., M.P., Aigburth, 2nd.

T. BROCKLEHURST, Esq., Liverpool, won a class for twelve blooms, distinct; and F. G. FOSTER, Esq., Havant, Hants, was 2nd.

That for thirty-six Japanese, not fewer than eighteen varieties, fell to Mr. HEATON; Mr. LEES being 2nd.

For eighteen Japanese, not fewer than nine varieties—1st, F. C. WATERHOUSE, Esq., who was also winner of 1st prize for twelve Japanese distinct varieties.

The best collection of thirty-six miscellaneous cut blooms was shown by Mr. McKellar, gr. to J. WATTS, Esq., Cheshire, Cheshire.

Baskets of cut blooms of *Chrysanthemums*, suitable for drawing-room, with Fern and foliage, were shown, and the best was staged from Mr. W. ELKIN, Pendleton.

Mr. J. KIRK, Heaton Chapel, had the best hand-bouquets.

The 1st prize for a miscellaneous collection of cut flowers was won by J. BROWN; and for the best collection of cut Orchid blooms, by T. STATTER, Esq., Whitefield.

MISCELLANEOUS EXHIBITS

were well shown in the shape of Orchids from T. STATTER, Esq., of Stand Hall, and R. ASHWORTH, Esq., of Wilmslow; who had a fine plant of *Vanda cœrulea* in bloom; Mr. DOE, gr. to Earl DERBY, Knowsley, had a fine collection of Apples and Pears.

The trade were well represented by Messrs. COWEN & Co. Garston; and Messrs. CHARLESWORTH & Co., Bradford; both of which firms had fine banks of Orchids. Silver Medals were awarded in each case. Messrs. DICKSON, BROWN, & TAIT, and Messrs. DICKSON & ROBINSON, also Messrs. CLIBBAN & SONS, Altrincham, were awarded Silver Medals for exhibits of miscellaneous flowering plants. Messrs. HUGH LOW & Co., Clapton, London, had a pretty exhibit of Orchids.

MESSRS. SUTTON & SONS, Reading, were awarded the only Gold Medal for a very fine display of Cyclamens and other plants, and a fine exhibit of Potatoes, Onions, &c. J. W.

SCOTTISH HORTICULTURAL ASSOCIATION.

NOVEMBER 16, 17, 18.—As briefly announced in the telegraphic dispatch in our last issue, the great Scottish exhibition, held as usual in the Waverley Market, opened under the most favourable auspices as to weather, number of exhibitors, and entries. The weather continued fine during the three days of the show being open, and the crowds of visitors remained loyal to the end, surplus receipts going to the Lord Provost's Fund for the relief of families stricken through the war. The exhibition as a whole was quite as good as any that have been held, the several sections being all well filled.

CUT FLOWERS.

Chrysanthemum blooms were remarkable, not so much on account of the numbers exhibited—though these were enormous—as for the high quality in most of the classes, and their evenness as a whole. The greatest interest naturally centred in the great class of thirty-six vases of Japanese, three blooms in each vase, and thirty-six distinct sorts. A strong contingent was expected from England, including the champion at the late show in the Aquarium, Mr. McHATTIE, and though it was thought Scottish flowers would be late, and perhaps deficient, the success of last year's winner in Ireland augured well for northern blooms. Their success, as a fact, was even greater than could have been anticipated, for though three of the prizes went over the border, the piece of Plate presented by the City of Edinburgh, value £20, with £15 in money added, and the £20 as 2nd prize, were both retained in Scotland. The 3rd, secured by Mr. McHATTIE, being almost as good as a Scotch victory when tested by the saying, "It's no lost that a freen gets." It was early apparent that the coveted 1st prize was not to be easily won, the even quality of the blooms staged by Mr. LUNT, gr. to Keir House, and by Mr. BEISANT, gr. to Castle Huntly, indicating a sharp struggle for supremacy. All the blooms were remarkably fresh and in perfect condition, as well as reaching maximum dimensions; the Castle Huntly blooms being, if anything, weightier than those from Stirling, which, however, were set up in slightly better form. The judges finally thought the latter were two points ahead of the

former; and the City of Edinburgh prize, for the second year in succession, goes to Keir. Mr. LUNT's blooms comprised extra fine examples of Mary Molyneux, Lady Ridgway, Oceana, Louise, Mrs. Mease, Mr. C. H. Payne, M. Cheon de Leche, Simplicity, and Australie; and slightly less good, Phœbus, Henry Weeks, Madame A. Rosseau, J. Bidencope, Midle. M. A. de Galbert, Robert Powell, Geo. Palmer, Pride of Exmouth, Madame Carnot, Pride of Madford, and Mrs. H. Weeks. In Mr. BEISANT's lot were included grand examples of Mr. Bailey, M. Cheon de Leche, Wonderful, Scottish Chief, Mrs. Weeks, and Emily Towers. Mr. McHATTIE, Strathfieldsaye, as already noted, was a good 3rd; Mr. CHANDER, Cotton House, Rugby, was 4th; and Mr. HAGGARD, Moor Park, Ludlow, 5th; two competitors being left out. The entries indicated the exhibition in this class alone, of 972 blooms; but two of the entrants failing to stage, gave the actual number as 756.

The next class of importance was that for thirty-six Japanese, distinct, shown on boards, the prizes offered being £15, £10, £5, and £5.—No less than ten competitors entered the list, and Mr. LUNT, after another close tussle, emerged again the victor; the 2nd prize going to Mr. D. NICOLL, gr. to Rossie, Forgandenny, last year's runner-up in the City of Edinburgh Class. Mr. McHATTIE came out 3rd, and Mr. BEISANT 4th.

The varieties in the winning stand were Australie, R. Hooper Pearson, Madeleine Davis, Lady Ridgway, G. C. Swabe, Edith Tabor, Simplicity, Mrs. M. Grant, Lady Hanham, Pride of Madford, Emily Towers, Martha Hodgson, Phœbus, Fierens, Madame P. Rivoire, M. Hoste (extra), Mutual Friend, Mrs. Darkley, Rose Wynne, M. Cheon de Leche, J. Bidencope, Eva Knowles, Oceana, Pride of Exmouth, Le Grand Dragon, Mary Molyneux, Mrs. G. Carpenter, Royal Standard, Miss J. W. Barks, H. Rivers Langton, Edith Dashwood, and Lionel Humphreys. All the blooms were in the pink of condition, and in the right stage of development.

Next comes the Scottish Challenge Cup Class, in which the competition is confined to the production of Scottish gardens. The prizes are a Cup, to be held for a year by the winner, with £10; 2nd, £7; 3rd, £5; 4th, £3. These are offered for three vases of Japanese, in twelve varieties, three blooms of each. Mr. NICOLL secured the Cup, with a fine even lot; Mr. KIRK, gr. to Norwood, Alloa, 2nd; Mr. BEISANT 3rd; and Mr. YOUNG, gr. to Stobo Castle, Peebles, 4th.

For four vases Japanese, six blooms in each, Mr. MURRAY, Blackford House, was 1st with fine flowers; Mr. KIDD, gr. to Carberry, Musselburgh, 2nd; Mr. McINNES, gr. to Falkland, Fife, 3rd; and Mr. CLARK, gr. to Bannerfield, Selkirk, 4th.

Twelve distinct Japanese.—1st, Mr. CUMMINS, gr. to Grantully Castle, 2nd, Mr. LUNT; 3rd, Mr. HAGGARD.

Twelve Japanese, four varieties, three of each.—1st, Mr. LUNT; 2nd, Mr. CUMMINS; 3rd, Mr. HAGGARD.

Six Japanese, distinct.—1st, Mr. LUNT; 2nd, Mr. MOIR, Rosehaugh, Aroch; 3rd, Mr. HENDERSON, Ellera, Windermere, Cumberland.

Six Japanese, any one variety.—1st, Mr. SHEARER, Summer Hall, Alloa.

One vase of twelve Japanese blooms.—1st, Mr. NORMAN, gr. to Alloa House, Alloa; 2nd, J. BOUCHER, gr.

Vase of six Japanese blooms, any variety.—1st, Mr. MOIR, gr. to 2nd, Mr. HOOD, St. Boswells; 3rd, Mr. WHANNELL, Gilmerton.

There were also several classes for single vases of six blooms of special varieties. These contained some of the weakest blooms shown, though in some instances superb examples were also set up. Of the latter, mention may specially be made of Charles Davis, Lady Hanham, M. Cheon de Leche, all fine.

Only five classes were devoted to the incurved section, and about £20 altogether in prizes. For twenty-four blooms distinct, £5, £4, £3, five exhibitors staged, the 1st position being secured by Mr. GOODACRE, gr. to Elvaston Castle, with finely-finished, full flowers, including the following sorts: E. Cannell, Lady Isabel, M. Desblanc, Duchess of Fife Dorothy Feist, C. H. Curtis, Countess of Warwick, Mrs. R. J. Jones, Madame Ferlat, George Haigh, Lady Kingston, R. Petfield, James Agate, Queen of England, Hanwei Glory, Mrs. Colman, Lord Alcester, Violet Tomlin, A. Salter, C. B. Winton, and Golden Empress; Mr. CHANDER was a close 2nd, in this stand blooms of C. H. Curtis, Topaze Orientale, and a seedling being conspicuous; Mr. McHATTIE, 3rd.

BOUQUETS, &c.

Some nice bouquets consisting solely of *Chrysanthemum* flowers were shown. The 1st prize bouquet having been arranged by Miss TODD, Musselburgh. The same exhibitor secured also 1st prize with a pretty arrangement, for a basket of coloured foliage and berries, as well as for a basket of Orchid blooms, which was arranged with great taste.

POT PLANTS.

In nothing has there been so noticeably great an improvement as in the section devoted to pot plants, which every year exhibits marked advance; the present being no exception to the rule; and the prizes offered in the various classes for *Chrysanthemums* were competed for with examples of large size, and bearing the stamp of high cultivation. The chief prize was for six distinct varieties, excluding singles and Pompons. To Mr. CAVANAGH, gr. to St. Edwards, Murrayfield, was awarded the 1st place, his plants being very large, La Triomphante and Mr. W. Holmes particularly good; Mr. PULMAN, gr. to Hollywood, Colinton, was 2nd with smaller specimens, bearing larger and fresher foliage, and blooms of better quality than the first mentioned; Mr. WALDIE, Dollarbeg, Dollar, was 3rd.

For four varieties Mr. CAVANAGH was again 1st with plants

of equal merit with those shown in the former class; Mr. THOMSON, Prestonfield, 2nd. And for two varieties, Mr. CAVANAGH the third time secured 1st place. Mr. HASWELL, Tranet, obtaining the like for one specimen.

A series of prizes was also offered for single specimens in various colours, and also a few confined to amateurs.

In addition to the above, a number of classes were set apart for other seasonable flowers, among which the more remarkable included that for six pots of Roman Hyacinths, the whole of the examples staged being remarkably good; Mr. SHEARER was 1st for these; Mr. MCINTYRE, The Glen, Innerleithen, 2nd; and Mr. McMILLAN, 3rd. Begonia Gloire de Lorraine was also shown in good form, the six plants with which Mr. CHAPLIN, Dalkeith Road, carried away the 1st prize being in every respect models of high cultivation. The same grower secured 1st also for three of the same flower trained to a trellis. In this section was included a group of Chrysanthemums, foliage and other flowering-plants, arranged in semi-circular form, and for which substantial money-prizes were offered. Four groups were arranged, and they partially occupied the west-end of the market. Chrysanthemums largely predominating over all the other plants. The groups were all somewhat flat, though not ineffective, and to that furnished by Mr. James Wood was awarded the 1st prize. A number of small plants of *Salvia splendens* distinguished it from the others. Mr. JARDIN, gr., Ravelston, Blackhall, with a group remarkable for its dwarf Chrysanthemums, and the meritorious blooms these carried, was 2nd; and Mr. WOOD, Canaan Lane, was 3rd. A quantity of Palms and other decorative stove and greenhouse plants were also largely shown.

FRUIT.

Though the prizes offered for fruit were meagre, when compared with the handsome ones accorded to cut blooms, no deterrent effect followed so far as the quantity shown was concerned, quite a large number of exhibitors staging in the several classes devoted to Grapes and to Apples.

For four bunches of the first-named distinct varieties there was a strong competition. Messrs. BUCHANAN, of Kippen, securing 1st place with good examples of Black Alicante, Gros Colman, Cooper's Black, and Muscat of Alexandria. Mr. LESLIE, gr., Pitcauld, 2nd, with Lady Hutt, fine; and Muscat of Alexandria, large in bunch, but hardly sufficiently finished. The last-named was 1st for two bunches, staging fine Alicantes and Muscats, and Messrs. BUCHANAN 2nd; who also secured 1st in the Muscat of Alexandria class with small clusters.

Messrs. MURRAY & SONS, Polmont, showed the finest Black Alicantes in a large class, and were also 1st with Cooper's Black in the "any other variety" class. Mr. WRIGHT, gr., Taymouth Castle, staged the best Gros Colman, grand Grapes; the 2nd prize lot, from Mr. BEISANT, was almost equally fine; and Mr. PATERSON, Benochry House, Kirkcaldy, a close 3rd.

In a very well-filled class Mr. MCNEIL, gr., Peebles, secured 1st for Lady Downes; Mr. McLEAN, gr., Greenfield, Alloa, 2nd, with finer-looking examples; and Mr. McPHERSON, Donisla House, 3rd.

For two Pine-apples, Mr. MURRAY, gr., Culzean Castle, Ayrshire, with fine smooth Cayennes, secured 1st place; Mr. MCINTYRE being 2nd.

There were two collections of fruit, Mr. KIDD, Carbery, being accorded 1st for fine Pears and Grapes, bulking largely in the collection; and Mr. MCINTYRE 2nd.

Apples, though numerous, were generally small in size, Mr. DAY, Galloway House, securing the chief prizes in the gardeners' section. The same exhibitor had 1st also for six varieties Scottish Pears; Mr. McKINLAY, gr., West Park, in the open class for six varieties, being 1st.

In a class set apart for market gardeners, six pecks of Apples, distinct, the finest examples came from Mr. PATERSON, Lochend, Dunbar, who contributed the 1st prize lot, and set up nice samples of Tower of Glamis, Warner's King, Cox's Pomona, Blenheim Orange Pippin, Prince Albert, and Kentish Fillbasket; Mr. COSSAR, Eskgrove, Inveresk, was 2nd, with slightly larger fruits; and Mr. McCUTCHEON, Doonside, Ayr, 3rd, with beautifully-coloured samples.

VEGETABLES.

Large quantities of vegetables, of sorts suitable to the season, occupied the tables allotted to their exhibition. In quality they were generally good, but as a rule not so bulky as in some past years. The chief prize was offered for a collection of ten sorts, nine staging in the class, and judging by the difficulty experienced by the adjudicators in allocating the tickets, the general quality of the dishes must have been very even. Finally, Mr. CAMERON, gr., Binrock, Dundee, was placed 1st; 2nd, Mr. WARDIE, gr., Dollarbeg, Dollar; Mr. STUART, Thirlstane Castle, Lauder, 3rd.

Only three collections, consisting each of six sorts of vegetables, were shown, the prizes going in the order named, respectively to Mr. AULDJO, gr., Monzie Castle, Crieff; Mr. CAMERON, and Mr. LOGAN, Coldstream.

The chief items in the classes devoted to single dishes were Tomatoes, Cucumbers, Leeks, Celery, and Cauliflowers, all of which were well shown.

MISCELLANEOUS.

The most striking object in the whole of the exhibition was, undoubtedly, the arrangement contributed by Mr. JONES, Lewisham. It consisted of a lightly-mounded mass of Maidenhair and other Ferns, with groups of Begonia Gloire de Lorraine, arranged on a low, broad platform. Rising from this groundwork, were numerous tall, trumpet-shaped glasses and handsome vases filled with large Chrysanthemum blooms, mostly one kind in each vase. Sprays of Beech and

other trees in autumn tints, and browned fronds of *Pteris aquilina* were lavishly employed among the flowers, the whole furnishing an object-lesson in floral arrangement of great value. Unfortunately, the position allotted to Mr. JONES was one of the worst, as regards light, in the whole building.

Another pleasing arrangement in flowers was contributed by Mr. NORMAN DAVIS, Framfield, Sussex, in which high-class blooms of Japanese, such as Western King, Madame Carnot, Mutual Friend, G. J. Warren, and Mrs. Rozain were conspicuous for fine quality. Some vases furnished with blooms on long stems, and of exhibition quality, added greatly to the general effect. King of Plumes and Framfield Beauty, decorative varieties, attracted much notice, as did also Daisy Birch among single-flowered varieties. A small selection, drawn from various sections of Chrysanthemums, was also forwarded by Mr. WELLS, Redhill, Surrey; and Messrs. DOBBIE & CO., Rothesay, sent for exhibition some of the earliest-expanded blooms from their nurseries. Scotch nurserymen were also represented by Mr. WHITEHEAD, Selkirk, who contributed a table of cut blooms.

Groups of Conifers in pots were arranged by Mr. DOWNIE, Beechwood; and by Messrs. LAIRD & SONS, Pinkhill.

Mr. FORBES, Buccleuch Nurseries, Hawick, exhibited a few plants of Begonia Caledonia, the white sport from Gloire de Lorraine, and to it a Certificate was awarded. Messrs. LAING & MATHER, Kelso, had a group of the last-named, along with examples of Carnation plants as cultivated for sale.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 17, 18.—The thirteenth annual show of this Society, held in St. George's Hall, proved a great success. The entries were far in excess of any previous show, and completely filled the large area of the St. George's Hall. Groups of Chrysanthemums were a special feature, there being eight staged for competition.

The "Cup" classes were keenly competed, and in the first class the prize of a 10-guinea Challenge Cup and £5 tempted fourteen exhibitors; Messrs. G. FAIRBAIRN & SON, Croft Nursery, Batcherby, Carlisle, proved the winner; and Mr. J. H. Goodacre, gr., to the Earl of HARRINGTON, Elvaston, 2nd. The 2nd prize stand contained some malformed flowers of Madame Carnot and Mrs. Mease, and the decision of the judges was severely criticised. Messrs. FAIRBAIRN had some superb flowers in their winning stand, and included Julia Scaramanga, which received the award for the premier bloom in the show.

In the incurved classes, Mr. G. BURDEN, Birkenhead, carried off the premier honours with a fine lot of well-finished flowers.

The local Cup classes created a spirited competition, and the Lord Mahon Challenge Trophy fell to Mr. J. BROOKE, Heaton, for a grandly staged lot of blooms.

The Cup presented by the city Members of Parliament for eighteen Japanese blooms was keenly contested, and Messrs. H. CLARK & SON eventually emerged as the successful exhibitors. Local classes were well filled, and the most successful exhibitors were Messrs. MIDOBY, JOHN THORNTON, W. MOORBY, T. BIRD, J. MOORBY, J. WHITTINGHAM, and W. BUTTERS.

Some very fine Roman Hyacinths were staged by Mr. BUTTERS. Primulas, Cyclamens, and table plants were also very good, especially those exhibited by Mr. L. SHEARMAN.

The classes for Grapes were most interesting, and two bunches of Mrs. Picee and Muscat of Alexandria, staged by Mr. MIDOBY were excellent.

A delightful feature of the show was class 8, for twenty-four Japanese varieties shown in vases, three blooms of each variety, for a special prize presented by A. Musgrave, Esq., Messrs. FAIRBAIRN & SON, Carlisle, were successful among eight competitors.—*Communicated.*

CHELTENHAM ROOT, GRAIN, FRUIT, AND FLOWER.

NOVEMBER 16, 17.—Cheltenham on such an occasion as this brings together the farmer and the gardener, and affords an opportunity for them to put their productions into comparison. The farm produce, roots, grain, butter, &c., were all very good, and so were the Chrysanthemums, vegetables, and fruit.

Splendid groups of Chrysanthemums were ranged in semi-circles round the sides of the hall of the Assembly Rooms; that from Mr. Lusty, gr. to Col. ROGERS, again won the handsome Silver Cup offered; the blooms were very fine, and the grouping excellent. Mr. G. MARSH, gr. to T. P. W. BUTT, Esq., Arle Court, was a good 2nd.

Plants were shown in several classes. The Japanese varieties were, in most instances, very well bloomed, but foliage appears to be too often sacrificed to flowers. This was particularly the case with the incurved types. There were notable exceptions to this rule. It was said the plants were better than had been seen at Cheltenham for years past. Mr. BATES, gr. to W. M. BAKER, Esq.: F. RAE, gr. to Mr. Southwood, Mr. LUSTY, and F. TAYLOR were the principal prize winners. The Baron de FERRIERES' special prize for the best specimen Chrysanthemum in the show was won by Mr. B. MOORMAN, with a very fine example of Madame Carnot.

In the cut flower classes the competition was very keen. Mr. MARSH'S 1st prize collection of twenty-four incurveds contained fine examples of Duchess of Fife, Miss D. and Miss Violet Foster, Lady Isabel (which, when refined makes a fine backrow flower), Mdlle. L. Faure, Hanwell

Glory, W. Carpenter, Ialine (which lacks refinement), King of Yellows, Miss Annie Hills, C. H. Curtis, &c. Mr. J. APJIN, gr. to W. MEATH BAKER, Esq., was a close 2nd.

Mr. F. DAVIES was 1st with twelve blooms, also well-developed examples. There were several entries in the class for six incurveds: Mr. J. MULLENS was 1st with some excellent blooms.

The Japanese varieties made a fine display, the 1st prize for thirty-six blooms going to Mr. G. W. MARSH, gr. to T. P. W. BUTT, Esq., Arle Court. A few of his leading blooms were Mrs. H. Weeks, Lady Hanham, J. Chamberlain, Werther, Western King, G. J. Warren, Mrs. W. Mease, John Pickett, and Madame Carnot; Mr. LUSTY was a close 2nd, having some very fine examples.

In the class for eighteen incurved Japanese, Mr. LUSTY was 1st; chief among them were F. A. Bevan, Swanley Giant, R. Powell, Graphie, T. Carrington, Lady Ridgway, Mrs. Seward, &c.; a good even stand. Mr. MAY, gr. to H. O. LOND, Esq., was 2nd.

With eighteen Japanese, Mr. LUSTY was also 1st with some finely-developed blooms; and Mr. JAS. HORLICK, 2nd.

There was a close competition in the class for twelve blooms also, and Mr. MAY was 1st with a good even dozen; Mr. Geo. BARROW, gr. to Dr. FERGUSON, was 2nd.

In the class for six blooms there was also a good competition. Mr. LUSTY also took the 1st prize with six vases of Chrysanthemums, Japanese, three blooms of each. Bouquets of Chrysanthemums, sprays, button-holes, &c., were also shown, and plants of Cyclamen, Mignonette, and Primulas.

Fruit made an excellent feature, many of the dessert Apples were of very fine quality.

There were classes for black and white Grapes, and also for vegetables. Messrs. SUTTON & SONS' special prizes brought a brisk competition. R. D.

ANCIENT SOCIETY OF YORK FLORISTS.

NOVEMBER 15, 16, 17.—The twentieth annual Chrysanthemum and Fruit Exhibition that is held under the auspices of the "York Florists" took place on the above dates.

The six entries for the larger groups of 120 square feet showed an increased competition, doubtless brought about by the valuable Cup offered by the Lord Mayor and the Sheriff for the past year (Ald. BRODER and Mr. J. J. HUNT), with 8 guineas added by the society, and a Cup (with 7 guineas added), given by Ald. PURNELL, for 2nd prize, whilst the 4th prize was given by Mr. J. E. SIMPSON, Mr. E. ALLEN, and Mr. G. F. W. OMAN.

The 1st honour fell to Mrs. WHITAKER, of Cliffe House, Hessele (gr. G. Jarvis).

The other prize groups in the class were also admirable, whilst the smaller groups (100 square feet) attracted attention by reason of the cultural excellency rather than, as in the former case, of the effect produced.

The Citizens' Challenge Prize for thirty-six specimens, half incurved and half Japanese, was the great attraction for competitors in the cut-flower classes, in which a number of other special awards were offered. The ladies class was again very attractive; and contiguous to the interesting tables comprised in it were several exhibits of drawing-room mirrors decorated, which formed a new feature of the show, and a very pleasing one too.

The fruits and vegetables were a grand lot, the Grapes, as usual, being very tempting.

Speaking generally, the exhibitors exceeded 100, which was a dozen or so in advance of the last show. Prize-money also exceeded that of last year.

The orchestra was tastefully adorned with Palms and shrubs by Mr. J. KUX, and presented a picturesque appearance. Ornamental shrubs and plants were placed in front, and at each side Mr. C. PEPPER had prettily arranged diminutive fairy electric lamps.

The receipts at the door were £325 6s. 3d., and £11 15s. 9d. in excess of any previous record. 732 members have this year paid subscriptions of 5s. and upwards. Total £184 17s. 6d., and £10 5s. 6d. in excess of the highest record.

There was a dense fog in the evening of Friday, and cabs and omnibuses, &c., were unable to run.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 22.—A meeting of the Floral Committee was held on Wednesday last, at the Royal Aquarium, Westminster. A First class Certificate was awarded to the following variety:—

Madame Von Aubré.—A pale primrose-coloured sport from the popular Japanese variety, *Mutual Friend*. From Mr. LEES, gr. to F. A. BEVAN, Esq., Trent Park, Barnet.

The variety *Miss Nellie S. Threlfall*, a white incurved, with slight suspicion of lemon tint, shown by Mr. G. FOSTER, Glendarragh Gardens, Teignmouth, was Commended.

A Vote of Thanks was passed to Mr. WIRRY, Superintendent of Nunhead Cemetery, who showed a group of plants of the variety "What Ho!"

The very fine blooms of the incurved Ialine were shown by Mr. W. HIGGS, Fetcham Park, Leatherhead, and just failed in obtaining a Certificate.

Pretty blooms of incurved variety Mrs. Howe (F.C.C. 1898) were shown by Mr. W. HOWE, gr. to Sir H. TATE, Bart. Streatham.

Mr. R. KENTON, Monkham Gardens, Woodford, showed Helen Shrimpton; and the DEVON CHRYSANTHEMUM Com-

PANY, Teigomouth, a crimson Japanese flower with gold reverse, named F. G. Fowle.

This committee will meet but once more during the present season, on the occasion of the December show of the Society at the Royal Aquarium.

The Annual Dinner of the National Chrysanthemum Society is to take place on Wednesday next, the 29th inst., at the Holborn Restaurant, at 6.30 p.m. The Challenge Trophy, Holmes Memorial, and other Cups, Medals, &c., will be presented to the winners during the evening. The official circular specially invites the presence of ladies.

MISCELLANEOUS EXHIBITIONS

conducted by the following Societies have been held recently:—

Birkenhead and Wirral Horticultural.—On Nov. 20 Mr. H. May read a paper on the renovating of fruit-trees. The essayist dwelt upon the importance of doing this in an intelligent manner. Root-pruning and lifting the trees, together with a judicious thinning of the crowded spurs and branches, were considered primary points. Newly-chopped loam, lime-rubble, and charred-refuse, with an addition of bone-meal, were recommended as the best ingredients to use after the operation. It was recommended that all fruit-trees against walls should be lifted and root-pruned every third year. Cherries were excepted, as these were stated to resent frequent root-disturbance.

Highgate and District Chrysanthemum.—The fifteenth annual dinner of the above Society was held on Thursday, 23rd inst., at which the President, Mr. C. F. Cory-Wright, J.P., D.L., presided, and was supported by about eighty members and friends of the Society. Mr. W. H. Burks, a former president of the Society, proposed the toast of the evening, "The Highgate and District Chrysanthemum Society, coupled with that of the President." He remarked that on the fifteenth anniversary of their Society they might well feel inclined to blow their own trumpet, but he did not know that this was necessary, as the show spoke for itself. In toasting their President they were not only thanking him for what he had done in the past, but having accepted the office of President for another year they were living in lively anticipation of favour to come. The President in responding, said that he had been connected with the Society in one way and another ever since it was formed. He, unfortunately, could not be present at their recent show, but friends who were there, had informed him it was the best show they had ever seen in Highgate. The Silver Cups and Medals won at the second exhibition were then presented, and the President remarked that as there was only one cup left, he and Mr. E. H. Smithett would give a Silver Cup, to be competed for next year.

Shirley and District Gardeners'.—A monthly meeting was held on November 21, when a discussion took place upon the exhibits of the evening. There being a good display of Chrysanthemums, a number of members spoke on the subjects of "training," "diseases," and upon the usefulness of Chrysanthemums. One member, speaking as a naturalist, thought it desirable to raise plants from seeds instead of cuttings, considering that to raise plants continuously by the latter method, resulted in weakness of constitution and consequent susceptibility to disease. This point of view was debated at some length. Mr. E. J. Wilcox showed seeds of *Magnolia*, *Ampelopsis Veitchii*, and *Catspa*; those of the last-named being very fine. The tree was said to be covered with them, and presented the appearance of a glorified Runner Bean.

Aberystwyth Chrysanthemum.—The second show was held on Nov. 15 in the Royal Pier Pavilion. The progress made by the society in the short space of twelve months has been considerable. The exhibits had increased to double, whilst the competitors included exhibitors from Shropshire, Hereford, and the lower part of Cardiganshire. One competitor exhibited in twenty-one classes, another in nineteen classes, another in twelve classes, and another in eight classes. In the open competition there were twenty-six classes, in the amateurs' six, and in the cottagers' six. In all the classes except one, there were over one entries, and in the majority of classes there were four, five, six, or seven entries. The special feature was the cut blooms, the finest class being the one in which a Silver Cup, value £5 (to be won twice before it becomes the property of owner), and £5 was offered as 1st prize; a Silver Medal and £3 as 2nd prize; a Bronze Medal and £2 as 3rd prize for the best twenty-four cut blooms, twelve Japanese distinct and twelve incurved. Lieut.-Colonel LLOYD, Aston Hall, Oswestry, won the 1st prize; Mr. THOMAS SEENCEN, Ross, Hereford, the 2nd prize; Sir PRYSE PRYSE, Bart., Gogerddan, 3rd.

Leeds Paxton.—The eleventh annual show of Chrysanthemums was held in the Victoria Hall on November 14 and 15. Various other flowers, as well as foliage plants and some samples of choice fruits, are exhibited under the Society's auspices, but the feature of the display is the wealth of Chrysanthemums. The arrangement of the show was quite satisfactory. On the orchestra were tall Palms and foliage plants, forming a pleasant background for the musicians, and immediately below, in front of the orchestra, were displayed some choice bouquets and rare exotics. The two

large groups of plants, and the Chrysanthemum groups were ranged in the recesses at the sides, and next came the rows of cut blooms of various kinds, fruit and vegetables, covering the tables, which extended crosswise from the centre to the back of the hall beneath the Festival Gallery. The colouring, viewed from this end, was remarkably bright, contrasting effectively with the darker shades further away. Of the Chrysanthemum classes, the incurved varieties were excellent, both in symmetry, colour, and finish, the twenty-four blooms of not fewer than eighteen distinct specimens, which were shown by the Earl of HARRINGTON, being voted among the finest staged this season. The competition in the class for a miscellaneous group of plants was confined to Sir JAMES KITSON and Mr. E. BECKETT FABER, and ultimately the judges agreed to divide the prize money, and award an equal 1st to each, for what one group lacked in brightness the other lacked in arrangement. The groups of Chrysanthemums, also, were noticeable for something too much of stiffness and flatness. The winner here was Mrs. TETLEY, Weetwood; Mr. PETTINGER, Harrogate, was 2nd. Of open classes, 1st prizes for Chrysanthemums or other blooms fell to the Earl of Harrington, Sir James Kitson, Mr. P. Clark (Rodley), Mrs. Taylor (Buckingham House, Headingley), and Mr. A. J. Hall (Harrogate); for fruits, to Mrs. Tetley, Mr. T. G. Mylchreest (Allerton House), and Mr. A. T. Walker; minor honours being taken by Mr. J. Thornton (Drighlington), Mr. Pettinger (Harrogate), Mr. J. Clayton (Rothwell), Mr. A. Taylor (Leeds Covered Market), and Mr. J. R. Groundwell (Buslingthorpe). In the classes for gentlemen's gardeners and amateurs, confined within a radius of 6 miles from the Town Hall, Mr. Matthew Kitchen, Eller Close, Roundhay, took 1st prize for groups of miscellaneous plants.

Rugby Chrysanthemum.—The thirteenth Annual Exhibition was held on Nov. 15 and 16, and cut blooms especially were very good. For a group of Chrysanthemums and foliage plants, Mr. S. BENNETT, The Firs, Rugby (gr., Mr. Whyman), staged the best exhibit. Mr. Chandler, gr. to ARTHUR JAMES, Esq., Cotton House, Rugby, had the best twelve Primulas; staging a dozen well-grown plants of the old double white. Of twenty-four Japanese blooms (distinct varieties), P. A. MUNTZ, Esq., Dunsmore, Rugby (gr., Mr. Blakeaway), was the only exhibit staged. The same competitor was 1st for eighteen Japanese blooms. For twelve Japanese blooms, Mr. PEARCE was 1st with some fine specimens of Madame Carnot, Mons. Pankoucke, Madame G. Henri, Mrs. W. Popham, G. C. Schwabe, Graphic, International, Edith Tabor, Mrs. J. Lewis, Vivian Morel, Mrs. Carrington, and Nellie Pickett; the last-named bloom won the Certificate awarded to the best Japanese bloom in the show. For twelve incurved blooms, Mr. PEARCE was the winner with nice blooms of John Lambert, Golden Empress, Violet Tomlin, Ma Perfection, Miss Violet Foster, Miss Mary Haggas, Miss Dorothy Foster, Queen of England, Lucy Kendall, Lord Alerster, Mrs. Heale, and Chas. H. Curtis. The National Chrysanthemum Society's Certificate was awarded to the last-named, as being the best incurved bloom in the show. There was a good display of fruit and vegetables, Mr. CHANDLER having the best Grapes; Mr. PEARCE, Mr. COLES, and Mr. JARRY being the chief winners in other fruit classes. Mr. COLES took leading honours for vegetables. H. K.

Longton Amateur Chrysanthemum.—The tenth annual exhibition of this Society was opened in the Town Hall, Longton, on Tuesday, November 14. The schedule comprised an open and amateur classes. In the open class the competition was keen, both in the incurved and in the Japanese section, the flowers in both divisions being remarkably good. Some splendid blooms were shown by Mr. McPHAIL, Superintendent of the Queen's Park, Longton, and took 1st prize. For incurveds, Mr. Holder, gr. to Lord FERRERS, Leicestershire, had an exceptionally well-grown lot, including two specimens of the green-coloured Mrs. Rogers. In the amateur division, there was a falling off in the entries for six cut flowers, but the collections that were shown were quite equal to former years. In the Japanese section, the competition was exceedingly keen, and both in the twelves and sixes, the flowers were very clean and well grown, and showed no traces of the smoky atmosphere in which they were grown, proving the great care which must have been devoted to their cultivation. The groups were only three in number, but these were well arranged, and contained a great variety of different forms both in Japanese and Chinese. The show of plants was not so good as in the case of some former years at Longton. Doubtless this was attributable to many of the growers preferring to show cut blooms, as on the whole there were a larger number of exhibitors in the cut bloom sections than formerly. The pretty Anemone section brought out a good competition.

Bristol & District Gardeners' Mutual Improvement Association.—The fortnightly meeting of this Society was held at St. John's Parish Room, Redland, on Thursday last, Mr. C. Lock presiding over a moderate attendance. The subject for the evening was "The Management of Bees," a paper being read by Mr. Kitley, of Redland. With the aid of a modern bar-frame hive and appliances, he made the subject very interesting, and showed how bees could be made not only profitable, but of much help to those interested in horticulture. He advised those of his audience who contemplated keeping bees to get at least an elementary knowledge of the subject before commencing, and gave many useful hints on manipulating, and the general management of bees. Mr. Kitley was cordially thanked for his lecture.

EARLY PEAS AND THEIR CULTURE.

It may appear rather early or rather late to write about Peas at this date, but most gardeners know that to have a regular supply from May to October, preparations must be made early in December, if the cool treatment be adopted. There are several methods, and as regards the forcing of Peas, one must study soils, position of the garden, and the variety grown; and I shall touch only briefly upon house or frame-culture from start to finish. I am not an advocate of sowing Peas in the open in autumn, there being so many difficulties to contend with, and the yield is uncertain on wet land; severe winters injuring the plants, as cutting winds also do after a spell of hard frost. My greatest successes with early Peas have been by sowing in pots early in December, and planting out early in the spring; but in this method much depends upon the locality. Peas may be grown successfully in the open with few difficulties in the southern shires, but only failure could be expected in northern ones; and a great deal always depends upon cultural details not necessary to go into here. If we take open air cultivation in the past, the only early Peas which were grown were the small varieties with blue, white, or green seeds—all much alike as regards quality, and lacking in flavour. These Peas had the merit of earliness, but the crop was soon over. The modern early Peas are larger than those, and their flavour much finer, besides being nearly as early. For the earliest crop from sowings made in the open ground, December is late enough; indeed, the first week in November is more advisable, it being of importance that vigorous root-growth takes place before mid-winter, and for this purpose some of the more robust dwarf-growers are very trustworthy, viz., Daisy, Early Morn, and Sutton's Bountiful, which are excellent out-of-doors, and equally good for growing in pots. The well-known Chelsea Gem is sown at Syon in pots, and also in frames, for which purpose its dwarf habit, earliness, and free bearing, are especially fitted. There is no lack of excellent Peas for early sowing, and it would be easy for me to name a dozen, all of which are reliable; indeed, so much attention has been paid to early varieties, that we now possess Peas which have size, quality, and true marrow-fat flavour, together with earliness. It will be understood that these early sowings should be made on south, or, at any rate, sheltered borders, and the seeds must be lightly covered. My own practice is to make rather deep drills; when by only partially filling these, a ridge of soil is left that forms a protection against the wind.

In heavy land the seed should be covered with soil of a lighter nature, such as leaf-mould or siftings from the potting-bench. It is prudent to sow the seeds more thickly than is necessary when the soil is warmer. Mice are often very troublesome, scratching out and eating the autumn-sown peas, that it is well to keep the sowings far away from buildings, and have traps constantly set.

The best returns are without doubt obtained from Peas sown in pots, say from December to March, and then planting them outside, grown in this manner there may be failures, but this mostly occurs by reason of coddling the seedlings by affording too much warmth, and not fully hardening them off before transplanting. The latter evil may be surmounted by sowing early, and using no artificial heat, but employing cold frames, merely affording a covering of litter over ordinary mats during severe weather. The plants suffer scarcely at all if grown cold, kept near to the glass, and afforded ample ventilation in mild weather. It will be well not to crowd the seed, but to sow six to nine seeds on the surface of the soil in $4\frac{1}{2}$ -inch pots, and to thin out the weaker plants, leaving six of the strongest. Cool-grown Peas give less trouble in the spring, and they do not feel the change when transferred to the open ground.

There is no difficulty in having Peas fit for

consumption in the second or third week in the month of May from plants started in pots as advised, and there is, on the whole, but little trouble attending their cultivation; where pots are not liked, troughs, drain-tiles, or sods, may be employed. I have used 6-inch pots to advantage, and no drainage other than spent Mushroom-manure, as then the roots get less broken when shifting the plants to the open ground. As regards the transplanting, much will depend upon the weather at the time, and no strict date can be given; but the first week in March is the best time, although the work may extend to the end of that month. The growth being then well-advanced, the work must be carefully done, and the soil well-trenched, and not manured with dung, and a sheltered position chosen for the sowing. The varieties I have named will answer for the sowing, and I have sown Gradus and other large growers; and these, if a little late, are worth growing.

If Peas are forced under glass, only those of dwarf growth should be chosen; and of these, none is superior to Daisy, Bountiful, or Early Morn, which possess a marrow-fat flavour, the haulm of which may be advantageously topped at 2 feet from the ground, and it will throw out lateral shoots freely that will bear pods. Grow them from the start in 8-inch pots. I prefer to sow in this size of pot, leaving four to six or fewer plants. *G. Wythes.*

NOTICES OF BOOKS.

ORNAMENTAL SHRUBS FOR GARDEN, LAWN, AND PARK PLANTING, ETC. By Lucius D. Davis. (G. P. Putnam's Sons.)

This book, as its sub-title tells us, is specially intended to set forth the capabilities of the numerous species, native or foreign, suited for cultivation in the United States.

Botany, says the author, in a phrase that requires considerable modification, deals chiefly with fixed forms, as represented by orders, genera, and species, and takes little or no note of such varieties as are constantly making their appearance throughout the world. These varieties, however, are often more valuable for horticultural purposes than the species from which they sprang. Accordingly, we find, to take one illustration only, several varieties mentioned under the head of "Deutzia," such as *Deutzia crenata* var. *candidissima* plena, *scabra*, *Watereri*, *Lemoinei* x, *discolor* var. *purpurascens*, "Pride of Rochester," a form of *D. crenata* sent out by Messrs. Ellwanger & Barry, &c. These varieties are briefly described, and their merits assessed. There seems to be no sort of order, arbitrary or botanical, but that is of the less consequence, as an index is provided. Nevertheless, we think the most careless amateur would like to have the shrubs arranged according to their natural orders; to have, for instance, the *Kalmias*, *Rhododendrons*, *Azaleas*, *Heaths*, &c., grouped under the order to which they belong, instead of being scattered biggledly-piggledly throughout the volume.

The book is largely a compilation, but it is well done, and the illustrations are pretty, and some of them new. Three are curiously misnamed, such as *Weigela rosea*, for which *Kerria japonica* does duty; *Stuartia pentagyna*, represented by *Shortia*; and *Elaeagnus longipes*, for which a Crab Apple is shown.

In spite of the defects we have mentioned, the book is likely to be useful, especially to those who would otherwise find a difficulty in procuring information about the newer varieties.

A PRACTICAL INTRODUCTION TO THE STUDY OF BOTANY: FLOWERING PLANTS. By J. Bretland Farmer. (Longmans, Green & Co.)

An excellent introduction drawn up by a master hand. The general conformation of flowering plants is explained, illustrations being selected from common plants, mostly easily obtainable.

The details relating to the minute anatomy or histology are treated with even greater skill; indeed, we know of no elementary work wherein this department is better or more clearly elucidated. Physiology is perhaps too meagrely represented. The latter part of the volume is devoted to demonstrations and illustrations of plants belonging to various natural orders, though strangely enough, we do not find any explanation of what the meaning of natural orders is, nor of the significance attached to "genera," species, or variety. A series of questions at the end of the volume serves to direct the students' attention to the main points for study.

Obituary.

ISAAC MATTHEWS.—On the 10th inst. occurred the death at his residence, Light Oakes, Milton, Stoke-on-Trent, of Mr. Isaac Matthews, senior partner of the firm of Isaac Matthews & Sons, nurserymen and seedsmen. Mr. Matthews, who was in his seventy-third year, was born at Wetley Moor, where his father was the proprietor of a small nursery of about two acres. Upon the death of his father this nursery was acquired by the gentleman now deceased, who soon afterwards obtained an additional eight acres, and later the Milton Nurseries of fifty-two acres, and a quarter of a century ago the Light Oakes and Bagnall Nurseries, making together near upon 150 acres. Trees and shrubs were a specialty in the business. Deceased, who was well known in the midland markets, leaves a widow and eleven children, eight sons and three daughters. Several of the sons are directly associated with the firm, and the business will be conducted by them as formerly.

The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending November 18, is furnished from the Meteorological Office:—

"The weather during this week was fair and dry over the Kingdom generally. Considerable rain was experienced, however, in the north of Scotland during the earlier half of the week; and a good deal of fog or mist prevailed later on in most inland localities.

"The temperature was again above the mean, the excess ranging from 1° in 'England, E.' and the 'Midland Counties,' to between 4° and 5° in Ireland. The highest of the maxima were registered either on the 13th or 14th, and ranged from 60° in the 'Channel Islands' and 'England, N.W.,' to 54° in 'England, E.' Towards the end of the week the daily maxima became gradually lower, until on Saturday that at Loughborough (where thick fog prevailed) was no higher than 32°. The lowest of the minima were recorded on the 16th in Scotland, and on the 18th in England and Ireland; they ranged from 23° in 'Scotland, E.' and 24° in the 'Midland Counties' and 'England, N.W.,' to 31° in 'England, S.' and 'Ireland, N.,' 36° in 'Ireland, S.' and 42° in the 'Channel Islands.'

"The rainfall was nearly equal to the mean in 'Scotland, N.,' but much less in all other districts, although some isolated places in the extreme north-west of Ireland reported large amounts. In many parts of the Kingdom the rainfall was scarcely appreciable, and in others it was entirely absent.

"The bright sunshine varied considerably in different districts, but in most instances it was above the mean—especially in the 'Channel Islands.' The percentage of the possible duration ranged from 55 in the district just named, and from 35 in 'England, S.W.,' and 31 in 'England, S.' and 'Ireland, S.' to 13 in 'England, E.,' 10 in 'Scotland, N.,' and 5 in 'Scotland, W.'"

MARKETS.

COVENT GARDEN, NOVEMBER 23.

[We cannot accept any responsibility for the unjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

SEEDS.

LONDON: November 22.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market was thinly attended, with but few transactions passing. Meantime, Clover-seeds all round, although quiet in demand, are steady in value. The late considerable and remarkable export movement of fine yearling English Reds to the Continent, and at good prices, is a thing quite unprecedented in the trade. Rape-seed is firm at the recent advance. There is no change in Mustard, but Linseed is weaker. In bird-seeds the sale is just now sluggish. Haricots exhibit an improved tone. Blue Peas meanwhile remain featureless. Tares are neglected.

FRUIT AND VEGETABLES.

GLASGOW: November 22.—The following are the prices realised since our last:—Canadian Apples, Kings, 16s. to 22s. per barrel; Baldwins, Greenings, Spies, &c., 14s. to 18s.; American Apples: Baldwins, ss. to 10s. per barrel; Northern Spies, 10s. to 12s. do.; various other sorts, ss. to 10s. do. Pears: Californian, Beurre Clairgeau and Winter Nelis, 12s. to 14s. per box; French, Beurre Magnifique, 7s. to 7s. 6d.; Glout Morcaus, ss. to 8s. 6d.; Easter Beurre, 7s. to 7s. 6d. per case. Grapes, Alneira, common, 7s. to 10s. per barrel; medium, 12s. to 16s. do.; best, 20s. to 25s. do.; English, 9d. to 1s. 9d. per lb.; Bananas, extras, 9s. to 10s. per box; No. 1, 7s. to 8s. do.; No. 2, 5s. to 6s. do.; Lemons, Malaga, 10s. to 18s. per half chest; Palermo do., 4s. to 5s. per box; do. new Messina 10s. to 12s. per case; Oranges, Valencia, ordinary 420s, 13s. to 15s. per case; Mushrooms, 1s. 6d. to 2s. per lb.; Tomatos, English, 3d. to 5d. do.; Scotch, do., 4d. to 8d. do.; Onions, Valencias, 5 in a row, 5s. per box; do., 4 in a row, 4s. 6d. do.; Parsnips, 3s. 6d. to 4s. 6d. per cwt.; Leeks, 2s. to 3s. per dozen bunches; Cucumbers, 3d. each; Beetroots, 6d. to 1s. per dozen; Spinach, 2s. 6d. per stone; Celery, 10d. to 1s. per dozen; Turnips, 10d. to 1s. per dozen bunches; Carrots, 8d. to 10d. do.; Parsley, 6d. to 8d. do.; Cabbages, 8d. to 1s. 3d. per dozen; Cauliflowers, 8d. to 1s. 4d. do.

LIVERPOOL: November 22.—Wholesale Vegetable Market.—Potatos, per cwt.: Lynn Grays, 2s. 9d. to 3s. 3d.; Giants, 2s. 8d. to 3s.; Main Crop, 3s. 6d. to 4s. 3d.; Bruce, 2s. 10d. to 3s. 6d.; Turnips, 10d. to 1s. per dozen bunches; Carrots, 1d. to 10d. per dozen bunches, and 3s. 6d. to 4s. per cwt.;

Parsley, 6d. to 8d. per dozen bunches; Onions, English, 5s. to 6s. 6d. per cwt.; do., foreign, 3s. 6d. to 4s. 3d. do.; Cauliflowers, 8d. to 1s. 3d. per dozen; Cabbages, 8d. to 1s. 3d. do.; Celery, 10d. to 1s. do. *St. John's*.—Potatos, 1s. per peck; Grapes, English, 2s. to 2s. 6d. per lb.; do., foreign, 4d. to 6d. do.; Cobnuts, 10d. per lb.; Mushrooms, 1s. 6d. per lb., and basket; Cucumbers, 6d. each. *Birkenhead*.—Potatos, 10d. to 1s. per peck; Cucumbers, 6d. to 1s. each; Filberts, 10d. per lb.; Grapes, English, 1s. 6d. to 3s. 6d. do.; do., foreign, 4d. to 8d. do.; Mushrooms, 1s. to 1s. 6d. do.

CORN.

AVERAGE PRICES OF British Corn (per imperial qr.), for the week ending November 18, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	28 1	26 1	- 2 0
Barley	28 5	26 4	- 2 1
Oats	17 2	16 7	- 0 7

GARDENING APPOINTMENTS.

MR. CHARLES HOPE, for the past four and a half years Gardener to G. M. ARTHUR, Esq., Morthen Hall, Rotherham, has removed with that Gentleman to Dinnington Hall, Rotherham.

MR. CHAS. STRAUGHEN, for over three years General Foreman in the Gardens, Stoke Edith Park, Hereford, as Head Gardener to J. CORBETT, Esq., Ynys-Macgwyn, Towyn, Merionethshire, N. Wales.

MR. PHILIP GAGEBURY, late of JAMES VEITCH & SONS, LIMITED, King's Road, Chelsea, as Head Gardener to J. B. AKROYD, Esq., Chalfont Park, Slough, Bucks.

MR. WILLIAM DYER, for the past four years Foreman at Lullingstone Castle, Kent, as Head Gardener to J. H. JOHNSTONE, Esq., M.P., Bignor Park, Petworth, Sussex.

CATALOGUES RECEIVED.

PLANTS, BULBS, SEEDS, FRUIT AND OTHER TREES, SUNDRIES, ETC.

JAS. COCKER & SONS, Aberdeen, N.B.
THOS. KENNEDY & CO., High Street, Dumfries, N.B.
LITTLE & BALLANTINE, Carlisle.
BEN REID & CO., Nurserymen, Aberdeen, N.B.
HERD BROTHERS, Perth.
CLARK BROS. & CO., 65, Scotch Street, Carlisle.
WILL TAYLOR, Osborn Nursery, Hampton, Middlesex.
DICKSONS, LTD., Chester.
JOHN COWAN & CO., LTD., Gateacre Nurseries, near Liverpool.
J. M. THORNBURN & CO., 36, Cortlandt Street, New York, U.S.A.
OSMAN & CO., 132 and 134, Commercial Street, London, E.
HOGG & WOOD, Coldstream and Duns, N.B.
W. FELL & CO., Hexham.
F. MOREL & FILS, 33, Rue de Souvenir, Lyon-Vaise, France.

TRADE NOTE.

MR. ARTHUR ROBINSON, of 1A, Bishopsgate Street Without, has purchased the florist and seed business at Putney, lately carried on by Mr. W. A. Holmes, and formerly by Messrs. Mahood & Son.

ANSWERS TO CORRESPONDENTS.

BOOKS: A. T. C. Joscelyne. *Nature* is published by Messrs. Macmillan & Co., St. Martin's Street, Leicester Square, London, W.C.; and *Fern Growing* by John C. Nimmo, 14, King William Street, Strand, W.C.

CHRYSANTHEMUM SHOW: R. K. It is quite impossible for us to fully report even the most important of these and similar exhibitions. If details of 3rd and 4th prize exhibits were given, we should have no room for anything else. In former times the awards were treated as advertisements, and paid for by the Societies. Our publisher would no doubt not object if the practice were revived.

LAWN TENNIS COURT: J. H. A court for the single game, that is, for two persons, is 27 feet wide and 78 feet long. The court is divided across the centre by the net. The "service lines" are parallel to the net, and 21 feet distant from the same. A court for three-handed or four-handed games should be 30 feet wide, and the same length as the smaller court, and the posts for supporting the net should be placed 3 feet beyond the sides.

NAMES OF FRUITS: P. 1, King of the Pippins; 2, Stirling Castle; 3, Maux Codlin; 4, Lewis's Incomparable; 5, Scarlet Noopareil.—M. N. 1, Hordcad's Pearmain; 2, Dumelow's Seedling; 3, Forge Apple; 4, Cornish Aromatic; 5, Gas, coigue's Scarlet Seedling; 6, Bismarck.—W. R. S. 1, Lane's Prince Albert; 2, Cox's Orange Pippin; 3, Mère de Ménage; 4, Gloria Mundi; 5, Hambledon Deux Ans; 6, Hoary Morning.—Enquirer. 1, Blenheim Pippin; 2, Adam's Pearmain; 3, Pear Beurré Diel.—H. P. A. Winter Codlin.—Alpha, Norfolk. Pear Grand Soleil; Apple Cellini.—G. J. 1, Beurré de Wetterin; 2, not recognised; 3, Beurré Lefebvre; 4, Alfriston; 5, Caroline; 6, Ord's Apple.—H. S. W. 1, Beurré Clairgeau; 3, Bergamotte Defays; 4, Bergamotte Thoin; the others were quite unrecognisable, owing to over ripeness.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. E. G. *Cotoneaster multiflora*, Bunge.—M. C. *Cedronella mexicana* var. *cana*.—G. C. A species of *Cotyledon*, which we cannot name without the flowers. The true ice plant is *Mesembryanthemum crystallinum*.—J. McL. 1, *Pteris Regina cristata*; 2, *Selaginella Wildenovii*; 3, two plants, the green one, *Pteris serrulata cristata*, the other, same as No. 1; 4, *Pteris cretica albo-lineata*; 5, *Pteris longifolia*; 6, *Ruscus androgynus*.—W. C. *Euonymus europæus* (Spindle Tree).—J. W. *Onocidium unguiculatum*, said by some authorities to be a variety of *O. tigrinum*, but differing in the elongated labellum.—White Card-board Box. No Name. *Epidendrum inversum*.—S. 1, *Hippophae rhamnoides*; 2, *Escallonia macrantha*.—G. W. We are unable to name the Swiss Aster.—S. Wright. *Hemanthus puniceus* (Waved-leaved Blood-flower).

SITUATION AS GARDENER IN AUSTRALIA: S. S. J. Advertise in these columns, or in some of the Colonial papers. There are many good situations to be had, but it would be prudent to go out and see for yourself.

SOLDIERS' WIDOWS' AND ORPHAN FUND: G. M. B. We do not think your plan feasible or desirable. Each of us has already made or will make his contribution; and each of us is, probably, willing to repeat it when requisite. Whilst acknowledging to the full our duty as citizens, we must in these pages give precedence to the claims of the gardeners' orphans, and of necessitous gardeners.

SUNDIAL: J. C. You must first ascertain the longitude of the place in which the dial will be set, and the true time for the place, and then at the summer or winter solstice, so to arrange the dial as to afford the right time. The metal disc on which the hours are marked being moveable, it is easy to do this.

SWEET'S GERANIACEÆ: H. W. You have only one volume. Apply to some second-hand bookseller. It is not very scarce.

VIOLET LEAVES DISFIGURED: Pontypool. No fungus; but cold drip is probably the cause.

VIOLETS MARIE LOUISE: A. B. An excellent lot of blooms.

WATER-PLANT: J. W. A *Conferva*-like plant, of which we will endeavour to give the name later on. See letter in to-day's issue.

YELLOW ANTS IN GLASSHOUSES: A. L. You seem to have tried every known antidote, and we regret to be unable to advise you further on the matter.

COMMUNICATIONS RECEIVED.—J. H. Howell.—C. W. D.—H. D. N.—J. W.—Major B.—W. L.—T. R. & Co.—E. White-way.—T. G.—J. M.—A. H.—Expert.—H. M.—A. O'N.—F. B.—A. C.—J. P.—Sydney.—W. R.—T. Christy.—W. G.—J. O'W.—W. H.—Countess of I.—Rt. Hon. J. C.—G. C.—D. R. W.—H. W.—R. C. B., next week.—C. T. & Co.—Earl of A.—G. N.—N. E. B.—A. C., Verviers.—H. J. V.—A. D. N.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle

No. 675.—SATURDAY, DEC. 2, 1899.

THE ITALIAN LAKES.

LEAVING Lucerne by the night express, and by the Brindisi route through the St. Gothard tunnel, no views of the scenery could be obtained of the Swiss mountains, nor could any sight be had of the spiral windings of the St. Gothard tunnel as the train proceeded on its journey to the highest point, and then descended in the same manner towards the plains of Lombardy. When daylight dawned, the first indication of luxuriant growth was to be noted in the waving fields or patches of Indian Corn scattered along the line of route. Thence onwards, until Lugano was reached, there was ever-varying scenery and vegetation to attract the eye. At Lugano a stop was made for breakfast, thence onwards by steamer down the Lake of Lugano, and by rail again to reach Menaggio, a railway station upon the Lake of Como. As soon as we emerged from the station at Lugano, the gardens began to claim attention by reason of the luxuriant growth of the Palms, Bamboos, &c. Proceeding down the lake, the one plant above all others that stood out conspicuously was the Oleander (*Nerium Oleander*); these were then just in their full beauty, thriving apparently in varied situations, but, generally speaking, near to the walls by the lake-side. Varieties of *Hibiscus* and of *Aralias* were also noticeable, whilst the Olive was present in large numbers upon the lower slopes of the mountains, where they dipped into the lake.

Leaving the steamer at Porlezza for the train again, a short railway journey upon this small railway soon brought us within sight of Como, but the gradients to be descended were very steep, hence it took time to complete the journey. Through this line of route both Figs and Walnuts were noted along the sides of the railway.

Having missed the steamer at Menaggio, an opportunity was afforded of performing the rest of the journey to Cadenabbia in the characteristic boat of these lakes—the gondola.

CADENABBIA, VILLA CARLOTTA.

The vegetation around this favoured spot is most beautiful, varied and luxuriant. An excellent use is made of the Plane-tree for forming shaded walks during the heat of the day by the side of the lake. The gardens attached to the Villa Carlotta are situated upon the southern slope of a range of mountains, of which Mount Galbiga is the chief, being only separated from the lake by the roadway. No more picturesque spot for a garden could well be found, and the utmost use has been made of the natural surroundings to produce a lovely effect. The vegetation here is luxuriant in the extreme, aided by the water descending from the higher grounds, and from the evaporation of the lake itself. The gardens are entered from the

immediate front of the villa, and steps at once have to be ascended. No attempt, or but little, is made to adopt any formal style; true, there was a little display of carpet bedding, but it was toned down by the use of larger foliage plants up to the giant *Musa Ensete*. Conifers, it may be imagined, were here perfectly at home; such as the following were specially noteworthy—*Araucaria brasiliensis*, *Cryptomeria japonica*, *C. Veitchii*, and *Cupressus funebris* (up which a scarlet Rose was climbing, a variety we did not recognise). *Cedrus Deodara* was very fine, as well as many other Coniferous subjects not hardy in England. Both *Camellias* and Indian *Azaleas* thrive in an amazing manner; so also do the *Myrtles*, *Pomegranates*, and *Oranges*. Of the latter, in combination with *Citrons*, and others of the same family, a long pergola was well clothed. The effect thus produced was such as we cannot hope to attain unto in this country; the nearly ripe and ripening fruits on these were hanging over the walk in great profusion. The Bamboos alone are a feature in themselves; the varieties present in the greatest quantity were *Bambusa japonica*, with large growths fully 30 feet or more in height, which arched gracefully over the walks; *Arundinaria Falconeri*, 30 feet high, which made handsome specimens, one upon the grass being specially good; *Phyllostachys viridi-glaucescens*, *P. aurea*, and other varieties were also well represented, all of imposing dimensions, such as we can scarcely hope to attain to in England. Climbers were made free use of, and generally, too, in as natural a manner as possible, many clinging for support to other plants; these included *Bignonia grandiflora*, amongst other good things. The *Magnolias*, chiefly *M. grandiflora*, form noble symmetrical specimens, clothed from base to summit with most luxuriant foliage and dense growth—the flowering season was over; the tallest were from 35 to 40 feet high. Palms, it might be assumed, would, under these conditions, also thrive well; many of them are huge specimens. Note was made of *Brahea speciosa*, *Chamaerops humilis* (very fine), and *C. excelsa*; *Phoenix* in variety, varieties of *Acalypha*, as *A. Macfeeana*, dotted here and there added to the effect; *Caladium esculentum*, *Papyrus antiquorum*, with *Funkias* in variety, well clothed with foliage, were used with excellent effect. Many flowering shrubs which with us in England have to receive the treatment of a temperate-house, grow there in the free manner one delights to see; the season of these was, however, over. But the scarlet *Hibiscus* was most effective still, and so was *Russelia juncea*, a plant we seldom see grown well in this country.

Especially good effect was produced in one spot, a ravine or dell, in which Bamboos and Ferns were luxuriating. The colour effect in this charming spot was produced by *Hydrangea Hortensia*, with its rich blue trusses of flowers. In dry, sunny positions, *Agaves*, *Aloes*, and other succulents were noted in profusion, many being huge specimens. In spots where grass would not thrive, *Ophiopogon japonicum* was used in the same way as we employ *Selaginella* in our conservatories.

In one spot immediately in front of the villa, *Adiantum capillus-veneris* formed a dense mass of fronds; this was in a well chosen position, being recessed, the water trickling

down into a pool below. The plants throughout this charming garden have thriven to that extent that some thinning-out will have to be done before long—regrettable as it seems to be obliged to do it. No doubt, however, it will be taken in hand in the same careful manner as characterises its present management. Well chosen spots here and there are kept open, through which delightful peeps of the lake may be had below. *Jas. Hudson.*

NEW OR NOTEWORTHY PLANTS.

CYMBIDIUM GAMMIEANUM.

A NEW *Cymbidium* which is generally supposed to be a natural hybrid, or a hybrid raised in England, which has got mixed with imported plants, is flowering in several collections; for in two of the instances which have come under my notice, the plants were purchased among *Cymbidiums* imported by Messrs. F. Sander & Co., St. Albans, who doubtless obtained them from the Sikkim Himalaya, where they have a collector of new types of *Cypripedium insigne*, and other desirable plants. *Cymbidium Gammieanum* is illustrated in that beautiful work, *The Orchids of the Sikkim Himalaya*, by Sir George King, K.C.S.I., and Mr. Robert Pantling.

The gardener will best be able to conceive its appearance when I state that it resembles a narrow-petalled, unstriped *C. giganteum*, with more flowers on the inflorescence than is found in that species. The sepals and petals, nearly 2 inches in length, are of a tawny-yellow tinge; the elongated lip is also of a tawny-yellow, spotted with purple, and bears a purple callus up the centre; the whole of the surface of the lip, and especially the callus, are downy. The column is of a yellow tint, slight, and it has spotting of a purple colour on the upper surface, and is more heavily spotted and tinged on the under side, the colour being the same. It is a plant of graceful habit, and if it should remain a constant winter flowerer, it will be a very useful one. *James O'Brien.*

BYBLIS GIGANTEA.

Amongst interesting plants of which seedlings have recently been raised in the Royal Botanic Garden, Edinburgh, is the *Byblis gigantea*, an insectivorous plant of the *Droseraceae*, restricted to a few localities in Western Australia. I do not know if this is the first record of seedlings of this plant in cultivation in Britain. In an account of the Glasnevin Botanic Garden (see the *Gardeners' Chronicle*, April 22, 1899, p. 241), Mr. Burbidge mentions *Byblis* as one of the many rare plants in cultivation there. Beyond this notice, I have seen no account of the genus as being in cultivation.

The seedlings have short linear cotyledons, with but few viscid tentacles, the subsequent leaves differing chiefly in their length, and in the number of tentacles. One feature of this, as on all seedlings of *Droseraceae* grown in this garden, is the extraordinary number of insects captured by them. The plants are simply covered with insects, and these always much exceed in number those found upon older plants.

Whilst referring to seedlings of *Byblis*, I may at the same time mention another insectivorous plant, the *Roridula gorgonias*, of South Africa. In the *Gardeners' Chronicle*, Jan. 23, 1897, p. 65, I noted the flowering of this species. We have saved seed in each of the past years, and have raised seedlings. The cotyledons here have no viscid tentacles, and are therefore very different from the subsequent leaves. The introduction to this garden of *Byblis*, completes the generic list of the family of *Droseraceae* now in cultivation here. The genera of the family are *Drosera*, *Drosophyllum*, *Aldrovanda*, *Dionaea*, *Roridula*, and *Byblis*, and of each of these we have one or more specific representatives. *R. L. Harrou.*

SYSTEMATIC BOTANY FOR INDIAN FORESTERS.

[The following extract is taken from Sir George King's address to the Botanical Section of the British Association at Dover. The earlier part of the address has been already given (p. 252), but in view of the prevalent neglect of systematic botany, referred to in a leading article on p. 328, it is desirable to make our report complete by the insertion of the remainder of Sir George King's address.]

"In conclusion, I wish to make a few remarks on the third great economic enterprise connected with botany in India, viz., the Forest Department. The necessity for taking some steps to preserve a continuity of supply of timber, Bamboos, and other products from the jungles which had for generations been exploited in the most reckless fashion, was first recognised by the Government of Bombay, who in 1807 appointed commissioners to fix the boundaries of and to guard the forests in that Presidency. This scheme was abandoned in 1822, but was resumed in a modified form during 1839-40. Seven years later a regular forest service was established in Bombay, and Dr. Gibson was its first head. Dr. Gibson in turn was succeeded by Mr. Dalzell—and both were botanists. In the Madras Presidency the first man to recognise the necessity of perpetuating the supply of Teak for ship-building was Mr. Connolly, collector of Malabar, who in 1843 established a Teak plantation at Nelumbur, which has been carried on, and annually added to, down to the present time. In 1847 Dr. Cleghorn (a botanist) was appointed to report on the conservation of the forests of Mysore (which contain the well-known Sandal-wood), and the following year Lieutenant Michael (still with us as General Michael, a hale and hearty veteran) was appointed to organise and conserve the public forests in Coimbatore and Cochin. The crowning merit of General Michael's administration was the establishment, for the first time in India, of a system of protection against the fires which annually used to work such deadly havoc. In 1850 the British Association, at their Edinburgh meeting, appointed a committee to consider and report upon the probable effects, from an economic and physical point of view, of the destruction of tropical forests. This committee's report was submitted to the association at the meeting at Ipswich in 1851. The weighty evidence collected in this report so impressed the court of directors of the East India Company that, within a few years, regular forest establishments were sanctioned for Madras and British Burma, the two main sources of the supply of Teak.

In 1856 Mr. (now Sir Dietrich) Brandis was appointed to the care of the forests of the latter province. These forests had been the object of spasmodic efforts in conservancy for many years previously. In 1827 Dr. Wallich reported on the Teak forests, and five years later a small conservancy establishment was organised, officered by natives. This, however, was kept up for only three or four years. In 1837 and 1838 Dr. Helfer reported on these forests, and an English conservator was appointed. In 1842 and 1847 Codes of Forest Laws were drawn up, but do not appear to have been enforced to any extent. In 1853 Dr. McClelland was appointed superintendent, but he continued to hold the office for only a short time. A few years after Sir Dietrich Brandis's assumption of the charge of the Burmese Forests, he was appointed Inspector-General of all the Government forests in British India; and it is to him that we owe for the most part the organisation of the Indian Forest Department as it now exists. That organisation includes two schools of forestry (in both of which botany is taught), one in connection with Cooper's Hill, and the other at Dehra Dun in Upper India. The latter has for many years been under the direction of a gentleman who is distinguished both as a forester and as a botanist. In the Cooper's Hill school, the higher grades of forest officers receive their training; at Dehra Dun those of the lower grades receive theirs. The officers of the depart-

ment on the imperial list, according to the latest official returns, now number 208, divided into the grades of conservator, deputy and assistant-conservator, with a single-inspector-general as chief. In addition to these, there are 566 provincial officers, ranking from rangers upwards to extra deputy-conservators.

Botanists took a leading part in moulding the department in its earlier years; for, as already stated, its pioneers—Gibson, Dalzell, Cleghorn, Anderson, Stewart, and Brandis—were all botanists. And to most people, who give even casual attention to the matter, it appears fitting that the possession of a knowledge and liking for botany should form a strong characteristic of officers whose main duties are to be in the forest. And this belief did for some time exercise considerable influence in the selection of recruits for the department. But, except in the Dehra Dun School, it does not appear to guide the department any longer. For example, at the Entrance Examination to the Forest School at Cooper's Hill, only three subjects are obligatory for a candidate, viz., mathematics, to which 3000 marks are allowed; German, to which 2000 are allowed; and English, for which 1000 are given. Botany is one of the nine optional subjects of which a candidate may take up two, and in each of which 2000 marks may be made.

Botany is taught at Cooper's Hill, and (according to the Calendar of the College) it forms one of the "special auxiliary subjects" for the forest student. I do not wish to say a single word in depreciation of the botanical teaching at this college, which is probably excellent of its sort. I do not know what value, as part of their professional equipment, students are accustomed or encouraged to attach to the possession of the means of acquiring a knowledge of the trees and shrubs in the midst of which they are to pass their lives in India. But this I do know, that the ordinary forest officer educated in England now arrives in India without sufficient knowledge to enable him to recognise from their botanical characters the most well-marked Indian trees. To tell such an officer the name of the natural family to which a plant belongs conveys no information to him whatever, for he knows nothing of botanical affinities. Moreover, the forest officer after he has arrived in India is not encouraged to familiarise himself with the contents of the forests under his charge. This will be better appreciated by giving an example than by any number of remarks. Some three years ago, Mr. J. S. Gamble (a Forest officer) published a monograph of the Bamboos of British India. From Bamboos, as you may possibly be aware, a very large amount of Forest revenue is annually derived. The sales of Bamboos for the year 1896-97 amounted to no less than 110 millions of stems. A great number of the species of Bamboos have the curious habit of flowering gregariously at remote intervals of thirty or forty years, and the flowering is followed by death. The absence from the forests for years in succession of flowers of a number of the species, and the similarity of many of them in leaves, had hitherto made members of the group most difficult of identification. Mr. Gamble had devoted himself to their study for many years. He had carefully examined all the previously collected materials stored in the Herbaria at Kew, the British Museum, Calcutta, and elsewhere; and large special collections had been made for him by Mr. Gustav Mann and other officers of Government. Moreover, he had General Munro's great paper in the *Linnean Transactions* as a basis. Mr. Gamble's work was undertaken with the full approval of Sir Joseph Hooker, who indeed accepted Mr. Gamble's account of the Bamboos for his *Flora of British India*. Mr. Gamble's monograph is illustrated by a life-sized drawing of each species, with analyses of the flowers on a larger scale. When completed, the book was published as one of the volumes of the *Annals of the Calcutta Botanic Garden*. In consideration of the supposed great importance of the book to the forester, and in the belief that the copies would be eagerly taken by the Forest Department,

an extra hundred copies were printed, and these hundred copies were put into stout canvas binding, suitable for camp use. These copies, or as many of them as he cared to take, were offered to the head of the Forest Department in India at the reduced price of fifteen rupees per copy. The result was, an official refusal to buy a single one, although the purchase of the whole hundred (which was not asked for) would have cost only 1500 rupees—a sum which would have reduced the revenue of the year by about one twelve-thousandth part! An appeal against this ruling having been made to a still higher authority, a modified order was subsequently issued permitting such forest officers as desired to possess the book to buy copies and charge the cost in their office expenditure. I may state that the book was not a private venture. It was produced at the expense of the Government of Bengal.

Having myself served in it from 1869 to 1871, I can speak from my own experience as to the value, from the utilitarian point of view, of a knowledge of the names, affinities, and properties of the trees, shrubs, and herbs which compose an Indian jungle, and of a knowledge of these as individual members of the vegetable kingdom rather than as masses of tissue to be studied through a microscope. The appointment which I held in India for twenty-six years after leaving the Forest Department gave me full opportunity of getting into touch with all who interest themselves in a knowledge of plants, and of discovering how few of these at the present day are Forest officers. The majority of the latter, if they love their trees, are content to do so without knowing their names or relationships! There are, of course, splendid exceptions who know as well as love. The general decadence of the teaching of systematic botany in England during the past twenty years is, perhaps, to some extent the cause of the low estimation in which the science is held by the authorities of the Indian Forest Department. Twenty-five years ago systematic and morphological botany, no doubt, had too great prominence given to them in the teaching at universities and colleges of this country, and the other branches of botanical science were too much neglected, although I do not think they were despised. Now, it appears to me, that systematic botany is too much neglected. I hope it is not also despised! Few of the systematists who survive in England are now to be found attached to the universities. They are mostly clustered round the two great Herbaria in London; and such of them as have to look to systematic botany for the means of livelihood, are not in the receipt of salaries such as one might reasonably expect in one of the richest countries in the world!"

ORCHID NOTES AND GLEANINGS.

"DICTIONNAIRE ICONOGRAPHIQUE DES ORCHIDÉES."

The third series of this useful publication is now complete. The fourth series will, we are told, appear in future at bi-monthly intervals, instead of monthly, the price of the subscription being reduced to 30 francs (£1 4s.), payable in advance. Subscriptions should be paid to M. Goossens, Rue Quinaux, Schaarbeck, Bruxelles. With the present number an index of the plates already published is given; thus we find forty-one *Cattleyas*, ten hybrid *Cattleyas*; eight species of *Cymbidium*, with two hybrid forms; about thirty species of *Cypripedium*, with fifty hybrid forms. *Dendrobium* is represented by about twenty-three species, and three hybrids; *Epidendrum* by fourteen species, and one hybrid; *Laelia* by about twenty-four species and five hybrids; *Laelio-Cattleya* by eight forms; *Lycaste* by ten species; *Mastrobella* by fourteen species, and two hybrids; *Miltasia* by fourteen forms, and seven hybrids; *Odontoglossum* by forty-eight, fifteen of which show variations of *C. crispum*, and ten

hybrids. The genus *Oncidium* is illustrated by twenty-eight species and varieties, and two hybrid forms. *Phalenopsis* comprises ten plates of species, and no hybrid forms. *Vanda* has fifteen representations of species and varieties, and no hybrid forms. Each of the above-named genera has its own special portfolio, but the species of the following genera are not numerous enough to be accorded such a privilege, which is to be regretted. Now that the plates can be bound in any way the possessor pleases, this objection is of minor moment. These genera are *Ada*, *Arides*, *Angraecum*, *Anguloa*, *Bifrenaria*, *Brassavola*, *Catasetum*, *Cirrhopetalum*, *Cochlidia*, *Coelogyne*, *Comparettia*, *Cyperorchis*, *Cyrtopodium*, *Disa*, *Epilaelia* ×, *Epiphrontis* ×, *Eulophiella*, *Maxillaria*, *Mormodes*, *Pescatorea*, *Phaius*, *Pleurothallis*, *Renanthera*, *Scuticaria*, *Selenipedium*, *Sobralia*, *Sophrontis*, *Stanhopea*, *Stauroopsis*, *Trichopilia*, *Warsce-*

Lord Burleigh, a late variety. It is short-jointed in growth, most prolific in bearing, and will be recognised as one of the best Apples for dessert in the early part of October. The fruit will probably not store long, and should be used within twenty-one days of gathering. It will be sent out in 1900. (See fig. 130.)

VITIS COIGNETIÆ.

THIS Vine, with its gloriously-tinted autumn leafage, appears to be not only capable of withstanding the severity of our Scottish climate, but also of affording decorative effects rivalled by no other plant. I do not know if two forms of the one species are in cultivation, or if two distinct species are grown under one designation, but we have here two kinds, which in general appearance exhibit no very marked difference until autumn, when the foliage of the one assumes a light-crimson tint of

FLORISTS' FLOWERS.

DECORATIVE CHRYSANTHEMUMS.

I do not think it can be said that exhibitors or the admirers of the decorative Chrysanthemum, so-called, have been neglected in these pages for the last month, at any rate, an enormous number of shows having been reported, and information concerning the winners of prizes disseminated. There are many other cultivators and *connoisseurs* who deserve some attention likewise, viz., those who admire Chrysanthemums solely for their decorative value in a mass, or in clusters of many blooms; really handsome floriferous plants, which will grow less than 8 feet high, and with but a small amount of labour and expense. Now that varieties have increased so much, plenty of material from which to select in all sections is at the service of every one. The admirer of the purely decorative varieties are as much catered for by the raisers of new varieties as even the exhibitors and cultivators of big blooms. There is no difficulty whatever in enumerating names of varieties, including the newer ones, which could not fail to give satisfaction if the cultural requirements are duly carried out; and these are simple, as compared with those called for in the production of blooms of the finest quality. A start must be made with stout, healthy cuttings in the first week in January, inserting these singly in 2½-inch pots in rich, sandy soil, which should be placed in a hand-light, or propagating-frame, standing inside a greenhouse or cold-pit until rooted. Rooting having taken place, gradually accustom the little plants to the air, and in the course of a week or ten days they may be stood on a shelf close to the glass in a cold greenhouse or cold frame, with protection against frost. The aim should be directed to the ensuring of a stocky lot of plants. As soon as growth becomes apparent, the points should be nipped out at 4 inches high, the nipping being repeated when about 5 inches of new growth has been made; afterwards the plants may be permitted to grow at will. The size of the blooms and their number on a plant can be regulated by disbudding or thinning the shoots later on.

As the roots fill the pots, re-pot them. There is no need to abide by any stated lines for re-potting, nor is any certain size of pots recommended, these being matters to be decided by the gardener. The chief point is the encouragement of growth from start to finish. It may, however, be stated that a pot 9 inches in diameter is large enough for the most robust-growing variety, and one 2 inches less in diameter will suffice for the small-growing and small-flowered ones, and such are very handy for indoors decoration.

The sort of potting compost to be used is a rich porous rather than a fanciful mixture of so many pounds of each; and such a compost will be found in good fibrous loam (three-quarters), half decayed stable-manure (one-quarter), with a small quantity of leaf-mould, silver-sand, and charcoal if the loam is heavy and tenacious. To every bushel of this compost 1 lb. of Thompson's Vine-manure may be added in the early stages of growth, the quantity being increased to 2 lb. at the final shift. The Chrysanthemum needs much care in affording water when young, for although a moisture-loving plant, it suffers irremediable injury from a too free use of the watering-can. As a general rule, it may be said that when the soil is approaching dryness is the proper moment to afford water, and at no other.

The following is a list of varieties which will not fail to afford satisfaction. As nearly as possible they are grouped in their colours, and selection is thus rendered easy:—

White-flowered varieties.—Elaine is still popular; in fact, of all white-flowered Chrysanthemums, this is still the whitest. It is the variety by which to test others, and it will be found that many of the so-called whites are not white at all when placed beside Elaine; then Madame Carnot is a good

FIG. 130.—APPLE MISS PHILLIMORE.

wiczella, *Zygocelax* ×, and *Zygopetalum*, containing respectively from one to five illustrations. These figures are near approximations only; but they are interesting, not only as showing the number of forms described by M. Cogniaux, and drawn by M. Goossens, but they serve to give an idea of the relative degree of popularity of certain genera and species, and of the extent to which they have been hybridised or cross-bred. The great advantage of this publication is, that accuracy of detail is considered of more importance than artistic effect, and hence these plates, restricted though their dimensions be, are of more service to botanists and Orchid-growers than many publications of a more ambitious character.

MISS PHILLIMORE APPLE.

THIS variety, which received an Award of Merit at the meeting of the Royal Horticultural Society on November 7, 1899, is a seedling raised by the veteran gardener, Charles Ross, of Welford Park, and was purchased by Messrs. Bunyard & Co., the Royal Nurseries, Maidstone, in 1896. It is said to be a cross between Gladstone, an early variety, and

wonderfully brilliant effect; and that of the other, less brilliant, becomes a duller shade of crimson, with some leaves bronzy-purple, and others yellowish-green. The former of these was sent from Carton, and the other from the nurseries of Messrs. Veitch and Sons, Chelsea. Both plants are almost equally meritorious, the Irish one excelling in brilliancy of colour. I drew Mr. Black's attention to dissimilarities in the two when he was here in September, but he was unable to give a definite opinion as to their identity. All the growths are pruned hard back in the spring, and after breaking, the stronger buds only are allowed to push. These produce long and vigorous shoots clothed with large leaves, that are attractive during the whole period of development. One plant, it may be added, is trained to a wall with an exposure to the west, but it is allowed to ramble, while extending, where it pleases. The other is trained as a standard, to a small tree-stem, from the top of which the shoots reach the same wall, so that it may safely be concluded that plants accorded a southern exposure, will be relatively more effective than even these. *R. P. B., Prestonkirk, N.B.*

free-flowering variety; Queen of the Market is superb; and Isabel Williams is a white flower of the Elaine type, with the florets of Niveum. These five are all that could be desired in white flowers. Mrs. H. Weeks is much better as a decorative variety than many would suspect; Mdle. Lacroix, when seen in a mass, has an unique character, and is very desirable.

Broad-petalled varieties are well represented by Emily Silsbury, Western King, and Lady Esther Smith.

Late-flowering varieties will easily be culled from Madame Philippe Rivoire, Niveum, The Queen, Souvenir de Petite Ami, and Lady Trevor Lawrence.

Yellow-flowering Chrysanthemums are much appreciated, and the variety R. Hooper Pearson is one of the first rank, with lustre quite unequalled by any other variety; the new Cheveux d'Or and Golden Plume must not be omitted. Clinton Chalfont is very fine and bright; Madame Liger Ligereau, Hugh Crawford, and M. Dysius are a trio of varieties but little known at present, but pale-yellow tints are represented by P. J. Warren, Lady Onslow, Mrs. Filkins, Soleil d'Octobre, Oceana, and Australian Gold. The variety H. Lincoln is still one of the finest of late-flowering "mums," so likewise are the incurved varieties C. Curtis and Major Bonnaffon.

Bronze-coloured varieties are popular and numerous, of which I may name Source d'Or, which is still a leading one; Charles Davis is free to flower, and dwarf of growth; Rycroft Glory cannot be excelled for its freedom to produce flowers; Secretaire Fierens is a fine variety, with a pleasing flush red; M. Charles Molin, T. Wilkins, Mrs. Maling Grant, Le Grand Dragon, Julia Scaramanga, Colonel W. B. Smith, and C. A. Owen complete my list of bronzes.

Crimson or red are favourite colours with many persons, and they are well represented by H. J. Jones, one of the best; Rycroft Scarlet, a dwarf, and very highly floriferous variety, and the nearest approach to scarlet that we possess; Reginald Godfrey, Matthew Hodgson, Lord Cromer, Hon. F. D. Smith, Hero of Omdurman, John Shrimpton, Royal Standard, Richard Dean, E. C. Schwabe, Edwin Molyneux, and Joseph Chamberlain are trustworthy. Pink and its nearly allied tints, lilac and mauve, are much liked, and Chrysanthemums of this class are La Nympe, Bouquet, Margot, and President Borel are old varieties still in vogue. Viviani Morel is newer, and, as yet, still unsurpassed; Mrs. F. A. Bevan and Madeline Davis are chaste varieties, exceedingly free to flower; Lilian B. Bird, with its long, narrow, quill-like florets, has still many admirers; Chatsworth, with its deep rose stripes on a lighter ground, is attractive; Belle Mauve, Pink Selborne, and the new Amy Ensoll, are all worthy additions to this class.

This list would not be complete without mention being made of Pride of Madford, one of the brightest of the Japanese varieties, when grown so as to present the surface of the petals instead of the reverse. *E. Molyneux.*

TREES AND SHRUBS.

TREES FOR SURREY SANDS.

IN an article in the *Field*, Sir Charles Dilke records his experiences with several of the newer and other Conifers. The blue variety of Lawson's Cypress, *Cupressus erecta glauca*, is highly praised as a wind-break as well as for its decorative properties. The Corsican Pine, *P. Laricio*, excites the writer's enthusiasm, while the black Austrian is placed on a lower level. Nothing is better than the common Scotch—the native Pine in former ages—and fast resuming its ancestral habitat where circumstances are propitious. For single specimens, *Pinus ponderosa*, *Picea orientalis*, and *P. pungens*; and for an

avenue, *P. Laricio*, if the iron "pan" be removed. *Picea pungens argentea* is also commended, but is not altogether trustworthy, for trees that once were beautiful have become "scrappy," a condition which almost all Conifers are liable to assume as they grow older. The green *pungens*, we may add, does well on London clay, and is very dense and strong growing.

CARYOPTERIS MASTACANTHUS.

It is evident that the good qualities of this aromatic shrub are bringing it into prominence in the south of England. It is pleasing to find it succeeds also in Scotland as a hardy shrub, though in our case it was planted out with some fear as to whether it would prove hardy, or bloom sufficiently early to escape frosts. Our bush is 7 feet across, and flowers in the most profuse manner, though it must be confessed it is growing along with *Carpentaria californica*, and other reputedly tender subjects in a very warm position, and I think it not unlikely that failure would ensue if it were grown in an exposed place. In general appearance it is when in full bloom somewhat reminiscent of *Ceanothus azureus*. As well as being pretty, the flowers, and also the leaves when touched, emit a very pronounced aromatic scent. The flowered-out shoots require to be cut back annually in spring, and weakly growths altogether removed. It succeeds in ordinary soil. *R. P. Brotherston, Prestonkirk, N.B.*

ARAUCARIA IMBRICATA.

It is no uncommon thing to meet with adult specimens of *Araucaria imbricata* in an unsatisfactory condition, and especially on light, well drained soils—the rooting medium usually advised for them. The trees grow symmetrically for, say, twenty years after being planted, then they get less vigorous, and eventually growth comes to a standstill; the lower branches die, and the trees become anything but objects of beauty. My opinion of the reason for this state of things is, that it is due to lack of water in the soil during the season of growth. In the province of Araucania, in Central Chili, the home of *Araucaria imbricata*, a considerable amount of rain falls between May and September, or later in the year, the remaining months of the year being almost rainless. It is this copious rainfall that is lacking in this country, especially in the north, south, and east; on the west coast and in Ireland, where a heavy rainfall occurs, the trees form fine specimens. A tree in these gardens (Isleworth), considered a good specimen, is about 40 feet in height, with a stem girth of 5 feet, and spread of branches 20 feet, began to decline a few years ago, and it was thought that it had reached the limits of its existence, and as the loss of the tree would have been a serious matter, it was resolved to copy nature; and water was laid down, and so arranged that a flow of about 30 gallons a day was secured during the summer months; a portion of the soil being removed, so as to form a basin to contain it. During the two years that this kind of water-cure was adopted, the tree has much improved, and the top is a dense thicket of young shoots, through which the sky can scarcely be seen, and the lower branches have drooped from the increase of their weight of new growth, and now fill the space occupied by dead branches before the treatment was commenced. New shoots which are pushing out directly from the trunk, also bid fair to restore the symmetry of the tree. This sort of treatment, or a modification of it, is neither desirable nor called for on retentive soils. *A. imbricata* is deservedly a tree for important points in garden landscape; and any kind of treatment that will keep a well formed specimen in good health is labour well expended. I may mention *apropos* of *Araucarias*, that a specimen of *A. excelsa*, 6 feet in height, was left outside last winter in order to test its hardihood, and it was found that it withstood 3° and 4° of frost unharmed, but finally succumbed to 8° of frost. *Geo. B. Mallett, Isleworth.*

THE BULB GARDEN.

MONTBRETIAS AND TRITONIAS IN SCOTLAND.

So valuable are the Montbretias in the flower-garden, that one need advance little in defence of the desirability of saying something about their behaviour in Scottish gardens. One finds that they are, year after year, becoming more largely grown, and that almost the only obstacle to their extended cultivation is the fear which exists in the minds of some that they are not hardy enough to withstand the winters of our northern land, whose rigours are, one has confidence in saying, much exaggerated, although certain districts are colder than others. The writer has had frequent opportunities of studying the hardiness of the Montbretias, either from growing them or from being in communication with others in various districts; and these comparisons lead him to the conclusion that in most Scottish gardens, with one or two precautions, not needful in some, the lovely hybrid Montbretias may be planted with safety. This remark is, however, made subject to the statement that there are gardens in which they cannot with safety be left in the ground during ordinary winters. Some who have failed to preserve their plants in the open in winter seem of opinion that their districts are too cold, but one finds that the failure generally proceeds from the character of the soil in which they are grown. One knows, for instance, of a garden in the southern counties of Scotland, in which the Montbretias have survived the most severe season of recent years, and, not many hundred yards off, another garden in which they are destroyed, even in the milder winters we have had of late. In one garden in the east they are not to be relied upon; in another only a mile or two away they give no trouble. In the north-east also, they are hardy in most gardens, and in the milder west they usually need no protection. There are two descriptions of soil which appear to give rise to those unfavourable opinions and experiences. The one, as in the southern garden referred to, is that of a cold, heavy, and damp nature; the other being one of a very light character through which the frost penetrates readily, and to a considerable depth. One sometimes finds that soil of the latter kind is not adapted to bulbous plants of doubtful hardiness.

If we can once realise that the Montbretia is hardy enough to stand our Scottish winters in most places, it would not be difficult for those who cannot grow it to give it a little surface protection when it is situated in light soils. One useful precaution is to leave the withered foliage uncut until spring. Our natural desire to have a tidy garden is responsible for depriving some plants of their natural shields from cold and wet. Those who have heavy and retentive soils must endeavour to lighten them if they wish to succeed with these flowers. So far as I can ascertain, a few of the yellow varieties seem a little less hardy than *Tritonia Pottsii* or even than *Crocus aurea*. In some districts the latter almost requires a covering of ashes or other loose material by way of precaution.

While one considers *Tritonia Pottsii* quite hardy in most gardens, one must speak with less confidence of the very beautiful *T. imperialis*. It has not yet been long enough tested in the outdoor garden under ordinary conditions for me to write with any confidence. I think, however, that we have a reasonable ground for saying that it may prove almost, if not quite, as hardy as the old *T. Pottsii*. I now know of a few gardens in the south of Scotland where it has been out for at least a couple of winters without injury. These winters have not been of what we may call average severity, but they have, on the other hand, been unusually wet, and have, besides, been followed by late spring frosts. Both of these, as is well known, are frequently more harmful than hard winter frost. I saw in the course of the past summer a very thriving clump of *Tritonia imperialis* in the

garden at Kirkconnell, Dumfries, where it had been for two winters with only the protection of a mulch of cocoa-nut fibre. Beyond the radius of the fibre, offsets had begun to appear. It seems almost superfluous to draw further the attention of Scottish growers to the desirability of experimenting with this fine plant, with which a new feature could be given to the flower border.

One would like to add a word or two as to the arrangement of the Montbretias in the garden. One has seen some fine beds consisting of one colour only, and similarly groups in the border all of one tint. Some time ago Mr. Brotherston, of Tynninghame, made the remark in the *Gardeners' Chronicle* that the red and yellow Montbretias looked

IRIS SUSIANA.

The pushing growths of this denizen of old gardens reminds one that those who wish to give it a trial should lose no time in procuring plants to set out at once. The real difficulty one has to face in its cultivation in the north is the unnatural period during which the earlier portion of its growth is made. Here it invariably starts into new growth in October as soon as cold nights set in. Fortunately, it is sufficiently hardy to withstand the frosts of an ordinary winter, though a little litter placed lightly among the foliage is an expedient worth adopting as a precaution. We have a clump that annually produces flowers, and every year increases in vigour, a happy condition

more than once been told is the correct treatment to accord this and allied species.

In Hill's *Eden*, which contains a beautifully engraved bloom, it is recommended to raise and increase stock from seeds, and if we are to credit the author the seedlings produce flowers in eighteen months from the time of sowing, a period which is, so far as my experience with seedling Irises goes, very much too brief. It is also recorded in this work that the Dutch introduced the plant into Europe in 1573. Gerarde engraves an exceedingly poor specimen of this flower under the name of "*Iris chalcidonica*, or Turkey Floure-de-luce," and adds, it is "*a rare and beautiful floure to behold.*" It may be noted, in conclusion, that a variety belonging to the Germanica group is sometimes cultivated in gardens as *I. Susiana*. *R. P. B.*, *Prestonkirk, N.B.*

CYPRIPEDIUM "MILO," WESTON-BIRT VARIETY.

THIS variety stood out among the fine lot of *Cypripediums* exhibited at the Royal Horticultural Society, from Captain Holford's garden at Weston-birt, Tetbury, on Nov. 21. It was raised from *C. insigne* Chantini and *C. oenanthum* superbum. The dorsal sepal is pure white, the lower half thickly spotted with deep blackish-purple spots. The lower pair of conjoined sepals is similarly but less conspicuously marked. The petals and the lip are deep purplish-brown, glossy on the surface. (See fig. 131.)

COLONIAL NOTES.

BOTANIC GARDEN, GRENADA.

Arca.—The Botanic Garden comprises 14 acres and 18 perches. It was established in the year 1886 by the Government upon the advice of Dr. Morris, then of Kew Gardens, to further the interests of agriculture and botany, &c.

The Botanic Garden lies upon a sloping site that continues down to sea level. A small jetty communicating with a shaded path leading to the gardens is built into the Lagoon, forming a comfortable landing place for visitors to the gardens. Its object is to introduce new economic and ornamental plants; to show by experiment what will, and what will not, grow in the colony; to advise colonists in general in agricultural and horticultural objects; to interchange plants, seeds, &c., for desirable plants, seeds, &c., with people, and institutions locally and abroad; to supply planters with small or large numbers of economic plants at rates published on the monthly plant sales list; to maintain and catalogue a herbarium of the indigenous flora, timber trees, medicinal and ornamental plants, grasses, ferns, mosses, fungi, and weeds; to afford generally practical information and advice in agriculture and horticulture; and to be the centre from whence economic and ornamental plants may be distributed throughout the colony of Grenada.

The curator visits the out-districts periodically in the interests of the peasantry, the planters, and the Botanic Garden.

Mr. W. E. Broadway is the curator.

GRAFTING-WAX, EFFICIENT, AND EASY TO MAKE.

To three parts of rosin add one part of beeswax, melt together in an iron pot; for use, remelt in a carpenter's glue-pot, and when the wax is of a consistency to work freely, apply with a small brush. The uses of the glue-pot are two-fold; the jacket of hot-water will prevent the wax being heated to a point dangerous to the scions, and further will retain it in workable state for a considerable time; without the intervention of the hot-water jacket, it is quite possible to make the grafting-wax much too hot for safety. The proportions of rosin and wax given would be suitable for the English climate; under the African sun I find it is better to use four parts of rosin to one of beeswax. This cheap and

FIG. 131.—CYPRIPEDIUM "MILO": FROM CAPTAIN HOLFORD'S COLLECTION, WESTONBIRT.

better mixed than separate. This is not what is usually found to be the case, and it was not until I had an opportunity of seeing this arrangement in the Tynninghame garden that I could appreciate the idea. The mixed Montbretias made a much prettier effect than groups of the same size, in the same borders, but consisting of one colour only.

I desire, ere closing, to remark that the Montbretia is greatly benefited by being lifted at intervals of two or three years and replanted, after taking off the offsets. I do not find 6 inches apart too much, if large spikes are required. Another remark is that it does not thrive nearly so well in a dry, sunny position as in one that is fairly moist, with a little shade, provided that the soil is properly drained, and not too heavy. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

that I am fain to attribute to manurial surface-dressings, the method of applying manures which, in the case of all species of *Iris*, appears to be that best suited to that family. Our plants came originally from northern Italy, and I inferred from the soil that clung to the roots that they had been cultivated in a heavy kind of soil. They were planted in a soil not exactly of the same nature, but in one that was slightly sandy, which was surrounded with sound loam as a root-run for the plants when once established, and this medium seems to have met their requirements perfectly. The position selected for their growth was the warmest and the most sheltered obtainable, and judging from the manner the plants have progressed from the first it appears they do not require to be subjected to the "roasting" process which I have

simple preparation has been used extensively in these gardens and nurseries for many years past with great success. *E. Tidmarsh, Curator, Grahams-town Botanic Gardens.*

THE FERNERY.

FERNS: VARIETIES.

It is difficult to account for the variations found among seedlings. It has been suggested that hybrids may be obtained by sowing spores of different kinds together. Many of the more distinct varieties do appear to be of hybrid origin; but from my own experience I am led to believe that the question of parentage must always remain a matter of doubt. All the different varieties that have come under my notice have originated by chance rather than by design. I have known instances among *Adiantums* where spores have been accidentally mixed before sowing which have resulted in some distinct varieties; but whether cross-fertilisation took place is open to doubt, for when I have tried experiments I have never succeeded in getting anything distinct. I think most of our best varieties are simply natural variations of the same species; those which prove abortive being the most beautiful, owing to the energy which would be expended in maturing spores being concentrated in the fuller development of the leafy portion of the fronds. Taking *A. Farleyense*, though I cannot understand why it should be considered a variety of *A. tenerum*, it is quite evident that it is a natural variation from some species, and the fact of its being entirely destitute of spores, the whole energy of the plant is concentrated in the leafy portion of the fronds. In *A. capillus-veneris* var. *imbricata* there is little doubt about this being closely allied to our native *Maideuhair*; this, too, is barren, though in the place of spores small bulbils are formed on the margins of the pinnules, and from these young plants may be established. This appears to have originated as a chance seedling. Reverting to my own experience, it was when spores of *A. æmulum* and *A. Waltoni diffusum* were accidentally mixed before sowing, which resulted in a greater variety among seedling Ferns than I have ever seen. *A. elegantissimum*, *A. tenellum*, *A. Hemsleyanum*, and others, came from this batch; in fact, among upwards of a hundred plants there were hardly two alike. *A. reginæ* came among a batch of seedlings where spores of *A. scutum* had been mixed with those of *A. Victorice*. The original plant of *A. reginæ* was very distinct, but although it may be raised from spores, they do not come true, many of the seedlings being dwarf as in *A. Victorice*.

LOMARIA GIBBA PLATYPTERA.

It is recorded that this was the result of sowing *L. gibba* and *Blechnum brasiliense* together, but I believe it is simply a barren form of *gibba*, and I am strengthened in this belief by the fact that I have found it among seedlings of *L. gibba* when no *Blechnums* could have come in contact with them. Although it appears to have spores along the mid-rib as in the *Blechnums*, I have never known of an instance where seedlings were raised; but I have on several occasions found them among the *gibbas*. *Lomaria ciliata grandis*, and *L. ciliata major* came as chance seedlings from *L. ciliata*, and these, especially the first-named, appear to be allied to the *Blechnums*, yet both of them reproduce from spores. *Grandis* does not come so free, but *major* may be raised as freely as any Fern I know, though a considerable variation will be found among seedlings.

GYMNOGRAMMAS.

Although the various distinct varieties usually come true from spores, occasionally a number of variations will be found among one batch of seedlings. The colour of the farina, or powder, varies almost as much as the colours in some flowering-plants. We now have some seedlings of the crested var. *Wettenhalliana*, some of which are silvery-

white, others varying from pale sulphur to deep yellow. I may mention that *G. Mayi*, which appears to be a vigorous form of *G. peruviana*, does not appear to come freely from spores; in fact, I have never known a batch to be raised, but have found stray plants among other varieties. *G. Pearcei robusta* is another which does not mature spores, and I am afraid it would now be difficult to find this beautiful variety. *G. schizophylla gloriosa* varies when raised from spores, and to keep the true form it should be propagated from the young plants or bulbils, which are formed on the extremities of the fronds.

DAVALLIAS.

Some good varieties of these have appeared among chance seedlings, especially from *D. fijiensis*; these all appear to be natural variations rather than hybrids, for I have found the same results from successive batches of seedlings.

NEPHROLEPIS.

These will also vary when raised from spores, and in selecting the spore-fronds they should be taken from the best habited plants, even the individual fronds make a difference. The beautiful *N. Bausei*, obtained from a frond of *N. pluma*, a few of the pinnæ of which were deeply cut.

ASPLENIUMS.

Some very distinct varieties of these have occurred, notably from *A. Baptisti Druryi*, a crested form being the most remarkable, being the only one of this section which has any semblance of a crest. *Mayi* and *elegantissimum* appear to be intermediate between *Baptisti* and *pteridoides*, but whether they are actual hybrids or not it would be difficult to determine.

POLYPODIUMS.

Varieties of these (except of the British species), are not numerous. *P. Mayi*, which came as a chance seedling among a large batch of *P. glaucum*, is another remarkable instance of the beautiful development of a barren variety. I may mention that from the same batch of seedlings a few of a semi-crested character were found, but I doubt if these would retain their character as they advance. *P. Schneideri* is another instance of remarkable frond development. I have found spore-cases on this, but have not succeeded in raising seedlings, nor do I think anyone else has done so.

PTERIS.

Of Ferns generally cultivated, the varieties of this genus are more numerous than of any other. A curious point with regard to some of the crested forms is that the multifid growths will continue to grow on the same fronds for an indefinite period. I have seen plants with fully-matured fronds, which, when stimulated, will start to make new growth from the extremities of the fronds; and in some of the densely-crested varieties it seems quite natural for them to go on increasing in density so long as they are kept in a healthy state. Of the varieties, it is difficult to divide those of *serrulata* from those of *cretica*, there being now such a number of intermediate forms. Of *serrulata*, I find among dried specimens collected nearly thirty years ago, a very vigorous variety, with large spreading fronds. I have come across a similar variety among seedlings since, but have never been able to get a batch of seedlings, though what have appeared to be good spores have been plentiful. Among all the various crested varieties, until the advent of *P. Wimsetti*, I never found one with the crested lobes on the sides of the pinnæ; it would be found that in all the others the multifid growths are terminal. In *P. Childsii*, which is a new variety, and, I believe, entirely devoid of spores, these side growths are very remarkable. *P. Summersii* is somewhat similar, but has a more decided terminal crest; these were both chance seedlings. *Wimsetti* was also an accidental find among a batch of crested *cretica*. *Tremula* has given some remarkable distinct varieties. The crested form which most resembles the type is *Smithiana*; *elegans* and

grandiceps have heavy, drooping crests, and at first sight *elegans* might be taken for a variety of *serrulata*, but on closer inspection the parentage is quite evident. Of *cretica* there are some very distinct varieties, both in simple and crested forms. *Drinkwateri* would suggest some affinity to *umbrosa*. I have lately received fronds of two other varieties from the raiser of *Drinkwateri*: one named *metallica*, has very broad pinnæ of a deep green, with the bright surface as in *umbrosa*. *Pteris Victorice*, the pretty variegated Fern which came from the Philippines, has given some distinct varieties, *Reginæ* and *Reginæ cristata* being the most useful. It is curious that the same varieties have been raised both on the Continent and in America as in England; also the variety named *tremula variegata*. When this first appeared, it looked very promising; but it has proved a disappointment, for, so far as I am aware, it does not reproduce from its own spores, and the limited number obtained from *Victorice* soon grew out of character.

It is curious that although we hear of crosses having been made, all the most beautiful garden varieties we know have been the result of accident rather than design. *A. Hemsley.*

ORNAMENTAL ECONOMIC PLANTS.

GENERALLY speaking, we see but few exotic economic plants in English gardens, even when they have sufficient ornamental value to warrant their inclusion in collections of stove and greenhouse plants. To the ordinary mind, plants yielding products for man's utility, and that are without beautiful foliage or flower, possess interest of no ordinary kind. Nor must we overlook the educational value of such plants, the more especially when they are grown in manufacturing districts interested in their products. Notably, and perhaps foremost among such plants are the—

Cottons (*Gossypium*).—These plants grow but a few feet in height; they have woody stems, palmate leaves, and numerous showy yellow flowers, followed by egg-shaped seed-pods, which burst when they are ripe, exposing the white masses of crude cotton surrounding the seeds. *G. herbaceum*, an annual, and *G. barbadense*, a biennial, are the best species to grow. The plants are most handsome when flowers, and half-grown and bursting pods, are shown on the same plant. They can be grown well in a tropical or sub-tropical house, with a moist atmosphere, and should be fed (to secure the best results) with similar manures to those given to *Chrysanthemums*. Seeds germinate readily in a moist hot-bed. The seed-pods, if undisturbed, will remain on the plants long after the leaves have fallen.

Coffee (*Coffea*).—Plants of Coffee are always interesting. They are hardwooded, dwarf shrubs, producing glabrous, Laurel-like leaves, and small white flowers, followed by green berries, which become red when ripe. They may be grown well in the cooler end of the stove-house, and give but little trouble. They may be propagated by seeds (the best method), or by cuttings of the ripened shoots, inserting either in a brisk hotbed. Pruning may be resorted to in order to keep the plants within reasonable limits.

Tea (*Camellia Thea*).—These plants may be easily grown in an ordinary greenhouse. They are small evergreen shrubs, bearing white flowers about an inch across. They like a liberal root run, for if confined in small pots the plants become thin, and speedily flower themselves to death. Compact plants of both these species, and of *C. sasanqua*, a bigger plant with larger flowers, are well worthy of the little attention they require.

Cocoa (*Theobroma cacao*).—Small plants of this species, confined to single stems, are very handsome. The flowers are brownish and small, and borne on the naked stems beneath the leaves. These leaves are bold in outline and of considerable substance. If the plants had no economic interest,

they would be worth growing for the foliage alone. I have not seen plants in fruit in English Gardens. They require similar treatment to that given to *Sococa* or *Codiaeum*.

Orange (*Citrus*).—This genus is well represented in gardens by the common *Orange*—*C. aurantium*, which is grown for its fragrant flowers. The *Tangerine* (a variety of *C. aurantium*) is much more floriferous than the type, and is by far the better plant to grow. It is compact in habit, and is rarely seen without a few fruits, which are very fragrant when ripe. In order to secure longevity of the specimens, the pots should stand on a cool bottom. The plants thrive well in a compost of fibrous loam and rough leaf-soil in equal parts, beaten tolerably firm. The "*Shaddock*" (*Citrus decumana*) is also well worth growing where room can be found for so large a plant, its bold handsome foliage has always a cool and fresh appearance.

Date Plum (*Diospyros kaki*).—This is a small, deciduous tree, bearing Tomato-like fruits, which are edible when ripe and thoroughly blotted. It may be trained to the trellis in an ordinary greenhouse, or grown as a bush. The tree is of handsome appearance when in fruit, and is worth growing on this account alone.

Among a host of other plants of historic or economic interest are *Ficus religiosa*, a small tree with ovate acuminate leaves, sacred to the Buddhists. It is quite as easy to grow as is *F. elastica*, and, like that species, makes a useful pot-plant. The markedly acuminate leaves single this plant out for notice in any collection.

Melia Azedarach, a woody plant, with elegant compound leaves, useful for greenhouse or table-decoration. It is evergreen, and grows well in an unheated house. It is known as the "*Manna Ash*" or "*Bead tree*."

Fatsia papyrifera, a small shrub, with the habit of *F. japonica*. It has woolly stems, and palmate leaves of soft texture. It makes an excellent pot-plant. So also do many plants of the orders *Ziniberaceæ* and *Cucurbitaceæ*, too numerous to mention here. *Geo. B. Mallett*.

CEREUS CANDICANS VAR. DUMESNILIANA.

THIS is a tall-growing columnar form whose deeply-furrowed stem is studded with tufts of long, straight spines. The flowers are large and pure white; the plant has flowered this season for the first time in the collection of Justus Corderoy, Esq., to whom we are indebted for the photograph here reproduced (fig. 132).

FIG. 132.—CEREUS CANDICANS VAR.
DUMESNILIANA:
FLOWERS WHITE.

A GERMAN OPINION OF ENGLISH GARDENS.*

AFTER visiting some fifty gardens in England, Mr. Brodersen writes as follows in *Die Gartenkunst*, one of the principal German horticultural journals, which devotes a considerable amount of space to matters pertaining to landscape-gardening and garden-architecture, and published under the auspices of the Society of German Landscape Gardeners:—

Before I had seen English parks and gardens, I thought, from reading descriptions and seeing the illustrations, that I was able to form a fairly accurate picture of what these gardens were like, but I must now confess that I was mistaken. Moreover, I now consider that the term "*English style of gardening*" as applied to many of our German gardens, is no longer correct. At the present time the difference between German and English gardens is so great, that there can be no longer any connection between them. When speaking of English gardens and their peculiarities, we are often told that England has a favourable climate totally different from our own; that, therefore, the plants at

the disposal of the landscape gardener are in greater variety in England than in Germany; moreover, that shade is not necessary to the same degree as with us, and therefore the plantations are smaller and the area of turf or lawns larger than with us; and that in England more money is spent on gardens.

But the fact is not pointed out that the principal difference between German and English gardens is not only in the climate, the material and the means employed, but more especially in the mode of construction, and in the style. Often, too, it is inferred that English gardens are more beautiful than the German ones, and should be taken as our models. Such conclusions in my opinion are entirely wrong. I am bound to admit at once that during winter and early spring an English garden must of necessity be more pleasing and more varied in effect than a German garden, on account of the many evergreen and flowering shrubs which will not stand our winters, and also on account of the amount of money and labour spent on flowers. I, therefore, fully understand the comments of praise bestowed on English gardens by those who

out the latter you have to walk on the grass, which sometimes is traversed by "*grass paths*" kept neatly mown for the purpose.

Since walks in English gardens are not of the same importance as those in Germany, this explains the fact that plantations and their effects with a view to picturesque grouping, as seen from the paths, receive but scanty attention in England.

It is certainly most remarkable that even in recent times the arrangement and planting of English pleasure-grounds are carried out without regard for the immediate surroundings, or without making use of distant pictures in the landscape [!]. Moreover, the grouping itself is, according to our ideas, not artistic, to say the least of it.

I could not discover in any newly-laid-out grounds the endeavour manifested in the older parks to make them appear as large as possible, enabling the eye to penetrate beyond the boundaries, and suggesting that the whole surrounding country formed a part of the park itself. My impression was that most modern plantations were arranged without the slightest regard to the surroundings, and with but little consideration for effect as a whole. The plantations are clumsy, and without picturesque effect.

Immediately on entering the park-gates at Enys, in Cornwall, I noticed in the park a certain repose in the grouping of the trees, such as I had not observed before, even the hedges had come in for a considerable share of attention. On communicating my impressions to Mr. Meyer, I was told that Mr. Hogbin, the head gardener, was also the home-steward of the estate. This explained matters. After a pleasant drive through the "*beautified landscape*," we reached the pleasure-grounds, and were fortunate enough to have Mr. Hogbin himself for our guide. Mr. Hogbin's taste for the beautiful—which had been shown even in the fields—was now further exemplified in having caused a judicious thinning out and a transformation of the plantations, with due regard to the park as a whole as well as its surroundings. Although these measures could only be considered as modest attempts, the good results obtained were nevertheless such as to be immediately noticeable. I was all the more interested in this matter since I had repeatedly mentioned to Mr. Meyer my regret at the evident neglect of beauty beyond the park boundaries generally.

Although it would often seem as if plantations were arranged quite at random, this is not the case entirely. Special care is taken to select for the plants positions suited to their requirements, where their well-being would be assured. But the individual plant, and not the whole effect, receives the greatest consideration, and this is the chief point of difference between German and English gardens. Very rarely are carefully-planned plantations consisting of trees and shrubs so arranged, that the individual specimen disappears in favour of the picture as a whole, and equally rare, are projecting small groups and single plants merging into the sward. But if the grouping in the plantations leaves much to be desired, one is compensated on the other hand, by a sight of splendidly-developed single specimen trees, Conifers, &c., which are often magnificent. The effect of such specimens is so grand, that one becomes inclined to overlook the faulty arrangements as regards a picturesque effect of the whole.

On open lawns, or on the outskirts of woods, we find gigantic Evergreen Oaks, Cedars, Araucarias, Bamboos, Palms, Dracenas, Rhododendrons, Hollies, &c., as well as many hardy herbaceous plants; *Gunnera manicata*, with leaves 3 yards across; alpine plants in artistic rock-gardens, which supply a continual source of delight.

The immediate surroundings of the residence are adorned with flowers in a manner but seldom seen with us. Everywhere the love of the English for well developed plants is apparent. In this particular we Germans are behind them; wherever you look you cannot fail to recognise the tendency of the Briton to embellish his home with

visited them during the spring. Such critics, however, appreciate in most cases only the beautiful details of the garden, without troubling about the arrangement as a whole, and the question of style is to them a matter of indifference. With regard to English gardens I feel firmly convinced of one thing, and that is among the English generally there is a lack of men whose aim in the first place is to see that in the gardens that are to be laid out there should be perfect harmony, and whose sense of beauty is developed to such a degree that even an ugly curve in a walk would be offensive in their eyes.

I feel sure that those Britons who are acquainted with some of our best parks and gardens are well aware of the fact that the latter have a higher artistic value than gardens in England. The curve of the walks is considered of but little importance in England. Most walks are laid out as required by the conditions of the traffic, &c., and whether the outline of the walk is pleasing or ugly appears to be quite immaterial!

In England, however, walks through a park are not at all of the same importance as with us. They are not as with us, "*the silent guides through the most pleasing parts of the landscape*;" but to find

* Extract from an article entitled "*English Gardens*," by A. Brodersen, Landscape Gardener and Garden Architect, Berlin.

plants. He is not content simply to possess them and to look at them, but he manifests his love for them by tender care, by studying their wants, and by bringing them to the highest degree of perfection. The love for plants penetrates all classes of society. Even the poorest woman has on Saturday still a penny to spare to buy some flowers for decorating her home.

In this direction a wide field is still open to the landscape gardeners of Germany; let us cultivate this field by endeavouring to increase the love for plants among our people. *Communicated.*

INDIA.

CARROTS AND THE FAMINE IN INDIA.

Mr. PROUDLOCK, the Curator of the Botanic Gardens in the Nilgiris, thus records the results of some experiments made under his direction:—

Plot 1 was sown with the special object of testing the value of the Carrot as a famine crop, and it was a complete failure, as every plant died within a month after watering was discontinued, or about eight weeks after sowing. The seed germinated well. The varieties sown were the long red and long white respectively. It may be noted that this is not considered to be a famine district.

Plot 2.—The varieties sown were the long red and the long white, and both germinated well. They were properly attended to as a garden crop, with the result that good crops of full-sized roots were harvested. The roots of the red variety were of good flavour, while the roots of the white variety were rather deficient in flavour. A considerable proportion of both varieties of seed was sold in small quantities to the general public; and I may add that, up to date, I have received no complaints about the seed sold.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Deciduous Shrubs.—Where new shrubberies are about to be planted, and the soil has not been broken up before, the first operation should be to thoroughly drain the land and afterwards trench it to the depth of 2 feet, mixing with the staple as the work proceeds decayed manure, wood-ashes, or charred rubbish, and throwing the bottom-spit up to the surface, so that it may become pulverised during the winter. As most deciduous shrubs are grown for their flowers and the colour and forms of their leaves, positions should be chosen where the sun reaches them the greater part of the day, as success in flowering greatly depends upon the strength and proper ripening of the shoots.

Helleborus, Christmas Roses, &c.—When these are required to bloom early, as in the case of *H. niger* the Christmas Rose, handlights should be placed over them, with some hay, bracken or tree-leaves pressed firmly between the hand-glasses in order to keep warmth in the soil, and thus hasten their flowering season. Treated in this manner the blooms are not spoiled by being splashed with earth, and the flower-stems are longer and stronger than when not protected. Another method of treating the Christmas Rose is to lift the root-masses and plant them in large pots with as little disturbance as may be, and place them in cold frames; but I have found that it is not so good for the plants, as the fleshy roots die back, and it takes a long time to re-establish them.

Herbaceous Borders.—The flowering-stems of most things may now be cut back to within 6 inches of the ground, the weeds removed from between them, and the border lightly dug over with a five-tined fork. When coarse-growing plants have become very large, or they crowd neighbouring plants of lesser growth, they may be dug up and divided at about this date and replanted; and they will flower earlier and stronger than if their removal had been delayed till the spring.

Window Boxes may be rendered bright-looking in winter by planting them with compact little

specimens of the yellow variegated *Euonymus japonicus elegatissima*, and *E. ovata*, or the silver variegated variety of *E. latifolius* and *E. radicans*; small plants of the golden forms of *Retinospora* and of *Viola minor* being placed between them, the trailing growth of the latter falling gracefully over the edge, and giving a furnished appearance to the boxes. When preparing the boxes use plenty of crocks at the bottom, and arrange the plants moderately close, so that heavy rain will not swamp them, a dryish state of the soil favouring their well-being. Tulips, Crocuses, and Hyacinths will make a pretty show in the spring, and if some mossy Saxifrage or *Sedum acre* be planted on the top, the soil will be hidden.

Liliums.—These bulbs always produce stronger stems and larger blooms if they are allowed to remain in one spot for several years. As *L. auratum*, *L. chalcedonicum*, *L. Humboldtii*, *L. Martagon*, *L. speciosum*, *L. tigrinum*, and *L. umbellatum*, are hardy, it will only be necessary to shorten back the stems, and to place some soot in the hollows of the stems and over the surface of the soil, as a check to the ravages of slugs. As a safeguard against frost, a layer of coal-ashes 2 to 3 inches thick may be laid over the bulbs.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

Tomatos.—The earlier fruiting plants, if they have produced a sufficiently satisfactory number of trusses, should be stopped; four or five trusses, according to the strength of the plants, and the size of the pots in which they are grown, will be as many as it will be prudent to retain. Light top dressings of soil and bone-meal may then be applied, in preference to manure-water, as a stimulus. The lateral shoots must be removed as fast as they appear. Let ventilation be afforded in a moderate degree in mild weather, and avoid the use of high temperatures, or the spot disease may destroy the fruit. The flowers should be artificially impregnated every day about noon; meanwhile keep the air of the house dry, and afford a small degree of warmth in the heating apparatus. Succession-plants in small pots should be placed where the fullest amount of sunlight reaches them. Tomato-plants raised in September or later in the year, when potted, should be placed near the sides of the pot and not at the centre; the plants keeping in better health, and the roots increasing in greater number and strength, than is the case when potted in the usual manner. If the white fly infests the plant, apply the XL-All vapour twice at short intervals of time. Flowers of sulphur made into a paste and smeared on the hot-water pipes is another good remedy for this insect, but it will injure tender plants which may be occupying the same glasshouse. More Tomato-seed may be sown if the stock of plants is insufficient, but unless the seed can be very thinly sown, and there is the convenience of a shelf near the glass in a warm house, sowing should be deferred to the new year.

Pruning Vines.—The Grape Vines, except in the case of the latest, may be pruned at this season; but Vines on which the leaves are still green and sappy should not be touched. Such Vines should be afforded a small amount of fire-heat by day, in order to finish the ripening. Different varieties require different methods of pruning, as, for example, the Black Hamburg may be pruned closer than would be suitable for Gros Guillaume, the latter being very shy of fruiting on short spurs; Gros Maroc, again, will benefit by its spurs being left of greater length than the Hamburg. As a rule of general application, it may be said that close spurring-in is productive of small bunches, which, in most families, are more useful than larger ones. A shoot should be cut back to a strong, plump bud which is in close proximity to the main rod. Vines whose fruiting-spurs have been allowed to grow to a considerable length are much improved by the occasional removal of the rods having the longest spurs and substituting young rods for them. This kind of partial renewal is best done at this season. If the rods cannot be spared, a few of the spurs should be shortened, when new shoots may push, which in time will form spurs. The rods of young or newly-planted Vines should be shortened more or less according to their strength, the weaker being the more severely shortened. In Vine-propagation by means of "eyes" be practised, some of the best shoots should be selected, plainly labelled in bundles, and then laid in out-of-doors. All vineries

that are not actually started, and in which no fruit is hanging on the Vines, should be thrown wide open. The greatest attention must be paid to the destruction of insect enemies infesting the Vines. The worst of these is undoubtedly mealy-bug, which if not waged vigorous war against renders the fruit perfectly uneatable. The Vines must have the loose bark rubbed off by hand, all crevices cleaned out, and then be washed with hot-water, and afterwards receive a dressing of Gishurst's Compound Soap at the strength of 3 ounces to the gallon of water, the dressing being repeated once before the Vines are started. The surface soil of the border should be removed, together with the leaves, prunings, &c., and be burned forthwith; the hot water-pipes scrubbed with strong soda-suds and soda, and all wood-work and the walls rendered quite clean. If the Vines can be allowed to freeze a few times it will do good.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener, North Myms Park, Hatfield.

Eranthemum pulchellum.—This plant is very serviceable for the decoration of the stove, intermediate-house, and warm conservatory at this season, and the flowers are of a colour not very common in winter flowers. They are produced successively for a considerable time when the plants are not subjected to too low a temperature, and therefore when used in the conservatory they should be placed at the warm end.

Stephanotis floribunda.—Plants which flowered early, and have since been afforded a good rest in a cool temperature, may now be started into growth. An application of tepid water should be made, and the temperature of the house raised to 60°. Plants in pots that are filled with roots should be shifted into larger pots; or if that be not possible, a top-dressing of rich compost should be afforded, after removing some of the soil. Later plants should be kept somewhat dry at the root, and rested in a temperature of 55°. If mealy-bug infest them, the opportunity should be taken while the plants are at rest to spray them with petroleum, soft-soap, and warm water.

Medinella magnifica.—The floriferousness of this fine plant is much increased by affording it a thorough rest. It should be grown throughout the summer in a light part of the stove, and at the beginning of the autumn, when the growth is matured, it may be freely exposed to the sun, with little risk of injury to the foliage. From the present time until the plants show bloom in the spring, they should be kept in a house with a temperature of 55°; but when about to flower, they should be removed to the stove, and be afforded frequent applications of manure-water.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Digging and Trenching.—All work of this kind should be carried on vigorously during the present month, affording the land dressings of manure at a good depth, if it need manure. Light and porous soils are considered by some gardeners to be the better for being dug at the end of winter, but where the area to be dug is large, a considerable proportion of kitchen-garden land, as a matter of prudence, should be dug at the present season. Wet and stubborn land is the better for being ridged at the winter season, the ridges being laid from north to south, so as not to have a wet side and a dry one. If draining is necessary, this should have attention before the digging is begun.

The Walks.—Having finished the digging of the land, the Box-edgings may require relaying or mending, and these operations may be undertaken in mild weather, although they are more properly carried out in March, April, and May. Where Box forms the edging material in a kitchen-garden, and nothing looks nicer, although to keep it in good order it entails a lot of trouble, a greater height than 3 inches should not be allowed.

Potatoes.—Sets for forcing should now be placed in shallow trays or boxes, and be covered lightly with finely-sifted leaf-soil, putting them in a newly-started Peach-house, &c., to sprout. Potatoes may be forced with every chance of success in pots or in warm frames and brick pits. If in pots, choose 12-inch ones, which should be washed clean, and allowed to get dry before they are three-parts filled

with light fresh soil. Place three tubers in each pot, burying them 3 inches deep. When the haulm reaches above the edges of the pots, moulding-up should be partially carried out, more soil (warm) being added when the tops get higher. This holds good of Potatoes in hot-beds as well as in pots. Water should be sparingly applied till the roots have become numerous, and leaf-growth considerable. All the light possible must be afforded the plants from the time the shoots break through the soil till the crop is ripe. Hot-beds for Potato-forcing should in preference be made with this season's tree-leaves and stable litter, and the whole mass should be turned over and mixed together three times at the least. The hot-bed materials should be made quite firm in the process of building, and when the heat has sunk to a safe point, say 75°, light rich soil to the depth of 10 inches should be spread over the bed. The tubers may be set at 8 inches apart in the rows. Carefully admit air after the tops appear above the soil; and if the heat should rise higher than the figure named, holes should be made all over the bed with a stout stake in order to let the heat escape. The top-heat should not exceed 60°, and it must be kept at that height by moderate linings of stable litter. Some gardeners sow early varieties of Radish after planting the sets, but these are seldom satisfactory. Cover well at night.

Peas.—Preparations should now be made for sowing Peas for forcing and growing in the open.

Onions.—The bulbs in some gardens were somewhat late in being harvested, and as decay is very likely to occur among them they should be examined at short intervals, and all rotting bulbs removed. Onions need to be stored in a very airy position if they are to keep well, and no place is less suitable for them than a damp, close one under ground. Hard frost will not injure Onions, provided the thawing of the bulbs is slow and gradual.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Madagascar Orchids.—Importations of these species are seldom made in large quantities, consequently when a small parcel arrives, efforts should be made to secure some of the plants, and having succeeded in this, to grow them well. The Orchids, native of this tropical island, have either curiously-formed or beautiful flowers, but unfortunately they are very often found to be intractable subjects to cultivate and maintain in a healthy state for any great length of time. *Eulophiella Elizabethæ*, although it is a species that was imported in thousands a few years ago, has almost disappeared from collections, yet, so far as my experience goes, its cultivation is comparatively easy. Imported plants, acquired at this season, should not be hurried into activity, but rather allowed to remain at rest till the spring, by placing them on a moist stage in an intermediate Cypripedium-house; and should any of them make roots, let the plants be placed in shallow, perforated pans filled with crocks, and surfaced with a compost consisting of fibry peat two parts, fibrous loam and sphagnum-moss one part each, and sprinkle in, as the operation proceeds, some finely-broken crocks. These pans should then be hung in the light in a warm house, and not be afforded much water, merely sprinkling them occasionally. Established plants of this species will at this season be finishing their growth, and strong plants thrusting forth flower-spikes. As the latter issue horizontally along the surface of the compost, there is much need of carefulness in applying water, otherwise they may damp off. The best method is to immerse the pan to the rim in tepid rain-water. The compost should have become fairly dry before water is afforded. The leaves should be often cleaned with a sponge, in order to remove red-spider and thrips.

Phaius tuberosus, imported sometimes with the above, should be treated in a similar manner, until potting becomes necessary. The plant does best in shallow Teak-wood baskets well furnished with crocks as drainage, and also mixed with the compost. The latter may consist of the best Orchid peat and sphagnum-moss in equal proportion, and on this the rhizomes should be secured with wooden pegs. For the present, let the plants be hung up with the *Eulophiellas*, carefully moistening the surface occasionally, without however wetting any young growths that may appear.

Phaius Humbloti should, when received, be fixed in pots of a suitable size, filled almost to the rim with crocks, and then be placed on a stage at the warmer part of the Cattleya-house, water being afforded occasionally. When roots appear the crocks should be removed to the depth of 1½ in., and be replaced with a compost similar to that advised for the *Eulophiella*. Moisture is essential, but much of it will similarly injure the new growths.

Grammangis (Grammatophyllum) Ellisii.—This is another newly-imported Madagascan, which the gardener seldom succeeds in keeping in a flourishing condition, the treatment afforded it during the earlier stages usually being wrong. If a plant be received at this season, let it be fixed in a pan filled with crocks, and staged or suspended in the East Indian-house, being careful that no drip reaches it. Until root activity begins, little notice need be taken of it so long as the pseudo-bulbs do not shrivel; when, however, new roots begin to show, a small portion of the crocks should be replaced with an equal part of peat and moss, and a kind of treatment similar to that accorded the *Catasetums* adopted.

Angræcums from Madagascar should not be afforded much moisture during the winter.

Epidendrum vitellinum should now occupy a position near the roof ventilators of the cool-house, and be so placed that cold draughts do not reach it, water being almost entirely withheld.

Cattleya citrina, now developing new growths, should be suspended in a light airy position, in a warm intermediate-house, and when roots appear be afforded water sufficiently often to keep the small quantity of material about them in a moist condition.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Bush Fruits.—The pruning of Gooseberry and Currant bushes may now be undertaken. In pruning the former, the spurring method, in vogue at one time, is not so much practised as formerly; but more young wood is left to produce a heavier crop of berries the following season. Where this style of pruning is carried out, some of the branches must be cut clean out from near the base, giving sufficient space to allow of the ready gathering of the fruits. The different varieties of Gooseberries vary much in habit of growth; some are of a stiff, erect growth, while others have a more or less pendulous form, and the pruning must be adapted to the various habits, removing, partially or wholly, from the latter these shoots which, if allowed to remain, would, when weighted with fruits and foliage, touch the ground. Red and white Currants may be pruned somewhat harder, by spurring in the side-shoots to two or three eyes, and allowing the leading shoots to extend, and training up young shoots from towards the base, so that a few of the old ones may be dispensed with annually.

Black Currants require a different mode of pruning. The young growths on fully-grown bushes should not be shortened, excepting in so far as to remove the points of the weaker shoots; but the oldest branches should be cut clean away at the ground-level, pruning so as to give the bush a shapely appearance, and leaving the branches sufficiently wide apart as to allow the light free access when in leaf. Growth arising from the roots should be preserved, as these will in the course of a year or two take the places of those annually removed. A strong, free growth should be encouraged by surface-manuring, as an antidote to the Currant-bud mite (*Phytoptus ribis*), which has become a scourge to the black Currant in some districts; and bushes of strong growth are not so liable to be infested. Where the buds are seen to be swelling unduly, the presence of this mite may be suspected; and it will be prudent to go carefully over the bushes and cut off all affected buds, and burn them. So far, no certain cure or antidote seems to have been discovered better than the constant examination of the bushes, and the removal of the buds. After pruning is completed, Gooseberry and Currant bushes should be dressed with some mixture to prevent the birds taking the buds; and in some districts the sparrows and bullfinches are often very troublesome in this respect. One of the best preventatives is a solution of Bentley's Quassia extract, used at the rate of half-a-pint to three gallons of

rain-water, with a little freshly-slaked lime and some soot added, which, when well mixed, will be of the consistency of thin cream. This can be syringed over the trees by using a syringe with the jet top. The bitterness of the quassia renders the mixture distasteful; but the dressing must be repeated occasionally during the winter to be efficient, especially after heavy rains.

The Gooseberry-Caterpillar.—Where this pest has been troublesome during the past spring, it will be advisable to take the precaution of removing a couple of inches of the surface-soil, together with any leaves and rubbish there may be under the trees, where the cocoons of this caterpillar are found during the winter; and when the leaves appear in the spring, the saw-flies emerge from the cocoons, and lay their eggs on the young leaves. The soil and rubbish should be removed to the middle of the rows, and be deeply dug in; or, better still, be placed in a hole at a little distance away, and the soil dug out replaced under the trees, after a sprinkling of fresh lime has been applied. If treated thus, the probability of a future attack will be much lessened.

Propagating the Gooseberry and Currant.—Cuttings should be selected and inserted in the open border forthwith, where home propagation is desired. The shoots selected for this purpose should be of moderate strength, and from 12 to 15 inches in length. With black Currants, whose basal growths are encouraged, the cuttings should be inserted intact; but for Gooseberries, and red and white Currants, all the buds, excepting four or five at the point of the cutting, should be cut out with a sharp knife—the buds that remain furnishing the main branches of the bush. When inserting the cuttings, cut out with a spade a somewhat upright trench, on any warm border where the ground is moderately light, about 6 inches in depth, bedding them in firmly 6 inches apart, in rows 9 to 12 inches asunder.

THE APIARY.

By EXPERT.

Wintering.—Every bee-keeper should now wrap up all bees warmly with cloths, &c. Old sacking is a very good thing, provided a little naphthaline-powder is placed between the pieces, so as to keep away the moths. This year has been a wonderful one for the wax-moth, and the size of these creatures this season has been remarkable. It is very important that these pests should be kept clear of the hives, as it does not take them very long to destroy a colony. I found this year two colonies destroyed by them; and the most remarkable thing about them was, that they had actually been impressed into the wood-work of the frames. A winter passage should be provided in all cases through or over the combs, to enable the bees to travel freely when so disposed. A tray fitting the hive, and filled with chaff, cork-dust, or sawdust, sewed up in a bag, should be placed over the frames. This will be found a good safeguard during the winter months.

Candy-cake.—All stocks, whether good or bad, should have a brick or two of candy-cake placed on them. It is prudent to take care of all half-finished sections, or those that have been damaged, and place these on the frames, instead of having the bother of making candy-cake; and I agree with a good many, that the natural food is by far the best.

Roofs.—These should be looked to at frequent intervals. A plan which I usually adopt is to ask a manufacturer of tarpaulin to save all small pieces, and when he has a sackful I send for it, or they bring some in, as the case may be. After all is wrapped up nicely, I place a piece of old rickcloth or tarpaulin over it, and by an occasional examination, I find out which are wet; I have then only to remove the cloth, throw off the water, and replace it, at the same time marking those which are bad. Should, however, the roof be very bad, cover it with a piece of felt or zinc. A roof which leaks very badly is always a trouble.

Wax.—All wax should be carefully extracted, and all refuse burnt or buried; this is very important, as by leaving comb about it is sure to get infested by the wax-moth, and sometimes foul brood may arise from it—and one has to bear in mind that, when an apiary is once infested with this terrible pest, what a job it is to get rid of it. Only one who has gone through it with a large apiary can realise the vast amount of labour and expense involved in stamping it out.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR DECEMBER.

TUESDAY,	DEC. 5	Royal Horticultural Society's Committee, Meeting.
		National Chrysanthemum Society's Mid-Winter Show (3 days).
		Scottish Horticultural Association, Meeting.
THURSDAY,	DEC. 7	National Rose Society's Annual Meeting and Dinner.
TUESDAY,	DEC. 12	Royal Horticultural of Ireland, Meeting.
MONDAY,	DEC. 18	National Chrysanthemum Society's Executive Committee, Meeting.
TUESDAY,	DEC. 19	Royal Horticultural Society's Committee, Meeting.
MONDAY,	DEC. 25	Christmas Day.
TUESDAY,	DEC. 26	Bank Holiday.

SALES FOR THE ENSUING WEEK.

MONDAY, DEC. 4, and the following Tuesday, Wednesday, Thursday, and Friday, Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 6.—Important Consignments of Japanese Lilies, Tree-Ferns, Azaleas, Roses, &c., at Protheroe & Morris' Rooms.

FRIDAY, DEC. 8.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

A PAPER prepared by Mr. D. E. State Forestry. HUTCHINS, Conservator of Forests, Capetown, and read before the Society of Arts on November 22 last, will, it is to be hoped, attract the attention of statesmen and landowners. Some of the statements made in it, and some of the proposals brought forward appear to err on the side of exaggeration, but there is nothing to be said against the general principles laid down. Details may require revision, but there can be no doubt as to the general truth of Mr. HUTCHINS' contentions. The paper is published in full in the *Journal of the Society of Arts*, but we may call

attention to some of its principal conclusions. Mr. HUTCHINS laments the wasted opportunities offered by the treeless mountains of Wales, Ireland, Scotland, and other districts. He shows how the defect might be remedied by the establishment of a State Forest Department, and of State forests on an adequate scale. Financial obstacles have no terrors for Mr. HUTCHINS. A million sterling per annum would be required as he estimates, but, as we have now to buy and import timber to the amount of over twenty millions, which might be grown here equally well, the sum mentioned is not out of proportion; whilst the fall in the current rates of interest on capital renders British state forestry remunerative for the first time in history. The rural population would be greatly benefited. If three-hundred thousand acres were annually planted, work would be found for at least fifteen thousand labourers, corresponding to a population of seventy-five thousand people, the numbers increasing each year till at the end of thirty years permanent employment in the forests would be provided for one hundred and fifty thousand labourers, or a total population of seven hundred and fifty thousand people.

On one point we do not think popular opinion will support Mr. HUTCHINS. He is of opinion that the present generation, as a whole, is of inferior physique to its predecessors, and he attributes this to factory life, dwelling in towns, and a relative absence of out-door exercise and occupation. We do not think the facts bear out these conclusions. Taken as a whole the country was never in a healthier condition than it is now, the death-rate has diminished, the mortality from phthisis even is stated to be only half what it was a few years ago. We have only to look at the young men of the present day and compare them, as some of us can, with their predecessors, to see that athleticism, in spite of being carried to absurd extremes, has had a most beneficial influence on the rising race. In any case, we quite concur with Mr. HUTCHINS in his estimate of the value of forests as recreation grounds.

What value the forests would have from a defensive point of view in case of an invasion we are not in a position to judge. In any case, some years must elapse before their value in this connection could be assessed, and decidedly the longer the period the better in all ways! The diminution of the smoke nuisance is another benefit that we or our successors will obtain by the use of wood rather than coal as fuel. Mr. HUTCHINS concludes his paper with the following reasons for immediate action:—

1. Twenty million seven hundred and fifty thousand pounds spent every year for wood that could be equally well grown at home.
2. Consols at two per cent.
3. Shrinkage in foreign sources of timber supply.
4. Fall in the value of land in Britain.
5. Livelihood for the country population.
6. Recreation for the towns' folk.
7. Aid in defending the country against invasion.
8. National insurance.
9. Abatement of smoke nuisance in towns.

Mr. HUTCHINS writes clearly and forcibly. He sees what is wanted, and he knows how it can be supplied. In a future issue we shall probably make extracts from what is certainly a most suggestive paper, and one demanding the most careful attention on the part of experts.

CHRYSANthemum MRS. ALFRED TATE.—

This flat-petalled Japanese variety was shown by Mr. Lees, gr. to F. A. BEVAN, Esq., Trent Park, Barnet, at the Floral Committee of the R.H.S. on Nov. 21, when it received an Award of Merit. We selected it for illustration (fig. 133) as a good representative of the short, flat-petalled section, and of symmetrical form. In colour, it is of a brownish-orange, our artist says "sienna-orange." It is said to have originated as a sport from Etoile de Lyon, than which it is more regular and uniform in shape.

ROYAL HORTICULTURAL SOCIETY.—The next Fruit and Floral meeting of the Royal Horticultural Society will be held on Tuesday, December 5, in the Drill Hall, James Street, Westminster, from 1 to 4 P.M. A lecture on "Some of the Plants Exhibited," will be given by the Rev. Professor G. HENSLOW, M.A., at 3 o'clock.

"THE JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The November number of the *Journal* has just been issued, and is creditable to the skill and diligence of the Editor. It contains a full report of the papers read before the Society from June last, as well as the lectures given to the students at Chiswick by Professor HENSLOW. In addition, there are the reports on the trials at Chiswick of French Beans, Peas, Tomatoes, Lettuces, Potatoes, Pompon Dabbias, and notes on the work of the several committees. The report of the Hybridisation Conference is postponed.

HORTICULTURAL CLUB.—The usual monthly meeting and *conversazione* was held on Tuesday evening at the Rooms of the Club, Hotel Windsor, Victoria Street, Westminster, when there was a good attendance of members. The subject for discussion was "The Fruit Crop of 1899," which was opened by Mr. ALFRED H. PEARSON, in a practical and instructive paper, which we give in another column. A valuable discussion followed, in which such experts as Mr. GEORGE BUNYARD, Mr. MONRO, Mr. ALFRED RIVERS, and others joined. It was much appreciated by all present, and a cordial vote of thanks was accorded to Mr. PEARSON for his paper.

LINNEAN SOCIETY.—On the occasion of the meeting to be held on Thursday, December 7, 1889, at 8 P.M., the following papers will be read:—1, Mr. J. W. FAWCETT, "On some Vegetable Poisons used for the Capture of Fish by the Australian Aborigines;" 2, Mr. G. M. THOMSON, "On some New Zealand Schizopoda;" 3, Mr. H. M. BERNARD, "On the Structure of Porites."

THE WALSHINGHAM MEDAL.—Mr. H. H. W. PEARSON, B.A., assistant for India in the Kew Herbarium, has been awarded the Walsingham Gold Medal of the University of Cambridge, which is given for the best essay in biological science.

FRILLED ANEMONE LEAVES.—Mr. AMOS PERRY, Plant Farm, Winchmore Hill, sends us leaves of *Anemone japonica*, lobed and frilled at the edges, as in some of the *Scolopendriums*. This is, of course, only an increased amount of subdivision, such as is common in *Anemones* and other Ranunculaceous plants. We have met with similar productions on other occasions, as from the garden of the Rev. WOLLEY DOD.

BELGIAN FLORA.—The easiest book on the Flora of Belgium is the *Abrégé de la Petite Flore de Belgique*, published by M. ALFRED COGNIAUX, a fourth edition of which, dated 1900! is now (November, 1899) before us. The Belgian Flora is so nearly identical with our own, that we have no hesitation in recommending this little volume to beginners in British botany conversant with the French language. We doubt the appropriateness of most of the vernacular names, feeling sure that they are not native-born, or used by the inhabitants. Do they speak of the *Pavot douteux* when they mean *Papaver dubium*? or of "*Renoncule scélérat*," and of scores of other names, which are

but translations from the Latin, and not required? Directly the pupil gets interested in his subject, away go the popular names; or if he does not become interested, why take any further trouble about him? His tastes lie in some other direction.

"ASSOUAN AS A HEALTH RESORT."—By W. E. KINGSFORD (SIMPKIN, MARSHALL, HAMILTON, KENT & Co., London).—As stated in the prefatory note, the chief object of this publication is to draw

comparatively slight, and is effected gradually. Assouan is now rendered easily accessible, and there is accommodation for invalids, by which many have already benefited; the chief danger here, as elsewhere, being in departing too soon after winter, while the European climate is still ungenial. Physicians, whose patients are prepared to remain in Egypt until March or April, should certainly turn their attention to this little Guide, and the locality therein recommended.

previous explorers. They are the most complete reports yet published, and will doubtless long remain standard works on these subjects. The work is liberally illustrated throughout. The plate of Eggs of the Little Stint has been reproduced in chromo-lithography by Herr GREVE, of Berlin (who so successfully executed the greater number of the plates in the late Lord LILFORD'S work on *British Birds*), and care has been taken to give the best results with the eighty-eight plates, as well as with

FIG. 133.—CHRYSANTHEMUM "MRS. ALFRED TATE": COLOUR REDDISH-ORANGE. (SEE P. 418.)

the attention of the medical faculty to the value of Assouan as a health resort, and to the provision of accommodation suitable for invalids at the hotel which is new in course of erection. The writer certainly makes out a good case, showing that at Assouan the dry Libyan desert air is obtained in its full purity; that, in fact, that station is "the driest health resort known in the world. It possesses the advantage that this is attained without elevation, and is accompanied by an almost ideal winter temperature." Further, the difference between the day and the night temperature is

"BEYOND PETSORA."—The book issued under this title by Mr. H. J. PEARSON is a record of two voyages to Novaya Zemlya, and the Islands of Barents Sea, undertaken with a view of studying bird-life during the breeding season. The author was fortunate in securing as companions Colonel FEILDEN (Naturalist of H.M.S. *Alert*, in the Arctic Expedition, 1875-76) and the Rev. H. H. SLATER. Colonel FEILDEN'S Appendices on the Botany and Geology form a very attractive and interesting portion of the volume, combining the results of his personal observations with those of

the maps. The edition is limited to 500 copies. Those desirous of possessing the work should communicate at once with Mr. R. H. PORTER, 7, Prince's Street, Cavendish Square, London.

MARKING IMPORTED POTATOS WITH NAME OF PLACE OF ORIGIN, ETC.—We learn that a Potato-exporter in Germany has commenced to mark the bags with a large stencil-plate, bearing his initials, name of town, a number, and the representation of a large cathedral, or similar object. His intention is to accustom the English small

consumers to his brand, and by these means to force the English importers to buy his Potatoes in preference to those of others. The goods are not packed by himself, but by a number of independent packers, who work at the same time for other exporters. The above mark, consequently, does not mean a real brand.

WIDOWS AND ORPHANS OF THE SOUTH AFRICAN WAR.—On the 7th ult. a public meeting was held in the Floral Hall, Covent Garden, by permission of the Duke of Bedford, for the purpose of collecting subscriptions for the Mansion House Fund for the widows and orphans (South African campaign). At the commencement of the meeting it was announced that about £270 had already been promised among several of the leading brokers, salesmen, and growers who were connected with Covent Garden Market; and at a subsequent stage of the proceedings it was intimated that the Duke of Bedford had given a donation of £500, in addition to the various amounts which he had already contributed for the same purpose. Before the meeting terminated, the list amounted to nearly £1000, and the total amount subscribed up to the present is about £1800. It is expected that the fund will reach £2000, and a cheque for £1000 has already been remitted to the Lord Mayor as a first instalment.

—We learn from the *Yorkshire Telegraph and Star* of Monday, Nov. 27, that on Saturday, Messrs. FISHER, SON & SIERAY (Limited), Royal Nurseries, Handsworth, carried out an excellent idea to help the fund now being formed for the relief of the wives and families of the men at the front, it having occurred to Mr. W. ATKINSON, the managing director, that the Sheffield people might be disposed to favour a sale in aid of this excellent object. Accordingly a sale was announced for last Saturday, at the Sheffield establishment, Market Street. The premises were handsomely decorated with patriotic flags, and foliage-plants, flowers, floral-baskets, &c. The sale was a signal success, and the promoters were particularly gratified by the number of working-men and their wives who gladly availed themselves of the opportunity of obtaining flowers and plants at a reasonable price. The amount realised was £40.

STERILISED GRAPE-JUICE FOR BEVERAGES.—It would appear as if our Canadian friends will soon be ready to place on the English market a quantity of the preparation sufficient to test its chances of success as a commercial speculation. We understand that at the agricultural station the manufacture was successfully carried out; the experimental stage is now in the hands of the capitalist. We may note that large quantities of juice have been made, but, not having been properly treated, it fermented, and became useless, the micro-organisms becoming masters of the situation. Now, the simplest process for the destruction of the objectionable organism is heat; heating is the safest and most effective means of sterilising, but, of course, care is required in so controlling the temperature as to secure sterilisation without doing damage to the flavour. The temperature of the juice should be gradually raised to 170° F., keeping it at this point for some ten minutes, and then bottling it rapidly, care being taken to use for this thoroughly sterilised and absolutely air-tight vessels. These vessels should be kept in a tank of boiling water, taken out as required, and immediately filled and corked up with the least delay. The experiments at the "station" proved efficacious in the matter of cider and perry—as was to be expected.

NATHAN MARKS, whose name has been mentioned in connection with the war in Natal, was a well-known nurseryman, carrying on business at Johannesburg.

CHARLOCK.—Mr. STRAWSON concludes, from the returns sent in, (a) that Charlock can be destroyed in growing corn crops in May and June without injury to the latter, by spraying with 50

gallons 2 per cent. solution of pure sulphate of copper per acre; (b) that the best time to apply this is when the Charlock is young and from 2 to 6 inches in height; (c) that where the Charlock is destroyed the corn crops are improved. That the principal causes of failure are: (d) spraying too late; (e) using insufficient solution; (f) using impure copper sulphate. The most successful spraying is on Charlock when 2 to 6 inches high. To those who intend to spray their crops in the future, it is most desirable to decide early upon the acreage to be sprayed, and make every preparation in good time in order to secure the greatest advantage from what has proved to be a beneficial discovery.

A CHRYSANTHEMUM EXHIBITION, at which no cut blooms are shown, or prizes awarded, lacks two very important features from the standpoint of the average visitor, and certainly of exhibitors. Such an one was, however, held on the 21st ult., at Retford, and it proved a success. The event was arranged to support the local fund in aid of the widows and orphans, and wounded, that will result from the present war in South Africa. Excellent groups of Chrysanthemum plants were contributed by residents in the neighbourhood. These exhibitors included E. E. Harcourt Vernon, Esq. (gr., Mr. Welsh), A. R. Garland, Esq. (gr., Mr. Hebden), H. Peake, Esq., West Retford House (gr., Mr. Heath), F. Huntsman, Esq. (Mayor) (gr., Mr. Nixon), West Retford Hall; F. W. Denman, Esq. (gr., Mr. Worthington), and Captain Whitaker, Babworth Hall (gr., Mr. Best). A magnificent group of Orchids was contributed from the gardens of F. LAYCOCK, Esq., Wiseton Hall, Capt. of the Sherwood Rangers, and who is now "at the front" with General FRENCH. The sum of £39 was realised.

THE GERMAN EMPEROR AT BLENHEIM.—During his visit to Blenheim, the German Emperor planted on the east side of the large lawn in front of the Palace, a specimen of *Picea pungens glauca*. Mr. WHILLANS tells us the specimen is about 4 feet high. This is not only one of the most beautiful, but also one of the hardiest of the Spruces.

MR. OWEN THOMAS, V.M.H.—The *Journal of Horticulture* reports that Mr. OWEN THOMAS was the recipient, on Saturday last, of a gold and blue enamelled Maltese cross from his Imperial Majesty the Emperor of GERMANY. The cross represents the German Order of Coronation, 1861 (4th class). We congratulate Mr. THOMAS on the distinction conferred.

PLANT PORTRAITS.

NERINE MANSELLI, *Garden*, November 11, 1899. Dull crimson, flushed with lilac.

PITCAIRNIA REGIA X. A hybrid between *Pitcairnia corallina* and *P. bracteata*. Flowers crimson, in elongated dense spikes. *Tyd. schrift voor Tuinbouw*, tab. iii., 1899.

ROSE GRAND DUKE ADOLF OF LUXEMBOURG. *Rosen Zeitung*, October.

ROSE GRUSS AN TEPLITZ, hybrid Tea, raised by Geshwind; bright crimson; semi-double. *Rosen Zeitung*, October.

STOCK (BROMPTON) EMPRESS ELIZABETH, double crimson very floriferous. *Benary Catalogue*, Erturt, 1899-1900.

NOTICES OF BOOKS.

BOTANY FOR BEGINNERS. Ernest Evans.

MESSRS. MACMILLAN & Co. have published under this title an elementary treatise which will be serviceable to beginners, and especially to those unable to obtain the aid of a trained teacher. It deals with the morphology of plants, general and histological, but the illustrations relating to the microscopical structure are rough and obscure. The physiology of nutrition, growth, and movement is treated very clearly. In at least two places the reader is told that classification is based on the resemblances and differences of plants, which is an inadequate statement, omitting as it does the very important fact that the nearer approach classification makes to genealogy, the more perfectly natural

is it. A natural system is necessarily a genealogical one, and it may so happen that the "resemblances" are specious, and the "differences" immaterial. On the whole, it is remarkable how the author has managed to condense into so small a space so lucid a digest of the details relating to the conformation, structure, and physiology of flowering plants. There are at least two, and we think three, other books with the same title, but although they all deal with the same subjects, the treatment is different.

LA CULTURE DES CHRYSANTHÈMES À LA GRANDE FLEUR. Par V. Viviani Morel.

FIVE years ago M. Viviani Morel, whose name is one of the most familiar to English Chrysanthemum-growers issued a little treatise on the subject of big bloom culture. It is evident from the issue now before us that further and fuller details have been wanted by his readers, and to supply this want the author has entirely revised, corrected, and enlarged what was a mere *brochure* into something much more substantial.

The new work is a neatly-printed little volume of sixty-two pages, with some capital illustrations. It contains chapters on propagation, on the cultivation of standards, specimen plants, big bloom culture in pots, in the open ground, together with much useful information on composts, manures, and insect pests. A monthly calendar of operations is given, and a list of the best varieties. We notice, too, at the close of the work a glossary of technical terms employed by growers, many of which, being borrowed from the English, need explanation. The price is one franc, and the book is to be obtained of the author at Lyons.

CULTURE DES CHRYSANTHÈMES À LA GRANDE FLEUR ET À TAILLE BASSE. Par G. Chabaudet et A. Choulet.

THIS is another handy little reprint of a work on the popular autumn favourite, somewhat larger than the preceding, but dealing more particularly with a phase of cultivation known as the "culture lyonnaise," which consists of growing the Chrysanthemum in a very dwarf form, but also aiming at the obtaining of large blooms. Many of the Chrysanthemum-growers in and around Lyons adopt this method, and plants grown in this way are most useful for grouping, and remind us very much of the "cut-downs" grown by Mr. C. Orchard some years ago. In addition to the cultural matter there is a chapter on fertilisation, which is the substance of a paper read by M. Gérard at the Congress of the French N.C.S. at Orleans. Another chapter contains M. Chiffot's paper on maladies and parasites.

A select list of varieties suitable for this mode of culture concludes the work, which, like the one previously mentioned, also contains some illustrations explanatory of the text. This one can be obtained of MM. Rivoire et fils, 16, Rue d'Algérie, Lyons.

AS DAHLIAS CACTUS. Par H. Cayeux.

WE think about four years ago we noticed a little pamphlet on the Chrysanthemum by this gentleman, who is head gardener at the Polytechnic School, at Lisbon. Like its predecessor, the one now before us is in the Portuguese language, and contains brief instructions relating to the history, propagation, and cultivation of the Cactus Dahlia in Portugal. It will no doubt be a useful addition to the somewhat limited horticultural literature of that country.

CULTURAL MEMORANDA.

RIVINA HUMILIS.

DURING the winter season berry-bearing plants are much sought after as decorative material for rooms and the dinner-table. This species of *Rivina* is effective, and one of the most useful for these purposes.

There are two modes of propagating *Rivinas*—by cuttings and seeds; and my own is by seed, of which I sow a small quantity at frequent intervals in a warm, humid house or pit, and the seedlings are kept in the early stages near to the glass. The plant grows to a certain height before branching, and I think it best to allow them to do this and pinch out the side-growths till the stem is 1 foot in height, and in this way obtain small standard plants, which is the prettiest form for this plant. Although a warm, moist house is the most suitable whilst the plants are growing fast, they should be afforded a dryer one as soon as the flowers begin to appear, in order to ensure the fertilisation and the production of perfect panicles of berries. *H. T. M., Stoneleigh.*

and in various situations in the grounds are some very fine old Cedars. But apart from these, there are few trees and shrubs that are noteworthy beyond the native species.

On the other side of the residence is a good-sized kitchen-garden, which also contains the necessary fruit-trees for home needs. Wexham Park is by no means remarkable for a large fruit supply, whether tender or hardy kinds; but Lady Pigott has a very great interest in well grown plants, whether flowering or ornamental foliage species. This fact explains the circumstance that at the present time some lean-to Vineries are in the process of conversion into structures more suited to the cultivation of Ferns, Palms, and a third for miscellaneous species of plants. The Fernery

with care and given shading until they have become established. The seedlings are put singly into 3-inch pots in September, and moved into 5-inch pots in October, using two parts of a rich fibrous loam, one part leaf-mould, and one part burnt wood-ashes, sand, and charcoal, adding a little bone-meal and soot. They are repotted into 8-inch and 10-inch pots in January. My best *Humeas* this year that reached a height of 12 and 13 feet, were grown in 10-inch pots. When the pots have become full of roots, I feed the plants regularly with sheep-manure and soot-water, using Clay's Fertilizer for a change. They have always soft water given them. *Humeas* do not require heat beyond what will protect them from frost and damp, and cold winds. Sudden changes of any kind are fatal to their growth. I have found that by keeping the plants growing and well fed, never allowing them to suffer for want of water, thrip or spider will not make its appearance. About 100 plants are grown here, and they are used for the decoration of the dwelling-house, conservatory, and flower garden. In the latter situation the pots are plunged in the beds, experience having shown that if planted out the

FIG. 134.—WEXHAM PARK, SLOUGH.

WEXHAM PARK, SLOUGH.

OUR illustration (fig. 134), shows the eastern front of the residence of Sir Charles and Lady Pigott, which is about two miles from the town of Slough, at Stoke Poges. In the forefront of the picture is the principal flower parterre, that at the time our photograph was taken presented a very charming effect. The beds were planted upon the "dot" system, and whilst the surface of each was neatly furnished with *Pelargoniums*, tuberous-rooted *Begonias*, *Coleus*, *Iresine*, and other popular bedding plants, the effect was much improved by frequent dot plants of standard *Fuchsias* and *Pelargoniums*, also *Humeas*, &c.

In tubs may be seen some magnificent specimens of *Agapanthus umbellatus*, a very suitable plant for placing in such positions, or upon terraces, where its effect in summer is decidedly better than is afforded by trimmed, stiff-looking *Laurels*, *Bays*, or other hardy shrubs. On the same side of the house, but a little further removed, is a rosary,

will be a prominent span-roofed house in the centre, and in appearance at least, the alteration will be a great improvement.

Reference to indoor plant-culture reminds us of the extraordinary specimens of *Humea elegans* exhibited from this garden on several occasions during the past season at meetings of the Royal Horticultural Society at Westminster (*Gardeners' Chronicle*, July 1, p. 15). We have so seldom seen such specimens in late years that the following details of the cultivation afforded the plants by Mr. John Fleming, gardener at Wexham Park, may be useful:—

"I sow seeds in July and in August in clean pans that have been provided with free drainage. The compost is one of two parts loam, one of leaf-mould, and one of sharp sand. This is pressed firmly into the pans to within half an inch of the top, and watered before the seeds are sown. After sprinkling sufficient sand over the surface to cover the soil, the seed is sown thinly and covered with just sufficient soil to hide the sand. The pans are then put in a cold frame and protected from draughts and direct sunlight. In the course of a month the seedlings are pricked off into boxes, and they are watered

Humeas die. They are very favourite plants of Sir Charles and Lady Pigott, who, in July last, had the honour of presenting four specimen plants in full flower to H.R.H. the Princess of Wales, who greatly admired them."

At the time of our visit to Wexham the *Humeas* for next season were in 5-inch pots, and gave every promise of again being a success. But it is after the commencement of spring that we have found *Humeas* most susceptible to attacks of disease, and until the plants are actually in flower it has seldom been safe to conclude what number of specimens would remain good.

In the other houses were noticed excellent plants of various species. *Begonias* Mrs. Heal and Gloire de Sceaux, *Poinsettias*, *Adiantum Farleyense*, and *Souvenir de la Malmaison* *Carnations*, in very considerable quantity. The winter-flowering *Pelargoniums* were making a fine show in a light span-roofed house. Most of the plants were in 5-inch pots, and many of them had near upon a score of flower-spikes. Mr. Fleming thinks it best with these to use rather small plants, and afford the

plants the necessary nutrition by a system of feeding.

Another house was filled with *Salvia splendens* grandiflora, some of the plants being in 5-inch pots, and others in 10-inch pots. This is a grand, showy winter-blooming plant, that may usually be expected to bloom until the month of February. *Cyclamens* also are well grown, and in quantity, and Mr. Fleming is in the habit of exhibiting them in December.

In the stove were capital *Codiaeums* (*Crotons*); that magnificent *Begonia*, President Carnot hung from the roof, with abundance of its showy blossoms; and *B. Gloire de Lorraine*, *Dracena Sanderiana*, *Saintpaulia ionantha*, and *Tillandsias*, were all observed to be thriving well.

Unfortunately for Wexham Park, in past years there have been far too many gardeners, and this has been attended with the usual results. But it would now appear that Lady Pigott's practical interest in the garden, and Mr. Fleming's efforts, will prove effectual.

HOME CORRESPONDENCE.

THE LOQUAT.—I beg to ask if you will furnish me with some particulars respecting the fertilisation of the Loquat (*Photinia japonica*), which is now flowering freely in the pleasure-grounds here. How would you advise the flowers to be fertilised? Do you think the fruit could by any means be induced to perfect themselves in the open air in this locality? I may mention that the specimen is an old one, standing 8 feet in height, and about 15 feet in circumference at the top; but somewhat irregularly grown. The Pomegranate also does well here grown on a wall, and flowers freely during July and August, but I cannot induce it to set any fruit. Perhaps some of your correspondents may enlighten me on the subject. *George Dance, jr. to Sir Elliott Lees, Bart., M.P., South Lytchett Manor, Poole.* [The flowers are perfect. The stamens ripen a little before the pistils. There would seem no difficulty in setting the fruit with a camel's-hair-pencil under glass in an orchard-house. We do not think you would succeed in the open-air, either with the Loquat or the Pomegranate, but shall be glad of any remarks from our correspondents. Ed.]

A CARGO OF APPLES.—A correspondent, writing on the subject of Canadian Apples, says: "The other day I was returning from Antwerp, and found a fine variety of Canadian Apples set out for consumption in the saloon, and on noticing their fine colour and flesh, was informed by my neighbour that he had furnished them for the appreciation of the passengers. He had freighted a 5000-ton steamer with choice lots—some of them consignments for continental customers, the remainder as a speculation. At Antwerp the steamer could not be got over the sill of the dock, and consequently had to lie off; and thus it came to pass that he was now on his way to London, to make arrangements for docking and selling. He would then telegraph to the skipper, who would 'bont ship, and get the job finished; and I understand the matter was successfully ended—thanks to the pluck and energy of a man who was all Apples—and these Canadian." *E. C.*

THE RAISING OF MUSHROOMS AT LEITH.—Your eminent correspondent, "D. T. F.," seems to be up in arms against the Leith Town Council for giving directions that the Mushroom-beds in old wine-cellar should be removed. I would say—"Well done, the Leith Town Council." Having to grow a considerable amount of Mushrooms, and once having lived in a bothy which was all cellared beneath, and where the Mushroom was grown all the year round, I think I should know something about the matter. It is all very well talking about home industry, but when the Mushroom has to be grown either in the open, or in house-cellars in thickly-populated districts, it becomes a nauseous business. The sweetness of a Mushroom-bed is not the kind of thing that any of us would care about having in our bedrooms. In my opinion, Mushrooms grown in such ill-adapted, badly-ventilated holes, cannot be as good for

human food as those grown in the open or well-ventilated sheds; and for that reason alone the practice should be discontinued. I think most readers of the *Gardeners' Chronicle* will smile at the comparison of plants in apartments, window-boxes, and Mushroom-beds. *D. L. M.*

CUSCUTA REFLEXA.—I send you a specimen of *Cuscuta reflexa*, as grown in open air on *Jasminum revolutum*, and *Forsythia suspensa*, from the branches and twigs of which it dangles and swings in a pretty way, being now covered with its white and sweet-scented flowers; 5° of frost kills it, however, or it would become a dreadful pest here as in N. India. *F. W. Burbidge.*

ODONTOGLOSSUM CRISPUM.—My ten years' experience with H. Garnett has taught me that, to grow *Odontoglossum crispum*, so that the last pseudo-bulbs made here about equal those made in its native habitat, air, and yet more air, must be afforded the plants. During the past two years our plants have made great progress; and for pseudo-bulbs to diminish in size is unknown, a condition which is due to the large amount of air afforded. The house in which the plants are grown is a half-span lean-to; the path is excavated out of the chalk, and the stage level or thereabouts with the ground outside. The plants are placed on an open teak stage, and drain-pipes with perforated zinc caps start from the ground-level, dip under the soil, and convey the cool air under the open stage, which is 10 inches above the ground-level. The shingle on the ground and the path are kept always thoroughly moist. A 4-inch flow and return-pipe runs half the length of the house, and along the back wall. Walters' roller-blinds, elevated 6 inches above the roof by means of iron trusses, are made use of. The door of the house is rarely closed except in extreme weather and high gales, and yet plants from the thumb-size and upwards thrive equally well. Plenty of moving air is life to *O. crispum*; and draughts, which we used to fear, do not alarm us in the least now. Let me advise my fellow-amateur cultivators of this queen of flowers to shake off old prejudices, and afford air to their plants. I am giving substantial and separate prizes for Orchid amateurs and professionals here in the spring, and hope the competition will be keen. *R. G. Fletcher, Brighton.*

SPECIMEN CHRYSANTHEMUM OF THE VAR. MADAME CARNOT.—I send you a photograph of Madame Carnot Chrysanthemum, with which I won the National Chrysanthemum Society's Silver Medal, awarded at the Bath Show. I obtained the plant from a cutting in May, 1898, and grew it that season in a 6-inch pot as a single-flowered plant for use in facing a group. Subsequently, in November, I cut the plant down to within 18 inches of the pot, and obtained afterwards three breaks. The plant was stopped once, and all the rest of the shoots were produced naturally. All the flower-buds "taken" were those known as second crowns, and they were taken during the last week in August, and first week in September. The plant was 8 feet across, and 5 feet 6 inches high in centre of plant. *Alfred Young, gardener to Lady Pitman, 17, Royal Crescent, Bath.* [A very fine plant indeed, but the photograph is not suitable for reproduction. Ed.]

A CHRYSANTHEMUM SPORT.—We are sending you this morning a specimen bloom of a sport which occurred here last year upon the variety Western King. The sport has the same habit and constitution as the parent variety, and has been named General Symons. *T. Robin & Co., Balmoral Vineries, Guernsey.* [The flowers are full, of a lemon colour, and the sport will doubtless be welcome. Ed.]

TOMATOS AS A FIELD CROP.—Having read the articles on the above subject on pp. 257 and 369, I may, perhaps, be allowed to add a few remarks. Your correspondent, "B. C. R.," says, that to be successful in the culture of open-air Tomatoes, it is necessary to put out plants from 5-inch pots, with one truss of flowers set. I quite agree with him, as it is an impossibility to reckon on 5 lb., to say nothing of 10 lb., of produce from each plant, if planted out from 60's, however good may be the position. To bring about the desired result, glass-houses in which to raise the plants are necessary, and as I should prefer a distance of 2 feet between the rows, and 1 foot from plant to plant, one would be

able to put more than 20,000 plants to the acre. To raise this number of plants, more than fifteen houses of 100 feet in length, and 12 feet in width, would be required, this, at the present cost of glasshouses, is a very large item of expense which would pay in time; but the initial outlay would be too great for many who, otherwise, might feel tempted to try. If considerably cheaper constructions, answering the same purpose as glasshouses could be obtained, many like myself would try it; and the crop, especially if it was produced in August, would be a sure instead of a chance crop. Enormous quantities of excellent fruit by this means could be raised, which would help to prevent the flow of inferior foreign Tomatoes into our markets. *W. M.* [Common garden-frames, if efficiently heated, would be as useful, and much less costly, than houses. Ed.]

DOUBLE-FLOWED DAISIES.—We naturally expect to find double-flowered Daisies, those dwarf, compact forms of *Bellis perennis* flowering freely in our gardens in April and May. But visiting a garden on Kingston Hill a few days since I noticed a couple of beds on the lawn that were masses of white flowers, and naturally wondered what the plants could be, to be thus so freely blooming in November. When I got near to them I found they were double white Daisies, and Mr. Blencowe, the gardener, told me that the plants, then quite 6 inches broad, were from seed sown in a shallow box under glass in May last, and were of Messrs. Sutton & Son's strain. How remarkably strong had they become in spite of the great heat and drought of the season! Many of these plants were carrying from ten to twelve fully-expanded blooms, white as snow, and as prettily double as the most ardent lover of double Daisies could desire. I could but think that growers of cheap plants for hawkers would find a good harvest in raising many thousands of such plants as these, that thus bloom so beautifully in November, for certainly, offered cheaply, they would find a ready sale. *A. D.*

MANURING.—No land is, as a rule, more productive of crops of vegetables of nice flavour than that of good-class private gardens. But in the manuring, there is very little of what may be described as scientific teaching observed. The practice is rather due to constant observation of effect derived from cause, and that ordinarily seems to be sufficient for the occasion. Necessity more generally governs gardening practice than do scientific teaching. Certainly, the gardener has learnt to know from his earliest years that deep cultivation of the soil, allied to the putting into it plenty of animal and vegetable matter in a state of partial decay, creates abundant crops, and that, too, on the same ground for centuries. No garden thus treated and occasionally dressed with lime or soot but continues to respond to the gardener's labours, even though that ground may have been cultivated and cropped continuously for 1000 years. We see forests of giant trees, or huge single trees of centuries old, fed only [partially. Ed.] from year to year by the decaying leafage of their own production; and the gardener, observing this, naturally utilises such vegetable matter in a more artificial way for crop production, and obtains splendid vegetables, fruits, and flowers. In how many gardens where there is a scarcity of animal manure, and but little of artificial manure is utilised, have the crops to be dependent for food supplies on vegetable matter in a state of partial decay, and yet what good crops result! But all gardeners none the less prefer the free use of animal, or as commonly called, farmyard manure, although, as a rule, very little of the farmyard products find their way into the gardens. Generally, the farmyard is the most wasteful receptacle for animal manure that it is possible to find. The manure becomes either highly fermented, and wastes exceedingly, or it is saturated and sodden with water, and its best properties washed out and lost in the ditch adjacent. Generally the gardener obtains his supply fresh from the stable, and it is at once either applied in the form of mulch to brace a crop; or is prepared by frequent turnings and moistenings, to avoid waste in any form, for the making of hot-beds or Mushroom-beds, and whilst so occupied, there is much decomposition, and little waste. [No: the nitrogenous matter is taken up by the Mushrooms, or disipated. Ed.] The beneficial effects of dressings of such manure, after it has done its work as beds, is amply shown in the nature of the crops that result. Just also is it the case with vegetable

matter of any description, properly decayed leaves especially. Thus it is that outside of scientific teaching, practical experience and observation become such valuable aids to the gardener in his manuring. Nothing in relation to any manure is worse than to allow it to lie about in heaps, to get heated, or washed by rain, and wasted. Those who have noted in a corn-field the spots of strong green growth seen in the young corn running down the ridges, see at once where the carts deposited the manure in heaps, and it was allowed to be for some time ere dispersed. Had that dispersal been done at once, all the ground covered would have benefited alike. As it is, portions are much overfed, and the greater portion is starved. We see the same thing in pastures where cattle run. We see it in a more painful way in fields where huge heaps accumulate for months, only to wantonly waste. Gardeners are not so careless, for they utilise every manurial element they can obtain, even such as some farmers would despise. Cultivate the soil deep and often, and feed it with any sweet decaying vegetable matter, and it will never become barren. That is a good garden axiom. *A. D.*

ROMAN HYACINTHS' ROOTS DECAYING.

There does not seem to be anything particular in "Perplexed's" experience in failing to grow Roman Hyacinths, as he is only one of many who have failed to grow bulbs satisfactorily through affording water after potting and before plunging them in Cocoanut-fibre refuse or coal-ashes in cold frames or out-of-doors; but if "Perplexed" will use the following compost, i.e., one part soil, one part leaf-mould, two parts sand, half part charcoal, and not afford water till top-growth has commenced, he will find that failure to cultivate bulbs will be a thing of the past. In potting these and other bulbs, place the base of each bulb on a pinch of powdered charcoal or silver sand. *F. Briggs, Cragdale Gardens.*

BEGONIAS.—In a note referring to hybrid Begonias (*Gardeners' Chronicle*, Feb. 25, 1899, p. 122), I mentioned the late Col. Clarke's beautiful hybrid "Moonlight," the result being that I found it was still in cultivation, Major Mason replying that he grew it in memory of his old friend, but it was not until after the Major's death that I secured some plants through the kindness of his son. These, when received, were in very small pots, but have done well and are now in full flower, and I may say fully bear out my earlier experience, being a mass of creamy white blossom, which is very suggestive of its name (Moonlight). If the white variety of Gloire de Lorraine proves as good as the pink it may be a dangerous rival to Moonlight, yet I fully believe if this had been taken up as Gloire de Lorraine has it would have become a general favourite. Early in the year there were several growers of Gloire de Lorraine who were very sanguine on the point of raising seedlings, but I have not yet heard of any successful results. "*A. F.*" (*Gardeners' Chronicle*, Feb. 18, p. 107) being among those, and from what he said in regard to the flowers closing over after attempting to fertilise, it would appear that actual fertilisation had taken place. If seedlings could be raised we might get some variation in colours, but I doubt if we should get a more pleasing shade of pink than the original, or a plant that would produce a greater abundance of bloom for such a long period, and this succession is no doubt owing to its being abortive, and as it can be propagated either from leaves or cuttings we do not lose much through not being able to raise seedlings. *A. Hemslay.*

CRATÆGUS PYRACANTHA AS A STANDARD.

—One rarely sees this fine hardy evergreen grown as a standard; but it is a superb ornamental plant in the autumn in this form. The plant I see daily has a good-sized head, literally covered with pendent branches, laden with bright coral-red berries. Originally planted against a low wall, it shot up above the wall by developing a strong main stem, which was allowed to go upward, and in time it developed a head. We are so accustomed to see this plant trained in a rigid or formal manner to a wall, with its branches in a horizontal position, that it is a relief to look upon the free head of a standard glorions in its sheen of brilliant berries; and as the birds appear to leave the fruit of this *Cratægus* long before they touch them, its comparative freedom in this respect is indirectly another testimony to its usefulness. *R. D.*

PEACH-TREES: PROTECTING THE BLOSSOMS, ETC.—A good deal has been written recently in the pages of the *Gardeners' Chronicle* on the protection and non-protection of Peach blossoms; but the subject is sufficiently important to admit of a few more remarks being made thereon. During the twenty-five years I had charge of the gardens at Longford Castle, I protected the Peach and Nectarine-trees every spring during the time they were in flower, and for a few weeks after they had set their fruits, being of opinion that the embryo fruits were liable to receive injury from frost during the period of time indicated. Every year during the whole of the time mentioned I secured heavy crops of Peaches and Nectarines from trees occupying walls having south, west, and south-west aspects, and which were protected with Eddy's No. 5 protecting material during the flowering stage. The fruit set so thickly as to render severe thinning absolutely necessary every year, the individual flowering shoots being closely studded with young fruits. A few trees of Violette Hâtive which had been planted against a wall having an east aspect to form a succession to supplies of ripe fruit of the same variety previously obtained from trees growing against south and west walls, and which were not afforded any protection during the flowering period, bore fairly good crops of fruit most years, but not every year. My experience goes to prove most conclusively that in order to secure a good crop of Peaches and Nectarines every year the trees must be protected during the flowering stage, and this, too, must be thoroughly done; otherwise the trees will be best left to take their chance in the matter of the blossoms being injured or otherwise by the effects of frost. As a matter of fact, many Peach-trees have been rendered short lived—practically ruined, through want of proper care and forethought being exercised in the fixing of the blinds employed for protecting the expanded flowers. The slightest wind arising during the night causes the blinds to flap against the trees, thereby destroying the young wood-buds, as well as knocking off the fruit-buds and flowers, with the result that the trees become quite bare of young wood in their "infancy," as it were, instead of being furnished from the bottom upwards with plenty of good healthy-bearing wood. The protecting "machinery," used with such good results at Longford during the number of years mentioned above, consisted of upright poles, the thinnings of young plantations of Fir, Spruce, and Larch, about 4 inches in diameter at the thickest end; coping-boards about 12 inches wide, and 1 inch thick. The thick end of the poles was let into the ground a few inches, at from 18 to 20 inches from the base of the wall, and at intervals of about 5 feet, the thin ends having a slice 4 inches deep, and 1 inch thick, cut off the face down to transverse cut, made with the saw at this point to screw battens to for tacking the blinds on in due time. The half-round side of the individual poles was let into brackets, driven into the wall immediately under the brick coping, at 5 feet apart, and screwed thereon. Screw-bolts, flat at bottom, with a threaded bolt and nut on top, were screwed on to the face of the posts at the top for the reception of coping-boards, the latter having holes corresponding in size with the above-mentioned bolts bored in them at the proper distances apart, and a few inches from the edge, to admit of boards resting on the projecting course of bricks when placed in position, a 2-inch plate being placed over the bolt on boards before putting on the nut, and screwing the latter closely down on same, thereby making the coping quite secure against the effects of wind and weather. This done, screw the necessary number of pulleys on battens—say one at every other pole (10 ft. apart), and put one hook on the batten midway between each pair of poles to loop up the blinds to when drawn up in the morning. The protecting material used was, as already stated, Eddy's No. 5. This I had in lengths, to suit lengths of individual walls, and 9 feet wide, so as to cover the trees to within a foot or so of the ground, three widths being joined together in order to give the required width. All blinds had webbing stitched on the sides (top and bottom) and ends next the wall, also crossways at intervals of 10 feet, in a perpendicular line with the several pulleys, in order to afford additional strength to the blinds, thereby enabling them to withstand the strain involved in raising and lowering them every evening and morning until a week or two after the fruit has set. Brass or galvanised iron rings should be stitched on the bottom of

blinds at 5 feet apart, so as to come opposite the upright posts, for securing on hooks driven into the latter low enough down to strain the blinds to the extent of slipping the rings over them when securing the protecting material for the night; rings should also be sewn at intervals of 1 foot on the pieces of transverse webbing to admit of lengths of sash-line being passed through them, and over pulleys fixed on battens immediately above the rings as a means of raising and lowering the blinds, one end of the line being secured to the first ring on bottom side. When the blinds are drawn well up under the coping in the morning (as soon as the sun shines on them after frosty nights), and the lines are securely fastened to hooks fixed on poles for this purpose, and looped close up to coping on hooks fixed on battens midway between upright poles, the trees are fully exposed to light and air from bottom to the top. So much for judiciously protecting the blossoms, and thereby securing a good set of fruit from trees previously well-cared for. Healthy young trees to begin with; planted in good-sized and carefully-prepared holes extending 2½ feet on either side the central position marked on the wall for the trees to occupy when planted, and extending the same distance therefrom; the outline of the holes curving inside these points. The holes should be excavated to the depth of a little over 2 feet, placing therein, if considered necessary, about 6 inches thick of brickbats, clinkers, or such-like, for drainage, covering the latter with thin turves or litter prior to filling in the holes to the ground-line with good loamy soil, and (if easily obtainable), one-fourth of lime-rubble or wood-ashes, this being well-mixed before being placed in the holes. Place the young trees in the centre of the holes thus prepared, and cover the roots with about 6 inches thick of the same compost, giving each tree a shake in an upward direction in planting, in order to let the soil well in among the roots, afterwards mulching to the thickness of 3 or 4 inches with half-rotten manure, and then water, to settle the soil about the roots. Trees thus treated will make satisfactory growth, and in due time, yield good crops of fruit, providing the foliage is kept clean, judiciously disbudded, and the young fruit thinned out to proper distances from each other—say 6 inches at first, subsequently reducing the number by one-half; and lastly, giving good supplies of water at the roots during the whole period of growth. Indeed, it is almost impossible to keep the soil about the roots of wall-trees too moist during active growth, if at any time. This I have proved to be the case time after time in transplanting wall-trees from one position to another. Clean, free-growing, and well-conditioned trees have larger and stronger flowers than trees of a different character. *H. W. Ward.*

NURSERY NOTES.

JOHN WATERER AND SONS, LTD.

THE fact that most species of evergreen trees and shrubs find an unusually suitable home around Woking, and in the district of Surrey which lies betwixt that town and Windsor, is fully impressed upon the visitor to Bagshot long before he reaches his destination. From the railway may be seen many plantations of Firs and other Conifers, whilst the grounds around every gentleman's residence that is passed are ornamented with choice Conifers, and a prodigality of hardy Rhododendrons. Alighting at Bagshot, the quiet little railway-station on a loop-line which connects "Royal" Ascot with the main route to the south-west of the London & South-Western Railway Company, is seen to be plentifully decorated with trim-looking specimens of the Irish Yew, Cupressus, Retinosporas, and others; whilst the cottage gardens on the roadside, which have a much-cared-for appearance, each possess one or more specimens of similar species. The reader will readily imagine therefore that the general effect of the landscape in this locality in winter is not bare, like a typical English scene at this season, but quite otherwise. It is warm-looking, well sheltered, leafy, as if determined to excel in the production of "Christmas" trees.

The nurseries of Messrs. Jno. Waterer & Sons are about ten minutes' walk from the station, and the land has been under cultivation by a branch of the Waterer family for more than seventy years. It extends upon both sides of the road, and with a few fields rather removed from the residence, includes an area of about 200 acres. The late Mr. John Waterer, it is well known, was a specialist in evergreen trees and shrubs, and by him were introduced from the Bagshot Nurseries many choice varieties of Conifers and Rhododendrons.

It is interesting now to inspect "original" specimens of types that at this day are exceedingly well known and equally valued. What a much better appearance, too, has the nursery through the retention of a few such specimens that, having now developed the characteristics that come of a number of years growth, serve to relieve to some extent the monotony begotten by great "drifts" of legitimate nursery stock! The original tree of the rosy-crimson flowering variety of Rhododendron known as Blandyanum generally produces a wealth of about 4000 blooms. A magnificent specimen of the Weeping Beech is a feature of the nursery that will also live long in the memory of the visitor. There are few, if any, like it.

HOLLY AND HOLLY-HEDGES.

Nor are the Weeping Hollies less remarkable. Several of these are perfect specimens, and fully bore out the statement of Mr. F. Gomez Waterer, under whose guidance the good things of the nursery were inspected, that the Holly is the most abundant and flourishing of the many hardy evergreen trees in the district. But we were surprised to hear Mr. Waterer declare that he could show us within half-a-mile the most remarkable hedge of Holly in England. With that magnificent hedge in the grounds at Keele Hall, Staffordshire, illustrated in the *Gard. Chron.*, Jan. 7, 1893, p. 19, fresh in our minds, we gladly accepted the opportunity to see one that could be so described. The hedge at Bagshot extends all round a private garden there, and was planted by the grandfather of the present generation of Bagshot Waterers, perhaps fifty or sixty years ago. For at least 100 yards of its length, the hedge rears itself wall-like to a height of about 40 feet. It is a single hedge, and in this respect, is somewhat different to that at Keele, which has a width of nearly 30 feet, and for some distance at least, there is a path through the centre, whilst there are bushes on either side, which meet as they grow up. We still think the Keele hedge the grander example, but that at Bagshot is none the less remarkable, and in height at least probably excels. Everywhere about Bagshot may be seen the Holly; and in all cases, except where they are robbed of necessary nutriment by larger forest-trees, they are vigorous specimens. It is not surprising, therefore, that Messrs. Waterer have elected to make one of the specialties in their nursery a plant that requires in that district a very moderate amount of cultural care. We shall not say much upon the varieties of Holly in the nursery. They are numerous, run very near to each other, and most of them are well known. But *Ilex latifolium*, a distinct species, with large leaves more like to those of a Rhododendron; *I. crenata* (Japanese), a small-leaved, compact habited species; *I. aquifolium* var. *Golden King*, a new variegated variety of the type of *I. a. Hodginsii*; and *Golden Queen*, a well-known variegated form of the common Holly, were conspicuous. As standards, the freer-growing varieties have the less stiff appearance, but except for particular purposes, we do not admire any of them cut to this form.

CONIFERS, &c.

All the best Conifers are cultivated at Bagshot, and of some species there are fine specimen trees. *Tsuga Mertensiana*, better known as *Abies Albertiana*, for example 60 feet, is a very fine tree; and so is one of *Abies grandis*, one of the quickest growing of Conifers, making fully 4 feet

advance upwards each year. These are but a few of the specimen trees, and the species that are not so represented, at least may be found in the nursery "drifts." The well-known and popular species of *Abies*, *Pinus*, and *Cedar*, including that magnificent blue Cedar, *C. atlantica glauca*, not quite a novelty, but of which the supply is as yet unequal to the demand.

The *Thuyas*, *Retinosporas*, *Cupressus*, *Juniperus*, *Librocedrus*, *Taxodium*, *Sequoias*, &c., and varieties of most of them, were observed in large quantities. The mention of *Librocedrus* reminds us that *L. decurrens foliis aureo-variegatis* was first distributed from the Bagshot Nurseries; but the best golden-coloured Conifer for giving effect, is probably *Retinospora obtusa densa aurea*, a name sufficiently long we should think for the tallest *Sequoia* that ever grew. *R. obtusa erecta* has an erect, exceedingly prim habit, and seven or eight-year-old plants looked very pretty. This particular form has the hall-mark of the R.H.S. First-class Certificate.

The golden *Arbor vitæ*, *Thuya occidentalis aurea*, was represented in some quantity, and green *Arbor vitæ* hedges intersect the grounds occasionally, to protect the nursery plants from high winds. The greater part of the nursery land lies in a narrow valley, but the banks and a good stretch of land upon the summit are also included, so that considerable variation in conditions is obtainable. A dry season seldom inflicts injury to any of the plants, and at the close of the year 1899 this circumstance is very noticeable.

There are hosts of flowering-shrubs cultivated, including the *Andromedas*, such as *A. speciosa*, *A. floribunda*, &c., now covered with inflorescence that will develop very soon after the turn of the year; *Kalmias*, *Sedums*, hardy species of *Ericas*, *Gaultheria*, *Buddleia*, *Catalpa*, *Corons*, *Cotoneaster*, *Deutzias*, *Escallonia Forsythia*, *Weigela*, *Skimmia*, *Lilacs*, *Laburnums*, *Honeysuckles*, *Berberis*, *Spiræas*, &c. *S. Thunbergi* was still in full leaf a week ago, being almost an evergreen, and it has great decorative value in late autumn as a plant, or for furnishing shoots to be cut for use in conjunction with flowers. Plants especially suitable for the formation of game coverts are abundant, and native forest trees, like the Holly already noticed, are raised from seeds each season.

RHODODENDRONS.

But in Rhododendrons exists the premier specialty of the firm. Bagshot is an ideal home for this extremely popular, exceedingly beautiful, and most useful of all spring-flowering shrubs. Whether it is the soil or climate that is most responsible for this we cannot say, possibly it is both. Local conditions are favourable, and the sandy loam which constitutes the staple soil, is a grand rooting medium for them. There is a field of 9 acres now full of plants, and 20 acres more almost wholly Rhododendrons; but taking into account "drifts" that appear here, there, everywhere, there are between 70 and 100 acres under Rhododendrons. We are not going into the question of varieties, because not a single sort is expected to bloom in December; and every plant, instead of being a wealth of bloom, as it may be next spring, at the present moment suggests a well-stocked larder. The shoots are terminated by big, fat flower-buds, that will only wait for the lengthening days before expanding into a mass of showy flower.

Perhaps in the base of the valley Rhododendrons do not always "bud" abundantly, but the year 1899 has been dry enough and warm enough for all. There is a fine stock of *Pink Pearl*, the most magnificent, hardy Rhododendron we have seen, which last season was awarded the Royal Horticultural Society's First-class Certificate.

LAYERING PLANTS FOR STOCK.

The stool-ground has a very remarkable appearance. Not a single Rhododendron is propagated from a cutting. All are layered or grafted. If grafted, the stocks are worked low, and afterwards planted low, and the scion itself encouraged to

make roots. For layering, the plants are brought down to the ground just as a *Carnation*; great specimens with thick branches that when "sprawling" upon the surface of the ground cover a very considerable area. How such branches are got down without breaking them, we do not know. They are layered without any tonguing. This additional operation, we were told, does not expedite the process of root formation, which is a singular fact. The layers are ready for removal in two years; some take three years, but varieties that will not "layer" in that time will not do so at all, and are therefore grafted.

It is surprising to see the number of species of plants that are so layered. Here an immense Rhododendron, there a fine *Garrya elliptica*, and yonder something else. Altogether an "American" nursery, as that at Bagshot is termed, is a very interesting one—even in November.

SCOTLAND.

CHRYSANTHEMUMS AT TERREGLES, DUMFRIES.

It is so short a time since a description of the beauties of Terregles Gardens, Dumfries (C. E. Galbraith, Esq.), appeared in the columns of the *Gardeners' Chronicle*, October 14, 1899, p. 290, that no account of them is now necessary. It is, therefore, merely to the fine collection of Chrysanthemums that reference will be made in these notes. Mr. McKinnon, whose name is not unknown to readers of this journal, has a considerable number of Chrysanthemums under his care, there being something like 1200 of all varieties grown for cutting purposes. For the most part, the plants—the larger varieties, of course—are left with only one flower to each stem, a practice which, if, perhaps, not the most profitable mode of culture, at any rate ensures the obtaining of at least one good bloom. All the plants are vigorous, and no difficulty whatever is experienced in inducing them to bloom freely.

Several of the newer varieties are grown with success, notably the two crimsons, *H. J. Jones* and *Mrs. W. Seward*. The favourites are, however, among the whites: *Mutual Friend*, *Madame Carnot*, *Lady Esther Smith*, *Mdlle. Marie Hoste*, and *Mrs. Harry Cheesman*; and, of other colours, *Vivian Morel*, *Charles Davis*, *Duke of Wellington*, *Duke of York*, and *William Seward*. *Lady Hanham*, which, like *Charles Davis*, is one of the beautiful sports from *Vivian Morel*, is also grown, besides the pick of modern varieties. A typical hairy Chrysanthemum is *Mr. Latimer Clark*, which grows well; and *Elsie*, a fine canary-yellow, may be mentioned as one of the reflexed varieties reared.

For decorative purposes, *La Triomphante* is found to be one of the best, its free-blooming being a great advantage; and *Source d'Or* and *Elaine* are also very useful. The plants are of a good dwarf and bushy habit. A large number of the early-flowering varieties are grown for cutting and other decorative purposes, including the rich, bronzy-yellow *Ryecroft Glory*, the rosy-tinted *Margot*, and the older pearly-white favourite, *Bouquet de Dame*. The single varieties are also extensively grown at Terregles from their suitability for cutting, the ease with which they are grown, and their graceful appearance being much in their favour. The chief plants are the chaste, rosy-white *Mary Anderson*, and the fine canary-yellow *Miss Annie Holden*. *Robert J. Arnott*.

CONTINENTAL NOVELTIES.

Mr. H. HENKEL, Darmstadt (Hesse), is offering fresh seeds of rare deciduous shrubs, Conifers, herbaceous perennials, Cacti, &c., including the following five rare Conifers, viz.:—*Picea pungens*

argentea pendula, a prickly, weeping form, with blue-green needles; P. Engelmanni glauca pendula, Engelmann's blue-green weeping Spruce; Pseudotsuga Douglasii glauca pendula, pendulous blue-green Fir; Abies subalpina var. coerulescens, Western American silver balsam Fir; and Abies subalpina glauca.

ENQUIRY.

MR. T. SPENCER would be much obliged if some of our readers would inform him if bisulphide of carbon could be safely used in a Vine-border infested with wire-worm. This fluid was, as we know, largely used in the vineyards of France as a remedy for Phylloxera, and is presumably not injurious to the roots.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

NOVEMBER 21.—Present: Dr. M. T. Masters, in the chair; Mr. Michael, Rev. W. Wilks, Mr. A. Sutton, Mr. E. F. Im Thurn, and Rev. G. Henslow, Hon. Sec.

Hippeastrum species.—With regard to the specimen exhibited by Mr. Wilks at the last meeting, supposed to be a reversion from the florists' "Amaryllis," which was derived by hybridisations on species of *Hippeastrum*, it appears to be very close to *H. stylosum*, Bot. Mag., 2278, introduced in 1822. It differs, however, in having white streaks instead of green on the perianth, and the stamens and style are shorter. The leaves also are narrower. Mr. Wilks observed that he has had it for eighteen years, and that it is remarkable for its very vigorous growth, being also very nearly hardy. Mr. Im Thurn remarked that it is very abundant in British Guiana, and is so close to *H. equestris* that it would seem to be a form of that species.

Lilium giganteum, capsule.—Mr. Wilks brought a ripe capsule of this species, and alluded to the readiness with which it ripens abundance of seed in various localities in this country, giving opportunities for producing varieties.

Canker on Apple Trees.—Dr. William G. Smith sent the following report on specimens received in October, and forwarded to him for examination:—

"A specimen of this canker was received recently with a request for some information on the cause of this common trouble. The case sent I consider a typical form of canker caused by the ascomycete fungus, *Nectria ditissima*. The action of this fungus in causing canker was first described by Robert Hartig (*Untersuchungen auf d. forst-botan. Institut*, (Munich) I. p. 209, 1880). Good descriptions are given in the English translations of Hartig's and Tuber's text books, in G. Massee's recent text book, in H. Marshall Ward's *Timber Diseases*, and by C. B. Plowright (*Gardeners' Chronicle*, April 19, 1884). It is unnecessary to repeat here the details given in these works. The reasons for considering *Nectria* as the chief agent in the present case are:—(1) Near the centre of each of the three canker areas sent is the dead stump of a side twig, which by being pruned or broken would afford an entrance to *Nectria*—a wound fungus; from this point the canker has spread, up, down, and round the still living main branch. (2) The presence of two forms of spores of *Nectria*. In one branch the external canker has passed over into a form of wood-rot, which is passing along the inside of the branch.

"This is one form of Apple-tree canker, but is not the only form. The condition which disposes a tree to canker is a wound deep enough to penetrate the softer tissues of the bark. This may be caused by the pruning of twigs, or by their being broken or gnawed; it might also be due to a deep crack in the bark, such as one sometimes seen on trees as the result of excessive growth or internal pressure; or it might be a crack in the bark caused by sun or frost, or the killing-back of immature twigs in winter. (The latter case Hartig distinguishes as frost-canker, capable of extending each successive winter without the agency of fungi.) Given, then, an open wound, the soft tissues exposed offer a suitable substratum for the growth of fungi, bacteria, or animal organisms. The tissues of the Apple-tree seem well suited for the growth of *Nectria*; and, when one considers the common occurrence of the fungus as a saprophyte, on dead wood, or as a parasite on many kinds of trees, it is not surprising that it is the fungus which generally establishes itself. Hartig and others have proved that, having obtained a footing on a wound, *Nectria* is able to attack the living tissues, and gradually to bring about a canker. In the same way any other organism with a partiality for the tissues of the Apple-tree may, individually or in company, be an agent in converting a wound into a canker; for instance, at least three species of *Polyporus* and a *Hymenochaete* amongst the Hymenochaete fungi, and probably some bacteria.

"Prevention.—No form of spray or wash is likely to give permanent results. Trees badly cankered should be removed and burnt as soon as possible. Where practicable, the canker may be cut out, care being taken to cut well into the healthy

parts around; the wound thus produced should be carefully painted over with tar. This must be done in autumn or winter, otherwise the tar will not sink in. Wounds made in pruning, lopping, or otherwise, should be tarred. If the orchard is liable to canker, it is safest to tar even small pruning cuts."

Apple stocks with caterpillars.—Mr. Ballard, of Colwall, sent some tops of a Lord Salford stock perforated. They had been attacked by the caterpillar of the "wood-leopard" moth (*Zeuzera Aesculi*), some being still within it. A woodpecker had subsequently further injured the shoots by trying to extract the grub. The best remedy is to insert a stiff wire, and so extract them.

Nests of the Rose-leaf-cutter bee.—Mrs. Biggs, of Leyton, contributed a large section of a decayed Poplar, perforated by the borings of a caterpillar. These were now occupied by the nests of this species of bee, *Megachile centuncularis*.

Fog deposit on glass.—Mr. Hudson sent a sheet of glass from a conservatory to show the large amount of deposit upon it after the late destructive fog described at the last meeting.

THE FRUIT CROP OF 1899.

SOME little time ago our esteemed Secretary asked me to give a few notes this evening on "The Fruit Crop of 1899," a somewhat barren subject at the best, and I asked myself the question, What can one say upon a matter like this that has not been said and repeated time and again? I found no answer to my question, and I have no excuse for coming before you this evening except the poor one that I am acting in accordance with our Secretary's orders. It is easy for those who are gifted with the pen of a ready writer to hang an article or write a paper upon any text, but, unfortunately, I do not find myself in that happy state; nevertheless, having set out I must carry through somehow, and I crave your indulgence if I wander slightly at times from the text.

First, then, we must, I think, admit that, speaking generally, the season of 1899 will have to be numbered amongst the poor fruit years; and the best we can say of it is, that good crops have been extremely partial. Certain favoured spots have produced fine crops of fruit, and the fortunate possessors have had a good time, sending fruit to markets, and with scant supplies, and receiving good returns in the way of money.

STRAWBERRIES.

To commence with the Strawberries, certain localities had good crops, but the fruit was never plentiful, nor did one see much of it on the coster's barrow. In our local markets the price ranged from 8d. to 6d. per pound, and back again to 8d., which would show that they were not in any way plentiful. Our local growers had an excellent crop and first-rate weather for picking, and consequently scored a great success; but in the county of Kent, where our largest supplies usually come from, one heard of hundreds of acres of Strawberries being ploughed-in, as there was no crop worth picking.

The cause of this disaster is not far to seek, and I think we may safely say that it was the long drought of 1898, for although we had a very trying spring this year, with late frosts and cold winds of long duration, I do not think that the spring weather would account for this total failure. Of course, one knows that spring frosts will blacken and destroy Strawberry flowers when they are expanded, but the blooms do not all come out at once, and it takes a considerable frost to kill the unopened buds; moreover, many growers tell me that they had no blooms to begin with.

Speaking of my own personal experience, our trial-beds of one-year plants, set thickly, were rarely, if ever, better, and we had so much fruit that much of it was wasted. It would not be of much interest for me to give a list of those varieties which did best, for I find that no fruit varies more in cropping and quality in different districts than does the Strawberry, and even from season to season one is compelled to form fresh opinions respecting many varieties. For instance, during the past three or four years Latest-of-All has been grand, and (although it is not one of the latest, by the way) it has been greatly in demand and a general favourite; this year, in spite of our having had a genial rain prior to their ripening, the fruits were many of them hollow and insipid. Royal Sovereign was A1, yielding an immense crop of good flavour; and amongst the earliest nothing came up to Scarlet Queen. I often wonder why this variety has not come more to the front. During the Strawberry season I generally have a walk round the beds before breakfast, when the fruit is at its best, and one can best appreciate its flavour, and I found my steps generally led me this season first to the Scarlet Queen beds, later to Royal Sovereign, and afterwards to Auguste Boisselot and President, my special favourite, Dr. Hogg, having failed to crop this year.

Speaking of the joy of eating these delicious fruits in perfection, is it not lamentable to see the stuff set before the general public for consumption? I live now in the city of Nottingham, a place with 260,000 inhabitants, many of whom are quite willing to pay a good price for a fair article, and yet I never once saw a nice punnet of clean fresh fruit which one would take a pleasure in eating, but only heaps of fruit which, however nice when first turned out of the baskets, by repeated handling and weighing, soon look as if the proprietor had made his bed upon them overnight.

SMALL FRUITS.

But to turn from this somewhat unsavoury subject, I may say that in the Midlands, despite the harsh spring, the crops

of Gooseberries and Currants have been excellent, although in some localities the Black Currants suffered from lack of moisture. Speaking of these fruits reminds me of the boom which was made some years ago over Berry's Early Kent Gooseberry, which turned out to be an extremely old friend—Keepsake—under another name; and this year we have fruited the new Comet Currant, which we are unable to distinguish in any way from La Versailles. There is a difference between the two, but it consists in the fact that the first-named cost us 2s. 6d. a plant, and the others did not.

Whilst we are thinking about small fruits I should like to ask if anyone has fruited Japanese Mayberry? I have asked many, but cannot hear of anyone succeeding with it. With us it has been cut each year by the spring frosts, and although in America it withstands a very low temperature with a dry atmosphere, I fear it is useless in this country. The Strawberry-Raspberry we have most of us fruited, and I presume that you will agree with me that although it may be considered as an interesting and somewhat striking addition to our in xed border, it has scant claim to a position in the fruit garden. The Logan-berry has, I think, come to stay—it has a flavour quite of its own, a mixture of Blackberry, Raspberry, and a decided dash of Mulberry; it is by no means to be despised as a dessert fruit when fully ripe, and it is really excellent when preserved. Speaking of preserves, some of those present will possibly remember having tasted that most delicious Medlar jelly which our friend the late Mr. Rivers brought up some years ago to the Fruit Committee. I was privileged in my school days to be the recipient of divers boxes of Guava jelly, which a relative sent from Brazil, and I used to think that nothing could ever equal it in its estimation; but Mr. Rivers' Medlar jelly would, I think, run it very close. Alas! I have tasted neither of late, so cannot well compare their merits, but I feel sure that Medlar jelly would find a ready sale if it were cunningly prepared, and as the Medlars can be worked on any hedgerow there need be no difficulty about providing ground for them. I throw this hint out to any who wish to make a fortune, and trust that when the money comes rolling in they will remember me substantially. I am not supposed to be writing about new fruits, but I may mention incidentally that two new Black Currants carried crops of fruit this season with me; the first, called Early Black, had a large crop of very small fruit, which dropped off as soon as ripe; the second, Golden Black, was a very sweet Currant of a dirty, muddy-brown colour and most unattractive appearance.

PLUMS.

Passing on to Plums, these were somewhat patchy in the Midlands, some localities having practically no fruit at all, whilst others had a very fair crop. It is, I know, the custom to lay the blame of all failures upon spring frosts, but mischievous as these undoubtedly are, I think that much loss is charged to them of which they are in a great measure guiltless. What I mean is this, when trees are suffering from an overcrop the previous season, and oftentimes also from a lack of manure, the blossom is more easily damaged by spring frost than would have been the case had the trees been in more robust health. I noticed particularly this year that the Plum and Damson bloom at Chilwell was almost entirely destroyed; whilst at Lowdham, 13 miles away, in the same valley, with the same climatic conditions and what seems an exactly similar soil, the trees were well loaded—in fact, many Victorias had to be supported with props, to prevent the trees being broken. I have purposely said, "what seems to be an exactly similar soil," for although the soil is on the same geological formation, and to all appearance is as much alike as possible, I believe that some difference exists (which possibly a chemical analysis would show), and that this difference in the constituents of the soil is the main cause why one village is essentially a Plum district whilst the other cannot lay claim to be anything more than a fair-weather locality for Plums. It may illustrate this point more clearly if I state that for twenty years we never saw fruit upon young nursery trees of Pond's Sealling at Chilwell, whilst this year at Lowdham, although an unfavourable spring, three-year feathered standards were roped with fruit; also untrimmied standards of Brussels and Brompton Plums, used for stocks, carried fruit, which I have never seen any but old-established trees do at Chilwell.

MEASURES.

Our neighbours made an excellent price of their Plums and Damsons, the latter realising the comfortable price of 3s. per peck of 18 lb.—in 1877 we sold Damsons at 11s. *td.* per peck, but the crop was so thin that they did not pay very well.

Speaking of pecks, is it not absurd that although these measures are supposed to be abolished, each local market, not to leave out London, which heads the list in these absurdities, has its own terms of pecks, bushels, baskets, sieves, pots, and whatnot, the meaning, or rather weight, of which not one person in a dozen living in the district understands, and still fewer out of it? For example, a housekeeper in Nottingham buys a peck of Potatoes and receives 20 lb. If she weighs her purchase and subsequently buys a peck of Pears or Plums she thinks they are short weight because they only weigh 18 lb. a peck, Apples 16 lb., Black Currants 14 lb., Beans 9 lb., Peas 8 lb. What idea do these quotations of pecks, pots, and others, convey to the intelligent grower in another county who is trying to study our market's prices? Our old-fashioned tons, hundredweights, quarters, and pounds, are somewhat cumbersome as compared to the metric system of our continental neighbours, but these local measures and weights for fruits, corn, and other things, are "confusion confounded."

PEARS.

Pears this season were generally a failure, and the French producers must have had a good time if they received anything like a share of the 2½d. each for which very ordinary Williams' Bon Chrétien were retailed in our shops. Strange to say, as soon as home-grown fruit came in (certainly within a fortnight) better Williams' Bon Chrétien could be bought at 3d. per lb.; what a profit to the grower would have resulted from the use of a tiny bit of thin blue paper wrapped around each fruit!

APPLES.

Apples in the Midlands have been almost an average crop; some varieties, indeed, have produced a heavy crop. I wish someone who has the time to study such things would tell us why certain varieties almost always pull through the worst of spring weather, whilst others alongside, in bloom at the same time, quite as constantly succumb. One of our leading nurserymen once told us that the hardy varieties were those in which the petals incurved, but the little observation I have given to this point does not quite bear this out, and I think the reason is still to seek.

PROGRESS.

If there is one fact which stands out more prominently than another in respect to the fruit crop of 1899, it is that the British gardener can, despite the weather, produce a sample of hardy fruits, which it would puzzle any other portion of the world to excel. Every visitor to the Crystal Palace Show must have been amazed to find that, with all the talk of failure of crops, cold, ungenial spring, and burning, droughty summer the fruit exhibited was really splendid. When one tries calmly to carry one's mind back to the Apple and Pear Conference of 1888, and the samples of Apples and Pears which were then exhibited and considered good, one cannot but marvel at the enormous progress which has been made in the production of fine fruit. I venture to say that many market samples from young and well cared for orchards of to-day, are far superior to the picked fruit which was exhibited at the Conference in 1888.

It would be difficult to exaggerate the value of the Apple and Pear Congress, the great Guildhall Show, and the subsequent Crystal Palace Shows from an educational point of view, and I am sure you will agree that the effect they have had in stimulating growers to produce better fruit has been simply marvellous. To many visitors at the earlier shows the fruit exhibited was a revelation; they had no idea such fruits could be produced in the open, still less had they any thought that such fruits could be grown anywhere except in favoured Kent and Devon; and yet to-day the Midland exhibitors stage fruits superior to the best seen in 1888, whilst our friends from Maidstone, Exmouth, Bassaleg, Hereford, and other places have made still further progress in excellency.

This march of progress is a matter of congratulation to all, for it is undoubtedly only by the production of fine fruit of high quality that we can hope to command our home markets, or to make fruit-growing a commercial success. That our exhibitors can much improve upon the results already attained with our present varieties of fruits we can scarcely hope, nor can we expect that market-growers can quite attain the high level at which our friend Mr. Woodward, of Barham Court, stands; but some of them are close upon his heels, and when one looks back upon the market samples of fifteen years ago, and tries to compare them with the best of to-day, one can but rejoice. I say the best of to-day, for unfortunately there is still a fearful amount of rubbish sent to market, but its day is over, and it must soon be a thing of the past, from the simple fact that the public will not buy it at any price, and the only market open for it is the "smasher," by which term I suppose you will recognise the jam-maker, who uses these small fruit as a basis upon which to make several kinds of jam, which are not always sold under the name of Apples. Our local grower has been making from 40s. to 55s. per ton of small Apples sent to the jam-factory, but they do not like the price, and many of them are now planting orchards of bush-fruits on cultivated land, and intend shortly to lay to the axe in the old orchards to provide some Christmas fuel.

I must apologise for having wandered somewhat from my subject, but I have been preaching improvement in fruit-growing for so many years now, that I find it difficult to keep away from a matter which is, after all, slightly connected with the fruit crop of 1899, nor can one help rejoicing when one sees the improvement which has been already effected, for the question is one of no mean importance or narrow bounds.

Seeing that during the past fourteen years we have imported no less than 55,727,756 bushels of Apples, valued at £15,726,476, the question is of some importance financially, especially when we see that the imports are rapidly increasing, and that the average price is higher during the latter half of the period than it was during the first seven years. This shows that the taste for fruit is increasing; a fact that is hopeful for the grower, and of great importance to the health of our people, for all medical authorities are agreed that fresh fruit is most beneficial to health, and is especially needed by the dwellers in towns and cities.

But the question of improved fruit-culture does not end here, for if the industry of fruit-growing can be made to pay in the future, as it most undoubtedly has done in the past, I know of nothing which will help to solve the difficulty of making the land reproductive to the capital and labour bestowed upon it, and of inducing men to live upon it and make their homes in the rural districts like this same fruit-culture. I find nowhere such thriving villages in districts not dependent upon manufacturers as those in which fruit-growing is extensively carried on, and if only for this reason

this matter is of national importance. We see tracts of land in the highlands of Scotland which once maintained a sturdy race of cottars, nearly all of whom sent a member to our highland regiments, now, alas! cleared of human habitations and sacred to the grouse or red deer; we see thousands of acres of land which in our younger days was in cultivation and maintaining a contented and healthy population, now laid down to grass, and we ask ourselves the question, Whence are our great towns and cities to receive fresh blood and sinew, whence shall come our future stalwart soldiers? I know not, unless it be by the help of fruit-growing, market gardening, and all kinds of small culture, and this is why I say this is a question of national importance. Paper read at the Horticultural Club by Mr. A. H. Pearson, Chilwell.

LINNEAN SOCIETY OF LONDON.

NOVEMBER 16.—MR. G. R. MURRAY, F.R.S., in the Chair. Mr. J. E. HARTING, F.L.S., communicated particulars of several cases in which parrots had been poisoned by eating Parsley. After commenting on instances in which plants that were innocuous to man had proved fatal to some of the lower animals, he mentioned in support of the converse case that the berries of the Yew and Privet, which are generally considered to be poisonous to man, were greedily eaten by blackbirds, thrushes, bullfinches, and other birds; while, on the other hand, several cases were on record of pheasants having been poisoned by eating Yew-leaves. The immunity of goats from Yew poisoning was remarkable in view of the fact that deer and cattle died after eating the leaves of that tree, although it had been stated that the ill effects were due to the leaves having been eaten in a desiccated state, and not while growing on the tree.

Mr. W. C. WOODS, F.L.S., read a paper on "The Comparative Anatomy of certain Species of Encephalartos."

The chief features of the anatomy were shown to be the presence of several vascular cylinders in the stem, a character found also in Cycas and Macrocarpia; and the medullary system of vascular bundles, forming, as in Macrocarpia Fraseri, Miq., a complex network, intimately united with a corresponding network of mucilage-canals. The system of mucilage-canals in the pith is continuous with that of the cortex, but the medullary bundles form an independent primary system. The mucilage-canals are probably of use as a storehouse of moisture during the dry season, when the roots and foliage die away.

A younger seedling plant of *E. horridus*, Lehm., exhibited in the hypocotyledonary region, the transitional region between stem and root, at one point a curious large caudex, and partially concentric strand, and several smaller strands or bundles lying farther out in the cortex. These, according to the author, represented the rudiments of the outer vascular cylinders. The character of these strands and the region in which they occur (which is that where the first-formed tissues are located, and where, therefore, ancestral characters would be sure to preponderate) tend to show that the collaterally-constructed vascular cylinders were originally derived from vascular cylinders possessing a concentric type of structure such as is met with in the stems of such fossil plants as the Medullosae. In the opinion of the author the ancestry of modern Cycads must be looked for in that fossil group.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 23.—On this occasion G. SHORLAND BALL, Esq., Wilmslow (gr., Mr. Gibbons), exhibited the handsome *Cypripedium* × *Fowlerianum* *Harrisianum* superbum and bellatulum, which, in its way, is one of the finest of the bellatulum hybrids, of a rich colour, fine size and substance, and a perfect flower from a florists' standpoint (First-class Certificate).

G. W. LAW SCHOFIELD, Esq., Rawtenstall (gr., Mr. Shill), exhibited a hybrid *Cypripedium* called C. × "Sir George White" = *C. Leeanum* giganteum × *concolor*; the flower is of middling size, and somewhat resembles C. Concolor-Laure, the effect of the *Leeanum* influence not being perceptible.

W. THOMPSON, Esq., Stone, Staffs (gr., Mr. Stevens), staged a choice group of *Odontoglossums*, the more remarkable of which was the hybrid O. × *Loochiense* var. "Canary Bird" (see last issue), which, as the plant strengthens, will prove to be of great excellence. A First-class Certificate was granted. *Odontoglossum* *Ruckerianum*, Thompson's var., is one of the finest varieties extant, the richness of the colouring being striking. The plant was greatly admired (First-class Certificate). *Odontoglossum* *crispum* var. *Meteor*, from the same collection, is another instance of the great variation met with in this species, nothing precisely like it having been previously observed. The flowers are circular, and the peculiarity of the marking is as though it was just beginning to develop or to fade (Award of Merit); and a vote of thanks for the group.

T. STATTER, Esq., Whitefield (gr., Mr. Johnson), staged a plant of *L. Cattleya* × *Ingrami* suberba, which received an Award of Merit. *Cattleya* × *Hardyana* magnifica, shown out of the same collection, is a very distinct form, with sepals and petals unusually pale.

J. LEEMANN, Esq., Heaton Mersey (gr., Mr. Edge), staged a beautiful group of Orchids, amongst which were *Cypripedium* *insigne* var. *Sandera* (First-class Certificate); *Laelio-Cattleya* × "Captain Scott," a good hybrid between *L. elegans* grandiflora × *C. labiata* var. *flammea* (Award of Merit); *Cattleya* Mrs. Herbert Greaves, the result of crossing C. Harrison and

C. Gaskelliana is a good shapely flower (Award of Merit); *Laelio-Cattleya* "Yellow Prince," is another of Mr. LEEMANN'S good things (*L. xanthina* × C. Gaskelliana), in form intermediate, but in colour a rich yellow (First-class Certificate); *Cattleya* × *Maroni* = *C. velutina* and C. aurea, bearing about nine flowers, was much admired, and received a First-class Certificate. A Silver-gilt Medal was awarded for the group.

S. GRATRIX, Esq., Whalley Range (gr., Mr. McLeod), gained an Award of Merit for his two plants, *Cypripedium* "Samuel Gratrix," *C. Leeanum* giganteum × *nitens*, and C. "J. Howes" (*C. Sallieri* × *villosum* aureum). *Cypripedium* *insigne* "David McLeod" comes in the section of albinos, but is entirely distinct from the numerous named forms, and of a very fine, rich greenish-yellow colour. The Committee desired to see the plant again. Mrs. GRATRIX received an award of Merit for *Cypripedium* *insigne* var. "Perfection."

T. BAXTER, Esq., Morecambe (gr., Mr. Roberts), staged a few well-grown *Odontoglossums*.

A. WARBURTON, Esq., Haslingden (gr., Mr. Lofthouse), showed *Cypripedium* *insigne* *Sandera*. "Peeter's var." which is the true and only acceptable form, and just the same as Mr. Measures' or Baron Schroder's plants, the name "Peeter's var." was therefore erased.

O. O. WRIGLEY, Esq., Bury (gr., Mr. Rogers), staged a charming group of *Cypripediums*, showing unmistakable signs of good cultivation. An Award of Merit was given to his plants of *Cypripedium* × *Titus*, C. *Spicerianum*, and *cananthum* superbum.

Mrs. BRIGGS-BURY, Accrington (gr., Mr. Wilkinson), staged a few good Orchids, among which were *Cypripedium* × *triumphans*, First-class Certificate; *Cattleya* *labiata* "White Queen," the latter did not show to advantage.

RICH. ASHWORTH, Esq., Newchurch (gr., Mr. Pidsley), gained an unanimous First-class Certificate for his *Cattleya* *labiata* *Gilmourae*, a fine white form with a pretty violet-purple marked labellum.

R. LE DOUX, Esq., West Derby, Liverpool (gr., Mr. Archer), sent *Cypripedium* × *Olga* Bagshaw (*cananthum* superbum × *callosum*).

H. PARTINGTON, Esq., Talbot House, Glossop, sent a few good plants of *Cattleya* *labiata* autumnalis, one of which was a fine specimen, and gained Cultural Commendation.

Mr. J. CYPHER, Cheltenham, staged a small group of Orchids, *Dendrobium* *Phalenopsis* var. *atropurpureum*, and was given an Award of Merit; and for the group, a Vote of Thanks.

Mr. A. J. KEELING, Bingley, again exhibited *Cypripedium* and *Magnificum* (*C. Pollettianum* × *insigne* giganteum). P. W.

DUNDEE CHRYSANTHEMUM.

NOVEMBER 23.—The annual show took place at the Drill Hall, and so far as regards the number of exhibits, was equal to those of former years, but in artistic grouping and arrangement, and as regards general quality, the collection showed a distinct advance.

The blue ribbon of the show—the Challenge Cup presented by Mr. J. M. WHITE, of Balruddery—was won by Mr. J. BEISANT, gr., Castle Huntly, in the cut flower section (open), thirty-six blooms, Japanese, not fewer than eighteen varieties. The winning collection was a magnificent one, including, among other splendid examples, blooms of such varieties as Mrs. Weeks, Edith Tabor, Mrs. Barclay, and white and yellow Madame Carnot. Mr. T. LUNT, gr., Dunblane, who at the Edinburgh show overcame the Castle Huntly gardener, had to content himself with the 2nd place. There was, however, very little difference between the two collections, the 2nd lot containing some very choice specimens.

The Challenge Cup presented by Mrs. GEORGE ARMITSTEAD, Castle Huntly, for excellence in the class of thirty-six Japanese blooms, distinct, was won by Mr. D. NICOLL, Rossie, who showed a splendid collection, including very fine specimens of G. J. Warren, George Seward, and Georgina Pitcher. So close did the 2nd prize-winner (Mr. Lunt) approach in general excellence, that the judges had considerable difficulty in coming to a decision.

For twenty-four Japanese blooms, in not fewer than twelve varieties, the winner to take the Cup presented by Mr. J. J. WATSON, Mr. BEISANT again beat Mr. Lunt, the collections in each case being quite up to the high standard shown in the preceding class. Mr. JOHN BELL, who last year won and obtained possession of the Cup, was awarded a 3rd place for a highly meritorious exhibit.

Mr. T. LUNT secured premier honours, and the Cup presented by Mr. J. W. BELL, in the competition for eighteen Japanese blooms.

The Cup presented by Mrs. ARMITSTEAD for excellence in twelve blooms, of Japanese incurved, was won by Mr. J. BELL; Mr. JOHN H. CUMMING won 2nd prize.

Mr. BELL won 1st prize for twelve Japanese blooms, having very fine specimens of Sunstone, Mrs. Mease, Master H. Tucker, and Nellie Pockett.

For six vases of blooms, attached to which is Mr. J. M. SMETON'S Cup, Mr. DAVID NICOLL won for the third year in succession, and the Cup has now become his property.

There was only one competitor in the class for a display of Chrysanthemums. Mr. R. CAIRNS, Balruddery, who sent a collection which gave a magnificent mass of colour. In the amateur section competition was keen in all classes. The Challenge Cup presented by Mr. J. B. LAWSON for twelve Japanese blooms, went to Mr. JOHN HIGGINS, Anstruther, who showed several magnificent flowers, including such varieties as Simplicity and G. J. Warren. Mr. W. S. MELVILLE, the President of the Society, was 2nd, but only one-and-a-half points divided his collection from that of the 1st prizeman.

For plants grown in 6-inch pots, Mr. JAMES BEATTIS took premier honours in both classes. For the Challenge Cup presented by Mrs. Mudie, Corona, for four pot plants, there were only two aspirants, but the plants shown were of the highest order. The judges awarded the 1st position to Mr. JOHN MATHERS. Among the winning collection was a very fine plant of Niveum, which secured for him the Certificate of the National Chrysanthemum Society, for the best plant in the show. Mr. DUTHIE, Locher, showed an excellent collection of Leeks, Carrots, and Onions, well worthy of the 1st prize which was allotted to him.

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, had a display best characterised by the adjective "magnificent." The table measured 24 feet by 10 feet. It was a perfect blaze of colour, including hundreds of Chrysanthemums varying from the large and massive blooms to the small decorative varieties. The arrangement was such as to show to the best advantage the many-tinted flowers. Placed in a prominent position and being one of the principal sights of the show, it naturally attracted a large amount of attention. A Gold Medal was awarded to Mr. DAVIS for his exhibit.

Messrs. LAIRD & SINCLAIR had a highly attractive and from the spectacular point of view a highly effective display. Tastefully arranged in front of a background of foliage was a choice collection of wreaths, crosses, and decorative floral designs. Mr. ROBERT GROSSART, Clarendon Park Nurseries, showed a collection of floral designs. Messrs. W. WELLS & Co., Ltd., Redhill, Surrey, had an exhibit of Chrysanthemums. Messrs. STORRE & STORRE exhibited a collection of Apples. Mr. Dingwall, gr. to Sir HENRY CAMPBELL BANNERMAN, at Belmont, had a fine collection of Apples, including thirty-six varieties. Mr. D. P. SCOTT sent six varieties of seedling Apples. Messrs. SINCLAIR & EWING displayed lawn mowers and other gardening tools. *Extract from the Dundee Advertiser.*

ROYAL BOTANIC.

NOVEMBER 23.—A meeting of the Fellows of the Royal Botanic Society was held on Saturday at the Museum in the Royal Botanic Gardens, Regent's Park, Dr. ST. GEORGE MIVART, F.R.S., presiding. Dr. ROBERT BOXALL delivered a lecture on "Bulb Culture in England."

Having briefly recapitulated the main points of his previous lecture on "Bulb Culture in Holland," Dr. Boxall proceeded to show how the growing of bulbs in this country might be made a source of much profit to anyone possessed of sufficient ground, and prepared to give to the work the same care and attention to detail that was bestowed by the Dutch people, in whose hands was at present the bulk of the trade in bulbs. He laid stress upon the fact that bulbs could be cultivated better in this country than in Holland, because the soil here was better suited to the culture, and did not require such tedious preparation. He explained at length the various requisites for the successful culture of bulbs, and exhibited slides illustrating the method by which the superintendent of Regent's Park cultivates the bulbs which produce so brilliant a show of flowers each spring. *Times.*

NATIONAL CHRYSANTHEMUM.

ANNUAL DINNER.

NOVEMBER 29.—The annual dinner of the members and friends of this Society took place in the Vegetarian Room of the Holborn Restaurant on Wednesday evening last. The chair was taken by PERCY WATERER, Esq., and there was present a company of about 130 persons, including a large proportion of ladies.

Following directly upon the loyal toasts, the Chairman proposed the toast of the evening, that of the "National Chrysanthemum Society," and alluded with satisfaction to the fact that the number of colonial and continental societies seeking affiliation with the Society continues to increase. Denmark afforded the most recent illustration, being admitted to affiliation on Wednesday, November 22.

Feeling reference was made to the decease of M. H. L. de Villemorin, and a tribute paid to the hospitality of the French and Belgian horticulturists on occasions when representatives from England have visited them.

It is intended that a large Chrysanthemum Exhibition and Conference shall be held in Paris next year, and English cultivators are strongly invited to exhibit and attend at that Conference. There had been some complaints from affiliated societies in England, but steps have been taken which it is to be hoped will meet these. The exhibitions this year had been in every way satisfactory, and the large "vase" class was referred to with pride. The Chairman thought that beginners should cultivate for exhibition some of the decorative varieties rather than the big Japanese blooms, and to encourage this, he generously offered a special prize for flowers of this class, and another for competition by the wives and sisters of exhibitors, who are to stage a "display" of these flowers.

Mr. R. Fyfe proposed "The Donors of Special Prizes," in the absence, through illness, of the treasurer, Mr. C. E. Wilkins, and this was responded to by Mr. H. J. Jones, Mr. Wood (a member of the firm of Messrs. Wood & Sons, Green), and Mr. J. T. Simpson.

Mr. Jones has promised to repeat his first prize of £20 for the best collection of Chrysanthemum blooms in vases.

The presentation was made by the Chairman of the Holmes Memorial Trophy, the National Challenge Trophy, and other special prizes won at the recent exhibition.

The officials of the society were toasted by V. B. M. Zuc'le, Esq., and the replies of Mr. T. Bevan and Mr. J. R. CHOLMELEY (Auditor) were of the most sanguine character. Other toasts included "The Ladies," "The Chairman," "Visitors," and "The Press."

MISCELLANEOUS SOCIETIES.

Aberdeen Chrysanthemum.—The annual exhibition of this society was held on the 24th and 25th ult. at Aberdeen. The number of entries was 550 against 360 last year. The attention of the visitor on entering the Art Gallery was immediately attracted by the semi-circular groups of Chrysanthemums and foliage plants, each group 10 feet in diameter. The variety and brilliancy of colour in these groups were superb. Mr. PROCTOR, gr. to Sir WILLIAM HENDERSON, Devanha House, Aberdeen, worthily carried off the premier honours in the first groups, while the 1st prize in the secondary groups was awarded to Mr. Mason, gr. to Mr. BISSET, Albion Place, Aberdeen. The show of cut blooms was splendid, and formed one of the finest exhibitions ever witnessed in the north of Scotland. The principal prizes were won as follows:—For the best group of Chrysanthemums, Silver Medal, Mr. JOHN PROCTOR, gr., Devanha House. For six Chrysanthemum plants in pots, 1st, ALEXANDER GRIGOR, Fairfield Gardens. For twelve Chrysanthemum blooms, 1st, Mr. JOHN FINE, gr., Strichen House. For twelve incured blooms, 1st, Mr. JOHN GRIGOR, gr., Maryhill, Elgin. For six blooms in two varieties, 1st, Mr. EDWARD NOONAN, gr., Stoneywood House. The Gold Medal for best blooms of varieties introduced by Messrs. WELLS, was won by Mr. JAMES ELDER, Banchoy House. An interesting feature of the show was the exhibition by local florists, Messrs. SMITH & SONS, Aberdeen; Messrs. BEN REID & Co., Aberdeen; and Messrs. COCKER & SONS, Aberdeen. Messrs. WELLS & Co., Limited, Earlswood Nurseries, Surrey, had a collection of decorated Chrysanthemums. The promoters of the exhibition, and not the least their secretary, Mr. SINCLAIR, are to be heartily congratulated on the result of their work.

MARKETS.

COVENT GARDEN, NOVEMBER 30.

[We cannot accept any responsibility for the unjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salemen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Puritan, Snowdrop, Main Crop, Up-to-Date, &c., 60s. to 90s.; Dunbar Main Crop, 100s. John Dab, 32 & 34, Wellington St.

REMARKS.—The season for forced Rhubarb from Yorkshire has now commenced; Branched Chicory (Monk's Beard) comes well bleached, and makes an excellent salad. There are numbers of Savoy, small and coarse-looking, which are of little value; the Cauliflowers now coming are not so fine, which shows that their season is waning. Parsley is plentiful and cheap. There are yet a few Quinces obtainable from the dealers.

SEEDS.

LONDON: November 29.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. write that there were but few buyers on to-day's market, and, as is usual at this season, but little business was doing. As regards Clover seeds, notwithstanding their inactivity, values for same keep steady. Rye-grass, meantime, is also firm, but Tares favour the buyers. Full prices are asked for Mustard and Rape-seed. There is no quotable variation this week in either Blue Peas or Haricot Beans, and not much attention for the moment is being given to Bird-seeds.

FRUIT AND VEGETABLES.

GLASGOW: November 29.—The following are the prices realised since our last:—Canadian Apples, King, 16s. to 22s. per barrel; Baldwin, Greeing, Spy, &c., 14s. to 18s.; American Apples: Baldwin, 8s. to 10s. per barrel; Northern Spy, 10s. to 12s. do.; various other sorts, 8s. to 14s. do. Grapes, English, 9d. to 1s. 9d. per lb.; Almeida, common, 7s. to 10s. per barrel; medium, 10s. to 16s. do.; best, 20s. to 25s. do.; Bananas, extras, 9s. to 10s. per case; No. 1, 7s. to 8s. do.; No. 2, 5s. to 6s. do.; Oranges, Valencia, ordinary 420s., 8s. to 9s. per box; large and extra large 420s., 11s. to 12s. do.; large 714s., 8s. 6d. to 9s. do.; Lemons, Malaga, 16s. to 18s. per half chest; Palermo do., 4s. to 5s. per box; Messina, do. new, 10s. to 12s. per case; Pears, French, Easter Beurré, 6s. to 6s. 6d. per case; Californian, Beurré Clairgeau and Winter Nelis, 10s. to 14s. per box; Tomatoes, English, 5d. per lb.; Scotch, do., 4d. to 8d. do.; Mushrooms, 1s. 6d. to 1s. 9d. per lb.; Onions, Valencia, 5 in a row, 5s. per box; do., 4 in a row, 4s. 6d. do.; Turnips, 8d. to 10d. per dozen bunches; Carrots, 6d. to 8d. do.; Parsley, 6d. to 9d. do.; Cauliflowers, 10d. to 2s. 6d. dozen; Cabbages, 7d. to 1s. 2d. do.; Celery, 10d. to 1s. 9d. do.

LIVERPOOL: November 29.—Wholesale Vegetable Market.—Potatoes, per cwt.: Lynn Gray, 2s. 8d. to 3s. 3d.; Giant 2s. 8d. to 3s.; Main Crop, 3s. 6d. to 4s.; Bruce, 2s. 9d. 3s. 4d.; Turnips, 8d. to 10d. per dozen bunches; 1s. 4d. to 1s. 6d. do.; Carrots, 6d. to 8d. per dozen bunches

and 3s. 3d. to 3s. 9d. per cwt.; Parsley, 6d. to 8d. per dozen bunches; Onions, 6s. 6d. to 8s. per cwt.; Cauliflowers, 10d. to 2s. 6d. per dozen; Cabbages, 5d. to 1s. 2d. do.; Celery, 10d. to 1s. 9d. do.—*St. John's*.—Potatoes, 10d. to 1s. per peck; Grapes, English, 1s. 6d. to 3s. per lb.; do., foreign, 4d. to 8d. do.; Pines, English, 4s. to 6s. each; Cobnuts, 10d. per lb.; Mushrooms, 1s. 6d. per lb. and basket; Cucumbers, 6d. to 8d. each. *Birkenhead*.—Potatoes, 10d. to 1s. per peck; Cucumbers, 6d. to 1s. each; Filberts, 10d. per lb.; Grapes, English, 1s. 6d. to 3s. 6d. do.; do., foreign, 4d. to 8d. do.; Mushrooms, 1s. to 1s. 6d. do.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending November 25, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London. Principal Grain, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending November 25, is furnished from the Meteorological Office:—

"The weather continued dry over the greater part of our islands, but rain was very frequent in the extreme north of Scotland, and falls were experienced occasionally in the 'N. and N.W.' generally. Much clonl prevailed in all parts of the kingdom, and mist and fog were not uncommon in the S.E. and S."

"The temperature was again above the mean, the excess 'traoping from 2° in 'England, E., S., and S.W.,' and in the 'Channel Islands,' to as much as 6° in 'Scotland, N.' and 'Ireland, N.' and to 7° in 'Scotland, E. and W.' The highest of the maxima were recorded on rather variable dates, and varied from 53° in 'Scotland, N.' and 'Ireland, N.' to 55° in 'England, S., S.W., and N.W.' as well as in 'Scotland, W.' The lowest of the minima, which were registered during the earlier days of the week, ranged from 22° in the 'Midland Counties' and 'England, S.W.' to 33° in 'Scotland, N.' and to 39° in the 'Channel Islands.'"

"The rainfall was considerably more than the mean in 'Scotland, N.,' but less elsewhere. Over the greater part of England and Ireland the fall was again scarcely appreciable."

"The bright sunshine was less than the mean in all districts. The percentage of the possible duration ranged from 17 in 'England, N.E.' to 6 in 'England, N.W.,' 5 in 'Scotland, N.,' and 3 in 'England, S.'"

BIRD THISTLE: *J. B. S.* *Carduus lanceolatus*, so called because goldfinches and other birds feed on the seeds; or perhaps a form of *Bur Thistle*, a name given to this species in Cumberland and Northumberland.

CORRECTION: THE LATE CHRYSANTHEMUM SHOW IN THE Waverley Market, Edinburgh. Class 7, six Japanese blooms, any variety; 1st prize, Mr. T. Lunt, instead of Mr. J. Shearer. Mr. T. Lunt took also the Wells Gold Medal for the best exhibit of Chrysanthemums, namely, twenty vases of three blooms each. Mr. Lunt had the best Japanese bloom in Pride of Madford.

CYMBIDIUM LOWIANUM FLOWERS FAILING: *B. B. E.* It is probable that your plant may have been kept too cold at times, or in a cold current of air. By the remarks in your letter also we infer that not sufficient water has been afforded, and that the pot being full of roots, the plant has not had enough water given to develop the flowers fully. Let it be afforded a thorough soaking with rain-water, and then apply water thoroughly occasionally.

FLOWERS BY POST: *Cut Flower.* Pack in small layers, with clean, fresh-picked moss between. Never use wadding, for it spoils all flowers. Large blooms may have the butt end of the stalk stuck into a damp ball of moss wrapped in waterproof paper, or oiled silk, or even into small Potatoes or pieces of Carrot or Turnip. A moderate amount of pressure is desirable. Hot-house Fern fronds should, previously to packing them be steeped in water for an hour. Blooms of half-opened Roses and Camellias, &c., should be wrapped in soft paper, and tied with a strip of bast.

"GLASWELLTYN" FLOWER: *D. H. D.* Kindly send a bit of the plant for identification.

KALOSANTHES COCCINEA GOING OFF: *F. F. R.* You evidently do not understand the proper methods of cultivation. The plants should now be resting. We will give directions for growing these plants in an early issue.

LARGE-FLOWERED SPECIMEN CHRYSANTHEMUM: *W. H.* We take it to mean that the specimen-plant must be of a large-flowered variety, in contradistinction to small-flowered. The word "specimen" also means a plant of large size.

NAMES OF FRUITS: *W. W.* *Aberfeldy.* *Beurre Clairgeau*.—*R. H. W.* 1, Eyewood; 2, *Beurre Dumont*; 3, *Anglique Leclerc*; others over-ripe.—*J. W.* 1, Not known; 2, *Hoary Morning*; 3, *Golden Winter Pearmain*; 4, *Wickham's Pearmain*; 5, Not received; 6, *Hawthornden*.—*F. R.* *Herne Hill*. 1, *Besi Vaet*; 2, *Brown Beurre*; 3, *Rotten*.—*F. Bostock.* *Pear, Summer Doyenné*; *Apple, Scarlet Nonpareil*.—*P. A. J.* *Norfolk Beefing*.—*W. H. S.* 1, *Worcester Pearmain*; 2, *Harvey's Wiltshire Defiance*.—*G. B.* *Glamorgan-shire*. 1, *Scarlet Nonpareil*; 2, *Melrose*; 3, *Caroline*; 4, *Durondeau*.—*Don.* *Hanwell Souring* attacked by *Fusicladium dendriticum*; see recent reply in these columns as to treatment.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*Major B. A.* *Bidens pilosa*; *B. leucantha*.—*H. D. W.* *Edinburgh.* *Peziza aurantia*; 1, *Collybia fusipes*; 2, *Panus conchatus*; 3, *Hypholoma fascicularis*. Very much dried up, and almost beyond identification. *M. C. Cooke.*—*Notts.* 1, *Ruellia Portellæ*; 2, *Aphelandra Porteanæ*; 3, *Crassula species*, seed in flower; 4, *Panicum plicatum*; 5, Of no horticultural value; 6, *Eleocharis orientalis*, see *Gardeners' Chronicle*, Dec. 18, 1886, p. 790. First known in gardens as *Aralia Chabrieri*.—*H. F. W.* 1, *Polypodium aureum*; 2, *Asclepias curassavica*; 3, *Adiantum cuneifolium*; 4, *Pellionia daveana*; 5, *Sansiveria zeylaica* (Bow-string Hemp); 6, one of the garden varieties of *Caladium*.—*S.* No numbers; the yellow is *Oncidium flexuosum*; the

other, *Cologyne (Pleione) Wallichiana*.—*W. G.* *Asclepias curassavica*.—*A. L.* 1, *Salvia splendens Bruniati*; 2, *S. pseudo-coccinea*; there are several varieties of *S. splendens*.

NUMBER OF CHRYSANTHEMUM PLANTS GROWING IN ONE POT: *W. H.* To show as "a specimen," two or more plants growing together in one flower-pot would be a risky proceeding, even should there be no rule in the schedule forbidding it.

OLD VINES DIFFICULT TO BREAK: *Young Gardener.* Cut a notch in the old stems and rods just above the point at which a shoot is desired, doing this forthwith, and cut-back all or most of the old, long fruit-spurs. When starting the Vines in the spring, bring them as nearly as may be to a horizontal position, i.e., the ends of the rods should be brought down near to the ground-level, and kept there till shoots form all along them. When a few inches of growth have been made, suspend them in the usual manner. The vinery on being shut up should be kept moist, and the Vines syringed twice or thrice daily; and if you could place a bed of fermenting dung and tree-leaves on a platform formed of boards, tiles, or bricks, it would greatly help the Vines to break regularly and well.

POLYGONUM BALDSCHUANICUM: *H. N.* Figure and notice in the *Gardeners' Chronicle*, p. 17, January 9, 1897.

"QUEENSLAND AGRICULTURAL JOURNAL": *A. P.* It is published, by authority, by Edmund Gregory, William Street, Brisbane.

RATING GLASSHOUSES: *Ladysmith.* The assessors may estimate the area of land covered with glass, but they will not measure the roof, as that would give a figure much in excess of the actual area. They will endeavour to arrive at the letting value of the glasshouses, and to enable them to do that you may have to let them inspect your account books, in order that they may estimate roughly the yearly value of the produce sold out of them. Nurseries do not now benefit under the new Rating Act, these holdings not being accounted agricultural land.

SODA AND CRUDE POTASH: *E. Whiteway.* The mixture, if made of the strength recommended by the writer of the Hardy Fruit Calendar, is not injurious to Cabbages, Coleworts, and similar vegetables, which may be growing underneath the fruit-trees. If used stronger, for which there is no necessity, it will not injure these plants, but will slightly injure Celery.

SPAN-ROOFED HEATED GLASSHOUSE: *E. L. C.* Your best paying crop would be another of Tomatoes, fruiting early in the spring; but if the necessary number of plants are not in your possession, you might take a catch crop of French Beans, and these being over, clear away plants and soil, and plant with Tomatoes sown soon after the New Year has begun. Good forcing varieties are Dwarf Canadian Wonder, Sir Joseph Paxton, Newington Wonder, and Osborne's Forcing, the first-named being probably the best. Sow at the end of December or in January; and as a saving of labour, sow on the beds in patches of half a dozen seeds together. The space between the rows may range from 2½ feet for Canadian Wonder to 1½ feet for the others. You must begin with a temperature of, at the least, 60°.

"SWISS ASTERS": *G. W.* *Michaelmas Daisy* is the popular name for various species of perennial Asters. We do not preserve specimens sent for naming, unless desired to do so at the time.

COMMUNICATIONS RECEIVED.—*C. W. D.*—*J. I.*—*G. B. M.*—*M. J.* SPECIMENS AND PHOTOGRAPHS RECEIVED WITH THANKS.—*A. & Co.*—*J. B.*—*H. D. N.*—*J. W. S.*—*G. W. N.*—*F. F. R.*—*E. L.*—*B. H. & Son.*

Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle

No. 676.—SATURDAY, DEC. 9, 1899.

favoured by Sir Trevor Lawrence, who also sent us the photograph from which the accompanying illustration (fig. 135) was taken.

"The enclosed are the photographs of *Solanum Wendlandi* as growing here out of doors. The plant was put out as soon as we were safe from frosts, and from the end of June until well into October it has been covered with fine trusses of bloom. It is still out, and none the worse for such frosts as we have had. It requires a warm and sheltered corner, and to be housed in winter. I may mention that it was almost as fine last year as this, and that by its side *Aristolochia elegans* did well and flowered freely. TREVOR LAWRENCE."

not become fully available until a year or two after its application.

This same land, after taking off the above three crops of Turnips, has grown twenty-five crops of Swedish Turnips, five crops of Sugar-Beet, and twenty-four crops of Mangel Wurzel, both without manure, with farmyard manure, and with various artificial manures.

Another fact, according to the Rothamsted experiments, is, that crop the same soil successively with the same crops, without manure, as long as you may, there is a limit below which you cannot exhaust it, and after which limit it will continue to bear crops of an average weight and quality that show but little average diminution, season being an important factor in the case. Sir J. B. Lawes experimented [and does so still. Ed.] with Wheat, Beans, and Turnips, and found that without manure the weight of crop decreased greatly, but when a certain limit was reached the decrease ceased. Ground cropped fifty-six years in succession with Wheat, for example, has given an average crop without manure of $12\frac{5}{8}$ bushels of grain, and $10\frac{1}{2}$ cwt. of straw. The first half of the period yielded $14\frac{1}{2}$ bushels of grain, and $12\frac{1}{2}$ cwt. of straw; while the second half yielded $11\frac{5}{8}$ bushels of grain, and $8\frac{5}{8}$ cwt. of straw per acre.

Turnips are so dependent upon a full supply of manure, that even in rotation, when grown without manure, they dropped to the size of Radishes; but this same land grew excellent crops of Barley and Wheat in the following seasons, although no manure had been applied.

ROTATION PLANTS.

The foregoing remarks show that we have a good deal to learn on this subject. Jethro Tull, one of the first experimenters in this direction, was of opinion that a rotation of different successive crops was quite unnecessary, and Sir J. B. Lawes followed in his footsteps. The market gardeners round London are said to quite disregard the practice of rotation, and prefer to dig deep, manure well, and plant whatever crop is ready. The Paris market-gardeners do the same for the reason, chiefly, that with the few varieties that they grow in their small gardens rotation would be difficult. Yet we are told by the best authorities that "there are few agricultural facts better ascertained than this, that the growth, year after year, on the same soil, of one kind of plants, or family of plants, and the removal from it, either of the entire produce, or at least of the ripened seeds of such plants, rapidly impairs the general fertility of the soil, and, in particular cases, unfits it for bearing further crops of the kind by which it has been exhausted." *Encyclopædia Britannica*.

It is in the vegetable garden and flower garden where the results of successive cropping is best exhibited, and practice there certainly does not corroborate the views of the agriculturist. The most exhaustive crops I have had any experience of were the bedding plants of the flower garden. I should be afraid to state how many years in succession beds and borders have been cropped by the same kinds of plants—*Pelargoniums*, *Lobelia*, *Verbenas*, *Calceolarias*, &c. The plants were put in thickly, too, and what agriculturists call the "crop," was entirely removed every autumn. Yet highly stimulating manures were seldom used, decayed compost of various kinds supplying the most of that. Yet no diminution of growth in the plants was noticeable. The display of flower was always good, and seemed to depend far more on the weather than on the soil.

FIG. 135.—*SOLANUM WENDLANDI*, GROWING IN SIR TREVOR LAWRENCE'S GARDEN, BURFORD LODGE, DORKING.

SOLANUM WENDLANDI.

THIS is one of the noblest creepers for the decoration of greenhouses that we possess, as all visitors to Kew must admit. At Kew it succeeds admirably in the Water-Lily-house, and it is equally at home in the Succulent-house, so that it is very accommodating as to its requirements—well adapted to varying conditions of environment, as the phrase of the day has it. This is still further exemplified in the following note with which we have been

A large illustration was given in our pages for September 16, 1893, where will be found a full description of the plant. The flowers are purplish-blue.

ROTATION OF CROPS IN TREES AND PLANTS.

THIS paper is suggested by an article in *Chambers' Journal*, on "Fruit Growing in Scotland," wherein it is stated that "it is an unfortunate fact, certainly true as regards reclaimed moorland, that when once a crop of Strawberries has been taken from the ground, it will never bear to much advantage again. Apparently they absorb some substance from the ground which cannot by any known process be replaced. Experiments have been tried by taking a five years' rotation of other crops off the ground, and then replanting it in Strawberries, but the result has never been satisfactory." This is a rather perplexing statement, for the experience of gardeners of the Strawberries is, that in gardens where the crops succeed each other often at short intervals, so long as you afford manure judiciously, good crops are obtained for an indefinite period. Strawberries may at any time be made to produce an abnormally heavy crop in pots by the application of manure in sufficient quantity at the right time [and fresh soil, too. Ed.]; and what can be done in pots can be done in the open ground. Still, there may be something in it, because the same thing has been asserted, on good authority, about other plants.

In Sir J. B. Lawes' experiments at Rothamsted with Norfolk White Turnips, grown with farmyard manure :—

Year 1843	9 tons 10 cwt. per acre.
" 1844	10 "	15 "
" 1845	17 "	1 "

This shows that the farmyard manure does

Verbenas were the only plants that seemed to deteriorate, and their decay was generally put down to their being "run out," as gardeners call it, but I suspect that in their case it was their being repeated too often on the same ground. For some twenty years I have known flower borders that never had anything in them but zonal Pelargoniums, Calceolarias, and Verbenas the most of that time, the same parts of the border being occupied by the same species, and the soil was of a light description. Doubtless my experience is shared by most gardeners, and may be set down as shaking the rotation theory to some extent. Sweet Peas are a very exhaustive crop, yet I have known exactly the same spot cropped successfully for many years in succession. The gardener has no choice. A row of Peas was desired at the back of a particular border, and the gardener's plan was to shift the row the space of one foot or thereabout annually to one side and back again, and add a little dissolved bones periodically. I cannot say that the row ever showed any difference year after year. Many examples of this kind could be given.

In the kitchen garden, rotation to some extent can be followed, but few gardens allow of a five years' rotation; and as for Strawberries, good crops are the rule so long as manure is applied and the plants are kept clean, and well managed otherwise. I certainly know gardens where, owing to the breadth of Strawberries laid down, a long rotation was out of the question, and yet the Strawberry crop has always been of a good average kind for over thirty years, and how long before that I cannot say, but probably for 100 years. The rotation has been something as follows:—First, Strawberries on trenched or double-dug ground, where they remained for three or four years; then the crop was dug down, and followed by Winter Spinach; that probably by some of the Cabbage tribe or late Peas; and these by Potatos or Onions, or some other main crop, and then Strawberries again. There was no space for more before the land was wanted for the latter. Then there was double-digging, manuring, and mulching again; and if the Strawberries did not respond, the gardeners wondered. [This can be greatly remedied by a sufficient application of lime to the soil. ED.]

Next take Turnips. The "finger-and-toe" disease is now becoming so disastrous and so general, that some fear the extinction of the Turnip crop altogether as an agricultural crop. In some of the very best farmed districts in Scotland, it seems impossible to get rid of the disease in a destructive form, and farmers have sustained great losses of late years. Rotation was considered the chief preventative of the disease, but that seems now to have failed to restore the root to its normal state, and agricultural chemists are almost at their wits' end what to do about it. Yet I would like to ask your gardening readers if they ever had any serious trouble with finger-and-toe in garden crops where the culture was fairly good? I never had a badly affected crop, such as one sees on farms where the crop is sometimes quite worthless. Occasional examples in dry seasons are found, but the general crop is always good enough where the ground has been deeply dug or trenched, and well manured for the previous crop. I suppose garden varieties of the Turnip are not different from field varieties, and that they suffer from the same maladies. The Turnip-fly is, at any rate, a pest both in the garden and field, but like finger-and-toe, the fly is never so bad in the

garden as in the field, deeper and better culture probably helping the crop through the critical stage sooner. In a garden where a good crop of a late, hardy, kitchen Turnip was wanted just off the ground, a north border was always sown in June with the Black Chirk Castle variety, and for about fifteen years this crop was repeated with only one year between the crops. One half of the border was planted with greens and allied species, and when these were over by the end of May, all the stumps were trenched down and Turnips sown. The greens were manured with any old potting-shed or other compost going, but the Turnips were not. From facts like these, I have long drawn the conclusion that "finger-and-toe" was caused principally by drought and shallow culture, and that deep ploughing or digging are the surest means of preventing it. Why the disease has appeared in such an aggravated form, as it is said to have done, I cannot tell.

Potatos have puzzled the rotationist a good deal, as there does not seem to be any limit to the period that the ground will go on producing Potatos with even a moderate supply of manure. I have had to do, sometimes, with a large number of allotments and cottage-gardens, and for over thirty years these have been devoted principally to Potatos, and during that time the Potatos have necessarily always occupied the same piece of ground. Yet the crops have been good, or at the worst very fair, considering that the owners of the gardens do not spend much on manure. Last year, however, I advised some of them to apply a mixture of kainite and some other artificials, and the crop at once responded and turned out a very heavy one. None of these gardens have ever been trenched, and are not more than a spade deep, the soil being thin.

The Cabbage is a plant I do not care to follow in quick succession on any kind of soil, because it seems to suffer not from lack of nutriment, but from grubs and insects on oft-cropped soil, more than is the case on fresh ground. Carrots and Onions are the same, and they do not like fresh manure, but always do best after some other crop that has been manured. For these and other crops it is the practice to trench, and turn the manure into the bottom of the trench in the expectation that the roots, if they reach so far down, may need it. I never could see the utility of burying manure in that way; we know from experience with well drained Vine-borders, for example, that of the manure put on the surface of the border, a great deal of it gets washed into the drains and lost; and how much would be lost if the manure was buried at the bottom of the border to begin with? Yet that is what is often done in kitchen-gardens. In one large and extravagantly-conducted garden in Scotland that I once knew, all the stable-litter and dung was sent to the garden, and was regularly buried, every winter, in the trenched part, about 2 feet deep. We have seen this manure turned up again several years after, and it was found lying at the bottom of the trench in a thin black layer, about half an inch thick, evidently inert, and much reduced in quality, no doubt, by the 50 inches of rain that fell annually and washed through into the drains. That is by the way.

What seem to be the conclusions to be drawn from farm and garden experience in regard to rotation is, that the practice may, to a very large extent, be dispensed with in any soil that can be deeply ploughed or dug and fairly well manured, and probably the

difference between the results in farming and garden practice may be accounted for by the difference of culture in these respects. It is not practicable for the farmer to till and dig his land in the way the gardener does, and as a rule farm-lands are shallow. There are great tracts in Yorkshire where the plough can hardly be entered without turning up a poor, bad subsoil; on such soils, in dry seasons, all kinds of crops are light or bad—Turnips particularly so, for they are almost a certain failure in dry summers from finger-and-toe or fly.

Rotation in relation to forest trees is a very interesting subject, but must be left to another chapter. *J. Simpson, Studfield House, near Sheffield.*

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM × PURPURATO-CURTISII.

THIS cross appeared in a group of seedlings raised by the late William Robison, the first flowers opening in July, 1899, on a plant in the collection of Mrs. F. L. Ames, at North Easton, Mass., U.S.A. The upper sepal is nearly orbicular, white, reflexed at the base; nerves of a dull purple tint, with green branches, eleven in number; the lower sepal narrowly ovate, with green nerves; petals spreading, slightly deflexed, greenish at the base, otherwise pale mauve, with numerous dots; labelum resembling that of *C. Curtisii*, but paler in colour; staminode crescent-shaped; ovary subtended by a small green bract; scape slender, pubescent; foliage intermediate, and in some plants being more glaucous than in others. (Oakes Ames, in *American Gardening*, for November 4, 1899.) *J. O'B.*

KEW NOTES.

AGAVE WOODROWI.—A very pretty little variegated Agave has been grown at Kew for the last four years under the name of *A. vivipara variegata*, but as there is another older and quite distinct plant to which this name has been given, it is proposed to name this new one in compliment to Mr. Marshall Woodrow, late Professor of Botany at Poona, Bombay, to whom Kew is indebted for the plant. He wrote: "This is a new variety of *Agave vivipara*, a sport which originated in the Botanical Garden of the College of Science, Poona, from the variegated form, of which I previously sent you plants. The new sport is of remarkable beauty, the white part being broad and of a pure ivory colour, with sufficient green to maintain vigorous growth." It differs from typical *A. vivipara* and the variety known as *variegata* in its habit of growth, the leaves being horizontal or recurved, whilst in them they are sub-erect. It is also slower in growth, and evidently more delicate under cultivation here, the leaves being in some cases almost wholly white and consequently apt to suffer in winter.

ALOE SOMALIENSIS.

This is a new species of Aloe, which was introduced by means of seeds collected in Somaliland, in 1895, by Miss Edith Cole. Plants of it were raised at Kew, and one is now flowering in the Mexican-house. A description of it by Mr. Wright will shortly appear in the *Kew Bulletin*. It has short thick fleshy leaves, 2 to 3 inches wide at the base, 5 to 6 inches long, narrowed gradually to a long point, the margins clothed with strong red-tipped spines, one-eighth of an inch long; upper-surface dark green, marbled with a paler green, under-side thickly spotted with grey-green. The spike is erect, branched, 18 inches high, bearing numerous dull-red flowers over an inch long. It differs from all other cultivated Aloes in the rigidity of its leaves, which are also remarkable in their glossiness and conspicuous mottling. *W. W.*

ODONTOGLOSSUM CRISPUM MOORTEBEEKIENSE.

THE illustration (fig. 136) shows the exact size and blotching of this fine form of *Odontoglossum crispum*. The sepals and petals are of a pure crystalline-white, heavily blotched, as shown in the drawing, with brilliant purple-brown or deep chestnut-brown, which on the lip is very glossy. The sepals are just faintly tinged with rose-purple towards the tips, while the crest, teeth, and surrounding ground is of a soft bright yellow, very conspicuous in the midst of the white. The denticulate edges of the lip are here and there dotted with crimson-purple. The plant which produced the flowers was shown at a recent meeting of the Manchester and North of England Orchid Society, and "created a great sensation" at the meeting. It not only received a First-class Certificate, but

many Palms and Tree-Ferns resemble each other strongly, and pinnate, bipinnate, and even tripinnate leaves and fronds ape each other markedly, as do the simple fronds and leaves of other species. This resemblance is very extraordinary when we consider the very different genesis and functions of the two kinds of foliage, and affords a marked example of how exposure to similar conditions of life can in time produce similarity of structure. The foliage of flowering plants represents a larger or smaller community of separate individuals, who work jointly together to build up a support, by which the community may not only benefit by an ample supply of light and air, constituting vital stimuli and food, but also derive other supplies from a root-system, which serves the double purpose of anchorage to the soil and provision of water, and certain salts needed by the aerial community above. The tree or the plant is

in the oldest coal formations we find the Fern fronds grandly developed, and differing in no essential degree from those of to-day. The Lichens and Marchantias have progressed but little from the small and creeping scale formation. Some imitate the true Mosses, which have taken a line of their own; some throw up beautiful structures, stalked stems and tablets for the same objects as fronds, i.e., spore-bearers and spore-scatterers; but none form a crown and central axis of growth at all comparable to Ferns; despite which, they have held their own, and thrive in damp soil, as every gardener will attest who keeps his plants over-wet.

What, then, induced the Fern tribe to develop as it has done, until finally its chief essential stage, the scale or prothallus, is but a brief episode at the outset of a life-career which lasts for an indefinitely long period?

This is one of the biologist's puzzles, for there is a distinct difference between the cell-formation of the prothallus and that of the frond, and although we can conceive that in the struggle for existence in primæval days, which meant in dense forests a struggle for the light, the frond was evolved as a necessity for survival, enabling the Fern to share the light of day with its many competitors; the beginning of such evolution is a mystery. Is it possible that we have a clue in the Aposporous Ferns, in which the frond-tissues merge at their tips and edges into the prothallus-tissue, reassuming the reproductive functions at all points, and, what is more essential, producing in the process, not the usual primary fronds of normal frond-texture, but long-stalked prothalli, with an axis of growth at their bases which subsequently throws up larger and larger fronds, each one with more of the frond proper in it, and less of the prothallic character, until finally true fronds are arrived at, save and except the aforesaid capacity of prothallus formation at the edges and tips?

The prothallus is the child of shade and moisture, the frond the tenant of the air and drier conditions, and certainly in these half-and-half beginnings of the frond stage we have a very plausible-looking commencement of frond evolution, which, once so commenced, would lead on and on to larger and diversely-shaped fronds, to which, as a correlated advantage as regards scattering, the formation of spores would become delegated. The sporangia so far found on prothalli are on short projections, presumably incipient fronds, and as it appears that the prothallus is capable of producing all its organs practically from any part of it, we have in these two cases of Aposporous primary fronds and sporiferous projections, evidence of first steps in the evolutionary process which merit careful study. *Chas. T. Drury, F.L.S., V.M.H.*

FOREIGN CORRESPONDENCE.

LILIUM RUBELLUM.

THIS beautiful Lily is the most recently introduced, and without exception the loveliest of Japanese Lilies for pot culture. During the last two years it has been sent to the European and American markets in large quantities, but, unfortunately for the shippers, at a considerable pecuniary loss, through their not sufficiently appreciating the requirements for the packing of the bulb. The buyers, on the other hand, have not been successful in their cultivation. The blame for this is due to the exporters not giving their clients a description of the conditions which surround this Lily in its native habitat. It grows in the northern part of Japan, and is therefore quite hardy. It is found in Pine forests with a dense undergrowth of Bamboo, &c., the soil being dry and poor. It follows that success is likely to attend its culture only by keeping the above information in mind. It is therefore suggested that a poor stony loam be used with 2 inches of drainage, and three bulbs to a 5-inch pot, keeping the soil slightly moist. Over-watering is sure to be disastrous. The pots should

FIG. 136.—*ODONTOGLOSSUM CRISPUM MOORTEBEEKIENSE*.

was awarded a Silver-gilt Medal. The plant is the property of A. Warburton, Esq., Vine House, Haslingden, near Manchester, who has been kind enough to send me a flower. *John Weathers, Isleworth, November 15, 1899.*

THE EVOLUTION OF FERN FRONDS.

GLANCING through a general collection of Ferns, native and exotic, we cannot fail to be struck by the many resemblances presented by the fronds of some species to the proper leaves of flowering plants; the finer cut *Adiantums* on the one hand, and massive *Platyceriums* on the other, alone displaying strong distinctive characteristic differences. True it is, that no Fern-specialist requires to look twice before determining the frond from the leaf, but as a humble, familiar instance of deceiving similarity, we may mention that on more than one occasion the common Cow Parsley has been sent to us as a pretty Fern; while an amateur might well be pardoned for mistaking *Asplenium septentrionale* for a tuft of stunted grass. Superficially

nothing without its leaves and branches, and the main object of such community of leaves is the reproduction of the species through flowers and seed. This main object, therefore, failing to be effected by the community of Fern fronds, though essential to the continuity of the race, we are induced to make a further examination, and find, to our surprise, that really and truly Ferns, from the smallest to the largest species, might exist and reproduce themselves without any fronds at all, and in such a lowly form as to be utterly unworthy of horticultural care. For all essential purposes, the tiny little green leaves [the prothallus], no larger than heriog-scales, which we often see in the soil of pots and pans in which Ferns are grown, is the Fern proper, and all the lovely panoply of frondage the mere spore-bearers, a function which it has been found the tiny scale aforesaid is occasionally capable of fulfilling for itself. Ferns consequently present a more interesting example of the production by evolution of large, conspicuous, and ornate foliage from originally very inconspicuous plants closely allied, and possibly derived from primæval Marchantias or Liverworts; and yet

be kept in the shade, but not such as would naturally draw the plants. The Lily attains a height of 1 foot, and is compact and sturdy in growth. This character should be maintained. It may safely be said of this pretty Lily, which blooms in April, or earlier, that it will prove to be the gem of the greenhouse, conservatory, or sitting-room. In Yokohama, out-of-doors, it flowers at the end of April and beginning of May. It should be grown on a raised bed of poor, dry soil, and out of the sun's rays, or plant on a dry bank, facing east or north. We in Yokohama grow it under deciduous shrubs, close into the roots, where the condition of dryness is natural, and protection is secured from the sun's rays. *L. Krameri* grows in the south of Japan under the same conditions as *L. rubellum*. It flowers one month later, takes the same cultural treatment, and attains a height of 3 feet. *G. W. Rogers, Yokohama.*

EUCALYPTUS IN THE TRANSVAAL.

IN following up the hint indicated in some remarks of mine earlier in the year on the growth of the Eucalyptus in South Africa, I take the liberty of communicating the result of my observations on the rearing and planting of them in the Transvaal, &c. The rearing and planting of exotics take more care and skill than are required for indigenous plants, as a knowledge of the conditions of their native habitat and climate are essential to success. Like the home country, South Africa has been fortunate in having several enterprising nurserymen, who early grasped the situation, and have done much to encourage planting by the introduction of many varieties of forest-trees, which will do much, if extensively planted, to very materially ameliorate the climate, and increase the agricultural value of the land. To the Nelsons of Johannesburg and King Williamstown, the Gowers of Grahamstown, and Smith of Port Elizabeth, all correspondents of the *Gardeners' Chronicle*, are due the credit of giving an impetus to tree-planting, and spreading a knowledge of the suitability of Australian sylvia for the wants of South Africa.

With, possibly, three or four exceptions, no genus seems to fulfil all the necessary requirements more than the Eucalyptus. It is quick-growing, attains to a useful size as timber in a short time, and, so far as is known, the quality of the timber of many of the more easily grown varieties is good, and suitable for general economic purposes, while it seems to be admirably suited to the climate and soil of a very large portion of that part of the African continent. From observations made over a wide area, I am convinced that in conjunction with a few other species afterwards mentioned, it will, in the near future, be the predominant tree grown south of the twentieth degree of south latitude. But I must now advert to the real object of this notice, viz., the rearing and planting as adopted generally in the Transvaal.

The seed of the Eucalyptus is very small, and requires considerable care in sowing and watering. The general practice is to sow in boxes thinly, and in a fine shallow mixture of sand and loam with that of leaf-mould. After germination, care is taken to prevent drawing and damping-off by giving plenty of air. Whenever the plants are strong enough to be handled they are pricked out in rows into beds or frames, half an inch apart and 6 inches between the rows, carefully shaded until they are established. Whenever they get crowded they are again transplanted into another bed, made up of good free soil, with plenty of vegetable fibre, laid at 2½ or 3 inches apart, and 8 to 10 inches between the rows, where they can remain until finally planted out. In some cases, in order to facilitate removal, they are planted in small tins or zinc square pots, with a movable side; at this stage much may be said in favour of this, but if not finally transplanted from these pots at the proper time they are liable to become pot-bound, and the roots take a spiral form, and necessitate

the breaking up of the ball in final planting, which as much as possible ought to be avoided, both for prudential and economic reasons.

The system adopted by Mr. Nelson, of Boysun's Nursery, Johannesburg, and which struck me as most to be commended, was the following. In lifting the plants out of the beds for final planting, each was lifted with a ball; there was a tub of alluvial clay-mud handy, and each ball was dipped into this and made firm with the hand. Then each was surrounded with some coarse grass, and tied with a piece of matting; the mud on the outside hardens and acts as a pot, keeping the ball together. In this way plants can be taken any distance, the dampness of the clay-mud outside being absorbed by the less tenacious soil round the roots, thereby keeping them fresh. In transplanting, all that requires to be done is to cut the enclosing matting, break the crust of the mud, and put it into the hole or pot prepared; the hard mud is soon dissolved with the surrounding moisture, and the grass acts as food to the young roots.

The next step is to prepare the ground for planting. The greater part of the country is bare grassy veldt. The surface is very hard, so much so that it can only be ploughed after the early rains have come. The first stage is to plough the ground, say, 6 to 8 inches deep in the month of October, sow a crop of Mealies (Maize), which will be reached in April. The following September or October, or whenever it can be done, plough again, and level with a harrow; cut any drains or water-courses necessary, then proceed to plant. The plants are brought on to the ground in the condition already indicated, and placed on the ground 5 to 5½ feet apart; a boy goes in front and cuts the matting, and the planter comes behind with a strong garden trowel and makes the hole, and plants. In this way one man and a boy can plant from 1200 to 1500 plants per day, or about an imperial acre. The next care is to see that the plants are not overtopped, and shocked by the coarse grass that is liable to rise. Of course, the ground must be enclosed from cattle.

Large areas have been planted in this way in several parts of the Transvaal during the last twelve years, and, as I have already said in a former communication, with very surprising results.

It is to be hoped, in the future development of South Africa, that due attention will be paid to the encouragement of afforestation, as a means to equalise the rainfall over the different seasons of the year and improve the agricultural capabilities of the country.

In addition to the Eucalyptus and the Acacias referred to in my former notice, it may not be out of place to state the other varieties of exotic forest-trees which seem to do very well, although perhaps not so rapid growers.

The first, in point of importance and beauty, is *Pinus insignis*; it is a quick grower, and so far as known the timber is fairly good and suitable for building and other purposes. This Pine has been extensively planted by Mr. Sam Marks at his lovely residence, Zwartkoppe, near Pretoria, where I had the pleasure of seeing some of his extensive plantations, and where the *Pinus insignis* was much in evidence, almost equalling the Gum-trees in growth. *Pinus Pinaster*, *P. pinea*, *P. halepensis*, *P. canariensis*, all do well, although slower growing.

Casuarina tenuissima, *equisetifolia* and *leptoclada* all do well and are most handsome trees. Several varieties of *Cupressus*, notably *macrocarpa*, are also useful trees; these, with the three Acacias, *dealbata*, *mollissima*, and *melanoxydon*, are the principal exotic varieties generally planted, in addition to the Eucalypti, and all of which are likely to be good timber trees.

From what has been said, I venture to hope that someone may give the Gum trees a more extensive trial in the British Isles than has been done yet, as I feel pretty certain, taking into consideration the evidence of the existence of several good specimens having in a measure withstood some of our most

severe winters, if suitable localities were selected, that they may become one of our useful timber trees. *Chas. S. France, Aberdeen.*

SEASIDE PLANTING OF TREES AND SHRUBS.

(Continued from p. 394.)

AMONG evergreens of somewhat recent introduction there is *Griselinia littoralis*, a small shrub with leathery, pale-green foliage, which thrives when planted among rocks or on a bank. There is a variety of *Griselinia* with nobler appearance, larger in all its parts, called *G. macrophylla*; but I am bound to say that it has proved tender and untrustworthy in Kent. Either is useful as a contrast to shrubs with dark-green leaves. For planting on sandy banks and knolls such as we find on the Norfolk coast, the Sea Buckthorn (*Hippophae rhamnoides*) is invaluable, as it not only decorates such spots, but also, when planted in close proximity and in quantity, prevents sand being drifted by the wind; moreover, wind and salt-spray do it no harm once the plant is established. Its small, axillary flowers are produced in profusion, and are greenish-yellow in colour; the female flowers, which are on separate bushes, are followed by bright, reddish, orange-coloured berries, which remain a long time on the branches, rendering the shrub very ornamental and attractive in autumn and early winter. There is a robust variety, a native of northern India and China, with lance-shaped leaves, like the Goat Willow, and flowers and fruits similar to the commoner species, but lacking its silvery sheen. It is a plant worth trying in suitable situations on the south or south-west and west coasts of this country, and in Ireland and south-west Scotland. Rabbits will not interfere with *Hippophae*, which is a great advantage when sandy banks have to be planted.

St. John's Worts, especially that strongly odiferous species *Hypericum hircinum*, seem to rejoice in the sea breezes, most of the species flowering freely, giving a succession of amber-coloured fruits, which gives it its common name, "Amber-tree;" while the free-growing species called Rose of Sharon (*H. patulum*), may be used with advantage when the trees and shrubs which are first planted begin to afford a certain amount of shade. The Japanese shrubby kinds I have little doubt would thrive at the sea-side, as for example, *H. patulum* and *H. Moserianum*. *H. patulum* is able by means of its widely creeping roots to bind sandy soil, and afford stability to any banks and borders where it is used.

The *Kerria*, single and double forms, and the elegant, low-growing sort with small acute leaves, and abundance of single flowers, called in the trade *Kerria elegantissima*, may be used on the rockery with good effect; and a member of the genus called *Rhodotypos*, which is merely a white, single-flowered *Kerria*, having a more stiff, shrubby habit, may be used as a counterfoil to the yellow-flowered kinds, and, berrying freely, it looks pretty when its leaves have fallen.

Olearia.—The singular looking shrubby Composite, *Olearia Haastii*, with its dark-green, leathery foliage and masses of hawthorn-scented flowers, which appear in early spring, is a shrub very suitable for seaside planting.

Veronicas, the shrubby New Zealand Speedwells, especially the smaller-leaved species—*buxifolia*, *incana*, and *Traversii*—succeed very well, and grow into bushes of large size, flowering almost the whole year where the climate is mild and the position sheltered. A useful hybrid form is named "Blue Gem." The downy-leaved Jerusalem Sage (*Phlomis fruticosa*), grows fairly well on sandy banks near the sea, and when covered with dense whorls of bright yellow flowers in June and July a bush of it forms an attractive object. Why called Jerusalem Sage I cannot imagine, as it is a plant of Spanish origin, and may be planted safely therefore in hot, dry positions.

The Oleasters (*Elaeagnus*), grown in a sheltered position, will also succeed, and give variety to the shrubbery; and some of the species of late introduction from Japan, notably, *Elaeagnus reflexa*, and its handsome varieties *Simoni* and *tricolor*, as well as a variety called *Frederica*, with highly-ornamental variegated leaves, if tried, and left to grow

make handsome single specimens along the coast, as does also the winter-flowering *Jasminum nudiflorum* treated as a bush—or, if possible, helped by the support of a wall or a fence.

Those who have been along the coast of Devon and Cornwall, or across the Solent to the Isle of Wight have, no doubt, noticed the size and luxu-

F. gracilis, though I have seen the old-fashioned florists' variety, named *Souvenir de Chiswick*, at least 8 feet high, and forming a dense elegant pyramid when supported by a stout central pole. Nor is this the sole florist's flower that will thrive in the open "by the sea wave," for I have seen two varieties of *Camellia japonica*, the old double white and the semi-double red, making large and very handsome shrubs on an open lawn sloping to the sea, and in mild winters flowering freely. In the same favoured spot, planted on southern and western slopes and sheltered from the north by a belt of trees and Firs, I have seen the white Indian Azalea and *I. alba* covered with flowers and looking quite at home. I scarcely dare to say plant these, as I fear it is only on a few favoured coasts that they will answer.

Then there are the common, the broad-leaved, and box-leaved Myrtles, varieties which will weather the storm and the winter's cold if afforded the shelter of a wall or fence, and flower freely. I have known the New Zealand *Metrosideros semperflorens*, the Bottle-brush plant, and yet another Myrtaceous plant, the *Lithospermum bullatum*, quite hardy on the Kentish coast, and even in sheltered places inland. *Philadelphus* (vernacular Syringa, or Mock Orange), grows strongly and flowers freely at the coast; the most hardy species being *P. coronarius*, though this is greatly surpassed by an improved form called *speciosissimus*, which being more robust, and larger both in foliage and flowers, should have a trial.

While we are with the Myrtles, we must not pass over the noblest members of the tribe, the Pomegranates, which will do quite well with a little shelter, or against a wall or fence, where it will flower freely, one called *Punica Legrelli* being the freest doer and bloomer I know. Although the double- and single-flowered scarlet forms will answer well enough they do not set their fruits. There is yet one more among tender shrubs which should not be omitted, I allude to the elegant Heath-like *Fabiana imbricata*, the growth and foliage of which resembles the *Tamarix africana*, but it produces dense spikes of small Heath-like white flowers in June and July. Loudon mentions it in his *Arboretum*, but has a singular error as regards its blossoms, which he says resemble those of a Peach. *Experience*.

(To be continued.)

MR. MILLER'S LILY-TANK AT BERKSWELL.

With some few exceptions the plan is my own. A grass path skirts the pond, intended for the culture of Marliac's hardy Water-Lilies; this is bounded by a Yew-hedge, which will finish with a golden Yew at each end. I formed the plan (fig. 137) and did the work with the help of one man. *W. Miller, Berkswell.*

THE COMMON BEECH AND ITS VARIETIES.

The common Beech, *Fagus sylvatica*, is well known as a useful and ornamental tree, and is also prized for its timber-producing qualities. Its area of distribution is somewhat wide, being found as a native in Britain, Spain, and various other parts of Europe, as far east as Asia Minor, while one of its varieties is indigenous to North America. In its young state it is useful as a hedge plant, its dead leaves clinging to the branches during the winter till the young leaves appear, affording shelter and protection in exposed situations. For timber purposes it has small value till it attains the age of from fifty to sixty years, and owing to its dense shade and the immense size of the crown it should be grown in plantations by itself. Several of great size are to be found in this country as specimen trees. Sir J. Hooker, in his *Students' Flora of the British Islands*, mentions a magnificent specimen at Ashridge, Herts, Earl Brownlow's seat, known as the "King's Beech," with a trunk 118 feet high; and there are many other magnificent Beeches at this place. There is another at Bicton, in Devon,

FIG. 137.—MR. MILLER'S LILY-TANK, BERKSWELL.

(Showing a Yew-hedge and an outer belt of shrubbery. The small circles represent earthenware pans, intended for the cultivation of aquatic plants.)

naturally, would make quite distinct and pretty shrubs. As a neat and pretty contrast to these, the golden *Diplopappus* (*Cassia fulvida*) may be used. This plant forms a close-growing erect bush, and its peculiarly yellow Erica-like foliage, showing quite golden in certain lights, makes it an acquisition.

The winter-flowering *Forsythia viridissima* and the more elegant spring-blossoming *F. suspensa*

riance of the hardy Fuchsias, which not only grow in gardens but form hedgerows there. Not here alone will they thus flourish, for all along the south coast they make goodly bushes, and flower freely through the summer; even though in some severe winters they may be killed to the ground, it is very rare that they do not send up some strong growth in the spring, and quickly recover themselves. The two best are the Riccarton Fuchsia and

also very large; while it is not at all unusual to find noble trees in various other parts of the country. This species possesses several varieties, most of which are probably more ornamental than the type, and all of them are well worth growing. Of the lesser known forms the following are worthy of notice, as being distinct and useful, and but little known in gardens at present.

F. s. rotundifolia.—This variety originated at Woking some years ago. It was discovered, growing naturally, in a wood near St. John's, and owing to its distinct and handsome appearance is well worth growing as a decorative tree. The leaves are small and almost round, and very closely arranged on short branches. They are slightly toothed, with ciliate margins, and in colour are dark glaucous-green above, with a paler green beneath. In growth it is very robust, soon forming a large tree, and in habit it is very erect.

F. sylvatica aurea variegata.—This is the finest of all the variegated forms. Its leaves are not so round in shape as in the type, and are also slightly serrated. They are in colour bright-green, splashed and streaked with golden-yellow. The variegation is more constant, and far more effective, than in any of the other varieties, and when grown as a specimen tree it is an object of great beauty. Its habit is erect, while its growth is also vigorous.

F. s. pendula is a highly ornamental form, with leaves similar in appearance, as well as shape and size, to those of the type, but differing in habit by reason of its weeping character. It is generally grafted standard-high on the common variety, and when seen in good condition is an object of great beauty. Several good specimens occur in this neighbourhood. The finest I have ever heard of, and the most interesting, is that one noted by London in his *Encyclopædia of Trees and Shrubs*, published in 1842, viz., the fine natural specimen that existed in a plantation at Milton Park, Northampton. [Can any of your readers say if this tree is still growing?]

F. s. albo-marginata.—As a variegated form this is very effective for a contrast, but the leaves are more conspicuous in the spring and earlier summer, as later they are apt to become brown and lose this character. The silvery variegation is generally prominent on the margins of the leaf, but some leaves have blotches and streaks of the same colour. It was introduced to our gardens about 1836 by Messrs. Loddiges, of Hackney, who at that time were famous for their collection of trees and shrubs. It is not so robust in growth as some varieties, and its habit is more spreading.

F. s. americana.—Under this name is known the American form, which is distinct in appearance from the typical species, although regarded by some authorities as identical with it. Its leaves are ovate glabrous, and toothed and ciliate on the margins. In its native home it grows considerably over 100 feet in height, but in this country is rarely seen growing beyond 60 to 70 feet. Few specimens exist in this country, but young trees are to be met with in nurseries and botanic gardens.

F. s. macrophylla.—This variety is very distinct in character. The leaves are very large and noticeable for their conspicuous ribs, which are disposed obliquely. In colour they are glaucous-green, and borne in clusters on short stems. It is very vigorous in growth, erect in habit, and soon attains a large tree.

F. s. cristata.—Although this can only be regarded as a monstrosity, it is well worth growing on account of its singular and quaint appearance. Its leaves are very small, and almost stemless, and produced in such a manner as to resemble small tufts, occurring along the branches at various intervals. In height it rarely exceeds 40 feet, but is deserving of culture as a very distinct and ornamental variety. Several fine trees are to be found in this neighbourhood, but I have never seen a large specimen of this kind.

F. s. asplenifolia.—As an ornamental variety

this is well worth growing, and is now easily obtainable. Its leaves are distinct in character from the type; in some cases they are long, and are deeply cut or serrated in narrow segments. At first sight they bear a marked resemblance to the fronds of an *Asplenium*. Its growth differs from the type, the branches being more closely set, and the leaves disposed to a great extent in bunches. It possesses numerous synonyms, adopted by various authorities, such as *F. s. heterophylla*, *F. s. incisa*, *F. s. salicifolia*. Of this variety I noticed recently a remarkably fine specimen in the pleasure-grounds at West Dean Park, Chichester, and this is the largest of this kind I have yet seen. From the mere glance which I had of it, it was about 15 feet high, and the head several yards in diameter.

Of the better known forms, which are now well known in our gardens, the following are worthy of notice:—

F. s. purpurea.—The Purple Beech is probably the best known variety of any of the forms. In the young state the leaves are in colour a bright red, but when fully developed they become of a deep purple tint, shading off to black. Its stems and shoots also exhibit to a great extent the same colour as its leaves. When associated with other trees or shrubs, more or less of an evergreen nature, it stands almost unrivalled for beauty and gracefulness. Its growth is very robust, and soon attains a large size. A fine specimen of this variety was illustrated in *Gardeners' Chronicle* of October 22, 1898. A weeping form, known as *F. s. purpurea pendula*, is also in cultivation, which differs only in its drooping character, and which will, when better known, become a welcome addition; while *F. s. purpurea roseo-marginata* is another useful form, whose leaves in the young state are purple, edged with pink, but when fully grown lose this distinctive feature and shade to dark purple.

F. s. cuprea, the Copper Beech.—The true variety is distinct from the purple-leaved Beech, in that the young shoots and leaves are not so highly coloured, and are in tint a deep copper, and they are generally rounder in shape. It was introduced by Messrs. Loddiges about the year 1836; as a specimen it is well worth planting.

The Beech prefers, as a rule, dry calcareous soils and sandy loam, with a substratum of chalk, but it sometimes thrives on heavier soils of a different character. [It does well on soils overlying lime stone and basaltic rock. Ed.] Its roots mostly keep near the surface, never descending deeply into the ground. It is increased by seeds, and seldom by layers, while its varieties are increased by grafting and inarching on the type, operations generally performed in the spring. *E. S., Woking.*

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Pruning Plum-trees.—The pruning and fastening of trees of the Plum on walls should be undertaken when the Pear and Cherry-trees are finished. Old trees having numerous and long fruit-spurs should have a few of the longer and worse placed ones removed, which, if carried out at this season will allow the dormant buds at the base of the spurs to start in good time in the spring. The spurs of Plums should stand out only an inch or two from the wall, otherwise much of the shelter provided by the latter is lost when the trees are in bloom. Old trees that may have been neglected, and on which the fruit-spurs are from 1 to 2 feet long, may require several years before these are brought to a reasonable length. This applies only to such trees as are in perfect health, whereas unhealthy ones should be grubbed up and young ones planted. The leading shoots of young and fairly strong trees which have not filled their allotted space should not be severely pruned, but have the young growths shortened slightly to ensure an even break, 2 to 3 feet being allowed to remain

for nailing in. If scale insects be apparent on the branches, let the entire tree be unfasted and cleansed by an insecticide similar to that recommended for scale on the Pear, using a moderately stiff brush. After nailing or tying and training are finished, well syringe all of the trees with the soda and potash mixture mentioned in a previous calendar, which will destroy any green or black-fly that remain. It will be advisable to repeat this syringing in early spring, before the trees come into bloom.

Protecting Fig-trees.—As the embryo fruits of the Fig are liable to be damaged by hard frost, the branches should be unfasted and brought down in a horizontal position near the ground-level and protected with mats, or thatched with straw, or covered with thatched sheep-hurdles. When the Fig-trees are being loosened from the wall, barren branches should be removed low down, the aim of the pruner being the retention of as many young growths of the past season as possible, allowing a space of 10 to 12 inches between each shoot when again fastened to the wall. As long as the somewhat mild weather continues the Fig is the better for remaining uncovered, but keeping the covering handy in case of need. Fig-trees which have made rank growth should be entirely lifted and re-planted in a confined space; or a trench should be taken out about 4 feet distant from the stem, and the roots undermined and shortened back, a portion of the soil taken away, and a quantity of mortar-rubble incorporated with the remainder, which should be rammed in firmly under and around the roots. When planting young trees the space for the roots should be restricted to about 2 feet square and 2 deep, and after a few years it may be increased to 3 or 4 feet square, a solid brick or concrete wall enclosing the space, with rubble for drainage. But let the gardener do what he will, the roots of the Fig will stray beyond the boundary, and recourse must be had to root-pruning from time to time. A rich soil does not suit the Fig in this country, as it causes a too vigorous and too late a growth, with the result that the wood is late in ripening, when it ripens at all.

THE ORCHID HOUSES.

By W. H. YOONO, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Remarks on Miltonias.—Plants of *Miltonia vexillaria* are steadily developing new growths, and should be given a position near to the roof-glass. Although growth is being made, the rooting medium need not be saturated with water, but apply a small quantity at frequent intervals. It is necessary to avoid both extremes—saturation, and excessive dryness. Examine the young growths frequently, and relieve any of the central leaves that adhere to each other with an instrument that will not scratch or otherwise injure them. Failing this, crippled growths will result.

M. Ratzii is seldom inactive, even in the depth of winter, and it may therefore be repotted at any season of the year. Few Orchids recover so quickly and appreciate a removal from decayed material as *M. Ratzii*, provided the work is done when the roots are emerging from the base of the new growths. Evaporation being now less rapid much less water is needed, and it must be applied as far as possible without wetting the foliage of the plants. The species loves dense shade; and the growth made during autumn and winter is stronger, and the colour of the leaves a deeper green than that of growths made in lighter periods of the year.

M. Phalenopsis is a beautiful plant at its best, but the cultivation of this plant is seldom attended with satisfactory results. It is usually afforded too much heat, and in many collections is disturbed too often. The species is a difficult one to establish, but once this is effected little should be done beyond renewing annually the surface of the rooting material, when root action has commenced. The plants thrive best in suspended pans, in an intermediate house, and at this season they should be afforded very little water. The various members of the *M. spectabilis* group are now at rest, and will require little moisture at the base to keep their pseudo-bulbs firm. The same remark applies to *M. Bluntii*, *M. Lubbersiana*, *M. Clowesii*, *M. flavescens*, *M. candida*, *M. Regnelli*, &c., which at present are in the cool end of the Cattleya-house or the warm part of an intermediate one. *M. x*

Bleuana thrives in the warmer part of the Cattleya-house, and as it is growing new, the compost should be kept moist, but not saturated.

Sophrenitis grandiflora and its varieties supply a much-needed glow of colour and warmth to our cool-houses in winter. As the flowers are produced whilst the growth is only partially completed, the compost should not be permitted to remain dry for long periods, but water should be applied frequently in small quantities. *S. cerisea*, owing to its peculiar habit, is best grown on a round block. After it has completed its growth, a long rest is necessary, though to prevent it shrivelling to any great extent the block should occasionally be immersed in water.

Temperatures.—During this and the following month, temperatures should be lower than at any period of the year, though in ordinary fair weather they need differ little from those tabulated in these columns on September 30. During severe frosts, or when cold easterly winds prevail, the amount of heat in the various compartments should be determined more by the personal sensation felt upon entering a house than by the amount registered by the thermometer. The parching effects of excessive fire-heat is more detrimental to plant-life than a low temperature.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barlet.

Lettuce and Endive.—The vacant spaces in frames and pits containing Lettuce and Endive should be filled up from outside. The stock of these plants must be kept perfectly free from decaying leaves, and the soil slightly stirred between them, and air admitted daily, the lights being removed in dry, bright weather. Successions of Cos Lettuce may be tied up at intervals, and but little water afforded the soil. Seeds of Lettuce may be sown thickly in boxes once a fortnight for cutting in the young state, which, if grown quickly, will be found useful as salad.

Cauliflower. &c.—The beds of Veitch's Self-protecting Cauliflower, now freely turning in, should be looked over weekly, and all plants with heads formed should be dug up and stored in pits, or placed together in trenches on a south border, to be protected with mats, bracken, or litter in the event of sharp frost occurring. Snow's Winter White Broccoli will follow this variety, and keep up a supply till the new year has somewhat advanced. Plants of the Walcheren Broccoli or Cauliflower under glass protection should be kept free of decayed leaves, and the ground freed of weeds. No protection is required in an average winter. Air must be afforded every day when there is no frost, and also by night, which will have the effect of making them sturdy and short-legged. A sprinkling of soot may be afforded as a deterrent to slugs.

Parsnips.—These roots may be left undisturbed if the ground be not wanted for other crops, the decayed tops being raked off. Parsnips grow best in a soil that is deeply worked, and a suitable plot of land should be selected for next year's crop and trenched, and be heavily manured if the land requires it, leaving the surface as thrown up by the spade.

Seakale.—Continue to put forcing-pots or boxes over the crowns in accordance with the demands of the establishment, making good any vacancies in the clumps with strong crowns. Having made the beds tidy, cover with fermenting leaves and stable-litter, as previously advised.

Mushrooms.—Those beds which are carrying a crop may need water, and in affording it remove the litter and replace it with fresh if mouldiness is likely to set in. Particular attention must be paid to the killing of wood-lice, by pouring boiling water round the sides of the beds, and setting traps of boiled Potatoes—an old remedy which is very effective.

PLANTS UNDER GLASS.

By G. R. FIELDER, Gardener, North Mymms Park, Hatfield.

Solanums.—When these plants are no longer fit for house or conservatory decoration they may be pruned back closely, and afforded a few weeks' rest in a cool greenhouse, preparatory to starting them into growth again.

Calla (Richardia) africana.—If the plants are wanted to be in spathe as early as possible, they

should be introduced into a temperature of from 55° to 60°, in which spathes will quickly appear. If the plants have been well cultivated, spathes will have been produced for the past month or longer. Plants which have been housed in cool vineries and Peach-houses will also be now showing their spathes, and it is such plants as these which may be the more readily hastened into flower. When only required for conservatory decoration, as a succession to Chrysanthemums, they may be allowed to come on slowly, and will be all the better for having been so grown.

Zonal Pelargoniums.—Any plants which have gone out of bloom may, if they are leggy, be cut closely back, if the shoots be not required for spring propagation. Other plants which are still shapely may, after flowering, be rested for a time, and then introduced into a house having a night temperature of 55°, where they will come into bloom again at a season when their flowers will be much valued. Weak manure, liquid or solid, may advantageously be applied to plants which are now coming into bloom. The conditions of the house containing these plants should be somewhat dry, and no decaying blooms or leaves should be left on them.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. RALPH VIVIAN, Road Ashton, Trowbridge.

The Early Vinery.—In order to have Grapes ripe in the month of May, the vinery should have been closed ere this. At the first, a higher degree of temperature than 50° by day should not be exceeded, and that much will be afforded by a heap of fermenting materials placed in the middle of the house on a platform, or in a brick pit, such as is found in vineries of old construction. This mass of fermenting material should be occasionally turned over, in order to let the vapour escape into the vinery. If no such bed can be made, reliance must be had on the heating apparatus. Afford a small quantity of fresh air when the day is bright, shutting off the heat from the latter at the same time. The Vines should be wetted once or twice a day, according to the state of the weather, until the buds burst. With fermenting dung and leaves in the vinery, less syringing becomes necessary than when heat is derived from a boiler or a flue. It is a common practice to tie the rods down to the front of the trellis, so as to facilitate the syringing, and cause the buds to break regularly. As the buds grow, allow the temperature to gradually rise by one degree week by week, admitting air in moderate amount during periods of bright sunshine. If the borders have been kept on the dry side for some weeks past, slight applications of water at a temperature of 70° or 75° will suffice to carry on the growth for some time, as the roots will not take up much moisture at the first.

Early Figs.—The earliest Figs are more readily obtained from trees in pots than from those planted in borders, although the latter, if treated similarly to the early Vines, will afford good crops of early fruit. The same attention must be paid them in regard to heat, ventilation, water, &c. Owing to the risk of the earliest formed fruits dropping off in the early stages from fluctuating temperatures, much attention must be paid to the degree of heat, so as to maintain a steady progress; neither should the soil become dry, nor, on the other hand, that the pots or border, too moist. Air, in the earlier stages of forcing should be afforded only by the upper ventilators—later on, when the crop of fruit may be ripening, it will be time enough to admit air at the front. Fig-trees in pots started a few weeks ago will probably need some slight addition made to the bed of fermenting materials in order to freshen up the declining warmth. This addition must be made with due carelessness, and only sweetened materials should be used, the object being the maintenance of a steady bottom-heat of 75°. If bottom-heat be derived from hot-water pipes, care should be taken that the Figs do not suffer from lack of water, or the pots stand in contact with them.

Strawberries.—If ripe fruits are looked for in February, selected plants may be forthwith introduced into a newly-started forcing-pit, preferably one furnished with a hot-bed of tree-leaves, and in which the top-heat can be kept below 50°. The plants may be stood on boards, not plunged. For very early fruiting, Royal Sovereign, or La Grosse Sucrée are

the best. [Do not omit Napier, Paxton, and Vicomtesse. &c.] When the plants have been selected, the old half-decayed leaves should be cut off, and the surface soil removed to a very slight depth, a top-dressing of fresh soil, wood-ashes, and bone-meal taking its place. If red-spider be observed on the leaves, syringe the latter, and then apply flowers-of-sulphur to the under sides of the leaves, or dip them in a mixture of sulphide of potassium and water at the rate of half an ounce of the first to one gallon of the second. Whilst the plants remain in the hot-bed the tops should be kept cool till the flower-trusses appear, and until this stage is reached, very little water, if any, should be afforded. It is prudent to afford air in small volume night and day. The top-heat at night may range from 45° to 48°. If fine fruits are desired, plants with one crown should be chosen. When the flowers begin to show, shift the plants to a forcing-house.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westnont, Tetbury, Gloucestershire.

Bulbs.—The planting of all spring-flowering bulbs, if not already completed, should now be hurried on. If space can be found for them, the May-flowering section of Tulips will be found very beautiful, and excellent for cutting purposes. When once planted, the bulbs may be permitted to remain in the same spots for several years. Ordinary garden-mould is the best soil for Tulips, and the bulbs should be placed deep enough that some flowering-annuals may be sown over the surface. Bontou d'Or, Golden Crown, Golden Eagle, persica, retroflexa, are the best of the yellows; Fulgens, Bridesmaid, macrospila, Oculis Solis are rich crimson and scarlet in colour. The florist Tulips are very beautiful, have long stems, are quaint in appearance, and marbled in different shades of colour; while the Darwin Tulips (breeders), which are the latest to flower, are for the most part self-coloured. Beds recently planted with bulbs should be examined, to see that mice have not destroyed any of them. If they have done so, fresh ones may be inserted, and duplicate bulbs planted in any spare piece of ground for the purpose of filling up vacant places in the spring.

Plants in Cold Frames should be afforded abundance of air during mild weather, the lights, even, being tilted a little at night. Water should be applied only when signs of flagging are observed, the drier the soil and the air of the frames are kept the better will they withstand low temperature. The dead leaves should be removed from Carnations growing in pots, and the soil slightly stirred. Slugs and snails, particularly the smaller kinds, gnaw the rind of the stems, and need to be diligently sought after, or trapped by placing some Cabbage-leaves near the plants. As a means of preventing slugs from interfering with Carnations, fresh soot should be sprinkled between the pots, and if any fall on the leaves there will be nothing to fear, as it will not harm them. When Carnations are afforded insufficient air, they are apt to get infected with green-fly; and in the event of this having occurred, plants should be dipped into a vessel containing weak tobacco-water, or they should be removed to another frame, fumigated with tobacco, and afterwards be sponged clean.

Chrysanthemums.—Plants of early-flowering varieties that grow in the borders should be deprived of their flower-stems, cutting these to within 6 inches of the ground, and for safety sake the stools should be lifted, divided, potted, and wintered in a cold frame. Later, the plants will produce shoots for making cuttings. If cold frames are not available, lift the stools, and plant them at the foot of a wall with a warm aspect, and apply light protection applied in hard weather.

NOVELTIES.

MESSRS. THORBURN, of New York, invite attention to the sterling novelty *Salvia splendens* "Silver-spot." For many years they have grown *Salvia splendens* on a large scale, and have given much attention to its improvement. Its most distinctive feature is its strikingly handsome spotted foliage. The leaves are rich, soft dark-green with light-sulphur or cream-coloured spots of various size liberally sprinkled over them. A handsome-coloured plate well shows the character of the plant.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY, DEC. 11, and the following Tuesday and Wednesday, Dutch Bulbs, at Protheroe & Morris' Rooms.

WEDNESDAY, DEC. 13.—Great Sale of Japanese Lilies, Azaleas, Roses, &c., at Protheroe & Morris' Rooms. English-grown Roses, Flowering Plants and Bulbs at Mr. Stevens' Rooms.

THURSDAY, DEC. 14.—Bulbs for late planting, at Mr. Stevens' Rooms.

FRIDAY, DEC. 15.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period November 26 to December 2, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the week has been dull, with much fog and frost on five mornings.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—40° 7'.

ACTUAL TEMPERATURES:—

LONDON.—December 6 (6 P.M.): Max. 57°; Min. 50°. December 7: foggy; mild; slight rain.

PROVINCES.—December 6 (6 P.M.): Max. 55°, Southern Counties; Min. 43°, Shetland.

The Sale of Poisons. The prosecutions which the Pharmaceutical Society is instituting against those who sell poisonous substances without legal warrant or adequate precautions are no doubt irksome to the persons most concerned, but in the interests of the public they are amply justified. A seedsman may, and we believe too often does, sell across

the counter, without any precaution, a tin of Weed-killer containing enough arsenic to destroy the population of a large parish. Sheep-dip, vermin-killer, and various potent insecticides are disposed of in the same manner. The law, as it stands, prohibits the sale of certain well-known poisons, mentioned in a particular Act of Parliament, except under certain conditions which cannot, in the circumstances, be called unnecessary. If a particular poison is not mentioned in that schedule, then it may be sold by anyone.

There is an impression prevalent that the restrictions we have mentioned are maintained as a monopoly for the benefit of the Pharmaceutical Society or of its members. This is altogether a mistaken view. It is compulsory on the Society to take action in such matters, and we have no doubt that the Council of the Society would willingly be released from what must be an invidious and irksome task. But public safety overrides every other consideration, and no body is more fit to have control over these particular matters than the Pharmaceutical Society. It is exceedingly difficult to draw a line between what shall be considered a poison and what shall not. Tobacco in excess is poison, but many people seem to require large and long-continued doses before much visible harm is occasioned. A large dose of Epsom salts may prove fatal, but the ordinary quantities dispensed or sold over the counter are innocuous. Should the tobacconist or the druggist be compelled to affix a poison-label in such cases? Should the sale of poisons be confined to qualified druggists, educated men who have given a guarantee of their fitness? Or should the sale be also permitted without restriction to gardeners' sundriesmen, grocers' young men, oil-shop assistants, or *employés* at the stores, who have had no special training, and can offer no certificate of competence?

Certain substances taken in reasonable quantities are, as we have seen, hardly to be considered poisonous, whilst "preparations" from them may be highly so. Tobacco in an ordinary way is not poisonous; in excess it is so, and the substance "nicotin," which is prepared from it, is among the most violent poisons known. Are we then to label tobacco, and particular preparations therefrom, as poisons? These are the questions which arise out of the Pharmacy Act, and we cite them, not with any idea of answering them here, but as illustrations of the inherent difficulties of the subject.

In a case which came before the Lord Mayor on the 30th ult., a well-known firm of seed-merchants was summoned, at the instance of the Pharmaceutical Society, for selling, without adequate precautions, the substance known as "XL All." This is, as most gardeners know, a most efficient insecticide, and as it is used in the form of vapour, there is comparatively remote chance of its being taken by mistake, and its poisonous qualities are not much thought of. Nevertheless, if we may rely on the analyses submitted to the Lord Mayor, it is a poison of the most virulent description. If it were not so it would not be so efficacious as it is. Being so virulent it is reasonable, to say the least, that adequate precautions should be observed in its sale, as in its use; and the gardener has only to comply with a few reasonable requirements to get as much as he wants.

The word nicotine is often used in general language to denote the foul, greasy liquid that collects in the bowl of a pipe after smoking. It is necessary to point out that this not very

delectable stuff is not nicotine, though it may contain it. Nicotine is, in fact, the quintessence of tobacco-juice as morphine is of opium, or aconitin of aconite. It is necessary to bear this in mind when reading of the large proportion of pure nicotin, which the analysts find in "XL All." As the particular case, promoted by the Pharmaceutical Society, will have to be decided upon in another court, we abstain from any special comment, and content ourselves with generalities. We condense from the *Times*, the following account of the proceedings:—

The charge was that of unlawfully selling a certain poison, to wit, a poisonous vegetable alkaloid called "nicotine," being a poison within the meaning of Schedule A, Part 1, of the Pharmacy Act, 1868, which poison when sold was contained in a bottle which was not distinctly labelled with the name of the article and with the word "Poison," and with the name and address of the company, the sellers of such poison; for selling the poison to Mr. Harry Moon, he being a person unknown to the company, and not being introduced to the company by a person known to the company; and for not making or causing to be made an entry in a book to be kept for that purpose stating in the form set forth in Schedule F of the Act the date of the sale, the name and address of the purchaser, the name and quantity of the article sold, and the purpose for which it was stated by the purchaser to be required, and to which entry the signature of the purchaser was affixed.

Dr. Thomas Stevenson, analyst to the Home Office, deposed that he analysed the contents of the bottle sold to Mr. Moon on November 7. It was a solution of nicotine and camphor in diluted alcohol. It contained 37.3 per cent of the alkaloid nicotine, 34.5 per cent of camphor, and 15.1 per cent of alcohol, the balance being water. Nicotine was a highly poisonous vegetable alkaloid. A small drop from the bottle killed a rabbit in two-and-a-half minutes. The bottle contained enough to kill thousands of people if swallowed. The witness said that three, four, or five drops of the preparation would be fatal to human life if taken.

Mr. Whiffio, a Fellow of the Institute of Chemists, was called for the defence, and said that he was the manufacturer of the preparation. He considered that it was not within the schedule of the Pharmacy Act. It was a "preparation of nicotine." Some poisons and their preparations were scheduled in the Act, but with regard to poisonous vegetable alkaloids their preparations were not scheduled, and therefore this preparation of nicotine did not come within the Act.

Mr. Parry, who had analysed the preparation, said it was not pure nicotine, but a preparation of nicotine containing 35½ per cent.

Mr. Avory, for the defence, said that the question which the Lord Mayor had to decide was whether the schedule to the Act included a preparation of nicotine. The Act made a distinction between certain poisons. In regard to some poisons, such as arsenic and aconite, not only the poisons themselves but their preparations also were included in the schedule, but as to others their preparations were not included. This was a "preparation of nicotine," and nicotine was not one of the poisons the "preparations" of which were included in the schedule, and consequently this did not come within the Act. A person who sold cigars sold a certain quantity of nicotine. He submitted that there was no difference between a man who sold tobacco and a man who sold nicotine mixed with other things as in this case. The label on the bottle stated clearly that it was only to be used for fumigating purposes.

The Lord Mayor said he was quite satisfied that this was a poison within the meaning of the schedule, and, while expressing his willingness to "state a case," imposed a penalty of £5 and £10 10s. costs on the first summonses, and a nominal penalty of 10s. and the costs of the summonses on each of the other two summonses.

ACALYPHA HISPIDA (SANDER).—Those who have only seen small specimens of this interesting plant are usually disappointed; but a fine specimen like that illustrated (fig. 138), which was grown by the gardener to H. HAMMOND-SPENCER, Esq., of Glendarragh, Teignmouth, establishes its claim to

popularity. The gardener, Mr. GEO. FOSTER, who, by-the-way, is known as a successful Chrysanthemum cultivator at the Royal Aquarium and elsewhere, has a good many specimens of this plant, the three finest of which were growing in a temperate-house in baskets. They were raised from cuttings in

February last. The plant in the photograph was taken with two shoots, and when photographed it carried 103 pendulous racemes, the longest of which measured 28 inches. Another fine specimen with a single shoot had 50 racemes. These plants are suspended from the roof in 8-inch wire baskets, and their long, pendulous, and brightly-coloured racemes are particularly attractive. Mr. FOSTER says he has no difficulty whatever in growing them to these dimensions. Whilst being brought on in the stove, abundance of water is required, and some liquid-manure is frequently applied.

GIRDLESTONE MEMORIAL.—It is proposed to form a fund to provide prizes for "garden" or decorative Roses, in the cultivation of which Mr. GIRDLESTONE always took a keen interest. Mr. GIRDLESTONE made so many friends among rosarians, that we have no doubt of the success of this attempt to hold his memory in honour. Subscriptions of any amount may be sent to EDWARD MAWLEY, Esq., Rose Bank, Berkhamsted, Herts.

"THE BOTANICAL MAGAZINE."—The current volume of this periodical is dedicated by its venerated Editor to the memory of HENRY LEVÉQUE DE VILMORIN "as a feeble tribute to his worth and works."

THE HORTICULTURAL COLLEGE, SWANLEY, KENT.—There are, we are informed, now eighty-two students in all, and the two new boarding-houses which were opened in the summer have proved insufficient to accommodate the numerous applicants for next term. The premises are therefore again to be enlarged. In addition to the four County Councils already offering scholarships (free training, board and lodging for two years), Staffordshire has just made the fifth. Good posts await the students, and several of those of three and a half or four years' standing are now in receipt of £100 a year and board and lodging, or its equivalent. People are beginning to realise that there is a future for their sons and daughters as well-trained horticulturists and fruit-growers, both in England and the colonies. In addition to the Banksian Medal (for fruit) at the Temple Show, the College has, this month, gained the Silver Cup, two 1st, and three 2nd class prizes at Bromley for Chrysanthemums; and three 1st and four 2nd class at Woolwich for Japanese and incurved blooms.

ROYAL BOTANICAL SOCIETY OF BELGIUM.—M. COGNIAUX, the distinguished orchidist, has been elected President of this Society.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, December 11, 1899, when the adjourned discussion on the paper read by Mr. PHILIP E. PILDITCH (Fellow) at the last meeting, entitled "Party Walls under the London Building Act, 1894," will be resumed. The chair will be taken at 8 o'clock. Definite notice is also given that the next Special-Certificate Examinations in Forestry and Sanitary Science will be held on Tuesday, Wednesday, and Thursday, June 12, 13, and 14. Particulars of these examinations can be obtained from the Secretary.

WEST AUSTRALIA.—We regret to hear of the death of Mr. J. EDNIE BROWN, the conservator of forests in that colony. Mr. BROWN was a son of Dr. JAMES BROWN, the author of *Brown's Forester*. We shall give an account of his career in our next issue.

"PUNCH'S ALMANAC."—Our evergreen contemporary, *Punch*, has again put forth fresh leaves for the coming year. The letter-press and illustrations are sure to find, as before, a large and appreciative public, for there is no falling off either in interest or amusement in the fare here provided for them.

ROSE SOILS.—The National Rose Society has obtained a series of analyses by Dr. BERNARD

FIG. 138.—*ACALYPHA HISPIDA* (SANDER), IN H. H. SPENCER'S CONSERVATORY, GLENDARRAGH, TEIGNMOUTH.

DYER, of certain selected soils on which Roses of exhibition quality have been grown for years past. The result, so far as the soil is concerned, is negative, and it is evident that the factors are numerous and complex, and do not permit anyone to say with accuracy—"Ah! so-and-so's soil is much better than mine; no wonder he can grow Roses." Whilst soil is not without its influence, it is evident that many other circumstances must be taken into consideration. We shall advert to the subject on another occasion.

"THE GARDEN."—We learn that this publication, which has rendered good service by the publication of its coloured plates, and the impetus it has given to the culture of hardy plants, has been disposed of to the manager of *Country Life*. The periodical will, we hear, in future be edited by Miss Jekyll and Mr. E. T. Cook, whose names offer a guarantee of success. Miss Jekyll has taken a very high place in horticultural literature; and Mr. Cook's career, first as a Chiswick student, and then as a member of the horticultural press, has been one of steady progress.

"THE ROSARIAN'S YEAR-BOOK FOR 1900."—Edited by the Rev. H. Honywood D'Ombraïn, V.M.H., Hon. Sec. of the National Rose Society, will be published early in January. It will contain articles on Mr. H. V. Machin (with photograph), by Mr. Charles J. Grahame; New Roses, by the Rev. Joseph H. Pemberton; Single Roses, Planting and Pruning, by Mr. George Paul, V.M.H.; The Rose and the National Rose Society in 1899, by the Editor; Amateur Rose Culture, by Mr. R. E. West; Standard Roses, by Mr. Cecil E. Cant; Rose Weather in 1899, by Mr. Ed. Mawley, F.R.M.S., Hon. Sec. N.R.S.

BURRS IN NATAL.—A correspondent sends from Natal specimens of "burrs," which by adhering to the fleeces of sheep or the clothes of the Boers, get disseminated over wide areas. The seeds were gathered at Elands Laagte, and belong to the genus *Bidens*, whose pappus scales are provided with recurved hooks.

LATE-FLOWERING CHRYSANTHEMUMS.—An inspection of the exhibition held by the National Chrysanthemum Society during the present week shows that the varieties upon the whole are the same as those displayed at the November show. It is doubtless the intention of the Society to encourage by these late shows the raising of later flowering varieties of sufficient size and good quality for exhibition in the competitive classes. If this be so, then the purpose has not in any degree been achieved. Take the classes for Japanese varieties, for instance, and it would seem that a December show is at present encouraging exhibitors to preserve in bloom as long as possible varieties that are seen at their best in November. If at the December exhibitions we are to continue to see the same varieties as in November, but in inferior condition, then it will be difficult to see what good is to be obtained by holding them. Unfortunately, the judges are in some measure, we think, responsible for this in part, as they are frequently disposed to award premier prizes to large, heavy blooms, although the older florets are considerably *passé*, and the colour of the flower is far from its best, in preference to fresher, brighter blooms that may be less in size. This is a pity, and it cannot be too often remembered that the first necessary qualities in a flower for exhibition should be its freshness and bright appearance. At the December show, whether the flowers be very large in size or not, let us have those that can be staged in as bright and perfect condition as the flowers that are staged in November, and not specimens that were perfectly developed a week or two previously. If this were done there would probably be found in the classes on future occasions a number of varieties that will naturally bloom at a later date than the second week in November. It can hardly be expected that a good exhibition bloom in December shall be

so large as those opening earlier. The heavier and larger the flower, so much the more difficult is it for the florets to expand perfectly; and as the days become shorter and less light, these varieties are the least successful. Of decorative Chrysanthemums there have been obtained during the past few years several very good later blooming varieties, but so far as the competitive classes at the exhibition is concerned, there is no evidence of this.

AGRICULTURAL CONFERENCE FOR THE WEST INDIES.—The invitations for the next Agricultural Conference for the West Indies have been issued by the Imperial Department of Agriculture. It is proposed to hold the conference as before, owing to its central position, at Barbados, and the dates fixed are Saturday, the 6th, and Monday the 8th of January next. The conference will meet in the Hall of the House of Assembly in Bridgetown. His Excellency, Sir JAMES HAY, K.C.M.G., the Governor of Barbados, has promised to meet the representatives in the hall on Saturday morning at 10.30 A.M., and offer them a welcome to the island. Immediately after, the President (Dr. D. MORRIS, C.M.G.), will deliver the opening address, and the business of the Conference will begin. A new feature in the coming Conference will be the presence of representatives of the leading Agricultural Societies in the West Indies. By this means, it is anticipated that the Conference will act as an educative agent of great value, and by enlisting the co-operation of those practically engaged in agriculture its deliberations will have wider scope, and the influence of the Conference will be more widely recognised. The list of subjects to be dealt with covers practically every branch of West Indian Agriculture. We understand the prospects of the Conference, so far, are very encouraging.

SILVER WEDDING PRESENTATION AT WORDSLEY.—The Silver Wedding of Colonel and Mrs. W. G. WEBB having occurred on October 14, the employees of Messrs. E. WEBB & SONS, the well-known seedsmen and nurserymen of that town were entertained to dinner at the Drill Hall, Wordsley, on the 28th ult., when the opportunity was taken advantage of to make a presentation to Colonel and Mrs. WEBB, of a massive silver Punch-bowl and a complete silver dessert-service. The utmost enthusiasm prevailed.

OSMUNDA REGALIS VAR. CRISTATA.

MR. BIRKENHEAD, of Sale, near Manchester, sends specimens of the fronds of this variety, in which the rachis is bent, and in the angle a bud is formed as shown in our illustration (fig. 139, p. 439). The bud, or bulbil, develops roots, and is capable of reproducing the plant, so that in this case the spore-bearing stage is not necessary.

HOME CORRESPONDENCE.

ODONTOGLOSSUM CRISPUM.—I am a large *Odontoglossum crispum* grower, and I have collected this species largely in its native habitat. What surprises me is the way in which Orchid growers pot these plants—they ram the compost so tightly. It seems to me that this gives the roots but little chance. Anyhow, I pot loosely, or comparatively so, and I grow them well. I should like to have your view of the matter. *Crispum*.

XL-ALL VAPORISER.—The seed and horticultural sundries-trades were severally affected some time since when the decision antagonistic to the sale of weed-killer liquid by non-certificated chemists was given in one of the law courts. These trades seem in danger of being much more seriously hit now that a decision has been given, although only at the Mansion House by the Lord Mayor, in relation to the XL-All Vaporiser, which, if supported on appeal, as most probably it will be, will render the sale of this compound by any other than a

duly certificated chemist illegal. But worse than that will be the fact that the thousands, if not tens of thousands of users of this most efficient of all insecticides will be greatly prevented from so doing because unable to obtain it except through the limited channels certificated chemists afford. Had there been from out of the vast usage of this compound which has grown up any case of harm to persons, then action might have been justified. But what we see is a privileged body, the Pharmaceutical Society, interfering with what had seemed to everyone hitherto to be a legitimate object of trade. Without doubt, as the analyst's evidence shows, the compound is a dangerous poison; but then how many other of the compounds, sold both as insecticides and fungicides, are not poisons also? Even paraffin-oil, sold by anyone, everywhere, is a poison if taken internally; and the greatest poison of all, alcohol, one that kills thousands of people every year, is sold everywhere by other than non-certificated chemists. After all, the point is, does all this professed anxiety for the public safety arise from generous motives, or from a desire to form a special trade privilege? and even if these potent insecticides be sold henceforth only by chemists, will they be less dangerous than now? Certainly, restricting the sale of alcohol to licensed premises has not rendered that less destructive to human life. A. D.

THE LOQUAT (*ERIOTRYA JAPONICA*) has been often fruited in England, but not, I feel sure, out-of-doors. Mine has bloomed beautifully this year in the conservatory. I suppose Mr. Dance knows there is a fruiting and a flowering Pomegranate, quite different? *Platanus Orientalis*.

PHYSALIS PUBESCENS.—In the *Gardeners' Chronicle* of September 23 last, you commented favourably on the quality of some fruit of the Cape Gooseberry (*Physalis pubescens* vel *edulis*), which was grown and ripened in the open air at "Oaklands," Marchwood, Southampton. Soon after then, several nights of sharp frost set in, which cut off completely my Dahlias, Runner Beans, and Tomatos, but only the tender tips of the Cape Gooseberries. One night my thermometer on the ground registered 5° of frost. Since then the plants have gone on ripening fruit, and I now beg to send you some fruit gathered from the plants to-day (December 2), which, although lacking the rich lusciousness of fruit ripened under a hot sun are still very palatable, especially if kept in a warm room for a day or so. The plants have gone on bearing fruit in various stages (and flowers also) since early in September. I gathered the first ripe fruit about the end of the first week in September. Thinking it may interest you, I send you a photo of the plants taken in September last. These plants are only of this year's growth, and I have not before seen such good results from plants in their first year, even in the country where they are indigenous. I am planting a large number out in the open ground to test their capability of standing the winter here. J. A. Ross, Dec. 2, 1899. [The fruits were very palatable. Ed.]

BEST CROPPING POTATOS.—Mr. Joseph Leader asks for opinion as to which is the best Potato as a cropper, and for market, Magnum Bonum, Maincrop, or Up-to-date? The first I grew many years, and of its kind, it proved very satisfactory; the second I know nothing of. As to the third, well! this—I gave instructions for a piece of ground to be planted with Sharpe's yellow-fleshed Victor. While away from home, the gardener not having been able to get Sharpe's yellow-fleshed in the neighbourhood, bought and planted some of the variety called "Up-to-date," and as a tasteless, third-rate, fashionable Putato it justifies its name. In its growth it made a large quantity of top, and where it caught the full blaze of sunlight, this, coupled with the drought, punished it severely, the other part growing freely; while some Beauty of Hebron in the next piece were unhurt. On lifting both batches, the last far exceeded the former in crop. Out of each sack of the former, nearly one-third were small, while the whole produce was not to be compared with that which I got from the "Magnum Bonum" in bygone years. Again, the texture and flavour (?), what there was of the latter, was such that I directed all to be sold that were saleable, and the "little things" to be boiled for the fowls. This is my first experience of "Up-to-date," and—it will be the last. Of one thing I am resolved, and so have many of my friends, and that is, I nor they will either grow or buy any but

yellow-fleshed Potatoes if it is possible to get them. In point of fact, we will sooner go without than run the chance of being choked with tasteless "balls of flour." *Harrison Weir, Sevenoaks, Dec. 4, 1899.*

THE PHENOMENAL MILDNESS OF LAST NOVEMBER.—The following letter from Mr. R. C. Mossman to the *Scotsman* of December 2 will have an interest to your many readers in the south and north, the temperature of the air at Edinburgh having been so unusually high. We have available for comparison weather records for Edinburgh which extend without a break to the year 1764. An examination of these long continued observations shows that such a mild November as the one that has just closed has not been experienced in

that the maximum exceeded 50° on twenty-three days, while on no occasion was frost registered in the screen (4 feet from the ground above the grass). The other extreme for the month of November took place in the year 1807, when heavy snow fell on seven days, twenty-one frosts being recorded. With reference to this severe month, a local observer remarked, the quantity of snow fallen, and the number of frosty days, as also the circumstance of the Clyde being frozen at Glasgow, and the Tweed at Kelso, are said to be unprecedented in the memory of the oldest inhabitant so early as November. *D. T. F.*

MUSHROOM-GROWING IN OLD WINE-CELLARS, LEITH.—The impression seems to have got abroad

in underground cellars fetch from 6d. to 9d. per punnet more than those grown under the conditions "D. L. M." names. The trade must be very bad judges indeed according to his estimation. I think most of your readers who are interested in Mushroom-growing will say that they are quite at home in an underground cellar. *W. H. M.* [We have omitted some personal remarks as unnecessary to our correspondent's argument. *Ed.*]

— Unless we are prepared to see this profitable industry suppressed in and around London, and all our large towns throughout the three kingdoms, we had need beware of such wholesale and groundless condemnations as those contained in "D. L. M.'s" letter on p. 422. Notwithstanding the tenour of it, and some recent editorial comments in a similar sense, I am bold to affirm that Mushrooms may be grown either in town or country, on the surface or in cellars or caves, without creating or sustaining a legal nuisance, or any nuisance dangerous to health. More, Mushroom-growing from start to finish, is a cleansing—not a polluting process. The grower begins by blowing off the steam in which is most of the impurity, if any, and it is not until his material is rendered, what is technically and correctly termed "sweet," that it becomes fit for conversion into Mushrooms. And not only is Mushroom-manure sweet, but it is rendered doubly inodorous through its covering of fresh soil. By all means abate nuisances, but do not suppress or destroy profitable industries. I have known many such back sheds or cellars near bothies, as "D. L. M." describes [in the rural districts. *Ed.*], but I never remember hearing of any complaints about nuisances where prudent and cleanly management prevailed. A pot of Mushrooms in a window may be as sweet and cleanly as a window-box, or any other properly-managed plants. But it is not necessary to labour this point, as no one will be likely to object to Mushrooms themselves, and were these suppressed the nauseous business or accompaniments would become worse than before. Suppress Mushroom-growing by a general order to-morrow, you do nothing to abolish the nuisances, which may be found in every street, sewer, stable, or cow-house; and not a few bar a wine-cellar. The Mushroom-grower, on the contrary, begins by cleansing the manure, and ends by changing it into nutritious Mushrooms, and converting the residuum into new Potatoes and refreshing salad. To begin by suppressing Mushroom-growing is beginning to purify the earth at the wrong end. If this *dilettante* inspection and suppression of nuisances is allowed to spread, we shall be having new and expensive machinery set up for the forcible suppression of dung-hills on all our big farms and gardens. Mushroom-manure is the least offensive of any; in fact, through decomposition and mechanical manipulation, it becomes virtually inoffensive, and there seems no good or just cause why its conversion into sweet Mushrooms and other profitable products should be forcibly arrested without weightier reasons than have yet been advanced. *D. T. Fish.*

HIPPEASTRUM STYLOSUM, as far as I am aware, seems to centre round the east coast of S. America, from Brazil to French Guiana, and doubtless Mr. Im Thurn is correct in saying that it is abundant in British Guiana also. However, I think this must be about its N. and W. limits, as I found nothing of the kind in Venezuela. I have noted five varietal forms, and have under cultivation a form close to *Bot. Mag.*, 2278, from which I have raised hybrids. There is a species existing in the north of S. America resembling *stylosum* in some particulars (but more closely, I consider, allied to *rutilum*) which has puzzled botanists. This is the *H. prunum* of Koch (in *Wochenschrift*, 1864, p. 37); compare *Burj. Hexand.*, 35. My own experience of *H. stylosum* is that it is delicate, never a strong grower, and requires more heat than any other species of *Hippeastrum*. It is also separated from *H. equestris* by wide lines of divergence. *A. Worsley, Isleworth.*

CEREUS CANDICANS, DUMESNILIANUS (see fig. 132, p. 415).—This variety of *C. candicans* is much smaller in growth than the species, and smaller in its ridges also; spines thin. One prominent one in the bunch, about 3 ins. long in the specimen figured last week in this journal, and that in its last growth; the others are not so long. A plant has just flowered with me for the first time; it is somewhat over 2 ft. high. The flower near the top of the plant, a beautiful thing, is 9 inches in diameter, white; the outside

FIG. 139.—GEMMIPAROUS FROND OF *OSMUNDA REGALIS* VAR. *CRISTATA*. (SEE P. 433.)

the Edinburgh district for the last 135 years, and probably for a much longer period. The following are the mildest and coldest Novembers during the period under review:—

MILDEST.			COLDEST.		
Year.	Mean	deg.	Year.	Mean	deg.
1899	...	47.4	1807	...	34.0
1818	...	46.7	1782	...	35.6
1881	...	46.3	1862	...	36.8
1894	...	46.0	1765	...	37.1
1857	...	45.6	1851	...	37.3
1897	...	45.6	1819	...	37.5
1847	...	45.6	1815	...	37.6

The mean temperature of last month was 47.4°, or 5.5° in excess of the average November temperature deduced from the records of the last 135 years. The above mean temperature is slightly in excess of the average for October in this district; indeed, seventy of the last 135 Octobers were colder than the month under review. An examination of daily temperature, observations taken last month, show

that this industry is being carried on underneath dwelling-houses; such is far from being correct. As a matter of fact, some of them are situated where there is no dwelling-house in the whole street. The others are all in the immediate neighbourhood, and surrounded by grain-stores and lofts, dealers in artificial manure, cement, soot, slates, cork, also by stores and stables, &c. The nearest dwelling-house has a stable on the ground floor. If Mushroom-growing be a nauseous business, dwelling-houses over stables must be unsanitary also. The ammonia which stable-manure contains makes it a very strong disinfectant, and proves the opposite to what your correspondent says. I must admit plants in a bedroom would be more decorative than Mushroom-beds, but had he grasped "D. T. F.'s" article in its true meaning, viz., that the one would be as detrimental to health as the other, he would probably have come to a different conclusion. Seeing that he considers himself an authority, he will perhaps be able to explain how Mushrooms grow

petals (as I call them), of a brownish-pink, narrow, and turned back at the points; the tubes 7 inches long, clothed with dark woolly, hairy scaly-green; the tube at base, 1 inch in diameter; at the top, 2 inches. Anthers yellow, in a circle all round the inside of the flower, and in a thick bunch round the stigma, which is large; the petals are over 1 inch wide in the inside of the flower. The plant, I have no doubt, is very well known to succulent growers; but as for myself, I have never known it to flower before, neither *C. candicans*, and I have two specimens, one nearly 6 feet high, or *C. c. var. robustus*. I have not seen any offset on *C. candicans* or *Dumesniliannus*; but *robustus* is branching from the base. *Justus Corderoy*.

RECIPE FOR WIREWORM, ANTS, EELWORMS, ETC., IN BORDERS.—Let small holes, 8 to 12 inches deep, be dug in the infected soil at regular intervals of 2 feet, and pour 2 oz. of carbon bisulphide in liquid form into each hole, carefully closing the holes with earth. The vapour will permeate the soil and destroys all insect and parasitic life. *T. Spencer, Goodrich Court Gardens.*

Obituary.

W. H. PROTHEROE.—Our readers must be familiar enough with the name of the senior partner in the firm of Protheroe & Morris, and very many of them counted him among the most cherished of their friends and acquaintances. The son of a well-known nurseryman at Leytonstone, he was educated to the business, but circumstances led to his undertaking the conduct of a large auctioneering and estate agency, and his sales of Orchids and other plants soon became known far and wide. Mr. Protheroe may almost be said to have died in harness; for though he had been in failing health for some time past, he was at business till the day before his death, on the 2nd inst.. By his friends and associates he was esteemed for his kindness and straightforwardness. He was a member of the Orchid Committee of the Royal Horticultural Society, and his knowledge of plants was more extensive than might have been supposed, his retiring nature forbidding all self-assertion; at the same time, his knowledge and experience were at the disposal of those who sought his aid.

Mr. William Henry Protheroe, was fifty-three years of age, having been born at Bourn House, Leytonstone, in 1846. He was the only son of Mr. Alexander Protheroe, of Leytonstone, who with Mr. Thomas Morris, founded the firm of Messrs. Protheroe & Morris, horticultural auctioneers, and nurserymen, about the year 1830, at Highbury. For some part of his early life he was educated privately, but at the age of sixteen he was sent to complete his technical education at the Government School of Horticulture, at Ghent.

After studying for three years at Ghent, Mr. Protheroe returned to this country armed with his diploma and the highest honours the college could bestow on him. At twenty years of age he took the first step in the career which he afterwards pursued, becoming connected in business with his father; and on that gentleman's retirement, after thirty-eight years of active life, he took his father's place in the firm. This event took place in the beginning of 1873. In 1869, Mr. Protheroe married the youngest daughter of Mr. John Sudbury, of Bois Hall, Halstead, by whom he had five children.

His business increased by leaps and bounds after he and Mr. George Field Morris became associated as partners. Increased business necessitated the acquisition of extensive premises for the exhibition and sale of horticultural produce, and in 1883 the firm acquired their present spacious rooms, situated at 67 and 68, Cheapside. The second sale-room, with an entrance from Queen Street, was secured in 1892. Orchid sales comprise one of the chief branches of the firm's business, and it was in the conduct of these that Mr. Protheroe was par-

ticularly successful, and secured the warm regard of his numerous clients.

As far back as 1840 the firm of Messrs. Protheroe & Morris acquired the American Nurseries at Leytonstone, then purely a rural locality. These nurseries were situated behind Bourn House, and for over forty years they occupied a prominent position. In 1885, on the death of Mr. Alexander Protheroe, the nurseries were, as we learn from the *Eastern Mercury*, broken up for building purposes, and the land they occupied is now covered with houses.

E. GRIFFITHS HUGHES.—The horticultural world will learn with deep regret of the decease of one of its leading lights, Mr. Evan Griffiths Hughes, on the 2nd inst. at Higher Broughton, at the age of sixty-four. As a Manchester man, Mr. Hughes was universally respected, and the entire community will deplore his loss. With horticulture Mr. Hughes had a very close relationship; by profession a chemist, he has for many years devoted his energies and researches to matters which were helpful to gardeners. By his invention of Fir-

THE LATE WILLIAM HENRY PROTHEROE.

Tree Oil he proved himself a benefactor to us all. In many other respects Mr. Hughes added materially to the gardeners' requirements.

His little work, *The Sources of Plant Food*, has proved of great value, inasmuch as the information contained therein is given as the results of experiments carried out by the author; natural and chemical manures being dealt with in a very simple and instructive way, and a good deal of attention is given to insect-pests, and the best methods of dealing with them. As one of the vice-presidents of the Manchester Horticultural Improvement Society, Mr. Hughes' presence always added interest to the meetings, and he was always able to impart useful scientific knowledge to the members—in fact, it may be said that he was the soul of the society, for a few years ago when it was in a languishing condition, Mr. Hughes practically took the reins, and the result of his work has been to establish the Society on a sound and go-ahead basis; he was indefatigable in organising summer visits to the various leading gardens within a

hundred mile radius of Manchester. He was a life member of the Royal Botanical and Horticultural Society of Manchester, the Council of which deeply mourn his loss. *P. Weathers.*

IRELAND.

UNDER the auspices of the Royal Dublin Society, a scientific meeting was held in the Leinster House on Wednesday, 29th ultimo. The chair was occupied by Dr. J. McWeeney (Professor of Bacteriology), the proceedings were mainly confined to a lecture by Professor Thomas Johnson, D.Sc., on "The Yellow Blight in the Potato Plant." His researches were based on the diseased crops in the west of Ireland. In July last he was asked on behalf of "The Congested Districts Board," to examine this question, and travelled down last August. He stayed more than six weeks, during which time he made several experiments in connection with this blight in the Potato plant, and the conclusions he arrived at were, that the fungus which attacked the stem and foliage was distinct from the fungus which had attacked the root, and although the disease was very prevalent in this locality, it was not limited to it, as he (the lecturer) had noticed in several other parts of Ireland, especially in the east of this country, also in close proximity to the metropolis, namely, in the neighbourhood of Greystones. The lecture was illustrated with lime-light views, illustrative of the developments of this fungus.

The chairman referred to Professor Johnson's paper as a very complete and highly instructive one on this dread disease; he alluded to his own researches on this topic, and he urged that it should be impressed upon the people the necessity that after the plant had been dug, they should immediately burn the Potato haulm, by which means the germs of disease which they (Potato stalks) contained would be destroyed; and if this practice was persisted in it would go a very long way to lessen the ravages caused yearly by this disease.

Mr. Moore (Curator, Glasnevin Botanic Gardens) complimented Professor Johnson on his very valuable paper, and he agreed thoroughly in what the chairman had just said, but he would desire to have legislative enactments, which would empower the authorities to punish severely any farmer who should utilise his diseased Potato-tops, either as a manure or as a protection for the tubers when they were carted to the farmyard or to the market—local or otherwise.

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 5.—The usual fortnightly meeting of the Committees of this Society was held on Tuesday last in the Drill Hall, James-street, Westminster. The weather was most unpropitious, and in London it was so dark that it was no possible to see the exhibits in the Hall so perfectly as could be wished—in fact, there would have been excuse for the use of artificial light during the whole day. Excellent Calanthes were shown by Sir Trevor Lawrence, Bart., and the Hon. Mrs. A. Brassey, Heythrop Park, Chipping Sodbury. The Orchid Committee awarded First-class Certificates to *Cypripedium* × *Hera* var. *Euryades*, and to *Cattleya* *Maggie Raphael*. Also Awards of Merit to *Oncidium Forbesii* var., and to *O. varicosum* Lindley; also to *Cymbidium longifolium* and *Sophr. Cattleya Chaubertiana*.

The Floral Committee recommended Awards of Merit to two varieties of *C. ryanthems*, one of these to a Japanese named Mme. R. Catbury, and the other to a single flowered variety *Oscar*. No award to novelties was made by the Fruit and Vegetable Committee, who had few exhibits before them. The lecture in the afternoon was by the Rev. Geo. Henslow, upon some of the plants exhibited.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. C. T. Drury, H. B. May, E. Molyneux, J. Hudson, J. Jennings, Thos. Peed, C. J. Salter, J. D. Pawle, Chas. E. Pearson, N. F. Barnes, Geo. Gordon, C. E. Shea, H. J. Jones, E. H. Jenkins, E. Beckett, Geo. Paul, and Chas. Jeffries.

Messrs. T. CRIPPS & SON, Tunbridge Wells, Kent, showed a group of well-grown, very freely-flowered Bouvardias. A good number of varieties were represented, and included singles and doubles (Bronze Banksian Medal).

Messrs. JNO. PERO & SONS, Rouppell Park Nurseries, Norwood Road, London, S.E., had a large group of plants of Begonia Gloire de Lorraine. The plants were dwarfer in habit than we are accustomed to see. Another collection of very finely-flowered plants of this Begonia was shown by Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N.

Messrs. HUOH LOW & CO., Bush Hill Park Nurseries, Enfield, again showed a group of Cyclamens in flower. The plants were more developed and bore a greater number of blooms than on the last occasion. The Bush Hill Pioneer, or crested strain, and the Papilio, or Butterfly strain, were finely illustrated. The crest is now obtained in several pretty colours (Silver Flora Medal).

Excellent Violets of the variety Marie Louise were shown by Mr. D. ALLAN, gr. to Lady ASHBURTON, Grange Park, Alresford, Hants. Upwards of a score of glasses were furnished with blooms, which in size were extremely unusual, and in colour most satisfactory.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, again showed flowers of their Rhododendron Jasminiflorum × Javanicum hybrids and varieties. These were beautiful and bright, and are indeed invaluable during the "short day" season when brightly coloured flowers are by no means plentiful.

Messrs. W. WELLS & CO., Ltd., Earlswood Nurseries, Redhill, Surrey, made a fine display with Chrysanthemum blooms. The exhibit was particularly rich in decorative varieties. Mrs. C. Brown (white with pale green shade, of which a number of well-flowered plants was shown) is a capital late-flowering decorative variety. There were many good singles, also varieties with rolled petals, some with thread-like petals, and other types (Silver Banksian Medal).

A grand show of single-flowered Chrysanthemums was made by Messrs. W. CLIBRAN & SON, Oldfield Nurseries, Altrincham. They had upwards of sixty bunches of blooms each in one of the Society's earthenware vases. Only one variety, Oscar, was given an Award of Merit, but a few other seedlings were noteworthy. Lord Methuen, large white; Oldfield Surprise, also white; and Miss B. Moffat, crimson, were amongst these (Silver Banksian Medal).

An extensive collection of Conifers lifted from the open ground in the nurseries at Brentwood and Richmond was shown by Mr. J. RUSSELL. The specimens were from 2 feet to about 8 feet high, and in most cases were excellent representatives of the numerous varieties, showing how well most Conifers will succeed in the outer suburbs of London.

Of Retinosporas so-called, but which are mostly forms of Japanese Cypress, were remarked such varieties as R. filifera very distinct by reason of its pretty drooping habit; R. pifera aurea, R. plumosa, and R. p. aurea, R. Hookeriana, R. squarrosa, R. obtusa nana and R. ericoides, a very pretty little plant. Cryptomeria elegans, beautifully tinted, was shown; Cedrus Deodara and C. atlantica, also the glaucous variety of the latter the most distinct and effective of Cedars.

Of Yews there were Taxus japonica and T. fastigiata aurea. Several of the more effective varieties of Cupressus Lawsoni were shown, and some nice plants of Picea pungens glauca (Picea Parryana glauca), Pinus Cembra, and others were noticed; and of Junipers, J. sinensis aurea, J. virginiana, and J. japonica aurea.

Mr. JOHN RUSSELL also showed a fine collection of Yuccas, which numbered about fifty specimens. These well-grown plants in pots represented such species as Y. striata, gloriosa, flaccida longifolia, aloefolia variegata, a. tricolor, stricta, marginata elegantissima, montstrosa, and recurva (Silver-gilt Flora Medal).

Awards.

Chrysanthemum Oscar.—A single variety, pale red, with yellow band around a rather prominent disc. Flower of good form and symmetry, but there are several rows of florets in place of the one only, as preferable in singles. From Messrs. W. CLIBRAN & SON, Oldfield Nurseries, Altrincham (Award of Merit).

Chrysanthemum Madame R. Cadbury.—A large white Japanese, with lemon shaded florets, often 3-in. wide, of much substance, fairly long, and very numerous, making a very deep, good flower. From Mr. WEEKS, Thrumpton Hall Gardens, Derby (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), De B. Crawshaw, H. Little, A. H. Smees, W. H. White, H. J. Chapman, W. H. Young, E. Hill, J. Jaques, T. W. Bond, C. Winn, T. B. Haywood, and J. Gurney-Fowler.

As usual at this season, Sir TREVOR LAWRENCE, Bart., the President of the Royal Horticultural Society (gr., Mr. W. H. White), brightened the Hall with a good group of winter-flowering Orchids, consisting principally of hybrid Calanthes, among which those raised at Burford were conspicuous. Some sixty plants of these Calanthes were staged, each kind grouped together, and the effect was excellent. Of the brightly-coloured dark forms noted were C. × Veitchi splendens, of a rich carmine-rose with white eye; C. × Burfordense, similar in colour, but with a rose-crimson centre; and C. × revertens in several forms; of the lighter forms C. × Bryan, white, with claret eye; C. × Wylamense, white, with purplish-rose centre; C. × Olive, of a purplish-rose tint; three of Mr. NORMAN C. COOKSON's hybrids were fine; and C. × nivea and C. × Veitchi lactea, two good whites. Others noted were

C. × anabilis, C. × Victoria Regina, C. × versicolor, and C. × labrorator. At one end were grouped grand specimens of Cypripedium Spicerianum, the one with ten, and the other fifteen flowers; C. × Statterianum, with three spikes, two of them twin-flowered; C. × Juno, C. × Fowlerianum, C. × microchilum, C. × Hera var. Euryades; the rare Dendrobium cymbidioides, with six spikes of white flowers; the singular D. Hughii, Maxillaria elegantula, Masdevallia hieroglyphica, Odontoglossum blandum, and Oncidium cucullatum (Silver Flora Medal).

The Right Hon. JOSEPH CHAMBERLAIN, Highbury, Moor Green, Birmingham (gr., Mr. J. Smith), again sent the pretty Cattleya × Mrs. Endicott (maxima × Loddigesii), a very delicate rose-coloured flower with the labellum finely veined with purple; and Sophro-Cattleya × Chamberlainiana var. triumphans (see list of Awards).

M. LINDEN, l'Horticole Coloniale, Parc Leopold, Brussels, showed several forms of a grand type of Oncidium Forbesii, that named nigricans being of a very dark chocolate-brown with yellow margin; and O. F. castanea being of a light chestnut colour. The largest O. F. Moortebeckiense secured an Award of Merit; and so also did O. varicosum Lindeni, a very remarkable variety.

The Hon. Mrs. ALBERT BRASSEY, Heythrop Park, Chipping Norton (gr., Mr. H. Downing), sent an effective group of well-grown Calanthes, chiefly C. × Veitchi and the yellow and crimson-centred types of C. vestita.

Messrs. F. SANDER & CO., St. Albans, showed a small group, the best plant in which was Lælio-Cattleya × Wilsonie (C. labiata × L. Dayana), a large and well-formed flower, having the sepals and petals bright light-rose, the front of the lip claret-purple, and the rose-coloured tube striped with dark purple. Also in the group were a singular Dendrobium allied to D. spectabile, Lælio-Cattleya × intermedia flava; Phalenopsis Sanderiana, Angreum Humboldtii, a polystachyum, Cypripedium × Bakerianum and C. × purum.

M. CHAS. VUYLSTEKE, Loochristy, Ghent, sent fine plants of Odontoglossum × Harryano-crispum, and O. × crispo-Harryanum, being the result of crossing O. Harryanum and O. crispum both ways. Each partook much of O. Harryanum in form and colour, but the flowers were more flat, and the ground colour whiter. The first-named was the darker, and the other the larger flower. Both had been previously certificated.

T. W. THORNTON, Esq., Brockhall, Weedon, sent a spike of a form of Cattleya × Euphrasia (superba × Warszewiczii Sanderiana). The cross was made August 4, 1889, sown May 7, 1890, and now the plant flowers. In general appearance it resembles C. × Wm. Murray, but the front of the lip is in form like C. Warszewiczii. It differs but slightly from the original, exhibited by Messrs. Veitch, September 7, 1897.

J. S. MOSS, Esq., Wintershill Hall, Bishop's Waltham, showed a fine variety of Cymbidium Tracyanum and C. longifolium.

Mr. H. A. TRACY, Amyand Park Road, Twickenham, showed flowers of Cymbidium Tracyanum, with but slight marking on the greenish sepals.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton (gr., Mr. Hudson), showed the white Cattleya Harrisoniana candida, and the old form of Laelia autumnalis.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell, showed a fine plant of Cypripedium × Leeannum giganteum, Cambridge Lodge variety, of a darker colour than the original.

Messrs. McBEAN & SONS, Cooksbridge, Sussex, showed Odontoglossum × Andersonianum, McBean's variety, a very large, broad petalled, heavily blotched flower.

Messrs. JAS. VEITCH & SONS, Chelsea, showed Cypripedium × Minos magnificum (Arthurianum ♂, Spicerianum ♀).

Awards.

Cattleya × Maggie Raphael (aurea ♀, Trianaei ♂). From H. S. LEON, Esq., Bletchley Park (gr., Mr. Hislop). A fine, distinct flower, equal in size to C. Trianaei. Sepals of an Indian-yellow tint; petals yellow, tinged and veined towards the margin with purple; lip almost entirely of a rich purple colour, lighter towards the sides and apex (First-class Certificate).

Cypripedium × Hera var. Euryades (Leeannum × Boxalli), from Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. White). A fine flower with shining purple-tinted lip, and the usual characters of the many varieties obtained from the same cross, the distinguishing feature in this being its finely-rounded dorsal sepal, which is emerald-green in the lower half, and snow-white in the upper, the base and middle portion being heavily blotched with purple (First-class Certificate).

Sophro-Cattleya × Chamberlaini var. triumphans (C. Harrisoniana ♀, S. grandiflora ♂).—This is the reverse cross to S.-C. × Calypso, and distinct enough to warrant the name of the raiser being attached, it being different in shape and brighter in colour than S.-C. × Calypso. Flowers large, equal in size to S.-C. × Calypso. Sepals and petals reddish-crimson, with darker veining. Lip chrome-yellow, with the tip of the front lobe and edges of the side lobes purplish-crimson (Award of Merit).

Cymbidium longifolium, from J. S. MOSS, Esq., Wintershill Hall, Bishop's Waltham. An elegant Himalayan species of the C. cyperifolium class. Sepals and petals greenish-yellow streaked with red-brown; lip, white with some dark markings at the base (Award of Merit).

Oncidium varicosum Lindeni, from L'HORTICOLE COLONIALE, Brussels. A fine advance on the O. v. insignie, noted recently in the *Gardeners' Chronicle*. Labellum of a rich chrome-yellow with large chestnut-brown mark around the crest, the colour spreading into the side lobes, which have only the tips yellow (Award of Merit).

Oncidium Forbesii Moortebeckiense, from L'HORTICOLE COLONIALE, Brussels. Flowers very large and of a rich brown colour, the broad margins being decorated with bright-yellow, irregular blotches (Award of Merit).

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., in the Chair, and Messrs. W. Poupard, W. Wilks, Jas. H. Veitch, W. Pope, Alex. Dean, S. Mortimer, W. Bates, C. Herrin, Geo. Wythes, F. Q. Lane, Jas. Smith, Geo. Reynolds, J. Willard, H. Balderson, and Jos. Cheal.

A very nice collection of Grapes was exhibited by Mr. J. Ryder, gr. to the Countess of LINERICK, Hawkhurst. There were twelve bunches in three varieties; Black Alicante, Mrs. Pearson (white), and Gros Colmar. The variety Mrs. Pearson was shown as well as it is often seen (Silver Banksian Medal).

Messrs. SUTTON & SONS, Reading, showed upwards of a hundred nice fruits, and a fruiting-plant of the Tomato Winter Beauty, which gained an Award of Merit when exhibited by Mr. MORTIMER in the spring of the present year. The fruits, as shown, were of moderate size, rather flat than globular, and very deep in colour, and free from corrugation except a little on the under surface. It is said to be a first-class winter bearer.

Mr. R. C. NORCOT, Winter's Nursery, Woodbridge, showed some nice samples of Winter Orange Stewing Pear, which gained an Award of Merit in March last. It is said, however to be deficient in flavour when cooked.

NATIONAL FORESTRY.*

SOME years ago, when last on leave in England, I climbed one of the highest of the Welsh mountains, and gazed with sorrow on the prospect around. Barren heather-clad hills bounded the view on every side, affording, I was told, but a scant pasturage for the few lean flocks of sheep I had seen on its slopes. It was an ideal forest country. Old records and names indicate more or less exactly where the forest once stood. The climate is a superb one for forests. I can readily imagine the close, clean, mast-like stems it must have produced. What would we not do with such a range of country in South Africa?

Now it pastures a few sheep! Sheep that could be pastured better in Australia or in South Africa, where it is too dry or hot to grow Coniferous timber. When the old forest was cut down, the usual soil deterioration followed. What was once a rich forest soil is now barren moorland. The contrast was all the greater as I had come straight from a tour in the Black Forest in Germany, where the reverse side of the picture is strikingly presented. There almost every square yard is utilised. In the fertile bottom lands of the valleys, sheltered and enriched by the forest, are villages, hamlets, cultivated lands, and factories. Factories, worked by water from forest streams, where the air seems as clear and pure as on the Alps. Above and all around, stretching over an apparently limitless expanse of rolling hills, lie the glorious forest, natural in its beauty, artificial in its productiveness. In the valleys are the spas, whither flees the German in summer as the Englishman to his seaside watering place. Few would hesitate which to choose if there were forests in England. Surely the aesthetic side of forests would have some influence on a not too artistic national character! I know of no reason why there should not be another "Black" forest on Dartmoor or Exmoor. Nor why we should not see in England that fair landscape of sea and forest that has rendered Knysna famous throughout South Africa. Is there any valid reason why many as fair a scene should not be reproduced in England to-day?

A quarter of a century spent in the administration of national forest estates in India and the Colonies enables me to affirm the proposition with some confidence, that the great want of England at the close of this nineteenth century is National Forestry.

Let me at the outset clear the ground by saying that the forestry for which I plead is not the necessarily fitful efforts of a few private landowners, nor the founding of quasi-chairs of forestry at certain agricultural schools; but the national forestry of a powerful Government department, properly manned and officered with scientific men; a department which, with a million pounds sterling to spend yearly, should work steadily at the formation of national forests, in the sense in which this term is understood in most other civilised countries, but especially on the continent of Europe.

There seems to be a consensus of scientific opinion in England now that national forestry should be taken in hand as a national work, and prosecuted as a sacred obligation to posterity, as far above party politics as is the national credit and payment of interest on the public debt.

The way to this end is perfectly clear. Of all the means that have been tried in various countries, but one has given permanent results. A distinct branch of the public service must be formed. It must be gradually built up of professional forest men, specially trained and educated to their work at schools and universities, such as the Government of India now maintains at Cooper's Hill and Dehra Dun. Forestry would have to be added to the curriculum at every technical school; then the spread of education would rapidly put an end to such a sad and far as the present state of the historical New Forest in Hampshire. There one sees nearly 100 square miles in the heart of fertile England solemnly condemned by a special Act of Parliament to perpetual waste and mismanagement.

To the average Englishman a forest is simply a collection of trees, at best badly-grown trees. The English parks throw

* Condensed extracts from a paper presented to the Society of Arts by D. E. Hutchins, Conservator of Forests, Cape Town.

him off the scent. Speak to him of a forest officer, his mind runs to a park-keeper or gardener. Of all that is meant by a close, clean, high timber forest—of its peculiar condition of soil and climate, its varied requirements and skilled treatment—he is as ignorant as is a Chinaman of electricity.

In spite of the protests of an enlightened and far-seeing few, little is thought of but forest destruction, with or without some return in money. The wanton destruction of the unique Kauri forest in New Zealand is one of the saddest spectacles on this fair globe of ours. Kauri is a class of tree that will never be replanted; while the forest, as a whole, could be worked conservatively nearly as profitably as it is now being destroyed. Broadly speaking, when as a colonist the Englishman goes abroad, he proceeds, like the Spaniard in Mexico, to destroy as a nuisance the forest that he encounters. He calls the forest "bush" in Australia and South Africa, and "jungle" in India. Timber was expressively christened "lumber" in America. As was justly observed by a recent eminent writer:—"In not one of the English colonies is the forest question seriously considered, if we except India and Cape Colony." A variety of circumstances led up to the conservation of the forests of India; the genius of one German (Sir Dietrich Braudis) founded the Indian Forest Department, the only complete organisation of its kind amongst English-speaking people. (The Cape Forest Department owes its formation and usefulness mainly (I fear it must be confessed) to the fact that half of the European colonists at the Cape are not of English extraction. The neighbouring colony of Natal, the "English Colony" of South Africa, after the temporary employment of an able forest officer from the Cape, and an exceptionally good professional man from Germany, has now gone the way of other English colonies. Three-quarters of its rare indigenous forest is hopelessly destroyed, and the remainder, now under only nominal conservation, is fast disappearing.

Along with the training of a body of professional English forest men, there would, of course, be required an annual vote for the formation and tending of the national forests. For many years the largest portion of this vote would be expended on formation, i.e., in the planting and acquisition of suitably situated forest lands as these came into the market. In this way the national forest estates, the glory of generations of Englishmen yet unborn, would be gradually built up. The present low price of land in the British Isles offers exceptional advantages for the early initiation of such a scheme. France spends yearly somewhat over £500,000 sterling on its forests. Of this, about one-half is expended on forest officials and their education. In Germany relatively more is spent on forest work, as the wood is there felled by departmental agency and brought to the roadside. The total value of the German forests is reckoned at £900,000,000 sterling, capitalising at 2½ per cent. on an annual out-turn of 60,000,000 cubic metres, valued at from £20,000,000 to £22,500,000 (Prof. Gayer).

Coming to a British colony, the yearly budget provision for forest-work at the Cape amounts to upwards of £60,000, which is somewhat over 1 per cent. of the total yearly expenditure of the colony.

If England were to re-forest at the same rate proportionately, 1 per cent. of the national expenditure would represent an amount of about £1,000,000 sterling as the annual forest budget. If this sum were voted annually by Parliament it would suffice for re-foresting yearly about 110 square miles, or say the present area of the New Forest in Hampshire, taking planting and fencing at £5 per acre, and the average cost of the land purchased at £10 per acre. While much of the land required for re-foresting—sand, mountain, and moor—could be obtained at very low rates, other land that it is desirable to re-forest would cost £15 or £20 per acre. This is a work to be undertaken in the prosperous days of a country's history. The report of the recent Recess Committee on the establishment of a Department of Agriculture and Industries for Ireland estimated that to re-forest 3,000,000 acres in Ireland would cost £20,000,000 sterling. No doubt Ireland alone is capable of producing one-half the present importation of wood from abroad into the British Isles. The present percentage of woodland in Great Britain and Ireland is 4 per cent.; while in Cape Colony, with its wide, treeless plains, forests cover only ½ per cent. of the whole area. While some of the colonies are in the position of having more forest than they want, or than is desirable, the proportion of woodlands to open country represents in the mother country a miserably deficient quantum. If we look at the position of Great Britain and Ireland among the States of Europe, it will be seen that in forestry it occupies the lowest place, standing below all the European States. It is even 1 per cent. worse off than Portugal. In Germany 25 per cent. of the country is wooded. This is the proportion that is considered usually desirable in a well-regulated country. The percentage of woodlands in the British Isles would be raised by 7 if there were planted the 10,000 square miles or thereabouts required to produce at home the present importation of wood and forest produce from abroad. The following is the proportion of woodland in some of the more important European States:—

	Percentage of Woodlands.	
Russia in Europe	56	Scientifically conserved and permanent.
Austria	30	
Germany	26	
Switzerland	19	
France	17	
Portugal	5	
Great Britain and Ireland	4	Parks, small plantations, &c.

* Schlich and Nisbet.

It is a curious reflection that if a like sum were spent yearly in reforesting in Britain, the desecrated land would be restored to its former glory in three generations. Take one item—the rubbish-heaps from the mines in Cornwall and the Black Country. A distinguished forest officer lately formulated a perfectly feasible scheme for afforesting these. I have not heard that any mining owner, wealthy though they mostly are, has yet planted an acre. A mine owner expects some better return than a doubtful 2½ per cent. on his outlay. Nor is he usually content to wait till his grandson's time for this poor and uncertain return. There is too often an element of uncertainty in the return from small private plantations. The State should do this work. Some one will object that the rubbish-heaps are private property, and as such are sacred. Doubtless; but they are also a national eyesore. The Legislature should deal with them as the French do with their sand-drifts. If the owners cannot or will not afforest, let the State do it, retaining always the management by its own forest officers, but paying to the owner the difference between revenue and cost of management.

Similarly with municipal or other forests owned by any public corporation such as a County Council. These must be managed by the Government forest officers to ensure the requisite continuity and stability in the operations. This proposition may sound bureaucratic and repugnant to English ideas of local self-government; but it is a matter that has been thoroughly threshed out on the continent of Europe, and the same conclusion arrived at by such differently complexioned States as Germany, Austria, France, and Switzerland. Corporate forests thus managed are but little inferior in condition and yield to those owned by the State. All net revenue is of course paid to the corporate owner.

Forests in Europe fall into three classes:—

- (1) Those owned and managed by the State.
- (2) Those owned by corporations, but managed by the State.
- (3) Those owned by private individuals.

Forestry in England is in the peculiarly unfortunate position of only being represented by usually ill-managed woods of the third class. No useful purpose would be served by attempting to palliate this fact, or by citing brilliant exceptions to the contrary. The planting in the Scotch Highlands should receive public recognition. I have heard of a landowner in South Wales who has planted 10,000 acres of Larch, and of a large English landowner who has obtained the services of a German expert to draw up a scientific working plan for his woodlands. Such exceptions cannot in the nature of things last long. There is rarely a guarantee that they will last beyond one lifetime. It would be one of the functions of national forestry to assist private forest enterprise in every way; not to supplant or forestall it. State forests worked at long rotations would supply the large clean timber now imported from abroad. Private forests, on account of the necessary length of rotations, cannot do this; they would continue to supply pit-props, poles, sleepers, and special timber, such as figured Ash, hedgerow Elm, &c.

Compared with State forests, private forests are at a disadvantage on these three points:—

(1) *Changing Ownership.*—The careful landowner may have a spendthrift son, or one of different tastes. The estate may have to be sold for various reasons. This usually entails a rupture of the working plan, together with the scientific working of the woodlands.

(2) *Interest on Borrowed Capital.*—The State can raise loans at 2 per cent. interest. The private forest owner would have to pay double this, or more, on the uncertain security of a private forest.

(3) *Cost of Management.*—A large forest estate can be more economically managed than a small one.

Thus we arrive at the curious fact (in sharp contrast to the general position) that forests are better and more profitably worked in the hands of Government than by private owners.

The assistance rendered by Government to private forest owners in Europe (and latterly America) takes the form of grants of young trees free, or at cheap rates; advice in drawing up working plans; and last, but not least, the example, which is better than precept, of scientifically managed forests yielding good returns dotted throughout the country.

BRISTOL AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

NOVEMBER 30.—The fortnightly meeting was held on the above date at St. John's Parish Room, Redland, Bristol, Mr. Lock presiding over a large attendance.

Hardy fruit was the subject for discussion, introduced by Mr. HOCKEY, of Yatton. He stated that the cultivation of fruit was becoming more popular each year, though to enable British cultivators to successfully meet foreign competition, our land laws required alteration. Dealing with the subject in detail, he gave clear instructions as to the soil and situation best suited to fruit culture, method of planting, pruning, and pests to which fruit-trees were most liable, and the directions given, referring to the culture of Apples, Pears, Plums, Cherries, Currants, Gooseberries, Strawberries, and Raspberries. Mr. HOCKEY was heartily thanked for his lecture. A good discussion followed, taken part in by several members.

THE ROYAL HORTICULTURAL OF IRELAND.

NOVEMBER 21.—The usual meeting of the above society was held at their headquarters, 61, Dawson Street, on the above date. GREENWOOD PIM, Esq., occupied the Chair. There was

a large attendance of the Council present. The Secretary (Mr. W. H. HILLVARI), submitted a report of the recent winter show, which entailed a deficit of close on £100, attributable to the unfavourable condition of the weather, &c.

The Council awarded a Gold Medal to Messrs. G. RAMSAY & SONS, Balls Bridge, for their magnificent group of foliage and flowering plants, likewise floral designs, at the Chrysanthemum Show. The Secretary was authorised to thank Lord IVEAGH for his cheque for £10 towards the prizes for the ensuing year.

The expenses incurred for the recent show, and including prize-money, amounted to £292, and cheques to this amount were ordered to be drawn in payment of the same; whilst the arrangements in connection with the annual meeting, to be held on the 19th inst., in the Central Lecture Hall, Westmoreland Street, were completed. A. O'N.

SMITHFIELD CLUB.

DECEMBER 4 to 8.—The Smithfield Club has held its usual exhibition of fat cattle, sheep, and pigs, in the Agricultural Hall, Islington, during the present week.

The scene presented the same appearance of excessive development and completeness as formerly, and those of us who are not "at the front" just now may be assured that the supply of Christmas fare, in the shape of fat animals, will be as plentiful as formerly. We are in the habit of referring to our Chrysanthemum shows as exhibitions of monstrous flowers, but it is at Islington that monstrosity is really worshipped, and there it constitutes the main feature of the event. The cattle, sheep, and pigs, are by no means more monstrous than the roots that are displayed to the uttermost extent upon the stands of various seedsmen in the galleries. When three Mangolds weigh together near upon one hundredweight, it can hardly be said that such roots do not bear some proportion to the cattle they are required to feed. All of the leading seedsmen seek to display the biggest produce, and such is intended as a recommendation of their particular seed. They do not pretend to have cultivated the crops themselves—enough for them that they are from their seeds; and so it is stated that this or that lot of roots was grown upon a farm belonging to Her Majesty the Queen, the Prince of Wales, or other notable agriculturists. Some of them, too, are doubtless the result of cultivation upon sewage farms. Many of the firms represented are also well known to our readers as horticultural seedsmen, as the following remarks will show:—

Messrs. SUTTON & SONS, Reading, had a capital display of roots in the North Gallery. Among the Mangolds considerable prominence was given to the variety Prizewinner, a very heavy Globe-shaped root, said to have given a crop of more than 75 tons to the acre. Golden Tarkard and Mammoth Long Red, and a lesser-growing root, Intermediate. Some of the best Swedes were Magnum Bonum and Champion. Of Turnips, a new one, named Centenary, at once arrested attention on account of its size and attractive appearance. Excellent roots of Kohl Rabi were shown, and samples of the firm's best Potatoes, besides grass-seeds and other agriculturist's requisites.

The well-known firm of Messrs. JAS. CARTER & CO., High Holborn, London, did not lack representatives in the shape of huge roots. Their Holborn Elephant and Kangaroo varieties of Swedes, Goldfinder, Golden Tarkard, Mangolds, and Turnips made a grand display. This exhibition of monstrosity was relieved by a miniature lawn, very green, that ran along part of the edge of the base of the exhibit. The seeds had been sown in boxes, and the grass had been given its first "cut." There were fine tubers of Potatoes, and grand Onions, especially of the variety Record. Carrots, Parsnips, the usual "Seed Corn," &c., were also included in the garniture of the stand.

Messrs. GARTONS, Ltd., Newton-le-Willows, Lancashire, a firm that has conducted considerable experiments with a view to obtaining new breeds of corn by cross-breeding, rather than by a process of selection, showed dried specimens and seeds of some of their new varieties. It is claimed that varieties of Oats and Barley have been thus obtained that have cropping qualities that very greatly exceed that of any varieties previously existing. It is a praiseworthy work by whomsoever conducted, and constitutes one attempt to solve Sir W. Crookes' "Wheat Problem."

Messrs. E. WEBB & SONS, Wordsley, Stourbridge, had a very attractive exhibit, illumined by the three large Silver Challenge Cups offered by the firm at the Birmingham and London Cattle Shows, and the Gloucester Root Show. Prominence was given to Imperial Swede, Green Globe Turnip, Mammoth Long Red, Lion Intermediate, Smithfield Yellow Globe, and Yellow-fleshed Tarkard Mangolds. About a score of varieties of Potatoes, including several good new ones, introduced by the firm, including Commonwealth, New Motor, and Pride of Britain, were arranged as a collection in the centre of the stand. They were a very clean lot of tubers. Wheats and Barleys, grain, seeds, and vegetable root crops, completed the imposing exhibit from Wordsley.

Messrs. W. & J. BROWN, Peterborough, had a collection of Apples, including specimens of the variety Bramley's Seedling, weighing 22 oz.; also good Mère de Ménage, and others. Samples of trained trees were also exhibited on the stand.

Mr. B. WELLS, Crawley, showed Apples and a few trees, specially intended for farmers.

Mr. J. K. KING, Coggeshall, Essex, had a fine lot of agricultural roots; also some Onions, Potatoes, Parsnips, Carrots, &c. A grand lot of "Kohl Rabi" was shown, the variety being "Defiance Short Top." It is a grand plant to withstand drought.

Messrs. HARRISON & SONS, Leicester, in addition to the inevitable display of Mangolds and Turnips, made a good show of Potatoes, Carrots, Parsnips, and Onions. A fine lot of seed Peas was shown also.

Messrs. DICKSONS, LTD., Chester, showed a few Apples and agricultural seeds.

Messrs. E. W. KING & CO., Coggeshall, had a stand of the usual products, and noteworthy samples of Prizewinner Onions. Messrs. JARMAN & JARMAN, Chard, Somerset; and Mr. ALAN BLATCHFORD, Coventry, were also represented by similar stands.

Messrs. CUTBUSH & SON, Highgate, London, exhibited about sixty dishes of Apples, &c., also trained fruit-trees. Potatoes were capitally shown by Mr. A. FINLAY, Markinch, N.B.; and Messrs. FIDLER & SONS, Reading. Mr. FINLAY had tubers of several excellent varieties raised by himself, including that of Up-to-date. Messrs. FIDLER, who had about sixty varieties of different raisers on view, included a new variety which they call New Maincrop, and another novelty, Fidler's Favourite, said to be a heavy cropper that matures as early as Ashleaf.

We would recommend anyone who wishes to see a representative collection of the newest and best agricultural and horticultural time-saving implements and machines to make a visit to this annual Show. We have a list of these important helps to the modern farmer that were noticed there, but it is much too long to reproduce here.

We could not leave this exhibition without viewing Her Majesty's splendid two years old Hereford that was adjudged the premier beast in the Show, as it was also at Birmingham and Norwich. It weighed about 17½ cwt., and was a very good-looking beast. The Prince of Wales, the Duke of York and Lord Rosebery were among the prizewinners.

NATIONAL CHRYSANTHEMUM.

DECEMBER 5, 6, 7.—The last of the three exhibitions arranged by this society for the present season was held in the Royal Aquarium, Westminster, on the above dates. In conjunction with this event also took place the last meeting for the season of the Floral Committee, and this body awarded on the occasion two First-class Certificates to varieties, of which description will be found below.

The exhibition was quite as large as usual, and was characterised by quality equal to the average at these mid-winter shows, but no more than this could be said of it. The holding of such shows has, so far, had little effect in producing essentially late-flowering varieties of exhibition size and quality. This is regrettable from several standpoints. It is worthy of remark that at this exhibition an increased proportion of the Japanese blooms were presented to the visitors' inspection in vases, and not upon boxes; many of the cut blooms lacked freshness. Several of the trade exhibits were of conspicuous quality, and a non-competitive exhibit of miscellaneous flowering and foliage plants from the garden of Sir CHAS. PIGOTT was a feature of the show, well deserving the Gold Medal awarded the same. Mr. Perkins, gr. to the Hon. W. F. D. SMITH, was a very successful exhibitor.

CUT BLOOMS.

Mr. R. KENYON, gr. to A. F. HILLS, Esq., Monkham, Woodford Green, Essex, had the best exhibit in the principal class for cut blooms. His collection of twenty-four specimens of Japanese in not fewer than eighteen varieties, was not lacking in size, nor particularly in colour; but several of the specimens had not so fresh an appearance as is desirable. The varieties Matthew Hodgson, Mrs. Barkley, Julia Scaramanga, and Wattleblossom, had the best effect of any staged. There were as many as six exhibits in the class; and the winner of the 2nd prize was Mr. D. WILLIAMS, gr. to the Earl of FEVERSHAM, Duncombe Park, Helmsley, York.

The best collection of twelve Japanese blooms, distinct, also exhibited on boards, was shown by Mr. R. C. NORCUT, and was remarkable for a very large bloom of the variety G. J. WARREN, and a brightly-coloured specimen of Amiral Avellan. Mr. J. SANDFORD, gr. to G. W. WRIGHT-INGLE, Esq., Woodhouse, North Finchley, was 2nd.

The best collection of twelve bunches of Japanese blooms in vases, not fewer than six varieties, was one from Mr. KENYON. There were some well-coloured blooms of the variety Matthew Hodgson, but all of the blooms were of varieties that were seen in the November show, none of them being peculiarly late-flowering ones. Mr. R. C. NORCUT, Broughton Road Nursery, Ipswich, had smaller, but for the most part fresher blooms, and was 2nd.

The 1st prize exhibit in the class for six Japanese blooms, distinct, was a remarkable one. The specimens of G. J. WARREN, Mrs. Mease, and Mrs. Compton, the latter a white Japanese, were exceptionally heavy and deep. The other varieties were Australia, Mary Molyneux, and a promising yellow incurved Japanese seedling. Mr. R. KENYON was 2nd.

In the class for six bunches of Japanese blooms, the best exhibit was again one from Mr. PERKINS; the quality of most of the blooms was satisfactory, but too many whites and yellows were included. Mr. TULLETT was the best of three other exhibitors.

In a class for twenty-four bunches of Chrysanthemum blooms, any varieties allowed, including Pompons, the winner of the 1st prize, Mr. Henry Perkins, gr. to Hon. W. F. D. SMITH, Greenlands, Henley-on-Thames, elected to stage Japanese blooms which were arranged in vases three in each; collectively these were a good exhibit, many of the blooms being most commendable for December specimens, a few only showing signs of being unduly kept.

Incurveds.—The largest class for incurved blooms at this December Show is one for twelve specimens in not fewer than six varieties. There were as many as five collections exhibited, and that from Mr. H. PERKINS was composed of blooms of very satisfactory quality; all of them were fresh in appearance, and most of them of good colour. There were the following eight varieties:—Chrysanthemum Bruant, Miss L. D. Black, The Egyptian, Mrs. J. Harvey, Mr. J. Gardiner, Miss P. Fowler, Bonnie Dundee, and C. B. Whitnall. The 2nd prize was won by Mr. THOS. ROBINSON, gr. to Mrs. LAWRENCE, Elsiefield House, Hollingbourne, Kent.

Single-flowered Varieties.—The best collection of six bunches of large-flowered single varieties was shown by Mr. T. TULLETT. There were three collections staged, and they were of moderate quality. The florets of these large-flowered single varieties soon show signs of drooping. That of Earlswood Beauty (white) stood much the best of any.

The best exhibit of six vases of small-flowered single Chrysanthemums was one from Mr. T. TULLETT, gr. to G. ALEXANDER, Esq., Warley Lodge, Brentwood. The colours shown were hardly representative, as four of the varieties were shades of rose or red, one was white (Miss M. Anderson), and the other yellow (Golden Sunset). Bronzes and crimson had not a representative. The 2nd prize was won by Mr. G. W. FORBES, gr. to Madame NICHOLLS, Regent House, Surbiton.

Decorative.—Class II. was a comprehensive one, calling for six bunches of decorative, spidery or thread-petalled, plumed, &c., varieties. The best exhibit of these was one from Mr. W. C. PAGRAM, and included King of Plumes (yellow), and Miss Carter (lemon), already well known varieties; and Houpe Fleuri, a new bronze and yellow-coloured small flowered continental variety, with thread-like florets.

PLANTS.

We did not observe any specimen-plants of Chrysanthemums.

Mr. David Gibson, gr. to W. JOHNSTONE, Esq., Coombe Cottage, Kingston-on-Thames, had the best display in Class 22 of flowering plants, &c., arranged upon a table to produce effect. The centrepiece was a cloué 4 feet or more in height, composed of plants of Begonia Gloire de Lorraine and Roman Hyacinths, the general effect being the same as would be afforded if a huge plant of this Begonia were trained similarly to a pyramidal Azalea. The exhibit contained very fine Cyclamens, Primula sinensis, Cypripedium, Cattleyas, Bouvardias, Odontoglossums, Carnations, &c., and had an attractive effect, if somewhat heavier than desirable.

AMATEURS.

In the classes for amateurs, the most successful exhibitors were Mr. W. PERRIN, gr. to C. W. RICHARDSON, Esq., Fairgreen House, Sawbridgeworth, who won three 1st prizes in the principal classes; Mr. A. HOONEY, gr. to G. H. COX, Esq., The Grange, East Barnet; and Mr. G. C. FARMER, Leeds Abbey, Maidstone.

ARRANGED FLOWERS.

Some of the exhibits in the classes for baskets and vases, decorated with Chrysanthemums, and others with foliage and sprays from berried plants were very pretty. The principal prizes were won by Miss C. B. COLE, The Vineyards, Feltham; Mr. H. PESTELL, gr. to F. S. WIGRAM, Esq., Elston, Bedford; Miss EASTERBROOK, The Brigs, Fawkham, Kent; Mr. W. G. PRUDEN-CLARKE; and Mr. F. BUSH, gr. to W. T. LISTER, Esq., Rose Hill, Tottenham.

CERTIFICATED VARIETIES.

The Floral Committee on Tuesday recommended First-class Certificates to the following varieties:—

Chrysanthemum Edith, a large single-flowered variety, pale-rose with light band around disc. From Mr. H. J. JONES.

Chrysanthemum J. R. Upton, a large yellow Japanese, very large, florets twisted to some degree; shade of colour similar to that of G. J. WARREN. From Mr. R. KENYON.

NON-COMPETITIVE EXHIBITS.

One of the prettiest groups of miscellaneous plants we have seen for a very long time, was an exhibit from Mr. JOHN FLEMING, gr. to Sir CHAS. PIGOTT, Wexham Park, Slough. The groundwork of this "floral scape" was composed of very dwarf plants, but there was a great variety of miniature groups that gave the most artistic relief. Beautiful Cocos Weddelliana Palms had their pots, as it were, "mossed over" with Cyclamens, themselves splendid specimens with large flowers of some substance. Codiaums were similarly "based" with Ericas, Cyclamens, or Begonia Gloire de Lorraine. The group itself was an exhaustive representation of the plants that will bloom at this season. There was a specimen of Humia elegans, the last of the season, associated with forced Lilies of the Valley and Daffodils. Poinsettias were numerous, and some of them not more than 4 inches high; Calla aethiopica added an appearance of stateliness; and there were Roman Hyacinths, Carnations, Chrysanthemums (but not many), Cypripediums, Dendrobiums, Bouvardias, Primulas, Panchiums, Statice, Solanum capsicastrum, Azaleas, Deutsche Perle, Datura double-white, Euphorbia Jacquiniiflora, &c. These were in conjunction with a nice collection of foliage plants (Gold Medal was awarded).

Messrs. CANNELL & SONS, Swanley, Kent, had a large exhibit in which the magnificent zonal Pelargoniums and uncommonly fine plants of the ever-recurring Begonia Gloire de Lorraine were most striking features. Amongst the Chrysanthemum blooms were several interesting new varieties. A sport from Sunflower, with florets half their length yellow, and succeeding half red, may prove to be a pretty novelty; Lord Methuen, an orange-red Japanese, is promising. A number of decorative varieties was included, and

additional ones of the same type as described in our last issue (Silver-gilt Medal).

Mr. H. J. JONES, Ryecroft Nursery, Hither Green, Lewisham, and Mr. NORMAN DAVIS, Framfield Nurseries, Sussex, exhibited large collections of cut blooms similar to those from the same cultivator at the November show, and they were staged in the same positions. On the occasion under notice, as at the November show, Gold Medals were awarded to each of the exhibitors.

In Mr. JONES' exhibit the new single variety Edith, described above, was shown, and numerous other novelties, besides a variety of well-known exhibition and decorative Chrysanthemums, which were effectively displayed in handsome vases, suitably relieved with green and coloured foliage.

Mr. NORMAN DAVIS' exhibit included fewer of the prominent vases used on the last occasion, but the blooms were well set up nevertheless, and were exceptionally fresh in appearance, and of good quality. Madame R. Cadbury, the new white Japanese variety raised by Mr. Weeks, was included among the novelties.

Mr. J. AOATE, Havant, exhibited twelve magnificent blooms of the new white incurved Japanese, Florence Molyneux.

Mr. W. J. GODFREY, Farnmouth Nurseries, Devon, was awarded a small Silver Medal for a collection of cut Chrysanthemums.

Mr. ROBT. OWEN, of the Floral Nurseries, Maidenhead, had a large exhibit of Chrysanthemums. There were 120 blooms in boxes, and a considerable number of vases, &c. Among these were many unnamed seedlings.

MISCELLANEOUS SOCIETIES.

Devon and Exeter Gardeners'.—Mr. W. MACKAY, of the Royal Nurseries, Exeter, at the last meeting of this society contributed a paper on "Cut Flowers and their Arrangement." A mistake was frequently made, said Mr. MACKAY, by cutting flowers in such a manner that insufficient stem is left to permit of the flowers being properly displayed. Cut flowers are sometimes put into vases or flower-glasses of unsuitable shape or colour. These should either harmonise or offer a striking contrast to the flowers they contain. Many charming effects are produced by using shades of one colour only, thus developing a pleasing harmony in light and shade. Most flowers when made up into sprays for the button-hole, have the best effect when relieved with their own foliage, and this was well illustrated by some Carnation blooms and Roses. In arranging sprays for ladies' wear, the great thing was to keep them light and graceful. Bouquets, also, should always be arranged lightly, and should not reveal a laboured effect. In table decoration, flowers should not be given too much space, and as a rule the best effects may be produced from the most simple flowers and foliage. Two colours of the same flower are effective, for instance, pink and dark Roses, but they require careful handling to keep them from looking heavy. Sweet Peas of bright or pale colours produce a light, cheerful effect. Mr. MACKAY showed, in a brown vase, a group of Chrysanthemums and foliage, treated in various ways to illustrate different methods of treatment.

Isle of Wight.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday, November 2. Dr. J. GROVES, B.A., J.P., presided over a very large attendance of members, who were present to hear a paper read by Mr. W. TUBBICK, F.R.H.S., Brooke House Gardens, on the "Cultivation of Muscat Grapes." The essayist, who is a master of Grape culture, dealt with every phase of cultivation in an interesting and practical manner. After the lecture a unanimous Vote of Thanks was accorded the essayist, after which followed a profitable discussion, taken part in by the Chairman, and Messrs. Kime, Sheath, Bennett, and others. A most successful meeting was brought to a close by the election of several new members. S. H.

NATIONAL AURICULA AND PRIMULA SOCIETY.—The Annual General Meeting of the above Society will be held in the Rooms of the Horticultural Club, Hotel Windsor, Victoria Street, Westminster, on Wednesday, December 13, 1899, at 7 P.M. Members of Committee are invited to meet at 6.30 P.M. on the same day and at the same place.

CATALOGUES RECEIVED.

PLANTS, BULBS, SEEDS, FRUIT AND OTHER TREES, SUNDRIES, ETC.

FOSTER & PEARSON, Ltd., Beeston, Notts.

ERNST BENARY, Erfurt, Germany.

VILMORIN-ANDRIEU ET CIE., 4, Quai de la Mégisserie, Paris.

S. F. RICHMOND, Chrysanthemum Nurseries, Ossett, Yorks.

GARDENING APPOINTMENTS.

MR. R. JAMES, for the past fourteen years Gardener to T. H. HEPBURN, Esq., Dunmore House, Bradninch, Devon, as Gardener to A. SCOTT, Esq., Rotherfield Park, Aiton, Hants.

MR. C. E. HOUGHTON, for nearly three years General Foreman at Shiplake Court, Henley-on-Thames, as Gardener to N. H. CORNELIS, Esq., Russ Hill, Charlwood, Surrey.

MR. POPE, formerly Foreman in the Botanic Gardens, Glasgow, has been superannuated; and Mr. POPE, formerly Propagator, has been appointed to fill the vacancy.

Mr. L. E. WALKER, for the last three years Foreman in the Gardens, St. Audries, Bridgewater, as Head Gardener to Sir HENRY BUNBURY, Bart., Barton Hall, Bury St. Edmunds.

Mr. E. F. THORNE, Head Gardener to T. M. CLUTTERBUCK, Esq., has removed with that gentleman from the Rookery, Stanmore, to Chequers Comit, Gerards Cross, Bucks.

Mr. A. BEECH as Gardener and Bailiff to W. SPENCER, Esq., Codicote Lodge, Welwyn, Herts.

Mr. C. FLOWERS, for the past three-and-a-half years Foreman under Mr. J. P. LEADBETTER, Gardener at Tranby Croft, Hull, as Gardener to R. HODGSON, Esq., Westwood, Beverley.

Mr. G. CHEILCOTT, as Gardener to A. HARDIE JACKSON, Esq., Glenforth, Harrow Weald, Middlesex.

Mr. JAMES A. MAY, Gardener to WICKHAM NOOKES, Esq., at The Red House, Leatherhead, has removed with that gentleman to Selsdon Park, Croydon.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending December 2, is furnished from the Meteorological Office:—

"The weather was generally fine over our Islands as a whole, but rain was again frequent in the extreme N. and N.W., and towards the end of the week unsettled rainy; conditions were experienced over the whole kingdom.

"The temperature was much above the mean, the excess ranging from 3° in the 'Channel Islands' to 7° in 'England, N.W.', 8° in 'Scotland, N. and W.', and 'England, N.E.', and to as much as 9° in 'Scotland, E.' The highest of the maxima were recorded during the earlier days of the period, when they ranged from 59° in the 'Midland Counties' to 56° in 'England, N.E., E., and S.W.' The lowest of the minima, which were registered towards the end of the week, ranged from 27° in 'Scotland, E.' and 'Ireland, S.', and 28° in 'England, E.' and 'Scotland, W.', to 33° in 'England, N.E. and N.W.' and 'Ireland, N.', and to 39° in the 'Channel Islands.'

"The rainfall exceeded the mean in 'Scotland, N.', but was much less in all other districts.

"The bright sunshine was less than the mean in most parts of the kingdom, but exceeded it over the northern, eastern, and central parts of England. The percentage of the possible duration ranged from 7 to 14 in 'Scotland,' 13 to 21 in 'Ireland,' and from 17 to 36 over 'England.'

BOOKS: *The Uses of Plants*, by Prof. Boulger, was published in 1889, by Roper & Drowley, 11, Ludgate Hill.

CLIMATE OF NATAL: X. The summer heat of Natal now approaching is excessive. The coldest months, July and August, have a temperature of 30° to 40°. Severe frost at Johannesburg is reported in our columns, May 20, 1899, p. 321.

DENDROBIUM KINGIANUM: W. J. Keep the plants tolerably cool and dry until growth recommences, then afford it an increased amount of rain-water at the roots, and a higher temperature, till the new growths are finished.

GLASS HOUSE FOR GROWING TOMATOS, STRAWBERRIES, &c.: A. C. The sort of house described would suit these plants if it were fitted up with hanging portable shelves on which the Strawberry plants could be stood. These might be ranged alongside the walls and over the side-paths.

GUMMING FLOWERS IN ORDER TO PRESERVE THEM ON BEING CUT: W. C., junior. A floral gum is sold by the horticultural sundriesmen and florists for this purpose. It is only necessary to let a few drops fall into the heart of a flower to prevent its petals falling.

HYDRANGEA PANICULATA FORCED: W. L. The flower-heads being terminal on well-ripened shoots of the current season's growth, would be sacrificed if you were to cut-back the shoots. The necessary pruning of Hydrangeas should follow flowering.

MOSSY FRUIT-TREES: L. A. W. Make some lime-wash of a good consistency, straining it through a hair-sieve to remove all grit, and apply this with the garden-engine or a big syringe twice during the winter. It may require repeating annually, or less often. The stem and larger limbs, if very much moss or rather lichen-grown, should be scraped with a piece of hoop-iron before the wash is applied. In your county, moss commonly overgrows the fruit-trees, more especially in orchards under grass, and to a greater degree on damp soils than on dry ones. In gardens, scrubbing the stems and branches of the trees with strong soap-suds, containing petroleum at the rate of a wine-glassful to two gallons of suds, may take the place of the lime-wash.

NAMES OF FRUITS: M. L. Tower of Glamis.—

Enigma. The variety is unknown either as a seedling or a sport; it is worth further trial, and we suggest working it upon both crab and Paradise stocks for comparison.—A. L. 1, Golden Winter Pearmain; 2, Cockle Pippin; 3, Scarlet Nonpareil.—J. W., Westmoreland. 1, Calville Rouge d'Hiver. The seedling fruits appear to be distinct and rather promising, except that they do not keep well, judging by those sent. There are several good varieties of the same type already in cultivation, and its usefulness would mainly depend upon the habit and productiveness. Graft a few stocks with it next spring and watch its behaviour. Considerable time is needed in testing seedling fruits.—G. P. 1, Doyenné du Comice; 2, Easter Beurré; 3, Glou Morceau; 4, Gloria Mundi.—W. H. 1, Resembles Red Ingestre; 2, If this is a fair sample it is too small to be of much use, and is probably a local variety, or the fruits must be from an old and neglected tree. Apples about the size of marbles are not required now.—R. The Pears were all smashed, being loose in the box; 5, Dumelow's Seedling; 6, Striped Beefing.—S. A. 2, Doctor Nelis; 3, Burgomeistre. The others were not recognisable.—M. T. 1, Durondeau; 2, Emile d'Heyst; 3, Josephine de Malines; 4, Beurré Hardy.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—H. S. We do not undertake to name varieties of florists' flowers.—Salop. 1, Codium (Croton) Nevillei; 2, C. pictum; 3, C. aucubae-folium; 4, C. variegatum; 5, Oncidium flexuosum; 6, Ruellia macrantha.—F. S. Cymbidium eburneum var.—J. I., Isle of Man. Dendrobium speciosum.

PRIMULA LEAVES SPOTTED: C. W. D. The leaves bearing yellow spots with dark centres show symptoms of a fungus disease. A fungus mycelium is present inside the leaf, but the fructification thereon is not satisfactory; it is very like Berkeley's *Ovularia interstitialis*. As, however, one authority gives four fungi as occurring on leaf-spots of Primula (and these fungi not very distinct), fresh material would be required to make certain. In any case, the remedy is thorough spraying with a dilute fungicide, say, Potassium sulphide, half an ounce in each gallon of water. Powdered copper sulphate, as already used, is likely to burn the foliage; and solutions of copper salts, if used, should be dilute. W. G. S., Leeds.

PROTECTIVE COMPOSITION TO PLACE ON TREES: J. A. If it be as a protection against hares and deer, use a thick paint of clay, cowdung, soot, and spirits of tar; the latter in the proportion of 1 pint to 3 gallons of the mixture. Apply with a brush once or twice in the winter, as high as the animals can reach, allowing for heavy snow falls.

PUBLICATION: A. C. It is a trustworthy work, quite up to date, and fitted for self-instruction.

STEPHANOTIS: J. Bailey. The brown markings on the leaves are entirely due to a discoloration of the epidermis. The internal leaf-structure is not in any way affected, and there is no trace of micro-fungi, or of insects. Is the disfigurement not due to applications of insecticide? R. Newstead.

TOMATOS, CUCUMBERS: J. G. At the new year Cucumber-seed may be sown on hot-beds or in the stove, the progress of the plants being more rapid in the former. In this case the bottom-heat should range between 75° to 80°, and top-heat of 70°, with a small amount of air given at night, and by day more of it whenever it is safe to afford it. The bed should consist of Beech or Oak-leaves and stable-litter, well made and sweetened before any seeds, cuttings, or plants are put into the frames. Tomato-seed may be sown and brought on in such hot-bed at the end of the month of January and later, but the seedlings must not stay therein too long, or spindling will take place, spoiling the plants for all useful purposes. As the daylight lengthens and strengthens, the raising of Tomatos from seed can be more surely undertaken, seeds being sown in any pit, house, or frame having a temperature ranging between 60° and 70°, no bottom-heat being required unless the seed is sown on a bed of soil instead of in pots and pans, when a trifle of bottom-heat is always desirable for early spring sowings.

DIED.—On November 23, at 2, Thanet Villas, Hanworth Road, Hounslow, STEPHEN SPOONER, of the Hounslow Nurseries, age thirty-six.

—At Commercial Court, High Street, Falkirk, on the 2nd inst., THOMAS SORLEY, many years Head Gardener at Mayfield, Falkirk, aged seventy-eight years.

Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

(For Markets, see p. xiii.)

THE

Gardeners' Chronicle

No. 677.—SATURDAY, DEC. 16, 1899.

SOME SUSSEX FRUITS.

I.—THE MEDLAR.

IF Sussex does not make a noise in the world, it is not because she has nothing of which to boast. The two great battles of Hastings and Lewes were fought within her borders, so that she is not without her military records. For centuries her forges were the most famous in the land. Her roads till recently were everywhere notorious for their badness; her Hop-gardens have ever been in repute, and her archaeology has fascinated the greatest scholars. Nowhere else do we meet with the comital subdivisions known as rapes. If Sussex has not the best bacon in the country, she certainly has a greater number of hams than any other county; and, in the matter of fruit she stands among the foremost. Her proximity to the sea, her southern aspect, her special geological features and peculiarly constituted subsoil, her plodding sons, and her age-long traditions, are all here in her favour.

Without attempting to exhaust the subject now under treatment, it will be the writer's aim to bring a few of the special products of Sussex more immediately under review, and the Medlar may conveniently be taken first, because it is the most nearly indigenous. It is true that some botanists question the right of this fruit to be regarded as a native of our island, even in the sunny south. But if it is not truly wild, Sussex is the county where it is most at home in woodland and hedgerow, and its spinous form is a sufficient indication of its near approach to an indigenous form. Here, too, its fruit in a wild state ripens in the hedgerow as well as it does on the cultivated tree. [Hooker, in his *Students' Flora*, considers it not indigenous. Bentham, in his *Handbook of the British Flora*, looks on it as an escape from cultivation; but adds, "In Britain apparently wild in several localities in Southern England, but probably not truly indigenous." Considering its European distribution it seems difficult to doubt the possibility that it may be or may have been indigenous, but that is a point for the botanist to settle.]

Three hundred years ago, Gerarde remarked that "it is very late before Medlars be ripe, which is in the end of October; but the floures came forth timely enough." Three centuries have brought no change in this respect. It was on the last day of October that I ran over to Bosham, the village whence Harold embarked for Normandy. As I cycled down the narrow lanes, redolent of autumn scents, I came presently to a magnificent tree overhanging the road, and laden with fruit. It must have been 30 feet high, and though the gardener had nearly filled a wheelbarrow with the dark-brown fruits, which stood out in striking contrast to the warm, sienna-coloured leaves, he assured me he had only just begun his work,

while the fruit was not so large as that from the adjoining tree. There are "odds of Medlars" as of other things. They vary in size and quality, as Apples do, though the range of divergence is not so wide.

The Medlar is one of those fruits which do not ripen in this country while they hang. Some fruits are never at their best unless eaten the moment they are plucked. In the present case, the conditions are just the reverse. The fruit must be placed on straw or bran to become mellow. It is essentially the dainty of the luxurious, because, like game, it has to be high before it is palatable. Gerarde's remark still holds good: "The pulpe or meat is at the first so harsh or choking, that it cannot be eaten before it become soft." In the smaller kinds, when the persistent calyx which crowns the fruit, the skin, and the stones are removed, there is very little left; but the larger forms contain a goodly quantity of rich edible matter, whose flavour is altogether unique.

The name is noteworthy, as it illustrates the influence which words exert on each other. As a magnetic rock will deflect a ship's compass, so one strong word will affect another. The name Medlar, though it has nothing in common with meddler, has undoubtedly been brought within its range. One authority says that the fruit was called in Normandy and Anjou *Meslier*, but as the verb *mesler* became meddle in English, so the name of this fruit was transformed from *Meslier* to *Medlar*. Thus *Medlar* represents the French *Meslier*, which is the Latin *Mespilum*. This, in turn, comes from the Greek, and several attempts have been made to get at the radical idea. There is a general agreement as to the first syllable. *Med-* is for *Mes-*, the Greek word for middle (*mes-os*). The second syllable, however, has given some trouble. I give three of the views which have been entertained:—

1. *Medlar* comes from *mesos*, middle, and *pileo*, to squeeze tight, to bind together, because the fruit is astringent and binding. "The Medlars are cold, dry, and astringent," says Gerarde, and he adds that the leaves are of the same nature, while the dwarf *Medlar* is not only dry and astringent, but sharp. It is doubtless due to this peculiar astringency, as Mr. Grindon has already remarked, that the *Medlar* has never held a high place among the fruits of the orchard; and almost always "when mentioned in literature, the associations are ignoble, if not offensive."

2. *Medlar* is derived from *mesos*, middle, then, cut in two, halved; and *pilos*, a globe or ball, because it has the shape or appearance of a hemisphere. In this case both the etymology and the shape are forced and unnatural, though it may be admitted that if the calyx were entirely removed the rest of the fruit is somewhat hemispherical.

3. *Medlar* is derived from *mesos*, middle; and *spilos*, a stone, because of the hard kernels which are contained in the middle of the fruit. Of the existence of the stones or hard seeds there can be no doubt, but where is the classical authority for translating *spilos* (a stain) by the English word stone? There is, however, another Greek word, *spilos*, a rock or crag, which may be intended, and this is the etymology to be preferred.

Our ever-ready Shakespeare has not failed to utilise the similarity between *Medlar* and *meddler*. In *Timon of Athens*, the following dialogue occurs between *Timon* and *Apemantus*. *Apemantus* thus charges *Timon*: "The middle of humanity thou never knewest, but the

extremity of both ends; when thou wast in thy gilt and thy perfume, they mocked thee for too much curiosity; in thy rags thou knowest none, but art despised for the contrary. There's a *Medlar* for thee, eat it." He has given him a bitter pill, a sharp, acid fruit to eat, something unpleasant to think about. *Timon* replies: "On what I hate I feed not," which leads to the question—"Dost hate a *Medlar*?" "Ay," says *Timon*, "though it look like thee." The outspoken *Apemantus* retorts: "An thou hadst hated *Medlars* sooner, thou shouldst have loved thyself better now."

I have claimed the *Medlar* as a Sussex fruit. It may grow, but is never so rich elsewhere; and in the north of England it rarely ripens its fruit though it will blossom there freely. In the days of Gerarde it was customary to graft it on the *Whitethorn*. "The *Medlar*-trees (he says) do grow in orchards, and oftentimes in hedges among *Briers* and *Brambles*, being grafted in a *White Thorne* it prospereth wonderfull well, and bringeth forth fruit twice or thrise bigger than those that are not grafted at all, almost as great as little Apples; we have divers sorts of them in our orchards." The tree may be raised in various ways, viz.: from seed, by cuttings, layers, or grafting. The common *Pear-stock* has been found suitable, and grafting thereon is generally regarded as the most eligible method. A rather moist situation on rich loam, with a deep bottom, seems best adapted to bring the fruit to perfection. Formerly, two varieties were selected out of the "divers sorts" spoken of by Gerarde. The first, known as the Dutch *Medlar*, has the flower and fruit large. In the Nottingham *Medlar* the fruit is smaller but much superior in quality, and the best fitted for dessert. A third kind now under cultivation bears the name of the Royal *Medlar*. The wood grows slowly, the timber is firm and durable, and in suitable situations the tree attains a great age. The Dutch *Medlar* does not reach a great height, and its branches are usually crooked and unsightly. On the other hand, the Nottingham attains a great size in old orchards in Sussex, and is sometimes exceedingly handsome, especially when the leaves have assumed their warm autumnal hues.

The name *Medlar*, with sundry distinguishing epithets, is applied to other fruits of a similar kind. Even in Gerarde's day the Neapolitan *Medlar* was known in England, and figured in his well-known *Herbal*. This is nearly related to our Hawthorn, is a native of Southern Europe and Palestine, and frequently finds a place among table-fruit, the Apple being pulpy, and of a pleasant but somewhat acid taste. The Orientals also have their *Medlar*, or *Loquat*, which is not unknown in England. The writer has eaten it in China, but would prefer a plate of Sussex *Medlars* to a bushel of the Eastern fruit. In Madeira, where the European *Medlar* is rarely seen, the *Loquat* is common. It was introduced about sixty years ago, and at once began to thrive, producing a fruit about the size of a Walnut, amber coloured, and of a grateful acid flavour.

It may be added that when the fruit of the *Medlar* has become soft and mellow it loses the chief part of its astringency, and with this loss there is a corresponding change in the action of the fruit and its effects on the system. For dessert at Christmas commend me to a dish of well-preserved Sussex *Medlars*; Oranges and other foreign fruits may then take their chance. A Sussex Naturalist.

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

LÆLIO-CATTLEYA × CAPTAIN PERCY SCOTT (L.-C. × ELEGANS GRANDIFLORA × C. LABIATA FLAMMEA).

A VERY fine hybrid with flowers over 7 inches across, and of a delicate purplish-rose, the front of the finely-cremped labellum being ruby-purple. A purple striped band runs up the middle from the base, each side of the opening of the tube having a cream-white blotch.

CATTLEYA × MRS. HERBERT GREAVES (HARRISONIANA × GASKELLIANA ALBA).

Flowers 5 inches across; the segments broad and well displayed; sepals and petals very delicate rose-pink: lip white, with a primrose-yellow tinge over the side lobes and opening of the tube; the margin being faintly tinged with pink. In form it resembles the similar cross known as "Miss Williams," but the use of the white form of *C. Gaskelliana* has produced a very chaste and delicately-tinted flower. All three were raised by M. Chas. Maron, of Brunoy, France, and have now flowered in the collection of John Leemann, Esq., West Bank House, Heaton Mersey (gr., Mr. Edge), who received First-class Certificates for the two first named at the Manchester and North of England Orchid Society's show, November 23.

LÆLIO-CATTLEYA × YELLOW PRINCE (LÆLIA NANTHINA ♀ CATTLEYA LABIATA GASKELLIANA ♂).

This is the reverse cross of L.-C. × The Hon. Mrs. Astor, and its distinctness warrants the distinguishing name. The flower is 4 inches across; the sepals and petals are rich, orange-tinted, chrome yellow; the labellum, which is showier than in L.-C. × The Hon. Mrs. Astor, is rich orange, beautifully veined and shaded with rose-purple. *J. O'E.*

SOPHRO - CATTLEYA CHAMBERLAINIANA VAR. TRIUMPHANS.

ON the occasion of the meeting of the Royal Horticultural Society, at the Drill Hall, Westminster, on the 5th inst., Mr. J. Smith, Orchid-cultivator to the Rt. Hon. Joseph Chamberlain, Highbury, Birmingham, exhibited a plant under the above name (fig. 141), which was considered to be so distinct as to warrant the retention of the name under which it was exhibited. The parents of this cross are *Cattleya Harrisiana* and *Sophranitis grandiflora*, the first-named being the seed-bearer. It is therefore the reverse cross to S.-C. × *Calypso*. The flowers are different in shape and of a brighter colour than those of that variety, but they equal them in size. The sepals and petals reddish-crimson, with darker veining. The lip is of chrome, with the tip of the front lobe and edges of the side lobes of purplish-crimson. It received an Award of Merit.

FORCING FRENCH BEANS.

FEW of those who force French Beans in November and December would say they were profitable croppers. That is also my own opinion after having given them more than ordinary attention; still, a dish of Beans at this season is sure to be greatly appreciated when it appears at table. I do not feel that I ought to say much of my failures, but rather to offer some hints as to treatment, so as to ensure a regular succession of pods. The plant does fairly well once the days begin to lengthen, and the artificial heat is sufficient, and bottom-heat as well, if that can be provided. Where no bottom-heat can be afforded, the plants may still be placed over the hot-water pipes, or in other such situation that would encourage the growth of roots. Many good gardeners advise the sowing of the seeds in small pots, and subsequent repotting. This is not my practice, as time is thereby lost, and, in dull weather, unless the plants are grown under very favourable condi-

tions, they receive a check. On the contrary, I would rather sow at once in the pots in which they will carry a crop, viz., 6-inch, the plants being assisted when podding with liquid manure. Another practice that may well be omitted with early-forced Beans is top-dressing, of which, so far as I have observed, the benefits have not been such as were looked for. It can scarcely be otherwise, seeing that only two or three weeks are available for the roots to benefit from the additional compost. I prefer to use the pots of the size named, and to fill them to within an inch of the top, and rely on manures. The method pursued at Sion is to sow 100 pots at fortnightly intervals. Beans can be gathered from plants in the open-air, the season for sowing beginning at the end of December. The first sowings are made in 6-inch, in February in

freer-growing *Ne Plus Ultra*, the period of bearing of the cross was lengthened, and pods are larger, and it is very suitable for forcing. For early forcing, Veitch's Early Favourite is a very suitable Bean, and the plant is of small growth, which is a great gain in a forcing Bean. The haulm is strong and vigorous, which are also points in its favour. The variety *Ne Plus Ultra* is still one of our best and most productive forcing Beans. Those who regard length in a pod as an important point, will find in the variety *Progress* something to their liking. It is a plant of dwarf habit, with rather large, broad, very fleshy pods. It is a cross of *Canadian Wonder* with *Mohawk*, and for planting-out in pits I do not know of any better variety. For early pot-culture, Sutton's Hybrid is splendid, but it is yet full early to write

FIG. 141.—SOPHRO-CATTLEYA CHAMBERLAINIANA VAR. TRIUMPHANS.
(Petals and sepals of reddish-crimson; lip chrome, edged with purplish-crimson colour.)

7-inch, and afterwards in 8-inch pots. I am aware of the utility of planting-out, and this is practised with the later sowings, when less heat is called for, but for the earlier sowings we have no suitable pits. The plants which are at the present time in bearing were sown about six weeks ago, and these cannot be termed profitable, for two days' continuous fog caused the flowers to drop before setting, and even under the best conditions the plants, from October to the end of December, make but weakly growth, and never produce a full crop.

A few words as to good forcing varieties, a subject to which I have paid particular attention with the hope of obtaining larger pods, with more flesh, and without losing the chief point in forcing, viz., time. For many years I grew the well-known variety *Mohawk* because of its earliness. After testing at the least a dozen varieties, *Mohawk* has remained my favourite variety, in spite of the crop being soon over. By crossing *Mohawk* with the

anything in reference to its qualities, although for forcing there can be no question as to its usefulness. It is a distinct type, and very free. The old *Syon House*, providing a good stock is grown, is still a valuable variety, and I have for years selected seed from the original stock with the intention of getting more size in the pod, and so far with fairly good results. It is a good pot variety, free, and of good quality, and if a larger pod can be secured, it will be valuable. *G. Wythes, Sion House Gardens.*

ORCHID NOTES AND GLEANINGS.

RESTREPIAS FROM GLASNEVIN.

THE Royal Botanic Gardens, Glasnevin, Dublin, possesses one of the richest collections of *Masdevallias*, *Restrepias*, and allied plants in these

islands, and their culture is a congenial study to the Curator, Mr. F. W. Moore, who kindly sends a selection of the most distinct forms of *Restrepia* at present in flower in the gardens there. One of the prettiest is *Restrepia maculata*, which has singular flowers, that are densely spotted and striped with purple. Another is *R. m.* "Glasnevin var.," which is so distinct in general appearance as to suggest at first sight a different species. The botanical features, however, are identical, and the differences are that in the Glasnevin variety the flowers are pure white, the pronounced purple markings of the type being reduced to faintly dotted lines down the lower sepals, and light purple lines in the upper sepal and petals. *R. antennifera* is one of the handsomest; and equally showy, though different in colour, is *R. guttulata*, a yellow flower with crimson spots.

and bears three flowers, the perianth measuring 1 inch across, and the tails nearly an inch in length. The reverse of the flower is white, slightly tinged with rose and yellow, the front being tinged with yellow and densely studded with reddish papillæ, the lower segments also having some dark red spots. The tails are orange colour, and the whole flower very attractive.

A NEW WINTER CABBAGE.

THE new variety, St. Martin, shown in fig. 142, was obtained by crossing Christmas Drumhead with the Rosette Colewort. The Drumhead shape is retained in the seedling, together with the quality and mild-sweet character so valuable in the Colewort. Another cross from the St. John's Cabbage

valuable in severe weather, which will have less effect upon these than others. Perhaps neither of the new varieties will be useful for supplying the market, as greater size is required. *G. Wythes, Sion House Gardens, Brentford.*

COLONIAL NOTES.

FRUIT CULTIVATORS IN NEW ZEALAND.

GLORIOUS spring, with the early blooms of the Plum, Peach, and Pear opening and distilling their perfume in the atmosphere, such is visible in New Zealand at the moment of writing. Many professional fruit growers add to their income by other means in our beautiful islands; and perhaps a few instances that I have come across may amuse your numerous readers, and also show that the New Zealand gardeners are quite "up-to-date." We have good men of various nationalities carrying on the ancient practice of gardening in this country. "We are the largest growers of bulbs in New Zealand," saith one firm. They print a very good catalogue of bulbs, &c., including in it bulbs of *Narcissus Madame De Graaf*, at 30s. each; and have 200 to 300 varieties of Daffodils correctly described. They print their own catalogue without any extraneous help; one member of the firm signs his name as printer, the guarantee required by the State. A large grower of fruit for our markets helps to swell his revenue by taking contracts to survey mines, forests, and land; he signs after his name, C.E., surveyor, &c. Another, who grows a lot of indoor Grapes, is a State schoolmaster; hours of attendance 9 A.M. to 4 P.M. Another is manager to a firm of lawyers, and attends his office daily by rail, and he makes a handsome profit by all sorts of indoor and hardy fruit. A fifth is a general merchant, and has about 1000 feet run of vineries, which he manages. So does a chimney-sweep, who grows splendid Black Hamburg Grapes, "hammer-marked," in large quantities. But perhaps the most remarkable is a canny Scot, whose ground on one side of his grand entrance-gate is covered with Aberdeen granite tombstones for sale; and on the other side is a brewing and bottling establishment, licensed. I do not say which of the two businesses come first, because it all depends from which quarter you approach the entrance; but they are rather suggestive, looking backwards from my point of vantage. In the rear of these two residences are some first-rate vineries, containing notably that best of all Grapes, Muscat of Alexandria, and as an English hot-house Grape grower, I pronounce the crop to be perfect. Just one more instance out of thousands I could mention: The "Painter's" brand of Apples is known in almost every town in New Zealand, grown by one who is celebrated as a painter in oils.

Thank goodness, we are now having better times in the colony, and can attend to our fruit-growing without having loaded muskets at our sides. *Joseph Mayo, Wellington, N.Z.*

CULTURAL MEMORANDA.

EUCHARIS GRANDIFLORA.

WHY do we not more often see healthy examples of these, the finest of all stove bulbous plants? I have often visited gardens and lived in gardens where *Encharis* could not be grown; all that there was consisted of a few pots full of yellow, sickly leaves. Nothing is more disappointing to gardeners than to have charge of such a collection of this plant, and, contrariwise nothing affords more satisfaction than to be able to show a good lot of healthy plants. The culture of these is so simple it makes a gardener wonder why failures so often occur. Many gardeners are never contented when their plants are doing well, but they must re-pot them in the spring of each year when other stove-plants are receiving attention, and to this it is that failure often may be attributed. Experience has taught me that the most successful mode of growing

From a photo by
J. Gregory, Croydon.]

[FIG. 142.—CABBAGE ST. MARTIN: RAISED BY MR. G. WYTHES, SION HOUSE GARDENS.

R. sanguinea has smaller flowers almost entirely purplish-red; and the little Venezuelan *R. aspicens* has singular-looking flowers, that are shorter and broader in proportion than the others, but bearing on its petals and sepals the thickened point characteristic of the genus. There is a charm about these remarkable, compact-growing *Restrepia* and *Masdevallias*, with their insect-like flowers, which renders them attractive and interesting to everyone who studies them.

MASDEVALLIA × ACIS.

An inflorescence of the pretty *Masdevallia* × *Acis*, raised by Captain T. C. Hincks, Terrace House, Richmond, Yorks (gr., Mr. Rushton), by crossing *M. abbreviata* with either *M. × Chelsoni* or *M. Veitchiana*, which first flowered in 1896, has reached us. We may say without hesitation that *M. Veitchiana* exists in its composition, and now that it has matured, the hybrid proves a showy plant. The scape is more than 6 inches in height,

gave a distinct conical-shaped head. Varieties that produce conical heads are more valuable than others for show purposes, and they hold less moisture or snow than flat-headed kinds. Each of the new varieties appear to be equally hardy, and both make capital growth, and are most useful for winter use. After a trial with other new Cabbages at the Royal Horticultural Society's Gardens, St. Martin was recently given an Award of Merit. There is no lack of excellent varieties of Cabbage, but there is room for really good winter kinds. In obtaining a new variety there is some difficulty in selecting stock. The Brassicas vary so much, it would surprise many readers of this note to see what curious variations there are amongst new seedlings, and this necessitates so much time and such rigid selection, that a private gardener cannot often afford. I am not sure that the St. Martin will prove as hardy as Christmas Drumhead; one could hardly expect it. A characteristic of the new Cabbage is its dwarf stem-growth, and this will be

Eucharis grandiflora is to keep the roots confined, that is to say, if flowers are wanted do not over-pot them, but aim at having the pots filled with bulbs as thickly as possible, and if they are doing well do not disturb them.

When potting has to be done always insert the bulbs deeply in the pots, which is preferable to raising them to the surface. One garden that I worked in possessed a splendid lot, which grew under the stove stage. The bulbs were planted in the space between the wall at the back and the edge of the floor in the front. The bed was so filled with bulbs that it was impossible to see the compost underneath, but they grew well, and flowered three or four times a year; the bed had not been disturbed for many years. I have flowered *Eucharis* five times in less than twelve months, which may scarcely be credited by some persons; still, it is true. The plants at this place are healthy, and at the present time they are affording a grand crop of fine flowers, and this the second time in the last ten weeks or thereabouts, and coming in at this season, when good flowers are so much appreciated, they are invaluable. The bulbs have not been disturbed for more than three years, the pots being now packed with bulbs and roots. The only aid to growth that is given is weak liquid-manure, two or three times a week. The plants stand in an intermediate-house during the early summer months, and are removed to the stove about the middle of the month of August, going back to the intermediate-house in early spring, having by that time yielded three or four crops of flowers. They are always kept growing, no drying-off being practiced. Such good results must, I think, be attributed to the kind of treatment afforded. *Arthur Smith, Edenhall Gardens, Langwathby.*

SCOTLAND.

NOTES ON PEARS.

APRICOTS and Pears were the two fruits of the present year, the crops of which were distinctly below the average in these gardens, the shrinkage in the last-named being due solely to the sterility of trees past their prime; what little these did bear was inferior in quality, and mostly fit for kitchen use. Young trees, on the other hand, carried a normally large crop of fruit, perhaps below the average as to weight, but remarkably good in flavour, and satisfactory as to the manner in which, so far, they have kept in store. Hitherto, though at no time more than sufficient to meet current demands, the supply has been uninterrupted, and this has largely been due to the very small percentage of fruit that has been lost through decay; the rot, so prevalent of late years, that rendered the flesh putrid without showing its presence outwardly till the fruit was wholly rotten, being entirely absent. Another circumstance of the present year worth remarking was the long time, which is equivalent to lateness, the fruit required to mature; considering the extreme heat and the long-continued absence of rain, that being a condition one did not expect. On that account all except the very latest varieties were later than usual in being gathered.

One result of the season has been the confirmation of one's previous estimate of varieties, Marie Louise, though not superior to former years, still holding the position of the finest-flavoured of all Pears, and joined to that, the one variety which can be obtained in good condition over an extended period. Emile d'Heyst is almost equal in flavour to the above. I grow it on a south wall only, and cannot say if the fruit would ripen equal in quality if produced on a west aspect where most of the trees of Marie Louise grow. At the same time, it is well worth the position, not only because of the richly-flavoured fruit it produces, but on account of the unfailing crop borne every year. Thomson's is another delicious Pear, but this year there was scarcely a fruit on

the trees. Passe Colmar, which is being used at the present date, bore not only a good crop, and the largest individual fruits it has ever done here, and these of a high flavour. The tree grows on a south wall, and it is obvious that it requires a very warm, dry season such as the present in order to attain to full perfection. I should be inclined to pronounce it a variety unfitted for the colder Pear districts, and on the other hand, one well worth planting where the best varieties of Pears succeed. The fruit, when small, requires severe thinning. In its season, Beurré Superfin easily occupied the first place for its delicious flavour. The tree crops well, and it is always good. Fondante d'Automne, generally first-rate, was less good this year; and another disappointing early variety to be named was Clapp's Favourite, which was more deficient in flavour than usual. The very old Louise Bonne, which at one time was known familiarly as the Good Lewis, was, as usual, of high quality.

What may be termed late Pears are below an average crop; moreover, they are usually very disappointing as to quality—but in our case that may arise from the trees being almost all trained to a west wall. We have, however, secured good crops of Knight's Monarch, Winter Nelis, and the very antiquated Crassane, of which it is sufficient to say that at its best it is only second-rate. The other two are, however, of the highest quality, though both require a little special attention in order to secure fine individual fruits. The tendency of the first-named to cast its fruit prematurely is a constant fault; but this evil can be lessened to a considerable extent by thinning the fruit whilst they are quite small, the tree nearly always setting a superabundant number of fruits. It requires a south aspect. The one drawback attaching to Winter Nelis is the small size of its fruits—a drawback often aggravated by permitting the tree to carry a crop of fruit beyond its capacity. In this case, as in the last, early thinning works wonders. It is no exaggeration to say the fruits individually may be increased to double the usual size by this treatment alone; and as the fruit sets, with an occasional exception, very freely, thinning becomes a part of the annual routine management of this variety. Moreover, the extreme smallness of the leaves provides another reason why its tendency to overcropping should be obviated by severe thinning. During several years the fruit, which at one time kept into January, and sometimes till February, has ripened towards Christmas, and sometimes earlier. The tree is one that responds readily to the somewhat drastic treatment of heading over for the production of young branches. I have known two apparently worn-out trees which have been rendered quickly fruitful by this expedient, which have continued to preserve the habit unimpaired for many years. This is a practice, however, which cannot be depended on in the case of many sorts—perhaps of very few; for though young branches are produced, and for a few years retain a fruitful habit, it is very soon lost, and the trees sink back into their original state of decrepitude. Neither can root-pruning in the case of very large and old Pear-trees which have lapsed into barrenness be depended on as a cure. Generally it is ineffective. So that, failing the less drastic method of removing a portion of aged spurs to be replaced by young growths, the course to pursue with trees in the condition alluded to is to replace them with young ones—a change, as I am aware, that few owners of gardens care to make.

I imagine also that in our northern latitude fruit-growers would discover an improvement in the best Pears, a few of which are referred to above, if, instead of planting on west walls, they were allotted positions with a south aspect. There is also often a palpable waste of wall-space where Pear-trees are allowed a liberal amount of extension. As these increase in years, good crops alternate with scarcity. How much better to increase the number of trees, to keep them always under control by means of root-pruning, and when signs of exhaustion arising from old age are noticed to replace with others! *B., East Lothian.*

NOTES FROM THE ITALIAN LAKES.

(Continued from p. 409.)

FROM Cadenabbia a beautiful view is obtained of Bellagio, which, by reason of its peculiarly favourable position, must hold the pride of place upon the lakeside. When looking southwards from Bellagio we have upon the left the Lecco branch of the lake, and upon the right the Como branch, whilst it extends in a north-east direction to Colico. Bellagio thus stands upon a promontory, and when viewed from the highest point of vantage in the grounds attached to the Villa Serbelloni, it has a rugged grandeur quite its own. The steamers that ply upon the lake render it easy to cross from one stopping place to another, but if time be not an object there are the boats, which are well appointed in every respect.

The first garden visited at Bellagio was that attached to the Villa Melzi, which is a veritable palace in style. This villa is immediately opposite Cadenabbia, hence it faces more towards the north. The vegetation is luxuriant in the extreme. The entrance for visitors is at the southern gate, the farthest removed from Bellagio, to approach which a *détour* above the gardens has to be taken. The grounds here, which were laid out with great skill and taste, have the advantage of greater expanse than those at the Villa Carlotta; thus there are several open spaces of verdant turf dotted here and there with grand Palms, Bamboos, and choice Conifers, whilst the lake forms the boundary, no road intervening. The ground behind the villa rises somewhat precipitately, and is well clothed, but not crowded, with large trees. The varieties of Bamboos noted were similar to those at the Villa Carlotta, but by reason of standing out prominently, they are seen to much more advantage, and the growth is extremely vigorous. The same may be stated of the Palms, Dracenas, Magnolias (*M. grandiflora*), and other important specimen plants. In some spots the Palms, chiefly *Chamaerops excelsa*, have been grouped with a very fine effect. The Camphor-tree was also noted as thriving well; so also were several Conifers, many having attained to such huge size as to be almost unrecognisable. Specimens of *Tsuga canadensis* were very fine, as also *Thuja dolabrata variegata*, of which an immense but compact specimen was observed. *Picea Moriuda* was also a noteworthy tree; *Acacia dealbata* grows to large dimensions, and when it is in flower the effect must be very good.

Of flowering-plants in beds and groups, combined with foliaged-plants, the Cannas are freely used, and they flower most profusely, as does *Hibiscus sinensis*, *Althæa frutex*, the single-flowered variety, making a brilliant display. Standard *Heliotropes* were usefully employed; whilst *Aloysia citriodora* was noted as growing in the most luxuriant manner—indeed, forming dense hedges in the garden. As at Cadenabbia, the Indian Azaleas grow freely; and also *Fuchsia fulgens*, and plants of the latter were nicely in flower. Cockscombs were thriving bedded-out; whilst, as may be imagined, the *Portulacas* made a most brilliant display in the bright sunshine. Tuberous *Begonias* were good, but not quite equal to those grown in cooler districts. Several specimens of *Lagerströmia indica* were in their full beauty, with quantities of large spikes of flowers. Much labour had been concentrated upon a huge basket-bed upon the sloping ground behind the Villa, but it did not strike me as being quite the thing with such lovely natural surroundings.

Near to the Villa Melzi is the Villa Poldi, which is not, as a rule, open to visitors. Although the proprietor was in residence, we were enabled by the courtesy of the head-gardener to inspect the gardens, the friendship existing between gardeners being the same in Italy as at home. With the use of French we got on very well together. I consider that this garden in the course of a few years will be finer than at the present, every consideration having been given for the future development of the very fine specimens. It has the advantage

of being made on undulating ground towards the lake side, from which it is only separated by the terrace wall, and it extends up the mountain side for a great distance.

The garden proper is divided from another part of the grounds, which partakes more of a wild garden, by the public road, which, being excavated throughout this portion, is not visible. Here were noted the finest individual specimens of Bamboos seen at Como. These were of *Phyllostachys mitis*, with stems 9 inches in circumference at 5 feet from the ground, and the growths more than 40 feet high; both *P. nigra* and *P. aurea* were also of huge dimensions, with large masses of *Bambusa japonica*. Perhaps the most graceful specimens, however, were of *Arundinaria Falconeri* (*A. falcata* ?), which were well placed for view from various standpoints. Bamboos were also noted upon the higher grounds in the wild garden, where they thrive so freely as to need frequent thinning, an operation that had recently been carried out.

The Palms were chiefly planted in groups of one variety. The following were noted in groups, and as single specimens:—*Cocos Bonnetti*, *Chamærops*

miles. The grounds, kitchen-garden, and flower-garden have an area of about 5 acres, and much of the estate was renovated and laid out anew by the late Lady Milton about thirty years ago. Many changes have been made in recent years, and flower-beds being sown down with grasses in order to lessen the amount of labour required. These changes and alterations have not been without their advantages, for no part of a garden is so pleasing to the eye as an extensive and well-kept lawn. The most notable thing in the pleasure-grounds is a long border planted with *Pæonies*. This border is the delight of all who had the pleasure of seeing it during the month of June, when the herbaceous *Pæonies* are at their best. [Our correspondent kindly sent a photographic view of this border, which however we found was unsuitable for reproduction. Ed.]

The border in question is 140 yards in length, and 7 feet in width. This year each clump carried from 100 to 130 fully-developed blooms. An ornamental chain-fence runs down the centre of this border, which makes the effect still more pleasing, being covered with creepers in variety, also *Roses*,

Mrs. Middleton takes a lively interest in her garden, and believes that that which is worth doing is worth doing well, with the result that the gardens and grounds compare favourably with many others in the country. Her head gardener is Mr. Wilson. *W. R. J.*

MARKET GARDENING.

PEACH AND NECTARINE TREES IN GLASSHOUSES.

REMEMBERING the fact that the annually increasing number of readers of the *Gardeners' Chronicle* refer to their instructor for any reliable information which they may require on any subject relating to the culture of plants, fruits, flowers, vegetables, trees, and shrubs, cultural remarks on any of these subjects will prove fresh and useful to the army of new readers. No matter how often and well the several topics may have been previously dealt with, there is always something of interest to add, or some antiquated fallacy to explode; new ideas and practices, resulting from experience gained by each succeeding generation of practitioners in the progress of events, taking the place of old ones.

The planting of Peach and Nectarine trees in glasshouses is an operation that should be performed as early in autumn as possible; and, for that matter, the same remark applies to the transplanting of the trees out-of-doors at the foot of walls having south, south-west, and west aspects.

VARIETIES TO SUPPLY EARLY FRUITS.

The earlier that supplies of ripe Peaches and Nectarines can be placed in the market after the meeting of Parliament in spring, the more remunerative prices will be obtained for them. This being so, the varieties which require the least amount of artificial heat to ripen the fruit by a given time should be grown. Having had an extensive experience in the cultivation of Peaches under glass as well as out-of-doors, I feel justified in recommending the four under-mentioned varieties, which I place in the order in which they have ripened with me on walls having the same aspect: 1, Early Alexander; 2, Waterloo; 3, Amsden June; 4, Hale's Early. These are all first-rate early, high-coloured Peaches of fine quality, and they will yield a succession of ripe fruits for about three weeks, whether the trees of the several varieties be all planted in one house or not. Although the three first-mentioned varieties are good all-round early Peaches, Hale's Early is undoubtedly the best in point of flavour. As Alexander ripens its fruits a few days earlier than Waterloo, the former will realise a higher price.

With regard to Nectarines, Early Rivers is a long way ahead of other varieties in regard to earliness; and in point of size, colour, and flavour it is equal to the best of the older varieties. Lord Napier, Humboldt, and Pine-apple are excellent varieties for forming a succession to Early Rivers.

PLANTING AND SUBSEQUENT CULTIVATION.

Mark the positions which the individual trees are intended to occupy alongside the front walls (the houses being spans running north and south) at intervals of 15 feet, each hole forming the outline of half a circle 5 feet in diameter. Excavate these to the depth of about 2½ feet, putting in the bottom about 6 inches deep of brickbats, stones, or clinkers, broken somewhat fine on top for drainage. Cover this with turves grassy side down, coarse grass, or long stable-dung, in order to prevent the soil getting among the drainage and clogging it. This done, fill the holes level with the ground-line with the best loam obtainable, to which one-fifth of lime-rubble and a like quantity of horse-droppings should be added, the whole being well-mixed before depositing it in the several holes. In the centre of the holes thus prepared, plant the individual trees as soon as possible, first trimming back any straggling or damaged roots that may

FIG. 143.—HASELBECH HALL.

humilis, and *C. Fortunei*. *Dracænas* were here towering aloft above many things. Such flowering-plants as the *Lagerstrœmia indica*, *Nerium Oleander* and *Cannas* in variety were in full beauty. Several *Coniferae* were also noted, some specially fine examples being well placed near the Villa, varieties of *Pinus*, *Picea*, and *Abies* abounding. *Dasyllirion acrotrichum* was noted, with tall erect spikes of flowers.

A further example of good taste was apparent in the position chosen for the family mausoleum, which edifice is to be seen a long distance away, being associated most appropriately with the upright Cypress. Far away upon the slopes in the wild garden hay-making, amidst Bamboos, was being carried on. The paths in this part are of grass also, winding in and out, so as to reach the higher ground in an easy manner. *Jas. Hudson.*

HASELBECH HALL.

HASELBECH belongs to Lord Hawkesbury, and is the present residence of Mrs. W. G. Middleton, who has been the tenant for eleven years. It is a pleasant, compact estate, not far distant from Rugby. From the south front good views are obtained of the surrounding country, and the battle-field of Naseby is within a distance of 1½

including the long trailing shoots of the Crimson Rambler, which succeeds admirably, and tones down the dazzling effect of the *Pæonies*.

On the opposite side to the *Pæony*-border is a border of herbaceous perennial plants, of choice species and varieties, in which something can be seen in flower every day of the year. A rosary exists, which is exceptionally strong in fine standard *Roses*.

In the grounds are fine symmetrical specimen-trees, including an *Araucaria imbricata*, which has not lost its bottom branches. An avenue, one mile in length and planted twenty-six years ago, contains some *Sequoia gigantea* over 40 feet high.

The south front of the Hall is adorned with a plant of *Ampelopsis Veitchii*, which in its autumn garb is magnificent. The kitchen-garden is surrounded by brick walls of a very substantial construction, which are covered on both sides with fruit-trees, which in most years afford a fairly good crop, although it is not a soil favourable to fruit-culture, being cold, heavy, and clayey. Trees and crops of all kinds are always best in this district in hot summers.

The glass-houses consist of vineries, Peach-houses, plant and forcing-pits, &c. Cut-flowers being in much request, numerous plants and bulbs have to be grown, and Violets are a specialty.

require shortening back, and cover with about 5 ins. thick of the compost described above, giving the trees a shake in an upward direction to let the soil well in among the roots during the process of planting. Should the natural soil of the covered-in spaces be of average depth and fertility, all that is necessary until more root-room is required, is to manure the intervening spaces between trees and central pathway, and dig it a good spade deep in spring for planting Tomatos in. Do not tie the trees to the wire trellis for about eight weeks from the date of planting to allow of the loose soil subsiding a few inches during the interval.

In training the young trees to the trellis do not cut back the shoots to within 10 or 12 inches of the previous year's growth, as was the practice a few years ago, and possibly is still followed in some places. Leave the shoots their full length, simply shortening back any growth that may have taken the lead of the majority in order to promote a balance of growth in the trees, and with the same object any extra strong growths should be cut clean out. The shoots of the young trees should be spread well out at regular intervals over the trellis so far as they will extend, leaving perhaps an intervening space of from 15 to 20 inches for training the necessary number of summer growths at intervals of 3 or 4 inches, which will at all stages of the tree's growth be none too much space to allow between current and previous year's growths on the trellises. Thus treated, the trellises are furnished with bearing wood within two or three years from the time of planting. This is the "extension" system pure and simple.

One important point in the culture of Peach and Nectarine-trees is never to allow the soil about the roots to become dry, and to maintain the wood and foliage in a perfectly clean and healthy condition during every stage of the plant's growth. A somewhat dry and airy atmosphere should be observed during the time the trees are in flower, reversing this order of things as soon as the fruits are set.

A somewhat dry and airy atmosphere should also be maintained from the time the fruits begin to change colour until they have been all gathered, after which the trees should be well washed with clean water applied either with hose or syringe, morning and afternoon, until the leaves begin to turn yellow, when, of course, it may be discontinued. The ventilators should be left wide open (in the absence of wind) day and night from the time the fruit is ripe until it is time to start the trees into growth again. During a long experience in Peach-culture, practising what I have occasionally preached in the columns of the *Gardeners' Chronicle*, I have never had experience of the bud-dropping trouble in my Peach-houses, which I believe can be prevented by treating the trees and borders in the manner described above. H. W. Ward.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Climbing Plants and Shrubs.—All long straggling shoots may now be shortened, and the main stems securely fastened to the walls or trellises, so that they may not be broken by the wind or weighed down by snow. Where the plants have become aged, and growth is not satisfactory, it will be better to replace them with younger plants, an operation which the mild weather, if it continue, will favour. Walls which need to be only partially covered may be planted with *Loniceras*, *Weigelas*, *Pyrus* (*Cydonia*), *Jasmin*, *Forsythias*, and the green, the golden and silver variegated *Livies*. These various plants are well adapted for planting on an eastern aspect. *Carpenteria californica*, *Azara microphylla*, *Choisya ternata*, *Griselinia littoralis*, *Osmanthus aquifolius* var. *aurea*, *Desfontanea spinosa*, and varieties of *Ceanothus* being tender evergreen plants, should be planted on a west wall. The *Magnolias* and most of the creepers succeed on a south wall, while *Euonymus*, *Elaeagnus*, the variegated *Eurya latifolia*, *Berberidopsis corallina*, and *Bridgesia*

spicata survive the coldest winters, and retain the variegated character of the foliage on walls facing the north.

Routine.—Now that the deciduous trees have shed their leaves, the latter should be swept up and stored in some place where they may be left undisturbed to decay. Those which have fallen amongst shrubs, and are liable to get blown about the ground, should be raked out, as by doing this now much labour is saved afterwards. All rough leaves, with sticks or Beech-masts should be burned, and their ashes mixed with other leaves and short-mown grass, which form when well decayed a good top-dressing for shrubs, &c.

Ornamental Crabs (Pyrus Malus).—Varieties of the Crab are very handsome, either in flower or fruit, and being hardy, they survive where the rather tender Almond perishes. They are effective when planted amongst evergreen shrubs, and ornamental as single specimens in the open lawn. The most distinct are John Downie, which bears clusters of fruit resembling a Bigarreau Cherry; the Orange-Crab, with fruit of a pale golden colour; Paul's Imperial, a scarlet Crab; Transcendent, an oval fruit, and very distinct; Fairy Apple, small and pretty; Siberian, in two varieties, scarlet and yellow fruited; and the American variety of the same, which produces larger fruits that are not so fine in colour. Of the larger-fruited varieties, there are the Dartmouth, a very prolific bearer, the fruit of which is of a rich deep crimson colour; Montreal Beauty, red and yellow varieties; Transparent, bright yellow. The value of the more delicate-growing trees lies in their abundance of blossom alone, and the following selection comprises P. m. floribunda, P. m. f. atropurpurea; P. m. Tenrei carnea, with small crimson-tinted blooms; and the double flowering kinds, P. m. spectabilis and P. m. s. Scheideckeri. Soil of a loamy nature, that is well drained, is the most suitable in which to plant them; but when grafted, as they usually are, on the wild Crab, they will thrive in most soils that are moderately rich, and of a good depth. The beauty of the baccate or berry-producing Crabs should not be overlooked.

Alpine Plants.—The succulent species, which usually have a tender constitution, should be lifted, potted, and wintered in cold frames, or if this be not done panes of glass should be laid over them, but not touching them, in order to afford protection against rain and snow. All tree-leaves which may have accumulated about the plants should be removed forthwith, otherwise these will set up decay, that may be communicated to the plants. If the rains have washed the soil from the roots, or if any plants have risen above the surface, they should be top-dressed with suitable kinds of soil, while those planted in very damp nooks should have a few sifted coal-ashes placed round them.

Stock Bedding Plants.—From the present until the middle of January is a trying time for these, and in order that they may be preserved in good condition, borders or shelves near the glass should be utilised for them so as to fully expose them to the light. Only as much water should be afforded as will preserve the roots from shrivelling. *Coleus*, *Alternantheras*, and *Hesines* may be accommodated in the stove, being careful not to expose them to cold draughts. Plants of *Ageratum*, *Petunia*, *Fuchsia*, *Verbena*, and the hardier bedding plants require a temperature ranging from 40° to 50°. Should aphids appear on them afford a slight fumigation, and against mildew of the leaves use flowers-of-sulphur.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

Wintering Strawberries.—Various means are adopted for the protection of Strawberry plants in pots. The chief concern is the preservation of the pots rather than the plants, for the latter are hardy, but the pots when exposed to the weather burst when the soil gets frozen. A good depth of fine coal-ashes in which to plunge the pots is perhaps as good as anything, and next to these are tree-leaves, gathered soon after they have fallen. It is much better for the plants than to be stacked on their sides one above the other in tiers. The only recommendation this practice has is in the small space occupied by a large number of plants. If unheated pits are available these are better for the plants than any method of plunging out of doors, the plants being come-at-able in all weathers.

And next to cold pits are unheated houses. In both of these it is well to plunge the plants in leaves or ashes, in order to obviate the need of affording water frequently, and the destruction of the pots by frost.

Outside Vine Borders.—A border, when it is well drained, and the situation is one from which the surface-water passes off freely, does not require much extra attention if the Vines are started late, neither frost or moisture injuring the roots. Vine borders are frequently made to extend in and outside the vinery, even where early forcing is carried on. When this is the case, nothing serves better as a covering than freshly-gathered tree leaves laid on the soil 1½ to 2 feet thick, covering this bed with boards or lights from frames, or tarpauling. A covering of this sort imparts warmth and retains the latent warmth of the soil. Failing leaves, stable litter may be employed. The stems of Vines which are planted outside the vinery should be protected by hay-bands wound round them, if the border is covered with leaves or litter not deep enough to form a protection against frost. Thick manurial dressings put on a border at this season do more harm than good by closing the soil to the ingress of the air.

Ripe Grapes.—Whether these are allowed to hang on the Vine, or are cut and placed in bottles in the Grape-room, the same necessity arises for a frequent examination of the bunches, and the removal of decaying berries, the thin-skinned berries, like those of Black Alicante, suffering very soon. If the Grapes are left on the Vines a dry air should be maintained in the vinery, with ventilation afforded on dry days, using on these occasions a small amount of fire-heat. Similar conditions should rule in the Grape-room, and if there is no connection with the heating apparatus, an oil or coal stove should be used for drying the air. Do not neglect to keep the bottles filled with water, and to place a bit of charcoal in each.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Change of Crop.—Although good crops of one kind of vegetable may be grown from year to year on the same piece of land with good cultivation, it is prudent to change the crop as often as it is possible to do so. In gardens where space is ample, a regular alternation of crops is readily practicable; but where the vegetable consumption is large, and space limited, frequent alternations are not easily obtained. At this season of the year much may be done in the preparation of the land for next season's crops: manure, decayed garden-refuse, charred earth and refuse being dug or trenched in. The wheeling of such materials to the quarter where it is required, should be carried out when the ground is hard with frost.

Peas.—Some gardeners still practice the sowing the round varieties of Peas at the end of November, or early in the present month. Sometimes the first sowing, if the winter proves mild, is apt to get too forward, and suffer injury if severe weather set in afterwards. For many years past I have sown in the first or second week in December; and again, weather permitting, in the middle of January, and from these sowings I have gathered good Peas at the end of the month of May. The seed should be sown thickly, and the drill made firm before the seed is put into it. It is a matter of prudence to roll the seed (damp) in powdered red-lead, or sprinkle it with paraffin, as a deterrent to mice eating them. As soon as the plants peep through the soil, scatter some finely-sifted soil along the rows, and often apply lime and fresh soot, so as to render the leaves distasteful to the sparrows, slugs, &c. When the plants are an inch in height, mould them up slightly, drawing the earth upon either side, so as to leave a little ridge, which will shelter the young plants considerably against the wind. In the event of very severe weather occurring without snowfall, Laurel or Spruce fir twigs should be stuck along the rows. Wrinkled varieties of Peas should not be sown till February or March, these being too tender to be profitable when sown earlier. Dwarf round seeded early-podding Peas, when sown on a south border, produce pods in quantity in the first week in June.

Broad Beans.—A few rows for a first supply may be planted at any time when the land is in a

state suitable for sowing, Early Longpod and Mazagan being useful varieties to sow.

Frames, Pits, &c.—In frosty weather much care is needed in affording air to pits and frames, a very moderate amount given about midday being sufficient for the more tender plants; but Parsley, Cauliflowers, [and other hardy plants, should be more freely ventilated. All frames, &c., should be closed early, and covered with mats before 5 P.M.

Pea and Bean Sticks, &c.—In bad weather, the old and new sticks should be prepared for next season. Pea sticks may be sorted into three sizes, and tied in bundles ready for use, placing them under cover, if possible. Labels of all sizes, short stakes for securing Gooseberries and Currant-bushes, and long ones for Raspberry-canes, should be got in readiness.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Disas.—Where the cultivation of these rather unsatisfactory plants is attempted, those belonging to the *D. grandiflora* and *D. racemosa* sections, will need at this season more light, heat, and air than is usually obtainable in a cool Orchid-house. A cool greenhouse offers the most suitable conditions for them just now, as a freer circulation of air is permitted there, and water can be afforded with less risk of the leaves decaying. The rooting medium being deeper and more cohesive than that employed generally for Orchids, water need not be applied very frequently, but, by no chance should the compost be allowed to get actually dry. As fumigation is injurious to these plants, any insects that may appear on them must be removed by sponging or other similar means.

Cypripedium insigne and others.—For general utility and attractiveness no other Orchid equals the old favourite, *C. insigne*, at this season; and since Messrs. Sanders' introduction of the so-called "montana" type, their value as winter flowerers has advanced greatly. *Cypripediums*, having no pseudo-bulbs to be exhausted of their store of nutriment, are not debilitated if the flowers remain on the plants until they decay, and as it is in this condition that the blooms appear to the best advantage, this is another recommendation in their favour. At this season the plants should occupy a house or a division where the temperature is kept at 50° by night, and 10° higher by day. The atmosphere should be buoyant, not saturated with moisture, and the material about their roots should be kept in a genial moist state, but never allowed to become actually dry. These remarks apply to all varieties which have an affinity with *C. insigne*, as well as to *C. villosum*, *C. Boxalli*, *C. venustum*, *C. x Lathamianum*, *C. x Harrisianum* (now showing their flower-scapes), *C. exul* and *C. caudatum*, where grown cool, should not be afforded water overhead for the present, the plants being apt to damp off at the base.

Lalia pumila and its varieties having finished flowering generally, and the bulbs completed their growth some time since, the materials at the root must be allowed to get much drier, but a lengthened period of drying off is not advisable, least of all for *L. p. Dayana*, which has thin pseudo-bulbs. The plants should be accommodated in an intermediate-house in a place near the roof. Here the growths and pseudo-bulbs will solidify.

Cymbidium.—*C. Lowianum* will now be showing its flower-spikes, and the air of the house being cool and moist, water should be sparingly afforded, alternated with applications of weak cow-yard manure-water. Plants of *C. giganteum* and *C. Tracvanum*, when the flowering is passed, should be afforded a short period of rest. *C. Devonianum* now developing its semiscandent flower-spikes should be afforded water very carefully, so as not to wet these. Plants of the *eburneum* section of *Cymbidium* should be kept merely moist at the root.

Protection against frost.—To obviate the necessity of a large amount of fire-heat in the cool-houses, the roofs, sides, and ends should be covered at night, where practicable, with mats. We find "hop pocketing" of great service during the winter; it is easily put on and secured, and is an excellent protection against frost. If the blinds remain in position they should be lowered at night, and even if they are of the lattice description, they afford a large amount of protection from wind and

frost. The formation of ice on the inside should be prevented as much as possible, for when this thaws, and the consequent drip falls on the plants, dire results follow.

General remarks.—The foggy, smoke-laden air prevailing in the suburbs of cities, and more especially of London, weakens the light and shortens the working day, rendering extreme care necessary in attending to the plants. As little beyond sponging the leaves and other cleaning operations now occupy the cultivator's time, Orchids are lacking in interest at this season. Still, there is much to think about in affording water, damping-down, and ventilation. At the commencement of this year, I alluded to a grub which sometimes attacks the roots of *Cattleyas*, and now that these plants are being cleaned, all infested portions of roots should be removed, or the grubs picked out with the point of a knife; also, all straggling growths should be neatly tied in so as to form compact plants. I do not advise the tying of the growths close to each other, but prefer to see plants present a natural appearance. All sheaths of winter-flowering *Cattleyas* from which the flowers have been removed, should, as soon as signs of decay appear, be cut clean off at their junction with the pseudo-bulb so as to avert decay injuring the latter.

PLANTS UNDER GLASS.

By G. R. FIELDER, Gardener, North Mymms Park, Barnet.

Ruellia macrantha.—Plants which were raised from cuttings in the spring, and have been grown liberally, will be now in bloom, and should be placed in a light position in the stove. The large tubular or trumpet-shaped flowers are of a rosy-purple colour, and extremely attractive. They are produced in loose terminal clusters, and may be used in a cut state for furnishing vases, for which purpose they are very suitable, by reason of the length of stem obtainable with them. The plants have a good effect in the decoration of the stove. Propagation is easily effected in the spring. When the cuttings have been rooted and potted off, they should be stopped once or twice. It is best to cultivate them during the summer in a warm, moist house, and when growth is completed they may be afforded more air, and fuller exposure to the sun, in order to mature the wood, otherwise there will be but few flowers. This slight difficulty in flowering the plant satisfactorily is, I imagine, the reason why it is not more generally grown.

Heliotropes will continue to flower more or less throughout the winter if they are given a temperature of about 50° and a little air daily, when the condition of the weather will allow. Young plants in small pots for flowering early in the season should be afforded a temperature of 45°. Remove the points of the shoots if the plants are not sufficiently bushy, and when they have recommenced growth shift into 5-inch pots, and afford a little more heat.

Chrysanthemums.—Where large blooms are required, preparations should be made forthwith for striking cuttings. Should a considerable number have to be propagated, a shallow one-light frame may be placed near the light in a house having a temperature of from 45° to 50°. The cuttings having been inserted singly in small pots, should be afforded water and subsequently stood on a layer of coal ashes in the frame and the light closed. It is advisable that no more cuttings should be taken off at a time than can be inserted and placed in the frame almost immediately. In order to prevent the cuttings from damping, the light should be removed for an hour early each morning, at the same time wiping the inside of the glass to remove the condensed moisture. Where only a small number has to be propagated, a handlight or bell-glass may be used instead of a frame, but the same precautions must be taken to prevent damping. It is necessary to take the cuttings early also, if large, trained plants are required. Where, however, only ordinary decorative bush plants, and plants to provide cut flowers in quantity are needed, the cuttings may be taken any time between the end of December and the end of February.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Fruit-tree Borders.—When the operations of pruning and nailing of the trees are finished, the borders should be raked clean, and the rubbish and

weeds burned. It is always advisable to leave fruit-borders uncropped for a width of at least 4 feet from the foot of the wall, except for a row of Violets planted close to the wall; and even these plants should be kept at some distance from the stems of the trees. This 4 feet space should now be dug with a fork to the depth of 2 or 3 inches, a small quantity of fresh lime being scattered over it previously. The soil of Plum borders being filled with roots at the surface, should be only just sufficiently pricked over to turn the surface, and if it be low a small quantity of new soil may be spread around the trees. The soil of a border immediately beyond the 4 feet distance, if cropped with vegetables, should be dug to the depth of one spit only. In mild weather, those aged trees on walls or elsewhere which produced heavy crops of fruits this year, if the growth be not strong, should be afforded manure-water of some kind, if it can be spared.

Top-dressing Quarters of Bush Fruits.—In pruning Raspberry canes, the points of the best canes reserved should be removed, leaving the canes about 4 or 5 feet in length. The plant being mainly surface-rooting, the ground in the vicinity of the stools should be cleared of weeds, rubbish, and some of the surface-soil, the whole being brought to the middle of the space between the rows, where there are few roots, and there turned under with the spade, making the land level in the process. Having done that, dress the soil around the stools with rich dung. Blackberries may be similarly treated. Aged bushes of black and white Currants may be likewise assisted with top dressings of manure laid over the roots, with a sprinkling of soil above it to keep it in position. The Gooseberry plantation and lines of bushes may receive a dressing of wood-ashes and hot-bed or potting-bench refuse soil; or bone-meal and potash may be mixed with such refuse soil, lightly digging the land under the bushes, and deeply in the middle space between the rows.

The Fruit-room.—With the arrival of frosty weather the doors and ventilators should be closed; and if the room be of light construction, the walls and the roof may be covered with straw or bracken, so that an equable temperature may be maintained. Means must be taken to keep such light materials in position. The ripening of Pears is most erratic this season, all the usually late varieties being now over, or ready for consumption. Josephine de Malines and B-m-ré Ronce are finished at Dropmore, and a few fruits of that late variety, Duchesse de Bordeaux, are quite ripe. The premature ripening of these late Pears is due to the hot summer. Apples, on the contrary, are keeping well generally.

THE HATFIELD CURE FOR RED-SPIDER.—That red-spider should have manifested itself on Vines and Peach-trees last summer is not to be wondered at. This fact was noted by Mr. Norman, the gardener at Hatfield. After the Grapes were thinned, red-spider appeared on the Vines to such an extent as to call for strong measures in order to repress it. Mr. Norman, believing that the fumes of sulphur will entirely kill red-spider on Vines and Peach-trees, set himself to devise how best to apply this substance. On calling at Hatfield recently, Mr. Norman took me to one of his lean-to vineries, 35 feet long by 12 feet wide, and showed me his method of applying flowers of sulphur. On entering the house, I saw five spirit-lamps placed at intervals along the beds, each within a cylinder, on the top of which was a saucer filled with a dark fluid, from which were rising strong sulphurous vapours. Mr. Norman stated that for many years he had tried various means to destroy the red-spider, and with varying results, and this year he had commenced the system I saw in operation. He experimented first in a house of the size given with one lamp; he went on to two, three, and four, and finally to five, the number that I saw. Directly I entered the house I could perceive that the atmosphere was filled with fumes, which soon began to affect my eyes, and I felt that a longer stay in the vinery was undesirable. Mr. Norman assured me that a series of experiments has enabled him to gauge exactly the amount of spirit and sulphur necessary to fumigate a house of a given size, and effectually do its work without in any way injuring the foliage of Vine or Peach. R. D. [Mr. Norman would be doing a great service to gardeners by making his method known, and we hope that he will do so.]

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DEC. 19.—Royal Horticultural Society's Committee Meeting.

SALES.

THURSDAY, DEC. 21.—Dutch Bulbs, Arancaria Plants, Roses, &c., at Protheroe & Morris' Rooms, at 11 o'clock. Imported and Established Orchids, at Protheroe & Morris' Rooms, at 12.30 o'clock.

WEDNESDAY, Dec. 20.—Arancarias, Palms, Lilies (Japan), Shrubs, &c., at Mr. J. C. Stevens' Rooms, at 12.30.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period December 3 to December 9, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the first part of the week was dull and mild. Rain fell on three days. The latter part of the week was remarkable for black fogs and cold easterly winds.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—39.7°.

ACTUAL TEMPERATURES:—

LONDON.—December 13 (6 P.M.): Max. 35°; Min. 30°.

East wind; light frost.

PROVINCES.—December 13 (6 P.M.): Max. 47°, Scilly; Min. 28°, Home Counties.

LORD PENZANCE, whose death at an advanced age is announced, as a lawyer and a judge often came in conflict with his fellows, and his decisions, however sound, must necessarily often have offended some body or other. None of the papers that we have seen have made allusion to the amusements of his later years in hybridising the Sweet Briar. Here was a field of work in which he may be said to have pleased everybody and offended none. Such are the delights of horticulture. Even thorny Rose-bushes fail to estrange their admirers! What Lord PENZANCE did is best read in his own words in the *Rosarians' Year Book* for 1892. He pleads for the "picturesque"

in flowers, as well as for "symmetry, regularity, and smoothness of outline." In that article he shows how he was led to experiment with the Sweet Briar, and gives full details of his trials, and most interesting they are. We do not know how long his fame as a lawyer will endure, but we do know that among rosarians his memory will be held fragrant for many a long day; and although he wrote but little, he will always rank among our eminent scientific hybridisers. It is even possible that in this department of his work he will remain in memory, whilst his legal dicta will be left undisturbed on the topmost shelves of a lawyer's library.

The Constitution of Rose Soils.

PROBABLY the most successful Rose grower will be the least surprised at the negative results obtained by the Committee of the National

THE LATE LORD PENZANCE.

Rose Society in their enquiry into this important subject. The soil itself had already told the majority of these that the chief secret of their success was not in any one, but in many complex factors; that, however, did not hinder them from doing their best to enrich the earth as one of the most important elements in successful Rose growing.

Local climate is another vital consideration. Cultural skill a third point, which ought perhaps to be placed first—and an infinite capacity for taking thought, to give the finishing touches, that result in perfect Roses.

Such qualities as these are more practically important than the analysis of Rose leaves, Rose petals, and at various stages. Most of the grumblers who have failed, have trusted too exclusively to the soil, and these should be comforted as well as guided by the statement that none of the soils analysed are remarkable for high conditions of fertility; they may be considered to range as good garden loams, having a moderate proportion of organic matter (humus), and a somewhat high percentage of sand, except the sample from Cheshunt, which is decidedly low in sand and proportionally high in clay.

It would appear, therefore, that these soils

are peculiarly adapted to encourage maturation and solidity of wood rather than luxuriance and over-abundance of leaf. Consequently, blooms of regular form might be expected from Rose-plants growing in such soils. This is one of the most important paragraphs in the report. For, given regular form in Rose-blooms, all other points of excellence are possible, and the amount of readily available potash and of phosphoric-acid is quite sufficient to ensure steady and vigorous growth, especially when encouraged by the carbonic-acid set free in the decomposition of applied farmyard or stable-manure, which is the usual manure added to such Rose-soils.

It is certain that the natural resources of the sub-soils, and of their mechanical condition and warmth, have an important influence in determining the character of Rose-growths in these cases, and that the climate of the district must be taken into consideration.

The soils of all the nurseries fall within the definition of sandy loams except the Cheshunt soil, which is generally described as a clayey loam, though Dr. DYER says this is a mistake, owing to the fineness of the sand. The mistake is common among rosarians, as when loams become adhesive through the fineness of the sand or other causes, they are called clays; and what is more to practical purposes, such clays often grow the finest Roses. In no case was the proportion of humus or organic matter especially high, and in some cases it is, for horticultural soil, decidedly low; and the same observation applies to the nitrogen, which is one of its constituents.

The oxide of iron varies from 2 per cent. in the light, sandy, Oxford soil, to nearly 6 per cent. in one of the Hitchin soils. Lime also varies from probably the lowest minimum for plant growth in the Cheshunt soil to the abundant 3½ per cent. in the Oxford soil. Probably those varying proportions in lime and oxide of iron, especially of the latter, are important. The total quantity is nearly the same in all the soils, and is in no case more than moderate, while the proportion of potash that may be taken as available varies from a decided scarcity in one of the Hitchin soils, to a comparative abundance in the Oxford soil.

The proportion of total phosphoric acid varies from the poor quantity of 0.115 per cent. in the Colchester soil, and the great abundance of 0.325 per cent. in the Oxford soil. It is remarkable, however, that in certainly three of the five soils, viz., the Oxford, the Cheshunt, and the Bearston (Hitchin) soil, there is a great abundance of phosphoric acid in a readily available form, more especially in the Oxford soil.

Some have assumed that this may be a factor in the colouring of Roses, and assuredly we have never seen Maréchal Niel more gloriously golden, or Souvenir de S. A. Prince more spotlessly white than at Longworth. How far either were affected by the ratio of phosphoric acid in the soil Dr. DYER does not profess to say. It is, however, true that no one could grow, or showed better and brighter Roses than the late Mr. PRINCE, of Longworth. The same may be said of Prince Arthur, which has never been grown or shown in such perfection as by its raiser, Mr. BENJAMIN CANT, of Colchester.

In two other of the soils analysed, regarding them as horticultural soils, the proportion of phosphoric acid is lower, but in these the available phosphoric acid is well above the limits of ordinary agricultural soil, and it may be that for Rose-culture the proportion is sufficient.

Dr. DYER concludes in the following words:—

"I am obliged, after careful study of the chemical results, to come to the conclusion that any common bond that may exist between the soils must be sought less in chemical resemblance or in abundance in any particular chemical ingredient, than in good mechanical and physical condition of the soil and good drainage. Under this head I need only say that it has been pointed out that all the soils are more or less sandy loams, although they differ in lightness and consistency within somewhat wide limits. They probably resemble each other in all being in good physical condition and well drained, either naturally or artificially. On the whole, I should say that if any part of the special productiveness of these various nurseries,

follows from these figures that all these famous Rose-gardens lie low, and have only a moderate rainfall.

Referring to the Committee's report for particulars as to the constituents, it may be stated here that the two samples from Hitchin and the one from Cheshunt have popularly been looked upon as heavy soils: Messrs. HARKNESS' nursery being a heavy loam, about 2 feet deep, having a subsoil of marl resting on chalk. Mr. E. B. LINDSELL'S is a heavier loam over a foot deep, resting on a subsoil of yellow clay. Cheshunt Nurseries: sharp sand 38 per cent.; clay and other fine matter, 62 per cent. Mr. Prince's nurseries, near Oxford: clean sand, 71 per cent; clay and other fine matter, 29 per

from beneath grass-paths, roads, margins, &c., occupying open positions, so that the natural soil of the locality might be alone represented. In most cases samples were taken from two or more different spots in each nursery, the samples of soil were obtained by paring off the turf, and then cutting off with a spade slices about 2 inches thick and 10 inches deep—the samples being immediately despatched to Dr. DYER for analysis."

Great care seems to have been taken to prevent mistakes, and to gain sound knowledge as to the relation between good soils and perfect Roses. Also as to the chemical constituents and physical characteristics concerned in the making of good Rose-soils. And yet the results

FIG. 145.—A BED OF LILIAM CANDIDUM, WITH GLADIOLUS TO FOLLOW, AT HOLLAND HOUSE, KENSINGTON. (SEE P. 454.)

in the matter of good Roses, is to be attributed to natural conditions rather than to the skill of the growers, it would seem that these conditions must be looked for in local climatic influences, aspect, and possibly good natural drainage, rather than in any special features in the actual composition of the soils themselves."

The Colchester soil was taken from the three well-known nurseries of Mr. B. R. CANT, Messrs. FRANK CANT & Co., and Messrs. D. PRIOR & SON. They are about 150 feet above the level of the sea, and the rainfall averages 26·25 inches. The Cheshunt nurseries of Messrs. PAUL & SONS are 90 feet above sea level, annual rainfall 25·85 inches. Longworth, near Oxford, is at the height above sea level of 275 feet, the annual rainfall 24·96 inches. Hitchin, Herts, 220 feet above sea level, mean rainfall 25·05 inches. It

cent. The mixed Colchester-soils consisted of sand, 63 per cent.; clay, emphatically a sandy loam, 27 per cent.

Some of those most familiar with these three nurseries are inclined to regret that their soils were not analysed separately. For, though within a few miles of each other, they have several differences in site, mayhap in soil and in culture. Mr. PRIOR is at the lowest elevation, and has special facilities for the use of sewage, which is one of the most potent stimulants in the growth of good Roses. The defect of these statistics as to the mechanical composition and chemical constitution of Rose-soils lies in the information given by the committee on p. 6— "None of the samples of soil was taken from any part of the nurseries which had received any manure for many years previously, but

are almost or wholly negative. The committee was one of great ability, and by no means too small to accomplish thoroughly useful work. They had excellent agents, and the best of materials to work upon. Perhaps the majority of Rose-growers will think they made one mistake in mixing the three Colchester soils into one sample. The Roses from the three nurseries, though so near, vary considerably in the hue, colour, form, substance, of their Roses. Neither is the skill and culture, though always great and good, always alike. The modern art of surface scarification, that sets free and keeps at work hosts of bacteria, and all the forces of earth and air, are largely and wisely used. And perhaps the veteran champion Rose-grower, of Colchester, Mr. BENJAMIN CANT, was the first to grow a corn

crop in rotation with his Roses, or to store his soils with nitrogen through following corn with legumes.

But the mistake in mixing the three Colchester soils—if mistake it was—was trivial to the conditions imposed on page 6 of the Report, to the effect that no sample soils were to be taken from any part of these Rose-nurseries or gardens which had received any manure for many years previously, but from beneath grass-paths, roads, margins occupying open positions—so that the natural soil of the locality might be alone represented.

The majority of rosarians will look upon this as the play of "Hamlet" with the chief character left out. For whatever else the rosarian grows, or fails to grow, he grows soils. All his cultures, stimulants, his operations with land and water, aim at growing finer Roses through richer soils. The natural soil of the locality, whatever that may mean, does not greatly concern us. But what the natural soil may be made by skill, culture, manure, points the way to perfect Rose-ground. Here were seven of the finest Rose-soils in the country summoned to give evidence, while not one of them was permitted to give proof or evidence of their power or ability to grow perfect Roses.

Those natural soils could not, in the view of some critics, give other than negative evidence. Few of them within the memory of the oldest inhabitant had ever been seen to give a perfect Rose. The negative evidence is valuable as showing growers how little natural soils can do to develop perfect blooms. Another series of soils, from the grounds that have grown our best Roses for years, might yield valuable positive results. The first set of soils have told us they did little or nothing to grow our perfect flowers. This second set of soil-samples might speak with greater authority, and tell all concerned how far the best Rose-soils have worked with sun and shower, skill and stimulants, hosts of active bacteria, and the influence of local environment to evoke our most exquisite Rose-blooms.

Roses and Rose Shows. THE annual meeting of the National Rose Society, which was held on Thursday in last week at the time our last number was passing through the press, was notable for one circumstance, to which we shall allude later on. Following the chronological order of the annual report, read to the meeting, and of the agenda-sheet, we note that the report is, on the whole, satisfactory. Two shows were held, one at Colchester and one at the Crystal Palace, which were as favourable as the season would allow. A revised catalogue of Roses has been compiled with much labour and judgment, and a report on the analyses of certain Rose-soils has been published. The financial condition is sound—things looking even more favourable than they really are, owing to the lapse of one of the three shows generally held. At any rate, there is a balance to the good of some £155, from which the expenses of the publications before alluded to will be defrayed.

There has been an increase in the number of fellows, which now amounts to five hundred and seventy.

The exhibitions to be held in 1900 are the Southern Show at Salisbury, on June 27; the Metropolitan Exhibition at the Crystal Palace, on July 7; and the Northern Show at Birmingham, on July 19, an additional display being provided for under the auspices of the Royal Horticultural Society at the Drill Hall

James Street, Westminster, on July 3. The report was proposed for adoption by the chairman, Mr. SHEA, a proposition seconded by Mr. BUNYARD.

A discussion concerning certain points of detail of minor moment so far as the visitors to Rose shows are concerned then took place; and lastly, at the instigation of Mr. GEORGE PAUL, a resolution was adopted which, though only of a tentative character, may, we hope, be regarded as the thin edge of the wedge, which successive blows will drive home till we see, except for special purposes, the end of the hideous arrangement in boxes and lines which render Rose shows repulsive, if such an adjective can possibly apply in the case of a Rose.

It is not the first time Mr. PAUL has ventilated this subject; and he and some others have put their ideas most beautifully into practice at various shows. The magnificent displays of Chrysanthemums made this season, will, no doubt, do much to encourage a better system than that now followed. Of course, the arrangement in boxes has some advantages in judging individual Roses point by point; and for this purpose it may be retained till after the judging is over, when the flowers may either be arranged in some less objectionable manner, or be removed to some corner where they would be accessible to those who prefer this method of grouping, but where they would not offend those who like to see flowers so arranged as to appear to best advantage. The proposal is, that Roses of distinct colours, or examples of the same variety, shall be placed separately in vases to contain three, seven, nine, or more specimens, and arranged in the most becoming manner. Even for judging purposes this method would have some obvious advantages.

No doubt strict rosarians will be slow to see the desirability of change. That it is not impossible is shown by the case of the Carnation. It was once considered an impracticable thing to do away with the cardboard collars which throttled the Carnations and reduced them to discs of curious mechanism, rather than lovely flowers, adapting themselves, if permitted to do so, to endless variations of conditions. No one would propose the return to these collars now. The Chrysanthemum of to-day sets at naught the rules of the old florists, once supposed to be immutable, to such an extent that even the incurved varieties are vanishing. We cite these facts as cheering indications of that in the next decade—aye, even early in that period a Rose-show will cease to be the formal, tasteless thing it is at present.

*** * OUR ALMANAC.**—According to our usual practice we shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1900. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us immediate intimation of all fixtures for the coming year.

A BED OF THE PAINTERS' LILY AND MIXED GLADIOLUS (see fig. 145).—In our issues for April 15 and 29 last we gave a description of the kind of garden decoration carried out at the world-famous Holland House, Kensington, which those who read the articles could not fail to notice differed greatly from that usually prevailing in gardens. It is a favourite method with Mr. DIXON, the head gardener to Lord ILCHESTER, the present possessor of Holland House, to plant two or more different species of plants in one flower-bed, which, flowering in succession, maintain the floral display for some months. In this way the objection which

many persons have to the employment of herbaceous plants and bulbs in the place of bedding plants is got over. Of course, there is no blaze of colour but with the good taste that is now exercised in flower gardening, this is thought to be no loss. At any rate, a long succession of interesting, varied, and beautiful flowers is obtained in place of merely a few species which are at their best for three months only.

LINNEAN SOCIETY.—There will be an evening meeting on Thursday, December 21, 1899, at 8 P.M., when the following papers will be read:—1, "The Air-bladder, and its connection with the Auditory Organ in the Notopteridae," by Professor THOS. W. BRIDGE, M.A., D.Sc., F.L.S., &c.; 2, "On some New and Interesting Foraminifera from the Fua-futi Atol, Ellice Islands," by Mr. F. CHAPMAN, A.L.S., &c.

ROYAL HORTICULTURAL SOCIETY.—The last meeting this year of the Committees of the Royal Horticultural Society will take place on Tuesday next, the 19th inst., in the Drill Hall, James Street, Westminster.

NATIONAL DAHLIA SOCIETY.—We are informed by Mr. J. F. HUDSON, hon. sec., that a Committee meeting will be held by permission of the Horticultural Club, in the Club Room, at the Hotel Windsor, Victoria Street, London, S.W., on Tuesday, December 19, at 2 P.M. Agenda: Report for 1899; Schedule for 1900; Financial Statement, and other business.

"BOTANICAL MAGAZINE."—The December number contains coloured illustrations of *Odontoglossum brevifolium*, tab. 7687. A native of Peru, flowered in the collection of Sir TREVOR LAWRENCE.

Cereus viridiflorus, tab. 7688.—A native of the Rocky Mountains of New Mexico and Colorado; the most northerly representative of its race. It is subglobose, with projecting ribs and tufts of straight spines; the flowers, which measure 1½ in. in diameter, are primrose-yellow. It is all but hardy at Kew, requiring little or no protection in winter.

Mina lobata, tab. 7689.—*Gardeners' Chronicle*, 1886, ii., 684.

Epipactis gigantea, tab. 7690.—Native of Western N. America and Temperate Asia. Hardy at Kew.

Kleinia Grantii, Hook., tab. 7691.—A native of E. Tropical Africa, with stalked, obovate, fleshy leaves, and button-like heads of crimson flowers. Botanic Garden, Cambridge.

THE ONION TRADE IN GERMANY.—Messrs. R. WEICHSEL & Co., of Magdeburg, state that there is, at the present time, a rather satisfactory demand for Onions, so that prices are fully maintained. They feel confident that prices will continue to rise when Dutch and Spanish Onions become scarcer. The German crop was small; and fair-sized Onions are difficult to obtain.

"GÄRTNERISCHEN CENTRAL-BLÄTTER."—We learn from a circular issued by the publisher of this organ of the Allgemeinen Deutschen Gärtner-Vereins, Weissenburg Strasse, 66, Berlin, that, on account of the success of this venture in the domain of horticulture, the annual subscription has been reduced from 10mk. to 6mk.

CHAILLETIA CYMOSA.—Professor MACOWAN, the Government Botanist at the Cape, identifies this as a poisonous weed, very fatal to cattle in the Transvaal.

THE JARDIN DES PLANTES.—We have received a copy of the catalogue of seeds and living plants offered for exchange by the Muséum d'Histoire Naturelle. Application should be made to M. le Directeur du Muséum, 57, Rue Cuvier, Paris.

AUSTRALIAN POISON PLANTS.—Some time since we received a parcel of dried herbage from Australia with the information that they were poisonous to sheep. There were no flowers or pods, and we could only guess that they were species of

Gastrolobium. W. Australian papers mention the poisoning of camels by *Oxylobium retusum*, a nearly allied plant, and it seems more than probable that several allied Leguminosæ may be dangerous to stock. The Macrozamia (Cycads) are also poisonous.

THE LIVE STOCK JOURNAL ALMANACK (VINTON & Co.), appeals especially to stock-breeders. For them a most varied and satisfactory programme is provided, copiously illustrated with appropriate figures.

UNWHOLESOME FRUIT.—At the Southwark Police Court, on December 7, several well known wholesale dealers were convicted of selling, or of having on their premises "unsound" fruit. Some of the defendants pleaded guilty. In all but one case heavy fines were inflicted. Some of this fruit consisted of Strawberries despatched from Rotterdam! How such soft fruit could be expected to be in good condition is matter for surprise, unless on the principle that anything is good enough for boiling down. In some of our Kentish fruit-grounds the factory is on the premises, and there is but a step from the field to the preserving-pan. The prospects of such establishments ought to be bettered by the recent revelations.

WILLIAM PAMPLIN, whose death at the age of 92 we alluded to in a recent issue, is the subject of an appreciative notice in the *Journal of Botany* for December, from which we take a few additional particulars. A portrait of the deceased botanist when in his ninety-second year is also given. PAMPLIN was the son of a nurseryman, but became widely known as a botanical publisher and bookseller till his retirement in 1863. He was elected an Associate of the Linnean Society in 1830, while still an assistant in his father's nursery, so that he had been connected with that Society for about seventy years. He was the original publisher of Sir WILLIAM HOOKER'S *Species Filicum* and *Century of Ferns*, of BOOTH'S illustrations of the genus *Carex*, HOOKER & THOMSON'S *Flora Indica*, THWAITES' *Enumeratio Plantarum Zeylanica*, and BROMFIELD'S *Flora Vectensis*.

CROSNEs.—The tubers or rhizomes of this vegetable are remarkable for their shell-like appearance, due to the short swollen spaces or internodes between the nodes, which resemble the coils of a shell. A correspondent was digging in a Potato-field and came across a number of these root-stocks, which had lost their usual character, and lengthened into long quadrangular stems of a white colour. These greatly puzzled him, and would have been puzzling to us had we not discerned among them one or two intermediate in form between the ordinary Chinese Artichoke and the long square underground stems above mentioned. This is a vegetable of the easiest culture, but it does not make so much way in this country as in France. Nevertheless, we have this year, for the first time, as we think, noticed a mention of it in our market reports.

"MONOGRAPHIEN AFRIKANISCHER PFLANZEN-FAMILIEN UND GATTUNGEN (COMBRETACEÆ)."—This is the third number of a publication devoted to the description and illustration of African plants. It is of quarto size, the descriptive matter in Latin, the comments in German, while the lithographs, of which there are thirty, and of excellent quality, may be understood by botanists of all or any nation. In some cases details are given as to the anatomical structure of the leaf.

MR. CULVERWELL.—We learn that this well known gardener and expert hybridist after serving the MILBANK family for fifty-one years is retiring to Ivy Cottage, Fencote, Bedale.

THE SWEET PEA.—A preliminary meeting took place at Edinburgh on September 13 last, Mr. GEORGE GORDON, V.M.H., presiding, when the following propositions were agreed to:—

That it is advisable to organise an exhibition of Sweet Peas in London, in July, 1900, in order to celebrate the bi-centenary of its introduction to Great Britain in 1700. That a Conference of admirers and growers of Sweet Peas be convened for the purpose of classifying the varieties into groups of colour and form; for the selection of the finest in each; and for such other purposes as may be deemed advisable for increasing the interest in the improvement and culture of this popular flower, both at home and abroad. That as visitors to the exhibition and conference are expected from the United States and several continental countries, it is desirable that suitable social functions be arranged in conjunction with such occasion. The preliminary committee appointed at this meeting have drawn up the following scheme:—1. An exhibition of Sweet Peas in London during July, 1900, at which prizes shall be offered for collections and bunches of Sweet Peas; and for illustrations of how the flower can be utilised for decorative purposes. 2. Trade exhibits of Sweet Peas, not competing in any of the classes in the schedule, but to which honorary awards will be made, will be invited. 3. Special prizes are invited, but those only can be accepted that are free from trade conditions. 4. A conference will be arranged at which certain experts will read papers dealing with the classification, history, evolution, and properties, &c., of the Sweet Pea. 5. A banquet and other social observances as may be deemed advisable. 6. That some person of distinction be invited to become president of the international celebration. 7. That a number of gentlemen, prominent in matters horticultural, be invited to become vice-presidents. 8. That a fund be opened to provide a prize list and defray expenses of the celebration, towards which a considerable sum has already been promised. It is estimated that the sum of £300 will be required to carry out the celebration in a manner that will ensure its unqualified success. Tickets of admission to the exhibition and conference will be allotted *pro rata* to subscribers to the fund. Any surplus remaining after the payment of necessary expenses will be given to the gardening charities. 9. That the following form an executive committee to carry out the celebration, with power to add to their number:—Chairman, Mr. George Gordon, V.M.H.; Mr. N. F. Barnes, The Gardens, Eaton Hall, Chester; Mr. E. Beckett, The Gardens, Aldenham House, Elstree, Herts; Mr. P. Blair, The Gardens, Trentham, Staffs.; Mr. Charles H. Curtis, 68, Whitestile Road, Brentford; Mr. Wm. Cuthbertson (Messrs. Dobbie & Co.), Rothesay; Mr. John Eckford, Wen, Salop; Mr. F. G. Foster, Brockhampton Nurseries, Havant; Mr. John Fraser, F.L.S., 5, Clements Inn, Strand, W.C.; Mr. J. McHattie, The Gardens, Strathfieldsaye, Mortimer, Hants; Mr. E. Molyneux, The Gardens, Swanmore Park, Bishop's Waltham; Mr. Thomas Lut, The Gardens, Keir House, Dunblane; Mr. H. J. Jones, Ryecroft Nursery, Lewisham; Mr. Hugh Pettigrew, St. Fagan's Castle, Glamorganshire; Mr. R. Sydenham, Tenby Street, Birmingham; Miss Willmott, Warley Place, Great Warley, Essex; Mr. Horace Wright, Dault Road, Wandsworth; Mr. J. Whytock, The Gardens, Dalkeith, Edinburgh; Hon Secretary and Treasurer, Mr. Richard Dean, V.M.H.

MR. J. EDNIE BROWN.—In our last issue we had occasion to record the death of this eminent forester at Cottesloe, West Australia, but we had then no time to do more than announce the fact. He was a son of the author of *Brown's Forester*, and he betook himself in early life to Canada, where he became Conservator of Forests. From Canada he migrated to South Australia, where he occupied a similar position until he accepted an invitation to proceed to New South Wales as Director-General of Forests. Adverse financial circumstances led to severe retrenchment in the Government service, and Mr. BROWN accordingly transferred his services to West Australia. His multifarious duties and migrations did not prevent him from undertaking

and carrying out a work in folio, with coloured plates, on the *Forest Flora of South Australia*. Mr. BROWN'S death will be a serious loss to West Australia, the importance of whose forests, as of their proper conservancy, can hardly be over-estimated. Mr. BROWN died from the consequences of influenza, in the fiftieth year of his age.

INJURIOUS INSECTS.—Mr. ROBERT NEWSTEAD has prepared a *General Index* to Miss ORMEROD'S *Annual Reports of Observations on Injurious Insects*, 1877-1898. The *Index* has been most carefully prepared, and will be of great utility. In addition to the General Index, there is a separate Plant Index and an Index of Annuals.

PRESENTATION TO THE SECRETARY OF THE PUTNEY CHRYSANTHEMUM SOCIETY.—The annual dinner of the members and friends of the Putney and Wandsworth Chrysanthemum Society was held at the Railway Hotel, Putney, on the evening of the 9th inst. There were upwards of sixty persons present, including many representative horticulturists. A pleasant incident at this event was the presentation of a handsome marble timepiece, suitably engraved, to the honorary secretary, Mr. J. F. MCLEOD, who, through pressure of business in connection with his position at Dover House Gardens, Roehampton, has found it necessary to resign the secretaryship. The presentation, which was made by Mr. TEW, was accompanied with many expressions of appreciation of the work done by Mr. MCLEOD since he accepted the position, and of regret that a change was necessary. Mr. MCLEOD suitably replied, and promised to continue his support of the Society in an unofficial position. The toasts were freely interspersed with a capital programme of vocal music. Before the guests separated, "The Absent-Minded Beggar" was sung, and a collection made in aid of the "War" Fund.

TRINITY COLLEGE BOTANIC GARDENS, DUBLIN.—There is at present here a very fine display of *Calanthes* in bloom, the varieties mostly consisting of *C. Veitchii* and *C. vestita*, the collections being displayed in the Economic-house.

CHRYSANTHEMUM EDITH.—This new single-flowered variety, recently awarded a First-class Certificate by the National Chrysanthemum Society, was exhibited by Mr. W. C. PAGRAM, gr. to J. COURTENAY, Esq., The Whim, Weybridge.

EDINBURGH SEED TRADE.—The assistants held their annual dinner on the evening of Friday, the 8th inst., and, as usual, it proved a most successful affair. The dinner was thoroughly Scottish in character, and included the indispensable haggis, red-herring, &c. After doing ample justice to the good things provided, the company were entertained for some hours with song and sentiment. The toast-list included the principal employers in town. During the evening a collection was taken for the Soldiers' Widows and Orphans Fund. The chairman (MR. DAVID MITCHELL) presided with his usual heartiness over a very large attendance. Eighteen seed houses were represented.

PLANT PORTRAITS.

HIBISCUS MILITARIS, *Mechans' Monthly*, November.
MYOPORUM PARVIFOLIUM, a pretty greenhouse, hard-wooded plant, with linear leaves and white flowers. *Revue de l'Horticulture Belge*, November.
ORANGE, JAFFA VAR. *Revue Horticole*, November 16.
PEAR BEURRÉ STERCKMANS, a Pear of first-rate quality, ripe in December. *Bulletin d'Arboriculture*, October.
PENTARHPIA FLORIBUNDA, a scarlet-flowered Gesneriad, with lanceolate, velvety leaves, and panicles of irregular, tubular flowers, with a white, spotted throat. *Revue de l'Horticulture Belge*, November.

HOME CORRESPONDENCE.

XL-ALL VAPORISING COMPOUND AND THE PHARMACEUTICAL SOCIETY.—The *Gardeners' Chronicle* in its issue of December 9, dealing with

the recent case of the Pharmaceutical Society v. Messrs. Jacob Wrench & Sons, Ltd., says:—"There is an impression prevalent that the restrictions we have mentioned are maintained as a monopoly for the benefit of the Pharmaceutical Society or its members. This is altogether a mistaken view, &c." I beg to submit that, in the eyes of thousands of traders, this is not a mistaken view at all. It is, in fact, just what they do think, and what they believe to be the fact. Without imputing mercenary motives to the Council of the Pharmaceutical Society in protecting the interests of its members, to say the least, it is strange that the XL-All Compound should not have been attacked before now. How is it that they have left it alone until it has become known to practically every horticulturist in the kingdom, and has become all but indispensable for use in the garden as an insect-destroyer? It has been suggested, that had not the trade in this gardeners' requisite developed to its present proportions, the attention of the Council of the Pharmaceutical Society would not have been drawn to it by its members. Why this sudden discovery of the fact that the XL-All Compound is a preparation which contains a percentage of nicotine? And why are they so fearful that some one will drink it, when it is manufactured and sold expressly for fumigating greenhouses? Why has it taken six years for them to discover that this is so dangerous, after it has been sold by nurserymen, seedsmen, and florists, for this length of time without a single accident? To all unbiased minds the answer suggests itself. It appears that neither the Pharmaceutical Society nor its members have any control over the sale of carbolic acid or its preparations, and these can be freely purchased anywhere for domestic use, and seem to stand about some households quite unguarded. If this and other poisons of a similar character can be, and are, sold without any restrictions for household purposes, surely the horticultural trade may claim the right to sell a preparation of nicotine for use (quite apart from the dwelling-house) in greenhouses, which, in nine cases out of ten, would be stored in an outhouse in the garden. It is the opinion of many that all interested traders who have suffered from similar jealous and needless interference at the hands of the Pharmaceutical Society should organise a Society of their own to watch over their interests, and to bring their grievances before Parliament at the earliest date possible, with a view to getting the Act of 1868 amended, so as to enable agents other than pharmacists to sell poisonous preparations for technical purposes (in the manufacturers' original packages) to the trades and professions, which, in the ordinary course of business, it should be their legitimate right to supply, of course under necessary restrictions. The Pharmacy Act of 1868, as affecting the sale of poisonous preparations for technical purposes, does not appear to be understood by one and all alike. It must be clear to all but the most nervous people that the skill of a pharmacist is not at all necessary to sell a farmer a tin of "sheep dip." Why, then, should not the latter be able to get it from the same source of supply as his other farm requirements? Again, why should a gardener not be able to order his "Fumigator" or "Weed-Killer" from his nurseryman or seedsman together with his bulbs or seeds, thus saving the expense and trouble of having to obtain one requisite from one source, and one from another? Next we shall hear of nurserymen and seedsmen being prosecuted for selling any kind of insecticide; and bulbs and seeds containing poison may not go exempt. I shall be glad to receive communications and suggestions from anyone who is willing to join such a movement as is above indicated. *G. H. Richards, 128, Southwark Street, London, S.E.*

THE KEEPING PROPERTIES OF COE'S GOLDEN DROP PLUMS.—At p. 401, "Greengage" rather throws doubt upon these. It does not seem, however, that he has tested them for any length of time beyond three or four weeks. Growing bold on this limited experience, "Greengage" proceeds to affirm that they cannot be kept much longer unless they are stoved, that is, converted into Prunes. Now, to say the least of it, this is rather hard on those who have done this impossible thing—of keeping Golden Drop Plums for six, nine, or twelve months, again and again, and who in sheer sympathy for his neighbours set forth in the *Gardeners' Chronicle* how to do, that any or all of your readers might enjoy this rare and luscious winter sweet. It seems there could be no fame and little thanks

reaped over the keeping qualities of the Golden Drop. Its long-keeping qualities have been well and surely known for half a century or more. The great Doctor in the editorial chair, Lindley, and his fruit Director, the late Robert Thomson of Chiswick, James Barnes of Bickton, Spenser of Bowood, Fleming of Trentham, the Ingrams of Frogmore and Belvoir, Beeton of Shrubland, and hosts of others, dead and alive, were familiar with the unique and late-keeping properties of Coe's Golden Drop Plum. But "Greengage" denies this, and also doubts whether it can be grown unless in a few favourite sites, and summers of equal warmth to those of the last few years. It can. Were I in need of guidance, I would rather follow such great authorities as Dr. Lindley and Dr. Hogg than "Greengage." I have also seen, handled, tasted fine Golden Drops off walls from every possible aspect and the open air in most of the counties of Britain, and the very best samples were from north walls—cordons, within a foot of the ground; and pyramids, as bushes, from 1 yard to 5 feet high. I have seldom or ever found Coe's Golden Drop either shy-bearing, tender, or miffy, but free, fruitful, profitable. The nearest match for it in sound keeping after gathering, or hanging on pot-plants in orchard-houses after ripeness, is the blue Imperatrice, the Ickworth variety, and that cannot be trusted to keep so long sound as Coe's Golden Drop. *D. T. Fish.* [Cannot any other correspondents of the *Gardeners' Chronicle* give their experiences on these various disputed points? Ed.]

GRAPES WITHOUT FIRE-HEAT.—I have recently seen and tasted Gros Guillaume and Gros Colmar Grapes of great size and excellent quality, the first bunch weighing just under 5 lb., and the latter 3 lb. 12 oz., with berries $3\frac{1}{2}$ inches in girth, and well coloured, which were grown at Dr. Houghton-Brown's Convalescent Home, Barn Rocks, Bognor, without fire-heat. The crop was heavy, and the Grapes keep well, not having been damaged by fog. There is no heating apparatus of any kind, and these varieties, which nearer London require fire-heat, attain to perfection in a viney near the sea, and well exposed to the sun. The bunches were so fine that if exhibited in competition with hot-house Grapes, either at the Crystal Palace or at the Aquarium, they would, in my opinion, have been awarded a prize. They reflect great credit upon the gardener, Mr. Jeoner, as they give evidence of great cultural skill. It is quite clear to me from these examples that Grapes can be grown at Bognor on a large scale at small expense, and that they would realise a good price in London. *W. Roupell, F.R.H.S.*

ROSE SOILS.—Your remarks (p. 438) on this subject bring to my mind a conversation I had recently with a young foreman-gardener on a similar matter. It was in reference to the culture of Euphorbias (Poinsettias). Without being in any way egotistical, I must say that for some twenty-five years we have been fairly successful in the cultivation of large batches of this useful winter flowering stove-plant. Numbers of my Yorkshire *compères* could bear out what I say if required. My own opinion has long been that there is something in our soil, or local conditions influenced by the soil, that has materially helped in bringing about this success. The young man alluded to was here the other day, and in going through the houses the culture of the Poinsettia pulcherrima was mentioned. Some years ago he was an assistant in these gardens; hence, he was well versed in the cultural methods pursued. Since then he has served in another garden in an adjoining county, where this plant was successfully grown. He is now foreman in a garden not more than 12 miles from Grimston Park, as the crow flies. He told me that it was next to impossible for them to grow Poinsettias satisfactorily. This has been the case for a long time. The head gardener, who is an old friend of mine, is a good general cultivator, and a man not easily put off his object when he sets his mind upon it. The geological formation is different to ours. The subject of soils and local conditions in the cultivation of plants and fruits generally are, as your readers will know, very important ones. When recording or criticising successes or failures, I do not think we gardeners always give this fact sufficient consideration. *H. J. C., Grimston, Tadcaster.*

COMET RED CURRANT.—Mr. A. H. Pearson, who always has the courage of his opinions, has said in his paper on "The Fruit Crop of the Year," published recently in the columns of the *Gardeners' Chronicle*, that so far as he has found, the new red Currant Comet sent out from Jersey, is practically the same as the well known La Versailles. I was interested in reading so much from that source because I held just that opinion when the Currant came before the Fruit Committee. Probably some other traders as well as Mr. Pearson have grown the variety Comet and are able to give an opinion. No one would wish to do an act of injustice on an *ex parte* statement, although there can be no doubt but that Mr. Pearson wrote without bias. The point ought ere now to have been determined at Chiswick. In any case it is evident that should the Nottingham dictum be sustained, any award made under a wrong impression should be revoked. *A. D.*

DOUBLE-FLOWED DAISIES.—The note by your correspondent "A. D.," in your issue of December 2, shows one of the ways by which the double Daisies may be introduced into our gardening for the late months. Judging by seedlings which have come here, I think we may, in time, develop a race of Daisies which would give us more or less bloom throughout a mild winter, and this without raising them yearly from seeds. I have a couple of varieties of this almost perpetual-blooming Nature. One of these, a pink Daisy, has been in bloom since October came in, and it will last throughout the winter unless the season becomes very severe. This plant I have had under observation for three years. At first I thought its flowering might be due to its being a young seedling, but it seems to be its natural habit to flower at this time. The other is inferior to this. The cultivation and improvement of the double Daisy have, it appears to me, been neglected to some extent for a number of years. How few named varieties we have now compared with what were in existence thirty years ago! There was at one time a grand collection in a nursery at Battle [Mr. Luff's? Ed.]. I once had seeds of this strain, and from it had very fine flowers. Unfortunately, the Daisy needs division in early summer, and re-planting in small tufts, and the exigencies of growing a large and varied collection of flowers in the small space the gardener can afford, leads to the neglect of some plants. Thus I have lost plants I would fain have kept. There are good strains of Daisies in the market still, but many are almost worthless, and cause disappointment. It is evident from the remarks of your correspondent that Mr. Blencowe has been fortunate in securing a reliable strain. *S. Arnott, Dumfries.*

BEGONIA GLOIRE DE LORRAINE.—Good sturdy cuttings sprang up from the base of the old plants, these having been subjected to a short rest, were duly cut down; upon the old plants being placed in a high temperature, strong suckers were plentiful; these were the ones selected, and they proved to be the best. Cuttings of these were, during the last week in May, inserted singly in small pots (2-inch), plunged in the propagating-case, where a steady bottom heat was maintained. Rooting having taken place, the small plants were stood upon a shelf near the glass in the same house in direct sunlight, the usual potting being taken in hand as soon as the plants required it; and the plants were again placed upon the shelf in the same position, which was one facing south-west. The potting materials at this stage consisting of equal parts of peat and good fibrous loam, with a large addition of sand, ample drainage being provided, the growth became both rapid and free. A thin stake inserted in the centre of each pot allowed the growths to be looped up readily, and the plant being naturally of a branching habit, no stopping or pinching was necessary. As the plants became too large to remain on the shelf, they were transferred to a warm pit, the growth not being checked. They were fed occasionally with artificial manure, in the proportion of a table-spoonful to a gallon of water. The result is that the foliage has quite enveloped the 4½-inch pots with a mass of flower, which brightens up the show-house considerably. *W. H. Sharpe, Highwood Gardens, Rochampton.* [With this communication came two excellent photographs, amply testifying to the successful cultivation practised by our correspondent. We do not reproduce them, having already given similar illustrations of the plant. Ed.]

YELLOW BLIGHT IN THE POTATO PLANT.—I should like to correct an error into which your correspondent (December 9, 1899, p. 440) seems to have fallen. I did not intend to give the impression that the fungus above ground was, in my opinion, distinct from that attacking the roots. I said I preferred, until certain cultures I was trying had given results, to keep an open mind on the question. I frequently found the now well-known *Sclerotinia* (*Peziza*) *sclerotiorum*, Massee, and *Rhizoctonia Solani*, Kühn, in a Potato plant suffering from Yellow Blight. The sclerotia of *R. Solani*, Kühn, which fungus seems to have been hitherto not noticed in Ireland, causes the so-called "small-pox" (not "scab") of Potato tubers, and is so prevalent in Ireland that this last week, at the winter show of the Royal Dublin Society, I found tubers with the disease present on every dish, practically of Irish-grown Potatoes. T. Johnson, *Science and Art Museum, Dublin*.

BOOK NOTICE.

"THE RIGHTS AND DUTIES OF JUSTICES."
By R. D. M. Littler, Q.C., and Arthur Hutton,
Barristers-at-Law. (London: Butterworth
& Co.)

THE country magistrate will find in this little book a useful reference, of handy size, to his various duties. The book contains in clear and concise language, and set out in excellent type, the criminal and civic business of a justice, together with some interesting notes on the history and hints on the responsibilities of the office. The Criminal Evidence Act of 1898, appeals to Quarter Sessions, and Licensing, are dealt with, and some existing abuses hinted at, such as the iniquitous "Pillory" system of certain newspapers, the reluctance of the public to commence prosecutions owing to the loss of time and money thereby incurred, the inadequate remuneration of witnesses, and so on. About a quarter of the book deals with the Inebriates Act of 1898, and the elaborate machinery whereby the criminal who is an habitual drunkard may be consigned to either a State or certified inebriate reformatory, with full details as to his treatment when he gets there; but, at the conclusion of the subject, the writers naively remark, under "Points Affecting the Success of the Act—There appears, at present, to be a want of apparatus for dealing with cases of inebriety in the homes . . . there is no single reformatory in existence for males!" Nor do the writers suggest that any such are in process of erection. The distracted magistrate called upon to administer this piece of, at present, family petticoat legislation, for there appear to be two or three female reformatories available, will probably comment to the effect that here again is plenty to sit on, but nowhere to put it. We recommend the writers to give the legal references in the margin of their pages instead of in the text when they go to a second edition.

Obituary.

WALTER KING.—We regret to have to announce the death on the 10th inst. of Mr. Walter King, head-gardener to Jeremiah Colman, Esq., Gatton Park, Reigate, which resulted from an attack of influenza. He was a very diligent and successful gardener, in the prime of life, carrying out the duties of the very large establishment placed under his care most satisfactorily. He was much respected by those under him, and by the many brought into contact with him in the neighbourhood where he lived, and where he also acted as clerk of St. Andrew's Church, Gatton. He leaves a widow and three children.

ALFRED OUTRAM.—A well-known figure in the horticultural world has been taken from us, and one as much respected as widely known. He was born at Tooting, and soon found his way into the then famous nurseries of Messrs. Rollison in that locality. Here he came under the tuition of

Mr. Geo. Buckley. He left Tooting for Mr. William Cole's nursery, near Manchester, from which establishment he was transferred to Manley Hall, the celebrated property of Sam Mendel. He did not remain here long, but betook himself to Messrs. Veitch's, where he availed himself of the excellent opportunities offered him. From Messrs. Veitch's he went to the late B. S. Williams as traveller in Great Britain and Ireland, Canada, and North America, with whom he stayed twenty-three years. Lately he was in the employ of Messrs. Sutton. Few men have had such varied experience, either of plants or of men, and this wide experience engendered a charity which endeared him to all with whom he came in contact. He was a valued contributor to our columns, furnishing us, among other things, with photographs and views of American gardens. He was a warm supporter of the Gardeners' Orphan Fund, and of the Gardeners' Benevolent, and will be greatly missed by

THE LATE ALFRED OUTRAM.

his associates. For some details relating to his early career, we are indebted to the courtesy of the editor of the *Gardening World*. Alfred Outram died on Friday, the 8th inst., at his residence in Moore Park Road, S.W., in the 53rd year of his age.

WM. MARTIN WELSH.—We regret to have to record the death of this gentleman, on the 8th inst. He was the senior partner in the firm of DICKSONS & Co., Edinburgh. We shall give an account of his career in our next issue.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

Present: Dr. M. T. Masters, in the chair; Mr. Michael, Rev. W. Wilks, Mr. E. F. im Thurn, and Rev. G. Heoslow Hon. Sec.)

Chinese Cabbage.—Dr. Masters gave some account of this species, *Brassica chinensis*, which is cultivated in China and also in the tropics, where the common Cabbage does not succeed. It has a taller stem, but does not appear to form so sound a "heart" as in our Cabbages. It is the custom to protect the heads in pits, frequently turning them over; they thus provide an excellent supply for winter use. The communication was received from Mr. Carles, Consul at Tsientsin.

Chermes Fagi.—This destructive but too common pest of Beech-trees was received, with inquiries as to the best means of destroying or preventing it. If the trees are but slightly

attacked, spraying with petroleum and soapsuds in water should be persevered with repeating the process from time to time. If, however, the trees are too badly attacked, nothing but cutting them down, and burning at least the bark, can prevent it spreading to other trees.

SCOTTISH HORTICULTURAL.

DECEMBER 5.—The closing meeting for the year was held on the above date in their rooms, 5, St. Andrew Square, Edinburgh, Mr. JAMES GRIEVE in the chair. Though it was a very wet night there was a good attendance, and a score of new members were enrolled.

Among the exhibits were some fine *Chrysanthemums* and *Roses*, the latter cut in Mr. Todd's garden at Musselburgh, from plants growing in the open air, which were still showing plentifully on December 5. The *Roses* chiefly consisted of General Jacqueminot, Victor Verdier, and Catherine Mermet. Half-a-dozen pretty plants of *Pompoo Chrysanthemums*, and a new variety of *Chrysanthemum* were likewise shown.

Towards the close of the meeting it was stated that the receipts of the late *Chrysanthemum Shows* were £1083, and the expenditure £1057, and that fifty guineas would be given to Lord Provost Mitchell Thomson in aid of the Transvaal War Fund. It was also proposed that the Association should hold a similar *Chrysanthemum Show* in November, 1900. On the motion of the Chairman, seconded by Mr. A. Mackenzie, the late Treasurer, a vote of sympathy with the family of the late Mr. W. Welsh, a Vice-president, and former President, and so long the universally-respected manager of Messrs. Dicksons & Co., of Edinburgh, was passed with much feeling.

Mr. LAIRD, the Secretary, then read an excellent paper on the parks of London, by Mr. G. BEECH, gardener at The Grange, Bishop Stortford, and formerly a member of the Association, and of Merton Hall Gardens. The paper was cordially received by the Association, and discussed by Messrs. Todd, D. P. Laird, and several other members. The former speaker advocated the use of more spring flowers in Edinburgh public parks and gardens; and the latter, while praising the natural beauty of Edinburgh, admitted that much more might be done in spring gardening, and admitted that the Glasgow Parks Committee did these things better than Edinburgh. Another speaker declared that some of the Dublin parks beat the best in London.

CHESTER PAXTON.

The annual general meeting of this Society was held in the Grosvenor Museum on Saturday last, the president, Mr. JOHN WYNNE, in the chair. The annual statement, which was submitted by the hon. secretary, Mr. G. P. Miln, was of a very encouraging character, a substantial sum being carried forward to the ensuing year's transactions. The secretary further reported that the number of members showed a considerable increase, as also did the number of subscribers to the Prize Fund.

The retiring president received hearty thanks from the members for his services during the past year; and Mr. Robert Wakefield, Newton Hall Gardens, was unanimously elected to take his place. Mr. A. F. Barnes, in proposing the election of Mr. Miln as hon. secretary, thanked him in the name of the Society for his past services, and his re-election was carried unanimously.

The balloting for the Committee for the ensuing year was then proceeded with, the result being as follows: Messrs. A. F. Barnes, John Wynne, John Taylor, Edwin Stubbs, J. D. Siddall, Thomas Weaver, William Pringle, A. Ellams, John Dutton, John Weaver, Stephen May, John Jackson, and S. Garner.

DEVON AND EXETER GARDENERS'.

At the last meeting, Mr. J. Reynolds, gr. to Sir Charles D. Cave, Bart., of Sidbury Manor, was the essayist, the subject being "Winter Flowering Plants: The Cyclamen, the Carnation, and the Euphorbia."

THE CARNATION.

Although, Mr. Reynolds said, it was a moot point whether the Carnations of a generation ago were not as well grown and flowered as at the present day; and he was inclined to believe that they were not so well grown, and that progress had been made. At the same time, such as Miss Jolliffe, Garibaldi, and Winter Cheer, were still among our best varieties. To show how quickly good varieties may be multiplied, he mentioned that when Mrs. Leopold Rothschild was raised, he, in two years, from ten plants, obtained by means of cuttings, 5,000, preparatory to its being placed in commerce by a London firm of florists. Other good market varieties were Reginald Gouffrey, John Peter Reyer, Duke of Fife, and Empress of Germany.

If the Carnation is propagated by cuttings, September is the best time at which to take them for flowering in the following autumn. About three piled wheelbarrow-loads of litter from the farm stables should be used to afford heat for an ordinary one-light frame, which is quite sufficient to afford the amount of heat required. The soil of the cutting-pots should consist of loam, leaf-mould, and silver-sand, and large 60-pots, clean and well crocked, should be made use of as cutting-pots. The cuttings should be placed round the rim of the pot, the soil not being pressed about them. When placed in the frame, place the light in position, and, if necessary, a small quantity of water may be applied whilst the cuttings are striking. After they have rooted, which

generally takes about fourteen days, remove them to another frame having a mild bottom heat, keep the frame close, afford a slight shading for two or three hours about noon, and air gradually as the plants grow in strength. In about ten days they will be strong enough to be potted off singly in small 60's, and in the same sort of compost. Great care is needed in handling, so as not to cause injury to the roots. When the plants have made a renewal of growth more air must be afforded. Soon another shift, this time into large 60's, will be necessary, in which they may remain till the end of the month of February. At this time, place them on shelves in a warm greenhouse, having a temperature of 50° to 55°, and do not afford much water. The next shift will be into 32's, using this time good turfy loam, a small quantity of leaf mould and silver-sand, and pot them firmly. This done place on shelves near the glass, and syringe them two or three times a day, and as soon as the plants make a new start, admit air freely, which will encourage the formation of roots; but in doing so be careful to let no cold draughts reach the plants, and in later stages see that the temperature is kept to about 50°. The final repotting will be necessary about the end of the month of May into 8-inch pots, in which they will flower. After repotting, place the plants in cold frames, and syringe the tops two or three times a day; they will hardly require the water-can. About the second week in June place them in the open with finely-sifted coal-ashes beneath the pots. About the end of the month of August remove them to the house in which they are to bloom, first making the same clean and sweet.

THE CYCLAMEN.

Mr. Reynolds said that he had the best results from an annual sowing made in the early part of September in well drained seed-pans, using a compost of finely-sifted loam, leaf-mould, and silver-sand. Having sown the seeds, the seed-pans received water from a fine rose-can, and were placed in a pit having a temperature of 55° to 60°, the soil never being let get dry. The seeds having germinated, the pans were kept near the glass. In pricking-off the same kind of treatment was followed; they were replaced on the shelf and well syringed daily. After repotting, much water should not be applied, or the soil might become soured. In the months of February or March a light shading may be needed by the plants. If they are to flower in 3½-sized pots, they should be repotted into 60's first, but if 48's are the size of pot, then repot into that size without an intermediate repotting. The corms must not be buried beneath the soil, or many of the flower buds will damp off in the winter. The plants should be transferred to cold frames almost filled with coal-ashes, so as to bring the plants up to the glass. When roots fill the pots, afford air plentifully, syringe the plants at 5 p.m., and close the lights till 8 or 9 o'clock at night when air should be afforded. After September is out, the lights should not be left off at night for fear that the flower-buds might be injured. Safe manures for Cyclamens are Clay's or soot-water. Should it be intended to flower the plants the second year, they should be rested after flowering, and afforded water twice a week. In order to ensure a renewal of growth, repot in the same kind of soil as before, and place the plants on a spent hot-bed. Care must be taken not to over-pot the plants. The second year the plants will afford greater abundance of flowers, which will appear a little earlier, but they will be smaller. The Cyclamen thrives in a moderate temperature, with but little artificial heat.

THE EUPHORBIA.

The two most useful Euphorbias are *E. pulcherrima* and *E. jacquiniiflora*. The first named is better known as Poinsettia, and its scarlet bracts are most useful for house decoration. If it is necessary to cut the bracts from the plants for a particular purpose, the cut end of the stem should be charred so as to prevent bleeding, or they will soon fade. Dwarf plants are preferable to cut branches, and they have a charming effect on the dinner-table. Start old plants in heat in June, and these will soon furnish plenty of shoots that may be removed and used as cuttings. Take them off with a heel when the shoots are about 3 or 4 inches long, and place the single cuttings in 60's, in a good bottom-heat, admitting a little air. When they have rooted, remove them to a place near to the glass, and afterwards to a frame. When potted finally into 5-inch pots, the soil used should be one half turfy loam and one half peat, with a little silver-sand. About the end of August syringing should be discontinued, so that the wood may become properly ripened. Early in September the plants must be housed, giving them a little heat and air at the same time. After flowering, dry the plants off gradually, and when the leaves have fallen, put the plants in any convenient place where there is a temperature of about 50° to 55°.

THE ROYAL HORTICULTURAL OF IRELAND.

DECEMBER 5.—The winter show of the above society for vegetable products was held on the above date in their quarters at Ballsbridge, Dublin.

Of the Potatoes exhibited many were exceedingly good; foremost being those of Messrs. SUTTON & SONS, Reading, Messrs. WEBB & SONS, Stourbridge, and Messrs. HOGG & ROBERTSON, Dublin; whilst in the competitive classes the tuber was equally well displayed. The attendance, considering the weather, which was not of the best, was just normal. The Lord-Lieutenant and party visited the show on the opening day, and were favourably impressed with the various exhibits.

The stand of Barley shown by the IRISH AGRICULTURAL SOCIETY was an exhibit of vital importance to farmers, and their extensive experiments will be watched with interest, the field of their operations is confined to the following five counties:—Wexford, Cork, Tipperary, King's County, and Queen's County, embracing as it does the area where Barley is a common farm crop, this work has been undertaken to settle several questions, but the answer will be delayed until a period of two years has elapsed.

The case of Messrs. GARTON'S display of improved cereals was the centre of attention, due to the great productivity of their produce, as this was the first time their breeds were available to our growers. They have brought the principle of cross-fertilisation to a very high pitch, as nearly all the cereals were hybrids; this stand was erected by Messrs. HOGG & ROBERTSON, their Irish representatives. THE PERMANENT NITRATE COMPANY, in harmony with the Council, were awarding several prizes to growers who used their speciality in the culture of their exhibits, and this display was highly interesting. An excellent exhibit came from Foxford, Co. Galway.

Miscellaneous Exhibits.—Messrs. SUTTON, of Reading, displayed a fine collection of Potatoes and farm produce, also an extra large Spring Onion, Ailsa Craig; whilst shown in cases were selections of Grasses, to enable a grower to select the most suitable varieties. Messrs. WEBB & SONS, Stourbridge, had a similar stand, their stand contained some choice-looking Potatoes. Messrs. HOGG & ROBERTSON had in a stand apart from GARTON'S cereals, a nice group of Swedes, farm produce, and Potatoes, notably, the new Main Crop, Le Maouta, and Champion the Second.

MISCELLANEOUS SOCIETIES.

Wargrave and District Gardeners'.—A fortnightly meeting was held on Wednesday evening, December 6. Mr. W. H. Scott described the "Growing of Roses on their own Roots," and illustrated his remarks with diagrams and specimens, thus making every point clear. The method of growing Roses from cuttings was the most satisfactory by which to secure a good stock of plants. The past season had not been a good one for bushes to make well ripened wood, and consequently a lot of this year's cuttings would be very spindly. The variety Mrs. J. Laing was much given to forming thin wood, and was practically useless for cuttings; while Roses of the Baroness type, La France, Caroline Testout, and Ulrich Brunner, were excellent. The proper method of taking cuttings, and the manner of inserting them in the ground or in pots, was explained.

NEW INVENTIONS.

A SUB-IRRIGATED FLOWER-POT.

THERE has been brought to our notice by Messrs. Toogood, nurserymen and seedsmen, of Southampton, a flower-vase or pot fitted by reason of its elegant form and artistic ornamentation for use in apartments. The vase is furnished with two channels, reaching from the rim to the bottom, which are intended to convey water to the soil, which will be drawn upwards into the ball by capillary attraction. The novelty in the idea is in the mode of conveying the water through pipes to the bottom of the ball, instead of affording it in the usual manner.

IMPROVEMENT OF LAND ACT, 1899.

(62 & 63 VICT. c. 46.)

THE Board of Agriculture desire to call attention to the provisions of the Improvement of Land Act, 1899, which comes into operation on January 1, 1900. This Act has been passed with a view to give increased facilities to owners of land desirous of carrying out agricultural and other improvements with the aid of borrowed money. With this object the new Statute amends the Improvement of Land Act, 1864, and other Acts authorising the creation of rent-charges for the improvement of land.

Under the new Act the maximum period over which rent-charges authorised after the commencement of the Act may be allowed to extend is forty years. It must not, however, be assumed that the full term will always be applicable. The period to be allowed in each case will be determined by the Board, regard being had to the character and probable duration of the improvement.

By another provision the land charged with the payment of the rent-charge may be land other than that which is directly improved; provided (a) that such other land is shown to the satisfaction of the Board, by statutory declaration, to be held

for the same estates or interests, and to be either subject to the same incumbrances (if any) or to be free from incumbrances; and (b) that in the opinion of the Board such other land may properly be included in the charge.

Improvement companies are empowered (by resolution passed by three-fourths of their shareholders present at an extraordinary meeting) to adopt, as improvements authorised by their own special Acts, all or any of the improvements authorised by the Improvement of Land Act, 1864, or by any enactment amending it.

The Board of Agriculture are empowered to extend the period of repayment of improvement charges created (whether before or after the passing of the Act) in respect of the planting of woods or trees, on application made by the landowner, not sooner than seven and not later than ten years from the date of the order creating the charge, but subject to the consent of the persons entitled to the charge.

The new Act extends to Scotland certain additional improvements already authorised as regards England and Wales and Ireland by the Limited Owners Residences Acts, 1870 and 1871; the Limited Owners Reservoirs and Water Supply Further Facilities Act, 1877; Sections 30 and 25 of the Settled Land Act, 1882; Section 13 of the Settled Land Act, 1890; and Sect. 74, sub-s. (1) (b) of the Housing of the Working Classes Act, 1890. 4, Whitehall Place, London, S.W., November, 1899.

DROPMORE.

MANY gardeners will learn with regret that very few opportunities remain for any of them to visit the classic domain of Dropmore under Mr. C. Herrin's guidance, as many have done since this estimable gardener took charge of the gardens thirteen years ago. Quiet, unpretending, but full of energy and perseverance, whilst carefully preserving and improving those special features that have made these grounds so attractive and interesting, he has materially increased and improved in other directions, especially in flower, fruit, and vegetable production. There are particular seasons when, to visit Dropmore, is to see it at its best, and specially interesting. Probably few would care to wander through its extensive woods in mid-winter, when nearly all trees but the Conifers are leafless. But to anyone appreciative of the beauty which Nature so lavishly supplies, how much pleasure may be found in contemplating the wonderful outline of the tree and branch so abundant on every hand. It is just then, too, that the Conifers, clad in sombre green or silvery foliage, stand out so distinctly, individualised amongst the crowd of deciduous trees around. The fine proportions of these famous Conifers are then well displayed. But there is a delightful time to visit Dropmore—just when in late April the trees are putting on their coats of green in so many tints, and all fresh from Nature's workshop. Then, too, the Bluebells, Primroses, Daffodils, Violets, and many other flowers, with here and there a rich red or pink Rhododendron to fling into the scene a delicious coloration. Then in leafy June, when all the trees are in luxuriant foliage, what delight it is to wander about the grassy or mossy walks and glades, and enjoy the marvellous coloration found in the huge clumps of Azaleas, so noble, so grand everywhere. Probably nowhere, because in no case at any time wantonly intruded, are Azaleas seen in more pleasing and appreciative form, or even more gloriously tinted than is the case at Dropmore. Then comes the autumn view. What wonderful colouring the trees and shrubs then give! Pleasing as are the spring greens, the autumn hues are, in comparison, glorious. What a brilliant hue, literally like fire, do those large Acers give, that, seen here and there amidst the other trees, present such rich coloration. Close to earth, the Azaleas are not less fiery, and present masses of brilliant crimson and red.

The Birch gives in its pendent branches, sprays

of gold intermingled with green; American Oaks here, and wild pieces of Virginian Creeper there, are aglow with colour; Chestnuts, Planes, Cherries, Beeches, and Elms, are rich in golden tints. Even the lowly Bracken and the Blackberry leaves respond, and add to the brilliancy of the scene.

So far as it has been possible, every feature of old Phillip Frost's labours has been under Mr. Herrin's care religiously tended. All the fine Conifers which have done so much to give Dropmore its high reputation are doing as well as years will permit. To many of them liberal top-dressings of soil and mild manure have been afforded, with excellent results. Of these, *Abies grandis*, *Cedrus atlantica*, very glaucous in hue; *Picea Morinda* (the Weeping Conifer), *Sequoia gigantea*, *Pinus insignis*, one grand specimen; *Cedrus Deodara*, equally noble; *Abies Pinsapo*, *Tsuga Mertensiana*, and, not least by any means, the giant male *Arancaria*, now (October) carrying clusters of large red catkins. All of these are improving in appearance and size year by year.

Dropmore flower-gardens are, doubtless, somewhat quaint and formal; they seem to belong to the old Dutch style minus the topiary. But the entire architectural surroundings, with abundance of vases and balustrades, seem not out of harmony, and are worth preserving, if but to illustrate flower-garden examples. A modern architect would erect a new and noble mansion further out on the brow which overlooks the park and lovely woodland. Critics are fond of decrying the old style of gardening, but were all gardens modelled alike, great indeed would be the pity. Under Mr. Herrin's charge a large kitchen-garden and fruit-orchard, some half a mile distant from the house, was added some years ago, which has been greatly improved. The whole of the walls have been renovated or newly planted. Apple, Pear, and Plum trees have been largely planted outside the walls; and within the garden round the quarters, similar trees have been planted.

Apples here on bush trees some ten years old, running up on each side of the centre walk, were, when I saw them, a brilliant picture of fruit, rich in colour. What crops they were carrying of fine and generally brilliantly-coloured fruits! Golden Noble, Lord Grosvenor, Wellington, Lane's Prince Albert, Grenadier, Cox's Pomona and Orange Pippin, Bramley's Seedling, Baumann's Red Russet, Blenheim Orange Pippin, Lady Sudeley, Ribston Pippin, Peasgood's Nonsuch, Lady Henniker, Newton Wonder, and many others. A. D.

FOREIGN CORRESPONDENCE.

THE CHINESE CABBAGE (BRASSICA SINENSIS).

"I AM sending you by this mail some seed of the White Cabbage (Pe'tsai), about which you (Prof. Bailey Balfour) spoke to me last November. It is said to be very good seed. So far as I can ascertain, the seed is sown either as soon as the frost is out of the ground, or in July. For early sowing, the seed is soaked a short time, then sown in boxes, and afterwards planted out when quite small. The spring crop is cut when about 1 foot high. If left longer it runs to seed. That sown in July grows double the height, and ought to have, like the other, a very compact heart. In this climate and in this soil it is kept for a long time in pits excavated in the ground and covered over. The Cabbage heads are turned over every day, and any decaying portion is picked off. The cold is intense here in winter, and hardly any rain falls between September and April, so that there is no fear of damp. The Cabbage makes an excellent salad in winter. The hills immediately behind Peking, which border this plain, are part of a lime-stone range, and our water here is very hard. Low-lying land in the plain, if left uncultivated, always bears an efflorescence of soda. The manure used is, I presume, desiccated

humau manure, as it is the general manure in use in this neighbourhood." H.M. British Consul, Tsientsin.

The fullest account we have of the Chinese Cabbage is from the pen of M. Pepin, the late head gardener at the School of Botany at the Jardin des Plantes, an account of which an abstract is given in Paillex & Bois, *Le Potager d'un Curieux*, 3rd ed., p. 464. The plant is an annual, which does not heart well, but the foliage furnishes an excellent vegetable in the hot dry season in Bourbon. In the north of China it is grown in enormous quantities, and is used in October and November, salted or cooked, with rice. Three kinds of Pe'tsai are mentioned: 1, with white, very delicate tender leaves, which heart like Lettuces if aided a little; 2, Nisontou, or "Beef Strawberries," because its leaves are crisped, fleshy, and full of juice; 3, "Violacees," in which the leaves are very thin, smooth, tender, and agreeable to the taste, but with a trace of bitterness. In addition there are numerous minor variations in form. Climate, soil, and season cause great variation in the Pe'tsai for better or for worse, so that experiment alone can determine whether the vegetable is worth growing in any particular locality. In any case, it is grown in vast quantities in many parts of China, north and south. The Cabbage is preserved in winter by two methods. In one case the Cabbages are exposed to the sun to remove superfluous water, then to pile them up in close heaps, or in pits dug for the purpose. The second method consists in planting them in sand. Those who do not wish to keep them so long, lie them flat on the ground, which is neither too wet nor too dry; cover them with straw, over which dry soil to the depth of a foot is placed. Others who have suitable means hang them up, leaves downwards, and as close together as possible.

In France, the results of experiments of MM. Paillex & Bois have not been satisfactory, but they recommend its trial at Roscoff and the West Coast, where the influence of the Gulf Stream is felt. Our south-western counties ought also to be favourable localities. See also *Gardeners' Chronicle*, 1886, p. 40. In the tropics, as in British Guiana, the Chinese Cabbage is greatly esteemed.

ENQUIRY.

PHYSALIS PUBESCENS (CAPE GOOSEBERRY).—A correspondent, Mr. C. J. Blake, who intends to cultivate this plant next year, would be very glad if Mr. J. A. Ross, who wrote about it in our issue of the 9th inst., would kindly give his experience, and the best methods of obtaining fruit for dessert over a lengthy period.

GARDENING APPOINTMENTS.

MR. S. F. MAY, for three years Gardener to A. SCOTT, Esq., Rotherfield Park, as Head Gardener to H. H. WALFORD, Esq., Arlebury, Alresford, Hants.

MR. DUNCAN BROUGH, lately Gardener to Sir ARCHIBALD EDMONSTONE, Bart., Duntreath Castle, Strathblane, N.B., as Gardener to Earl FITZWILLIAM, Corlatin, Shillelagh, co. Wicklow.

MR. J. HAMMOND, for fourteen years at Winkton Lodge, Winkton, R.S.O., Hampshire, as Head Gardener to Mrs. GUBBINS, Longmead, Bishopstoke.

MR. GEO. TINLEY, of the Plant Department, Hyde Park, and Kensington Gardens, as First Assistant to the Botanical Collector for the School Board for London.

T. MARRIOTT, Esq., having taken Park Hall, Hayfield, Stockport, has engaged MR. ALFRED J. DEIGHTON to remain with him as Head Gardener.

CATALOGUES RECEIVED.

FIDLER & SONS, Reading—Seeds.

UGANDA JUNIPER. — The *Kew Bulletin* for October last, p. 197, contains an extract from a letter of the late Captain B. L. SCLATER, R.E., relating to a Juniper identified at Kew as in all probability *Juniperus procera* of Hochstetter:—"I think I told you about the Juniper forests on the top of the Kedony escarpment. The forests to the north of Lake Naivasha are of the same Juniper, and we are building the bridge over the Morendal with it. It is also extremely plentiful here, and I have seen large trees 200 feet high, and at least 8 feet in diameter, at the base."

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and the combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending December 9, is furnished from the Meteorological Office:—

"The weather was very cloudy or dull over our island generally. Rain fell rather frequently during the earlier half of the period, but towards its close the weather became fine, and the air drier, especially over England."

"The temperature was again above the mean for the time of year, the excess ranging from 1° in the 'Midland Counties' to 4° in 'Scotland, W.', and over Ireland. The highest of the maxima were recorded during the earlier days of the period, and ranged from 61° in 'Ireland, S.' and 58° in 'Ireland, N.' to 54° in 'Scotland, W.' and 'England, E.' The lowest of the minima were registered either at the beginning or at the end of the week, when they varied from 22° in the 'Midland Counties,' and 'Scotland, E.' and 24° in 'England, N.W.' to 28° in 'Ireland, S.' and to 35° in the Channel Islands."

"The rainfall exceeded the mean in most districts, but was rather less in the 'Midland Counties,' 'England, S.W.' and 'S.', and just equal to it in the 'Channel Islands.'"

"The bright sunshine was deficient in nearly all districts. The percentage of the possible duration ranged from 24 in 'England, E.' and 23 in the 'Channel Islands,' to 3 in 'Scotland, N.' and 'Ireland, N.' and to 1 in 'Scotland, E.'"

CARNATIONS DYING: *W. H. P.* Deep potting seems to us to be the cause, aggravated, probably, by the close nature of the potting compost.

CROQUET LAWN: *J. W. H.* If you were to purchase a little Manual on the game of croquet, it would afford all the required information. Such a Manual is published by Mr. Upcott Gill, 170, Strand, W.C.

CUCUMBER PLANTS DYING OFF: *J. M.* We should suppose from your description of the methods pursued in renewing the beds of soil, that the whole has become unwholesome, or, at the least, no longer suitable for the growth of the Cucumber-plant. We fail to understand how, in the entire absence of bottom-heat, you manage to get any crop of winter Cucumbers. The soil, besides, must be "Cucumber sick." There were no eel-worms on the roots sent, and the cause of death is traceable to the unwholesome state of the soil, due to its long continuance *in situ*. Clear every particle out, making a new start with fresh soil, and affording some bottom-heat for the winter fruiters.

GRUBS: *C. B.* The grubs eating your Cyclamen are those of some weevil. They are very destructive, and have been introduced with the potting-soil. All you can do now is to trap as many as you can with slices of Carrots, Potatoes, &c. In the future bake or scald the soil; if baked, place it in sacks and bury it in the earth for a week or two to moisten before using any of it. As a rule, only pasture-loam that has been in stack for a year or two should be used in potting plants, and during the whole of that time the stack should have been kept quite free from herbage, by which means the weevil grubs, wireworms, &c., are starved to death. Fresh pasture-loam, or that from weedy heaps, is almost sure to contain creatures which live on the roots of plants.

INSECTS: *Norman C. Cookson.* The grubs from your herbaceous borders are the larvæ of the garden Swift Moth, *Hepialus lupulinus*, L. (fig. 147). Your only course is to lift the plants and trench the borders. Roots of all infested plants should be carefully examined before replanting, and all larvæ destroyed. If after this treatment the grub reappear, try the effect of one application of lime-water to the roots. *R. N.*

FIG. 147.—GARDEN SWIFT MOTHS, LARVÆ, AND CATERPILLAR.

MUSHROOM-HOUSE: *Reader.* The best position is wholly or partially underground, thus ensuring a less fluctuating warmth than that obtainable in an above-ground building, doing away with the need of fire-heat, excepting in very severe weather, and maintaining the desired degree of moisture without having to damp down. If it be wholly beneath the ground-level, it may take the form of a tunnel, or it may be a parallelogram, with a groined roof in brickwork, and the roof may rise above the soil and be mounded over and covered with Ivy, as is frequently done with ice-wells. The area should be large enough to admit of four to six beds being made, some in bearing, others coming on, beside material in process of being prepared. In this event, an underground house need not be fitted with hot-water pipes, the heat from the beds and the stable-litter more than sufficing to maintain a

warmth of 60°, than which it should never rise. Such a house should have either a sloping roadway, up which the spent materials may be wheeled, or else stone steps, with a good wide space at the bottom, where the men might work in throwing the materials to the surface. In lieu of wheeling or pitching, an iron derrick sufficiently strong for hoisting a garden wheelbarrow when filled should be fixed at the top of the steps. The Mushroom-beds might be wholly made on the floor, or a tier of beds constructed with stone or slate, 4 feet above the lower beds. The worst and the most expensive sort of material in a Mushroom-house is wood. For keeping the materials together in the floor-beds, stout slate slabs, 15 inches high, should be used, or failing these, bricks set in cement. Unless the site is a very dry one, provision should be made for drainage by means of pipes running along the outside of the walls below the footings, leading these into a dry well if they lie below the level of the garden main-drain. There must be ample means for affording ventilation, and two openings are better than one. The width of a simple house with beds at the sides should be 12 feet, and not less than 11 feet. For an above-ground Mushroom-house double walls should be employed, and there should be a plaster-ceiling beneath the roof. The latter may consist of tiles, or a thick thatch of reeds or straw, never of slates. There should be some means of obtaining fire-heat; for unless a greater mass of fermenting materials exist in the house at all times during the winter than would be perhaps practicable, the necessary degree of heat could not be maintained. In an underground Mushroom-house, good fleshy produce can be obtained in the height of summer, which is an impossibility in an ordinary house. Windows are not wanted, but if they are considered desirable, leaded casements are to be preferred to wooden frames.

NAMES OF FRUITS: *T. T.* Apple Waltham Abbey Seedling.—*A. N. G.* 1, Apple Harvey's Wiltshire Defiance; 2, Apple Borsdörffer Maschanzker; 3, Apple Norfolk Beefing.—*G. W. N.* 1, Apple Early Nonpareil; 2, A. Dredge's Fame; 3, A. Scotch Bridget.—*A. & Co.* 1, White Paradise or Egg Apple; 2, Calville Rouge d'Antonne; 3, rotten and unrecognisable.—*A. U. S.* 1, Apple Smart's Prince Arthur; 2, A. Harvey's Pippin.—*F. F. R.* [No numbers were attached to the fruits, we therefore cannot deal with them. It is so easy to attach a piece of postage-stamp edging to a fruit with the number written plainly upon it, that it is surprising anyone omits this very simple means of identification.—*E. L.* 2, Pear Beurré Duval; the other was rotten.—*S. M.* 1, Apple Cox's Orange Pippin; 2, A. Wadhurst Pippin.—*J. M. S.* The spots are caused by the fungus, *Fusicladium dendriticum*; it is known popularly as the Apple Scab, and attacks the foliage also, early in the season usually. You will find it well described in *Massee's Text-book of Plant Diseases*, p. 303, and he also mentions the usual remedies, i.e., applications of Bordeaux Mixture several times during the season. This has also been referred to repeatedly in these columns. It is very prevalent this season, and so far as we have observed, Stirling Castle suffers the most generally, but it depends to some extent on soil and situation; more varieties are affected in cold, wet soils than in dry positions.—*W. R.* 1, Pear Chaumontel; 2, P. Beurré Capiaumont; 3, Apple Yellow Ingestre.—*J. W. G.* It is useless sending Pears so far advanced as yours: we cannot identify them.—*M. O.* 1, Apple Bramley's Seedling; 2, A. Gloria Mundi.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. T.* 1, *Cypripedium* × *Leeanum*; 2, *C. insigne*. The narrow-leaved *Crotons* we cannot name. The variations of one plant are often great.—*J. M. B.* *Odontoglossum* × *Andersonianum*, with the peculiarity in the lip you mention. We should like to see a flower again when next the plant flowers, to discover if the peculiarity is maintained.—*C. E.* *Mühlenbeckia complexa*, an excellent plant for conservatory-baskets or rock-work outdoors.—*Cape.* *Cyrtanthus McKenii*.—*P. G. T.* Two very handsome forms of *Cypripedium insigne*, probably out of the recent importations. No. 2 is near to *C. i. Chantioi*; the other is the best form of a typical *C. insigne*.

T. R. Stenotaphrum americanum, variegated form.

NOTICE TO QUIT SERVICE: *Perplexed.* We are of the opinion that a month's notice is usual. If the servant's tax is paid by your employer for you it constitutes you an assistant gardener, therefore a domestic servant, and thereby entitled to a month's notice, excepting misconduct be brought against you, when immediate discharge could follow.

POTATOS TO FOLLOW THE EARLIEST VARIETIES: *Reader.* Jeannie Deans, British Queen (Findlay's), a white kidney, disease-resisting, and ripening in September; The Bruce, and Lady Frances (Findlay's). If you do not mind small croppers, and those liable in some seasons to disease, grow at the least some of the Lapstone, Egyptian Kidney, as mid-season. For late use grow some of Carter's Magnum Bonum, a heavy cropper, and excellent in flavour, if not "balls of flour."

SIX POT-HERBS MOST COMMONLY ASKED FOR: *Reader.* Thyme, common and lemon; Spearmint, Tarragon, Winter Savory, and Marjoram; tender pot-herbs grown from seed sown in heat from March till June are Sweet Basil and Pot Marjoram.

TABERNEMONTANA FLOWERS DROPPING: *A Subscriber, Worktop.* The specimens sent seem to indicate that the plant is in bad health, and possibly the root-action has been arrested. This, taken in conjunction with the fact that the plant has to expand its flowers in dull, sunless weather, may account for their dropping. In districts where fogs prevail these cause similar results.

THREE VARIETIES OF RASPBERRY: *Reader.* Baumforth Seedling, Superlative, and Yellow Antwerp.

TWELVE DESSERT GOOSEBERRIES: *Reader. Red:* Ironmonger, Keen's Seedling, Scotch Nutmeg, Warrington. *Green:* Pitmaston Greengage, Early Green Hairy, Green Walnut, Glanton Green. *Yellow:* Bright Venus, Broom-girl. *White:* Crystal, Snowball. Winham's Industry, a red variety, is the most prolific for picking in the green state.

VICTORIA PLUMS AND DAMSONS: *D'Helenefeld.* These fruits may be grown as half-standards and bushes; it is merely a question of height of stock on which they are budded. The bush is probably the best form for a market gardener, as it admits of the rapid gathering of the fruits and the pruning of the branches. Plant the Plums at 15 feet, Damsons at 12 feet apart. Plums and Damsons do not lend themselves to the pyramidal form of tree. Of course, it can be done. Damsons as screens to other fruit-trees are planted pretty close together, say, 10 feet in double and treble rows, quincunx fashion. For this purpose, the outer row should consist of trees with 6 feet stems; and the inner rows of half-standards and bushes. A space of 12 to 14 feet should be left between the rows for the convenience of gathering the crop. Not much pruning is needed by Damsons thus planted, only as much at the first as to give a sufficient number of main branches as will form the foundation for the head; and as the trees age, the inner useless shoots should be removed yearly. The Victoria Plum needs the same kind of pruning as the Apple; the head being kept open by the removal of intersecting branches and thin sprays; and the leading shoots left at full length—or during the early life of the tree, slightly shortened.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is reserved for reference in all the principal Libraries.

(For Markets, see p. viii.)

THE

Gardeners' Chronicle

No. 678.—SATURDAY, DEC. 23, 1899.

GARDENING 6000 YEARS AGO.

ALTHOUGH the Egyptian soil is extremely fertile, it is a remarkable fact that no country in the same latitude has so poor a variety of indigenous plants. Wild flowers are rare; native trees are few. Owing to the annual inundation of the Nile much of the land is under water for nearly four months in every year; for another four months the valley is green with growing crops, or golden with ripening corn, and the remaining four months of the year the surface of the soil is bare, parched and baked by the burning sun. Of natural shade there is very little. The commonest trees that are met with at the present day on a journey up the Nile are the *Acacia Nilotica* (the *Sunt tree* of the Arabs), the *Date Palm*, the *Dûm Palm*, the *Nebak* (*Zizyphus spina Christi*), the *Parkinsonia*, or *Wild Seseban*, and the *Tamarisk*, none of which trees produce much shade.* The only tree of any size bearing dense foliage is the *Wild Fig*, or *Sycamore* (the *Gimmez* of the Arabs), which grows here and there in an isolated fashion. Yet if there be a country where the cool shade of trees is required, that country is Egypt. The native inhabitant longs for it as much as the foreign resident, and during the midday heat of spring, summer and autumn, when the sky is always cloudless, the observing eye will note that the fellaheen men and boys utilise every available shady corner. The ancient Egyptian must have equally felt this need of a cool place wherein he might take his noonday siesta, and with this object in view he undoubtedly first planted trees around his house. Numberless inscriptions record the prayer that a man might sit in the shade of his *Sycamores* and "inhale the sweet, cooling breeze of the north wind."

The most ancient description of a garden that has come down to us plainly shows that when the garden was laid out the chief object of the designer was to make a shady place to sit in. This description, written in hieroglyphic writing (fig. 149, p. 462), was discovered in a tomb near Abusêr, a little village not far from the modern city of Cairo. According to the inscriptions in the tomb, the garden belonged to a certain wealthy noble named *Amten*, who owned several landed estates. At the outset of his career, his father obtained for him a Government appointment connected with the Administration of Provisions, and it was *Amten's* duty to receive, register, and distribute the

The magnificent avenues of the *Lebbek* (*Albizia Lebbek*) around Cairo were planted about thirty years ago. The tree is of Indian origin, and not known in Egypt until the present century.

meat, bread, fruits, and fresh vegetables, which in those early days constituted part of the Government taxes. While still a young man, he became Director of the Royal Flax, which meant that he supervised its culture, cutting, and general preparation for the manufacture of linen. Later in life he was appointed to the rank of a Provincial Governor, and became rich enough to build for himself a magnificent villa upon one of his own estates. Of the garden which he laid out around this villa he has left us a remarkable description, which, though brief, is nevertheless of great interest, as being by far the oldest record of a garden yet discovered. "The boundary-wall," he writes, "was 200 cubits (i.e., 350 feet) in breadth, and the same in width; the garden inside it was planted with beautiful trees, and a very great pond was excavated in its centre, the surrounding garden being planted with Fig-trees and Vines." When the "writing for the royal rescript had been made, a very great vineyard was planted, which yielded me wine in great quantity. I trained 2 acres of Vine hidden in the interior of the wall, and I planted trees around it."

It will be noticed that only two kinds of tree are mentioned. The first is the Fig-tree, called *dab** in this early inscription, but in later writings invariably named *nehat* or the tree *par excellence*—that is, the shade-giving tree of the country. The second is the Vine, called *âareret*, from a word, *âar*, meaning "to bind," "to twist round," "to twine," showing that the Egyptian name of the Vine has the same etymological sense as our European word *vinum*. In hieroglyphics a word was often written with two distinct groups of signs, one group having phonetic—that is sound—values, the other ideographic or picture-values. Sometimes these picture signs have simply a general meaning; at other times they have specific meanings. To illustrate this, let us take the ancient Egyptian name of the Lotus, or Water-Lily, which may be written in two different ways (see fig. 148, A and B). In both

FIG. 148.—TWO WAYS OF WRITING THE NAME OF THE EGYPTIAN WATER-LILY.

examples the word is spelt out—that is, it has three sound signs—(1) a line with two strokes in the middle, which is equivalent to our *s*; (2) a rectangular sign, representing a tank, equivalent to our *sh*, and (3) a zigzag sign, equalling our *n*. These three sound-signs give the sound of the word—*seschen*. The last sign of the two examples of the word, however, differ. The three flowers attached to one stem in the first example (A) is a general picture sign, which may be placed at the end of all flower or plant names, and merely means "a flower," or "any kind of plant;" but the sound-signs before it fix its precise meaning—that is, it is the *seschen*-flower or plant. In the second example, we see the last sign is a Water-Lily, thus proving beyond all doubt

* *Dab* is really the name of the Fig itself; that is, the fruit.

that the *seschen* was the Water-Lily.* In the case of tree-names, the generic picture-sign (or determinative, as it is technically called) is a pointed tree, somewhat like a Cypress-tree. Sometimes, however, merely a single branch of a tree is used as a determinative, though this latter sign is generally confined to such trees as supplied the ancient carpenters with good wood for building or other purposes, and not to fruit-bearing trees. The names of fruits, likewise, are determined generally by three little round balls, or a number of balls in a basket. The names of grains, also, are determined by three grains of Wheat or a number of grains in a basket. From the above-mentioned examples the reader will have obtained some idea as to the system of old Egyptian writing, and the use of picture-signs or determinatives.

On referring to the inscription describing *Amten's* garden (fig. 149), it will be seen that the word for a vineyard is determined by a little picture of a Vine growing over three upright forked stakes, from between which hang two fine bunches of Grapes (first line to left, fifth sign). This shows that the Vines were trained as at the present day in Egypt and in Italy, over stakes, so as to form a shady arbour. At Luxor I myself had a vineyard nearly 2 acres in extent of this type; and in summer time, when the Vine-leaves formed a thick impenetrable shade, this was by far the coolest place in a well-stocked orchard and garden.

At the time of the pyramid-building kings, the Vine was extensively cultivated in different districts of Egypt, and wine-making appears to have been an important industry. In many of the tombs of this period we have representations of vineyards and scenes illustrating the process of wine-making. In the tomb of Ptah-hetep at Sakkara (15 miles south of Cairo), is preserved a series of scenes of this kind (fig. 150, p. 463—from Paget & Pirie's *The Tomb of Ptah-hetep*). We see first of all a gardener named *Ahî* watering the roots of a trellised Vine, from which two men and a boy are gathering bunches of Grapes, and carefully placing them into wicker or Palm-leaf baskets. The inscription above them reads "plucking Grapes." Following this scene is another, showing the treading of the Grapes, and it is curious to note that among them is a professional wig-maker or hair-dresser. A third scene shows the final process of wine-making, the extraction of juice from the pulp. The latter has been put into a strong bag with a loop at either end, a pole has been passed through each of the loops, and the juice is wrung out with great force by five persons. As early as 3500 B.C., six sorts of wines were made, and in the inscriptions we read of red, white, and black wines, as well as northern wine from the Delta provinces of Lower Egypt; and *Sunu*-wine, from Grapes grown at Assuan, in Upper Egypt. One of the favourite kinds was the *Amu*-wine, grown in the neighbourhood of *Nebesheh*, a town in the Delta, some distance to the north-east of Cairo.

Another important industry in ancient Egypt was the cultivation of the Papyrus plant for the manufacture of papyrus-paper. It was grown in the marshes, and there are several scenes preserved in the tombs showing the Papyrus harvest. It seems to have been chiefly cultivated in Northern Egypt, and in

* Of course, this is not the only way of determining the meaning of Egyptian words. Coptic, the lineal descendant of the ancient Egyptian language, gives the clue to the meaning of numberless words, and the Semitic languages help the enquirer considerably. The above word, *seschen*, for instance, is identical with the old Hebrew *Shushan*, and the modern Arabic *beshtin*.

P.E.N.

FIG. 149.—DESCRIPTIVE PLAN OF AMEN'S GARDEN. (SEE P. 461.)

the hieroglyphic writing a Papyrus plant with three stalks signifies Lower Egypt, or the marshy district of the Delta. The corresponding sign for Upper Egypt was a Rush-like plant, perhaps some variety of *Scirpus*.

In the lists of offerings which are written upon the walls of some of the early tombs, the cultivated Fig, the wild or Sycamore-Fig, the Nebak (*Zizyphus spina-Christi*) fruit, of which a kind of bread was made, the *Balanites ægyptiaca*, and some other fruits, are mentioned. The Onion, called *hez*, "the white vegetable," was extensively grown, and perhaps also the Radish.* Several kinds of grain are named, including the *durrah* (*Sorghum vulgare*), and Wheat and Barley. The names of localities and estates were often, as with us in Europe, taken from the names of trees or plants, and among these we find at the earliest historical period the "village of the Vine," the "village of the Barley," the "*heglig* (*Balanites ægyptica*) town," the "Fig-tree town," and so forth.

A side-light is thrown upon the gardens of the Nubians at this period from a passage in the Inscription of the General Una. He tells us that in one of his expeditions beyond the southern frontier of Egypt, he "cut down the Vines and Fig-trees of the outer barbarians." This general, according to his lengthy biography, which has luckily been preserved almost intact to the present time, began his career as one of Pharaoh's† gardeners. Born late in the reign of King Unas (about 3500 years before the Christian era), this remarkable man tells us that he wore the flower-crown‡ of a boy courtier under King Teta, by whom he was appointed to the post of overseer of one of the royal store-houses, at the same time acting as under-gardener§ to the king. Then, after serving some time as a courtier and an under-priest, he was, curiously enough, appointed judge. So much esteemed was he, that he was ordered by the king to try, "alone with the chief justice and prime minister," several important legal cases, because, as he naïvely tells us, "the king's heart was satisfied with me more than with any of his princes, his officers, or his servants." For the services which he rendered in this connection, he was rewarded by the magnificent gift of a specially-prepared sarcophagus and material to build a fine tomb for himself—a present which may seem strange to our eyes, but was one of the greatest honours that an Egyptian could receive at the hands of his monarch. During the time that he acted as a judge he probably still retained his office as gardener, for he writes: "Now when I was judge, his majesty made me superintendent of the garden of Pharaoh, and I instructed the overseers of the garden that were there." While still a comparatively young man, he was commanded by the king to enquire into certain matters connected with what appears to have been a conspiracy against the life of the ruler of the state. Concluding this enquiry to the king's satisfaction, he was soon after given even more important duties to perform than any of the preceding.

* Herodotus tells us that quantities of Radishes were supplied to the workmen employed in building the Great Pyramid, and I found among the vegetable remains from the ruined town of Kahun (about 2500 B.C.) a single Radish see my paper in Petrie's *Kahun*, p. 64.

† The word Pharaoh means simply the King or Monarch.

‡ Called *mech*, and made of Lotus-flowers tied to the head by a band or fillet.

§ A garden, or perhaps rather an "orchard," was called *Khentesh* in ancient Egyptian; and a head-gardener or "superintendent of the gardeners," was called *mer Khentesh*.

For the safety of the kingdom it was necessary to organise an expedition against the tribes on the southern frontier, and Una was sent at the head of a great army of many tens of thousands. "I it was," writes the autobiographer, "who planned their procedure, although my grade was that of superintendent of Pharaoh's garden." The expedition was successful, and the General returned to Egypt covered with glory, and was promoted to one of the highest administrative positions in the country, the whole of Southern Egypt from the first cataract to the Fayum being placed under his jurisdiction. Such was the eventful career of one whose "grade," as he expresses it, was at first no higher than that of an "under gardener" to Pharaoh. *Percy E. Newberry.*

ORCHID NOTES AND GLEANINGS.

LINDENIA.

THE plates in the present number are :—

COMPARETTIA SPECIOSA, tab. 673.—It was discovered in the mountains of Ecuador by E. Klapprodt, and described in our columns 1878 ii., p. 524, by Professor Reichenbach. The flowers are in racemes like those of a *Calanthe*, but

penetrated the horny shell of the weevil. In a few moments the weevil began to stagger, and eventually fell, still with the wireworm attached, to the ground. Both were then carefully pushed on to a piece of paper, and the writer hastened indoors to obtain some boiling water, with a view to killing them both while yet united. On his return, however, the wireworm had entirely penetrated the body of the weevil, and was making its way into the lower right-hand side of it. The consequence was on dropping them into the hot-water, they became separated. I at once despatched the twain to Miss Ormerod with a note of the occurrence as witnessed, and received an interesting reply from her on the subject. From the fact that the wireworm made its way entirely through the weevil, I am inclined to think that the occurrence was accidental; the weevil, as is the habit of the insect, having possibly wedged itself into the caudex of the Fern prior to an intended attack of the wireworm upon the Fern-root itself, at same spot, the result being the penetration of the weevil's skin instead of the Fern caudex, immediately upon which, the weevil attempting to escape, crawled up the rachis of the nearest frond, carrying the wireworm with it at the moment when I chanced to be by. *Chas. T. Drury, F.L.S., V.M.H.*

troops "dipped their weapons in *Malache* (Mallow) poison." The explanation is that this expression is really intended as a satirical reference to the healing, or at least harmless, properties of the herb. It is referred to twice more in this True History. Certain offenders were struck with rods of Mallow; possibly again in reference to the comparatively soft nature of the stems.

The other allusion to Mallow is that roots of it were drawn from the ground and presented to the heroes as a preservative from harm. The annotator seems to consider this use of Mallow suggested by that of the herb Moly, given by Hermes to Odysseus to preserve him from the spells of Circe. It is difficult indeed to identify the plants to which such scant reference is made, but certainly the three uses of *Malache* as a poison, an antidote, and a scouring-rod can scarcely allude to one and the same plant, and decidedly not to that which modern authorities know as Mallow.

ASPHODEL.

Another word used in a significance far different to that which it now bears is *Asphodel*, or rather the adjectival expression, *Asphodel-wood*. Of this, a boat was made from a single piece large enough to carry fifty men, the true rendering must probably be the Corsican Pine, or some variety of it

FIG. 150.— GATHERING THE GRAPES.

TREADING THE GRAPES.

THE WINE-PRESS.

(SEE P. 461.)

pendulous. Each flower is about an inch in diameter, orange-red, with narrow segments, and a broad transversely oblong lip. The spur, formed apparently from the sepals, is long and slender.

CYPRIPEDIUM ARGUS, Rehb. f. (VAR. *NIGRICANS*), tab. 674.—A discovery of Wallis in the Philippine Islands, and described in the *Gardeners' Chronicle* 1873, p. 608. The back sepal or standard is ovate, acute, with numerous spotted stripes, and of a greenish colour; the two petals are spreading, spoon-shaped, greenish, with purple blotches and hairy margins; the lip is brownish-olive, and glossy.

ODONTOGLOSSUM CRISPUM VAR. "ROSETTE," L. Lind., t. 675.—In this variety the flowers are of medium size; the segments are white, flushed with red, and heavily blotched with purplish-brown.

ARACHNANTHE CATHARTI, Benth., t. 676.—Better known under the name *Vanda*, but differs from that genus by the absence of spur at the base of the lip. Its large flowers, with broad deep red segments transversely streaked with yellow, are very remarkable.

WIREWORM TRANSFIXING A WEEVIL.

AMONGST the foes of the gardener, both the wireworm and the weevil figure so prominently, and do so much damage without presenting, apparently, a single redeeming feature, that a sense of satisfaction is experienced when we find them at war with each other in a way that we should hardly have expected. The following evidence to this effect was recently afforded the writer in his own fernery. Despite constant search, both for the grubs and the beetle, the weevil has for many years been a great pest among the writer's Ferns; the wireworm, on the other hand, is extremely rarely seen, which increases the peculiarity of the case observed. A weevil was noticed to be climbing up the stalk of a frond of *Osmunda regalis* with a wireworm firmly attached to it near the upper hinder part of its body on the left side; when first seen, all but the head of the wireworm was visible, that having

TRAVELLERS AND THEIR TALES.

WHAT LUCIAN IMAGINED.—Travellers have frequently been famous for displaying in their tales a knowledge of natural history more marvellous than accurate.

Sir John Maundeville and Othello are widely differing instances of adventurers, whose recitals met with a reception so flattering, that they were tempted to enlarge and dwell upon them until themselves almost persuaded of their truth.

The tale of *Gulliver's Travels* is told in a far different spirit. The author was not himself deceived, nor would he lead others astray by the wonders of Brobdingnag, Lilliput, and Laputa, which were but satirical representations of the manners and customs of the day, and of those who took part in the public business of the time. A book less well known is the *Vera Historia* of Lucian [between A.D. 160-190], of which a translation has been brought out by Professor Church under the name of the *Greek Gulliver*. Between the work of Swift and that of Lucian there is this resemblance: the Greek author's work is also a satire, directed, in his case, against the tales of other travellers. They have vouched for the truth of their adventures; Lucian can out-do them in marvel-telling, and yet make no pretence to veracity, rather glorying in his powers of invention.

The author begins his little book with an account of a voyage to the Moon, where rules King Eudymion, then at war against the forces of the Sun, and whose soldiers ride upon Cabbage-Fowls. "Now, the Cabbage-Fowl is a mighty great bird, with Cabbages all over him for feathers; but the swifter have Lettuce-leaves."

MALACHE.

Passing this obviously mythical creature, we are stopped for a time by the statement that the

(*Pinus Laricio*), which would be known to the author, and might certainly furnish a boat of the size mentioned.

THE ELYSIAN FIELDS.

Lucian visits in his travels the Islands of the Blessed and the Elysian Meadow. Round the latter is a "wood of all kinds of trees, very thick, which shade those that sit at the banquet; and under them are couches to lie on, made of flowers." The trees are some of them of glass, with cups instead of fruit, which cups being gathered are of their own accord filled with wine.

Some of the advantages enjoyed by the heroes in the Island of the Blessed are singularly parallel with those mentioned in the twenty-first and twenty-second chapters of Revelations, supposed to have been written about A.D. 95. Thus, "Nor have they in their land any night, nor yet the day in its full brightness; but as the twilight is with us when it grows very near to the morning, but the sun has not yet risen, such is the light that prevails continually among them;" the parallel biblical passage being: "And the city hath no need of the sun, neither of the moon, to shine upon it."

The wondrously plentiful harvests in the Elysian land and in the New Jerusalem are, again, not merely the expression of a similar idea, but are chronicled in language showing remarkable similarity. According to Lucian, "The whole land is covered with every kind of flower and shrub, that is, both of the wild and of the garden sorts. The Vines which they have bear their fruit twelve times in the year, so that in every month there is a vintage. As to the Pomegranates and the Apples and all other kinds of fruit, these, they told me, ripened not twelve but thirteen times in the year, for that in one month which they call the month of Minos they ripen twice." And the account in

Revelation runs thus: "The tree of life, bearing twelve manner (or crops) of fruits, yielding its fruit every month."

The *Vera Historia* describes springs of water, honey and perfume, and rivers of milk and of wine. The Wheat "does not bear ears such as we have among us, but loaves at the end of the stalk, ready made and baked for eating." Many other marvels are mentioned well worth studying by the thoughtful reader.

Now that the English translation has brought Lucian's travels within the comprehension of everyone, it is to be hoped that it will meet with the wide appreciation that it deserves.

The critical may consider the natural history, the satirical or the political points raised therein; or, with the original Greek also before them, may study the language. Those of lighter mood may well take it up merely for amusement, enjoying the descriptions, the sparkling witticisms and comical situations detailed by the author, which are as fresh and apposite now as when first penned by him for the entertainment of a very different public.

A LARGE YEW TREE.

I SEND a photograph (see fig. 151), which I took a few weeks ago, showing a portion of a very large Yew which stands in the churchyard at Loose, near Maidstone. The girth of the stem is 31 feet at a height of 3 feet, and this stem is divided into five large branches, at about 10 feet from the ground, and show remains of other large pieces which have been removed. The crown is in good health, and measures about 60 feet in diameter, and the same in height, at a guess. The parish authorities have surrounded the trunk with an iron fence as a protection against injury, and I see no reason why it may not live for hundreds of years longer. Considering the slow rate of growth of the Yew, this specimen must be very old; but I have no means of ascertaining its exact age. Some of your readers may realise the size better when I say it is 6 inches more in circumference than the trunk of the celebrated Major Oak in Sherwood Forest, inside of which a dozen people can stand. The Buckland Yew near Dover is one of our most celebrated Yews, but this was only 22 feet in circumference in 1880. Does anyone know of a larger tree than the Loose specimen (31 feet)? *W. H. Divers, Belvoir Castle Gardens, Grantham.* [Dr. Lowe, in *The Yew Trees of Great Britain and Ireland*, does not mention the tree at Loose; but he mentions a tree at Hampstead Marshall, in Berks, which had a girth of 47 feet at the ground-level; and one at Hambledon, Surrey, with a girth of 39 feet at 3 feet from the ground. He cites twenty-seven trees in England and Wales with a girth of 30 feet and upwards. *Ed.*]

THE ROSARY.

NOW, AND THEN.

The New Catalogue of the National Rose Society.—People are very fond of instituting comparisons between the present and the past. It may be the growth of a city, and the increase in the number of its inhabitants. You are told that a few years ago there was a certain number of inhabitants in a place, and now that has been multiplied tenfold; and places which a few years ago were composed of green fields and flourishing trees, are now covered with rows of unlovely houses. The comparison which I now wish to make has been suggested to me by the publication of the new official catalogue of the National Rose Society—*The Then*—with which I want to contrast the present, does not go very far back; in truth, it is only six years since the last catalogue was issued, and yet considerable changes have occurred during those years. A catalogue committee was appointed to consider the whole subject. This committee was composed of some of our most experienced

Rose-growers, both amateur and professional, and this catalogue is the result of their labours; and I am sure that the Rose world ought to feel indebted to them for the trouble that they have taken. That they have been strict and impartial may be gathered from the fact that they have not hesitated to exclude from the list of exhibition-Roses some even of those which had obtained the Gold Medal.

In looking over the present catalogue, I find there are seventy-eight Hybrid Perpetuals, thirty-seven Teas and Noisettes, and thirteen Hybrid Teas. In the last catalogue issued, there were eighty-

Annie Wood, Comte de Paris, Devienne Lamy, Duchesse de Vallambrosa, Ella Gordon, Harrison Weir, Lady Helen Stewart, Madame Heury Pereire, Madame Lacharme, Magna Charta, Marguerite de St. Amand, Marie Cointet, Mons. Noman, Mrs. Baker, Pierre Notting, Pride of Reigate, Salamander, Victor Verdier, and Violette Bowyer. And yet how often has one seen a box of twelve Madame Lacharme's taking a high position! while I well recollect a box of six Annie Woods exhibited by Mr. R. E. West which I thought at the time most perfect flowers.

FIG. 151.—THE LARGE YEW-TREE IN THE CHURCHYARD AT LOOSE, NEAR MAIDSTONE.

seven Hybrid Perpetuals, forty-one Teas, and ten Hybrid Teas; thus the number of Hybrid Perpetuals and Teas has somewhat diminished, while the Hybrid Teas are slightly advanced. Nor is this the only change; there are a certain number of flowers in the old catalogue which have been either excluded or classed as Garden Roses, showing that they are not considered worthy of a place as exhibition-flowers, but may be used for general decorative purposes. Some old favourites will be found amongst the number of those that are excluded, while there are some whose right to be classed as exhibition Roses many have for a long time doubted. Those excluded are as follows:—Alfred Dumesnil, Alphonse Soupert,

to the Tea section eleven have been taken out of the list, but several of these being of the Dijon race, have a very questionable position, for they are rarely ever seen in exhibition form. No one could with any confidence rely on Bouquet d'Or, or Madame Berard, &c.; they have a very unpleasant way of expanding and showing their eye before the judges come round to examine them.

The following new hybrid perpetuals have been added to the catalogue, Capt. Hayward, Clio, Comtesse de Ludre, this is a Rose nearly twenty years old, which had somehow or other been overlooked; Duc d'Orleans, Duke of Fife, Helen Keller, Madame Delville, Mrs. R. G. Sharman Crawford, John Wood, and Ulster; and also the following

Teas: Bridesmaid, Golden Gate, Maman Cochet, Medea, Mrs. Edward Mawley, Muriel Grahame, Sylph, and white Maman Cochet; while of the class of hybrid Teas, of which we have heard so much, the only additions have been Bessie Brown, Charlotte Gillemot (this has a very doubtful position, as its constitution is by no means good), Madame Cadeau Ramey, Marquise Litta, Mrs. W. J. Grant, and White Lady.

While upon the subject of Tea Roses I may refer to some observations made by one of your correspondents, in which I was taken to task for not writing favourably of high-coloured Teas. Of course, it is simply a matter of taste, but I think I may say I have on my side the great number of exhibitors. We have had for

Beauty of Waltham, was raised nearly forty years ago. But another fact I think will strike one, that most of the Roses in our catalogue have been raised during the last thirty years, so that out of the seventy-eight hybrid Perpetuals fifty-two have been raised since 1870. It may be thought that there is no further room for improvement, and that the raisers of seedling Roses have but little to encourage them. Yet this is not so, for grand gain would accrue to whomsoever raised a white Charles Lefebvre, or a yellow A. K. Williams, and the same careful cross fertilisation which has taken place in other flowers might possibly produce this result. The catalogue contains also a good deal of information concerning garden Roses, and the selection of those suitable for various purposes. *Wild Rose.*

manifested in the destruction of human life. It is not a joyful season for the earth. The fields have lost their tender, delicate green; the wayside flowers, those meek children of Nature, no longer arrest our reverential attention, or steal upon our gaze. The trees are bending, as if disconsolately, over their fallen, leafy offspring, fast mouldering to decay. Our gardens wear a forsaken and desolate aspect. The last Rose of autumn that outlived the Viola, and rivalled the Chrysanthemum, is "faded and gone."

But we know by intuition that the latent energies of Nature are sleeping underground. Ere long the bright angel of the spring shall touch them with the glory of his resurrective rays; and they shall rise at the sound of a voice we cannot hear into new and marvellous life. No sooner have the Chrysanthemum and the pallid Rose of Christmas faded from our vision, than the Snowdrop arises to tell us Spring is born.

And thus this hybrid, intermediate season, while expressive of patience and calm resignation, is not destitute of hope. The fair floral children of gracious Nature are not dead; with them this is the period of repose, they are repairing their vitality and renewing their strength, they are resting from their manifold beneficent activities till they experience once more the inspiration of the spring.

I find attractiveness in my garden at all periods of the year. Even at this date (December 1) my Lilac Primroses are beginning to bloom. *Jasminum nudiflorum*, the naked flowering Jasmine, has been for some time in luxuriant beauty, and will continue to unfold its golden treasures till its much-loved successor, the Snowdrop, has appeared. I perceive that the beautiful Madonna Lily (*Lilium candidum*), which is in sheltered situations, such as those which I have given it, a veritable evergreen, has, even on the confines of winter, been steadfastly growing, fearless of all danger, and spreading out with tranquil confidence its green and luminous leaves; exhibiting a vitality which survives, through its strength, the sternest grasp of frost. The Wallflower, which loves to adorn ancient ruins (as I recently saw it adorning the crumbling walls of the Abbey at Luce), is as verdant as the Hollies, which gleam through the naked, envining woods. I watch almost daily, with patient hopefulness, the gradual growth of the pendulous Snowdrop, the first daughter of Nature that rises from the grave of her former beauty, to hail with its purity and unobtrusive loveliness the new-born year. I bend, reverentially, remembering its exquisite sacred associations, over the snowy splendours of the Christmas Rose. And thus to me winter is not desolation. I know from experience not less than observation of her potentialities and achievements, that to Nature it is not death. I rejoice in her white shroud (too seldom witnessed here) of intensely glittering snow; for I feel that beneath this mystic covering, as if enfolded in softest ermine, the heart of Nature is beating still. That this is her own instinctive preservation against the imperious dominion of that element which is the greatest destroyer of vegetative life; and thus it is that when the covering snow has gradually faded into and fertilised the earth, a wondrous transformation, vernal in its freshness and beauty, is disclosed.

Throughout the entire season of winter we can find abundant evidence, especially in the regions of root-formation, of those latent energies which shall hereafter generate the glories of the spring. Nature, while seeming to rest from her labours, is earnestly preparing for the life that is to come—

"In all places, then, and in all seasons,
Flowers expand their light and soul-like wings,
Teaching us by most persuasive reasons,
How akin they are to human things.
"And with child-like, credulous affection,
We behold their tender buds expand;
Emblems of our own great Resurrection;
Emblems of the bright and better land."

David R. Williamson, Kirkmaiden, Wigtownshire,
December 1, 1899.

FIG. 152.—FRUITING SHOOT OF THE OLIVE.

many years one high-coloured Tea Rose, *Souvenir de Thérèse Levet*, yet you may run your eye over the Tea and Noisette sections at our great metropolitan show and rarely see it—so much so, that in Mr. Mawley's careful analysis of Roses exhibited on that occasion, it finds no place, and I talked with some of our most successful exhibitors, both amateur and professional, and they would have none of it. If then I have gone wrong, I have gone in good company.

In looking through the catalogue that is now prepared, one is struck by the position which the production of home-bred Roses has attained; most of those which have been added of late years not being of Continental origin. The late Mr. Bennet set the example, which has been so successfully followed by the firm of Messrs. Alexander Dickson & Sons, of Newtownards, who obtained during the last few years twelve Gold Medals awarded by the National Rose Society for new seedling Roses. It was also interesting to notice that the Rose which has been longest with us amongst exhibition varieties is that lovely tea-scented Rose, *Devoniensis*, raised in Devonshire in 1838; while another English Rose,

FRUIT OF THE OLIVE IN AN ENGLISH GARDEN.

It may interest your readers to know that the enclosed Olive is one of several that have been grown in my garden at Pippbrook, near Dorking, fruiting for the first time this year (see fig. 152). The tree was sent to me by Commendatore Thomas Hanbury, from his garden at La Mortola, Ventimiglia. It is planted against a south-west wall, and its only protection in the winter time is some evergreen boughs, which I doubt being necessary. *H. Gurney Aggs.*

NOTES FROM A SCOTTISH MANSE.

(Continued from p. 390.)

THE INTERMEDIATE SEASON.—Many, and not seldom impressive, are the thoughts instinctively suggested to the earnest horticulturist by this season of the year. It is a period indeed whose outward aspect, notwithstanding the activity that prevails beneath the surface, is by no means expressive of beauty or of hope; especially when we consider its atmospheric influences, so tragically

FORESTRY.

PARK CLUMPS OF TREES.

(Continued from p. 394.)

THE form and size of park clumps should be determined according to which of those objects is in view, and the method of treatment should also vary for the same reason. When a background is wanted to break up and relieve the monotony of a dead level, the clump should act as a partial screen to the view beyond, and must be dense enough below to prevent the eye penetrating beneath or between the branches of the trees. With clumps thrown open to cattle or horses, the browsing-line, or height at which the shoots and leaves are continually nibbled off, is sufficiently high to enable the observer to look under it, and a clump in this condition aggravates rather than relieves the monotony of the aspect. The comparative density of the clump above the browsing-line, and the uniform sharpness and distance from the ground by which it is characterised, make an artificial division between the ground and the trees which stand upon it, only connected by the stems of the trees, which resemble the iron pillars which support a vermin-proof stack stand. This browsing-line can be broken and destroyed by pruning the trees up to different heights, but this only renders the clump more open; and to make it at all effective as a screen, some means must be found for providing trees or shrubs which retain their branches to the ground. A simple method is to retain the fence round the clump so that Thorns, Hollies, Yews, or similar dwarf and bushy plants may be maintained throughout its surface, and when the fence consists of iron standards and wire, it is quite invisible from a moderate distance. If the fence can be removed back a few yards from the outer line of trees so much the better, as a more natural effect is produced, and the sharp contrast between the grazed and ungrazed surface avoided. Another, though more laborious process, is the formation of a sunk fence round the ground which it is desired to enclose, but since the introduction of wire fences this is rarely resorted to.

FORM OF CLUMPS.

As regards the particular shape such clumps should take, a distinction must be made between the actual clump of trees and the fence which surrounds it in the earlier stages of its existence. As already stated, the usual course followed is that of making a circular enclosure and filling up the whole of the enclosed spaces with trees of either the same species or a mixture of different kinds of tall-growing forest trees. The result of this method is a mass of trees in which individual characteristics are entirely lost, and beyond the fact that the marginal trees retain their side branches, it differs in no essential point from ordinary plantations on a small scale. Viewed from any side its appearance is exactly the same, a feature which may possibly recommend it to its devoted admirers, but which does away with all possibility of picturesque variety in form and grouping. In some instances, it is never, or only slightly thinned; in others, the thinning is done with mathematical precision, and only trees which are strictly "proper" allowed to stand. When wind or accidental causes have made a gap here and there, and invested it with some claim to an attractive irregularity, as often as not the gap is promptly filled up by planting a young tree enclosed in a ponderous wooden guard, a practice probably adopted as a precaution lest some careless observer might mistake it as a natural production of the soil. Clumps framed and maintained on this principle do not, as a rule, improve a landscape; and often they are eyesores. Yet how many of our finest deer-parks throughout the country are disfigured by their presence in all stages of growth, and in every degree of ugliness!

No doubt, motives of economy have something to do with a circular form of clump, as more ground

can be taken in with the least length of fence, and so far as the latter alone is concerned, there can be no great objection to its being erected with as few angles as possible. But it is quite unnecessary to fill up the whole of the enclosed area on one uniform pattern, and with the same degree of density. Smoothly-flowing lines are not required when dealing with such material as trees, in which every branch and shoot aims at giving the crown, of which it forms a part, a more or less globular form—a law of growth which effectually prevents any approach to angularity or awkward corners. A round clump of crowded trees is nothing more than a crown of foliage with a base out of all proportion to its height, and cannot fail to have a squat and unpicturesque appearance, and instead of relieving the monotony produced by a large number of round-headed trees, increases it. The larger the clump, the worse becomes the effect in perspective, unless single trees in proximity to the margins obscure the profile, or irregularity of surface takes off some of its formality. *A. C. Forbes.*

(To be continued.)

HOW THE JAPANESE GROW THE DWARFED TREES IN JARDINIÈRES.

THUJA OBTUSA.—"During spring and summer, by preference keep this plant in a sunny, airy situation, where the wind will pass freely through the branches; water once a day, affording just enough to make the soil moist. In dry, hot weather it may be necessary to afford water twice a day, care, however, should be taken not to have the soil wet, and never to apply water unless the plant needs it. Sprinkling overhead in dry weather is bad, but rain is always beneficial. During winter keep the tree in a cold greenhouse, partially shaded, or in an unheated orangery, applying water about once in ten days; the soil, however, must never be allowed to get quite dry. The art of successful culture of all plants in pots consists in the judicious application of water, too much or too little being equally injurious. Treated in this manner, the plant is very ornamental on balconies, terraces, &c. If this plant is kept indoors, it should always be placed out-of-doors at night, and as often as it is not wanted for decoration. Indoors it should never be exposed to the dry heat from a stove or open fireplace, otherwise the leaves will drop off, and the plant perish.

Pinus pentaphylla, and *Pine-trees* in general, growing in jardinières require the same attention in regard to water and general treatment as *Thuja obtusa*, but they are not so much influenced by atmospheric conditions; nevertheless, sun and air are necessary to the maintenance of health. It is therefore good to keep the plants out-of-doors as much as possible.

Maples and other deciduous trees need the same kind of treatment as *Thuja obtusa* as regards water at the root, but are more accommodating than evergreens. In fairly mild climates *Maples* may remain out-of-doors all the winter, but in places where the frost is severe they should be kept in a cool cellar, after the leaves have fallen in autumn; the soil must always be kept moist but not wet. Early in spring put the plants out-of-doors, and fully exposed to all weathers, and when in full leaf use them for decoration indoors as may be needed.

Manuring.—When the trees commence to grow in the spring, we afford manure twice a month, say, in March, April, May, and June, and again in September and October; in the hot days of July and August, no manure is afforded, nor in winter and early spring, the plants then being at rest. The best kind of manure is finely-powdered oil-cake and bone-meal, and to a jardinière 1 foot in diameter, three or four large teaspoonfuls, not heaped, of this dry manure is spread evenly round the edge of the jardinière; and a larger or smaller jardinière will require more or less, for a small jardinière, say, 3 by 6 inches, half-a-teaspoonful will be ample each time.

Repotting.—This is done by us once in two or three years, as follows:—Lift the plant out of the jardinière, and with a sharply-pointed stick remove about one-third of the old soil around the edges and bottom, cutting away a portion of the old, fine roots, but none of the strong roots, then replace the plant in the same jardinière, first looking to the drainage. For a small shallow jardinière, use a flat piece of tin or a flat crock over each hole, and over this spread some rich, fresh soil; neatly balance the plant, and fill up with the same rich fresh soil to within $\frac{1}{2}$ in. of the rims, and make it sufficiently firm around the edges of the jardinière to prevent the escape of water, it being of the first importance that the entire ball of soil be moistened at each application. Should the plant be neglected and the soil become quite dry, put the jardinière in a tub of water for ten or fifteen minutes, and if the dryness is not very great the plant will recover. In the case of large plants, concave crocks should be employed for drainage, such as are used by growers of specimen plants. After several repottings, the plant, having increased in size, will have come into a pot sufficiently large, and as dwarfness is the aim the smaller the shift the better. Repotting should be done in February or March, just before growth recommences. We advise when it is possible to get the above work done by a good gardener, who has been accustomed to the handling of Heaths, New Holland plants, &c. In the case of very shallow jardinières, it is found desirable to replace annually a portion of the old soil in order to maintain a healthy growth.

Pruning.—To maintain dwarfness in the trees, the young growth is pinched from April to the middle of the month of June, and always with the finger and thumb, a practice followed by the late Mr. Thomas Rivers, of Sawbridgeworth, England, with fruit-trees for fruiting in pots. In *Thuja obtusa* we pinch out the points of the young growth all over the plant, so as to maintain the right form; and this practice is also applicable to *Cryptomeria* and all other Conifers except *Pinus*. *Pinus* should have the points of the irregular growth pinched out simply to maintain the shape of the plant. In *Pomegranates*, *Lagerstrœmia indica*, the flowering *Peach* and *Cherry*, &c., we pinch back the non-flowering shoots either before or after blooming. *Wistaria* is pinched in July and August so far as regards the young shoots, leaving only four or five leaves on each. *Maples* and other deciduous trees are pinched back at the same time as *Thuja obtusa*, leaving two to four leaves as may be necessary to maintain the desired shape of the plants. Should a second growth be made, the same rule is followed of pinching out the points.

The following is a list of the names of dwarfed trees:—*Thuja obtusa*, *Pinus pentaphylla*, *P. Massoniana*, *P. densiflora*, *Larix leptolepis*, *Juniperus rigida*, *J. procumbens*, *J. chinensis*, *Podocarpus macrophylla*, *P. Nageia*, *Tsuga Sieboldi*, *Cryptomeria japonica*, *Acer palmatum* (*Maple*), *A. trifidum* (*Maple*), *Styrax japonica*, *Lagerstrœmia indica*, *Pomegranate*, flowering *Cherry*, flowering *Plum* (*Prunus Mume*), *Chamaerops Palm*, *Cycas revoluta*, *Wistaria*, *Cratægus cuneata*, *Zelkova Keaki*, *Euonymus alatus*, *Ivy*, *Bamboos*. "The Yokohama Nursery Co., Ltd., Japan."

[*Cupressus obtusa nana* is so dwarf by nature as to need no pinching. We have two flourishing plants about 18 inches high, which have increased very little since they were planted on a rockery some twenty years ago. Near them is a *Maple*, planted about the same time, which has a trunk 39 inches round at 3 feet from the ground, and a head between 30 and 40 feet in height. Ed.]

COLONIAL NOTES.

TRINIDAD.

THE October number of the *Bulletin* contains a portrait of our valued correspondent, Mr. J. S. Jenman, the Government Botanist of British Guiana. Of the seedling Sugar-canes, some were

found, on analysis, to contain over 20 per cent. of sugrose, eleven over 19 per cent., and fourteen over 18 per cent., while the highest cane showed 21.41 per cent. of sugrose. "We are fairly under way to obtain the 20 per cent. required by cane planters to maintain a supremacy over the Beet-sugar industry."

THE MAIDENHAIR-TREE.

SOME of our Japanese friends may be able to tell us the meaning of the work Ginkgo, which by right

catkins on one tree, its female flowers on another. Cunning botanists have secured seed by grafting the male on to the female.

Now as to its history. It is generally known nowadays that this earth, and our own little island like the rest, has undergone numerous and vast changes in pre-historic times; its surface has been repeatedly altered, now raised mountains high, now depressed to the bottom of the ocean, now covered with thick layers of ice, now basking in a tropical sun. The proofs of all this are seen not only in the varied strata of rock that form the crust of the earth,

fully realised; is the fact that we have still among us direct lineal representatives of those palaeophytes—those plants of remotest ancestry.

What should we say if we were to meet in our gardens or streets an Iguanodon, a Megatherium, or any other of the huge beasts whose bones are impressed in the rocks of Wealden or liassic formation? What should we do if a Mastodon—which is relatively a recent inhabitant—were suddenly to appear before us? Probably, if fear did not get the upper hand, we should try to shoot it, as is the deplorable custom when anything new or interesting makes its appearance. Self defence might, nevertheless, supply in such a case as this a justification.

Now the Ginkgo was a contemporary of some, at least, of the creatures we have mentioned, and of many others. Traces of it are to be found as far back as the coal-measures, abundantly in the oolites and miocene formations, in Spitzbergen, in Greenland, in Mississippi, in New South Wales, in Russia, in Siberia, and in our own country in the oolite of Scarborough. Dozens of variations, some of which are of sufficient importance to constitute separate genera, have been found. In any case there is proof that this particularly antediluvian tree, now confined to China and Japan, was once very widely diffused, and that it presented more variety than it does now. The Mastodon is no longer with us, but the Ginkgo is. So much for its history, of which we have only sketched the outline.

That it is attractive in appearance, no one who has seen a good specimen, such as the one at Panshanger, can doubt (see fig. 153). The branches are of two kinds, extension shoots, long and flexible, pushing the leaves into the light and air, and short thick spurs like those of an Apple-tree, which serve to store up food for the tufts of leaves and clusters of flowers, which spring from their summits. These spurs are strictly analogous to the thick stems of Cycads. The long shoots which are more or less pendulous, give an elegant appearance to the tree, whilst the bunches of Fern-like leaves clothe it with deep green verdure, to be replaced by golden-orange as the winter draws near. The male flowers, as we have said, are in catkins, the female flower ripens into an Olive-like berry, of which we shall have more to say by-and-by. It is very nauseous to the taste, but encloses a toothsome kernel. A curious peculiarity of the tree is that it withstands not only cold, but also the smoky atmosphere of our towns, much better than most trees. It may then be confidently recommended as a town tree, if it can be procured in sufficient quantities. Is it permissible to co-relate the endurance of this tree in our towns with its survival through the ages? Surely the same endowments have been favourable to the tree in the one case as in the other. By the way, we may say that it is easily propagated by seeds or by layers. Again, it must be remembered that in its earlier age it is not very remarkable in appearance; its beauties, and they are great, grow with age. "Pulcherrima et procerissima arbor," Bunge calls it. This citation applies to the tree as growing in China. Its native locality was for a time doubtful. The tree is planted in the vicinity of Buddhist temples, and thus protected; but most botanists, even Professor Sargent, were of opinion that it no longer existed, either in China or Japan, in a wild state. Mrs. Bishop, however, met with it in the forests of Yezzo; and if we remember rightly, Dr. Henry found it in south-west China.

Fine specimens of the tree are known to occur in various gardens, thus at Whitfield, near Hereford, there was a tree which measured 50 feet in height in 1868. The tree at Panshanger was estimated at 53 feet in 1868, and is now approximately 62 feet, with a girth of 10 feet at 1 foot from the ground. At Blaize Castle, Henbury, is a tree 65 feet in height (figured in *Gardeners' Chronicle*, December 6, 1879). At Broadlands, in 1882, a fine tree with a spreading habit, was 46 feet in height, with a trunk 7 feet in girth at 3 feet

FIG. 153.—GINKGO BILoba AT PANSHANGER PARK, HERTFORD.

of priority is attached to the Maidenhair-tree. *Ginkgo biloba* is the accepted denomination, but it has also borne the name of *Salisburia adiantifolia*, in memory of a "critical" botanist, and in allusion to the *Adiantum*-like form of its foliage. It is a tree with a history—attractive in appearance, and full of interest to the student. It is a Conifer, or, more strictly speaking, a Taxad. Some say it is a Cycad, and recent discoveries undoubtedly point in that direction. It has deciduous leaves, wedge-shaped at the base, broad and two-lobed at the apex, with Cycad-like veins. Before they fall, in winter, they turn of a beautiful yellow colour. Its male flowers are borne on

which the expert geologist reads as from a book, but also, and, as some would think, even more decidedly in the remains of animal and vegetable life which they contain. The Isle of Sheppey in the mouth of the Thames is now a mere mud-bank, with the vegetation common to all estuaries along our coast, but its muddy cliffs contain in profusion relics of Palms, of Cycads, of Pandanads, and of scores and scores of plants now only met with in tropical or semi-tropical localities.

Our coal-measures teem with tree-Ferns and gigantic Equisetums, also indicative of warm climates—but it is unnecessary to give more illustrations; the fact is well known. What is less

from the ground (figured in *Gardeners' Chronicle*, July 22, 1882). The tree at Kew, once against a wall, was 60 feet high when we gave its portrait on March 2, 1889.

Our third rubric related to the interest attaching to the tree; perhaps we have said enough on this heading already, but to mention the Ginkgo without alluding to one of the most important discoveries ever made, would be to leave out the part of Hamlet from the play of that name.

The Ginkgo, together with the Cycas, bridges over the gulf between flowering plants and Ferns, and their like, a gulf very wide until two Japanese botanists in 1896, Prof. Ikeno and Dr. Hirase, constructed a bridge across by showing the existence of antherozoids instead of pollen grains formed in the pollen tube of both Ginkgo and Cycas, as they are in the antheridium of a Fern. Here, then, we have plants with the habit and appearance of flowering plants, and with the fertilising apparatus of the higher Cryptogams, a discovery second only in its consequences to the discoveries of Hofmeister, foreshadowed by Robert Brown. The researches of the Japanese botanists have been amply confirmed (in *Zamia*), amongst others by Mr. Herbert Webber, an honoured guest at our hybridisation conference (see *Botanical Gazette*, October, 1897).

Further researches have been made by Mr. Kenjiro Fujii, who describes some interesting malformations, and concludes that Ginkgo should stand as a distinct family between Cycads and Conifers, a view supported by Engler in the Supplement to the *Pflanzen Familien*. So much for the Ginkgo. We sometimes see the announcement, "What may be learnt from a tree." It is clear that in this case very much indeed may be learnt from a tree.

VARIORUM.

DOES KAINIT INJURE FRUIT-TREES?—Mr. Cornell, a correspondent of the *Rural New Yorker*, thus describes his experience in relation to this question:—"The use of potash in moderate quantities as a source of potash on different fruits has given me, in past years good results. I have not used it recently, as muriate of potash is more satisfactory, and cheaper. With my experience, I would not apply kainit to any trees, except when they were in a dormant condition. With the orchard spoken of, where I had such a disastrous experience, it will be necessary to go somewhat into particulars, in order to understand the case. For a number of years we have been afflicted very badly with the Pear-midge—so much so that the fruit of Lawrence, which suffers most from its work, has been entirely destroyed by it. In my efforts to find a remedy for this pest, I saw kainit recommended, so tried it. I made my first application as an insecticide on or about April 15, 1894, on an acre of Lawrence trees. The trees were about twenty years old, and were in thrifty condition. I spread the kainit as evenly as possible all over the ground by hand, using 1 ton in the application. Some time later, I learned that it should not have been applied until the midge-maggot fell to the ground, which occurs the fore part of June. Fearing to use any more that season, I waited until the following year, 1895, when about June 15 I used the same amount in the same manner. The next year I used at the rate of half-a-ton to the acre. During this period this orchard was ploughed and harrowed, but was not given absolutely clean culture. The trees, in the summer of 1894, looked fine, the foliage was exceptionally good, and the trees showed great vigour. The growing season of 1895 showed no bad results except some fire blight, which was quite prevalent with me that year; but the summer and fall of 1896 showed many trees in a bad condition. Late in the autumn, finding some trees dying, I dug them out, when I found the large roots near the surface dead, or nearly so, while the deeper roots appeared healthy. I have continued digging up

trees to the present year. The trees now remaining look healthy, with two or three exceptions. The loss of trees has amounted to fully 50 per cent. I was strongly impressed with this fact—where the moisture was the greatest the loss was the greatest. Part of this plot is somewhat lower than the rest, and is much moister soil; there the loss was nearly total. I could not see but grass and weeds thrived well, notwithstanding this excessive dose of potash salts." In moderation, kainit has been used with great advantage for fruit trees in this country; but it will be seen that Mr. Cornell applied 2½ tons per acre in three years. *Agricultural Gazette*, December 4, 1899.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clars Lawn, East Sheen.

Orchids for Christmas decoration.—As flowers of every description are most valuable at this festive season for use in the usual decorations, a few remarks upon species and varieties of Orchids that flower at or about Christmas-tide may be useful. *Cattleya* blooms will be rather scarce, and will consist almost wholly of a few representatives of *C. Trianae*, *C. Percivaliana*, and possibly *C. Dowiana*. *Laelia anceps*, *L. autumnalis*, *L. albida*, are very useful, also *Dendrobium aureum*, *D. atro-violaceum*, *D. crassinode*, *D. Wardianum*, and *D. formosum*. The last named species is a grand white-flowering *Dendrobium*, and its flowers of much value when cut. *Cypripediums* are very prominent, the commoner and most useful species being *C. insigne* in many varieties and colours; the lovely *C. Spicerianum*, *C. × Leeannum*, *C. × Arthurianum*, *C. Boxalli*, *C. villosum*, *C. venustum*, and the various species and hybrids of the *Selenipedium* section, of which perhaps the finest is *S. × Perseus*, a hybrid from *S. Sedeni porphyreum* crossed with *S. Lindleyanum*. The flowers are uncommonly persistent, and the branching spikes have ten or a dozen flowers expanded at one time. There are numerous other hybrid "slipper" Orchids that are in flower now. It is rather early for *Odontoglossum crispum* to flower, though a few will be in bloom in large collections. *O. Rossii* also is hardly in season; but the pretty, sweet-scented, white-flowering *O. pulchellum* on the contrary is in flower. The genus *Oncidium* furnishes us with an excellent Christmas plant in *O. varicosum*, the golden yellow flowers of which form a beautiful contrast to the scarlet and rose coloured forms of *Sophranitis grandiflora*. In other than foggy districts, nothing surpasses the beauty and utility of the variously coloured forms of *Calanthe Veitchii*, and its parental relation *C. vestita*; but in or near smoke-laden districts, it is impossible to flower these plants with success. In *Masdevallia tovarensis* we have a very useful white-flowering winter plant, *M. amabilis*, *M. × Chelsoni*, *M. Hincksiana*, and *M. Veitchii* supplying blossoms of grateful colours. Blooms of *Cologyne cristata* are sometimes cheaper to buy at this season than scarlet *Pelargoniums*, the reason being that the latter are very scarce, but the Orchid is ill-adapted for use as a cut flower, and is also a "bad traveller." *Cymbidium Tracyanum* is not yet common enough to be grown in quantities, but it will hereafter form a strikingly beautiful addition to the florists' Christmas list. *C. giganteum*, *C. elegans*, and *C. Mastersii* are now in bloom, the last two however are of little use as cut flowers. From a misconceived idea of the difficulty attending their cultivation, *Phalenopsis* are not grown to the extent they deserve to be, for most of the showier species flower in winter. *P. Aphrodite*, *P. amabilis*, and *P. Stuartiana*, are now in bloom, and as their prevailing tone is white they are very acceptable. *Miltonia Razzi* is not common for a similar reason, but where a dozen or more plants are grown, one or other will generally yield a few welcome flowers. This list is by no means an exhaustive one, but it includes most of those Orchids suitable for display in the houses, or for use as cut flowers.

Bletia hyacinthina may now be repotted or top-dressed, the latter sufficing where the tubers are not overcrowded. If however any are overcrowded, turn out the plants and place them in larger pots, or divide them so as to increase the stock. The pots

should be half filled with drainage material, and a rooting medium consisting of one half fibrous loam, one half peat, a little chopped sphagnum moss, and sufficient coarse sand or finely broken crocks scattered in in order to render the whole porous. The tuberous portions of the plants should be covered with the compost when completed, the young growths appearing through it like "Lily-of-the-valley" crowns. Place the pots in a light part of a cool house, and until the flower spikes appear, afford only sufficient water as will keep the soil moderately moist, but afterwards they will need a more liberal supply.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

The Hardy Fernery.—As there are so many distinct hardy, evergreen and deciduous species of Ferns, no necessity exists to plant any other in the hardy fernery, and if the method of planting, and subsequent treatment are such as were advised in a previous calendar, the plants will withstand a hard winter, providing all the dry fronds are allowed to remain as a kind of protective covering. Large Ferns should be cleared of all accumulations of leaves, &c., that may have lodged in the crowns, which, if allowed to remain for any length of time, would cause the young fronds to decay.

Hardy species of Ferns growing in pots.—These plants should be plunged in coal-ashes or leaf-mould, in a sheltered place so that the soil will not freeze the pots and burst them. They may also be placed in cold frames (plunged) and be afforded plenty of air when there is no frost, and be kept moderately moist at the root. When hardy Ferns are wintered in a greenhouse they do not obtain sufficient rest, being apt to start into growth prematurely, the fronds then coming weakly, and in many instances the natural character of the plant is changed.

Roses worked on the Briar, and those on their own roots, require, in order to maintain them in vigorous health, to be liberally manured. If the plants have occupied the same spot for several years a top dressing of rotten farmyard manure may be afforded in mild weather when the soil is not frost bound. Let the soil be loosened with a digging fork, after treading the manure evenly to the depth of from four to six inches. The Dog-Rose stocks on which the Rose is budded to form standards, should be procured this month, giving preference to those with green rind, such having more latent vigour than stocks with hard and brown rind. In lifting Dog-Roses from hedgerows, efforts should be made to secure the fibrous roots in quantity, and when replanting the stock the root should not be planted deeper than four inches. Secure the stems against the wind, make the soil firm about the roots, and shorten the stems to various heights.

Plants growing in Tubs.—Specimens of *Hydrangea*, *Agave*, *Agapanthus*, *Orange*, *Lemon*, *Myrtle*, *Pomegranate*, *Nerium*, &c., winter satisfactorily and in a house having a temperature of 40° minimum, and 50° maximum, being kept moderately dry at the roots. *Rhododendron*, *Sweet Bays*, *Portugal Laurel*, and other hardy trees should be placed where they may be sheltered from the cold winds, the tubs being tilted on one side, and some mats, bracken or straw placed over the soil, in order that frost and snow may not penetrate the latter.

Plants in Frames.—The recent change will call for liberal coverings of litter and mats on pits and frames containing hardy plants, but uncovering them when the temperature rises by day a few degrees above the freezing point, and admitting air for a few hours. If it be found that the frost has penetrated the pits, &c., the plants should, when thaw weather sets in, be gradually exposed to the light; and in severe cases a sprinkling of water a few degrees colder than the air of the pit, &c., will assist in withdrawing frost from the plants.

PLANTS UNDER GLASS.

By G. R. FIELDER, Gardener, North Myms Park, Barnet.

Hydrangea hortensis.—Where a number of this species was raised from cuttings in the early autumn, and afterwards placed in a cool pit, they will now have lost their foliage, and be quite at rest. If it is desired to have a portion of the

plants in bloom as early as possible, one half of the number may be transferred from the small pots in which they were struck singly into others of 5 inches in diameter, leaving the remainder to be similarly treated in a month's time. A suitable compost would consist of three-parts loam, one-part leaf-soil, together with a small quantity of rotten manure, and a sprinkle of sand. In potting, the plant should be kept low, so that, if possible, only the flower-bud remains above the soil. A position near the light, in a house having a temperature of from 50° to 55°, should be afforded them, and water applied sparingly until the plants begin to grow and make fresh roots, when water may be more freely afforded. As soon as the flower-trusses appear, which should be when about four pairs of leaves have been developed, liquid-manure should be applied, and its use continued at frequent intervals till the plants are in full bloom.

Hydrangea paniculata grandiflora.—This plant is largely grown in pots, and forced into bloom for conservatory and house decoration. In the cut state, the large creamy-white flower-trusses are very useful for filling large vases. Plants which have been received from the nursery should be placed in pots sufficiently large to contain the roots comfortably, where this has not already been done. The strongest plants will require 8-inch pots. A similar compost to that recommended for *H. hortensis* should be afforded; and after potting, the plants ought to be plunged in coal-ashes in the open till brought indoors for forcing.

Adiantum cuneatum.—Plants for furnishing an early crop of fronds for cutting purposes, provided they have been resting for some weeks, may be afforded a temperature of from 55° to 60°, and afforded water sparingly until active growth begins. Plants bereft of most of their serviceable fronds should be cut over, and then rested in a house with a temperature of about 45°, and for a few weeks be sparingly afforded water.

Reinwardtia (Linum) trigynum and *R. tetragynum*.—Both species, having now finished flowering, should be cut well back, to furnish young shoots later, for purposes of propagation. The plants should be examined for red-spider, and means taken to thoroughly rid the plants of this pest before cuttings are taken. Cut-back plants, and those which will be cut back in February, should be kept clear of all kinds of insects by the use of insecticides, and be afforded less and less water till an application once a week will suffice. The plants may be rested in a temperature of 55°. Repotting may take place in February and March.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Forcing Asparagus.—The supply of heads once begun should be maintained by placing batches of roots in the forcing pits at intervals of two to three weeks. After the new year not much warmth is required to get Asparagus into growth, and a newly-started vinery or Peach-house will do as well as a forcing-pit proper. The roots should be stood close together on the borders, and covered with finely-sifted leaf-soil. Air in small quantities should be admitted in favourable weather to the pits in which the heads have appeared above the soil, so as to impart flavour and colour to them. Materials may continue to be prepared for filling pits and frames for the later forcing of Asparagus, which will be succeeded by Potatoes, Cauliflowers, and Lettuces. Forcing pits dependent on leaves and dung for their heat should be watched carefully, and if the bottom-heat falls below 75°, and the top correspondingly decreases, the dung linings must be renewed wholly or partially as may appear necessary. Only tepid water should be employed when water is needed, and all shoots that are fit for table use cut daily, as to leave them on the roots will make them tough-eating.

Celery should now be protected with a slight covering of long litter or bracken, removing this in mild weather, but keeping it handy. A supply of heads should be lifted and stored in damp soil in a frost-proof shed or cellar, thus ensuring a supply if hard frosts should set in. The same may be said of Horseradish, Chicory, Dandelion, Parsnips, Turnips, Kohl-rabi, Artichokes, &c.

The Ice-house.—If ice be stored at home, the

drags, hooks, mallets, &c., used in doing the work should be put into good order. Having filled the ice-house with clean ice, well rammed down as it was shovelled into it, a large heap may be formed in a cool shady place provided with natural drainage. An enclosure, say 20 feet square, may be surrounded with a wall of slabs of green timber, railway-sleepers, &c., and be filled with ice, well pounded and sprinkled with water, so as to cause it to set in a solid mass, and finish off the heap with a domed top. The sides and top may be covered, the former with sawdust and the latter with straw 2 feet in thickness. This heap will afford a supply of ice for five months, saving that in the ice-house for late summer and autumn use.

Potatoes.—Afford ample protection to the stores of Potatoes in clamps out-of-doors, and in sheds and cellars, so that neither frost nor light reaches them. On wet or snowy days an examination should be made of all Potatoes stored indoors, and those in clamps be inspected, and the decayed tubers extracted in fine mild weather.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Dressing and pruning Orchard Trees.—During such frosty weather as that which we are experiencing at the time of writing, culling and pruning of wall trees cannot well be carried on excepting when the sun shines for a few hours in the middle of the day, and the opportunity this frosty weather affords, should be utilised in thinning of the heads of orchard trees, that is, taking out the branches where these are crowded together. The operation should not be carried out severely, although it may seem to be much called for, but be carried out in several successive winters till the crowns are sufficiently thinned. The first job should be the removal of the interior spray, and the intercrossing branches, sawing the latter off low down, and smoothing the jagged edges left by the saw, with a knife or chisel. The main idea for the pruner should be a symmetrical crown with not too many branches which the sun's rays can readily penetrate when the trees are in leaf. While pruning, look out sharply for American blight, a pest which has been rather prevalent this year, and afford infested trees a dressing of soft soap, petroleum, or the trade petroleum emulsion. In making the former at home, use half-pint of petroleum, and four gallons of boiling rain water with sufficient soft soap to form a good lather. This may be applied with a new scrubbing-brush, working it into the crevices of the bark. A lather made with Gishurst's Compound-soap is likewise an efficient dressing. Trees which are badly infested should be cleared of the soil around the stems to the depth of three or four inches, dressing the stems with the mixture. The old method of lime-washing the stems and branches is not to be condemned as a remedy, especially on lichen-covered trees. Used of the consistency of cream and put on warm with a little size dissolved therein, it forms a useful winter dressing.

Delayed Planting.—Owing to the sudden fall in the temperature, accompanied by snowfall in places, planting may be somewhat retarded in some gardens, and it is better to wait than to plant whilst the soil is covered with snow, and perhaps frozen. Bundles of fruit trees which may have arrived from the nursery should be unpacked without delay, laying them in temporarily till suitable planting-weather arrives. To lay them in properly, let a good sized trench be thrown out in which the roots should be laid and covered with unfrozen soil, burying them fairly deeply, afterwards covering the whole with litter, but leaving the tops exposed.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. RALPH VIVIAN, Road Ashton, Trowbridge.

The Cucumber House.—The late spell of wintry weather has not been good for winter Cucumbers under ordinary conditions, but any loss of vigour in the plants should be counteracted by occasionally sprinkling the beds with fresh loamy soil mixed with finely sifted leaf-mould and bone-meal in small quantities, and failing these, with loam and fresh horse-dung. Neither liquid nor artificial manure are much needed if there is due attention paid to top-dressing the beds. The roof glass should be kept bright by removing the deposits due

to fog, plenty of sunlight being of great importance in the winter months. Water should be applied when needed. When bottom heat is derived from the hot-water apparatus, the soil is apt to get rapidly dry, and needs applications of water at short intervals of time; but when bottom heat is derived from fermenting materials wholly or partly, great care must be observed in affording water, or the roots will become inactive, and the soil sour. Syringing should only be practised on sunny mornings, but damping down of floor and wall spaces may be practised daily, and the evaporating troughs kept filled with water with which a small proportion of manure-water may be mixed. The temperature of the fruiting-house should be kept at a not lower figure than 70°, except in severe weather, when it may be allowed to fall a few degrees. With sunshine the warmth may rise to 80°, and whenever the air is mild a small amount may be admitted when the thermometer in the house indicates 80°. The temperature of the water applied to the roots or foliage should not be less than 75°. Let attention be constantly paid to the pinching of the young shoots, without which it is impossible to keep up a regular supply of fruits. The latter, as fast as they become of a useable size should be removed, keeping them in a warm place with their stalk-ends immersed in water.

Sowing Cucumber-seed.—If winter Cucumber culture is not practised, but the season begins at an early date in the spring, seeds may now be sown. If a propagating-bed made of fermenting materials is available, and it has a steady bottom heat of 80° and top heat of 70° to 72°, Cucumber seeds may be sown 2 in a 60, or 6 in a 48-pot, which should be plunged wholly or partly in the plunging materials overlying the bed. Moist loam and leaf-soil should be used to fill the pots, and no water afforded before the rough leaves appear on the seedlings. The seedlings in the 60's may be singled to the stronger in each pot, or they may remain together and be shifted intact into 48 or small 32's. Those in 48's may be lifted with a ball of earth and potted in 60's or 48's, singly or in pairs. Be careful to use quite warm soil, replacing them in the frame directly, and keeping close for a few days. If no leaf-soil is available, use Mushroom-bed dung, and be sure to use new or clean pots for sowing and potting. Slightly press the soil before sowing the seeds, but do not press that which is used in the filling of the pots. Keep the glass bright, as full sunshine strengthens the plants, especially when air can be afforded simultaneously. A shelf near the glass is not a good place for growing these plants, as it is usually one to which draughts of cool air have access, and the hot-bed frame or propagating-pit is a much better place for them.

HARD WEATHER IN THE NORTH AND MIDLAND COUNTIES.—Some of our correspondents state that cold of 27° was experienced in Northamptonshire on Friday, December 15; and 1° less at Wylam-on-Tyne on the same morning. Lincolnshire has been visited with severe cold.

ANNUAL DINNER AT THE TURNFORD HALL INSTITUTE.—The little village of Turnford, near Cheshunt, is sometimes called "Rochfordville," because it owes its growth, almost its very existence, to the nursery industry introduced there some fifteen years ago by the three Rochford brothers, Thomas, John, and Joseph, who rank among the most successful market-gardeners in Britain. There was a large gathering on the 16th inst., at the Workmen's Institute associated with the Turnford Hall Nurseries, over whose destinies Mr. THOS. ROCHFORD, the eldest of the three brothers, presides. Mr. THOS. ROCHFORD, who is president of the club, occupied the chair, and was supported by a number of influential gentlemen. The most pleasant feature of the banquet was the amicable relationship so unmistakably manifest between that gentleman and his great army of employees. Mr. F. W. MARTIN gave the most popular toast of the evening, "Our President;" and Mr. ROCHFORD in responding said he was proud of his staff of men, and proud of the club, and the uniform respectability which had characterised it ever since it was opened. The speeches were interspersed with musical and humorous selections.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DEC. 25—Christmas Day.
TUESDAY, DEC. 26—Bank Holiday.

SALES.

FRIDAY, DEC. 29.—Dutch Bulbs, Japanese Lilies, Rose &c., Imported and Established Orchids, at Protheroe Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period December 10 to December 16, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the week has been very foggy and frosty. Snow fell on the evening of the 12th inst. to the depth of 1 inch. A partial thaw set in on Saturday, followed by a sharp frost at night.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—37.8.

ACTUAL TEMPERATURES:—

LONDON.—December 20 (6 P.M.): Max. 42°; Min. 36°.

East wind; dull; cold.

PROVINCES.—December 20 (6 P.M.): Max. 47°, S.W. Ireland; Min. 39°, E. Counties.

At this season of the year in particular we think of our friends, past and present, with more than ordinary sympathy and pleasure. Unless we are very unfortunate, or very morose, which comes to the same thing, it is astonishing to find, on calling the muster-roll, what a goodly fellowship of friends we horticulturists find ourselves connected with. As the years spread out, no doubt some go, never to be replaced, but their memory remains a valued possession indeed. We are reminded of this right good-fellowship when thinking of Mr. HARRISON WEIR. Who that knows him will not set him down as a right good fellow? and the number of people who know him, in some way or another, must be vast indeed. How many

years he has been at work adding to our pleasures and enjoyments, inciting us to an appreciation of Nature's works, guiding our taste, and stimulating our love of the beautiful, we do not care to count. Suffice it to say, that the portrait we now offer was taken on May 5 of this present year, when Mr. HARRISON WEIR completed his seventy-fifth birthday, and the

and the artist work together, no doubt, but it is the born naturalist that has the precedence; and what he sees—aye, and what he feels—is reflected on his canvas.

There is hardly a branch of natural history in which Mr. WEIR has not interested himself. He is an excellent judge of poultry, dogs, and pigeons; he is the historian of cats; he knows

HARRISON WEIR.

look of that genial face seems to indicate that Mr. WEIR has yet more, and of good quality, in store for us.

Mr. HARRISON WEIR is an artist by profession, a member of the new Society of Water Colours, and the author and designer of illustrations innumerable in books and in the press; but it is not in that respect that we would here speak of him, even were we competent to do so. It is rather as a naturalist that we would think of him in this place. The naturalist

the little ways of birds, and beasts, and fishes; and he has written more articles and books about them than we could count. More than that, he is an enthusiastic and a progressive gardener, revelling in "wild gardens" before the name was invented, ever seeking to let a particular plant develop itself to its best, so that its beauty and exquisite adaptation to circumstances (environment we call it now-a-days) may be seen, studied, and pondered over, after the way of plant-lovers. On the other hand,

the faultless symmetry of florists' flowers, and their exquisite gradations of colouring, find in him a warm admirer, and no one knows better how to gain effect by grouping and massing. As an experimentalist he has always been at work. As a cross-breeder he has raised new

"The Floral Art of Japan."

This is a second and revised edition of the *Flowers of Japan*, and the *Art of Floral Arrangement*,* by Mr. JOSIAH CONDER. A notice of it at this season is opportune when we western barbarians are apt ourselves to recognise the

Significance and simplicity are the two leading features in Japanese floral decorations. Significance in that there is a definite meaning or purpose in what these deft-handed people do, whereas we inexperienced Westerners cram as many flowers as possible into our vases or our wreaths without thought of underlying purpose other than that of making a display.

Subtle harmonies, striking contrasts, beautiful compositions, and appropriate combination, if they occur at all do so with us by accident. This is all very different from the Japanese plan. The Japanese go to the other extreme, and attach undue importance to trifles—push significances to absurd extremes, and becloud the art of flower arrangement under a veil of tedious and irksome etiquette; or so it seems to us. To them it may be as important as sundry details of ceremonial are to some among us. The Japanese are intense in their love of flowers. The pages of the book before us show how they make high festival when the Plum, the Peach, and the Cherry, are in bloom; how they revel in the beauties of the Wistaria, the flat-petalled Iris (*Kämpferi*), the Peonies, and Azaleas.

In autumn the cult of the Chrysanthemum, and of the coloured foliage of the Maples, is practised with fervour. The coloured illustrations in the book before us are delightful as representations of Japanese manners and customs with relation to flowers; and the text gives us full details as to the flowers suited for this or that occasion, ceremonial, festive or funereal, specifying what may be used and why, and noting what may not be used for equally good reasons. To follow out these suggestions fully, the decorator would have to be thoroughly imbued with the religious feelings, the romance, the history, the sentiments and sympathies of Japan—in fact, he would have to be a cultured Japanese. All floral designs are made with the object of giving pleasure to visitors. The arrangement is placed to the best advantage in a special recess, in front of which the visitor squats with his knees bent, and the body resting back on the heels. He is supposed to take in the spectacle with careful deliberation and rigid ceremonial. He is to begin at the top and examine from the left and then from the right. After such inspection at close quarters, the guest slides backwards to regard the whole composition from an appropriate distance. He may then express his admiration, but he must do so only in the formulas which etiquette prescribes; and then the unlucky morning-caller may be invited—not to write a copy of verses in a lady's album, but to form a floral arrangement for himself. Materials for the purpose are provided, and the guest proceeds on his task under somewhat painful circumstances, and hampered with an infinitude of embarrassing rules of etiquette.

The general principles of Japanese flower arrangement are easily seized. They are founded on love of and imitation of Nature, and on simplicity.

See, for instance, how, in the cheap hangings or kakemonos now so common in our shops, the character of the stems of the trees is indicated by a few vigorous strokes of the brush, and with such verisimilitude that it is often quite possible to see what particular species of *Pinus* the artist has copied. Notice, too, how in the book before us, the rugged stems of the wild Plum are, as it were, emphasized in floral decorations, only a branch of wild Plum in a vase, but so arranged that, simple as it is, the material it forms an artistic composition. Our author gives copious details and illustrations of

FIG. 155.—*PERISTERIA ELATA*, THE DOVE ORCHID: FROM THE GARDEN OF J. BROOME, ESQ., SUNNY HILL, LLANDUDNO. (SEE P. 473.)

Cacti and new Pelargoniums, of which "Kate Greenaway" was the best; and he has also paid considerable attention to the variation in fruits induced by single, double, and treble grafting.

Long may he continue to be as one—

"Who loveth well
Both man, and bird, and beast."

symbolism of flowers, and to decorate our dwellings with less or more taste. It is evident from a mere glance at this interesting and beautifully illustrated volume, that we have much to learn from the Japanese in the way of utilising flowers for decorative purposes.

* Sampson, Low, Marston & Co., St. Dunstan's House, Fetter Lane, E.C.

these compositions, and of the means the Japanese make use of to secure due balance. As we have said, they are very simple in the abstract, but they require an inborn taste and a trained eye to carry out in the concrete. The following extracts will show what association the Japanese connect with flowers:—

"There are said to be in Japan 269 colour varieties of the Chrysanthemum, of which 63 are yellow, 87 white, 32 purple, 30 red, 31 pale pink, 12 russet, and 14 of mixed colours. A fancy prevails that in this flower the same tint is never exactly reproduced, and that it thus suggests the endless variety of the human countenance. Blooming longer than most flowers, the Chrysanthemum has come to be associated with longevity. In the province of Kai, a hill, called the Chrysanthemum Mount, overhangs a river of clear water, into which the petals fall, and a belief exists that long life is assured by drinking the water of this stream. A favourite motive of decoration, which may be seen in numerous conventional designs, is the Chrysanthemum blossom floating in running water. A custom also survives of placing small blossoms or petals in the cup during the wine-drinking which takes place on the festival of the ninth day of the ninth month.

"The ordinary varieties of Chrysanthemum are to be seen in great abundance in the street fairs during the autumn months. Dango-zaka, in Tokio, is a favourite popular resort during the Chrysanthemum season, but here the flowers, mostly of the smaller kind, are used, artificially, modelled into groups of figures and animals representing historical subjects, scenes from popular theatrical performances, and even the battle scenes of the China-Japan war."

"For the floral decorations of the New Year, it is customary to adopt a combined arrangement of Pine, Bamboo, and Palm-branches in a large bronze or porcelain vase. These flowers are, however, sometimes used separately, in which case the Pine is displayed on the first, the Bamboo on the second, and the Plum on the third day of the year. In some cases a vase of green Bamboo, with twigs and leaves left on, is used to hold branches of Pine and Plum-trees, the floral triad being formed by including the vase itself. The Willow is a favourite tree for use in hanging compositions at this season, and plants such as the *Adonis amurensis* (Fukujuso), *Rhodea japonica* (Omoto), and *Ardisia japonica* (Yabukoji) are often employed in combination with the Plum."

* * OUR ALMANAC.—According to our usual practice we shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1900. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us IMMEDIATE INTIMATION of all fixtures for the coming year.

NEW GARDEN PLANTS, 1898.—The Appendix II., 1899, to the *Kew Bulletin* (Eyre & Spottiswoode), is a record of all the plants introduced into gardens during the year, compiled from the various publications foreign as well as British. Many of these names are merely temporary or provisional, destined it may be, to be changed when more knowledge has been obtained. Such names are published necessarily without full botanical details, and should therefore be treated simply as "garden" names. They should be recorded, and the place and time of publication given, but no author's name should be given in the absence of any authentic botanical description or adequate illustration.

JAMES MARTIN MEMORIAL FUND.—It is intended to raise a fund for the purpose of placing a child on the Orphan Fund. The fund will be known as the MARTIN Memorial Fund, and will perpetuate the memory of a zealous and conscientious man, and at the same time relieve the neces-

sities of some unfortunate child. Messrs. ARTHUR SUTTON and HARRY VEITCH are the Treasurers; Mr. WOOLFORD, East Thorpe, Reading, and Mr. H. C. COX, Fernlea Junction Road, Reading, are the Secretaries.

PRESENTATION TO MR. T. W. SANDERS.—At the recent annual dinner of the National Amateur Gardeners' Association, held at the Holborn Restaurant, rather more than ordinary interest was evinced in that gathering. For some time past the members have expressed a wish to recognise the valuable services rendered to the association by their president, Mr. T. W. SANDERS, who, during nine complete years has freely given his advice and help in many ways. On behalf of the members, Mr. D. B. CRANE, deputy-chairman, presented a handsome gold watch and chain, engraved on the outside with Mr. SANDERS' monogram, and with the following inscription engraved on the inside of the case:—"Presented to T. W. SANDERS, Esq., by the Members of the National Amateur Gardeners' Association, as a token of esteem and regard, and in recognition of his long and invaluable services [as their President: December, 1899." Reference was made to the founding of the association on the initiative of Mr. SANDERS, whose many years of service had been ungrudgingly given.

OOM PAUL AS A GARDENER.—OOM PAUL KRÜGER has inherited from his forefathers a love for floriculture. Strange to say, he cares little for Tulips, less, in fact, than for any other flowers, perhaps because the South African climate is scarcely suited to the development of these gorgeous bulbs. He does not dislike all bulbous plants, however, for the Daffodil is one of his favourites. For many years he has imported Narcissus bulbs from Europe, but alas, he cannot make them grow. OOM PAUL has consequently announced with due gravity that he has given up the Narcissus, which is probably equivalent to saying that it cannot be grown in South Africa with success. To one accustomed to imagining this obstinately powerful Boer as ever subjugating or resisting some one or something, it will be strange to picture him as having trowel in hand, fussing with loam in flower-pots and watching the seeds sprout. His Phlox garden is the pride of Pretoria, and every morning early when the good burghers drop into the Executive Mansion, they find their President sitting or standing by a table which invariably bears four vases of these flowers, red, white and pink, in outlandish contrast with the hottelgreen tablecover resembling an immigrant's scarf, and occasionally some visitor will be honoured with a *boutonnière* of white and red flecked Phlox. There is one colour that Oom Paul cannot abide in his garden, and that is purple, and if such a flower of that hue chances to intrude he will cast it out as if it were a rank weed. When KRÜGER is not fussing about his trees he is attending to the potted plants, which are his especial delight. He has many of them in variously shaped receptacles, most of which are of tin. Even the tomato-can is made use of, as several Ivy-vines just being trained go to show. When one steps on to the piazza of OOM PAUL's cottage, he encounters long rows of shelves laden with potted plants. Red Geraniums are especial favourites, and he always points to each new budding stalk with pride. Azaleas of some size bloom about the house in their season, and in the early spring one may see a box of sprouts as carefully tended as an occupied cradle. OOM PAUL's eldest living son inherits his father's love for almost everything, but plant-culture has never taken his fancy. It is related that an Englishman who had travelled in the Transvaal had learned of OOM PAUL's fancy for plants, and played the practical joke of sending him some seeds of the obnoxious Russian Thistle, which has become the pest of the farmers of Europe. OOM PAUL was pleased with the stranger's courtesy and immediately planted the seed, not knowing what it was. Only one seed sprouted and then died a melancholy death. Thereupon, in

all innocence, and not to be balked in his attempt to grow anything, he wrote and asked the courteous stranger for more of the seed. *Evening Sun*.

"A MOST SUCCESSFUL GARDENER."—MR. CHAMBERLAIN was recently described in perfrigid Latin as "*florum ipse cultor felicissimus*." The occasion was when an honorary Doctor's degree was conferred by the University of Dublin, on the eminent Minister and well-known orchidist.

WEST EUROPEAN MINTS.—M. ERNEST MALINVAUD, who is well known as the French Mint specialist, sends us a short paper on the genus extracted from the *Comptes Rendus* of the learned societies for 1898. M. MALINVAUD published in 1877-8 four fasciculi containing twenty-five specimens each, collected principally in France. He places in a distinct sub-genus *M. Pulegium*, *cervina*, and *Requienii*, and considers that the primary species run into numerous sub-species and varieties, and that they hybridise copiously, the primary hybrids sometimes hybridising again. In this country very little has been done in the genus since the publication of Mr. J. G. BAKER's monograph in *Seemann's Journal of Botany* for 1865. In Germany the Mints have been studied carefully by MM. F. SCHULTZ and WIRTGEN, who also have published a fasciculus of specimens; in Belgium by M. DURAND and the Abbé SHAIL; and in France by MM. BOREAU and DÉSÉGLISE. The third edition of BOREAU's *Flora du Centre de la France*, contains descriptions of fifty-five species, and the Abbé SHAIL's monograph of the Belgian Mints in vol. xxvi. of the *Bulletin of the Royal Botanic Society of Belgium* (pp. 63-168) of 134.

JAFFA ORANGES.—The *Revue Horticole* of November 16 has an article from the pen of M. ANDRÉ, and an excellent coloured figure. Our excellent colleague tells us that this variety is not mentioned in that curious old book, FERRARI'S *Hesperides*, nor in RISSO & POITEAU's famous *Histoire Naturelle des Orangers*. The variety is cultivated in the coast region about Jaffa, but M. ANDRÉ has succeeded in introducing it to the Riviera, and the illustration now given is taken from a fruit produced in his garden at Golfe Juan.

MOUNT KOSCIUSKO.—In the *Agricultural Gazette* of New South Wales for October, Mr. MAIDEN narrates how he made the ascent of this mountain, which reaches an altitude of 7328 feet. After leaving the pastures, the travellers passed through a dense scrub of Snow Gum (*Eucalyptus coriacea*), the trees being about 20 feet in height. Intermingled with this were large patches of *Dianella tasmanica*, bearing a profusion of blue flowers, of whose beauty Mr. MAIDEN speaks enthusiastically. A list of the plants collected is also given.

THE FRENCH FORCING GARDENERS (PRIMEURISTES).—A deputation from the Syndicate of the French Market Gardeners (Primeuristes) visited the kitchen garden of the National School of Horticulture to see the preparations for forcing Strawberries in 1900. The deputation found 25,000 pots or plants, a number against which they protest as being much larger than is requisite for the tuition of the pupils. According to the *Bulletin of the Syndicate*, France sent us fruit to the value of 12,173,000 francs in 1899, far more than to any other country. Personal interests alone, therefore, should induce her to keep the peace with a neighbour who is so good a customer.

UNWHOLESOME FRUIT.—The magistrate at the Southwark Police-court recently fined a well-known firm of fruit-brokers the sum of £149, with £10 10s. costs, for having a quantity of unsound Strawberries and Raspberries at the premises of LIPTON, Limited, Rouel Road, London.

DEVON AND EXETER GARDENERS' ASSOCIATION.—The lecture with further experiments with garden-manures, by Mr. F. W. SHRIVELL, of Tonbridge, which was to have been given on Wednesday last, is unavoidably postponed to the spring session.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the Lecture-hall of the Institution on Monday, Jan. 15, 1900, when a paper will be read by Mr. JOHN NISBET (Colonial Fellow), entitled "Forest Management, with Suggestions for the Economic Treatment of Woodlands in the British Isles." The chair will be taken at 8 o'clock. Notice is given that the Institution will be closed from Thursday evening, the 21st inst., to Thursday morning, the 28th inst. Members who are graduates of any of the recognised universities of the United Kingdom are requested to intimate the fact to the secretary of the Institution, in order that the same may be indicated in the next issue of the list of members.

WOUNDED AT MAGERSFONTEIN.—The many horticulturists who know Mr. NEIL FRASER, Rockville, Edinburgh, for so long the genial Treasurer of the Royal Caledonian Horticultural Society, will sympathise with him over the regrettable news from Magersfontein, where his son was wounded on the 12th inst. He is attached to the Highland Light Infantry, and only in October last received his commission, and proceeded at once to South Africa. The young Lieutenant's great-grandfather was one of the originators of the Royal Caledonian, and early in the century wrote an account of gardening in Holland, &c.

DINNER AND ENTERTAINMENT TO THE EMPLOYÉS OF MESSRS. HURST & SON.—This annual function took place in the King's Hall, Holborn Restaurant, on the 16th inst., a party of some 120 persons being present, including the representatives of business houses who have dealings with the firm, and others who were present in the capacity of visitors. Mr. N. N. SHERWOOD, the head of the house, presided, supported by his two sons, Messrs. WILLIAM and EDWARD SHERWOOD, some of the heads of departments occupying the vice-chairs. A few of the employés were unavoidably absent. The proceedings were greatly enlivened by the orchestral band connected with the firm, of which Mr. EDWARD SHERWOOD is the leader, and their excellent performances were greatly appreciated. In the course of the evening, Mr. HUGH AITON, on behalf of the employés of the firm, presented him with a silver baton and some musical scores, he having recently come of age. Abundant testimony was forthcoming during the evening showing the admirable relations which exist between Mr. SHERWOOD and his two promising sons and their employés. In an excellent speech Mr. G. M. INNES proposed success to the firm of HURST & SON, to which Mr. SHERWOOD made a feeling response, making special reference to several of the employés by name, who had been in his service for many years, bearing testimony to the high value he set upon their services, and expressing the hope they would remain in the house for many years to come. Mr. HUGH AITON, an old and trusted servant of the firm, proposed the health of Messrs. W. and E. SHERWOOD, each of whom made suitable response. The visitors, the Press, the representatives and heads of departments were similarly honoured, as was also the cricket-club and the musical society. The musical programme was well carried out, and gave great satisfaction.

GOLDER'S HILL.—The pictorial estate adjoining Hampstead Heath has been secured for the public benefit by the London County Council. It is one of the most picturesque gardens near London, and was the residence of the late Sir SPENCER WELLS.

STOCK-TAKING: NOVEMBER.—The chronicle of last month's trade as recorded in the Trade and Navigation Returns for November is a very pleasant and encouraging one; for is not there an increase in imports amounting to £2,175,997, and in exports of £4,751,733? In the appended table it is satisfactory to note that our food supplies continue to increase in quantity if not always in value; and suitable supplies run short from one

locality, the loss is made up in excess from another—the ever-open door receives all comers with ready welcome. So also with material for textile fabrics, and, in fact, in all subjects outside of food and drink supplies. The following is our usual extract from the Summary of Trade:—

IMPORTS.	1898.	1899.	Difference.
	£	£	£
Total value ...	42,068,814	44,244,811	+2,175,997
(A.) Articles of food and drink—duty free ...	14,531,624	14,862,986	+331,362
(B.) Articles of food & drink—dutiable	2,843,111	2,787,804	—55,807
Raw materials for textile manufactures ...	7,805,385	7,130,831	—674,554
Raw materials for sundry industries and manufactures	4,127,950	5,178,602	+1,050,652
(A.) Miscellaneous articles ...	1,637,147	1,858,278	+221,131
(B.) Parcel Post ...	97,367	105,735	+8,368

The value of the imports for November is £44,244,811, against £42,068,814, a gain of £2,175,997. And now we come to the figures relating to the imports of fruit, roots, and vegetables, to be found in the annexed table.

IMPORTS.	1898.	1899.	Difference.
Fruits, raw:—			
Almonds ... cwt.	36,151	31,818	—4,333
Apples ... bush.	811,788	765,477	—46,311
Currants, dried.. cwt.	185,165	202,697	+17,532
Raisins " " "	123,234	137,830	+14,596
Grapes ... bush.	199,407	159,156	—40,314
Lemons ... " "	109,122	80,710	—28,412
Nuts, as fruit ... value	£157,188	£120,756	—£36,432
Oranges .. bush.	742,718	732,921	—9,797
Pears ... " "	47,092	28,904	—18,188
Plums ... " "	1,194	1,436	+242
Unenumerated... "	108,804	104,331	—4,473
Roots and Vegetables:—			
Onions ... bush.	665,631	648,056	—17,575
Potatoes ... cwt.	130,680	351,568	+221,188
Vegetables, raw, unenumerated ... value	£112,612	£112,231	—£381

Quite a row of minus figures, but Currants and Raisins for home consumption show plus quantities, and in a marked degree. So also do Potatoes. By the way, the total imports for the eleven months just closed foot up £44,339,264, against £425,283,431 or a gain of some £19,055,833. Come we now to the—

EXPORTS.

the figures relating to which are of a most satisfactory character. There is an almost all round increase—the total being £4,751,733—thus gained: total for month of November, £24,571,940 against £19,820,207 for the same period in the previous year. A line may be spared to China, where our market is widening, and will widen still more under the new Chinese Department of Commerce, which may yet achieve the "open door" and save dismemberment. All other items in the returns indicate a prosperous condition of things in most of the home industries. The exports for the eleven months foot up £242,622,158, against £212,412,384 for the same period in 1898—or a gain of £30,209,774.

PERISTERIA ELATA.

THE Dove-plant as it is called in British gardens. El Espiritu Santo of the Spanish settlers in its native habitat in Central America, has always been a favourite in gardens, where, since its first introduction in 1826, it has commanded a fair amount of attention, and when in flower never fails to be admired by all who see it, the event being usually marked in olden times by the visits of all the gardeners and others interested in gardening to behold

its stately, wax-like white flowers. In the days when large specimen Orchids used to be exhibited at the Royal Horticultural Society's great shows at Chiswick, those of the Dove-plant often formed the most important of the exhibits, and in those days probably, on the average, finer specimens were seen than in our times, though the art of growing *Peristeria elata* to perfection cannot be said to be a lost art, for the grand specimen shown by Mr. Owen Thomas, the Queen's gardener, at the Royal Horticultural Society, September 6, 1898, when it was awarded a Silver Floral Medal, will rank among the best observed in recent years. The plant in question was about 8 feet in height, and bore a number of stout flower-spikes, having an aggregate of over 300 flowers. Mr. Joseph Broome, of Sunny Hill, Llandudno, whose gardener is Mr. A. C. Axtell, and by whose courtesy we are enabled to give the accompanying illustration (fig. 155, p. 471), succeeds in growing and flowering the plant well, and with regularity, the plants in his collection being of the best type imported from the isthmus of Panama, that form having the largest flowers, and of a more clear white, than those obtained from other regions.

Every gardener does not succeed in growing *Peristeria elata* in a satisfactory manner, so that a few cultural remarks will be valued by some of our readers. It is a native of the tropics, and must, therefore, find a place in a warm-house, such as a moist plant stove; and the plant should be potted and treated in a somewhat similar manner to the larger *Phaius*. That is to say, that the material used in potting should consist of two-thirds turfy loam and one-third fibrous peat, both materials being broken up by the hand, so as not to have too much fine soil in the compost. To this should be added a good sprinkling of well-decayed and dry cow-manure. After the plants are potted (the pseudo-bulbs being not raised, as with epiphytal Orchids, above the rim of the pot), afford them a surfacing of live sphagnum-moss. When in active growth, plenty of rain-water at the roots should be applied, and once or twice a week weak liquid-manure. When the bulbs are fully developed, water should be restricted in amount, and liquid-manure withheld entirely.

HOME CORRESPONDENCE.

MARKING POTATO-BAGS WITH THE VENDORS' NAMES.—If, as is doubtless assumed, it is likely to lead to good business when bags of Potatoes have the names of the foreign vendors fixed on to them, why should not such plan be good for home-growers or vendors also? The foolish people who, in their desire to restrict foreign trade, insisted in having all imported goods branded with the name of the place from whence it came, did the very thing they desired to prevent, by publishing everywhere the name and address of the foreign merchant. If the result has been a boon to foreign trade, why should not a similar course be made a boon to home trade? But is there any better trade-mark than is found in excellence of samples or of material? Are German Potatoes better than our own? If they are, so much the worse for our growers. But it has to be shown not only that they are better, but as good. After all, trade is very much a matter of intelligence and enterprise. Those who go to sleep must expect to be overmatched by the wide-awake. *A. D.*

GARDENERS' ROYAL BENEVOLENT FUND.—As the present rule of the above society stands, no men are eligible for joining unless in the position of head gardener or foreman. It has occurred to me that it would be advantageous to the society, and

also to the gardening community in general, if the managers and committee could see their way clear to include also all journeymen. By so doing young gardeners could commence earlier, and if the thing were well explained to them, and they were allowed to subscribe the usual guinea in two instalments—one at Midsummer-day, the other at the end of the year—it is possible some would join, and they would not miss the money so much then as later on. For example, supposing a young man begins to subscribe at twenty years of age, he would be only thirty-five years when the allotted time of fifteen years had expired. I think most of your readers will agree with me that it is easier to subscribe at an early age than when a man is married and has, perhaps, a family to maintain. I am aware that in most cases the individual would be married long before the term expired; however, if permitted to join at an early age, he would have made a good start, and the well-known words "well begun is half done" would be applicable. *A. J. L., Gardens, Wyfold Court, Reading.*

ROSE SOILS.—This subject of soils the most suitable for the Rose is an interesting one, but we should have a care that in arguing from insufficient premises we do not discourage the cultivation of Roses in gardens which do not happen to consist of an ideal "Rose soil." What should the average Rose-grower look for? Is it Roses so fine in substance, form, and colour, that they are pre-eminently exhibition blooms, and that, too, with no very great attention on the part of the grower? These can be found only on the deep, clayey loams where gravel-beds, chalk or green-sand, lay many feet below the surface. We cannot all live on such strata, and some of us are fain to content ourselves with light land overlying chalk, or sand, or gravel, as it exists in many parts of southern England. Still, by the addition of heavy loam brought from a distance, and mixed with the staple, very fair Roses are obtained. In these light soils made heavy, the wood of the Rose gets well matured, and the plants bloom abundantly, but the flowers are often thin of petal. Another class of medium loams is met with overlying basaltic or limestone rock at no great depth. This is met with in the northern counties of England and southern Scotland. In these soils the Rose is very floriferous, with vivid colouring and large-sized flowers, and owing to its good drainage and the warmth of the soil consequent thereon, the second flowering of H. P.'s, Teas, and H. T.'s is extremely good. The goodness of the Roses grown in the neighbourhood of Aberdeen, especially on Messrs. Cocker & Sons' land, which probably overlies granite, is due to the same causes, although usually attributed to good culture alone. The Rose-soils *par excellence* are the Oxford and Essex clays, the first overlying the oolite and the latter the London clay. We see this at every Rose-show where the Messrs. Cant from Colchester, and Mr. Prince from Thame and Oxford, compete, their flowers being of great excellence in every point, Mr. Prince usually excelling in Teas and Hybrid Teas. Excellent Roses are grown in Messrs. Veitch & Sons' nursery at Coombe Wood, the soil of which is far removed, as regards its constituents, from Oxfordshire and Essex loams or that arising from the abrasion of granitic and basaltic rocks. The fact remains that Roses in gardens are mostly cultivated on "made soils," and their growth, and the goodness or otherwise of the blooms, are chiefly due to the sort of cultivation pursued, and very little to local climatic conditions. With field culture it is different, the very extent of the area devoted to Roses precluding any attempt at much amelioration of the soil. Hence, under ordinary cultivation in fields, and without special aids, the undisputed superiority of Essex, Oxford, and Aberdeen Roses. *F. M.*

BEGONIA "CALEDONIA," OR THE WHITE GLOIRE DE LORRAINE.—Since Mr. Forbes of Hawick exhibited this charming new winter-flowering Begonia at the Drill Hall, I have had the pleasure of inspecting his by no means limited stock of these plants. Mr. Forbes is fortunate in being the possessor of this decided novelty, a novelty not like many that are introduced, which are here to-day and away to-morrow, but one which has undoubtedly come to stay, and which is indeed worthy of a foremost place in every collection of winter-flowering plants. It is the exact counterpart (except in the matter of colour, which is in this case pure ivory-white) of the now extensively cul-

tivated Begonia, Gloire de Lorraine, which has risen by leaps and bounds in the estimation of the flower-growing and flower-loving public, and no doubt it will be as extensively cultivated, or even more so, than its parent Gloire de Lorraine. It is a sport from that variety; and Mr. Forbes informed me that it is a decided break, as it had not in a single instance reverted to the original type. The houseful of plants is a sight well worth a visit; and arranged, as it is, in combination with the pink variety, the effect is gorgeous. Small plants are as floriferous as those in larger pots, and the cultivation is as simple, and its wants as few, as Gloire de Lorraine. There is not the slightest doubt that this new Begonia, named appropriately Caledonia, has a bright and lasting future before it, and the demand for plants will tax the resources of the Buccleuch Nursery to the utmost. I examined the lot of plants after their long journey to and from London, and they had stood the test of railway travelling extremely well. *R. T. S.*

THE WEATHER IN NORTHAMPTONSHIRE.—Our thermometer registered on the night of the 13th inst. 27° of frost, Fahr. The glass is 15 inches above the ground, and faces S.E. This district has an elevation of 465 feet. *H. Kempshall.*

MISLETO GROWING ON OAK.—A friend of mine, an ornithologist, visited Slavonia for the purpose of noting the birds. He says that he saw the Mistleto mostly growing on the Oak there. In an extensive forest, almost entirely consisting of Oak, near the town of Semlin, on the Danube, he noted that the Oak was the tree mostly infested by the parasite, whose green, luxuriant growths were conspicuous by their lofty situation. Unfortunately, he did not bring a specimen. I have looked into Wagner's *Deutsche Flora*, Ludwig's *Biologie der Pflanzen*, and Engler & Prantl's *Pflanzen Familien*, &c., but cannot make out whether it was *Loranthus europæus* or *Viscum album*, that my friend saw. He was there in May. I shall feel greatly obliged if you can give me any information on the subject through the columns of the *Gardeners' Chronicle*. *A. R. Hall, Edinburgh.* [Both *Viscum* and *Loranthus* are wild in Slavonia. *Ed.*]

SOILS AND LOCAL CONDITIONS.—The remarks of my valued friend "H. J. C." (p. 456) form very interesting reading to me. Having had the great advantages of serving under him 25 years ago, I can fully bear him out with regard to Poinsettias being well grown at Grimston Park at that time. His modesty however must not be allowed to attribute all the credit to soil and local conditions, as from experience gained under him, the following season (viz. 1875), I took the same subject in hand at Heckfield Place, under the late Mr. Wildsmith, and the plants produced bracts 18 inches in diameter, some of which Mr. Wildsmith sent to the Editor of the *Gardeners' Chronicle*. Of the influence of soil and local conditions upon certain subjects, I am quite convinced. As an instance of this, I may relate, that for about five years I had grown a batch of Chrysanthemum Princess Victoria at Maiden Erlegh, hoping to meet with the same amount of success which other gardeners had obtained with the variety. Each year I met with the same sort of failure—the plants merely producing a few weakly blooms in the month of January, being assured by my present foreman at Sherborne Castle, who was with my predecessor, that C. Princess Victoria had always been flowered satisfactorily. I have grown a good batch of it, and I am more than pleased with the result. The plants are blooming as freely as C. W. H. Lincoln, and although in bloom for the last three weeks, they will remain well over the Christmas season. *T. T., Sherborne Castle, Dorset.*

THE KEEPING CAPABILITY OF COE'S GOLDEN DROP PLUM.—My experience in keeping the above Plum (*Gard. Chron.*, p. 456) has been limited to a few weeks only. I can however corroborate the remarks of "D. T. F." with regard to it being grown successfully on any aspect of wall—at the least, in the South and West of England. At Maiden Erlegh, Reading, a tree on a N.E. aspect never failed to produce a crop of fruit of the finest quality, some of which each season were exhibited at the Crystal Palace Fruit Show, and once at least they were awarded a 1st prize. Here it is grown on S. and N. aspects, and the fruit from the latter aspect is as fine as that from the S. aspect, and more useful, as they afford good dishes for the

dessert throughout the month of October when Peaches are becoming scarce. *T. Turton, Sherborne Castle, Dec. 18.*

CHINESE CABBAGE.—This plant has been cultivated at Kew since 1887, when seeds of it were presented by Mr. George Hughes, late Commissioner of Customs at Chefoo, China. An account of it was published in the *Kew Bulletin*, 1888, p. 138, and also in the *Gardeners' Chronicle*, May 19, p. 619, which contained a description of the several varieties, and their uses as a vegetable in China, together with a few particulars of its behaviour under cultivation at Kew. Since then it has annually ripened seeds at Kew, which have been included in the list of seeds for distribution published every year. In 1890, Mr. Charles Ford, of Hong Kong, sent seeds of two varieties, which were called White and Green Shantung Cabbages. These were shared with the Royal Horticultural Society, and Messrs. Paillex & Bois, Paris. The *Kew Bulletin* for 1893 contains the following note, which was contributed by Mr. Milne Redhead, of Holden Clough, to the pages of *The Garden*:—"Being specially fond of vegetables, I tried a few years since some seeds of Shantung Cabbage, for which I was indebted to Kew. For two years I thought it worthless, its open heartless head running up to seed very quickly. But this year I sowed the remains of my seed, and yesterday a dish of what appeared to be beautifully white Cos Lettuce was brought to me. Boiled, for dinner, I found it most insipid and worthless, simply so much tender green vegetable between the tongue and teeth, with absolutely no flavour to the palate. To-day I have tried it as a salad, and I find it excellent, white, crisp, and sharp as the best summer Cos Lettuce. Worthless as a vegetable, but of great value as supplying an excellent late autumn salad." *W. W.*

EUCALYPTUS OUT-OF-DOORS IN KENT.—Against my house is an Eucalyptus, which I planted in May, 1897, in a north-west aspect, and which has never been otherwise sheltered in the least. It is now 20 feet high. There are also six specimens in the open, in the kitchen garden, which are 15 feet high, and look well, although we have had 17° of frost. *Wm. Lewis, East Sutton Park Gardens, Maidstone.*

MUSHROOM GROWING IN OLD WINE CELLARS AT LEITH.—Your correspondent writing over the initials "W. H. M.," has proved little further than that he is thoroughly acquainted with the topography of the town of Leith. Volumes of words in themselves are by no means convincing arguments. I did not say that Mushroom growing was a nauseous business, nor did I say that underground cellars were unsuitable for their cultivation. What I did say, was, that when Mushrooms were grown in thickly populated districts the culture became nauseous. And no matter whether there are dwelling houses in the same street or not. One has only to look at the population of Leith, and the number of acres the town covers, and I think he will be convinced that Leith has a fair portion of human beings residing within its boundaries. As to the prizes given for town-grown Mushrooms, I think the least said about it the better. Not so very long ago I visited one of the largest Mushroom growing establishments in the country, carried on in a tunnel beneath a city. And from what I saw then leads me to the belief that such Mushrooms could be, if anything, bought cheaper than of those growers out in the country. Mr. Fish seems to have run away with the idea that I want to suppress Mushroom growing; far from that, I would like very much to see it considerably extended, but not in towns. Mr. Fish gives a graphic sketch of how the manure should be prepared, and of the cleansing power of Mushrooms. But what about the steam and noxious gases evolved during the period of the preparation. They are not just what one would care about having within a few yards of a dwelling, more especially in a town. In the rural districts it is altogether different because there is plenty of fresh air to counterbalance the bad effect, and carry away the products of fermentation. It has often surprised me how the authorities in London permit Mushroom growing within the Metropolitan district. I have seen men and women working at the manure when they could hardly be seen for steam, and the stench could by no means be pleasant. And strange to say the London authorities are very particular that the manure should be taken

away before it gets time to accumulate or ferment in the mews. The one is hardly consistent with the other, yet it is the case. As for getting machinery set up for this forcible suppression of dung-hills about large farms and gardens, nature has already provided the necessary machinery for the destruction of refuse, in the way of manure. Bring the manure to the farms and gardens and grow the Mushrooms there, and they will be good, sweet and pure, and the price will be equal to if not better than those grown in towns. D. L. M.

CHRISTMAS POTATOS.—It is generally conceded that Potatos are not good this year. But to the rule there are exceptions, as I have found, some soils turning out quite nice, dry-eating, starchy tubers, whilst in other cases there has been a great lack of finish, and in many instances tubers of varieties ordinarily excellent show evidence of blackness when cooked. That defect is doubtless largely due to the excessively dry nature of the season, which prevented in tuber formation that full deposit of starchy matter without which all Potatos are imperfect. Even the famous Ashleaf is not free from this defect, as in many tubers there is at the stem end an unmistakable evidence of blackness when cooked that shows how imperfectly that portion of such tuber has been matured. There are, no doubt, myriads of cases in which Potatos would greatly benefit were lime and wood ashes more freely used. Still, these ingredients fail to compensate for lack of moisture of which the Potato plant needs enough, but is equally undesirous of too much. But it may be questioned whether the common practice of cooking Potatos by boiling them does not materially help to create this offensive blackness. Water varies very much in the elements it contains, and if there be objectionable constituents, Potatos in the course of cooking suffer. But where tubers with all possible care still fail to boil so well as to be presentable at table, no doubt well washed then partially baked in a slow oven, the produce becomes much more acceptable. But it is doubtful whether any Potato is more pleasant eating in a cooked state than when baked in its coat, especially if so cooked in hot peat or wood ashes. So prepared, then well cleansed of dust, cut in halves, and neatly removed from the hard coats, and dished up, Potatos are delicious eating. No better method of serving up tubers to table at Christmas can be devised. But after all, good or indifferent, what Christmas dinner would be regarded as complete devoid of a dish of Potatos? A. D.

ODONTOGLOSSUM CRISPUM.—My twenty years' experience has taught me to grow *Odontoglossum crispum* to perfection. Air in abundance, shade in summer, plenty of moisture in the house, particularly in the summer months, in fact you cannot keep the house too moist during hot weather; loose potting, for the roots require air, as much so as bulbs and growths; no fire-heat applied, or only sufficient to keep the temperature from falling below 40°, and 2° or 3° lower in severe weather. The above methods I have followed for years, and have had spikes bearing from twenty to twenty-four flowers. I have frequently had *O. crispum* flower from the apex of the pseudo-bulbs, caused, I should suppose, through the extraordinary vigour of the plants, certainly not through weakness or checks. Our *Odontoglossum*-house is 50 feet long, and in severe weather it is covered with mats, over the lath blinds. I do not employ much artificial heat, which is the ruin of *O. crispum*. H. Garnett, gardener to R. G. Fletcher, Esq., Mount Harry, Brighton.

APPLES PEASGOOD'S NONSUCH AND ALFRISTON.—About three years ago I sent you a photograph representing a crop of Peasgood's Apple upon Espalier trees, which you subsequently published on March 7, 1896. During last autumn I again had the crop photographed, and now enclose a copy. Many gardeners call here who seem to think the Peasgood Apple a shy cropper, and they cannot understand why the variety crops so freely here. Many years ago, when at the Duke of Beaufort's gardens (S. Wales), and when at Capt. H. Goschen's, Heathfield, Addington, near Croydon, I was told not to prune this Apple hard, but my own experience is exactly opposite to this. I spur them very closely, except in the case of the leaders, which are cut to half their length. Then again, many have the impression that this Apple is not a good keeper, therefore I am sending

you a few fruits, so that you may see their condition at Christmas. As to cooking qualities, I do not know any better Apple, although I grow some eighty-five varieties. I also send you a few "Alfristons" gathered from a tree forty years old, which had quite as good a crop as Peasgood's. Alfriston is a grand keeper, if gathered at the proper time. It will never decay, but it shrivels. I measured a fruit of "Peasgood's" which was 13 inches in circumference. The length of the "Peasgood's" espalier is 50 feet, and its height 5 feet. Wm. Lewis, *The Gardens, East Sutton Park, Maidstone*. [Our correspondent grows exceptionally fine Apples, and none succeeds better than the variety "Peasgood's Nonsuch." The fruits received with the above note were handsome specimens, and as fresh as possible. We do not reproduce the photograph, because the one published in 1896 sufficiently illustrates the magnificent crops obtained. A description of this garden was given in our pages on October 15, 1898, p. 283. Ed.]

SEEDING OF BEGONIA GLOIRE DE LORRAINE.—In reference to the subject of Mr. Hemsley's article (p. 423), which I had overlooked, I may state that I was not successful in obtaining fertile seed from this *Begonia*, although every female flower which I pollinated, in all about thirty, responded to the influence of the pollen by closing its petals over the stigma. Flowers which I purposely left alone showed no difference, the petals

FIG. 156.—GLOOSKAP TURNING A MAN INTO A CEDAR-TREE.

remaining open till the flower perished. I used pollen from several varieties and species, principally *B. coccinea*, *B. Knowsleyana*, a pretty pink, fibrous-rooted variety, and others, and with all the ultimate result was the same. The ovary of one of the flowers swelled more rapidly and became larger than any other, and I had hopes of getting fertile seeds from that one, but I was disappointed. I tried every method I could think of, and hoped that bright sunshine might assist me in March and April by ripening the abundant apparently good pollen grains; but although all the conditions seemed favourable to successful fertilisation, nothing but non-germinating seeds were obtained. Although I frequently sought after it, I obtained no good pollen grains from the staminate flowers wherewith to pollinate other varieties; so it would seem that both male and female organs have lost their reproductive powers for the time. No doubt some one will be successful in getting good seed, if this has not yet been accomplished, and he will be a fortunate man who first succeeds. A. F.

A VETERAN GARDENER.—Few gardeners can lay claim to such a long period of service as Mr. James Clarke, who, as far back as December, 1837, became head gardener to G. Beauchamp, Esq., Ford Place, Thetford, and on the death of that gentleman in 1838, Mr. John Buxton having hired the place, he was re-engaged. Mr. Buxton, succeeding to the title on the death of his father, Sir R. J. Buxton, brought Mr. Clarke with him to Shadwell Court in September, 1844, at which place he served the family for three generations in the capacity of gardener. The Shadwell Court estate was sold in October, 1898, to J. Musker, Esq., and

after remaining under the new owner until August, 1899, Mr. Clarke left his old home at Shadwell, having been there for fifty-five years, and is now with one of the old family, Miss Buxton, who, when Shadwell was sold, hired Icklingham Hall, the property of Lord Iveagh. Mr. Clarke is one of those hearty, jovial, and enthusiastic gardeners, taking an active interest in all that concerns his profession, as may be judged from the fact that in a letter to me the other day he describes in detail the Chrysanthemum Show at Bury St. Edmunds in November last, and regrets that at his advanced age, and in a new place, he cannot manage to exhibit Chrysanthemums. Our old friend, who is now in his eighty-third year, was married in 1842, and Mrs. Clarke is still enjoying fairly good health, and is as happy and cheerful as her husband, who, although now occasionally troubled with rheumatism, is still managing a place, having had a lease of active service which very few indeed get. We trust that Mr. and Mrs. Clarke may spend their remaining years in happiness, and heartily wish the aged and worthy couple every good wish of the season. J. M'K.

FERTILE FROND OF ADIANTUM CAPILLUS-VENERIS IMBRICATUM.—On p. 414, Mr. Hemsley writes of *A. c. v.*, variety *imbricata*, as being barren or producing bulbils in the place of spores. I have several plants of that variety under my care, and I would have no difficulty in supplying him with fronds that are loaded with spores. The original plant, which was obtained of Mr. Cripps, of Tunbridge Wells, sometimes produces fronds equal to those of *A. Farleyense*, and some may be selected that are facsimiles of the variety *A. Farleyense alcornae*. E. Sandford, 20, Argyll Terrace, Bognor, Author of "*Exotic Ferns and Selaginellas*."

—Replying to the above letter from Mr. Sandford, I may say that the frond sent by him is quite distinct to any that I have seen of this variety; and if it is from the true variety it has evidently reverted to the normal form. I send you a frond which was given me by Mr. Masters on October 12, 1886, when it received a First-class Certificate from the Royal Horticultural Society. I have had plants under my personal observation from the time it was first distributed, but I have never seen a fertile frond. Mr. Schneider in his *Book of Choice Ferns*, writes as follows:—It is interesting to note that this plumose form of the common Maidenhair-Fern, like most other forms of a plumose character is entirely barren." But I had not read this before writing my former communication. Like most British Ferns, *A. capillus-veneris* varies very much, and there are quite a number of distinct varieties. In looking over a batch of seedlings of the type, I find a great variation, both in size of pinnules and shape of fronds. I enclose a fertile frond taken from quite a young plant, which would appear as large in the pinnules as the variety grande. [Yes, that is so. Ed.] I may add that I find on further reference, Mr. E. J. Lowe obtained a First-class Certificate in June, 1872, for a variety under the same name, but I do not know if this was ever distributed. Mr. Masters' variety being the first I met with under the name. A. Hemsley.

MYSTICAL TREES.

IN running the boundary between British Columbia and the United States, the axe-men had in one locality the herculean task of hewing out the line through patches of gigantic Douglas Spruce, many of which were 30 feet in circumference and from 200 to 250 feet in height.

In Eastern Canada some years ago two old Pines of remarkable size enjoyed a local fame as the Old Man and Old Maid of Kempenfelt, on the shores of the bay of that name.

There is an Indian legend that shows very well how the aborigines, the children of the forest, esteemed the Pine and Cedar for their size, stability and length of life. Glooskap was a divinity. "Hearing that they could win the desires of their hearts there went forth men unto him; and all got what they asked for in any case, but as for having just what they wanted that depended on the wisdom with which they wished and acted.

"Three brothers journeyed from afar to the isle of enchanting beauty, where in three wigwams

dwelt Glooskap with Cuhkeo, the Earthquake and Cool-pig of a man without any bones. The first of the brothers who was very tall and was vain of his comeliness, asked to become taller than any Indian in all the land. And the second wished that he might ever remain where he was, idly gazing on the beauty of the scene. The third wished to live to an exceeding old age, and ever be in good health.

"Then Glooskap called Earthquake and bade him place them with their feet in the ground, and as he did so they became, as one tradition declares, Pines, and another, Cedars. The head of the first now rose above all the forest, and he who listens in the wood may hear him murmur—

'Oh, I am such a great man!

Oh, I am such a great Indian!'

The second, too, has his wish, being fast rooted in the ground and obliged to stay there: whilst the third, who wished for long life, is still standing as of yore." *A. E. Mickle, in Canadian Horticulturist.*

NOTICES OF BOOKS.

LA CONSERVATION DES FRUITS, DES LÉGUMES, DES GRAINES ET DES RACINES BULBEUSES.
Par Henri Coupin. (Paris: Octave Doin, Place de l'Odéon, 8.)

THE preservation of fruit and vegetables is a matter of such great importance that we cordially commend to those who read the French language this eminently practical treatise. The first section, devoted to the preservation of fruit, is arranged alphabetically from "Abricots" to "Sorbier," while the same idea is carried out in the next part that is devoted to vegetables. Most fruits can be preserved in one of three ways: they can be dried, bottled in syrup, or bottled in spirit. Dr. Coupin gives detailed receipts for preserving Cherries that, with slight variations, apply equally to other fruits. Bottled Cherries are, he says, prepared by enclosing them with powdered sugar in corked bottles, and standing these in a saucepan of water that is allowed to boil for nearly half an hour. The corks are then sealed over, and the fruit will keep good for about two years.

One method of preserving fruits in brandy is to first prepare them by boiling in syrup for twenty-four hours. The fruit is then taken out and mixed with the spirit, while the syrup is boiled for another half hour, then added to the fruit and spirit, and the whole is corked down and sealed. Cherries (and other fruits) are sometimes dried by keeping them for twelve hours in a baker's oven until the skin appears sufficiently toughened, yet is still soft and yielding.

For drying fruit (and certain vegetables also) there are now several kinds of evaporators. These, our author describes and recommends, as by their use the necessary current of hot dry air can be maintained and regulated round the fruit far more satisfactorily than by any hand process and with very little labour. As regards Apples there is much to be said. There are many ways in which they may be dried; and by modern machinery, as our readers know, the fruit is peeled, cored, and evenly sliced in a very brief time.

Vegetables are usually preserved in bottles or are dried and sent out in boxes, their preparation being in the main similar to that of fruit, "pick-

ling" being much the same as preserving in spirit, except that vinegar is substituted for brandy and syrup.

The preservation of seed, to protect it from insect and fungoid enemies, and to check premature germination, occupies another section of this book. We have not space to repeat the author's remarks here, but may refer those specially interested in the subject to his table of the duration of the vitality of seed. After a certain time the germinating power of seeds naturally diminishes in proportion to the period that they are kept above ground.

The preservation of bulbs and tubers is not an elaborate matter. Dryness and protection from frost are the most important considerations, any sudden changes of temperature being injurious.

Dr. Coupin's work may be seen, by the above brief summary of it, to be comprehensive in its treatment of the subjects discussed. His recipes are adaptable to small or large quantities of fruits, and hence to household as well as to trade purposes. He enters also into such details as the arrangement of a fruit-room, the keeping Grapes fresh by suspension, or by keeping the stalks in water; he also furnishes useful hints on the subject of packing fruit and vegetables. In fact, we can recommend this book to the consideration of all to whom such matters are of interest or importance, by reason of the excellence of the methods recommended, and the lucidity and conciseness with which they are explained.

MORE POT-POURRI FROM A SURREY GARDEN.

By Mrs. C. W. Earle. (London: Smith, Elder & Co., 15, Waterloo Place.)

WE need scarcely say that this is a sequel to a former book of similar name, to the readers of which the authoress has dedicated it. It is discurative, even bewilderingly so, yet herein lies its charm, as the womanly kindliness of the writer shines out through the medley of gardening rules, cookery recipes, and educational advice that she has put together. Many people keep such a note-book as is this, and it is now-a-days not uncommon to see it published; certainly the volume before us is good of its kind, being one of the comparatively few interesting to the general public as well as to the compiler. The subject-matter is arranged in twelve chapters, one for each month of the year, and it is in part classified to bring it appropriately into one or other of these divisions. Needless to say, the jottings made by Mrs. Earle of her own garden are the most interesting part of the book, for no extracts, however delightful in themselves, can be so valuable as is original observation. Thus, we really do not care to see the often-published and widely known salad receipt by Sydney Smith brought up yet again, but the following chit-chat about familiar plants will awake an answering note in many an amateur gardener:—

"April 10.—I have never had Forsythia suspense so good in the garden as this year. The shrub is one golden mass, and when picked in long branches it is quite admirable in water. I suppose its being so good is partly an accident of the weather, partly that after flowering last year it was cut back hard, and partly that we twisted black thread about it to prevent the birds eating the buds in February, which they invariably do here, both with this plant and with *Prunus pissardi*. *Spirea Thuobergi* responds in a most delightful way to constant pruning. The more the dear little thing is cut the better it seems to do. That is the real secret of all these early-flowering shrubs: they do not exhaust themselves then with leaf-making and growth . . . Nothing, I think, tempts me so much to neglect all duties and to forget all ties as gardening in early spring weather. Everything is of such great importance, and the rush of work, that one feels ought to be done without a moment's delay makes it, to me at least, feel the most necessary thing in life."

The interest thus shown in certain plants is elsewhere expressed for others; for Roses, Lilies,

greenhouse plants, in fact, for all and sundry. The writer may not have a very large, nor a well stocked, nor a rare garden, but it is obviously a satisfactory one, on the excellent principle she herself sets forth, that "the best gardens are those where the master of the house superintends the gardening himself." In this case the mistress has both knowledge and enthusiasm, and we commend her book to the notice of other amateurs. As said before, there is a great deal in it, and if all the pages do not please many, at any rate, are sure to charm.

WILD FLOWERS FROM PALESTINE. Collected and Pressed by Rev. Harvey B. Greene, B.D., with an Introduction by the Very Rev. S. Reynolds Hole, Dean of Rochester. (London: Edward Arnold, 37, Bedford Street.)

THIS book is the embodiment of a pretty but not very original idea, fairly carried out. It contains seventeen pressed flowers from Palestine, neatly stuck down, and each with a brief description appended to it. It may well be imagined how charmed many persons will be with such a souvenir of the Holy Land. The book contains, further, as frontispiece, a picture of the Mosque of Omar, Jerusalem, and some accounts of the plants of Palestine in general, and of those within in particular, and of how they were collected. So much pains has been taken, that it is a pity that still a little more care was not bestowed by the author on his work. Considering that Mr. Greene was assisted by a "large number of native Arabs, and a most faithful dragoman," with whom for three springs he travelled in search of flowers, he might certainly have selected rather better specimens. Thus, three tiny flowering-heads represent the grass of the field, and an *Anemone*-flower (leafless) is given for the Lily of the Field. As there are 120 different plants mentioned in the Bible, it would have been interesting to have made selections from these, and excluded such as could not be accompanied by a text. The identity of the Lily of the Field with *Anemone coronaria* is very doubtful. Indeed, the whole book is open to much criticism, and that not only concerning plants whose identity is rendered uncertain owing to the indefiniteness of the descriptions that have been preserved to us, but also as regards those species of which modern research has made the true recognition more probable. But these difficulties will not trouble the average reader, who will welcome the book for its appearance and associations, and not for its accuracy.

The Dean of Rochester speaks, in the short introduction to the work, of the charm of these real souvenirs from Judea, Galilee, and Samaria.

L'INDUSTRIE DES FLEURS ARTIFICIELLES ET DES FLEURS CONSERVÉES. H. L. Alph. Blanchon. (Librairie J. B. Baillière & fils, 19, Rue Hautefeuille, Paris.)

THIS book deals with an industry, the various branches of which have seldom, if ever, been previously detailed within the scope of a single volume. The writer has collected information concerning the manufacture of flowers in silk and velvet, in paper, wool-work, and wax; and he deals also with the processes of reproducing portions of plants by nature-printing and by moulding. Further, there are pages relating to the preservation of natural flowers and grasses, and to the ways in which these may be arranged.

First as to artificial flowers, usually so-called. Full accounts are given as to the stuffs used in their manufacture; we are told how these are bought by the piece and are dyed, cut, gauffered, and moulded by hand, the labour expended upon each blossom being in proportion to the closeness of its imitation of Nature. Most of the best artificial flowers come from Paris, from the neighbourhood of the Rue St. Denis, where it is calculated that forty-thousand "hands" are employed in their production, and at wages varying, in the season, to from three to

twelve francs a day. There may be said to be five classes of manufacturers engaged in this business—the specialists who send out, some only Mimosa, others Myosotis, and yet others Roses; secondly, makers of various flowers for decorative, funeral, or church use; thirdly, there are the foliage manufacturers; fourthly, fruit-makers; and lastly, the mounting houses, where the productions of all the other makers are put together. Those who make flowers on a small scale usually buy the several portions required ready-made, instead of colouring and forming them on their premises, where their work is that of putting together and mounting only. It may well be believed that the production of really high-class artificial flowers requires no small amount of both knowledge and skill.

Passing over the making of flowers in beads, paper, wool, and wax, we come to descriptions of nature-printing, and to electro-chemical and galvanotype processes of reproduction.

The last part of this book deals with the preservation and mounting of natural flowers. Among the hints given for prolonging the existence of cut flowers are the following:—The stems should be cut with a knife rather than with scissors, as the latter are apt to bruise them. Before mounting cut flowers, they should be laid in or under damp moss for a time, or be wrapped in a damp cloth and covered with a bell-glass or box. In opaque vases, damp sand is preferable to water, or, if water is used, it should be changed daily, and should contain a lump of charcoal or of camphor. Cut Ferns and foliage generally last fresh longer if plunged into water for an hour or two before being used. The fertilisation of flowers should be prevented by taking out or gumming over the stamens or pistil.

In mounting flowers, such kinds should be selected for use together as will last fresh for about the same time. It is better to cut flowers before they are fully expanded, and to keep them in water for some hours before packing them.

M. Blanchon devotes much space to the subject of drying flowers and foliage for decorative purposes. Grasses, various flowers known as Immortelles, and Gynuriums, keep sufficiently well, if gathered dry before they are fully expanded, and hung, blooms downward, in a dry but well-ventilated place, shaded from all light. Certain grasses and rushes are improved if, when dry, they are lightly shaken out before a brisk fire.

Pansies, Violets, Cornflowers, Clematis, Delphiniums, Pelargoniums, and various other flowers, can be dried in sand in the following manner:—The stems are placed in water for some hours, then the wet tips are cut off, and the flowers stuck in the bottom of a deep box. Sand that has been sifted, washed, and then soaked in boiling water to destroy any possible germs, is dried, mixed with stearine or other fatty matters, and sifted cautiously into the box until the flowers are wholly covered. The box is then subjected to stove-heat, until the plants within are thoroughly dried, when the solid bottom is removed, and the greased sand is allowed to trickle out.

Besides the above, and other methods for drying flowers, we find here an explanation of the ways in which plants are coloured or dyed. Certain foliage plants, such as Reeds, Gynuriums, Cycas, and Palms are plunged into a boiling bath of carefully-prepared dye, and afterwards to restore their flexibility are passed through glycerine. Semi-artificial plants of Dracena, Ficus, Begonia, and Cycas are made up of individual leaves of these plants, carefully mounted round a wooden core to imitate a growing plant. These leaves are slightly varnished before being made up.

The mounting of bouquets and sprays is dealt with by M. Blanchon, but beyond a few general hints this art is not one that can be taught in writing.

An interesting account is given of the manufacture of the straw foundations for wreaths of Immortelles, so much used in France. These foundations are made by a machine which is,

briefly speaking, a revolving wheel, fed by a workman with straws, which the rotation of the wheel forms into a cylindrical band of the desired size, and at the same time secures with wire paid out by the wheel from a reel. The straw band moves into a cylindrical mould, which gives it the required circular shape. Before the machine has done with the straw it has woven it into the wreath, into which the flowers are mounted by hand.

These shortened extracts from the book, an English edition of which is desirable, will give some idea of its scope, and will show how valuable it will be found by both amateur and professional florists. The information is clearly given, and there are illustrations that help on the text.

PRACTICAL INSTRUCTIONS. By James Dobbie, Rothesay ("Buteman" Office).

To cite the whole title is to give a full table of contents—here it is—"Practical Instructions to Procure Shelter for the Animal and Vegetable Kingdom, and kill Caterpillars, Snails, Worms, Insects, Green-Fly, Parasites, &c., that destroy Plants." Mr. Dobbie has, in fact, given us in these pages a few disjointed memoranda relating to his practical ex-

THE LATE W. M. WELSH.

perience during fifty-five years, and most valuable they are. Do you want to increase the size of your Apples? Mr. Dobbie will tell you how to accomplish it. Do you want to know how to plant shelter-hedges? Mr. Dobbie will tell you. Are you troubled with millipedes or snails? You need be so no longer if you put into practice the recommendations of this pamphlet. Do you want to grow Leeks, Onions, Parsnips, Cabbage, or Beetroot, to perfection? Mr. Dobbie's instructions will enable you to do so if you follow them out properly. As may be inferred, the directions are of a practical character, and as such we may thoroughly commend them to the notice of young gardeners and amateurs. But they have a scientific interest as well as one of great importance to students of variation. The following extract will indicate what we are alluding to:—

"Names of vegetables and flowers which have been raised from the seed tend to mislead many of the inexperienced, as they generally believe that the quality as well as the variety raised year after year from the same class of vegetables and flowers remain the same, while it is well known to intelligent professional gardeners that the varieties change for the better or worse, as often as they are raised from seed. Those who may doubt this

will be convinced of the truth thereof by purchasing a small quantity of seed—say, the Musselburgh, or any other Leek—from half-a-dozen growers (not sellers, as they may get all the seeds from one quarter), who have, in different localities, raised the seed of it, as they may suppose. After testing the whole of the seed, they will, in all likelihood, find at least six varieties from which it will be difficult to select the Musselburgh, or any other variety of Leek." A more instructive sixpenny-worth it would be hard to find.

Obituary.

MR. WELSH, whose death on the 8th inst. we briefly alluded to in our last issue, was the senior partner in the well-known house of Dicksons & Co., Waterloo Place, Edinburgh. He was born in 1838 at Ericstane, near Moffat, as we learn from the *North British Agriculturist*. He commenced his career with Mr. Jobo Shaw of Manchester, from whom he derived his knowledge of landscape-gardening. In 1862 he entered the firm of Dicksons of Edinburgh. The nurseries of the firm have a well-earned repute; but it is not so well known that Mr. Welsh was also a fruit-grower on an extensive scale. Mr. Welsh was an active member of the Scottish Arboricultural Society, and of the Royal Caledonian Society.

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 19.—The last meeting of the Committees of this Society for the present year, which was held in the Drill Hall, Westminster, on Tuesday last, was not a very brilliant event. Probably there were good reasons advanced for holding more frequent meetings during the winter months than had been the custom in previous seasons, but the results, so far as they have been at present observed, have hardly justified the policy of continuing the meetings fortnightly in the very darkest months of the year. The Society is now given such support by its Committees and by the press, that the holding of a meeting necessarily brings together a considerable number of horticulturists, many of whom travel some distance to be present at Westminster, and do so at some personal inconvenience. Unless, therefore, it is fairly certain that all meetings will be well supported, and sufficiently interesting to repay those who attend, the Society would be wise to arrange a smaller number. In the case of the meeting on Tuesday, the unsatisfactory weather was probably to blame to some extent for the poorness of the show, and the date was near the Christmas festival that many establishments were already busy preparing decorations.

It is worthy remark that of the three Committees, Orchid, Floral, and Fruit and Vegetable, not one of the Chairmen was present, two of them, we believe, being indisposed. The Orchid Committee made several awards to novelties; and a new species of *Dendrobium* was shown in flower by Major JOICEY.

The FLORAL COMMITTEE made no award other than Medals; and the only one granted by the FRUIT AND VEGETABLE COMMITTEE was to a new culinary Apple.

Floral Committee.

Present: George Gordon, Esq., in the chair; and Messrs. R. Dean, J. F. McLeod, C. R. Fielder, H. J. Cutbush, E. Beckett, E. H. Jenkins, D. B. Crane, C. T. Drury, H. J. Jones, H. Turner, E. Molyneux, J. Fraser, and E. T. Cook.

Messrs. W. WELLS & Co., Ltd., Earlswood Nurseries, Redhill, Surrey, had a group of *Chrysanthemums* in pots. The variety was a white decorative one, named *Letrier*. It is a capital late-flowering variety, and just the one to supply white blooms of good size and wide petals for decorations at Christmas. Cut blooms were shown of a number of additional varieties, also of great decorative value, including *Sunset*, of a soft shade of yellow, and very charming. A golden sport from *Good Graciosa*, obtained from Australia, and a similar one from Princess Victoria was also observed; the latter will doubtless prove acceptable (Silver Banksian Medal).

Messrs. W. CLIBAN & Son, Altrincham, Cheshire, again showed several varieties of single-flowered *Chrysanthemums*, but none of them was valuable as represented.

Sprays of *Bouvardia* blooms were shown by Mr. J. Fitt, gr. to F. W. CAMPION, Esq., Colley Manor, Reigate. The two double varieties, *President Garfield* (pink) and *A. Neuner* (white), were grandly represented; and there was a fine bunch of the single variety *President Cleveland* (brilliant scarlet).

Messrs. JAS. VEITCH & Sons' *Javanica*—*Jasminiflorum* hybrids of *Rhododendron*—which have been represented at so many meetings during the year, were capitally shown at the

"Christmas" meeting. That fine truss of these beautiful flowers may be cut in London during the week preceding Christmas, is a very striking testimony to their value. The colours included several shades in yellows, reds, crimsons, and pinks, as well as pure white, like Princess Alexandra; and in Nina, a deep red variety, may be observed the result of crossing these *Rhododendrons* with a variety of *Azalea indica*. This variety, and its progenitors, was figured in these pages on February 1, 1896, p. 133.

Orchid Committee.

Present: Henry Little, Esq., in the chair; and Messrs. Jas. O'Brien (Hon. Sec.), A. H. Smea, R. Brooman-White, J. Gabriel, H. J. Chapman, W. H. Young, F. J. Thorne, H. T. Pitt, J. Jaques, E. Hill, W. Cobb, J. Colman, De B. Crawshaw, and T. W. Bond.

The show of Orchids was a small one, though there were a good number of remarkable exhibits to go before the Committee. The only group was a small but interesting one, staged by W. M. Arleaton, Esq., Tyn-y-Coed, Weston-super-Mare, and in which was a remarkable variety of *Cypripedium* insigne named "Oddity," exhibiting a constant case of peloria, or what is called trilobellia, the centre being composed of three more or less perfect labellums, arranged like the standards in an Iris, all the flowers being alike. In the group also were *Cypripedium* × *Mortoni* (Lecanum Maserebianum × Chamberlainianum) with singularly elongated reddish lip, the upper sepal being narrow, green at the base, with dark chocolate lines, and pure white in the upper half; *C. insigne* Macfarlanei, C. l., Tyn-y-Coed variety, and a fine plant of *Laelio-Cattleya* × *intermedia*-flava, Golden Queen. A Silver Banksian Medal was awarded.

REGINALD YOUNG, Esq., Linnet Lane, Selton Park, Liverpool (gr., Mr. Poyntz), showed an interesting collection of cut *Cypripediums*, the finest of which was *C. × Minos*, Young's variety (*Spicerianum* magnificum ♀, *Arthurianum* ♂), a very fine flower, with the upper sepal broader than high, white in the upper part, emerald-green at base, with fine dark radiating lines and dots running into the white; the petals and lip yellowish, with red tinge. Another interesting exhibit was shown as *C. callosum*, as it closely resembled that species, although it is the result of a cross between *C. callosum* and *C. × microchilum*, the latter being suppressed in the progeny, which, however, exhibits unusual colour in the upper sepal. Other pretty hybrids were *C. × Lachesis* (× *Crossianum* ♀, *marinorophyllum* ♂), *C. × Belus* (*Harrisonianum* nigrum ♀, *Mastersianum* ♂), and *C. × Endymion* (*barbatum* grandiflorum ♀, *Mastersianum* ♂).

J. T. BENNETT-POE, Esq., Holmewood, Cheshunt (gr., Mr. Downes), showed a grand branched spike of *Oncidium tigrinum*, and a form of *Laelia anceps*.

J. GUNNEV-POWELL, Esq., Glebelands, South Woodford (gr., Mr. Davis), sent *Cypripedium* insigne *Woburnianum*, a very finely-formed and distinctly coloured variety.

MESSRS. CHARLESWORTH & CO., Heaton, Bradford, showed a grand specimen of *Cypripedium* insigne *Sanderi* with all flowers (Cultural Commendation), and the beautiful *C. × Lord Roberts* (see list of Awards).

M. JULES HYE, Coupure, Ghent (gr., Mr. Coen), showed *Cypripedium* × *Madame Jules Hye* (*Spicerianum* × *tonsum*), a massive flower with white upper sepal tinged with rose, and with a purple mid-rib. (Illustrated in the *Gardeners' Chronicle*, January 28, 1899, p. 103.)

MESSRS. HUGH LOW & CO., Enfield, showed *Cypripedium* × *Lord Roberts* (a different cross to that shown by Messrs. Charlesworth, this being *C. niveum* × *venustum*), a pretty yellowish-white flower, the petals finely spotted with purple.

W. E. PADBURY, Esq., Langley Park Farm, Beckenham, sent *Cypripedium* × *Antigone*, Padbury's variety; a good white flower, tinged and spotted rose-purple.

Major JOCKEY, Sunningdale Park, Sunningdale (gr., Mr. F. J. Thorne), showed for the first time the extraordinary *Dendrobium spectabile* (See Awards), *D. atrovirens*, with four spikes; and the white *D. Johnsoni*.

Awards.

Dendrobium spectabile.—From Major JOCKEY, Sunningdale Park (gr., Mr. F. J. Thorne). This is the fine plant figured in *Ranunculus* as *Lataurea spectabilis*, the flowering of which, out of Messrs. Sander's recent importation from New Guinea, has been looked forward to with interest. Mr. Thorne, who grows this class of *Dendrobium* and other difficult Orchids well, being the first to show it. The flowers, which are produced on upright spikes, are large, and singularly formed, the labellum taking much the same form as the other segments, though being the largest. The sepals are triangular at the base, extended into a long, wavy apiculate tail; the petals are narrower, both pale yellow in colour, and prettily marked with purple. The labellum has the side lobes erected hood-like, the front being elongated, wavy, and apiculate, white in colour, with a beautiful veining of clear purple. A very fine addition to our gardens (First-class Certificate).

Cypripedium × *Hera*, *Euryale splendens* (Boxall ♂, *Lecanum* ♀).—From Messrs. JAS. VITCH & SONS. A very distinct form, having the middle area of the lip of a rich rose-purple, and not spotted. The broad petals were greenish-white, tinged on the upper halves with brown-purple, and spotted with the same colour on the lower halves. The lip yellow, tinged outside, and spotted inside with purple, in some respects it resembles the fine *C. × Beckmanni* (First-class Certificate).

Cypripedium × *Lord Roberts* (Charlesworth × *Oreum*), from Messrs. CHARLESWORTH & CO., Heaton, Bradford. A fine example of flower colouring, and the best Charlesworthi hybrid

yet shown. Upper sepal broad and flat, amethyst-purple, darker in the veining, the upper part showing a pure white spotting between the richly-coloured feathered lines. Lower sepal orbicular, greenish, with some purple lines. Sepals ovate, oblong, rose-purple, with brownish veining. Lip surface brownish-rose; staminode pale lilac, with a yellow boss in the centre, all the parts shining. A very fine hybrid (First-class Certificate).

Cypripedium × *conco-callosum*.—From Captain G. W. LAW-SCHOFFIELD, New-Hall-Hey, Hawtensall, Manchester (gr., Mr. Shill). Upper sepal white, with green veining at the base; the upper portion, except a narrow white margin, being flushed with rose-colour. Petals greenish at the base, white at the tips, flushed with rose, and bearing minute purple spots. The lip greenish-yellow, the upper part tinged brownish-rose (Award of Merit).

Laelio-Cattleya × *Wellsiana ignescens* (L. purpurata ♂, C. Trianae ♀).—An improvement on previous varieties in shape and richness of colour. Sepals and petals rosy-lilac, with silver-white base. Lip ruby-purple, with pale yellow centre (Award of Merit).

Zygocorax × *Amsiana* (Z. brachypetalum × *Colax jugosus*).—From Messrs. F. SANDER & CO., St. Albans. A pretty hybrid with flowers larger than those of *Colax jugosus*. Sepals and petals apple-green, heavily marked with purple; lip white, with narrow, violet-coloured lines radiating from the base (Award of Merit).

Cattleya × *clatior* (Schilleriana × *Mossii* Reineckiana).—From C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond). Flowers much resembling those of *C. × Lathenia* Prince of Wales. Sepals and petals bluish-white, lip handsomely marked with bright rose-crimson, some orange and brown lines being at the base (Award of Merit).

Fruit and Vegetable Committee.

Present: Jos. Cheal, Esq., in the Chair; and Messrs. W. Wilks (Rev.), W. Poupert, M. Gleeson, A. F. Barron, Jas. H. Veitch, A. Dean, S. Mortimer, W. Bates, Robt. Fife, J. Willard, F. Q. Lane, and Jas. Hudson.

Very fine and perfectly ripe fruits of the *Persimmon* (*Diospyros kaki*) were shown by Mr. T. Edington, gr. to Lord DUNDEE, Tortworth Court, Fallowfield, Gloucestershire. They were grown upon a south wall out of doors (Cultural Commendation).

A collection of sixteen bunches of fine Grapes in eight varieties was shown by Mr. W. Taylor, gr. to C. BAYNE, Esq., Tewkesbury Lodge, Forest Hill, London, S.E. There were two bunches of first class Gros Colman, with berries of extraordinary size, a mammoth bunch of the white variety Mrs. Pearson that was certainly remarkable, two of Black Alicante, two of Trebbiano, three of Muscat of Alexandria, three of Mrs. Pince's Muscat, one of Gros Guillaume, and two of Lady Downe's Seedling (Silver-gilt Knightian Medal).

MESSRS. J. CHEAL & SONS, Lowfield Nurseries, Crawley, Sussex, contributed a large collection of Apples, consisting of eighty dishes in as many varieties, and including a fine dish of the variety Parquet, to which an Award of Merit was recommended on October 24. It is a very showy fruit of high colour. Amongst the numerous specimens of well known sorts that were represented, we noticed fine samples of Queen, Peasgood's Nonsuch, Bismarck, Cox's Pomona, Emperor Alexander, Lane's Prince Albert, Beauty of Kent, Malibot's Pennmain, Newton Wonder, Chelmsford Wonder, Bess Pool, &c. (Silver-gilt Banksian Medal).

Another collection of Apples was staged by Mr. J. Butler, gr. to the Earl of ANCASTER, Normanton Gardens, Stamford. There were about seventy dishes from this garden, and a large number of well known varieties was included. These fruits were fringed with a single growth of *Lygodium scandens*, 16 feet 4 inches in length. About a score varieties of Potatoes was also shown (Silver Banksian Medal).

Mr. Chas. Ross, gr. to Capt. CAISTAIRS, Welford Park, Newbury, exhibited a dish of capital fruits of the old Northern Greening Apple (Vote of Thanks). Also dishes of three new seedling Apples, one from a cross between Golden Reinette and Lane's Prince Albert, and another from Peasgood's Nonsuch and Duke of Devonshire.

Award.

Apple Stanway Seedling.—Fruits of good average size, and somewhat conical in shape; colour yellow throughout. Eye closed, or nearly so, inserted in a moderately deep basin, slightly ribbed. Stem short, and in a green and russet-lined cavity, with swelling upon one side. A good kitchen fruit. From Mr. T. H. KETTLE, King's Ford, Colchester (Award of Merit).

THE NATIONAL CARNATION AND NATIONAL AURICULA.

FLORICULTURE, as applied to the cultivation of special subjects denominated florists' flowers, appears to be on the up grade, judging from the proceedings at the annual meeting of the National Carnation and Picotee, and the National Auricula Societies. The members of the first-named met at the Horticultural Club, Hotel Windsor, on the 13th inst., Mr. Martin R. Smith presiding. The annual report set forth that, everything considered, a very satisfactory year with the Carnation had been experienced. The annual exhibition at the Crystal Palace was very much better than was expected; there had been a satisfactory addition to the membership, though they had experienced losses. The financial statement showed a

good balance on the right able; subscriptions had amounted to £251 2s. 6d. Prizes were awarded to the amount of £228 6s. 6d., and a balance of £229 10s. 10d. was carried forward.

During the year the Society had taken up the classification of the true yellow-ground Picotees as distinct from the yellow-ground Fancies. A special Floral Committee consisting of leading growers was appointed, and the results of their work was seen in the valuable report presented on this occasion. The lists of classified flowers will be published in the schedules of prizes as a guide to exhibitors. The President, Mr. Martin R. Smith, was re-elected by acclamation, and also the Vice-Presidents and Committee. The annual exhibition was fixed for July 25, though this date is subject to change, according as the incidence of the season may determine. Changes were made in the schedule of prizes, mainly in the direction of adding new or desirable classes. The Secretary, Mr. T. E. Henwood, to whose exertions so much of the success of the Society is due, was, on re-election, heartily thanked for his services.

The report of the Committee of the National Auricula Society was also satisfactory. Subscriptions amounted at £75 7s. 6d., and prizes were paid amounting to £56 17s., a balance of £201 8s. 9d. being carried forward. In the course of his statement, Mr. T. E. Henwood, the Secretary, said that sixteen new members had joined during the year, and already two for 1900; and there was not wanting evidence that the Auricula was growing in favour, and cultivators for exhibition were steadily on the increase. The officers and Committee were re-elected, only one change being made in the latter body. The annual exhibition, as usual in connection with one of the Royal Horticultural Society's meetings at the Drill Hall, was fixed for April 24.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 14.—The severe weather prevailing on this date was not conducive to a good meeting, and there was a poor display in consequence.

T. BAXTER, Esq., of Morecambe (gr., Mr. Roberts), however, brought a few very choice plants of *Odontoglossum crispum*, of which O. c. Baxteri was the best, and bore a handsome spike of about fourteen flowers. The flowers are small, and have a distinct leaning towards the shape of *O. Humei*-*lanum*, the sepals and petals incurving somewhat, and are slightly larger than in that species; the segments brilliantly marked with irregular spots (First-class Certificate). *O. crispum* sulphureum was another pretty and distinct variety, of a pale primrose tint (Award of Merit). *O. crispum* var. "Morecambia" was a plant flowering from the apex of a newly imported pseudo-bulb, only one flower being on the spike (Award of Merit). *O. crispum* "Heaton Beauty" was another good form, of a large size, and spotted all over with crimson (Award of Merit). A Vote of Thanks was given for the group.

G. W. LAW-SCHOFFIELD, Esq., Rawtenstall (gr., Mr. Shill), showed a hybrid between *Cypripedium* Charlesworthi × *C. tonsum*.

T. STATTER, Esq., Stand Hall (gr., Mr. Johnson), exhibited *Laelia Cattleya* × "Mrs. Astor (Award of Merit). From the same collection came also *Laelia* Treaceleriana, and a good form of *Cattleya labiata*.

E. J. LOVELL, Esq., Alderley Edge (gr., Mr. Garner), exhibited a very handsome form of *Cattleya aurea*, with segments of an unusual size and substance; the lip was of a peculiar shade of pale rose.

W. DICKWORTH, Esq., Shawe Hall, Flixton (gr., Mr. Tindall), sent *Dendrobium Phalaenopsis* var. *Stalteriana*, a fine form; and also a magnificent white variety of *D. P. Schoderiana*, called Shawe Hall var. (Award of Merit). P. H.

BRISTOL and DISTRICT GARDENERS' MUTUAL IMPROVEMENT.

The fortnightly meeting was held at St. John's Parish Room, Redland, on Thursday last. A large attendance was presided over by Mr. G. BACOCKS.

Mr. J. H. DAVIS, of Redland, read a paper on the cultivation of the *Bouvardia*, *Polargonium*, *Begonia*, *Primula*, and *Chineria*. He urged the cultivation of flowering plants as one of the most important branches of the gardener's work, and claimed that some one or other of the plants forming the subject of his paper could be had in bloom all the year round. In a careful manner he dealt with the culture of each species, giving his opinion as to the time suitable for sowing seeds or striking cuttings, soil in which they were likely to succeed and hints as to potting, affording water, and ventilation.

LINNEAN SOCIETY OF LONDON.

DECEMBER 7, 1899.—Dr. A. GUNTHER, F.R.S., President, in the Chair.

Dr. OTTO STAFF, A.L.S., exhibited specimens of *Malayan* and *African* species of *Kickxia*, Blume, to show the differences which exist between the two forms. As the name *Kickxia* would have to be retained for the *Malayan* species, he proposed the name *Funtumia* for the *African* species, from *Funtum*, a vernacular name for *F. elastica*. He further pointed out, by means of flowering and fruiting specimens of *F. africana*, *S'apf* (*Kickxia africana*, Benth.), and of *F. elastica* (*Kickxia elastica*, Preuss), that the latter, and not the former

as was originally assumed, was the source of the so-called lagoon rubber, thus confirming the conclusion to which Dr. Preuss had come with regard to the origin of this rubber.

Dr. STAFF also showed, on behalf of the Director of Kew Gardens, a large infructescence of *Musa Ensete*, Gmel., lately received from the Azores.

Mr. GILBERT CHRISTY, F.L.S., exhibited a preparation of India-rubber from a new process from *Castilleja elastica*, and also specimens of rubber obtained from *Kickxia elastica*.

Mr. J. W. FAWCETT read a paper on some "Vegetable Poisons used for the Capture of Fish by the Aborigines of Australia."

Mr. B. DAYDON JACKSON pointed out how widespread was the practice of obtaining fish in this way, and gave a brief review of the literature bearing on the subject.

SHIRLEY & DISTRICTS GARDENERS' & AMATEURS' MUTUAL IMPROVEMENT ASSOCIATION.

DECEMBER 18.—The monthly meeting of the above Society was held at the Parish Room, Shirley, Southampton, on the above date, there being a good attendance of the members, presided over by Mr. B. LADHAM.

Mr. H. J. JONES, Ryecroft Nursery, Lewisham, gave a lecture entitled "The Raising and Producing the most useful *Chrysanthemums*." The lecture was a capital selection of useful hints for the successful culture of this plant.

CARDIFF GARDENERS'.

DECEMBER 12.—Over one hundred members belonging to the Cardiff Gardeners' Association, *Chrysanthemum* Society, and Horticultural Society sat down to a banquet at the Park Hotel, Cardiff, presided over by W. P. PIKE, Esq., Chairman of the Horticultural Society, supported by the Mayor of Cardiff (Councillor S. A. Brain), James J. Graham, Esq. (Chairman of the Association), and F. G. Treveler, Esq. (Chairman of the *Chrysanthemum* Society), and the two Hon. Secs., Messrs. H. Gillett and J. Julian; besides many other influential members of the Cardiff Corporation. After the dinner a short toast list was gone through.

The toast of the evening, viz., "The Three Horticultural Societies," proposed by the Chairman; the chairman and secretaries of each society responded. The chief item alluded to was the progress Cardiff horticulturists had made this year, first, in visiting the Royal gardens at Windsor in August last; and secondly, in having a collection of fruit sent to our autumn exhibition by Her Majesty's gardener at Frogmore.

Councillor Geshold during the evening recited the "Tenth Hussars" and the "Absent-minded Beggar." After the latter £3 10s. was collected towards the Mayor's fund for the wives and children of soldiers now in South Africa. Other toasts, songs, and solos were rendered.

This was the first occasion on which these three societies have amalgamated at a function of this kind, and it has turned out to be an unqualified success. *John Julian, Hon. Sec.*

EDUCATIONAL INSTITUTE OF SCOTLAND.

STUDY OF PLANT LIFE.

THE subject most recently added to the Educational Code—Nature-Knowledge—continues to receive the earnest attention of teachers in Scotland. At a recent meeting of the Aberdeen Branch of the Educational Institute of Scotland, held in Aberdeen University, the chief business was a lecture on "Nature-Knowledge in School-Plant Life," by Mr. JAMES WILSON, M.A., B.Sc., Lecturer on Agriculture, Aberdeen University.

Mr. Wilson, after a few preliminary remarks on the work carried on in connection with the Agricultural Department of Aberdeen University, indicated, first, how plant-life should not be taught to the children. The two great points to be kept in view, then, were to teach as full a knowledge of plant-life as the opportunity afforded, and to teach it in such a way as to maintain and develop the interest of the pupils in it. To do so, he would have them begin at the very beginning—that was to say, they ought to begin with the seed of the plant.

Mr. Wilson here brought into use an array of a dozen or so of small tubes, in each of which was a bean-seed, suspended in water, and each at a different stage of germination. And he suggested leguminous seeds as specially suitable for purposes of illustration. Taking up the first tube, he urged that the pupils should first be familiarised with the appearance of the seed prior to the illustrative operations. Then it was to be suspended by a wire in the water, and in a few days (another tube was here shown) the seed would be seen to have become bigger. What had happened? Water—and with it food for the young plant—had been taken up. A few more days and the coat of the seed bursts, and in due time one bit of the young seed emerged, and took its way upwards the stem; and another forced its way downwards. Here was now the teacher's opportunity to explain what a seed really is—a young plant, with a store of food. As the growth of the plant went on, the teaching would gradually become wider in its scope. In due time the pupils would discover that the seed had become empty, the store of food had all been used up (and by this time the plant should have been put into the ground); and now came the opportunity of showing how the plant supplies

itself with food, and how that food is extracted partly from the ground and partly from the atmosphere, and how it is turned into a form in which it provides sustenance for the plant. The food itself would be an interesting study too, for the elements extracted from the earth and air were turned by the plant into exactly the same food-stuffs as are required by human beings—albumen, starch, and fat. Having been taken thus far, the attention of the pupils might probably be directed to the flower, and particularly to the young pod inside the flower, when they would find that they had again reached the seed, and so completed the cycle of plant-life. Naturally, as the pupils went on, they would be fit to go more fully into the different branches of the study. By simple experiment they would readily come to understand that in order to obtain food, plants must be given daylight, and that biennial plants, like Turnips, store up food one year to be used the next; that some plants store their food in the root; some, like the Onion, in the leaf; and others, like the Potato, in the stem. They would also come to know the variations in the manner of growth of different plants. They would be able to deal intelligently with the commonest plants and grasses they found growing in the meadows or by the wayside, and these lessons would yield them a new and practical interest in Nature. Mr. Wilson's lecture was illustrated also by lantern-slides.

NATIONAL DAHLIA.

DECEMBER 19.—The Committee of this Society met at the Horticultural Club on the above date, Mr. E. MAWLEY in the Chair, the principal business being the annual report and financial statement. The former set forth that the summer of 1898, as of 1899, was a very dry one, drought and sunny days being particularly felt in August. Still, the annual exhibition was a satisfactory one, there being as many as 200 entries. Allusion was made to the supplemental show at the Royal Aquarium, at which prizes were offered to the amount of £26 5s. As many as seventy seedlings were submitted for certificates, and ten of the First-class was awarded. The report is in favour of more classes being provided for the decorative Dahlias, and also for improved methods of exhibiting. The membership of the Society had been maintained but an accession of new blood was most desirable.

A mournful reference was made to the death of the late President, Mr. T. W. Girdlestone, and the great loss sustained by the Society.

As far as the financial statement is concerned, it is estimated there will be a balance in hand of from £5 to £6. The report was adopted for presentation at the annual general meeting on January 16. The Society having hitherto been without bye-laws, some were proposed for confirmation at the general meeting. Mr. E. Mawley was nominated for President; Messrs. W. Marshall and Geo. Gordon as Vice-presidents, and it was resolved to recommend that the Committee be limited to thirty persons. The idea of a second show was generally approved, but it was left to the annual general meeting to determine if one should be held, and where. It is proposed that a fund be opened for the purpose of providing some memorial of the late President, and it was generally considered that a specially struck Commemorative Medal would be most appropriate.

COVENT GARDEN MARKET.

THIS finest of the London markets, where the best productions of the earth are to be found, has now assumed the appearance which it usually does at this season. It is truly a big business that is transacted at Covent Garden, and no one knows better than Mr. Assheton, the Duke of Bedford's superintendent, the enormous extent of it. The Floral Hall, with its auction sales, is a great place; and the old, or market proper, built in 1830, on the site of the old market, has seen several improvements in recent years in the way of glass and iron roofs, and the adjustment of the ground-levels; and very recently, a new covered section eastward, extending to Bow Street, has been built, besides a large section on the south side, open to the sky, contiguous and adjoining the Flower-market. The latter is a modern building, constructed for the sale of flowers in pots and cut bloom (roots are sold in another section), which when viewed in the spring-time, when it is well stocked with flowers, is a wonderful sight. At all times, however, a good supply of plants and flowers can be observed between the hours of 5 and 7 A.M., the best time to view this market, and one which well repays the visitor for his pains; it is necessary to be in good time, as the building is closed at 9 A.M. In the open market at this season are to be found enormous lots of Holly, Mistletoe, Laurel, Ivy, Spruce Firs, for Christmas-trees, and decorative-plants in abundance.

In the old market proper, the covered section, and some of the shops and warehouses, will be

found the fruits and vegetables, amongst which, first and foremost, are the home-grown Grapes, consisting of Black Alicante, Gros Colmar, and Muscat of Alexandria, the first class having fine large berries; besides second quality Grapes in plenty, namely Belgian, Channel Islands, and the well known Almcira, which come in barrels. Bananas will be found in abundance, the supply in the past few years having grown enormously; the same remark applies to Tomatos. Those of home growth are about at an end for a short time, but the supply from the Canary Islands is large, and the fruit is well grown, and consists of smooth varieties of good colour, which arrive in fine condition, owing to the excellent method of packing adopted. It is a trade that has made wonderful progress. The business done in St. Michael Pine-apples is extensive, and fine, well-grown fruit can be bought at very moderate prices.

There are now dried Figs, Dates, and Lychees from China, and a curious little fruit enclosed in a nut-like brown shell, which has apparently come to stay; and Custard Apples from Madeira. Of Oranges, there are Jaffa, Lisbon, Murcia, Valencia, Jamaica, Tenerife, Tangierine, &c. Lemons from Naples, Messina, Malaga, Murcia, &c. In Nuts there are home-grown Cobnuts and Filberts, the others are foreign. Sweet Chestnuts are mostly of French and Italian origin. Brazils, Walnuts, Almonds, Barcelona and Sapneia form the remainder. Home-grown Apples are found in great variety and in large quantities, some very good ones among them. The best culinary varieties are Wellingtons, which are and have been arriving in very good order; Blenheim Orange, Warner's King, and others. For dessert, there are Cox's Orange, Ribston, King, and Eearn's Pippin, Golden Knob, and others; the Knobs are small this year. Then there are Canadian Newtown Pippins in barrels, Californian Newtown in cases, and Nova Scotian Ribstons, and King of the Pippins—in market parlance, Kings, in barrels.

Among Pears, the chief are foreign, French Glout Moreeau, packed in single layers in what are called crates, a cage-like box, made of thin strips of wood, with space between each piece in which the fruits are packed, and in which also Asparagus and other things are sent over. These boxes are lined with paper, and they are extensively used for French goods. There are also Californian Pears, such as Glout Moreeau, Duchesse, Bourré Del, Easter Bourré, &c.

Among vegetables may be found Asparagus, Seakale, French Beans from the Channel Islands, France, and Madeira, whence large supplies are obtained; new Potatoes of home-growth, and from Tenerife; Globe and Jerusalem Artichokes, also Cress, Cardoons, Rhubarb, Brussels Sprouts, Spinach, Celery, Chicory, Salsify, Cauliflower, Broccoli, and other green vegetables and roots to suit all classes, with Cucumbers, Celery, Lettuce, Endive, Monkshead, Chicory, and various other salads in variety. There are also some very grotesque-looking heads and faces of tattooed New Zealanders, carved and manipulated on the outer husk of the Cocoa Nuts, to be seen in a shop in the North Row.

The supplies all round are of good quality, and prices are very moderate, some indeed being very low. *T. P., December 21.*

POTATOS.

Main Crop, Up-to-Date, &c., 65s. to 90s.; Dunbar Up-to-Date, 90s.; Dunbar Main Crop, 100s. Other varieties, 65s. to 80s. John Bath, 32 & 34, Wellington Street.

REM. MKS.—The recent severe frosts have seriously damaged green vegetables, and quite spoiled the trade in Brussels Sprouts, Savoy, and Cauliflowers, most of the latter being absolutely destroyed; those quoted above are from St. Malo, Cherbourg, and Cornwall and their qualities are in accordance with the order of their names. Some Brussels Sprouts and Savoy found a very poor market on Tuesday last, owing no doubt to their condition. Home-grown Apples are plentiful, and prices low. Pine-apples are abundant, at various prices; some of these St. Michael's Pines weigh 6lb. and upwards. Citrons of Guernsey growth are fairly plentiful, at prices ranging from 6s. to 12s. per dozen, and the quality is varied. The Chow-Chow is not seen this season in the market. Mistletoe and Holly are abundantly berried.

SEEDS.

LONDON: December 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that a fair quantity of English Clover-seed has been changing hands this week. Germany is still a buyer of this description, if however at moderate rates; any attempted advance would at once check sales. There is no quotable change in either Alsike, White or Trefoil. Rye-grasses, meantime, keep steady, and full prices are asked for Koenigsberg Tares. Birdseed move off slowly on former terms, but there is an improved inquiry for Haricot Beans and Blue Peas. The market for Mustard and Rape-seed is firm; Linseed, however, remains quiet.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending December 16, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	27 2	25 4	- 1 10
Barley	28 5	25 7	- 2 10
Oats	17 0	16 1	- 0 11

A KITCHEN-GARDEN BOUNDARY-HEDGE: N. R. A mix'd one of Holly and Beech will afford protection against intruders and wind. The leaves of the Beech will remain on the hedge all the winter. It will readily bear clipping, and may be allowed to reach a height of 8 feet, and extend to a width of 2 to 3 feet at the bottom. Growth is quick if the land be manured and trenched previously, and well-tended after planting. You ought not to plant trees closer to the hedge than 10 feet, or it will suffer from being over-shadowed, growing thinly and weak where the shade is dense. Small-growing fruit would be the best to plant (bush-trees). Hornbeam may be substituted for Beech if preferred; it is equally good, making a rigid hedge. Plants of both species, 3 to 4 feet high, are usually quoted in lists at 5s.

per 100, or 40s. per 1000. Both may be planted at 10 to 12 inches apart. Holly of the same height, about 90s. per 100; and it may be planted at the same distance in the line. The trees planted alongside the hedge may be as far apart as they stand distant from the hedge—say 10 to 12 feet. These may consist of Apples, Medlars (Nottingham), Damsons, the hardier Plums and Pears, Quinces, Cob and Filbert-nuts.

APPLICATION OF LIME TO GARDEN SOIL, &c.: J. B. Quicklime may, with advantage to future crops, be dug into the land during the late autumn and winter, but not immediately before planting or sowing. Powdered fresh lime may be used as a top-dressing at any season in moderate quantities when the land is under crop, or at other times. Annual dressings for a series of years may be applied to land in which lime is naturally deficient, and it may take the form of mortar and plaster rubbish, or fresh unslaked or slaked lime, the unslaked being preferable in stiff, unctuous loams, and soils containing much inert vegetable matter, as is often the case in gardens which have been long under cultivation, in which no manure should be afforded for three or four years. It forms a suitable dressing for peaty soils for the same reason. We will give a list of suitable shrubs in our next issue.

CARNATION SEEDLING: H. E. Your seedling from the variety Miss Joliffe is a valuable one. It is an effective colour—a rather uncommon shade of red—very fragrant, and has a satisfactory calyx.

CHEMICAL MANURES: Mixture. Your question being incomplete, does not admit of an answer being given. All of the manures cited are useful if applied in proper quantities, but it is necessary to know upon what area of land you propose to use them, and whether it is intended to apply them separately at different times, or as a "mixture." If as a mixture, and you suggest the quantities to be afforded per acre, the amount is excessive and wasteful. But much would depend upon the kind of crop for which it is intended. In any case, we should not care to use a greater quantity of sulphate of ammonia than 2½ cwt. per acre.

NAMES OF FRUITS: W. The Pear is Reine des Poires. The Apple is Barton's Incomparable.—J. T. 1, Reinette Grise; 2, Calville Rouge d'Hiver; 3, Mela Carla. This is said to be of Italian origin, and is often cultivated in continental gardens; we have seen it at several places in Switzerland. It is occasionally grown here, but usually does best in an orchard-house, or in warm positions.—F. W. Scarlet Nonpareil.—A. H. 1, Cellini; 2, Bellegue Pippin.—W. R. 1, Fearn's Pippin; 2, Cornish Aromatic; 3, Ribston Pippin; 4, Cox's Orange Pippin.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—C. J. P. 1, Leucothoe axillaris; 2, Retinospora ericoides of gardens; 3, Taxus baccata; 4, send when in flower; 5, Juniperus communis; 6, Prunopitys elegans alias Podocarpus auoma.—Major B. Leontotis dysophylla, Natal.—Fisher, Son, & Sibray. A Panicum, probably sulcatum. Send again when in flower.

THE DAMAGED HEAD OF A YOUNG LORD SUFFIELD APPLE-TREE: P. M. T. The injury points to hail having been the cause. The wounds are all on one side of the stem and branches, which seems to show that the tree was bent over at the time the injury was done—probably by the wind. The bark was in places detached, in others bruised, as also the wood below it, sufficiently severely as to destroy its vitality. Such injury would in all likelihood favour the appearance of canker, and greatly check development. Nothing can be done of any real utility beyond cutting away damaged parts, so as to permit of new rid covering the bared spaces.

THE

Gardeners' Chronicle

No. 679.—SATURDAY, DEC. 30, 1899.

OBSERVATIONS ON THE COLOURS OF FLOWERS.

A PAMPHLET with the above title has been published by Mr. E. W. Hervey, of New Bedford, Mass., U.S.A. It deals chiefly with the supposed evolutionary sequence of colours, as expounded by Grant Allen; and the relationship of insects to the production of colours, in which the author criticises Müller's and Lubbock's conclusions.

The author regards as "glaringly erroneous" the following statement of Grant Allen:—"As flowers advance in type they pass from yellow, which is the lowest colour, through white, pink, red and lilac, to purple and blue, which are the highest. And when through any special cause they begin to retrogress, they pass backwards through the same stages in inverse order."

To support this criticism he mentions several species of *Cypripedium* and other flowers, which are mainly green, but more or less associated with white, purple, rose, as well as yellow; similarly of *Ranunculaceæ* (the simplest types of flower), there are many greenish-white, purple, or blue flowers. Again, of *Polygala*, two sepals are at first green, then purple, and then green again.

The above shows that individual flowers do not necessarily pass through the series mentioned by Grant Allen, a fact of which he was probably quite aware. He, however, is referring to plants as a whole; and here we do find the first colour to have been yellow, as seen in the male catkins of Pines, which preceded the existence of petals and sepals. Now, as yellows are produced by solid granules, and reds, purples and blues by liquids, it seems that the latter are not, as a rule, produced out of yellow, but that this must be more or less got rid of, if present, before making the former, hence white intervenes; but in the development of individual flowers, no yellow need have been made at all, so that petals pass from the colourless condition in the bud to any bright colour on expansion.

Still, as Grant Allen says:—"Most early and simple flowers are yellow, because the stamens are generally yellow, and when they developed into petals they naturally retained at first their original colouring." A Buttercup may illustrate this fact. But when he says "The *Corollifloræ* betoken in their shape high modifications, yellow is a comparatively rare colour, while purple and blue become almost the rule," he apparently forgets the very numerous yellow Composites; the Composite being regarded as the most differentiated of all orders. He also makes a slip in saying: "It is not remarkable that the Pinks should never be yellow, as the five principal [*sic*] carpels have completely coalesced into a five-celled ovary." *Dianthus ochroleucus* and *D. ferrugineus* are yellow, and there are not five, but two carpels in this genus. Moreover, there are plenty of yellow flowers with syncarpous

pistils, as *Hypericum*, *Hibiscus*, *Rhododendron*, *Iris*, &c.

Grant Allen was rather apt to generalise from too few data; thus taking the *Ranunculaceæ* as a primitive type, we find purple in *Clematis*, scarlet in *Pheasant's Eye*, deep blue in *Aconite* (as well as yellow), scarlet in *Ranunculus asiaticus*, crimson in *Peony*, &c.; and in *Corollifloræ* there are yellow *Primroses*, *Calceolarias*, *Allamandas*, &c. Scarlet can retrograde at once into yellow, as occurs in *Kniphofia*, "the young flowers at the top being scarlet, and the older at the lower end of the spike being yellow." A not uncommon variety of *Adonis vernalis* is called *citrina*, in which the petals are yellow and rather smaller, indicating a degenerate form, apparently reverting to an ancestral condition in which the flowers were yellow. Yellow sports in *Chrysanthemum* are also reversions.

Though yellows and reds may follow the disappearance of chlorophyll in *Caltha* and *Helleborus*, in which the sepals become coloured, it is a question how far the actual chlorophyll-grains themselves become changed. The first is possible, as we see green leaves becoming yellow by oxidation in autumn; but in red leaves, as of *Beet*, *Beech*, &c., the green granules are obscured by the coloured fluids present in the cells, and known as *erythrophyl*. Reds, however, can probably result from chlorophyll itself, as Mr. Sorby observed, "It appears to me extremely probable that reds, often found in leaves, are products formed by the action of light on chlorophyll under conditions which have not been reproduced artificially." Whether this be so, and experts' opinions are still doubtful, the red fluid, or at least certain constituents of it, run through all the reds in vegetable bodies, and are certainly independent of chlorophyll in most, if not all, cases of petals in flowers which were never green in the bud.

The author, therefore, would seem to be correct when he says:—"It is apparent that when a chlorophyll green is the foundation, the first colour to follow is not restricted to yellow, but may be red, purple, or blue." This is the case now. But when petals were first evolved out of stamens, the probability is that they were yellow.

Taking yellow as the ancestrally primitive colour of flowers, the author recognises Grant Allen's series, viz., yellow, white, red, purple, blue; but truly observes that any colour may spring from white.

In the fifth chapter he enumerates a large number of flowers in which the colours change from yellow to some shade or compound of red, or from white to such colours, as well as reversions back to yellow, thus showing that Grant Allen's sequence often holds good for individual flowers, though the sequence of colours is not invariably the same, some being wanting.

As further illustrations of the fact "that original colours develop in different ways," i.e., in existing flowers, the author gives numerous examples in which different colours characterise different whorls. Thus, "*Delphinium nudicaule*, sepals red, petals yellow; *D. variegatum*, sepals purple, petals white; *Bilbergia vittata*, flowers indigo-blue, tubular calyx carmine; *Strelitzia regina*, orange sepals, ultramarine-blue petals."

The probability seems to be that, although the first colour acquired by stamens (as stated) appears to have been yellow, and that this might have been transferred to the first corollas, of whatever plants they were, yet

Nature can now at once proceed to make reds and purples without this intermediate yellow at all. Thus, numerous leaves are more or less coloured, as *Coleus*, but there may be no trace of yellow present.

Mr. Hervey devotes a chapter to the colours of honey-guides in flowers, and refers to Henslow's *Origin of Floral Structures* (p. 182), where that author says:—"It has been observed that the 'spots' are more persistent than the base colour of the flower. Whenever they occur as guides or path-finders they have been determined by insects, and have become hereditary." Mr. Hervey adds:—"Not a hint is vouchsafed of the manner in which they are determined. . . . I shall, therefore, offer the following as an original [*i*] elucidation of the subject."

The following is his description of the process:—"This richness of colour is occasioned by the irritating influences of the bees in traversing the same route to and from the nectary, thus stimulating the flower to send more of its peculiar pigment to this point."

As Mr. Henslow had said (only four pages preceding the above quotation):—"The guides, like obstructing tangles of hair and nectaries, are always exactly where the irritation would be set up; and I take them to be one result of a more localised flow of nutriment to the positions in question." Mr. Hervey's "original elucidation" is a curious instance of unconscious assimilation and appropriation of Mr. Henslow's theory!

The twelfth and last chapter is an answer to the question—Are the colours of flowers the result of insect selection? Contrary to Lubbock's, his own observations tend to prove that there is no special selection:—"Honey-bees have absolutely no regard for special colours; they go readily everywhere that nectar is accessible, naturally taking shorter tubes to probe than bumble-bees." It would seem, therefore, that whatever is sufficiently brightly coloured or white will attract insects as well as scent, as bees can readily discover the honey-glands of *Aucuba japonica*, and on leaves of *Laurel*. Insects can be deceived, too, for a white butterfly was noticed hovering in front of a closed window in Holborn, behind which was a China vase with flowers painted upon it!

FARMYARD AND STABLE-MANURE.

THE crop-producing capacity of a soil is greatly dependent on the presence therein of microbes, which render available for the plant the inert food in the soil. Our view of the nature of fertile soils has, during the last few years, become considerably enlarged, and instead of regarding it simply as a porous mass of clay, sand, and humus, we now look on it as a medium full of life. Professor Warington aptly says—the soil beneath our feet is, in fact, not dead, but thickly peopled with a variety of organisms, with the particular functions of which we are only gradually becoming acquainted. The multiplication of these microbes, or silent workers in the interest of the gardener, is largely dependent on the humus in the soil and the nature of that humus. Experiments have shown that farmyard and stable-manure conduce largely to the multiplication of these microbes; not that commercial fertilisers have no such effect, but the variety of microbes which do the work in the latter case is different.

The organisms which effect the oxidation and nitrification of organic matter are abundantly present in surface-soils, but are probably absent, or nearly so, in subsoils; in surface-soils they will most probably be abundant in proportion to the richness.

of the soil in organic matter or humus. The oxidising power of soil is always considerably greater in summer than in winter, consequently the increased temperature of the surface-soil to which large dressings of farmyard or stable-manure have been applied is greatly engendered by the decomposition or oxidation of such large amounts of organic matter within it, whilst the carbonic acid evolved in the decomposition will, with the aid of moisture, serve to render the mineral resources of the soil more soluble. In this way, the mineral elements will act as bases to be combined with the liberated organic nitrogen, and thus form available plant-food.

If for no other reason, therefore, than what has been stated above, there are few subjects connected with horticulture of greater interest and importance to the gardener than that of farmyard and stable-manure.

Professor F. T. Shutt, M.A., chemist to the Dominion Experimental Farms of Canada, in a recently issued *Bulletin* upon the subject of farmyard manure, says, in this necessary and naturally large product of every farm, the agriculturist should recognise his home supply of plant-food, the chief means by which he may maintain and increase the fertility of his soils. That this truth is not fully realised is evident from the wasteful neglect so frequently to be seen in the cars of the manure. Through carelessness, or ignorance, or both, the most valuable part of the manure—because the richest in available plant-food—is allowed to drain away. The following facts are given on soil fertility:—

Factors necessary for Plant Growth.—Since the object in applying farmyard and stable-manure—or, indeed, any manure—is to increase a soil's fertility, it is important to have a clear understanding at the outset as to what constitutes this quality or condition. A soil's fertility, or crop-producing power, is dependent upon various factors, chief among which undoubtedly is the presence of an abundance of assimilable—that is, more or less immediately soluble—plant-food. There are, however, other factors or conditions that tend toward soil-productiveness, and since farmyard and stable-manure, besides supplying the elements for the nourishment of crops, affects directly or indirectly these conditions it will be well to consider them, if only briefly.

Light and Air.—In the absence of light and air plants cannot thrive, for while the latter supplies the greater portion of their nourishment (about 94 per cent.), the former serves to convert such nutritive matter within the plant into vegetable substances. Since, however, light and air are abundantly provided by Nature, it will not be necessary here to dwell at any length upon their horticultural functions.

It is, however, important to point out that plant-roots, as well as stems and leaves, require air. Water-logged, badly-drained soils, especially when in garden-pots and heavy plastic clays, exclude the air, and consequently have a low degree of fertility by reason of the de-nitrification which takes place in the plant-food. Farmyard and stable-manure, and all organic manures and composts, do yeoman service for such soils, by rendering them more porous and permeable to air and to the development of surface plant-roots.

Respecting the value of light, it will only be necessary to state that the full effect of manure is not obtained when crops are too thickly sown or planted. An excellent illustration of this is afforded by the Turnip or Onion crop. Carefully conducted experiments have shown that the amount of marketable growth furnished by these crops, sown broadcast, is very much less than that obtained from a similar area planted in rows and properly thinned. The same is true with regard to fruit-culture; it has been demonstrated time and time again that no work in connection with a fruit-orchard pays better than judicious thinning.

Warmth and Moisture.—With these the control of the gardener is more direct than that of the

farmer, owing to the smaller area of land with which he has to deal. In out-door work it is well to remember that suitable culture may vastly increase and also regulate a soil's warmth (so necessary, especially in seed-germination and the younger stages of plant growth), as well as affect beneficially its capacity for holding moisture. Between 50 and 70 per cent. of every growing plant in the garden is water, and sometimes the amount is much higher than this. The whole of the water, and much more which is transpired through the leaves during the life of a plant, is drawn by the roots from the soil. The presence of organic matter, as furnished, for instance, by farm-

the same parentage as the one now under notice, though the matter was always considered more than doubtful on account of its exhibiting so little trace either of the yellow colour or the form of *C. Dowiana aurea*. It is barely possible that *C. × Massiliensis* of M. Maron may have been the reverse cross to this, and the variable *C. labiata* Trianaei bearing the seed may have caused this difference, but if such is the case it is a remarkable departure from the generally accepted rule. In the production of *C. × Maggie Raphael* a superb form of the Popayan type of *C. Trianaei* was used, and that made a difference in the fine form of the flower, though it is not easy to see why it should

FIG. 158.—CATTLEYA × MAGGIE RAPHAEL.

(See Royal Horticultural Society's Report, December 9, 1899, p. 441.)

yard and stable-manure, is instrumental in controlling a right degree of soil moisture during seasons of drought, and, as previously stated, by its germination and decomposition raises the soil's temperature. *J. J. Willis, Harpenden.*

(To be continued.)

CATTLEYA × MAGGIE RAPHAEL (DOWIANA AUREA ♀, LABIATA TRIANAEL ♂).

THERE is a special interest about this fine hybrid, which we here illustrate (fig. 158), raised by H. S. Leon, Esq., Blotchley Park, Blotchley (gr., Mr. Hislop), and shown at the Royal Horticultural Society, Dec. 5, this year, as it is not only a very fine and distinct hybrid, but it also serves to check an error in a previous record, viz., *Cattleya × Massiliensis*, which was said to be of

be so very different in colour from other crosses botanically analogous, as for example the fine *Cattleya × Lord Rothschild* (*C. Dowiana aurea* × *C. labiata* Gaskelliana), illustrated in *Gardeners' Chronicle*, October 24, 1896, p. 489, which has sepals and petals freckled with rose colour, nearly resembling *C. Gaskelliana*; or the natural hybrid *C. × Hardyana* (*C. Dowiana aurea* × *C. Warscewiczii*) which has since been home-raised by Mr. Norman C. Cookson, and which exhibits but little of the yellow colouring of *C. aurea*. On the other hand, *C. × Maggie Raphael* has the yellow colour of *C. Dowiana aurea*, with the addition of a bronzy-rose tint towards the edges of the petals, and a number of purple spots along the veining on each side of the mid-rib. The lip is of a rich purple colour, lighter towards the margin and apex, and with some yellow lines running from the base to the centre. It is a very distinct and beautiful flower.

CYPRIPEDIUM × HERA VAR. EURYADES.

OUR illustration (fig. 159) represents the finest form of the many varieties resulting from crossing *C. × Lecanum* and *C. Boxalli*, and for which Sir Trevor Lawrence, Bart. (gr., Mr. W. H. White), was awarded a First-class Certificate at the Royal Horticultural Society, on December 5, this year, it having previously secured an Award of Merit as *C. × Euryades*, but since that time had greatly improved. As with other hybrids between parents exhibiting great variation in themselves, there is great dissimilarity in the progeny, in this case as in others, resulting, perhaps excusably, in some amount of confusion in the nomenclature. In 1892, Messrs Jas. Veitch & Sons flowered one of the

coloured flowers being among the best of its class. The upper sepal has a greenish base, a pure white upper portion; the whole spotted with dark purple, almost black at the base. The petals and lip are greenish-yellow tinged with brown, the petals bearing dark purple blotches.

ROOTS, ROOT-STOCKS, AND ROOTING-MEDIUMS.

A SUITABLE root environment is of the utmost importance in the cultivation of all plants. Apart from the value of soils in their power to support plant-life, they must show such mechanical and hydrometric conditions that roots, in whatever form, may be preserved from extreme drought on

once debilitated through loss of roots are a long time regaining health, and frequently exhibit traces of the ordeal through which they have passed—for a time, at least—spoiling them as objects of ornament.

Any study, therefore, that will lead to the right temperature, the right kind of soil, and the right amount of moisture being afforded to plants at the right period, is time well spent. Orchid cultivators have made remarkable strides in the cultivation of what were once known as difficult plants to grow, mainly because they have diligently studied, imitated, and in instances improved upon, the natural conditions under which these plants thrive. On the other hand, plants, other than Orchids, have not received such marked attention. It is not suggested that they have been systematically neglected, but that there is yet much to be learned. It is far too general a practice to pot up a variety of plants in the same kind of soil, grow them together in the same house without any assortment, according to their nativity (save in a very rough way), or according to such evidence of the treatment they require, as may be found in either the root, root-stock, leaf, or stem. Happily, the majority of plants thrive in ordinary compost, consisting of leaf-soil, loam, and sand; or in ordinary garden soil, provided such fair and uniform amount of moisture is maintained, as would be in accordance with the amount of leafage they carry; and in the case of deciduous plants, such moisture as will keep the roots in a healthy state.

It is those plants that live on high mountain ranges, on dry or arid plains, and those tropical plants which live partly or wholly in an epiphytal state, which prove most puzzling to the cultivator. Take true alpine plants as instances: they are, for the most part, accustomed to such rooting-material as crude, disintegrated rocks (which may or may not be covered with an inch or so of turf), and their own dead tissues. Many root into the fissures of rocks, and are thus preserved from excessive heat, drought, and cold. Such plants, when brought under cultivation would find garden-soil and the loam of pastures too rich in humus, and too retentive of moisture for perfect root-action, not so much in the summer as in the winter. They would be well suited with rocks, some around them as ornaments, and for providing sunny and shady sites; others buried beneath them as suitable well-drained surfaces on which roots could run. The advantages of buried rocks, either entire or broken up and mixed with the soil as suitable anchorage for alpine, is occasionally overlooked when the study of artistic effect predominates in the building of rockeries. Many may have noticed the flattened, wiry roots of some imported alpine, clearly revealing the nature of the rooting medium in which they flourished on the mountains.

Andine plants, and plants from dry districts, mostly have some kind of tuberous or bulbous root-stock, rendered necessary by the long periods of rest they have to undergo. They are among the first to suffer if given faulty rooting mediums. Presumably, it is reasonable to attribute the heavy losses of small and delicate bulbous and tuberous plants, such as *Placeas*, *Cyrtanthus*, *Habranthus*, *Besseras*, *Tecophyleas*, *Iris*, *Tulipa Greigi*, and a host of others, to no other cause than this. They all require a very free soil, such as turfy loam, crushed sandstone, spent lime, rubble, &c., for plants in pots, and the addition of the rubble and coarse sand to the soil for plants in the open. What is most needed is free drainage, in order that the bulbs and permanent roots could receive the requisite amount of moisture when resting, to ensure plumpness without the slightest risk of stagnation.

BULBS AND ROOT-STOCKS.

The bulbs and root-stocks of spring-flowering hardy plants in the open border, which prove difficult to keep, may be encircled with living roots from other plants during the resting season—a perfectly natural method of protection from rot

FIG. 159.—CYPRIPEDIUM × HERA, VARIETY EURYADES.

cross, and exhibited it as *C. × Adrastus*; but later found, it is stated, that they had previously named it *C. × Hera*. In November, 1893, the form under notice was shown by Messrs. Veitch as *C. × Euryades*, it being florally sufficiently distinct from that previously shown as *C. × Adrastus*. But when Sir Trevor Lawrence exhibited it as *C. × Euryades*, on December 5, it was thought advisable to refer it to the supposed original *C. × Hera*, and make it a variety. But with that rendering of the question the difficulty is not quite done with; for, in *The Orchid Review*, vol. i, p. 295, is the remark, "*C. × Hera* was derived from *C. Spicerianum* ♀ and *C. villosum* ♂, and thus must be a variety of *C. × Lathamianum*." If this remark is correct, and it is a prior name, the present form had better be put under *C. × Adrastus*. In any case, its beauty is not in question, its glossy, richly-

the one hand, and what is of greater importance—excessive moisture on the other.

In Nature, the geographical limitations of given types is greatly influenced by the facilities afforded to roots to perform their duties to the plants they support. In Nature, again, given species have either become extinct, owing to the alluvial and hydrometric changes of that part of the earth's surface they particularly inhabited, or they have become greatly altered in habits, and modified in size.

The influence of unsuitable temperatures on any plants in cultivation is so apparent to the eye, that the cultivator may correct it before much harm is done; cases of faulty root-action from unsuitable conditions of soil are not so readily apparent, and much undermining of the constitution of the plants may occur before it is observed. Moreover, plants

through excess of moisture. Batches of slender, dwarf-growing annuals suggest themselves as suitable for this purpose, as well as many dwarf and not too dense herbaceous perennials. I know nothing better suited to preserve Tulips in the open border than bedding Pelargoniums and Gazanias. They could be planted between the rows of Tulips, and would permit of the leaves of the Tulips remaining on the plants as long as they will. Both plants being capital drought resisters, moisture to the extent of being injurious to the bulbs would not be needed. The tubers of *Helicodictyon crinitus* and other doubtfully hardy Aroids may be covered with the common *Sedum* acre as a means of protection from penetrating frost, aided by efficient drainage. It is probable, though I have not tried them, that *Calochortus* and *Tigridias* would survive all but the severest winters similarly protected. The *Sedum*, when in flower, and at all times, would be much more interesting than bare soil.

Liliums.—The best members of this genus are very particular as to the rooting mediums. The best groups of *L. auratum* and its varieties I have seen have been old-established, with one bulb growing on the top of another, and every bulb in excellent condition. Examination showed the permanent roots of the uppermost bulbs working among the scales of the lower bulbs, each bulb helping the other by removing moisture from a place where it would do more harm than good. It may not be possible to associate bulbs in this manner, for their mutual benefit, in all the phases of Lily cultivation, but it shows in what manner the permanent roots and the bulbs are preserved. In pot-culture, the conditions are within the power of the cultivator to imitate, though by other means, i.e., he can control the supply of water, and provide an open, free soil to surround the bulbs. Other *Liliums*, doubtless, are preserved under the same system of association, the bulbs and roots being of a similar character throughout the genus.

STOVE-HOUSE PLANTS.

These plants, naturally requiring a great deal of moisture the whole year round, should have special attention as to soils and drainage. Being for the most part inhabitants of districts which are covered with heavy layers of organic remains, in the form of tangled masses of living and dead roots, leaves and other vegetable debris, they should have as rough a compost as is possible, consisting of material that will resist speedy decay. Plants with stout roots, such as *Heliconias*, *Palms*, *Tillandsias*, and most *Bromeliads*, *Eucharis* and other tropical bulbs, should have such rooting material as pieces of fibrous-loam, half-rotted leaves, small pieces of sandstone, charcoal, charred-sticks, and other ingredients that will tend to keep soil sweet and porous for years, and which will afford food through decay at just the rate at which it would be appropriated by the roots. The ingredients should be well incorporated, and pressed firm in potting. Beside the method of affording aid to plants with manure-water applied to the roots, the practice of damping-down with lime and soot-water is a useful one, ammonia being carried on the atmosphere to the roots.

Tropical Aroids, being almost identical with tropical Orchids in the habit of depending upon an atmospheric food supply, are very impatient of a close-rooting medium. Examination of these plants in bad health usually shows such living roots as they may have either permeating the top layer of the compost, or among the drainage at the bottom of the pot; the conditions in either case offering the best protection to the delicate roots. The soil advised for stove-house plants, with the addition of firm peat, is suitable for Aroids, and such plants as are generally grown with them. The soil should be pressed just sufficiently firm to allow of water spreading over the whole surface before passing away. The more delicate Aroids and Marantaceous plants thrive best in pots with holes in the sides, thus admitting air to the

compost. Delicate *Caladiums* may also be treated in the same way. A word on the resting seasons of tropical bulbous and tuberous plants, and I have done. It is not possible to enter into detail as to the nature of the rest required by each plant, but a rule, to which there are few exceptions, may be found useful. Evergreen bulbs must not have water, and a growing temperature withheld from them long enough to make the leaves suffer. Forcible resting out of season, or retarding plants that incline to grow, is a risky proceeding, and should not be attempted with valuable plants. In the case of deciduous bulbs, it may be ruled, but not conclusively, that the longer and more slender the bulb, the shorter the rest required. With regard to tubers and pseudo-bulbs of any kind a similar rule applies. *Geo. B. Mallett, Isleworth.*

THE HOLLY AND YEW AS WOODLAND TREES.

Is it probable, as I lately heard remarked, that the Yew, which with the Oak, according to geological researches, flourished in British forests prior to historical times is, together with the Holly, in danger of becoming a rare tree, if not absolutely a thing of the past, in British woodland scenery? Owing to the great age that these trees live, this prophecy is not likely to be fulfilled for at least many years to come, but should it ever become true, we shall lose from our woods and coppices two of our most beautiful and indigenous evergreen trees, that with our poetry and history, help to link us to our ancestors. No one in looking through our nurseries and observing the great number of young trees there, would entertain a thought about this, and yet, upon reflection, are not a very great proportion of these used for the formation of hedges, topiary work, and the like, and but few for the purposes of beautifying our woods or landscapes? Both of these trees fruit freely, and notwithstanding that birds are fond of it, many seedlings in favourable places spring up; in too many cases, however, it is feared to be destroyed as soon as visible by the rabbit. Whether this is the case or not, so far as I have observed, where these trees revel in natural beauty, but few of them are very young.

Doubtless the popularity of the many newly-introduced beautiful species and varieties of Conifers and shrubs, do much to lessen the planting of the Holly and the Yew in pleasure and other dressed grounds; but this is outside the question, and yet it may be asked if the planting of some of these is not being overdone? such, for instance, as the easily-raised *Retinospora*, *Cupressus Lawsoniana*, and others, groups and single specimens of which may be seen almost everywhere, either in character or out of it, with their surroundings, while it is in comparison a rare occurrence to meet with fine specimen Hollies, as may be seen for instance at The Duffryn; Mountain Ash, or groups of them as at Cardiff Castle.

In no other district have I seen the Holly in a wild state so plentiful as on the border of Ashdown Forest, where in winter it enlivens the appearance of the woods in a most picturesque manner. Similar remarks apply to the Yew in the neighbourhood of Monmouth. It is common on the Hendre estate, where it is especially effective upon the undulated surfaces of the woodlands, and in the park it is also plentiful. One fine group of wide-spreading trees possesses some with trunks 16 feet and 18 feet in circumference at 4 feet from the ground. Then, again, in the Wye Valley, it is found in great numbers, and there at the Wind-cliff it takes a prominent part in making the scenery so charmingly romantic, and so greatly admired and enjoyed by tourists and others as it is. Here the steep winding banks of the river, which for long distances are supported by huge perpendicular Ivy and Bramble-clad rocks, are grandly furnished with trees, consisting chiefly of the Yew, Oak, and Birch. The magnificent effect of the whole, particularly in autumn, when the brown-tinted foliage of the Oak, and bright yellow leaves and white stems of the Birch in their harmony, afford greater visibility to the Yew, evinces the loss British woodland scenery would sustain by being robbed of this old British tree. *Thos. Coomber.*

TACSONIA MILITARIS ×.

UNDER this name we lately received from Messrs. Sander flowers of a hybrid *Tacsonia*, said to have been raised in the Transvaal, between *Tacsonia Volkemi* and *T. insignis*. The floral details do indeed suggest an infusion of *T. insignis*, but they are very different from the flowers raised between the two species named by Mr. Anderson, Sowerby House Gardens, Hull, in 1875 (see *Gardeners' Chronicle*, 1875, August 7); and also by Mr. Smythe, of Basing Park Gardens, June, 1887 (*Gardeners' Chronicle*, July 9, 1887; July 23, p. 107), so that whilst we are inclined to admit *P. insignis* as one of the parents we doubt whether the other was truly var. *Volkemi*. In some respects it suggests *T. manicata*. The present plant has three-lobed, finely serrate leaves, as shown in the illustration (fig. 160, p. 487), the upper surface being glabrous, the lower surface densely setose, like the petiole, though hardly so shown in the illustration. The stipules are linear, subulate. Three large, leafy, oblong bracts surround the flower-tube, which is cylindrical, with an inflated base, which is not ribbed. The colour of the flower is dull rose, the projecting threads of the corona dull crimson. The details of the inner rows of the corona, the most important parts for botanical discrimination, but of little importance to horticulturists, are sufficiently indicated in Mr. Worthington Smith's drawing. The ovary is oblong and glabrous. *M. T. M.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

A Retrospect.—The chief fact to note in the department of Orchid-culture during the past year is the extreme favourableness of the weather conditions for almost every class of Orchid. The one essential element which was lacking in many gardens towards the end of the summer was rain-water, but where other partially suitable water was available, nothing probably suffered with the exception of the sphagnum-moss, which always loses its fresh-looking appearance when hard water is employed. Strong, clear sunlight and warmth proved beneficial to the plants, such conditions being rare in this country, although they are those the plants enjoy in their native habitats. Those best suited for cultivation in the cool-house are not any the worse for being subjected to unusual warmth; for example, the cool *Odontoglossums* have, since cooler weather prevailed, made more satisfactory progress than in dull, wet summers; and, doubtless, it will be found that *Cattleyas*, *Lælias*, *Dendrobiums*, and indeed most genera, will, under average conditions of cultivation, show the beneficent effect of the high temperature of the past season. Another effect which may become more apparent as time goes on, is the increased germinating power of the seeds of Orchids during the last two seasons, the increased light and heat being responsible, I think, for the greater number of seedlings which have germinated, which otherwise would have, more or less, proved abortive. If ill effects are noticeable among certain species, the fault lies more probably with the methods of cultivation than with the weather. Shade-loving plants, for instance, would appreciate the extra heat, but not the light. Well, the latter is easily dealt with when too abundant; now, unfortunately, when a little would be acceptable, we cannot command it. Cold, drying winds were less common than usual, with the result that a greater volume of fresh air could be admitted to the plants. Fog also, until the end of the year, caused but little injury, so that, taken as a whole, this year has been an extremely good one for Orchids.

Ornithidium Sophronitis.—Though this is a plant that need not be grown in quantity, it commends itself to those who esteem the beautiful in miniature. The habit is trailing, and the plant forms a dense mass of tiny, dark green leaves, from the axils of which brilliant, orange-scarlet flowers arise singly. It should be fixed in a shallow pan, large enough for two or three seasons' extension,

and furnished with large quantities of drainage-materials, surfaced with a layer of peat and sphagnum-moss mixed together, the latter predominating. The longer pieces should be made secure to the compost with wooden pegs. Let the plant be placed near the glass in a house where *Masdevallias* are grown, and afforded the same kind of treatment as those plants. The plant is in flower at the present time.

Pleurothallis Roezli, now in flower, will succeed if cultivated with the plants of *Miltonia vexillaria*. The species generally dislike frequent disturbance at the root, and when once they are established, little should be done beyond replacing decayed sphagnum-moss with fresh. At the present season *P. Roezli* requires merely sufficient water to keep the material from becoming excessively dry.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

SEEDS being usually ordered by gardeners early in the year, there is time before that to test the germinating qualities of the various seeds left over from last year. To do this readily, place a certain number in small pots and stand the latter in a temperature of 60°. Those which germinate sparingly should be discarded, as certain to fail when sown in the open air.

Carrots.—In order to force the Carrot, a mild lasting bottom-heat is essential, and the forcing carried on in pits and frames. These should be cleansed previously to being utilised, and the sides limewashed; after making up beds 3 feet deep with leaves and stable dung made firm, put a layer of sandy soil on the top to the depth of 7 inches, and when this has been warmed throughout, sow seeds of some early varieties, not too thickly, in shallow drills or broadcast. Let the frame be kept close till the plants appear, then admit air by tilting the lights, more or less, according to the state of the weather, covering the glass at night with mats, and in hard weather with litter as well. The top heat should range from 55° to 60°, with a rise of ten degrees in the day time in bright weather.

French Beans.—Let sowings be made in pots, and start them in a temperature of 55°, and afford a higher temperature when they have germinated. The best kind of soil for French Beans is loam used in a rough state, and Mushroom-bed manure. The size of the pot for the first sowing need not be larger than 8 inches in diameter. The warmth may be increased to 65° by the time of flowering, and a light position near the glass is very essential for their success. *Ne plus Ultra* is a very productive variety of dwarf growth, and excellent for an early crop.

Peas in Pots.—Where accommodation exists for forcing Peas, a sowing of dwarf wrinkled varieties may now be made in clean pots filled with rich, rough loam, charred rubbish and decayed manure. The temperature at the start should not be higher than 50°, the Pea not bearing hard forcing till after podding has begun.

Herbs.—The roots of Mint, Tarragon, &c., may be put into heat in quantities equal to the demand, shallow boxes being employed to hold the roots and the soil necessary to cover them.

Spinach-Beet.—In establishments having a large demand for Spinach, the Spinach-Beet should be grown in addition to the ordinary Spinach, the young leaves being used separately or together with those of the latter.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucestershire.

Beds and Borders, if vacant, should now be deeply dug or trenched in order that the frost may pulverise the soil. In the case of beds and borders which are filled annually with the same kinds of plant it is advisable before each season to add some leaf mould, fresh soil or manure, according to the requirements of the various plants, and in quantity sufficient to nourish the plants without producing gross growth. If new beds are being made, great attention should be given to the drainage in all soils and situations needing artificial means of carrying off the moisture, many failures occurring from neglect of this precaution. When it is seen that the soil of a bed, &c., has become retentive of

moisture it should be dug out to the depth of two feet, and a drain made sufficiently large to take off the water, some brick-bats or tiles being laid at the bottom, and be covered with turf, or brushwood, or straw, finally replacing the soil in a loose manner.

Top-dressing.—*Peonies*, *Delphiniums*, *Sun-flowers*, *Asters*, and other plants of strong growth, if they have not been replanted recently should be afforded a liberal top-dressing of manure, which will afford a certain amount of protection against frost, and does not excite growth; although the benefits are apparent in the flowering season. Lily of the Valley and Solomon's Seal crowns required for forcing should now be lifted, and the stronger ones selected and placed in pots or boxes containing a mixture of leaf-mould and soil, and allowed to be exposed to a few degrees of frost before placing them in a warmer structure. The weaker crowns if heeled in soil may be planted later on. The remaining crowns should have the leaves and stems remoulded, some soot sprinkled over them, and sufficient leaf-mould to cover them.

Conifers and Shrubs.—Many of the Conifers and evergreen shrubs that withstand wind and frost when of specimen size are very liable to injury if planted when young in exposed positions. Such plants should have shelter given from the colder winds; for which purpose Spruce or Yew branches if tied securely to stakes make an excellent protection. Similar wind screens must also be used for affording shelter to Tea Roses and a variety of tender shrubs in exposed positions on walls, but they should not be placed so thickly as to exclude the light. In the event of a heavy snowfall the branches which seem to be too much weighted down should be relieved but not wholly uncovered; in respect to rather tender species snow affords a protection against frost.

Work in General.—When inclement weather hinders or puts a stop to outdoor work, the men may be employed by preparing creeks, washing and stacking flower-pots, preparing stakes, or mixing and sifting soils.

Composts.—The various loams, leaf-mould, peat, manure, and road scrapings, &c., should now be got in and stored in conical heaps; while leaves which are usually to be found in low-lying places, in woods, and in ditches, may be collected and carted to the dépôt. Leaf-mould being the chief ingredient in most composts, it is as well to have a good supply of it in a well-rotted condition.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener, North Mymms Park, Barnet.

Euphorbia (Poinsettia) pulcherrima.—This plant becomes useless for purposes of decoration when the bracts fall, and at that period water should be gradually withheld, until at last the soil may become quite dry. The plant may then be rested in an intermediate house, or a dry warm shed.

Allamanda nobilis and A. grandiflora.—If any of these beautiful stove climbers are required to bloom early, those which have been afforded a long rest may now be started into growth, after cutting back last season's shoots to within a few inches of the old wood, unless it is desired to extend the plant, when it will be sufficient pruning if partially-ripened growth be removed. The plants will be found to start into growth readily at this season if afforded bottom heat of 75° or 80°, although this is not necessary. The plants having been kept dry while resting must be afforded a thorough application of tepid water, and be placed in a house having a temperature of 65°. Re-potting, if such be necessary, should be performed when the young growth has reached a length of 2 inches. Cuttings of *A. Williamsiana* may be inserted at the present time for raising plants to flower in 5 inch or 6 inch pots in September and October. Suitable short shoots will be found on plants which have lately gone out of flower. The cuttings should be inserted singly in small pots, and the latter plunged in bottom heat in the propagating frame.

Selaginellas, Oplismenus (Panicum), and Tradescantias.—The stock of these little plants may be kept up by propagating them, as the necessity arises, beginning at this season; the *Selaginella* by dividing large potsful, and the *Oplismenus* and *Tradescantia* by cuttings inserted in sandy soil, and placed in a propagating frame.

Miscellaneous.—Assiduously remove decayed foliage from Violets and other plants in cold pits

and frames, affording air whenever the weather is mild, particularly when the opportunity occurs during a spell of frosty weather, when pits and frames of necessity have been closely covered. Afford the *Chrysanthemum*-stools required to furnish cuttings a position near the light in a greenhouse from which frost is excluded. Examine bulbs which are covered with plunging material at short intervals of time, removing all of those which have grown an inch in height, and possess plenty of roots, to a cool pit. Examine herbaceous Calceolaries, show Pelargoniums, Cinerarias, &c., for aphids, affording the plants a fumigation of Richards' XL-All insecticide if any be found on them.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Canker of Apple-trees.—When the pruning of the trees is in progress, every case of canker should be duly noted, and if the tree is not worn out, in which case it should be rooted up, the diseased parts should be scraped clean, all the cankered portions of the bark removed, and afterwards scrubbed with a strong mixture of soft-soap and water, applied hot. When the dressed parts are dried, paint them with a mixture of Stockholm-tar and tallow in equal proportions. If warmed, the two mix readily, and the mixture is easily applied with a half-worn-out paint-brush. Trees that are badly cankered should be cut hard-back, and new growth encouraged, affording the soil over the roots a heavy dressing of rotten manure; or apply Pearson's Chemical Manure in the quantity recommended by the vendors.

Filberts and Cobs.—The pruning of these bushes may also be performed without loss of time, the buds of the female-flowers being in a very forward state, and easily seen—in fact, some of the earliest are almost on the point of bursting; but we shall probably get cold weather to check their further advance. The male-cattkins are very numerous this season. Head-back some of the longest branches, keeping the heads of the bushes open, and where they are planted between Apple or other fruit-trees, let them be kept of moderate size, and their branches from running into those of the fruit-trees. Strong young growths should be cut back to 1 or 2 feet from the base, which will encourage the lower buds to break, otherwise they soon run up to an undue height before breaking. Every sucker arising from the roots should be dug out, and the best of them planted in the reserve-garden.

Top-dressing and Manuring Orchards.—After pruning and dressing the trees, let all prunings and rubbish be collected and burnt. Orchards inter-cropped with bush-fruits and the like, are much to be preferred to those under grass, as top-dressing the land is more efficiently carried out. The land being cleared of rubbish, should be top-dressed with a mixture of wood-ashes, lime-rubble or lime, leaf-soil, and rotten manure, in greater or smaller quantities according to the state of the trees, and the condition and texture of the soil, burying the dressing by digging the land with forks. In the operation, all suckers and large weeds should be dug up. Orchards consisting of vigorous young trees will not require manuring. Trees under grass should be fed with liquid-manure, and some heavy dressings of rotten dung put on early in the winter.

Miscellaneous Hints.—Where grafting is contemplated, the scions may now be selected, labelled, and the butt-ends buried in the soil to the depth of 3 or 4 inches in a cool, shady position. Trees which it is intended to graft may be headed-back to within 6 inches of the spot, which will eventually be worked. If Peach-trees are removed from the wall annually, they may now be pruned, cutting away old fruiting-growths, and retaining as many of those of the current year as will fill the space without crowding. If the trees were partially pruned after the fruits were gathered, the pruning now required will be of a light description. Where the trees are to remain affixed to the walls until nearly in bloom, the branches should be fastened to stakes fixed in the soil in the front of the wall. Any pointing-up of nail-holes or other repairs should also be done in favourable weather. In weather when outside-work is impossible, shreds may be cut into different sizes, wall-nails burnt, and prepared for future use; labels made, and where new ones are required, the names may be written or painted thereon.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY, JAN. 1.—Dutch Bulbs, Roses, Greenhouse Plants, &c., at Protheroe & Morris' Rooms.
WEDNESDAY, JAN. 3.—Japanese Lilies, Lily of the Valley Crowns, Roses, Azaleas, &c., at Protheroe & Morris' Rooms.
FRIDAY, JAN. 5.—Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period December 17 to December 23, 1899. Height above sea-level 24 feet.

Remarks.—A very foggy, dark week; some days scarcely any light. Small quantities of rain fell on the 22nd and 23rd.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—36°6'.

ACTUAL TEMPERATURES:—

LONDON.—December 27 (6 P.M.): Max. 35°; Min. 28°.

Dull; cold; rainy.

PROVINCES.—December 27 (6 P.M.): Max. 38°, S.W. Ireland; Min. 29°, Home Counties.

THE year now at its close has been one of great activity in horticultural centres. If generally it closes in gloom and uncertainty, there is at least plenty to look back upon with pleasure, and to anticipate with hope. We can only mention a few of the leading features of the period under consideration; and first as to the weather. After a sharp spell of cold weather in March, the summer became hotter and more hot—or, what is of more moment to us, drier and yet more dry. Heat and drought, indeed, characterised the summer of 1899, as they did that of the preceding year. We recognised the difficulties of the situation at the time, but it is more than probable that we shall witness its effects on trees and shrubs during the next year or two, and perhaps—so short is our memory of such matters—wonder why our trees and evergreen shrubs are suffering so much. Of course, much will depend on the nature of the soil.

The gardener is less or more independent of the seasons, and the completion of the temperate-house at Kew endows us not only with

the largest horticultural building in existence, but will—nay, does already—show how far more favourable to a plant's health and beauty is the open border than the best flower-pot that ever was made. In saying that, we by no means belittle that valuable article, as in some cases it is, as we all know, indispensable; but if we are to have permanent, tasteful arrangements under glass, we must largely dispense with pots. In this connection it may be stated that there is, or was till lately, at the Old Chelsea Botanic Garden, a north-house erected under the superintendence of the late N. B. WARD, and arranged in the natural style. We cannot say that the atmospherical conditions were favourable to such a house in such a place. It was not easy to keep clean, and the stronger plants overpowered the weaker, till at length but few of the latter category remained. It is interesting to know that in the present year the old garden has been rescued from threatened abolition, and although the Board of Management seems far too numerous and unwieldy, it may be hoped that some good results may accrue. Nevertheless, the main interest in the garden will henceforth be historical in character, and from that point of view the old physic garden, considering its size, may challenge comparison with any in the country.

The decision of the House of Lords in the rating case deprives nurserymen, and especially market gardeners, of the benefit of the Agricultural Rates Act. This is a deplorable incident, as it is likely to injure a thriving industry which has made astonishing progress during the past quarter of a century; and in a degree compensated for the depression among agriculturists. It is inconceivable that this result could have been intentional on the part of our legislators; simply the conditions which are now prevalent were at the time the law was passed, not in existence.

Another point that affects the trade is the restriction attempted to be placed on the sale of such substances as weed-killers, insecticides, and other compounds, containing in some cases enormous amounts of the most deadly poisons. Some people are so incautious that no regulations will save them from the consequences of their own want of care. Other people may, nevertheless, fairly demand that the sale of these substances should be carefully regulated, and though accidents cannot wholly be prevented, yet that every reasonable precaution should be taken to avoid them. Suppose a drop or two of some of these more potent insecticides were by accident to be introduced beneath the skin, or into an open wound, a mere scratch would be enough, the consequences would be most lamentable. Horticultural requisites of this nature should, of course, be obtainable from traders connected with horticulture, but only under such conditions as are imposed upon the druggist. The encroachment on the liberty of the subject is here only a means for securing the preservation of the liberty of the multitude.

The great horticultural event of the year has certainly been the Hybridisation Conference held under the auspices of the Royal Horticultural Society. Although many of our own botanists seemed to held aloof, or were conspicuous by their absence, the meetings excited great attention; but the interest exhibited by our own workers in this field furnishes no adequate measure of that taken in the Conference by our foreign friends on the continent as well as in the United States.

In France, Belgium, Holland, Germany, and in the States, all of which countries sent representatives—in some cases two or three—we know of our own experience how great was the interest excited. We may be permitted, perhaps, to mention our own efforts to promote the work of the Congress by the publication of a series of historical articles on the production of garden varieties and hybrids, a series which should be of value to the historian of hybridisation. We also took the opportunity of publishing a large number of portraits of distinguished "raisers," with brief indications of their work, so that our record of the proceedings, and of the incidental subjects connected with it, was as complete and up to date as the exigencies of a weekly periodical will permit.

Of the other exhibitions there is no need to say more than that they were of their usual excellence, but presented no very special feature. A noticeable tendency in the special societies to adopt a more tasteful arrangement of the beautiful material at their disposal is most welcome. For many years we have advocated this, and from time to time we have been gratified by indications that the reign of the show-boards and lines is approaching extinction (except for special purposes). The Chrysanthemum show at the Aquarium this autumn must surely have convinced everybody which is the most effective and beautiful method of exhibiting.

The losses by death in the horticultural community have this year been singularly numerous and lamentable. Among the older members, the veteran JOHN LEE died on January 20, aged ninety-four. Well had he borne the stress of all those years, and his work as a nurseryman and as a strenuous upholder of the Gardeners' Royal Benevolent, will not soon be forgotten. KELWAY, of Langport, had attained the age of eighty-three; his services in the improvement of Pæonies, Gladiolus, Delphinium, and many other categories of plants, place him in the front rank of raisers. Of Lord PENZANCE we have spoken too recently for it to be necessary for us to do more than call to mind his happy thought of hybridising the Sweet Briar with the hybrid perpetuals, with the result of originating the Penzance Briars.

Dr. WALLACE, of Colchester, may also be classed among the veterans; his memory will long be held in esteem among bulb-growers. CHARLES NAUDIN, naturally less known here than in France, was one of the first hybridisers and keenest of botanists; he had charge of the beautiful garden at Antibes, formerly in the possession of M. THURET, and was in the very forefront of garden-botanists and experimenters, but at his advanced age little more could have been expected from him. Passing from the ranks of the octogenarians to those in middle life, from whom we might fairly have expected further good work, the losses are very severe, as may be seen from the following selection: MALCOLM DUNN, T. A. DICKSON, T. J. SALTMARSH, JAS. ANDERSON, Major MASON, T. W. GIRDLESTONE, FRANCIS RIVERS, the honoured son of an honoured father; the noble-minded HENRY VILMORIN, ALFRED JOHNSON, WILLIAM THOMSON, JAMES MARTIN, the hybridist; SYDNEY COURTAUD, W. H. PROTHEROE, and A. OUTRAM. We need not cite more, these will suffice to show how the ranks have been thinned. While we venerate their memories, we acclaim the new comers, in the full assurance that they will rival the achievements of their predecessors, if not in one department at least in another.

**** OUR ALMANAC.**—According to our usual practice, we shall issue in our next number a *Gardeners' Chronicle Almanac* for the year 1900. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and allied Societies, or any of our correspondents, will send us IMMEDIATE INTIMATION of all fixtures for the coming year.

DREES & Co., of Philadelphia. Doubtless in due time we shall be able to judge of these novelties for ourselves.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The sixty-first annual general meeting of the members and subscribers of this Institution will be held at "SIMPSON'S," 101, Strand,

six by votes of subscribers. The chair will be taken by HARRY J. VEITCH, Esq., Treasurer and Chairman of Committee, at 3 o'clock. The poll will open at 3.15 o'clock and close at 4.30 o'clock precisely, after which hour no voting papers can be received. The voting papers have been issued; any subscriber not having received a copy should communicate with the secretary. The annual

FIG. 160.—*TACSONIA MILITARIS* X, HORT. SANDER: FLOWERS DULL ROSE-COLOURED. (SEE P. 484.)

HYBRID WATER-LILIES.—We hear of three new hardy hybrid Water-Lilies, which have been certificated by the Massachusetts Horticultural Society, and which are highly spoken of. Some of them are said to remain open the whole day. They are "William Falconer," dark crimson; "William Doogue," pink; and "James Gurney," dark rose. They are to be sent out by HENRY A.

London, W.C., on Friday, January 12, 1900, at 3 P.M., for the purpose of receiving the report of the Committee and the accounts of the Institution (as audited) for the year 1899; electing officers for the year 1900, and for the purpose of placing sixteen pensioners on the funds, ten of whom will be recommended to receive the benefits of the Institution without election, and the remaining

friendly supper will take place also at "SIMPSON'S," 101, Strand, W.C., at 6 P.M., on the evening of the same day, when W. A. BILNEY, Esq., of Weybridge, will preside.

ROYAL INSTITUTION OF GREAT BRITAIN.—Friday evening meetings before Easter, 1900, to which members and their friends only are

admitted: Friday, January 19, the Right Hon. Lord Rayleigh, M.A., D.C.L., LL.D., F.R.S., M.R.I., "Flight;" January 26, the Hon. Charles A. Parsons, M.A., F.R.S., M.Inst.C.E., "Motive-power—High Speed Navigation—Steam Turbines;" February 9, Professor J. Reynolds Green, Sc.D., F.R.S., "Symbiosis and Symbiotic Fermentation;" February 16, H. Warington Smyth, Esq., M.A., LL.M., F.R.G.S., "Life in Indo-China;" February 23, Prof. John H. Poynting, Sc.D., F.R.S., "Recent Studies in Gravitation;" March 2, Major Ronald Ross, D.P.H., M.R.C.S., "Malaria and Mosquitos;" March 9, Professor Frank Clowes, Sc.D., F.C.S., M.R.I., "Bacteria and Sewage;" March 16, Sir Benjamin Stone, M.P., "Pictorial Historical Records;" March 23, Sir Andrew Noble, K.C.B., F.R.S., M.Inst.C.E., M.R.I.; March 30, Professor J. Arthur Thomson, M.A., "Facts of Inheritance;" April 6, Professor Dewar, M.A., LL.D., F.R.S., M.R.I., "Solid Hydrogen."

PELORATE CYPRIPEDIUM.—The variety of *Cypripedium insigne* shown at the last meeting of the Royal Horticultural Society was remarkable for the presence in each of the flowers of three lips—that is to say, that the two lateral petals had assumed the lip-like aspect. This, then, is a case of peloria by the increase of the irregular portions—irregular peloria. When the lip of a *Cattleya* becomes flat like one of the lateral petals, we have a case of regular peloria, wherein the flowers become regular by the increase of their regular parts. A further interest in the *Cypripedium* shown by Mr. APPLETON is that it is reproduced each year.

MALFORMED CYPRIPEDIUM.—MR. SCHOFIELD kindly sends us a monandrous *Cypripedium* "Hera" ×, which is of great interest structurally, but not very desirable culturally. In the first place, it is dimorous—that is, the parts are in twos. In the next place the dorsal sepal is absent, but its place is filled by a segment having the form and coloration of one of the lateral petals. Opposite this petal is the lip of the ordinary character. The second lateral petal is absent. The column is straight, with no staminode, but with a single central anther, and a second lateral one. The stigma is two lobed. The plan of the flower may be thus represented:—

ABBOTSBURY GARDENS.—The Countess of Ilchester has caused to be printed for private circulation only, an alphabetical list of the hardy trees, shrubs, bulbous and herbaceous plants growing in the rich collection at Abbotsbury, near Dorchester, to which we have often had occasion to refer. The arrangement is alphabetical, the several categories of plants being indicated by appropriate symbols. The native countries also are mentioned. The catalogue comprises about 115 pages small 8vo.

PARIS EXHIBITION: INTERNATIONAL CONGRESSES OF HORTICULTURE, ARBORICULTURE, AND POMOLOGY.—We have received the programmes and regulations of the two Horticultural Congresses to be held in Paris in 1900; the first on May 25 and 26; the second on September 13 and 14.

HORTICULTURAL CONGRESS.

This Congress will be held during the temporary meeting that commences on May 22. Séances will be opened at 3 P.M. in the Palais des Congrès on Friday, May 25, and Saturday, May 26. The following items comprise the programme:—

1. Progress realised and to be achieved in heating glasshouses.

2. Formation of public gardens in different latitudes.

3. Decoration of public squares and promenades in large towns; advisability of labelling the trees, shrubs, and flowers used therein.

4. Causes and treatment of the Clematis disease.

5. The art of floral decoration; its development, progress, value, and position in horticulture; its employment of horticultural products.

6. Means of preventing or curing diseases of market-garden crops, such as the mildew of forced Lettuces and Cos Lettuces, "nuile" of Melons, "grise and ronille" of Celery; Tomato diseases.

7. Is it desirable in market cultivation to heat by means of hot-water pipes?

8. Manner of employing and composing chemical manures for different market crops.

9. What part has artificial fecundation played in horticulture?

10. What is the intervening cause favourable to vegetation when plants are placed near the glass and under the influence of sun or moonlight?

11. The part taken by electricity in vegetation.

12. Comparative study of the physical and chemical agents capable of hastening or of retarding germination; stratification.

13. Application of the principle of selection of seed to the production and "fixing" of various horticultural novelties.

14. Comparative study of methods of cultivation applicable to the establishment of nurseries in various countries; their management.

15. Study of vegetable and animal parasites that attack plants in nurseries. Methods of preventing their incursions or of combating them.

POMOLOGICAL CONGRESS.

At the Congress on Fruit Culture and Pomology to be held on September 13 and 14, opening on September 13 at 9 A.M., in one of the Salles du Congrès, Place de l'Alma, the following subjects compose the programme:—

1. Fruit farms, cultural and economic considerations, choice of the best varieties and their uses.

2. Fruit plantations along roads, varieties, uses, cultural requirements.

3. Harvesting and preserving of fruits under shelter or in the open, packing and transport.

4. Atmospheric agencies: their influence on the cultivation of forced fruit-trees and Vines.

5. On the influences of different cultural operations on the produce of fruit, grafting, pruning, form and direction of the branches.

6. Tariffs and conditions of the transport of trees and fruits.

7. Insects, diseases, remedies.

8. Manures and foods (physical and chemical properties); considerations based on the composition of the soil, and the nature or needs of the plant.

9. Fruit-trees for introduction into, and propagation in the colonies.

10. Instruction in fruit, arboriculture, primary and normal schools, special schools, outdoor instruction, lectures, conferences, publications, &c.

IMPORTS OF FOREIGN FRUITS AND VEGETABLES.—We have often complained that the monthly report issued by the Board of Trade relating to the imports of foreign and colonial fruit and vegetables were incomplete—much of the information being merged in the lines "unenumerated fruit" and "unenumerated vegetables." A few years since we induced the Board of Trade to particularise a few of these, but at present, and for some months past the evil, if so we may term it, has been a prominent one, requiring correction. Our old correspondent "E.C." took stock of this, and being interested in the returns appealed to the President of the Board of Trade to discriminate among the figures, and the matter was referred to the Committee of the Board, whose duty it is to consider all proposals for improvement in the conduct of affairs. The result of their deliberation on the subject of "E.C.'s" communication being recorded in the subjoined extract from an official letter

of date December 20:—"In future the more important items hitherto included under the heading 'Fruit, Raw, unenumerated,' will be shown separately. The following fruits will therefore be shown under separate headings, both in the annual and monthly trade accounts: Apricots and Peaches, Bananas, Currants (not dried), Gooseberries, Strawberries. A separate heading will also be raised in the Returns referred to for 'Tomatos,' which have hitherto been included under the head of 'Vegetables, raw, unenumerated.'" We are sure the reader will be glad of this added information, rendering, as it will, a monthly "stocktaking" paragraph of greater interest and seasonable value.

THE WEATHER IN CORNWALL.—At Pencarrow on Monday, December 11, 10°, and on the 15th, 12° of frost were experienced.

STATISTICAL SOCIETY, DUBLIN.—GEORGE W. RUSSELL, Esq., spoke recently on "Co-operation in Congested Districts," at the Social and Statistical Society, Molesworth Street; he pointed out the great disadvantages under which the poor farmer suffers from the standpoint of sale of his produce, and want of education, likewise the absence of any power to organise. The action of "The Irish Agricultural Organisation Society" in starting local associations throughout the country has been a great benefit, and is doing a large amount of good, by gradually raising the standard all round. The lecturer would advise a form of self-help very suitable to the congested districts; it is the system of co-operative credit, which first originated in Germany about fifty years ago, and is slowly spreading itself through the country. There are at present about thirty-five Raiffeisen banks in the congested districts, and these were situated in the poorest parishes; he alluded to the economic conditions of the farmer would necessitate societies to meet his pressing wants if the produce of the country was to be increased and improved.

PUBLICATIONS RECEIVED.—From the Michigan State Agricultural College Experiment Station, Entomological Department, Bulletin 175, July, 1899, *Some Insects of the Year 1898*, prepared under the direction of Walter B. Barrows by Rufus H. Pettit; and Bulletin 176, Horticultural Department, *Strawberry Notes for 1899*, by L. R. Taft and H. P. Gladden.—U. S. Department of Agriculture, Division of Vegetable Physiology and Pathology (Washington), Bulletin No. 17, *Wilt Disease of Cotton, Water-melon, and Cow-pea (Necrotomopsis, nov. gen.)*, by Vivian F. Smith.—*The Century Book of Gardening* (George Newnes, Ltd., 7-12, Southamp-ton Street, W.C.), Part 16.—*Anne Pratt's Flowering Plants* (Frederick Warne & Co., 15, Bedford Street, Strand), Vol. III., No. 27, and Vol. IV., No. 28.—*Pharmaceutical Journal*, December 16.—*La Semaine Horticole*, December 16.—*Bulletino della R. PLANT PORTRAITS.

KNIPHOFIA TUCKER, *Garden*, December 9.

NECTARINE HUMBOLDT (Rivers), *Bulletin d'Arboriculture*, &c., December.

ONYBAPHUS HIRSUTUS, *Meehans' Monthly*, December.—In this plant the flowers open in the afternoon and remain expanded till daylight; and there are other very curious details narrated by Prof. Meehan.

PEACH LEOPOLD I. (Van Oort), *Bulletin d'Arboriculture*, &c., November.

RICHARDIA PENTLANDI, *Moniteur d'Horticulture*, Dec. 10.

TULIPA SPRENGERI, *Garden*, December 2.

ZEPHYRANTHES AJAX.—A hybrid between *Z. candida* and *Z. citrina*. Flowers creamy-yellow, suffused in places with pink. *Garten Flora*, December 15.

TAXODIUM DISTICHUM VAR. PENDULA.

THERE is some confusion between this tree, a variety of the common Florida Cypress, and the south Chinese *Glyptostrobus heterophyllus*. The former, of which we give an illustration, is a very elegant feathery tree, the branchlets of which fall off in

winged. The descriptions in books describe the seeds as erect, but in the Chinese specimens we have examined they are decidedly pendulous. The distinctions between the two genera are therefore definite, and it is to be regretted that so much confusion should have arisen.

Taxodium distichum, like the Ginkgo (to which we lately referred), has a history! Geologists

and closely appressed acerose leaves, belong to the same species as those with spreading distichous branchlets, and flat leaves. . . . [This form] has long been an inhabitant of the gardens of the Eastern United States and Europe, and is generally cultivated as *Glyptostrobus pendulus*, and believed to be a native of China."

From the facts above cited, we suggest that the Chinese tree alone has the right to be called *Glyptostrobus*, and that it is generically different from *Taxodium*, to which Bentham and Hooker have referred it.

The illustration at fig. 161 is taken from a photograph obligingly transmitted to us by Mr. A. C. Bartlett from Pencarrow Gardens, Cornwall, who sends the following note:—

"Fine specimens of *Taxodium distichum* are fairly plentiful, but of *Glyptostrobus heterophyllus* generally so-called I have seen only three specimens out-of-doors in England. By far the best of these is the one I send a photograph of. It was planted at Pencarrow, Bodmin, about 1841, by that famous Cornish statesman and ardent horticulturist, the late Sir William Molesworth, Bart., and is now over 30 feet in height; at 5 feet from the ground the stem measures 2 feet 9½ inches, and, as the photograph shows, is a really beautiful specimen. At the time of planting little or nothing was known of the majority of Conifers, and the position given this tree—a very sunny spot on a dry lawn—would now, with a greater knowledge of its habitat, be considered unsuitable. But Sir William was evidently fully aware of the value and necessity in wild north Cornwall of screens and wind-breaks; so around this tree, at a little distance, he planted *Rhododendron ponticum*, and still further away to the west he planted some Beeches. The *Rhododendrons* have been removed, and the Beeches have so far outstripped the nurse plants that instead of being in the full glare of the sun, this *Glyptostrobus* is completely shaded after midday. This fact most probably explains the unusual vigour and symmetry of the specimen. A. C. B."

FIG. 161.—*TAXODIUM DISTICHUM* VAR. *PENDULA*.

HOME CORRESPONDENCE.

HYACINTHUS AZUREUS.—Although up to the day on which this is written, the pretty *Hyacinthus azureus* has not made its appearance above the soil, it will not be long before it pierces through, and shows its clustered cone of Grape Hyacinth-like flowers. It is among the earliest of our bulbous plants, flowering in January or February, and giving in its own modest way a pleasant variety to the Snowdrop or the few other plants in bloom at that early season. Its colour is said to be sky-blue, but there is a faint tinge of green about the blue which makes the colouring unlike that of other things which show flower at the same time. It is so like a *Muscari* that it is not easy to persuade the unlearned in botany, or, for that matter, those who do know something about it, that it is not a Grape-Hyacinth but a *Hyacinth*, so exact is the resemblance it presents to the former. With some it is not very hardy, but here it has proved so for a number of years in light soil. It is, however, a little too early in its flowering time to be quite satisfactory here unless it is covered overhead with a sheet of glass to ward off the rain. The latter accumulates in the cavity formed by the leaves, and, if frost comes, the ice formed injures and decays the flower-stem. The precaution of a sheet of glass above the plants is one easily applied. Slugs are also troublesome, and should be warded off if possible. The attention of those who have a liking for early bulbous plants in the garden is drawn to *Hyacinthus azureus* with every confidence. *S. Arnott, Carsethorn-by-Dumfries, N.B.*

RESTRICTING FIG-TREE ROOTS.—Passing through a Fig-house at Ruxley Lodge, Esher, recently, I remarked to Mr. Miller that he seemed to keep his trees to a very short allowance of soil, three very strong trees were seen to be growing in a border 2 feet wide, and had but recently been

autumn, and the leaves on which are usually distichous, or two-ranked, but in some varieties spirally disposed. The Chinese plant, which we believe to be very much less common in gardens, has linear leaves arranged in three or more ranks; the cone is club-shaped, and the cone-scale is not peltate, but elongated; the bract is confluent with the scale at the base, deeply lobulate at the apex, and the two seeds are pendulous, flattish, and

tell us that it or its ancestors and their allies, *Sequoia* and *Glyptostrobus*, grew in the Miocene epoch in Central Europe, as well as in Greenland and the United States. Of the variety *pendula*, Sargent, *Silva* x., 152, adnot. thus speaks:—"No one unfamiliar with the fact that branches of the two forms occasionally occur on the same individual would imagine that the Cypress trees with erect or pendulous, thread-like branchlets,

newly made. He said that the trees were each in a 20-inch pot, and had been so for several years. That kept the greater portion of the roots severely restricted. These stood on a concrete floor, and were filled in round each year with good turfy loam, with which was mixed some old, hot-bed manure, wood ashes, and old mortar refuse, the outer edge of the soil being of slabs of turf to form a solid wall. Into this fresh soil roots from the surface of the pots broke freely each year, and whilst the roots in the pots finished up the first crop of fruit the new surface roots seemed to render similar service to the successive fruit crop. In the winter of each year, when the old soil or, in any case, a portion of it, was removed, the whole of the surface-roots made from the pots are cut quite hard back. That may be said to be very severe restriction; yet the results are found in stout, sturdy growth and heavy crops of fruit. The very fine collection of Figs in pots at Chiswick, one of the very best of its kind in the kingdom, show conclusively how well these trees thrive with limited root areas. When, in the autumn, I was looking over the gardens at Chilworth Manor, Romsey, and observed a Fig-wall, some 6 feet in height and 100 feet long, covered with wood throughout. Here it is found needful to open a trench 2 feet from the stems and as deep every two years, to sever all roots, and then refill with soil. Trees having a liberal root-run, especially in well-manured borders, practically produce far more wood than fruit. Hard root-pruning remedies that. *A. D.*

DRESSING TO PRESERVE TREES FROM HARES, ETC.—Your note of Dec. 9 on the proportions of a mixture for the prevention of the attacks of hares and rabbits upon trees and shrubs, reminds me of an article which has long been in commerce, and which on the testimony of great numbers of landowners and practical foresters, has proved at once handy and effective in achieving the object in view. I allude to the widely known "Ahlbottins Composition." In my experience it is the best that has as yet been discovered. Neither hares, rabbits, or other browsing animals will touch, bark, or twig to which it has been applied, and from its greasy or treacley consistency, it is not liable to be washed off with rain, so as to require frequent renewal; it is, moreover, inexpensive and readily procured from any of the nursery or seedsmen, while the facility of its application is such that it can be handled with the greatest ease by any unskilled labourer. It may be added that the composition contains no poisonous ingredients, and that it is not only harmless to the most tender barks, but has a curative effect on such as may have been damaged, by the gnawing of such animals, the perforation of insects, &c. *Silva.*

THE SWEET PEA CONFERENCE.—In reference to the list of "promised" subscriptions in connection with this project, which appeared in the *Gardeners' Chronicle* last week, may I be permitted to say that the Secretary has not received any consent or authority from me to use my name in the form in which it appears in circulars and the press. It is quite true that I have not promised him anything, but I object to this fact being advertised, as thousands of persons would object under similar conditions. I am not out of sympathy with the movement, but on the contrary, wish it success. The Editor was, of course, justified in publishing the list officially sent for that purpose. *J. Wright.*

EULALIA JAPONICA ZEBRINA.—Among hardy grasses this *Eulalia* is one of the most attractive. It has a very ornamental effect during the summer months when growing in clumps in the pleasure-grounds, especially if the plants be near to the margins of a stream or lake. In addition to its graceful foliage, the plants produce flower-stems which rise boldly to a height of 6 feet or more. If these be cut in autumn, and placed in a warm room, the plumes will develop well. I have seen excellent specimens of this *Eulalia* thriving well in a clayey soil, and probably such a root-medium suits the plant best, especially during such dry summers as we have lately had. A dry soil is, without doubt, unsuited to the plant. The plant may be easily increased by division. *H. T. M., Stoneleigh.*

DOUBLE-FLOWERED DAISIES.—Referring to your suggestion on p. 456, that the Battle Nursery, whence the seed of the large double Daisies was obtained, might be that of Mr. Luff, I may state

the nursery was that of Mr. B. W. Knight. I have an impression that it has passed into other hands; but I should be glad to hear that his Daisies are still kept up by some one. It must be fourteen or fifteen years since I had the seeds, and I cannot lay my hands upon the list. I recollect that it contained the names and descriptions of a fair number of named varieties, under names not to be found among those offered in catalogues of the present time. As I have always had a liking for raising seedlings, I preferred to take my chances with the seed to buying named plants. I hope someone in the locality may be able to tell something more about the Battle Daisies. Those I grew had large flowers on tall stems. *S. Arnott.*

—I am very pleased to find that my recent note on these hardy plants has evoked a commendatory rejoinder from Mr. Arnott. I fear it would not be practicable to induce Daisies to flower freely in the autumn and winter in the north, through divided plants, as in all cases, except the summer be unusually moist. Plants that are so shallow rooted suffer very much in heat and drought, and reproduce blooming crowns too late in the autumn to carry flowers until the following spring. Generally, too, these propagated double Daisies, even of the best varieties, flower late. But seedling plants, raised as were those at Kingston Hill from an early summer sowing, if they get ordinary attention, keep on growing all the summer, and thus create strong flowering crowns. That is one of the great benefits which result from raising from seed. No doubt seedsmen having done so much will yet do more not only in perfecting doubleness, but also in getting good varieties in set colours. I can have no doubt but that Messrs. Sutton & Sons have noted the commendatory remarks which closes Mr. Arnott's note. *A. D.*

THE HATFIELD CURE FOR RED SPIDER.—Relative to the note on the above subject, which was published on the 16th inst., and the footnote appended, on the utility of sulphur as an effective antidote for this insidious pest, the following quotation from E. G. Lodeman's (Instructor on Horticulture in the Cornell University) book on *The Spraying of Plants* may have a fitness, along with the practical experience of Mr. Norman. "Sulphur is valuable both as an insecticide and as a fungicide. Its use for the first purpose is practically confined to greenhouses and conservatories, and even there only few insects are affected by it. It is most rapidly applied by evaporating in a sand bath over an oil stove, but extreme care must be given that it does not take fire, as then it will instantly destroy all the plants. Red spider and related insects are said to be destroyed by the fumes, and treatment should be made as soon as they are discovered, or even before. Sulphur may also be evaporated successfully by placing it upon the heating pipes; it is well to mix it with an equal amount of lime, and then add water to form a thick paint, with which the pipes may be covered. When applied in a dry form directly to the plants, it possesses little value as an insecticide. A moist atmosphere in the house probably renders the fumes more effective (this latter suggestion should form a valuable adjunct to the sulphur treatment, as observation tends to show that a dry atmosphere is favourable to its development; whilst the converse, namely, moisture, is a deterrent, and spraying with water has always been advocated as a specific)." Sulphur is one of the most valuable fungicides for the treatment of surface mildews, and it has long been used for this purpose. Previous to 1880, it was almost the only fungicide used in Europe, and it did excellent service in controlling the European mildews which attacked the Vine and many other plants, whether grown under glass or in the open. Out of doors it was commonly applied in a dry condition, being blown upon the plants by means of hand bellows. Under glass it was used in three ways: in the form of powder, when mixed with water, and when evaporated from the heating surfaces. The first method was executed in the same manner as out-doors. When mixed with water both the sulphur and the water assist in destroying many pests, and it is a common practice to make such applications. The proportion of the two varies greatly. It has been recommended to use 1 ounce of sulphur to 5 gallons of water, and also as much as 1 pound to 1 gallon. The more dilute mixtures are more easily applied, and if the work is thoroughly done are, on the whole, equally valuable. The fumes of sulphur for treating mildews are obtained

as described above. When the powder is used out-of-doors, the value of the remedy undoubtedly rests in the fact that the sulphur gradually gives off fumes on account of the heat of the sun, and the mildews yield for the same reason that they do when the powder is evaporated under glass. One of the most valuable preparations of sulphur is known as "Grisson's Liquid." Although this latter insecticide is fairly old, to give the formula may be of service to some growers. Take the following:

Flowers-of-sulphur	...	500 grams, or 17 oz. (avoird.)
Freshly-slaked lime	...	500 " " or 17 " "
Water	...	3 litres, or 5½ pints. "

Boil the above ingredients for ten minutes, let the mixture then settle, and draw off the clear liquid, after which the liquid must be bottled to use, 100 parts of water to 1 part of liquid, and apply with a syringe (still lately the quantities of sulphur and lime have been reduced respectively to one-half). This prescription was always advocated as an excellent cure for surface mildews, and about three applications were sufficient to preserve the foliage. It seems feasible to suggest that instead of syringing, heating the intending wash might prove more effectual in the houses. *A. O'Neill.*

CARNATIONS AND VIOLETS AT THE GRANGE, ALRESFORD, HANTS.

DURING a recent visit to the gardens of The Grange at Alresford, the country seat of Lord Ashburton, I was particularly impressed with the beautiful display of Tree Carnations and Violets to be seen there. The principal Carnation-house is a large span-roofed structure, with stages running round the sides and one end, with a central stage arranged in tiers, so that the plants receive abundance of light. This house accommodates about a thousand plants grown in 6 and 7 inch pots, each plant a typical example of what a Carnation should be, not tall and straggling, but well clothed to the pot with strong sturdy growths, many of them surmounted with a wealth of buds and blossoms, that plainly shows that the treatment given them by Mr. Allen, the able chief, is of the best. On the occasion of my visit the plants were scarcely at their best, but there were already some hundreds of expanded blooms, and the fast opening buds promised a succession for a considerable time. A span-roofed pit, with a hot-water pipe running round it, contained a batch of plants to succeed those in flower, the plants being equally as good as those in the flowering-house. They are being kept cool and well aired, but are already commencing to throw up for bloom. The favourite variety is Mrs. Leopold de Rothschild (syn. Mdle. Thérèse Franco), although some other varieties are well represented.

Of Violets in frames there are between nine hundred and a thousand plants grown, the demand for them being so great that more frame room has had to be given up to them this year than formerly. Two long spans, containing about five hundred plants, were in full flower at the time of my visit; they are planted about a foot apart, well up to the light, and just before coming into flower the plants receive a top-dressing of cocoa-nut fibre, which not only keeps the blooms from getting soiled and splashed from contact with the soil, but also, to a great extent, prevents the ravages of slugs, and at the same time affords an agreeable setting to the plants. I counted as many as a dozen blooms on some of them, such blooms as one rarely sees, some of them recurving until they were quite globular in shape, with good long stems attached. Another lean-to pit, containing about the same number of plants, had been gathered rather freely, but the numbers of buds peeping from amongst the dark green foliage promised a good display of bloom in the near future. This pit has a hot-water pipe running round it level with the soil, but divided from it with boards. Heat is only applied in severe weather, and then only sufficient to exclude frost and create a circulation of air. The

chief advantage claimed being easy access to gather the blooms during hard weather, when those in unheated frames are sometimes covered for days together with protective material. The chief variety grown is Marie Louise, and a few lights are devoted to Comte Brazza and California. *Visitor.*

DENDROBIUM SPECTABILE.

IN fig. 162 is given an illustration of the new species of *Dendrobium* shown at the meeting of the Royal Horticultural Society on December 19, from

fine addition to our gardens was awarded a First-class Certificate. Further details respecting the species will be given in an early issue.

A SURVIVAL.

"CULPEPPER'S HERBAL."—The sixteenth and seventeenth centuries abounded in so called botanical works, but in nearly all cases drugs were regarded first, and then botany afterwards, if at all. Still, in those centuries botanical science was being slowly differentiated from medi-

the "Colledg of Physitians" of publishing in Latin "because that doth not make against their interest, which, I perceive is the great *Diana* they adore!"

In "The Translator's Preface to the Catalogue of Simples," he makes several side-thrusts at the College. Thus, with regard to the names of plants—which the College published in Latin only—he adds the English, and observes: "All the Latin names to one herb are not set down, most of which are superfluous. Some are idolatrous, as to attribute one herb to the Virgin Mary, another to the Holy Ghost, &c. So in the compositions, "to call

FIG. 162.—DENDROBIUM SPECTABILE.

Major Joicey's collection at Sunningdale Park (gr., Mr. F. J. Thorne). This plant was figured in *Rumphia* as *Latourea spectabilis*, the flowering of which, out of Messrs. Sander's recent importation from New Guinea, has been looked forward to with interest. The flowers, which are produced on upright spikes, are large, and singularly formed, the labellum taking much the same form as the other segments, though being the largest. The sepals are triangular at the base, extended into a long, wavy, apiculate tail; the petals are narrower, both pale yellow in colour, and prettily marked with purple. The labellum has the side lobes erect, hood-like, the front being elongated, wavy, and apiculate, white in colour, with a beautiful veining of clear purple. This very

cine. This latter art had been more or less always separated into the professional and the non-professional; and in the seventeenth century they were represented by the College of Physicians on the one hand, and by the herbalists on the other. One of the most noted of the latter was Nicholas Culpeper. He boldly threw down the gauntlet by translating the Latin "Dispensatory made by the Colledg of Physitians of London." He says:—"It is a Base, dishonorable, unworthy part of the Colledg of Physitians of London to train up people in such ignorance that they should not be able to know what the Herbs in their Gardens are good for; both *Gerrhard's Herbal* and *Parkinson's*, which is an hundred times better, being of such a price that a poor man is not able to buy them." He accuses

an oyntment, the Oyntment of the Apostles. . . . The Colledg might have been ashamed of it, if they had ever come where shame grew!"

The third edition of this work appeared in 1651, and in 1653 Culpeper published his famous herbal, which has gone through many editions; and what is so surprising is, that it is still published in immense quantities, the last (12mo) being issued in 1896. The herbal is entitled, "The English Physicall. . . . An Astrologo-Physical Discourse of the Vulgar Herbs of this Nation, containing a complete Method of Physic, whereby a Man may preserve his body in Health, or cure himself, being sick, for Threepence charge, with such Things only as grow in England, they being most fit for English Bodies." It contains "(1) the way of making

plaisters, ointments, syrups;" (2) what planet governeth every herb or tree; (3) the time of getting them, &c. By Nich. Culpeper, Gent., Student in Physic and Astrology." It commences with "An alphabetical Table of Herbs and Plants; also what Planet governeth them."

He does not generally say why plants are under the dominion of the planets, but now and then he gives a reason which the intelligent reader of to-day will hardly consider sufficient. Thus, in speaking of Henbane:—"I wonder how astrologers could take on them to make this an herb of Jupiter. . . . The herb is, indeed, under the dominion of Saturn, and I will prove it by this argument: All the herbs which delight most to grow in Saturnine places are Saturnine herbs, and the Henbane delights most to grow in Saturnine places. . . . Scarce a ditch [or manure-heap] is to be found without it growing by it: *ergo*, it is an herb of Saturn."

Hot, biting plants, as Mustard, Hedge Mustard, Peppermint, Radish, and Horseradish, are under Mars, as being of a fiery, martial temper; but why, e.g., Ragwort should be "under the dominion of Dame Venus," is not quite evident.

As another sample of Culpeper's lucid and convincing reason, is the following observation upon *Carduus benedictus*:—"It helps swimmings and giddiness of the head . . . because Aries is in the house of Mars. It is an excellent remedy against the yellow jaundice and other infirmities of the gall, because Mars governs choler. . . . The continual drinking the decoction of it helps red faces, tetter, and ringworms, because Mars causeth them. It helps the plague, sores, boils, the bitings of mad dogs and venomous beasts; all which infirmities are under Mars. Thus you see what it does by sympathy." "So, that is how the trick is done," the conjuror obligingly observes!

As another specimen of the author's logic is his account of *Celandine*:—"This is an herb of the Sun, and is under the celestial Lion, and is one of the best cures for the eyes; for all that know anything in astrology know that the eyes are subject to the luminaries. . . . Is not this [drug] far better than endangering the eyes by the art of the needle?"*

The book is full of this sort of stuff, the plants being classified alphabetically, and their descriptions in paragraphs, headed Description, Place, Time, Government, and Virtues.

The remarkable fact about this herbal is its extraordinary persistence to the present day. Happening to meet with a recently-published 12mo edition, with seventeen plates containing some 120 small coloured illustrations of plants, the publishers very courteously replied to my enquiries as follows:—"We have looked up our books, and find that the first edition was in August, 1847, 12mo, and the present edition was published in 1896. In the fifty years we have published 68,385 copies of the small book; of a larger edition we have sold 9,864. We sell to all the wholesale houses, and a large majority of the retail booksellers in English-speaking lands."

I observe that Mr. W. A. Bishop Culpeper presided over the annual meeting of the Astrological Society on February 6, 1897. Who would have thought that this science, "falsely so called," could not only have existed till A.D. 1900, but that a college of astrology should be actually proposed to be founded on that occasion! *George Henslow.*

more natural manner. The capabilities of the Chrysanthemum are being probed to their full extent, and the introduction of varieties is assiduously carried on, both here and abroad. The charms of the single-flowered kinds are much admired, but there is an inclination on the part of raisers to increase the list of varieties unduly, and varieties are brought forward which are not sufficiently meritorious to deserve cultivation. It is a weakness of the enthusiast to regard with favour anything which approaches the ideal of the moment; but it behoves us to be exacting, and to ask for those only which possess some good or new colour, compact habit of growth, stoutness of flower-stalks, and freedom to flower. A type of fancy Chrysanthemum is rapidly coming into favour which will probably obtain appreciation for use as cut flowers. The recently-introduced and beautiful Golden Shower, and the strangely-named "What Ho!" are instances of the type referred to. Their characteristics are variable, some have long thread-like drooping florets, others short and Thistle-like, or intermingled in a confused sort of way, others have florets split at the tips, or divided for the greater part of their length.

The cultivation of this type is the same as that followed with other types, but one point is of importance, i.e., the pinching of the shoots, in order to induce free branching, must not be carried on later than the middle of the month of June.

I give a list which includes the best varieties, viz.:—Bouquetière, Sam Caswell, King of Plumes, Cheveux d'Or, Mrs. Filkins, Miss Harvey, Golden Shower, Gold Faden, Lovely, White Thread, Cannell's Favourite, Elegans, Arachnoideum, Star of Honour, Mrs. Brown-Potter, Daisy, Mrs. W. Butters, and Gold Lock. *W. H. Lees.*

Obituary.

WILLIAM MAYO.—On Friday, the 21st inst., the remains of William Mayo were laid to rest in the cemetery at Winchester. The deceased, who had held the position of head gardener for forty-four years to the late Mr. and Mrs. Fitzgerald, of Shalstone Manor, Buckinghamshire, was a thorough gardener and a successful exhibitor in the counties of Buckingham and Oxford. He came to reside at Winchester seven years ago, and during that time he took a very active part in the Winchester Gardeners' Association, of which he was elected chairman three years in succession; and his genial personality will be greatly missed by all who knew him. The deceased was seventy years of age.

JAMES SELDEN.—We regret to record the death on Christmas Day, at The Gardens, Brookwood Park, near Alresford, of this estimable gardener, at the age of forty-eight years. He was a few years ago well known as an exhibitor in the Kingston and Wimbledon district, whilst gardener at Coombe Cottage, Kingston. Mr. Selden's decease was due to a severe attack of influenza, followed by pneumonia, and the circumstances are rendered more sad by the fact that his wife suddenly succumbed to the same malady only two days previously. They were both buried at Tichborne, Hants, on the 27th inst. They leave one son, aged eleven years.

SOCIETIES.

WARGRAVE GARDENERS'.

The last meeting for the current year was held on the 20th inst. A contingent from the Reading Gardeners' Association paid a visit on that occasion, and a paper on "The Cyclamen" was read by Mr. J. CASWELL, gr. to the Rev. H. M. WELLS, Scarlets, who treated the subject in a practical way, explaining the details of cultivation from the sowing of the seed until the plants would be in bloom.

A fine group of *Begonia Gloire de Lorraine* was exhibited by the Chairman (Mr. W. POFF).

BOOKS: *H. E. T.* We believe Messrs. Cannell and Sons, Swanley, Kent, publish a book of flower-bed designs.

CUCUMBER PLANT DYING OFF: *W. P.* The root and collar of the plant sent are healthy, and we imagine that the death of the bine is due to mechanical injury, fumes from furnace, syringing with a detestable substance, &c. You afford no particulars of treatment. Obtain the advice of some good gardener in your neighbourhood.

CUCUMBERS FOR MARKET: *J. W. K.* The two varieties mentioned are as good as any. The true Telegraph is scarcely surpassed by any other variety.

GRAPES DECAYING: *F.* Notwithstanding that which you tell us you have done in the way of precaution, we believe the injury is caused by damp within theinery, aggravated it may be by inability to afford air during recent foggy weather. Examine the bunches daily, and remove any berry that shows any trace of decay. Keep theinery free of all kinds of plants which have to be supplied with water, and remove everything likely to harbour damp.

HERBACEOUS PLANTS: *A Subscriber.* We are unable to devote so much space to the mere enumeration of the names of herbaceous plants, and would refer you to the volumes for the present year, where lists are given by our writer of the Flower Garden Calendar.

KITCHEN-GARDEN CROPPING: *L. H.* We know of no work dealing exclusively with intercropping. Most gardeners, who have to deal with a garden that is too small for the needs of the mansion, have to adopt intercropping, and seldom can allow a piece of land to lie fallow. A book that would suit your purpose is Mr. H. W. Ward's *My Gardener*, published by Eyre & Spottiswoode, East Harding Street, London, E.C.

LAWN TENNIS COURT: *H. E. T.* See our issue for November 25 this year, p. 408.

TULIPS: *C. W. and C. H.* The failure to root or produce flowers is due to the immaturity of the bulbs, or to improper treatment whilst in store. They were very bad samples.

VIBURNUM MACROCEPHALUM: *B. B.* Try cuttings taken in the months of March or April, selecting well ripened one-year-old shoots. Previously to taking the cuttings, prepare a bed of sandy soil 1½ ft. deep, make it firm and level, and having made the cuttings 10 to 12 inches in length, drop these carefully into perpendicular holes made with a thin dibber, leaving two buds above the ground-level. Fill in the holes, making the soil firm about the cuttings, and afford water, so as to settle the soil about them. You might find that grafting by approach, having stock and scion growing in pots, a successful method, using *V. Opulus* as the stock. The other question will be answered in our next issue.

VIOLETS: *A Subscriber.* Marie Louise, California, Wellsiana.

COMMUNICATIONS RECEIVED.—D. T. F.—G. B. M.—Rev. H. F.—W. W.—H. E.—J. B.—W. G. S.—Mungo Temple.—E. Burton.—H. T. M.—A. O'N.—S. A.—J. A.—A. S.—W. R., and numerous correspondents who have obliged us by sending particulars of appointments for 1900, which will be included in the Almanack to be issued with the *Gardeners' Chronicle* for next week.

Continued Increase in the Circulation of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

TREBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS' and GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

(For Markets, see p. viii.)

FLORISTS' FLOWERS.

FANCY CHRYSANTHEMUMS.

THE season has proved that there is no diminution in the popularity of the autumn flower, whether exhibited in its utmost development or in a free and

* A case was tried in 1895, in which a quack had injured a man's eyesight by putting a needle under the skin of the eye-ball.
