INDEX OF CONTENTS.

JULY TO DECEMBER, 1899.

A

ABBOTSBURY CASTLE, Dorchester, 142
 Aberdeen Botanic Gardens, 266;
 great nursery sale at, 315; Uni-
 versity, the agricultural department
 of, 315
 Abutilon vitifolium at Cork, 167
 Acton Castle, Cornwall, 237
 Adare Manor, flower-garden at, 393
 Adiantum capillus-veneris imbrica-
 tum, a fertile frond of, 475; A.
 scutum, 68
 African, South, notes, 223
 Agave Woodrowi, 430
 Agricultural conference for the West
 Indies, 438; land-rating cases, 130,
 132
 Air, liquid, as a refrigerator, 347
 Albuca hybrids, 56
 Allamanda Hendersoni, 372
 Alloa, N.B., Grapes, climate and
 atmosphere at, 250
 Aloe, a fungus parasitic on, 291;
 A. somaliensis, 430
 American blight, and other plant-
 lice, to destroy, 184
 American Red Bud (*Cercis cana-*
densis), 24
 American notes, 222, 250, 308
 Ames' conservatory, Anthurium
 Veitchi in Mrs., 227
 Ampelopsis Hoggi, 344
 Anemone albana, 72
 Anemone-leaves, frilled, 418
 Annuals in pots, 184
 Anthemis tinctoria, 222
 Anthurium Veitchi in the conserva-
 tory of Mrs. T. L. Ames, U.S.A.,
 227
 Anthuriums, hybrid, 54
 Apiary, the, 9, 29, 89, 129, 245, 295,
 311, 327, 397, 416
 Apple crops in the U.S.A., 193, 362
 Apple culture at Battle Abbey Gar-
 dens, 126
 Apple Greenup's Pippin, or Yorkshire
 Beauty, 154; Miss Phillimore, 411;
 Mr. Leopold de Rothschild, 395;
 Ribston Pippin, 346; the origin
 of, 94
 Apple stocks with caterpillars, 425
 Apple-trees, American blight on, 94;
 diseased, 116; in Scotland among,
 the, 372; prevention of canker on,
 425
 Apples, a cargo of, 422; Ben's Red,
 Thos. Andrew Knight, and Venus'
 Pippin, 259; for planting as bushes,
 best varieties of, 346; Peasgood's
 Nonsuch and Alfriston at East
 Sutton Park, 475; speck in, 276
 Arabis albidia, fl.-pl., 33
 Arachnanthes Lowi flowering at Glas-
 nevin, 381
 Araucaria imbricata, 212; A. i., a
 monœcious, 195; A. i., requires
 much water, 412
 Arddarroch, N.B., 278
 Argemone grandiflora, 210
 Agricultural Returns of Great Britain,
 194
 Aristolochia gigas var. Sturtevantii,
 138
 Arnebia echioides, 211
 Arundinaria auricoma, 53
 Asbestos as a packing material for
 fruits, 258
 Ash-tree struck by lightning, 347
 Aspidistra luvda, fruit of, 113, 155
 Asplenium Fawcettii, 121; A. fra-
 grans var. foeniculacea, 115
 Aspleniums, 414
 Aster, the single-flowered China, 313,
 331
 Asters, perennial, at Stoneleigh
 Abbey, 346
 Attar of Roses in Turkey, 72

Auricula, hybridisation of the, 1
 Azalea rosæflora, 64; A., the Indian,
 raisers of, 44
 Azaleas, hardy, and raisers of, 21;
 the training of, 229

B

BARTHOLINA pectinata, 15
 Battle Abbey Gardens, Apple culture
 at, 126
 Bean, Runner, Ne Plus Ultra, 249;
 the Chinese Runner, 74; Veitch's
 Climbing Runner, 155
 Beans, forcing French, 446
 Beech, the common, and its varieties,
 433
 Begonia, a monstrous, 116; B. "Cale-
 donia," 474; change of sex in, 283;
 B. fuchsoides for summer bedding,
 380; B. Gloire de Lorraine, 456, and
 seeding of, 475; B. hybrids, 56,
 173; B. × Moonlight, and others,
 423; B. semperflorens for bedding,
 202
 Begonias, 84, 186; bedding, 202
 Belginn, Flora of, 418
 Belgrove, co. Cork, a fine clump of
 Pampas-grass at, 31
 Benevolent Institution, Gardeners'
 Royal (Annual Dinner), 12, 329, 361,
 151, 152, 473; (Worcester Auxili-
 ary), 31
 Benefit and Provident Institution,
 United Horticultural (Annual
 Dinner), 298
 Bergamot from Southern Italy, 137
 Berlandiera tomentosa, 282
 Bignonia grandiflora, &c., at Park
 Place, Henley, 230
 Birdall House Gardens, York, 196
 Birds in Gardens, 237, 317, 369
 Blenheim, tree planted by the German
 Emperor at, 420
 Bleu, Alfred, 25
 Boltonias, 222, 310
 Books for under gardeners, 380

BOOKS, NOTICES OF: Abrégé de la
 Petite Flore de Belgique (A.
 Cogniaux), 418; A Colour Dic-
 tionary (B. W. Warhurst), 112;

 Buda-Pesth, horticultural exhibition
 at, 266
 Budding, waxed tape for, 92
 Buds, adventitious, 329
 Bulbophyllum mandibulare, 293
 Bulb-planting on turf, 305, 325
 Bulbs, &c., 262; in grass, 114
 Burrs in Natal, 438
 Byblis gigantea, 409

C

CABBAGE, the Chinese, 457, 474;
 C. St. Martin, 447
 Cactus hedges for Pine forests, 112
 Calceolaria, hybridisation of the, 1
 Calceolarias, 64
 Calcutta, the Cinchona plantation at,
 224
 Callistephus hortensis (single-flowered
 Chinese Aster), 313
 Calvat, M. Ernest, 41
 Calystegia macrostegia, 210
 Campanula Mayi ×, 126, 211; C.
 mirabilis, 83, 148, 173, 195, 275;
 C. species and hybrids, 116; C.
 Vidali, 278
 Canada Rice, 210, 229
 Cancer in human beings and in trees,
 92
 Caoutchouc, the collection and prepa-
 ration of, 193
 Capsicums, fruiting, 219
 Carbon, the fixation of, 378
 Cardiff Castle Gardens, 372
 Carnation hybrid between a Clove and
 Malmaison variety, 210
 Carnations, 186, 457; and Pinks for
 market, 293; and Violets at The
 Grange, Alresford, 490; C. Mal-
 maison the culture of, 338; raisers
 of new, 22; tree, or perpetual, 163,
 204, 231
 Carton Gardens, 181
 Caryopteris mastacanthus, 412
 Castlewella, Pittosporums at, 370
 Catatum macrocarpum chrysan-
 thum, 324
 Cattleya × Atlanta, 182; C. guttata
 variety, 217; C. × Hardyana var.,
 305; C. × Hardyana, Oakwood
 var., 274; C. labiata, 390; C. l.
 Gaskelliana, 161; C. l., imperfect
 peloria in, 362; C. l. "Mrs. R. I.
 Measures," 337; C. l. Pectersiana
 superba, 389; C. l. alba "Sir
 George White," 389; C. Law-
 renceana, 258; C. Leopoldi, 116;
 C. × Lord Rothschild, 338; C. ×
 Maggie Raphael, 482; C. Mrs. Her-
 bert Greaves, 446; C. Skinneri
 alba, 2; C. superba var. splendens,
 324; C. Warscewiczii, 280, 289
 Cauliflower-seed cultivation, 362
 Cedar catkins, 377
 Centaurea americana alba, 12; C.
 ragusina, 223
 Cerastium arvense, 341; C. a. oblongi-
 folium as a bedding-plant, 111
 Cercis canadensis, 24
 Cereus candicans var. Dumesniliana,
 415, 439
 CERTIFICATED PLANTS: — Abies
 Douglasii pumila, Colorado var.,
 96; Acer californicum aureum, 96;
 Adiantum Burni, 334; Antholyza
 athiopica var. vittigera, 366;
 Arundo Donax macrophylla, 96;
 Aster Amellus "Distinction," 301;
 A. N. B. Robert Parker var. nana,
 301; Begonia "Caledonia," 366;
 B. Mrs. Leopold de Rothschild,
 232; B. Mrs. Jno. Caul-
 field, 96; B. M. Waucoot, 96;
 B. Sylvia, 402; Caladium A. Sie-

bert, 58; C. Madame Jean Dybowski, 96; C. Marie Mitjana, 58; Campanula × Mayi, 96; C. "Warley," 96; Canna Beauté Poitevine, 197; Carnation Heather Bell, 58; C. Lady Gerard, 17; C. Rosalind, 58; C. The Baron, 58; C. Trojan, 17; Caryopteris mastacanthus, 267; Cattleya Dowiana aurea, Little's variety, 301; C. × elatior, 478; C. Gaskelliana formosa, 17; C. Harrisoniae alba, 58; C. × Kienastiana var. Aurora, 232; C. labiata, 367; C. l. Gilmouriae, 367; C. l. alba Princess of Wales, 367; C. Luddemanniana alba, 233; C. × Maggie Raphael, 441; C. Mrs. J. W. Whiteley ×, 402; C. Mossie Lawrence, 17; C. "Princess," 334; C. vestalis ×, 402; C. × Weedoniensis, 268; C. × Whitei, Wigan's var., 156; Centaurea americana alba, 156; Chrysanthemum Edith, 443; C. Florence Molyneux, 334, 336; C. J. R. Upton, 443; C. Lady Temple, 351; C. Le Grand Dragon, 334; C. Miss Alice Byron, 334, 336; C. Mme. R. Cadbury, 441; C. Madame von André, 405; C. Miss Edith Pilkington, 334, 336; C. Mrs. A. H. Hall, 336; C. Mrs. Alfred Tate, 402; C. Oscar, 441; C. Ralph Hatton, 386; C. R. Hooper Pearson, 334; C. No. 653.—SATURDAY, JULY 1, 1899.

THE

HYBRIDISATION CONFERENCE.

AN International Conference on Hybridisation is to be held under the auspices of the Royal Horticultural Society on Tuesday, July 11, at Chiswick, and on the following day at the Westminster Town Hall. A luncheon will be offered to the foreign visitors at Chiswick on the 11th, and a dinner at the Horticultural Club in the evening. On Wednesday a banquet will be held at the Hôtel Métropole, when some members of the Government and public men will be present to greet the foreign guests, and to evince their sympathy with the Royal Horticultural Society.

In view of the great importance of the subject, we propose to publish a series of short notes illustrative of the progress that has resulted from the practice of cross-breeding. At the same time we shall hope to be able to issue a large number of portraits of representative hybridisers and plant-breeders. We shall not attempt to treat the subject exhaustively, or even to follow any regular sequence. We cannot hope in the space at our command to make the collection complete, but we shall endeavour to make it suggestive.

HYBRIDISATION AT KEW.

Plant-breeding has hitherto been left almost entirely to the commercial and amateur horticulturists; it is indeed only recently that a plant of garden origin has been allowed to have a scientific interest. Hence the fewness of hybrids raised in botanical establishments compared with those raised elsewhere. Probably, more hybrids have been raised at Kew than in all other botanical gardens put together. Writing from memory, the principal hybrids raised in others are the *Sarracenias*, *Lachenalias* and *Nerines*, raised at Glasnevin; the *Cinerarias* at Cambridge, and the *Cypripediums* at Birmingham. The following is a list of the Kew hybrids: of these the plants of chief horticultural interest are the *Cinerarias*, *Disas*, *Rhododendrons* and *Streptocarpus*. The *Cinerarias* are remarkable for both size of plant and colour of flower, in which respect they bid fair to modify the character of the garden *Cineraria*. The *Disas* are now well known, and rank among popular cool-house Orchids. *Rhododendron Kewensis* is one of the handsomest of first hybrids in this genus, and the *Streptocarpus* now almost rival *Gloxinias* in popularity. They owe their position in the first place to the introduction of the remarkable *S. Dunni* from the Transvaal. This was crossed at Kew with other species, and their progeny again crossed. The results were striking enough to attract the attention of Messrs. Veitch, who obtained a selection of the seedlings from Kew, and from them have obtained the race of plants now associated with their name. Messrs. F. Sander & Co., and J. Laing & Sons also had a selection of hybrids from Kew. The *Phyllocactes* and

Hippeastrums have also been hybridised at Kew, and some first-class seedlings have been raised there. Of the unflowered hybrids it is too soon to speak, beyond stating that they all promise to be interesting botanically, if not horticulturally.

LIST OF HYBRID PLANTS RAISED IN THE ROYAL GARDENS, KEW.

Name.	Parentage.
<i>Aloe Lynchi</i>	<i>A. albocinara</i> × <i>Gasteria verrucosa</i> ×
<i>Aloe</i>	<i>A. macracantha</i> × <i>Gasteria verrucosa</i> ×
<i>Bravoa</i>	<i>B. Bulliana</i> × <i>B. geminiflora</i>
<i>Amayllis</i>	<i>A. Belladonna</i> , <i>Brunsvigia Josephinae</i> ×
<i>Cereus</i>	<i>C. triangularis</i> × <i>C. grandiflorus</i>
<i>Cereus</i>	<i>C. Macdonaldii</i> × <i>Phyllocactus Cineraria Kewensis</i>
<i>Cineraria Kewensis</i>	<i>C. crenta</i> × garden seedling
<i>Cheiranthus</i>	<i>C. mutabilis</i> × <i>C. Cheiri</i>
<i>Crinum</i>	<i>C. longifolium</i> × <i>C. Moorei</i>
<i>Cytisus Kewensis</i>	<i>C. Ardoini</i> × <i>C. albus</i>
<i>Cytisus</i>	<i>C. Ardoini</i> × <i>C. biflorus</i>
<i>Disa Kewensis</i>	<i>D. grandiflora</i> × <i>D. tripetaloides</i>
<i>D. Langleyensis</i>	<i>D. racemosa</i> × <i>D. tripetaloides</i>
<i>D. premier</i>	<i>D. Veitchii</i> × <i>D. tripetaloides</i>

<i>Disa</i>	<i>D. grandiflora</i> × <i>D. nervosa</i>
<i>Hippeastrum</i>	Various crosses
<i>Musa Kewensis</i>	<i>M. Manni</i> × <i>M. rosacea</i>
<i>Nymphaea Kewensis</i>	<i>N. lotus</i> × <i>N. devoniensis</i> (Bot. Mag., t. 6985)
<i>Passiflora Kewensis</i>	<i>P. Raddiana</i> × <i>P. coerulea</i>
<i>Phyllocactus</i>	Various crosses
<i>Rhododendron Kewense</i>	<i>R. Griffithianum</i> × <i>R. Hookeri</i>
<i>Rhododendron</i>	<i>R. Smirnowii</i> × various seedlings
<i>Rhododendron</i>	<i>R. Fortunei</i> × various seedlings
<i>Rosa</i>	<i>R. macrophylla</i> × <i>R. rugosa</i>
<i>Rosa</i>	<i>R. microphylla</i> × <i>R. rugosa</i>
<i>Streletzia</i>	<i>S. Repine</i> × <i>S. angusta</i>
<i>Streptocarpus Bideri</i>	<i>S. Rexi</i> × <i>S. parviflorus</i>
<i>S. Dyerianus</i>	<i>S. Dunni</i> × <i>S. Wenlandi</i>
<i>S. Kewensis</i>	<i>S. Dunni</i> × <i>S. Rexi</i>
<i>S. Watsoni</i>	<i>S. Dunni</i> × <i>S. parviflorus</i>
<i>Streptocarpus</i>	<i>S. Fannini</i> × <i>S. Rexi</i>

W. W.

FLORISTS' FLOWERS.

THE AURICULA.

It is difficult to say for certain when the improvement in the Florists' Auricula commenced, and the materials employed to bring about the evolution of the show varieties. It appears probable that the work commenced in Holland, and that when the Flemish weavers, driven from their own country by religious persecution, came to this country, they doubtless brought their Auriculas with them, as things too precious to be left behind. It is well known that they and their descendants were cultivators of this flower, especially in Lancashire.

Gerarde, in 1597, enumerated eight kinds as commonly grown in the gardens about London, but there is reason to think they were not much esteemed, and there is no mention of improving by raising from seed. Johnson, in his edition of Gerarde, published in 1633, says there were then a great many varieties of these flowers growing in the garden of Mr. Tradescant. Tradescant's garden was at Lambeth, and he at the time that Johnson wrote, was gardener to Charles I. Tradescant was a Dutchman, and it is probable that bringing with him to this country that knowledge of floriculture for which his countrymen were even then justly famed, he applied it to the improvement of the Auricula. Hughes, in his *Flower Garden*, published in 1672, gives short directions for the cultivation of this flower, and it is said he was the first writer on gardening known to speak of the subject as the Auricula. In 1757, James Thompson, a florist of Newcastle, printed in that town a scale of properties of a good flower under the title of *The Distinguishing Properties of a fine Auricula*. But these were not the first, for Richard Bradley, in his *New Improvements of Gardening*, published in 1718, gives seven characteristics of excellence which are "required by florists," to be possessed by the Auricula. Maddock, in his *Treatise on the Auricula*, published in 1792, states that the Auricula "owes its present improved state principally to the assiduity and attention of English florists to its culture, who have from the seed of a flower imported from Holland about fifty years

since, produced by continued cultivation, almost all the varieties we now can boast." George Glenny held that the Dutch had their Auriculas in the first instance from England, and that it was the Dutch who obtained the first improved varieties, because the English growers used to buy them from the Dutch in large quantities.

In the forties the leading green-edged Auriculas in cultivation were Leigh's Col. Taylor, Page's Champion, Booth's Freedom Oliver's Lady Ann Wilbraham, Hudson's Apollo, Dickson's Matilda, Dickson's Earl Grey, and Lightbody's Star of Bethlehem. Grey edges: Lancashire's Lancashire Hero, Dickson's Prince Albert, Fletcher's Ne Plus Ultra, and Mary Ann; Grimes' Privateer, Headly's Stapleford Hero, Oliver's Lovely Ann (in later years classed with the green edges), Kenyon's Ringleader, and Waterhouse's Conqueror of Europe. White edges: Taylor's Favourite, and Incomparable; Lee's Bright Venus, Popplewell's Conqueror, Lee's Earl Grosvenor, Lightbody's Fair Maid, Ashworth's Regular, Campbell's Robert Burns, and Taylor's Glory. Selfs: Smith's Mrs. Smith, Netherwood's Othello, Martin's Eclipse, Kaye's Jupiter, Redman's Metropolitan, and Gorton's Stadtholder (a yellow self).

With very few exceptions, we know little or nothing of the men who raised the foregoing varieties, or the material from which they derived them. In the succeeding ten years, such green edges as Beeston's Apollo, Dickson's Duke of Wellington, Dickson's Prince Albert, and Ashton's Prince of Wales, had put in appearance. Grey edges: Smith's General Bolivar, and Headly's Superb. White edges: Heaps Smiling Beauty, and Hepworth's True Briton. A little later came Headly's George Lightbody, and Lightbody's Richard Headly, two of the finest grey edges of the present day; Smith's Lyeurgus (green edge), Lightbody's Meteor Flag, Martin's Mrs. Sturrock, Spalding's Blackbird, and Kaye's Topsy, a quartette of selfs; and with such material the Rev. F. D. Horner, B. Simonite, J. Douglas, Woodhead, Mellor, and others, set about adding to the varieties which form the cream of our collections in the present day.

The alpine type is to a larger extent a product of more recent years. Fifty years ago, but few appeared to be grown, the leading varieties Fair Rosamond, Fair Ellen, Queen of the Alps, &c.; succeeded by a very popular light variety named *Conspicua*. It was not until Mr. C. Turner took the alpine Auricula in hand, that substantial improvement came; and excellent work has also been done by Douglas, Phillips, and others. The leading varieties in this section appear to emanate from the south of England.

Two old double-flowered varieties, the Double-Black and the Double Yellow, have been in cultivation for many years, but they are quite superseded by varieties so large, full, and fine, as to stand in the same relation to the single Auriculas as the double *Cinerarias* do to their single forms. They flower later than do the other sections. *R. D.*

THE CALCEOLARIA.

It is difficult to trace the commencement of the crosses made with a view to the improvement of the Calceolaria, but it would appear it was Mr. H. Major, of Knosthorpe, Leeds, who was one of the earliest to take the flower in hand. Desirous of improving it as a show flower he, about 1830, commenced by crossing such reputed species as *rugosa*, *bicolor*, *arachnoides*, and others, and by 1834 he had added considerably to the quality of the strain, and had succeeded in obtaining a crimson-scarlet self, which was regarded as a great acquisition; and also a shrubby variety, which it was thought was the forerunner of a dwarf strain. Such coloured illustrations as were given in the thirties show small, ill-shapen, bag-like blossoms, such as the earliest productions of Major, Sharnar, Plant, and others; indeed, it would appear that in the early thirties there was in Yorkshire several raisers who were doing their utmost in the way of

improvement. These illustrations, poor [as] they appear to us sixty years afterwards, are valuable as presenting the flower in its elementary form; a shilling would almost cover the largest of them.

It was probably such material as this which formed the ground-work of the late Mr. T. R. Kinghorn's experiments when gardener to the Earl of Kilmerey, at Twickenham; Mr. Pennycuik, of Twickenham; Mr. W. H. Holmes, of Sudbury; Mr. W. Willison, New Gardens, Whitby; Messrs. Dicksons & Co., Edinburgh; Mr. N. Gaines, Surrey Lane, Battersea; Mr. M. Woodhouse, Whitby; and others. That *C. rugosa* had much to do with the production of the shrubby habit in the *Calceolaria* there can be no doubt, as instances are recorded in which it was employed, either as a pollen or seed-bearing parent. Mr. H. Constantine, gardener for many years at Hillingdon Court, Uxbridge, made a considerable reputation as a raiser and exhibitor, and forty years ago had much to do with shaping the present character of the flower. The Dobsons, of Isleworth, a firm in their day celebrated for *Calceolarias*, *Pelargoniums*, &c., had a very fine strain of the former, and by their selections did much to develop the dwarf-habited type grown in the present day.

In the fifties a distinct section of shrubby *Calceolarias* was cultivated with a more thickly-branching habit, and weedy stems, as many as fifty varieties being enumerated in a list I have before me, published in 1856. It appears to be an acknowledged fact that crosses between different species of *Calceolaria*, in common with other plants, are more fertile than the original species from which they have descended, and this may account for the additional vigour in their subsequent progeny found in the earlier crosses made between the shrubby species. In 1855, Mr. J. Cole, of St. Albans, raised from seed a batch of shrubby varieties, which were great improvements on any preceding forms. At that time there were in cultivation certain sub-shrubby varieties, of which one named Sultan was a very fine type, and it was the pollen of such Mr. Cole employed on the best of the shrubby varieties; a batch of ten varieties of Mr. Cole's raising was sent out in 1856, by the late Mr. Charles Turner.

At that time, Mr. J. James was the gardener at Redlees, Isleworth, and was growing *Calceolarias*, *Cinerarias*, *Pelargoniums*, &c., for exhibition purposes. He made use of the pollen of these new shrubby varieties, which he grew and exhibited in fine character, on to the best of Dobson's more soft-wooded types, and may justly be said to have originated our modern strains, which his son, Mr. W. J. James, of Farnham Common, Messrs. Sutton & Sons, and others, have brought to such a high stage of perfection. There is one danger attending the present strains, that the attempts in the direction of attaining mere size is being done at the expense of substance, and a gain of flabbiness in the corollas. R. D.

CYCLAMEN.

It would seem that no serious attempts were made to improve *C. latifolium* (*persicum*) until early in the fifties, when Messrs. E. G. Henderson & Son, of the Wellington Road Nurseries, produced some new forms, which they denominated "hybrids;" but no record is made of any cross which produced them, and there is no doubt that no hybridisation between species took place. It may be supposed that some seedlings showing improvements had put in appearance, and cross-fertilisation of the varieties was attempted, and in this way Messrs. Henderson & Son's so-called hybrids were produced; but who took the lead in the matter is not recorded. It is possible that it was discovered some variation could be obtained from seeds, and possibly some attempts at cross-fertilisation were made.

Probably two of the first to attempt cross-fertilisation of the *Cyclamen* were Mr. H. Little and Mr. B. Hooke, of Twickenham, as both were successful in obtaining new varieties of a very promising character. Mr. Hooke certainly went to

work in a systematic manner, for he crossed deep-coloured varieties with their fellows, whites with whites, and so on; and in this way he materially affected the improvement of the flower. I used to visit Mr. Hooke both at Twickenham, and later at Hillingdon; and when Mr. Little moved to Hillingdon also, he maintained his work of improving the flower, aiming at the production of dark crimson-coloured varieties, seeking also to improve the size of the blossom, and the floriferousness of the plants.

The large-flowered or giant type has been developed during the last twenty years, and mainly at the St. George's Nursery, at Hanwell. Messrs. Sutton & Sons, at Reading, made many successful crosses in developing new colours, adding substance to the flowers, and enhancing the decorative value of the *Cyclamen* more than forty years ago. Mr. James Atkins added to the value of the more hardy types, by crossing *C. latifolium* on to *C. Coum*. Some of the seedlings were reproductions; one in particular showed a true hybrid character, and became known as *C. Atkinsii*. The seeds which produced *C. Atkinsii* were sown in August, 1852, and bloomed in 1854. Seedlings from *C. Atkinsii* are very apt to revert to the *C. Coum* type, only a small proportion of them coming true to character.

THE GLOXINIA.

The earliest coloured illustration of a *Gloxinia* I can find is in the *Floricultural Magazine* for 1836, then edited by the late Mr. Robert Marneek. It is that of *G. Youngiana*, a white flower with a pale purple throat, raised by Mr. Young, nurseryman, of Epsom. How great an improvement this was upon *Sinningia* (*Gloxinia*) *speciosa*, introduced in 1815, it is difficult to say, but twenty years afterwards it had been recognised that new varieties were readily raised from seed, that there was a strong tendency to run into varieties, and that not a few varieties of great beauty had been raised in this way. Mr. Carton, at that time in charge of the gardens at Syon House, Brentford, and a skilful hybridiser, was leading the way in improving the flower, and obtained a variety named *Cartoni* from *Gloxinia rubra* and *Sinningia guttata*; and he also made use of *S. hirsuta*; and he also raised *magnifica*, *insignis*, *bicolor*, and others. These were exhibited at a meeting at the Royal Horticultural Society in Regent Street, in June 1844, by Mr. R. Glendinning, then a nurseryman at Turnham Green, and there is no doubt they found their way into cultivation, and became valuable seed-bearing parents.

In the following year the first erect-flowering variety, so far as known, was raised by Mr. Fyfe at Cothesay, and received the name of *G. Fyiana*; it is generally believed to have been a cross between a large-flowered *Gloxinia*, and *G. caulescens*, which we learn on authority was the first form having erect flowers. It will be noted that not only was the corolla raised from a pendent to an erect form, but it gradually lost its irregular form and became rounded, with equal-sized equi-distant lobes [regular *peloria*]. Here and there systematic attempts have been made to obtain increased size, substance, and marking, notably by Messrs. Sutton & Sons, of Reading; and so large in size and splendid in quality are the present-day strains, that one is disposed to ask, "How much further can improvement possibly go on?" The marbled and maculated varieties appear to be less stout in substance than the self and edged flowers, probably because a later development in time; but solidity of texture will no doubt come in course of time, as careful selection for seed purposes can accomplish much. R. D.

ORCHID NOTES AND GLEANINGS.

CATTLEYA SKINNERI ALBA.

ORIGINALLY introduced by Messrs. James Veitch & Sons from Costa Rica some twenty years ago, sufficient time has elapsed to admit of this chastely-

beautiful white Orchid being well represented in gardens, if it were other than a rare plant in its native habitat. But at the present day many orchidists are longing for it, and still more are lamenting the outlay of their money on what has turned out to be a spurious substitute. It is a pleasure to see a fine inflorescence of the best form (for even in the true plant, so far as colour is concerned, there is variation in size) from Mr. G. W. Cummins, gardener to W. H. Lumsden, Esq., Balmedie, Aberdeen. The flowers are pure white, with a sulphur-yellow tint in the tube of the lip, and a slight purple mark at the base, where it is not visible unless the lip is expanded.

BRASSIA BRACHIATA.

There are signs that the *Brassias*, once leading favourites in Orchid collections, are again to be given the consideration which their elegant and easily-produced flowers deserve. The best form of *Brassia verrucosa* is a beautiful object, and the other, of the warted-lip section, is still more handsome, though unfortunately far from common in gardens. What may be termed a major form of it is flowering with Arthur S. Hargreaves, Esq., Gooden House, Harrow-on-the-Hill, an enthusiastic lover of uncommon plants of all kinds. The long yellowish sepals and shorter petals are quaintly spotted with brownish-purple; the lip, which is much larger than in the type, is cream-white, changing to yellow, and decorated with olive-green flattened warts, not so prominently displayed as in *B. verrucosa*. It is a very fine and effective plant.

LÆLIA JONGHEANA.

This charming *Lælia* has always been a mysterious plant, for although a great desire to possess it has been from time to time revived by the flowering of the now historical specimen in Baron Schroder's collection, it has persistently eluded the vigilance of the Orchid-collector, whose energies have been directed to obtaining it in equally as great a degree as was for years maintained in hunting after the true autumn-flowering *Cattleya labiata*. That its advent would give a fresh start to the hybridist is well shown by the lovely and unique *Lælia* *Cattleya* × *Baroness Schroder* raised from it and *Cattleya Trianae* in Baron Schroder's collection.

Lælia Jongheana was sent from Southern Brazil about the year 1854 by Libon to M. de Jonghe, of Brussels, and unfortunately soon disappeared from cultivation, nothing more being heard of it until 1872, when a plant of it flowered with MM. Thibaut & Keteleer near Paris, and which furnished material for the late Professor Reichenbach's enthusiastic description and illustration in the *Gardeners' Chronicle*, Mar. 30, 1872, p. 425. It is a grand and distinct species, with brilliant amethyst-rose or bright pink flowers, the seven elevated, crimped, rich orange-coloured keels on the lip rendering it easily recognisable.

ABNORMAL FLOWERS.

From Sir Trevor Lawrence we have received flowers of *Cattleya gigas*, which, if not specially attractive, are at least interesting, as serving, like the puzzle-blocks of our childhood, to fill in the gaps and bind the structure of Orchids into a consistent whole. In one flower there is a reduction of parts owing to the absence of one of the lateral petals without other change. Another flower offers a similar reduction, two sepals only being present, and one of the lateral petals being adherent to the column. A third flower is likewise defective in two sepals, whilst one of the petals occupies a central position at the back of the flower, opposite to the lip, this lip being only lip-like as to one-half, the other portion being like a lateral petal. Lastly, there is a flower with no sepals, but two lateral petals, more or less lip-like, and a lip opposite the column. In each case the column was normal, but the ovary was more or less imperfect. It is possible these reversions, if they are reversions, may be due to cross-fertilisation in former generations.

Mr. J. Wilson Potter obligingly sends us a flower of *Cypripedium Lawrenceanum*, in which the

dorsal sepal or standard shows a few glandular warts along the nerves, similar to those on the petals, but smaller, and less hairy. What is the significance of these glands? Are they mere organs of excretion for the purpose of throwing off superfluous water or other undesirable product, or are they designed as insect-traps, or as insect deterrents?

From the garden of R. Morris, Esq., Beachfield, Doncaster, comes a "synanthic" flower of *Odontoglossum crispum*, in which two flowers are joined

has also similarly influenced the uncommon *S. Josikaea*, which is flowering very well this year. It is a true and distinct species of Lilac, native of the mountains of N. E. Hungary, and although inferior to the various forms of *S. vulgaris*, is of considerable value in extending the Lilac season. This year it was at its best in the second week of June. Its flower-spikes average 5 to 7 inches in length, and differ from those of the common Lilac in being much more slender, and in having the flowers arranged in distinctly separate tiers. The individual flowers are rather smaller than in the common

known at present. There is a specimen in the collection of Leguminosæ at Kew which has been this summer perhaps the most remarkable of all the hardy shrubs in the gardens. The chief difference between this species and the common *Wistaria* is in the shape of the raceme. In *W. chinensis* this is comparatively short and broad, with the flowers closely packed. In the present species they average 2 feet in length (occasional racemes are almost 3 feet), and the flowers are much further apart. On the plant at Kew I counted twenty-eight of these racemes on a branch 12 or 15 inches long, all in flower at the same time! But the whole plant was almost hidden by a curtain of pendent, pale lilac racemes. This *Wistaria* is worth growing because it flowers a fortnight or three weeks later than *W. chinensis*, and also because it can, although a climber, be easily kept as a bush by an annual pruning after the flowers are past. There is a picture in the *Gardeners' Chronicle*, February 25, 1893, p. 233, of a remarkable specimen of *W. multijuga* at Kameido in Japan. It is given as *W. chinensis*, but there is, I think, no doubt of its being this species, both from the picture itself and the description in the text, where the racemes are described as 3 to 4 feet long.

RHODODENDRON KAMSHATICUM.

This is one of the very rarest and most distinct of Rhododendrons, and according to Loudon was introduced as long ago as 1802. No doubt it has flowered at intervals since then, but, personally, I had not seen it in bloom till last week. There is a little group of plants in the rockery at Kew, and one of them is now flowering. The flowers are borne singly or in pairs on each stalk, and for a Rhododendron, are curiously flat and open—something like those of *R. chamaecistus*, or *R. lepidotum*. Each flower is about 1½ inch across, with the broad segments of the corolla of a distinct reddish-purple.

In many Rhododendrons the lobes of the calyx are scarcely discernible, but in this species they are large and almost leaf-like, and of lanceolate outline. The leaves are obovate, sessile, 1 to 2½ inches long, furnished beneath with bristly hairs, and still more so on the margin. The plant grows from 6 to 12 inches high only, and has a close tufted habit. Plants have been found most abundantly on the great peninsula of Kamshatka, but the species also occurs on the Aleutian Islands, in the Behring Strait region, and even in British dominion in the far north-west of Canada. Pallas figured it in his *Flora Rossica* in the year 1784, and another figure appeared a few years ago in *Gartenflora*, t. 1260. In nature the species is found in boggy ground, and similar conditions have to be provided for it under cultivation. *W. J. Bean*.

DR. FOCKE.

FOREMOST amongst those interested in cross-breeding we must place Dr. Focke, of Bremen. He had been selected by the committee to take a leading part in the forthcoming conference, but we learn with great regret that his numerous avocations will prevent him from being present on this occasion. His work, entitled *Die Pflanzen-Mischlinge*, published in 1881, is the most complete list that we have of the natural and artificially-raised hybrids that we possess. It contains a brief summary of the history of the various hybrids known to him up to the date of publication. The labours of Kolreuter, Gaertner, Herbert, Knight, Naudin, and other labourers in the field, are condensed in a manner that renders his book invaluable to the student. May he be spared to give us a new edition, supplying the deficiencies of the first, and bringing the record up to date. Dr. Focke is also well known to botanists in this country for his studies in that intricate genus *Rubus*; and his assistance and opinion are eagerly sought by those who are endeavouring to reduce the endless variations of our common Brambles to something like system.

*

HERR DR. W. O. FOCKE.

together sideways like Siamese twins. Owing to the pressure of one flower on the other, some of the segments have been pushed out of place and slipped one behind the other, so as to give the appearance of a double flower.

TREES AND SHRUBS.

SYRINGA JOSIKÆA.

THE Lilac season, which so far as concerns the common species and its numerous varieties is now quite over, has been the best we have had for some years, the great wealth of blossom being, no doubt, primarily due to the splendid ripening weather of 1898. Whatever the cause, it

Lilac, but are equally fragrant and of true Lilac colour. The leaves are even more distinct than the racemes, being 2 to 4 inches long, lanceolate, tapering towards each end, and of a dull dark green. The species was named in honour of the Baroness von Josika, to whom was due its original discovery. This was about seventy years ago, and it has been cultivated in Britain since 1835.

WISTARIA MULTIJUGA.

With regard to *Wistarias* in gardens, it has hitherto been a case of *W. chinensis* first, "the rest nowhere." And there can be little doubt that the common *Wistaria* is not only the best in the genus, but in some respects the finest of all hardy flowering climbers. I now desire to say a word of praise for its ally, *W. multijuga*, which is scarcely

CHLOROSIS IN FRUIT TREES.

(Concluded from vol. xrr., p. 405.)

IN 1889, an important series of experiments was commenced with chemical or artificial manures, and some extremely interesting results followed, though not always of a favourable character. The chief substances used were nitrate of soda, nitrate of potash, sulphate of potash, chloride of potash, kainit, sulphate of ammonia, bone-flour, superphosphates of various grades, basic-slag, and soot. As regards nitrate of soda and sulphate of ammonia, when either was employed alone on Plums, excessive growth followed, which could not be kept in check, and it was only arrested by the appearance of the too familiar disease; and in the case of Apple-trees, canker became very prevalent, similar results being noted where soot alone was used. These effects were general, but Pears and Apricots were especially unsatisfactory in fruit, foliage, and growth, both canker and gumming following. The addition of sulphate of potash, kainit, and chloride of potash alone to either of the two stimulants named did not effect any improvement, but when a mixture of nitrate of potash, superphosphate, and sulphate of iron was tried, the results were most marked, and highly satisfactory—cankered Apricots recovered, Pears and Apples became healthy and clean, the fruits ceased cracking, and heavy crops of fine fruits which ripened well, and proved of good flavour, were secured. These pleasing results might reasonably be attributed to the use of sulphate of iron, and no doubt it did produce an effect, but it is very remarkable that Mr. Wallis states: "We ceased using the sulphate of iron, as when left out the trees did not seem to suffer." The compound, which has now been employed for some years, consists of nitrate of potash one part by weight, and a high grade superphosphate (45 per cent.) two parts by weight, used at the rate of 12 ozs. per square yard, divided into three dressings, one applied during January, another when the buds begin to open, and a third when the fruits are set. This has been found particularly beneficial to Pears, and some trained trees against a wall comprising Glon Moreau, Doyenné du Comice, Pitmaston Duchess, Williams' Bon Chrétien, Louise Bonne of Jersey, and others, admirably demonstrate its effects, as the trees are mostly in pairs, one of each having had different treatment as regards the manurial supplies.

A satisfactory measure of success having thus attended the efforts to counteract the fell disease chlorosis, further experiments were devised to endeavour to find a cheaper mixture that would answer the same good purpose, and enable the expensive nitrate of potash to be dispensed with. Sulphate of ammonia, nitrate of soda, sulphate of potash and kainit, have been so used in conjunction with the high grade super-phosphate, and in some cases, especially with Apples, the results have been equally good. An endeavour has been made to ascertain in what form phosphoric acid gives the best results, and to effect this an experiment was undertaken with Apples, the varieties selected being Warner's King, King of the Pippins, Ribston Pippin, Lane's Prince Albert, Golden Noble, and Reinette du Canada. Six trees of each of these were planted in parallel lines, then, taking rows across the plot, so that one tree of each variety was included, the following manures have been applied:—

1, six trees ...	Bone-meal.
2, " ...	Chloride of potash.
3, " ...	Superphosphate of lime (26 per cent.).
4, " ...	Phosphate of potash.
5, " ...	Phosphate of soda.
6, " ...	Superphosphate of lime (45 per cent.).

The amount of manure applied has been calculated, so that the same quantity of phosphoric acid has been given to each six trees (with the exception of No. 2). Except in 1 and 2 all the trees have succeeded well in this experiment, and have borne good fruit, though some differences have been observed in the colouring of the ripened fruit, particularly where the potassic manures are

used. This experiment is still being carried on, and three other varieties have been since added, namely, Blenheim Pippin, Peasgood's Nonsuch, and Cox's Orange, which show similar results. The importance of phosphoric acid in such a soil as this, and in the treatment of chlorosis, is conclusively shown; but there does not appear to be any certain evidence as to which form is the most efficacious or the cheapest, though general results seem to favour the high grade superphosphates.

Much more of interest to horticulturists might be recorded concerning the work on the Hamels Park Estate; and on a future occasion, perhaps, I may be enabled to add something to the facts set forth in these notes. Mr. Shepherd-Cross is commencing a new series of experiments with the assistance of Mr. T. B. Wood, M.A., of Cambridge, which may be expected to yield important results, and considerable care is being exercised in testing the hardness of the water supplied to various trees and plants. Many difficulties have had to be overcome and much expense incurred in the investigations at Hamels Park, but notwithstanding defects in the earlier methods, all records (of which those concerned are fully conscious), valuable work has been accomplished, that should be helpful to many who are similarly situated. *R. Lewis Castle.*

NURSERY NOTES.

THE ROYAL NURSERY, SLOUGH.

It can be said of the Carnations as is said of the poor—that they are always with us. There is scarcely a period of the year when there are no Carnations in bloom. Every type—Malmaison, perpetual or winter and summer-flowering varieties—have all been so increased of late that the round of the various seasons sees something in flower, and there have been so many splendid additions of strains and varieties, with so much of fragrance in the blossoms, that it is not to be wondered at that the Carnation increases in popularity.

Just now there can be seen at the Royal Nursery, Slough, a spacious span-roofed house containing on a central and side stages some 450 plants, one each in an 8-inch pot, carrying remarkable heads of bloom. They do not represent the ordinary winter-flowering varieties, but Mr. Martin R. Smith's summer-flowering varieties, potted the second week in January last, in the hope that they would be in bloom at the time of the Temple Show, which they missed only by a fortnight, and, remarkable statement, this large collection is the production of one enthusiastic raiser. It is a floricultural exploit, standing as a record in horticultural methods, and attesting to the quality of Mr. Martin Smith's strain.

As a matter of course, the flower-stems are rather tall, and the prolific "grass" drawn a little; but there is nothing to suggest that anything in the way of constitutional weakness will result from this spell of indoor culture. As soon as the flowering-time is over, the plants will be fully exposed in the open; this will serve the purpose of thoroughly hardening the shoots, and they will be layered at the usual time, and probably a little earlier. The number of varieties forming the collection is large, but the average is remarkably good. Mr. Smith's preference for varieties that do not split their calyx is abundantly shown; there are magnificent blooms full of large, smooth, shell-shaped petals; and there is decided novelty, especially among what are termed the Fancy varieties.

Of the maroon and shaded crimson shades there are Agnes Sorel, very rich dark-maroon, a variety of the highest quality, so smooth and rounded in petal, and perfect in shape; Comet, deep crimson, very fine; Triton, not so dark as Agnes Sorel; also Sir Bevy's, dark crimson; those four can be appropriately grouped together, though they are quite distinct from each other.

Bright pale crimson and scarlet selfs are found in Maxman, bright scarlet; Killigrew, having more of red than scarlet; Earl of Mercia, pale scarlet; and La Flèche, also pale scarlet, yet distinct from the foregoing, a flower of very great refinement.

Good purple selfs are not so numerous as some of the others, or else they do not show decided improvement, for there is only one in the collection, but it is a beauty, namely, Dick Turpin, bright purple, with large shell-like petals, very fine indeed.

Rose-shades include some flowers of first-class excellence: Chieftain, deep bright rose, extra fine; Ann Boleyn, differing in shade, but equal in quality; Flora, pale rose; Jack Cade, much the same shade, yet distinct; and Lady Hermione, delicate rose, a lovely variety. Pink, deep and pale, fine expression in several flowers, at the head of them I place Wynona, soft clear pink, a beautiful variety; Melita, pale pink; and Bridesmaid, soft clear pink. A little paler is Maid Marian, fleshy pink, a lovely flower, and is a charming companion to Lady Hermione.

There are some fine yellow selfs among them which will greatly strengthen this section, viz., Miss Judith Harbord, deep yellow, extra fine in colour and build; Goldfinch, Falcon, Zampa, and Rizzio are all yellow selfs of the finest quality, differing sufficiently to justify them in being classed as distinct varieties.

And there are grand white selfs too, with the Martin Smith build and petal, for it must be admitted that Mr. Smith has set present-day raisers, cultivators, and exhibitors a standard of approximate excellence. He has, no doubt, reached the ideal he set himself as a pattern; but it is ever thus that the ideal assumes higher shapes of possibility, and recedes as advance is made. Much the Miller is a very fine pure white; Lady Dartmouth, Chancer, White Cockade, and Ethelwolf are all very fine indeed; and to these may be added Llewellyn, the most delicate blush-white, very pretty and winsome.

There are buff selfs, too, for there is ample room for them. The two best are Benbow, clear buff; and Lagadère, with a slight salmon shading in the centre. And when an estimate is made of the fancies, one sees what great accessions are made to this section, some of them presenting to view quite new combinations of colour. From a number, I selected the following as the gems of the collection:—Ossian, buff ground, flaked with maroon and crimson, and striped and feathered with fiery rose; Goldyllocks, yellow, with flakes of white on the main petals, with slight pencillings of purple in the centre; Heroine, primrose ground, edged and flushed with bright cherry; Guinevere, creamy-yellow, heavily flaked with pink; Charles Martel, yellow ground, heavily edged and marbled with scarlet and crimson; Eclair, sulphur ground, edge and pencillings of delicate rosy-purple; Desmoulins, white ground, heavily edged and marbled with maroon-crimson; Britomart, a very distinct variety, white ground, flaked with rosy-pink, maroon and purple; Pretorius, pale yellow, edged with pink and heliotrope; Renegade, yellow ground, heavily edged and striped with deep crimson, extra fine; Galileo, creamy yellow, flaked and edged with purple, the former reaching to the centre of the flower; and Persimmon, scarlet, flaked with purple.

One heliotrope self challenged attention, viz., Humbert, having a fine tint of heliotrope, and a decided improvement upon Garville Gem.

There yet remain some charming yellow Picotees which form useful additions to the few we already possess, and form helps toward the attainment of a section of true yellow Picotees, with their petal edges beaded with colour as perfectly as in the case of the white ground Picotees. Those of Mr. Smith's raising are, Lady Bristol, deep yellow, with medium edge of scarlet; Galatea, clear yellow, edged with a deeper scarlet than the preceding; Fashion, pale creamy yellow, edged with pink; Carloman, clear yellow edged

with deep scarlet, extra fine; Duke of Alva, yellow, edged with purple; and Edith, clear yellow edged with lively rose.

I have contended myself with selecting what I thought to be the very best in a large collection of new named varieties. I think some of them may be correctly regarded as epoch-making flowers. R. D.

AURICULAS, CARNATIONS, &c., &c.)

NOTES ON SOME QUEENSLAND ORCHIDS.

The following is an extract from an interesting paper read before the Horticultural Society of Queensland, by Mr. J. F. Bailey:—

The Colony of Queensland is well off in genera and species of the Order, but cannot boast of a great number of showy ones, and the best of these cannot be compared with those of India, South America, or the Malay Archipelago; nevertheless, there are a goodly number of those enumerated in the following list that are well worthy of the attention of the Orchid cultivator.

DENDROBIUMS.

Pride of place among the Australian Orchids must be given to *Dendrobium bighum* and its many varieties, which inhabit North Queensland and the islands of Torres Straits. The stems of the normal form are about a foot long, and bear a few leaves, about 4 inches long, at the top. The flowers measure about 1½ inch across, and are of a magenta-purple colour, the lip being a little deeper coloured, with a white crest. Mr. E. Grimley, of North Quay, the well-known grower of Orchids, had growing in the bush-house last June some plants of a variety with yellow crests instead of white. The variety *superbiens* has stems 3 to 4 feet high, and wavy flowers of a rich crimson-purple, bordered with white. It has the largest leaves of all the varieties.

The variety *Phalenopsis*, which is considered the best, has flowers about 3½ inches across, of a rosy-mauve colour.

The variety *albo-marginatum* has light pink-coloured flowers, the sepals of which have a well-marked white border; the plates on the lip are also white.

The variety *venosum* has flowers of an almost uniform dark pink colour, but distinct from all others by the very prominent venation.

The variety *macranthum* is one of the most showy of the varieties. The sepals and petals are of a heliotrope colour, and the lip of a rich mauve. A specimen of this, which was

received from Geraldton, is growing at the Acclimatisation Society's Gardens, Bowen Park. The foregoing usually flower during the months of April, May, and June.

One of the commonest throughout the colony is *Dendrobium speciosum* var. *Hilli*. This is a robust grower, which flowers during September and October, and will thrive well either in a bush-house or in the open. The racemes are about 15 inches long, and bear numerous fragrant flowers of a pale yellow colour, which remain open for a considerable time. A variety now growing at the Acclimatisation Society's Gardens, which was obtained at Lady Elliott Island, has curved stems, and has had the name *curvicaule* attached to it. The variety *delicatum*, which grows on the Main Range, has slender stems, only 6 to 9 inches high, swelling at the base into pseudo-bulbs. The racemes are from 7 to 8 inches long, bearing eight or nine fragrant white flowers exceeding an inch in diameter.

Dendrobium fusiforme.—Stems, as the name denotes, are spindle-shaped, also corrugated and of a dark colour. The flowers are somewhat similar to *D. speciosum*, but are of thinner texture, and are more fragrant.

D. undulatum, found growing on rocks on the north-east coast, is another very robust grower, having stems several feet high, and thick leaves about 3 to 5 inches long. Flower-raceme 1 to 2 feet long, bearing numerous wavy flowers of a bronze colour which remain out for several weeks, and are very hardy, and will stand watering better than any other species. Mr. Hugh Dixon, of Sydney, who has the finest collection of Australian Orchids, has a plant of this species which has stems 7 feet 6 inches to 8 feet in length, and one 9 feet 6 inches, which bore at one time 30 racemes, averaging 36 flowers, i.e., over 1,000 flowers.

The variety *Bloomfieldi*, only differs from the normal form in having the flowers canary yellow and the stems more angular.

D. Johannis has stems from 1 to 3 feet high; leaves narrow, and not very harsh. Flowers in form rather similar to *D. undulatum*, but of a brown colour and yellow lip. There are several forms of this, differing in size and colouring.

D. Tofti is a stont species resembling *D. undulatum*, but stems are prominently marked with purple ribs, and more compressed than that species. Flowers about 2½ inches across, nearly white, stained with violet inside. I have only seen one plant of this, viz., the one from which the published description was drawn up. Mr. Toft, from whom it was received, stated that he found it at a creek off the Johnstone River.

D. Ada, which is found in the Cairns district, is a most desirable species to grow, on account of the strong perfume of its flowers, which are white.

D. tetragonum, with its four-angled pendulous stems, is met with in our scrubs north and south. Flowers spider-like, pale yellow, suffused with green and red. The northern form has larger and brighter coloured flowers. Flowers during August, September, and October.

D. emulum, a species abundant on box-trees in scrubs of South Queensland, has pretty white flowers about 1½ inch across, which, when they have been out a day or two, emit a sweet perfume. Flowers, which come out in August and September, last about a fortnight, but if exposed to a shower of rain or watering, fade away very quickly.

D. canaliculatum, with short stems, the bases of which are swollen into pseudo-bulbs, has rigid leaves, deeply channelled on the face, and numerous pretty flowers marked with white, yellow, and purple, which are rather fragrant. This is generally found on Tea-trees in North Queensland. Under cultivation it bears abundance of flowers the first year, but yields fewer afterwards. No doubt it would bloom better if given a more exposed situation than in a bush-house. Flowers during September, October, and November.

D. linguiforme, the Tongue Orchid, is met with throughout the Colony. In South Queensland it is generally found on Tea-trees, rocks, and other exposed situations. The flowers are small, white, and fragrant, but are delicate, and do not last long. In bloom during September and October.

D. teretifolium, the pencil Orchid, with its long branching stems and pencil-like leaves, forms large masses on trees in scrubs. The flowers are white and fragrant. There are two forms of this Orchid, one having quite slender leaves and fewer flowers than the other. Flowers from September to November. I discovered a variety with yellow flowers some years ago at Killarney. This has been called *aureum*. In flower in November.

D. agrostophyllum is a neat-flowering species, with slender stems, which are leafy from the middle upwards. Flowers, which come out from August to October, are yellow. Habitat: ranges about Cairns.

D. Mortii is somewhat similar in appearance to *D. teretifolium*, but the leaves, instead of being terete, are channelled down one side. Flowers small, in pairs. In flower, April.

D. Beckleri has corrugated leaves of two forms, the lower ones on the stems being thick and somewhat spindle-shaped, while those in the upper part of the plant are quite slender. The flowers, which are yellowish with dark lines, are borne on the slender branches at the upper end of the stem, and come out during September.

D. monophyllum, which is very common in our Southern scrubs, as also are the two last-mentioned, has short, yellowish, corrugated pseudo-bulbs, which come out erect from a creeping rhizome, and at the end of each a single leaf is produced. The flowers are small and yellow, and in form remind one of the Lily of the Valley. Flowers July to November.

D. cucumerinum has leaves resembling small Gherkins, hence the name. The flowers are small, white, streaked with

reddish-yellow. It is found on the small branches of shrubs, &c., on the Southern ranges, and flowers in the months from February to May.

D. Smillie, a native of North Queensland, is unique among the Queensland Orchids. Its thick cluster of flowers, which are pinkish, tipped with green, and the swelled end of the lip, a dark bluish-green and very glossy, lasting a long time. In its native habitat this is generally found in the forks of trees, and one would naturally suppose that it would require a deposit of decomposed matter, such as bark, &c., often found in such situations, for the ramification of the roots, but I have a plant thriving admirably off a naked board, without any covering to the roots. Flowers in October and November.

D. gracilicaule, a common species in the scrubs about Brisbane and elsewhere; makes plenty of stems, but the flowers, although numerous, are not of a good colour, which, by the way, is very variable. Flowers August and September.

Dendrobium pugioniforme has a very insignificant flower, but bears numerous dagger-like leaves. From the bright and unusual shape of the foliage it would be worthy of hanging basket cultivation. I obtained my plant from the Bunya Mountains, where it hangs down in large masses from trees.

MR. J. MARTIN.

(CALCEOLARIAS, GLOXINIAS, CYCLAMENS, &c., &c.)

D. Kingianum, usually found on rocks on mountains in Southern Queensland, has stems 6 to 9 inches long, swollen towards the base, almost club-shaped. Racemes bearing a few purple flowers, which have a strong heliotrope-like scent. Flowers in October. The variety *pallidum* grows much smaller, and the flowers are white or lilac-stained. The clustered stems of this variety form large patches on the rocks of the Main Range.

BULBOPHYLLUMS.

Our *Bulbophyllums* are very small-growing species; the only one that could be recommended for growing on account of flower is *B. Baileyi*, of North Queensland. The flowers are cream to golden-yellow, spotted with purple, and are about 1½ inch in diameter, and very fragrant. In bloom November and December.

SARCOCHILUS.

The Queensland species of *Sarcochilus* are small-growing and, as a rule, are found clinging to branches of trees, also in crevices in rocks. They emit numerous strong, white roots. With the exception of *S. Cecilie* and *S. Hilli*, the foliage of those mentioned herein is very similar, the leaves being strap-like, varying in size from 2 to 4 inches. The two above-mentioned have erect, narrow leaves, from 1 to 3 inches in length. The former with pretty little pink flowers, and the latter, which is a rare species, with white. Both flower about November, and are found in rocks and trunks of trees respectively.

S. montanum.—Flowers about an inch across, white, striped with purple and red. Flowers August to November.

S. falcatas.—Very like the last-mentioned, but flowers are white, or only slightly spotted. The leaves are also much longer, generally found on Myrtles and Figs, and flowers from September to November. This and *S. montanum* are met with on the Main Range.

S. Fitzgeraldi is a very pretty species, having white flowers with maroon spots. Flowers in November on Darlington Range, South Queensland.

S. Hartmanni has white flowers, with red centre, and is found on the Main Range, where it flowers in the months of August and September.

S. divitiflorus is unique among the plants of this genus, and can be distinguished from all others by the roots alone, the top-sides of these being rough like a rasp. The racemes attain from a few inches up to 18 inches in length, and sometimes bear as many as sixty flowers, the segments of which are long and thread-like, and are of an old-gold colour, blotched with red. Flowers in October, in Southern scrubs.

ERIA AND CYMBIDIUMS.

Eria Fitzalanii, a Northern Orchid, has short pseudo-bulbous stems, terminated by a solitary narrow leaf. The flowers, although not large, are fragrant, and remain out for a long time.

Cymbidium, the three Queensland species mentioned herein, are generally found in forest country, growing in the forks of live or dead trees, and frequently in the hollow branches of the latter. The roots attain a great length, and penetrate the hollow part of a tree for a great distance.

C. canaliculatum has pseudo-bulbs 2 to 4 inches long, and grey, rigid leaves. The flowers are the most showy of the three; but *C. albiciflorum*, the leaves of which are 2 or more feet long, has larger pseudo-bulbs, and also by far the longest racemes of flowers.

C. suave has long slender stems, often 1 to 2 feet long, which do not swell into pseudo-bulbs. All flower about October and November.

CLIMBING ORCHIDS.

In climbing Orchids, two species of *Galeola* are found in the scrubs of South Queensland, viz., *G. cassythoides* and *G. foliata*. Both are leafless climbers, although the bracts subtending the branches of the latter are enlarged almost into leaves, hence the name. The flowers of *G. foliata*, which is the more robust grower of the two, are yellow, with a white and maroon centre, 2 or more inches broad, and fragrant. The bracts are 1 to 2 inches long, whereas in *G. cassythoides* they scarcely exceed a quarter of an inch. The flowers of the latter species are also smaller, and brownish.

Many attempts have been made to cultivate these species, but hitherto with little or no success. They grow in old logs and stumps where much of the wood has decayed. I have seen the yellow stem of *G. foliata* almost covering an old culvert bridge at Eumundi, on the North Coast line, with the flowering portion, which is at the end of the growth, 5 or 6 feet long, and over 2 feet broad, and the flowers innumerable. I would recommend those desirous of cultivating these Orchids, and who have bush room for them, to obtain a quantity of decomposed and decomposing wood from some scrub-tree stump; place this partly in and partly above the ground (mixing a small quantity of sharp sand with it) near the side of the bush-house, so that when the plants start to grow they will have something to climb up. Or it would look well if given a central position in the house, in which event a good-sized branch of a dead tree, from which the bark has not been taken, should be put in position for it to climb up. Plants should be removed from their native habitat at the first period of their growth.

TERRESTRIAL ORCHIDS.

There is also much to be said in favour of the many terrestrial Orchids of the colony with regard to showiness, shape, or irritability of the flowers, but to speak of all would extend the paper to a great length. I will, therefore, confine myself to only a few of the larger kinds, leaving the others to form the subject for a paper on a future occasion. Those mentioned may either be grown in the ground or in pots. They should be given plenty of drainage, and a peaty soil with a good mixture of sand.

Phaius grandifolius is plentiful on Stradbroke, Moreton, and Fraser's Islands. The leaves are from 1 to 2 feet long, and the flower-scapes 1 to 6 feet high, and bearing a number of large flowers, which are brown outside, white inside, and the lip streaked with red. Flowers in October. Besides the other localities, it is met with in swamps near the coast both north and south. A variety with double flowers, obtained from Stradbroke Island, is growing at the Acclimatisation Society's Gardens at Bowen Park, and at Mr. Grimley's, North Quay. The variety *Bernaysii*, named after our worthy President, has pale yellow flowers, the lip being edged with white, and so far as at present known is only found on islands of Moreton Bay. Flowers in October.

Calanthe veratrifolia might, by seeing leaves only, be taken for the foregoing. The flowers, however, are white, and of a different shape, and stay out for many weeks.

Spathoglottis Paulina, which, in its native habitat, North Queensland, is generally found growing in peaty soil, accumulated on damp rocks, has purple flowers, borne on scapes 3 to 4 feet long. The leaves are about 2 or 3 feet long, and the tubers are small.

THE ROSARY.

TEA-ROSE BERYL.

Of late years what are now called button-hole Roses, mostly of the Tea sections, have very much come to the front. The blooms are small in com-

parison with ordinary Roses, and brightness of colour is always considered a requisite. It is easy to obtain small blooms of larger varieties, but they are not so desirable as the so-called button-hole Roses, which are, as it were, raised for the purpose. The varieties, William Allan Richardson and Gustave Regis, are amongst the prime favourites in this division, the latter with its long pointed flower-bud seems the veriest ideal of a button-hole Tea-Rose; and of course, the colour is always an attraction when the Rose comes true, which is, unfortunately, not always the case, as in many situations it loses its distinctive character and becomes nearly white, and more especially is this the case when planted on a south wall. I have one large plant in this aspect, but it is so disappointing in its colour that I fear I shall have to remove it. Messrs. Alexander Dickson & Son, the famous raisers of pedigree Roses, have, however, come to our rescue with their beautiful Rose Beryl, a Tea Rose of vigorous growth, branching habit, very free flowering, and continuing in bloom during the whole season of Roses. The bud is of that distinctly pointed shape, which is so valued by those who have to do with Rose decoration; the colour is a deep golden yellow, reminding one of William Allan Richardson when in its best condition. I am sure it is likely to become very popular when well-known, both for its beautiful shape and charming colour. *Wild Rose*. [We must not lose sight, in praising the new comer, of Niphetos, Mrs. W. J. Grant, and Devonensis as button-hole Roses, for they are all excellent in the unexpanded state, Ed].

SCOTLAND.

APPLES AND PEARS.

The unbroken sunshine makes us conclude that the fruit there is of the above, will this year be highly coloured. The show of blossom was, in the case of both, most abundant, but the set of fruit unfortunately meagre. The reason appears to me to have arisen from weather influences of a character directly opposite the one to the other. All the time Pears were blooming there was practically no sunshine, but cold weather, and often with rains. Several times the bloom was examined, but not once was there, even in the most favourable weather, any save the least discernible quantity of pollen on the anthers. The result was, that comparatively very few flowers were fertilised, and the necessity for thinning is largely obviated. Apple blossom was equally profuse, but results as regards a set of fruit has been equally adverse. The reason for this appears to have been attributable largely to the intense heat following the cold wet weather. An examination of the flowers showed that stamens and pistils were shrivelled, and the hope of an abundant crop crushed. The effect of continued sunless weather, and at the same time, cold or very hot weather, would therefore appear to be as disastrous to fruit setting as an occasional sharp frost.

STRAWBERRIES.

Not a few expected to see this an off-year with Strawberries. The heat, however, has brought these round wonderfully, and has no doubt gladdened market-growers by bringing the crop rapidly forward, and thus obviating a very late one, when, owing to the exodus of people from the cities, it does not realise so much.

DOUBLE LILACS.

These have flowered extremely well this year, and one has been able to pretty fairly estimate their merits. Of all those we grow, the only variety of real value is Madame Lemoine; it is pure white, the pips full, and the racemes large and standing boldly up. I estimate this as a standard plant. It may be added that as a cut flower it is finer than the single whites.

DIERVILLAS (WEIGELAS).

D. Looymaesia aurea fully exposed to the sun is proving a splendidly effective shrub; the flowers harmonise so perfectly with the clear yellow leafage. In shaded positions it is of small value. Almost as fine, and quite distinct is *D. amabilis variegata*. When smothered under a load of its slender looking blooms, with the green and cream variegation showing through among them, it is eminently attractive. Many of the hybrid named varieties are also in beautiful form. They range from pure white and cream to darkest maroon, the sorts most generally known being Candida, Eva Rathke and Dr. Bailloo; but in addition to these are many sorts of equal or enhanced value. When well grown, and weakly growths excised, some sorts may shoot annually, up to 5 feet in length, which in June are wreathed in bloom. *R. P. Bro'herston*.

SWEDEN.

FRUIT-SHOWS IN STOCKHOLM.

A SERIES of fruit-shows on a new plan is to be held in Stockholm this year. The object of the shows is to afford an impulse to improved fruit-growing and fruit-marketing. The fruit is to be exhibited packed in receptacles suitable for bringing to the markets, soft fruits, Cherries, and Plums, 10 to 20 litres, and the harder fruits, 20 to 100 litres in each package. In judging, not only is the quality of the fruit to be taken into consideration, but the mode of packing. There will be no competition between fruit-growers from different counties, but only between those of the same country, on account of the great differences of climatic conditions. The exhibits must be grown by the exhibitor. No money prizes or medals, only certificates (diplomas), will be given. The show will be at the same time a kind of central market.

Only one package of each kind of fruit may be exhibited, but this sample may be accompanied by a notice of how much of the same kind of fruit the exhibitor has to dispose of, and the price at which he will sell. The committee of the show will then give out a list of the fruit offered for sale, and the buyers can then get into direct communication with the grower.

The shows will be held once in each of the months of July, August, September, October, and December. If the results turn out well, the shows will be continued the following year. The costs are defrayed by the Gardeners' Society (*Gartner-sällskapet*) in Stockholm, and by *Hushållnings-sällskapet*, a kind of agricultural society of the different counties. The Government has granted free carriage of the exhibits on the state railways.

Pomological Exhibitions, with the object of ascertaining the most suitable kinds of fruit for the different localities, and for promoting the better naming of fruits, are to be held in the usual style at the same occasions.

A *Chrysanthemum Show*, open to exhibitors from the whole country, is to be held at Stockholm on November 10 to 12 this year. Besides Chrysanthemums, there will be classes for cut-flowers in general. *A. H. M.*

THE ROYAL SCOTTISH HORTICULTURAL ASSOCIATION'S VISIT TO "THE GLEN," INNERLEITHEN.

IN our last issue (p. 416) we made mention of the fact that the members of this body of Scottish gardeners had paid a visit to "The Glen," Sir C. Tennant's place, near Innerleithen, on May 27, and we now give our readers an account of the visit, kindly sent by our old friend and correspondent, D. T. Fish.

A pleasant journey by railway from the Waverley station to Peebles, and a drive by road to The Glen by Innerleithen through the valley of

the Tweed; and all the way the road on either hand thickly strewn with the beauties of the present, and ancient ruins with their memories of the past, brought the party to their destination.

We pull up for rest and refreshment at the Traquir Arms, Inverleithen, as we are still four miles from The Glen, though the entire valley of the Quair might well be called by that name. Glen House, for which we are bound, is on Quair Water, and the same water gives its name to the hostelry we have left, which was a favourite resort of tourists, sportsmen, anglers, and those in search of the beautiful, in mountains, wood, and stream.

We find that The Glen has a history that leads one back to the time of Robert Bruce; but in those days it seems there was not only one glen, but three—the East, West, and Northern Glen. Nor is this to be wondered at, for after plunging into the road, lightly labelled "To The Glen," the country became all glen, growing in beauty and in loveliness as we proceeded.

En route on the left we have rich and varied views of mountain, wood, pastoral meadows, and water. Among these a glimpse is got of a part of the old Ettrick forest of Birches, now almost

that "The Glen" came into possession of the present owner—so this well-known liberal patron of horticulture and fine arts has lost no time in building and improving his residence. The style of architecture, as will be seen from the illustration, is the old Scotch baronial, and Mr. Bryce the architect has been known to speak of "The Glen" as his model illustration of this style. As the party had the privilege later on of seeing the superb pictures, and chief rooms, it may be said that the former exceeded all expectation, and that the rooms and furnishing seemed in perfect harmony with the architecture. Several inscriptions over the front door, and on either side of an arch near, claims notice, the following two in old English, the other two in Latin:

Blessed be God,
And all his gifts.

They are welcome
Here who the
Lord do fear.

As you enter the arch the word "Welcome" greets you. As you leave the word "Farewell"—bids good-bye to "The Glen." Mr. McIntyre explained the merits of some fine specimen Hollies, used in excellent effect to clothe the square near the front door. They are about 20 feet through and well adapted for such purposes. It is a variety known as *Hodgins*. The Herr Späth's Irish Yew some 30 feet through, of a dense rather dwarf variety, seems but seldom grown. But fine old Scotch Firs, and other Conifers and deciduous trees and shrubs besides *Rhododendrons* abound in all directions; and Oaks, Elms, and some fine Beeches—one near Lucy's Barn has a bole of 14 feet in circumference 4 feet from the ground—a veritable giant. The trees on this lawn are broadened and expanded into denser clumps and groups in the park—and these again repeat themselves in larger and freer lines on the hills and mountains in the more distant background, converting "The Glen" into a sylvan retreat of endless variety and inexhaustible beauty.

Passing the waterfall with its rippling and leaping music on Lucy's Barn, which we have heard was one of Mr. McIntyre's earliest improvements at "The Glen," we came to the tennis-lawn and the bowling-green, the finest examples of velvet-piled turf yet seen by the writer. Here we had a view of the mansion, with the terrace beds furnished with flowering shrubs, *Azaleas*, *Rhododendrons*, *Berberis*, &c., just coming into bloom.

On the west a fine view is obtained of the rolling ground so richly and skillfully clothed with flowering shrubs, with Yews, Hollies, *Rhododendrons*, flanked with Beech, Ash, Birch, &c. Artistic use is also made of the striking and early rich tints of the Golden *Corstorphine* Plane. Possibly the abnormal lateness of the season was chiefly responsible for an apparent lack of crimson, gold, purple, and white in this pleasure ground in the last week of May; and the lack of flowers on *Laburnums*, *Crataegus*, *Lilacs*, *Rhododendrons*, *Philadelphus*, *Deutzias*, and *Spiræas*.

The best of the Penzance Briars were noted, which in time will fill "The Glen" with their fragrance, and enrich it with their coloured beauty. Later on, the choice terrace and flower garden, which very appropriately is a sort of multiple of the Prince of Wales' feathers, will add its finishing touches of colour, until the whole melt into the rich tints of autumn.

Casual observers, noting merely the robust health of shrubs, trees, grass, lawns, and vegetation in general, can imagine the amount of labour and foresight needed to sustain such a paradise of a garden, resting as it does on a thin layer of half-decayed basaltic rock. Of course, much of this material had to be removed or covered to a depth of from 1 to 2 or more feet of good soil, before permanent success was possible. But with good soil, freely and intelligently used, the apparently impossible is accomplished.

The Glass-houses.—The conservatory is 90 feet long, and it is furnished with large Palms, *Tre-feras*, *Orange-trees*, *Camellias*, and *Dracenas*, and has, therefore, a tropical appearance. From this house branch three other houses, each 30 feet in length. The first we entered was filled with Palms, a very choice collection, most of which have won many honours abroad; and perhaps the finest specimen in the house is a *Phoenix Roebelini*, perhaps the only, assuredly the best specimen of this rare variety in Scotland—a greatly improved variety of *P. humilis*.

We next entered the *Codium*-house. Those who have seen Mr. McIntyre's plants at the great flower-shows or at home, will know how perfect they are in health, habit, and colour. To others no amount of description could give any adequate idea of the beauty and substance of the leaves. The collection was quite representative, and the whole was artistically arranged with rare new *Caladiums*. Among the *Codiums*, the more notable were *Golden Ring*, some 3 feet through; *Queen Victoria*, a grand plant, 5 feet through; a fine plant of *Russellianus*; another of *Newmanni*. Some of the more notable *Caladiums* were *Botofogo*, *George Buyer*, *John Laing*, *Meyerbeer*, and *Alice Van Geert*.

MR. W. WATSON.
(KEW HYBRIDS. SEE P. 1.)

environed with a fine plantation of Scots Firs. These are probably a part at least of Birch trees immortalised in the Song of the Bush, also in Traquir.

Entering by the East Lodge we were driven along an avenue a quarter of a mile or more in length through exquisite scenery, planted with good taste and in perfect keeping. Here were some Elms and other trees and shrubs, and a fine Oak planted by the late Wm. Ewart Gladstone when on a visit to Sir Charles Tennant, Bart., in 1890. Near here is also a lake, in a snug and charming position.

Entering the mansion on the north-east over the bridge, through the arch covered with Ivy, we were at the front door of The Glen, where Mr. McIntyre was ready to receive us, and show us the natural and artistic beauties of the garden and house. Before starting, however, several things seemed to rivet the party to the spot—one being the size and beauty of the mansion (see fig. 6, p. 11), which has been truly described as a "splendid edifice." The present house was built in 1852, and enlarged in 1873, and together with the surrounding grounds cost some £50,000. It was only in the former year

MR. J. HEALE.
(RHODODENDRONS, AMARYLLIS, &c., &c.)

The third was a show-house with a mixture of flowering plants and roof-climbers, rare *Calceolarias* and *Cyclamens* of choice strains, and select varieties of *Pelargoniums*, Chinese *Primulas*, and other plants. Passing the head gardener's house, and by an ivy-clothed wall to the flower-garden, we come to a rest built for visitors, who are free to visit The Glen on two days in the week—Tuesdays and Fridays. Near by we found plants of *Azalea indica*, making their growth and forming their flower-buds for next season; and hereabouts is a Pine-stove, 60 feet long, filled with promising fruiting plants, and an East Indian Orchid-house filled with fine plants of *Aerides*, *Vandas*, *Cypripediums*, *Anthuriums*, especially two fine specimens of *A. Wardi*, well furnished with spathes, one of which possessed nearly one hundred; some fine pieces of *Oncidium ampliatum majus*, and intermixed with these plants were *Cocos Weddelliana*, and over half-a-dozen nice plants of *Adiantum Farleyense*. In one of the vineries some fine plants of *Cymbidium eburneum* were found, as well as some very fine specimens of *Dracena Leonardi*.

In the Muscat vineries, too, the choice greenhouse Rhododendrons were making their wood and flower-buds for next year.

The next house entered was that in which the intermediate Orchids were grown, and a show-house 60 feet long. The first was filled with Cattleyas, Cælogynes, and fine baskets filled with Lælias, the plants being edged with a wonderfully good strain of Streptocarpus, Maidenhair Fern.

The cool Orchid-house contained Odontoglossums in perfect health, with a few spikes of blossom thereon, for we were following closely on the heels of his Royal Highness the Prince of Wales, and other distinguished visitors. On the back wall of the Odontoglossum-house the old Begonia Rex and the Selaginellas made a rich display. Here was also a greenhouse 30 feet long, with some good Australian and Cape plants, among them some fine specimens of Erica Cavendishii, and some fine batches of Lilium were also coming on. Another glass-house was devoted to growing successional Pelargoniums, to furnish the show-houses as wanted. The Carnation-house contained pink and white Malmaisons in pots, and these form a sight worth going a long way to enjoy. The Tomato-house is 50 feet long; the Melon-house is planted at the back with Melons, and the front is used for growing Dracænas. Near here were noted about 600 Chrysanthemums, and the succession Pine-pits some 70 feet long.

Returning to the vineries, we find about 80-feet run in the first series, divided into two classes or divisions, Hamburg and Muscat of Alexandria both carrying excellent crops, and looking prosperous in all points. At a much higher elevation, along the top of the old kitchen-garden, there is another most useful range of fruit-houses some 300 feet long. Here Mr. McIntyre had used an ingenious device to utilise old Vines, while running up young ones in front. This was done by adding some 6 or 8 feet to the width of the vineries in front, adapting the roofs to the new conditions, and leaving the old Vines on the back wall and up the rafters as before. The two latter form a pleasing arch of Vines over the main path, and the whole of the Vines are healthy and promising. The kitchen-garden forms a series covering some 5 acres on the sloping side of a hill at different elevations. We enter these beautiful and admirably-furnished gardens through an iron-gate of admirable workmanship, said to be 350 years old, presented to Sir Charles Tennant on his marriage by Sir Thos. Carmichael. It is a singular illustration of the taste and skill, the thoroughness of the technical education received in the olden times.

Each flight of steps commands fine views, which are so extensive and beautiful as to rather distract attention from the trees, fruit-bushes, admirably covered walls, and promising growing crops, that abound in all directions. Assisted greatly through the rolling ground, few of the fruits seemed to have suffered spring-frost. Neither has the scourge of Black Currant-mite been seen at The Glen. I also noted Cherries, Plums, Pears, and Apples, on the walls. The highest, and also the newest, kitchen-garden is planted with fruit-trees on the walls.

In a subsequent issue we shall give additional illustrations of this fine estate.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Celery.—The time has arrived when the forward batch of Celery should be planted in the trenches, choosing a showery day for the purpose. Should the nursery-beds be dryish, let water be afforded some hours previously to lifting the plants. These should be cut round about, and lifted with a garden-trowel, thereby preserving a good ball of soil and roots. They should be set out at 8 inches apart in the rows, water being afforded the soil previous to planting, and when a trench is planted throughout. The early varieties should be planted

altogether, so that when these are consumed, the land can be conveniently prepared for other crops. The Celery-fly, if troublesome, may be kept in check by dressing the leaves with fresh soot early in the morning; there will then be very little injury caused to the plants. If leaves get badly infested, remove the injured parts, and burn them forthwith, syringe the foliage with soapsuds, and dust it with soot. Successions should be kept thoroughly moist at the roots, and the nurse-beds free from weeds. Dryness at the roots now may cause the plants to bolt later on.

Coleworts.—No time should be lost in getting seeds of Coleworts sown. My rule is to sow the seeds about the first week in June, and again at about this date. Coleworts should be grown in quantity, the plants occupying very little space, and they come in handy for planting any spare piece of ground, besides the crop is usually a useful one. Sow in drills in an open spot, and plant-out direct from the seed-bed. The ground for Coleworts should be firm and compact, and need not be dug if in good heart.

Dwarf French Beans.—A large sowing of the Ne Plus Ultra or other fine large-podded variety, may be made on land that has carried the earliest Potato crop. Let all rows of Beans be moulded up early, and apply a good mulch of short dung if the soil be light, and in dry weather afford liquid-manure alternately with water. Remember that a regular removal of useable pods prolongs the bearing of the plants.

Lettuce may be sown on the Celery-ridges, sowing the seed thinly in drills at 1 foot apart. Spinach, or any other quick-growing vegetable that does not grow tall, may also be grown on these ridges.

Endive.—A sowing of Endive may now be made on a border, the plants to be transplanted later on if land is not yet available. The Green Curled and Digswell Prize are useful varieties, and should be grown in quantity. Other sowings may be made later.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen.

Dendrodiums.—Many of these will need attention during July. *D. chrysotoxum* and *D. suavisimum* may require larger pots, and in this case carefully break those in which they are at present, and drop the ball of roots with the adhering fragments of the pot into the new one; add more drainage-material, and surface with peat and a small quantity of sphagnum-moss. When the new growths have become mature, remove the plants from the East Indian-house to one where cooler and drier conditions prevail, and do not water them over much. *D. Parishii* grows well in suspended pans when treated like these, except that the plants should remain permanently in the warm-house. *D. formosum* is in very few instances long lived, but given careful treatment, the plants will retain a vigorous and floriferous character for several years. It seems to thrive best when grown in pans or baskets, suspended in a warm and light position, where the syringe may be plied amongst them on bright days, given ample supplies of water when rooting freely, and at other times only sufficient to prevent the pseudobulbs from greatly shrivelling. New roots are now being made from the base of the plants, and fresh rooting material consisting of good fibrous peat and a little moss, should be given. *D. Lowi*, *D. Draconis*, *D. scabrilingue*, &c., succeed fairly well under similar treatment. *D. Jamesianum*, *D. infundibulum* and *D. longicornu*, should be grown in pots placed in an exposed position in the Cattleya-house, and be syringed and watered frequently when growing, but kept moderately dry when at rest. Repotting or resurfacing may be done now, taking care to confine the plants to small receptacles. *D. Pierardi* should be grown in baskets suspended in the Cattleya-house, and the plants resurfaced at this season. *D. ochreatum* (Cambridgeanum) now in flower, grows best in a temperature considerably below that of the warm-house. Plant in well-drained baskets, and suspend them where the light is not very strong. As root-action seldom occurs until after the plants have flowered, repotting should not be done until then.

Dendrobium Deari.—If the blooms be removed soon after reaching development, the plants resurfaced with good peat and a little sphagnum-moss, it will benefit them greatly. This very

desirable species frequently deteriorates after introduction to our gardens. It should be grown in baskets suspended in more shade than is usually afforded Dendrobiums, and the rooting-material should consist almost exclusively of first-class peat. Afford an ample quantity of water when the plants are growing freely, but allow the compost to become fairly dry between each application.

Dendrobium McCarthii is another species that often fails. Imported plants should be fixed in shallow pans of just sufficient size to accommodate them, using a moderate amount of small drainage-material, and some good fibrous peat. Suspend them in the sunniest part of the East Indian-house, and keep them merely moist. When the thin stems have attained a height of about a foot, and roots are observed at the base, rather more water may be afforded; but, again, when the growths have matured, and during the winter months, very little will be required.

Epidendrum bicoloratum is just making new growths, from which roots will soon emerge, and fresh rooting-materials may be afforded; remove as much of the old material as is convenient. Members of this species are best accommodated in baskets, so that large and frequent supplies of water may be safely applied. They should be suspended in the warmest and lightest part of the East Indian-house, or better still, in an ordinary plant-stove where shading is seldom necessary. The pseudobulbs being hollow, careful watch must be kept during the resting period, so that they do not suffer from lack of moisture, though an excess during that time is equally hurtful.

Cymbidium Devonianum having flowered, is now developing new growth; and if any of the plants require more root-room this may be afforded. Owing to the pendent character of the flower-spikes, it is a good plan to put it in a pan that can be suspended when in bloom, or permanently. A large quantity of drainage material is needed, and a compost of one-third each of peat, fibrous loam, and sphagnum-moss, sprinkling in some finely-broken crocks as the work proceeds is suitable. The temperature and other conditions usually prevailing in a Masdevallia-house suit this plant.

Masdevallias, such as *Schlimi*, *macrura*, *Mooreana*, and *elephanticeps*, may be afforded new surface materials, or be repotted according to their needs. *M. towarensis* will also need attention. Where possible, this species should be grown on a shelf, where drier conditions prevail, as it does not need large quantities of water, excepting when rooting freely.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

The Removal of Flowers and Seed-vessels.—The flowers of Rhododendron, mollis and Ghent Azaleas, and Syringas, also Decandolleas (Weigelas), should be removed as soon as faded, as if the plants form seeds they become impoverished, and in the case of Rhododendrons, the growth is hindered to a great extent. Care must be exercised in removing the remains of flowers, as damage will be done to the buds at the apex of the shoots. Usually three growths will start; but where the varieties are of a delicate constitution, only one should be allowed to extend, the result being fine flower-trusses next year.

Summer treatment of Rhododendrons.—Grafted plants should have every root-sucker and all shoots that are thrown out by the stem below the graft removed. If growth is not luxuriant, apply mild liquid-manure in quantity, and put around the plant a dressing of decayed cow-manure. *R. ponticum* and its varieties may be propagated this month by layering, or the plants strengthened by layering those branches which are near to the soil. The branches of this plant root readily if the under part is slit or tongued with a knife and then bent downwards, pegged firmly down 4 inches under the surface of the soil, and covered with peat. The choicer varieties of Rhododendrons make stronger growths if during hot and dry weather the foliage is moistened in the evening with rain or river water.

Bulbs.—All Tulips, Ranunculus, and Anemones, that have been lifted should be placed in a cold frame, kept quite dry, and exposed to the sun. When fully ripened they should be placed in trays in a cool fruit-room till planting time.

The Flower-beds.—The planting of beds and

borders having been completed by this date, all flowers should be removed from the plants till they have begun to make growth, a sign that they are re-established. The leading shoots of *Coleus*, *Iresine*, and other soft-wooded plants should be pinched back so that they may grow compactly and bushy. Afford water to annuals in order to keep them in a growing state and prevent premature flowering, thus weakening growth. Secure all weakly plants by affording them neat sticks and bast-ties; peg down *Verbenas*, *Phlox Drummondii*, *Gaillardias*, and other trailing plants so as to get them to cover the ground quickly. See that such plants as *Helleborus*, herbaceous *Spiraeas*, *Lobelia cardinalis*, *Salvias*, *Phloxes*, &c., have plenty of moisture at the roots, and a slight mulch of manure.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Layering Strawberries.—If the runners are sufficiently advanced, layering may commence forthwith. If young plants were put out last autumn specially for the production of runners, and the blossoms have been pinched out, there should be a quantity ready for layering at this date. The required number of clean 60-sized pots, and pegs for fixing the runners, should be in readiness before making a start. The soil used should be a heavy rather than a light loam, and that from a spent Melon-bed, with some rotten manure added, is as suitable as any. Let it be sifted through a $\frac{1}{2}$ -inch meshed sieve, the coarse siftings being used at the bottom of the pots, or a piece of partially-decayed leaf-mould or horse-dropping, no crocks being needed. The soil must be pressed firmly, and plenty of space left at the top for affording water. Before layering, plunge the pots to half their depth, it will prevent them being knocked over, and by thus keeping the soil moist reduce the labour of applying water. The first young plant on the string should be selected for the layer, and the rest should be pinched off. In dry weather afford water forthwith, and keep the soil in the pots moist, and roots will soon form. When well rooted, remove from the bed, and stand for a few days in a shady spot.

Plums.—The pruning of the Plum on walls may now be commenced, carrying out the operation gradually, so that no check be given. Where early disbudding of young growths was practised, there will be little of this kind of work to be done at this date. Surplus and foreright shoots should be cut back to the fourth leaf, and the long ones which will remain should be temporarily tacked in or otherwise secured to the wall. Although the Plum crop is generally light, it is good in some localities, and thinning of the fruits may be required. In some cases, where the crop of fruit is not heavy, there may be thick clusters that will require some slight degree of thinning to allow of full development to those that remain. Afford water plentifully to the borders if these are getting dry, which is very generally the case, more especially to such trees as are carrying large crops of fruit. An occasional washing of the foliage will keep the trees clean and free from insects; and where aphids infest the points of the Plum shoots, it will be advisable to dip them in Bentley's Quassia extract, used according to the directions sent with it.

Miscellaneous operations.—In most gardens the dry weather is causing birds to become troublesome, and the protection of the various kinds of fruit will require timely attention. The blackbirds and thrushes began to peck the fruits of the Strawberry when these were still green, and Currants are being carried off whilst they are unripe. The colonies of American-blight on Apple-trees may be dabbed with a brush dipped in a solution of carbolic soft soap, or Gishurst Compound-soap. Newly-made plantations of forced Strawberry-plants will need copious applications of water till established, and a mulch of short stable litter. These forced plants may still be planted.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Camellias.—Any plants which require to be repotted may receive attention as soon as growth is completed, and before the flower-buds become

prominent. Loam and peat in equal proportions, together with some sharp silver-sand and a little broken charcoal, form a suitable compost for these plants. But loam which contains but very little lime is preferable; therefore, where the only sample obtainable is of such a nature that *Rhododendrons* will not succeed in it, it is advisable to reduce the quantity of loam to one part, adding three parts good peat, and sand and charcoal as above. The turf and peat should be broken by hand, and used in as lumpy a condition as the size of the shift will admit; and if at all dry, it should be well sprinkled with water from a rose watering-pot, and, after being repeatedly turned, allowed to remain in a heap for a few hours before using. The old balls should not be disturbed beyond what is necessary in removing the crocks, and as much of the old soil as is unoccupied by roots. Let the pots be well drained, and in potting ram the soil evenly round the old ball until the new soil is as firm as the old. If the plants are sufficiently moist at the root (and if not, they should be afforded water before being potted), a copious syringing morning and evening will supply all the water which will be necessary for several days. If the plants are grown in a house having a southern aspect, shade will be necessary during bright sunshine.

Miscellaneous.—*Lapagerias* planted in tubs, or pots, and growing freely, will require copious supplies of water, and an occasional application of liquid-manure. No time should be lost in ordering of the nurseryman the season requirements in Roman Hyacinths and *Polyanthus Narcissus* if it is desired to have these in bloom at the earliest possible date, for which purpose, only bulbs of the best quality should be purchased. *Polyanthus Narcissus*, "Early Snowflake" is a very desirable variety for early forcing. *Crassula coccinea*, *C. delicata*, &c., should be cut down to within a few inches of the top of the pot as soon as they go out of flower, and stood outside until the end of the summer. If large blooms of tuberous-rooted *Begonias* are desired, the female blooms must be removed as soon as they can be seen, and only one male bloom should be allowed to develop on a flower-stem.

FRUITS UNDER GLASS.

By W. STRUENELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

Shading Fruit-houses and Pits.—Melons up to the end of May stood bravely what sun there was, and were in robust health, but a few days of broiling heat in June rendered shading an immediate necessity. Cucumbers suffered similarly. These were cases where the system of ventilation provided is faulty, but it serves to show the necessity of promptly taking such measures as local conditions require. Peach-houses and vineries in some gardens need the same attention, or scorched leaves, red-spider, and hurried crops are some of the evils that will follow. Gros Colman Vine in some houses scorches badly unless a slight shading be given; while Peaches and Nectarines advance too rapidly when left to chance.

Late Melons.—A further sowing may be made with a view to providing ripe fruits at the end of September and in October. Use small pots and loamy soil, with a little leaf-mould or lime-rubble added. When these are ready for a shift, beds now carrying a maturing crop of fruits will probably be available for them, otherwise they can be put into larger pots to await transplantation at a convenient time.

Bananas.—Plants which are in bearing may be afforded large quantities of mild liquid-manure, more particularly those planted in confined spaces. Planted in large, well-drained beds the plants will take much water, though less than potted plants or those in confined spaces. Soot-water, prepared by immersing a bagful of fresh soot in a hogshead of water, is a good manure for the banana, giving colour to the leaves when these assume a yellow cast, as is sometimes the case, when the roots are much restricted. Where a house is devoted to Bananas, a high temperature may be permitted with advantage, but as they more often find a place in the stove, their treatment cannot, then, be of a special character. Dry fertilisers may be used as alternatives to ordinary liquid-manure; or if the latter has alone been used for some time, it may be

discontinued for a week or so, and artificial manures used instead. Slight shading is beneficial in the brighter hours of the day, and so is frequent damping down.

The Orchard-house.—The stopping and thinning of the shoots and tying them to the trellis where this is necessary, causes much work; still, it must receive attention often. The management of the house and of individual trees, must be governed to some extent by circumstances. Where an assortment of Peaches, Plums, Apples, Pears, and Cherries are grown together in the same house, some care is necessary in the syringing—Plums crack, and become badly rusted if they are continually being syringed; and Cherries crack if syringing be carried far into the ripening season. When it is convenient, the pot-trees whose crops are gathered, may be placed at one end or side of the house so that they may be syringed heavily, or afforded a sulphur dressing in order to free them from insects. Flowers-of-sulphur is an effective remedy to use against red-spider or scale, but not against aphides or mealy-bug. Let no tree suffer lack of water at the root, much of next year's success being dependent on the proper treatment of the trees at this season. Pot-trees need water twice or thrice a day in bright weather when these are cropped heavily, or are in any way restricted in the size of the pots. Manure-water, too, in such cases may be afforded freely, but not to trees that are bare of fruit and growing strongly. Peaches, Nectarines, and Figs may have all their shoots stopped; Plums, Apples, and Pears which are later, must be treated according to the state of their shoots. In July, however, the first flush of summer growth is expended, and sub-laterals are not so freely produced after this date. A sufficient thinness in the crowns should be provided in all cases by timely disbudding and pruning, as trees which are allowed to form a thicket of growths cannot be expected to carry satisfactory crops of fruit. The ventilation of the house should be modified to suit requirements, and if fruit is required late in the autumn, it should be continuous night and day; on the other hand, if a succession of fruit is looked for, it must be modified to suit the varieties grown. Early, mid-season, and late fruits are best arranged in a large house in this order, so that air can be afforded freely at one end, and sparingly at the other. Pot-trees and those planted out are each benefited by a mulching of strawy manure.

THE APIARY.

By EXPERT.

The Prevention of Swarming is unquestionably one of the most important points connected with the management of bees, and it arises from the fact of its being one of the strongest and most forward stocks that yield the surplus honey; while these from their condition at the time are the ones most apt to swarm. For years past makers of bee appliances have turned their thoughts to the manufacture of non-swarming hives, in order to solve this problem; but so far, the present-day bee-keeper has advanced very little beyond those who kept bees hundreds of years ago in the old-time straw skeps, and who adopted with various success the simple means of preventing increase by the use of "ekes" and "nadiris." The same idea, then, in one form or other, is, in principle, the best method yet known of preventing increase. It is also well known that certain seasons are more apt to start the swarming mania than others. When the weather is warm and showery, bees are kept just sufficiently employed in carrying-in stores for their every-day wants, without storing any appreciable quantity of surplus nectar. At such times the brood-nest increases largely, and bees hang outside the hive in clusters; should the weather then suddenly become bright and warm, such as will encourage swarming, the bee-man will have a busy time of it for some days to come, when all his extra bee-gear must be ready for use at a moment's notice. In my own experience I have had at various times seven swarms hanging around my apiary before 10 A.M. on a Sunday morning. The preventing of these several swarms from joining together requires some skill, and I have frequently on such occasions found it necessary to secure one swarm at a time as rapidly as the bees clustered, tie it up closely, and carry it indoors to some darkened room to allow the others time to settle down before living them.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Remarks.—The weather during the week has been generally dull, with cool winds. No rain fell between May 24 and June 18.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63.1°.

ACTUAL TEMPERATURES:—

LONDON.—June 28 (6 P.M.): Max. 77°; Min. 52°.

PROVINCES.—June 28 (6 P.M.): Max. 67°, Southern Counties; Min. 52°, Aberdeen.

Thunder-storm; rain; fine.

The Next Fruit Show.

THE displays of British-grown fruits that the Royal Horticultural Society has been successful in making at the Crystal Palace for five years past, have such an educational value for the public, and exert so powerful a stimulus to excellence in cultivation amongst fruit-growers themselves, that we hope these exhibitions may now be regarded as annual events. The schedule for that to be held in the forthcoming autumn is now before us, and if there are few new features to be seen in it, it is very satisfactory to know that several desirable innovations that were adopted last year and previously, have been retained.

The special district County prizes in Division III., for instance, will again permit of exhibitors competing in certain classes, with others only whose locality offers much the same conditions from the cultivators' point of view as does their own. There is now no reason why there should not be collections of fruit from all the midland and northern counties, which would not be represented were the fruits to be unfairly placed in competition with produce from Kent, Worcester, Surrey, or other favoured counties. The classes for market-growers have been the means of bringing before gardeners who visit this show, the best of the methods at present employed by the trade in the packing of fruits for transit. It is interesting to note that at Stockholm there are to be held fruit shows this year, at which such market classes and district competitions will be introduced for the first time. Whether the hint has been taken from our own Crystal Palace shows matters little; the fact may be taken as affording some testimony to the useful purposes such competitions serve. It would appear from the present schedule that the idea of maintaining any interest in trade competitions at this show has been abandoned. In the nurserymen's classes there has never been sufficient competition to justify their retention; and last year we expressed the

opinion that greater inducements would need to be offered if the classes were to be made interesting ones. Here, again, the question of locality is largely concerned. Scarcely two of our fruit nurserymen, though they may grow excellent trees, have the same opportunities to obtain colour, size, and finish in their fruits.

At the forthcoming show, nurserymen may apply for any one of several distinct areas of space for collections of fruit; and medals will be awarded to such exhibits at the discretion of the council—in place, we suppose, of first, second, or third prizes. Under certain limitations, nurserymen may adopt any method of arrangement they may desire; and it is very necessary that they should introduce as much originality in this matter as circumstances will permit.

The classes for gardeners and amateurs show little variation from those of last year, and the single dish classes for the choicest Apples and Pears are retained. A gardeners' luncheon will be provided on the first day of the exhibition, September 28, at which the council and judges will be present.

There is no doubt but that the display at the Crystal Palace will be the best exhibition of fruits generally during the year. Of Grapes, however, we shall be surprised if our Shrewsbury friends do not as usual obtain the best exhibition in the kingdom. The enterprise of the society is worthy of this.

T. W. Girdlestone.

THE announcement of the death of this gentleman on Sunday last at Sunningdale will be received with widespread regret. Rosarians and lovers of the Dahlia will especially miss his energy and zeal. Bright, intelligent, indefatigable, genial, his services to the National Rose Society and to the Dahlia Society contributed not a little to the success of those institutions. As an exhibitor he showed great taste, and as grower great skill and as great judgment, so that his opinion was eagerly sought, and as highly valued. His tastes were catholic, and his appreciation by no means confined to the objects displayed on the exhibition-table. He loved plants for the sake of the plants, and "garden-Roses" were as much beloved by him as the more formal artificialities which appeal to the florist. As a raiser of Dahlias he is known for his successful efforts to produce a dwarf race with relatively small, neat flowers, which make a more powerful appeal to the sympathies of many, than do the flaunting giants which furnish our exhibition-tables. A portrait of him appeared in the *Rosarians' Year-book* for 1892. His delicate frame was ill-adapted to the strain put upon it by his ceaseless energy and continued work; but withal, as he was still a young man, we might have looked forward to a prolonged career of usefulness. It was not to be; and we must console ourselves with the remembrance of a refined intelligence, a careful worker, and an esteemed friend.

THE GARDENERS' CHRONICLE (LIMITED).—The proprietorship of the *Gardeners' Chronicle* has been vested since June 30, 1899, in a limited liability company. This alteration, which is made for reasons of personal convenience only, will entail no change in the general management of the paper.

LINNEAN SOCIETY.—JUNE 15, Dr. A. GÜNTHER, F.R.S., President, in the chair. The President exhibited a living specimen of a Tree-Frog, *Polypedates quadrilineatus*, which was introduced

APPOINTMENTS FOR JULY.

SATURDAY, JULY 1	National Rose Society's Exhibition at the Crystal Palace.
TUESDAY, JULY 4	Scottish Horticultural Association, Meeting. Rose and Horticultural Shows at Gloucester and Harrow.
WEDNESDAY, JULY 5	Hanley (Staffs) Floral Fête, in Hanley Park (two days). Rose and Horticultural Shows at Hitchin, Redhill (Reigate), Brockham, Tunbridge Wells, Ealing, and Bexley Heath.
THURSDAY, JULY 6	Colchester Rose Show (National Rose Society's Prov. Exhibition). Rose and Horticultural Show at Farnham.
FRIDAY, JULY 7	Rose and Horticultural Show at Hereford.
SATURDAY, JULY 8	Rose and Horticultural Shows at Manchester and Wood Green. Royal Botanic Society, Meeting. National Amateur Gardeners' Association, Exhibition at Regent's Park.
TUESDAY, JULY 11	Royal Horticultural Society's Conference on "Hybrids," and Exhibition at Chiswick. Wolverhampton Floral Fête (three days). Horticultural Show at Reading.
WEDNESDAY, JULY 12	Continuation of Conference on Hybrids, at the Town Hall, Westminster. The Royal Horticultural Society's Dinner at the Hotel Métropole.
THURSDAY, JULY 13	Rose and Horticultural Shows at Norwich, Woodbridge, Bedale, Brentwood, and Helensburgh.
FRIDAY, JULY 14	Rose and Horticultural Show at Ulverston.
SATURDAY, JULY 15	Rose and Horticultural Show at New Brighton.
TUESDAY, JULY 18	Royal Gardeners' Orphan Fund Annual Dinner.
WEDNESDAY, JULY 19	National Carnation and Picotee Society's Exhibition at Crystal Palace (?) Carlisle and County Horticultural Society's Show (two days). Newcastle-on-Tyne Great Horticultural Exhibition (three days).
THURSDAY, JULY 20	Rose and Horticultural Show at Sidenp and Salterhebble.
SATURDAY, JULY 22	Royal Botanic Society, Meeting. Rose and Horticultural Show at Newton Mearns.
TUESDAY, JULY 25	Royal Horticultural Society's Committee. Rose and Horticultural Show at Tibshelf.
WEDNESDAY, JULY 26	Beckenham Horticultural Society's Show.

SALES FOR THE ENSUING WEEK.

TUESDAY, JULY 4	Imported and Established Orchids, at Protheroe & Morris' Rooms.
FRIDAY, JULY 7	Imported and Established Orchids, at Protheroe & Morris' Rooms.

accidentally into Kew Gardens with a consignment of plants from Singapore. This is not the first instance of accidental introduction of a tropical frog into the Royal Gardens, Kew. Some five years ago a species of *Hylodes*, from Dominica, appeared in some numbers in several of the propagating-houses, and has evidently reproduced its species since arrival. Mr. W. WHITWELL, F.L.S., exhibited:—1. The only known British specimen of *Bettrychium matricariaefolium*, A. Braun, gathered in July, 1887, on the seashore at Stevenston, Ayrshire (*Journ. Bot.*, 1898, pp. 291-297). 2. An undescribed variety of *Asplenium Ruta-muraria*, Linn., from an old wall on Dartmoor, about five miles from Plympton. Its chief peculiarities were stated to be the length (3 inches) and

ments. The head in question, that of an adult ram, unlike the typical *Ovis orientalis* found in Northern Persia and Armenia, more nearly approached that of *Ovis ophiion*, the Mufflon of Cyprus, a curious and unexpected resemblance. Dr. A. B. RENDLE, F.L.S., read a paper entitled, "A Systematic Revision of the genus *Najas*," a primitive genus of Monocotyledons, containing about thirty known species, generally distributed in both Old and New Worlds, and consisting of submerged herbs, often of great delicacy, growing in mud in fresh or brackish water. The slender stem branches more or less profusely, and the laxity or density of branching determines the habit, which shows considerable variation. The leaves are in pairs at each node; one member

— The next session of the Society will commence on Thursday, November 2, at 8 p.m., particulars of which will be duly announced.

FACTS ABOUT BRITISH FRUIT GROWING.—The statistics published by the Board of Agriculture relative to the total area of land under cultivation in Great Britain, point to a marked decline in recent years, traceable, in many places, to the increase of building operations, railway extensions, the formation of open spaces, and so on. As regards the returns concerning small fruit in 1898 the figures are as follows—Arable section: acreage 46,503, per cent. 0.4. Grazing section: acreage 16,935, per cent. 0.1. Total of England: acreage 63,438, per cent. 0.3. It should be said that the

FIG. 6.—THE SOUTH-WEST FRONT OF "THE GLEN," INNERLEITHEN. (SEE P. 6.)

the narrowness ($\frac{1}{2}$ inch) of the lamina. The pinnæ are closely set, expanded, and flabellate, partially subdivided, and placed on short stalks on alternate sides of the rachis; the contour of the whole thus differed entirely from that of the ordinary forms of *A. Ruta-muraria*. 3. A specimen of Rye with two ears on the same stalk, gathered at Romsey, Hants. Mr. ROBERT T. GÜNTHER, M.A., read a paper on the "Natural History of Lake Urmi, in N.W. Persia," the neighbourhood of which he had explored during the autumn of last year. In many of these groups (notably amongst the fishes) several new species were described; and a good deal of interest centred in the skull and horns of a wild sheep which had been picked up on Koyun Daghi, the largest island in Lake Urmi. Although no living wild sheep were observed there during the traveller's short visit, small herds were reported to exist, the island, with lofty and precipitous hills, being apparently well adapted to their require-

of the pair is slightly older than the other, and in its axil arises a branch. The flowers, which are extremely simple, arise by the dichotomy of a branch-rudiment; the lower half forming a male or female flower, the upper the lateral branch, at the base of which the flower seems in the adult plant to stand. There is a difference of opinion as to the value of the parts of the flower, Dr. RENDLE's view being that the male consists of a single anther (of axial origin) surrounded by a sac-like perianth, which is enveloped in a bottle-shaped spathe, absent only in *N. graminea*. The female consists generally of a naked ovary, terminated by two or three stigmas, and enclosing a single anatropous ovule; in a few species it is enveloped by a spathe like that of the male. The seed has a hard testa, the detailed structure of which affords useful specific characters. Others are also furnished by the shape of the leaf-sheath and the form of the marginal spines.

arable section comprises the counties of Beds, Hunts, Cambs, Suffolk, Essex, Herts, Middlesex, London, Norfolk, Lincoln, Yorks E. R., Kent, Surrey, Sussex, Berks, Hants, Netts, Leicester, Rutland, Northampton, Bucks, Oxon, and Warwick. The grazing section comprises the counties of Salop, Worcester, Gloucester, Wilts, Menmouth, Hereford, Somerset, Devon, Cornwall, Northumberland, Durham, York N. R. and W. R., Cumberland, Westmoreland, Lancashire, Stafford, Chester, and Derby. The general summary of statistics for the three past years gives the returns of small fruits as follows—1896: acres 76,797; 1897: acres 70,245; 1898: acres 70,238. It is remarked that, although the total area returned as under small fruits remained practically the same in 1898 as in 1897, there was a good deal of alteration locally. Thus, of the forty-three English counties, twenty-one showed an increase, reaching in one case as much as 190 acres, and twenty-two showed decreases ranging from 4 to

193 acres. These changes, which, as will be observed, almost exactly balance, are to some extent attributable to corrections, or greater accuracy in the returns. The land returned as occupied by orchards in Great Britain showed a further extension of 1,943 acres, making the total 226,059 acres. The figures given below marks the estimated total acreage of orchards in 1898: England 220,220, Wales 3,690, Scotland 2,149, Isle of Man 424, Jersey 1,113, Guernsey, &c. 321.

THE ROYAL HORTICULTURAL SOCIETY'S EXAMINATION IN HORTICULTURE (April 11, 1899).—The following questions were put at the last examination. Eight questions only had to be answered, four in each division:—

DIVISION A.

ELEMENTARY PRINCIPLES.

1. Compare the structure of a Bean with that of an Onion Seed. How do they differ in germination? Describe the peculiar movements which germinating seeds exhibit.
2. What differences exist between the manner and places where rootlets arise from roots, and branches from stems? Of what use are branches, and what trees have none?
3. What hinders the proper functions of leaves, and what should a cultivator attend to, in order to enable them to exercise their complete action?
4. Give any instances of failures, and state your opinion as to their causes, in crossing distinct species. What are the general characteristics of hybrids?
5. What is meant by "fixing" a new race, and how is it to be effected, if possible?
6. Describe the flower of the Pea, of a Primrose, of a Salvia, and of any Orchid, and explain how they are adapted to insect pollination.
7. What are the injurious effects of (i) too much water; of ii) too great a heat; and of (iii) excessive drought, upon plants?
8. To what natural orders do the following plants belong, and why—Clematis, Malope, Geum, Gunnera, Fuchsia, Escabiosa, Cobaea, Amaranthus, Ixia, and Ruscus?

DIVISION B.

HORTICULTURAL PRACTICE.

9. What is generally understood in this country by an "American Garden"? Give the names of the most suitable plants for it, and the best kind of soil.
10. What is meant by a "Sub-Tropical Garden"? Describe the best position for such a Garden; also the most suitable plants, and how to cultivate them.
11. What is the right width for garden paths and carriage drives? Describe their formation, and the best materials to use.
12. Is it possible to obtain a supply of Roses all the year round from an English garden? Describe their propagation and culture under glass and in the open ground.
13. What are the most useful Fruit Trees (exclusive of Vines) to grow under glass? Describe the best form of glass structure for the purpose, and the method of culture.
14. How would you proceed to obtain a succession of Garden Peas and Dwarf Kidney Beans? Can they be obtained all the year round? If so, how?
15. What plants are generally grown for Salads in British Gardens? How may a supply be obtained all the year round?
16. What is the best aspect for a Flower Garden? How would you proceed to lay it out and stock it?

FRUIT PROTECTORS.—The Rev. E. DARNLEY SMITH sends us specimens of his celluloid protectors for fruit, to which we have already referred. Now that the fruit will shortly ripen, the wasps and the birds will perhaps be too intrusive in their attentions, so that protectors of this kind will be very serviceable, especially in the case of fruit required for exhibition or for special purposes. We fear for general use they are too much of a luxury, but they are so neat and effective that they will be welcome to the connoisseur.

FLOWERS IN SEASON.—*SALVIA CARDUACEA* is an attractive and beautiful species, fit for the garden of the "curious," as our predecessors would have said. The plant is more or less covered with white cottony hairs. The flowers are in dense terminal spikes, each spike being about 2 to 3 inches long, with many flowers thickly covered with white cotton hairs, and intermixed with leafy, reflexed, deltoid, lanceolate bracts, with long spiny teeth at the margin. The flowers are about 25 mill. or 1 inch long, the sepals ending in dark brown spines; the corolla double the length of the calyx, pale blue or white, the upper and especially the lower lip elegantly fringed; the stamens with the peculiar structure of the genns, with orange pollen, contrasting with the blue of the flowers. The plant is

a perennial, with Thistle-like leaves. It was described by BENTHAM from plants collected by HARTWEG in California, and is figured in the *Botanical Magazine*, t. 4874, but is still little known in gardens. Its woolly investment and bristly spines protect it from the consequences of undue evaporation or the assaults of unwelcome visitants, while its beautiful flowers and curious arrangement of the stamens facilitate cross-fertilisation.

EREMOSTACHYS LACINIATA is a tall-growing perennial, like a *Phlomis*, densely covered with down, the uppermost leaves sessile, pinnately lobed, the lobes themselves lanceolate and sharply toothed. The flowers are about 3 cent. (say 1½ in.) long, with a tubular cylindrical calyx bordered by fine minute teeth. The corolla is double the length of the corolla, bilabiate, and of a dull purplish-brown colour. The upper lip is hooded, the lower three-lobed. The plant is a native of Syria and the Holy Land, and is fully described in Boissier's *Flora Orientalis*, iv., 793. It is the *Phlomis laciniata* of Linnaeus, and therefore cannot be called a new plant; nevertheless, it is not seen in gardens, nor can we recommend it to those to whom beauty of colour or form are the only considerations. The connoisseur will be glad to give it a place in the herbaceous border.

LINARIA RETICULATA is always an attractive annual, the variety called *aureo-carminata* is specially so from its rich crimson flowers and the bright orange "palate."

CENTAUREA AMERICANA ALBA is a pretty white-flowered form of the "Sweet Sultan" category. It will be serviceable for aiding in the supply of cut flowers and for decorative purposes.

A FRUIT-GROWER'S VISIT TO GUERNSEY.—Mr. WILLIAM BROOMHALL, of the Country Gentlemen's Association, 49, Bedford Street, Strand, is, as we learn, organising a visit to Guernsey on co-operative lines, to enable English Fruit-growers and others to see how the Tomato crop is raised. He has the entrée to most of the leading estates in the island, and a visit, especially at the present time when the Tomato-crop is at its best, should be full of interest. The cost of the trip, lasting four days, including rail and boat-ticket, accommodation at the best hotel, and driving expenses in the island, is six guineas.

BROCKWELL PARK.—We are informed that at the last meeting of the Lambeth Vestry, it was unanimously resolved, it being understood that a piece of land adjoining Brockwell Park is about to be developed for building purposes, that the London County Council should acquire the same for the purpose of enlarging the park for the use of the public. This plot is a fine piece of wooded-land, running from Dulwich Road to the old English gardens. It was noted that Lord Rosebery, in opening the park, remarked that it was a pity such a fine bit of land was permitted to remain in private hands. It now remains for the London County Council to take the necessary action—aided by the vestries on the "Surrey side of the water."

CROPS IN THE UNITED STATES.—From the report for May of the U.S. Department of Agriculture, we learn concerning winter Wheat that the average winter crop is about 25,900,000 acres, showing a fall (owing to winter killing) equal to 13·15, but exceeding by 160,000 acres, the area of winter Wheat harvested last year. The average condition is 76·2, as compared with 86·5 on May 1 last year, or 80·2 at the corresponding date in 1897. Concerning winter Rye, the average condition is 85·2, as compared with 84·9 one month previously, and 94·5 on May 1, 1898. Cotton indications point to a reduced average, but the acreage taken from Cotton is placed to the credit of food-producing crops suited to the various localities.

LEAF DISEASE IN COFFEE.—In a report of a visit paid to Coorg, Mr. J. CAMERON, Superintendent of the Mysore Government Botanical Gar-

dens, makes the following remarks concerning Coffee growing:—"Good cultivation is a *sine quâ non* of future management. The application of proper manure in correct quantity and at the most serviceable time, are things which should be assiduously learned from practical experience. A table showing quantities of different manures to be applied per acre for different crops is not of the slightest use to the planter, who possesses but one product on many different kinds of soil. Next in importance to hybridisation and proper culture, the interchange and special selection of seed must take a high place. The Coffee fields of the whole planet must be studied with a view to improvement being made by selection—a work which, I am glad to observe, is already being promoted by the editor of *Planting Opinion*. There are no magic remedies either for the prevention of pests or the improvement of Coffee, but if the methods recommended in this report are correctly and patiently practised, the results, in the long run, should be satisfactory."

SOME GERMAN GARDENING HANDBOOKS.—A useful series of gardening handbooks is issued by Herr KARL SIEGISMUND, of Berlin, under the editorship and superintendence of Dr. UDO DAMMER. Of this *Gartenbau-Bibliothek*, volume 1 is a *Monats-Kalender* (Monthly Calendar), by Dr. Udo Dammer; 3, *Gewürzkräuter* (Pot-herbs), by Alexander Bode; 5, *Zimmerblüthenpflanzen* (Flowering Plants for Windows), by Dr. Udo Dammer; 8, *Farnpflanzen unserer Gärten* (Garden Ferns), by W. Monkemeyer; and 10, *Staudengewächse* (Perennials, &c.), by Franz Gieschke. These books are appropriately illustrated, and have usually an index.

RARE LÆLIAS AND CATTLEYAS.—Cultivators of Orchids will be interested to learn that the whole of the rare *Lælias* and *Cattleyas* belonging to W. Thompson, Esq., Walton Grange, Stone, Staffordshire, have passed into the hands of Messrs. Charlesworth & Co., Heaton, Bradford. The famous collection so admirably grown by Mr. W. Stevens, contains many remarkable and unique specimens. Mention may be made of the brilliant *Cattleya labiata* Peetersii superba; the original plants of *C. × Victoria* Regina; a grand form of *C. Trianae* alba, *C. intermedia* alba, *C. Skinneri* alba, and *C. Schroderae* alba; *Cattleya × Massaiana*, *C. Trianae* Reine des Belges; *Lælia Perrini* alba, *L. tenebrosa* Walton Grange var., and the magnificent *L. Charlesworthi*. The forms of *Lælia* purpurata also have been selected with great judgment, and comprise the best-known varieties, such as "Stevensii," "Thompsoni," "The Duchess," and "Victoria."

HYBRIDISTS AND CROSS-BREEDERS.—(See p. 1.) We propose to issue during this month a series of portraits of some of the leading raisers, in connection with the Hybridisation Conference, in which it is expected that most of them will take part. Many of these gentlemen are so well known that we need not dilate upon their services, but there are others less widely known out of their immediate circle, concerning whose career and work we shall give a short account. In our present issue we give a portrait of Dr. FOCKE (p. 3), the author of the leading work on the subject of Hybridisation; of Mr. DOUGLAS, so well known as a raiser of Anemones, Carnations, and many other flowers (see p. 5); of Mr. J. MARTIN (p. 5), the energetic hybridiser in the employ of Messrs. SUTTON & Sons, of Reading, and noted for his success with Primulas, Cyclamens, Gloxinias, and many others; of Mr. WILLIAM WATSON, whose record is given on p. 1; and of Mr. JOHN HEALE, of Messrs. JAMES VEITCH & Sons' establishment, whose work among greenhouse Rhododendrons, Hippeastrums, and other groups too numerous to mention, are well appreciated by flower-lovers.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The annual dinner of the Institution took place on Wednesday evening, June 28, at the Whitehall Rooms, Hôtel Métropole, the Earl of

DERBY, G.C.B., taking the chair. The friends of the Institution assembled in considerable numbers from far and near. After the toasts of the Queen, and of the Prince of Wales, its patroness and patron, and the other members of the Royal Family, proposed by the chairman, had been duly honoured, the toast "Continued Success to the Gardeners' Royal Benevolent Institution," was proposed by his lordship, who remarked he had wished that Mr. Veitch and Mr. Ingram had called on anyone else, pleading that the practical knowledge failed, much of his time having been spent in military

service. His lordship described in humorous terms some of his experiences of gardening in military cantonments, and he stated that it was late in life before he was brought into contact with gardening and gardeners. The interest from the funded property of the Institution amounted to about £900, but the sum actually required to meet their engagements was about £2500. Allusion was made to donations which ceased with the death of the donors, and to small subscriptions, preference being accorded the latter, for while they brought in a larger sum, they also spread the interest felt in the institution over a wider area. The chairman read a letter from the Rev. Dean

HOLE, which had been received by Mr. INGRAM, the Secretary, which described the benefits accruing to his old gardener and the wife of the latter for a great number of years. The gardener, through age, became unable any longer to follow his calling, and having been a subscriber to the institution he became a pensioner, and with the help of a few shillings weekly from the Dean, he was able to live in comparative comfort for several years, and likewise his widow, to whom the pension was also granted. The chairman then gave a brief history of the charity, and described its aims and its work

Thirty candidates remained unelected in January last, and these were receiving assistance from the Victorian Era Fund until they could be elected. He asked for money to form a Good Samaritan Fund, stating that if a sum of £2000 was obtained, it would be devoted to the same good purpose. Allusion was made, in the course of his remarks, to the aid afforded by the auxiliary branches, especially to those of Reading and Worcester, and to the intention to found one in Edinburgh, and in this connection Mr. VEITCH feelingly alluded to the interest which the late MALCOLM DUNN took in this matter. He closed his speech by an earnest appeal for help. Other speakers were Sir Whittaker Ellis, Messrs. Atkinson (Handsworth Nurseries), W. A. Bilney, R. Piper (Uckfield), and N. N. Sherwood. The Donation List included Lord Derby 200 gs., Worcester 100 gs., Messrs. Rothschild 100 gs., Dicksons (Chester) 50 gs., H. J. Veitch 50 gs., Lord Mountstephen 50 gs., Milligan Hogg 10 gs., Sir Whittaker Ellis 20 gs., Thames Bank Iron Co. 10 gs., Mr. Lee 10 gs., N. N. Sherwood £25, and a further sum of 13 gs. from the Misses Sherwood, the total sum subscribed or promised exceeding £2500. The following gentlemen were amongst those present on the occasion:—Messrs. W. Oakshot, Esq., J.P.; P. Crowley, G. J. Brackeridge, James Lee, J. H. Veitch, H. Morgan Veitch, A. Hatchard, John G. Veitch, Arnold Moss, R. Lowe, H. W. Nutting, Whitpaine Nutting, W. Crump, Owen Thomas, Lieut.-Col. Pilkington, H. Williams, W. G. Weeks, G. May, Geo. Monro, J. Assbee, A. Watkins, W. J. James, Arthur Turner, W. L. Correy, and John A. Laing.

A TERRIFIC HAILSTORM IN HANTS.—Our correspondent, Mr. WM. SMYTHE, Basing Park Gardens, Alton, sends us the following telegram:—"A terrific hailstorm broke over this district last evening (Wednesday), effecting great destruction, and stripping all fruit-trees of their crops, doing irreparable damage to bedding and all other plants in the open for this season. The stones were large enough to break glass."

STORMY WEATHER GENERALLY.—The recent sultry weather was followed on Wednesday by a series of severe thunderstorms, which spread during the day right across the country, reaching London about 8 o'clock in the evening. They broke over the Isle of Man at 7 o'clock in the morning, and raged there with great fury for five hours. Several sheep were killed in the country districts, trees were uprooted, and great damage was done to growing crops. At Liverpool, in the afternoon, there was a storm, which is described as one of the most violent ever experienced there, the thunder being very heavy, and the lightning continuous. At Blandford very large hailstones fell during the height of the storm, but no great damage was done. At Cheltenham there was a terrific thunderstorm. At Pittville Park, where a school-treat was being held, six persons had taken refuge under a tree which was struck by lightning. Five of them were thrown to the ground, and of these a small boy was untouched. At Windsor the storm continued upwards of two hours, and was accompanied by a heavy downpour of rain. The storm commenced just as the QUEEN was returning from her drive to the Castle. From Woking it is reported that the lightning was most vivid, and that the rain fell in sheets. In South Berkshire and North Hampshire there was a succession of thunderstorms in the afternoon and evening, but the rainfall there was not very heavy. *Times.*

DENDROMECON RIGIDUM.

THE Tree Poppy is a Californian Poppy with a slender stem, and stiff, entire leaves. Its flowers are yellow, and exactly those of a Poppy. The plant flowers in the open at Kew every year. Our illustration (fig. 7) was taken in the Royal Gardens. It was originally described by Benthham in the *Journal of the Royal Horticultural Society*, and is included in the first volume of the *Botany of California*.

FIG. 7.—DENDROMECON RIGIDUM: FLOWERS YELLOW.

from its establishment. The toast was responded to by J. H. VEITCH, Esq. He was happy to say that the institution was progressing, and despite the smallness of the staff, which, as usual, consists of "a man and a boy," a great amount of work is done. The year, he said, began with 174 pensioners on the books of the institution; and he quoted, as evidence of what a good investment is reaped by a subscriber to the institution who becomes a recipient of a pension, the case of a gardener who had received the large sum of £568 for an outlay of about £20; and many other striking examples of this kind could be named. The total amount required for paying pensioners was £3200,

HOME CORRESPONDENCE.

SUPERPHOSPHATE AND NITRATE OF SODA.

—There was a rather serious slip in the article, "Chemical Manures for Pot Plants," *Gardeners' Chronicle*, June 17. The writer recommends a mixture of superphosphates and nitrate of soda "previous to using." This mixture is condemned by all the authorities as destroying the nitrate. Superphosphate and sulphate of ammonia form a safe mixture. *E. C., Belmarino, Kingstown.*

CLEMATIS FLAMMULA, ETC., IN KENSINGTON GARDENS.—If not the largest and oldest of its kind in England, it is certainly a very remarkable plant. It extends for a distance of 20 yards, and is 15 inches in breadth, and about 15 feet in height. Close by on a plot of turf are planted about two dozen Birebes. The borders along the main walk are more or less bright and gay at all seasons with hardy herbaceous plants, and at the present English and other species of *Iris* and *Pyrethrum roseum* in variety, *Geranium Endresii* and *G. sanguineum*, *Lilies*, *Homeroicallis flava* and *H. fulva*, *Lupines*, *Hesperus*, &c. That hardy plant, London Pride, does well here planted under the large spreading trees, and *Sedum Sieboldi* is very common. *G. A. Bromfield.*

A PLEA FOR THE PINE-APPLE.—The adoption of steam as a motive-power has revolutionised almost all industries and vocations. Amongst others, horticulture has been, to some extent, affected, whether beneficially or otherwise in Great Britain, I will not attempt to discuss; but that it should have, in the British Isles, almost driven out Pine-apple culture will doubtless be regretted by many a gardener. Its culture was considered, thirty years ago, one of the most important, in many private establishments. Manuals written by accomplished gardeners were numerous, and good prizes were offered at horticultural shows for specimens of the different varieties, and gardeners for good places were chosen for their experience in the cultivation of the plant. The dessert-tables of the wealthy were not considered complete without Pines. Among gardeners who obtained a reputation for Pines, the names of Barnes, D. Thomson, Murray, Miles, W. Speed, and Wilson come to mind. All this is changed, and to-day the Pine-apple takes an unimportant place in British gardens. Home-grown fruit is seldom seen upon a dinner-table, and only in exceptional cases are classes found for it in exhibitions, while it is usually excluded from collections of fruit. The chief cause for this change is the abundance of foreign fruit, combined with the erroneous opinion that the Pine is a very expensive plant to cultivate, and requires more than ordinary skill to grow it to perfection. No one can be blamed for discontinuing to grow anything that he does not require; at the same time, I am sorry to see the Pine going out of cultivation, and feel that it deserves better treatment. Good home-grown Queens are far superior in flavour to the imported, which are necessarily cut from the plant several weeks before they are ripe. With reference to the cost of cultivating Pine-apples at home, I believe that it does not exceed that of many other subjects commonly grown, and the weight of fruit that can be produced in a given time per cubic foot, will compare favourably with that of most other kinds of fruit. Its culture also entails but little labour and time—at least, that is my experience. Of course, as applies to all other subjects, in order to ensure success, its requirements must be understood, although these are far from being difficult, and a modest structure will suffice to accommodate it. As a proof of the truth of this, it may be observed that some grand Queens which were grown in the end of an ordinary Cucumber-house in a garden near Tunbridge Wells, once caused even Mr. Miles to take second place at South Kensington; and, moreover, another gardener took two first prizes with fine Queens that were cut from the first lot he had ever grown, or assisted to grow. In conclusion, I will note a few important points that should be observed in the management of the plants. As a compost, fibrous sandy loam, with a sprinkling of bone-meal and soot, answers its requirements; and in potting it should be used in a tolerably dry state, and be firmly rammed into the pots. 8-inch pots are a suitable size for suckers, and 12-inch for fruiting plants. Newly-potted suckers and plants need but very moderate supplies of water until some

sensible progress at the root has been made, as any error in this respect being fatal to success, and a knowledge of the requirements with respect to watering, is an essential point in the culture of the plant. As a stimulant, nothing is better than a small quantity of Peruvian-guano dissolved in water, and afforded after the plants have made considerable root progress. The plunging-material should be preserved in a firm and moist state, and the plants disturbed as little as possible—really, they only need it when repotted. Atmospheric temperature and moisture should be regulated according to external conditions, but extremes should be avoided, particularly when the temperature depends upon hot-water, steam, &c. Hard forcing is at all times hurtful, and especially whilst the fruits are swelling, not only preventing free swelling, but causing undue growth of their crowns, and thus marring the appearance of the fruit. *Thomas Coomber.*

IRIS RETICULATA DISEASE.—The description on p. 412, last vol., of the disease to which this *Iris* is liable in most gardens is of great interest to me, because I have for many years tried in vain to find it described, though it is an exception to find a garden free from it. I have always called it the "ink" mildew, because the bulbs attacked by it look in the first stage just as if they had been soaked in ink; but a month later, nothing is to be found but the empty tunic containing a little black powder. The natural increase of these *Irises* in my garden is about threefold annually, but nearly two thirds are always destroyed by this disease. If planted in quite new soil it is sometimes three or four years before the mildew reaches them, but it always finds them out sooner or later. I grow many species of bulbous *Iris*, but have never noticed this black mildew on any other. If I have not sent specimens of the disease to the *Gardeners' Chronicle*, it is only because I thought it too well known. It is fully mentioned in Prof. Fester's "Notes on Bulbous *Iris*," published in the *Journal of the Royal Horticultural Society* some years ago, but no remedy is there suggested. Mr. W. Thompson, of Ipswich, once told me that he thought deep planting helped to preserve the bulbs from it. *C. Wolley-Dod, Edge Hall, Malpas.*

SHROPSHIRE COUNTY COUNCIL.—At the Cleobury Mortimer Agricultural College, we are carrying out some very interesting work in the way of vegetable and flower plots, and also Botanical (Agricultural) work. This is attracting a great deal of notice. Lately we had a visit from the Worcester and Hereford Chamber of Agriculture—they were delighted with it. We have a piece of ground about an acre, marked out in plots. Each boy formerly had a vegetable plot to work; during the last winter, I thought it would be useful to extend this, and gaining permission to do so, I arranged a certain piece in flower plots, and another large piece we marked off, according to the Natural Orders, and with the gratuitous assistance of some of my friends, we have planted these as far as we are able with collections of cultivated crops, both farm and garden, and also some of the weeds. Messrs. Dicksons, Chester, sent me good collections of Grasses, Clovers, Vetches, &c., and Pedigree Oats. Messrs. Webb, Stourbridge, sent me Wheat, Barley, and Rye. Mr. Eckford, of Wem, fifty vars. of sweet Peas, a good collection of culinary Peas and ornamental grasses. Messrs. Dicksons also kindly took the trouble to send specially to France for some Dodder-seed, a plant of which is now twining round Clover, and I notice one plant is twining round a Potato, which has come up in the plot. The students take very great interest in this part of the work, and it is most useful to them in their examinations. At Oswestry College I have a small arrangement of botanical orders, and Mr. Nicholson, of Kew, very kindly helped me much; but this is only the commencement, and scarcely worth notice yet, and I have to work (as yet) the best way I can, but no doubt there is a prospect of development. *Alfred Gault.*

HOT WATER, MEALY-BUG, AND MILDEW.—Whilst agreeing that hot water is a dangerous remedy for mildew on Vines when injudiciously applied, I must admit that there is no danger if the method described in the *Gard. Chron.*, p. 335, last vol., is carefully followed out. Before I applied the hot water, the possibility of applying heat sufficiently of a high degree to destroy so small

a plant as mildew without destroying so large a plant as a Vine, was carefully thought out. The fact that the mycelium of the common edible Mushroom is easily destroyed by excess of heat, lent some weight to the idea. Water was considered to be the best means of conveying the heat to the fungus, as it would retain the heat when in volume and radiate it quickly in the immediate vicinity of the fungus or spores when syringed. It was also considered that the radiation would be too rapid and momentary to harm the Vines. The result obtained showed that the surmise was a correct one. The leaves were not harmed (examples were sent to the Editor), nor were the berries, whilst the mildew was killed. Better and safer methods of destroying mildew may exist, but whether hot water is dangerous as a fungicide depends on the care exercised in its application (do not boil the plants), and the volume of the spray. Whether hot water is efficacious as a fungicide would depend upon the thoroughness of the application. It has been proved to be such by the only correspondent (p. 383, ante) who records that he has tried it beside myself. The possibility that hot water may prove efficacious in destroying mildew affecting other plants, of course, exists; such experiments would require to be carefully carried out, and in a systematic manner. It occurs to me that the majority of fungicides, being poisons, are certainly more dangerous both to use and after use, than hot-water can be. With regard to hot-water as an insecticide, I may say that American-blight and the caterpillars of the Lackey-moth have been destroyed with water heated to 150° without harming the leaves of Apple-trees. Green-fly has been killed with water heated to 130° F. without harm accruing to the young shoots of Rose-trees. In no case was the syringe directed to one spot for any length of time. It is difficult to account for the tenacity of life exhibited by the mealy-bug when immersed in boiling water, as described by Mr. Godfrey on p. 414, ante; there can be but few living creatures which would stand that treatment unharmed! Anyway, they are the toughest bugs I have ever heard of. I have some much more tender ones here, which succumb to water heated to 175°, forcibly applied with a syringe; these were infesting *Mandevilla suaveolens*. *Geo. B. Mallett.*

—Your correspondent, Mr. Mallett, did good service in calling attention to the above remedy, and which, used with caution and care, as all insecticides should be used, is useful. It is not by any means a new remedy. As long ago as 1861 I can recollect, when in the Royal Exotic Nursery, Chelsea, assisting other young gardeners, under the direction of the foreman of the stove and greenhouse department, of going over entire houses and stove plants, plant by plant, syringing them outside the house with water heated to 140°, more as a preventative than a cure, as some of us thought it was labour in vain as there was not much visible to wash off—but it was ours to obey. I have no doubt many men still in the gardeniog ranks could relate a similar experience. *R. M., Newbury.*

A BIRD'S NEST IN AN ORCHID.—In one of our Orchid-houses a robin has made its nest in the centre of a medium-sized plant of *Cypripedium Dominionum*, and has, further, hatched two young ones. We may add that the plant in question is not secluded, and we have never seen such a thing occur before. *Hugh Low & Co.*

THE SHADING OF GLASSHOUSES.—This interesting subject which is referred to in the *Gardeners' Chronicle*, p. 410, vol. xxv., opens up a wide field for discussion. It is undoubtedly one of the most important factors in successful plant culture. As mentioned in the notes referred to, the use of bast-mats for the purpose is almost a thing of the past, though for shading cuttings in a hot-bed frame, I know of no better material. Except for cuttings, all heavy shading should be avoided. My own experience is that many plants which are usually grown under shade, when, if started from the earlier stages, with more exposure, may be grown almost entirely without shade. As an example, I may mention that I once planted some seedling *Gloxinias* on some half-spent hot-beds, these had no shading whatever, except just as the blooms were opening, and they made sturdy growth with leaves of great substance. I have also experimented with many other subjects, and find that if taken from where they have grown under shade

they will, in most instances, suffer when exposed; but start them from the first and there will be little danger of the sun doing any mischief. When grown under more exposed conditions, plants naturally require more attention, but this is fully compensated for by seeing plants of dwarf sturdy growth which may be used for decorations without fear of seeing them flagging and looking generally miserable before they have been exposed many hours. I do not mean to suggest that shading can be dispensed with altogether; but that it has been generally overdone is an indisputable fact. Now with regard to material for shading. Blinds which can be removed are most desirable, but the expense of these does not admit of their use in the more extensive establishments devoted to plant culture, and the prices now realised in our markets. Thin lime-wash, put on with a syringe, is an expeditious method for large structures; but it has disadvan-

prevent the condensation of moisture on the glass, as it is often the globules of moisture which condense the sun's rays, and cause burning. Large globules of water on leaves may also have the same effect. While a large drop of water on a leaf may prove disastrous, it may be quite safe to syringe, and provided the whole surface is wetted, there will be no danger of burning from the sun. Although atmospheric conditions require careful study, root-moisture must also be looked to. Plants allowed to flag through want of water at the root will be more liable to suffer than from any other cause, hence the fallacy of the old notion that plants must not be watered while the sun is on them. The whole problem of shading rests in doing it judiciously. Blinds which may be drawn up are certainly preferable, but with these it often happens that they are left down much later in the day than is good or necessary; and with the permanent

Obituary.

GEORGE FRY.—It is not long since we had occasion to mention the work of George Fry of Lewisham, and now it behoves us to announce his death, on Wednesday, June 28, at a good old age. Mr. Fry commenced his gardening career early in the thirties, and in 1837, when the first gardening journal appeared, he became a subscriber to it. The most interesting period of his life, as he declares in his autobiography, published in this journal on February 5, 1898, was whilst he was serving as an under-gardener in John Angerstein's garden, The Woodlands, Blackheath. It was here that he was induced to take the Fuchsia in hand, and improve its cultivation, and raise new varieties. He was very successful in both directions, and the impetus which was thus given to the cultivation of this pretty plant, nearly sixty years ago, is still felt. Many of Mr. Fry's varieties had, and have, many admirers. We would refer those of our readers who may desire to know more of his life to the issue of the *Gardeners' Chronicle* named above, where an account of this worthy gardener and nurseryman will be found.

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 27.—**ROSES:**—The competitive Roseclasses held in conjunction with the ordinary fortnightly meeting of the Committees on Tuesday last, in the usual Hall at Westminster, resulted in making the exhibition a very large one. At this season of the year, even when there is no such extra feature, the exhibits very rarely fail to fill the hall as full as is consistent with a due regard to convenience, and consequently on this occasion a great number of the exhibits were necessarily crowded, and suffered severely in effect from this cause. Notwithstanding that Mr. WRIGHT, who has the management, of these shows, communicated by telegraph on Monday, with would be exhibitors, with a view to decreasing the inevitable disappointment that is felt by them when a large proportion of their collections have to be placed under instead of upon the stages. We should imagine that the provision of a hall affording greater capacity than does the present one would be hailed by no one with greater satisfaction than the Chiswick superintendent, whose task at the Drill Hall is frequently a most unenviable one. It was no doubt owing to the crowded condition of the stages that one of these, that was laden with fruits, including Pines, Melons, Strawberries, &c., and with Messrs. PEED'S Begonias, and Messrs. W. PAUL & Son's Roses, gave way about noon, and precipitated the exhibits upon the floor. The fruits escaped with little injury, but the Roses and Begonias were much damaged, and were practically rendered unfit for exhibition. Messrs. W. PAUL & Son's Roses were chiefly of garden varieties, and included a nice collection of the "Moss" section.

ORCHIDS were numerous, and the Orchid Committee recommended the awards of four First-class Certificates, an equal number of Awards of Merit, and two Botanical Certificates.

The Floral Committee awarded two First-class Certificates and four Awards of Merit; it had before it a large number of exhibits, including some excellent groups. A group of specimen *Humeas* and *Codiaeums* from Sir CHAS. PIOTT'S garden, Wexham Park, and a large group of miscellaneous plants from Lord ALDENHAM, were constant subjects of remark. There were magnificent collections of Sweet Peas, Paeonies, Stocks, Aquilegias, Delphiniums, and hardy flowers generally, well cultivated, and of the finest strains.

The exhibits before the Fruit Committee included a dozen or so Pines from Lord LLANGATTOCK'S garden, The Hendre, Monmouthshire. Amongst the visitors at the meeting was Mr. WEBBER, who will officially represent the United States Agricultural Department at the forthcoming Hybrid Conference.

In the afternoon a lecture upon "Some of the Plants Exhibited" was delivered by Professor HENSLOW.

Floral Committee.

Present: W. Marshall, Esq., chairman; and Messrs. JNO. FRASER, CHAS. T. DRURY, R. DEAN, THOS. PEED, JOHN JENNINGS, J. F. McLEOD, J. FRASER, CHAS. JEFFRIES, CHAS. E. SHEA, GEORGE GORDON, JAMES WALKER, HERBERT J. CUTBUSH, ED. BECKETT, E. T. COOK, E. H. JENKINS, C. J. SALTER, D. B. CRANE, ED. MAWLEY, and J. D. PAWLE.

One of the most attractive of the magnificent groups staged was one from Sir CHAS. PIOTT, Bart., Wexham Park, Slough (gr., Mr. J. Fleming). It was composed of a score of plants of the scented *Humea elegans*, each of them in 10 to 12-inch or larger pots, and about 8 feet in height, just opening into bloom. They were perfect specimens of health and grace. Associated as they were with handsomely coloured *Codiaeums* of large dimensions, and a very freely-flowered pyramidal plant of *Isora*, upwards of 8 feet high, the effect of these

FLOWERS WHITISH.

tages, as it will either wash off with a heavy rain and before it can be replaced, the sun, whose rays are always brighter after rain, has cleared the air, may do mischief; or if it will withstand the rains, it will entail much labour to clean the glass in the autumn. I prefer the use of whitening; this may be used in various ways. Where the extent of glass is not great, it may be applied with a brush; it should be powdered up quite fine, and mixed into a stiff paste with boiling milk, and then thinned, taking care that the milk is as near at boiling point as possible; or if milk cannot be had, Linseed-oil may be used, but this is more difficult to remove in the autumn. There are also other methods, one being to use a portion of ground starch with the whitening, and mix with boiling water. This may be used with either brush or the syringe; and when used in proper proportions and well mixed, it will withstand ordinary heavy showers, but continual wet after it has become softened will render it necessary to reshade when bright sunshine returns. Now, to return to growing plants without any shading: the first point is to see that a little top ventilation is given early, to

shading, it is often put on too thick, or, worse still, some green colouring is added, either green glass, or green shading being one of the greatest errors ever committed in the culture of plants under glass. In glancing out of my window I can see a large market establishment where the only shading used is clay mixed with water, and applied with a syringe. This may be economical, but I hardly think it has any other advantage, though I should prefer it to green shading. *A. Hemsley.*

BARTHOLINA PECTINATA.

This is a Cape terrestrial Orchid with a single roundish leaf and a single flower on a slender, erect stalk (fig. 8). The flower is relatively large, with small, herbaceous sepals, small petals, and a large lip with a long spur, and the free edge deeply fringed. It is a charming plant, and was exhibited at one of the recent shows of the Royal Horticultural Society by Leopold de Rothschild, Esq., receiving a Botanical Certificate.

Humeas was as delightful as it was uncommon, whilst the fragrance could be appreciated throughout the hall (Silver-gilt Flora Medal).

Messrs. W. COTARSH & SON, Highgate Nurseries, London, N., showed a capital group of Malmesbury Carnations, backed with Bamboos in pots; some of the newer varieties with pretty tints were included, such as Lady Ulrica, Lord Welby (crimson), Mrs. de Saige (very bright crimson), and others. Better-known ones, such as Chas. Freeman, Churchwarden, Princess of Wales (pink), Calypso (very pale flesh), &c., are also noticed, and a fine crimson border Carnation, named Sundridge (Silver Banksian Medal).

Mr. J. RUSSELL, Kew Road, Richmond, staged a most interesting exhibit of hardy ornamental trees and shrubs, all of them in pots. *Andromeda* (*Zenobia*) *speciosa*, with fine inflorescences of giant Lily of the Valley like flowers; *Ptelea trifoliata aurea*, a plant not nearly common enough; Golden Oak*, many varieties of Japanese Acers, silver variegated Beech, *Cornus sibirica variegata*, *Catalpa spongiosa aurea*, *Acer Negundo variegatum*, *Robinia pseudo-Acacia aurea*, *Coranus Spithii*, a golden variegated tree of much value, were noticed in the group. Also a purple-leaved *Catalpa*, *C. purpurea*, as d-decidedly purple as the purple Beech, &c. (Bronze Banksian Medal).

The most extensive group in the hall was composed of flowering and ornamental-leaved plants, from Lord ALDENHAM's garden, at Aldenham House, Elstree (gr., Mr. E. Beckett). It was arranged upon the floor, there being in it some handsome Palms, 8 or 10 feet high, with an undergrowth of highly coloured *Cordulines*, *Cordylines*, varieties of *Lilium speciosum* and *L. longiflorum* in flower, *Hydrangeas*, *Crasulads*, *Ericas*, *Gladiolus* *The Bride*, *Calsidiums*, *Carnations*, *Odontoglossum cirrosum*, *Astilbes*, *Crimson Rambler Roses*, &c. The plants showed the effect of good cultivation, and together produced a very pretty effect indeed (Silver gilt Flora Medal).

Mr. H. B. MAY, Dyson's Lane Nurseries, Upper Edmonton, showed *Selaginellas*, their exhibit comprising as many as fifty species and varieties, and including such divergent forms as the broad fronded *S. grandis*, and the tiny dense growing light-green coloured *S. apoda*. Many uncommon varieties were shown, but the very popular and common *S. Kraussiana* was not excluded. This is sometimes called *S. denticulata*, but is quite distinct and much more serviceable, though less valuable (Silver Banksian Medal).

Mr. MAURICE HUTCHARD, Christchurch Nurseries, Hants, in a collection of hardy flowers, showed a number of flower-spikes of *Brodiaea coccinea*, with its long, tubular, deep-red flowers tipped with green, *Calochortus vinctus citrinus*, one of the larger yellow-flowered varieties; *Nepeta Mussini*, with long, densely-flowered spikes of lavender-tinted blossoms; *Lilium Martagon album*, *L. umbellatum* Cloth of Gold, a very showy variety; *Clematis integrifolia Durandi*, with deep blue, much recurved flowers; *Kniphofia caulescens*, *Philadelphus Lemotinci erectus*, and some extra fine spikes of the purple-flowered *Orethys* (*O. foliosa*), &c. (Silver Banksian Medal).

Messrs. B. S. WILLIAMS & SON, Upper Holloway, London, N., staged a group of Carnations in pots, of such popular varieties as R. H. Measures (reddish-scarlet), Queen of the Yellows, Prime Minister, &c., and a few novelties.

Mr. JAS. DOUGLAS, Edenside Nursery, Great Bookham, Surrey, showed some new border Carnations of merit, one of which is described under "Awards."

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, made a very gay exhibit of Peonies and *Delphiniums* (Bronze Banksian Medal).

Messrs. GEO. JACKMAN & SON, Woking, had a very meritorious exhibit of hardy flowers, including *Delphinium Belladonna*, varieties of their *Clematis coccinea* hybrids, a nice lot of *Roses*, *Cercopsis grandiflora*, and other species (Bronze Flora Medal).

Messrs. H. CANNELL & SONS, Swanley, Kent, had an exceedingly gay exhibit, composed of a great variety of *Aquilegias* in pots, lifted from the open ground probably. They were smothered with blooms, and the beauty of most of the varieties was surpassing. There were tints of lavender, brown, lemon, purple, pink, white, and some almost red. They had a good display of blooms of Ten-week Stocks also, the strain being one of great excellence. These were of various colours, including majenta, white, creamy-pink, purple, plum, light rose suffused with white, bright lavender, canary yellow, deep rose, &c. A variety named *Camelliflora*, fl.-pl., has extra fine blooms upon a sparsely-flowered spike; Princess Alice being of the same strain, and pure white (Bronze Banksian Medal).

Messrs. DOBBIE & CO., Rothesay, N.B., made a charming exhibit of Sweet Peas, showing some seventy varieties; but they were much too crowded, through no fault of the exhibitors. We noticed some fine novelties, as Lady Grisell Hamilton, very large, pale-blue in colour; Lady M. Currie, Rose colour; Sadie Burpee, pure white; an improvement upon *Blanche Burpee*. *Salopian* was the best red, and Princess of Wales is still a first-class rose-coloured variety. Black Knight will meet with favour from those who admire the deepest-coloured forms (Bronze Banksian Medal).

Another very beautiful display of Sweet Peas was one from Mr. F. G. FOSTER, Brockhampton Nurseries, Surrey. He had eighty-six varieties, and some of the best of these are varieties raised by himself. Snowdrift for instance, as a pure white variety, has claims almost equal to Sadie Burpee, and is quite distinct. Navy Blue is a deep blue flower from New Zealand. Golden Gleam is a lovely shade of pale yellow; Pink Friar (American), is pink and white. Princess of Wales very similar to Grey Friar (Bronze Flora Medal).

Messrs. BARN & SONS, King Street, Covent Garden, London, made a fine exhibit of hardy flowers, including some very beautiful *Irises* and herbaceous *Peonies*, *Potentillas*, and the first herbaceous *Phlox* we have observed this season; also Shirley and Iceland Poppies, *Ixias*, &c. (Silver Banksian Medal).

Messrs. WALLACE & CO., Kilnfield Gardens, Colchester, had cut flowers of *Incarvillea Delavayi*, of *Ixias*, including *I. viridiflora*, the green-coloured flowers of which always attract attention; *Peonies*, including a highly coloured one of great merit, but unnamed; *Lilium Thunbergianum* in great variety, some of the best of which were *marmoratum aureum*, *Orange Queen*, *Alice Wilson*, and the deeply coloured *Van Houttei*. The distinct flowers of *L. Washingtonianum* were observed, and other *Lilies* that we must forbear to mention; *Browallias* and *Calochorti*, including the dwarf and pretty *C. pulchellus*, and varieties of *C. venustus*, &c. (Silver Flora Medal).

Messrs. WATKINS & SIMPSON, Exeter Street, Strand, London, were awarded a Bronze Flora Medal for a nice group of hybrid *Lantanas* in great variety. All of the plants were of dwarf habit, and very freely flowered.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, exhibited a large group of *Campanula Medium calycanthema roseum*, pink Canterbury Bells, very finely grown in 9-inch flower-pots. They also showed a great number of cut blooms of herbaceous *Peonies*, in striking variety. Very pretty were those of *Vicomte de Fonceville*, magenta-rose; *Falstaff*, a semi-double flower of a deep crimson tint, with prominent golden-yellow anthers; *Souvenir d'Anguste Meille*, light rose and blush, a double flower with confused petals; *Rosa Rendatler*, rosy crimson, double and full; *Lady Carrington*, pale flesh, double; *Leone*, a still paler flesh-tinted flower, large and full; *Gen. MacMahon*, of a deep crimson, full bloom; and *Lachesis*, the stamens of which are white, with yellow tips, these being developed in great numbers, and in some cases petaloid; guard petals lilac, running out to pale flesh tint at the margin. The same firm showed a number of English *Iris*, charming in the variety and richness of their tints. We call attention to the gentian-blue-flowered *Raphael*, to *Poupre benatre*, *Blue Celeste*, and *Rembrandt*. The exhibit contained a number of varieties of *Gladiolus venosus*, *insigis*, and *cardinalis* varieties, early-flowering *Ixia*, *Babiaras*, &c. The pretty *Escalonia Langleyensis* x, a plant 5 feet high, and furnished abundantly with pink blooms on pendulous shoots, was a conspicuous object from this nursery. Other plants were *Delphinium Sultan*, a flower of a rich metallic dark blue, a showy, hardy perennial.

Mr. H. WALTERS, gr., Eastwell Park, Ashford, showed a large sized creamy-white Carnation, named *Lady Gerard*, an almost scentless flower (Award of Merit).

A nice white Pink, of regular form, and fairly full, came from Mr. J. LAMP, florist, Burton Joyce, Notts.

Mr. G. FOSTER, gr., Glendarragh, Teignmouth, showed a big yellow Carnation, but no Award was made by the committee. Shoots and flowers of *Lonicera Hildebrandti* were exhibited from Glasnevin, and various *Gladiolus cardinalis* and *Crocus* plants were noted.

A plant of *Anthurium Andreanum*, with two large spathes, was shown by Messrs. H. LOW & CO.

Messrs. W. PAUL & SON, Waltham Cross, had a fine and extensive collection of Garden Roses, inclusive of about forty varieties of Moss Rose, all of which, in the mishap that occurred with the table on which these and other exhibits had been arranged, were a good deal mixed and shaken up. *R. robusta* is a dark crimson Bourbon, as is *H.P. Triomphe de Caen*, a very fine, full flower; *Madame Engel* is a pink and yellow China Rose, very pretty in bud; *Duke of York* is another China of the same tint as the old China or monthly Rose, but with more numerous petals. A quantity of the now seldom seen *Maiden's Blush* (*Celestial*), of Mrs. G. Brunt, a French white in hue, large, and with but few petals; *Noisette*, *Blanche Moreau*, a pretty, white pillar or garland, Rose, with a full flower, and the old Red Damask, carmine, with the stamens showing plainly (Silver Flora Medal).

Messrs. KELWAY & SON, Langport, Somerset, had an extensive exhibit of hardy perennial flowers, chiefly consisting of *Peonies*; and of these, King of the Thistles is a remarkable single-flowered variety of a crimson colour, and with prominent stamens; *Gaillardia grandiflora* in much variety, of which the fine yellow-coloured *Langport Wonder* and *Sir John Millais* were the more striking; *Delphiniums* in great variety, and well grown and flowered as these plants always are at Langport. *D. Sir Walter Scott*, a flower of deep cobalt-blue tint, and possessing a long flower-spike, received an Award of Merit (Silver Banksian Medal).

ROSES.

COMPETITIVE OPEN CLASSES.

The quality of the blooms staged was moderately good, and being one of the earliest exhibitions, satisfactory, but the general quality should be better at the Palace on Saturday, and at Colchester it should be better still. Roses are generally late this year; garden varieties, however, were capital at the Drill Hall, and there was a very fine display.

In the principal class, which asked for twenty-four blooms distinct, the winner was Mr. B. R. CANT, Colchester. He had a very handsome flower of Mrs. W. J. Grant, and other very remarkable flowers were *Helen Keller*, *Madame Cadeau Ramey*, Mrs. John Laing, *Ulrich Brunner*, Mrs. Cocker, Dr. Sewell, *Gustave Piganeau*, &c. Another Colchester firm, Messrs. D. PRIOR & SON, of the Myland Nurseries, exhibited with success, and included some very pretty blooms; and the 3rd place was taken by yet another Colchester exhibit, one from Messrs. F. CANT & CO., Braiswick Nurseries.

The winner of the 1st prize for eighteen single trusses was Mr. CHAS. TURNER, Royal Nurseries, Slough, who deserves much praise for the excellent blooms shown. Those most striking were Mrs. J. Laing, *François Michelin*, *Clio*, *Gustave Piganeau*, Mrs. W. J. Grant, and *Antoine Rivoire*. For 2nd place, Messrs. J. BURRELL & CO., Howe House Nurseries, Cambridge, were successful, and their collection included several blooms of much merit. Messrs. GEO. COOLING & SONS, Bath, were 3rd; and there were two other exhibitors.

Teas and Noisettes.—Messrs. D. PRIOR & SON made a very commendable exhibit in the class for eighteen single trusses, distinct, the varieties being very choice, but somewhat deficient in highly-coloured ones. There were beautiful specimens of *Maman Cochet*, *The Bride*, *Cleopatra*, *Madame de Watteville*, *Catherine Mermet*, *Madame Cusin*, *Souvenir d'Elise Vardon*, &c. The 2nd prize was won by Mr. GEO. PUNCE, Oxford, whose premier bloom was one of *Comtesse de Nadailac*, and he had good blooms of *Catherine Mermet*, and others. There were four collections.

Garden Roses.—The garden Roses made much the finer display, and there was competition in each of the two classes. The premier class for thirty-six distinct varieties was won by Messrs. G. COOLING & SONS, Bath, a firm who have a fine reputation for the successful cultivation of this type of Rose. It was a very representative collection, and remained fresh in appearance throughout the day. A white Rose with smooth foliage in this exhibit looked like a large mock-Orange. *Marquis of Salisbury*, *Bardon Job*, and *Cooling's Single Crimson Bedder* were the darkest-coloured ones in the group; whilst of pink, white, and rose-coloured varieties, including some of Lord Pezance's hybrid Sweet Briars, there were splendid specimens in large, neatly-arranged bunches. Messrs. PAUL & SON, The Old Nurseries, Cheshunt, who won 2nd prize, also made a really excellent exhibit. *Royal Scarlet*, and *Paul's Carmine Pillar* were noticeable varieties in this exhibit.

AMATEUR CLASSES.

The best amateur class was that for eighteen single trusses, and the premier honour was obtained by Mr. A. G. ORPEN, West Bergholt, Colchester. His best blooms were *White Lady*, *Maréchal Niel*, Mrs. W. J. Grant, *Souvenir d'Elise Vardon*, and *Maman Cochet*. The 2nd place was taken by T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter); and the 3rd by E. M. BETHUNE, Esq., Denne Park, Horsham, Sussex. There were eight competitors in this class.

There were five collections of twelve blooms, distinct, and the winner proved to be G. W. COOK, Esq., The Briars, North Finchley. There were in his stand superior blooms of Mrs. W. J. Grant, and *Souvenir de President Carnot*. The 2nd prize was won by Wm. KINGSTON, Esq., 52, Guy Street, Bedford; and the 3rd by R. W. BOWYER, Esq., Haileybury College, Hertford.

The class for six single trusses was won by Miss B. H. LAXTON, Raynham, Heulton, showing *Gustave Piganeau*, *La France*, *Charlotte Gillemot*, *Capt. Hayward*, Mrs. W. J. Grant, and *Capt. Christy*. Of eight additional competitors JOHN BATEMAN, Esq., Rosevale, Archway Road, N., won 2nd place; and G. H. BLAXTON, Esq., Hutton Park, Brentwood (gr., Mr. H. Holloway), 3rd prize.

Mrs. SHARMAN G. CRAWFORD was the variety staged by FERCY BURNARD, Esq., Hill Grange, Reigate, who was best exhibitor in a class for nine blooms of one variety of H.P., H.T., or H.B. The 2nd prize was taken by T. B. HAYWOOD, Esq., who had rather small blooms of Mrs. J. Laing; and the 3rd prize fell to Rev. F. PAGE ROBERTS, The Rectory, Scole, Norfolk, who had *Gabrielle Lunet*.

The best collection of six single trusses was from G. W. COOK, Esq., with rather small blooms of the new and very popular variety Mrs. W. J. Grant.

Teas and Noisettes.—For eighteen single trusses, of not fewer than twelve varieties, or more than two trusses of any one variety, there were four competitors. The best collection was from the Rev. F. PAGE ROBERTS. The varieties most remarkable were *The Bride*, *Comtesse de Nadailac*, *Muriel Grahame*, *Maman Cochet*, *Golden Gate*, *Niphotos*, and others. The 2nd prize was won by O. G. ORPEN, Esq.

The best collection of twelve single trusses, not fewer than nine varieties, was from CONWAY JONES, Esq., Blenheim House, Hucclescote, Gloucester. This was a very fine lot, all the varieties being good. They were *Niphotos*, *Catherine Mermet*, *Maréchal Niel*, *Ethel Brownlow*, *Madame de Watteville*, *Golden Gate*, *Maman Cochet*, *The Bride*, *Souvenir d'Elise Vardon*, *The Bride*, and *Jean Ducher*. The Rev. A. FOSTER MELLIAN, Spronghton Rectory, Ipswich, was a capital 2nd prize exhibitor.

The Rev. F. R. BURNSIDE, St. Margaret's Bay, Dover, had the best collection of six blooms in four varieties, his best blooms being of *Madame de Watteville*.

The variety that won in the class for nine blooms was *Maréchal Niel*, staged by O. G. ORPEN, Esq.; and in the class for six blooms, the winning variety was *Anna Olivier*, from H. P. LAXTON, Esq., The Lodge, Shenfield, Brentwood.

Garden Roses.—The Amateur's Class for eighteen distinct varieties was won by H. TATE, Esq., Downside, Leatherhead. *Paul's Carmine Pillar*, *Crimson Rambler*, *Bardon Job*, *Safrano*, *Hebe's Lip* (white single), *W. A. Richardson*, *Marquis of Salisbury*, *Homer*, and *Réve d'Or* were some of the most remarkable varieties. For 2nd prize the most successful exhibitor was F. W. CAMPION, Esq., Colley Manor, Reigate (gr., Mr. J. Fitt). The Rev. J. H. PEMBERTON, Havering, Essex, was 3rd.

Orchid Committee.

Present: H. J. Veitch, Esq., in the chair; and Messrs. S. Courtauld, J. Colman, De B. Crawshaw, A. H. Smee, C. Winn, H. Ballantine, W. Cobb, H. T. Pitt, E. Hill, J. G. Fowler, H. M. Pollett, W. H. Young, W. H. White, H. J. Chapman, J. Douglas, H. Little, A. Outram, J. T. Gabriel, T. B. Haywood, and Jas. O'Brien (Hon. Sec.).

An excellent display was made of Orchids. Owing to the abundance of out-of-doors flowers staged, there was a difficulty in finding space for the exhibits, which were intended by the senders to be brought to the notice of the committee.

Sir TREVOR LAWRENCE, Bt., Burford (gr., Mr. W. H. White), showed four remarkable and distinct varieties in *Lælia tenebrosa atrata*, a dark, rich-coloured form allied to the one known as "Tring Park variety;" *Catasetum timbratum superbum*, with fringed-lipped, cream-coloured flowers, densely spotted with purple; *Cattleya Mossie Lawrencei*, a charming white flower; and *Odontoglossum crispum purpurascens*, both of the last named securing Awards (see Awards).

Mrs. BRIGGS-BURY, Bank House, Accrington (gr., Mr. Wilkinson), exhibited three superb Orchids, viz. *Lælio-Cattleya* × *Dominiana*, "Fire King;" *L. C.* × *Canhamiana* alba, with pure white sepals and petals and rosy purple lip; and a fine plant of the famous *Lælia purpurata*, "Walton Grange Variety," which had previously received a First-class Certificate.

Sir FREDERICK WIGAN, Clare Lawn, East Sheen (gr., Mr. W. H. Young), showed in fine condition *Odontoglossum* × *Harryano-crispum*, said to be the reverse cross to that previously certificated; a grand variety of *Lælio-Cattleya* × *eximia*, with intense claret-purple front to the lip; *Cattleya Mossie* excellens, a very handsome form, remarkably well-grown, and carrying six flowers on one spike (Cultural Commendation), and the small, pretty *Eria acervata*.

In regard to groups of Orchids, Messrs. J. VEITCH & SONS made an effective display, and were awarded a Silver Banksian Medal. The different forms of *Lælio-Cattleya* × *Aphrodite*, *L. C.* × *Canhamiana*, and other hybrids, gave a showy and distinct character to the group. There were also *Cattleya Mossie Arnoldiana*, a white-petalled variety with delicate pink base to the segments, and ruby-purple blotch on the lip. Some good panfuls of the dark rose-coloured *Disa* × *Veitchi*, the distinct *Cattleya* × *Juliet* (*Mossie* ♀, *labiata* ♂); fine forms of *Lælia tenebrosa*, *L. purpurata*, *Cattleya Mendeli*, and *C. Gaskelliana*, of which the handsome bluish-white *C. G. formosa* was a very chaste beauty.

J. BRADSHAW, Esq., The Grange, Southgate (gr., Mr. Whiffen), was awarded a Silver Banksian Medal for a pecty group, in which were the fine fringed-lipped *Lælio-Cattleya* × *Thorntoni* (*C. Gaskelliana* ♀, *L. Digbyana* ♂), a good example of *Lælio-Cattleya* × *exoniensis*, an excellent example of *Odontoglossum* × *excellens*, besides some of *Cattleya Mendeli*, *C. Mossie*, *Odontoglossum crispum*, *O. cordatum*, *O. constrictum*, &c.

Messrs. HUGH LOW & CO., Bush Hill Park, had a large group of their fine type of *Cattleya Mossie*, of *C. Mendeli*, and *Odontoglossum crispum*, together with two plants of the fringed-lipped, fragrant *Lælia Digbyana*, which is always a striking object when in flower; *Cypripedium Rothschildianum*, *Dendrobium Lowi*, and in the centre of the exhibit a fine plant of the rare *Cypripedium callosum Sanderæ*. Two specially distinct things in this group were the *Cattleya Gaskelliana corulea* and *Odontoglossum Hunnewellianum superbum* (Silver Banksian Medal).

Messrs. STANLEY MONKS & SON, Southgate, had a good group, that consisted of *Odontoglossum crispum*, *Cattleya Mossie*, including *C. M. Newtoni*, a superb flower, with rich dark orange-tinted lip, having a resemblance to the variety, *C. M. aurantiaca*; *C. Mendeli*, *Lælia tenebrosa*, the singular-looking *Oncidium unicolor*, *Lælio-Cattleya* × *Schilleriana*, *Cattleya Forbesii*, *Phalenopsis grandiflora*, *Miltonia vexillaria*, and *Cypripedium Curtisii* (Bronze Banksian Medal).

Messrs. B. S. WILLIAMS & SON, Holloway, staged an excellent group, in which were good varieties of *Cattleya Gaskelliana*, the best and most distinct of which were *amena*, *plumata*, and *purpurea*. The forms of *C. Mendeli* were also distinct. Other plants remarked were *Dendrobium nutabile*, *Epidendrum vitellinum majus*, *Lælia tenebrosa*, and the orange-red-coloured hybrid of it, *L. C. cinnabrosa*, *L. purpurata*, *Odontoglossum crispum* of fine quality, *Oncidium lamelligerum*, *O. macranthum*, *Thunia Bensonie*, *T. Marshalliana*, *Acriodes multiflorum Lobbi*, *A. m. roseum*, *Vanda suavis*, and a number of fine *Cypripediums*.

Messrs. CHARLESWORTH & CO., Heaton, Bradford, showed *Cattleya Mendeli* Princess Victoria, a charmingly-formed white flower with a very faint tinge of pink; *Cattleya dolosa*, *Lælia* × *cinnabrosa*, a fine *Lælio-Cattleya* × *Aphrodite*, and a grand example of the pure white *Cattleya Mossie Wagneri*, having numerous flowers (Cultural Commendation).

De B. CRAWSHAW, Esq., Rosfield, Sevenoaks (gr., Mr. S. Cooke), showed *Odontoglossum crispum* "Seraphim," and *O. C. "Cherubim,"* two superb white forms, excellently grown.

The Right Hon. Lord BURTON, Bangmore Hall, Burlington-Trent (gr., Mr. W. Bennett), showed a fine *Cattleya Mendeli*, with five flowers on a spike; and *C. labiata Warneri*.

R. I. MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), showed *Masdevallia angulata*, a fine species, with large purple-tinted flowers.

W. P. BURKINSHAW, Esq., Hesse, Hull, showed *Odontoglossum crispum* *Amelia*, a good flower tinted with rose, and bearing effective blotches. W. A. BILNEY, Esq., The Grange, Weybridge (gr., Mr. C. Whitlock), showed *Cattleya Gas-*

kelliana Mrs. W. A. Bilney, a grand flower, with the dark brilliant colouring usually seen in *C. labiata Warneri*. Mrs. TEMPLE, Leyswood, Groombridge (gr., Mr. Bristow), sent a fine example of *Cologneya Dayana*, with many long drooping spikes of flowers. W. C. WALKER, Esq., Winchmore Hill (gr., Mr. Geo. Cragg), showed *Burlingtonia fragrans major*, with several spikes of large white flowers.

Lieut.-Col. SHIPWAY, Grove House, Chiswick (gr., Mr. Walters), staged a group, in which were *Cattleya Mendeli* Mrs. Shipway, a charming white flower with claret-crimson lip, and a feather of purplish-crimson on the petals—very distinct; good *Lælia purpurata*, *Masdevallia Schlumi*, *Cypripedium Chamberlainianum*, *Brassia verrucosa*, &c. Mrs. J. T. HOLMES, Beechen Cliff, Bath, sent a peculiar form of *Cattleya Warseeiczii*. F. W. MOORE, Esq., Royal Botanic Gardens, Glasnevin, Dublin, sent the scarlet *Epidendrum pristis*, and *Gongora gratulabunda*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Carnation Lady Gerard.—See p. 16.

Carnation Trojan.—A first-class border variety, with large white blooms of fine form, smooth-petalled, and excellent calyx. From Mr. JAS. DOUGLAS, Great Bookham (Award of Merit).

Delphinium Sir Walter Scott.—A very fine purple-and-blue single-flowered variety, each bloom being about 2 inches across, and the spike long, stout, and densely flowered. From KELWAY & SON, Langport (Award of Merit).

Pelargonium Fire King.—A scarlet-flowered zonal variety, with curious stellate-like flowers, due in some measure to the petals being reflexed longitudinally, or fluted reversely. It is, therefore, described by some as "Cactus" flowered, and was figured in the *Gardeners' Chronicle*, June 3, p. 363, as seen at the Temple Show. From Mr. E. S. TOWELL, Llewot, Hampton Hill (Award of Merit).

Davallia illustris.—A handsome Fern with dense, overarching fronds, pinnae, finely cut, and of a pleasing light-green hue. As seen, the fronds in some instances, measured 3 feet in length by 1½ foot in width. The rachis is dark-brown approaching black. Shown by Messrs. J. VEITCH & SONS (First-class Certificate).

Draecena intricata Schneideri.—A dwarf form, with narrow, channelled, rigid leaves of a dark-green tint. Shown by Messrs. J. VEITCH & SONS (First-class Certificate).

Lælio-Cattleya × *Dominiana* "Fire King" (*L. purpurata* × *C. Dowiana*), from Mrs. BRIGGS-BURY, Bank House, Accrington (gr., Mr. Wilkinson). This is one of the finest of the *Lælio-Cattleyas*; sepals and petals bright purplish-rose, lip very large and broad, the front dark, velvety, ruby-red; the orange colour in the tube and fine reddish-purple veining, showing marked characters of *Cattleya Dowiana*.

Lælio-Cattleya × *Aphrodite eximia* (*L. purpurata* ♀, *C. Mendeli* ♂), from Messrs. JAS. VEITCH & SONS, Chelsea, sepals and petals dark rose, lip elongated and crimped, dark claret, crimson with narrow whitish margin.

Odontoglossum crispum "Sera phim," from DE B. CRAWSHAW, Esq., Sevenoaks (gr., Mr. S. Cooke). A grand white flower, all the parts broad, a peculiar feature being the clear yellow disc to the lip.

Odontoglossum × *Harryano-crispum*, from Sir FREDERICK WIGAN, Clare Lawn, East Sheen (gr., Mr. W. H. Young). A distinctly intermediate form, with French-white flowers, prettily marked with purplish rose-flush and blotches.

AWARD OF MERIT.

Lælia tenebrosa, "Victor Warburton" from A. WARBURTON, Esq., Vine House, Haslingden (gr., Mr. Lofthouse). A very distinct form allied to *L. C. "Walton Grange,"* sepals and petals lemon-yellow, faintly tinged with purple. Lip bluish-white, with pure rose-coloured markings in front.

Cattleya Mossie Lawrencei, from Sir TREVOR LAWRENCE, Bart. (gr., Mr. W. H. White). A beautiful pure white form, nearest to *C. M. Wagneri*, but with a slight pencilling of rose over a small area in the front of the lip.

Odontoglossum crispum purpurascens, from Sir TREVOR LAWRENCE, Bart. Allied to *O. C. "Starlight."* Flower fine in form, white, tinged with rose, and having many rose purple spots, and a few larger brownish blotches.

Cattleya Gaskelliana Formosa, from Messrs. JAS. VEITCH & SONS. Flowers fine in form, white, with faint blush tint; disc of lip cowslip-yellow, the front having a tinge of rose colour.

Masdevallia × *Rushtonii* (*racemosa* ♂, *ignea* Eeckhautei ♀), from Captain T. C. HINCKS, Richmond, Yorks. A pretty hybrid, with the general characters of *M. racemosa* (Cressii), but more robust. Flowers orange, tinted scarlet.

BOTANICAL CERTIFICATES.

Gongora gratulabunda, from F. W. MOORE, Esq., Glasnevin, Dublin. Flowers whitish, with rose purple spots.

Eria acervata, from Sir FREDERICK WIGAN, Bart. (gr., Mr. W. H. Young). An elegant white-flowered species.

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. Jos. Cheal, O. Reynolds, W. Ponpart, A. F. Barron, E. Shaw Blaker, Jas. H. Veitch, A. H. Pearson, Alex. Dean, S. Mortimer, H. Balderson, Geo. Wythes, Geo. Th. Miles, J. W. Bates, F. Q. Lane, J. Willard, Robt. Fife, J. Wright, and M. Gleeson.

Messrs. J. VEITCH & SONS, Chelsea, showed a plant of their new Strawberry, Prolific, bearing numerous fruits in all stages of development (Vote of Thanks).

Mr. TAYLOR, gr. at Penbrdw, Nannereck, showed Tomato Klondike—Ham Green × Early Ruby, a seemingly prolific variety, with solid, smooth globose fruits, of a deep crimson tint when quite ripe.

C. A. PEARSON, Esq., Frensham Court (gr., Mr. J. PREWITT), showed a collection of fruit, consisting of Royal Sovereign Strawberry, fine and large; Hale's Early Peach, extremely well coloured, even for this variety; a dish of very fine Early Rivers' Nectarines, Royal Jubilee Melon, an oval fruit of a creamy colour, and with fine netted rind; and very nice bunches of Black Hamburgh and Foster's Seedling Grapes (Silver Banksian Medal).

Mr. HAYNES, The Gardens, Carlton, R.S.O., Yorkshire, showed a new Cucumber, named Sir Roger, smooth, spineless and short necked.

Several exhibits of Melons were remarked, but no award was made.

Mr. T. Coomber, gr. to Lord LLANGATTOCK, The Hendre, Moomouth, showed fifteen Queen Pineapples, some of them being very creditable specimens, the crowns in every instance being small, a feature showing good culture. One sees such exhibits all too seldom at these meetings (Silver Knightian Medal).

Big baskets filled with extremely fine fruits of Monarch and Mentmore Strawberries came from Messrs. LANTON BROTHERS, Bedford.

Messrs. T. RIVERS & SONS, Sawbridgeworth, Herts, exhibited a quantity of extremely fine fruits from trees grown under glass, viz., Rivers' Gladstone, Thomas Rivers, Princess of Wales, Grosse Mignonne Peaches; Victoria and Byron Nectarines; Stint and the Czar Plums; Elton Early Rivers and Frogmore Bigarreau Cherries. The Peaches were of enormous size, and the other fruit most appetising in appearance. This firm likewise showed six trees in pots of the Thomas Rivers and Sea Eagle Peaches, three trees of each. These were stated to have been forced for eight years in succession. The crop in each instance was a heavy one, and may have been more so, and the fruits were above the average size, and of high colour (Silver-gilt Banksian Medal).

SHIRLEY AND SURROUNDING DISTRICTS.

JUNE 19.—The monthly meeting of the above Society was held at the Parish Rooms, Shirley, Southampton, on the above date, the president, W. F. G. SPRANGEN, Esq., J.P., presiding. The lecturer was Mr. W. Wheeler, of Messrs. Hugh Low & Co.'s Nurseries, Clapton, and was under the auspices of the Southampton County Council, Technical Education Committee. The subject of Mr. Wheeler's lecture was "Ferns and Palms." Ferns, Mr. Wheeler considers the most useful and beautiful plants for various decorative purposes, and gave valuable hints on the cultivation of the former from spores, or the latter from seeds, and growing on into useful plants, grouping the varieties for decorative uses; the best kinds of Ferns for cutting purposes, for indoor decoration, or for the conservatory; and lastly, British Ferns for growing outdoors, and in frames or sheltered nooks and corners where nothing else would succeed so well. Palms were treated in the same style, and the best kinds for general purposes of decoration were mentioned.

The exhibits included Roses from Messrs. W. H. Rogers & Son, Limited, Red Lodge Nursery; and from Messrs. Hullet, Curtis, Mankelov, Tidridge, and Gardener; Ferns and Palms, Messrs. Curtis & Biggs; a grand bit of *Cattleya Mendeli* by Mrs. A. J. Keates, Rownhams House; seedling *Pelargonium* by Mr. E. Cozens; and herbaceous perennial plants by Mr. B. Ladhams, of the Shirley Nurseries.

ISLE OF WIGHT ROSE.

JUNE 21.—The annual exhibition of Roses took place at Shanklin, at the date given. Entries were many, and the quality excellent.

In the open classes the prizes fell to outsiders, viz., the veteran growers, B. R. CANT, J. PRINCE, D. PRIOR & SON, F. CANT, and PAUL & SON.

For sprays, bouquets, and buttonholes, C. PRINCE, Mrs. J. KENT, and the Rev. A. T. RICHARDSON were the most successful. In the amateur classes, open to all, the Rev. J. E. JEANS, Miss CARTER, and R. E. WEST, were the most successful.

In the Isle of Wight classes there was keen competition for the Isle of Wight Silver Challenge Cup, which was won by Mr. J. LEE-WHITE, East Cowes, with a splendid stand of twenty-four Roses, distinct varieties. The same exhibitor was also successful in winning the Queen's Gold Medal for twelve distinct Roses; and a Silver Medal for the best H. P. from the Island exhibits with Mrs. Sharnham Crawford; and a Silver Medal for the best Tea, with Medea, which also secured the exhibitor the Isle of Wight Certificate for Cultural Merit. Mrs. CHORNTON secured the Silver-gilt Medal for twelve distinct Teas.

The show was the most successful one ever held by this Society, a fact that reflected much credit upon the honorary secretaries, the Rev. J. E. JEANS and Mr. E. V. MATTHEWS.

Mr. G. W. PIRN, of Uckfield, showed his new Rose Sunrise; and Mr. J. PRINCE showed Alexander Hill Gray, a Rose which will probably be found an acquisition to the exhibition table.

On Thursday, June 22, the members of the Isle of Wight Horticultural Improvement Association had a most pleasant

and enjoyable outing, at the invitation of the Rev. J. E. Jeans, to visit his gardens at Shorwell Vicarage, which proved a very agreeable one.

WINDSOR ROSE AND HORTICULTURAL.

JUNE 24.—The eighth annual exhibition of the Windsor and Eton Rose and Horticultural Society was held in the private grounds around Windsor Castle on the above date, the weather being very favourable for the holding of a show of this kind.

The Queen, accompanied by H.R.H. Princess Christian and H.H. Princess Victoria of Schleswig-Holstein, honoured the show with her presence during the afternoon, and drove through the principal tent, where the displays of the chief prize-winners had been arranged for Her Majesty's inspection. Several of the stands of cut Roses were afterwards taken to the Castle, and were graciously accepted by the Queen. Although not very numerous, the plants, fruits, and flowers generally were a high order of excellence. One end of the centre of the large tent was occupied by an imposing group of stove plants, sent by Messrs. SANDER, including many of their recent introductions.

GROUPS.

At the opposite end, Mr. Ballantyne, gr. to Baron SCHRODER, Tee Dell, Egham, had arranged a group of choice Orchids, conspicuous amongst them being *Cattleya gigas*, *Thunia Veitchii* superba, *Disa Veitchii*, and *Cypripedium Mastersianum*. The middle of the table was filled with splendidly-coloured specimens of *Crotons* from the Royal Gardens, Frogmore. Messrs. VEITCH were represented by an exceedingly bright display of hardy herbaceous flowers from Langley. An attractive group of well-grown fancy *Pelargoniums*, and a group of Roses in pots, from Mr. C. TURNER, of Slough, was much admired.

Messrs. CUTBUSH's Carnations were in evidence; and Messrs. WALLACE, of Colchester, showed a beautiful lot of *Ixias*, *Liliums*, *Calochorti*, &c. Messrs. FITT, of Windsor, and JACKMAN, of Woking, were other exhibitors, the former of some charming cut flower decorations, the latter of Roses, Sweet Peas, *Pyrethrums*, &c. Mr. CANNELL, of Swanley, had a nicely-arranged circular group of *Cannas*, containing several fine varieties.

The best group of plants in the competitive class was that staged by Sir CHAS. PIGGOTT, Bart., who was deservedly given 1st honours. A very pretty effect was obtained by using the flowering shoots of *Humea elegans*, *Fraxinea ramosa*, and *Oncidium*, all called gracefully over the *Codiaeums*, *Liliums*, *Clerodendron fallax*, *Caladias*, and *Gloxinias*. A. E. GOVETT, Esq., gained the 2nd prize.

SPECIMEN PLANTS.

The competition in the class for specimen plants was keen, and some excellent *Cyatheas*, *Davallias*, *Platyneriums*, *Ixias*, and *Crotons* were exhibited.

The pleasing colours in the displays of Sweet Peas added not a little to the beauty of the show. For twelve bunches of Eckford's varieties, Lady MARIE CURRIE took premier place.

ROSES.

Mr. B. R. CANT, of Colchester, was very successful with cut Roses, being 1st in the class for forty-eight blooms, distinct; the blooms of Hon. E. Gifford, Mrs. J. Laing, and Marchioness of Downshire being among his finest. To the first-mentioned, the Silver Medal of the Society was awarded, as being the best Rose in the show. Messrs. PRIOR & SON, Colchester, also had some excellent flowers in their stand, to which a 2nd prize was awarded. Mr. G. PRINCE, of Oxford, had the best eighteen Teas or Noisettes. Messrs. F. CANT & CO., Colchester, following closely with fine, deep blooms.

A beautiful stand of Mrs. J. Laing won for Mr. C. TURNER, the 1st prize in the class for twelve H.P.'s or H.T.'s in one variety; whilst Mrs. W. J. Grant, finely-coloured, took 2nd place for Mr. B. CANT.

Comtesse de Nadaillac was well shown by Mr. G. PRINCE, Oxford, his exhibit securing for him the 1st prize for twelve single trusses, Teas or Noisettes. Messrs. PAUL & SON, Cheshunt, showed eighteen bunches of garden Roses, including the striped *Rosa mundi*, *Carmine Pillar*, *Royal Scarlet*, &c., and were awarded the 1st prize. For twenty-four distinct, single trusses, R. E. WEST, Esq., was 1st; and C. ROMAINE, Esq., 2nd.

Mr. J. W. PIPER, Uckfield, showed his Tea-scented Rose Sunrise, and also Carnation flowers in variety. Mr. E. SUGG, Maidenhead, contributed a large collection of bunched Roses and herbaceous flowers. One tent was devoted wholly to table decorations, and the entries were very numerous. *Aquilegias*, Sweet Peas, and Poppies, *Smilax*, *Asparagus*, and various grasses were chiefly made use of in the embellishment of the tables.

FRUIT

exhibits were few, nevertheless very creditable Black Hamburgh Grapes and Strawberries were staged. Lord BOSTON, L. J. BAKER, Esq., and Miss RIDGE, were the principal prize-winners.

For a collection of vegetables grown from seeds supplied by Messrs. FITT, Hon. C. JOLI took 1st prize. The Duke of Albany Peas and Cauliflowers were here uncommonly good.

The same exhibitor also gained the 1st prize for vegetables grown from Messrs. Carter's seeds, H. H. T.

CROYDON HORTICULTURAL.

JUNE 28.—The thirty-second annual show of this Society was held on the above date in a meadow at Broad Green, West Croydon. As usual at this exhibition most of the interest was centred in the competitive Rose classes. Somehow or other the Croydon Society generally manages to get some good Roses, always as good as the average of the season, and there was no exception to this rule on Wednesday last. The quality generally we hope to see beaten at the Palace on Saturday, but having said this much the blooms may be described as very satisfactory. In the premier class there was a collection of beautiful Roses from Messrs. PRIOR & SON, who were disqualified for duplication. This was the best exhibit in the Rose classes.

In the amateurs section there were competing Mr. T. B. HAYWOOD and Mr. PHILIP CROWLEY, both of whom gentlemen are well known to horticulturists in connection with the finances of two important Societies. Apart from the Roses there were good specimen plants shown, and groups of miscellaneous plants, *Fuchsias*, *Pelargoniums*, *Gloxinias*, *Ferax*, &c. There were few exhibits of Fruits or of Vegetables. Table decorations were very pretty, the Shirley Poppies being appropriately a distinguished feature in these arrangements.

ROSES.

OPEN CLASSES.

The most important class was for forty-eight Roses, distinct, and the 1st prize, including the National Rose Society's Silver Medal, was won by Messrs. F. CANT & CO., Braiswick Nursery, Colchester. Varieties that had most effect in this stand were *Ethel Brownlow*, Rev. Allan Cheales, *Marie Van Houtte*, Comtesse de Nadaillac, Duke of Teck, *La France* de 1899, *Catherine Mermet*, *Auguste Rigotard*, Captain Hayward, *Helen Keller*, Charles Lamb, *Madame Cusin*, *Souvenir d'Elise*, and *Marchioness of Downshire*. In the second place, Messrs. G. & W. H. BURCH, Peterborough, were successful, and included nice specimens of *General Jacqueminot*, *Ulrich Brunner*, and *Jeannie Dickson*.

The exhibit in this class from Messrs. D. PRIOR & SONS, Colchester, was unfortunately not in accordance with the schedule. Thus was lost a 1st prize.

The best exhibit of twenty-four varieties in triplets was from Messrs. D. PRIOR & SON, the Roses being very fresh, and some of the triplets really very fine. Such were *Prince Camille de Rohan*, Mrs. John Laing, *Catherine Mermet*, Capt. Hayward, *Kaiserin A. Victoria*, *Ulrich Brunner*, *Duchess of Bedford*, Mrs. W. J. Grant, *Marquise Litta*, and *Duchess of Bedford*. Messrs. G. & W. H. BURCH were 2nd, and FRANK CANT & CO., 3rd.

Twenty-four Roses distinct were best shown by Mr. A. C. GREEN, Gt. Horkeley, Colchester. 2nd Mr. THOS. BUTCHER, Shirley.

Teas and Noisettes.—Messrs. D. PRIOR & SON showed capitally in a class for eighteen Teas or Noisettes, distinct, all of the flowers possessing quality. The varieties were *Innocente Pirola*, *Marie Van Houtte*, *Souvenir de S. A. Prince*, *Souvenir d'un Ami*, *Niphotes*, *Maman Cochet*, *Cleopatra*, *Caroline Kuster*, *Bridesmaid*, *Bride*, Comtesse de Nadaillac, *Madame Hoste*, *Alba rose*, *Jean Duclier*, *Catherine Mermet*, *Maréchal Niel*, *Ernest Metz*, and *Amanzone*. Messrs. FRANK CANT & CO.'s blooms were too far expanded—these were 2nd; and Mr. A. G. GREEN, whose flowers were very small, 3rd.

Mrs. Jno. Laing was the best H.P. shown in dozens, and the exhibitors were Messrs. D. PRIOR & SON; Messrs. F. CANT & CO. were 2nd, with Mrs. W. J. Grant; and Mr. A. G. GREEN 3rd, with Mrs. Jno. Laing.

Messrs. PRIOR & SON were 1st also for the best Tea in dozens, showing *Souvenir de S. A. Prince*; Miss Edith GIFFORD, from Messrs. BURCH, being 2nd.

The only collection of twelve bunches of garden or decorative Roses was a collection from Mr. FRANK CANT, Braiswick Nursery, Colchester.

AMATEURS' CLASSES.

The Challenge Cup, value 25 guineas, was won by F. W. CAMPION, Esq., Colley Manse, Reigate, who had a collection of thirty-six distinct Roses of much merit. The best in the group were *Souvenir d'Elise Vardon*, *La France*, Mrs. P. Morgan, a very pretty Tea; Mrs. John Laing, *Cleopatra*, François Michelin, *Catherine Mermet*, *Mme. Graham*, *Madame Cusin*, Hon. E. Gifford, *Maman Cochet*, *Madame de Watteville*, *Bridesmaid*, *Marquise Litta*, and *Francisca Kruger*. The collection was a very fine amateurs' exhibit. The 1st prize was won by E. M. BETHUNE, Esq., Deane Park, Horsham; 3rd, R. E. WEST, Esq., Reigate, and there were two other competitors.

The only collection of twelve Teas or Noisettes, distinct, was shown by E. MAWLEY, Esq., Rosebank, Berkhamsted, his varieties being *The Bride*, *Anna Olivier*, *Souvenir de S. A. Prince*, *Souvenir d'un Ami*, *Bridesmaid*, *Caroline Kuster*, Comtesse de Nadaillac, Hon. Edith Gifford, *Madame Willermot*, *Maréchal Niel*, *Madame Bravy*, and Mrs. E. Mawley.

E. M. BETHUNE, Esq., won the class for eighteen Teas or Noisettes in not fewer than twelve varieties, and showed some pretty blooms of moderate size; 2nd, T. P. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr. Mr. C. J. Salter). The last-named exhibitor was the only exhibitor of six Roses in triplets, and won 1st prize for the best Rose shown in dozens, having some very commendable blooms of Mrs. J. Laing. The same variety was shown by F. W. CAMPION, Esq., who was 2nd.

Twelve Roses, distinct, were capital from Mr. E. MAWLEY, who was well in front of Mr. ALFRED SLAUGHTER, Jarvis Villa, Steyning.

G. W. COOK, Esq., The Briars, North Finchley, won the class for four trebles, with excellent blooms of Mrs. J. Laing, Captain Hayward, *Marquise Litta*, and Mrs. W. J. Grant. The same exhibitor won for nine Roses, distinct, and one of these being Mrs. J. Laing, was awarded the Silver Medal for the premier bloom in the amateurs' classes; 2nd, D. FRESHFIELD, Esq., The Wilderness, Reigate.

The best exhibit of six bunches of garden Roses was one from F. W. CAMPION, Esq., his varieties being *Gloire de Polyantha*, *L'Idéale*, *Réve d'Or*, *Reine Olga*, *Wurttemberg*, *Crimson Rambler*, and *Polyantha grandiflora*. There were two other collections.

MISCELLANEOUS CLASSES.

The 1st prize for a group of miscellaneous plants, arranged for effect, was won by Mr. J. Harris, gr. to the popular treasurer of the Royal Horticultural Society, Philip CROWLEY, Esq., and from the same garden came the best collection of six specimen Ferns; and the best specimen of an ornamental foliage plant and a flowering plant.

At Croydon there exists a class for a table of plants arranged according to the taste of the exhibitor. Mr. J. Slater, gr. to F. LING, Esq., Park Hill Road, won 1st prize, principally for the choicer description of the plants employed. Some *Odontoglossums* were effective, and half-a-dozen or so plants of *Celsia* were as pretty in effect as *Oncidiums* would have been. 2nd, Mr. F. Bishop, gr. to E. D. MORTON, Esq., Hayling Park Road, Croydon.

Vegetables were not shown in large quantity. The class for nine dishes was won by Mr. J. JOHNSON, gr. to Mrs. CROWLEY, Bramley Oaks, who had very nice Tomatoes, Peas (*Exonian*), Cauliflowers, Turnips, Carrots, and Cabbage.

Mr. C. Perrett, gr. to Mrs. FULLER, Duppas Hill, beat Mr. G. Eales, gr. to J. GLAISHER, Esq., Heathfield Road, Croydon, for six dishes.

T. B. HAYWOOD, Esq., won 1st prize for twenty-four varieties of cut flowers, and the exhibit was a very choice one, being composed almost exclusively of Orchids and *Cannas*.

The best plants suitable for table decoration was shown by J. GLAISHER, Esq., Heathfield Road, Croydon.

ALFRED SLAUGHTER, Esq., won 1st prize for a collection of twenty-four Roses, distinct, but had no rivals in the class.

The best collection of twenty-four bunches of hardy cut flowers was shown by H. G. FILEY, Esq., Penanroy, Bramley Hill, Croydon.

Among other prize-winners were Mr. C. Perrett, gr. to Mrs. FULLER, Duppas Hill, who won for *Gloxinias*, *Fuchsias*, &c.; Mr. G. LEWRY, gr. to Mrs. BLAKE, Duppas Hill, who had excellent *Gloxinias*; Mr. J. GALVIN, gr. to H. BUTCHER, Esq., Russell Dene, Purley (Ferns), &c.

HONORARY FERRITES.

Messrs. WALLACE & CO., Colchester, had an exhibit of hardy flowers; Messrs. JOHN LAING & SONS, Forest Hill Nurseries, showed a collection of cut Roses, giving a prominent place to the most popular Mrs. Jno. Laing. The same firm contributed an imposing group of stove and greenhouse plants, tuberous *Begonias*, and a group of hardy trees and shrubs in pots.

Hardy flowers were shown by Messrs. J. CHEAL & SONS, Lowfield Nurseries, Crawley. A group of small Cacti and other succulents in pots, were from Mr. C. A. BLOCH, Brighton Road, Croydon. Messrs. H. CANNELL & SONS, Swanley, again displayed the glory of *Cannas*.

Mr. Jno. R. BOX, West Wickham and Croydon, showed some very good tuberous *Begonias*, in association with stove and greenhouse plants.

RICHMOND HORTICULTURAL.

JUNE 28.—Richmond, the gayest of suburban towns, held its twenty-fifth annual horticultural exhibition on Wednesday last, in the Old Deer Park, and, as usual, it was visited by a very large and fashionable company. The show was opened by Sir W. T. THISELTON DYER, Director of the Royal Gardens, Kew, who was accompanied by Lady Dyer, and the exhibition was graced during the afternoon by the presence of H. R. H. the Duchess of York.

The exhibition was a very satisfactory one, and the accommodation provided by four spacious marquees was sufficiently adequate to allow everything to be well displayed. Roses were extremely fine. Several of the premier classes invited trebles, and the veteran Mr. B. R. CANT, who won in the largest class, and Messrs. D. PRIOR & SON, particularly had really fine collections. Plants, and arranged groups of plants, were also a good feature, many of the non-competitive groups being uncommonly interesting. Orchids were rather better than we have previously observed them at Richmond; in fact, most creditable to a suburban society. Fruits, including Grapes, were of the highest quality. Vegetables were shown in considerable quantity. The local florists, assisted by a number of amateurs, made a splendid display of table decorations and other florists' devices, and these were a source of great interest to the visitors, and filled the whole of the centre of one tent.

ROSES.

The premier open class was for forty-eight varieties in trebles, and Mr. BENJ. R. CANT of Colchester won for the second time the handsome Challenge Cup, value 25 guineas. It was a fine collection, the varieties being *Helen Keller*, *Ulrich Brunner*, *Lady Mary Fitzwilliam*, *Duchess de Monny*, *Duke of Fife*, *Madame Cusin*, A. K. WILLIAMS, *Madame de Watteville*, *Comte de Rainaud*, Mrs. SHARMAN CRAWFORD, Rev. Allen Cheales, *Kaiserin Augusta Victoria*, *Marie Verdier*, *La France*, *Tom Wood*, *Bridesmaid*, *Madame Gabrielle Litta*, &c.

Dr. Andry, Marquise Litta, Maréchal Niel, Madame Eugénie Verdier, Le Havre, Souvenir d'un Ami, Dupuy Jamain, Mrs. Cocker, Auguste Rigotard, Souvenir Madame Eugénie Verdier, White Lady, Countess of Rosebery, Fisher Holmes, Souvenir de S. A. Prince, Gustave Piganeau, Mrs. John Laing, Suzanne-Marie Rodocanachi, Duke of Edinburgh, The Bride, Marchioness of Downshire, Catherine Mernut, Capt. Hayward, François Michelin, Mrs. W. J. Grant, Camille Bernardin, Crown Prince, Muriel Grahame, Madame Cadeau Ramey, Caroline Testout, Duke of Wellington, Duke of Edinburgh, and Golden Gate. Messrs. Prior & Son, Colchester, were excellent as 2nd winners; and Messrs. F. Cant & Co., Braiswick Nurseries, Colchester, 3rd.

Messrs. Prior & Son won the class for twenty-four trebles, distinct, and we noticed in the exhibit very fine specimens of Madame Gabrielle Luizet, Captain Hayward, La France, Helen Keller, Duchesse de Morny, Ulrich Brunner, Mrs. John Laing, Marquise Litta, &c.; Mr. Benjamin R. Cant was a good 2nd prize-winner, and exhibited a collection of even, bright-looking trebles; Messrs. F. Cant & Co., were 3rd.

Mr. B. R. Cant won for twelve trebles, but was closely followed by Messrs. D. Prior & Son, and Mr. Chas. Turner, Royal Nurseries, Slough. There were several other exhibitors. The best H.P. in dozens was Mrs. John Laing, shown by Mr. Chas. Turner in splendid condition, large, full, and of good colour. The same variety was placed 2nd from Mr. B. R. Cant; and Prince Arthur, from Messrs. D. Prior & Son, was 3rd.

Marie Van Houtte, from Messrs. D. Prior & Son, was the best Tea in dozens, and is really a very charming variety; 2nd, Madame de Watteville, from Messrs. Frank Cant & Co.; and 3rd, The Bride, from Mr. W. Vause, Leamington Spa.

In the amateurs' class for twenty-four distinct single trusses, the most successful exhibitor was J. P. Kitchen, Esq., Manor House, Hampton (gr. Mr. C. Warwick), the specimens shown being of moderate size, but pretty. W. C. Romaine, Esq., The Priory, Old Windsor (gr. Mr. J. Guttridge), was 2nd.

The 1st prize for twelve single trusses, distinct, was won by W. C. Romaine, Esq., his best blooms being Kaiserin A. Victoria, Madame Cusin, and Madame G. Luizet; 2nd, J. P. Kitchen, Esq.

In the local classes, James Wigan, Esq., Cromwell House, Mortlake (gr. Mr. Wm. Jones), won a class for eighteen blooms, distinct, very easily; and likewise a class for twelve single trusses.

ORCHIDS.

The best collection of six exotic Orchids, was from H. Little, Esq., Baronshalt, E. Twickenham (grower, Mr. A. Howard). He had Cattleya Warneri superba, a very fine plant of Vanda teres, Cattleya Mendeli, well bloomed, C. Mossiae, a good variety, as well as being freely bloomed; Vanda suavis Veithei, and Dendrobium suavisimum. The 2nd place was taken by Sir F. Wigan, Bart., Clare Lawn, East Sheen. He had a nice plant of Cypripedium Rothschildianum, Cattleya gigas Sanderiana, Miltonia vexillaria, Phalenopsis grandiflora, &c.

H. Little, Esq., had a gorgeous group of Cattleyas, Cypripediums, Dendrobium, Odontoglossums, &c.

PLANTS.

A collection of Stove and Greenhouse plants in flower was shown finely by Mr. Vause, Leamington. He had Bougainvilleas Sauderi and Cypheri, Erica ventricosa grandis, Aphellexis macrantha Barnesii, Anthurum Scherzerianum, &c. Mr. Vause was also successful for six fine foliage plants.

Sir Fred. Wigan, Bt. (gr. Mr. Want), had a splendid collection of six exotic Ferns, the plants being of considerable size, and including Davallia Mooreana in a very pretty specimen. From the same garden came the best group of miscellaneous plants in a special class; the Orchids and Carnations adding much to the effect of the group; 2nd, J. W. Harker, Esq.

The best Coleus were from W. Cunard, Esq., Orleans House, Twickenham (gr. Mr. J. Allsop). These were pyramidal specimens, about 3 feet to 4 feet high. The best Caladiums were also from this garden.

Six magnificent Palms were shown by W. Cunard, Esq., Twickenham, specimens 10 to 12 feet high. These and others in the same and similar classes helped greatly to furnish the centre of the large marquee.

A grand collection of eight Exotic Ferns was shown by A. Pears, Esq., Spring Grove, Isleworth (gr. Mr. W. Farr). His plants were Davallia bullata, D. filiensis, Alsophila australis, Nephrolepis exaltata, Phlebodium aureum, Asplenium bulbiferum, &c.

Six specimen Pelargoniums (zonal) were shown in grand form by H. Little, Esq.; plants from 3 to 4 feet across, and very abundantly bloomed. His varieties were Model (white), Constance (pink), Alfred Ware (salmon scarlet), J. Miller (crimson), Mrs. Gordon (scarlet), and J. Pearson (pink). Also a 2nd prize for six plants of Ivy-leaved Pelargonium.

Mr. C. Turner, of Slough, showed beautiful collections of show, decorative and fancy Pelargoniums.

Nine Gloxinias were shown best by Mr. H. E. Fordham, Twickenham; and also by J. W. Harker, Esq., The Elms, Ham (gr. Mr. W. Castle), who won 2nd prize.

Mr. Farr, gr. to A. Pears, Esq., won 1st prize with a group of Malmaison Carnations.

Messrs. Paul & Son, Cheshunt, won a 1st prize for twenty-four bunches of hardy herbaceous or bulbous cut flowers, having beautiful specimens; and the 2nd prize was well won by an amateur, Rev. R. Hamilton, Cranbourne Vicarage, Windsor Forest.

FRUITS AND VEGETABLES.

The best collection of six dishes of fruit was from W. H.

Ellis, Esq., Clovelly, Hounslow, showing Grapes, black and white; Strawberries, Peaches, a Melon, and Sweet Cherries. C. E. Strachan, Esq., Gaddesden Place, Hemel Hempstead (gr. Mr. H. Folkes), was a close 2nd.

The best three bunches of Black Grapes were of Madresfield Court, from Mr. H. W. Blake, gr. to the Earl of Onslow, Clondont Park, Guildford. These were very remarkable for so early in the season, being very beautifully finished. Mrs. Tulk, Cowley House, Chertsey (gr. Mr. A. Sadler), was 2nd, with Black Hamburgh.

White Grapes were best from Mr. Thos. Osman, Ottershaw Park Gardens, Chertsey, the variety being Buckland Sweetwater. The same variety, but not so ripe, was 2nd, being shown by Mr. G. Lane, gr. to Miss A. S. Ridge, Highfield, Englefield Green.

The best local exhibitors of Grapes were Mr. W. Farr, who had 1st prize for Black Grapes, and Mr. A. Meaton, gr. to J. B. Hilditch, Esq., Asgill House, Richmond, who had 1st for Whites.

Mr. J. Allsop, gr. to W. Cunard, Esq., exhibited two dozen fruits of Early Rivers' Nectarine, and an equal number of Lord Napier.

The 1st of the special prizes offered by Messrs. Sutton & Sons, Reading, for a collection of VEGETABLES was won by J. B. Johnstone, Esq., Coombe Cottage, Kingston (gr. Mr. David Gibson). All of the produce was of very fine quality, the Duke of Albany Peas, also Magnum Bonum Canilliflowers. The Rev. O. L. Powell, Woburn Park, Weybridge (gr. Mr. A. Basile), was a wonderfully close 2nd, his Duke of Albany Peas being very exceptional. The same exhibitor won Messrs. Carter & Co.'s prize as was successful in Messrs. Sutton's competitions; and the Rev. O. L. Powell was 2nd.

The Society's class for a collection of twelve varieties of vegetables, was won by Rev. O. L. Powell; and he was followed by J. B. Johnstone, Esq.

NON-COMPETITIVE EXHIBITS.

There are always a fine lot of groups at Richmond exhibited by the trade and others. Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a very pretty ground group of Begonias and excellent Gloxinias; Messrs. T. S. Ware, Ltd., Hale Farm Nurseries, Tottenham, a group of their excellent Begonias, such as exhibited at the Temple Show; Messrs. Hill & Son, Lower Edmonton, made a splendid exhibit of Ferns; Messrs. Rivers & Son, Sawbridgeworth, had Peach and Nectarines similar to those noticed at the Drill Hall on the previous day; Mr. J. Russell, Kew Road Nurseries, Richmond, a group of Ivies in pots, a group of hardy trees and shrubs, and other exhibits; Messrs. Peed & Sons, West Norwood, a fine display of Gloxinias, Carnations, and Caladiums, the last-named forming a very large group; Messrs. Fromow & Sons, Chiswick, a group of Acers; Mr. W. Icton, Granard Nurseries, Putney, a group of fine-foliated plants; Messrs. Cutbush & Son, Highgate, a group of Malmaison Carnations; Messrs. Veitch & Sons, Royal Exotic Nurseries, Chelsea, cut Roses and hardy flowers; Messrs. J. Carter & Co., High Holborn, a miscellaneous group of plants; Mr. N. Thompson, Sheen Nursery, Richmond, Hydrangeas, &c.; Messrs. H. Cannell & Sons, Swanley, Stocks and Aquilegias; Messrs. Paul & Son, Cheshunt, Poppies and Roses; Messrs. Geo. Jackman & Son, Woking, hardy flowers, &c.

An interesting group of hardy Lilies, in pots, were shown by A. W. Wooten, Esq., Anyard Park Gardens, Twickenham. Lillium Henryi was upwards of 8 feet in height, and varieties of L. Thunbergianum one foot in height.

MARKETS.

COVENT GARDEN, JUNE 29.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Jersey, new, 6s. to 6s. 6d. per cwt; Cherbourg, cwt., 5s. to 6s. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—New Carrots from Essex and Bedfordshire are now coming in, also Potatoes from Kent and Lincoln. Asparagus is nearly over for this year, most of our home producers ceasing to cut about June 24. Strawberries now coming freely to market, some Royal Sovereigns being very good. The price fluctuates greatly even in the course of a single day. Some Apricots sent to market in sieves to-day appeared to be of good quality; Cucumbers are easier in price, and English Cherries are now coming in fast.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending June 24, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.

GARDENING APPOINTMENTS.

Mr. DANIEL CRUDEN, Foreman, Ballikinrain Castle, Balfour, Stirlingshire, as Gardener to R. REID, Esq., Killellan, Campbellton, N.B.

Mr. H. T. WILSON, as Head Gardener to H. A. PORTER, Esq., Cranbourne Court, Windsor Forest.

TRADE NOTES.

WE understand that Mr. G. Bethell, who has had the management of Mr. William Whiteley's nursery at Hillingdon Heath for the last seven years, has resigned, with the intention of going into business on his own account.

A "SINGLE-HANDED" GARDENER'S SITUATION: F. S. Have nothing to do with a man who has such a multiplicity of jobs for his gardener, many of them outside his strict business, and who pays a wage not much higher than that of a day-labourer. We do not consider that any good purpose would be served by publishing your letter.

BOOKS: W. B. *My Gardener* was written by Mr. H. W. Ward, gardener for many years at Longford Castle, Salisbury. The publishers were Eyre & Spottiswoode, East Harding Street, E.C., and not Walter Scott, Limited, as you suggest.—C. A. F. *The Nature, Uses, &c., of Fungi*, by Cooke; published at 5s. (International Scientific Series).—G. D. 1, The book you mention, published in 1801, will be of no service to you now; 2, We do not know the book; get Bentham's *Illustrations of the British Flora*, which is within the price you mention. It may be had of Lovell, Reeve & Co., Henrietta Street, Covent Garden; 3, The true *Juniperus bermudiana* is not, so far as we can make out, in cultivation now, unless, perhaps, at Kew. Several things are grown under the name.

FIGS IN UNHEATED HOUSE: E. S. G. Mouldiness attacks the fruits because the house has not sufficient ventilation afforded to rid it of the dampness arising from the border. Do not ply the syringe on the trees over-much whilst ripening fruits are hanging upon them—once a day, about 3.30 P.M., being sufficiently frequent even in bright weather; and in dull weather, merely damp the path. About 7 P.M. open the upper sashes or ventilators a little.

FRUIT TREES: W. H. M. We can only suppose that the nurserymen's land suits the trees in all respects, and the cultural treatment is correct. A great deal depends on the proper use of insecticides and fungicides, and the nursery trees being small, both pests are easily seen, and readily dressed with these things.

MOSS ON FLOWER POTS: F. de L. The growth of moss or of *Marchantia* on the soil in flower-pots may generally be taken as an indication of excess of moisture and deficient aeration, due to insufficient drainage. If the soil be heated before use, or if boiling water be thrown upon it, the germs would probably be killed.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—G. P. A variety of *Pyrus Aria*.—W. C. Z. The specimen seems to be *Tecoma* (*Bignonia*) *grandiflora*, although this plant does not grow into a bush unless compelled to do so.—W. F. *Gumm*, 1, *Carex ovalis*; 2, *C. hirta*; 3, *C. sylvatica*; 4, *C. vulgaris*; all these plants are known as Sedges.—C. A. F. *Agaricus campestris*. One of the numerous varieties of the edible Mushroom. See also "Books."—A. F. C. 1, *Ranunculus Lingua*; 2, *Salix repens*; 3, *Orchis maculata*; 4, *Spergula arvensis*.—G. H. S. 1, *Alstromeria pelegriana*; 2, *Hyacinthus comosus*; 3, *Veronica stricta*; 4, *Syringa Josikaea*; 5, *Picea Clanbrassiliana*; 6, *Juniperus communis*.—Palmeta. 1, *Campanula glomerata*; 2, *Dictamnus fraxinella*, white; 3, not found; 4, *Tradescantia virginica*; 5, *Epilobium montanum*, withered; 6, *Silene maritima*, double-flowered.—A. D. W. *Marchantia polymorpha*.

—J. W. *Syringa Josikaea*.—J. Symon. *Cytisus Laburnum Adami*, a graft variety of the common *Laburnum* worked with *Cytisus purpureus*.—E. M. 1, *Metrosideros floribunda*; 2, *Pernettya mucronata*; 3, *Diplopappus chrysophyllus*; 4, *Cornus* (*Benthamia*) *fragifera*.—Rockwork. 1, *Saxifraga umbrosa*, but no leaf sent; 2, *Sedum rupestre*; 3, *Senecio Deroniceum*; 4, *Deroniceum plantagineum*; 5, *Hieracium aurantiacum*; 6, *Crataegus cordata*.—K. B. 1, *Geranium pratense*; 2, *Lychnis vespertina*.—D. C. *Chimeneanthus occidentalis*, in fruit.—G. B. 1, *Lilium pomponium*; 2, *Philadelphus grandiflorus*; 3, *Geranium pratense*.—Map. *Astrantia major*.—G. C. 1, *Picea Alcockiana*; 2, *Citrus myrtifolia*; 3, *Philadelphus coronarius variegatus*; 4, *Escallonia macrantha*.—Junio. *Philomis frutescens*.—Kylemore Castle. *Pernettya mucronata*.—D. Y. L. C. 1, *Tilia americana*; 2, *Fraxinus excelsior* var. *monophylla*; 3, *Rhamnus alpinus*; 4, *Gaultheria Shallon*.—R. A. *Rubus nutkanus*.

NOTICE TO QUIT: H. G. and E. G. G. We think that you are entitled to a month's notice, or money in lieu thereof, notwithstanding you do not live on the premises, and there is no agreement. Gardeners are, in law, classed with domestic servants, and the employer has to pay male servant's tax for them, precisely as he must do in the case of the latter.

ODONTOGLOSSUM CRISPUM: F. de L. The spotting is not sufficient to render the variety of any particular commercial value.

PEARS CRACKED IN THE SKIN: W. H. M. Caused by a fungus, *Cladosporium dendriticum*; see *Gardeners' Chronicle*, November 5, 1898, for figures and description of this fungus. Try weak solutions of the Bordeaux Mixture twice or thrice during the summer as a preventative.

ROSE: G. S. Probably the effect of frost on the growing shoot.

SOLANUM DISEASED: W. W. The blisters along the veins of leaves bear a fungus resembling those which cause the "Anthracoses" on many plants. The position of the blisters is, however, just in the places where insects might harbour, although no insects were found. The plants might be thoroughly sprayed, especially on the under surface of the leaves, with potassium sulphide (½ oz. in each gallon of water). This will check the fungus, which is not a very serious one.

TOMATO: G. W. G. Probably the sleepy disease, but we cannot be sure without seeing the leaves.

TOMATOS DISEASED: S. H. The yellowish spots resemble those caused during the early stages of attack by certain fungi, although no fungus is yet evident. A good many greenly were present. The leaves look robust, and the check might easily be caused by a slight mistake in cultivation. A thorough spraying with dilute Bordeaux Mixture would do no harm; at the same time it looks as if ventilation (without draught), and less moisture on the foliage, would do much to help.

DIED.—On June 21, at his residence, Hounslow, WILLIAM, eldest son of the late STEPHEN SPOONER, of the Hounslow Nurseries, in the forty-seventh year of his age.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS' AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle

No. 654.—SATURDAY, JULY 8, 1899.

HYBRIDS AND THEIR RAISERS.

(Continued from vol. xxv, p. 292.)

THE HARDY AZALEAS.—Nearly all the really hardy Azaleas are deciduous, and with the exception of *A. pontica*, from the Levant, the few species which formed the parents of the great majority of the now numerous varieties, are natives of North America, and though introduced into Europe at intervals between the years 1734 and 1818, little was done for a long time by way of producing new varieties by hybridisation.

It would appear that the first person to attempt crossing the American Azaleas was a M. Mortier, a baker residing in Belgium. He commenced with the species *A. pontica* and *A. calendulacea*, and also impregnated the pollen of the former with that of *A. viscosa*. These attempts afforded this enterprising amateur a greater result than he anticipated, and the produce was the foundation of a new and very distinct section denominated *tardives*. In this class was displayed, it is said, all the variations of which the Azalea is capable. It appears quite certain that the Azalea became very popular in Belgium before it was so in this country, but the work of improvement has been carried on with great success in both countries. *A. viscosum* ♀, and *A. calendulacea* ♂, were crossed by Herbert, with the result that several varieties differing in colour were obtained. Gowen, of Highclere, crossed *A. viscosum* ♀ and *A. flavum* ♂, raising many new varieties.

In later years the Chinese *A. sinensis* and the Californian *occidentalis* have been judiciously mingled with the hardy sorts, the result being increased size, improved form, and clearer colours of the flowers, as well as prolonged duration. With not a few very handsome and attractive double varieties, Mr. Anthony Waterer proved highly successful in raising new forms at the Knap Hill Nursery, which are being much employed for forcing purposes. His son (see p. 27) is continuing the work of the father.

Belgian raisers are really too numerous to mention specifically. No one who has seen the magnificent displays at Ghent of the mollis and sinensis sections, can doubt the skill of our Belgian friends. *R. D.*

THE RHODODENDRON.

Probably *R. ponticum*, *R. catawbiense*, *R. caucasicum*, and a form known as *R. maximum* were the only hardy Rhododendrons cultivated in this country about seventy years ago which were deserving of being named. The marvellous improvement which has been effected in the hardy Rhododendron came chiefly through crossing the hardy, late-flowering species with the early Indian types, particularly the crimson *R. arboreum*; and it is no doubt to this species we are indebted for most of the shades of scarlet, crimson, and pink which are so much admired to-day. Of hardy varieties, the first results of hybridising in this direction was *R. altaclarensis* ×. [According to Dr. Focke, in *Die Pflanzen Mischlinge*, J. R. Gowen, of Highclere, Hants, in 1826, was the first to obtain seeds by crossing a hardy species with the pollen of *R. arboreum*, and from the seeds resulting he

raised 1800 seedlings, of which Lord Carnarvon retained a portion, the remainder being distributed among numerous English and Scottish gardeners, and possessors of gardens. The first correctly described and illustrated form of Gowen's crossings was *R. × altaclarensis*; and about the same date several English nurserymen obtained similar hybrids. Ed.] *R. Smithi* was raised by Smith of Norbiton, from *R. ponticum* × *R. arboreum*; and *R. Nobleanum* from *R. caucasicum* and *R. arboreum*. This latter cross produced dwarfier plants than the other hybrids of *R. arboreum*, and the flowers were chiefly crimson and red with purple spotting.

R. Russellianum × was first raised by Russell, of Battersea, and described by Sweet. Herbert raised seedlings from the same cross, viz., *R. catawbiense* and *R. arboreum*, giving it the name of *R. Haylocki*, a form which he described as being distinct, and easily recognised by means of the foliage.

It would be difficult to trace the various acts of hybridisation in exact chronological order, but among the first to make the attempt were Smith, of Norbiton; Russell, Battersea; Burn, Tottenham Park, Wilts; Mr. Carton and his employer, J. R. Gowen; Messrs. Anthony, John & Hosea Waterer, of Bagshot and Knap Hill; Messrs. Standish & Noble, of Bagshot; Messrs. Lee, of Hammer-smith; Baker, of Windlesham, and many others.

Mr. F. Burbidge, in his work on the *Improvement of Cultivated Plants*, points out that "as a rule, the sorts which have arboreum blood in their veins perish—generally root and branch. [If *R. arboreum* is the seed-bearer, but they are hardy if arboreum is used as the pollen-parent; and for this reason raisers have ceased to use it as the seed-bearer. Focke, in "*Die Mischlinge*." Ed.] Those of the *R. ponticum* strain are apt to sustain much injury to their blossoms. It is only those bred from *R. catawbiense* that escape with impunity, and these in a greater or lesser degree, in accordance with the influence of their ancestors, in cases where intermixture of blood has taken place."

In all the various crosses made during the last half century, attention has been paid both to the hardihood and habit of the parents, *R. catawbiense* being much employed as seed parent. From *R. caucasicum* appear to have been derived the early-flowering dwarf varieties, which are generally numerous in collections.

In a comprehensive sketch of the various crosses made with the Rhododendron, Mr. Burbidge states that Mr. John Standish, while gardener to the Duchess of Gloucester, at Bagshot Park, was one of the first to improve the hardy Rhododendrons with the Indian species, commencing soon after the introduction of *R. arboreum*, and one of his first hybrids was *altaclarensis* × (see above). Mention may here be made of *R. campanulatum* (*D. Don*) × *R. arboreum*, nearly allied species of which twelve examples were raised at Preston Hall. The crosses are hardy in the milder parts of these islands. Other crosses were *R. c.* and *R. cinnamomeum*, *R. glaucum*, and *R. ciliatum*; and further, a number of greenhouse hybrids. Another race came from the North American species; *R. maximum*, fertilised by pollen from *R. arboreum*, raised among others by Herbert, and in the second generation, a numerous and varied progeny was produced. *R. altaclarensis* was employed to fertilise varieties of this race with great success. A purple form of *R. ponticum* crossed with *R. altaclarensis* gave a series of beautiful varieties, and so on with other crosses. Work of this character was also carried on by MM. Lemichez on the Continent with considerable success.

Scarcely less satisfactory have been the series of crosses made with the Indian species, many glorious varieties of which are to be found in various parts of the country. The earliest-known forms, such as *R. arboreum*, *R. Nuttalli*, *R. Aucklandi*, *R. Edgeworthi*, &c., were crossed to some purpose, and among the progeny were *Sesterianum* = *R. formosum* ♀, *R. Edgeworthi* ♂, *R. Fortunei*

× *R. Thomsoni* (Luscombe); the well-known Countess of Haddington, raised by Mr. Lees, gr. to the Earl of Haddington, at Tynninghame. Mr. Fraser, Leith Walk Nurseries, obtained Duchess of Buccleuch; and Messrs. Isaac Davies & Son, of Ormskirk, obtained a new race by crossing the Himalayan species with hybrids of dwarf growth—such varieties as Countess of Sefton, Lady Skelmersdale, and others, resulting. J. Anderson Henry possessed a triple bastard from *R. Dalhousiae*, *R. ciliatum*, and *R. Nuttalli*. These require cold-house culture, and bloom early, freely, and finely.

Quite a new section of greenhouse Rhododendrons has been obtained by Messrs. James Veitch & Sons through a cross between the Javanese *R. javanicum* and *R. jasminiflorum*; from this originated a variety named *Princess Royal*; and the last-named, crossed with *R. Lobbi*, have given a numerous progeny of varied colours and sizes, including very fine double varieties. The name of Mr. John Heale (see p. 7, ante), of the Chelsea Nurseries, should be mentioned in connection with this race, the varieties of which require a warmer temperature than the Himalayan species, in which to flower.

Among German raisers the Messrs. Seidel, of Dresden, take a prominent place; and the Belgians have raised a distinct group which they call *Azaleodendron*, a name which recalls their origin. *R. D.*

THE PINK.

Mr. F. W. Burbidge is not alone in holding the opinion that "it is difficult to say with any degree of certainty exactly what plants were the parents of these old garden flowers," though some say it is a progenitor of *Dianthus plumarius*; while others assert that, like the Carnation, it originated from *D. caryophyllus*, or Clove-scented Pink. One of the latest raisers of laced Pinks is Mr. James Thurstan, and his experience in rearing seedlings, extending over many years, led him to the conclusion, from the variable character of the progeny, that the Carnation and Pink proceeded from one common parentage.

Thos. Fairchild, a gardener in London, raised, according to R. Bradley, at the commencement of the seventeenth century, a bastard *Dianthus* from *D. caryophyllus* ♀, and *D. barbatus* ♂, which since that time has gone under various names—Fairchild's Sweet William, The Mule, *D. hybridus*, hort., &c. Gaertner says, however, that such a cross is not successful.

It is recorded that previous to 1772 there were but four sorts of Pinks, and these of little note, being cultivated only as common garden flowers. A Mr. James Major, at the time gardener to the Duchess of Lancaster, in the South of England, saved some seed in 1771, and from it reared several plants, which, blooming the next season, one out of the number proved to be a double flower, with laced petals, at which he was agreeably surprised. He was advised to increase the stock on one variety, and sold plants to the public under the name of Major's Duchess of Lancaster, the orders for which amounted to the sum of £80. It is probable that no new Pink raised since made such a sum as that. A Pink named *Lady Stoverdale* is said by Maddock to have been the first laced Pink; but there is on record the testimony of Mr. Major that *Lady Stoverdale* was not raised by him till two years after his Duchess of Lancaster, it being a seedling from it.

Our laced Pinks of the past forty years have originated, in many instances, from careful fertilisation of varieties either to obtain a perfect red or perfect purple lacing, these being the two shades of colour on the edge. Those who have mostly contributed to the lists of named sorts have been Looker, Dr. Maclean, of Pea fame; Hale, Bragg, Norman, Turner, Hooper, the Rev. Charles Fellowes, Paul, &c. But this fragrant subject, as an exhibition flower, has fallen upon evil days, and is now rarely seen in complete laced character.

There are now many distinct and showy border varieties of considerable merit which are much

grown for cutting purposes, raised by Messrs. Hooper, Dean, Ladhams, Lakin and others, generally compact in growth, and very free of bloom. *R. D.*

THE CARNATION.

Dethycke, in his *Gardeners' Labyrinth*, published in 1586, and Parkinson in his *Paradisus*, published in 1629, divided Carnations as then grown into two classes, viz., Carnations, being the largest in flower and leaf; and Gilloflowers, the latter being of less size in both cases. Parkinson says they were then "the chiefest flowers of account in all our English gardens." It is held that the first improved varieties were brought to this country from Flanders by the Protestant worsted manufacturers, driven thence by the persecution of Philip the Second, and settled in Norwich in 1567. The Orange Tawney, or Yellow Gilloflower, was not introduced until about thirty years after, for Gerarde in 1597 says:—"A worshipful merchant of London, Master Nicholas Leto, procured it from Poland, and gave me thereof for my garden, which before that time was never seen or heard of in these countries."

All the colours we now find in the Carnation appear to have been known to the older florists, and the varieties had so largely increased in number, that in 1702 Rea enumerated 360. Then some attempts at classification were made, and we find them arranged as *Flake Carnations*, having only two principal colours, disposed in broad flakes or stripes quite through the petals. *Bizarre Carnations*, having three or four different colours, red, purple, scarlet, &c., in different shades, irregularly disposed in spots and stripes. *Piquette Carnations*, having always a white ground, pounced or finely spotted with red, scarlet, purple, or other colours; and *Painted Lady Carnations*, having the petals a bright red or purple above, and entirely white beneath.

According to Maddock (1792), the varieties of Carnations cultivated in this country, up to about 1740, were bursters, i.e., being possessed of a great number of petals, by their swelling caused the calyx to burst, but by the introduction from France at that time of a strain denominated Whole-blowers, in which the calyx was preserved in an entire state, they soon obtained a decided preference. Maddock, at this time, informs us that the smooth edge to the petals of the flowers had largely taken the place of those with serrated edges.

Neither Maddock nor Thomas Hogg throw light upon the names of those who were the raisers of their day. W. B. Page, in his *Prodromus* (1817), divides *Dianthus caryophyllus* into two sections, viz., "Clove Carnations," and "flor. variegatus, variegated flowers, of these there are forty five sorts, with named flowers."

Hogg in his *Treatise on the Carnation*, said that "A florist who raises six new Carnations in his lifetime may be considered fortunate." The two principal raisers of Carnations fifty and sixty years ago, were a Mr. May, of Sonning, and a Mr. Puxley, of South Wales, the latter earliest in the field. By 1850, Mr. Puxley had raised nearly six times six varieties; and Mr. May, who began about 1846, had raised some sixteen varieties in about three years, and he made a point of naming all his flowers (he raised Picotees also) after Shakspearian characters; an older raiser was Ely, also Holloway, Milwood, Brabbin, and others.

The names which pre-eminently stand out as raisers during the past twenty-five years are the late Mr. E. S. Dodwell, Mr. James Douglas (*ante*, p. 5), and Mr. Martin R. Smith (see p. 23). Mr. Dodwell, first at Derby, then at Clapham, and finally at Oxford, spent a lifetime in improving his favourite flower, and enriched collections with varieties of high merit. Mr. Smith is still at work. He has raised the standard of quality in a remarkable degree, enriching the self, fancy, and yellow-ground sections with varieties as superb in quality as many of them are distinct in character. Nor must the labours of Turner, Douglas, Simonite, Abercrombie, Lord, Payne, and others be forgotten.

If Mr. Ernest Benary, of Erfurt, had done nothing else but raise Germania and Stadthall Bail, with the delicate but beautiful heliotrope-tinted Theodore, he would have laid the Carnation growers of to-day under obligation to him. All those whose names have been mentioned were, and are, systematic cross-breeders, working by scientific methods to reach certain desired ends.

THE TREE OR WINTER-FLOWERING CARNATION, doubtless originated as a sport from the ordinary summer-flowering type, and has been perpetuated by florists because blooming in winter and spring. The Malmaison type, which flowers in the spring, is so distinct in character, owing to its larger foliage and robustness of growth, as to form a distinct race. It is said to have originated in the gardens of the Empress Josephine at Malmaison—hence its name. By means of cross-fertilisation and selection, Mr. Martin R. Smith has been able to produce several varieties varying in colour from white to deep crimson. *R. D.*

THE CINERARIA.

In volume iv. of the *Cottage Gardener* for 1850, it is stated that the earliest raisers of varieties of the Cineraria was Mr. James Drummond, curator of the Botanic Gardens, Cork, in 1827, and he then stated that he annually cultivated many. Cinerarias were his great greenhouse favourites, and he says, "Except in cases when it becomes desirable to preserve any particular variety for its superior beauty, I prefer raising the Cineraria cruenta every year from seeds which the plant perfects with me in the months of April and May. Care should be taken to select the finest varieties, and those which produce the finest heads of flowers." It will be thus seen that Mr. Drummond had already commenced selecting the very finest varieties for seed purposes.

One of the earliest recorded varieties was *C. Waterhouseana*, raised by Mr. James Tate, gardener to John Waterhouse, Esq., Well Head, Halifax, "by intermixing and hybridising the various species." This being so, it would seem that Mr. Tate commenced as early, if not actually earlier than Mr. Kelway, the work of improving the Cineraria. The record states: "It flowers in March, and continues in bloom towards the end of June or July."

It has been claimed for the late Mr. James Kelway, whose portrait we gave on p. 343 of our previous volume, that he was one of the first to raise improved forms of the Cineraria from *C. cruenta*, commencing this work in 1837, but he was forestalled by both Mr. Drummond and Mr. Tate. Still, he deserves credit for what he did in this direction: from his seedlings he selected two of the most distinct, one dwarf in growth, the other tall. From these he raised others, and so gradually selected until the Langport strain became famous. It has been stated that the woolly-leaved *C. lanata* and an old slender-habited *C. aurita* were also employed as seed-parents, but no results of their productiveness have, so far as we know, been placed on record; and the hybrid origin of these plants is questioned by no less an authority than Sir William Thiselton-Dyer. Mr. R. Irwin Lynch (p. 27) is one of those who is endeavouring to solve the question by direct experiment.

From this point onwards, it may be assumed that our modern strains of Cinerarias are the result of careful selection. The *Florists' Guide* for 1850 gives an excellent coloured illustration of four named varieties, in which we can see the flower emerging from the star-shaped type of *C. cruenta*, and gradually becoming quite smooth and circular on the edges of the ray florets. The leading raisers in those days were Ivory of Peckham, Kendall of Stoke Newington, Henderson of St. John's Wood, Gaines of Battersea, and others. During the next ten years the Cineraria was very popular, and varieties were named for some years after, until the strains grown became of such high quality, that naming became unnecessary. Foremost among the raisers may be mentioned Mr. James and his son, W. J. James (p. 23).

The introduction of a dwarf strain from the Continent helped to reduce the height of growth, and some new colours were obtained from the same source. Then came the re-introduction of *C. cruenta*, and now raisers are proceeding along much the same lines as Drummond, Tate, and Kelway did a half century or more ago. So floricultural history repeats itself.

Double varieties of Cinerarias, some of them having large, symmetrical, and handsome flowers, have appeared from time to time, but it can scarcely be said they have become popular. It is recorded that the first double varieties came from Germany about 1874, and in alluding to them the late Mr. Thomas Moore said in the *Florist*, "Double-flowered Cinerarias are not absolute novelties, for we remember having seen exhibited in London, in 1861, by Mr. Kendall, of Stoke Newington, a variety called *C. rosea plena*, to which a commendation was then awarded, and which was a very pretty, compact-growing, double-flowered variety, with the flower heads of a magenta-rose. Whether that was lost or not, or did not perpetuate itself, we do not know, but it was not seen again in public, nor has a double-flowered Cineraria appeared since that time, so far as we are aware, till this year, 1874." Some fine varieties were exhibited in 1876-77 by Messrs. E. G. Henderson & Son, plants generally of dwarf growth, very free blooming, the blossoms large, full, and rounded, varying in colour from blush to rose and lavender. Occasionally, plants put in an appearance, and at the spring show of the Royal Botanic Society in the present year, a really magnificently-bloomed batch of varieties was exhibited by Messrs. James Carter & Co., of Holborn, which emphasised the value of the double forms as decorative plants. *R. D.*

THE FUCHSIA.

One of the earliest to attempt the improvement of the Fuchsia was Mr. W. H. Story, of Newton-Abbot, Devon. [The gardeners about the year 1825 began to hybridise the Fuchsia, namely, *F. coccinea* ♀, and *F. arborescens* ♂; and *F. macrostemma* ♀, and *F. arborescens* ♂; and Beaton believed that the cultivated varieties conica, gracilis, tenella, and virgata were the result of the first-named of these crosses. *F. globosa* came from *F. macrostemma* and conica. Ed.] Seedlings were being raised in those days by various persons, but no records of systematic crossing appear to have come down to us until Mr. Story made use of a reputed species, named *F. radicans*, or *affinis*, and selected to cross with it seedlings of the highest colour, having expanding sepals, and freedom of blooming. It was Mr. Story more than any other raiser, who laboured to make the sepals first horizontal, and finally recurved. In 1843 Pince's *Exoniensis* appeared, and Mr. Story made use of this for crossing purposes, but the results were failures for some reason.

About this time Mr. Lobbs sent home to Messrs. Veitch & Sons some fine species from Peru; such as *serratifolia*, *apetala*, *decussata*, *dependens*, *macrantha*, &c., and pollen from these was used by Mr. Story; while Messrs. Veitch & Sons had some curious hybrids from *F. macrantha* and *F. serratifolia*, and these were employed by Mr. Story upon some of his best seedlings. The *Florist* for March, 1850, contains a coloured plate of Mr. Story's seedlings, in which can be traced the gradually lengthening of the tube, which was one of the aims sought by Mr. Story, and the reflexed sepal was already manifesting itself.

Mr. John Salter, during the time he was in business at Versailles, France, raised and distributed a number of varieties up to the middle of the forties. And in the early fifties Mr. T. Cripps of Tunbridge Wells also distributed several new varieties; and among them *Venus de Medicis*, about 1856, which we are informed it was attempted to again send out as new in 1873.

In his work on the *Propagation and Improve-*

H. WEEKS.
(CHRYSAETHUMS.)

ment of *Cultivated Plants*, Mr. F. W. Burbidge informs us that "the first white-sepalled Fuchsia was *Venus Victrix*. This was raised by Mr. Gulliver, gardener to the Rev. S. Marriott of Horsemonden, Kent. It was sent out by Messrs. Cripps of Tunbridge Wells, in May, 1842, at one guinea each," and this variety was the forerunner of a whole race of beautiful white-sepalled flowers. This old, distinct, and highly popular variety, finds a place in the Catalogue of Messrs. H. Cannell & Sons nearly sixty years afterwards.

Meanwhile, Mr. Edward Banks of Deal had been at work for several years, but his methods of procedure have not been put on record. It is quite certain that by 1855 he had raised such popular varieties as *Glory*, *Autocrat*, *Queen of Hanover*,

In 1846, Mr. J. Sheriff, of Bromsgrove, Birmingham, raised a very distinct variety from a named variety, known as *Wilmore's No. 2*, which he named *Scarlatina reflexa*, such names being common in those days; and it was a leading variety up to 1851. Mr. Stokes, of West Bromwich, was another well known raiser in the Midlands, and the flowers, raised by the two aforementioned, were sent out by Messrs. Henry Mayle & Co., nurserymen, of Birmingham, a charming light variety, raised by Mr. Stokes about 1849, with blush-white tube and sepals; and a crimson corolla, and named *Hebe*, was distributed in 1851, and is figured in the *Birmingham and Midland Counties Gardeners' Magazine* for 1852. The appearance of this Fuchsia led to a sharp controversy as to the length of the tube. It was

JAMES LYE.

(POTATOS.)

came about in this way: Mr. Story obtained from Mr. Veitch, of the Exeter nurseries, some pollen from a species with a small and almost white corolla, and transferred it to a dark variety, obtaining a batch of seedlings of which *Queen Victoria* was one. I think I am correct in stating that two years or so afterwards, an improved form was sent out from France, followed later by the double-white corolla *Madame Cornelissen*.

W. J. JAMES.
(CINERARIAS, &c.)

held by London authorities of that time that the sepals of the flower should reflex, and cover the whole of the tube, and so form a ball, with the corolla issuing from the base of it. It is, perhaps, well that the Birmingham growers warmly protested against this, and held up the long-tubed Hebe as their model flower.

In the fifties, quite a host of raisers at home and abroad were seeking to improve the Fuchsia. A published list in 1856 shows that Mr. Edward Banks was far away the leading raiser; while Messrs. E. G. Henderson & Son, of the Wellington Road Nursery; George Smith, Tollington Nursery, Holloway; C. Turner, Slough; W. J. Epps, Maidstone, and others, were sending out new varieties. This list is interesting, as containing some varieties which made a great reputation in their day, and held their own for many years—Duchess of Lancaster (Henderson), Maid of Kent (Banks), Prince Albert (Banks), Queen of Hanover (Banks), and Venus de Medici (Banks). About this period, Mr. Edmund Bland was conspicuous for the new Abutilons and Fuchsias that he raised, a list of which was given in our columns, Feb. 3, 1894, p. 146. Mr. George Fry, whose death we recently chronicled, was also a great Fuchsia raiser, whose achievements have recently been chronicled.

Ten years after (1866), Mr. Henry Cannell, then at Woolwich, was a Fuchsia specialist, and some years previously, when a private gardener, had taught his contemporaries how to grow splendid specimens. The leading varieties were Minnie, La Favorita, Gipsy Girl, Puritan, Prince Alfred, all raised by Mr. Banks; Rose of Castillo, Sir C. Campbell, Schiller, Enoch Arden, &c.

It was about this time that Mr. James Lye, of Market Lavington (see p. 23), began to raise new varieties, which he continues to do to the present day, and also to produce magnificent examples of exhibition specimens at Trowbridge, Bath, and elsewhere, which have made the West of England famous for their production. *R. D.*

(To be continued.)

NEW OR NOTEWORTHY PLANTS.

HYBRID ANTHURIUM.

I SEND you per parcel-post a flower of a hybrid Anthurium raised in my hot-house. I crossed Anthurium Clarkianum (a form of Andreanum purchased of Pitcher & Manda) in the spring of 1894 with *A. ornatum*, the latter being the seed-parent. The only plant raised from the cross is now blooming for the first time, and plant as well as flower appear to be fairly intermediate between the two parents. The leaves (last leaf is 14 inches by 8½ inches) resemble those of the pollen-parent *A. Clarkianum*, being oblong, cordate, the base of the leaf not surrounding the petiole as in *Anthurium ornatum*. The flower, which is thrown far above the foliage, has a stalk 21 inches long. The spathe, which is 5½ inches long by 4 inches broad, is of a beautiful whitish mother-of-pearl colour and lustre, with faint pinkish lines, and two faint blush bands on each side the median line. The surface is not irregularly wrinkled, as in the pollen-parent (*Andreanum* variety), but perfectly smooth, and forming an angle with the spadix, which is exactly intermediate between those of the parents. The spadix is 2½ inches long, its lower half a greyish-violet, upper half of a light carmine. The form and outline of the spathe are almost exactly those of the *Andreanum* variety, and quite different from those of the seed parent. *A. W. Hoisholt, Stockton, California.*

C. E. SHEA AND THE CHRYSANTHEMUM.

As a raiser and hybridist, Mr. Shea (p. 23) is best known for his work among the Chrysanthemums. Mr. Shea's results are the more valuable in that they are due not to haphazard procedures, but to purposeful intent. Mr. Shea knows what he wants

to do, and what are the most likely or most available methods of attaining his end.

Mr. Shea's 1st object has been—to prove the possibility of fertilising and ripening seed of the *Chrysanthemum* in England.

The result has been the production of many popular new varieties, including Dorothea Shea, Elsie Teichmann, Silver King, Maggie Bleakiron, &c. Incidental to the foregoing, demonstrating the great power in the hands of the fertiliser in producing definite and foreseen results, both as to colours, habit, and season of flowering.

2. Experiments to get a blue Chrysanthemum—(a), by selection and blending of varieties, white and those most tending to blue in the spectrum; (b), and by cross-fertilisation with the nearest allied species having blue flowers.

The results are still in the experimental stage. In one case a hybrid appeared to have resulted, the plant showing distinctly modified foliage, and bore blooms in pairs, each pair differing in colour. The position of the arrangement of the sexual organs of the blooms also differed slightly from those of the ordinary Chrysanthemum. The plant was very weak and small, and got killed while Mr. Shea was abroad. He, however, pollinated some Chrysanthemums from it, and the offspring showed—and still show—a curious "webbing" on the backs of the petals. These conclusions must be held to be too doubtful for definite assertion of success.

3. Efforts to produce sports and variations in foliage in Chrysanthemums—(a), by injection of acids (formic acid others) and alkalies into the stems; (b), by starvation of the plants; (c), by admixture of various substances (notably sulphur) with the soils.

Results—(a), generally death of shoot operated on; (b), established a general disposition to sport. Clearly a step in the right direction, but giving no clue to any law; (c), one variety—"Croda"—produced variegated foliage, and still shows it. "Croda" was raised by the crossing of Edward Molyneux and another variety, neither of which had ever been known to show variegated foliage.

4. Attempt to cross *Primula siensis* and *P. obconica*. The results were submitted to the Scientific Committee of the Royal Horticultural Society last year, when the general opinion was that the cross had been made.

THE BOTANY OF THE LILIES.

THE genus *Lilium* is one of several which are more interesting to the horticulturist than to the botanist. In almost every case the gardener calls his Lilies by their botanical names. There are not many horticultural varieties, as in some other groups. For these reasons the literature of the genus, which is rather extensive, has always been, and should always remain, rather horticultural than botanical.

The *Gardeners' Chronicle*, foremost among other horticultural periodicals, has been the medium of publication of many important contributions to this subject. Taking this in connection with the fact that a great deal of the best work with Lilies has been done in England, I am led to feel a considerable responsibility to the *clientèle* of this magazine when I make a contribution to the confusion of the genus *Lilium*.*

The botany and nomenclature of the Lilies are very much confused already, from the circumstance that they have been long known, cultivated, and admired. I can hardly hope that the study which I have given the genus will clear up many of the disputed points; but horticulturists and botanists will find it convenient, I hope, to have the Lily names gathered all together once, where we can see the group at one view. It is now a quarter of a century since Mr. J. G. Baker made his monograph and twenty-two years since Elwes published his monu-

mental work. Since that time many new species have been added to the list, and some fresh light has been thrown on such as were imperfectly understood before.

In the publication in the *Botanical Gazette* here referred to, I have numbered sixty-four species in the genus *Lilium*, which, with their varieties, stand as follows:—

- | | |
|--|--|
| <i>Sub-genus I., Fulvion, Baker.</i> | 29. <i>L. papilliferum</i> , Franchet. |
| 1. <i>L. philippinense</i> , Baker. | 31. <i>L. Henryi</i> , Baker. |
| 2. <i>L. Wallichianum</i> , Sch. f. | 31. <i>L. auratum</i> , Lindley. |
| 3. <i>L. sulphureum</i> , Baker. | 32. <i>L. speciosum</i> , Thunb. |
| 4. <i>L. neigherrense</i> , Wight. | var. <i>rubrum</i> , Hort. |
| 5. <i>L. longiflorum</i> , Thunb. | var. <i>album</i> , Hort. |
| var. <i>eximium</i> , Nicholson. | |
| 6. <i>L. yunnanense</i> , Franchet. | <i>Sub-genus IV., Martagon, Rupp.</i> |
| 7. <i>L. Delavayi</i> , Franchet. | 33. <i>L. puberulum</i> , Duch. (L. Humboldtii). |
| 8. <i>L. japonicum</i> , Thunb. | 34. <i>L. Martagon</i> , Linn. |
| var. <i>Browni</i> , Nicholson. | 35. <i>L. maculatum</i> , Thunb. (L. Hanson). |
| var. <i>roseum</i> , Hort. | 36. <i>L. superbum</i> , Linn. |
| var. <i>Alexandrae</i> , Hort. | var. <i>Carolinianum</i> , Chapm. |
| 9. <i>L. candidum</i> , Linn. | 37. <i>L. occidentale</i> , Purdy. |
| 10. <i>L. Lowi</i> , Baker. | 38. <i>L. pardalinum</i> , Kellogg. |
| 11. <i>L. primum</i> , Baker. | var. <i>angustifolium</i> , Kell. (L. Roezli). |
| 12. <i>L. nepalense</i> , B. Don. | 39. <i>L. Columbianum</i> , Hort. (L. parviflorum). |
| 13. <i>L. rubellum</i> , Baker. | 40. <i>L. taliense</i> , Franchet. |
| 14. <i>L. Parryi</i> , Watson. | 41. <i>L. laukongense</i> , Franchet. |
| 15. <i>L. Washingtonianum</i> , Kellogg. | 42. <i>L. avenaceum</i> , Fischer. |
| var. <i>purpureum</i> , Masters. | 43. <i>L. monadelphum</i> , Bieb. |
| <i>Sub-genus II., Isolirion, Baker.</i> | var. <i>Ledebouri</i> , Baker. |
| 16. <i>L. philadelphicum</i> , Linn. (L. dauricum, Gawl.). | 44. <i>L. polyphyllum</i> , B. Don. |

This arrangement of the names is, I think, conservative. No new species have been made, and no new names introduced where it did not seem entirely unavoidable.

There is not space here to discuss the reasons for adopting one name to replace another, as has been necessary in a few cases. The reasons for such steps will appear fairly well from the text of the article in the *Botanical Gazette*.

The largest accession of species comes from Franchet, in his contributions to the sixth volume of the *Journal de Botanique*. It is interesting to note the large number of species added from China. In so far as these have come into cultivation, they are very acceptable acquisitions (e.g., *L. Henryi*).

It will be seen that there is a considerable number of species still to be introduced to cultivation. When we get them all a thriving in our gardens, what a showing it will make! *F. A. Waugh, Burlington, Vt., U.S.A.*

TREES AND SHRUBS.

CERCIS CANADENSIS (AMERICAN RED-BUD).

APPARENTLY this species fills the same space in the flora of Eastern North America that the common Judas-tree (*C. siliquastrum*) does in Europe. For the gardens of the South of England, it is evidently not the equal of the European one; it has, at any rate, been in cultivation since 1730, and is still uncommon. But as there are parts of this country where the Judas-tree is not strictly

* F. A. Waugh, "A Conspectus of the Genus *Lilium*," *Botanical Gazette*, Chicago, April and May, 1899, vol. xxvi. pp. 235-254, and 340-360.

hardy, it might be worth trying there, for it comes from localities where a great winter cold is experienced, and, on the authority of Prof. Sargent, it is hardy in parts of the United States where no other species of *Cercis* will survive. I have not seen plants more than 6 feet high, although doubtless there are such in England. I believe Mr. Lynch has a good specimen at Cambridge. A plant has recently been in flower at Kew. The flowers are rosy-pink, and borne in fascicles as in the Judas-tree, but the individual flowers are smaller. When seen at its best, it is, no doubt, as handsome as the European species, for Prof. Sargent observes that in parts of the United States it makes a "beautiful and conspicuous feature in the landscape." It can be very readily distinguished from *C. siliquastrum* when in leaf by the leaves being pointed and bright green above, whereas in *C. siliquastrum*, the apex is very rounded and the surface conspicuously glaucous. *W. J. Bean.*

HENRY ECKFORD.
(SWEET PEAS, FLORISTS' FLOWERS, &c.)

preference being given to such Roses as bloom in the summer, and again more or less in the autumn.

I notice in a continental journal a number of varieties mentioned as being good for this purpose. I know nothing about them, but give a few names:—*Coquette des Blanches* (N.H.), *Claire Carnot* (N.H.), *Mlle. Blanche Dürrschmidt* (N.H.), *Blanche Lafitte* (B.), *Emotion* (B.), *Kronprinzessin Victoria* (B.), *Madame Eugénie Resal* (B.), *Bridesmaid* (T.), *Eliza Fugier* (T.), *Fürst Bismarck* (T.), *Jean Pernet* (T.), *Papa Gontier* (T.), *Triomphe de Pernet* (T). Will some Rose-grower kindly state what is known of these varieties, and if they are likely to be good doers in this country? I find the names of many well-known modern Roses of the Tea, Bourbon, and Hybrid Noisette sections in the list of group Roses, and the list is evidently written by a gardener possessing an excellent knowledge of Roses. *M. W.*

A. BLEU.
(CALADIUMS, GLOXINIAS, ORCHIDS, &c.)

THE ROSARY.

BEDDING-OUT VARIETIES OF ROSES.

As Rose-growers in a general way, we all know what excellent Roses the commoner varieties make as bedders planted in the mass, so as to produce colour-effect in this concern. I refer more especially to such varieties as have a stiff erect habit, or which, having long pliable shoots, possess also stiff flower-stalks capable of holding the flowers erect, so as to avert the splashing of the flowers with earth by heavy rain. Of the first-named, the erect-habited Roses, I may mention *Boule de Nanteuil*, *Duchess of Buccleuch*, *D'Agnisseau*, *Kean*, *Marjolin*, and other Gallicas; most of the Moss Roses and hybrids from them, and Hybrid Perpetuals, such as *Crimson Bedder*, *Horace Vernet*, *John Hopper*, *Lady Sutherland*, *Magna Charta*, and *Lord Macaulay*. Of those with pliable shoots, I refer to such Roses as *La France*, *John Stuart Mill*, *Camille Bernardin*, *Duke of Edinburgh*, *Prince Camille de Rohan*, &c.: these are good Roses that anyone could ill afford to dispense with; still, if newer varieties could safely be planted as bedders, it would give added interest to the Rose-garden in which colour-effects are a desideratum,

JAS. O'BRIEN, V.M.H.
(NERINES, &c.)

ALFRED BLEU,

Of 48, Avenue d'Italie, Paris, is known to the world of horticulture as the raiser of most of the finest *Caladiums* at the present time in cultivation (p. 25). The evolution of the quaint and showily-coloured leaves of these plants seems to follow so closely on his wishes in that direction that his friends say that he has only to imagine a new *Caladium* and forthwith it appears. But the admirers of his novelties in this line cannot know the great amount of thinking required in order that a wished-for result is achieved. Later, M. Bleu engaged in hybridising other species of plants having fine foliage, and then he turned his attention to Orchids, among which he had many successes, viz., *Cattleya* × *calumnata*, which made a great stir when it flowered for the first time, which, when crossed again with *Cattleya Mossiae*, gave *C. × Parthenia* and its pretty varieties. But perhaps the most beautiful of M. Bleu's hybrids is *Miltonia* × *Blenana* (*vexillaria* ♀, *Roetzli* ♂), a very handsome hybrid, giving great variety.

C. T. DRURY.
(FERNS.)

JAMES O'BRIEN, V.M.H.

ALWAYS took interest in hybridising and endeavouring to improve the plants at his command. He made the earliest use of the striped-leaf *Amaryllis reticulata* for crossing with the *Hippeastrums*, the best being named *Amaryllis O'Brieni*. Subsequent to the appearance in gardens of tuberous *Begonias Sedeni* and *boliviensis*, he was the raiser of the first eight new ones, which included a good white; and later the first two double-flowered tuberous *Begonias*. *Gloxinias* were improved by him by crossing *Gloxinias* with *Sinningia*. He carried out the hybridising of other plants, but perhaps the most enduring was the happy use that he made of a pretty but rather weedy-looking *Sonchella* detected on a freshly-imported Orchid, and which, on flowering, Mr. O'Brien crossed both ways, the result being the many pretty varieties, both as regards foliage and flowers, named *Sonchella Hendersoni*. Also *Nerines*, of which *N. atrosanguinea*, *N. cinabarina*, and *N. Manselli* are yet the only hybrids which in their classes have excelled the best of the species, such as *N. Fothergilli*, &c., as *N. O'Brieni* and its numerous varieties are still the best of the *N. pudica* crosses. He also raised the earliest hybrids of coloured-leaved

Dracenas. At the present time he is best known as honorary secretary of the Orchid Committee of the Royal Horticultural Society, Orchids having been his special *forte* through life.

FOREIGN CORRESPONDENCE.

THE GENUS NICOTIANA.

PROFESSOR DR. O. COMES, Director of the Botanical Institution at the Royal School of Agriculture at Portici, near Naples, the author of the work *Del Tabacco*, which has been translated into almost all the modern languages except German, at the expense of the government of the respective States, is occupied at present with a *Monograph of the Genus Nicotiana*, which will appear in French.

By long years of study, especially of living specimens, which hitherto has never been to such an extent at the disposal of either Dunal or any other writer on the subject, Professor Comes has come to the conviction that it is desirable to reduce the fifty-eight species noted down of *Nicotiana* to forty-one. This is an energetic proceeding, but it is entirely sound according to our opinion, and such a reduction will also aid in simplifying the confusion of forms and hybrids of the genus *Nicotiana*. Professor Comes reduces the ten species of the class *Tabacum*, enumerated by Dunal, to one good species. He cancels *N. ipomopsisiflora*, Dunal, which he scarcely considers a form of the *N. trigonophylla*, Dunal, and transfers *N. plantaginea*, D. Candolle, to its right place in the petunioides! *N. auriculata*, Br., *N. petiolaris*, Schl., and *N. pilosa*, Dunal, have a hybrid character; while *N. loxensis*, H. B. & Kunth, *N. lancifolia*, W., and *N. chinensis*, Fischer, are mere varieties. All of these belong, according to him, to the type *Tabacum*, and have no right to figure as different kinds, however much the individual hybrids and varieties may deviate from each other in time, in this or that district, in the various climates and soils. The representatives of the typical *N. rustica*, which are cultivated in the present day in the immense tracts from the river Amazon northward to Canada, and which several authors have noted as various kinds are: *N. texana* (Naudin), *jamaicensis* (Ten.), *brasilia* (Schrank), *humilis* (Schrank), *asiatica* (Schrank), and *scabra* (Cavalier). For the rest the acute observations and proofs of the author's statements show undoubtedly the work to be not only an excellent treatise, but also one that will be useful to scientific institutions, botanists, and naturalists, as well as in a special degree to all tobacco-planters and the cultivated trading public. *C. Sprenger, Naples.*

ORCHID NOTES AND GLEANINGS.

LÆLIA JONGHEANA.

It is not yet generally known that this plant has been in England in thousands for more than six months. On November 4, 1898, F. Sander & Co. sold a large importation at Protheroe & Morris' Rooms, under the title of *Lælia pumila* var., which their collector discovered while searching for *L. Jongheana*. The plants bore numerous pods, and dead blooms on them, amply sufficient to show anyone who knows the true plant, that its re-discovery was accomplished by the firm to which we are indebted for so many recovered plants, as well as new ones. It was previously so scarce, that very few people had seen it. I was one of the few, and at once pronounced it *L. Jongheana*. Many did not agree with me, but time and the blooming of the plant by Mr. Keeling (*Orchid Review*, June, 1899) have proved my opinion correct. Readers may fancy my object in this note is to publish my own knowledge. Far from it. I have only for my object to claim for the year 1898 the re-introduction of this plant, and not for 1899, as stated in an advertise-

ment. The plant is a difficult one to establish, as all can testify, and with its re-introduction Mr. Sander might tell us its exact treatment required, or as nearly describe its habitat so as to enable growers to meet its wants better than we at present know them. Microscopical examination of the leaf reveals to me a structure capable of dealing with heavy torrential rain, mingled with intermitted blazing sunshine. *De B. Crawshaw.*

ABNORMAL FLOWERING OF DENDROBIUM DALHOUSIEANUM.

At Gallowhill gardeos, Paisley, there is a plant of *Dendrobium Dalhousieanum* with two flower-spikes coming from the root. The flower-spikes of this variety usually come from the top of the stems, but these two spikes I allude to strike from the same joints as the roots just at the level of the soil. *Robert Macfee.*

LINDENIA.—The plants figured in the 7th and 8th parts of the *Lindenia*, lately published, but dated February and March, are:—

CATTLEYA LABIATA Lind., var. **LILACINA**.—A form with bluish-lilac sepals, the disc of the lip rich purple, and the throat golden-yellow with purple stripes; t. DCXLIX.

ODONTOGLOSSUM CORADINEI var. **MOORTEBEKEENSE**.—A star-shaped flower, with narrow, acute segments, heavily blotched with chestnut-brown spots, the outer segments are yellow, the petals whitish, the lip pale yellow, with chocolate-coloured spots. The plant illustrates the difficulty experienced in drawing any definite line of demarcation between *O. Coradinei* and *excellentis* and *O. Wilckeannum*. *O. Coradinei* was conjectured by Reichenbach to be a natural cross between *O. triumphans* and *O. odoratum*; t. DCL.

ODONTOGLOSSUM CRISPUM var. **TIORINUM**.—The flower-segments taper from a broad base, are wavy at the margins, white, with rich reddish-brown blotches; lip cordate ovate acute, yellow at the base; t. DCLI.

LÆLIA PRESTANS var. **LEEMANNI**, L. Lind.—Flower-segments white, spreading; lip convolute, white at the base; anterior lobe expanded, rounded, somewhat two-lobed; violet, with a yellow throat; t. DCLII.

CATTLEYA TRIANEL Lind., var. **CERULESCENS**, Lind. fil. — Segments white, spreading; outer, oblong-acute; inner ones very broad; lip convolute, white externally; anterior lobe spreading, rounded, with a large bluish-lilac blotch, and a yellow throat, marked with reddish-brown stripes; t. DCLIII.

ODONTOGLOSSUM X SOLEIL DE MUYSEN, Lind. fil. — A form with large, bold, flat flowers; broad, undulated segments; the petals narrow at the base, sharply pointed, yellowish-white, thickly blotched with chocolate. The lip is oblong, somewhat tongue-shaped; lateral lobes spreading obliquely towards the column, whitish, with brown streaks; crest yellow, with small brown linear markings. It is supposed to be a natural hybrid; t. DCLIV.

LÆLIA PRESTANS var. **ALBO-OCULATA**, L. Lind.—Flower nearly wholly white, with, on the front of the lip, two yellow blotches, each terminating in a rosy-violet spot; t. DCLV.

CYPRIPEDIUM INSIGNE, Wall., **NOBILE**, L. Lind.—A magnificent variety, with large white standard, heavily blotched from the centre downwards with purplish-brown spots; petals yellow, with a lustrous brown flush; lip of the same colour, but more intense, and the margin of the pouch edged with lilac; t. DCLVI.

Most of the above-named varieties were flowered at the Horticulture Internationale, or at Noortbeke. *Odontoglossum Soleil de Muisen* bloomed in the collection of M. Trieu de Terdonck, at the Château of Muisenhuis, at Muisen.

THE FERNERY.

BRITISH FERNS FOR THE GREENHOUSE.

I HAVE become convinced by degrees that the beautiful varietal forms of our native Ferns are indispensable to the amateur who finds himself in possession of a cold greenhouse or conservatory, and knows not how to furnish it. Here, then, are the most suitable plants for this purpose, and more is the pity that their suggestions of coolness, their freshness, and delicacy of their fronds, and their general usefulness, are so little recognised. They may be grown under conditions unsuited to almost every other kind of plant, in aspect the most unpromising, and in partial shade, short of that caused by overhanging trees. My own fernery, which measures 20 feet by 12 feet, has a full southern aspect, a very unsuitable one for plants,

needing much moisture; but by means of roller-blinds, and some permanent summer shading, slate stages covered with broken cinders, a concrete-floor, and water freely distributed, I am able to create the requisite conditions, the success of which I believe is reflected in the freshness and vigour of my Ferns. It follows then that wherever flowers will grow, there also Ferns may be cultivated. And, moreover, what is of still more importance to the average amateur, the dull, dark, shady places are made equally pleasant-looking as crystal houses by the display of those delicate evergreen charms for which some of the forms of British Ferns are so remarkable. Ferns have thus an advantage over flowers; for while the latter are periodic or even spasmodic in their floral effects, the former are evergreen. Do not let me be misunderstood, however, for I do not wish to decry flowers. I love them, as I love the sunshine, the fresh air, or the sights and sounds of rustic life. When I cannot go Fern-hunting, I go flower-searching, and when neither is available I devote my spare time to the cultivation of both.

Ferns.—The growth of British Ferns is worthy of the amateur's best efforts, as it is one which he can take up and develop according to his lights and his leisure. It is an inexpensive hobby after the first outlay; it grows in intensity and interest; it requires no elaborate structure or preparation; and it develops all along the line, especially where spore-raising and crossing are resorted to. Results there must be, normal, peculiar, or unique. "Rogues" will, of course, step in; and forms depauperate and otherwise inelegant, will want to stay; but selection and eradication must be rigorously attended to, and those only that are equal to, or an advance upon, their respective parents, retained to beautify the collection; and to add to the pleasures and experiences of the collector.

To those who have got beyond the initiation stage, and can appreciate a "good thing" when they see it, I say come and see the collection the writer of this note possesses, which contains the best forms of every British species, and it will appeal to the most obstinate despiser of native Ferns, and show the great value and beauty of these plants, as furnishing for the cold greenhouse, &c. *C. B. Green, Acton, W.*

HYBRIDITY.

At one of the meetings of the Royal Society of Edinburgh held this spring, Professor J. Caesar Ewart read the second part of his paper on "Contributions to the Theory of Heredity, Interbreeding, and Variation." He clearly laid down the following propositions. When members of the same variety or race breed together, there was no cross-fertilisation; when members of two different varieties or races were interbred, they had interbreeding; when animals or plants belonging to different species or genera were interbred, they had hybridisation. Cross-fertilisation had two evident and well recognised uses, it led to rejuvenescence, that is it restored the growth-power; and by insuring the intermingling of germ-plasms from two individuals, it favoured the production of new variations. Presumably if cross-fertilisation favoured variations, interbreeding would lead to the like results, but on a grander scale; while interbreeding, if carried far enough, reduces this influence of cross-fertilisation to a minimum. Experience and experiments showed that when two varieties were crossed, the offspring might either resemble the male parent or the female parent; or some might resemble the one, some the other, or all or some of them might unite in different degrees the appearances of both parents. In most cases there was more or less reversion, although it would not be wise to draw far-reaching conclusions from his simple experiments.

Considering the influence of interbreeding in renewing the constitution, Prof. Ewart pointed out that a change in the condition of life seemed to

operate more as an invigorator than to stimulate variation. In other words, while the constitution might be bettered by a change in the environment, active variation was not likely to supervene without the disturbance that accompanied an inter-crossing.

In view of the coming Conference to be held by the Royal Horticultural Society in the gardens at Chiswick, the above views call for special consideration. I agree in the main with Mr. Burbidge's views on the modifying influences of environment. The inferiority of our finest Scotch Gooseberries south of the Tweed first convinced me of the great influence of local soils, climate, surroundings, and quality. I am not sure that I go so far as Mr. Burbidge in the following sentence, though I admit he is a very high authority on the subject. He exclaims, "Nature abhors self-fertilisation, but she specially abhors perpetual cultivation, unless either seed or soil, or both, are continually being changed; or, as in the continuous Wheat-crops of Sir John Lawes', of Rothamsted, sufficient suitable food is provided. Still, it is a

be careful not to underrate the old. Take, for example, the old Ribston Pippin, often spoken and written of as worn out. I boldly affirm that in this year, 1899, there are more and better Ribston Pippins grown in Britain than in any former year of its existence. True, it is generally mounted on a better, more healthy and fertile stock; but surely not a little credit is also due to the latent energy of the sound, good scions of the Ribston Pippin which enabled it to co-operate so effectually with the Paradise and other stocks in rejuvenating its health, intensifying its fertility, and extending its life. *D. T. Fish.*

NURSERY NOTES.

FISHER, SON, & SIBRAY, HANDSWORTH, SHEFFIELD.

THE improvements effected in this nursery during the past twelve years in the removal and conversion of the original houses, and in the erection of new ones, are such that the place may be said to have been remodelled. There are 200 acres of land filled with hardy plants, trees, and shrubs, and all of these bear a remarkable appearance of health and vigour. The Coniferae are most interesting; Cupressus, Retinospora, Cedars, &c., of sorts, in the freshness of their early summer growths. The Rhododendron quarters were, at the time of my visit, gay with colour, and many of the varieties grown in quantity are in separate batches, so there are beds filled with white, pink, and mauve flowering sorts, and indeed every shade of colour represented by this glorious family. I remarked the clean, straight stems and abundant foliage upon Limes, Oaks, Chestnuts, Beeches, and other deciduous trees. Hardy Clematis grown in pots and plunged in beds there are in large numbers. Mr. Atkinson has carried out the purpose with which he started, and has now both indoors and outside a most varied and extensive collection of plants. The glass-houses are numerous, well arranged, and many are of great length. In each there was perfect order, method, and cleanliness. The paths are made of red tiles, just sufficiently wide to walk along, and were spotlessly clean.

Entering the nursery from the office, we passed through a large show-house, more particularly devoted to foliage plants, and containing *Dicksonia antarctica*, *Araucarias* in different forms, *Kentias*, *Cocos*, *Seafortthias*, *Bamboos*, and a most distinct and bold *Aralia* named *pulchra*, some 5 feet high, with broad shiny leaves, eight of which are developed on one stalk. *Lapagerias* cover a good portion of the roof and end of this structure, and *Cobaea scandens variegata* hang in festoons. The *Croton*-house contained plants from 6 inches high to 4 feet, and they were vigorous and highly coloured. This house was not shaded; the blinds were there, but it is only on an exceptionally hot and glaring day that they are used, and then more for the protection of young and tender leaves than for those already developed; heat, moisture, and strong light are the conditions necessary to the development of *Crotons*, but if one of these essentials be neglected, and either of the others obtain greater influence, the plants will lose vigour, colour, and attractiveness.

A large house full of *Cocos Weddelliana* in different sizes reminds me that at one time £50 and £60 were paid for single plants. There were houses of *Adiantums*, *Pteris*, and other decorative Ferns, as well as the more choice species and varieties; also of stove plants, among which were *Alocasias* and *Anthuriums* in many varieties. Overhead were many *Nepenthes* in baskets, whose pitchers were hanging in quantity, and of capital colour; *N. Curtisii*, *Burkei*, *Mastersiana* *superba*, *mixta*, were among those noticed. Another house contained a fine lot of the choice *Aralias*, the demand for these being, I was told, greater than at any previous period. The old *Hoya Paxtoni* was

flowering most profusely. *Begonias* in quantity are of a choice strain, whilst of the *Carnations* it is impossible to speak too highly. The tree and *Malmaison* sections are of great vigour, and full of large flowers. Another house contains a splendid lot of the small-flowering *Azaleas*, and among them *A. obtusa* is largely represented. *Vitis purpurea* and *V. Coignetii*, two most useful species for walls and arbours, were also numerous and in good condition.

Of the hybrid greenhouse *Rhododendrons* the stock is great, and though the plants are not quite so large as the specimens the firm used to show some years ago, they are more saleable. The Duchess of Portland, Duchess of Westminster, and Countess of Yarborough are among those for which there are most often enquiries made. For *Lapagerias*, this nursery has been famous for many years, and the Handsworth variety is known far and wide; the stock at present is very large, the plants of large size, and growing freely.

In another large house were fine plants of *Araucarias*, including *A. Cunninghami*, *A. excelsa*,

ANTHONY WATERER.
RHODODENDRONS, &c., &c. (See p. 21.)

R. IRWIN LYNCH.
(CINERARIAS, &c.)

safe rule to alternate crops in fields and gardens. So powerful is the tendency for distribution in all plants bearing seeds or spores, by removal to fresh soils and pastures new, that the contrivances adopted for the purpose seem almost miraculous. Hence," adds Mr. Burbidge, "in rearing cross-bred seedlings, we are, apart from other possible gains, bringing, comparatively speaking, *new plants to our old soils* (the italics are mine) and climates." And Mr. Burbidge concluded the whole matter almost in the words of Professor Ewart, at the Royal Society of Edinburgh,—"This brings me back to the pith of the whole matter of cross-breeding, viz., that, apart from variety or added value, *per se*, in the produce, we also gain, what is even of more importance, the plants best adapted to particular soils and particular climates or atmospheres."

This literature of hybridisation needs collecting, condensing, and popularising. Special exhibitions should also be held of cross-bred and hybrid plants, side by side with their parents. In our ceaseless efforts to mend Nature by these and other cultural devices, while doing full justice to the merits of new plants, fruits, and flowers, we must

Napoleon Baumann variety—this is very distinct and dense in growth, and the leaves very glaucous. *A. excelsa glauca* is also beautiful, not quite so robust as the *N. Baumann* variety, but the silvery sheen on its spiny leaves give it a peculiar charm. Palms are grown in great numbers, *Cocos*, *Kentias*, *Geonomas*, &c.; houses 100 feet long are full of the best of these.

The *Orchids* are in fine condition, and many are carrying trusses of flower. *C. Mendeli*, *Warneri*, and *Mossiae* are represented by choice varieties and in great quantity; of the latter, one flower measured no less than 9½ inches across the petals, and the whole of the flower was correspondingly large. *L. purpurata* and *L. tenebrosa* were also very gay. *Cattleya aurea* in baskets was making splendid growths, and pushing up numerous sheaths. *C. Gaskelliana* is also numerous, and full of sheaths. Choice *Dendrobium* hybrids and varieties were worthy attention. *Odontoglossums* are grown in quantity, and are in capital condition, many excellent forms have appeared among them.

Filmy Ferns, *Todeas*, *Trichomanes*, *Hymenophyllums*, in many species, are grown in glass

cases; these were full of clean fronds, and in capital health and colour.

In a large, airy house were some of the best forms of Conifers, Acers, fine-foliaged and variegated forms of all hardy trees and shrubs. These are placed here that the lovely tints and variegation may be the more early and perfectly developed. The results are in every way satisfactory, and one of the most interesting houses in the whole of the nursery was this one.

Out-of-doors there are large beds of *Ampelopsis Veitchi purpurea*, which retains its foliage and rich colouring much later in the autumn than the type. Breadths of the Golden Elder were common, and a very interesting feature were the bush Ives grown in pots; many also are planted at the outer edges of beds and borders. This old firm has now passed its third Jubilee, and evidence of further extension is apparent, since ground is being cleared, and foundations of new houses, sheds, and offices are being commenced, as additional conveniences are found to be necessary for the rapid despatch of an ever-increasing business. *W. S.*

THE HERBACEOUS BORDER.

HELIANTHUS NUTTALLI.

This earliest of the perennial Sunflowers is now fully out, in the last week of June. It is described on p. 277 of Asa Gray's *Flora of North America*, and was given to me by a lady for whom it was collected in the Rocky mountains of Wyoming. It grows about 2½ feet high, the flowers are about the size of those of *H. giganteus*, and the habit is neater than that of most of its tribe. It is not yet common in cultivation, and perhaps its early flowering will not be thought a recommendation, but it is a desirable plant for botanical gardens, being a distinct and well marked species. *Helianthella quinquevallis*, often sold wrongly as *H. occidentalis*, is as early to flower, but it is not a true Sunflower. *C. Wolley-Dod, Edge Hall, Malpas.*

VARIORUM:

REMEDY FOR THE TURNIP-FLEA, OR FLY.—

As considerable damage appears to have been done by the ravages of this pest in different parts of the country, I think it cannot be made too widely known that dressing the seed with turpentine the night before sowing it is a simple and effectual remedy. Several years ago, a farmer, writing from forty years' experience, gave this as an unfailing remedy, and I have tried it since with complete success. While others in the neighbourhood have had to sow a second time in consequence of the attack of the fly, I can show to any of your readers who may care to inspect it, a full and excellent plant from adopting this simple remedy. Half-a-pint of turpentine is sufficient to dress 40 lb. of seed, but I would rather err on the side of using a little more. Paraffin or other oils will not have the same effect. Turpentine being a spirit, penetrates the seed (without destroying its germinating powers), and gives to the young plant a flavour of turpentine, which the fly does not relish, until the plant has got into the rough leaf, when it is safe from further attack. *John Hill, Severn Stoke, June 26, 1899. "Worcester Herald."*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to the Right Hon. W. H. LONO, Rood Ashton, Trowbridge.

The Cucumber-house.—The principal operations are a daily syringing of the plants once or twice, according to the state of the weather, the stopping of the shoots as the growth proceeds, fastening them to the trellis, and affording water and liquid

manure to the beds, according to the needs of the plants. The bottom-heat should be maintained steadily at about 80°, and top-dressings of dung and loam afforded at intervals of fourteen days. In Cucumber cultivation, it is prudent to be provided with surplus plants in pots, either seedlings or cuttings, and in sufficient numbers to meet any ordinary emergency. Plants from cuttings fruit quicker than seedlings, but the latter are the more vigorous and enduring. It does not pay to keep plants which have lost their vigour, and it is better practice to replace them with new plants; in fact, start anew, with new soil as well as plants.

Frame Cucumbers.—Much of what has been said about the treatment of the Cucumber in a house applies to frame-culture. The plant needs but little bottom-heat, sun-heat being sufficient with that derived from, perhaps, a bed of leaves used for other purposes early in the season. The ventilation of the frames needs careful attention, especially in "choppy" weather, as when the plants get a check from cold air admitted to the frames, it may cause bitterness and toughness in the fruits. The frames should be syringed and closed by 3 P.M., even when the weather is warm; and while the lights are being partially removed for the purpose, let the needful stopping of the shoots be carried out. Plants may be in vigorous and clean growth, but unless the shoots are often stopped, cropping is slow and uncertain.

Melons.—Fruits approaching ripening will need to be carefully afforded water and air, otherwise splitting will occur, and the fruit spoiled for table use. Some varieties are not affected in this way, but others are very liable to split, as for example, Hero of Ethingham and Frogmore Orange, even when the ventilation is carefully done, and artificial heat is afforded, and no syringing of the plants practised. With the change to cooler weather but little shading will be necessary. To plants whose roots have reached the surface, top-dressings of heavy loam mixed with old mortar and ballast may be applied, together with occasional sprinklings of artificial manures, or diluted drainings from the cow-yard. Let the fruits be supported with nets, pieces of board, or slings of stout bast, before they become too heavy. It is a mistaken practice to completely dry off Melon plants when the fruits are approaching ripeness, as then the foliage dies or withers greatly, which, in its turn, affects the flavour of the fruit, and diminishes its size.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Carnations.—The different varieties of *Souvenir de la Malmaison*, and other early summer-flowering Carnations are now going out of flower, and preparations should forthwith be made to layer shoots for next season's plants. It is a simple and efficient method of propagation at this season if the plants to be layered are put into a cold frame or pit, which has been occupied by early vegetables, as this will contain a bed of soil of the required depth. A commencement should be made with those varieties which have made shoots of a sufficient length to admit of their being layered readily, deferring the layering of such as have not made sufficient growth until later in the month. The healthiest plants should be selected from which to propagate, and if at all infested with green-fly, they must be thoroughly cleansed before being layered by dipping the points of the shoots into some diluted insecticide. The soil having been loosened with a fork to the depth of 9 inches, the plants should be turned out of their pots and planted in a sloping position, so that the shoots which are to be layered may lie upon the surface. The simplest course is to layer each plant as it is planted, it being then more easily manipulated. Previously to layering, some finely sifted, sandy soil, to the depth of a couple of inches should be placed around the plant. Old potting-bench refuse-soil does perfectly well for this purpose. A few of the leaves should then be removed from the base of each shoot, and a slit made with a sharp knife on the under side of the shoot, cutting just below a node, and drawing the knife towards the top of the shoots, and passing it through one joint. This slit should be about 1½ inch in length. A little of the soil should then be removed from under the shoot, which should then be firmly but gently pegged down in the hollow thus made, the hooked peg crossing the shoot at the point where

the transverse incision was made. After layering, water should be afforded to settle the soil. Subsequent treatment consists in keeping the soil moist by sprinkling it with a fine rose water-pot as often as may be necessary; affording a moderate amount of air, and shading lightly during bright sunshine. As soon as the layers are sufficiently rooted, they should be removed from the plants and potted into 3-inch pots, in a compost consisting of two parts loam, one part leaf-soil, and a good sprinkle of silver-sand, and be placed in a cold frame, which should be kept somewhat close and lightly shaded for a few days, after which time the amount of air must be increased and the shading dispensed with, ultimately removing the lights entirely during fine weather. The earliest batch of winter-flowering Carnations should receive the last pinching of the points of the shoots, and as soon as they break they should be shifted into the pots in which they are to flower. Carnations raised from seed sown in February or March will require to be shifted into 48's.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

The Pear.—The pruning of the current season's shoots of trees on walls may commence, growth having been rapid during the past fortnight of hot weather. Earlier pruning was not advisable, in view of a probable second growth, but from the present date to the middle of July is usually considered to be a safe time to begin the summer pruning of the Pear. With a view of not indicting a check on the growth of the trees, the pruning should be carried out at two operations, that is, by taking the upper half of a tree first, and a week or ten days later the lower half. Cut, or rather with the thumb and pruning-knife, sever the shoot by a sharp twist at about the fourth leaf from the base, excepting all leading or extension shoots, and in the event of any after-growth being made, the two lower buds will then remain dormant. Cordons should be similarly treated, the leading growths being secured in an upright or oblique direction, as the case may be, before getting damaged by the wind.

Peach and Nectarine trees.—The training-in of young necessary shoots and leaders should have timely attention; these being mostly secured by thrusting 6-inch lengths of thin Willow or Privet-twig behind the older shoots and branches; and as the sun is apt to scorch the fruits, the shoots near to a fruit may be temporarily fastened to prevent them blowing about or breaking, and the points allowed to droop, and thus afford shade to the fruits for a time. Where nails and shreds are used, be sure that space be left for the increase of growth, and still more care is necessary when ties of bast are employed. Let the shoots be laid in thinly so as to admit of full development of leaves, without the leaves of one shoot overlapping those of the next shoot below it. The final thinning of the fruits of late varieties should soon be undertaken. During sunny weather let the trees be syringed once a day, either before 8 A.M. or after 4 P.M. By this means red-spider will be kept in check and aphid destroyed. If necessary, the insecticides I have previously recommended should be used in addition to the syringing with clean water. If no copious rains fall during this month, water must be afforded the borders in quantity, that is, enough should be applied as will reach the lowermost roots. The fruits of the earlier varieties of the Peach are swelling fast, still they will not be as early as usual.

Early varieties of the Apple.—The required thinning of fruits on bush-trees, and cordons on dwarfing stocks, should not be delayed. The varieties Ecklinville Seedling, and Lord Grosvenor have set a heavy crop of fruit at Dropmore, and thinning is very much needed.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

The Lawn.—If seeds of grasses were sown in April for renewing or mending the lawn, and the grass has grown sufficiently long to render it desirable to mow it, and a mowing-machine is to be used, the cutters should be set so high that only the taller grasses are cut, and not the shorter bottom grass. Let the lawn be examined care-

fully, and all coarse weeds and grasses spudded out. On light soils, if no rain fall, water must be afforded, preferably in the evening, and the roller applied afterwards. On heavy soils the ground is apt to show cracks and fissures in dry weather, and these should be filled up with some sifted light soil, a little of which may be sprinkled over the surface, in order to keep the young grasses alive. It serves a good purpose to remove the collecting-box of the mowing-machine, and allow the cut grass to lie on the surface. Where turfing was undertaken at a late date in the spring, the same kind of benefit will accrue if the mown grass be left on the turf.

Liliums.—The flower-spikes of *Lilium auratum* and its varieties, *platyphyllum*, *rubrum vittatum*, and *virginale*, will now be showing, and should be staked according to their strength and probable height. The best kind of stakes for this and other purposes are Bamboo rods, which taper nicely, and these should be pushed firmly into the soil, and the Lily stems slung loosely to them. Lily bulbs that were planted this year in a rich soil will require but little manure, but any which may have remained in the same spot for three or four years will be benefited with an occasional application of liquid-manure. All species of Lilies thrive under the same kind of treatment.

Lily of the Valley may be afforded water copiously, and the foliage moistened when the weather is hot and dry.

Glycerium argenteum, and other ornamental grasses, *Hymenocallis*, *Kniphofias*, and many other strong-growing plants, require liberal applications of water during July, and to those which are making weakly growth liquid-manure may be afforded.

Japanese Acers, now making their midsummer shoots, golden-leaved Yews, Cupressus and other conifers of dense growth, sometimes suffer at this season from lack of moisture at the root, and should be afforded water near the stems—a part the rain seldom reaches.

Spring flowering Plants.—If the seeds of Wall-flowers, *Silene pendula*, *Saponaria calabrica*, *Alyssum saxatile compactum*, be sown in drills thinly, the plants will grow sufficiently large without transplantation to be planted direct into the beds in the late autumn. Seeds of the Brompton Stock, Sweet William, Aquilegia, and other biennial plants may now be sown in boxes, the latter being placed in a cold frame, and shaded from strong sunshine.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Temperatures.—Only the warmer divisions need any artificial heat at this season; for although the right temperature may be maintained during genial weather without any fire-heat, even in the East Indian-house, the atmospheric conditions are greatly improved by keeping the water-pipes lukewarm in this section, or where *Phalenopsis*, *Cypripediums*, *Dendrobiums*, &c., are growing. This will serve to stimulate the circulation of the lower stratum of air, and thus prevent a condition favourable to the spread of certain plant pests. The temperature should drop during the night to as near the normal point as possible. A low temperature, in conjunction with a stagnant atmosphere, however, is a condition to be avoided.

Summer Treatment of Miltonia vexillaria.—The type form of this showy species has, in most cases, passed out of flower, and the treatment afforded during the next two months is of great importance. Keep the plants cool in a moderately shady and moist house, and afford water with care. Admit abundant air by day and night—especially during the night—so long as the inside temperature is maintained to 58°. The mountain forms, such as *M. v. Klabeckorum*, *M. superba*, and *M. Leopoldi* are still growing, and should be given the conditions described above, except that more water at the root must be afforded.

Miltonia spectabilis and its varieties thrive here in a warm, moist corner of the East Indian-house, where they are well supplied with water overhead. These plants are growing vigorously, and any that require to be re-surfaced should be attended to; but repotting should be deferred until they begin to grow after resting, or soon after the flowers have been removed. Peat and large quantities of drainage materials serve for the rooting medium.

Miltonias flavescent, stellata, Claesiana, Regnelli, candida, and others of this section succeed best in the Cattleya-house. The plants are now growing and rooting freely, and should be afforded abundant supplies of water. *M. Blunoti* Lubbersiana should be given a moist position in a house where the temperature is a trifle below that of the warm division, and it will require frequent applications of water.

Odontoglossum cirrosus and *elegans* succeed along with *Miltonia vexillaria*. Their period of growth is indefinite, and they should be repotted when the new growths have become a few inches in length. They do not need quite as much water as *O. crispum*.

Scuticaria Steeli and *S. Hadweni*.—The former species, when imported, should be fixed, with the leaves depending, to a raft, first placing a little sphagnum-moss between it and the raft. Suspend the plants in a light position in the warm-house, and afford sufficient water to keep the long, cord-like leaves in a plump condition. *S. Hadweni* is an erect-growing species, and should be planted in a well-drained basket, surfaced with peat and sphagnum-moss. This plant also may be suspended, but in a house having a few degrees less heat.

Acinetas Humboldtii and *densa* will probably need attention now, as they are commencing to grow; and as the spikes take a downward direction, it is inadvisable to place many crocks in the baskets. Two or three round sticks of charcoal laid at right angles to the bottom bars will answer for drainage, providing the basket is a shallow one. A compost of one-third each of fibrous loam, peat, and sphagnum-moss should be worked in amongst the roots, and be carefully afforded water for a time. They are intermediate subjects, and need but little water, excepting when rooting freely. Luddemanias are allied subjects, requiring similar treatment, but a slightly higher temperature.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STAFFORD, Wrotham Park, Barnet.

Brussels Sprouts, &c.—The heavy rains will have materially aided in establishing the plants of Brussels Sprouts, Cauliflowers, and other Brassicas lately planted. When the plants have made some progress in height, let the stems be moulded up, in order to steady them, and preserve the moisture about the roots. If clubbing be noticed, lose no time in affording soot-water to which a small portion of salt has been added. Plant out successions as they become fit, affording everything space for sturdy development. Take advantage of showery weather to plant the late Broccolis, Savoys, Cabbages, &c., and fill vacant plots as fast as these get cleared of their crops. If Potatoland must be utilised, owing to the small extent of the garden, plant in the furrows, and at intervals bend the Potato-haulms down along the rows, so as to admit light and air. When taking heads of Cauliflowers and Lettuces, pull up the entire plant, rather than to leave the stumps and leaves to exhaust the land.

Peas.—The earliest Peas, American Wonder, Chelsea Gem, and William I., are over, and the land may be got in readiness for other crops; and if in the open quarter, Celery-trenches may be thrown out and dunged, or the ground may simply be dug deeply, after heavily manuring it, in readiness for winter Spinach, Turnips, &c. The Criterion Pea is closely following William I., and it has proved to be one of the best second earlies.

Onions.—Now that the rain has moistened the land to a good depth, the bulbs may be still further thinned where left too thickly at the first thinning; remembering, however, that middling sized bulbs are the more useful. If the crop is likely to be a short one, even at this date moderately sized Onion plants, if carefully drawn and planted in shallow drills with a little soot or guano sprinkled along the rows will make useful bulbs. The tops of the autumn-sown Tripolis, &c., should be pressed over with a stake or a wooden rake, and the flower-stems cut off, and if very large bulbs are required, some kind of artificial manure in minute quantities may be applied in a liquid or dry form.

Potatoes.—If inter-cropping is practised, lift each alternate row of second early varieties for daily use in preference to making a clearance of the entire crop, and by so doing the Savoys, &c., will obtain more light, and grow stronger and sturdier than other-

wise they would do. When early varieties are ready for lifting, get them dug up without delay, and thus avoid supertuberage; and when dry, store them in a cool, dark place.

Shallots and Garlic.—As the tops of these begin to die away, pull up the bulbs, and as soon as fairly dry remove them to their winter quarters; they must be stored dry, and kept very cool. If some of the roots of Garlic be left in the ground for another year, they, as a rule, make fine, large bulbs.

THE APIARY.

By EXPERT.

Introduction of Queens to Queenless Stocks.—An Apiarist writes, "Being unsuccessful last year in trying direct introduction of an imported Italian queen into a queenless stock of native bees, I adopted the following plan, which might well be called the 'Wells system' of queen introduction (if Mr. Wells does not object). I confined the bees to six frames on one side of the hive by means of a Wells' dummy board, and continued the division through the entrance by placing a 4-inch strip of wood made to project well on to the alighting board. I then liberated the Italian queen and her attendant bees (about 150) on the other side of the dummy board, putting a little naphthalene in both sides of the live where the queen was, and she soon commenced laying. This stock had a queen when examined about the end of March; she was most prolific last year, and swarmed rather late in June. Her age I do not know, but this spring she did not seem very fit, and at the end of April, I noticed the stock was not working as well as the others, only a few bees carrying in pollen, and these with only half a load; so I suspected something wrong, and found the hive queenless, broodless, and eggless. Last March I drove two of my skeps and united both lots in a frame-hive. Owing, I expect, more to good luck than management, they are now very strong, with nine frames full of brood, but I cannot get them to take to a super. They persist in building queen-cells, and hanging out, although honey is coming in very fast. Can anyone tell me what to do, as I have no drawn-out combs to give them? My other two frame hives are extremely strong, one of them (holding fifteen frames) having brood in twelve frames, and it has two supers on, one of the supers being fit for removal, although only put on ten days ago. Now with regard to my queens, I know that they are all old ones except one hive, from which I had a swarm last year. I should like to re-queen all my stocks in the coming autumn, but try how I may I have never yet seen the queen of any hive. Can you tell me a way out of the difficulty, as it seems to me I cannot re-queen when I cannot find and remove the old ones?" There must surely be some hitch in the arrangements for giving bees access to supers to cause them to refuse possession in such weather as this. We can only advise an examination to be made to find out if there is free access. Queen finding will come with a little experience.

THE GHENT SCHOOL OF HORTICULTURE this week celebrates its jubilee. Established and organised in Van Houtte's nursery, it burst its bounds, and became associated in some degree with the Botanic Garden, the University Professors in the latter establishment sharing in the work of tuition. Crépín, Planchon, Kieckx, have been among its Professors; and still the notable four, constituting the four-leaved Shamrock, so-called, are connected with the school in the persons of M. Rodigas (the Director), Van Hulle, Pynaert, and Barvenich. How many men excellently trained it has sent out we do not know; but as the old students are to assemble this week to participate in the functions and festivities, a good opportunity will be afforded of testing the value of the training received. Till lately, we may say up to this time, we have nothing of the kind, and our nurserymen send their sons to pick up information some of which, at least, might as well be imparted here. From personal friendship with many of the Professors for many years, we cannot but feel great sympathy with the Ghent School of Horticulture, and we cordially wish continued prosperity to the School and its Professors. The proceedings begin on July 8, and terminate on the 11th.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 8	Rose and Horticultural Shows at Manchester and Alexandra Palace (Wood Green), London, N.
TUESDAY, JULY 11	Royal Horticultural Society's Conference on "Hybrids," and Exhibition at Chiswick. Wolverhampton Floral Fête (three days). Horticultural Show at Reading.
WEDNESDAY, JULY 12	Continuance of Conference on Hybrids, at the Town Hall, Westminster. The Royal Horticultural Society's Dinner at the Hôtel Métropole.
THURSDAY, JULY 13	Rose and Horticultural Shows at Norwich, Woodbridge, Bedale, Brentwood, and Helensburgh.
FRIDAY, JULY 14	Rose and Horticultural Show at Ulverston.
SALE.	
FRIDAY, JULY 14	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period June 25 to July 1, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the first half of the week was very warm and dry; the latter being remarkable for rough winds and frequent storms, with heavy thunderstorms on the 28th and 30th ult., the lightning on both dates being very vivid.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63.3°.

ACTUAL TEMPERATURES:—

LONDON.—July 5 (6 P.M.): Max. 71°; Min. 50°.

PROVINCES.—July 5 (6 P.M.): Max. 71°; Eastern Counties; Min. 56°, Sunbury Head.
Fine, warm; some rain.

Hybrids and their Raisers.

THE approaching Conference will, we believe, deal with hybridisation in a broad sense and under many aspects, scientific as well as practical. There is, indeed, no line to be drawn between the cross-fertilisation of a variety or even of a variation and hybridisation or the cross-fertilisation of two reputed species. The case is one of degree only, ranging from the simplest case of cross-breeding to the raising of bigeneric hybrids. For our present purpose, anything that is not self-fertilisation is cross-breeding. Selection does not necessarily imply cross-breeding, though the two factors are responsible for the production of the fine strains and races that constitute the bulk of our garden-raised flowers. It may be that there is no hybridity in the case of the *Cineraria*, that is a matter to be proved by experiment; there is

certainly none in the *Cyclamen latifolium* (persicum), or the Chinese Primrose; but there has been abundant cross-fertilisation between variations of these plants. No two flowers are absolutely alike even on the same plant. Gardeners are always on the look-out for these variations, and when they see them they inter-cross them.

In our present issue, we continue a series of notes on garden flowers raised by cross-breeding which we began in our last number; and we also give further portraits of some of those, to whom in recent times, we have been the most indebted. It is obvious that in so vast a field we must leave many portions untouched, and we cannot hope to give a complete portrait-gallery, but we shall do our best to give a representative collection, and afford a good general view of the subject. It is necessary to make this statement lest some should be disappointed that their names or their productions are not mentioned.

The "raisers" whose portraits we give this week include those of the veteran ROBERT FENN, p. 23, whose work in cross-breeding as well as selecting Potatoes, is too well known to further comment at this time. ANTHONY WATERER, the worthy son of a worthy sire, p. 27, may well be taken as a representative raiser of hardy Azaleas and Rhododendrons. It was the policy of his father to raise hardy varieties, to be only satisfied with the best, and never to rest till the best had been superseded by something better. JOHN WATERER & Co. must also always be thought of in connection with the improvement of these plants.

MR. MARTIN SMITH's name (see p. 23) is as indissolubly connected with the *Carnation* as that of the WATERERS is with the *Rhododendron*. He too works for robustness of habit as well as beauty of form and colour.

LYE'S Fuchsias are wonderful examples of careful breeding and selection (see p. 23).

Turning to Chrysanthemums, MR. WEEKS (p. 23) has furnished us with a detailed account of his mode of operation, which will be read with interest by the growers of these favourite plants; and MR. SHEA contributes an all too brief note (p. 23) on the objects for which he is working. M. CALVAT will follow in due course.

M. BLEU, of Paris, is well known as the raiser of some of our finest *Caladiums* and other plants (see p. 25).

MR. O'BRIEN has long been known as one of our most intelligent and successful raisers. His works are briefly alluded to at p. 25.

MR. C. T. DRURY is a Fern enthusiast, who treats his subject from a scientific point of view as well as merely from the cultural side (see p. 25).

MR. ECKFORD (p. 25) is a veteran worker in the field of cross-breeding. Of late years he has made a name for himself in raising by cross-breeding as well as by selection, superb varieties of Sweet Peas, and is famed also for the new culinary varieties, which owe their origin to his judgment and skill.

MR. R. IRWIN LYNCH, the Curator of the Botanic Garden at Cambridge, is well known as an enthusiastic and intelligent cultivator, and takes his place among the "raisers" by virtue of his endeavours to unravel the history of the *Cineraria* by direct experiment (p. 27).

MR. W. J. JAMES (p. 23), is worthily continuing those experiments initiated by his father, and which have made their strain such wonderful illustrations of the gardener's art.

Next week the Conference will hold its meetings at Chiswick, and at the Town Hall, West-

minster, near the offices of the Society, and the home of the Horticultural Club at the Hotel Windsor. Our next number therefore will be largely devoted to the proceedings of the Conference, and we hope to give numerous portraits of those who are to take part in the business of the meetings.

A Text-Book of Plant Diseases.

WHILST much may be effected to prevent the occurrence of disease in plants, and to put a stop to its diffusion, and whilst something may be done to mitigate its consequences, little or nothing can be done in the way of cure. Day after day we receive samples of diseased plants with an enquiry as to the nature of the disease, and almost invariably an enquiry as to a remedy. Sometimes no information is vouchsafed as to local conditions, and as to the method of cultivation adopted, and often, indeed, nothing but continued inspection during growth would enable us to arrive at a satisfactory diagnosis. In most cases absolute cleanliness and free ventilation, together with the methods of cultivation appropriate to each plant, will suffice to keep plants in health. Indeed, in very many instances it is obvious from the specimens sent to us, that slovenly or careless cultivation has been practiced, perhaps unavoidably, from adverse circumstances not known to us. However this may be, disease and parasites, whether vegetable or animal, often find the conditions suitable for their growth and propagation in plants whose cultivation is neglected. This is, however, by no means invariable. Many of the samples sent us come from establishments where rigid care is exercised, as in market establishments where superb cultivation is the rule. Nevertheless, a fungus may make its appearance, and quickly destroy the hopes of the cultivator. Over-crowding, and the growth of the same crop in the same houses year after year necessarily favour the spread of the disease when it does break out. How often do we find the Tomato crop spoiled from this cause? The Tomato, indeed, affords a valuable illustration of the attacks of disease. Forty years ago, Tomato-culture under glass was all but unpractised, and Tomato diseases were quite unknown! Then, as the fruit became more and more used, the cultivation extended till it has reached a degree which may well be called enormous, and the diseases have increased proportionately. House after house in closest proximity to each other are devoted to its cultivation; no thought is given as to the necessity for isolation, and so the disease is well cultivated by the grower at the expense of the crop he wishes to grow. As a rule, no attempt is made to destroy by fire the affected foliage and haulm; on the contrary, it is thrown on to the rubbish-heap, and afforded the best possible means of preserving its spores for future growth. Perhaps the pigs or the fowls are allowed to consume the diseased foliage, and thus again every advantage is given to the fungus.

We see the same carelessness in woods; the unfortunate trees get injured in a variety of different ways, but all resulting in an open wound. Nothing is done to cover this over, and so the wound, it may be a mere crack, offers a resting place for the spores of the fungi, which, as in the case of canker of the Apple, eventually compass the destruction of the tree. Now the main reason for this loss—much of it avoidable—the main reason, is sheer ignorance—indifference and apathy do the rest.

It cannot be expected that the cultivator who has his business to attend to can attain that knowledge of detail that it is the duty of the expert to accumulate, but he should get a sufficient grasp of general principles, and sufficient information as to the manners and customs of fungi and insects, to be able to avail himself of the teachings of the expert, and turn them to practical account.

It is with this object in view that we desire now to call attention to Mr. MASSEE's recently published *Text-book of Plant-diseases caused by Cryptogamic Parasites* (Duckworth & Co.). After some generalities, the author proceeds to describe seriatim the chief parasites which affect our cultivated plants. The order followed is that of the botanist, the author going from order to order in systematic series.

For the use of practical gardeners it might have been better, after giving a general introduction, to have discussed separately the several diseases attacking each plant—say, the Vine, the Cucumber, the Tomato, or whatever it may be; but as an ample index is given, the actual order in which the information is conveyed is a matter of secondary importance. A less meagre account of the disease of Vines, which the French call "Brunissure," is desirable, and although we find mention made of *Plasmiodiophora vitis*, we find no reference to Roze's *Pseudocommis*. One excellent feature of the book before us consists, however, in the references to the most important literature of the subject, such as the Germans call the "Wichtigste literatur!"

We have waited long indeed for anything like a complete handbook of this kind. We have had special books like those of Marshall Ward and Worthington Smith, excellent in their way, but strictly limited; we have had various translations from the German, and we have had endless articles in our own columns and those of our contemporaries, but Mr. MASSEE is the first to give us in anything like a complete form, a combination of these scattered records into a systematic whole. This will be invaluable as a book of reference. Our gratitude to the author is proportionate.

The Flavour of Melons.

It is a common belief that excess of water in the soil and a deficiency of air during the last stage of maturity are the ordinary causes of lack of flavour. That may be so under the modern method of thin layers of soil placed over hot-water pipes, for if water be not afforded at all stages of growth, up to and during the progress of ripening, the plants lose their foliage, and the fruit, as a consequence, is poor in flavour.

Here there is a regular sequence of occurrences: the thin bed of soil, the continued application of water and manure-water, with the consequent loss of flavour. Now, contrast that with the thick bed of loam overlying a well-made hot-bed, but separated from it, say, by a thin flooring of boards or roofing-slates, or even a layer of brush-wood trampled flat. Here the plant needs less water, the greater body of soil retaining its moisture for a long time; moreover, the hot-bed extracts but little, if any, and it may impart some moisture, and with one good application of water just before the ripening stage begins, the foliage, provided it is free from red-spider and thrips, will keep green and in health without any more being afforded till the last Melon is removed from the plant. These last three weeks of the plant's existence settle the matter of flavour in the fruit; if you have to afford water in order that

the plants may live, and supplement this by doses of manure in order to obtain inordinate size, the flavour is sure to be poor, or it may be non-existent. In the other case no water being needed in these weeks, the flavour is brought out to the fullest extent.

Great size and flavour are seldom co-existent in the same fruit, and we may take it that a Melon-plant possesses only a definite quantity of flavouring matter, and then if this be diluted with much water, and spread this through the pulpy mass of four or five over-grown fruits, the flavour, if not the aroma, practically disappear.

GARDEN HYBRIDS—A WARNING.—If the labours of the Hybrid Conference are to add anything to our accurate knowledge of a very mysterious subject, the ordinary language of cultivators will need to be given some precision. The word "hybrid" should be restricted properly to the result of the union of two distinct species; "cross" may be used of that between two more or less distinct races or strains of the same species, or even between its separate individuals. I find that this very important distinction is by no means observed, and that cultivators often speak of cultivated races as being of hybrid origin, when, strictly speaking, they are nothing of the kind. The remarks in your pages (July 1), on the Cyclamen, are a case in point. I have been unable to obtain any evidence that the forms in cultivation are of hybrid origin. Everything I have been able to learn on the subject goes in the opposite direction. It is stated that *Cyclamen Atkinsii* is a hybrid between *C. latifolium* and *C. coum*. But Mr. BAKER, who made a critical study of the genus, and published a monograph upon it, considered *C. Atkinsii* to be identical with *C. ibericum*, and Mr. ATKINS did not disagree with this conclusion. It has been repeatedly asserted that the cultivated *Cineraria* is of hybrid origin, and Mr. DARWIN has published the statement on information furnished by myself, which I received from the late Mr. THOMAS MOORE. But I have now no doubt whatever, that what are cultivated are all derived forms from *C. cruenta*. Hybrids in the genus are readily obtained, but they appear to me to be easily distinguishable from the cultivated strains. In the same way some of the cultivated forms of the Chinese Primrose are said to be of hybrid origin; but I cannot ascertain any ground for the assertion, or that the Chinese Primrose has ever been hybridised at all. Hybridisation is a subject upon which anyone who is favoured with a correspondence such as mine, will agree that the wildest statements are constantly made in perfect good faith. I can only repeat that the records of such cases are of no value at all, unless carefully sifted and tested, in which case they not infrequently collapse. *W. T. Thistleton-Dyer.*

A FINE CLUMP OF PAMPAS-GRASS (see supplement).—To Mr. GUMBLETON, of Queenstown, Ireland, we are indebted for the fine illustration given this week as a supplement. As a decorative plant, the illustration tells its own tale. The only comment we need add is as to the name, which is in accordance with Dr. STAFF's paper in our columns, Nov. 20, Nov. 27, and Dec. 4, 1897. We regret the necessity of the change, but for gardeners the name Pampas-grass will suffice.

ROYAL HORTICULTURAL SOCIETY.—INTERNATIONAL CONFERENCE ON "HYBRIDISATION," CHISWICK GARDENS, JULY 11, 1899.—The ordinary Committees of the Society will meet at Chiswick on Tuesday, July 11, at 12 o'clock punctually, and plants, &c., for certificate will be placed before them as at the usual meetings in the Drill Hall; but with the exception of plants, &c., for certificate, and hybrids and their parents, no other plants, &c., may be exhibited on this day.

THE HORTICULTURAL COLLEGE, SWANLEY.—The Rose-garden, which has just been laid out at

this college, was opened on Thursday by the Viscountess FALMOUTH. The Rose-garden was laid out under the superintendence of the Dean of ROCHESTER, who enlarged on his favourite topic. The Countess of WICKLOW, Sir JOHN and Lady LENARD, &c., were also present.

THE VILLA THURET.—We learn from the *Revue Horticole* that M. POIRAUT has been appointed to succeed our old correspondent and friend, CHARLES NAUDIN, as Director of the Experimental Garden at Antibes.

CHISWICK GARDENS.—Visitors to the Hybridisation Conference on Tuesday next, will be too early to obtain much information from the many trials that are being made this season, but the methods pursued in these comparative experiments will be seen, and they will doubtless interest British and foreign horticulturists. The trial of Sweet Peas may offer some information as they are now commencing to bloom; but the Culinary Peas, the Potatoes, Spring-sown Onions, French Beans, and a very extensive trial of Cactus and Pompon Dahlias will not show any results for some time. There is a batch of Caladiums, including a fine lot of new varieties in one of the houses, also a group of zonal Pelargoniums in full bloom; and the large breadth of Violas near to the north wall by the Council Room, though they are not nearly at their best, are nevertheless blooming freely, and the recent rains will be sure to afford them immediate benefit. The fruit trees out of doors, excepting the Strawberries, though arranged alphabetically, would be more interesting were the meeting an autumn one. Indoors, however, there is a splendid crop of ripe Peaches and Nectarines on the standard trees in a lean-to house, and the well-known collection of Fig-trees in pots are at the present time ripening a grand crop of fruits. Possibly, at the luncheon or other time, visitors may have an opportunity to taste these (we hope they may), and if it should persuade gardeners of the expediency of introducing into their houses some of the better and more delicately-flowered varieties, to be grown with that universal Brown Turkey, the result will be pleasing to them. Brown Turkey is deservedly popular, and a very reliable cropper; but it should not be grown to the exclusion of every other kind. Any information that visitors may seek of the Superintendent, we are sure, will be most willingly afforded.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION, WORCESTER AUXILIARY.—On behalf of the funds of the aforesaid, his Excellency Earl BEAUCHAMPE, K.C.M.G., very kindly gave permission to the Auxiliary Committee to have the beautiful gardens and glass-houses at Madresfield Court thrown open to the public on June 22. A small charge was made, and refreshments could be obtained. Unfortunately the weather was threatening and showery, otherwise there would doubtless have been a much larger attendance. About 500 people visited the gardens, and appeared to thoroughly enjoy the privilege. The net proceeds amounted to about £18. There are many gardens in the country which might offer similar privileges to the public, and add profit greatly to the funds of the charity, "if" only gardeners were less apathetic.

HORTICULTURAL CLUB.—On the occasion of the holding of the Conference on Hybridisation by the Royal Horticultural Society, the committee of this club have decided to invite the distinguished foreign visitors to a Dinner at the Hotel Windsor, on Tuesday, July 11, at 7 p.m. It is hoped that as many members as possible of the club will be present on the occasion to do honour to their foreign guests. Rev. H. HONYWOOD D'OMBRAINS, Westwell Vicarage, Ashford, Kent, is the Secretary.

THE ROYAL GARDENERS' ORPHAN FUND.—We beg leave to remind our readers that the annual dinner will take place on Tuesday, July 18, at the Hôtel Métropole, at 6.30. Sir REGINALD HANSON will take the chair, and will, we trust, be

heartily supported. The objects of the Fund are :—To make allowances or grants of money to aid in the maintenance and education of the orphans of gardeners, foremen in public, private, and market gardens, and the managers or departmental foremen in nursery and seed establishments. By means of the Fund seventy-eight fatherless children are this year (1899) being assisted at the rate of 5s. per week until they attain the age of fourteen years, and who, with the sanction of the Executive Committee, may be placed with relatives, or other responsible persons, acting as guardians. The Committee also has power to grant a sum not exceeding £10 towards apprenticing or otherwise promoting the start in life of any orphan who may be eligible for such assistance; and to make arrangements for placing children elected to the benefits of the Fund, either with carefully-selected foster-parents as cottage-boarders, or with the master or mistress of a school or institution, from whom satisfactory security is required for the proper discharge of their duties. Further information will be gladly given by the Secretary, B. WYNNE, 8, Dares Inn, Strand, London, W.C.

NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL PICNIC.—The annual picnic and outing will, by the kind permission of the Rt. Hon. the Earl of ROSEBURY, K.G., take the form of a visit to Mentmore, Bucks, when the gardens and magnificent grounds will be open to inspection. The date fixed for the picnic is Monday, July 17, and the cost, inclusive of railway fare, conveyance to and from Mentmore, dinner and tea, will be 9s. 6d. for members, and 10s. for non-members. Ladies are specially invited. The company will be conveyed to Cheddington Station on the London & North-Western Railway, from which there is a pleasant walk to Mentmore, about 1½ mile. Conveyances will meet the train at Cheddington for such as may be disposed to ride, the cost of which is included in the ticket for the day. Dinner and tea will be provided in a tent on the village green of Mentmore, which is close to the gardens. Railway-tickets are available from Euston, Camden Town, and Addison Road stations, passengers changing at Willesden in the two last cases. Members and friends not using railway-tickets will be charged 6s. for conveyance to and from Mentmore, dinner and tea. RICHARD DEAN, V.M.H., is the Secretary.

BRITISH MYCOLOGICAL SOCIETY.—Some years ago at a meeting of a students' society, the lecturer of the evening began to enumerate the several societies known to him. At length, wearying himself and his hearers long before any sign of the end was reached, he stopped. We do not think the British Mycological was included among those enumerated, nor even among those "taken as read." In some of these smaller societies, the feeling of companionship is stronger than in the case of larger bodies, and the workers more in earnest and proportionately more numerous. This appears to be the case with the British Mycological. The *Transactions* for the season 1897—1898 are before us, containing an account of the very successful "foray" held in Dublin in September last. A list of the more important fungi collected on that occasion is given, as well as the presidential address, delivered by Dr. PLOWRIGHT. Dr. PLOWRIGHT also contributes a very useful summary of "ERIKSSON'S Observations on the Rusts of Cereals," the life-history of which is very complicated, but obviously of great interest to the agriculturist. Thus, *Puccinia graminis*, the Wheat mildew, one stage of which occurs on the Berberry, in the form of cluster-cups or *Aecidia*, is now known to exist in six forms, which cannot be distinguished by their appearance, but which are distinct physiologically on Rye, Oats, Wheat, Aira, *Agrostis*, and Poa. All these have their *aecidiospores* (cluster-cups) on the Berberry, but the *aecidiospores* formed on the Rye (for example), will not, when placed on Oat, or Wheat, or on any of the five other plants, give rise to the Uredo form, but when placed on Rye they will do so. Here, then, we

have varieties well marked biologically, but indistinguishable one from the other morphologically. It would be a pretty problem to ascertain whether these phenomena denominate the gradual differentiation of new species or the disintegration of an old one.

FRUIT PROSPECTS IN THE UNITED STATES.—From reports just to hand we learn, concerning Apples, that in the thirteen States, having 3,000,000 or more Apple-trees in bearing at the last census, the condition for our report, as compared with the average June condition for the last fifteen years, was as follows:—New York, 1 above; Pennsylvania, 6 below; Michigan, 14 below; Missouri, 2 above; Illinois, 8 above; Indiana, 5 above; Kansas, 4 above; Kentucky, no difference; Tennessee, 2 above; Virginia, 3 below; North Carolina, 4 below; Iowa, 11 below; and Maine, 31 below. Peaches: the crop, it is said, will probably come as near being a total failure as it ever will come in a country of such vast extent and such varied climatic conditions as the United States. With the exception of California, where the conditions indicate from 75 to 95 per cent. of a full crop, there is not a State that has the promise of so much as two-thirds of a normal crop; few look for even a half crop, and in many important Peach-growing States there will be practically no crop whatever.

HOOKE'S ICONES PLANTARUM.—The first part of the seventh volume, dated June, 1899, has lately been issued by Messrs. DULAU & Co. It is devoted, but not exclusively, to Grasses described by Dr. STAFF. Among them is *Secale africanum*, remarkable for having been seen by THUNBERG, but not collected since his time. It is, nevertheless, so abundant as to have given the name Roggeveldt to the district where it occurs. It is suggested that this may be a variety of the common Rye become wild; but, says Dr. STAFF, Rye varies very little, and "so far as I am aware never in a way which would explain the differences that characterise the new species described above;" tab. 2601. *Arundinaria auricoma* of MITFORD, t. 2613, is a broad-leaved species, confounded with *A. Fortunei*, and related to *A. macrosperma*; it is only known as a cultivated plant. *Phyllostachys Henonis* is a Japanese species near to *P. Stauntoni*, Munro, but is different; tab. 2614.

"ALBUM DES ORCHIDÉES."—M. CORREYON has recently issued under this name a treatise on the Orchids of central and northern Europe, accompanied by sixty coloured plates. It is published by O. DOIN, 8, Place de l'Odéon, Paris, or may be obtained from Messrs. WILLIAMS & NORGATE, or other foreign booksellers. The author describes the general conformation of the plants, the process of fertilisation, and the classification of the family. As to this last point, M. CORREYON follows the arrangement of PFTIZER, which is largely founded on the mode of growth, and which appeals, therefore, more directly to the gardener than do the minute details of floral conformation. We do not, however, agree with M. CORREYON when he calls this system more natural than that of LINDLEY, as modified by BENTHAM; nor do we understand what he means by the system of REICHENBACH. We believe the Hamburg Professor became lost in the forest of detail that he himself had been largely instrumental in accumulating. The most useful chapter in M. CORREYON'S book is that devoted to the method of cultivation, in which he sums up briefly the methods employed by the most successful cultivators of these plants in our country, in France, Switzerland, Holland, and other countries. But we do no injustice to the author by specially commending the coloured illustrations, which are well drawn, not too highly coloured or otherwise exaggerated, and with sufficient detail for practical purposes. As these are available to readers of all nations, and to those who may not know any but their own native language, we heartily commend them as being trustworthy and serviceable.

BOOK NOTICE.

A TABULATED LIST OF ORCHARD INSECT PESTS AFFECTED BY SPRAYING. By F. V. Theobald (Headley Brothers, Ashford).

For a long time we were as a voice crying in the wilderness. Again and again we urged the desirability of having recourse to spraying, but it was not until the establishment of agricultural stations by the various county councils that the matter was taken up with any energy, and this, in spite of the fact that the hop-growers had long before included washing in the routine of cultivation. Our American cousins, it may be, go to the other extreme, and sometimes employ spraying when it is neither necessary nor judicious. In fact, a knowledge of the life history and mode of life of the insect, and of the local circumstances, are demanded before spraying can be advantageously carried out; and hence we cordially welcome the little pamphlet which has just been issued by Mr. Theobald, the zoologist to the agricultural college at Wye. In it the author treats of the principal insects attacking the Apple, the Cherry, the Currant, the Gooseberry, Medlar Nut, Pear, Plum, Quince, Raspberry, Strawberry, and Walnut.

The name of the insect is given, together with a reference to the treatise in which it is described. Then in tabular form, information is supplied when and where the eggs and the larvæ are to be found; what is the best wash to be applied and when. Directions for making the several insecticides are given, and care is taken to utter cautions as to the extremely poisonous character of some of these substances, and the consequent need of extreme care in storing and handling them.

HOME CORRESPONDENCE.

CRATÆGUS TANACETIFOLIA.—The accompanying flowering-shoot has been sent to me under the above name from a garden in Gloucestershire, where for several years past the whole tree, excepting one branch, has flowered regularly every other year, that particular branch flowering as regularly on every alternate year, at which time there is no bloom at all on the other parts of the tree. Is not this very unusual? W. Thomson, Teignmouth.

ACCIDENT TO A YOUNG GARDENER.—I have to relate that during the recent storm, Geo. Hubank, one of the young gardeners employed at Powis Castle Gardens, and son of the head gardener of Styche, Market Drayton, Shropshire, when passing under a large Elm-tree on his way to shelter from the terrific storm of June 28, just as it was struck by lightning, was unfortunately struck on the head by a large piece, and rendered unconscious; but I am pleased to state that he is recovering from the wound that he received, and the shock to his nervous system. J. L.

DENDROMECON RIGIDUM.—There are two distinct forms of this beautiful half-hardy Californian Tree-poppy, one of which figured on p. 13 of your last issue, and of which a coloured plate appeared in the *Garden* for October 10, 1896, is, I consider, far inferior in size and beauty of flower to the other, and comparatively worthless form. This I believe to be a native of South California. The other and far finer variety which is figured in the 85th volume of the *Botanical Magazine* on plate 5134, is, I believe, a native of North California, and is apparently a much scarcer plant even in its native country. This fine plant was introduced many years ago, 1859, by Messrs. Veitch, who received it from their collector, Lobb, but has for some time been lost to cultivation. There is now, however, in cultivation at Kew another and very different looking plant recently received from Los Angeles, under this name, which it is to be hoped may turn out to be the true form sent by Lobb to Messrs. Veitch. W. E. Gumbleton.

NORTHERNHAY PUBLIC GARDENS, EXETER.—A year ago the corporation of Exeter resolved to pay more attention to these gardens, which are situated in the heart of the city, and at the back of Rougemont and the Castle of Exeter. A fore-

man, Mr. W. Andrews, was appointed to look after the public gardens, and as Northernhay is the chief of these, it came in for a considerable amount of attention from him. Rockeries and dripping cascades and ponds were formed, and alterations effected in various directions by Messrs.

turi. The show has been held in Northernhay for more than fifty years. It has been decided to hold the exhibition in Bury Meadow. *Andrew Hope.*

IRIS REVERSION.—I have pleasure in sending a spike of a dark-blue English Iris var. (*I. xiphioides*),

only this one during the present flowering season, and I saw a similar flower of a Spanish Iris variety some years ago. *Ernst H. Krelage.*

ARABIS ALBIDA, FLORE-PLENO.—This has come before us with such a flourish of trumpets, that it is a source of astonishment to me that we have not had an opportunity of seeing it in fine condition at one of the meetings of the Royal Horticultural Society. This is what an enthusiastic American writer says of it:—"It is certainly one of the best introductions of the year. The plant is perfectly hardy; the individual flowers are perfectly double, of a pleasing pure-white colour, and are freely produced on graceful spikes. The difference between the new form and the type is as great as that which exists between a fine double and a poor single Ten-week Stock." All this is very glowing indeed, but is it true? A miserable example did certainly come before the Floral Committee of the Royal Horticultural Society at an early meeting in the present year, but it was ridiculously unequal to the single form. I have a mournful recollection of the advent of the double form of *Iberis sempervirens* fl. pl. a few years ago, and on the strength of some such plausible recommendation as that I have just quoted, I invested in plants. It was the single form deformed and spoilt, and this experience leads me to infer there is a danger of its being so with the double *Arabis*. *R. D.*

LAVATERA ARBOREA VARIEGATA.—The variegated Tree-Mallow, though very beautiful when well grown, is by no means a common plant in gardens, and especially in gardens attached to a farmhouse. But I lately found a number of fine plants of it in the pretty gardens surrounding the dwelling of Mr. Alfred Priest, at Tithe Farm, Roxeth, Harrow. These were each 3 to 4 feet in height, and bearing dense heads of the most beautiful variegated foliage, in which the cream-white colour predominates. The handsome, light-coloured foliage appears to great advantage amidst excellently-grown Roses, covered with a profusion of flowers, and the numerous other fragrant and showy flowers which always seem to thrive so vigorously in farmhouse gardens. The large-flowered Perennial Pea, the Canterbury Bells, and the Mule Pinks and Pansies are also very fresh, bright, and showy, and the mingling here and there of Cherry trees, Plums, Apples, and other fruit-trees gives an additional attraction, first with their flowers, and afterwards with their fruits. In front of the house is a small Weeping-Ash, covered with wire netting to form an ideal cage for the doves, the wire netting, while restricting their flight, not preventing them from enjoying a certain amount of liberty among the branches of the tree, and serving also the useful purpose of protecting them from possible enemies. *J. O'B.*

HOT-WATER CURE FOR MILDEW.—I have been much interested in the discussion going on in the *Gardeners' Chronicle* on hot water as an insecticide. I first heard of the method from an American source about six months ago, and have since adopted it with success on various plants. The temperature recommended was 140° F., and I was careful to have it exact in my first experiment, which was on a large *Imantophyllum miniatum*. I did not dip the plant on account of size, but used the syringe with force. All the mealy-bug, by which the plant was badly infested, was dislodged, if not killed, as I have not been able to find one on it since. I found the plant was not in the least injured, hence I was encouraged to make further experiments. I now use the water as hot as I can dip my hand in without being scalded, and I find it most effectual in destroying mealy-bug and scale. Syringing is much better than dipping, as the white powdery matter on the bug acts as a protection, and the water does not easily penetrate it, on the same principle that water will not penetrate very dry, dusty soil. All the eggs of the mealy-bug seem to be destroyed, hence the advantage of the hot water over many other insecticides. I have a very large collection of Cacti under my charge, in which mealy-bug, yellow thrip, and scale have been very troublesome, especially by infesting the densely-spined *Echinocacti* and *Mammillarias*. I have tried vaporising with XL All at double strength, spraying, as recommended by some growers, with spirits of wine, Fir-tree oil, &c., all with more or less damage to Cacti, with the exception of the first-mentioned. I now rely entirely on hot water for

FIG. 21.—A VIEW IN THE AVENUE, "THE GLEN," INNERLEITHEN.

(See p. 6 in our last issue.)

R. Veitch & Son. Now, when the result is apparent, the citizens are much pleased with the improvements that have been made. The corporation being now mindful of the improved appearance of the garden, the council at their last meeting decided against the Devon and Exeter Horticultural Society holding its summer exhibition there, on the ground that it would injure the

a part of the flower having reverted into light blue, evidently the colour of one of the parents. The demarcation-line between the two colours is very conspicuous. The second flower, not yet open at this moment, will probably show the same phenomenon, although the demarcation-line may differ from that in the first flower. Similar cases are, as far as my experience goes, rather scarce. I observed

these plants, and I find they are stimulated rather than injured thereby. I strongly recommend it to growers of Cacti in particular. There are hundreds of plants thrown away annually on account of their being badly infested with insect pests. I would advise my *confrères* to try hot water on such in future before consigning them to the fire or rubbish-heap. *Arthur Cobbold, Heaton Mersey.*

While the discussion in your paper continues on destroying mildew on Vines by hot water, I may say it is a process I do not agree with on Vines. The best cure and preventive I ever tried was flowers-of-sulphur mixed in boiling water, made into a thin paste, and applied to the hot-water pipes by a brush in the afternoon at closing-time, and with pipes hot. I have never known this remedy fail me. Of course the house must be kept closed after applying the sulphur, and if not thoroughly destroyed the first time, continue it the next afternoon at closing-time. Respecting mealy-bug, I think hot-water at, say, 130°, or according to the hardness of the plant, is a good remedy, and especially if mixed with insecticides, make it more effective. *Wm. Smythe, Basing Park.*

HYBRIDISTS AND CROSS-BREEDERS.—The notes on p. 1 of your last issue on the history and improvements that have been effected in florist's flowers, are very interesting reading to those who have been closely identified with the investigations that have helped to bring about the advance we see to-day. Our reason in writing is to express regret that your correspondent should have omitted to make any mention of the leading part we have taken in improving these flowers during the last forty years. We have only to refer you to the columns of the *Gardeners' Chronicle* during the last three years, where have appeared comparative illustrations of what we have done with the *Calceolaria* and *Petunia*, as against the original types. Our experiments with the *Primula*, *Cineraria*, *Gloxinia*, and *Cyclamen*, have equally advanced. In the case of the *Primula*, we may mention that we were awarded a First-class Certificate by the Royal Horticultural Society for the first Blue *Primula*, and our *Cinerarias* last year beat in open competition one of the best known strains in cultivation; our *Gloxinias*, too, are considered to be exceptionally fine, and we hold several gold medals for groups of all these plants that have been staged at various exhibitions. *James Carter & Co.* [From the abundance of material at hand, we cannot undertake to notice the work that each individual or firm may have done, but even in such a general survey as we propose to make, it is obvious that the name of Carter & Co. could not be omitted without exposing ourselves to the charge of incompleteness. If Messrs. Carter will kindly wait, they will find that we shall have plenty of opportunities of rendering to them the credit that is their due. *Ed.*]

SOCIETIES.

ROYAL HORTICULTURAL.

JUNE 29.—At a meeting of the Fruit and Vegetable Committee, held on the above date at Chiswick, there were present, Mr. P. Crowley, Chairman; S. T. Wright, Secretary; and Messrs. Addison, Barrow, Dean, Mortimer, Smith, and Pope.

The earliest varieties of sixty-five stocks of Peas were examined; these varied very much in height, some very dwarf, others 5 feet in height. The shortest varieties, probably because too near the hot soil, had not set well. Some of the taller ones had done admirably. Three marks were given to Duke of Cornwall, 5 feet in height, good cropper; pods large, green, well filled, and Peas green, and of excellent quality; and to Alderman, a very fine tall variety, that has been some two or three years in commerce, and is, apart from being early, and a great cropper, probably the finest of all exhibition varieties. Duke of York, a well-known variety, was also in capital form; and of smaller-podded Peas, *Acme* was good, but lacks colour. All Peas now, first early or late, must have good green colour, to meet modern requirements, and the Peas should be tender, and have nice flavour. Too many of even new ones are deficient in these respects. Several stocks, also, were yet indifferently selected. Some Peas that were good croppers would have been regarded as first-class ten years since.

Some twenty stocks of both old and new Lettuces were seen. The best of the Cabbage forms were All-the-Year-Round, Early Market, Continuity, Crystal Palace, and Leyden White Dutch; and of Cos forms, Pyramidal Brown Cos, and Paris White Cos, the best. A few varieties seemed to have more fitness for the flower border than for table use.

Mr. Beale, of Loughborough, sent heads of a late Broccoli as Latest-of-All, that arrived at the Drill Hall on the 27th ult., too late; these the committee unanimously pronounced to be late Chou de Burleigh. It was agreed that for examination of the later Peas, the committee meet at Chiswick at 11 A.M. sharp on Tuesday, the 11th inst.

The Fruit Crops.—When presently the customary census of the season's fruit crops is obtained, I fear the returns will show a comparatively poor crop. A jam-maker recently told me that the fruit reports sent into the market gave but a poor prospect; and whilst Apples and Gooseberries were the best, with Currants, Raspberries, and Strawberries fair, others were very poor indeed. The Strawberry crop, owing very much to the previous season's drought and the late spring frosts, was little better than half one, and I fear in many private gardens it is hardly so good as that. Pears and Plums are very thin indeed, almost failures; Damsons being absolutely so. Cherries are partial, and in a few places good, in so many are very thin. I have rarely heard so many complaints with respect to the falling of stone fruits, after apparently setting, as this season. Without doubt, so general a failure in fruit production can hardly have other than an embarrassing effect on fruit-culture generally. It is so difficult in the face of the poor crops of the past and present seasons, to be enthusiastic in advocacy of fruit-tree planting. Unless advocates can show something tangible in results, their advocacy finds little credence. Must certainly, what between weather so seriously affecting trees and bloom, and insect pests, which seem to be as prevalent as ever, in spite of the myriads of palliatives and insecticides advertised, the fruit-grower's life is hardly a happy one. But, no doubt, presently we shall hear pessimists pointing to our fruit imports, and asking why we do not grow more fruit in this country. Did we now have crops relative to trees, bushes, and plants, we should have a great one. A really great, or even relatively great, fruit crop seems never to greet our efforts now. If any one can, in discussing the causes of our existing season's poor crop, but tell us how to avoid failures and secure good results, then something tangible may come out of present failures. That is a task, I fear, no one will care to undertake. *A. D.*

Scientific Committee.

JUNE 27.—Present: Dr. M. T. Masters (in the chair); Dr. Müller, Rev. W. Wilks, Rev. G. Henslow, Hon. Sec.; visitor, Mr. H. J. Webber (Agricultural Department, New York).

A monstrous Cuttle.—Dr. Masters observed that the specimen brought to the last meeting was characterised by having a sepal in a petaloid condition; but the same feature occurred in three flowers on the spike.

A malformed *Cotoneaster rostratum*.—A spray bearing two flowers, with the lateral petals bearing characters of the lip, was sent by Sir Trevor Lawrence.

Diseased Carnations.—Specimens were sent by Mrs. E. Mackay, which proved to be attacked, both by bacteria and *Puccinia dianthi*. Mr. Webber observed that the disease known as bacteriosis is now generally regarded in America as a result, and not a cause; that it follows upon some lesion to the foliage, as by punctures, &c., by insects. The same observation might apply to the presence of the *Puccinia*. No remedy could be suggested. It is best to destroy the plants entirely.

NATIONAL ROSE.

JULY 1.—The annual display of Roses at the Crystal Palace, under the auspices of the National Rose Society, was held on Saturday last, and probably few were disappointed either by the number of Roses staged or in the quality of the blooms generally. Anything like a "record" show was not anticipated. The spring and early summer have not been of a "record" character in respect to weather, unless it be that it has been more than usually changeable and ungenial. There has been no long spell of great heat, but Roses have nevertheless suffered from drought, owing to the moisture in air and atmosphere having been absorbed by the E. and N.E. winds that prevailed during the month of May and some part of June. The rains have been delayed until the plants were commencing to bloom, and although much needed by the roots, have served in a measure to disfigure the blossoms. The occasional contributions in the *Gardeners' Chronicle* by "Wild Rose" have not been very optimistic in respect to the "Prospects of the Season," and as we were not expecting to see a magnificent show, that on Saturday last was considered rather more than satisfactory. There were capital blooms found for each of the six medals offered, and that has not always been the case. Mr. E. Mawley had to bear the most of the work, and did so with his usual kindness and courtesy, but we were pleased to see that the esteemed and veteran Secretary, the Rev. H. H. D'Ombrian, was able to visit the show. Mr. B. R. Cant followed his success of last year by again winning the Challenge Trophy for seventy-two blooms, and the Amateur's Trophies were won by Mr. E. B. Lydsell, for thirty-six blooms, distinct; and Mr. O. G. Orpen, for eighteen Teas and Noisettes, distinct, respectively. The Society's Gold Medal was awarded to Mr. Piper's Sunrise, an excellent Tea that has been shown extensively this season. The Nurserymen's exhibits were staged in the Central Transept opposite the large Organ, and the Amateurs' in the Eastern section of the Nave.

NURSERYMEN.

Seventy-two blooms, distinct varieties.—In this most important Trophy class there were six exhibitors, and consequently four hundred and thirty-two flowers staged. The Trophy and 1st prize were won as last year by Mr. B. R. Cant, of Colchester; and another Colchester firm, Messrs. Prior & Son were 2nd; the 3rd position was secured by Messrs. Harkness & Sons, Bedale and Hitchin. The 1st prize collection was much better than had been anticipated this season. The varieties were:—Back row: Gustave Piganeau, Marchioness of Dufferin, Duke of Edinburgh (a very good bloom of this old finely-coloured variety), Mrs. Sharnan Crawford, Ulrich Brunner, Comtesse de Caledon, Camille Bernardin, La France, François Michelon (very good), Cleopatra, Tom Wood, Lady M. Fitzwilliam, Suzanne M. Rodocanachi, Muriel Grahame (a magnificent bloom of this pretty variety that gained the Silver Medal for the best T. or N. in the Nurserymen's classes), Marquise Litta, Mrs. John Laing, Xavier Olibo (grand colour), Mrs. W. J. Grant, Madame Victor Verdier, Her Majesty, Duke of Fife, Caroline Testout, Crown Prince, and a pretty bloom of Madame Gabrielle Luizet. Centre row: Dupuy Jamain, White Lady, General Jacqueminot, Innocente Pirola, Abel Carrière, Kaiserin Augusta Victoria, Duchess de Morny, Souvenir de S. A. Prince, Horace Vernet, Jean Durher, Alfred Colomb, Charlotte Gilmet, Helen Keller, Souvenir d'Elise Vardon, Rev. Allan Cheales, Mrs. Sandford, Le Havre, Madame Cusin, Marie Baumann, Marchioness of Londonderry, Marie Verdier, The Bride (a very nice bloom), Auguste Rigotard, and Bridesmaid. Front row: Edouard André, Souvenir d'un Ami, Duke of Connaught, Comtesse de Nadaillac, Comte de Rainbaud, Golden Gate, Sultan of Zanzibar, Margaret Dickson, Madame Eugénie Verdier, Maréchal Niel, Marie Radzy, Medea, M. Noman, Maman Cochet (very good), A. K. Williams, Marchioness of Downshire, La Fraicheur, Catherine Mermet, Comtesse de Ludre, Madame de Watteville (good), Earl Dufferin, Ernest Metz, Mrs. Cocker (very large, full, and good in colour), and Madame Hoste. Messrs. D. Prior & Son's exhibit was a commendable one, and this firm may hope to win the class in the near future. The varieties best shown were Mrs. John Laing, Maman Cochet, Dr. Seward, Suzanne-Marie Rodocanachi, Pride of Reigate (the old striped rose), Madame Delville, Helen Keller, Catherine Mermet, and Comtesse de Nadaillac. 3rd, Messrs. Harkness & Sons, Bedale, Yorks, and Hitchin, Herts.

Forty distinct varieties (trebles).—There were six hundred Roses shown in this class, which in effect is one of the most showy. Messrs. D. Prior & Son, who were 1st, had a capital exhibit. The most effective varieties were Ulrich Brunner, Marquise Litta, Dupuy Jamain, Margaret Dickson, Madame de Watteville, Maman Cochet, Mrs. W. J. Grant, Camille Bernardin, Duchess de Morny, Abel Carrière, Madame Gabrielle Luizet, General Jacqueminot, Innocente Pirola, &c. Mr. B. R. Cant had a pretty exhibit of somewhat smaller blooms, and including many pretty trebles of Teas and Noisettes. Messrs. Frank Cant & Co. were 3rd.

Forty-eight blooms, distinct varieties.—Messrs. J. Townsend & Sons, Worcester, who were 2nd in this class last year, this season won premier place. The best flowers in the stand were of the following varieties: Gustave Piganeau (an excellent corner bloom), Caroline Testout, Marquise Litta (this H.T. was a splendid colour in this case), Mrs. Jno. Laing, Catherine Mermet, Souvenir de Marie Levet, Mrs. Sharnan Crawford, Suzanne-Marie Rodocanachi (excellent colour), Madame de Watteville, Innocente Pirola, Prince C. de Rohan (deepest crimson, and shown in grand colour), Ulrich Brunner, Prince Arthur, Mrs. W. J. Grant, Madame de Watteville, and Niphetos. Messrs. G. & W. H. Bunch, Peterborough, had smaller Roses, but were nevertheless commendable in the 2nd degree, and included some fine blooms, particularly of the varieties Helen Keller, Tom Wood, Madame Gabrielle Luizet, Lawrence Allen, Horace Vernet, and Mrs. Jno. Laing. 3rd (very close), Messrs. J. Burrell & Co., Cambridge.

Twenty-four blooms, distinct varieties.—Mr. Chas. Turner, who staged an excellent exhibit in this class last year, on the present occasion was beaten by Mr. Geo. Paisner, of Oxford. Mr. Prince's varieties were, back row, Comtesse de Nadaillac, Marquise Litta, Her Majesty, A. K. Williams, Beauté Lyonnaise, Ulrich Brunner, Maréchal Niel, and Mrs. Sharnan Crawford. Centre row: Mrs. W. J. Grant, Souvenir de S. A. Prince, Reynolds Hole, Margaret Dickson, Gustave Piganeau, Maman Cochet (good), Victor Hugo, and Innocente Pirola. Front row: The Bride, Souvenir C. E. Rohan, Souvenir d'un Ami, F. Michelon, Catherine Mermet (good), Sultan of Zanzibar, Golden Gate, and Mrs. Jno. Laing. Mr. Chas. Turner, Slough, had a bright collection that was placed 2nd; and Mr. J. Mattock was the best exhibitor of the other five that competed.

Twenty-four trebles, distinct varieties.—There were five exhibitors in this class, and the 1st prize was won by Mr. John Mattock, of New Headington, Oxford. The blooms were small, but they were remarkably fresh and clean in appearance. Mrs. Sharnan Crawford, Marquise Litta, Catherine Mermet, Maman Cochet, and Madame de Watteville, were among the most effective. Messrs. G. & W. H. Bunch, Peterborough, were very good as 2nd prize exhibitors; and Messrs. J. Townsend & Sons, Worcester, were 3rd.

Twelve blooms, distinct (Dickson Cup Class).—The best stand of twelve blooms of distinct Roses sent out by Messrs. A. Dickson & Sons, Newdowns, was shown by Messrs. P. Cant & Co., who besides winning the 1st prize have now

become absolute owners of the Dickson Challenge Cup, presented by Mr. C. J. Grahame, who is responsible also for the money prizes in this class. The varieties were Mrs. G. Sharnan Crawford, Mrs. W. J. Grant, Marchioness of Downshire, Marchioness of Londonderry, Margaret Dickson, Helen Keller, Ethel Brownlow, Marchioness of Dufferin, Countess of Caledon, Ethel Richardson, Tom Wood (exceedingly bright), and Ellen Drew. The last-named Rose is one of the newest, and a pretty pink H. P. of moderate size, and very sweet. Messrs. A. DICKSON & SONS, Newtownards, were 2nd, but last year they were the winners. In their stand were Mrs. W. J. Grant (fine), Muriel Grahame, Ulster, Bessie Brown, a beautiful white Rose with faint blush petals very fine, Robert Duncan, and Daisy, &c. 3rd, Mr. B. R. CANT. At least two other collections were unplaced.

Twelve distinct varieties, seven trusses of each.—This class is probably intended as a means of introducing novelty in the method of exhibiting Roses. Boxes may not be used, but the bunches must be staged in vases or other receptacles. Mr. GEO. PRINCE's exhibit was a most delightful one. The Roses were arranged in elegant receptacles over a black velvet ground adorned with Rose shoots. The point in which the exhibit was open to criticism was in the matter of

Nadaillac, Souvenir de S. A. Prince, Princess of Wales, and Madame Hoste. Messrs. J. RURRELL & Co., Cambridge, were 2nd, and included beautiful blooms of Maman Cochet, The Bride (best in the stand), and Catherine Mermet. 3rd, Messrs. J. TOWNSEND & SONS. There was only one unplaced stand.

Eighteen distinct varieties (trebles).—In this large treble Tea class the winner last season, Mr. GEO. PRINCE, was again most successful. His best trebles were Catherine Mermet, Madame Cusin, Innocente Pirola, Madame de Watteville, Maman Cochet, Bridesmaid, Comtesse de Nadaillac, Laciote (described by a visitor as more like a Tulip than a Rose), and Maréchal Niel. Mr. B. R. CANT had an even lot of rather small flowers, and was 2nd. Messrs. F. CANT & Co., whose exhibit contained too many whites and yellows (good) was 3rd. One collection failed to get a place.

GARDEN OR DECORATIVE ROSES.

These very beautiful varieties were almost at their best on Saturday last, and some magnificent exhibits were staged.

Twenty-six distinct varieties, not fewer than three trusses of each.—Messrs. GEO. PAUL & SON, The Old Nurseries, Cheshurt, beat Messrs. GEO. COOLING & SONS, Bath, these being the

An extra class with identical requirements to the one above, but open to all nurserymen whether competing in the above classes or not, was won by Mr. CHARLES TURNER, Slough; the 2nd and 3rd prizes being obtained by Messrs. FRANK CANT & Co. and Mr. GEORGE PRINCE respectively. There was one other exhibit.

OPEN CLASSES.

Twelve blooms of hybrid Teas distinct.—Messrs. F. CANT & Co. had a stand in which each of the dozen blooms staged was beautiful. The varieties were Mrs. W. J. Grant, Caroline Testout, Marquise Litta, La France, Kaiserin A. Victoria, Clara Watson, Charlotte Guillemot, Lady Fitzwilliam, Madame Abel Chatenay, Souvenir de President Carnot, Viscountess Folkestone (magnificent bloom), and Souvenir de Madame Eugénie Verdier. Mr. B. R. CANT took 2nd place, also showing most creditably; 3rd, Messrs. A. DICKSON & SONS. Each of these exhibits was of excellent merit, and went to show what a number of the most lovely of modern Roses belong to this section. There were six collections in the class.

Twelve blooms of any yellow Rose.—There was half-a-dozen collections and the 1st prize was won by Mr. GEORGE PRINCE,

FIG. 22.—SPECIMEN PLANTS OF GREENHOUSE RHODOBENDRONS, AS GROWN AT "THE GLEN," INNERLEITHEN.

(See p. 6 in our last issue.)

labelling, there being no names to the Roses whatever, a serious disadvantage to the public. Marquise Litta, staged in a neat bunch, was exceedingly effective. Mr. JOHN MATTOCK was 2nd, and Messrs. PAUL & SONS, Cheshurt, 3rd.

TEAS AND NOISETTES.

Twenty-four blooms, distinct varieties.—Teas and Noisettes were not specially good, being somewhat undersized, and many of them were disfigured by wind and rain. Messrs. F. CANT & Co., Braiswick Nursery, Colchester, however, who won this class, staged an excellent exhibit. The varieties were, back row, Catherine Mermet, Innocente Pirola, Ernest Metz, Madame Cusin, Madame Koster, Cleopatra, Maman Cochet, and Rubens. Centre row: Souvenir de S. A. Prince, Souvenir d'Un Ami, Golden Gate, Niphetos, Madame de Watteville, Maréchal Niel, Bridesmaid, and Medea. Front row: Amazone, Ethel Brownlow (very fine indeed), The Bride, Empress Alexandra of Russia, Marie Van Houtte, Souvenir d'Elise, Comtesse de Nadaillac, and Hon. Edith Gifford. 2nd, Mr. B. R. CANT, who had rather smaller flowers, his best blooms were of the varieties Bridesmaid, Ethel Brownlow, and Madame de Watteville. 3rd, Mr. GEO. PRINCE, there being one unplaced stand.

Twelve blooms, distinct varieties.—Mr. JOHN MATTOCK, New Headington, Oxford, proved to be the winner of this class, his varieties being: back row, Madame de Watteville (beautiful), Maréchal Niel, Souvenir d'Un Ami, Souvenir d'Elise Vardon. Centre row: Amazone, Catherine Mermet (very fine), The Bride, Maman Cochet; front row, Comtesse de

only firms competing in this class. Each exhibit was arranged similar but not perfectly like to the other, being in large bunches or sprays, in moss-surfaced boxes.

In the 1st prize exhibit were noticed of Polyantha varieties, Perle d'Or, Gloire de Polyantha, China, Marie de Montivert (white), Grandiflora, &c. Of Noisettes, Madame P. Cochet (fine yellow), Alister Stella Gray, L'Idéal, W. A. Richardson, &c. Then there were the popular varieties of garden Rose, Crimson Rambler, H. T. Dawn, a large rose-coloured semi-single, fig. in *Gardeners' Chronicle*, July 23, 1898 (supplement). PAUL'S Carmine Pillar, H. T. Camoens; H. T., Madame P. Ducher, Reine Olga de Wurtemberg, Sweet Briar, Janet's Pride; H. P., Royal Scarlet (a most effective single Rose); Moss Roses, Prolific and Crested; Noisette Psyche (pink); Rugosa varieties, Madame C. Worth, Alma, Mundi, &c. Messrs. GEO. COOLING & SONS' exhibit was also very attractive, and differed considerably in the varieties displayed.

Eighteen distinct varieties, not fewer than three trusses of each.—There were three exhibits of eighteen bunches of Garden Roses, distinct, and Messrs. FRANK CANT & Co. were the victors. There was excellent quality in these Roses, and the varieties were Crimson Rambler, W. A. Richardson, Reine Olga de Wurtemberg (gorgeous), Madame Falco, Marquis of Salisbury, Madame Chedane Guilaissan, Carbon Job, Crested Moss, Gustave Regis, Laurette Messimy, Ma Capucine, Common Moss, Pernet Ducher, Rainbow, Madame A. E. Not'e, Souvenir de Catherine Guillot, Cecile Brunner (Polyantha), and L'Idéal. Mr. CHAS. TURNER was 2nd, and Mr. JNO. MATTOCK, 3rd.

who had Comtesse de Nadaillac (his favourite Rose), in admirable condition; Marie Van Houtte from Mr. J. MATTOCK, and Madame Hoste, from Mr. BENJAMIN R. CANT, were 2nd and 3rd respectively.

Twelve blooms of any white Rose.—Of a dozen exhibitors in this class, the best was Mr. BENJAMIN R. CANT who showed White Lady very finely. Messrs. D. PRIOR & SON were 2nd with Bessie Brown, showing a collection which included the Silver Medal H. T. bloom; and Messrs. D. PRIOR & SON who exhibited The Bride were 3rd.

Twelve blooms of any light or dark crimson Rose.—There were nine collections, and of these, one showing the variety General Jacqueminot was 1st, from Messrs. D. PRIOR & SON. The variety Ulrich Brummer, from Mr. CHAS. TURNER, was 2nd; and Gustave Pigancien, from Messrs. TOWNSEND & SON, 3rd.

Twelve blooms of any light pink or rose-coloured Rose.—There were thirteen exhibits in this class, and no fewer than eight of the exhibitors relied on the popular variety Mrs. John Laing. The 1st prize was awarded to this variety, as exhibited by Mr. CHAS. TURNER; and 2nd prize to Mr. W. J. Grant, as shown by Mr. BENJ. R. CANT; and 3rd to Mrs. JNO. LAING again, as displayed by Messrs. PRIOR & SON.

The best H. P. in the nurserymen's classes was shown in this class, being a magnificent bloom of Mrs. JNO. LAING in an exhibit from Mr. AUGUSTUS G. GREEN, Rose Lands, Great Hockesley, Colchester.

Twelve blooms of any Tea or Noisette.—Comtesse de Nadaillac was given the place of honour in this class, and was

appropriately shown by Mr. GEO. PRINCE, Oxford, in splendid fashion. Mr. JOHN MATTOCK was 2nd, and Messrs. F. CANT & Co. 3rd.

Twelve distinct varieties of single-flowered Roses.—Messrs. PAUL & SON, Chesham, won this class, which is a very pretty one. His varieties were, Nutkitensis (white), Paul's Carmine Pillar, Rugosa x pumila (purple), Royal Scarlet, Andersoni (pink), Lucy Ashton (pale pink), Lady Penzance (a copper-coloured Sweet Briar), Pink Roamer, Benda (large pink), Paul's Single White, and Gallica pumila. Mr. CHAS. TURNER was 2nd, and Mr. JNO. MATTOCK 3rd.

Six Roses suitable for buttonholes, and shown in bunches or sprays.—Mr. JOHN MATTOCK was the winner of this class. His varieties were Madame Hoste, W. A. Richardson, Amazone (yellow), Anna Ollivier, Ma Capucine, Souvenir Catherine Guillot, Marie Van Houtte, Rubens and Papillon. Mr. GEO. PRINCE was 2nd, and Messrs. TOWNSEND & SONS 3rd.

Three sprays of Roses suitable for ladies' wear, with any foliage or grasses.—This appears to be a class entirely for the ladies, at any rate they secured all the three prizes offered. Mrs. O. G. ORPEN won the premier award, her spray was composed of the tiniest buds possible, and was very pretty in effect. Miss BEATRICE L. LANGTON, Hendon, was 2nd; and Mrs. G. W. COOK, North Finchley, who had much larger flowers, 3rd.

NEW ROSES (OPEN).

Nine blooms of any new Rose.—In this class Roses are admitted that were not catalogued by English nurserymen previous to 1896. Messrs. A. DICKSON & SONS were the winners with nine beautiful blooms of Bessie Brown, a large fine-petalled Rose, almost white, but possessing a faint blush. Mr. B. R. CANT was 2nd with H. P. Mrs. Cocker (pink), and Messrs. F. CANT & Co. were 3rd with Mrs. F. Cant, a very pretty pink variety that is now moderately well known.

Twelve blooms, distinct varieties, not catalogued previous to 1896.—This class was also won by Messrs. A. DICKSON & SONS, their varieties being Killarney, Rev. Allan Cheales, Bessie Brown (as shown in previous class), Countess of Caledon, Muriel Grahame (the premier T. or N. in Nurserymen's classes), Daisy, Madame C. Rainey, Antoine Revoire, Tom Wood, Mrs. Edward Mawley, Ulster and Robert Duncan. Mr. B. R. CANT was 2nd, and Messrs. FRANK CANT & Co. 3rd.

Three trusses of any new seedling Rose or distinct sport.—The Gold Medal of the Society was awarded to Tea Rose Sunrise, a quantity of blooms of which was shown by Mr. G. W. PIPER, Uckfield. This beautiful and distinctly tinted Rose was figured in *Gardeners' Chronicle*, May 20, p. 319. It is brilliant orange-yellow, the backs of the petals being rosy-pink. The blooms are excellent in form, and the variety very free-flowering.

Messrs. PAUL & SON were requested to exhibit their new Rose, Alex. Hill Gray, on a future occasion. It is a fragrant, broad-petalled Tea, cream-coloured, with suspicion of pink towards the margin of the petals. There were several other varieties submitted, but none of them gained an award.

PREMIER BLOOMS.

The best H.P. bloom was Mrs. John Laing, shown by Mr. A. G. GREEN; the best Tea or Noisette was Muriel Grahame, in Mr. B. R. CANT's 1st prize collection of seventy-two blooms; and the best H.T. was the new Rose, Bessie Brown, in a stand from Messrs. D. PRIOR & SON, in the class for twelve blooms of any white Rose.

AMATEURS.

There was very close competition in many of the classes for Amateur growers only, and some really good flowers were staged.

The Champion Trophy for thirty-six blooms was again secured by E. B. LINDSELL, Esq., Hitchin. Among these was the Silver Medal Hybrid Perpetual, François Michelin, Earl of Dufferin, Marchioness of Londonderry, La France, Ulrich Brunner, Mrs. J. Laing, Gustave Pignean, Madame G. Luizet, Captain Hayward, Helen Keller, S. M. Rodocanachi, Sharnan Crawford, Dupuy Jamain, K. A. Victoria, Comtesse de Luttre, Madame Cusin, Comte Raimbald, Catherine Mermet, Madame de Watteville, Charles Lefebvre, Horace Vernet, Muriel Grahame, Bridesmaid, Her Majesty, A. K. Williams, Caroline Kuster, Sir R. Hill, Innocente Pirola, Duchess of Bedford, Madame E. Verdier, Etouard André, Merveille de Lyon, Marie Baumann, Mrs. W. J. Grant, Madame Hausmann, and Lady Mary Fitzwilliam were the remaining varieties. T. B. HAYWOOD, Esq., Reigate, made a good 2nd, having G. Pignean, Her Majesty, Louis Van Houtte, Abel Carrière and Margaret Dickson in grand form; Rev. J. H. PEMBERTON, Havering atte-Bower, securing 3rd place.

Twenty-four blooms, distinct.—This year, the class for twenty-four varieties was very wisely tied from winners of the Champion Trophy during the last ten years. The Rev. A. FOSTER-MELLIAR, Ipswich, was successful with very bright and even blooms. Dr. Sewell was especially good, the other most noticeable flowers being Caroline Testout, General Jacqueminot, Souvenir de S. A. Prince, Madame Hoste, Medra, Etienne Levet, Ulrich Brunner, The Bride, and Marquis de Litta. A. TATE, Esq., Leatherhead, followed very closely, his stand containing the Silver Medal Tea in Princess Beatrice, a really grand flower. F. W. CAMPION, Esq., Reigate, was 3rd.

For twelve distinct trebles.—E. B. LINDSELL, Esq., was well ahead; there were grand trusses of Ulrich Brunner, Marie Beaumann, K. A. Victoria, Mrs. J. Laing, and Captain Hayward. As in the Trophy Class, T. B. HAYWOOD, Esq., of Reigate, made a good 2nd to the champion grower, being followed by Colonel J. H. PITT, Maidstone. Both of these stands contained some capital flowers.

For twelve trusses of any Rose except Teas or Noisettes.—T. B. HAYWOOD, Esq., was first with some very clean and bright examples of Her Majesty. C. J. GRAHAME, Esq., Leatherhead, was 2nd, with Mr. J. Laing; and O. G. ORPEN, Esq., Colchester, 3rd, with K. A. Victoria.

For six distinct new Roses.—The Rev. J. PEMBERTON was well ahead, baying Madame Cadeau Ramey in good form.

RESTRICTED CLASSES.

Some of the best blooms in the show were found among the classes open only to growers of fewer than 2,000 plants. E. M. BETHUNE, Esq., Horsham, won for 24 varieties, the six best being Clara Watson, K. A. Victoria, The Bride, Captain Hayward, Marie Van Houtte, and Pride of Reigate. W. COLIN ROMAINE, Esq., The Priory, Windsor, took 2nd place, and R. E. WEST, Esq., Reigate, 3rd. The last-named exhibitor had The Bride, Maréchal Niel, and Prince C. de Rohan, in particularly good form.

For eighteen distinct, single trusses.—CONWAY JONES, Esq., Gloucester, was well in front. We noticed here, a good bloom of Catherine Mermet, that was almost as pale as Muriel Grahame; La France, Captain Hayward, and Dupuy Jamain, were also very good. E. MAWLEY, Esq., Berkhamsted, followed, his Marquis de Litta, Dupuy Jamain and Ferdinand de Lesseps being extra clean and good. P. G. C. BURNAND, Esq., Reigate, was 3rd.

Six competitors entered the class for eight trebles, Mr. E. MAWLEY being well ahead in this instance; and his most noticeable blooms were Margaret Dickson, and Mrs. E. Mawley. P. G. C. BURNAND, Esq., had La France, Mrs. R. G. Sharnan Crawford, and François Michelin in good form; and he was followed by CONWAY JONES, Esq., Gloucester.

There were also six competitors for nine blooms of any Rose except Teas or Noisettes: P. G. C. BURNAND, Esq., winning with Mrs. Sharnan Crawford; Rev. H. A. BERNERS, Harkstead Rectory, was 2nd with Margaret Dickson; and R. E. WEST, Esq., 3rd with Mrs. John Laing.

For growers of fewer than 1,000 plants.—Miss B. H. LANGTON, Hendon, was well ahead of eleven competitors for twelve distinct varieties. Her Majesty, Mrs. W. J. Grant, La France, A. K. Williams, General Jacqueminot, and Marquis de Litta were the best blooms. The last-named variety secured the Silver Medal as the best Hybrid Tea in the Amateur section, and was extra good. Second and third positions were taken by Rev. F. PAGE ROBERTS, Seale Rectory, and G. MOULES, Esq., Hitchin, in the order named.

Nine growers competed for six blooms of any one variety; G. W. COOK, Esq., North Finchley, securing 1st prize with Mrs. J. Laing; Mr. J. BATEMAN, Archway Rd., N., and R. FOLEY HOBBS, Esq., Worcester, following with the same variety.

For growers of fewer than 500 plants.—There were nine competitors in all of these classes, and some of the very best flowers were found in this division.

For nine distinct varieties a piece of plate presented by C. E. SHEA, Esq., was secured by Mrs. L. E. LINES, Hitchin; the best blooms were Alfred Colomb, Mrs. J. Laing, G. Pignean, and Ulrich Brunner. Mr. E. R. SMITH, Melford Lodge, and Mr. J. CARRER, Halstead, Essex, following in the order named.

A grand half-a-dozen flowers came from J. T. THOMSON, Esq., Round's Green, N., consisting of Mrs. W. J. Grant, Prince Arthur, Marquis de Litta, Mrs. S. Crawford, Captain Hayward, and Mrs. J. Laing. W. D. FRESHFIELD, Esq., Reigate, was 2nd, and had one of the best blooms of Viscountess Folkestone we have seen this season; 3rd place was awarded to J. HUNT, Esq., Hitchin.

F. WELLESLEY, Esq., Woking, was a capital 1st, for six blooms of any variety except Teas or Noisettes, winning with Mrs. J. Laing; the same variety from R. W. BOWYER, Esq., Haileybury College, taking 2nd prize; and Caroline Testout, from G. A. HAMMOND, Esq., Burgess Hill, 3rd.

The Silver Challenge Cup, for twelve blooms, distinct varieties, presented by C. J. GRAHAME, Esq., was secured by Mr. G. MOULES, Hitchin, against twelve competitors, who all showed very strongly. Niphetos, Marquis de Litta, K. A. Victoria, Etienne Levet, Souvenir d'Elise Vardon, Xavier Ohbo, Madame Cusin, Comtesse de Nadaillac, Ulrich Brunner, Marchioness of Downshire, A. K. Williams, and François Michelin, made a really good dozen. Rev. A. C. JOHNSON, Capel St. Mary, Suffolk, and R. FOLEY HOBBS, Esq., Worcester, followed in like order.

Ten competed for four distinct trebles.—Rev. J. PAGE ROBERTS, Seale Rectory, winning with Comtesse de Nadaillac, Marquis de Litta, Mrs. J. Laing, and Cleopatra; the last-named were superb flowers. H. P. LONDON, Brentwood, and G. W. COOK, North Finchley, followed with very creditable exhibits.

The Runney Cup, for twelve blooms, distinct (open to all Amateurs), was won by the Rev. J. H. PEMBERTON, against eleven competitors. His flowers were Marchioness of Dufferin, Niphetos, Marquis de Litta, Ulrich Brunner, Comtesse de Nadaillac, Mrs. J. Laing, G. Jacqueminot, A. K. Williams, Etienne Levet, and Horace Vernet. Mr. C. J. GRAHAME, and Mr. E. B. LINDSELL, Hitchin, following very closely.

The Rev. J. H. PEMBERTON also won Messrs. PAUL & SON's prize, for nine distinct varieties (open to all Amateurs); and Mr. O. G. ORPEN, Colchester, was 2nd.

MAIDEN WINNERS, AND SUBURBAN GROWERS.

In the class open only to amateurs who have never won a prize at an exhibition of the N. R. S., J. C. THOMSON, Esq., Round's Green, N., F. WELLESLEY, Esq., Woking, and G. H. BAXTER, Esq., Brentwood, were successful against

eleven competitors; H. ADAMSON, Esq., Bedale, Yorks, Colonel J. H. PITT, Maidstone, and A. E. GIFFORD, South Norwood, being successful against nine competitors.

The Langton Memorial Cup, for six blooms grown within eight miles of Charing Cross, was won by G. W. COOK, Esq., North Finchley.

TEAS AND NOISETTES.

The Challenge Trophy for 18 blooms, distinct, was easily won by O. G. ORPEN, Esq., Colchester, who had grand flowers of Elsie Fugler, Maman Cochet, and Bridesmaid. A. HILL GRAY, Esq., Bath, and Rev. FOSTER-MELLIAR, Ipswich, being 2nd and 3rd.

Mr. A. HILL GRAY, Bath, won for twelve varieties, the variety Cleopatra being especially good and clean. The same gentleman was also the winner of the piece of plate for eight varieties, three blooms of each; and again of nine blooms of any one variety, staging The Bride in better form than we have seen it before during this season.

Among Growers of fewer than 500 plants.—The Rev. PAGE ROBERTS, Seale Rectory, was ahead for twelve blooms distinct; his blooms of Comtesse de Nadaillac, Maman Cochet, and Cleopatra, being very large and bright. Miss B. LANGTON, Hendon, was 1st for nine blooms; and Rev. R. POWLEY, Wainminster, and E. S. MAWLEY, Esq., Berkhamsted, next.

The six best blooms of Maréchal Niel in the Show came from CONWAY JONES, Esq., Gloucester.

For Growers of fewer than 200 plants of Teas and Noisettes.—A. MUNT, Esq., Slough, won for nine blooms with very clean and pretty flowers, and was followed by G. MOULES, Esq., Hitchin, and Mr. G. H. BAXTER, Brentwood.

The Rev. BURNISE was 1st for six varieties, The Bride and Medea being particularly good.

For six blooms of any one variety.—The Rev. A. C. JOHNSON, Capel St. Mary, Suffolk, won with the variety, Edith Gifford; the Rev. F. R. BURNISE following with Madame de Watteville.

For four varieties (trebles).—Mr. CONWAY JONES, Gloucester, was well in front, Niphetos and Maman Cochet being especially good.

In a class for six varieties, seven trusses of each, Mr. O. G. ORPEN, Colchester, was successful.

GARDEN AND DECORATIVE ROSES.

The best "garden or decorative Roses" came from A. TATE, Esq., Leatherhead, who was well in front of Mr. O. G. ORPEN, Colchester, and Mr. F. W. CAMPION, Reigate, Mr. A. F. PERKINS and Miss D. A. NEXFIELD, Tunbridge Wells, winning in the class for nine varieties.

Miss E. TURNER, Hendon, won for a vase of cut Roses, staging La France in very pretty form; Mrs. O. G. ORPEN and Miss WEST also being successful in this class.

PREMIER BLOOMS.

The best H.T. Rose was Marquis de Litta, shown by Miss LANGTON; the best H.P. was François Michelin, shown by Mr. LINDSELL in the Trophy Class; and the best Tea or Noisette was Princess Beatrice, shown by A. TATE, Esq., Leatherhead.

MISCELLANEOUS EXHIBITS.

Mr. Maurice Pritchard, Christchurch Nurseries, Hants, showed hardy flowers; Mr. F. G. FOSTER, Brockhampton Nurseries, Sussex, a collection of Sweet Peas; Messrs. W. Cutbush & Sons, Highgate, London, a group of Carnations, &c.; Messrs. Jaa. Cheal & Sons, Lowfield Nurseries, Crawley, hardy flowers, and sprays of ornamental shrubs; Messrs. Geo. Jackman & Son, Woking, hardy flowers, and a fine exhibit of cut Roses; Mr. W. Spooner, Arthur's Bridge Nursery, had cut Roses, mostly of Tea or garden varieties; Messrs. Wallace & Co. Kilmfield Gardens, Colchester, in a group of hardy flowers, included some fine Lilies, and varieties of Calochortus venustus, Brodiaea, &c.; Messrs. Laxton Bros., Bedford, had a collection of mammoth fruits of varieties of Strawberries, including Mentmore, Laxton's Admiral, Monarch, Thos. Laxton, and some large pale-coloured fruits of the perpetual-fruited variety, Louis Ganthier. Messrs. John Laing & Sons, Forest Hill Nurseries, London, had the largest exhibit staged. There were numbers of cut Roses and hardy flowers; also Cannas in pots, and a group of ornamental trees and shrubs in pots. Messrs. Geo. Bunyard & Co., Maidstone, exhibited cut Roses; Mr. W. Rumsey, Joyning's Nurseries, Waltham Cross, had blooms of his H.P. Rose, Mrs. Rumsey; and Mr. J. Williams, Oxford Road, Ealing, had table decorations, &c.

THE ROYAL SOUTHAMPTON HORTICULTURAL.

JUNE 27, 28.—This important Society held its annual summer show on the pier on the days named, this being the second year since its establishment.

The groups of plants in the Concert Hall were of themselves an imposing display; and the awards fell to Mr. E. Carr, gr. to W. A. GILLET, Esq., Fair Oak Park, Bishopstoke, 1st, the group contained numerous Orchids.

Specimen stove and greenhouse plants were well shown by Mr. W. PEEL, with profusely-flowered plants of Ixora Williamsii, Anthurium Scherzerianum, and a Codium angustifolium, highly coloured. Mr. BLANDFORD took the 1st prize for specimen plants, including a very fine Bougainvillea glabra, and a Stephanotis floribunda. Ferns

were well shown, and Mr. OSMAN was 1st for four plants. Mr. CARR had the best *Caladinnia*; Mr. C. HOSEY, gr. to J. C. E. D'ESTERRE, Esq., Elmfield Hill, Southampton, the best *Gloxinias* in a brisk competition.

Roses of good quality were stage 1, if not in large numbers. Messrs. D. PRIOR & SON, Colchester, were awarded all the leading prizes in the open classes, viz., for thirty-six blooms, distinct, eighteen trebles, twelve Teas, and six dark, and the same number of any light-coloured variety. In the local classes, Mr. W. NEVILLE, gr. to F. W. FLIGHT, Esq., Twyford, Winchester, Dr. SEATON, Bitterne, and Captain RAMSAY, Fareham, were the principal prize-takers. In the class set apart for ladies, for a basket of Roses Mrs. C. S. FERGUSON was awarded the 1st prize. Miss WILLS was 1st for an Epergne, tastefully filled with flowers, &c.

Mr. B. LADHAMS, Florist, Shirley, secured the premier award for bridal and ball bouquets, both being of more than average merit.

Hardy herbaceous flowers were a strong class, and the best twelve were shown by Mr. LADHAMS.

Fruit and Vegetables made a good and extensive display; Mr. BOWERMAN, gr. to Mrs. C. HOARE, Hackwood Park, Basingstoke, was 1st for three bunches of Grapes, also for two of black and two white, and in all classes he showed garden productions of more than average merit.

In Vegetables Mr. BOWERMAN was invincible. His exhibits of Onions, Carrots, Peas, and Potatoes leaving nothing to be desired.

Mr. LADHAMS received an Award for *Campanula periclyfolia*, variety *Mont Blanc*—a large-flowered form of *C. p. Backhouseana*; and for *Coreopsis Eldorado*, a variety with flowers 3 inches in diameter.

Messrs. E. WEBB & SONS, Stourbridge, and Messrs. TOOGOOD & SONS, Southampton, exhibited immense bunches of leading varieties of Sweet Peas; Mr. M. PRITCHARD, Christchurch, hardy flowers; Messrs. ROGERS & SON, shrubs; Messrs. JAMIAN & CO., Chard, Roses and herbaceous flowers.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JUNE 29.—The meeting was a good one, and there was quite a fine display of good Orchids, forty-three subjects being brought under the notice of the Committee.

Mr. BRIGGS BURY, Accrington (gr., Mr. Wilkinson), exhibited a nice plant of the now well-known *Lælia tenebrosa*, "Walton Grange" variety, and received a First-class Certificate for the same.

Messrs. F. SANDER & CO. exhibited three very choice Orchids, one a very handsome form of *Cattleya Mendeli*, which received an Award of Merit; *Cattleya Mossie Sandere* is a beautiful and distinct variety, but received no award; and *Thunia* × *Bymeriana* (T. Bensonie × T. Marshalliana), and well intermediate between its parents, was also passed over.

F. STATTER, Esq., Whitefield (gr., Mr. Johnson), showed *Lælio-Cattleya* × *Hippolyta*, the best form we have yet seen in Manchester, but still not good enough to receive any award; *Lælio-Cattleya* × *Statterii*, from the same collection, a good and somewhat distinct plant, which, as seen, it gives one the impression of being a natural hybrid, having *Lælia purpurata* as one of its parents; the plant was put back, to be seen upon a future occasion. *Odontoglossum crispum* "The Albino" is from the same collection, and is certainly a variety of much distinctness, still the Committee could perceive no point in it for which to grant an award.

J. LEEMANN, Esq., Heaton Mersey, put a choice group of Orchids up, amongst them were two good varieties of *Lælio-Cattleya* × *Eudora*, one called *alba*, *Cattleya* × *Gandi*, having *C. guttata* Leopoldi and *C. Loddigesii* for its parents, was not an improvement upon either of its parents. The group was awarded a Silver Medal.

Mr. A. J. KEELING, Bingley, Yorks, exhibited a plant of *Masdevallia Gairiana*, a pretty, but by no means new, hybrid between M. Davisii × M. Veitchii.

Messrs. JAS. VEITCH & SONS staged a small group of choice plants, the best being *Lælio-Cattleya* × *Eudora* var. *eximia*, possessing a wonderfully brilliant, large and well-shaped lip; possibly this was the best Orchid shown on this day. *L.-C. Canhamiana* var. *albida* was given an Award of Merit; and *Cattleya Gaskelliana* var. *formosa*, a very choice light variety, an Award of Merit.

Mr. J. CYPHER staged a plant of *Cattleya Mendeli* var. "John Leemann," and it received an Award of Merit; it is a splendid grower, and the plant bore fine flowers on the spikes. JOHN COWAN & CO., LTD., Gatacre, had a few very pretty *Odontoglossums*, showing a good type.

G. W. LAW-SCHOFIELD, Rawtenstall (gr., Mr. Shill), had half-a-dozen excellent plants, his *Lælio-Cattleya* "Fire King" var. "Frances Mary" received a First-class Certificate. *Cypripedium Shillanum* (C. Goweri × C. Rothschildianum) is a very good plant, and has the qualities of both its parents, and makes a bold and imposing flower (Award of Merit). Mr. SCHOFIELD also had some fine forms of *L.-C. Canhamiana*, and his *L.-C. Eudora* received an Award of Merit.

A. WARBURTON, Esq., Haslingden (gr., Mr. Lofthouse), sent a very handsome variety of *Odontoglossum vexillarium* called *Warburtonianum*, which was admired, and received a First-class Certificate. It is in the way of *O. v. Leopoldi*, but the marking in the lip is not so acute nor so dark as in that variety. It deserves to rank in the same class.

Mr. JOHN ROBERTSON, Altrincham, exhibited a magnificent plant of that beautiful "old-fashioned" Orchid, *Epidendrum prismatocarpum*.

Messrs. CHARLESWORTH & CO., Bradford, had a few nice plants, the best being a specimen of *Cattleya Mossie* var. *Wagneri*, bearing ten or a dozen flowers, which were slightly past their best. Other good things from the same firm were *L.-C. Eudora*, *L. × cinnabrosa*, which composite specific name implies its parentage as *L. cinnabarina* and *L. tenebrosa*, an interesting plant, but not far enough removed from *hippolyta*, *Phrebe*, and *latona*. *Cattleya Mendeli* var. *Princess Victoria* is a handsome and charming variety, although no award was given to it.

F. BAXTER, Esq., Morecambe (gr., Mr. Roberts), sent a few plants of *Odontoglossum crispum*, flowering for the first time, and indicating a possible "Klondike" for the firm who imported them (Vote of Thanks).

THE BIRMINGHAM AND MIDLAND COUNTIES CHRYSANTHEMUM.

GRATEFUL as was the success of the Chrysanthemum Exhibition, held in Bingley Hall in 1897, the report of 1898, their thirty-eighth annual show, held in November last, was even a greater success. The Committee hope by strict attention to the comfort of visitors, the convenience of exhibitors, together with the largely-increased prize list, and due regard for the safety and preservation of exhibits committed to their charge, to make their 1899 exhibition by far the most notable of its kind ever held in the midlands. The general statement of accounts shows:—

To cash at National Provincial Bank, Limited, viz.—		£	s	d
Deposit account	...	215	4	7
Current account	...	125	5	10

Schedules and all particulars sent free on application to the Secretaries—J. Hughes, 140, High Street, Harborne, Birmingham; F. W. Simpson, Victoria Road, Harborne.

RYDE HORTICULTURAL.

THE annual Rose Show was held on Coronation Day in the beautiful grounds of Appley Towers, by permission of Mr. G. W. HUNT, who greatly interested himself in the event of the day, taking a prominent part in the management of the sports. The exhibits were very fine indeed.

In the open classes, Mr. F. CANT, Chelmsford, secured the higher Awards; and in the local classes the competition was keen. The principal exhibitors and prize-winners were Mrs. E. CROFT-MURRAY (gr., J. H. Kent), Miss CARTER (gr., J. Kent), T. L. WINTHOPE (gr., C. Pince), J. LEE-WHITE (gr., Mr. Knapp), Colonel SMITH (gr., E. Moth), Rev. J. SPARKE (gr., W. Brett), J. O. BNOOK (gr., W. Spragg), Mrs. MAINWARING (gr., W. Burdell), Mrs. HARBIDGE (gr., J. Cluitt), Geo. WILLIAMS, J. LEEK, J. WOODFORD, and G. E. LIFSCOMBE.

Mrs. G. H. KENT secured the premier Award for table decorations.

Mrs. CROFT-MURRAY showed excellently garden-Roses; also Mr. E. C. GOBLE, F.R.H.S.

ISLE OF WIGHT.

JULY 1.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday, Dr. J. Groves presiding.

Mr. A. Colten of Lisle Court, Wootton, gave a lecture on the "Cultivation of Ferns," which was followed by a profitable discussion. The exhibits consisted of culinary and Sweet Peas, seedling tuberos Begonias, &c.

ROYAL HORTICULTURAL, IRELAND.

JUNE 29.—The annual Rose Show of the Royal Horticultural Society was held on the above date, under very favourable circumstances, in Merion Square, Dublin, although the intended visit of the Lord Lieutenant was postponed. His Excellency having to be present at the conferring of degrees of the "Silent Sister" Trinity College.

The Rose Show of this year was not so good as usual, but in the opinion of the judges, the quality of the exhibits was above the ordinary standard; and the entries numbered 160. The Carnations were very fine—the Carnations in particular were the finest that have been seen in recent years; and the double tuberous-rooted Begonias staged by Lord ASHERBROOK were a meritorious stand. Fruits and Vegetables were up to the usual standard.

FLOWERING PLANTS.

At the entrance of one of the marquees, Messrs. DICKSON, nurserymen, Chester, staged a very fine collection of herbaceous plants; amongst the *Pæonies*, some fine specimens of *Caroline*, *Elaine*, *carnea elegans*, *M. Bouchardii*, and *grandiflora nivea*; and an equally splendid group of Spanish Irises, which were highly admired.

Mr. W. WATSON, Nurseryman, Clontarf, staged a splendid collection of plants; specimens of *Prunella Wellsiana*, *Iris anglica* *White Lady*, *Philadelphus hybrida*, *Coronilla varia*, *Coreopsis lanceolata*, *Cephalaria alpina*, *Tradescantia vir-*

ginica, *Inula Hookeri*; but probably the distinctive item of this stand was the fine collection of *Violas*, including *Florizel Pembroke*, *Lizzie Barron*, *H. W. Stewart*, *A. J. Rowberry*, and *White Perfection*, the whole forming a very creditable stand.

Messrs. RAMSAY & SONS, nurserymen, Balls Bridge, staged a very good collection of plants. The stand included *Hydrangeas*, *Cannas*, and some extra good samples of *Cocos Weddelliana*.

D. DRUMME, Esq., J.P., Belle Vue, Booterstown, staged a magnificent collection of *Gloxinias*, and a very fine plant of *Dendrobium suavisissimum*. The Right Hon. J. M. MEADE, LL.D., P.C., Ailesbury Road, Merion, staged some fine *Fuchsias*, possessing a wealth of blossoms.

C. T. SEAR, Esq., Glebegary, sent a fine sample of *Sobralia macrantha*. Also Mrs. BERRIOWS, Dornden, Booterstown, an example of *Kalosanthes coccinea*; and both came in for a fair share of attention.

ROSES.

Messrs. ALEXANDER DICKSON & SONS, The Nurseries, Newtownards, co. Down, exhibited one of the finest stands of Roses in the show; also a fine collection of herbaceous perennial plants. Amongst the Rose, splendid samples of Mrs. J. W. Grant, Mildred Grant, Alice Lindell, Mrs. Conway Jones, and Bessy Brown.

J. A. MILLAN, Esq., Windsor House, Monkstown (gr., D. Colohan), staged a very effective group of Roses, the best of which were Messrs. Sharman Crawford, Margaret Dickson, Niphotos, Ulrich Brunner, and Gloire de Dijon.

E. BEWLEY, Esq., 5, Cowper Road, Rathmines, had a nice stand of Roses, including nice specimens of *The Bride*.

J. HUME DUDGEON, Esq., Merville, Booterstown, had a fine stand of *La France*.

Messrs. CHARLES RAMSAY & SONS, Balls Bridge Nurseries, staged an excellent collection of Roses, amongst which the following were worth noting:—Baroness Rothschild, Prince Camille de Rohan, Niphotos, Dupuy Jamain, Countess of Nadailac, Mrs. John Laing, Captain Christie, and Madame Willermoz.

AWARDS.

Stand of thirty-six Roses, cut blooms, not fewer than twenty-four varieties, nor more than two of any variety. A Challenge Plate, value £25, presented by Messrs. Alexander Dickson & Sons, Newtownards, co. Down. The Society adds money prizes: 1st prize, F. A. MILLER, Windsor House, Monkstown (gr., D. Colohan); 2nd, Lord ASHBROOK, Woodlawn, Galway (gr., A. Porter).

CARNATIONS.

Carnations formed a goodly show, and were the objects of much critical attention; the marquee was filled during the afternoon by troops of admirers. The chief exhibitors were Surgeon-General BEAUMONT, M.D., Palmerston House, Palmerston Park; J. J. McKellar, gr. to Lord ASHBROOK; Lord CLONCORNLY LYONS, Hazelhatch; Col. C. F. CHICHTON, Mullabaden, Ballymore, Eastace.

Begonias were well shown by Messrs. CHARLES RAMSAY & SONS, Balls Bridge, and by Lord ASHERBROOK.

PLANTS.

The group of plants staged by Mr. F. W. MOORE, The Botanic Gardens, Glasnevin, were a very noteworthy exhibit.

FRUITS AND VEGETABLES.

EDMUND D'OLIER, Esq., Knocklinn, Bray, had some fine samples of Royal Sovereign; also Earl of DROGHEDA, with Laxton's Leader.

J. HUME DUDGEON, Esq., Merville, Booterstown, exhibited a fine dish of Cherries, May Duke, and took 1st place.

Lady EMILY BURY, Tullamore, King's County, took 1st place with a dish of Perfection.

Earl of DROGHEDA, Moore Abbey, Monasterevan, exhibited a choice selection of *Drummondii Desideratum*.

G. C. ASHLIN, Esq., St. George's, Killeiney, took 1st place with his collection of vegetables, the Green Peas and Tomatoes being the best of the kinds.

AWARDS.

Stand of two bunches of Grapes, one black and one white, with 1st prize the Society's Large Silver-gilt Medal, and with 2nd prize the Society's Bronze Medal: 1st, J. V. WESTBY, Roebuck Castle, Dundrum (gr., Mr. Bunting); 2nd, The Lady EMILY BURY, Charleville Forest, Tullamore, King's County (gr., R. McKenna).

Grapes, white, stand of two bunches, 1st, Lady EMILY BURY, Tullamore, King's County; 2nd, J. V. WESTBY, Roebuck Castle, Dundrum.

Grapes, black, stand of two bunches, 1st, J. V. WESTBY, Dundrum; 2nd, Lady EMILY BURY, King's County.

Melon, green or white flesh, 1st prize, Mrs. MOORE, Ashdown, Phenix Park (gr., M. Kearns); 2nd, Rt. Hon. J. M. MEASE, LL.D., P.C., Ailesbury Road, Merion (gr., J. Colgan).

GLOUCESTERSHIRE ROSE

JULY 4.—The Gloucestershire Rose Society held their eleventh annual exhibition of Roses at Gloucester on the above date. The entries, which numbered 207, were far in excess of those of last year, and the quality of the blooms exhibited bore favourable comparison with any previous collection shown in the city.

With regard to the special awards, the Gold Medal given by the Society for the champion class in the county was again won by Mr. E. C. HORTON, Hucclecote. Mr. CONWAY JONES (who did not compete in this class, having won the prize twice before) secured the Silver Medal for the best Tea or

Noisette exhibited by any amateur, with The Bride. Mr. G. R. BONNAR was awarded a similar honour for the best hybrid perpetual, with Mrs. John Laing.

The 1st prize in the class for the City of Gloucester amateurs, given by the Mayor and Corporation, went to Mr. H. M. HARTLAND; whilst Mr. CONWAY JONES was awarded the piece of plate given by the High Sheriff for a magnificent box of Tea Roses, twelve varieties.

EALING HORTICULTURAL.

JULY 5.—This was the thirty-fifth exhibition of this Society, and took place in the park attached to the residence of the aged Miss Perceval, Manor House, which is in the centre of Ealing and adjacent to the green. Five commodious tents were filled with exhibits, but as compared with the exhibitions held a dozen years ago, there was a considerable falling-off in the competitive classes.

Miscellaneous exhibits made a very imposing feature. From Gunnersbury Park and also from Gunnersbury House came two superb groups. Mr. REYNOLDS made use of Lilies, Ixoras, Orchids, &c., with foliated plants, while Mr. HURSON had Cannas, with foliated plants, and in the foreground of his group the rich blue *Exacum macranthum*, which with its yellow stamens represents the colours of the Rothschild family; and he had also blooms of *Nymphaea Stella*, which formed a fine feature. Mr. CHARLES TURNER sent from Slough about thirty specimen plants of large-flowered and fancy *Pelargoniums*; Messrs. J. VEITCH & SONS had very fine cut Roses and a rare collection of hardy cut flowers; Messrs. C. LEE & SONS had a large and imposing group of hardy variegated plants. Messrs. FROMOW & SON, Chiswick, had a large group of Japanese Maples; Mr. GEORGE CANNON, St. John's Nursery, a fine group of plants; and Mrs. H. B. SMITH, the local Court florist, some very elaborate floral decorations.

Cut Roses are always a leading feature, and in the nurserymen's class for forty-eight blooms Mr. C. TURNER came in first with bright, fresh, medium-sized flowers, the crimson varieties being especially effective. Messrs. G. & W. BROWN, Nurserymen, Peterborough, were 2nd.

In the local class for twenty-four blooms, the first being the Gold Medal of the National Rose Society, there was a keen competition, the award going to Mr. E. P. OAKSHOTT (gr. C. Long).

The other Rose classes were well filled, but the average of quality was affected by the close warm weather.

Other classes for cut flowers produced excellent *Gloxinias*, stove and greenhouse cut flowers, *Pelargoniums*, hardy perennials, Sweet Peas, &c.

Groups arranged for effect were a good feature; and in the class for a large one Mr. J. HARRIS was 1st; and in that for a smaller, Mr. M. HULBERT came in 1st. Fine foliated plants, stove and greenhouse flowering, among which a grandly-bloomed specimen of *Datura suaveolens* was a conspicuous feature; *Fuchsias*, *Caladiums*, *Coleus*, Ferns, &c., were also exhibited.

Fruit was sparingly shown, the hardy varieties predominating; there were very good vegetables, a good deal of the soil of Ealing being well adapted to produce them in good character.

Cottagers' productions filled a large tent, and the numerous allotment gardens at Ealing being well tilled, the display is always numerous and very fine; and in a competition between the allotment gardeners and the private gardeners, we think the former would hold their own.

NATIONAL ROSE EXHIBITION AT COLCHESTER.

(By Telegraph.)

JULY 6.—The National Rose Society is this year holding but one exhibition in the provinces, and this took place at Colchester, in connection with the Colchester Rose and Horticultural Society, and in the centre of one of the greatest Rose growing districts in the kingdom.

A very fine show, and the quality of the Roses in the leading classes was excellent. Some who had entered were unable to show owing to the weather. In the Jubilee Trophy classes, i.e., for seventy-two blooms, distinct, and thirty-six, distinct, Mr. B. CANT was 1st; he also won three Medals for premier blooms. The competitions for thirty-six and eighteen blooms, distinct, were won by Mr. D. PRIOR & SON, with twenty-four.

For twenty-four blooms, Teas or Noisettes, distinct: 1st, Mr. FRANK CANT & CO. And for twelve blooms, Messrs. HARKNESS & SONS were 1st. Mr. FRANK CANT & CO. had the best garden Roses. The twelve best Teas or Noisettes were shown by Mr. B. R. CANT.

The Amateurs' Jubilee Trophy, viz., for twenty-four blooms, distinct, was won by Mr. E. B. LINDSELL, with a very fine stand, including a Medal bloom.

Class 18, for thirty-six blooms, distinct, and open to all amateurs, irrespective of the number of plants that they grow, was won by the Rev. J. H. PEMBERTON.

The prize given by the Mayor of Colchester for twelve blooms, distinct varieties, was won by Mr. O. G. ORPEN, the stand including a Medal bloom.

The best collection of eighteen blooms (amateurs), Teas and Noisettes, came from the Rev. A. FOSTER-MELLIAR, Sproughton Rectory, Ipswich; Mr. O. G. ORPEN was 2nd. The weather was fortunately fine.

WADDON HOUSE, CROYDON.

THERE are about 15 acres, chiefly gardens and pleasure-grounds, surrounding the residence of Philip Crowley, Esq., F.L.S., Treasurer of the Royal Horticultural Society. In every part there is evidence that its owner is a lover of plants, and especially of beautiful, old, and now but little-known ones. The house stands on high ground, with a fine expanse of smooth and well-kept lawn around it, belted by shrubberies and grand old trees, the Beeches being specially beautiful. To the left, and beneath the trees, are rockeries planted with Ferns, &c., some of which have been collected by Mr. Crowley, or some of his family, in Switzerland and Germany. Of these, two very remarkable and interesting instances may be cited, viz. *Asplenium septentrionale*, collected by Mr. Crowley in 1883, and *A. fontanum* collected by a member of the family in 1841, which have been kept in vigour, the safety of the stock being secured by having good plants of each protected. In places the rockeries merge into a wild, but still well-kept garden, in which the spring flowers, such as seen in the illustration of *Anemone apennina*, in the *Gardeners' Chronicle*, June 24, p. 407, make a charming show. Beyond are the well-cropped kitchen and fruit gardens, which are reached by walks bordered by herbaceous perennials, the same continuing through the kitchen-gardens, a fine show being made with Peonies, Pinks, Roses, Sweet Peas, Campanulas, Delphiniums, &c. Conspicuous in the herbaceous borders is *Papaver pilosum*, with its showy heads of orange-red flowers, and Lord Anson's Pea (*Lathyrus magellanicus*).

On the other side of the house is a conservatory furnished with Palms, Ferns, and flowering plants, and adjoining it is a rockery-house, very tastefully planted with Ferns, Begonias, and other plants; an effective feature in the house being its flooring of rock, shelving downward and arranged to match the rest of the rockery; another effective feature being a partial screen of *Ficus stipularis* running across the upper part of the structure.

THE GLASS-HOUSES

are arranged for the accommodation of a representative collection of plants, or rather for the best representatives of each of the species cultivated, Orchids included, and of these, although no general collection is attempted, fine examples of most of the leading showy species were remarked. Some species reputedly difficult to grow, the gardener, Mr. J. Harris, is capable of growing satisfactorily. Among these may be noted *Vanda cœrulea*, several plants of which have here been growing with increasing vigour, and one fine form was recently in bloom. Another is *Epidendrum bicoloratum*, which thrives and flowers annually; *Vanda suavis* and *V. tricolor*, old Waddon plants, are still in vigorous health; *Saccolabium ampullaceum*, with many growths, each year produces a fine show of flowers; *Vanda Sanderiana*, and other *Vandas*, *Saccolabiums*, and *Aërides*, which few growers manage successfully for any length of time.

The occupants of all the Orchid-houses, without showing any abnormal growth, afforded evidence of vigour well maintained. Among those in flower were varieties of *Cattleya Mendeli*, and *C. Mossii*; *Lælia purpurata*, among which two remarkable and dissimilar forms were noted, viz., *L. p. "Waddon House"* variety, a white flower with a rose-purple zone to the lip, and pale rose apex; and a form of *L. p. Brysiana*, a richly-coloured flower, with petals bearing a fine rose-coloured veining. Grouped with these were very fine *Odontoglossum crispum*, and a lesser number of *O. Pescatorei*, and other species. The cool house: *Masdevallia Harryana*, and *M. ignea*, with *Odontoglossums*, *Sophranitis grandiflora*, *Oncidium*, *Phalenopsis*, *Epidendrum vitellinum*, &c. A feature in this house was that the whole of the basement beneath the staging is moss-grown rock-work, in which large tufts of *Trichomanes radicans*

(Killarney Fern) are growing in the most luxuriant fashion, their fresh, cool-looking frondage being perfect. With them grow other Filmy Ferns, all doing well, and presenting a much more beautiful appearance than when seen enclosed in Wardian cases, or otherwise protected by glass, as is usually the case.

Other Orchids noted in flower were *Aërides Lobbi*, *Lycaste Barringtoniæ*, *Lælia tenebrosa*, *Saccolabium Blumei*, *Odontoglossum citreum*, *Coleogyne Massangeana*, *Oncidium Lancoanum*, and other *Oncidiums*; the fine old *Maxillaria tenuifolia*, covered with its reddish flowers; *Dendrobium Dearei*, *D. chrysanthum*, *Cypripediums*, *Cymbidiums*, &c.

The Fern-houses contain some very handsome specimen Ferns, the beautiful plants of *Davallia fijiensis*, *D. F. plumosa*, *D. F. elegans*, *D. polyantha*, *D. Mooreana*, and others, being each several feet across, with fronds quite perfect. Specimen *Selaginellas*, which are here grown in the pyramid-form, are also very beautiful objects, even the very dwarf ones, such as *Selaginella apoda*, being arranged in conical form.

The stoves also have a very fine lot of specimen *Codæums*, *Dracenas*, *Alocasias*, *Anthuriums*, &c., as well as grand examples of the showy flowering species, among those in bloom being specimens of *Clerodendron Balfouri*, *Anthurium Laingi*, *A. carneum*, *Hymenocallis littoralis*, *Acalypha hispida*, *Crinum Mooreanum*, some of the best *Ixoras*, finely flowered shrubby *Begonias*, &c. The roof in each of the houses is made use of to train flowering climbers which aid much in growing an effective display, those in flower now being *Dipladenia amabilis*, *D. Brearleyana*, *Clerodendron Balfouri*, *Allamandas*, *Aristolochia elegans*, and the large claret-coloured *Hoya imperialis*, which continues its flowering for about ten months each year.

Other things well-flowered noted were a showy collection of *Gloxinias*, fine specimens of *Achimenes*, *Pavonia multiflora*, *Asclepias curassavica*, *Eucomis punctata*, handsome flowering Cannas, *Begonia Gloire de Lorraine*, as usual covered with flowers almost hiding the leaves; and coming into bloom a fine bush of *Coffea arabica*, which usually bears Coffee-berries here; and a good batch of the yellow *Richardia Elliotiana* raised from seed on the place.

The vineries and other fruit-houses showed capital crops of fruit of special interest, being a house the roof of which is covered by a very old specimen of *Citrus medica* (Citron), which annually bears a large crop of fine fruits.

NOTES FROM A SCOTTISH MANSE.

ATMOSPHERIC conditions are at present highly favourable for vegetative growth; our gardens are assuming a fresher and a brighter aspect. The African *Ixias*, Californian *Calochorti* (with the exception of the *Mariposa Lilies*) are in splendid bloom, and the gracious reign of the Rose has begun. The wild flowers, which so greatly glorify our waysides and sequestered woodlands; our deep glens and shadowy valleys with their murmuring silver streams, are also very beautiful, especially such beauties as the stately pink *Campion* and the tenderly-formed *Wood-sorrel*, the lesser *Stitchwort*, and the wild *Geranium*; the white and yellow *Marguerites*, the wild *Pinks*, the insectivorous *Sundew* (*Drosera rotundifolia*), and graceful *Milk-wort* on the confines of the remote, rocky regions of Heath and Heather cresting the western sea; and the fragrant *Burnet Rose* (*Rosa spinosissima*) on picturesque slopes along the eastern shore. By the side of the barns that make musical our glens, the *Myosotis*, overlooked by the happy "Bird's-foot Trefoil," loves to dwell; it is, like its frequent companion, *Iris pseudacorus*, a moisture-loving flower; the supreme beauty of the Hawthorn—the bride of the woodlands—has been succeeded by that of the richly fragrant *Woodbine*, the crowning glory of our Scottish woods.

While such are the romantic surroundings of the garden, its predominating attraction is unquestionably the Rose. The Roses that flower earliest are always exceedingly interesting; they come to us with what may be entitled a new-old aspect of brightest hopefulness, after the long, patiently experienced period of winter gloom. True indeed that the Snowdrop, the Crocus, and the Narcissus exquisitely intervened with their infinitely varied colours and memorable fragrance, which lingers in our consciousness when their fair forms (like many whom we have loved and lost, but whose influence remains to bless our activities) have silently passed away—

"They may be called the creatures of a day,
Yet deathless is the grace they leave behind."

But though the season intervening between winter and summer is made so consoling by the providential advent of such marvellous types of beauty, we hail with gladness the annual reappearance of the queenly Rose. I have said already that her earliest flowers have always for the earnest and loving cultivator a peculiar fascination. The first Roses which opened impressively in my garden this year were Clio, a grand pale-pink variety, endowed with splendid attributes, raised by Mr. Wm. Paul at Waltham Cross; and Papa Gontier, one of the finest of French Hybrid Teas, the value of which for garden decoration can hardly be emphasised or eulogised too much. Immediately following these came Madame Pernet Ducher, a very precious variety, canary-yellow in colour, with a centre of somewhat richer hue, akin to apricot—introduced by the distinguished Continental rosarian whose name it bears, in 1891; Captain Hayward, a brilliantly-coloured crimson, highly perfumed Rose; Viscountess Folkestone, and Grace Darling, for which three Roses of the greatest attractiveness we are indebted to the late Mr. Bennet, some of whose creations will not soon be superseded; Margaret Dickson, and Mrs. W. S. Grant, "the fairest of the fair." And though the Dukes of Edinburgh and Wellington are only as yet on the confines of their wonderful beauty (scarlet flashing through maroon, like the deep lustre that sometimes radiates through the plumage of a dark bird); we have the hardly less radiant flowers of A. K. Williams, Madame Lambard, and Duke of Albany; to be followed by Cheshunt Scarlet, and, above all, those of Clara Watson and the incomparable La France.

Among Roses of recent origin at present in bloom two of the most interesting are Ardroyer and Countess of Caledon, both of which possess the attribute of fragrance in an eminent degree. Meta and Beryl, also from Newtownards, are not grown well with me; the latter has produced one solitary but extremely charming flower. Mr. Paul's Aurora, of whose merits I have heard much, I cannot characterise, as it is not yet (June 29) in bloom.

My Oriental and American Lilies are already far advanced. The development of *Lilium giganteum* is so rapid as to be astonishing; and on many of my auratum the flower-buds are conspicuous. *Lilium davaricum*, which belongs to the sub-genus *Isolirion*, and is a native of Siberia, has reached its flowering season; so also has a much lovelier Lily, *Lilium Washingtonianum*, which American naturalists call the "Queen of the Sierra Nevada," a title which, even when it is placed in comparison with such Californian rivals as *Lilium pardalinum* and *L. Humboldtii*, it amply deserves. Its colour at first is almost pure white, gradually shading off to delicate lilac; its form is faultless, and it has the fragrance of the Honeysuckle. *Lilium Washingtonianum* is, therefore, "a gem of purest ray serene." Its fairest companion at present in my garden is *Magnolia Watsoni*, which has flowered this season for the first time since the summer of 1895. It is of eastern origin, a native of Japan. David R. Williamson.

Obituary.

JOSEPH DAWSON.—We regret to announce the death recently of Mr. J. Dawson, of Darley Dale, for many years gardener, and latterly steward to Sir Joseph Whitworth, at Standcliffe Hall, Derbyshire. When Sir Joseph came into possession of the Standcliffe estate in 1856, Mr. Dawson was engaged to lay it out under his employer's superintendence, with eminently satisfactory results. Previously he had acted as one of the late Sir Joseph Paxton's trustworthy assistants in the laying-out of the grounds of the Crystal Palace. The deceased was for the period of forty years gardener, and subsequently steward at Standcliffe. As evidence of his skill as an artist in rockwork and in tree-planting, we would refer our readers to two supplements given with our issues of Dec. 24, 1884, and August 14, 1886.

MARKETS.

COVENT GARDEN, JULY 6.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Jersey, new, 5s. 6d. per cwt.; Cherbourg, cwt., 5s. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—Cherries are coming in variety, but unless they consist of fair samples they are not in much request; plenty of buyers for anything that is very good. Of Strawberries a short supply to-day, and what have been coming in during the week have been a little under the average size, and pale in colour, owing to the lack of sunshine. Some Pine Strawberries were to-day very bright and good. The principal sorts of Strawberries are Royal Sovereign and Sir Joseph Paxton, the latter being considered by far the best for keeping when gathered.

SEEDS.

LONDON: July 5.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there were not many buyers on to-day's seed-market, and still fewer transactions passing. It is noteworthy that England has just been shipping American Red Clover-seed to Germany. Samples of new French Trifolium are now arriving. For Mustard and Rape seed the sowing demand is meagre. In Canary-seed a further advance has taken place. A widening speculative movement, and also short crops and dwindling stocks, look like driving up Canary-seed prices still higher. Hempseed continues scarce and dear. There is no change this week in either Peas or Haricots. Linseed favours holders.

FRUIT AND VEGETABLES.

GLASGOW: July 5.—The following are the averages of the prices recorded since our last report:—Cherries, English, halves, 5d. to 5 1/2d. per lb.; do., French, 4d. to 5d. do.; Apricots, 9d. to 1s. per box; and 2s. 6d. per basket; Gooseberries, 10s. to 13s. per cwt.; Grapes, Belgian, 11d. per lb.; do., Guernsey, 8d. to 1s. do.; do., English 1s. 3d. to 1s. 6d. do.; Pines, 2s. 9d. to 3s. 6d. per basket; Peaches, home, 4s. to 7s. per dozen; do., French, 1s. to 1s. 6d. do.; Strawberries, Cornish, 2s. 6d. to 4s. 6d. per dozen punnets; do., Kent, 5s. to 6s. per basket; do., Lincolnshire, 5d. to 6d. per lb.; do., Scotch, 2 1/2d. to 3d. do.; Tomatoes, Scotch, 8d. to 1s. 2d. per lb.; do., English, 7d. to 8d. do.; do., Guernsey, 6d. to 8d. do.; Cucumbers, 3s. 6d. to 4s. 6d. per dozen; Turnips, Dutch, 3s. 6d. to 4s. per mud; Peas, 3s. 6d. to 5s. 6d. per bag; Carrots, Dutch, 1s. 3d. to 1s. 4d. per dozen bunches; Cabbages, 7d. to 1s. 6d. per dozen; Cauliflowers, Edinburgh, 2s. 6d. to 4s. do.; Mint, green, 6d. to 9d. per bunch; Onions, 4s. 6d. to 5s. per cwt.; Parsley, 2s. 6d. to 4s. per stone; Lettuces, round, 1s. 3d. to 1s. 6d. per dozen; do., Cos, 11d. to 1s. 3d. do.; Radishes, round, 9d. to 1s. 6d. per dozen bunches; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroots, 6d. to 7d. per dozen; Rhubarb, 1s. 3d. to 1s. 6d. per cwt.

LIVERPOOL: July 5.—Wholesale Vegetable Market.—Potatoes, per cwt., Early Regents, 5s. to 5s. 6d.; Jersey, 5s. to 5s. 6d.; Main Crop, 2s. to 3s. 6d.; Kidneys, 7s. 6d. to 9s.; Bruce, 1s. 8d. to 2s.; do., new, 1s. 6d. per 21 lb.; Turnips, 6d. to 10d. per dozen bunches; Carrots, 6d. to 10d. do.; Parsley, 6d. to 8d. do.; Onions, foreign, 2s. 6d. to 3s. 6d. per cwt.; Lettuces, 6d. to 8d. per doz.; Cucumbers, 1s. 3d. to 1s. 6d.; Cauliflowers, 1s. 6d. to 3s. do.; Cabbages, 8d. to 1s. 6d. do.; Peas, 3s. to 4s. per bushel. St. John's.—Potatoes, 1d. to 3d. per lb.; Grapes, English, 1s. 6d. to 3s. do.; Pines, English, 4s. to 6s. each; Currants, red and white, 6d. per lb.; do., black, 8d. do.; Strawberries, 4d. to 8d. per lb.; Gooseberries, 3d. per quart; Peas, 1s. to 1s. 4d. per peck; Cherries, 4d. to 8d. per lb.; Apricots, 1s. per dozen; Cucumbers, 3d. to 4d. each; Mushrooms, 1s. 4d. per pound and basket. Birkenhead.—Potatoes, new, 1d. to 2d. per pound; Peas, 1s. 6d. to

3s. per peck; Asparagus, 1s. 6d. to 3s. per 100; Cucumbers, 2d. to 4d. each; Strawberries, 4d. to 6d. per pound; Cherries, 6d. to 10d. do.; Currants, black, 6d. to 8d. per pound; do., red, 6d. do.; Apricots, 1s. per dozen; Gooseberries, 3d. to 4d. per pound; Grapes, home, 1s. 6d. to 2s. do.; Mushrooms, 1s. to 1s. 6d. do.

THE WEATHER.

The term "accumulated temperature indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 1, is furnished from the Meteorological Office:—

"The weather during this week gradually became very unsettled. Rain was very frequent and general. Thunderstorms occurred in nearly all parts of the Kingdom on Wednesday and Thursday, and again towards the close of the period in many parts of central and eastern England.

"The temperature was a little above the mean in most districts, but only just equalled the normal in 'Scotland, N. and E.' and was slightly below it in 'Scotland, W.' The highest of the maxima were recorded during the earlier days of the period, and ranged from 82° in 'England, S.' and 79° in the 'Midland Counties,' to 72° in 'Scotland, E.' 'England, N.W.,' and 'Ireland, N.,' and to 70° in 'Scotland, N.' The lowest of the minima occurred on the 27th in Scotland, and on irregular dates over England and Ireland; varied from 38° in 'Scotland, E.,' to 47° in 'England, S. and N.W.' and 'Ireland, N.,' and 54° in the 'Channel Islands.'

"The rainfall exceeded the mean in all districts except 'Scotland, N.' In 'Scotland, W.' the fall was more than three times the mean amount, and in most other districts between two and three times the normal. Great local variation in the fall was experienced, and at Easby (near Dover), on Thursday, as much as 2.5 inches fell during five hours.

"The bright sunshine was again deficient generally, but exceeded the mean in 'England, S.' and the 'Channel Islands.' The percentage of the possible duration ranged from 50 in the last-named district, and 44 in 'England, S.,' to between 18 and 25 in Scotland, and to between 10 and 15 in Ireland."

ENQUIRY.

WANTED to know whether professional growers of Asparagus for the trade or for show purposes, or private gardeners, have ever cut one Asparagus 6 feet 4 inches long and 1 inch wide where cut in earth, and exactly same width for its entire length, bearing more than double the quantity of seed of any others in three large beds? *Laroring, E. Devon.*

ROYAL HORTICULTURAL SOCIETY.—A special general meeting of the Fellows is fixed for Friday, July 21, at 3 P.M., at the Offices of the Society, to discuss the draft of an amended Charter, and, if approved, to adopt it. Considering that the matter comes as a surprise at the very busiest season of the year, and without any obvious urgency, we suggest that the meeting be adjourned, in order to give the Fellows the opportunity of considering the details, which they obviously cannot do at the meeting in question. Perhaps the Council intend to circulate the draft in advance; but even then we plead for mercy at this season.

ANSWERS TO CORRESPONDENTS.

AMARYLLIS: *W. S.* Being pure white, but for the exception of a greenish tinge of the lower half of the tube, it might be worth keeping, but as regards form it leaves much to be desired, the segments being acutely pointed, narrow, and not reflexing, so as to show a good area of white.

ANTHURUM CRYSTALLINUM: *B. Reid.* We should say that the plant is either attacked by the small brown thrips, which keep so close to the midrib and edges of the leaves as to be frequently overlooked; or that for some reason the roots have suffered. If upon examination the latter is found to be the case, all the soil should be washed off the roots, cutting the decayed portions of the latter away, and repotting the plant into a smaller-sized pot, affording a compost consisting of one part loam, two parts good fibrous peat broken into small lumps, one part fresh sphagnum, and sufficient broken charcoal and sand to keep the compost open and porous. Should the presence of thrips be detected, the plant should be sponged with an insecticide until it is quite free from the pest.

ASTERS: *E. Scapellhorn.* The Asters are probably attacked by a worm, figured and described in *Gardeners' Chronicle*, August 14, 1897, pp. 97 and 98.

CLEMATIS: *A. B.* Materials insufficient; probably, *C. montana*.

CORRECTION: *Windsor Rose Show.* For Messrs. Fitt, read Messrs. Titt; and for Hon. C. Joli, read Hon. C. Irby. The Pea shown by this exhibitor was Carter's Improved Telegraph, not Duke of Albany.

FUNGUS: *J. Leach.* The Stink-horn Fungus, *Phallus impudicus*, not uncommon.

GARDENERS AND TAXES: *N. W. P.* By the latest decision of the Courts, trade employees are not liable.

GRAPES AND MILDEW: *Jack.* Why do you not try the hotwater-cure, as sulphur fails to do any good? Peruse the notes on the subject in our Home Correspondence this week. Grapes which have had mildew upon them are spoiled, and should be removed from the bunches.

GREEN BERRIES IN A RIPENING BUNCH OF GRAPES: *J. S.* These may have resulted from flowers which opened later than those on the rest of the bunch.

HOYA CARNOSA: *A. C. C.* It is not of common occurrence for this plant to set its flowers and bear seed-pods.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*J. O. B.* *Pernettya mucronata*.—*S. Nash.* *Thunbergia Harrisii* (laurifolia).—*E. C. D.* *Marrubium vulgare*, Horehound, British.—*H. O. ORCHID-LEAF: *Argyll.* The leaf shows that there is something in the house in which it has been grown that is not as it should be. Probably the shading has not been sufficient, or the heat excessive, especially at night time.

PEAR LEAVES: *S.* The leaves have been infested with a mite, *Phytoptus pyri*, difficult to cope with, it being a mite doing much injury in Pear orchards, and although you may try to keep your trees clean by washes and fumigation, if your neighbours are less assiduous, your efforts are useless or nearly so.

POND LEAKING: *R. S.* We should not advise the use of horse-dung in the clay, but to obtain the most tenacious form of clay, free from stones, and well pugged, to render it homogeneous before laying down. It should not be less than 9 in. thick. Of course, all clay will crack under hot sun, unless covered with water or shaded by vegetation, such as Reeds, Sedges, Iris, *Salicaria*, &c.

RASPBERRIES: *C. T. N.* For some reason or other that we do not know, the flowers have not been fertilised. Perhaps the insects were not about at the right time, or the weather was unpropitious when the stigma was ripe, or it may be a case of tendency to a dioecious condition. In any case, we should get a fresh stock.

STRAWBERRIES MOULDY: *Hume.* The fungus on the berry sent appears to be that known as *Monilia*, which causes fruit-rot on Cherries, Plums, &c., although we have never before heard of it on the Strawberry. In any case, the fungus has made its way through the whole fruit, and if the disease is widespread, the treatment must be thorough. The soil should be well trenched before next season; this would, of course, be best done if the plants were cleared out; but you must decide if this is advisable. If the plants be left on the ground, they should be mowed over, and all the gatherings burnt. This is the course recommended for Strawberry mildew—a somewhat similar disease. Next season a spraying of dilute Bordeaux Mixture or potassium sulphide before flowering would be a good preventive measure.

TOMATO: *J. L. F.* Your fruit and foliage is attacked by a fungus (*Cladosporium lycopersici*), which is supposed first to attack the decaying style, and later to establish itself in the fruit. It always causes the apex of the fruits opposite to the stem to become flattened and black, and is thus known as "black spot." Remove and burn each fruit as soon as it can be noticed that it has become attacked. During the early stages of growth, Tomato plants should be frequently sprayed with the Bordeaux Mixture, which would tend to prevent this and other fungoid pests from obtaining a hold upon the crop.

VINE-LEAF: *Argyll.* The leaf of Vine seems to have been scorched by the sun, otherwise its roots may have got into unsuitable material.

VINE LEAVES SPOTTED, &c.: *Grower.* We have seen similar brown-spotted leaves before, and neither they nor those now sent, showed any insect or fungus. In a recent case the Vines had partially-decayed roots, which showed signs of fungi. Perhaps the roots of your plants are in some way defective, and either they or the border require attention. The shrub must be sent when in flower.

CORTADERIA ARGENTEA (PAMPAS GRASS), AS GROWN IN THE GARDEN OF W. E. GUMBLETON, ESQ., BELGROVE, QUEENSTOWN, IRELAND.

THE

Gardeners' Chronicle

No. 655.—SATURDAY, JULY 15, 1899.

HYBRIDS AND THEIR RAISERS.

(Continued from p. 24.)

[SEE SUPPLEMENTARY SHEET.]

M. LATOUR-MARLIAC AND THE NYMPHÆAS.—M. Latour-Marliac was born at Granges, Lot-et-Garonne, on March 6, 1830. Having been early initiated by his father into the study of natural history, M. B. Latour-Marliac has devoted his life to horticulture. M. Latour-Marliac has his nurseries at Temple-sur-Lot, of which town he has been elected mayor. One part of his grounds may be said to be devoted to agriculture, as it is occupied principally with plantations of Plums, Vines, Japanese Kakis, and Japanese Lacquer plants.

The remaining portion of the nursery is exclusively devoted to Bamboos, Lacquer-trees, aquatic plants of all kinds, and especially to Nymphæa.

The Bamboos, most of them imported from their native countries by M. Latour-Marliac, include some fifty species and varieties of this most useful and ornamental genus. The Lacquer-tree (*Rhus vernicifera*), a native of China and Japan, is also valuable to the landscape-gardener; it is perfectly hardy in all parts of France, and grows nearly 40 feet high. It yields the well-known lacquer of China and Japan, still unequalled by European imitations.

But the chief interest of M. Latour-Marliac's establishment is found in the fine collections of Nymphæa, in hybridising which he has been so markedly successful.

The aquatic garden at Temple-sur-Lot consists of numerous tanks and fountains, and occupies the sides of a brook whose banks are screened with Bamboos and other appropriate plants.

Here are found the fine Nelmumbiums and new hybrids of hardy Nymphæa, of gorgeous colouring, such as the splendid *N. Laydekeri rosea*, very bright carmine-rose; and *N. rubra punctata*; *N. flammea*, deep amaranth.

M. Latour-Marliac also cultivates many of the inter-tropical Nymphæas, such as *N. zanzibarensis*, *rosea*, *azurea*, *cœrulea*, *scutifolia*, and *stellata*. These are in a tank 50 feet long. After October, the water admitted into this is maintained at a uniform temperature of 12° Cent. (53° F.), and the plants are kept under glass; towards the end of April the lights are raised, the temperature of the water is reduced to that of the atmosphere, and the plants begin their usual summer growth.

The most favourable months in which to visit the nurseries are July, August, and September, as then the flowers of both indigenous and exotic species are in full beauty. There is much to interest even the most casual visitor in the grounds of M. Latour-Marliac, whose novel and beautiful hybrids are becoming more and more widely known, appreciated, and distributed. In 1898 M. Latour-Marliac received a Veitch Memorial Medal, and in 1899 was nominated an officer of the Academy. (See Supplementary sheet.)

M. ERNEST CALVAT.

This gentleman may be justly regarded as the most famous of our Chrysanthemum raisers, and his novelties have been remarkable for the high position they have maintained at our shows. He is the son of the late Mayor of Grenoble, and was born in 1852. After completing his education here in England, he returned to France, and entered his father's glove-making manufactory, devoting his leisure to his garden. About twelve years ago he became specially interested in the Chrysanthemum, and then centred his sole attention upon its improvement. Owing to a favourable position and a climate that aided him in his work, he raised his first seedlings in 1889, and from that time has systematically practised cross-fertilisation with the largest varieties obtainable, with the view of creating a new race of the finest show flowers. So great has the progress been, and the demand for his products increasing, that M. Calvat, a few years since, gave up the glove-making, and devoted himself wholly and solely to his work with the Chrysanthemum, and this comprises not only raising new varieties, but supplying the markets with many thousands of blooms grown in exhibition form for the Paris florists.

Among the earliest varieties from M. Calvat's seedlings, Louise, Mrs. C. Harman Paync, President Borel, L'Isère, Mdle. Thérèse Rey, Souvenir de Petite Ami, M. Chenon de Leché, and Madame Carnot, the incomparable white Japanese, and the parent of several equally good yellow sports, are still well-known. Later novelties, and their name is legion, comprise Madame Gustave Henry, Mrs. J. Lewis, Ma Perfection, Madame Ferlat, Mdle. Lucie Faure, N.C.S. Jubilee, Soleil d'Octobre, Werther, President Bevan, Le Grand Dragon, M. Fatzer, Topaze Orientale, the curious green Madame Ed. Roger, and others far too numerous to mention, and afford ample ground for believing that this eminent Frenchman's seed-bed has still many more floral wonders in store for the ardent admirer of this protean Oriental flower.

Of M. Calvat's successes, both here and on the Continent, we have no space to speak, and it must suffice to say that he exhibits at all the Continental shows, and is a member of the leading societies that deal with the Chrysanthemum. He also enjoys the unique distinction of being the only Frenchman that has won medals of the English N.C.S., of which Society he is an honorary Fellow. In recognition of his valuable services to horticulture, the French Government has conferred upon him the Cross of Officer of the Order of the Mérite Agricole. *C. H. P.* (See Supplementary sheet.)

CHARLES MARON.

Though still young, M. Maron has done great work as an Orchid hybridist. As a young man he served under Mr. J. O'Brien, in the nurseries of Messrs. E. G. Henderson & Son, at that time a good school for one interested in plants. Afterwards M. Maron was gardener at Corbeille, where some interesting hybrids were raised; but his best work commenced with his taking charge of the establishment of M. Louis Fournier, at Marseilles, where *Lælio-Cattleya* × *Berthe Fournier*, L.-C. × *Andreana*, L.-C. × *Sallieri*, and other showy things were raised. Recently M. Maron has installed himself at Brunoy, Seine-et-Oise, France, from where some truly remarkable things have been shown, notably *Lælio-Cattleya* × *Digbyano-Mendeli*, L.-C. × *Ernesti*, Princess Olga, L.-C. × *Henry Greenwood*, and the beautiful *Cattleya* × *Maroni* (*velutina* ♀ *aurea*), the last three having been illustrated recently in the *Gardeners' Chronicle*. *J. O'B.* (See Supplementary sheet.)

JOHN SEDEN.

I first fell in love with Orchids, &c., in 1859, when I lived in a private place next door to the late Dr. Butler, who had at that time a good

selection of the best Orchids in cultivation, and exhibited very successfully at Regent's Park and the Crystal Palace. The late Mr. Robert Bullen, late curator of the Botanic Gardens, Glasgow, was the grower. In 1860 Mr. Bullen went to Chelsea as Orchid grower, and recommended me also to the late Mr. James Veitch. I started work there in January, 1861. In the autumn of that year Mr. Veitch wished me to go to Exeter, under Mr. Dominy; it was there I got the first idea to follow up the work of hybridisation of plants, &c.

In the autumn of 1862, after the death of the late Mr. James Veitch, of Exeter, I was asked to return to Chelsea, to take charge of Orchids, some stove plants, including Nephentes. I began my work, then, first with *Caladiums*, *Chelsoni* being the only one worth keeping out of the batch; then came *Alocasia Sedeni*, *A. intermedia*, and two others; *Gloxinias*, from which six were selected and sent out; then *Amaryllis Chelsoni* were selected to grow; then *Nephentes Chelsoni* and *N. Sedeni*.

In 1867 Mr. James Veitch went to reside at Stanley House, next to the Chelsea Nursery. Mr. Veitch said he wanted a man after his own heart, and wished me to leave the nursery and be his private servant; this I did. I raised the first tuberous *Begonia*, *Sedeni Chelsoni*, and many others; then my first *Cypripedium Sedeni*, *Sedeni candidulum*, *Morgania* James H. Veitch, *Schrodera Lecanum superbum*, *œnanthum superbum*, *Niobe*, Baron Schroder, and a host of others; *Dendrobium splendissimum grandiflorum*, *Ainsworthii intertextum*, *Aspasia*, *endocharis*, *euosmum leucopterum*, and many others, and more to follow. *Masdevallia Chelsoni*, *Gairiana*, and others; *Phalenopsis intermedia*, *John Seden*, *Harrietia*, and several others; *Epiphronitis Veitchi*, a great success; *Epidendrum James O'Brien*, *Endresio-Wallisii*, and many others; *Disa Veitchi*, and others; *Angræcum Veitchi*; *Sopbro-Cattleya Batemanniana eximia*, and others; *Lælio-Cattleya bella*, L.-C. *Empress Frederick*, L.-C. *callistoglossa* and var. *ignescens*, L.-C. *Digbyana-Mossie*, a great success; L.-C. *Digbyana Trianae*; L.-C. *Thorntoni*, L.-C. *Cauhami alba*, L.-C. *Decia alba*, L.-C. *Wellsiana* and var. *alba*; L.-C. *Endora*, and several fine varieties; L.-C. *eximia*, very fine; L.-C. *Nysa* and varieties, good; *Dominiana* var. *Langleyensis*, very fine. *Thunia Veitchi*, *Sobralia Veitchi*, *Chysis Chelsoni* and *Sedeni*, and others.

In 1889 Mr. Harry Veitch invited me to Langley, that I might have some outside work; that has resulted in raising various fruits, such as Strawberries Veitch's Perfection, Veitch's Prolific, Raspberry Golden Queen, Apple Langley Pippin, Apple Mrs. John Seden, Gooseberries Langley Beauty, Langley Gage, and Golden Gem, all of which have been acknowledged by the Fruit Committee of the Royal Horticultural Society. About 490 various crosses of my raising have been brought before the public since I began. *Ed.* (See Supplementary sheet.)

GEORGE PAUL.

My first trial was with Weigelas and Diervillas. I obtained one or two things, but they did not attract attention, so I left off. Secondly, I tried *Amaryllis*, beginning with *De Graaf* and *Veitch* strains, carefully selected; and looking back on the species several kinds were certificated, such as *Silver Queen*, Mrs. Hudson, and others rewarded my efforts, which are still being continued. I began *Cannas* after the last French exhibition, when I was struck with *Crozy's*, and in this my aim has been to get dwarf, quick-flowering varieties, suited to our climate both out-of-doors and also indoors; William Trepto, Cheshunt Yellow, and many other certificated flowers rewarded my efforts.

In *Rhododendrons*, by crossing with *R. Fortunei*, I have gained a group of hybrids with larger flowers, some scent, and but slightly earlier than the *Catawbiense* hybrids. Duke and Duchess of York, Her Majesty, Ardenue, Lady Thiselton Dyer, have all gained awards. Roses I have left, so far as cross-breeding goes, to my son, whose recent gain

of Psycho, from Crimson Rambler, and a yellow Polyantha Rose are not uninteresting. *George Paul*. [For portrait of Mr. Paul, see our Supplement to this issue. Ed.]

WILLIAM CULVERWELL.

IN my early days I was very much interested in hybrids, and made several attempts to produce a new fruit. Among them was a cross of the Raspberry and Blackberry. The Strawberry and Raspberry cross, this certainly is a hybrid, and produced abundance of flowers, but is not fertile, the leaves are intermediate, the inflorescence is on the top of the shoot, but a fruit has never been found. [This cross is identified by Dr. Focke as *Rubus Leesii*, and its hybrid origin has been, as we think, needlessly doubled. Ed.]

The Gooseberry and the Black Currant is also a hybrid (already figured in the *Gardeners' Chronicle*), and produced a great crop of fruit in 1898; it was in bunches like the Black Currant, the berries were smaller than those of the Gooseberry, but larger than those of the Currant. They are good for tarts, as the ripe fruit was better than green Gooseberries, also much sweeter than the Black Currant; the crop is not good this year, the frost in spring destroyed it.

Of Peas I have had a multitude of crosses, and am very proud of them. The first was a cross between Laxton's Supreme and Veitch's Perfection, the result of that was amongst others, *Invincible* and *Telegraph*, both of these are great croppers, and will stand the cold in spring, consequently they are used for field culture in great quantities. *Telegraph* has sported a number of good Peas, but for hardiness and field culture, it still has no equal.

I have also done a great deal in improving the Polyanthus for more than thirty years, the colours are now perfect, and very distinct. Those have passed into the hands of Messrs. Veitch & Sons, Ltd., year after year for a great number of years. *William Culverwell*. [Mr. Culverwell's portrait is given in this week's Supplement. Ed.]

WILLIAM SMYTHE.

PASSION-FLOWERS are among the easiest plants to cross-fertilise, the more so as some of them positively refuse to set seed with the aid of their own pollen. This tendency to cross-fertilisation is, no doubt, responsible for much of the beauty of these flowers, and for the great difficulty there is in satisfactorily identifying or describing certain species, especially among the *Tacsonias*. Sabine was one of the first to write on hybrid Passion-flowers. His account of *Passiflora cœrulea racemosa*, raised by Mr. Thomas Milne, of the firm of Whittey, Brames, & Milne, was published in the *Transactions of the Horticultural Society of London*, November 7, 1820, tom. iv., t. 9, accompanied by a coloured figure. Mr. Masters, of Canterbury, was one of the earlier raisers, having produced a hybrid between *P. alata* and *P. cœrulea*, which was figured in the *Bot. Reg.*

Of late years new forms have been raised in the gardens at Woodhatch, near Reigate, from *P. racemosa* × *P. quadrangularis* (*Gardeners' Chronicle*, Dec. 22, 1881, p. 732). Eynsford Gem, a lovely hybrid form, raised by Mr. Geeson, when at Exeter, between *P. racemosa* and the white form of *cœrulea*, known as *Constance Elliot* (see *Gardeners' Chronicle*, July 11, 1885). *P. Kewensis* × was raised at Kew in 1888, out of *P. Kermesina* by *P. cœrulea*. Messrs. Haage & Schmidt have also sent out some splendid hybrids between *P. racemosa* and *P. Londoni* ×. These were described, and some figured in the *Gardeners' Chronicle*, April 21, 1883. Mr. Munro also raised, about 1868, numerous hybrids between *P. alata* and other species, which were described in these columns.

Our space will, however, not allow us to mention the numerous French and German hybrids, but in

this connection we must not overlook the achievements of Mr. Smythe, of Basing Park Gardens [see Supplement in present issue. Ed.] the raiser of *Tacsonia Smythiana* ×, between *T. mollissima* and *T. Volkemi*. Mr. Smythe also exhibited a dwarf crossed Bean at the Royal Horticultural Society's meeting last year, under the name of *Goliath*, which the Committee spoke very highly of, and wished to see again. It was the result of twelve years' crossing and re-crossing the Runner Bean (*Phaseolus multiflorus*) with the dwarf French Bean (*Phaseolus vulgaris*), and it has produced the well known scarlet flower of the Runner Bean, with thick fleshy pods of excellent flavour, a great improvement on all existing varieties.

Henderson & Son, of Pincapple Nursery, distributed in 1850, *Viola stricta grandiflora*, of my raising. It was, I believe, the first cross with the *Viola* and *Pansy*.

Mr. Smythe also raised several tree Carnations, distributed by Messrs. Cannell and Messrs. Low, and a great many varieties of *Amaryllis*, which Messrs. Williams & Sons distributed. [See Supplementary sheet. Ed.]

HENRY WEEKS.

I WAS born in the year 1866 in the village of Foots Cray, in Kent. I had to start work at an earlier age than most lads. When I was twelve years old, my old schoolmaster, who was an enthusiastic gardener, obtained a situation for me as garden-boy at Frognaal, the seat of the late Lord Sydney, Foots Cray, Kent. After serving three years here, I obtained through the same influence another situation in the neighbourhood, where I stayed three years. From here I went back to Frognaal as kitchen-gardener under Mr. T. Crasp. After serving two years in this capacity, I was promoted to be foreman of the kitchen-garden and pleasure-grounds, which post I filled for two years.

While at Frognaal, I saw Chrysanthemums grown on the big bloom system for the first time. They were, however, then in their infancy as compared to what they are at the present day. About this time I read an article on Chrysanthemums in which it was stated that it was impossible to obtain mature seeds in this country, and I determined that if I ever was in a position to do so, I would try and disprove that notion, but this was done before I started, and, strange to say, one of those who matured seeds was Mr. Shea, of Foots Cray.

After serving for four years at Frognaal, I obtained, through Messrs. Veitch & Sons, of Chelsea, a situation as foreman of the French and Italian flower gardens at Stanwick Park, Darlington, under Mr. Wm. Higgie, gardener to the Dowager Duchess of Northumberland. To him I owe in a great measure my present position. I bought a couple of books on elementary botany, and passed many what would have been dull evenings reading them. When I left that place, I knew those books by heart, and I have felt very thankful for it ever since. A knowledge of botany, if only slight, is of great service to a gardener.

After being at Stanwick two years, I obtained a situation as gardener to the Hon. and Rev. G. W. Bourke, at Pulborough, in Sussex. This was not a move upwards, but it placed me in a better position to assist my mother. While here I made my first attempt at cross-fertilising the Chrysanthemum, but without success. After I had been at Pulborough about two years, I obtained a situation in the plant-houses at Elvaston Castle, but had only been there two or three months when I was offered the situation of general foreman at Thrumpton, which I accepted, and I succeeded Mr. Geddes as head-gardener in 1893. With a deal of estate-work, I do not find much time in the ordinary working hours to pay the attention I should like to a great many things, still I think I may add,

that our garden will compare favourably with many; but it is in the Chrysanthemum world that I am best known. All these have to be seen to in what would otherwise be my leisure hours; but if I had no other return for my labour, the pleasure of watching them open in their great variety would be ample recompense to me.

I have the last three years been paying as much attention as I could find time for to the cross-breeding of *Hippeastrums*, and should say I have raised some very finely-coloured selfs; but being unable to get up to the London shows, I cannot tell if they are up to the present-day standard or not. Another class of plants which I have just started upon is flowering *Cannas*, and I trust I shall be able to give a good account of some seedlings I have soon to flower.

CHRYSANTHEMUM RAISING.

When I first came to Thrumpton, the Chrysanthemum Mrs. Alpheus Hardy was much thought of, on account of its novelty. I was much struck with its purity of colour, but could do nothing with it on account of its making weak roots; but the second year I struck some cuttings, and grew them on single stems in 3½-inch pots; the buds appeared late, but they all produced beautiful blooms like balls of snow. I was so much struck with this that I decided to make another attempt at fertilising, and although most of the other varieties were over, yet I found a quantity of pollen on a bush of *Puritan*. I went over the blooms carefully, but either the pollen was not good, or the blooms were too far gone for me to obtain very good results; but I was elated some time after to discover that I had got seed, though these numbered only four. From these seeds I obtained the varieties *Lady Byron*, certificated October 28, 1895; *Mrs. H. Weeks*, First-class Certificate, November 11 of the same year; and *Mrs. G. Carpenter*, certificated the following year. Hitherto my attempts had been confined to plants in large pots, but my success with this variety suggested the advisability of growing them in small pots, so the year following that in which I obtained the four seeds previously mentioned, I struck a batch of cuttings late in the summer from which I obtained about 200 seeds. The result of these was very disappointing, as in my anxiety to obtain seed, I had paid no attention to the varieties I was employing as parents; some which might have made good varieties were so ungainly in habit that I did not feel justified in growing any of them again. The next year I determined to work on different lines, keeping habit in view above everything, with the result that I have now a strain which leaves very little to be desired, as out of the set of this year's novelties, only two of them attain a height of 6 feet, while five do not reach 3 feet, and seven varieties from 3 feet to 4 feet 6 inches.

Last year's batch exceeded my most sanguine expectations, for, besides being awarded certificates for nine varieties, I had quite as promising a reserve stock for next season. The varieties certificated were: *Mrs. Wm. Cursham*, on October 24; *Lady Crawshaw*, Emily Towers, *Mrs. Coombe* and *Henry Weeks*, on October 31; *Miss Annie Hills* (incurved), Nov. 14; *Mrs. Barkley*, *Edith Dashwood*, on Nov. 21. At this meeting of the National Chrysanthemum Society Floral Committee I was awarded a Silver Medal for a collection of sixty seedlings, and I received a First-class Certificate for *Madame R. Cadbury* in December. Besides these, there are several varieties sent out this year by Mr. Norman Davis, which I feel sure will be certificated eventually.

I have never cared for the incurved sorts, but at the wish of several growers I tried my hand the year before last, but only went at it in a half-hearted way, only fertilising one head; but it struck me afterwards that they must be more easily fertilised than the Japanese section, but not being sure, I took careful notice last autumn, and have come to the conclusion that such is the case, as I scarcely troubled with them and yet I got more

seed from three heads of these than I can get so far from a score of Japanese.

There are several things connected with this branch of Chrysanthemum culture which one needs to take note of. In the first place, either soil or cultivation, or both, appear to be prime agents in the matter of pollen-bearing, as some varieties which I have grown for years have not produced a grain of seed, while the same varieties in other collections bear seed in abundance. Also, that flowers of dark colours, yellow and intermediate shades of colour, produce it more abundantly than do white flowers. This may be caused by the same conditions. It is therefore necessary to make a note of those varieties, so as to have a good percentage of pollen-bearers. Seedlings, with very few exceptions, bear abundance of pollen the first year, but I have never seen it afterwards on many of them.

Another thing I have observed is, that such varieties as Thos. Wilkins and W. Seward, which produce conspicuous bracts in the flower-heads, are more easily fertilised than those which do not possess them, or on which they are less evident.

to be worked upon. If the latter is backward, this is not necessary.

As soon as the first row of florets on the plant that is intended to be the seed-bearer are fully expanded, they are cut back carefully with a pair of grape scissors, and if the variety is a true Japanese, all the florets are drawn out except the outer row, as I find these give a greater percentage of double flowers than those towards the centre; and in a Japanese it is essential that the centre should be full, but in the case of incurved, and incurved-Japanese varieties, this is not necessary, as in my opinion they are apt to become confused if they are too double, so these are simply cut back to expose the stigma, and the pollen is worked on florets quite near the centre. When fertilisation has taken place, a little weak manure-water is given, and as soon as the seed is ripe, the fertile ones are carefully selected and sown at once, as if allowed to get too dry, the small seed leaves appear unable to burst the outer husk. Most of the seeds will be out of the soil in from eight to ten days if placed in an interme-

Cannas of a few years ago were very tall plants, with small and late dull red, narrow flowers, and they were grown exclusively for their foliage effects. How has this transformation come about?

In the first place, it should be said that there are many species of Canna, and about a half-dozen of these were well known to gardeners at the opening of the century. About 1830 the Cannas began to attract much attention from cultivators, and the original species were soon variously hybridised. Crossed seeds, and seeds from the successive generations of hybrids, introduced a host of new and variable forms. The first distinct fashion in Cannas seems to have been for tall, late-flowering forms. In 1848, Année, a cultivator in France, sowed seeds of *Canna nepalensis*, a tall oriental species, and there sprang up a race of plants which has since been known as *Canna Année*. It is probable that this *Canna nepalensis* had become fertilised with other species growing in Année's collection—very likely with *Canna glauca*. At any rate, this race of Cannas became popular, and was to its time what the French dwarfs are to the

(See p. 52.)

METHOD OF PROCEDURE.

My mode of procedure is as follows:—From about the middle to the end of the month of July, I take cuttings from plants which were planted in the open ground in the spring, and insert these thickly in 3½-inch pots, and place in a cold frame till rooted, when they are shaken out, and potted singly into the same sized pots, using poor soil, as they appear to be more fertile in a semi-starved condition. They are then returned to the frame, and lightly damped overhead night and morning, if the weather is bright; and as soon as the plants are re-established, the lights are removed, until there is danger from frost, when the lights are put on at night and taken off in the morning. All side-shoots are pinched out, and when the bud shows, all side-buds are rubbed out. Early in October the plants are taken to a Peach-house, where the trees are bare of leaves, and kept there till they show the colour of the floret, when they are removed to a house having a night temperature of 50°, and a day temperature of about 55° without sun. Those intended for pollen-bearers are kept a little warmer, according to the forwardness of the female parent, which it is

diated-house. After this, the treatment is about the same as that advised for exhibition-plants, with the exception of a few, which often refuse to run up a leader, and do nothing but throw up clusters of suckers. These are shaken out, and all the shoots rubbed out and planted out on an old hot-bed, and keeping close for a week or two, when they will go away all right.

With few exceptions, seedlings should not be discarded under three years' trial, the exceptions being those with ungainly habits, and those with poor florets. *Henry Weeks*. [Mr. H. Weeks' portrait appeared in last week's issue, p. 23. Ed.]

CROZY.

"Few plants have shown more remarkable evolutions in very recent years than the Cannas. At the present time, the Crozy Cannas—so named from Crozy, of Lyons, France, who has introduced the greater number of them—are most popular. This type is often called the French Dwarf, or the Flowering Canna, and it is marked by a comparatively low stature, and very large and showy spreading flowers in many colours; whereas the

present day. The plants were freely introduced into parks, beginning about 1856, but their use began to wane by 1870 or before. Descendants of this type, variously crossed and modified, are now frequently seen in parks and gardens.

The beginning of the modern race of dwarf, large-flowered Cannas was in 1863, when one of the smaller-flowered Costa Rica species (*Canna Warscewiczii*) was crossed upon a large-flowered Peruvian species (*Canna iridiflora*). The offspring of this union came to be called *Canna Ehemanni*. This hybrid has been again variously crossed with other species, and modified by cultivation and selection, until the present composite type is the result. Seeds give new varieties, and any seedling which is worth saving is thereafter multiplied by divisions of the root, and the resulting plants are introduced to commerce." *L. H. Bailey*, in "*Plant Breeding*," p. 140-2.

We also reproduce the following note, which appeared in our columns in June, 1897:—

"I began," says M. Crozy in *Moller's Deutsche Gärtner-Zeitung*, "hybridisation between *Canna Warscewiczii* and *C. nepalensis*, a variety with large yellow flowers, and very long creeping tubers. My first Cannas obtained from this cross were named Bon-té and Planterii, the latter of which showed

green foliage and orange flowers. The first one came close to *C. Warszewiczii*, with dark red-brown foliage and pretty large flowers, was very free flowering, and a favourite for some time. After this, by crossing with *C. aureo-pecta*, I succeeded in getting hybrids with yellow-spotted flowers, which year by year grew larger and rounder. I then tried to get an early bloomer, and finally succeeded in obtaining a type which was very floriferous. I constantly threw inferior plants away, and kept only the best.

"As to the number of crosses raised by me, I suppose that I have raised, without exaggeration, some 180 to 200 varieties, which, step by step, showed improvement over the older kinds. Among my varieties not yet in commerce, are *Cannas* with flowers measuring from $\frac{1}{4}$ to 6 inches in diameter. These have all very glowing colours, and bear immense flower trusses.

"My constant zeal for superior varieties show successes every year in regard to colour as well as size and number of flowers. The flowers now are borne more erect, are of better substance, and show broader, rounder petals, and some are of a size not known before.

"These *Cannas* for our climate have the advantage of being dwarf and early flowering, and they stand rain and other adverse weather conditions well, which the older varieties do not."

As regards the new type of *Cannas* seen in the varieties Austria and Italia, M. Crozy states he awaits the competition of these without fear, and comments adversely on the lack of substance and early wilting of the flowers.

"We may add," says the *Gärtner-Zeitung*, "that M. Crozy is known in Nancy, France, under the name of 'Papa Canna'; and one of his best novelties is named 'Papa Canna.'"

The *Canna* may be described as a subject of comparatively recent development; a few of its forms were in English gardens for years before a happy inspiration induced Mr. Alex. Roger to introduce them into his sub-tropical arrangements at Battersea Park thirty years or so ago, which was the means of popularising the *Canna* as an ornamental decorative plant; and what was so well and effectively done at Battersea Park was speedily imitated by others, and so considerably more importance than formerly attached to it. That the *Canna* is an old inhabitant of our gardens there can be no doubt, for Parkinson in his *Paradise*, gives a description of one with "yellow flowers, spotted with red."

It may be assumed that any improvements in *Cannas* were due to the efforts of continental florists, and others. It may be that the Peruvian *C. iridiflora* was employed for fertilising purposes on to *C. indica* and its allies; the former, while not suited to our English out-door climate, can be bloomed in the open air in Paris gardens, and it is natural to suppose its value as a parent was not overlooked by the early improvers. Mr. W. Robinson in his *English Flower Garden*, informs us that "Foremost among the raisers of new varieties may be named M. Anoué, a French amateur." He commenced about forty years ago, and raised several varieties during the sixties and later, which bear his name; and it is believed that, like later raisers, he employed *C. iridiflora* in his crosses.

By 1877 considerable additions had been made to our cultivated *Cannas*, and M. Jean Sisley, of Lyons, made use of some of them, and obtained by crossing two mentioned in the list then given, viz., *Maréchal Vaillant* and *Député Héron*, a large-flowered crimson-scarlet variety, which in its turn was employed as a parent with excellent effect. M. Chate, M. Louis Van Houtte, and others, were also engaged in this work, and generally with good results.

But it is to M. Crozy, of Lyons, that we largely owe the race of splendid large-flowered *Cannas*, so popular in the present day. It is not difficult to imagine M. Crozy taking up the work at the point where M. Jean Sisley concluded, and so giving an impetus to the development of the *Canna*, which has resulted in forms of the highest value. The newer French and other varieties are of dwarf growth, very unlike the earlier forms which M. A. Roger employed at Battersea Park; as, for instance, *C. Ehemanni*. Some are scarcely more than 18 inches in height; some are from 4 to 5 feet, with intermediate statures; they have ample leafage, in some cases tinted with bronze and wine-colour; and for house decoration they are now much grown. If the shortness of our summers, and the uncertainty of our autumns, fail to produce a succession of

bloom when the plants are cultivated in the open air in this country, in greenhouses and conservatories they are much more persistent. One remarkable feature in the later varieties is the large size, and varied markings and combinations of tints seen in the flowers. Awards to new varieties need now to be made with due caution, as they increase rapidly, and from various sources. Ed. (See Supplementary sheet).

THE PANSY AND VIOLA.

THE history of the Pansy has been so frequently told as to have become almost an oft-repeated tale. But it is of much interest, and the details may be briefly given at this important conjuncture in matters horticultural.

As far as floricultural records afford reliable information, it was about 1810-1812 that the work of improvement of the Heartsease commenced in earnest. Whether the first to take the *Viola tricolor* in hand, our wild *Love-in-Idleness*, was Lady Mary Bennet, the daughter of one of the Earls of Tankerville, who had a garden at Walton on-Thames, and with the assistance of her gardener, Mr. Richardson, raised improved seedlings; or Lady Monk and her gardener; or Mr. Thomson, gardener to Lord Gambier, of Iver, can scarcely be determined. It would appear that all took part in the work; though I am inclined to think it was Thomson who contributed most to the remarkable success which attended their efforts. It was about 1811 when Lord Gambier gathered in the grounds of Iver a common yellow and white Heartsease, and taking them to Thomson, requested him to cultivate them. "I did so," writes Thomson, "saved the seeds, and found that they improved far beyond my most sanguine expectations. In consequence thereof I collected all the varieties that could be obtained. From Brown, of Slough, I had the blue, and from some other person whose name I do not now recollect, a darker sort, said, then, to have been imported from Russia." After raising seedlings for four years, he named the first of his seedlings *Lady Gambier*, and then commenced a series of naming, extending over several years, and continued to our time.

Meanwhile, Hogg, of Paddington; Brown, of Slough; Young, of Epsom; Mountjoy, of Ealing; Henderson, of London; J. & W. Lee, of Hammer-smith; Allan and Rogers, of Battersea; Silverlock, of Chichester; and others, took up the work, followed later by Dickson, of Edinburgh; Paul, of Paisley; Hale, of Stoke; C. Turner, of Slough; Downie, of Edinburgh; and various florists, until the time came when the culture of the show Pansy in the south became extremely difficult, through the appearance of a disease, which carried off the plants by the hundred.

In the north, and especially in Scotland, the show or English Pansy is still cared for, and new varieties are raised annually and put into commerce; though in the south the large fancy type has almost entirely taken its place in gardens, and especially for market work.

The story of the origination and subsequent improvement of the Belgian or fancy Pansy was so recently and fully told in the previous volume (p. 343), that it is only necessary to state, by way of continuity of the subject, that John Salter, first at Shepherd's Bush, next at Versailles, near Paris, and finally at Hammersmith, originated and improved the type, which M. Mieliez, of Lille, and other continental raisers advanced to a high state of perfection by 1868; and from the leading varieties of which Mr. William Dean raised fine seedlings, which, finding their way into Scotland, were warmly welcomed by the Scotch florists, the climate being so well suited to their growth and fine development of bloom. Strains of high quality are now common; Bath of Wisbech, S. Pye of Garstang, W. Sydenham of Tamworth, are among the leading English raisers. In Scotland, Laird of Edinburgh, Dicksons of Edinburgh, Dobbie and Lister of Rothesay, Paul

of Bridge-of-Weir, Forbes of Hawick, Campbell of Altyre, and others, are present-day raisers of new varieties, though so fine have been the productions of the past twenty years, but little substantial improvement can be noticed in the novelties of recent years; stoutness of substance is a prime gain.

Professor Hillhouse, at the *Viola* Conference, held in Birmingham in 1895, appeared to be of opinion that *V. lutea*, which he asserted to show "remarkable variability in colour, varying as it does from pure blue to pure yellow, with every possible transition between;" and *V. Rothemagensis*, the Rouen Heartsease, had played some part in the early history of the cultivated *Viola*, the former especially.

The early use of the Pansy and *Viola* as bedding plants was greatly due to Mr. J. Fleming, who while in charge of the gardens at Cliveden, in the fifties, raised some seedlings which he used very extensively in his spring garden. About 1859-60, Mr. James Grieve, then with Messrs. Dicksons & Co., Edinburgh, and Mr. John Baxter, of Dal-dowie, near Glasgow, made use of *V. lutea* and other species as seed parents, crossing them in various ways. Then came the boom with *Viola cornuta* by Mr. John Wills about 1863, and this induced some persons to set about crossing such material as they had; and *V. cornuta* Perfection, *V. lutea grandiflora*, and others appeared. Messrs. Dickson & Co., Edinburgh, and my brother, Mr. A. Dean, at Bedford, were both active as raisers, and during the seventies I sent out several new varieties, including *Blue Bell*, which originated as a chance seedling, and has outlived most of its contemporaries.

Dr. STUART, of Chernside, N.B. (see Supplementary sheet), commenced his valuable work with the *Viola* about 1872-73, by making crosses between *V. cornuta* and *Pansy Blue King*, and soon raised new varieties which were warmly welcomed, and while others fell aside from the march of improvement, he laboured for the production, and that most successfully, of a rayless section, and subsequently obtained the miniature type also, with their mossy growth and small well-shaped flowers.

The work of my brother, Mr. W. Dean, done twenty years or so ago, while at Walsall, must not be forgotten. He raised and sent out several distinct varieties; and both seed-saving from selected varieties and cross-fertilisation were had recourse to by him, and *True Blue*, a rich, deep-tinted *Viola*, still remains an excellent and popular bedder.

A number of raisers are still busy at work producing new varieties, which are so numerous that it would appear invidious to particularise, and the *Viola* is now largely employed in our summer bedding arrangements, and almost invariably with excellent effects.

What is wanted is a race of early-flowering varieties for use as carpet plants in the spring garden in March, April, and May. Such a race would be very welcome to gardeners, who find it difficult to carpet their bulb-beds with plant which will be in flower simultaneously with the Hyacinths, Tulips, Daffodils, &c., and furnish blossoms when these have gone out of flower. R. D.

THE INDIAN AZALEA.

It is difficult to say who took the lead in crossing the various species and varieties of *Azalea indica* which came to us from China. From early times the "Indian *Azalea*," like the *Camellia japonica*, *Chrysanthemum indicum*, *Pæonia moutan*, *Rosa indica*, have been cultivated in the gardens of China and Japan, and numerous varieties have been brought to Europe. The varieties raised by European gardeners are there not sprung from a homogeneous species, but from numerous races and varieties which have been under cultivation for centuries, and probably had among them artificial as well as natural hybrids and crosses. Planchon (see *Die Pflanzen Mischlinge*) states that the Indian

Azaleas may be referred to three sub-species, which he differentiates as *Breyni*, *Kämpferi*, and *Simsii*. Maximowicz inclines to two type species, viz., *A. ledifolium*, with four; and *A. indicum*, with five sub-species. Mr. Smith, of Norbiton, was one of the first to cross-breed, and about 1830 he raised a variety named *speciosa*; from this came an improved form he named *Smithi*; and later still, *splendens* and others. The striped varieties are regarded as descendants of *A. variegata*, for it has been observed its progeny have a tendency to produce blotched and striped flowers, and they partake also of the *A. variegata* habit.

Perhaps one of the earliest of English raisers of

that the greater majority were of continental origin. By that time it may be said that the raising of seedlings had passed into the hands of foreigners, chiefly Belgians and Frenchmen, and fine double-flowered varieties, as well as single-flowered, were produced in great numbers. In the early seventies, M. Louis Van Houtte sent over to one of the meetings of the Royal Horticultural Society a number of very fine single and double-flowered varieties, which were regarded as great advances, and they became very popular, and the production of new varieties still goes on. Not a few varieties have originated as sports, not only in Europe, but also in China and Japan.

FIG. 25. —*DEUTZIA DISCOLOR PURPURASCENS*. (SEE P. 46.)

Indian Azaleas was Mr. Philip Frost of Dropmore Gardens, who succeeded in raising some novelties, which between 1830 and 1840 passed into the hands of Messrs. Knight & Perry of Chelsea for distribution. Mr. Frost made an experiment by sowing seeds of a white variety, and raised a varicoloured progeny from it.

It was possibly such material as the foregoing which came into the possession of Ivery, of Peckham, and Ivery of Dorking, and others, and led to the raising of *Admiration*, *Criterion*, *Queen Victoria*, *Iveryana*, *Beauty of Reigate*, and others, and from these various raisers produced seedlings which were named and distributed. A lengthy list of varieties published twenty-two years ago shows

Crosses have been made with considerable success between *A. indica* and *A. amœna*; one of the first was *A. Caldwelli*, raised by Messrs. Caldwell, Knutsford; and Mr. W. Carmichael was also successful in raising some valuable varieties from *A. indica* *Stella*, crossed with *A. amœna*. In addition, that form of *A. sinensis* known as *mollis* has been used in a variety of crossings with *A. indica*, and also with *Rhododendron ponticum* and others, with more or less success.

Mr. Vervaeke, of Ledeborg, has been so successful in raising new varieties, as illustrated at the Ghent show this spring, that we select him as a representative of a group of distinguished Belgian raisers (see Supplementary pages). *R. D.*

ORCHID CROSSES.

As with other important classes of plants in which the hybridiser has intelligently worked, in the matter of forming an opinion of the gains in Orchids by his agency, it is profitable to pass in review the species acquired by importation, which represented the family in gardens before the home-worker began to effect their inter-crossing; and then, to turn from the species and varieties and consider the very large number of beautiful and useful hybrids which the hybridiser has evolved, some few of them superior in beauty to the species used in obtaining them. A larger proportion equal in beauty to the species, and all possessing some distinct feature, if it be only in the matter of flowering at an intermediate season, which render them distinct gains to gardens.

In the larger and showier genera, the good results are very evident; and now that the fruits of former labours are being perfected, good novelties come rapidly, as will be seen when it is considered that during 1897 and the first half of 1898 no fewer than fifty hybrid *Cattleyas*, *Lælias*, and *Lælio-Cattleyas* have been deemed worthy of Certificates by the Orchid Committee of the Royal Horticultural Society, and many others shown in an immature condition which will doubtless receive awards when more fully developed.

A glance at the names of the raisers and exhibitors disclose results only to be expected, viz., that Messrs. Jas. Veitch & Sons, the earliest in the field, and who have had the benefit of the assistance of such earnest workers as the late John Deming and John Seden, bear off "the lion's share" of the honours which their beautiful hybrids fully entitle them to. Among amateurs, Norman C. Cookson, Esq., in conjunction with his able gardener, Mr. Wm. Murray, has done great things; so also the popular President of the Royal Horticultural Society, Sir Trevor Lawrence, Bart.; and among the thousands of hybrids as yet unflowered in the nurseries of Messrs. Sander & Co., Messrs. Charlesworth & Co., Messrs. Hugh Low & Co., and others, a large number of beautiful things are sure to appear, the innumerable tiny plants in each establishment giving ample warrant that the industry of raising hybrid Orchids is not intended to collapse for want of interesting material.

On the Continent, the names Linden, Maron, Bleu, Mantin, Vynsteke, Peeters, and others appear with honour, and their products are of equal merits to those obtained in the British Isles, to say the least of them.

There is also another branch of Orchid-raising from seeds which might well be more fully developed, and run concurrently with the hybrid branch, and that is, the raising of fine varieties from seeds uncrossed, and perpetuating and improving by selection the best forms already in gardens. That there is a good field in this direction has been proved by Norman C. Cookson, Esq. securing an improvement of the coveted *Cypripedium Lawrenceanum* *Hyeannum*, and by a few other cases of a similar nature, and which among the plants in a wild state no doubt gives the chief factor in securing the fine varieties which the amateurs so keenly compete for when they appear among importations.

Among other gentlemen worthy of honourable mention for their work in Orchid hybridisation, are Sir Wm. Marriott, W. E. Brymer, Esq.; C. C. Hurst, Mr. T. W. Thornton, Reginald Young, Esq.; Drewett O. Drewett, Esq.; Captain Hinecks, and Chas. Winn, Esq. In Baron Schroder's gardens Mr. H. Ballantine has raised some important hybrids; and in the gardens of R. I. Measures, Esq., Mr. H. J. Chapman has done good work; Mr. T. W. Bond, gardener to C. L. N. Ingram, Esq., also having produced a number of desirable hybrids, especially among *Cattleyas* and *Lælias*. *J. O'B.*

MESSRS. SANDER & CO.'S HYBRID ORCHIDS.

For many years the hybridising of Orchids has been carried on by Messrs. Sander & Co. at St. Albans. The first attempts were made, as with

many other workers in the field, as a sort of amusement, and the crosses then made were effected by Mr. F. Sander himself. Later, when good results gave interest to the subject, in conjunction with his energetic manager, Mr. J. Godseff, the extent of the operations was increased, with the result that soon a special department had to be organised for the hybrid Orchids, and Mr. Maynard, who is now pursuing his occupation in the United States, had charge of the department for some years, and with the best results. Recently, Mr. Armstrong, who previously did good work with Chas. Winn, Esq., at Birmingham, has taken charge of the St. Albans' hybrids, and doubtless the good standard will be maintained.

Among Cypripediums, Messrs. Sander & Co. have been very successful, a large number of good new ones has been raised by them; and in the favourite genus *Cattleya*, &c., we find credited to them *C. × Lord Rothschild* (*Gaskelliana × aurea*), *C. × Ballantinei* (*Trianaei × Warszewiczii*), *C. × Burberryana* (*intricata × superba*); *Lalio-Cattleya × C. G. Roebling* (*L. purpurata × C. Gaskelliana*), *L.-C. × Frederick Boyle* (*C. Trianaei × L. anceps*), *L.-C. × Kranzlini* (*C. Mossiae Wagneri × L.-C. × elegans*); *L.-C. × Maynardi* (*L. Dayana × C. dolosa*); *L.-C. × Mrs. Astor* (*C. Gaskelliana × L. xanthina*); *L.-C. × Sandere* (*L. xanthina × C. Dormaniana*), and a fair proportion of other showy hybrids. *J. O'B.*

ROSES.

To go into the history of cross-breeding in Roses would demand much more space than we can now give to it; moreover, it has on more than one occasion been treated of in our columns. We may specially refer to the magistral paper of M. Crépin in our columns, 1895, January 19, p. 76; and to the full account given in the Jubilee numbers (see June 12, 1897). All we can do now is to mention a few of the more prominent Rose-breeders of later times. In this connection we may mention the late Henry Bennett, who raised many "pedigree" Roses, mostly crosses between Hybrid Perpetuals and Teas, amongst them being *Her Majesty*, Mrs. John Laing, and Viscountess Folkestone. The veteran William Paul, of Waltham Cross (see Supplementary sheet), has always taken a leading part as a cross-breeder and a fluent writer. To enumerate all the choice productions that have emanated from Waltham would be impossible; it must suffice to mention some of the more recent, such as *Sappho*, *Medea*, *Queen Mab*, *Enchantress*, and *Empress Alexandra of Russia*. In the hands of his son the work is likely to go on valiantly, so that we look forward to many more Beauties of Waltham.

Mr. Dickson of Newtownards, Ireland (see Supplementary sheet), is another representative Rose-raiser, and if he had done nothing more than give us Mrs. W. J. Grant, he would have done enough to hand his name down to a grateful posterity: *Earl of Dufferin*, *Helen Keller*, *Margaret Dickson*; while *Bessie Brown* is one of the sensations of the season.

Of Mr. George Paul's productions may be mentioned *Cheshunt Hybrid*, Mrs. Reynolds Hole, *Sultan of Zanzibar*, Paul's *Single White*, and many others.

How many of these Roses were simply raised as selected seedlings, and not as the result of intentional cross-breeding, we cannot tell, but of Lord Penzance's beautiful and fragrant *Briars* the history has been given in the *Rosarian's Year Book* for 1892. Ed. (See Supplementary sheet.)

DEUTZIA DISCOLOR PURPURESCENS

(SEE FIG. 25, P. 45.)

FOR the possession of this most distinct and beautiful hardy shrub I am indebted to the kindness of the director of the Muséum de l'Histoire Naturelle at Paris, more commonly known as the Jardin des Plantes, who sent it to me some three or four years ago when still very scarce, in fact, almost unknown in European gardens. It is one of the

many fine hardy plants sent to the Museum garden from China by the collectors sent out by the French Government, probably the Abbé Delavay. It was distributed some little time ago by the well known French nurseryman, M. Victor L. Lemoine, O.L.H., who has used it as one of the parents of his beautiful new hybrid *Deutzia* (*gracilis* being the other parent), named *D. gracilis rosea* and *D. gracilis venusta*, which he is now sending out for the first time. *W. E. Gumbleton.*

CULTURAL MEMORANDA.

GLORIOSA SUPERBA.

A WARM, moist temperature is necessary to grow and flower these plants well, and the pots should not be over-large. Three or four strong bulbs should be placed in a well-drained 10-inch pot, filled with sandy loam, small lumps of peat, and plenty of sharp sand, and then started in a fairly brisk heat, not affording much water for a time. The strong shoots which will be thrown up should be supported with sticks, or attached to a wire stretched across a house near the roof. When the pots get filled with roots, clear soot-water or weak liquid manure may be applied occasionally. The surface should be top-dressed twice during the season, and when growth ceases, the quantity of water afforded the plants should be gradually lessened, the bulbs being wintered in a warm place.

JUSTICIA CARNEA.

Plants that were struck from the tops of old plants in the spring, and grown on in an intermediate temperature in small pots, make, when small, useful decorative material. If four or more heads of bloom are required, if only one per plant, the top of the stem should be nipped off; but when only one head is wanted, the laterals should be removed, the crown flowers being retained.

JASMINUM REVOLUTUM.

This well-known inhabitant of our gardens is much admired when grown as a bush. Last summer I noticed on the lawn at Mrs. Gray's garden at Birchington, Isle of Thanet, a large bush covered with bloom. Slips taken in the spring and early autumn, and put under a hand-glass in sandy soil, soon make roots in a shady position. *H. Markham.*

LAW NOTES.

Re FRANK FREEMAN PAGE, LATELY RESIDING AT STONECOT NURSERY, LONDON ROAD, SUTTON, NURSERYMAN.

THE statement of affairs filed under this failure shows gross liabilities amounting to £1444 14s. 6d., of which £1277 12s. is due to unsecured creditors. The assets are returned at £426 10s. 10d., from which £153 12s. 6d. has to be deducted for the claims of preferential creditors payable in full, leaving nett assets at £272 18s. 4d., and showing a deficiency of £1004 13s. 8d. The debtor alleges his failure to have been caused through "insufficient returns to pay working expenses until last year, and loss through failure of Mushroom and Tomato crops."

A SINGULAR CLAIM.

(*W. C. Spittle v. Spencer & Co.*)

At the Wandsworth County Court, before his Honour Judge Lushington, Q.C., Mr. William Charles Spittle, market gardener, of Ashen Grove Farm, Wimbledon Park, sued Messrs. Spencer & Co., the well-known aeronauts, of Holloway, to recover the sum of £30, as compensation for damage to growing crops near Southfields, owing to the descent of a balloon on the land. Mr. H. E. Jones appeared for the plaintiff, and Mr. Colam defended. The defendant had paid £2 into court. The plaintiff's case was that about 600 people were attracted to the spot where the balloon descended, and, as a consequence, his crops were much damaged. After hearing evidence on both sides, his Honour was of opinion that the amount paid into court, £2, was sufficient, and he therefore gave judgment for the defendant, with costs.

ORCHID NOTES AND GLEANINGS.

VANDA AGNES JOAQUIM.

WHEN calling at Bletchley Park the other day, the beautiful country residence of H. S. Leos, Esq., I saw a fine strong plant, about 4 feet high, of this *Vanda* bearing a spike with several flowers open. I think this is the second plant only that has flowered in this country since its introduction, about five years ago. This hybrid *Vanda* (*Hookeri × teres*), has beautiful flowers, but the fine purple colouring of *Hookeri* is almost lost in it, and little trace of this parent remains beyond the rather broad cuneate-formed labellum. There are several more plants of it here, and the whole seem to be treated to a somewhat cooler and less moist atmosphere than is usually given to this class of *Vanda*. Mr. Hislop took up *Orchid-crossing* some years ago, and is now the fortunate possessor of a very large progeny, from *Laelia Digbyana*, with many kinds of *Cattleyas* and *Laelias*. This offspring is now very healthy and robust, some among them showing strong flower sheaths; and there ought to be some agreeable surprises in store from this batch, if one may venture to judge from the crosses pointed out.

A peep at the grounds shows a very large extension during the past two years, and it is satisfactory to note how well the many large golden Yews are doing, these being brought from a nursery and planted since the extension. Mr. Hislop is using a lot of golden Privet for grouping with fine effect. *A. Ingram.*

TWO RARE NATIVE ORCHIDS.

It may be of interest to some of your readers to know that the sweet little summer *Spiranth* (*Spiranthes aestivalis*), and the purple-leaved *Helleborine* (*Epipactis purpurata*, Smith), are both found in plenty within a dozen miles of the great metropolis—the *Spiranth* at Chislehurst, and the *Helleborine* at Farnborough, both in Kent. In our standard works on botany, the summer *Spiranth* is only recorded from Hampshire, Worcestershire, and the Channel Islands; while the purple-leaved *Helleborine*, found in Bedfordshire and Worcestershire, has quite escaped notice by both Beetham and Hooker. The *Spiranth* grows in dampish ground, by the stream-side, and is readily cultivated in our gardens; while the *Helleborine* inhabits deep loam on chalk, in shady, woody situations, but in its cultivation I have never succeeded. *A. D. Webster.*

HOME CORRESPONDENCE.

CHLOROSIS IN A ROSE.—I have recently had my attention drawn to a H.P. standard Rose, of which one of the smaller branches, stems, thorns, leaves, and flower-stalks are entirely of a creamy-white colour, and the flowers are the natural colour. I have seen many times a few leaves come with splashes of white and yellow, but never before an entire branch. It has carried a good number of perfect flowers—in fact, it seems quite as vigorous as the rest of the Rose. The variety is in the way of the *Earl of Dufferin*. Have any readers of the *Gardeners' Chronicle* ever met with such a freak? Is it possible to perpetuate it, as the branch can contain no chlorophyll? *W. P. Bound, The Gardens, Bill Hill.*

BRITISH FERNS.—On p. 26 in last week's issue I am, unfortunately, made to say that "I possess a collection of these charming plants which contains the best forms of every British species," a statement which I beg to be allowed to contradict, as it is neither true in substance nor in fact. In many respects my collection is comparatively poor, although it has been lately enriched by contributions from such well-known specialists as Mr. C. T. Drury and Mr. E. J. Lowe, to the former of whom the offending phrase is evidently intended to apply. I am extremely sorry this inadvertence should have occurred, as I regard myself as a mere novice on the subject of British Ferns. *C. B. Green, Acton, W.*

GARDEN HYBRIDS.—With much that Sir W. T. Thiselton Dyer has written on p. 31, I am in agreement, but may I be allowed to respectfully suggest that the frequent use of the word "hybrid," in seedsmen's catalogues especially, and among the gardening fraternity generally, as applied to particular strains of florists' flowers, &c., is an error, or rather a misconception, when highly bred is merely the meaning they desire to convey; just as we say high-bred when speaking of pedigree in domestic animals and cage-birds. Few men can claim to have collected and saved, and, for that matter, sold, more seeds of *Cinerarias*, *Calceolarias*, *Primulas*, *Cyclamens*,

It is merely a matter of opinion, and altogether arbitrary. The species of *Cattleya* and *Laelia* are admitted by the best authorities to be very closely allied, and might even be reduced to sections of one genus; but while that is admitted, the two are kept separate as much for convenience sake as anything else. Until it can be definitely settled as to what should constitute a genus, authorities will never agree as to what is, or is not, a bi-generic hybrid. In practice it will be found that many plants which have long been considered to belong to different genera will inter-cross. The remarks you make about birds offer another strong case in point. So various are the

several nurseries—belonged to C. Coum (Miller). Canon Ellacombe wrote to me, saying that he knew the late Mr. Atkins, who had told him that the *Cyclamen* he had called by his own name was a hybrid between *C. persicum* (*latifolium*) and *C. Coum*, that it was not hardy, and that it was soon lost. As for crosses between these hardy *Cyclamens*, which are in common cultivation in English gardens, their flowering seasons are so well marked and so different, that they do not get a chance of forming spontaneous hybrids. Amongst the many names in nursery and bulb catalogues, I have found only four hardy species, counting *C. Coum* and *C. ibericum* as one, for whatever

FIG. 26.—*KALANCHOE FLAMMEA*.

(See Report of Royal Horticultural Society's Exhibition, p. 58, col. 1; also *Gardeners' Chronicle*, July 10, 1897, p. 22.)

Gloxinias, *Pansies*, *Begonias*, &c., than I have done during the twenty years—1898 to 1888—I was in the service of the late Messrs. Lucombe, Pince & Co., of the Exeter Nurseries; and fewer men can claim to have visited so many of the parks, gardens, and gardeners, so often and so regularly as I did during the latter portion of that long service, whence I think my notion that high-bred, as applied to strains, was originally meant, and not hybrid at all. Again and again, during recent years, I have stirred up this subject of hybridism in the gardening press and that of the feathered world, and one of my notes brought forth the following valuable discourse from a high authority, which will just now, I hope, prove of some service: "Doctors do not yet by any means agree as to what should constitute a species, nor even a genus.

opinions of ornithologists about the affinities of birds, that the science is simply an intricate labyrinth of synonymy. If the authors cannot agree as to the genera, they cannot state what is, and what is not, a bi-generic hybrid. Our opinion is that the hybridisation of plants, and the breeding of different species of birds together, is merely a case of sexual affinity." Wm. Napper, 28, Tetcott Road, Chelsea, S.W.

HYBRID CYCLAMEN.—In reference to Sir W. Thiselton Dyer's mention of *Cyclamen Atkinsii*, on p. 31, I do not pretend ever to have seen a hybrid *Cyclamen*; but two years ago when I had been writing notes on the cultivation of hardy *Cyclamens*, and had mentioned that all the *Cyclamen Atkinsii* I had ever seen—and I had collected them from

C. ibericum (Goldie) may be when collected as a wild plant, the *C. ibericum* of nurseries is *C. Coum* (Miller) and nothing else. The four hardy kinds with me are (1) *C. Coum* (Miller), flowering time January to March; comes up freely from seed, colour and leaf very various. (2) *C. hederifolium* (Aiton), syn. *repandum*, flowers April and May; rather tender here; flowers, dark crimson or white, fragrant. (3) *C. europeum* (Lin.), flowers end of June and July, very fragrant; flower shape and size of that of *C. Coum*—does poorly with me. (4) *C. neapolitanum* (Tenore), flowers in August and September; every shade of colour from dark crimson to white, leaves very various; seed ripens abundantly, and comes up readily, flowering in the open ground the third year. This species is figured in Sowerby's *Botany*, under two or three

names as British; and is figured as *C. europæum* in Bentham's *British Flora*. I have never seen specimens of the naturalised species, but from the readiness with which *C. neapolitanum* establishes itself in gardens, and the difficulty I have always found—and, I believe, others have found—in establishing *C. europæum* as a hardy plant, I should say that *C. neapolitanum* (Tenore) is the so-called British species. I have had also *C. cilicium* (not *C. cilicium*), Boissier,* whether true or not I do not know, but it did not prove hardy. *C. Wolley* Dod. Edge Hall, Malpas.

THE PINE-APPLE.—I quite expected that the article on "Pine-apple Culture," by Mr. Coomber, in your issue for July 1, would have induced some of our noted growers of this fruit to reply. As the name of Barnes (formerly the gardener here) is introduced among other good growers of the past (and probably of the present day), I venture to offer a few remarks thereon. In the first place, I may say that there is only about one-half the number of plants fruited here to-day than was the case twenty-five or thirty years ago. There are two common causes for reduction, the first being that employers expect far more flowering and foliage plants grown for indoor decoration of the mansion, especially the former, than was then the case, as well as a succession of Melons and Tomatos, the latter looked for pretty well throughout the entire year, and in many instances the glass structures which once contained a good collection of Pines, are at the present day utilised for the cultivation of the plants mentioned. The other reason being not quite so convincing, namely, that the returns for produce marketed, are not so good as formerly. I shall be within the mark when I say that one-half of the big establishments dispose of their surplus Pine-apples in this way. It is quite certain that employers having two or more country seats, and gardening carried out with spirit in each place, cannot consume all the produce grown. In my case, having a dozen or more of Pine-apples on hand, and my employers abroad, I wrote to a well-known salesman in Covent Garden only ten days ago, asking if there was likely to be a fair sale for them; and he replied, "There is practically no market for home-grown fruit, the St. Michael's taking their place; good fruit, 4 to 6 lb. selling for as many shillings." The most I ever made was 8s. each for good Queens from 5 to 6 lb. each; and I suppose twenty years ago a fruit of this description would have fetched 15s. to 20s. each. The labour is not over-great, as your correspondent says, for if overhauled at the end of August or early in September and replugged, they are right until March comes again, when some may require potting and the suckers put in. These should be taken at different times, so as to keep up a succession as far as is practicable. I must take mine in a smaller state than Mr. Coomber, for he advocates 8-inch pots to start with. Mine go in 4½-inch, 5½-inch, and 6-inch, respectively, and fruiting them in 10-inch pots instead of 12-inch, as advocated by him. This last-sized pot, when well rammed with loam, is rather a heavy one for a man to shift about; and I think quite as good fruit is grown in the smaller pot. *James Mayne, Bicton, Devon.*

FLAVOUR IN MELONS.—A recent note with respect to the culture of Melons with the object of securing higher flavour in the fruits, seems to have in it a somewhat dogmatic bias, though probably not intentionally so. The assumption that Melon-plants grown in troughs or shallow boxes over pipes, are unable to produce fruits so fine or of such high flavour as is found in fruits on plants grown in pits or frames, or where a greater body of soil is provided, seems contrary to general experience. Some of the most delicious Melons tasted in recent years have been grown in troughs, nearly all growers now realising that plants do not need such extensive root ranges as was formerly given them, but that with a restricted area and some suitable feeding, better results are produced. [?] But there is this fact about the best of Melons, that no matter how grown, the getting of high flavour even in the finest varieties of repute is quite a lottery. One fruit may be delicious, three may be very commonplace, and all from the same plant. Sometimes a large Melon is first-rate in flavour; sometimes quite a small and almost an

imperfectly formed one. Externally the fruits may be perfect in appearance, and beautifully netted, yet not good in flesh. Even fruits may have a delicious perfume and yet be quite commonplace in flavour. Aroma is no safe guide in the matter. I do not think the Melon-grower exists (or that the variety exists) who can guarantee high flavour from any one fruit or from many. Melons have gained little because of so much inter-breeding. Some, when diverse coloured flesh varieties have been inter-bred, have given hard white or green flesh externally, and soft, succulent red flesh in the centre. Very many of such fruits crop up amongst new ones, and they are always worthless. We must seek further for the secret of securing flavour in these fruits than is furnished by greater root areas. *A. D.*

MILDEW ON VINES.—In last week's issue of the *Gardeners' Chronicle* I perceive Mr. Wm. Smythe does not agree with the practice of employing hot water on Vines as a cure for mildew. As others and myself have used it, and found it to be a certain cure, it would be interesting to know why he objects to its use, seeing that he thinks water at 130° Fahr. would be a good remedy for any plants infested with mealy-bug. Now, if good for the one, why not for the other? My own experience in using flowers-of-sulphur is, that one application is not enough, whereas one application of hot water has proved effectual. There is no doubt that most of us have in our time resorted to the use of sulphur for plants attacked with mildew; but why should not hot water be as efficient a remedy as sulphur? in my case I have found it better. *G. Littlewood.*

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Hybrid Orchids.—Generally, these plants are fairly easy of cultivation once they have passed through the earlier stages of growth, and become of a size amenable to ordinary Orchid-house treatment. Experience teaches us that home-raised hybrids are more tractable than their parents, each succeeding year the growth being stronger, and root-production greater; and up to a certain age, varying in different crosses, single leads are produced, and these in the course of time afford chances for division if that be called for. In the earlier stages, one great need of these plants is a sweet rooting-material, and failing which, the progress of the plants is slow. Providing the work be carefully and thoughtfully executed, little or no harm comes from frequent repotting, the growing roots eagerly seizing upon the fresh material. Almost everyone having to do with Orchids has attempted the raising of seedlings with more or less success, and in some instances ideas of practice have been formulated calculated to briog about the more speedy realisation of their efforts. From what I can gather nothing makes a better seed-bed than the surface of any well-conditioned material in which an Orchid is already growing. Oft-times, seed is sown on well-prepared surfaces, but the sower's hopes are not realised, a few seedlings springing up where he least expects to find them. For instance, some *Dendrobium* seedlings were raised at this place on soil in which some *Thunias* were growing, and which contained a preponderance of loam, and strange to say, in almost every case, the seedlings were found in the loam.

Lælia and *Cattleya* Hybrids succeed under the same kind of treatment as that given their parents, and I think that often our non-success is due to over-zealous care rather than to any inherent difficulty in the seedlings themselves. Choice plants are isolated and special treatment is applied, with the result that they fall victims to kindooses. Let all Orchids be afforded a suitable kind of treatment, and then all varieties will thrive more or less. Certainly, in some few cases, special details have to be attended to; the very fact that a plant is the result of crossing different species or genera, renders it necessary that the cultivator should consider the idiosyncracies of both parents, and aim at a compromise between them. For example, *Lælio-Cattleya* Digbyano-Trianæi: here we have a moderately cool growing, winter-flowering *Cattleya* united to a warm-growing, summer-flowering

Lælia, the resultant progeny being as might be conjectured, as near as possible of an intermediate nature. To meet the mixed wants of this lovely hybrid, it is necessary to grow it in a warm house, and rest it in a much cooler one, or growth would follow so quickly after flowering that the plant would not have the necessary time to recover from the exhaustion consequent upon flowering. When we know the parents of these plants, there is little difficulty in choosing the proper kind of treatment. My method is to generally take into consideration the weak points of the parent plants, and treat the hybrid accordingly, the more robust character of the other parent aiding me in my efforts.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Raspberries.—These fruits are ripening fast, and should, therefore, have some kind of protection from thrushes and blackbirds. Previous to putting nets over the plantations, suckers springing up between the rows of stools should be destroyed, and where more than three or four canes arise from a stool the rest should be pulled out. The current year's canes should be loosely tied together, and when the fruiting canes are tied to lengths of wire, or to stakes, a framework or support of some kind, at a height of from 7 to 8 feet, must be erected to carry the netting so that the fruits may be conveniently gathered without much need for disturbing the net. Stout stakes fixed 12 to 15 feet apart with a galvanised wire on the top, strained tightly and fixed by a staple driven in to each stake, make a good framework for carrying nets. The nets should be allowed to fall to the ground; or, a piece of galvanised wire netting 2 feet deep may be run round the piece of land, and the fish netting secured to this and thus be kept dry. If a more temporary support for the netting is desired, a flat bit of wood, T shaped, a foot or so in length, may be fixed with one nail on the top of the posts, to support the same.

Gooseberries are ripening fast, and will likewise need to be protected. Owing to the thorny nature of the bushes it is not prudent to lay netting on them, but some form of support must be erected, like that advised for Raspberries, but with shorter supporting poles. Before pulling the nets over the bushes let the leading-shoots be stopped, and others where growth is dense cut back somewhat closely. When Gooseberries are grown together in a square it is a boon to a gardener to have the plantation permanently wired in with galvanised wire-netting, small enough in the mesh to exclude not only thrushes &c., but tom-tits and bullfinches. In one or two instances where this kind of protection is given, the bushes have not been more infested with insects than others unprotected, notwithstanding the doleful consequences predicted by the champions of the birds.

Grafts should be examined, and when it is seen that the ligatures are cutting into the rind, the grafting-clay and the ties should be removed. If the scions are growing freely most of the shoots growing from the stock may be rubbed off; the stronger—a few only—may be left about 8 inches long, to draw sap to the stem, otherwise it will be long in acquiring strength. Scions likely by reason of top-heaviness to be blown out, should be secured to a short piece of stick made fast to the stock.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Begonia Gloire de Sceaux.—This fine, late, winter-flowering *Begonia* is a very effective decorative plant when grown to a large size, a plant grown in a 5-inch pot conveying not the slightest idea of the possibilities of the variety when at its best. It is necessary, therefore, to start in the spring months with strong healthy cuttings, and these having been repeatedly shifted when the state of the roots showed this to be necessary, will at the present time be in large 4½s. As soon as the roots begin to run round the side of the pot, transfer the plants to larger pots, say, of 7 or 8 inches. When strongly grown, this *Begonia* freely makes lateral shoots, and assumes a pyramidal form. Any of the plants of about the indicated size which have not yet thrown out laterals, should be forced so to do by nipping out the leading points. It will

* The classical form of this word is *cilicium*, as E. Boissier, the namer, wrote it (see *Fl. Orient.*, vol. iv., p. 11, and *Index Kewensis*), not *cilicium*, as often erroneously spelt.

be necessary to afford them another shift at a later part of the season, the size of the flower-pots chosen for this repotting being suited to the strength of the plants, 8-inch or 9-inch pots not being too large for the last re-potting of strong specimens. In order to preserve the beauty of the foliage, the plants should not be damped over-head, but the syringe may be freely used between the pots below the leaves during fine weather. A watch should be kept for thrips, which sadly cripple and disfigure the plants by feeding upon the succulent growths and the under-sides of the leaves. This variety should be cultivated in the stove, and shaded during bright sunshine.

Begonia Gloire de Lorraine.—The plants of this variety should be shifted into larger pots when well-rooted, but judging from the excellent specimens frequently seen growing in 5-inch and even smaller pots, it does not appear to be necessary in the last re-potting to exceed 5 inches in width. The flowers should not be allowed to develop on those plants that are required to afford a display in the autumn.

Manettia bicolor.—Plants which have been raised from cuttings, as advised in a former calendar, should be growing freely in 4½-inch pots, being shifted into 6-inch ones before they get pot-bound. Afford a compost consisting of three parts loam, one part peat, and some silver sand. It will be necessary to provide some kind of trellis, to accommodate the large amount of growth which the plants make by the time they are in full flower. They should be grown near the glass in a warm, moist house, and should be freely syringed, in order to keep them clear of thrips, which are partial to the foliage.

Campanula pyramidalis.—Let some weak manure-water be applied twice a week to those plants of a flowering age, which are being grown on for the decoration of the conservatory.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to the Right Hon. W. H. LONO, Rood Ashton, Trowbridge.

The Early Vinery.—In most gardens, Vines will have been cleared of the bunches; but in vineries in which Grapes are still hanging, a little shade will be required over black Grapes, in order to preserve their colour. The Black Hamburgh soon loses colour if exposed to much sunlight after the fruit is ripe, and other varieties are similarly affected, but less quickly. Continuous ventilation of the vinery will be required, whether the Vines are cleared of fruit, or the ripe fruit still hanging on them. It is a good practice to slightly shorten the laterals on the earliest Vines in order that the basal buds may develop fully, otherwise the buds furthest removed from the stem will become the stronger. No hard pruning should be done at this season, for fear of back buds starting to grow. The border should be afforded water, and liquid-manure well diluted and clear whenever it appears to be in need of moisture, and a mulch of strawy manure afforded. If any kind of insects infest these early Vines, the present is a suitable season to make clearance of them. Mealy-bug may be dealt with partly by using water at a temperature of 150°, escaped insects being destroyed by touching them with methylated spirit. If a petroleum emulsion be applied with the hot water, and kept well agitated, it forms an effectual and safe insecticide in the hands of those experienced in its use. Thrips may be eradicated by the same means, or by fumigating with the XL-All compound. Red-spider cannot long endure being vigorously syringed with clear water, or the leaves dusted with flowers-of-sulphur, applied by means of a syringe in the form of a wash. If the latter method be employed, more than one application will be needed, sulphur not adhering regularly and evenly on the smooth leaves. Sulphur mixed with milk, and the hot-water pipes coated therewith, is a capital anti-red-spider means.

The Succession Vinery.—In order that the density of bloom and depth of colour may be preserved for some time, the ventilators should never be quite closed, otherwise moisture will condense on the fruit, spoiling that pleasing bloom that is so much valued in the Grape. Damping down should be less frequently practised; do not, however, keep the vinery unwholesomely arid, but afford moisture according to weather conditions, otherwise red-spider will quickly increase. Vines whose roots are in

borders outside the vinery, should be mulched as previously recommended. If the soil is light and porous, cowshed-litter is better than that from a stable, it being more retentive of moisture. Unless rain falls in sufficient volume to penetrate deeply, water will have to be applied after the mulch is laid on the border. If the border has a steep slope and the surface is compacted, lightly dig it with a fork prior to affording water. As a stimulating manure for Vines, nothing is safer or more beneficial than decayed night-soil; but for the borders it should be well incorporated with dry soil or burnt ballast, more especially if it be not much decayed. This will deodorise it and avert a nuisance. It should be lightly pointed in, and a mulch put over all before water is applied. A light dressing of this manure may be applied to any Vine at any stage of growth. Vineries in which are growing thin-skinned Grapes, such as Foster's Seedling and Madresfield Court, must be carefully ventilated and have the damping down modified to suit their requirements; otherwise trouble will arise; and the borders must be kept in an uniformly moist state, as any excess of water afforded after a period of drought, always induces cracking.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

Budding Roses.—The propagation of Roses by budding is far the easiest system, and the work may be done now, or before the end of August is reached. It is necessary to ascertain that the bark will part easily from the inner-wood before commencing the operation. Select your bud from firm shoots of the present year's growth, and remove the leaf, but leave about half-an-inch of the leaf-stalk at the base of the bud. To prepare a bud, cut away a portion of the wood surrounding it down into the pith, then remove the woody portion from under the bud, drawing it away carefully without injury to the base of the bud. Make a clean longitudinal cut now on the stem where the bud is intended to be placed, and from the middle of this cut another one should be made crossways, thus forming as nearly as possible the letter T. Insert the bud immediately afterwards, and bind with worsted or matting, leaving the bud only exposed. Tea-Roses when budded on standard Briars do not form good heads, neither will they withstand severe frosts. A few of the Hybrid Teas, such as Captain Christy, La France, and its sport, Duchess of Albaoy, Marjorie, and Rainbow, will succeed; but the best varieties to form standards are the vigorous-growing hybrid perpetuals. Rose-trees after flowering are sometimes attacked with blight, and to keep them clean it may be necessary to syringe them with insecticides, such as Kilmright or tobacco-juice and soft-soap of moderate strength. Mildew, too, often makes its appearance after hot, dry weather, but may easily be kept under by puffing with the Malbec-bellows, some anti-blight mixture, or dusting over and under the leaves with black sulphur.

Pinks.—These plants are easy of cultivation, and well repay the gardener for his trouble. Their chief requirements are a well-drained loamy soil, sand and decayed stable or cowstall-manure, and an aspect fully exposed to the sun. Pinks when employed as edgings to walks, should be planted 1 foot from the Box or other margin, and 9 inches from plant to plant; when fully grown they form a line of beautiful glaucous foliage. The show and lace kinds are the more delicate, and it is necessary that the pipings be struck under hand-lights or cold frames. Select some of the stronger shoots, remove a few of the lower leaves without damaging the buds, cut off the tips of those retained with a sharp knife, and cut the base of the piping close under a joint of firm growth. Throw them when made into a vessel holding water; and when a quantity is made, dibble them in a bed of sandy loam, 2 or 3 inches deep, and 4 inches apart, fixing them firmly, and finally sprinkle some river or coarse sand over the surface. Afford water, and let the frame be closed and shaded from bright sunshine; give the cuttings an occasional sprinkling until rooting has taken place. At this stage air must be admitted, gradually at first. The best of all Pinks, Mrs. Sinkins, strikes readily if strong pipings are dibbled into prepared ground, and kept moist. Pinks should not remain in the same soil more than two years, or they will diminish in size, and the

flowers become very small. A selection of the best white varieties are alba maxima Her Majesty (rather a delicate constitution), Albino, and Snowflake; Boiard is a fine white flower, with bright-red lacing; John Ball is a rich, dark plum-coloured variety; Sarah, fine white, with dark-red centre; Lowlander, red; and Ernest Ladhams, a very free, fine large flower, with deeper centre of pink.

Carnations and Picotees.—The best method of propagation to adopt is layering, but when the shoots are too short, propagation by pipings must be had recourse to. Layering should begin about the middle of the present month. A compost consisting of sand, loam, leaf-mould, and rotten manure in about equal parts should be placed round the plants to be layered, having first scooped out a depression the depth of 2 inches. The best shoots should then be stripped of the basal leaves, and cut with a sharp knife half through the shoot just below a joint, carrying this cut in a slanting position up through the joint, so that the knife emerges just above it. The layer should then be pegged down in the prepared soil, the operator being careful not to break or let the tongue close upon the shoot from which it is slit. The layer may be buried to the depth of 1 to 1½ inch. When a few plants are layered all round a plant, apply water with a fine-rose can, just so as to settle the soil above the layers. In dry weather, water should be afforded occasionally, but not so heavily as to lay bare the layers.

Screens and Hedges.—Those consisting of Yew, Holly, and other evergreens, which have to be kept of small width, may be clipped this month, so as to allow the plants to make a small amount of growth, which will take off the stiff appearance.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Parsley.—A good breadth should now be sown on a warm border, where in hard weather glass or other protection can be readily afforded; and the land should be in good heart, and before proceeding to sow, it must be made moderately firm. The drills (for it is better drilled) should be made at 10 inches apart, and deep enough to allow of a good mixture of fine soil mixed with soot and wood-ashes being first strewn in the bottom of the drills. If the soil is dry, water should be applied heavily a few hours before sowing the seed. Myatt's Garuishing Parsley is a useful variety, but the very dense, curled leaves do not withstand frost to the same degree as the more moderately-curved varieties. When the seedlings are in a fit state to plant, thin them out to 3 or 4 inches apart, and plant the best of the thinnings either in cold frames or at the foot of a south wall.

Turnips.—Two or three breadths may be sown at intervals of ten days, and if the land has been occupied with some light crop, and is in good heart, no deep digging should be done, but the surface afforded a dressing of manure, or of soot and guano, and be pricked up 3 inches in depth. Let it be raked over with a wooden rake, and then draw the drills at 16 inches apart. Encourage a rapid growth by watering the drills if the weather prove hot and dry; thin out the plants early, and frequently dress the plants with a mixture of soot, lime, and wood-ashes.

Spinach, &c.—A large sowing of Spinach for autumn use may now be made, sowing again in about a fortnight. In order to have a vigorous plant, the land should be prepared thoroughly, i.e., it must be deeply dug or trenched, after a heavy dressing of rotten manure has been applied. After the digging is finished, apply a dressing of soot, turning it in slightly with the spade; make level, and trample it firmly and evenly, then proceed to draw drills 1½ foot apart, or sow rather more thickly in beds, 3 lines in a bed, with 2 feet alleys between the beds. The varieties Monstreux de Viroflay, and Victoria, are large-leaved, very hardy and productive. A few rows of the Spinach-Beet may be sown in drills drawn at 18 inches apart. Sow at intervals good breadths of Endive and Lettuce. Radishes, Mustard and Cress, &c., should be kept up by frequent sowings on cool borders. Herbs should be cut and dried as fast as they become fit to do so; these should be neatly tied up in quantities and properly labelled, so as to avoid any confusion later on.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 15	Horticultural Show at New Brighton.
TUESDAY, JULY 18	Royal Gardeners' Orphan Fund, Annual Dinner.
WEDNESDAY, JULY 19	Newcastle-on-Tyne Horticultural Show (two days). Cardiff and County Horticultural Show (two days).
THURSDAY, JULY 20	Rose and Horticultural Shows at Sidcup and Salterhebble.
FRIDAY, JULY 21	National Carnation and Picotee Society's Exhibition at Crystal Palace.
SALE.	
FRIDAY, JULY 21	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 2 to July 8, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the first part of the week was rather dull and cloudy, the latter part being very bright and warm.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63.4°.

ACTUAL TEMPERATURES:—

LONDON.—July 12 (6 P.M.): Max. 80°; Min. 62°.

PROVINCES.—July 12 (6 P.M.): Max. 69°, off Cromer; Min. 58°, Holyhead.
Fine, warm; some rain.

GREAT pains were taken to make this gathering a success, and it was so to a large extent; but a larger gathering of botanists to meet the foreign visitors would have been more graceful. The first day's proceedings comprised a visit to the exhibition, staged in the large Vinery. This was so extraordinarily interesting that it is a pity it could not have been continued

next day in a cooler place. Then came a luncheon to the foreigners and to the committees, after which the business of the Conference commenced. Our readers will be able to judge for themselves of the value of the communications, of which we publish an abstract. Unfortunately, they cannot appreciate the excellence of the lantern demonstrations and other illustrations given by Mr. WEBBER, of the United States Department of Agriculture, Dr. WILSON, M. DE VILMORIN, and others; nor can we give any adequate idea of the spirit and wide scope of the discussion which followed.

In the evening the dinner of the Society took place at the Hôtel Métropole, of which a few notes appear on p. 60.

The following comprises the substance of the remarks made by Dr. MASTERS on opening the business of the Conference:—

Our first duty, and a very pleasant one it is, is to welcome our foreign guests, our friends

HERBERT J. WEBBER.

(United States Delegate to the Conference.)

from across the sea, as I prefer to call them, to thank them for their presence here to-day, and to express a hope that their sojourn among us may be both agreeable and profitable. At the same time, we regret that some, such as Dr. Focke, the historian of hybridisation, has not been able to preside over this meeting, as we had hoped he might have done. Nor can we at such a meeting do other than express our abiding regret at the loss, though at an advanced age, of the great hybridiser, CHARLES NAUDIN.

Our next duty is to thank the council of the Royal Horticultural Society for this opportunity of meeting once more in these time-honoured gardens to discuss what I venture to think, is one of the, if not the most, important subject in modern progressive experimental horticulture. I use the words "progressive" and experimental, because I believe that the future of horticulture depends very greatly on well directed experiment.

So far as the details of practical cultivation are concerned, we are not so much in advance

of our forefathers. We have infinitely greater advantages, and we have made use of them, but if they had had them they would have done the same. We are able to bring to bear on our art not only the "resources of civilisation," to a degree impossible to our predecessors, but we can avail ourselves also of the teachings of science, and endeavour to apply them for the benefit of practical gardening. We are mere infants in this matter at present, and we can only dimly perceive the enormous strides that gardening will make when more fully guided and directed by scientific investigations. One object of this Conference is to show that cultural excellence by itself will not secure progress, and to forward this progress by discussing the subject of cross-breeding and hybridisation in all their degrees, alike in their practical and in their scientific aspects.

To appreciate the importance of cross-breeding and hybridisation we have only to look round our gardens and our exhibition-tents, or to scan the catalogues of our nurserymen. Selection has done and is doing much for the improvement of our plants, but it is cross-breeding which has furnished us with the materials for selection.

A few years ago by the expression "new plants," we meant plants newly introduced from other countries, but, with the possible exception of Orchids, the number of new plants of this description is now relatively few.

The "new plants" of the present day, like the Roses, the Chrysanthemums, the Fuchsias, and so many others, are the products of the gardeners' skill. From Peaches to Potatoes, from Peas to Plums, from Strawberries to Savoys, the work of the cross-breeder is seen improving the quality and the quantity of our products, adapting them to different climates and conditions, hastening their production in spring, prolonging their duration in autumn.* Surely in these matters we have out-distanced our ancestors.

But let us not forget that they showed us the way. I do not propose to dilate on the share which CAMERARIUS, MILLINGTON, GREW, MORLAND, and others, at the close of the seventeenth century had, in definitely establishing the fact of sexuality in plants, but I do wish to emphasise the fact that it was by experiment, not by speculation, nor even by observation, that the fact was proved, and I do wish to show that our English gardeners and experimenters were even at that time quite aware of the importance of their discovery, and forestalled our HERBERT and DARWIN in the inferences they drew from it. In proof of which allow me to quote from a work of RICHARD BRADLEY, called *New Improvements of Planting and Gardening, both Philosophical and Practical*, published in 1717, cap. ii. After alluding to the discovery of the method of the fertilisation of plants, he says (p. 22):—

"By this knowledge we may alter the property and taste of any Fruit by impregnating the one with the Farina of another of the same class; as, for example, a Codlin with a Pearmain, which will occasion the Codlin so impregnated to last a longer time than usual, and be of a sharper taste; or if the Winter Fruits should be fecundated with the Dust of the Summer kinds, they will decay before their usual Time; and it is from this accidental coupling of the Farina of one with the other, that in an Orchard where there is Variety of Apples, even the Fruit are gathered from the same Tree differ in their Flavour and

* See some interesting observations of MACFARLANE on the period of flowering in hybrids as intermediate between that of the parents, *Gardeners' Chronicle*, June 20, 1891; and on the structure of hybrids, May 3, 1890.

Times of ripening; and, moreover, the *Seeds* of those Apples so generated, being changed by that Means from their Natural Qualities, will produce different kinds of Fruit if they are sown.

"Tis from this accidental coupling that proceeds the numberless varieties of Fruits and Flowers which are raised every day from *Seed*. . . .

"Moreover, a curious Person may by this knowledge produce such rare kinds of *Plants* as have not yet been heard of, by making choice of two *Plants* for his Purpose, as are near alike in their Parts, but chiefly in their *Flowers* or *Seed* vessels; for example, the *Carnation* and *Sweet William* are in some respects alike, the *Farina* of the one will impregnate the other, and the *Seed* so enlivened will produce a *Plant* differing from either, as may now be seen in the garden of Mr. *Thomas Fairchild*, of *Hoxton*, a plant neither *Sweet William* nor *Carnation*, but resembling both equally, which was raised from the *seed* of a *Carnation* that had been impregnated by the *Farina* of the *Sweet William*."

Here we have the first record of an artificially-produced hybrid, and you will remark that this was more than forty years before *KOLREUTER* began his elaborate series of experiments. *FAIRCHILD* was the friend and associate of *PHILIP MILLER*, and of a small knot of "advanced" thinkers and workers who banded themselves together into a "Society of Gardeners."

"He is mentioned," says *JOHNSON* in his *History of English Gardening*, "throughout *BRADLEY*'s works as a man of general information, and fond of scientific research, and in them are given many of his experiments to demonstrate the sexuality of plants, and their possession of a circulatory system. He was a commercial gardener at *Hoxton*, carrying on one of the largest trades as a nurseryman and florist that were then established. He was one of the largest English cultivators of a vineyard, of which he had one at *Hoxton* as late as 1722. He died in 1729, leaving funds for insuring the delivery of a sermon annually in the church of *St. Leonard's*, *Shoreditch*, on *Whit Tuesday*, 'On the wonderful works of God in the Creation; or On the certainty of the resurrection of the dead, proved by the certain changes of the animal and vegetable parts of the creation.'"

FAIRCHILD was thus not only the raiser of the first garden hybrid, but the originator of the flower services now popular in our churches.

We do not hear much of intentionally-raised hybrids from this time till that of *LINNÆUS*, in 1759.* The great Swedish naturalist, having observed in his garden a *Tragopogon*, apparently a hybrid between *T. pratensis* and *T. parvifolius*, set to work to ascertain whether this conjecture was correct. He placed pollen of *T. parvifolius* on to the stigmas of *T. pratensis*, obtained seed, and from this seed the hybrid was produced.

About the same time (that is, in 1760), *KOLREUTER* began his elaborate experiments, but these were made with no practical aim, and thus for a time suffered unmerited oblivion.

Some years after, the President of this Society, *THOMAS ANDREW KNIGHT*, and specially *DEAN HERBERT*, took up the work, with what splendid results you all know.

It is curious, however, to note that objections and prejudices arose from two sources. Many worthy people objected to the production of hybrids, on the ground that it was an impious interference with the laws of Nature. To such an extent was this prejudice carried, that a former firm of nurserymen, at *Tooting*, celebrated in their day for the culture, amongst other things, of *Heaths*, in order to avoid wounding sensitive susceptibilities, exhibited as new species introduced

from the Cape of Good Hope, forms which had really been originated by cross-breeding in their own nurseries.

The best answer to this prejudice was supplied by *DEAN HERBERT*, whose orthodoxy was beyond suspicion. He, like *LINNÆUS* before him, had observed the existence of natural hybrids, and he set to work experimentally to prove the justness of his opinion. He succeeded in raising, as *ENGLEHEART* has done since, many hybrid *Narcissi*, such as he had seen wild in the *Pyrenees*, by means of artificial cross-breeding. If such forms exist in Nature, there can be no impropriety in producing them by the art of the gardener.

In our own time, *REICHENBACH*, judging from appearances, described as natural hybrids numerous *Orchids*. *VEITCH* and others have confirmed the conjecture by producing by artificial fertilisation the very same forms which the botanist described.

It remains only to speak of another respectable but mistaken prejudice that has existed against the extension of hybridisation. I am sorry to say this has been on the part of the botanists. It is not indeed altogether surprising that the botanists should have objected to the inconvenience and confusion introduced into their systems of classification by the introduction of hybrids and mongrels, and that they should object to hybrid species, and much more to hybrid genera; but it would be very unscientific to prefer the interests of our systems to the extension of the truth.

I may mention two cases where scepticism still exists as to the real nature of certain plants: *Clematis Jackmani* of our gardens, raised, as is alleged, by Mr. *JACKMAN*, of *Woking* (*Gardeners' Chronicle*, 1864, p. 825), was considered by *M. DECAISNE* and *M. LAVALLÉE** to be a real Japanese species, and not a hybrid. This may be so, but there is no absolute impossibility in the conjecture that the Japanese plant and the cultivated plant originated in the same way. Again, Mr. *CULVERWELL*'s supposed hybrid between the *Strawberry* and the *Raspberry* has been pronounced to be no hybrid, but to be *Rubus Leesii*. But what, we may ask, is *Rubus Leesii*? It appears to be a sterile form more closely allied to the *Raspberry* than to the *Strawberry*. Is it not possible that Mr. *CULVERWELL* has produced it artificially?

The days when "species" were deemed sacrosanct, and "systems" were considered "natural" have passed, and *DARWIN*, just as *HERBERT* did in another way, has taught us to welcome hybridisation as one means of ascertaining the true relationships of plants and the limitations of species and genera.

DARWIN's researches and experiments on cross-fertilisation came as a revelation to many practical experimenters, and we recall with something akin to humiliation the fact that we had been for years exercising ourselves about the relative merits of "pin eyes" and "thrum eyes" in *Primroses*, without ever perceiving the vast significance of these apparently trifling details of structure.

It would occupy too much time were I to dilate upon the labours of *GAERTNER*, of *GODRON*, of *NAUDIN*, of *NAEGELI*, of *MILLARDET*, of *LORD PENZANCE*, of *ENGLEHEART*, and many others. Nor need I do more than make a passing reference to the wonderful morphological results obtained by the successive crossings and inter-crossings of the tuberous *Begonias*, changes so

remarkable that a French botanist was even constrained to found a new genus, *Lemoinea*, so widely have they deviated from the typical *Begonias*.

For scientific reasons, then, no less than for practical purposes, the study of cross-breeding is most important, and we welcome the opportunity that this Conference affords of extending our knowledge of the life history of plants, in full confidence that it will not only increase our stock of knowledge, but also enable us still further to apply it to the benefit of mankind.

WITH our present issue we publish a series of abstracts of the papers presented to the Conference, for facilities in preparing

which we are indebted to the Secretary of the Society. We also give, in continuation of the series given last week, a large number of portraits of men eminent as raisers, and especially of those who have enriched our gardens with the results of their experiments in cross-breeding and hybridisation. Many of these gentlemen are mentioned in other columns in connection with their own specialty, but concerning others we may here add a few remarks.

WILLIAM PAUL, V.M.H., celebrated as a raiser of *Roses*, *Hollyhocks*, and other flowers, is alluded to under the head of *roses* in another page.

T. F. RIVERS continues the work so ably commenced by the celebrated *THOMAS RIVERS*, and has enriched our gardens with a number of improved varieties of hardy fruits, many the result of selection but others of intentional cross fertilising. Of *Nectarines*, for instance, the *Sawbridgeworth* firm has introduced among others, *Lord Napier*, *Newton*, *Advance*, *Albert Victor*, *Byron*, *Darwin*, *Improved Downton*, *Pine-apple*, *Spencer*, *Victoria*, *Cardinal*, and *Early Rivers*. Many excellent *Peaches*, too, has Mr. *RIVERS* raised, including the handsome and large-fruited *Thomas Rivers*, now being shown by the firm, but which is not yet in commerce; and the same is true of *Plums*, &c. These varieties have not only increased our stock, but have much extended their season.

C. C. HURST is mentioned in our note concerning the *Orchids* (p. 45).

JOHN DOMINY is remembered with honour as the first *Orchid* hybridiser, prompted thereto by *DR. HARRIS*, of *Exeter*. What has come from this, our pages sufficiently show. See also our notes on hybrid *Orchids* (p. 45).

JOHN SEDEN's career is alluded to in other columns (p. 41).

Mr. *ROLFE* has devoted himself to the study of *Orchids*, and has specially concerned himself with the question of natural hybrids and their limitations.

GEORGE PAUL, of *Cheshunt*, has contributed to another column a brief account of his cross-breeding operations. See under the head of *Roses* (p. 46).

HENRY CANNELL, a man of enterprise and energy, which others admire, but few can imitate. His greatest successes in cross-breeding have been in *Primulas*, *Chrysanthemums*, zonal *Pelargoniums*, *Begonias*, *Gloxinias*, *Dahlias*, *Cannas*, and many other plants.

ALEX. DICKSON, of *Newtownards*, is alluded to under the head of *Roses* (p. 46).

Professor *HUGO DE VRIES*, the Professor of Botany at *Amsterdam*, has dived into the deepest mysteries of horticulture, and lately has established a race of twisted *Teasels*, concerning which he spoke at the Conference, and

* *Ann. Acad. ed. Gilbert*, vol. i., p. 212.

* *LAVALLÉE*, *Les Clematites à Grands Fleurs*, p. vi. and p. 9, tab. iv.: *Clematis Hakonensis*.

which are of great value to the speculative botanist. An abstract of his paper is printed in another column.

M. DUVAL of Versailles, a Chevalier of the Legion of Honour, one of the foremost French nurserymen, has a claim to admission on this occasion by reason of his work among the Bromeliads, Gloxinias, Anthuriums, and other plants. His exhibition of hybrid Bromeliads was one of the finest of the exhibits.

VICTOR LEMOINE, a Chevalier of the Legion of Honour, needs no introduction to English readers. We have on former occasions had an opportunity of alluding to his manifold work, and an instructive paper from him on "Hybrid Lilacs" is given in the present issue.

PROF. L. H. BAILEY.—It is with great regret that we are unable to announce PROF. BAILEY as one of our visitors, his engagements preventing him from coming among us at this season. His numerous books have a philosophical interest far beyond the majority of gardening books, and in the present connection we may specially mention his *Plant Breeding*. PROF. BAILEY, who was born on a fruit farm in Michigan, in 1858, graduated at the Agricultural College of that state in 1882. For two years he acted as assistant to Asa Gray, as much beloved here as in his own country. After that he was Professor of Horticulture and Landscape Gardening at his Alma-mater, and is now occupying a similar position in Cornell University, Ithaca, New York. The paper which he contributed to the Conference is summarised in another column.

M. A. DE LA DEVANSAYE, of the Château de Fresne, near Angers, the President of the District Horticultural Society, is an enthusiastic raiser of Anthuriums, and has raised many of the most striking forms. An abstract of his paper is given in another column.

B. LATOUR-MARLIAC, the raiser of the splendid hybrid Water-Lilies, contributes a short paper, and particulars are given on p. 41.

OTTO FROEBEL, an eminent Swiss Nurseryman, is known for his work with Begonias, hardy Water Lilies, and Anthuriums.

CHARLES MARON. For a reference to the work of this gentleman see p. 41.

HENRI L. DE VILMORIN, with his brother MAURICE DE VILMORIN, was an attendant at the Conference. Both are too well known to require introduction.

J. VERVAENE, of Ledeberg—one is almost tempted to say which one? for VERVAENE is an honoured name in Belgian horticulture, and M. J. VERVAENE has been selected as a representative of the large body of Belgian raisers who have devoted their attention to the Indian Azalea. In our report of the late exhibition at St. Amand, Ghent, we had occasion to mention M. VERVAENE as the most fortunate of the prize winners, so far as Azaleas are concerned.

M. ALBERT TRUFFAUT, a Versailles nurseryman, is well known in this country, and is specially occupied with the hybridisation of the Bromeliads. His son is doing excellent work in connection with the chemical analysis of plants and the preparation of appropriate manures.

LUTHER BURBANK is one of the most successful hybridisers of plants which the United States has yet produced. We extract the following from an American Journal:—He was born March 7, 1849, at Lancaster, Mass. In 1870 he purchased a small tract of land at Lunenburg, Mass., where he began his career

as a horticulturist, and where his first work for the science was consummated in 1873, when he originated the Burbank Potato. In 1875 he removed to Santa Rosa, Cal., where to-day he has extensive grounds and a large collection of Lilies and many other plants, shrubs, and trees. Always an indefatigable worker, Mr. BURBANK has run the whole gamut of horticultural experiment, and has many times duplicated his first success with the Potato. He grew more than a million seedlings to establish a new race of Gladiolus; and the Canna, Iris, Calla, and the Rose, have also responded to the masterly touch of this adept hybridiser. Raspberries, Blackberries, Walnuts, Quinces, Prunes, and many other fruits have been developed to man's greater good at his garden of the Pacific, but it may be said for his work that his best introductions are yet to come—at least, that is his opinion. It requires much time and close attention to properly segregate, classify, test and propagate, and after having secured the desired improvement, the work increases in value and results in geometrical ratio as time progresses, one life affording only a good beginning for others to build upon.

The work of M. CROZY, to whom we owe so many of our fine Cannas, is alluded to in another column (p. 43).

ERNEST CALVAT's work with the Chrysanthemum is summarised in another column (p. 41).

A. G. JACKMAN bears an honoured name, as anyone who remembers Clematis Jackmanni must admit. The raiser of this fine plant, which some say is a Japanese species, has joined the majority; but his son continues the work, and has lately sent out a group representing crosses between *C. coccinea* and other species and varieties, many of which were shown at the Congress.

T. ARMSTRONG, the hybridiser at Messrs. Sanders' establishments, is alluded to under the head of Orchids (p. 45).

W. LAXTON continues the work commenced by his father, and is well known for culinary Peas and for the cross-bred Strawberries, of which we may mention Royal Sovereign as his greatest success, and Mentmore the most recent of his gains, the worth of which has still to be gauged.

ERNST BENARY, a veteran taken from us in 1893, is known as the raiser of an endless series of fine things. His work is continued by his son.

DR. CHARLES STUART, Chirnside, Berwickshire, has laid all lovers of the bedding Viola under lasting obligation to him. He commenced operations with the Viola in 1874, by taking some pollen from the well-known bedding Pansy Blue King, and impregnating Viola cornuta with it. His first batch of seedlings were all blue-flowered, and generally of a compact habit. He next took pollen from a pink garden Pansy, and fertilised some of the flowers from the first cross, which gave him greater variety of colour. The selected varieties from this cross were propagated and sent to Chiswick Gardens for trial, and six Certificates of Merit were awarded. It was suggested to him at this time that a rayless white Viola would be an acquisition, which induced him to search his seedlings for any indication of such an one; and in 1887 he found such an one, and this was the commencement of what is known as the Violetta strain, the popular race of rayless Violas. Violetta proved the mother of a huge progeny of rayless types, and from the host

obtained from it have come many fine varieties, including the miniature section. The Aquilegia, the gold-laced Polyanthus, and other subjects, have engaged Dr. STUART's attention, and as a raiser of such he has achieved considerable success.

REV. F. D. HORNER, genial man and thorough florist, is best known as a raiser of Auriculas, but by no means confines his attention to these plants. Among his best Auriculas are Monarch, Glow-worm, and a fine yellow self called Buttercup.

LORD PENZANCE's reputation is, and will for ever be, fragrant for his experiments with Sweet Briars. See also p. 46.

DR. WILSON, of St. Andrew's, contributed a series of lantern illustrations connected with hybridisation, especially of Passion-flowers, Albuca, &c., which were highly appreciated (see p. 56).

REV. PROF. HENSLOW, V.M.H. is the Professor of Botany to the Society, and Secretary to the Scientific Committee. For many years he has rendered valuable service to the Society, and his lectures are highly appreciated. PROF. HENSLOW's paper is given in another column (p. 54).

SIR MICHAEL FOSTER, K.C.B., more familiarly known as Professor FOSTER, or may we without offence say as MICHAEL FOSTER, was unfortunately prevented from presiding over the Conference on the second day. He is an enthusiastic horticulturist, and a raiser of hybrid Irises.

WILLIAM SMYTHE tells his own tale in another column, and a similar remark applies to WILLIAM CULVERWELL (see p. 42).

JOHN LAING.—What is to be said of this veteran hybridist? It is enough to mention the Tuberous Begonias, though we should have plenty to do if we went at length into his services to Horticulture.

HARRY TURNER (p. 43), following in his father's steps, is known in the world of Roses, Auriculas, Carnations, Dahlias, and other things. His success as a raiser in these genera has been marked.

HERBERT WEBBER (p. 50) is one of the representatives of the United States Department of Agriculture who has been sent over by the American Government to honour us by his presence. Mr. WEBBER and Mr. SWINGLE have charge of the hybridisation department, and are effecting much good. One special object in view is to produce an Orange sufficiently hardy to withstand the occasionally severe winters of Florida.

BEN SIMONITE.—No northern florist is held in greater esteem and more thoroughly trusted than BEN SIMONITE (see p. 43); as an accomplished florist, cultivator, and judge of florists' flowers he is in the foremost ranks. Of a singularly modest and retiring nature, there is an entire absence of self-assertion; he elects to be estimated by what he does rather than by what he says. The value of his work is seen in the way it is appreciated, and the trust reposed in him. Wherever he is appointed as a judge of florists' flowers, there is entire confidence in his awards. If any man can be said to know aught of the hidden mysteries of the flowers he loves and tends, it is BEN. He comes of a stock of florists with an abiding passion for florists' flowers, which seems hereditary in the family. It is with the Auricula especially that his labours as a raiser have been most successful: of green-edged, Talisman, Rev. F. D. Horner, John Hannaford, and Shirley Hibberd; white-edged, Frank

Simonite and Heather Bell. As a floricultural collaborator with the Rev. T. D. Horner, he has been the means of putting into commerce several of the new varieties raised by Mr. HORNER. The Tulip, Carnation, Chrysanthemum, and other flowers come also under his care. How, in the smoky environs of Sheffield, he manages to grow things as he does, is a question which can be answered only by a consideration of that persistence which overcomes difficulties and says it shall be done. One of the worthiest of present-day florists is BEN SIMONITE, of Sheffield.

HONOUR TO BRITISH HORTICULTURE.—His Majesty the King of the BELGIANS, by decree signed at Laeken on June 27 last, has conferred on Dr. MAXWELL T. MASTERS, the Editor of the *Gardeners' Chronicle*, the honour of Officer of the Order of Leopold.

PARLIAMENT STREET.—A splendid opportunity is now afforded for adorning this fine thoroughfare with trees, and softening and harmonising its harsher features. We observe that some of the officials object, but so far as we can see, there are no objections that cannot at this stage be obviated. It is objected, also, that some of the trees on the Embankment will have to be removed. This should have been done long ago, and saved much of the mutilation which is now imperative. The Plane is a forest tree, and demands plenty of space; but there are other trees of smaller dimensions that would be equally ornamental, and not too large for street use. The great difficulty is that the nurseries do not at present contain them in sufficient numbers, but were a demand to spring up, the supply would soon be forthcoming.

HYBRIDISATION.—*American Gardening*, a journal directed by our old colleague, Mr. LEONARD BARRON (the son of BARRON of Chiswick), has offered a series of prizes for the best essays on hybridisation. The three most successful essays have already been published in *American Gardening*, viz., that by Mr. G. W. Oliver, Dr. J. H. Wilson, and Professor F. A. Waugh. Necessarily, they are concerned with the same subjects that are occupying so much of our attention this week, so that it is not necessary to do more than allude to them as valuable summaries.

FIERCE HAILSTORM AT CANTERBURY.—A most fierce hailstorm swept over Canterbury on Saturday afternoon, July 8, and with it a thunderstorm of great violence. A waterspout broke in the vicinity of Hollow Lane, and damage was done to furniture and house property, fruit and Hop plantations, corn crops, and market-garden produce, many of the fruit orchards having been nearly stripped of their crops. The hailstones were cubic in form, and some measured 1 inch square, and weighed 1 oz. each. Owners of glasshouses suffered heavily, one nurseryman having over 1000 panes of glass broken. The city moat was filled with water. At Nackington, on the old Dover-road, the water washed down hedges, and tore up asphalted paths. The storm had not a very wide belt, the north of the Stour valley not being affected; but towards the south and east the damage was considerable.

TWISTED VALERIAN.—Messrs. BARR & SONS send us a plant of Valerian in which the stem is twisted on its axis. It is hollow in the interior, and dilated at the upper end, so that the stem resembles a Carrot in shape. This spiral torsion is not uncommon in certain plants, such as the Teazel, and sometimes the peculiarity becomes hereditary, and is transmitted by the seed. Professor HUGO DE VRIES, of Amsterdam, who took part in the Hybridisation Conference, has paid much attention to this subject. He was good enough to send us seed from a twisted Teazel which he had raised during two or three generations; but probably

from a difference in climate, or variation in some other of the factors which go to make what is called the "environment," the seeds with us produced only straight stems of the ordinary character.

GREAT INDUSTRIAL FLOWER-SHOW.—The new schedule has been issued for the "One-and-All" Flower-show, to be held at the Crystal Palace in August, in connection with the Annual Co-operative Festival. The schedule this year is in two parts, forming two illustrated pamphlets, running into about 140 pages, and containing offers of prizes calculated to stimulate every kind of horticultural excellence amongst working-men, women, and children, throughout the kingdom. The prizes, over 1000 in number, include a Silver Champion Cup by Countess GREY; Gold, Silver, and Bronze Medals, by the Agricultural and Horticultural Society; a Silver Cup by Miss WILMOTT, V.M.H.; an original Water-colour Drawing by Miss MARIE LOWE (Mrs. HENSLEY); special prizes offered by many Co-operative Societies; £150 by the Crystal Palace Company; and £200 by the Council of the Agricultural and Horticultural Association. The increase in the number and variety of classes is very notable. One new class is a novel departure in the direction of educational judging. The judges are to announce the points of excellence, &c., upon which these particular Awards will rest, the object being to instruct exhibitors and growers in what is good and what bad in each kind of garden-production. The photographic classes have been extended to thirty-four in number, and are this year divided into two sections, the first of which will be judged from a horticultural point of view, and the second by their artistic merits as photographs. Copies of either schedule may be obtained free of charge from the Hon. Secretary, Mr. EDWARD OWEN GREENING, at 3, Agar Street, Charing Cross, W.C.

STRAWBERRY: "VEITCH'S PERFECTION."—We have received for tasting a very excellent sample of this variety from Mr. A. BATEMAN, gardener at Brixworth Hall, Northamptonshire. It is a large conical or wedge-shaped fruit, as wide as it is high, deep crimson in colour with embedded seeds, and an agreeable amount of acidity combined with its sweetness. A very desirable variety, as we might well suppose, would be the case in a cross between British Queen and Waterloo. When suitably packed the fruit travels well; which, unfortunately, in the case of those sent to this office, was not the case. It is a very prolific variety.

LIVE SEA-APPLES.—Most of our readers will remember the loss at the end of last year, of the Dominion liner, *Labrador*. She went on to a reef in the vicinity of Mull during a fog, and a cargo of splendid Apples was lost to a waiting market. But the inhabitants and the various quadrupeds of Iona and Mull had a fine time of it with the choice Canadian fruit, until the barrelled fruit thrown up on the shore was declared to be unwholesome—saturated as they were with seawater. Beyond high-water mark the seed took root, and to-day we are told that the stems are already from 2 to 5 inches high, and the plants healthy and vigorous. The crofters are engaged in transplanting the strongest roots to their gardens. It will be curious to gain further particulars concerning the growth of these live Sea-apples.

WEST INDIA FRUITS.—The report of the Commission which was sent to the West Indian Islands to inquire into the causes of the bankrupt condition of the various industries in the colony was published in these columns at the time of its issue, and it was felt that the Government would be justified in holding out a helping hand in order that a fresh start in life might be given to people who had suffered long and struggled manfully against adverse fortune. There had been too much of the one-basket system; our Government is about to help to inaugurate a new state of things, and we may here briefly epitomise what

it is the Colonial Department has made up its mind to do. A contract has been signed by Mr. CHAMBERLAIN with the Jamaica Fruit and Produce Association for direct fruit and passenger service between this country and Jamaica, and there are now four steamers being built on the Clyde and the East Coast to run between Southampton and Jamaica, the running to begin in May of next year. This contract will last for five years, and the ships will run fortnightly. The steamers will be fitted for fruit carriage, and will have storage sufficient for at least 20,000 bunches of Bananas; a few passengers will also be carried. The subsidy proposed to be paid is £10,000 per annum, of which the government will contribute half, to be increased to £12,000 if more passenger accommodation is required. Of course, fruit other than Bananas may be carried, but taste seems to have set that way, and we are asked to believe that 3 lb. weight of baked Bananas are quite equal to seven times that weight of Wheaten bread. It is further stated that Banana flour may be profitably utilised for the nursery as well as the adult *cuisine*; but the flour could, of course, be most profitably manufactured where the fruit is produced, as sugar where the cane is ripened.

PARIS UNIVERSAL EXHIBITION.—The organising Committee of the International Arboricultural and Pomological Congress of 1900, which recently held a meeting in the offices of the Universal Exhibition, was constituted as follows:—President, M. CHARLES BALTET, nurseryman, President of Class 45 (fruit-tree culture). Vice-Presidents, M. DELAVILLE, Prof. of Horticulture; M. NANOT, Director of National School of Horticulture. General Secretary, M. NOMBLOT, nurseryman. Secretary, M. DAUTHENAY, Assistant-editor of *Revue Horticole*. Treasurer, M. GEORGES BOUCHER, nurseryman. Members, MM. Bois, Canon, Abel Chatenay, Lucien Chauré, Director of the *Moniteur de l'Horticulture*, Coulombier, Crapotte, Honoré Defresne, Fauquet, Jamio, Lapiere, Professor Leroux, Leroy, d'Angers, Loiseau, Martinet, Director of the *Jardin*, Noël, Opoix, H. Saginer, Manager of the *Journal de l'Agriculture*, Salomon, Henri de Vilmorin, Maurice de Vilmorin, Vitry de Montreuil. The Session will be held on September 13 and 14, 1900, in the Palais des Congrès. The programme is in course of preparation, and will be published as soon as is possible.

THE WEATHER.—A heavy thunderstorm, writes the gardener at Blankney, accompanied by a terrific hail-storm, swept over the district round Lincoln between the hours of 1 and 2 o'clock on the 12th inst., during which time the wind blew with hurricane force from S.S.W., breaking large branches from Elms and other trees in the grounds, and scattering small branches everywhere. Much damage was done to garden crops, tender things like Beans, Vegetable-Marrows, Lettuces, &c., being very badly broken, and the foliage perforated by the hail-stones, which were very large.

ARUNDINARIA AURICOMA.—Three or four good-sized specimens of this species are flowering in the Bamboo garden at Kew. By some it is considered a variety of *Fortunei*, and named *A. Fortunei aurea*. The habit is somewhat similar, but looser, more vigorous, and less inclined to branch. The leaves are nearly twice as broad, and recurve along both edges when unfolded; while in *A. Fortunei* they retain an upward curve. Both agree in being densely clothed on both sides of the leaf and on the sheath with short down, which gives a satiny feel to the leaf, and is the more noticeable to the eye on a dewy morning. *A. auricoma* is well worthy of general cultivation; the soft, clouded yellow leaves, relieved by lines of bright green, being extremely pretty. Altogether, it is one of the prettiest of the dwarfier species of Bamboo. Other Bamboos, looking very fresh and attractive just now, are:—*B. nagashima*, *B. palmata*, *B. disticha*, *B. pygmaea*, *Arundinaria glauca*, *A. Falconeri*, *A. nitida*, and *A. chrysantha*.

THE HYBRIDISATION CONFERENCE.

THE arrangements made by the Royal Horticultural Society to collect into a "record" what information had been obtained upon the great subject of Hybridisation were commenced in Chiswick Gardens on Tuesday last, July 11. Dr. Masters, F.R.S., occupied the chair, and the substance of his introductory speech, setting forth the objects the Conference hoped to attain, and extending a welcome to all taking part in the proceedings, whether Britishers or "friends from across the sea," is given in our leading article on p. 50.

The Conference was held in a tent erected near to the Council-room in the Gardens, and the attendance throughout, notwithstanding the great heat, was satisfactory. The programme for the first day was adhered to pretty closely, and below we are able to give summaries of all the papers read.

HYBRIDISATION AND CROSS-BREEDING AS A METHOD OF SCIENTIFIC RESEARCH.

Mr. W. Bateson, M.A., F.R.S., read the first paper, which dealt with "Hybridisation and Cross-breeding as a Method of Scientific Research." It was he with whom the original idea of the Conference started, and he is an example of the broad-minded men that are to be found in the ranks of the zoologists. He said that he had accepted with great pleasure the invitation of the committee to address a gathering of persons interested in the subject. Such an opportunity could not be better used than in pointing out exactly what are the legitimate aims of the methods in question, and what it may be hoped that they will prove. He assumed that the scientific importance of this work lies primarily in its direct bearing on the problem of species.

Though we now believe all forms of life to be connected in descent, yet the fact that they are divided into species is certainly true. The existence of species is a fact that must be faced. How did they arise in evolution?

The two great difficulties besetting all theories of descent are—

I. If the variations leading to specific differences are small, how can they matter?

II. Why are such initial variations not lost in intercrossing?

Here comes in the work of the breeder, and his experiments are the only ones which can answer these questions. By such work, Mr. Bateson said, it had already been shown both that variation was often large, and that varieties were discontinuously produced; that such varieties are perpetuated in crossing, and are not, as a matter of fact, obliterated.

This work is to show us which variations are thus discontinuously produced, and which are not; we have speculated long enough on the general theories of evolution; it is better to attack the special case of—How did species A arise from species B.

Taking hairiness and smoothness as typical forms of variation, it was shown that in *Matthiola incana*, *Lychnis vespertina*, and *Biscutella levigata*, though the relation is in each case a discontinuous one, the mode by which the discontinuity is maintained is different. Plants of these species were produced illustrating the experiments made by Miss E. R. Saunders in Cambridge, from which these results have been obtained. Here the test of cross-breeding revealed at once that variety and type might stand to each other in various physiological relationships. We talk of "species and varieties" as though the phenomena denoted by these terms are homogeneous. By the test of breeding it is shown that whole sets of distinct phenomena are confused together under these headings. Using the metaphor of chemical science, it is by cross-breeding that the genetic properties of species and varieties must be examined, as the affinities of chemical bodies are.

In this way the confused mass of contradictory properties, which are now attributed to species, may be unravelled, and we may be delivered from the fruitless debates on this unprofitable subject.

As a practical point Mr. Bateson stated it is by experimental crossing of nearest allies that the work should be begun. It is essential, he continued, that the records should be statistical. Such statistics might at first be rough, but a few notes as to the proportion of offspring, which shows the various characters, are absolutely necessary.

Mr. Bateson in conclusion, emphasised that those who would take part in such work, would earn the gratitude of posterity, and in all probability lay the foundation of a new science of natural history.

HYBRID ANTHURIUMS.

Monsieur A. de la Devansaye contributed a paper upon "Fertilisation in the genus Anthu-

rium," in which his previous work upon kindred subjects was briefly alluded to.

[For Aroids, see the *Flore des Serres et des Jardins de l'Europe*, vol. xxii (1877), p. 37; and for Anthuriums, the succeeding volume, p. 26, as well as the *Revue Horticole*.]

Two laws already laid down as governing fertilisation and variation in the genus Anthurium were repeated, while a third was added, and strongly emphasised. These are as follows:—

1. Fertilisation is usually only effected in the genus Anthurium when the flower containing the pistil to be ripened, and that from which the pollen is brought, have sprung from a different batch of seeds.

2. The bringing into use of pollen from a different species of the same tribe (say *Spathiphyllum*, for example) has a beneficial result. Fertilisation is assured, and variations in the colour of the flower or form of the foliage often arise.

3. In spite of good cross-fertilisation, there are cases where little or nothing new is seen in the first or second generation, and then the experiment is usually abandoned forthwith, and the seeds destroyed. This proceeding is a very great mistake, for it is necessary under the circumstances to wait, for the desired variations may be produced in the third or fourth generation, as a result of the disturbance caused by cross-fertilisation. If a variation should arise in the first crop, few individuals will show it. The seedlings from these will give a greater percentage of the "variety," which may come up to a half in the third generation, and to 75 or 80 per cent. in the fourth. Further remarks upon the selection necessary to fix the "variety" concluded Monsieur de la Devansaye's observations.

HYBRIDISING AS A MEANS OF PANGENETIC INFECTION.

PROFESSOR DE VRIES explained that Pangenetic infection means the transference of particular qualities from one species to another by means of crossing. Darwin assumed in his Pangenesis that each single peculiarity was represented in the living matter of the cells by a distinct unit. Such unities must, therefore, be capable of isolation and of transmission to allied species.

Many cases in horticultural practice come under this head, but in a scientific way our knowledge on this subject is extremely deficient. Two cases were treated of and illustrated. First were shown twisted stems of *Dipsacus sylvestris torsus*, the new race with hereditary twisting, raised by Professor de Vries, and of a cross between this race and the ordinary teasel, *Dipsacus fullonum*, raised by Professor Le Monnier, at Nancy. It was pointed out that the twisting in the two stems of the hybrid, which were demonstrated, was developed to the same high degree as in the seven stems of the parental form, shown for comparison.

In the second place, it was attempted to gain a smooth form of *Lychnis diurna* by crossing the ordinary hairy form of this species with a newly-detected hairless or glabrous variety of *L. vespertina*. The hybrids of the first generation were all uniformly hairy, but in the second generation they split up in a multiform mixture, in which the characters of the two parental forms were mixed in all possible combinations. Between these it was easy to find the desired glabrous form, having, in all other respects, the characteristics of a true *L. diurna*. Such plants were isolated, and fertilised artificially. In the following generation, the new variety proved itself to be fully constant. Of 390 plants, all were glabrous, and of the type of *L. diurna*. The transfer of the hairlessness, which was the aim of the experiment, was therefore completed in the course of three to four years.

A glabrous variety of *Lychnis diurna* was found some fifty years ago by Sekera near Mürchengrätz, and described under the name of *L. Preslii*. It was shown to be identical with the hairless hybrid form, an original specimen of Sekera being shown in comparison with living specimens of *L. vespertina glabra*, and of the new *L. diurna glabra*.

The result of the experiment was, therefore, to copy the *Lychnis Preslii*, Sekera, which is acknowledged by many writers also as a good species, and which probably originated in the Bohemian Alps from *L. diurna* by following a totally different way.

HYBRIDISATION AND ITS FAILURES.

Rev. Prof. Henslow remarked that any discussion on hybrids necessitates the preliminary enquiry as to what is a species? It may be defined as being known by a collection of presumably constant characters taken from any or all parts of the plant. Bentham superadded that all the individuals of a species are presumably descended from a common parent. Knight and Herbert, as well as other botanists of their day, found it necessary to introduce the element of hybridisation, for it was thought that if two so-called species produced fertile offspring, they must be really one species, and so, said Herbert, "Botanists must entrench themselves within the genera."

Systematists, however, cannot test the point, and therefore cannot utilize physiological affinities in their diagnoses; the result is, consequently, sometimes unsatisfactory, because the number and kind of characters sufficient to indicate a genus or a species is arbitrary, and when it is reduced to a single feature, though theoretically members of the groups would presumably cross, they are often found not to do so. Thus, both an inferior and a superior ovary are found in the genus *Saxifraga* and in *Begonia*; but it is really the sole difference between *Liliaceae* and *Amaryllidaceae*, yet no cross exists between any member of these two orders.

False Bigeners.

Again, *Laelia* and *Cattleya* cannot be at all sharply distinguished, unless it be by the single feature of the number of pollen-masses; yet they cross as easily as two varieties of the same species.

Now, *Rhododendron*, *Rhodora*, and *Azalea* are as well differentiated morphologically as any three genera usually are; but they happen to cross, and the question arises: Why are they not still to be regarded as good genera?

Constitutional Affinity.

To take a particular genus, Herbert found that some closely, i.e., morphologically allied species of *Crinum* would not cross, while more distantly allied species—in the opinion of some they should be distinct genera—readily crossed. From this and other experiences, he drew the conclusion that it was really a question of "constitution," as much as of "form." That while the rule holds good that plants which are nearly alike in form are more likely to cross, yet it is not always so. Observing that sub-aquatic species of *Crinum* failed to cross with more xerophilous species, he thus regarded the failures as due to constitutions induced by external conditions.

Similarly, it frequently happens that groups of species from the same country will readily cross among themselves; but will not ally themselves with other groups of widely separated countries. Thus, the East Indian *Rhododendrons* refuse to unite with American and Asiatic forms; yet they have produced the "greenhouse" forms in great numbers, with varieties of colours. The same observation holds good sometimes with varieties. Thus, some French strains of *Scarlet Pelargoniums*, though fertile *inter se*, fail when crossed with English varieties.

Prepotency.

Another cause of failure is excessive prepotency. Taking a normal hybrid as being morphologically intermediate between the two parents, it is now known that either parent may be so excessively prepotent, as not only may the offspring show some considerable inclination towards the parent, but it may practically suppress all features of the other. M. Millardet, in crossing the alpine with the Virginian *Strawberries*, called them "false hybrids."

Non-reciprocity.

This is another puzzling cause of failure; for a

cross may sometimes be readily produced one way, but all attempts to raise offspring by crossing the parents in the opposite way may totally fail.

Partial Hybridisation.

This gives only too frequent and disappointing results. It is due to the fact that the development of the pollen-tube may stimulate the surrounding tissues into growth, without its effecting any impregnation of the ovule itself: so that every external appearance of a successful result may be offered by the enlarged and full-sized fruit; yet there may not be a single seed within containing an embryo.

False Inferences.

It has often been found, both by Herbert and later experimenters, that perseverance may be ultimately crowned by success after many disappointments. For the impregnation is so susceptible to external conditions—irrespective of morphological affinities—that a species may fail to be crossed, or to cross another, in one season; but such can be effected in another. Some have even asserted that the time of day may make all the difference between success and failure in certain cases. Or, again, even if progeny be obtained, they may be sterile for years, yet finally bear good seed; hence, an expert has no need to despair, in all cases, when he is anxious to secure some special result, as Nature is as likely as not to reward him for his perseverance. *George Henslow.*

EXPERIMENTS ON HYBRIDISATION AND CROSS-BREEDING.

Mr. C. C. Hurst, F.L.S., was able in his paper to give a number of conclusions based upon his own observations, and to bring forward evidence, sometimes for, but more often against, generally accepted ideas as to the characters of hybrids.

With regard to inheritance by hybrids among the Orchideæ, Mr. Hurst pointed out that what we understand by varietal characters, though of great practical importance, are so indefinable, so uncertain, and so fleeting, as to be traced with difficulty, even in the second generation. Specific features, on the other hand, are more lasting, while generic ones persist but little changed for a number of generations, and would not easily breed out.

As bearing upon the impression that varieties are prepotent, the question was treated in more detail under several headings.

(1) The tendency is admitted, especially when varieties are fertilised with their own pollen; exceptions are, however, by no means rare.

(2) The chief exceptions are apparently in cases where the parents or ancestors have been variable.

(3) Slight variations are seldom inherited.

(4) Abnormal sports are, for the most part, transmitted wholly, or not at all.

(5) Distinct varieties, as a general rule, transmit their qualities in different degrees—sometimes wholly, sometimes partly, sometimes not at all.

(6) When the same variations are found in both strains they may be traced in the second or following generations, but seldom otherwise, as mentioned above.

(7) A law of Partial Prepotency, advanced in the paper, is offered as a possible explanation of the varied results in the inheritance of varietal characteristics.

In speaking of generic hybrids, which, as a rule, combine the specific characters of their parents in fairly equal proportions, seven cases were reviewed where the reed-like species of *Epidendrum* were prepotent in every instance when crossed with species of *Cattleya*, *Lælia*, and *Sophranitis*. Also fifteen others, where more distinct genera, mostly of different tribes, have been crossed together, and in every case have reproduced the seed parent almost exactly, both in generic and specific conformation. The explanation offered was, that this is the result of a kind of parthenogenesis, the pollen probably not having power to fertilise the egg-cells in the ordinary way, but exerting sufficient influence to cause them to start growth.

Primary hybrids, we were told, do not by any

means differ so widely from the parent as secondary ones. [Compare Monsieur Devansaye on *Anthuriums*.] Sex has but little influence *per se*, and in some recorded cases the resulting offspring from both reverse and obverse cross were practically identical.

Further, in connection with primary crosses, Mr. Hurst exemplified the meaning of his term Partial Prepotency. A certain part of one individual hybrid may show the configuration of one parent; a sister plant may, so far as that is concerned, exemplify the other, while a third hybrid from the same cross may combine in the portion under consideration, the structure of both original species. In colour the exact reverse may be the result. A fraction of the hybrid has alone been considered; repeat the process for all the components of the plant, and the scope for variation, under the circumstances, may easily be understood.

The law of Partial Prepotency is founded by Mr. Hurst, he said, upon practical observations with regard to the genus *Paphiopedilum* = *Cypripedium*.

The above remarks, it was pointed out, do not agree with the idea that a hybrid leans first towards one parent and then towards the other, for while it may favour, say, the seed parent in evident characters, in minute details it may reproduce the seed parent. [See Monsieur Morel's remarks upon the *Clematis* à Ville de Lyon, p. 5.]

Passing on to variation in secondary hybrids, twenty-four individuals of a *Paphiopedilum* exhibited at the Conference were alluded to. They all came from the same capsule, produced by a hybrid between two species when crossed with a third. The parent hybrid failed to show in its leaves, the special colour of one of its immediate ancestors, but the grandchildren reproduced it strikingly. Statistics were then given that do not support the current opinion as to the absolute sterility of hybrids. Ninety distinct genera, said Mr. Hurst, are recorded in which fertile hybrids have been obtained, and only these where all are practically infertile.

Sterility was a term used by Darwin simply to denote diminished fertility, and this occurs in hybrids undoubtedly, but more owing to diminished power in the males than to anything else. In *Paphiopedilum*, of crosses made between distinct species 95.05 per cent. were fertile; of hybrids crossed with pure species, 91.82 per cent., while only 60 per cent. of the pure species produced seed when fertilised with pollen from hybrids.

Diminution of fertility in hybrids has already been noted by Darwin, Dr. Focke, Dr. Masters, and Professor Macfarlane in plants, as well as by Professor Ewart in the case of zebra hybrids. It is not, however, confined to hybrids, for it occurs within the limits of a single species; for example, certain races of *Primula sinensis* raised by Messrs. Sutton & Sons, are difficult to propagate on this account, and Mr. Hurst ascribed diminished fertility rather to conditions of life than to difference in form or constitution brought in through hybridisation.

The stability of hybrids next took up Mr. Hurst's attention, and his statistics did not give the impression that self-fertilised hybrids revert to a parent form when propagated by seed. Out of five hundred seedlings of a hybrid *Berberis* no less than 90 per cent. reproduced the parent form faithfully and well, and not a single individual reverted wholly to either grandparent.

The increased vigour of hybrids is a well-known fact, and Mr. Hurst puts it down as abnormal growth due to out-crossing the strength of a primary hybrid, he obtained, being reduced to the normal again by in-breeding in the second generation. In discussing the limits of crossing, it was computed that while four species have been combined in *Gladiolus*, and five in *Rhododendrons*, no less than twenty-seven genera of Orchideæ, many, belonging to different tribes, have been linked together by hybridisation, while possibly there may yet be more.

As a rule for breeders it was held out that

success might be hoped for within the limits of a tribe, and, generally, experimenters were exhorted not to be discouraged by even several failures, and recommended, in the interests of science, to keep an accurate record of their work whether successful or otherwise.

SECOND DAY, WEDNESDAY, JULY 12, 1899.

Sir Michael Foster, K.C.B., Sec. R. S., it was much regretted, being unwell and unfortunately confined to his room, the Rev. Professor Henslow, M.A., V.M.H., very kindly took his place, and presided over the second meeting of the Conference, held on Wednesday afternoon at the Westminster Town Hall. In re-opening the proceedings, Professor Henslow expressed his opinion that there was no necessity for a second address from the chair, and contented himself with making a few brief but pertinent remarks in his usual delightful manner upon the value of the Conference. This, he said, depended in a great measure upon the way in which scientific and practical interests were discussed together. As representing the former side himself, he had to own that botanists did not do all the giving, as they were able to get much valuable information from horticulturists, and, indeed, the two bodies of workers had really to make progress hand in hand.

The lantern demonstrations by Mr. Webber, from the U.S. Department of Agriculture, and from Dr. Wilson, of St. Andrew's, were very instructive. After the meeting, a discussion, *de omnibus rebus*, including copyright in new plants, was indulged in, and proved very acceptable to the auditors.

THE WORK OF THE UNITED STATES DEPARTMENT OF AGRICULTURE IN PLANT HYBRIDISATION.

Mr. Herbert J. Webber, one of the special envoys from the United States department of Agriculture, gave an account of their work which bears on the question in hand. The department is conducting a series of experiments upon a number of plants, including among others the Orange, Lemon, Pomelo, Pine-apple, Pear and Grape, as well as Wheat, Indian-corn, Cotton, Tomatos, Carnations, Holly-hocks, and Aquilegias.

The speaker discussed the general work which is in progress, and illustrated individual cases of interest by means of lantern-slides. One of the most noteworthy, but at the same time difficult fields of investigation at present pursued, is the production of hardy races of Oranges and Lemons, by hybridising the hardy *Citrus trifoliata*, which is a deciduous, trifoliate-leaved plant, of very distinct character.

Of forty hybrids of the common Orange ♂, and *C. trifoliata* ♀, twenty-nine resemble the female-parent almost wholly, while the remaining eleven are clearly intermediate in character. The latter show the effect of the Orange in their increased vigour and larger leaves, with elongated central lobes and laterals, which show a tendency to decrease in size as well as in their evergreen habit. Of fourteen reciprocal hybrids—orange ♀ × *C. trifoliata* ♂—nine have unifoliate leaves entirely, resembling the mother-parent; and five have them with three lobes like the male, but with the central one elongated and larger than in the typical *trifoliata*.

A special point is the complication which arises through the occurrence of polyembryony in *Citrus* fruits, for besides the embryo developing from the egg-cell proper, which is the only one affected by hybridisation, several other embryos are produced adventitiously from the nucellar tissue of the mother plant.

Seedlings from adventive embryos naturally reproduce the mother parent truly, showing no effects of the hybridisation. A number of photographs was exhibited where several seedlings were seen developing from a single seed, one showing the effect of hybridisation, the others not.

Of 126 hybrids of the Pomelo (*Citrus decumana*) ♀ and Orange (*Citrus aurantium*) ♂, 106

resemble the mother, and, as is almost invariably the case with a few, the rest take after the male parent. Of 103 reciprocal hybrids, 95 were like the Orange, and 8 like the Pomelo. These experiments were undertaken with the view only of obtaining new valuable varieties.

In other crosses, notably in one where it was sought to unite the loose and easily removable skin of the Mandarin Orange (*Citrus nobilis*) with the features of the common kind, the same large proportion of plants favoured the seed parent, and a smaller number the pollen parent, which ever way the cross was made.

Experiments to improve the staple of Upland Cotton were also reported upon, and others of which the result is expected to be a tawny cotton similar to the Egyptian kind, which will be suitable for growth in America. It is hoped also to increase the yield of Indian corn by hybridising the best races commonly grown with distinct varieties, such as the largekerneled Peruvian Corn.

HYBRIDS OF PASSIFLORA, ALBUCA, RIBES, AND BEGONIAS.

DR. J. H. WILSON, F.R.S.E., illustrated some remarks upon hybrids he has obtained, by means of a fine show of lantern slides. Among the Passion-flowers, a cross between *Passiflora Buonanaparte* ♀ × *P. cerulea* ♂ has been named Margaret Wilson, and was figured in the *Gardeners' Chronicle* for February 11, 1899. The first-mentioned Passion-flower has a winged quadrangular stem, in the second this is slightly five-angled, and the hybrid's stem has the same number of angles, but they are well marked. The flower is structurally a mixture of the two parents from all points of view. The anthers, though well developed, contain but little pollen, and this abnormal. More remarkable is the peculiarity shown by the ovaries: either these contain crumpled, coloured rays, like the coronal ones, or else a miniature ovary, with three styles and stigmas. These structures arise by proliferation of the floral axis at the base of the ovary, but the invaded ovaries are not abnormally enlarged, nor do the ovules seem to be reduced in number. The flowers first produced are most prone to develop the structures above described, while those at the ends of branches have almost always normal ovaries. Assiduous pollination has not yet produced perfect seeds.

A hybrid between *P. alba* and *P. Buonanaparte* (St. Rule) has three-lobed leaves, like its seed-parent, while the pollen-parent's are ovate. In the previous case, where the seed-parent (*P. cerulea*) had five, or sometimes seven-lobed leaves, the hybrid had invariably three lobes, and if a mean between, ovate and three-lobed leaves has been obtained, two-lobed structures might have been looked for in the present case. The form has not hitherto produced seed. In the third hybrid between *P. Constance Elliott* ♀ and *P. alba* ♂, the leaves are often five-lobed, as in the first, but mixed with the three-lobed form characteristic of the other parent. A fourth cross between *P. alba* and *P. edulis* has also resulted in seedlings, but neither these nor the last have yet flowered.

Dr. Wilson briefly alluded to the crosses among eight or nine species of *Albuca* which he has raised to the number of seventy or more. Details as to their usual intermediate character, and to the propensity of *A. prolifera*, so far as its erect white flowers went when crossed with the drooping blossoms of *A. minor*. Details as to structure in leaves were illustrated by photomicrographs.

Like two or three other experimenters, Dr. Wilson has crossed the Black Currant and Gooseberry, but he has not obtained fertile seed. The pollen of neither parent species takes effect, but a fruit is now ripening as a result of bringing pollen from *Ribes divaricatum*. An interesting point is, that while the larvæ of the Gooseberry-sawfly will not attack Black Currant, it is only too ready to feast on the odourless leaves of the hybrid.

In Begonias, by crossing tuberous kinds with *Begonia coccinea*, many stages intermediate in habit were obtained; some plants retained all their

branches, others shed the outer ones by a process similar to leaf-fall; while others, again, approached the tuberous condition. A few details with regard to other experiments concluded an interesting contribution.

HYBRIDISATION VIEWED FROM THE STANDPOINT OF SYSTEMATIC BOTANY. By R. Allen Rolfe, A.L.S., Kew.

The author gave a summary of his paper, commencing with some remarks of Dean Herbert's of the way his early experiments in hybridisation were received by systematic botanists, who believed that such experiments would tend to confuse their systems. The practice of hybridisation had since made enormous progress, but was still regarded with disfavour by many systematists, who failed to realise how frequently it was carried on in nature, some going so far as to deny that it took place to any considerable extent, if at all, and explaining away the numerous supposed wild hybrids by variation, or mistakes on the part of those who professed to recognise them, whom they described in not very complimentary terms as "hybrid-mongers." By degrees, however, it was being recognised that the views of these individuals were entitled to more respect, for a considerable number of these supposed natural hybrids had been reconstructed artificially, by crossing the supposed parents together. The author then proceeded to enumerate examples of such plants, taken from the genera *Epilobium*, *Narcissus*, *Tragopogon* (raised by Linnaeus himself), *Verbascum* (quite a series of them), *Digitalis*, *Geum*, *Salix* (at least a dozen), *Hieracium*, *Rubus* ("that class of undecided forms in the face of which all the efforts of botanical describers miscarry"), the hybrid *Oxlip*, two *Sarracenias*, and a few other plants, beside something like a dozen Orchids, one of which he only recognised at the exhibition on the previous day, though as a wild hybrid it had been known for several years. In *Hieracium*, particularly, many so-called "new species" had recently been described, both on the Continent and in Britain, which had no right to the title. On the other hand some authors had recognised a number of natural hybrids, combining the characters of others with which they grew, and at least four combinations had been effected between distinct species, one of which did duty in botanical works under no less than eleven spurious specific names. In various other cases what had proved to be one variable hybrid had originally been described not as one, but as several species. In several groups of plants natural hybrids were evidently much more common than was generally admitted, but even sceptics could no longer deny the hybrid origin of those which had been reconstructed artificially. Hybrids certainly broke down the limits between species, sections, and even genera in a few cases, which no doubt accounted for the want of sympathy with which artificially raised ones were regarded by systematists, but the fact must be faced that they also occurred in nature, and could not be ignored. They could not be classified either as species or varieties, and when their true rank was understood many of the difficulties now attending the classification of the latter would vanish. He hoped to see many more experiments undertaken with the view of clearing up the origin of these intermediate and doubtful plants which at present were the bugbear of systematists.

HYBRID POPPIES.

M. Henry de Vilmorin directed attention to two new forms of Poppies, both of which—and particularly the second—he claimed to be plants of real merit for horticultural purposes. In each case *Papaver bracteatum* was crossed with *P. somniferum* to begin with; while in the second instance, the hybrid was further crossed with *P. orientale*, which M. de Vilmorin considers to include *P. bracteatum*. The special point of interest is that an annual has been crossed successfully with a perennial. A fine series of water colour drawings illustrated M. Vilmorin's remarks.

DISCUSSION.

As one or two contributors of papers were not present in person to read them, there still remained some little time at the disposal of the Conference, which was devoted to a general discussion. The Chairman set the ball rolling by pointing out what a small amount of attention had been paid during the proceedings to the microscopic structure of hybrids, except by Dr. Wilson. The latter worker, he said, had mentioned Mr. McFarlane's paper on "The Histology of Primary Hybrids," and expressed his opinion that in secondary ones the characters of ancestral species would be much more difficult to trace. Professor Henslow was able to endorse this from his own minute and detailed examination of Messrs. Veitch's greenhouse *Rhododendrons*, though it must be remembered that they all arose from species presumably nearly allied in structure, and hailing from the same part of the world. With hybrids derived from species of markedly different conformation, such as might depend upon adaptation to a different climate for instance, the task of picking out specific points which were not found to exist with hybrid *Rhododendrons*, might be rendered possible. Then Mr. Burbidge brought before the meeting the very great difficulties that had arisen, and do still arise, in systematic work through the Latin names, which have been, and are given, to horticultural hybrids. This speaker was in favour of none but English names being applied; but if the old practice was

continued, one should adopt some such plan as combining two generic or specific names, or parts of them, as had been done by Dr. Masters and Sir Michael Foster, and of which the word *Luello-Cattleya* was another instance. In some cases it was stated that classical names had been given to hybrids with the express reason, sad to relate, of hiding their real origin. One reason for it, it will be remembered, was hinted at in Dr. Masters' address. The Rev. G. H. Engleheart, M.A., addressed the meeting upon the difficulty of finding the results of others' experience in hybridising, all the records being scattered about, and he suggested that a handbook should be compiled with a view to saving hybridisers much time and trouble. Another point with a practical bearing raised by the same speaker was with regard to the present condition of affairs, where the inventor could protect the results of his brainwork and labour, but anyone rather than the raiser of a new variety obtained the pecuniary reward for the pains taken.

Mr. Geo. Paul, as one commercially interested, spoke upon the same subject, saying that legislation might well be introduced, but Mr. Bunyard, following, showed a way in which a raiser could ensure whatever profit he required by raising sufficient stock before distributing any, and putting a sufficiently high price upon each plant sold. He had often told Mr. Rivers how the latter had given away his varieties, for he (Mr. Bunyard) had sometimes, with his facilities and skilled men, raised a bigger stock in a short time than Mr. Rivers himself had in hand.

He pointed out that legislation would be powerless to preserve the rights of the raiser of a new variety or a new plant; prunings might be conscientiously thrown upon the rubbish-heap, but someone else might give them away, and as many plants as there were cuttings struck, or buds inserted, could be reared elsewhere by persons who had 100 paid for the privilege.

Mr. Willet Hays, of the United States, pointed out how the work of experiment stations might help the producer of a new variety by testing it in various parts of the country, and by proving its adaptability to the region and other advantages, at the same time as it was being made known to growers, and before it was distributed.

Mr. WILLIAM CUTHBERTSON, Rothesay, said he had this summer bloomed Mr. E. J. Lowe's hybrid between an *Aquilegia* and *Clematis Montana*. The plant resembled an *Aquilegia*, but the flower was half saucer-shaped and without spurs. It was bearing seed, and to anyone who wished a few seeds for scientific purposes he would have pleasure in sending them. Some years ago he had tried another of Mr. Lowe's hybrids, one said to be between a *Sunflower* and a *Dahlia*, but at the time he was not impressed with it and had not grown it since.

SOCIETIES.

ROYAL HORTICULTURAL. (CHISWICK, JULY 11.)

The exhibition in connection with the Hybridisation Conference was held in the Great Vinery, and the excessive heat in the building was exceedingly trying to those who wished to thoroughly examine the various hybrids shown, and to take particulars of their pedigrees. The exhibition contained many most interesting plants, but there were no instances of hybrids between unexpected species or genera to cause a sensation. In regard to the award of the Veitch and Williams Memorial Medals, the judges chosen to examine the hybrids have reported to the Council of the Society, and it has not yet transpired to whom the medals will be awarded.

The Orchid, Floral, and Fruit and Vegetable Committees awarded a number of First-class Certificates and Awards of Merit, and a list of these is given below, except certain awards that were made to plants growing in the gardens, which are held over. These novelties include varieties of Peas, a yellow-fruited Raspberry, a Strawberry, Carnations, Delphinium, Sweet William, Caladium, Roses, and some valuable Orchids.

If the Society went to Chiswick more frequently, the arrangements in connection with the exhibitions might be expected to become more perfect. In respect to the luncheon, it was surely an unintentional omission that invitations were not extended to the Press. In consequence of this, most of the representatives, who had by no means a light task at Chiswick, were compelled to leave the gardens to obtain the necessary refreshments, and thus there was lost most valuable time. The luncheon was quite informal, and beyond the usual loyal toasts, and an expressed welcome to the foreign guests, there were no speeches.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. Chas. E. Shea, J. F. McLeod, W. Bain, J. H. Fitt, J. Jennings, W. Howe, C. R. Fielder, Chas. T. Drury, E. H. Jenkins, C. J. Salter, R. Wilson Ker, R. Sydenham, J. W. Barr, Geo. Pan, H. B. May, Chas. Jeffries, Ed. Beckett, J. Fraser, Jas. Walker, Ed. Mawley, and H. Turner.

HYBRID AND OTHER NEPENTHES AND SARRACENIAS.

MESSRS. JAS. VEITCH & SONS, Royal Exotic Nursery, King's Road, Chelsea, showed a collection of *Nepenthes*, and a rare

These were also shown from the Gunnersbury House collection of Leopold de Rothschild, Esq., by Mr. Hudson, and formed a fine feature at the end of the staging upon the ground. The exhibit consisted of 26 forms and varieties, only a few of which are introduced plants, the rest being hybrids raised by M. Latour-Marliac. Of the former there were *N. tuberosa*, a large white from N. America, and *N. odorata rubra* (the Cape Cod Water Lily), both of which have presumably exercised their influence in the hybrids; others comprised *N. odorata* (pure white) and *N. odorata minor*; *N. candidissima* was also shown, so also was *N. stellata* in large numbers from a tank in the open air, the water in which is warmed. The finest of the many hybrids were *N. Marliacea rosea*, specially fine and

quite distinct from *N. M. carnea*, also shown; *N. M. alba* like the preceding, was of extra large size and pure in colour; *N. M. Chromatella*, *N. M. Rubro-punctata*, *N. Gloriosa* and *N. Ellisiana*, the last two being the finest of the large flowered highly-coloured forms; *N. odorata rosacea*, *N. o. exquisita*, more deeply tinted than the preceding; *N. o. sulph. grandiflora*; *N. Laydekeri rosea* and *N. L. lilacea*; *N. flammea*, *N. fulgens*, *N. ignea*, and *N. sanguinea* were also conspicuous examples; *N. Caroliniana nivea* (a gem), *N. C. perfecta*, *N. pygmaea helvola* (the smallest of all the hybrids), and *N. Robinsoni* were also shown.

OTHER EXHIBITS.

Messrs. JAS. VEITCH showed plants of the hybrid *Escallonia Langleyensis* (figured in *Gard. Chron.*, July 10, 1897, p. 15, and July 2, 1898, p. 11), and the parents *E. Macrantha sanguinea* ♂ and *E. Philippiana* ♀. In almost all respects this true hybrid is midway in its characteristics between its parents, as was shown in the strength of habit, size of leaves, &c.

Messrs. WALLACE & CO., Kilnfield Gardens, Colchester, showed *Lilium Burbanki*, a pretty spotted Lily with reflexed sepals, raised by Luther Burbank from *L. Washingtonianum* f. and *L. Pardalinum*. The spike exhibited was described as a w.a.t. one from bulbs planted last March, and not sufficiently strong to show its free-flowering habit, a habit obtained from *L. Washingtonianum*, also *L. Dalhousii* from *L. Dalmaticum* and *L. Hansonii*. This is a small-flowered Lily, with sixteen or so flowers upon a spike, very stellate in form, deep brown in colour, with curious spotting. *Lilium occidentale* is a new species from California, with spotted flower, segments very reflexed.

From Messrs. BARR & SON came an exhibit of hardy flowers. *Campanula persicifolia alba grandiflora*, *Iris Momieri*, *Hemerocallis Amantiana major*, very lovely. *Lilium pardalinum* Michauxii, *Heuchera sanguinea splendens*. *Potentilla* in variety; also many beautiful varieties of *Iris levigata*, notably a large double white variety named *Mimnota* and *Tomoye*, a very large single white with lavender blue shades. *Delphinium* were also shown well.

Messrs. JAMES VEITCH & SONS showed a plant in flower of *Kalo-rochea Langleyensis*, from *Kalosanthus coccinea* f. and *Rochela falcata*. This is a hybrid obtained some years ago, that, if not valuable commercially, is a fine instance of ordinary hybridity, the plant being in many respects intermediary. The leaves are shortened and otherwise modified in the direction of the female parent, and the flowers and inflorescence show evidence of the same kind. In colour the hybrid is almost perfectly that of the *Kalosanthus*.

M. MOREL, Lyons, France, showed a large number of flowers of *Clematis*, representing crosses effected between *C. coccinea*, and *C. Pitcheri*, *C. viticella*, and varieties of these species. In many of these varieties the pretty colours and extremely good form of the flowers were greatly admired. The intense heat, however, caused the blooms to wither a little.

Messrs. DUVAL & SONS, 8, Rue de l'Ermitage, Versailles, showed a magnificent collection of hybrid *Vriesias* and other Bromeliads, the varieties obtained being greatly admired by visitors who were interested in this class of plants.

M. DE LA DEVANAYE, Angers, showed a green-leaved *Anthurium* named *A. Fraxinense*, obtained from a cross between *A. crystallinum* × *A. colocasiaefolium*. The new plant has very handsome broad foliage, and the plant when further developed, promises to be very ornamental.

Mr. C. C. HURST showed sprays of *Berberis*, illustrating many crosses he has effected between *B. stenophylla* and *B. Darwini*, and referred to in Mr. Hurst's paper.

Dr. J. H. WILSON, St. Andrew's University, showed illustrations and dried specimens of *Passiflora* Margaret Wilson raised by him from *P. Buonapartea*, fertilised by pollen from *P. cœrulea*, and fig. in *Gardeners' Chronicle*, Feb. 11, 1899, p. 89. Also of *Abutilon Incheape Belli*, a cross from *A. Megapotanicum* = *Abutilium* variety, and *A. Darwini*. Also several *Strawberries*, and a *Papaver*.

Mr. C. G. VAN TUBEROEN, Haarlem, Holland, showed *Lilium Marhan*, a very free flowered Lily from a cross between *L. Martagon album* and *L. Hansonii*. Also *Hymenocallis laphne*, from a cross between *H. speciosa* and *H. calathina*.

Mr. HUDSON, Gunnersbury House Gardens, Acton, showed a new species of *Nicotiana* (*N. sylvestris*), which, through being staged as a group, did not come under the particular observation of the Floral Committee. It was grown at Kew last season for the first time, where it gave especial promise for the future as a sub-tropical plant. The growth is vigorous and branching, the flowers being pure white, tubular, sweetly scented, pendent, but expanded during the daytime, whilst towards evening they assume a horizontal position. As shown, the terminal corymbs were very effective; but later, when the lateral growths are in flower, they will be even more so.

From the Director of the Royal Gardens, Kew, was exhibited what many considered to be the best plant in the show. This was a new species of *Kalanchoe*, named *K. flammea*, from Somaliland, and mentioned in *Gardeners' Chronicle*, July 10, 1897, p. 22. There was a considerable group of these plants, each about 1½ ft. high, in pots. They were said to be eighteen months old, having been cultivated in an airy greenhouse, and some of the plants have been in flower for more than a month past. The flowers are produced in large compound umbels, and are very bright red (or as some describe it, orange-scarlet) in colour (see fig. 26, on p. 47).

From Kew also was shown *Disa* × *Kewensis*, from *D. grandiflora* and *D. tripetaloides*; also several hybrid *Aloes*, one from *A. latifolia* and *A. striatus*; *A. insignis*, from *A. drepanophylla* and *A. echinata*; *A. Lynchii*, from *A. striatus* and *A. verrucosa*, and the very beautiful and well-known

hybrid *Passiflora*, *P. × Kewensis*, that resulted from a cross between *P. raddiana* and *P. carnea*.

Mr. R. I. LYNCH, Cambridge Botanic Gardens, showed hybrid *Cinerarias*, in which the species *Senecio Heritieri*, *multiflorus*, *cruentus*, and *Tussilaginis*, had been crossed. One of the plants was described as consisting of the three first-named species, and the florists' *Cineraria*.

Messrs. DOBBIE & CO., Rothsay, N.B., showed Sweet Peas, &c.; and some choice Peas, both sweet and culinary, were shown by Mr. H. ECKHARD, Wem, Salop.

Mr. G. YELD, Clifton Cottage, York, showed a hybrid *Hemerocallis* called *Pioneer*, from a cross between *H. aurantiaca* and *H. Thunbergii*. The colour of the flower is very intermediary, and the foliage rather larger than that of the female parent. The cross was made in 1896, and the flower shown being from a weak seedling, future flowers may be expected to be larger and better.

Messrs. G. JACKMAN & SON, Woking, showed flowers representing varieties of *Clematis laniginosa* crossed with *C. Fortunei*, also crosses of *C. Jackmanni* and *C. patens*.

Mr. WILLIAM PRITZER, Stuttgart, Germany, showed blooms of varieties of tuberous *Begonias* with fringed flowers. In this characteristic they were not more remarkable than that figured in these columns, June 6, 1896, p. 711; but the shades of colour in Mr. PRITZER's specimen were peculiar.

AWARDS.

Caladium A. Siebert.—A narrow-leaved variety from *C. Refus* and *C. albaneum*. The leaves have very wavy margins, are dull-red in colour, but green towards the edges. From F. SANDER & CO., St. Albans (Award of Merit).

Caladium Marie Miljana.—A fine rose-coloured variety, sent for trial at Chiswick by Mr. J. F. McLeod, Dover House Gardens, Roehampton (Award of Merit).

Carnation Heather Bell.—A border variety, having large yellow-ground flowers, with rose edgings; surface of flower when fully expanded rather flat; calyx excellent, non-splitting. From Mr. DOUGLAS (Award of Merit).

Carnation Rosalind.—A border variety, with dark maroon self-coloured flowers, of very good form. From Mr. DOUGLAS (Award of Merit).

Carnation The Baron.—A border variety, having flowers with a white ground, very deeply edged with maroon or deep crimson; rather high flower, and scented. From Mr. DOUGLAS (Award of Merit).

Delphinium Michel Lando.—A very deep blue variety, with immense spikes of large double flowers. From Messrs. JAS. VEITCH (Award of Merit).

T. a Rose, White Manan Cochet.—A very beautiful Rose, white, with faint marking of blush-pink on margins of petals. From W. PAUL & SONS, Waltham Cross (Award of Merit).

Rose Cadeau Ramey.—A hybrid Tea variety, very pale rose, creamy-white at base of petals; high-centred, and of very fine form. From W. PAUL & SONS, Waltham Cross (Award of Merit).

Sweet William, "Elizabeth".—A variety of a peculiar tint of red, popularly described as "crushed Strawberry." From Viscountess ENFIELD, Dancer's Hill, Barnet (Award of Merit).

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. W. Thompson, H. T. Pitt, De B. Crawshaw, T. B. Haywood, F. J. Thorne, H. Ballantine, H. M. Pollett, T. W. Bond, J. Douglas, E. Hill, J. Jaques, W. Watson, W. H. White, W. H. Young, H. J. Chapman, and Jas. O'Brien, Hon. Sec.

The numerous exhibits well accorded with the objects of the Hybrid Conference, though in the matter of Orchids, perhaps, fewer really distinct and showy new plants appeared than at some of the ordinary meetings at the Drill Hall. Two plants were entered for the Veitch Memorial Gold Medal for the best hybrid Orchid not previously shown, the exhibits being the beautiful *Cypripedium* × *Schillerianum* (*Gowerianum* × *Rothschildianum*), sent by Captain G. W. LAWSONFIELD (gr., Mr. Shill); and *Odontoglossum* × *crispum* Halli var. *Crawshayanum*, sent by De B. CRAWSHAW, Esq. The *Cypripedium* was adjudged the Medal, but ultimately it was withdrawn, both plants having been previously exhibited, and therefore not eligible.

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), staged an interesting group, the centre of which was a splendidly-flowered example of *Vanda* × *Miss Joaquim* (*teres* × *Hookeriana*), together with an inflorescence of *V. teres*. Other interesting exhibits were *Cypripedium* × *Elinor* (*Salligerum majus* × *C. superbiens*), with good examples of both parents, the fine specimen of *C. superbiens* (Veitchii), having eleven flowers; *C. × grande atratum* (*longifolium* × *caudatum*), with the parents; *C. × Dominianum*, *C. × Climberryanum*, with its parents; *C. Curtisii* and *C. Philippinense*; *C. × porphyrochlamys* var. *Fraseri*, with the plants from which it was derived; also *Masdevallia* × *Hinckiana*, *M. × Ajax*, and *M. × Parlatoreana*, with as many of their parents as were procurable in flower, a rule observed throughout the group, which also contained *Disa* × *Kewensis*, *Epiphrontis* × *Veitchii*, *Cattleya* × *Breantiana*, and other fine hybrids, including a noble *Odontoglossum* × *excellens*.

Messrs. JAS. VEITCH & SONS, Chelsea, staged a very remarkable group of hybrids, and the agents used in obtaining them, the whole serving as an excellent illustration of the good work which they have so untiringly pursued for so many years. The showy varieties of *Lælio-Cattleya* × *Aphrodite*, *L.-C. × Canhamiana*, and other fine hybrid *Lælio-Cattleyas*, in company with their scarcely less showy parents, made a really fine display,

Noticeable also was the delicately-tinted *Sobralia* × *Veitchii*, together with *S. macrantha*, and *S. xantholeuca*, from which it sprang; *Epiphrontis* × *Veitchii*, still the most brilliant of hybrids of moderate size; *Cattleya* × *Enid* (*Mossie* × *Warszewiczii*), the fine orange-scarlet *Epidendrum* × *radiante-vittatum*, *Disa* × *Veitchii*, *D. × Dioreas* var. *Chio*, *D. × Langleyensis*, and *D. × Kewensis*; *Phalaenopsis* × *Ludde-viacea* and parents, *Epidendrum* × *Wallisii-ciliare*, *E. × Violayensis*, *E. × Endrosii-Wallisii*, *E. × O'Brienianum*, and other *Epidendrums*, together with their progenitors in most cases, or one of them; *Masdevallia* × *Gairiana*, *M. × Imogen*, in two very dissimilar forms; *Lælio-Cattleya* × *Zephyra*, *L.-C. × Felix* (*L. crispata* × *C. Schilleriana*), one of the Domes set of Veitchian hybrids, or rather a *Sedenian* resurrection of it. With these were arranged *Odontoglossum* × *excellens*, with its parents, *O. Pescatorei* and *O. triumphans*, *Spathoglottis* × *aureo-Veillardii*, and various good hybrid *Cypripediums*, &c.

Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen (gr., Mr. W. H. Young), staged an effective group of fine showy things, comprising *Lælio-Cattleya* × *Aphrodite splendens*, *L.-C. × Canhamiana*, *L.-C. × eximia*, *L.-C. × Arnoldiana*, *Cypripedium* × *Gertrude Hollington*, *C. × macropterum*, *C. Stoeckii candidum*, *Lælia tenebrosa gigantea*, and a noble form of *Cattleya Warszewiczii*, together with, in some cases, the parents of the hybrids.

Messrs. HUGH LOW & CO., Enfield, contributed an interesting group, the *Cypripediums* being specially well represented by the noble *C. × l'Ansoni*, with its parents, *C. Morganii* and *C. Rothschildianum*; most of the other *Cypripediums*, which included *C. × Alfred Hollington*, *C. × T. W. Bond*, *C. × Alice*, *C. × Milmani*, *C. × macropterum*, *C. × De Witt Smith*, and *C. × Lawrencei-Mastersianum* being staged with their progenitors. Also in the group were *Cattleya crocata albens*, *C. Mendeli enfieldensis*, and *C. Gaskelliana enfieldensis*, all three good whites, with a slight tinge of colour; the fine *C. Gaskelliana rosea*, a brilliant dark scarlet *Dendrobium sanguineum*, the pretty *D. barbatulum*, &c.

Messrs. F. SANDER & CO., St. Albans, staged an interesting set of hybrid *Cypripediums*, of which *C. × Lady Maple* (*Yongianum* × *Gowerianum*), with its delicately rose-tinted upper sepal was the prettiest. The others were *C. × Garbari* (*Lawrenceanum* × *Rothschildiana*), *C. × Duchess of Sutherland* (*Yongianum* × *Rothschildianum*), *C. × Premier* (*Beediana* × *Rothschildianum*), *C. × A. de Laireesse* (*Curtisii* × *Rothschildianum*), and *C. × Comte Adrien de Germiny* (*Swaniamum* × *Rothschildianum*).

De B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed the fine white *Odontoglossum crispum* "Mrs. De B. Crawshaw," and the finely blotched *O. C. Crawshayanum*.

M. CHAS. MARON, Brunoy, France, showed a fine group of showy hybrid *Lælio-Cattleyas*, among which the forms of *L.-C. × Aphrodite*, *L.-C. × callistoglossa*, and allied hybrids were very telling. One unnamed seedling, supposed to be between *Cattleya Schroderae* and *Lælia purpurata* *Schroderiana*, was a charming cream-white flower tinged with clear rose or Peach-blossom tint. Three plants of M. MARON's hybrid *Lælio-Cattleya* × *radiata* (*L. purpurata* × *C. Walkerianum nobilior*), well represented it. *Lælia* × *negrescens*, *L. punila* × *L. tenebrosa* was a distinct richly-coloured flower, and all the other pretty and distinct things, especially *L.-C. × Berthe Fournier* (*L.-C. × elegans* × *C. aurea*).

WALTER COBB, Esq., Dulcote, Tunbridge Wells (gr., Mr. J. Howes), showed the fine *Cypripedium* × *l'Ansoni*, and *Catasetum callosum* bearing flowers of both sexes, and therefore very interesting. *C. L. N. INGRAM*, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), showed *Cattleya* × *Firebrand* (*Schilleriana* × *Lawrenceana*), a pretty flower of good substance, with sepals and petals tinged with bright rose-purple, the front lobe of the lip being bright purple.

A. H. SMEE, Esq., The Grange, Hackbridge (gr., Mr. Humphrys), sent the singular *Microstylis congesta*. *C. C. HURST*, Esq., Burbage, Hinckley, sent an interesting exhibit of un-flowered plants of *Cypripedium* × *Phito*, raised from seeds obtained by Reginald Young, Esq., and in which the foliage exhibited the most remarkable variation, both in form and marking.

Mr. GEO. HANSEN, of Seaside Track, Berkeley, California, submitted his useful and now well-known work of enumeration of hybrid Orchids and their derivation, for which the Committee recorded a Vote of Thanks.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Harrisonii alba.—A true, absolutely white albino, from the Rev. F. PAYNTER, Stoke Hill, Guildford (gr., Mr. Cooke).

Lælio-Cattleya × Duraliana (*C. Luddemanniana* × *L. purpurata*).—A fine hybrid, of the usual form of the section. Sepals and petals tinged with rosy lilac, the large and peculiarly elongated front lobe of the lip dark claret-purple.

AWARD OF MERIT.

Lælio-Cattleya × Martinetti (*C. Mossie* ♀, *L. tenebrosa* ♂).—A pretty flower, comparable to *L.-C. × Gottoiana*, and bearing much resemblance to *Cattleya maxima*. Flowers lilac-rosy, the lip heavily veined with purple. From Mr. Chas. Maron, Brunoy.

Cypripedium Stoeckii candidum.—A distinct variation, in which the upper sepal is wholly white, some rose-coloured markings being on the reverse side. From Sir Frederick Wigan, Bart. (gr., Mr. W. H. Young).

Lælia tenebrosa gigantea.—A very large form, with brownish copper-coloured sepals and petals, and dark-rose lip, heavily marked with purple. From Sir F. Wigan, Bart.

Epilobium × *Charlesworthii* (D. cinnabarinum × E. radicans).—A bright addition to the elegant, free-flowering, orange-scarlet hybrids of E. radicans. From Messrs. James Veitch & Sons.

Laelio-Cattleya × *Adolphus* (L. cinnabarinum × C. Acklandiae).—A very quaint-looking little novelty, with Indian-yellow flowers, the sepals and petals bearing a few claret-coloured spots, and the rounded front-lobe of the lip being also rosy-purple. From the Rev. F. PAYNTER, Stoke Hill, Guildford (gr., Mr. Cooke).

Cypripedium × *Shillanum* (Gowerianum (Lawrenceanum) ♀, Curtissii) × *Rothschildianum*.—A grand flower, and one of the finest of its class. Dorsal sepal very large, white, very slightly tinged with rose, and bearing distinct purple lines. Petals long, and almost horizontally extended, of the form of those of C. Rothschildianum, but broader; pale yellowish-green, with a few white lines, and many dark chocolate blotches, with the margin being hairy; lip large, brownish-rose. Stamens clearly indicating C. Rothschildianum. From Captain G. W. LAW-SCHOFFIELD, New-Hall-Hey, Rawtenstall, Manchester (gr., Mr. Shill).

Fruit and Vegetable Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. J. W. Bates, H. Balderson, Alex. Dean, P. C. M. Veitch, James Smith, John Basham, Geo. Woodward, A. H. Pearson, Robt. Fife, J. Gleeson, A. F. Barron, W. Pope, G. Norman, W. H. Divers, Prof. Hugo de Vries, Jas. H. Veitch, W. Poupert, J. Willard, G. T. Miles, Chas. Herrin, J. Clive, and S. Mortimer.

LEOPOLD DE ROTHSCHILD, Esq. (gr., Mr. Hudson), Gnnersbury House, Acton, W., showed 10 varieties of dessert cherries in boxes, as packed for transit. These consisted of extra fine fruits of Black Circassian and Bigarreau Napoleon, both gathered from trees 50 years planted, and of which the crops are heavy; Early Rivers, Emperor Francis, Bigarreau de Schreken from younger trees were equally fine, both in quality and size; other excellent kinds were Black Eagle, later than Black Circassian; Late Black Bigarreau, Frogmore Early Bigarreau, and Governor Wood. These fruits made a fine show, being illustrative of cherry culture within a few miles only of Charing Cross. The soil upon which these trees are growing is a light loam, resting on gravel overlying the London Clay (Silver-gilt Knightian Medal).

Messrs. LAXTON & SONS, Bedford, showed dishes of Waterloo, Latest-of-All, and Climax Strawberries; also upwards of a dozen varieties of Culinary Peas.

A purple-podded Pea, named Nero, was shown by Sir Trevor Lawrence, Bart., Bedford.

Messrs. W. PAUL & SON showed two early-fruited varieties of Apricot, named Early Brouillon and Domazon. Standard trees were shown, well fruited.

AWARDS.

Raspberry, *Golden Queen*.—This is described as a cross between Raspberry Superlative and Rubus laciniatus. The fruits are large and of good quality, similar to Superlative, but in colour yellow. It will probably make a fine companion for Superlative. From Messrs. JAS. VEITCH & SONS, Chelsea (First Class Certificate).

Strawberry, *Lord Kitchener*.—Described as a cross between the varieties Waterloo and British Queen. The seedling is an excellent bearer, and will be a mid-season variety. The fruits are dark coloured, roundish in shape, of pleasant flavour, somewhat suggestive of Keen's Seedling. From JAS. VEITCH & SONS, Chelsea (Award of Merit).

Pea, *Glory of Devon*.—A fine large Pea in long pods, which contain about eight or nine each. ROBERT VEITCH & SON, Exeter (Award of Merit).

HANLEY HORTICULTURAL FÊTE.

JULY 5.—The third annual exhibition was held on the above date, and was well attended by the public. The exhibits in general were far in advance in quality of those at the two previous exhibitions.

Groups of plants, arranged for effect, are a fine feature at this show; and very good indeed was the group covering 300 square feet, from Mr. Blair, gr. to his Grace the Duke of Sutherland, Trentham Hall, who won the 1st prize. Odontoglossum crispum, Masdevallias, Cattleyas, Coddieums, Cordylines, Acalyphas, &c., were used to splendid effect, with larger growing ornamental species. Mr. J. CYPHER, Cheltenham, was 2nd.

Smaller groups, occupying 150 feet space, were shown by Gentlemen's Gardeners and Amateurs in the counties of Stafford, Chester, Salop, and Derby. Mr. HOWSON, The Elms, Hanley, was placed 1st.

The best group of Orchids in bloom on a space not to exceed 100 square feet, was shown by Mr. W. STEVENS, gr. to W. THOMPSON, Esq., Walton Grange, near Stone, who put up a lovely group of his well-known Odontoglossums, Cattleyas, and other species. Mr. J. CYPHER was 2nd with a very good group, in which were some very fine varieties.

Malmesbury Carnations were shown in groups of 100 square feet, and the best exhibit was made by Mr. P. BLAIR. A very nice group was also shown by Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston.

Mr. J. CYPHER had the best collection of twelve stove and greenhouse plants, including fine specimens of Anthurium Scherzerianum, Erica ventricosa, Salix profusa, Crotons, Flambea and Queen Victoria, Ixora salicifolia, Bougainvillea Sanderiana, and Stephanotis floribunda.

ROSES.

Roses were very finely shown. Messrs. A. DICKSON & SONS, Newtownards, Ireland, were 1st for a collection of forty-eight varieties; and Messrs. TOWNSEND & SONS, Worcester, 2nd.

For thirty-six varieties (open), Messrs. A. DICKSON & SONS and Messrs. TOWNSEND were again 1st and 2nd respectively.

Messrs. PERKINS & SON, Coventry, followed Messrs. A. DICKSON & SONS for twenty-four varieties; and Messrs. PEARSON & SONS, Chilwell, Nottingham, followed Messrs. DICKSONS in a class for twelve varieties.

Messrs. TOWNSEND & SONS had the best collection of twelve Tea Roses; and Messrs. DICKSON & SONS were 2nd.

The best dozen blooms of one variety was Mrs. John Laing, from Messrs. TOWNSEND & SONS.

In the amateurs' classes, the best collection of twenty-four varieties was shown by Mr. WILLIAM PYATT, Newcastle.

OTHER CUT-FLOWERS.

The best display of floral arrangement in a space of 20 feet by 5 feet, for which the 1st prize was £10, was made by Messrs. JENKINSON, Newcastle; Mr. WILLIAM VAUSE, Leamington, being a good 2nd; and a Manchester firm 3rd.

Messrs. JENKINSON & SON had also a very conspicuous success in the classes for bouquets of various descriptions.

A class for a decorated dinner-table with flowers, foliage, and fruit upon a table 8 feet by 4 feet, was a very pretty one: Mr. GOODACRE was 1st with a table neatly arranged with Odontoglossums, Masdevallias, Cattleyas, and Ferns, also fine White and Black Grapes, Peaches, Nectarines, Melons, Strawberries, and Cherries. Mr. McINDOE, gr. to Sir J. W. PEASE, Bart., was 2nd; and Mr. J. EDMONDS, Bestwood Gardens, Notts, 3rd.

FRUITS.

The best collection of ten dishes of fruits was from Mr. GOODACRE, who had very fine Muscat and Black Hamburgh Grapes, Frogmore Scarlet and Lockinge Melons, Bellegarde and Chancellor Peaches, Early Rivers and Elrige Nectarines, Strawberries, and Cherries. Mr. BANNERMAN, gr. to Lord BAGOT, Blithfield, was 2nd; and Mr. J. McINDOE, 3rd.

The best Black Hamburgh Grapes were from Mr. GOODACRE; and the best exhibit of any other black variety, was from Mr. A. HALL, gr. to J. C. WATERHOUSE, Esq., Prestbury.

For Muscat of Alexandria Grapes, Mr. J. McINDOE was 1st; and for any other white variety, Mr. A. H. HALL won.

There were good Peaches, Nectarines, Melons, Figs, Cherries, and Strawberries, in special classes.

MISCELLANEOUS EXHIBITS.

There were trade exhibits from the following firms:—Messrs. CUTBUSH & SONS, Highgate; J. VEITCH & SONS, Chelsea; HILL & SONS, Edmonton; DICKSONS, LTD., Chester; CLIBBON & SONS, Altrincham; BARR & SONS, London; HARTLAND & SONS, Cork; CHARLESWORTH & CO., Bradford; JONES & SON, Shrewsbury; CLAPHAM & SONS, Stockport; JARMAN & CO., Chard; COWAN & CO., LTD., Gateacre, Liverpool; W. & J. BIRKENHEAD, Sale; WEBB & SON, Stourbridge; Mr. WM. SYDENHAM, Tamworth; Mr. PATTISON, Shrewsbury; Mr. ECKFORD, Wem, Salop; and the Executors of J. H. WHITE, Worcester.

NATIONAL ROSE, COLCHESTER.

JULY 6.—A few particulars, communicated by telegraph, of this show were given in our last issue. The enjoyment of the afternoon was marred by a storm of rain, accompanied by thunder and lightning, which lasted rather more than half an hour.

MIXED ROSES.

As Mr. BENJAMIN R. CANT's collection of thirty-six blooms (distinct), which won the Jubilee Trophy Class, was the best collection from the point of view of quality that has been shown this year, and included two Medal blooms, we append the varieties. Back row: Alfred Colomb, Madame Eugénie Verdier, Marie Baumann, Marchioness of Dufferin, Dupuy Jamain, La France, Ulrich Brunner, Marchioness of Londonderry, Marquise de Litta, Her Majesty, Gustave Figanneau, and Mrs. John Laing. Centre Row: White Lady, Horace Vernet, Maman Cochet, Crown Prince, The Bride, Helen Keller, Mrs. Sharman Crawford, Prince Arthur (Medal Bloom), Innocente Pirola, Earl of Dufferin, Muriel Grahame, and Comtesse de Luttre. Front row: Mrs. W. J. Grant (Medal bloom), Mrs. Cocker, Dr. Andry, Comtesse de Nadaillac, Madame Cusin, Bridesmaid, Tom Wood, Duchess de Morny, Madame de Watteville, E. Y. Teas, and Catherine Mermet. Messrs. D. PRIOR & SON, Mylands Nursery, Colchester, were 2nd; and Messrs. HARKNESS & SONS, Bedale and Hitchin, were 3rd.

Mr. B. R. CANT's 1st prize blooms in the class for seventy-two flowers, distinct, were also of very high quality. He was followed by Messrs. FRANK CANT & CO., Braiswick Nursery, Colchester.

Mr. B. R. CANT was again successful for 1st prize in a class for thirty-six trebles, and his most glorious triplets were of the varieties: Mrs. W. J. Grant, Earl of Dufferin, Madame Gabriel Le Luizet, Mrs. John Laing, Her Majesty, Duchesse de Morny, and Marquise de Litta. Messrs. FRANK CANT & CO. were 2nd.

Messrs. D. PRIOR & SON won 1st prize for thirty-six blooms distinct, competitors in the two preceding classes being debarred. Throughout this class, in which were exhibits from Messrs. G. & W. H. BURCH, Peterborough, 2nd, and Messrs. J. BURNELL & CO., Cambridge, 3rd, the quality of the Roses was quite up to the average.

Messrs. D. PRIOR & SON were 1st in the same division for eighteen trebles, being followed by Mr. CHAS. TURNER and Messrs. G. & W. H. BURCH.

Colchester Firms Excluded.—Messrs. PAUL & SON, Cheshunt, won a class for twenty-four blooms, distinct, no grower within seven miles of Colchester to compete. Messrs. HARKNESS & SONS, and Mr. GEO. PRINCE, Oxford, were 2nd and 3rd respectively. There was not the fulness or weight in these blooms that characterised those in the open classes.

Amateurs.—Mr. E. B. LINDSELL's varieties which won the Amateurs' Jubilee Trophy were—Front Row: Her Majesty, Earl Dufferin, La France, Ulrich Brunner, Marchioness of Londonderry, Chas. Lefebvre, Mrs. John Laing, and Gustave Figanneau. Centre Row: Marie Baumann, Maman Cochet, Horace Vernet, Muriel Grahame (Medal bloom), Prince Arthur, Innocente Pirola, Susanne-Marie Rodocanachi, Merveille de Lyon. Front Row: Mrs. S. Crawford, Capt. Hayward, Comtesse de Nadaillac, F. Michelon, Souvenir d'Elise, Madame G. Luizet, White Lady, Madame E. Verdier. 2nd, Rev. J. H. PEMBERTON, Havering-atte-Bower, Romford, who had good and even flowers; 3rd, Mr. O. G. ORPEN, Hillside, West Bergholt, Colchester, and secretary to the Colchester society.

The Rev. J. H. PEMBERTON won the following class for thirty-six varieties, and though there was not the size and quality that was present in Mr. Lindsell's exhibit in the previous class, the flowers were good; Mr. LINDSELL was 2nd.

Mr. E. B. LINDSELL showed a beautiful exhibit of eight distinct trebles, La France and Madame Cusin being very effective.

Mr. O. G. ORPEN had the best nine blooms of any Rose other than Tea or Noisette in Kaiserin Augusta Victoria.

Among the growers of fewer than 2000 plants, Mr. ED. MAWLEY (who was busy and courteous as usual) was very successful, winning 1st prizes for eighteen blooms, distinct; six distinct trebles, and six blooms of any Rose other than a Tea or Noisette, showing in this class the variety Mrs. John Laing.

Of growers of fewer than 1000 plants, prizes were taken by Rev. A. C. JOHNSON, Capel St. Mary; and Mr. J. T. THOMPSON, Round's Green, London, N.

In the Mayor of Colchester's class, the quality of Mr. O. G. ORPEN's Roses was capital. The varieties were—Her Majesty, François Michelon, La France, Gustave Figanneau, Grand Mogul, Mrs. W. J. Grant, K. A. Victoria, Ulrich Brunner, Marquise de Litta, Sylph, Horace Vernet, and The Bride. The Rev. A. FOSTER-MELLIAR and the Rev. J. H. PEMBERTON followed.

TEAS AND NOISETTES.

MESSRS. FRANK CANT & CO. won the class for twenty-four blooms, distinct, with the following varieties:—Back row: Madame de Watteville, Muriel Grahame, Souvenir d'un Ami, Souvenir de S. A. Prince, Madame Cusin, The Bride, Catherine Mermet, and Maman Cochet. Centre row: Medea (very pretty), Golden Gate, Madame Hoste, Maréchal Niel, Cleopatra, Bridesmaid, Innocente Pirola, and Souvenir d'Elise. Front row: Sylph, Anna Olivier, Ernest Metz, Jules Finger, Comtesse de Nadaillac, Hon. Edith Gifford, Marie Van Houtte, and Ethel Brownlow. Mr. B. R. CANT followed; and in Mr. GEO. PRINCE's 3rd prize collection was a magnificent bloom of the lovely variety, Maman Cochet (awarded a Medal).

Messrs. HARKNESS & SONS won for twelve blooms, and following Messrs. BURELL & CO., the 3rd prize was won by Mr. A. AUGUSTUS GREEN, a new grower, who has commenced a nursery in the vicinity of Colchester.

AMATEURS.

The Colchester Medal and 1st prize, for eighteen blooms, distinct, was won by the Rev. A. FOSTER-MELLIAR, with the following varieties:—Back row: Madame de Watteville, Madame Willernoz, Catherine Mermet, Niphotos, Maman Cochet, Golden Gate. Centre row: The Bride, Comtesse de Nadaillac, Innocente Pirola, Muriel Grahame, Souvenir de S. A. Prince, and Souvenir d'Elise. Front row: Souvenir d'un Ami, Bridesmaid, Marie Van Houtte, Sylph (capital), Corinna, and Hon. Edith Gifford. 2nd, OSMOND G. ORPEN, Esq.

Mr. ORPEN had the best nine blooms of any one variety in Souvenir de S. A. Prince; the Rev. FOSTER-MELLIAR following with Anna Olivier.

Of growers of fewer than 200 plants, the Rev. F. PAGE ROBERTS, Scole, and Mr. R. W. BOWYER won 1st prizes.

OPEN CLASSES.

MESSRS. FRANK CANT & CO.'s varieties, which won 1st prize for twelve blooms of the newer Roses were: Mrs. Frank Cant, Tom Wood, Madame Cadeau Ramey, Marguerite Appert, Mr. F. W. Sanford, Antoine Rivoire, Robert Duncan, Ellen Drew, Countess of Caledon, Beanté Lyonnais, Empress Alexandra of Russia, and Muriel Grahame.

The best white Rose in dozens was Marchioness of Londonderry, from Messrs. PAUL & SON; Mr. B. R. CANT's White Lady, being 2nd. Mr. PRINCE, of course, had the best yellow Rose in Comtesse de Nadaillac; and Marie Van Houtte, from Mr. R. CANT, was 2nd.

Mrs. John Laing was again declared to be the best light pink or rose-coloured variety, and was from Mr. B. R. CANT. Messrs. HARKNESS & SONS were 2nd with the same variety.

The best dark crimson Rose was Gustave Figanneau.

Mr. B. R. CANT beat Messrs. FRANK CANT & CO. for a collection of Teas and Noisettes, twelve varieties, in trebles.

GARDEN OR DECORATIVE ROSES.

MESSRS. FRANK CANT & CO. won a class for eighteen varieties, and they were well shown; they were W. A. Richardson, Reine de Wurtemberg, Rosa rubra, Crimson Rambler, Hebe's Lip, Baron Job, Madame Pernet Ducher, Laurette Messimy, Madame Falcot, Marguis of Salisbury, The Garland, L'Idéal, Madame Chedane Guinoisseau, Camoens, Rainbow, Ma Capucine, Gustave Regis, and Souvenir de Catherine Guillot. Messrs. PAUL & SON were 2nd.

Amateurs.—There was only one class in each section for the garden roses, and Mr. O. G. ORPEN won the amateurs' class for twelve distinct varieties. The single whites, Hebe's Lip and Rosa Alba were very fine; and Noisette, The Garland, pure white semi-double, was beautiful; 2nd, Rev. J. H. PEMBERTON.

THE DINNER.

THE Festival Dinner, which terminated the proceedings of the Conference on Hybridisation, took place at the Whitehall Rooms, Hôtel Métropole, London, on Wednesday, under the presidency of Sir TREVOR LAWRENCE, Bart., the President of the Society, about 130 ladies and gentlemen being present. The usual loyal toasts, proposed by the President, having been fittingly disposed of, the Rev. Prof. HENSLOW, in the unavoidable absence of Sir MICHAEL FOSTER, K.C.B., proposed "Horticulture." He said that gardening as now understood was unknown to the ancients, which might partly be accounted for by the profusion of beautiful flowering plants in Greece, Italy, and the Levant; and even in the middle ages gardens were to be found in the monasteries, and nowhere else. He then briefly followed gardening through later ages up to the present time, and the institution of the Horticultural Society of London, now the Royal Horticultural Society, about 100 years ago, and the great results that have followed its establishment.

This toast was responded to by Mr. HERBERT J. WEBBER, special envoy from the United States Department of Agriculture. He brought, he said, the friendly greeting of American horticulturists. It seemed to him, from what had been brought out on this occasion, that we are merely on the threshold of the matter, and it was a great misfortune that no reward awaited the originator of a new plant or variety. He considered that more honour was due to him who brought out a new plant than to him who but reproduced it afterwards.

M. HUGO DE VRIES spoke also to this toast. There was, he said, formerly very little continuity in the hybridiser's efforts; now, however, in various research stations this kind of work is being systematically and continuously carried on, with much good result to the community at large. Having made up their minds what was wanted—say a late-flowering or hardy Orange—they worked till it was produced; and so with many other things. Hybridising was applied botany, and improvement of existing species and the creation of new forms was the aim of this Conference, and nothing would help on the good work like continuity.

M. H. DE VILMORIN 'also spoke to the toast, choosing as his chief point the anticipation of the results of hybridisation of plants for house and open-air culture, and thus we should be enabled to compete with, and eventually exclude foreign competition.

The toast, "Hybridists," was proposed by Mr. W. BATESON, F.R.S., who advocated the union of science with practice. The practicals, he said, thought the gain would be on their side, but he believed the scientists alone will gain. Science was something like a shirt which the Irishman brought to be attached to a button. In this connection Mr. BATESON alluded to the value attached in the United States of America to work done at the numerous research stations scattered over the land. Here we are "quite out of it," and we greatly need some permanent home for research and scientific investigation. The fruits of this Congress would hereafter be judged by "First-class Certificates."

Mr. WALTER T. SWINGLE responded. It was England which produced the first horticultural society, and it seemed to him impossible to over-estimate the importance of hybridisation on the future of horticulture.

The toast, "The Royal Horticultural Society," was proposed by the MASTER OF THE ROLLS, who in the course of a sympathetic speech alluded to the great Chiswick shows which he was old enough to remember, and which attracted the great world of London to the Society's gardens. Mention was made of the fine shows held in the Botanic Society's Gardens, Regent's Park, and of the work done by the Royal Horticultural Society in sending collectors to China, Japan, California, Mexico, and other countries, special allusion being made to R. Fortune's introductions.

Those were halcyon days for the Society, but there came a change, and they were obliged to pursue a new course. He alluded to the institution of the Scientific Committee and its great importance as a factor in the advance of British gardening, and to the efforts of Sir TREVOR LAWRENCE, to resuscitate the Society and make it a success.

Sir TREVOR LAWRENCE, in responding to the toast, said that the question has arisen how best to celebrate the centenary of the Society. During the 100 years of its existence it has done inestimable service to this country, and he very much doubted if Sir JOSEPH BANKS foresaw the important results that would follow its inception when they met at 147, Piccadilly. FORTUNE's visit to China was one of these, the tea trade having shifted its centre from that empire to our Indian possessions. And again, the introduction of the Mexican and Californian Conifers had imparted great beauty to our parks and gardens. The success of the Royal Horticultural Society in recent years was not due to him, but rather to the determination of the Society to stick to horticulture, and as an instance of this he cited the great increase in the number of Fellows.

Mr. SHEA, in the absence of Sir J. T. D. LLEWELYN, Bart., proposed the toast "The Visitors," coupling with it the name of the Belgian Minister, and making special allusion to the foreign visitors, as evidence of ties across the water. The Americans differ more in their methods from ours than do the Continental horticulturists, and he contrasted the friendly attitude of their Governmental departments of agriculture and horticulture with that adopted by similar authorities in this country.

The toast of the Chairman having been proposed by M. MARC MICHELI, of Geneva, and responded to by Sir TREVOR, the function came to an end.

THE HORTICULTURAL CLUB.—The informal Dinner of the Horticultural Club, when the foreign visitors to the Royal Horticultural Society Conference were entertained on Tuesday last, proved a great success, and the utmost good feeling was expressed by the guests, who greatly appreciated the entertainment. Mr. HARRY J. VEITCH presided, in the absence of Sir JOHN T. D. LLEWELYN, Bart., M.P., whose Parliamentary duties obliged him to quit early. Messrs. VEITCH supplied fine Roses, flowers and plants for the tables, and Messrs. BUNYARD some fifteen kinds of Kent Strawberries, which astonished the visitors; Messrs. RIVERS orchard-house Cherries; and Mr. GEO. MONRO Cherries from the open.

* * We are compelled to hold over until next week, several reports of Horticultural Shows, including a very successful one held at Wolverhampton.

CARNATION SOUVENIR DE LA MALMAISON: W. Hurlston. Very fine, not over-large blooms. Kindly send photo, and remarks on the cultivation of the varieties as suggested.

CLOTHING A DRY SUNNY BANK: J. J. M. The best sort of plant for a dry bank, and one that looks like grass, is *Pyrethrum Tchihatchewi*. It flowers in early summer, but not for a long season. The seeds should be sown in pans, and the seedlings when large enough transplanted, and finally set out permanently.

CORRECTION.—Mr. L. H. Bailey, of Cornell University, in a communication received as we go to press, states that Bechtel's Crab, figured in *Gardeners' Chronicle*, p. 397, as *Pyrus coronaria*, is the Prairie States Crab, *Pyrus ioensis*, and refers us to his *Native Fruits*, p. 261.

LAURELS: Mr. E. G. The best season for pruning the young growth of the Common and Portugal

Laurels is the latter half of the present month and the first half of August. The knife or scéateur only should be used. A small growth of leaves will soon take place, which will hide the scars of the operation, and but very little pruning will be needed for the rest of the year.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. H. D. 1, *Calla palustris*; 2, *Scilla peruviana*.—E. S. R. 1, *Sedum rupestre*; 2, *S. album*; 3, *S. sexangulare*; 4, *Sempervivum montanum*; 5, S. Ewersii, all finely grown; 6, *Campanula persicifolia*.—The *Bothy-men*. Always glad to be of service to you, especially when you help us so much by your own notes. 1, *Arum dracunculoides*; 2, *Scabiosa caucasica*; 3, *Tradescantia virginica*; 4, *Rubus odoratus*; 5, *Rhus Cotinus*; 6, *Spirea aruncus*.—T. C. H., Yorks. Probably a very light form of *Stanhopea oculata*.—N. D. P. *Maxillaria nigrescens* and *Epidendrum pallidiflorum*.—M. McD. 1, *Syringa Josikaea*; 2, *Eraethnum aureo-reticulatum*; 3, *Polypodium glaucophyllum*; 4, *Davallia pentaphylla*.—F. C. Carefully packed, but the numbers on the labels obliterated. *Achillea*, *Hypericum perforatum*, *Spirea Douglasii*, *Sedum spectabile*, *Limnanthes Douglasii*, *Tropaeolum polyphyllum*; 6, *Linaria vulgaris*.—W. J. K. *Rhodochiton volubile*.—Alpha. Dodder, *Cuscuta Europea*. Pull up every scrap and burn, also the affected plants.—B. D. 1, *Dendrobium thyrsiflorum*; 2, *Dendrobium clavatum*; 3, probably an *Ipomoea*, send flowers; 4, not recognised; 5, *Escallonia macrantha*; 6, *Adiantum macrophyllum*.—E. H. Thornton House. *Clinanthus Dampieri*; five samples.—R. T. D. *Oncidium Batemanianum*; the number of flowers varies according to the strength of the plants. K. I. T. T. 1, *Adiantum capillus-veneris daphnites*; 2, *Nephrodium molle*; 3, *Nephrolepis tuberosa*; 4, *Phytolacca decandra*; 5, cannot name from leaf alone; 6, *Erigeron speciosus*; 7, *Hieracium aurantiacum*.

PEACHES DROPPING: W. F. This malady may be due to a variety of causes, a fertile one being dryness at the root, and less so an excessive crop; although dropping even then does not take place unless accompanied by dryness of the soil. We advise you to examine the state of the border to a depth of 2 or more feet. The applications of some artificial manure (perhaps of an improper kind), of fowl's dung, and of Thomson's Vine and Clay's fertiliser, seem to err on the side of excess, and may have something to do with the dropping. There is far too much of this sort of indiscriminate manuring of fruit-trees under glass going on in gardens.

PEAR LEAVES: W. B. Your assumption is right; the pest is known as the Pear-midge (*Diplosis pyrivora*). If these be very numerous, and you can cover the trees with a cloth, many of the flies might be killed by fumigation. But they have wings, and if your neighbours do not adopt vigorous measures also, you will find it difficult to keep the trees clear of them.

TOMATO: Tomato. The fruit is attacked by the black spot fungus (*Cladosporium lycopersici*). Burn all affected fruits, and syringe the plant with sulphide of potassium, $\frac{1}{2}$ oz. to 1 gallon of water. Wash all fruits before using them.

TOMATO-LEAVES: Hogg & Robertson. The Tomato-leaves sent were almost putrid on arrival, so were useless for getting a reliable result. We might try again with material better packed.

ZONAL PELARGONIUMS: F. Cozens. The varieties have considerable merit, but we cannot appraise their value from a flower sent through the post in hot weather. Obtain the opinion of one of the large traders in these plants, but first give him the opportunity to see your plants as they are growing.

COMMUNICATIONS RECEIVED.—W. D. & Sons.—A. O'N.—W. P.—W. D.—J. Wallis.—E. H. J.—D. T. F.—A. H.—R. D.—E. M.—S. A.—J. S.—C. T. D.—A. V. M.—E. C.—M. C. L.—W. S.—A. P.—Cromdale.—A. D.—Kent & Brydon.—J. L.—H. W. R.—J. J. W.—W. S.—J. C. & Co.—A. & Co., Ltd.—H. G. S.—Anxious.—J. W.—P. Knowles.—J. H.

DIED.—At 60, South Audley Street, London, W., suddenly, JANET ELDER, wife of Walter Mackay, florist. All friends accept this, the only intimation.

THE DEODAR AND LARCH.

I HAVE referred to these two species in your pages before, and I am more than ever convinced that if a substitute for the Larch is wanted, the choice is between the Corsican Fir and the Deodar; and if I wanted to plant a mixture of Firs, I would plant Larch, Deodar, and Corsican Fir. I should then probably have the surest paying crop of timber that could be planted. Of the Larch's value there can be no doubt, because it can always be sold at a paying price. At least, I never knew of a crop of Larch that did not "go off" quickly when offered for sale, unless it was so far from the consumer that the carriage "killed" it. The great fear is the disease. A few weeks back, I saw, in Surrey, a plantation of Larch growing on the poor upper greensand, worth nearly £300 per acre—although not much above fifty years of age, the agent told me. I reckoned the average number of trees and feet to the acre myself. I never saw taller trees for their age, or cleaner, and there was no disease about them; yet on the same estate, and not far off, the young plantations of Larch were diseased. It is still worth while planting Larch in mixed woods, in which the disease is not so liable to spread, but nowhere should it be planted alone, or the loss may be complete. The Deodar (*Cedrus Deodara*) is sure to grow in suitable situations, and it is absolutely free from any destructive disease, unless it be the *Agaricus melleus*, which I have had more trouble with at Wortley than any other disease. It attacks most of the Firs, and kills them when it does; and the reason I think it may attack the Deodar also is, that amongst the great number of fine Deodars growing at Murthly Castle, Perth, that I saw last October, one fine tree had all the appearance of succumbing to this disease. Had the clever forester there, Mr. Murray, not left to take charge of Lord Powerscourt's woods in Ireland, I meant to have asked him to examine the trunk of the tree at the base, where, if the disease existed, the fungus would be found under the bark.

The only drawback to the Deodar, as a general substitute for the Larch is, that it does not always thrive where the Larch does. In the New Forest, where the Scots Fir becomes a fine timber-tree, and most of the Firs grow, the Deodar is a poor sickly specimen. Its home is on the mountain-side and dry uplands, up to at least a thousand feet, in the North of England, and it is not particular as to aspect; but the soil must be dry, very dry. Under these conditions it does not grow as fast as the Larch, but it is not far behind it, and its timber is of more value for all purposes than the Larch is used for, and others. The Deodars at Murthly, according to dimensions sent me by Mr. Murray last year, average about fifty cubic feet each, and as the tree was only distributed about sixty years ago, and might not have been planted at Murthly for sometime after, that number of

feet represents an annual increment in timber of one cubic foot. I could not learn the date of the planting. The above is not the average of a few trees, but of a large number, for there are many at Murthly. The above rate of growth is about the same as at Wortley, where the trees are about eight hundred feet above the sea. At both places the soil is poor and dry. In plantation-culture the trees would not be so bulky, but the number to the acre would be greater, and the feet also, for it is a fact that can be demonstrated, that within properly calculated limits you can get a greater quantity of timber to the acre from a crowded plantation than you could get from an acre of garden—specimens allowed sufficient room to retain all their branches to the ground. I guessed that the space allowed the Murthly trees would allow about fifty trees to the acre, or two thousand five hundred feet of timber in sixty years, worth £125 at the very least, standing, which is a good rent for good, let alone poor, land, and under plantation-culture the quantity of timber would be greater, and the value more.

The Deodar resembles the Larch more than the casual observer might think. Dr. Masters, in his *Notes on the Genera of Taxaceæ and Conifereæ*, says that the resemblance, botanically, of the Larch to the Deodar (*Cedars*) is striking, and from the forester's point of view, I have often thought the same thing. The one being deciduous and the other evergreen is, according to the same authority, a distinctive difference, and no doubt it is; but in this country, under some conditions, the Deodar is deciduous. Trees on eastern exposures I have known to shed their leaves annually for years in succession about the month of March, but otherwise continue quite healthy. The timber, which I have felled at a nearly mature age, is hard, heavy, close-grained, and of the highest commercial value. I doubt if there be any other Fir that equals it in that respect. How well the tree grows as an isolated specimen is well known, but what it might do under plantation culture has got to be proved. That the tree, under such conditions, would grow faster in height, and produce a clean trunk, I do know from examples I have watched for over thirty years, but a regular plantation I have never seen, and the nurseryman's price of eighteen shillings per dozen small plants, is prohibitive. The tree is absolutely safe to plant under the conditions named, and a tree which grows near the snow-line in its own country to a height of one hundred and fifty feet or more, and endures our severest winters with impunity, is a pretty safe subject. On the peaks to the northern side of the Boorung Pass, it grows to a height of sixty or seventy feet before branching. *J. Simpson, Wortley.*

THE

HYBRIDISATION CONFERENCE.

(Continued from p. 56.)

HYBRID DIOSCOREA.

THE Chinese Yam (*Dioscorea Batatas*) has an elongated tuber, penetrating with its bigger end the soil for 3 to 4 feet, and consequently not easily to be dug up. MONS. P. CHAPPELLIER, in trying to obtain a variety that should not present this disadvantage to the culturist, made a series of hybridising experiments, of which he furnished an account.

He took principally the species *D. Decaisneana*, with a spherical tuber as the seed parent, and crossed it with the pollen of the Chinese Yam, with-

out, however, getting very far towards gaining his end, though obtaining some thousands of seedlings. Most interesting, however, was one individual hybrid he obtained between the two species, for it bore both male and female flowers, these, of course, being restricted to different plants in the parent species; the seeds, however, did not ripen. Another experiment was made in sheer desperation. MONS. CHAPPELLIER tried to cross the pigmy *D. pyrenaica* with *D. Batatas*, but obtained no result whatever.

Monsieur Chappellier briefly alluded also to a hybrid he had obtained from *Mirabilis longiflora* ♀, and *M. jalapa* ♂. This pre-eminently displayed the common characteristics of hybrids to be more vigorous than either parent species, a single plant of the one in question bearing no fewer than four hundred flowers at one time. The plants are also fertile *inter se*, but such variations arise among the seedlings that it is necessary to propagate them vegetatively. Reprints also of his paper on "Recent Hybrids of *Crocus sativa*" (*Bull. Soc. Bot. de France*, vol. xlv., Feb. 20, 1897), and others bearing upon the question, were sent to the Conference by M. Chappellier.

PROGRESS IN THE UNITED STATES.

PROFESSOR BAILEY, of Cornell University, in his paper on the progress of Hybridisation in the United States of America, gave a bold summary of results rather than an investigation into specific experiments in hybridisation. In judging the question it must be remembered that the standards are different on the two sides of the Atlantic, because the natural and economic conditions are not the same.

In relation to area, intensive gardening is rarer in America than in Europe; there are relatively fewer glass-houses, less interest in individual plants, and less of the amateur's instinct. On the other hand, larger tracts of land are devoted to horticulture. Fruit-growing is more developed than anywhere else in the world, and greater interest is taken in cosmopolitan varieties.

Again, there is much less interest in hybrids, simply as hybrids. Those hybrids most valued in America are those which fulfil some particular conditions of withstanding sun, or rain, or drought; and it must be remembered that there is as great a diversity of climate in the United States as in the whole of Europe. Hybrid ornamental plants, such as *Cannas*, *Lilies*, &c., are quite common over the water, but they are purchased from Europe; and Professor Bailey suggested that we probably should not care for this to be altered.

The hybridising of fruit trees, Vines, Apples, Plums, &c., with native species, was then gone into in some detail, all the work apparently having been undertaken on an economic standpoint, with a view to obtaining plants suitable to special cases. An Apple is wanted to stand the climate of the cold North—Russian races, and Siberian Crab are stocks that have been imported to aid in the pursuit, and so on.

An idea of the magnitude and scope of the work is, that Craig alone made 5000 crosses in Iowa in 1899, and a messenger went 500 miles into Arkansas to obtain pollen to be used at the Experimental Station in the former place.

The European Pear does not thrive in the Southern States, and the introduction of a new specially-raised variety has made profitable Pear-growing possible there.

Attention was also drawn to the Orange experiments brought before the Conference by Mr. Webber. The paper concluded with a list of the chief experimenters, the names of plants dealt with under the heading of particular States, and including Canada.

In his final sentences, Professor Bailey pointed out that by producing a single hybrid which could be named and sold, more immediate results, so far as glory and so on, might be obtained; but when species are blended so that the resulting plants cannot be distinguished from ordinary varieties, then a more useful end is attained.

HYBRIDS IN THE JARDIN DES PLANTES.

MONS. L. HENRY, Curator of the Open-air Department of the Paris Natural History Museum, contributed his notes upon the hybridising experiments, successful or the reverse, to the number of over a hundred, made by himself between the years 1887 and 1899. Perhaps the fullest account which he presented was upon *Lilacs*, and he sent for exhibition a water-colour drawing of a hybrid and its parents. This was obtained by crossing *Syringa Bretschneideri* ♀ and *S. Josikaea* ♂, and the object sought was accomplished, namely, to get darker flowers than those of the seed parent, while retaining its foliage.

In the converse experiment, *S. Bretschneideri* ♂ showed its prepotency again, so far as foliage went, the flowers, on the other hand, agreeing with the seed-parent, in colour, form, and size.

M. Henry also made experiments similar to those

of M. Lemoine, alluded to elsewhere, with a view to clearing up the origin of *S. dubia*, or Varin's Lilac. By crossing *S. vulgaris* and *S. persica* (? *S. p. laciniata*), he obtained plants identical with Varin's form, so far as foliage went, but unfortunately they died before flowering.

PROPOSED EXPERIMENTS.—Monsieur Henry, when alluding to the discovery of the parentage of the Varin's Lilac (*Syringa dubia*), through the crossing of various species of the genus, took the opportunity of suggesting that the Conference should institute a series of investigations with a view to clearing up the doubtful history of other plants. His first selection of species to be made the subject of hybridising experiments is given below:

Amygdalus persicoides, Duham.
 " = *persico-amydala*, Dalsch.
Esculus rubicunda, D. C.
Berberis Neuberti, Hort.
 " = *ilicifolia*, Hort.
 " = *stenophylla*, Moore.
Cerasus fontanesiana, Spach.
 " = *Prunus graeca*, Desf.
Crataegus oxyacantho-germanica, Gilot.
 " = *C. lobata*, Bosc. = *Mespilus Smithi*, D. C. ?
Cytisus Adami, Poit.
Dianthus semperflorens, Hort.
Juglans hybrida, Hort.
 " = *pyramidalis*, Carr.
 " = *Vilmoriniana*, Carr.
Prunus cerasifolia, Hort.
Pyrus ualifolia, Spach.
 " = *bolwylliana*, D. C.
Ribes Gordonianum, Lem.
 " = *intermedium* (Billard, 1867).
Robinia Deodaisneana, Cam.
Rosa alba, L.
 " = *Fortuniana*, Lindl.
 " = *Hardyi*, Cels.
 " = *hybrida*, Schlecht.
 " = *Noisetiana*, Red.
Rubus nobilis, Rge.
Sorbus hybrida, L.

HYBRID FERNS.

Mr. CHARLES T. DRUERY, V.M.H., pointed out in his paper on "Fern-crossing and Hybridising," the difficulties arising from the microscopical size of the reproductive organs in Ferns, and their position on the underside of the prothallus. Scientific accuracy as to percentage is one of these, as stray Fern-spores cannot easily be kept out. Florists, he said, can practically make sure that a seed-pod contains A + B, but in Ferns the cross is mainly determined by the resulting combination of characters.

The ordinary process of reproduction in Ferns was entered into in order to emphasise the points alluded to, and then Mr. Druery went on to give details of several planned as well as unintentional crosses which cannot be doubted. Mr. E. J. Lowe's hybrid between *Scolopendrium vulgare* and *Ceterach officinarum* is one, and Mr. Druery exhibited fronds of the scaleless *Ceterach* form with confluent lips and sori infused pairs. *P. Schneideri* x was next described and brought forward as illustrating the possibilities of endowing exotics allied to our rare British Ferns, with the characteristics of the latter, increasing their beauty, and at the same time rendering them more hardy.

Hints were then given as to facilitating the transit of antherozoids from one prothallus to another in mixed sowings, or where prothalli from separate sowings are subsequently paired, and these were followed by suggestions as to the severance of the sexes by cutting up the prothalli. Crossing in Ferns, continued Mr. Druery, is not limited as in flowers by the necessity of the pollen-tube being of a length agreeing with that of the style, the prothalli being alike except in the case of filmy Ferns, and the size of the Fern proper being quite immaterial. On the other hand it was noticed, in conclusion, that habitual asporogamic reproduction proves an effectual bar to cross-fertilisation in many Ferns.

HYBRID CLEMATIS.

A paper was received from M. MOREL on "Hybrids and Mongrels of Clematis," and these may be considered under his various sub-headings.

Clematis coccineo-Pitcheri.—The first experiment in crossing *Clematis coccinea* ♂ and *C. Pitcheri* ♀, which belong to the same group, produced a large number of fertile seeds. The seedlings obtained

were chiefly interesting from their resemblance *inter se*, and constituted a form intermediate between the species they were derived from (see E. André, *Revue Horticole*, August, 1893, for a detailed description of the hybrid, as well as for figures of itself and its parents). From *C. coccinea* it gets its habit of early flowering and its colour, while from *C. Pitcheri* its vigour, its sepals reflected at their extremities, and its sweet vanilla-like scent. This hybrid seeds copiously and reproduces itself almost exactly, but if pollen from one of the parent species is used, a large number of forms is obtained, that more nearly resemble the pollen parent. Its fertility is adduced as evidence of the near relationship of *C. coccinea* and *C. Pitcheri*.

Hybrid No. 378.—This is between *C. coccinea* ♂ and a large-flowered *Clematis* as yet unnamed (No. 140) ♀, two species which belong to very different groups. The pollen parent contributes the consistence and a number of sepals. The flower is intermediate in form between the urceolate blossoms of *C. coccinea* and the spreading ones of No. 140, which latter gives the colour. The leaves are more like that of the former species, and the hybrid has proved sterile up to the present.

Hybrid No. 401.—This hybrid, though having the same pollen parent as the last, and produced also from the seeds of a large-flowered *Clematis* (*Oriflamme*), almost completely retains the characters and habits of *C. coccinea*. The number of its sepals is variable, being sometimes four as in the latter species, sometimes five or six as on the other parent. No. 401 has always proved sterile.

Clematis à Ville de Lyon.—This, which M. Morel considers the most beautiful form of the genus yet obtained, was described and figured in the *Revue Horticole* of April 16, 1899. The parents are *C. coccinea* ♂, and a large-flowered form called Vivand Morel, and the appearance of the progeny at first sight seems to belie its origin. The foliage of the hybrid is altogether that of a large-flowered form; the enlarged open flowers in no way recall the sepals of *C. coccinea*, to which its other hybrids retained some resemblance. The colour of the blossoms, as well as the number, dimensions, and arrangement of the stamens, agree with the pollen-parent, which it also resembles in its constitution, being immune against the attacks of the terrible disease that attacks the large-flowered species of *Clematis*. M. Morel quoted a parallel case of the hybrid Pæonies between *Pæonia officinalis* ♀, and *P. Rossii* ♂, which altogether resemble the seed-parent.

HYBRID LILACS.

Under the title of "Hybrids of the common and of the lacinated Persian Lilac," Monsieur EMILE LEMOINE pointed out that in approaching the subject of hybridisation, the technical processes must be studied by means of which the work is accomplished. His paper illustrates how the classificatory position and origin of certain plant forms may be cleared up by hybridising trials. Opinions differ as to what the Lilac of Varin really is; whether it be a pure species, a hybrid, or simply a form of *Syringa vulgaris*.

In endeavouring to obtain a double-flowered variety, M. Lemoine persistently tried to cross Varin's Lilac ♀, and the common double form ♂, and *vice versa*, but without success. A like attempt where the Varin's Lilac was replaced by the typical Persian Lilac, and the white form with similar leaves also failed, but all the flowers of the lacinate Persian Lilac, which has very different foliage from the other, yielded seed when supplied with pollen from the common double Lilac. Some sixty seedlings were obtained; some which have produced single, half-double, and double flowers, and the last, have been named *Syringa varina duplex*. The conclusions are, that Varin's Lilac is a hybrid, and arose as a chance cross between *Syringa vulgaris* ♀, and *S. persica laciniata* ♂. M. Lemoine's cross, in which *S. vulgaris* was the pollen-parent, has usually leaves which are smaller than the original Varin form, and sometimes at the base of branches are slightly lobed. The

experiments point towards the typical Persian Lilacs also being hybrids.

HYBRID MIMULUS, VIOLA, &c.

Dr. STUART, of Cherside, sent in an account of his hybridising work as an amateur horticulturist. First of all he gave a description of his raising of *Mimulus tigrinoides* from the garden *Mimulus* (Scarborough Defiance) ♀, and *M. cupreus* ♂. The plants which proved the dwarfest of this particular section of *Mimulus* were sent out by Mr. Cannell, of Swanley, and were favourites in their day.

Next, the author alluded to his verification of the steps by which Mr. Grieve obtained his "coloured Pelargoniums." Very weak plants, with highly-coloured leaves were produced as a result of crosses either way between Golden Choice and Golden Pheasant. To give vigour of constitution a dwarf, horseshoe-leaved species was used as seed parent, and pollen taken from one of the highly coloured forms.

Among Dr. Stuart's seedlings, obtained from a horse-shoe leaved seed-parent crossed with one of Mr. Grieve's highly-coloured forms, those that had parti-coloured leaves showed most tendency to send out a branch with the characteristic tri-colour markings. When these appeared they were cut off and struck, and the plants so raised kept their character wonderfully. Some plants did not, however, show their true character for years.

Passing on to the question of Tufted Pansies, as he calls the plants commonly alluded to as Violas, Dr. Stuart went into the origin of his well-known hybrids on the genus. Following the idea, started by Mr. Wills, of crossing *Viola cornuta* from the Pyrenees and the garden Pansy, to increase the hardihood of the cultivated varieties, Dr. Stuart chose "Blue King" as the pollen parent, and was able to raise a dozen hybrid seedlings from *Viola cornuta*. Their flowers showed the long spur of the mother, but were markedly different from known varieties. The reciprocal cross resulted in straggling plants with Pansy-like flowers, that were of no interest horticulturally speaking. By again crossing the first hybrids with garden Pansies, a number of the large flowered kinds were obtained. Much interesting information was also given by Dr. Stuart with regard to hybrid Aquilegias, Trollis, and Primulas.

RASPBERRY GOLDEN QUEEN.

(SEE FIG. 28, p. 63.)

IN our last issue, on p. 59, was given a description of a new yellow-fruited Raspberry, shown at Chiswick by Messrs. Jas. Veitch & Sons, Chelsea, and awarded a First-class Certificate by the Fruit Committee of the Royal Horticultural Society. Mr. Seden states that the variety is the result of a cross between Raspberry Superlative and *Rubus laciniatus*. The evidence of any influence of the *Rubus* is not marked, and many may regard the variety as a yellow-fruited Superlative. If this be so, this newest Raspberry will be certain of a cordial reception, as it will make a capital companion to the finest of all Raspberries.

ORCHID NOTES AND GLEANINGS.

THE INDIAN ORCHID SOCIETY, CALCUTTA.

THE object of this Society is to encourage the cultivation of this wonderful order of plants, by exploring different parts of India, Burma, and the Straits, and collecting Orchids, which will be distributed amongst the members at a moderate price.

Notes on the cultivation of Orchids will be published from time to time for the information of the members.

An annual exhibition of Orchids will be held, at which handsome prizes will be given to the growers of the best specimens, and thereby the public of India will be made familiar with and appreciative of the beauties of "The Flower of the Age."

Free distribution of Orchids to the value of Rs. 10 to local members, or 10s. to foreign members. On any additional purchases a discount of 25 per cent. will be allowed to the members of the Society only.

Free admission to the Society's annual exhibition. All publications of the Society will be distributed free to all members.

It is intended to start a horticultural library in connection with this Society (as funds will permit), and members of the Society will be entitled to the use of the library, and take loan of books and papers according to the rules and byelaws to be framed hereafter.

An Orchid congress will be held with the annual Orchid show in March every year, where the interests of the Society will be discussed, due and

many readers of the *Gardeners' Chronicle*. I will begin with the intermediate-house, a large one, which is chiefly filled with large, fine *Cattleyas* and *Lælias*, an example of which was recently given in a supplementary illustration in the *Gardeners' Chronicle*. Two equally well-grown specimens of the same species, one a huge mass, 2 feet 6 inches across, bearing altogether fifty-four large blooms, and the other a fine healthy plant, having twenty-

thought by many orchidists to have ceased to exist, and, indeed, it was at that time in poor condition, but under the care of Mr. Chamberlain, the Duchess's gardener, the plant has nearly regained its former fine health and vigour. When *Cattleyas* or *Lælias* here deteriorate from any cause, they are turned out of their pots, the whole of the rooting materials picked out, rotting roots removed, and the healthy parts washed with warm water. The plants are then placed in small pots, filling in around the roots with clean crocks only, which are kept in a moderately moist state. In a very short period of time fresh roots push forth, and the plants are re-potted in the ordinary manner.

In the same house were noticed fine specimens of *C. Warscewiczii* (gigas) in fine health and vigour, almost every new growth sending up strong flower-spikes, which, by the time these lines are in print, will be making a gorgeous display. Mr. Chamberlain attributes his success to thorough maturing of the growths after flowering is over, and a long, dry, resting season. Large plants of *C. Bowringiana* and *C. Lawrenceana* were likewise noted in excellent condition; capital examples of *Odontoglossum citrosum* were suspended from the roof. At one end of the house were placed strong plants in bloom of *Anguloa Clowesii* and *A. sanguinea*. These plants were already making promising growth. Among others which thrive well in the intermediate-house were *Lælia cinnabarina* (several in flower), and three vigorous specimens of *Epidendrum prismatocarpum*, Veitch's variety, with nine, seven, and six large spikes of bloom respectively; *Miltonia vexillaria*, with clean, healthy foliage; *Lælia anceps*, the different varieties of which were breaking freely. A large number of *Cypripedium insigne* are grown for cutting for house-decoration, these coming into bloom when other flowers are scarce.

In the warm-house were *Cypripediums*, as *C. selligerum majus*, *C. Roezlii*, *C. grande*, *C. Dominicanum*, *C. Lawrenceanum*, *C. Sedeni*, and its light-coloured variety, *candidulum*, fast growing into massive specimens. *C. Godefroyæ*, generally considered a difficult plant to manage, is well grown at the Deepdene. The plant is potted in well-drained pots, filled with fibrous loam, and the cultivation is that of an ordinary stove-plant. The rare *Vanda Roxburghi* was nicely in bloom at the time of my visit; its violet-purple lip is a very attractive feature. *Phalenopsis Schilleriana* and *P. amabilis* appear to thrive planted in baskets, hung up to the roof on the shady side. The sweet-scented *Angraecum Leonis* does well similarly treated. Here, too, were several pans filled with *Anaëtochilus*; the species *A. patula* increasing rapidly. So few gardeners succeed with these beautiful plants, that a few hints on the treatment found to answer, will be acceptable to many. When new shoots emerge from the old growths, they should be cut off as soon as they begin to make roots, and put singly into small pots, using peat, moss, with finely broken crocks, and sand, all mixed together; five or six of these small plants are then plunged together in sphagnum-moss in a large pot or pan, and over all a bell-glass is placed. During the day-time the bell-glass is tilted several inches, but at night it is closed.

The next house, a lean-to, facing south, is filled with *Dendrobiums* which were making their growth. From these a grand display of bloom is expected in due season. Several plants of the white-flowered *D. Dearei*, hung up near the roof, were growing most luxuriantly. In a low span-roofed house, were *Calanthes* in capital condition, many of them having immense growths. The *Odontoglossum* or cool-house contained numerous young plants fast growing into half specimens, and I noted several spikes of *O. crispum* which numbered thirteen and fourteen flowers; also plants of *O. Pescatorei*, *O. Coradinei*, and *O. Uro-Skinneri*; *Oncidium macranthum* making strong growth, and also in flower. Plants of *Masdevallia Harryana*, *M. Veitchiana*, the pretty *Leptotes bicolor*, *Epidendrum vitellinum*, and other species were growing

FIG. 28.—RASPBERRY GOLDEN QUEEN: COLOUR OF FRUITS GOLDEN-YELLOW.

(SEE P. 62.)

(Awarded a First class Certificate at the Chiswick Conference on July 11.)

proper regard being given to the propositions of individual members, and papers on the "Cultivation of Orchids" will be read.

All communications to be addressed to S. P. Chatterjee, Victoria Nursery, 78, Narcoledangah Main Road, Calcutta.

ORCHIDS AT DEEPEENE, DORKING.

Having lately had the pleasure of inspecting the fine and interesting collection of Orchids in the gardens of her Grace, Lily, Duchess of Marlborough, at her residence, Deepdene, near Dorking, a few remarks upon what I saw in flower may interest

six flowers, were remarked. On the central stage some splendidly-grown *C. Mendeli*, many of which were well advanced in bud, a few plants only being in bloom, were remarked, one of them a pretty variety having pure white sepals and petals, and a lip of a pale, rosy-mauve tint, each of the three spikes carrying nine large flowers. Unfortunately, I was too late to see the remarkable *C. Mendeli* Duke of Marlborough in bloom, of which there are now two fine healthy plants. This variety is regarded as one of the finest of the genus to which it belongs. It may be of interest to note, that some few years ago this particular plant was

in this most agreeable temperature, and under a well-shaded roof.

The Palm-house contained several large, healthy specimens of *Sobralia macrantha*. It may be mentioned, as showing what a *Sobralia* will endure without harm, that the temperature of this house often falls during winter to 50°. There are other glass-houses filled with miscellaneous decorative plants which are as well grown as the Orchids. *W. H. W.*

PLANT PORTRAITS.

APRICOT FERTILE DE CHATENAY, *Revue Horticole*, June 16. Excellent quality; ripens (in France) in middle of July. Raised and sent out by M. Croux of Chatenay (Seine).

ECHINOCACTUS SETISPINIS, *Mechanics' Monthly*, June. Native of Texas.

ODONTOGLOSSUM CRISPUM VAR. MADAME METDEPENNINGEN X, *Revue de l'Horticulture Belge*.

POLYGALA DALMAISIANA X, *Revue de l'Horticulture Belge*, July. Raised in 1839 by M. Dalmals, out of *P. grandiflora*, by *P. cordifolia*.

POLYPODIUM AMMIFRONS, *Makino*, l. c., t. vii.

POLYPODIUM LINEARE, THUNB., and var. OSOBI, *Makino*, *Phanerog.*, etc., Japan *Icon. Illustrat.*, t. ix, x.

POLYPODIUM SESQUIDEALE, FORMA LEIOPTERIS, *Makino*, *Phanerog.*, etc., Japan *Icon. Illustrat.*, t. viii.

RHODODENDRON PENTAPHYLLUM, *Makino*, l. c.

ALPINE GARDEN.

GENOTHERA OVATA.

THOSE who do not know this beautiful little day-blooming *Enothera*, will do well to obtain it. My plant is growing on a dry rockery where the sun shines on it until the afternoon is advanced. It seems to be quite hardy, and although not increasing much in size, the plant is healthy. If one remembers aright, it was catalogued as resembling a Primrose in its habit. After making due allowance for this as a figure of speech, one cannot say that the reference was inapplicable. The ovate leaves are pretty, and the bright yellow flowers, about an inch across, are pleasing. They are produced on stalks about the length of those of a common Primrose. The plant is herbaceous, and as the crowns are small, care is necessary in working near it while at rest. It comes from California. Although suited by the condition of a dry position, it ought not to be allowed to suffer from drought.

AZALEA ROSEIFLORA.

As a rock-garden shrub in suitable districts, this dwarf plant is much to be coveted. I have purposely in speaking of it retained the garden name by which this *Azalea* or *Rhododendron* is generally known in nurseries. Unless I am mistaken in my reading of the *Kew Hand-List of Trees and Shrubs*, it is considered to be the same as *R. indicum* var. *balsaminiflorum* = *Azalea balsaminiflora*, Carr.; *A. Rollisoni*, Hort. On referring to the *Index Kewensis*, I have not found the name *A. roseiflora*. I think, however, that for garden purposes we shall find it quite enough to retain *A. roseiflora* as sufficient for the purpose of identification. I have only grown it in the open without protection for two winters, but its behaviour in the late frosts in March last, which were so disastrous to many other flowers, gives one some confidence in its hardiness. It was on the recommendation of an Irish nurseryman that I tried it on one of my rockeries, and I have been more than pleased with the result. Its pretty, double, rosy-salmon flowers are this year being produced very freely, and they last in bloom for a wonderfully long time, even in the hot weather we have had of late. The half-shaded position in which it is grown accounts largely for this. It is nearly three years since it came here, and it is as yet only a few inches high, and shows a valued tendency to increase more in diameter than in height. It is grown on the east-side of a rockery not far from the top, but partly shaded and surrounded by such plants as *Iberises*, *Alyssums*, and *Aquilegias*. The soil is sandy-peat, and in dry weather watering is regularly attended

to. As already mentioned, *A. roseiflora* is grown without protection, except what is afforded by the surrounding plants.

CYTISUS PURPUREUS.

Among the many members of a delightful class of rockwork shrubs one may well find room for *Cytisus purpureus* and its varieties. The type, with its pretty purple flowers, is a good rock-garden plant, but it is, one is of opinion, inferior in beauty to its two varieties—that known as *C. purpureus* var. *incarnatus* is considerably brighter. Those who were at the Temple Show would observe it in the collection from the Riverslea Nursery; and there is, I think, a good plant in the rock-garden at Kew. It is a variety well worth securing, although at present considerably higher in price than the typical form. The variety with white flowers, known as *C. purpureus* albus, has, if one is not mistaken, been rather longer cultivated, but it is not, as yet, often seen in rock-gardens. It is very beautiful, and, like the others, has a pretty effect with its sprays of Pea-shaped flowers. Some recommend that this *Cytisus* should be grafted on some other stem, such as that of the Laburnum, and grown as a standard. For the rock-garden, it is much more pleasing when growing in its natural way. *S. Arnott.*

(To be continued.)

FLORISTS' FLOWERS.

CHRYSANTHEMUMS.

THE month of July brings plenty to do among the Chrysanthemums, for there are many details to be attended to, the neglect of any of which may spoil the labours of the entire year. Plants being grown for producing large blooms for exhibition, or for home-decoration only, will require just the same kind of treatment. Every plant should now be in suitable summer quarters, as well as in its flowering-pot. Chrysanthemums are sun-loving plants, and when all the other details of cultivation receive proper attention, they do not suffer from the fullest exposure. The ground on which the plants are stood should be sheltered from south-west winds, so prevalent in September and later, and which do much damage to the plants in unsheltered places. By that time the flower-buds are mostly formed, with a stalk several inches in length, and these and the leaves suffer much from strong winds, which bruise them by whipping them against each other. Let sufficient space between the plants be afforded, that the leaves of one shoot do not overlap those in its vicinity. Bear in mind that the proper ripening of the growth is of the utmost importance. Plants whose shoots and stems are sappy, owing to a want of space during the summer, will afford satisfactory blooms.

Where the cultivation is of the best modern kind, that is, with three shoots to each plant, these may be trained to wires running horizontally. The pots should stand on a hard, worm-proof, and yet pervious bottom, cinders, gravel, spar, or what not, so long as it fulfils these conditions. See that the shoots are tied to the supports in good time, many branches being lost by lack of attention to this point, remembering that every shoot injured now means one bloom the fewer. Affording water to the plants is a most important detail; but do not keep the soil constantly wet, rather allow it to get moderately dry before affording any. During hot weather, examine them twice daily, rapping the pots with the knuckles to find if water be needed. When rain or river-water cannot be obtained, and cold well-water must be used, in order that no check to root-action be given, it should be exposed to the air for a day or two. If this cannot be done, mix a little common washing-soda or "anti-calcaire," commonly known as milk of lime; $\frac{1}{4}$ lb. of the former is sufficient for 40 gallons of water, and 1 lb. of the latter to 200 gallons. Dissolve the soda in hot-water, adding it then to the bulk; in twenty-four hours the lim

held in suspension in the water will be precipitated to the bottom of the vessel. Not only does the soda soften the water, but it acts as a stimulant to the plants. Syringe the plants daily—at least once in the evening, and also in the morning when the weather is exceptionally hot and dry.

CINERARIAS.

Let the plants be re-potted when the roots have reached the sides of the pots they are now growing in. A suitable compost consists of fibrous loam three parts, half-decayed stable-manure one part, and some leaf mould with peat if the loam is considered to be too retentive. As much coarse clean sand should be mixed with the whole as will give free passage to water. The plants at this season are the better for occupying a cold frame on the north side of a wall, then shading can be dispensed with. If the pots can be plunged to half their depth in a bed of coal ashes, less water will be required by them. It is still time to sow a small quantity of seed.

Offsets may be taken with a portion of the roots attached, potted and placed in a cold frame and kept close till growth has begun anew. Cinerarias require to be grown at this season almost in the open air, and if the lights are employed by day, they should be drawn off the frames at 7 p.m., and so left till the early morning, excepting in the event of rain or hailstorms being imminent. The leaf-mider, *Tephritis onopordinis* sometimes attacks the leaves, but being readily seen, there is no excuse for allowing it to do much harm to the leaves.

Calceolarias.—The seed which was sown last month having germinated, a little more may now be sown for affording late flowering plants. A serious mistake often made is to sow thickly, with the usual effect of having drawn and weakly plants to begin with, which never give satisfaction. As soon as the plants can be handled, prick them off in pans filled with a mixture of equal parts of loam and leaf-mould; and plenty of silver-sand. The plants should not stand closer together than 1 inch. Stood in a cold frame or cool-house, and shade well, sunshine at this stage being very injurious. Apply water often, but sparingly in quantity, the mere moistening the leaves being of more consequence than wetting the soil for a day or two. If the soil cakes, stir gently with a pointed stick. As the plants make progress afford more air, and when four to six leaves have been put forth, transfer each plant to a thumb-pot; and to the compost named, add one part finely sifted, half-decayed horse-dung. Transfer the plants with all the soil that will hang to the roots. The after-treatment is similar to that recommended for the Cineraria.

PARSNIP-FLY.

CYCLING trips to market-gardens in different parts of Surrey and Middlesex, for the purpose of studying plant-diseases in the field, have shown that during the last fortnight, or rather, just following the last spell of rain, the Parsnip-fly is very much in evidence, and may be considered as the cause of the most general epidemic just now prevalent.

The fly known as *Tephritis onopordinis*, Fab., is rather smaller than the common house-fly, having a brown head and body, deep bottle-green eyes, and two gauzy transparent wings, ornamented with several brown patches.

The eggs are deposited singly in the substance of the leaf, and the larvæ or maggots hatch within a few days, and feed on the substance of the leaf, enclosed between the upper and under-skin of the leaf. In this way large dead brown patches are formed, in which the maggot can be clearly seen when the leaf is held between the eyes and the light. If, as is usual, several such dead patches are present on a leaf, and nearly all the leaves are attacked, the Parsnip rots at the crown, or ceases to grow, owing to the destruction of the leaves. Several broods are hatched during the season. The

maggots of the autumn brood become transformed into pupæ, which remain in the soil until the following year, when they change to the imago or fly condition.

Preventive Measures.—Crushing the maggots present in the leaf, most effectually prevents the appearance of a second brood of flies. While this is being done, badly-blistered leaves should be removed, placed in a basket, and burned. If simply placed on the manure-heap, many of the maggots hatch out.

Sprinkling the leaves with a mixture of soot and slaked lime has in some instances proved of value; and when a small quantity of tobacco-dust is added to the mixture, it proves very effective. Soot alone, I am informed, does not prevent the deposition of eggs.

As already stated, the pupæ pass the winter in the soil. To destroy these, fresh gas-lime should be lightly harrowed in. The same insect does an equal amount of injury to the Celery crop, and is too well known to gardeners as the Celery-fly. (*Geo. Massee*.)

INDIA.

CEYLON BOTANIC GARDENS.

THE miscellaneous section of the Reports for 1898 of the Ceylon Botanic Gardens has lately been published by the Director, Mr. J. C. Willis, and as regards all districts, is, on the whole, satisfactory. Thus, we read that:—"The general condition of the Peradeniya Garden, both as regards its beauty and utility, has been much improved during the past year, and reflects much credit upon the Curator, Mr. Macmillan."

Again, of the Hakgala Garden:—"Mr. Nock has, as always, kept this garden in beautiful condition, in spite of the drawbacks of a very insufficient supply of water. During the drought in the latter part of the south-west monsoon, the garden had to be watered with water carried a long distance."

It is further mentioned that:—"The laboratory-room in the museum building has been very full during the year, and the want of space has been acutely felt. Mr. Parkin has occupied one bench from March 20 to the end of the year. Dr. Max Fleischer, now of Buitenzorg, worked here from February 2 to 24, and collected mosses in many parts of the island. Mr. J. B. Carruthers occupied a bench at intervals for the investigation of the Cacao fungus and other mycological studies. Mr. A. K. Coomardswamy, of University College, London, commenced work here on November 17, and other visitors have also made use of the laboratory for short periods. Besides the investigation of many points in economic botany, the Director has been occupied during the year in a thorough revision of the Ceylon and Indian Podostemaceæ, a little-studied order of plants of much botanical interest. Mr. Parkin has made a very extended study of the coagulation of latex, chiefly in rubber-yielding plants, and has also worked at some other problems in physiological botany. The completion of the late Dr. Trimen's *Flora of Ceylon* has been vigorously pushed on by Sir J. D. Hooker, and towards the end of the year the fourth volume, containing the remainder of the Dicotyledons and the Monocotyledons to the end of Eriocauloneæ, was published, as well as the last series of twenty-five plates. The final volume is well in hand, and will contain the Cyperaceæ and the Grasses."

From the notes on economic plants, we extract the following reports:—

Tea.—The total export is once again larger than in any preceding year, being 119,769,071 lb., against 116,054,567 lb. last year. Exchange has been very steady at about 1s. 4d., and prices have been low, but with a tendency to rise later in the year. The extension of this cultivation has now practically ceased, but large areas planted during

the last few years continue to come into bearing, so that for some time yet the total output will probably slowly increase. One of the most promising features of the past year has been the large increase in the export to countries other than the United Kingdom, America taking 2,180,188 lb., against 830,873 lb. in 1897, and Russia 2,714,003 lb., against 439,349 lb., whilst the export to other countries has also increased very much. Australia now takes the large amount of 15,126,891 lb. The net result of this has been an actual decrease of the export to the United Kingdom by 2,796,226 lb., which should help to improve the prices obtained.

Cacao.—The export has again risen from 34,503 cwt. to 36,982, in spite of the ravages of the Cacao-canker, which has been a troublesome pest during the year. The life-history of this fungus has been very thoroughly investigated during the year by Mr. J. B. Carruthers, the expert engaged by the Planters' Association. His observations and conclusions, with recommendations for treatment of the disease, have been published in pamphlet form by the Association. The treatment of the pest now rests with planters of Cacao themselves, and there seems no reason to apprehend very serious danger to this cultivation, if proper pains be taken to attack the disease promptly wherever it may appear. As was predicted, the planting of the hardier *Forastero* varieties is extending, and the older varieties are being steadily replaced by them.

India-rubber.—A great deal of attention has been given to this product during the year. Mr. J. Parkin has spent the bulk of his time since March 20 in the laboratory here, carrying out chemical and physiological investigations into the processes of tapping and coagulation, &c. A tour was made in March to the Ratnapura and Kalutara districts to see the plantations of Para Rubber made by the Forest Department, and on various estates. These trees are growing very well on the whole, and some have yielded very good Rubber in promising quantity. The trees in the gardens have done well, and yielded a large quantity of seed, much of which was sold by auction at an average price of about Rs. 27 per 1000. A large quantity of seed was also sold from private estates."

EXIT COAL.

THE President of the Institute of Mining Engineers recently made a statement which has a rather alarming look about it at first sight. He limits our supply of coal to fifty years; but, even supposing the limit to be strictly correct, we do not think gardeners or the rest of mankind need to give way to fear. We suppose the President had purposely ignored the fact that new fields have been discovered, especially in the South of England. But there is a possibility then in half a century we may be able to do without coal—at least in many departments of social life; and before the fifty years have lapsed, it is certain that the demand will have grown wonderfully small compared with that now existing. No one can, of course, for a moment overlook the great fact—that the power which turned decayed and decaying vegetable matter into that coal, now supposed to be nearing the extinction-point here and there, is still at work every moment of time making and transmitting force to the uttermost ends of the earth. The great gravid cloud-masses are ever being persuaded to clasp and embrace the hill and mountain-tops in all these islands—parting with their life-giving contents to rill and river, torrent and waterfall—ready at all points for the electric accumulator and distributor to be snatched from various centres to farm or garden for ploughing, reaping, harvesting, grinding, hauling to warehouse or market, ready for grass and hay-cutting, for use in the greenhouse or orchard-house, in expediting the ripening of all kinds of fruits, as demonstrated by Sir W. Siemens. This all-pervading force can be used in the driving of all kinds of machinery, in

sundry manufactures—none may tell where it ceases to be a great factor in the daily life of mankind.

As is well known, Niagara has been harnessed, and what the power thence derived has been made to do would form a curious chapter in American daily life, for the force of Niagara is felt for many leagues distance from that great New World wonder. Quietly as the sun prepared in far-back ages the fuel for our daily requirements, for hot-house and warm greenhouse use, for lighting conservatory and drawing-room, so to-day it continues quietly to raise moisture from river and sea into cloudland, thence to be distilled for ever, to fall, not only on to the earth to vivify all Nature, but to provide that power which will most assuredly be recognised as the world's friend when the decree has really been passed—exit coal!

TREES AND SHRUBS.

THE ELÆAGNUS.

ALTHOUGH the genus *Elæagnus* is an extensive one, and consists of both deciduous and evergreen shrubs or small trees, it is, as a whole, but little known in English gardens. In the case of the evergreen species, their beauty is more apparent in the winter. Being of easy culture in ordinary garden-soil, and, moreover, vigorous in growth, some of them should be introduced into most gardens. Increase is by means of seed sown in the spring, by cuttings of ripe shoots inserted in the autumn, and by layering the shoots in the period of growth. The following species are the more ornamental.

Elæagnus reflexa (golden-leaved form).—This is a very ornamental object in the shrubbery, or as a solitary plant on the lawn, the golden variegated foliage being very fine. It is an evergreen, growing to a height of 8 feet, vigorous and free, and much branched. The leaves are ovate, oblong, acuminate, smooth, glabrous on the upper surface, white on the underside, slightly serrated on the margins. The deep green ground colour is attractively marked or shaded with yellow, and the variegation is constant. In some cases the green colour is almost absent, in which case the beauty of the plant is greatly enhanced.

E. reflexa (silver-leaved form) is distinct from the foregoing, the leaves being in colour deep green, with a distinct marked silvery edge; ovate-oblong, smooth, and very glabrous on the upper surface, toothed or serrated at the edges; the underside is furnished with a silvery tomentum. The plant grows with freedom, and reaches a height of 6 feet. Like the first named, it is of a compact and symmetrical form. The stems and branches are very smooth, and of a brown tint.

E. longipes.—I first saw a plant of this species about twelve years ago at Mr. Ware's nursery, Tottenham, as a large shrub, which probably still exists. It has conspicuous fruits, which are esteemed by some persons in a preserved state, like Cranberries. It is also an evergreen, of a distinct, spreading habit, its branches and stems of a reddish-bronze colour, and it reaches a height of 10 feet in good soil. The leaves are of a deep green tint, ovate-lanceolate, glabrous above, and silvery beneath. The flowers are of a creamy-yellow colour, small, and abundant; and the fruit long-stalked, oval, transparent, of an orange tint, and of the size of a Gean or wild Cherry. *E. longipes* forms a very pretty shrub, valuable alike for fruiting or as a decorative object. The species was introduced from Japan in 1873. (*See Gardeners' Chronicle*, 1873, p. 1014.)

E. macrophylla has the largest leaves of any of the species; in shape, roundish-ovate, smooth, and glabrous, and deep green in colour above, with a scaly white tomentum on the underside. The flowers, greenish-yellow, are borne in clusters, and appear in the autumn. It will grow to a height of

8 feet, and is an attractive evergreen, destitute of spines. A native of Japan, the year of its introduction is uncertain.

E. pungens.—A pleasing evergreen bush, of about 6 feet in height, its stems and branches furnished with numerous spines. The leaves are oblong, entire, and undulated; in colour, of a deep green tint above, and silvery-white beneath. The creamy-white flowers come singly, and in pairs, are of small size, and abundantly produced during the summer. A native of Japan. There are several garden forms, with silver and golden-coloured leaves, in cultivation.

E. hortensis is a handsome deciduous species, which reaches a height of 20 feet. A native of the East, it was introduced to this country from Southern Europe in 1633. The flowers are yellow in colour, scaly on the exterior, possess an agreeable fragrance, and appear in the months of May and June. The leaves are lanceolate, of a deep green tint, covered with minute hairs, and in length they measure 2 to 3 inches. The stems and branches are more or less spiny, and of a dark-brown tint. A form of this species, known as *E. h. angustifolia*, differs only in having long, narrower leaves.

E. argentea.—A North American species of decorative value; the leaves oblong, ovate, glabrous on both surfaces, and covered with silvery-white scales. The flowers of a yellow colour are borne in clusters in the axils of the leaves, and appear during the months of July and August. In growth the shrub forms a striking object, of from 9 to 12 feet in height, vigorous in growth, and useful for associating with other shrubs, &c. It was introduced in 1813. Of the lesser known forms, which are seldom seen outside Botanic Gardens are:—*E. canadensis*, with white flowers, and distinct evergreen leaves; *E. Simoni*, and its variety tricolor, pretty and effective species from China; and *E. triflora*, *E. umbellata*, and *E. conferta* from Nepal, may be commended for garden-planting, being distinct and pretty, but requiring some slight protection in the winter in cold or much exposed situations. *E. S.*, Woking.

FORESTRY.

THE DECAY OF TREES.

DR. PLOWRIGHT'S notes on destructive fungi, on p. 392 of the *Gardeners' Chronicle*, vol. xxv., are very interesting to the practical forester, not merely because they give the life-history of the fungi referred to, but also to the fact that they open up the evergreen question as to whether true parasites and saprophytes are the cause or the effect of tree death and decay. And in using the term "death and decay" in reference to trees, we must remember that death is not the same thing as decay in the majority of cases. Death in a tree is a physiological event which accompanies the total loss of vitality, as in the case of animals; but decay of branch or heart-wood cannot always be accepted as evidence for or against the health or vitality of a tree. As a matter of fact, most trees begin to decay in some part or another while still saplings, the most familiar example of this being the death and decay of suppressed branches in a thick wood, or in the middle of a thick crown. In such cases, where the dead portion falls off before any length of time has elapsed, the general health of the tree is not affected in any way, and its value as timber is greatly increased. But when large limbs and branches die, or are broken off by storms, the danger of parasites attacking the dying portion, or of saprophytes gaining an entrance into the heartwood of the stem from the exposed surface of the stump of the broken branch, is often a serious menace to the health of the tree, or at any rate, to its longevity. The great age which many trees obtain when growing in suitable soil and climate is evidence that in the absence of the various destructive factors to which trees are exposed, growth is comparatively interminable.

We have Oaks and Yews reaching an age of over 1000 years, and still growing on in comparative vigour, although their trunks may be little more than hollow shells, and the actual annual increase in girth imperceptible. It is a noteworthy fact that almost all examples of very old trees are either pollards or resemble pollards in their stem and growth. We know of no instance of a long clean-boled tree reaching an age anything like that of these patriarchs of the tree kingdom, although, perhaps, the very fact of their high commercial value may reduce their chance of escaping the axe when economy or expediency are called upon to decide their fate. Other reasons may be found, however, which account for the comparatively short lives of tall timber-trees. In the first place, they are much more exposed to the full force of the wind than trees of short stature, and any weakening of the root system results in their overthrow after a few years. Another reason may be found in the tendency tall trees exhibit of becoming stag-headed as they advance in years. Tall Oaks are especially subject to this weakness, usually attributed to a deleterious subsoil, but more probably connected with a reduced supply of sap to the crowns as the heartwood of the tree approaches the bark. For the same reason, the root system gradually becomes weaker as the supply of elaborated sap from the crown becomes lower, for it is obvious that a tall, clean stem appropriates a much larger share of this material than a short or well-branched bole, with a smaller superficial area. Tall trees, again, have usually been grown in close order, or under conditions which are less favourable to the growth and development of the individual, than to the production of commercial timber, and trees, like animals, suffer in after life for the privations or misfortunes of their youth. Probably many other causes operate in this matter of longevity, but the above are, we think, the chief ones in accounting for the comparatively greater age of short stemmed trees compared with their taller brethren. *A. C. Forbes.*

(To be continued.)

ODONTOGLOSSUM × HARRYANOCRISPUM.

THERE was shown at a meeting of the Royal Horticultural Society, held in the Drill Hall, on June 27, a hybrid *Odontoglossum*, from a cross between *O. Harryanum* × *O. crispum*. This hybrid, which came from the collection of Sir F. Wigan, Bart., Clare Lawn, East Sheen, S.W. (gr., Mr. W. H. Young), is distinctly intermediate between its parents. The flowers are French-white, prettily marked with purplish-rose-flush, and blotches, which are distinctly shown in our illustration on p. 67. A First-class Certificate was awarded the plant on the date above mentioned.

THE ROSARY.

AMONGST THE PLANTS.

WHILE thousands and tens of thousands have lately been enjoying a feast of Roses at the exhibitions now being held in various parts of the country, and while eager enthusiasts are discussing the merits of the various exhibits, and exhibitors are exulting over their triumphs, or mourning over their defeats, it must not be forgotten that the Rose season offers enjoyment of a more quiet and not less pleasurable kind to those who can look round in their own gardens, small or large, and view them either in their general effect, or in the character of their individual blooms. Such is my present position, and I think that I may safely say that I have never had a better or more favourable time for enjoying the varied Roses which I cultivate. I do not grow my Roses for exhibition, so that I am not influenced in the selection of varieties that I cultivate by this one factor alone; nor,

again, do I plant my Roses for any particular effect—that is, I do not group them in various colours, nor am I able to grow a quantity of the same variety, as my space is limited. Moreover, I am obliged to grow them more closely than strict rules would enjoin. I probably have three plants where an exhibitor would only have one, and yet with all that I have many a bloom which would not disgrace a prize stand. I have been growing my Roses here for thirty years, but I do not think that I ever had a more enjoyable time for them than in the first week of July, 1899. We had a splendid rain the week before, and I have not a trace of aphids amongst any of my Roses, except on a few plants on a south wall. What does determine the irruption of aphids? some people say that thundery weather brings them, others that an east wind and a bright sun are most favourable to their incursion; and I saw in a morning paper yesterday, that there has been a complete plague of them in Dover. But whatever may regulate their movement, certain it is that here we have not been troubled by them. Now, this in itself materially tends to enhance the good appearance of the Rose garden; when we have to use soft-soap, Gishurst compound, or any of the insecticides which are now so lavishly offered to us, they leave the foliage besmeared and disfigured. Nor have I as yet seen any signs of orange-fungus, although I daresay it will make its appearance by-and-by. We have had no great alternations of heat and cold, and consequently no appearance of mildew; moreover, there has been a quiet time as regards wind, so that our plants have not been blown about. Along a fence which separates my herbaceous border from the rest of the garden, there are plants of single and other Roses which have been, and some of which are now, in very great beauty. Paul's Carmine Pillar is unquestionably a beautiful Rose; it is, moreover, very early, being among the first of the single Roses to flower, profuse in blooming, while the flowers are a fair size. Then there are a couple of Lord Penzance's hybrid Sweet Briars, Lady Penzance (the best of them all), and Anne of Gierstein; then come those two grand single white Roses, Macrantha, with its golden stamens, and Paul's Single White; Bardon Job shines out very conspicuously, but it will be eclipsed, I think, by Paul's Royal Scarlet—this is the most brilliant flower we have yet had. In looking over the Roses that I have out in the beds, I come across some fine flowers, and when I gather one and put it, as one unconsciously does with a Rose, so that I could inhale its perfume, I find, alas! that it has none. This is the case with many of our newer Roses, and it is due, I believe, in great measure to the blood of Victor Verdier having entered into them; but I think it ought to be a rule that no new Rose should be decorated by the National if it lacks perfume. Here is a new Rose which I think will be valuable, viz., Ards Rover, a seedling of Messrs. Alex. Dickson & Sons, of Newtownards, said to be of scendant habit; it is a flower of good form, high colour, and very fragrant, and as we have no Rose as yet amongst our climbers at all like this in character, I think it is likely to prove a great acquisition to rosarians.

Then I see standing up some nice blooms of Gustave Regis, whether Tea or Hybrid Tea it does not matter—quite an ideal button-hole Rose, with its long, pointed, bright yellow bud. Of course, like all Roses of this character, it is of no use when expanded, as it is only semi-double, and consequently loose and shapeless. What a capital Rose for garden decoration, too, Gloire Lyonnaise has proved itself, although it did not fulfil the promise with which it was announced, a yellow hybrid perpetual, yet undoubtedly its vigorous constitution and fine glossy foliage must always secure it a favourable position in our gardens. There is indeed the faintest suspicion of light yellow at the base of its petals, which the imagination of Mons. Guillot has exalted into a yellow hybrid perpetual.

In looking over the portion of my garden

which is devoted to Teas, I find that the frosts which we had at the end of May, and which proved so injurious to many things, has made many a blank here, but there are very many beautiful flowers to delight one. Comtesse de Nadaillac I have always regarded as the very *crème-de-la-crème* of Tea Roses; my plants of it have given me flowers of a very brilliant colour, almost if not equal in this respect to those of Mr. Prince, at Oxford. Anna Ollivier and a beautiful and most popular Tea Rose, Catherine Mermet, and its fair daughter, The Bride, afford a great treat. How beautiful too is Maman Cochet, and the white sport from it! and I see there a strong plant of that beautiful Rose, Madame Hoste; while such old flowers as Innocente Pirola, Edith Gifford, Madame do Watteville, Madame Cusin, Francisca Krüger, and other well-known favourites are there to delight one's sense of beauty and refinement, for I think this latter to be the peculiar characteristic of the Tea Rose. It is never huge and coarse, as we often find some of the H.P.'s.

practised by one of the old school may be of interest to those who have not struck Roses before. It is always pleasant to have a few plants at hand to fill up any blanks in the borders, and if there are some to spare to give to the cottagers on the estate for their gardens—it helps to promote that kindly feeling which it is desirable to foster.

If the following directions are carried out, 95 per cent. of the cuttings will strike in from ten to twenty-five days, according to the variety. Bottom heat of from 75° to 80° degrees is necessary. This may be obtained from a bed of litter and leaves on which a frame can be placed; but a flue underneath a narrow frame is better, as with careful firing the heat is more under control. If a flue is employed, 1 foot of damp ashes should be placed over it. The depth of ashes will depend on the distance this part of the flue is from the furnace. The part of the particular flue I have in mind at the moment is 14 yards from the furnace, and when Roses are being struck a small fire is lit morning and evening. Over the ashes place 7 inches of soil, in a mode-

once or twice a day, according to the dryness of the weather, care being taken not to saturate the soil. If the frame is situated on the north side of a wall no shading will be required, but otherwise, careful shading from the sun at all times is necessary.

After roots form, the cuttings should be potted off into 3-inch pots. In very mild localities the young plants may be planted out-doors in the autumn; but in colder districts, if afforded a further shift into 5-inch pots they can be wintered in a cold frame, and planted out after the first heavy rain the following April. From three to a dozen blooms can be had the first season, if the ground is in good condition.

Roses can be struck with less trouble, and in any free soil, but to root 95 per cent. requires a little care.

The following extracts are from a note-book relative to Rose-striking in Scotland; the years are immaterial:—

August 25.—Put in cuttings of Baroness Rothschild, Alfred Colomb, &c., on the 16th inst., and some are rooted this day—in nine days.

October 8.—Put in cuttings of Alfred Colomb on the 1st inst., and some roots are an inch long—in eight days.

October 31.—Put in 157 Rose-cuttings, nine varieties, on September 18, and all rooted and potted-off bar two. *James Baxter, Boldre Grange Gardens, Lymington.*

PLANT NOTES.

MASCARENHASIA CURNOWIANA.

THIS beautiful plant, a native of Madagascar, requires only to be more generally known, to ensure its popularity as a stove-climber. The scarlet flowers somewhat resemble those of the Jasmine, and are borne in great profusion at the end of the branches. They last a long time in perfection. It is figured in the *Botanical Magazine*, t. 6612, where the name *Mascarenhasia* is described as being commemorative of the Commander of the Portuguese Fleet, Don Mascarenhas, by whom the Island of Bourbon was discovered in 1545, and in honour of whom it was first named.

PLUMERIA ACUTIFOLIA.

Although a deciduous plant during the winter months, it is nevertheless a plant that should be cultivated by all lovers of stove-flowering plants on account of its white, deliciously-fragrant flowers, which are produced at the apex of the branches, where alone also the foliage is borne; while below are the leaf-scars of former years. The plant comes from the East Indies, and was introduced by Sir Joseph Banks in 1790. Both this and the first-named plant are in flower here. *J. G., Botanic Gardens, Liverpool.*

THE VINE IN AUSTRALIA.

IN the course of a paper read before the Australian Association for the Advancement of Science, Mr. F. B. Kyngdon stated that the first Grape-Vine in Australia was planted at Castle Hill, near Sydney, in 1791, by Colonel de la Campe, a French *émigré*. The first Grape-Vine near Paramatta, a few miles from Sydney, and famous for its oranges, was planted in 1801. After the fall of Napoleon in 1815, Mr. John Macarthur, a spirited colonist, obtained, while in Europe, a number of cuttings of the finer varieties of Vine, but the London nurseryman to whom they were entrusted for despatch to Sydney, substituted others of an inferior kind. The trick was not discovered until several years afterward, the soil and climate of the colony being in the meantime blamed for the failure of the experiment. In 1825, cuttings of the Muscat and Madeira varieties were sent to Sydney, and thrived splendidly. Other cuttings followed, but the British Government refused to grant passages

FIG. 29.—*ODONTOGLOSSUM* × *HARRYANO-CRISpum*: COLOUR OF FLOWERS FRENCH WHITE, MARKED WITH PURPLISH-ROSE. (SEE P. 66.)

But there is another sense which is gratified in walking through one's Roses at this time, namely, the delicious perfume which they shed around; to this the high-coloured hybrid perpetuals, such as Charles Lefebvre, Duke of Edinburgh, Duke of Connaught, Abel Carrière and others of the same kind chiefly contribute. I suppose we may conclude that this comes from their having the blood of the Damask Rose in them, and the more this is present, the sweeter the Rose is; and so I think that we who are non-exhibitors may take our fair share of enjoyment out of the Queen of Flowers. But it must ever be borne in mind that this cannot be had unless we attend to her wants; and, for instance, I take as much pains over planting, pruning, and feeding of my Roses, as if I were going to compete at every show. I also disbud carefully, so that I do my very best to secure good bloom. I am quite aware that plenty of bloom could be had without doing so; but I prefer one good flower to three or four indifferent ones, and a little extra care and attention are never thrown away. *Wild Rose.*

ROSE CUTTINGS.

As many people are naturally anxious to increase their stock of Roses, and as a suitable time is at hand to insert cuttings, perhaps a note on the plan

rately damp condition; on the surface one-eighth of an inch of silver-sand—this reflects the heat to the undersides of the leaves. Let the surface of the soil be about 1 foot from the glass. The best soil is turfy peat which has been one year in stack, one-quarter silver-sand, and about one-thirtieth powdered charcoal, the whole mixed and passed through a $\frac{3}{8}$ sieve. If in any doubt about the temperature, plunge an ordinary thermometer 6 inches in the soil.

Having all in readiness, choose a dull day or evening for taking the cuttings, these should be six or seven joints long, and neither too old nor too young. When the shoot has just shed its bloom, the cutting is about right. They should have healthy foliage, and be taken as close to the old stem as possible. Trim about three of the leaves off the bottom, and I always cut the base with a slight slope, as I find slow-growing varieties root quicker than when cut transversely. Take a handful of the cuttings and dip gently into soapy water three or four times, and before laying them down repeat the same operation in clear water. This frees them of green-fly, and keeps them clean for a time. They may now be dibbled in the frame about four inches apart, but do not crowd the foliage. No air will be required until roots form, but the foliage should be moistened

to Continental Vine-dressers, and it was not until 1844 that such men found their way into the colony. Thenceforward the progress of Vine-cultivation was rapid, and with its increasing spread the production of wine became a recognised industry. In 1861 there were in New South Wales, Queensland, South Australia, Victoria, and Western Australia, 7,009 acres under Vine-cultivation; in 1896 the area had become increased to 58,642 acres, the product being 5,606,035 gallons of wine, 7,901 gallons of brandy, 63,665,280 lb. of table Grapes, and 2,145,360 lb. of raisins. The Grapes grown in New South Wales are equal in size and flavour to the finest grown in Continental Europe, but both their cultivation and the production of wine from them remain imperfectly developed as a whole. In 1897 the area under wine cultivation in the colony was 8,061 acres, producing 794,256 gallons of wine, 7,134 gallons of brandy, and 6,462,400 lb. of table Grapes. The raisin manufacture is still one of the industries of the future in New South Wales. In 1893, with 462 acres less under cultivation than in 1897, the quantity of wine produced was 931,542 gallons. Most of the vineyards are of limited extent, but several are of large size. They are scattered over the whole of the colony, save on the more elevated table-lands and in the sub-tropical regions. There are over 2,000 vigneron in the colony, the most successful being Italians, Germans, and Frenchmen, or individuals having some practical knowledge of Vine cultivation as practised in Europe. The colony offers an unlimited field for enterprise in this direction, there being many thousands of acres eminently adapted for Vine cultivation remaining unutilised. It has been stated by a leading authority that New South Wales is more favourably situated for raisin production than is any of the other colonies, and that when the industry has become introduced and firmly established, a large intercolonial and export trade may reasonably be anticipated. Of the 16,695,560 gallons of wine imported into Great Britain in 1896, only 6,394 gallons were from New South Wales, most of that produced in the colony being locally consumed. Such is the abundance of Grapes, mostly the black varieties, in the colony, that during the season they are retailed at 1d. per lb. in Sydney, the finest Muscatels bringing from 3d. to 6d. per lb. In the vicinity of the vineyards they are cheaper still. *J. Plummer, Sydney, N.S.W.*

MARKET GARDENING.

MARKET FERNS.

LOMARIA CILIATA MAJOR.—This may be recommended as one of the best of the genus; spores germinate freely, and with good treatment useful plants may be established in a few months. Its great advantage over *L. gibba* is that the fronds stand more erect; the fronds are also longer—few Ferns make more symmetrical table-plants. To establish good plants, they must have careful attention from the start. The seedlings should be divided singly as soon as large enough to handle, and potted in a light compost. When large enough for potting into 48-sized pots, a good rough compost may be used, fibrous-loam, leaf-mould, and peat, with plenty of sand added, and good drainage; or if leaf-mould is not to be had, some well-rotted stable-manure may be used. They may be grown on in a stove temperature, and like a moist atmosphere, but over-watering at the roots should be avoided. After the plants have attained to a useful size, they may be gradually hardened-off and well exposed to the light, when the fronds will harden and will stand well when used for house decoration.

The *Lomarias* are not the most popular of Ferns, but I have found that the above variety finds a ready sale, and should rank among our most useful market Ferns.

ADIANTUM SCUTUM.

Of the larger-fronded Maidenhair Ferns, this is the most useful; it makes a well-furnished plant in a 48-sized pot, or as a larger specimen it is very useful. The plant should be potted in good rough loam, and plenty of manure, and a good sprinkling of sharp sand; unless the loam is very heavy, no peat should be used. Grown in good loam, the fronds are of better substance than when a light, peaty compost is used. Young plants may be raised freely from spores; it is, however, necessary to be careful to collect new spores, and they should be taken just as the first spore-cases begin to burst open. I may add that in potting off the young plants, clumps of three or four seedlings may be potted together, and will make well-furnished stuff much quicker than when grown singly. In the earlier stages they may be grown in plenty of heat; but after they are well advanced, an intermediate temperature, with plenty of light and air, will ensure firm fronds, which last well either when cut, or used as pot plants. I believe if a regular succession of this useful Fern were sent to market, it would soon become as popular as *Pteris cretica major* is at the present time. In referring to this variety, it occurs to me how changes come about from time to time, even in the demand for Ferns. A few years ago the crested varieties of serrulata and cretica were more in demand. Now the plain-fronded varieties find more favour, especially cretica major or Ouvrardi, as the best variety is often called. Perhaps I should have said "what was the best variety," for the variety raised by Messrs. Stroud Brothers, and named Drinkwateri, seems likely to supersede it, being of more vigorous growth. This may certainly be recommended to all who grow for market, and especially to those who grow on larger-sized plants than the ordinary 48-size. I find it comes true from spores, and when grown in clumps, it soon makes well-furnished, market-sized stuff; but for larger plants, grown singly, they make tall and symmetrical specimens. *A. Hemsley.*

BOOK NOTICE.

THE TENTH ANNUAL REPORT OF THE MISSOURI BOTANICAL GARDEN, founded by Mr. Shaw, an English settler in St. Louis, has just been published.

The garden is instituted for "the prosecution of research in botany in the broadest sense, including vegetable physiology, the diseases and injuries of plants, and horticulture, and other branches of science closely connected with these, and the instruction and training of gardeners." Ten years have elapsed since the foundation, and each year ample reports have testified to the progress that has been made, and to the scrupulous care taken to carry out the wishes of the testator both as regards the pleasure of the general public, and the advancement of the science and art of horticulture. The herbarium is based upon the collections of Dr. Engelmann, which are invaluable to the student. The library, also, is very rich, especially in books relating to the literature of field, garden, and orchard plants, presented by the late Dr. Sturtevant, and in the pre-Linnean books collected by that botanist. Each year a "flower-sermon" has been preached in accordance with the will of the founder, and two banquets, one to the trustees and their invited guests, and another to the staff of gardeners and invited florists, nurserymen, and market gardeners. It will be seen that the Institution, which is under the direction of Professor Trelease, is calculated to advance horticulture and botany in all their aspects, and to bring together in one common bond all, or as many as circumstances will allow, of those who are interested in them.

The volume before us gives a condensed history of the garden, and various scientific papers, including notes on the grasses of Bernhardi's Herbarium, now in possession of the gardens, by Mr.

Lamson Scribner. A peculiar disease of Beech-roots, due to the presence of sclerotia, is treated on by Hermann von Schrenk. Mr. C. S. Plumb contributes a valuable biographical notice of the late Dr. Sturtevant, who, after serving in the army, collected a herd of Ayrshire cows, and in 1875 published a monograph concerning them. The improvement of Iodian Corn was another subject in which Dr. Sturtevant achieved a desirable reputation, and which doubtless led to his position as Director of the splendid Agricultural Station at Geneva, N.Y., the development of which is mainly due to his sagacity and energy. A list of serial publications received by the garden, and an index to the ten preceding volumes, complete a work of much interest to those concerned in the progress of botany and horticulture.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Tripoli Onions.—The beds should now be made ready for the first sowing of Tripoli and other winter Onions, by heavily dressing with decayed manure and deeply digging it. Before proceeding to draw the seed-drills, roughly level the surface, and tread it evenly all over. The end of the present month, and again fourteen days later, will be soon enough to sow the seeds. It is prudent to dress it with fresh soot before sowing, and to rake it to a fine tilth. Giant Rocca is a hardy variety that may be sown at this season, also Dutch Blood-red, Globe Tripoli, and Flat Tripoli.

Celery must be attended to daily, affording water so as to keep the plants growing without receiving a check, applying liquid-manure, and dusting the leaves well with soot two or three times weekly, and keeping the soil amongst the plants loose. No time should be lost in planting out the latest succession plants in shallow trenches in single lines. It is of no advantage to plant in deep trenches, but plenty of decayed manure should be placed in the trenches, and water liberally afforded before and after planting. The nursery beds should likewise be thoroughly soaked with water previous to lifting the plants, and but a few plants should be lifted at one time.

French Beans.—The last sowing for the season may be made on a south border, choosing early varieties only. Let the seeds be soaked in water for a few hours before sowing them, and apply water to the drills. All seeds may in dry weather be sown a little deeper than in wet weather.

Vegetable-Marrows.—Let the bine where crowded be thinned once a week, and the roots well supplied with water and liquid-manure, removing all fruits as fast as they become fit for use.

Peas.—The rows of Peas must be afforded plenty of water at the roots, mulching heavily if this has not been done. Syringings of an evening are beneficial after hot days.

Endive.—A large sowing of Endive may now be made in drills on land where it may stand till fit for use, which is better than sowing in beds and transplanting. Thin out the seedlings to 10 inches apart, afterwards applying water with a rose-can. Make other good sowings of Endive and Lettuce at fortnightly intervals.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt Tisbury, Gloucester.

Dahlias.—These plants are now making rapid growth, and as the main stems are easily broken by rain and wind, it will be necessary to keep them tied up. To produce fine blooms, a liberal amount of liquid-manure must be afforded after the first few flower-buds have appeared where planted in light soils, and a mulch of manure placed over the roots, but kept clear of the stems. Earwigs and thrips are troublesome insects to Dahlias, and the former may be trapped by placing the stems of Broad Beans or reeds amongst the leaves, or small flower-pots stuffed with moss or hay may be put upon the tops of the stakes, the pots being examined every morning and emptied of insects. Thrips may be kept in check by

syringing with a weak decoction of tobacco-juice and water— $\frac{1}{4}$ of a pint of the former to 4 gallons of the latter.

Chrysanthemums.—The early-flowering Pompon varieties now showing flower-buds should be well supplied with liquid-manure, and the varieties flowering in September and October should have the leading shoots pinched back, so as to throw strength into the lateral shoots, and thus form fine bushes. Put stakes and ties to each stem sufficiently far apart to allow the sun to ripen the wood; and in cases where the side shoots are much crowded, thin them out according to the size and sort of blooms required. It is best to afford liquid-manure to these plants later in the season, as so much depends upon the proper maturing of the shoots and grass; unripened growth never producing good blooms.

Violas and Pansies.—These plants suffer much during this month from heat and drought if neglected. Water should be applied after sunset twice a week, and liquid-manure from the cow-stalls with some soot put in it, and much diluted with water, is beneficial to them. All faded flowers and seed-vessels should be removed, and when growth becomes crowded, the older shoots should be pinched back to the base, when fresh suckers will grow up, and thus keep up a succession of bloom. Should the plants be attacked with mildew, pinch off the shoots, and dust the plants with black sulphur (*S. vivum*) in dry weather, keeping the beds dry for three days, and then lightly fork in some leaf-mould, and damp lightly overhead till fresh growth commences, when a more liberal treatment may be afforded. The plants in the reserve garden should now be cut over, so that they may produce shoots for dividing and growing on for another season.

Herbaceous Plants.—Much water will now be required by these plants, especially in the case of Phlox, Helianthus, perennial Asters, Rudbeckias, Potentillas, and cross-feeding plants generally; and in poor soils manure-water is of great benefit in keeping the foliage healthy, and producing fine blossoms. Let the border be kept in a tidy state, but do not cut-back the stems of the plants till they have become dry, as till then they are of use to the plants. Annuals as they pass out of flower should be pulled up, and if gaps are left, fill them by plunging Fuchsias, Pelargoniums, and any plant that will stand exposure, and not look out of character with the surroundings.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

Strawberries.—Layering should be pushed on with despatch, especially the runners intended to make plants for early forcing. It is optional whether layering is done on the fruiting-pots, or on others of small size; in any case, the pots must be quite clean, be afforded a moderate amount of drainage, and the soil pressed firmly into them, in order that the plants may be dwarf. In layering, choose the first runner nearest the parent plant as being the one most likely to produce the best plant, cutting back the runner to this point. Arrange the pots in rows, and in a way that admits of water being readily afforded once, twice, or thrice a day, as may be necessary. Be careful to take no layers from infertile plants. These usually make an abundant growth, and their runners are of a very tempting size. Pieces of brick or stone are good for keeping layers in position on large pots, and wooden books for small pots. Small pots should be plunged to half their height in the soil, in order to lessen the labour of supplying water. The soil used should be turfy loam, one year in stack, or the same with garden-soil mixed with it, and but little, if any, animal manure. Some $\frac{1}{2}$ -inch bones spread over the drainage, affords a good aid to growth when the soil has become filled with roots. Two quarts of bone-meal mixed with each wheel-barrow-load of soil, will be sufficient to impart due vigour. The layers which will be forced the earliest should be fully exposed to sunshine on a coal-ash floor, afforded plenty of space, and generally brought along with a due regard to early maturity, the potting off being carried out without delay. Until the roots push freely into the new soil, water must be administered cautiously, a sodden soil always bringing unhealthiness in its train. Clear water suits the Strawberry best until forcing begins, manure afforded sooner than this producing an undesirable luxuriance of foliage. If the loam made use of be very adhesive, fine ballast or sand should be mixed

with it, or the plants may suffer from the retention of moisture and consequent lack of air in the soil. The plants, whether they are potted in their fruiting-pots or not, should be sprinkled overhead about 6 p.m. if the day has been warm and bright.

Tomatos.—In order to have plants for affording an early winter supply of fruit, seeds may now be sown thinly in a shallow wooden box, and when the plants are strong enough transplant them direct into 4-inch pots. An ordinary cold frame will suit the young plants during the early stages, as well as for the germination of the seeds. I would recommend as suitable varieties for present sowing Frogmore Prolific, Ham Green, Favourite, Conference, and The Cropper. Seeds may also be sown in 60's, the strongest plants only being retained, but the growth of the plant is more rapid when the seeds are sown in shallow wooden boxes and no transplantation is done. The seed, however, must be sown, or rather dabbled down, at $1\frac{1}{2}$ to 2 inches apart; the plants must be kept near the glass, and plenty of air afforded them.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener to the Dowager Lady HOWARD DE WALDEN, St. James's House, Malvern.

Chrysanthemums.—Where large blooms are looked for, not more than three shoots should be retained on a plant; but those plants which are grown for the production of flowers for cutting may be allowed to develop from six to twelve shoots each, according to the size of the pots in which they are growing. All flower-buds appearing during the present month should be pinched out, and from the resulting break one shoot only should be retained on each branch. Roughly speaking, buds which are produced after the first week in August may be "taken," or, in other words, may be allowed to develop by pinching off the shoots which subsequently appear around and below the bud. Early plants which are beginning to fill their pots with roots, may now be assisted with an occasional application of weak liquid-manure—and when procurable that obtained from the farm-yard tank is probably the best; but, failing this, a bushel of horse or sheep's manure may be put into a sack, and steeped in a hogshead of water, and the manure-water thus produced may, after being diluted to a safe point, be applied to almost any kind of plants. At this early stage, however, care must be exercised not to afford manure too often, otherwise an unduly gross and sappy growth will be induced. It will be necessary to go over the plants frequently, and tie-in the shoots, in order to prevent injury by the wind, and by birds settling upon them. Water should be carefully afforded, examining each plant several times a day in hot weather; and in the evening the plants benefit greatly by being syringed.

Miscellaneous.—Seeds of *Cyclamen latifolia* may now be sown, using for the purpose shallow pans, well drained, and filled with sifted sandy loam. Having made the surface level, firm, and smooth, place the seeds half-an-inch apart, and cover them to the depth of a quarter-of-an-inch with fine soil. Place the seed-pans near the glass in a cold-frame, keeping the same moist and close, and shaded from bright sunshine. The seed will soon germinate. Further sowings of *Cinerarias*, *Primulas*, and herbaceous *Calceolarias* may be made, following the directions given in a previous calendar. The earliest-sown *Calceolarias* will now be large enough to be pricked-out into pans or pots. Let the same conditions with regard to shade and moisture be maintained as before.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Cleaning Strawberry Quarters.—The earliest and mid-season varieties having ceased to bear fruit, should have all the dead and useless foliage removed, together with the runners, where these are not required for propagation—and these are not usually in good condition after fruit-gathering is finished. Together with these goes all of the littery mulching material. Let the beds be then slightly hoed over, and if the soil is found to be dry, apply water heavily, having first afforded the beds a light top-dressing of Mushroom-bed or similar short manure. No bed should be allowed to fruit for more than three years, and if the plants that were forced are used to form the plantations, two years is long enough. Where the beds are to be destroyed, let the plants be cleared off forthwith, and plant with

winter Broccoli in drills made 4 inches deep, a stout dibber being employed to make the holes. The plants for new Strawberry quarters should be forthwith layered in 3-inch pots, if this has not been previously done. These runners should be ready to plant out early next month if a good crop of fruit is looked for next year.

The Morello Cherry.—The training-in of the young shoots and the removal of surplus ones should be carried out as far as practicable before the necessity arises for putting netting over the ripening fruits. If black aphids infest the shoots, afford the trees a heavy syringing with diluted Quassia-extract as before recommended, but if it is the points of the shoots only that are infested, dip these into the solution instead of using the syringe on them. The next day well syringe the trees with clean water. The nets should be suspended from the top of the wall, and be kept far enough away from it by means of forked twigs or light poles to allow of a person walking underneath.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Natural Hybrids.—So far as is known to me, no plants answering to this description exist in large number, for even where two good species grow together, inter-crossing does not take place to such an extent as might be supposed. The largest recognised group is that of *Lælio-Cattleya elegans*, and the form called *Schilleriana*, both the result of intercrossing of *Lælia purpurata*, *Cattleya guttata* Leopoldi, and *C. intermedia*. From the cultivator's point of view, it is usual to treat *L.-C. elegans* as a distinct species, its requirements differing greatly from those of its supposed parents, and contrary to what was said concerning home-raised hybrids, it is not so amenable to the ordinary methods of treatment as are the latter. Of the two, *L.-C. Schilleriana* is the easier managed, the influence of *C. intermedia* predominating. Both forms should be cultivated in well-drained and well-ventilated pots, deep pans, or baskets, the latter being, perhaps, the better for temporary use, whilst perforated pans should be chosen for permanence. The best kind of Orchid-peat, with a small quantity of sphagnum-moss inserted here and there to improve appearances, and afford the grower an indication of the condition of the materials as regards moisture. Let the temperature of the house in which the plants are placed range from about 58° as the lowest in winter, to 68° in the summer, and conditions such as these are usually to be found at the warmer end of the *Cattleya*-house; place them more in the shade than in the sun. Numerous species and varieties of Orchids have made considerable growth at the top, as well as new roots, and this makes it a suitable season for renewing a portion of the surface material. Until the present time water has been afforded in limited quantity, but it may now be considerably increased, the rooting material being kept in a well moistened state. A disease peculiar to *Cattleyas* is induced by sodden materials in the dull season, when evaporation is arrested, and the plants, once attacked by the disease, seldom recover. The most that a cultivator can do is to cut back the diseased parts down to healthy tissue. When he detects its presence in a very early stage, a cure is perhaps possible if powdered-charcoal and sulphur be rubbed in, and the plant kept in a dry state for a short period of time.

Lælio-Cattleya Gattoiana is a natural hybrid between *Cattleya Warneri* and *Lælia tenebrosa*. It possesses a good constitution, and thrives when treated similarly to *C. labiata*. A plant here is now throwing up its flower-sheaths, and will in consequence need water oftener.

Hybrid Odontoglossums of natural origin provide us with many fine forms, *O. Wilckeanum*, *O. excellens*, *O. elegans*, *O. Andersonianum*, *O. Ruckerianum*, *O. Hunnicum*, and *O. aspersum* being the better known ones. All but the two last named should be afforded treatment similar to that found to answer with *O. crispum*; the last named being treated like *O. Rossii*, which plant is at the present time in a state of comparative rest.

Cymbidium Tracyanum.—Plants of this fine natural hybrid are in active growth in an intermediate-house, where sunlight is moderated by thin shading, and the air is maintained in a fairly moist state. Some much-diluted farmyard manure-water may be afforded occasionally.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, JULY 22	Royal Botanic Society, Meeting. Rose and Horticultural Show at Newton Means.
TUESDAY, JULY 25	Royal Horticultural Society's Committee. National Dahlia Society's Committee Meeting at Hotel Windsor, 5.30 P.M. Horticultural Show at Tibshelf.
WEDNESDAY, JULY 26	Beckenham Horticultural Society's Show.
FRIDAY, JULY 28	Imported and Established Orchids, Maori Skulls, and Caeti, at Protheroe & Morris' Rooms.

S A L E.

PROVINCES.—July 19 (6 P.M.): Max. 82°, Eastern Counties; Min. 54°, N.E. Scotland.

Excessive heat.

The new Charter of the Royal Horticultural Society.

We are unable to furnish any official information concerning the new charter of the Royal Horticultural Society. As a rule, we never hear of the charter till there is something the matter, and when that happens, there is usually a difficulty in routing up a copy. It might fairly be assumed from the sudden way

in which the announcement has been made, that something is the matter with the Society. Yet it is so very prosperous at present, that we do not believe there is aught amiss.

We prefer to believe that the Council are wisely providing for possible future emergencies, but why they should have selected the week of the Hybridisation Conference, and the busiest season of the year to make the announcement, passes comprehension. As the meeting is to be held on Friday, our readers can learn nothing of the proceedings till next week.

Recalling by an effort of memory the troublous times which are happily past and gone, we remember there was such a thing as a charter granted in 1809, and another (the new charter) in 1861. When the time of trouble came, so far from being a help, the charter proved a nuisance and an encumbrance. People found themselves doing illegal things, and prevented by the provisions of these precious documents from doing other things which seemed right. It is, therefore, not wonderful that now, when the Society is once more prosperous and in good repute, the Council should move for a new charter. We presume certain obsolete provisions will now be cancelled, certain difficulties and inconsistencies removed, and that the whole thing will be simplified. The power of governing the Society by bye-laws, rather than by charter, will also be more fully secured. The bye-laws can be modified at any meeting called for the purpose, and so the government and administration can be at any time brought into harmony with the exigencies of the times. Such, we suppose, will be the general outcome, and if our surmise be true, there will, of course, be nothing to object to, but much to be thankful for. The only thing, as we said before, that raises a doubt, are the suddenness and reticence with which the proposal has been sprung upon us at the most unsuitable period of the year.

Paraguay Tea, or Yuba Maté.

NOTES on the enterprise of our German friends are frequently cropping up in unexpected quarters,

as the following paragraph will show. Reporting on the trade of Paraguay for 1898, the Ortung British Consul thus speaks of the Yuba Maté, or Paraguay tea (*Ilex paraguensis*):—"The trade has been depressed owing to keen competition with Brazilian in the Argentine Republic, which is the principal market, otherwise the production has been good, and at the end of the year there were large stocks on hand. This Yuba Maté is one of the most important productions of the country. It is the leaf of a tree which grows in the forests in certain parts of the country only, without any cultivation. The owners of these trees have the young branches cut and prepared, and after four years they return and repeat the operation. A "Yerbal" might be compared to a Tea or Coffee-plantation, with the exception that it requires no planting, no cultivation, only care being taken not to cut the young branches before four years have elapsed. The infusion made from this tea is very agreeable, refreshing, and invigorating, and is naturally the national beverage of the country. It is used all over the Argentine and Uruguayan Republics, and to a certain extent in Chili. It has superior qualities to coffee, and is much more economical, as 1 kilo. of this tea will give 100 litres of infusion. It has a small sale in Europe, and endeavours are now being made to increase its acceptance by preparing it in a

different manner to suit European tastes. It has just been very favourably reported on from Germany, and it is considered that, for armies and navies, it would be invaluable."

Paraguay tea has been from time to time introduced, and even "pushed," in this country, but it has never seemed to "take on" with the English palate. The fact of its being "more economical" than either tea or coffee, will no doubt be a strong recommendation for use in Germany.

From Bavaria we learn that, according to the report of the Chamber of Commerce, published last August, indigo prices were very low, and the consumption of indigo small in consequence of the use of the cheaper Alizarine for blue dyes. It was anticipated that a complete change would shortly take place in the indigo market, as the large dye-works at Ludwigshafen, which employ 5000 men, had succeeded in establishing artificial indigo on the market, which was about to be largely used for dyeing uniforms in Germany, instead of natural indigo.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will be held on Tuesday, July 25, in the Drill Hall, James Street, Westminster, 1 to 5 P.M. A lecture on "Seed Dispersal" will be given by Prof. G. S. BOULGER, at 3 o'clock.

JUBILEE OF THE GHENT SCHOOL OF HORTICULTURE.—The *Semaine Horticole* publishes an account of the proceedings on this interesting occasion. They comprised an exhibition, a Congress, and the foundation of a Guild, comprising the old pupils of the school. Numerous representatives of foreign governments were present, but we regret not to see any British subject among them. This may partly be accounted for by the occurrence of the Hybridisation Conference nearly at the same time. The Director, M. RODIGAS, was honoured by the presentation of a floral trophy, and memorial wreaths were laid at the foot of the statue of VAN HOUTTE, the founder of the school; and on the tomb of Professor KICKX, the second Director of the school. Banquets, *raouts*, and *fêtes*, of various descriptions, contributed to render the Jubilee a very memorable event.

FRUIT, ETC., BY RAIL.—The Superintendent of the Great Eastern Railway has informed us that the statement of the number of fruit and farm-produce boxes conveyed on that line during the six months ended on June 30 has been got out; and from this it appears that the number was 79,000, as compared with 71,000 for 1898. This is a favourable return, and must be very encouraging to those engaged in the transit.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual outing of the Members took place on the 17th, about 170 persons proceeding to Cheddington by rail, from whence they were conveyed to Mentmore. Dinner was served in a spacious marquee on the village green, Mr. P. WATERER, the Chairman of the Committee, presiding. The health of Lord ROSEBERY was drank with great enthusiasm, and Mr. J. SMITH responded on behalf of his employer. The afternoon was devoted to an inspection of the gardens and grounds, which are just now to be seen at their best. After partaking of refreshments, the party was conveyed to Cheddington, and reached Euston at 9.30 p.m., all delighted with the day's holiday.

WARGRAVE AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT.—An ordinary meeting of the above association was held on July 12, Mr. W. POPE in the chair. The subject for the evening was Carnations, and two useful papers were read by Mr. W. H. SCOTT, on border varieties, and Mr. T. HASKETT, on Souvenir de la Malmaison.

FIG. 30.—ECHINIUM CANDICANS: FLOWERS DEEP BLUE. (SEE P. 74.)

THE CAPABILITIES OF TONGA.—Tonga, in the Western Pacific, would seem to be a happy land wherein to invest capital, judging from the British Vice-Consul's opinion, as expressed in a recent report. After drawing particular attention to the whale fisheries, he says, another opening for capital is the institution of a factory and farm for the cultivation and extraction of fibres and the distillation of oils from flowers. "The Ramie, Pine-apple, and Aloes are said to grow to perfection without the slightest difficulty," to say nothing of the hundreds of thousands of Cocoa-nut husks which lie rotting on the ground. Many flowers, notably a species of *Gardenia*, are in abundance, and their increase is only a matter of will. Labour at about 30s. to 40s. per month can be had in large quantities from Savage Island; land can be obtained, and there can be but little doubt that such an undertaking economically, intelligently, and systematically carried out by experienced men, would be a success. The reason of so many failures in South Sea operations in the past, of so much money having been lost, has been, not from any fault in either soil or climate, but from ignorance, inexperience, and extravagance on the part of those conducting them.

A GOOD GARDENER.—"Let me begin by saying that a good gardener loves his plants. Now, a good gardener is one who grows good plants, and good plants are very unlike poor plants. They are unlike because the gardener's love for them has made them so. The plants were all alike in November. In January, the good gardener's plants are strong and clean, with large, dense leaves, a thick stem, and an abundance of perfect flowers; the poor gardener's plants are small and mean, with curled leaves, a thin, hard stem, and a few imperfect flowers. You will not believe now that the two lots were all from the same seed-pod three months ago. The good gardener likes to save his own seeds or make his own cuttings, and next year his plants will be still more unlike his neighbour's. The neighbour tries this seed and that, reads this bulletin and that, but all avails nothing, simply because he does not grow good plants. He does not care for them tenderly, as a fond mother cares for a child. The good gardener knows that the temperature of the water and the air, the currents in the atmosphere, the texture of the soil, and all the little amenities and comforts which plants so much enjoy, are just the factors which make his plants successful; and a good crop of anything, whether Wheat or Beans or Apples, is simply a variation." *L. H. Bailey, "Factors of Organic Evolution."*

SELECTION.—"This simple process of thinning out vegetables has had a most powerful effect upon the evolution of our domestic flora. It is a process of undesigned selection. This selection proceeds upon the differences in the seedlings. The weak individuals are disposed of, and those which are strongest and most unlike the general run are preserved. It is a clear case of the survival of the unlike. The labourer who weeds and thins your Lettuce-bed unconsciously blocks out his ideas in the plants which he leaves. But all this is a struggle of Jew against Jew, not of Jew against Philistine. It is a conflict within the species, not of species against species. It therefore tends to destroy the solidarity of the specific type, and helps to introduce much of that promiscuous unlikeness which is the distinguishing characteristic of domestic plants." *L. H. Bailey, "Factors of Organic Evolution."*

COLUMBINE AND CLEMATIS.—Some of our correspondents are making merry over this supposed cross, mentioned at the end of the discussion at the Hybridisation Conference. We think the agnostic, rather than the sceptical, attitude should be assumed; for, superficially unlike as are the two plants, they are, as every botanist knows, so nearly related, as to be placed in the same order. Let us wait, and see,

PRODUCTION OF FASCIATED STEMS AND INFLORESCENCES.—In a paper contributed to the *Comptes Rendus de l'Académie des Sciences*, for June 26, M. L. GÉNEAU DE LAMARLIÈRE details the results of experiments made with the object of producing fasciation in the stems and inflorescences of plants. *Barkhausia taraxacifolia* was the species chosen for the trials, and the following paragraph explains the manner in which the desired malformations were effected. "Mutilations, practised upon the principal stems and branches of *Barkhausia taraxacifolia* favoured the formation and development of dormant abnormal buds, and thus gave rise to branches and inflorescences more or less fasciated. Mutilation of the principal axes is then a cause of teratological growths; an indirect cause, certainly, but not the less effectual."

ANEMONE ALBANA.—Dr. DUTHIE writes: I found this species in flower in July 1892, growing on loose stony *débris* near the Marpu Pass in Baltistín, at elevations between 12,000 and 13,000 feet. The flowers were mostly of a dull yellowish colour, more or less tinged with brownish-purple; but, owing to the bell-shaped perianth being so thickly clothed outside with grey silky hairs, these colours were not perceptible at a distance. Whilst on the subject of Anemones, I may mention the recent discovery of *A. rupicola*, Camb., on the precipitous limestone cliffs near the summit of a mountain called Deoban, in Jaunsár, at an elevation of about 9,200 feet. This is a very isolated locality for this species, which had previously been known only as confined to the dry inner ranges of the Himalaya, whereas Deoban is exposed to the full force of the monsoon. *J. T. Duthie, Mussoorie, India.*

DUBLIN BOTANIC GARDENS.—These form the subject of an article in the *Pharmaceutical Journal*, written by someone conversant with his subject, and in sympathy with it. The same number contains some very judicious remarks on botanical nomenclature, by Mr. E. M. HOLMES.

A NEW COATING, which is said to successfully protect posts and other timber surrounded by earth from rotting, is prepared, according to the *Baugewerkzeitung*, from resin, 50 parts; finely-crushed chalk, 40 parts; fine white sharp sand, 500 parts; linseed-oil, 4 parts; native red cupric oxide, 1 part; and sulphuric acid, 1 part. First heat the resin, the chalk, the sand, and the linseed-oil in an iron kettle, then add the oxide and the sulphuric acid with caution, mix everything carefully, and paint the wood with the hot mass, using a strong brush. If the mixture is not liquid enough, it is diluted with a little linseed-oil. When the coating is dry, it forms an extremely hard varnish, which allows no moisture to enter. *Scient. Amer.*, 86, 135 (*ex. Pharmaceutical Journal*).

ROTTEN FRUIT.—Many cartloads (14 tons one report says) of decaying Strawberries and Raspberries have been destroyed by order of the magistrates. They were seized on the premises of a great jam-factory in Bermondsey. With a never-satisfied demand for Strawberries, there must have been sad blundering somewhere to have brought about such terrible waste. Jam-eaters may take comfort from the fact that, in all probability, all poisonous germs would be destroyed by the boiling to which they would be subjected, but the fermentation of the fruit would sadly interfere with the flavour. We shall probably hear more of the matter.

VANILLA CULTURE IN TAHITI.—The increase of Vanilla culture in Tahiti is said to be spreading rapidly; the natives, with few exceptions, are giving their whole attention to the growth of the plant, and curing of the pods. Its export, which in 1893 was 29,858 lb., valued at £3938, reached during 1898 to 92,137 lb., but owing to a serious decline in its market value, that quantity realised only £20,468, as against £35,862 for 75,740 lb. in 1897.

HYBRID BETWEEN THE SWEET PEA AND THE FIELD PEA.—Mr. ECKFORD brought up to the Conference some accidentally-produced seedlings, apparently intermediate in floral characters between the two plants mentioned, and which attracted much attention.

STOCK-TAKING: JUNE.—The trade and navigation returns for June continued to bear an encouraging aspect; true, there was a falling-off in the value of imports, but as in the case of Wheat, whilst there is a large increase in the quantity imported, there is a great fall in the value, the comparison being with Chicago "corner" prices of last year. But here it is needful to give our usual excerpt from the summary table, as follows:—

IMPORTS.	1898.	1899.	Difference.
	£	£	£
Total value ...	39,032,305	38,348,943	—683,362
(A.) Articles of food and drink—duty free ...	15,196,692	14,243,992	—952,700
(B.) Articles of food & drink—dutiable ...	1,725,623	1,673,858	—51,764
Raw materials for textile manufactures ...	4,889,464	3,752,018	—1,136,446
Raw materials for sundry industries and manufactures ...	4,487,625	5,106,174	+ 618,549
(A.) Miscellaneous articles ...	976,990	1,083,896	+ 106,906
(B.) Parcel Post ...	127,484	78,647	—48,837

There are other "decreases" to be noted in addition to those given above, but these are made up for by increments on other accounts. The figures relating to fruits, roots, and vegetables possess all their old interest, as will be seen by the following table:—

IMPORTS.	1898.	1899.	Difference.
Fruits, raw:—			
Apples ... bush.	17,241	62,424	+ 45,183
Cherries	166,012	129,655	—36,357
Grapes	5,018	5,325	+ 307
Lemons	134,217	155,716	+ 21,499
Oranges	79,134	340,495	+ 261,361
Pears	4	56	+ 52
Plums	9,543	7,401	—2,142
Unenumerated ...	220,526	216,744	—3,782
Onions	388,746	325,508	—63,238
Potatos	1,531,374	1,629,050	+ 97,676
Vegetables, raw, unenumerated ... value	£233,972	£237,427	+ £3,455

To conclude the import section, we note that the figures representing the trade of the six months are £236,736,876, against £233,995,751 for the same period last year—an increase of £741,125. Coming now to—

EXPORTS.

we find these foot up at some £21,980,067 for the past month, compared with £19,413,696 for June, 1898—an increase of £2,566,371. In conclusion, the value of exports for the past half year are valued at £126,521,894, against £112,508,179 for the corresponding period in 1898, or an increase of £14,013,715.

"REPORT ON FIELD EXPERIMENTS."—We have before us the fifth annual *Report on Field Experiments*, conducted in Berkshire, Dorset, Hampshire, and Oxfordshire, in co-operation with Reading College, Agricultural Department, during 1898. This pamphlet also details the results of experiments on Potatos in Messrs. Suttons' trial-grounds in 1895—1898. In the first of these years drought seriously interfered with the trials; but the general conclusions to be drawn from the experiments of the past four years are:— "That small results were obtained by direct application of manures to the Potato crop in a district with a dry soil and limited rainfall. Potatos are most successfully grown on land in high con-

dition, and results tabulated indicate that on such high-conditioned land the direct application of many artificial manures for Potatos will do harm rather than good. It has been very striking all through the experiments that nitrate of soda has had far more effect in increasing the luxuriance of the haulm than the weight of the tubers. Another result of the experiments is, that potash manures have not had the effect of increasing the crop to the extent anticipated when the investigations were commenced. It is also noticeable that farmyard manure has, with few exceptions, failed to give satisfactory results; this is in all likelihood due to the manure keeping the soil dryer, and thus intensifying the effect of dry seasons, and partly also to the land having been heavily dressed with farmyard manure in previous years." It is stated that in two important points the Reading results agree with those obtained during the past twenty-three years at Rothamsted: (1) The addition of a potash manure to superphosphate has not materially increased the crop; (2) Farmyard manure has not given as good results as a judicious application of artificial manures. Nitrate of soda has given a better result than ammonia salts (including sulphate of ammonia), containing the same amount of nitrogen. Further, nitrogenous manures, while producing the most luxuriant growth, give the greatest proportion of diseased tubers when disease is present.

AN IMPETUS TO THE MANUFACTURE OF ATTAR OF ROSES IN TURKEY.—It is stated in a recent issue of the *Bulgarian Commercial Gazette*, the official organ of the Government, that orders have been given by the Turkish Government to remit the tithe on all land under Roses for commercial purposes, and all Rose nurseries and plantations for a period of fifteen years, in order to extend and aid the cultivation of Roses in the empire. The majority of these Rose nurseries and schools for teaching the art of Rose cultivation and process of manufacture of attar, are found at the present time in Broussa (Asia Minor) and Salonica (Macedonia), and a few are found in other parts of the empire. In Broussa the results have been very satisfactory, both in the quantity produced and in the condition of the plantations. At this place the best machines and implements have been procured for the manufacture of attar, and the pupils at the nurseries are being instructed in their use. This news is creating no little searching of hearts among the southern Bulgarians, who, hitherto, have been the chief producers; and among the Germans, who contemplate the wholesale cultivation of Roses, the soil and climate of Asia Minor being without doubt very favourable for Rose cultivation, and what is still more important, labour is very cheap there as compared with the rates prevailing in Germany.

BLADDER-RUST OF PINUS STROBUS.—Specimens of the so-called Bladder-rust of the Weymouth Pine were sent to the Imperial Sanitary Office, Berlin, in the beginning and middle of May last, in full development. The Imperial authorities, having examined the specimens sent, have published the following particulars concerning the fungus:—"The yellow spore-cases of the parasite covered the surface of the bark of the diseased branches and stems, yielding enormous quantities of yellow powder. Attention was repeatedly called to this important disease, and to measures for its cure, two years ago; but the present information will not be in vain if it again brings attention to the subject. The spores of the fungus falling on the leaves of the Gooseberry and Currant, afford a second generation, which, going through the usual cycle of development, return again to the Weymouth Pine, attacking the shoots and twigs. The shoots, branches, &c., that become infested, gradually die and should be removed in good time. Old trees can be preserved for a long time if the affected parts are cut out, and the wounds bound over with something that prevents contact with the air. As the malady is readily spread by the transport of

young trees from nurseries, buyers should be careful to ascertain the condition of the nurserymen's stocks of Weymouth Pine." We have received no information regarding its appearance in these islands.

"CACTUS CULTURE FOR AMATEURS."—Mr. W. WATSON has published through L. UPCOTT GILL, 170, Strand, a second edition of his useful work on the Cacti cultivated in European and specially in British gardens. The appendix is the important addition to those who have the original work. In it are contained additional cultural notes and descriptions of some species introduced since the publication of the last edition. Cactuses have special attractions for the few, though even the most indifferent are roused into admiration at the gorgeous beauty of many of the species when in flower. Messrs. VEITCH's exhibits of varieties of Phyllocactus are so startlingly beautiful that their popularity is ensured, and once this is obtained, growers will find that there are other sources of pleasure beyond the flowers to be obtained from these most interesting plants.

WHEAT AND OTHER CROPS IN THE UNITED STATES.—From the official report for June we learn respecting spring Wheat that the extent of the decrease in acreage is 470,000 acres, or 2.5 per cent., as compared with last year, and that the condition of the crop is represented by 91.4, as compared with 100.9 on June 1 last year. The condition of winter Wheat would appear to be very backward; the present average (67.3) is below that of the preceding fifteen years. Of Oats, the average is given at about 169,000 acres—a trifle under last year's acreage; the condition is represented by 88.7, as compared with 98 on June 1 of last year. Barley: the acreage has increased by 3.1 per cent. over last year, and the condition is reported at 91.4, as compared with 78.8 at the same period last year.

NEW PUBLIC GARDEN FOR DALSTON.—The Earl of MEATH, who opened the Albion-square Public Gardens at Dalston, Wednesday, 12th inst., said it was a very important day in the history of the Metropolitan Public Gardens Association, for the Albion Gardens made the hundredth open space which the association had been instrumental in securing for the public enjoyment.

HINTS FOR FLORAL DECORATIONS.—As success in decorating is largely the result of observation and experience, it is worth while noting what flowers are most effective this season, with a view to employing similar mixtures of colours and foliage next year. London window-balconies often furnish many a useful hint; while at gatherings held in the country, floral decorations naturally appear to even greater advantage. At Henley, for instance, the house-boats, fewer in number than usual, looked pleasing in proportion to the simplicity with which they were adorned. Yellow Calceolarias amid green foliage, the ever-popular pink Ivy-leaf Pelargoniums and white Marguerites were far more satisfactory than mixtures of many tints. One of the prettiest of the boat-houses showed, outside, rich scarlet Pelargoniums and white Marguerites. The interior decorations were naturally more varied. Wreaths of pink Roses surrounded the pyramids of ice, that looked refreshingly cool that hot week; large bouquets of Sweet Peas, with abundance of delicate foliage, stood on many of the tables, while fire-place, chimney-piece, and over-mantel were abundantly yet lightly stored with trails and masses of Crimson Rambler Rose. In fact, nearly all the flowers used were red (from pink to deep crimson) and white, with an abundance of feathery foliage. There is seldom room for much floral display on the smaller boats, but a gondola attracted considerable attention. It was, of course, black, the wood either carved or moulded, and in the place of honour stood a vase of scarlet Anthuriums and white Campanulas. These looked refreshingly uncommon, and stood out in relief against their dark background.

PUBLICATIONS RECEIVED.—*Orchid Review*, June. This includes short papers on *Acinetia Hrubiana* (colossa), Change of Colour after Fertilisation, *Cypripedium* × *Sallieri*, *Dendrobium Wardianum* as a Seed parent, Feeding Orchids, Hybrid Odontoglossums, Hybridisation, *Laelia Jongheana*, *Odontoglossum crispum heliotropium* (with illustration), *Odontoglossum* × *Denisonia*, &c.—*Tabulated List of Orchard "Insect Pests" affected by Spraying*, by F. V. Theobald (Hendley Brothers, London and Ashford). A useful publication, detailing the "date of appearance of egg, larve, &c., and the advisable washes, and time for application."—*Pharmaceutical Journal*.—*Agricultural Gazette of New South Wales*, May. Among the contents are the following articles:—Dessert and Raisin Grapes (illustrated), by W. J. Allen; Vine Culture in N.S.W., by F. B. Kyngdon; Phylloxera of the Grape-vine (with coloured plate), Messrs. Blunno and Froggatt; Botanical Notes, J. H. Maiden; and Notes on Wheat in N.S.W., by W. Farrer.—*Bulletin of Miscellaneous Information, Trinidad*, April. This includes a paper on Cacao Pod Disease; an analysis of Sun-dried Balata latex and (appendix) West India and Guiana Ferns. We note that the Potato has this year yielded excellent crops (for the tropics) in Trinidad, but it is only considered worth growing as a curiosity for those fond of Potatoes, and to whom the expense is no object.—*Florists' Exchange* (New York), June 10.—*Mechanics' Monthly*, June (Philadelphia). This contains a description and coloured plate of *Echinocactus setispinus*, as well as many shorter papers and notes.—*Contributions to the Life-History of Plants* (No. XLII.), by Thomas Meehan. This pamphlet is divided into the following sections:—1, Sex in Flowers; 2, *Clethra alnifolia* in relation to Morphology; 3, *Sanicula*—a biological study; 4, *Rosa rugosa* in connection with Evolution; 5, *Viola* in relation to Pollination and Fecundation; 6, *Isardia palustris*—additional note on its Stipular Glands; 7, Pathogenesis; 8, *Lactuca scariola* in relation to Variation and the vertical position of its Leaves; 9, the Stigma of *Asclepias*; 10, Phyllotaxis in connection with *Chenopodiaceae* and *Polygonaceae*; 11, Influence of Fungi on the characters of Plants; 12, Movements of Plants; 13, Eccentricity in the Wood-circles of Rhms and Hedera; 14, Morphology of the Grape.—From the New York Agricultural Experiment Station come the following *Bulletins*:—*Bulletin* No. 121, Appendix, March, *Spray Pumps and Spraying*, Wendell Paddock; No. 135, December, 1898, *Sugar-Beet Investigations* in 1898, L. L. Van Slyke; No. 156, December, 1898, *Spraying Cucumbers* in 1898, F. A. Serrine and G. C. Stewart; No. 157, December, 1898, *Self-fertility of the Grape*, S. A. Beach; No. 158, May, 1899, *Combating the Striped Beetle on Cucumbers*, by F. A. Serrine.—*Revue Horticole*, June 16, a coloured plate of Abricot fertile de Chateaufort.—*Le Moniteur d'Horticulture*, June 10.—*Le Semaine Horticole*, June 17.—*Journal de la Société Nationale d'Horticulture de France*, May.—*Journal Horticole et Viticole*, June 1.—*Tijdschrift voor Tuinbouw*, twaalfde aflevering.—*Bulletino della R. Società Toscana di Orticoltura*, Maggio.—*Gartenflora*, June 15.—*Botanisches Centralblatt*, Band 78, No. 13.—*Illustrirte Flora*, June 1.—*Die Natürlichen Pflanzenfamilien*.—The Country Gentlemen's Catalogue for 1899, published by the Country Gentlemen's Association, Bedford Street, Strand. This, the seventh annual issue of the publication, includes an illustrated article on Tring Park, Herts, the seat of Lord Rothschild. The remaining pages deal with such subjects as the Management of a Farm, its fields, root-crops, and stock; Gardens and Orchards, Mushroom Culture, Poultry-keeping, Bee-keeping, Sport, Horses, and Dogs. There are also some racing calendars, and the usual meteorological tables and post-office information. Laws for motor-cars are given—in fact, a great many notes on miscellaneous subjects, such as are generally to be found in an annual of this sort. They are likely to be found especially adapted to, and therefore to be particularly appreciated by the class of readers to whom they are here addressed.—*Disease of the Black Currant*, by Dr. John H. Wilson, D.Sc., F.R.S.E., issued by the County Council of Fife. Life-history of the mite, and methods of combating its ravages.—*Journal of the Board of Agriculture*, June. This contains articles on Spraying Fruit-trees, Eradication of Charlock, Seeding of Sainfoin and Lucerne, Growing Sugar-Beet, and various other subjects connected with crops and stock.—*British Mycological Society's Transactions for the Season 1897-98*. This includes the reports of Forays, an address on the Agraricini of Great Britain, by the President, Dr. Plowright; Notes on a Potato Disease, and on *Penicillium* as a Wood-destroying Fungus, by H. Marshall Ward, D.Sc.; New and Rare British Fungi, Dr. Plowright; Some curious Moulds, Greenwood Pim; Sclerotia Diseases of Potatoes, Professor E. J. McWeeney, M.D.; British Mycology, Miss Annie Smith; and Recent Observations by Professor Eriksson on the Rusts of our Cereals. Four plates are included in this issue.—*Bulletin of the Botanical Department, Jamaica*, May; with papers on Jamaica Dogwood (*Piscidia erythrina*), by Herman Berberich; Peppers or Chillies (from the *Kew Bulletin*); Vegetable Soap (*Agave Morrisii*), by Dr. Anthony Robinson, from the *Columbian Magazine*, Jamaica, January, 1898; *Mimosa* Elengi, and Developments in Rubber Culture.—*Queensland Agricultural Journal*, May; with papers on Buckwheat, by H. A. Tardent; History of the Potato, W. Soutter; Market Gardening (No. 4), H. W. Gorrie; Arrowroot, A. J. Boyd; and Value of Manure, S. C. Voller; as well as the usual contributions on the subject of Bush work, Dairying, Poultry, the Orchard, Forestry, &c.—*Agricultural Journal of the Cape of Good Hope*, May 25, contains reports from the various districts, notes on Prolific Mealies, on the Fruit-growers' Congress (held at Worcester), and on the Value of Eucalyptus Leaves used as a Winter Mulch for Fruit-trees as a preventive of Blight, Scald, or Fungi of any sort.—*Canadian Horticulturist*, June. This has articles on

Co-operative Transportation of Fruits, How Ringing affects Grapes, Potatoes for Profit, &c.—*Primitive Flora Costaricensis*, edit. par H. Pittier, tome II., fasc. 2; Gametale, J. Donnell Smith, San José de Costa Rica.—*Annales Agronomiques*, June 25, includes Recherches sur l'emploi des betteraves dans l'alimentation du bétail, MM. L. Brégnière et Dupont; Causes que président à la transformation de l'aubier en bois parfait, M. E. Mer; et Dissémination des ferments dans le sol, M. P. P. Delhérain.—*Le Moniteur d'Horticulture*, June 25.—*Gartenbau-Bibliothek* (Karl Siegmund, Berlin). Band 2, Foliage Plants for Rooms, by Dr. Udo Dammer; 4, Balcony Plants, by Dr. Udo Dammer; 6, Annuals and Biennials, Franz Goeschke; 7, Gardening Tools, Alexander Bode; 9, Dwarf Fruit-trees, Karl Koopman.—ROYAL BOTANICAL SOCIETY OF BELGIUM: We have received two *Bulletins* from the Société Royale de Botanique de Belgique: vol. xxxvii., part 2 (1898); and vol. xxxviii., part 1 (1899), respectively. The former issue includes papers on "The Dissemination of Alpines, by Jean Massart;" "Ideas of an Anatomist on Species of the Genus *Rosa*," by François Crépin; and "Botanical Excursion to the Sahara," by Jean Massart. Reports of the various meetings are also given, and of the papers read on those occasions. The later *Bulletin* contains—"The Flora of the Congo," by Th. Durand and Em. De Wildeman (cont.); and Reports of Meetings of the Society. Both issues are illustrated with plates.—SOME USEFUL FRENCH HANDBOOKS: *Bibliothèque des Connaissances Utiles* (Paris, J. B. Baillière & Fils), includes a valuable series of handbooks, the most recently published amongst them being a second edition of *Le Petit Jardin, Manuel Pratique d'Horticulture*, by M. D. Bois. It begins with the making and laying-out of a garden, mentions the tools needed, and the foods suitable on various soils; deals with the propagation of plants, and the management of flower, fruit, and vegetable plots. A chapter on plant diseases and injurious insects is appended, and the whole work, illustrated with about 200 pictures, is both reliable and attractive.—FLOWER AND FRUIT-FARMING IN ENGLAND: An important series of articles under the above title has been contributed to the *Journal of the Royal Agricultural Society of England*, by Mr. W. E. Bear, who, in vol. x., part 2 (June 30), brings his work to a conclusion by a paper on "Fruit-growing under Glass." This industry, as the writer remarks, has made greater advance than any other during the last thirty years. "Thirty years ago," he says, "only one nurseryman in Cheshunt, Herts, had a hothouse, and now there are at least 125 acres covered with glass in that parish. . . . From the evidence collected it seems safe to assert that there were not 100 acres in all England covered with commercial hothouses thirty years ago; whereas now I estimate the total at fully 1100 acres. . . . There are no data for an estimate of the proportions of hothouse space devoted to fruit, flowers, and vegetables, respectively; but, as an immense space is mainly used for Grapes, and vegetables are not at all largely grown under glass in this country, if Cucumbers as well as Tomatoes be classed as fruit, as both are botanically, there is no doubt that a great preponderant proportion is devoted to fruit as its chief object, though flowers are forced in a large number of fruit-houses during the winter and early spring, as well as in many devoted entirely to them." Mr. Bear next considers the increase and value of the forced-fruit industry in certain English districts treated of separately; and though, naturally, the reports vary according to circumstances, there is no doubt but that any beginner in the trade has many difficulties to contend with. Fruit-growers have not so much for ign and colonial competition to fear as has the ordinary farmer, as their crops are less perishable. On the other hand, the expenses of planting, cultivating, manuring, gathering, packing, transmitting, and marketing, are heavy; and nowadays these operations must, to be successful, be undertaken, not merely carefully, but scientifically, by men specially trained and educated for the work. Small growers, again, have little chance now that they are brought into competition with large and long-established firms who produce such quantities (especially of Grapes and Tomatoes) as to considerably lower market prices. "The best openings for new nurseries appear to be, not where they are now to be found in great groups, and especially not in the neighbourhood of London, but in suitable spots near the great centres of population in the midlands and the north, or large towns elsewhere not already well supplied with nurseries. By such a selection of a locality, the beginner may build up a retail trade in hot-house fruit, or at least a trade with local fruiterers and grocers, thus avoiding railway charges and salesmen's commissions to a great extent, though it may often be advantageous to send certain kinds of produce to a distant market." On the other hand, "with respect to open-air fruit-growing, the opening for new ventures appears to me to be much brighter, because the level of efficiency from the selection of varieties to the packing and marketing of the produce is very much lower. In other words, whereas the practice of the majority of hot-house nurserymen is so skilful, so well up-to-date, and so thoroughly a high-pressure system, that a new competitor, however well trained, will find it difficult to rise above mediocrity, the converse is true of open-air fruit-growers. . . . The bad condition of the great majority of farm-orchards is notorious, and many landowners, farmers, and amateur-gardeners who have planted fruit on a more or less extensive scale, have mismanaged their undertakings from first to last. . . . The general conclusions arrived at are that supplies of flowers and fruit, as a whole, are increasing at least as rapidly as the demand, while the production of bulbous flowers and hot-house fruit appears to be expanding excessively with the system of distribution as it exists at present. But it is to be observed that there is a very wide margin between the prices paid by consumers of

flowers and fruit, and those received by producers, partly owing to a cumbrous and extravagant system of distribution, and that it is probable that a very great increase in the consumption of these products might be developed by more economical methods of supply." Such is, briefly, the summary of Mr. Bear's report on enquiries made by him into English fruit and flower-growing. For fuller details, readers are referred to the numbers of the journal in which his paper was published. It is to be hoped that Mr. Bear's papers may be published as a separate volume.

ECHIU CANDICANS.

THE handsome plant shown in the illustration (fig. 30, p. 71) was exhibited at one of the May meetings of the Royal Horticultural Society, under the name of *Echium formosum*. The latter, however, is quite a distinct plant from the Cape, with long, tubular flowers, and has been referred to another genus under the name of *Lobostemon formosus*. *E. candicans* is a cool greenhouse plant of easy culture, attaining in time a shrubby character, and growing to a height of from 2 to 4 feet, or even higher. The blue flowers are borne in dense panicles, and have long, red, exerted filaments. The plant when in flower forms a striking object, with its silvery-grey leaves clothing the base of the stout stem. It is a native of Madeira. J.

HOME CORRESPONDENCE.

HYBRIDISATION AND RETROGRESSION.—I am of the opinion, and there are numerous instances to support it, that men, and all fruits, flowers and vegetables, were more perfect, larger, and finer when first created than they are at present; but during the centuries when they have had to be reproduced in the wild state from the strongest, a survival of the fittest was only left for us, according to Nature's laws. Naturally, they degenerated to what we found them, while many species have been probably totally lost. As men became more numerous and enlightened, they commenced cultivating, and those plants that showed the best properties were preserved, encouraged, and developed by cultivation. We see evidence of this in the Strawberry, Potato, Pelargonium, and numerous other plants. But why should they occasionally show improved forms or vary from their parent? This is, I think, satisfactorily explained as follows: because there is blood of the original still in the plant showing itself when man or insect applies the pollen, and gives the effect of impregnation from one that showed distinctness from the parents, and exhibited a tendency to revert to the excellence of those first created for us; so we thus, now and then, by degrees obtain more and more the desired form, flavour or prolificness. This is plainly shown during our own time in the Strawberry, Pea, Potato, Dahlia, Chrysanthemum, Fuchsia, and Gloxinia. It is absurd to suppose that we can make a new constitution of any fruit, flower, or vegetable; we can unquestionably by selection obtain far better and more suitable varieties, and perhaps in time equal to those first created. To my mind, we have only to go on with our present cross-fertilising with the best and finest we possess, and select those most likely to meet with our requirements and approval, we shall in the course of time by perseverance obtain something like what, in my opinion, was first created. In fruits we are familiar with the sweetness and pleasant flavour of British Queen Strawberry, and Cox's Orange Pippin Apple. These important and agreeable acids must have existed strongly in the original varieties; if otherwise, it could not have shown itself now. It is absurd in my opinion to say we put sweetness into any plant; it must have existed in the imperfect ones we possess, and it manifests itself whenever opportunity offers. The Pea is an example, and probably 300 years ago only the grey variety existed, so long had it been left to reproduce itself. Fuchsia Phenomenal, a variety with a very large-sized rich purple-blue-coloured corolla, produced three separate branches, and on these came, the one just mentioned, a rose coloured corolla, and a pure white corolla, the sepals in all being similar. This occurred on a plant in a cottage window, and from these three different and distinct colours, grown and flowered, wood was propagated, and is now sold as three popular and lovely kinds. It must be understood these three colours came, grew, and

flowered from one stem. I mention this fact to show that the colouring sap hidden in plants is capable of retaining and transmitting distinct features, in my opinion, from those of the earliest existence. *Henry Cannell.*

CROSS-BREEDING OR INTER-BREEDING.—It is hoped that what has recently been written and said in relation to what is really hybridisation, will have cleared the air of the kind of cant that has been too plentiful in relation to it. It seems even needful to define what is really cross-breeding, because almost everyone who is engaged in fertilising flowers with pollen taken from other flowers that are precisely alike, perhaps, in every respect [No.] but colour, refers to such acts as cross-breeding or fertilisation [Why not? Ed.]. Because so much fertilisation is done by hand, it by no means follows that cross-breeding is performed. The proper term for work of that description seems to be more fitly described as "interbreeding," which simply means intercrossing allied flowers one with another that differ only in colour. True hybridisation, I take it, cannot possibly be performed between two genera or species that are absolutely dissimilar botanically. What is recognised as hybridisation presumably consists of combinations of members of the same genera that, all the same, materially differ in appearance. A notable example is found in Harrison's Musk, the product of crossing the common Musk with *Mimulus luteus*. The old Clove Pink is another such family hybrid, and probably the now well-known *Marguerite-Carnation* is another. I once obtained such a hybrid by crossing *Digitalis lutea* with pollen of *Digitalis purpurea*, or the garden form of it. Mr. Smythe has the same sort of hybrid in his product of crossing Dwarf Kidney and Scarlet Runner Beans. But then, some of such products, as Harrison's Musk, for instance, are seedless, whilst some others, because the connection is of a less violent order, are free seeders. Crossing Sweet Peas with *Lathyrus grandiflorus*, Potatos with Tomatos, Melons with Cucumbers, would be real hybridisation; but Sweet Peas or edible Peas, or Potatos or Tomatos, one with another, is only inter-breeding, yet has probably been productive of more valuable results to gardening than has true hybridisation. *A. D.*

THE CHINESE RUNNER BEAN.—A plant of the above is growing in one of the tropical-houses in the gardens of Alton Towers; it was raised from seed received from China some five or six years ago. It is remarkable for the length of the fruit it produces, and the rapidity of its growth; one pod which has just arrived at maturity on the plant measures nearly 30 inches in length. The Bean, as its name indicates, is a native of the warmer parts of China, where its produce is used for culinary purposes by the natives. The plant has a twining habit, trifoliate leaves, and bright blue flowers (which only open for two or three hours), borne singly in the axils of the leaves. Fertilisation takes place very quickly, and the pod at once begins to lengthen rapidly, careful measurement showing a daily increase in length of $2\frac{1}{2}$ in., its greatest growth taking place between 6 P.M. and 6 A.M. ($1\frac{1}{2}$ in.). At the end of seven days from the flowering period, the Bean had attained a length of 16 in., and at the end of twelve days, 26 in., showing a regular and constant growth until the ripening process commences, when increase in length slows down, and finally stops. When mature, the pod is yellowish in colour, cylindrical in shape, containing about seventeen seeds. *R. Charles Gault, Alton Towers Gardens, Staffordshire.* [Can you please send us a specimen for identification? Ed.]

MILDEW ON VINES.—On p. 48 of your last issue, Mr. G. Littlewood writes, "It would be interesting to know why I object to using hot water on Vines for mildew." First, I think most growers of Grapes aim at a good bloom and finish on their bunches, and I feel sure that after using hot water, applied with the desired force to penetrate the centre of a bunch, it must disfigure it in some way, and no practical man to my way of thinking would ever attempt it. There is a wide difference between using it on plants and Vines, as I should not think of using it on very tender foliage or plants in a young state of growth. Secondly, there is the risk of their scalding, and where the loss of a crop of Grapes means serious consequences to most gardeners, I should think the remedy I advocate is the best and safest, as there is no need to

touch the Vines or berries, and it is certainly an effective cure. I think Mr. Littlewood will find that I have never said "it was not a cure for mildew." I object to it simply because there is a safer remedy; and as to the time of destroying it, I have found one application quite sufficient in my case. Of course, I thoroughly dress the pipes, and give the house a good steaming by sprinkling them with water occasionally, and thereby inducing the fumes or vapour to spread all over the house. After twenty-four years' experience with six vineries here, I have had mildew appear only twice, and my remedy was successful in destroying the parasite on each occasion without injury in any way being caused to the Grapes or foliage. I have not the pleasure of knowing Mr. Littlewood, but if he will favour me with a call, I shall be pleased to show him the result. *Wm. Smythe, Basing Park Gardens.*

PINE-APPLE CULTURE.—I have reason to thank Mr. Mayne for his remarks upon my note, if for nothing more than drawing my attention to an error which I committed in writing it, attributable to a slip of the pen; I should have recommended for suckers, 6 and 7-inch pots, which we invariably use instead of 8-inch ones, and which are none too large for strong sturdy suckers, which it is almost needless to say we select. I find that well-drained 12-inch pots are the most suitable size for fruiting-plants, when the compost I recommended is employed, particularly for Cayenne and Charlotte Rothschild; and as we never disturb the plants from the plunging material except at the time of potting them, the question of their being a little more heavy than in 10-inch ones, is to us of trifling importance. *Thos. Cosmber.*

SECOND FRUITING STRAWBERRIES.—I saw on July 13, at Ashted Park, Surrey, a large quantity of winter-forced plants of Royal Sovereign Strawberry, that had been planted out to form a permanent plantation in May, now fruiting freely. The plants had been forced and had carried a fine crop so recently as March and April. Now there were ripe fruits of good size, green ones, and bloom, in quite considerable plenty, and there was every prospect that the plants would give successional fruit for two or three weeks. At that time all the ordinary crop had been gathered, although that outdoors as well as inside had been a good one. It would be interesting to learn whether any other gardener, who may have so treated this now most popular of Strawberries, has had similar results. In any case it seems worth testing, as there is no reason to assume that Mr. Hunt's experience at Ashted Park is singular to the place, if it be to the variety. *A. D.*

FLAVOUR IN MELONS.—Probably not a few great growers may agree with "A.D.'s" concluding sentence, page 48. We must seek further for the secret of securing flavour in these fruits than is furnished by greater root area, and also in his statement that some of the delicious Melons tasted in recent years have been grown in troughs, neither distinguished by their width nor depth. Neither has size, colour of flesh, nor skin, nor the most elaborate finish or profuse netting any such close relation to flavour as has often been too hastily assumed. Many growers have grown first-rate Melons in foot borders, 12-inch pots, 9-inch troughs, and yet others, equally good, can hardly do better in masses of loam from 30 inches to 3 feet deep. Culture has far more to do with flavour than any mere mass or shallowness of soil, though all these points, as well as the texture of the loam, whether heavy or light, may prove more or less vital to the development of the highest quality in Melons. But these and other points raised by the letter of your clever and generally practical correspondent may be discussed, if needful, on future occasions. The following sentences are so revolutionary and totally opposed to the experience of growers, that I hasten to protest. "A. D." says (p. 48):—"But there is this fact about the best of Melons, that, no matter how grown, the getting of high flavour, even in the finest varieties of repute, is quite a lottery. One fruit may be delicious, three may be very common, and all from the same plant." Now I boldly declare such supposed facts mere fancies, and, with your leave, will abundantly prove facts of an opposite sort in a few sentences. Instead of calling up a host of good Melon-growers, with records of half a century's experience to back their testimony as to the constancy and uniform high quality of the Melon.

they grow, it will be better and easier to cite the Melons into the witness-box of the *Gardeners' Chronicle*. My first witness shall be good on green-flesh Melon, Beechwood, never yet beaten for flavour, and with us to-day, as true to type, character, colour, size, quality, finish, and flavour, as it was fifty or a hundred years ago, or as it came fresh to us—a boon and a blessing to Melon-growers. In the whole of its long and popular history, I have never seen or heard of a natural cross or sport, and so constant and steady and self-contained has the Beechwood Melon seemed, in its own rich and luscious quality, that it has been shown to enter into alliance with other Melons, however skilfully conceived or accomplished. Here we have a single variety of Melon coming true from seed, for many years exposed to innumerable disturbing influences of insects, climate, and culture. Yet “A. D.” has only to ask for it of any of our reputable seedsmen to-day, sow it, grow it, eat, see, and taste for himself the finest flavour of them all, and marvel at his audacity in dubbing its constancy in advance a lottery—a whirling thing of volatile changes, that

less valuable as to the continuity, constancy, solidarity to Melons, whether new or old. Neither the fruit nor the plants of well-established varieties of Melons are lotteries or weather-cocks in quality, but rather staples, as Grapes, Peaches, and Potatoes. In all my long experience, I have never known a well-established Melon produce another and a different Melon on the same plant. The law in this, as in most families that are pre-potent, is, like shall produce like; occasionally there is a cross, a mixture of two parents, still more rarely a reversion to some inferior or an advance to some superior type or variety. I hasten to quote and comment on another sentence or two: “Even fruits may have a delicious perfume and yet be quite commonplace in flavour—aroma is no safe guide in this matter. I do not think the Melon-grower exists (or that the variety exists) that can guarantee high flavour from one fruit or from many.” Surely it cannot be possible that these sentences represent Melon-growing experience in this year 1899. Aroma no safe guide to quality or flavour! Then in the name of the prophet what is? Perhaps also “A. D.” will tell us what

fittest,” and others of a like nature, are not easily understood by those who take a casual glance at the book of Nature.

As examples of plants growing under adverse climatic conditions, certain moorland types were described. Moorland is so plentiful in this country that it has been said that it is possible to walk from Ilkley in Yorkshire to Glasgow without stepping off the heather. In such bleak situations, devoid of shelter and of trees, only those plants grow that can withstand extremes of cold and heat, of dryness and damp. The water is so pure, so free from mineral salts, that the nutrition of plants suffers accordingly.

The Ling is particularly successful in coping with these difficulties by developing a marked individuality. It puts forth low, wiry, straggling stems, and possesses deep-seated roots. The special character about its leaves is that they are dry, hard, and evergreen, last for two or three years, and then crumble, but do not fall. Large intercellular spaces are formed; the stomata are deep-seated, and protected by hairs. By these means the Ling secures many advantages: the deep roots cover a lot of ground, while the hard, tough leaves serve to guard the plant from drought, being helped by the protected stomata, which prevent excessive transpiration. Furthermore, the leaves being evergreen, the power of feeding is held in reserve, so that the plant can take advantage of the

FIG. 31.—MESSRS. WEBB AND SONS GLOXINIAS.

(See report of Wolverhampton Show, on p. 78.)

could not be warranted to give you two Melons alike off the same plant. Believe this, and how can “A. D.” account for the existence of the Beechwood, or any other of our older varieties, of which we have still a goodly number, notwithstanding our hosts of novelties? The theory of the survival of the fittest will not help your correspondent to an answer. Fitness in Melons is not only the highest quality, but each fruit good, and all good alike. Destroy our faith in the stability of varieties in Melons, and we might as well relinquish all hope of growing Melons for either pleasure or profit. Not only must we be fairly sure of reaping as we sow, but what we have sown. Sow the Old Rock, Scarlet, or Cantaloupe Melons, or the Windsor scarlet-flaked, or such semi-permanent varieties of green flesh as the Bromham Hall, the Egyptian Green Flesh, Trentham Hybrid, and we may be sure of cutting the same varieties; and the same holds good of the more popular Melons that have done so much to sustain the character of British Melons through the closing half of the century, so near its close, such as Eastnor Castle, Victory of Bath, Golden Perfection, Cox's Golden Gem, Green Gem, Hero of Lockinge, William Tillery, Blenheim Orange, Scarlet Gem, Meredith's Hybrid Cashmere, Monro's Little Heath, almost as hardy and quite as constant as a Marrow, and many others. Modern Melons, if called to give evidence, would yield similar testimony, though, of necessity,

the aroma or delicious perfume of fruit really is. The quality is there already as a finished product, or we could never smell nor taste. Besides, if such odour is no test of quality, what of the judgment of jurors at our great shows, who have, with few exceptions, accepted it as a sufficient test of quality? Neither are these so far astray as many suppose; for the nose and the palate are very closely correlated. Tasting might almost be defined as internal smelling, and when a house or room is full of aroma of luscious Melons, they are tasted through the olfactory nerves before they reach the mouth or touch the palate. One more point is equally certain: aroma, luscious perfume in Melons, Peaches and other fruits, not only indicate, but is quality etherealised in the way I have already said, and unless we allow it to be wasted between the fruit and the lip, mouth, or palate, it must not only be enjoyed, but accepted as a sure and safe measure of quality in many fruits, and almost an exact, sure, and absolute test of the quality of Melons. D. T. F.

ADVERSITIES IN THE LIFE OF PLANTS.

In the course of a lecture before the Pharmaceutical Society, Professor Green stated that the phrases “struggle for existence,” “survival of the

short snatches of fine weather that occur even in the winter months. Moreover, the chlorophyll-containing cells being arranged all round the central respiratory cavity, or air-space, the plant is provided with every conceivable adaptation for availing itself even of transient gleams of sunshine all the year round. Erica, another moorland plant, possesses rolled leaves, thus exposing a small leaf-surface, with hairs on the under surface and protected stomata. Plants so exposed to biting winds economise shelter and reduce leaf-surface and the above-ground part to a minimum.

Another kind of difficulty with which plants have to contend is the

CROWDING OF LEAVES,

which makes it hard to obtain an equal illumination. Since a considerable amount of energy and much food material are used up in producing leaves the plant requires to limit their number; whilst, on the other hand, it is advantageous for the plant to receive a maximum of illumination, which entails a corresponding multiplication of leaf-surface. To avoid overlapping a modification takes place in the length of the leaf-stalks. For example, *Geranium pyrenaicum*, a plant growing on waysides and in meadows, has a small axis, and lies almost flat on the ground. The enormous number of its leaves renders the problem of packing no easy task, but it is performed by a co-ordination of the leaf stalks, the oldest being the longest, forming loose rosettes. Thus no shading results, while all the leaves are well-illuminated, and in one plane. *Campanula pusilla*, growing on the steep slopes of sub-alpine regions, has a similar mechanism. The flower-stalk, rising vertically, bears small narrow leaves, which point upwards at a sharp angle, and so do not shade the rosettes below, while they obtain an equal illumination for themselves. By a co-ordination of leaf-stalk and blade, the stalk alone is in

shadow, and that does not matter. This co-ordination of the length of the stalks, the lower being six or eight times the length of the higher, is well seen in *Amarantus*, *Datura*, and *Impatiens*. The stems of these plants are elongated, and when viewed from above the whole plant looks like a rosette. In *Datura* the small leaves are developed between the larger ones, thereby effecting an economy of space.

Passing to trees, it was shown how a similar mode of behaviour obtains. The terminal erect branch of *Acer platanoides*, the Norway Maple, shows decussating leaves, i.e., pairs of leaves successively placed at right angles, that do not shade each other. The lower stalks having the advantage in length, form a sort of pyramid, while the stalks of each pair are equal in length. On the lateral (horizontal) branch it is seen that the stalks of each pair are unequal in length, one being sometimes three times as long as the other; thus the branch exhibits an almost perfect adaptation to a vertical source of light. Other mechanisms than co-ordination may give a similar result, e.g., by a twisting of the internodes, as may be noticed in *Helianthemum*, *Diervilla*, the Hazels and Beeches, and other plants. In *Helianthemum*, the Rock-Rose, the stem being low and flat, some of the leaves twist through ninety degrees, so that two rows are produced instead of four. In certain cases the petiole twists, in order to bring about a similar result. A further method of gaining a maximum amount of illumination is found, e.g., in *Bryonia* and *Ficus*, mosaics being formed by the economical arrangement of unsymmetrical leaves, which appear to be packed into each other. An economy of space is thus effected by utilisation of the irregular shapes of leaves. *Atropa Belladonna* furnishes a good example of plants whose adjoining leaves are unequal in size. The larger leaves are in two rows, and the gaps left between them are filled by small leaves, which twist themselves until they come to lie in the gaps, forming a mosaic pattern. *Ulmus* is an example of trees that show the same behaviour, in taking advantage of the unsymmetrical form of the leaves.

Besides difficulties arising from adverse climatic conditions, and those connected with the attainment of a maximum degree of illumination with a minimum expenditure of leaf-surface,

PLANTS OFTEN HAVE TROUBLE IN OBTAINING WATER.

The absorption of water is a serious problem in the case of epiphytes, e.g., certain Orchids. The flattened, strap-shaped roots which anchor the plant to the surface of a tree, do not derive enough water from the cranules in the bark to supply the needs of the plant. The air in tropical forests—the home of epiphytes—being humid, long roots hang down to absorb moisture by means of a glistening, spongy coating of cells known as a velamen. These plants in this way may obtain from 8 to 13 per cent. of their weight of water, and once obtained it is not readily parted with.

Terrestrial plants sometimes have peculiar ways of dealing with the problem of water supply. The normal course is for the root-hairs to come into intimate contact with the soil, and absorb from it a film of water. When this supply is inadequate, abnormal means are adopted. Thus *Stellaria media*, the common Chickweed, has a ridge of fine, delicate hairs running from node to node. These hairs catch and absorb water when a shower falls by means of an appropriate mechanism. The common Ash, has a grooved rachis, strengthened at the sides, the groove being curved at the edges, forming a channel which gapes open when the leaves are exposed on the rachis. Absorbing hairs and glands are found along the groove, and these act as a subservient mechanism for utilising showers, by the collection and retention of rain. The leaves of the Aspen (*Populus tremula*) possess cups with an absorbing surface; the fibro-vascular bundles almost reach the absorbing surface, and so in a shower the plant is well supplied with water. A kind of varnish is then secreted, which swells, and so retains the water.

One of the most ingenious mechanisms for procuring water is possessed by certain species of *Saxifraga*. A depression in the thick and succulent leaf absorbs and holds water; there are prominences (plugs), and water glands in the hollow, besides openings (water-stomata). Water charged with lime is poured out, and forms a calcareous cake over the depression. In this way water is absorbed, and passed to the gland beneath; this method is common in plants growing in deserts. The Teasel has leaves with sheathing bases, which act as funnels; delicate protoplasmic filaments are said to absorb water from these cups into the plant-body; but this is open to doubt. Insects are sometimes accidentally caught in these cups, and their capture serves as an additional advantage to the plant. Professor J. Reynolds Green, Sc.D., F.R.S., at a Meeting of the Pharmaceutical Society, Tuesday, March 14, 1899.

NURSERY NOTES.

MR. BENJAMIN R. CANT'S ROSES.

A CIRCUMSTANCE of very frequent remark at the recent show of the National Rose Society at Colchester, was the winning by Mr. Benjamin Cant of most of the large open classes in the nurserymen's section. His collection of thirty-six blooms, distinct, that won the Jubilee Trophy was a splendid exhibit, and contained two Medal Roses, one of which, Prince Arthur, was the best bloom of

a dark-coloured Rose that we have seen exhibited this year; and the bloom of Mrs. W. J. Grant was a magnificent one, while the general quality of the collection was also very high.

It was this conspicuous success that induced some of us to re-visit Mr. Cant's nursery, and see the plants from which such excellent flowers were obtained. We never had a greater treat than this inspection afforded. The whole of the 60 acres or so which are planted with Roses were not only scrupulously and almost painfully clean from weeds, but they were covered with such magnificent plants that amateurs and trade-growers alike were astonished. Passing from one field to another (for the acres are divided into seven rather small fields with hedges between them that may help, in some measure, to break the prevailing winds), from cutbacks to maidens, from dwarfs to standards, in every part were the plants of unusual vigour, and most of them bore abundant flowers. We examined certain varieties that are so apt to become attacked by mildew, but they were very clean, nor could greenfly even be detected until we had looked for it for some time. There was such health, and strength, and growth in the plants that had so far saved them from injury from these pests.

A glorious effect was made by the two newer varieties, *Marquise de Litta* and Mrs. W. J. Grant. Both of them were growing and flowering abundantly, and the colour of each of them is a very grateful addition to the Rose-garden. The climbing variety of Kaiserin Augusta Victoria had already made growths more than 5 feet high, and there seems little doubt that it has really climbing propensities. Messrs. W. Paul & Son's *Euchantress* we have not previously seen growing in the open, but it is quite a success there. The new rose-coloured Robert Duncan was growing with extraordinary vigour, and had great thick leaves. It would appear to possess a capital constitution. Countess of Caledon, La France, Margaret Dickson, Lady Mary Fitzwilliam, Gustave Pigunneau, Madame Hoste, Madame de Watteville, Maman Cochet, Marchioness of Londonderry, and Madame Cusin were all remarked as unusually interesting.

Then there were the standard trees. What magnificent specimens they are, and what a pretty effect they made when in full bloom! Most of them are grouped together in a field with a considerable slope to the S.W., and are protected from N. and E. winds. All of the popular varieties were represented, and all were vigorous. We particularly noticed the pretty *Tea Medea*, and the showy *Caroline Testout*. Countess of Caledon will evidently be of great service as a standard Rose if its success under Mr. Cant's cultivation may be taken as evidence of its general behaviour.

We were interested in a number of plants of La France, presumably on the *Manetti* stock. They had been planted fourteen years, and are still growing and blooming splendidly, even affording exhibition flowers.

Everyone was sorry that Mr. Cant was too unwell to visit the show, or to receive the numerous visitors to the nursery. But he has sons who now relieve him of most of the cares of the nursery, and who, with a regular staff of thirty-two men, maintain the establishment in such fine condition as we have attempted to describe in a necessarily short note.

IRELAND.

THE STUDY OF BOTANY.

OF the many scientific subjects that have become popular, botany has for a long time been practically ignored in our schools, but a steady and growing interest has been noticed within recent years; the great difficulty that had to be overcome was getting the country students. Under the tutorship of Professor Johnson, assisted by his able co-adjutor, Henry Hanna, B.Sc., there is quite a large attendance of national school teachers

at the summer course of lectures, which means that their labours will touch a larger number of students than heretofore, as well as to encourage a willing but hampered pupil, whilst the practical benefits that will necessarily flow, cannot be underestimated.

ROYAL HORTICULTURAL SOCIETY.

On Tuesday, the 11th inst., the monthly meeting of the Council-members of the above Society was held in their offices, 61, Dawson Street, Dublin. The attendance was small, the reason a decidedly unpleasant afternoon. Hamilton Drummond, Esq., J.P., occupied the chair. The incurred expenses of the recent Rose Show, which amounted to £125, including prizes, were up for settlement, and payment was ordered. A notice *re* altering date of forthcoming show was briefly discussed, the date being eventually altered from Friday, the 25th, to the Tuesday previous, August 22; and general arrangements were made in reference to the autumn show.

THE FLAVOUR OF MELONS.

WE note that which our correspondent writes regarding some remarks upon this subject which appeared in this journal on July 8, and that he finds more fault with the Melons than with the gardeners' methods of cultivation. Now this, we take to be a libel on a very delicious fruit, and a direct encouragement to the cultivator to persist in his mistaken practices.

We will not go so far as to say that every variety when brought into commerce is of the best quality, but the most of them may be so described under suitable methods of cultivation. The inherent and permanent deterioration in flavour in a variety, when this is due to other causes than cultivation, may go on slowly or rapidly, as the case may be—slowly or scarcely at all if self-fertilisation be carefully attended to, and vagrant pollen excluded by closely netting the air inlets to frames and Melon-houses, so as to exclude the hive and other bees, and by not cultivating other varieties, or at the least, not having them in the flowering-stage contemporaneously; and rapidly if no precautions are taken, or the gardener not caring to save seeds of his Melons, but buying all that he wants from his nurseryman.

The accidental mixing of varieties does not always result in deterioration of flavour, or in undesirable shapes or flesh tints, when crossing takes place indiscriminately between good varieties growing adjacent to each other, or whose pollen is made use of to pollinate the flowers of the bearing plants. The probability would be rather the other way, and although several types of Melons might be obtained from the seeds of any given variety, still the product might be excellent, and, indeed, in some cases superlative as regards flavour. And why not? On the other hand, the intentional cross-breeder of Melons, with and in spite of all his foresight, and the precautions with which the process is hedged round, often gets rubbishy varieties. He has, moreover, to contend with the nature of the Melon to revert to some earlier, or maybe some worthless form, and repeated trials have to be made, and close selection carried out over a series of years, before he obtains a variety better or as good as the fruits of the parent plants. The result of this care and this selection is usually the attainment of a well-flavoured and, perhaps, handsome fruit. We, therefore, incline to the belief that it is our incorrect methods of culture that are mostly to blame for that lack of fine flavour in Melons which is nowadays so common.

We think that some persons of leisure, with a definite idea of what is wanted in a Melon, should work to that end, and should work continuously. We want Melons having greater bearing capabilities, varieties that fruit early, and others that are good for fruiting late; and in the case of the latter, that will keep a month or longer after being cut from the plant. We want Melons with thin rind for home consumption, and with thick rind for the

market and for sending long distances by rail, &c.; and, more than all, we would like a comparatively hardy race that may be grown without bottom heat.

TRADE NOTICE.

WE understand that a man is going about furnished with bogus references and testimonials, and has been successful in obtaining money and goods from various persons in and about London. He represents himself as having been appointed gardener at a large place at Wimbledon. In one case he visited a horticultural sundriesman, saying that his employer had empowered him to make purchases. He then inspected the tradesman's stock, and three days later he returned and selected articles to the amount of £35, which were to be sent to the

FIG. 32.—A LAWN-SWEEPING MACHINE.

address given, taking away with him goods to the value of about £6. The goods were taken in a van to the address given, where, of course, the swindler was not known. The man is about fifty years of age, short, with fair beard, and says that he was with Messrs. Cannell & Sons, Swanley, some years ago.

LAW NOTES.

MAY v. THYNE.

THIS case was taken in the Sheriff's Court, Glasgow, before the Registrar, W. Guthrie, on June 19 last, but owing to its importance, judgment was then reserved. The chief points of the case are as follows:—

Early in 1898, Mr. George May, market-grower, Upper Teddington, gave a verbal personal order to Mr. Thyne McCullum, representing Messrs. J. & R. Thyne, bulb importers, Glasgow, for 10,000 bulbs of *Lilium longiflorum* in two sizes, 5000 of each. In due course, the first portion of the order was supplied, and promptly paid for; the remaining 5000 bulbs, which were 7 to 9 inches, and booked at

£6 10s. per 1000, being the lot forming the basis of the present action. At about the time when these should have been delivered, Messrs. Thyne wrote to Mr. May, informing him they had only some 2000 bulbs of the size he required according to his order, and suggested sending bulbs of *Lilium Kratzeri* partly in lieu thereof. Replying to this, Mr. May asked that the 2000 stated to be in stock, should be sent on at once—declining, however, to accept the other kind named, which at the time would be useless. Thereupon Messrs. Thyne wrote intimating that their offer of the two kinds was intended as full and complete settlement of the original order, and must be accepted as such by Mr. May. Subsequently, as the season was advancing, Mr. May wrote to Messrs. Thyne, asking that his order be completed forthwith, otherwise he would be compelled to purchase against them, which indeed in part was done. In defence the Messrs. Thyne pleaded that

the bulbs of the size quoted were not purchasable in the country; but it was shown by a large buyer of this particular Lily, that a heavy consignment was really sold by auction in London at the time, and though at greatly increased prices, Mr. May's order could have been completed many times over.

The following is the judgment in the case:—

"Glasgow, June 27, 1899. Declares the proof closed, and having heard parties' procurators, finds that the defenders in spring, 1898, sold to pursuer 5000 bulbs *Lilium longiflorum* (7 to 9 in.), at £6 10s. per thousand. Finds that in November they found that they were unable to supply the said bulbs, and intimated this to the pursuer, and that they did not deliver the same. Finds that it is not proved that there was any condition or custom releasing the defenders from their contract in the event of a failure of the foreign crop, or that there was such a crop. Finds that the pursuer has suffered loss by the defender's breach of contract to the amount sued for.

"Therefore decerns against the defenders as craved. Finds them liable to the pursuer in expenses, allows an account thereof to be lodged, and remits the same to the auditor of Court to tax and report. (Signed) W. GUTHRIE."

LAWN-SWEEPING AND COLLECTING MACHINE.

THE illustration (fig. 32) represents a lawn-sweeping and collecting machine invented and patented by Messrs. Sutton & Pull, of Petworth Park, Sussex, to which has been affixed "an improved rubbish receptacle, and a side-delivery apparatus," the invention and patent of Mr. J. Challis, gardener to the Earl of Pembroke, Wilton House, near Salisbury. Those persons who have seen the original machine at work can testify to its merits as a cheap, simple, and effective machine; but with this, as with other machines intended for sweeping and collecting grass, tree-leaves, &c., heretofore constructed, it has been necessary, in order to remove leaves, &c., from the receptacle into which they have been swept, to stop the machine and detach the rubbish-receptacle therefrom, thus causing loss of time. Now this side-delivery apparatus enables the person tending the machine to readily clear the receptacle at either end, whether the machine be at rest or in motion, thus effecting a great saving in time and labour. The receptacle is provided with a door at each end, and a slide and pusher. To each end of the movable slide is attached a rope, wire, or chain, that extends around the grooved periphery of a band-wheel, bolted to the framework of the machine, the wheel being arranged in such a position that the operator can conveniently turn the wheel without changing his position relatively to the machine.

Eight acres of ground can be swept per day by a 4-foot machine drawn by a pony, and from twelve to fifteen acres per day by a 5-foot machine drawn by a light carriage-horse. The machines, made in all sizes, varying from 18 inches to 5-feet wide, are light, strong, and durable, being made of the best materials, and moderate in price. They are almost noiseless when at work.

To any person wishing to see the machine, Mr. J. Challis, gardener, Wilton House, near Salisbury, will be pleased to show it in operation, if notice be given by post beforehand; also to answer any inquiries with reference to it. The machines are manufactured by Mr. P. Buchan, engineer, Caledonian ironworks, Chichester.

NEW INVENTIONS.

CHAMPION LAWN-WEEDER.

THIS useful implement (fig. 33, p. 78) enables weeds to be extracted from turf expeditiously, and without the back-aching accompanying the use of the trowel or the short-handled spud. It works cleanly, and leaves no holes, excepting the small one occupied by the root-stock of the Dock, Thistle, Plantain, &c., as the case may be. The tool is most effective when used on moist land. The makers are Messrs. Vaughan Brothers, of Birmingham, and the article was patented last year. We have tried it with success.

SOCIETIES.

ROYAL HORTICULTURAL.

At the meeting of the Committees at Chiswick, on the same day as the Hybridisation Conference on July 11, the following awards were made to plants upon trial in the gardens:—

Pelargonium Cassiope.—A distinctly zonal variety, with large salmon-coloured, single flowers, shaded with pink, free-flowering and vigorous in habit (Award of Merit).

Pelargonium Countess of Derby.—A zonal variety, with salmon-coloured, single flowers, a little flesh coloured towards the margins of petals (Award of Merit).

Viola Archibald Grant.—A variety of compact growth, and free-flowering. Flowers large and handsome, colour deep blue (Award of Merit).

Viola Jacksones.—A very free, but small-flowering variety. Flowers golden-yellow, upper petals brownish-erimson, with dark rays. Recommended $\times \times \times$ in 1898 (Award of Merit).

Viola J. B. Riding.—This is a sport from the variety W. Neil. It has a spreading habit, is free-flowering, and the

blossoms are purplish-rose with pale mauve centre, and deep-coloured rays. Recommended $\times \times \times$ in 1898 (Award of Merit).

Viola Lord Salisbury.—A very large, yellow-flowered variety, distinct (Award of Merit).

Viola Pencaitland.—A bushy habited and free-flowering variety that continues to bloom in dry weather. The flowers are cream-white, of excellent shape and substance. Recommended $\times \times \times$ in 1895 (Award of Merit).

The whole of the following varieties of culinary Peas were sown on March 29 :—

Pea Duke of Cornwall.—Fit for gathering on June 29. From Messrs. Tooton & Sons (Award of Merit).

P. Dalby's Prolific.—A variety with rather small pods, very full. Ready for use on July 10. From Messrs. JAS. VEITCH & Sons (Award of Merit).

P. Altman.—From Mr. DEAL. Ready for use on June 29 (Award of Merit).

P. The Bruce.—From Mr. H. ECKFORD, Wem, Salop. Ready for use on July 4 (Award of Merit).

P. Winifred.—From Mr. DEAL. Ready for use on July 4 (Award of Merit).

P. Nobleman.—Also from Mr. DEAL, and ready for use on July 4 (Award of Merit).

SCOTTISH HORTICULTURAL ASSOCIATION.

JULY 4.—At the meeting held on the above date, the Society awarded a First-class Certificate to a seedling of *Oplismenus Burmanni variegatus* var. Munroi, exhibited by its raiser, Mr. ROBERTSON MURRO, Langside House, Glasgow. The leaves are nearly white, considerably wider, and the plant dwarfer, and very much more showy than the type. Assuming that the new variety has sufficient chlorophyll to ensure its enduring, it should prove a good decorative plant.

Mr. MURRO showed a hybrid Passion-flower, said to be a cross between *P. corulea* and *P. quadrangularis*, called *P. Munroi*, which, though not new, was highly commended.

The new early Pea, *Ameer*, shown by Mr. SCARLET, Inveresk, Musselburgh, was awarded a First-class Certificate. This was sown in the open on January 10, and picked on June 20, grown without stakes; the height was from 30 in. to 3 feet. Though not a wrinkled Pea, it was remarkably sweet, while few varieties equal it in fertility.

Mr. JOHNSTONE, gr., Hay Lodge, showed a nice bloom of *Bragmansia Hongkai*, that used to be planted to afford fragrance and distinction in herbaceous borders; *Fuchsia corymbiflora*, red and white, in alternate plants, formed a striking second row to this double white trumpet-flower.

In the absence of Mr. Angus, Norwood Hall, Aberdeen, Mr. J. H. MURRAY, the Assistant-Secretary, read his brief paper, entitled "The Pleasures and Profits of Herbaceous Plant Growing." At the close of the paper a discussion took place, in which many gardeners present took part.

The Strawberry meeting of this Society will be held within the next fortnight, members being advised of the date by card. D. T. F.

LAND STEWARDS' AND GARDENERS' BENEFIT ASSOCIATION.

JULY 7.—The second Annual Meeting of "The Drummond Benefit Association for Land Stewards and Gardeners," resident in Ireland, was held in the Central Lecture Hall, 12, Westmoreland Street, Dublin, on the above date.

This Association was formed in 1897 with the object of affording assistance to members while out of situation, when incapacitated from work by old age, or when out of situation through sickness; and also the granting of aid to widows, orphans, or others who were dependent upon deceased members. The Chair having been taken by Mr. William H. Drummond, the Report and statement of accounts were thereafter presented. The Chairman, in moving their adoption, commented on the highly satisfactory condition of the Association. Messrs. Drummond had offered to subscribe a sum equal to the members' subscriptions up to one hundred guineas a year. This year their subscription was eighty guineas. Mr. Hamilton Drummond urged upon the members to put their shoulders to the wheel, and thus largely increase the membership. The Association had made rapid progress, but there was a large constituency of land stewards and gardeners throughout Ireland they could work upon. The Association was not a charity, nor, with a balance at its credit of £472 16s. 2d. after satisfying all claims, was it one of which they need be ashamed.

WOLVERHAMPTON FLORAL FÊTE.

JULY 11.—The eleventh annual show was held in the West Park, in most favourable weather. The entries were more numerous than ever, and competition was keen in most of the classes. The receipts at the gates alone amounted to £1953 1s. 6d.; about £100 more than last year, and £600 more than in 1897.

In the open class for groups of plants arranged for effect, Mr. CYPHER, of Cheltenham, was well 1st. It was composed of fine Palms, Bamboos, *Humea elegans*, *Cattleyas*, *Odontoglossums*, *Thunias*, *Crotons*, *Ixoras*, *Lilies*, and species of ornamental plants, and there was perfect finish in the arrange-

ment. Mr. VAUSE, florist, Leamington, was 2nd; and Mr. Macdonald, gr. to J. H. KENRICK, 3rd.

STOVE AND GREENHOUSE.

For sixteen specimens Mr. CYPHER was a long way ahead, with fine Palms, splendid *Crotons*, *Ericas*, *Ixoras*, *Bougainvillea Cypheri* and *B. Sanderi*, *Staticea profusa* and intermediate, &c. Mr. VAUSE was 2nd with smaller, but well-grown plants; and Mr. FINCH, Coventry, was 3rd. Mr. CYPHER was also 1st for six fine foliage plants.

For eight exotic Orchids, Mr. CYPHER was 1st with *Cattleyas Sanderiana* and *Gaskelliana*, and *C. G. alba*, *Epidendrum vitellinum majus*, *Odontoglossum Pescatorei*, *Oncidium macranthum*, *Dendrochilum filiforme*, and *Epidendrum prismatocarpum*. Mr. Macdonald, gr. to J. H. KENRICK, Esq., was 2nd.

For decorative plants and cut flowers combined, Messrs. DICKSONS, Ltd., Chester, were 1st with a splendid collection of cut flowers, chiefly of herbaceous species, arranged with *Crotons*, *Caladiums*, *Palms*, *Alocasias*, *Dracenas*, and a good number of *Roses*. The Hawley Silver Challenge Vase was awarded to this collection, and as, we believe, Messrs. DICKSONS won the Vase for the third time last year, when it became their property, this is the first win towards another one. Mr. WHITE, florist, Worcester, won 2nd prize and a Gold Medal with a good arrangement of cut flowers, but lacked in plants.

ROSES.

Roses were very fine indeed. For seventy-two *Roses*, distinct varieties, Mr. B. R. CANT was 1st, with a splendid lot. Messrs. PRIOR & SON, 2nd; and Messrs. HARKNESS & SON, 3rd.

FIG. 33.—LAWN-WEEDER.

(For description, see p. 77.)

Mr. B. R. CANT was again 1st for forty-eight *Roses*; and Messrs. J. TOWNSEND & SONS, 2nd; and the same exhibitors were 1st and 2nd respectively for twenty-four *Roses*, distinct.

The best collection of twelve new *Roses*, distinct, was also shown by Mr. B. R. CANT, as was the leading class for Tea *Roses*.

The most decorative arrangement of *Roses* in a space of 12 feet by 5 feet was shown by Mr. J. MATTOCK, Oxford. The Rev. J. H. PEMBERTON won the leading classes for *Roses* in the amateur section.

DINNER-TABLE DECORATIONS, BOUQUETS, CUT FLOWERS, &c.

Messrs. JENKINSON & SON, Newcastle-under-Lyme, were 1st for a decorated dinner-table, with an exhibit of much merit. The leading prizes for the bouquets were also won by Messrs. JENKINSON & SON.

Mr. BLAIR, gr. to the Duke of SUTHERLAND, beat Mr. CYPHER for twelve bunches of greenhouse flowers, distinct.

The best arrangement of hardy border flowers was from Mr. W. F. GUNN, Olton; and Messrs. R. WALLACE & Co., Colchester, were 2nd, beating Messrs. HARKNESS & SONS.

Sweet Peas were very fine indeed, and were shown largely. The 1st prize and Gold Medal, for an arrangement of Sweet Peas for effect, was won by Mr. W. F. GUNN; Messrs. JONES & SONS, Shrewsbury, beating Mr. Goodacre, gr. to the Earl of HARRINGTON, for 2nd place.

Messrs. JONES & SONS had the best collection of eighteen varieties; Mr. BLAIR being 2nd.

FRUIT.

The best collection of nine dishes of fruit came from Mr. GOODACRE, Elvaston Gardens, Derby, with fine Canon Hall

Muscat, and Black Hamburg Grapes, Queen Pine and Royal George Peaches, Elruge Nectarines, Countess Melon, Brown Turkey Fig, fine Strawberries, and Beauty of Bath Apple; 2nd, Mr. BANNERMAN, gr. to Lord BAGOT.

Mr. GOODACRE had the best collection of six dishes, with Muscat and Black Hamburg Grapes, Royal George Peaches, Elruge Nectarines, Countess Melon, and Royal Sovereign Strawberries; 2nd, Mr. READ, gr. to the Earl of CARNARVON; 3rd, Mr. BARNES, gr. to the Duke of WESTMINSTER, Eaton Hall, Chester.

Grapes, four bunches, distinct vars., were best from Mr. GRINDROD, gr. to G. T. RATES, Esq., who had Black Hamburg, Gros Maroc, Buckland Sweetwater, and Foster's Seeding; 2nd, Mr. ASHWOOD, gr. to A. NEWELL, Esq. Muscats were best from Mr. BRENNIMEL, gr. to H. H. FRANCE HAYHURST, Esq. Mr. GRINDROD had the best Black Grapes. Mr. BANNERMAN had the best Peaches with fine Royal George, and Mr. READ the best Nectarines. Mr. BARNES, of Eaton, won 1st prizes for Melons and Strawberries.

VEGETABLES.

The 1st prize for Messrs. SUTTON & SONS' competition for vegetables was won by Mr. WILKINS, gr. to Lady T. GUEST, who also won 1st for Messrs. WEBB & SONS' prizes.

MISCELLANEOUS EXHIBITS.

Mr. W. HALIDAY, gr. to the Earl of DARTMOUTH, Patshull House, put up a very fine group of Malmaison Carnations, very well grown, and carrying large blooms. Messrs. BIRKENHEAD & SONS, Sale, had a fine exhibit of Ferns; Messrs. WEBB & SON, Wordsley, Stourbridge, had a fine lot of *Gloxinias*, some of which are illustrated on p. 75. Messrs. HINTON BROS., Warwick, a collection of eighty-four distinct varieties of Sweet Pea. Mr. MURRELL, Shrewsbury, had an excellent display of *Roses*. Messrs. JARMAN & Co., Chard, Somerset, had also a good show of *Roses*; and many other firms were represented by excellent exhibits.

BRENTWOOD HORTICULTURAL.

JULY 13.—The exhibition of this Society took place in the grounds of Middleton Hall, Brentwood, on the above date, in brilliant weather. Several tents were required to take the exhibits, and garden produce of all kinds was represented, but the leading feature was the *Roses*; the principal Essex growers and others competing, and exhibiting splendid blooms.

The best twenty-four varieties came from Mr. B. R. CANT, Colchester, who had grand examples of *Horace Vernet*, which has been generally shown in fine form this season. In the class for twelve trebles, Messrs. HARKNESS & SONS, and Mr. B. R. CANT were adjudged equal 1st, the best of the grand blooms shown by the former were *Horace Vernet*, A. K. Williams, and *Maman Cochet*. Mr. B. R. CANT had two superb blooms in *Gustave Piganeau* and *Her Majesty*.

With twelve Tea-scented, Mr. B. R. CANT was again 1st, with very fine blooms. All the blooms being exceedingly good.

To the amateurs' division with twenty-four blooms, the Rev. J. H. PEMBERTON, Havering, was first, the leading flowers being A. K. Williams and *Horace Vernet*. Mr. LAXTON, Shenfield, won the Challenge Cup for twelve blooms, his premier flower was *Maman Cochet*, which was selected as the medal Tea-Rose in the amateurs' division; Ulrich Brunner and Mrs. J. Laing were also very fine. G. BAXTER, Esq., was 2nd; he had very fine *Comtesse de Nadaillac*, A. K. Williams, and *Her Majesty*. 3rd, W. KINGSTON, Esq., Bedford. The Rev. J. H. PEMBERTON was 1st with six trebles, and Mr. LAXTON 2nd. The best twelve blooms of one variety also came from the Rev. J. H. PEMBERTON, who had *Her Majesty* in excellent condition.

With twelve Tea-scented varieties, the Rev. J. H. PEMBERTON was 1st, and Mr. LAXTON 2nd.

There were several plant classes, which included stove and greenhouse subjects in sizes, which consisted of *Allamandas*, *Bougainvilleas*, &c., while plants for the beauty of their foliage consisted of *Palms*, *Crotons*, &c. Some good *Gloxinias* were staged, and there were collections of exotic and hardy Ferns, &c.

In the way of cut flowers, hardy perennials and annuals made a good display, and bunches of Sweet Peas were charming, the most attractive were those which were relieved by their own foliage; other cut flowers were also shown.

VEGETABLES were a leading feature; the special prizes offered by Messrs. SUTTON & SONS, brought several good collections.

WEYBRIDGE GARDENERS' MUTUAL IMPROVEMENT.

JULY 13.—Weybridge, which contains as strong a community of gardeners as any district in England, and also a very liberal support on the part of its inhabitants, has inaugurated its first summer show in connection with the Weybridge Gardeners' Mutual Improvement Society, in the charming grounds of "Ostlands Mere," the residence of its President, A. SHANNON STEVENSON, Esq. It proved a great success, both with regard to the quality and the number of exhibits.

The most noteworthy exhibit, which was the leading feature of the show, was a group arranged for effect by Mr. J. LOCK, gr. to C. SWINFEN EADY, Esq., Q.C. The same exhibitor showed also very strong in several of the other classes.

Stove and greenhouse plants were well shown, as were also four Ferns, by Mr. J. LOCK, including a *Gymnogramma*,

Microlepia hirta cristata, *Davallia filijensis*, and *Marattia Cooperi*. A very fine collection of orchids were staged by Mr. C. Whitlock, gr. to W. A. BILNEY, Esq., Firgrange Weybridge, not for competition.

In the class for Sweet Peas, there was a strong competition, the 1st prize falling to the last-named competitor. *Begonias*, *Streptocarpus*, and *Gloxinias* were well shown, the last-named being exceptionally good from Mr. W. Steadman, gr. to G. BARKE, Esq., Weybridge, one plant carrying as many as eighty flowers.

In the fruit class some very fine Muscat Grapes were shown by Mr. J. LOCK; and also well-finished bunches of Madresfield Conrt, by Mr. H. Buckmaster gr. to F. W. SMITH, Esq., Dunedin, Weybridge.

The 1st prize collection of vegetables was a very fine one in every point, as shown by Mr. A. BASILE, gr., Woburne College, Addlestone.

Amongst the nurserymen, Messrs. CUTNISH & SONS of Highgate showed a fine group of their Gold Medal Carnations; Messrs. FEED & SONS, NORWOOD, a group of *Begonias* and *Gloxinias*; Mr. CHARLTON of Tunbridge Wells a fine bank of flowers of herbaceous perennials and bulbs, in all over eighty varieties; Messrs. JACKMAN & SONS of Woking showed similar, also Roses and Border Carnations; and Messrs. FLETCHER & SONS, Ottershaw, herbaceous perennials and Roses.

ROYAL GARDENERS' ORPHAN FUND.

ANNUAL DINNER.

THE annual dinner of the supporters of this Fund was held on Tuesday evening last in the Whitehall Rooms, Hôtel Métropole. The chair was taken by Alderman Sir REGINALD HANSON, Bart., M.P. for the City of London, and there was a company present of considerably more than one hundred guests.

The chairman was supported on his right by Sheriff Probyn, and on his left by N. N. Sherwood, Esq., Treasurer to the Fund. We also noticed amongst those present Mr. Harry J. Veitch, Mr. Baker (Thames Bank Iron Company), W. Marshall, A. W. G. Weeks, F. W. Moore (Glasnevin), G. R. Richards, J. Smith (Mentmore), Jas. H. Veitch, Arnold Moss, Rev. S. B. Mayall, J. F. McLeod, J. Jennings, W. Howe, Geo. Gordon, A. F. Barron, Leonard Barron, A. Outram, and most of the members of the committee.

The health of Her Majesty the Queen having been drunk with musical honours, and the Chairman had also proposed the toast of "The Prince and Princess of Wales, patrons of the Fund, and the rest of the Royal Family," Alderman Sir Reginald Hanson proceeded to propose the toast of "The Royal Gardeners' Orphan Fund." In the course of his speech, and whilst referring to the work that had been done since, in 1887, the Fund was originated, the Chairman said that he felt sure that the need for such a Society as this was existent long before, for in every profession some were weak or unfortunate, and for these reasons, if called away in the prime of life, were unable to make provision for their children. Then was brought out a point upon which the Chairman insisted with considerable force. He was pleased to see that the Fund had so far kept itself free from bricks and mortar. His experience during the past forty years, had been unusually great in respect to similar Societies, and he knew both sides of the question. Consequently, like Punch, he said "don't" build an orphanage. His experience as treasurer of another society made him delighted to find an institution that does not have a constantly recurring account for "repairs." "Do not," said the Chairman, "be induced to believe that a fine building will have value as an advertisement, or that it will attract more subscriptions; it won't." Having expressed himself most clearly upon this point, Alderman Hanson then referred with approbation to the action of the Technical Committee of the London County Council, who were offering scholarships for gardening or botany. He was not always able to speak flatteringly of the London County Council, especially in the company of his friend at his right hand. The Chairman concluded with an earnest appeal to those present to increase the income of the Fund by all means in their power. He was afraid that though certain candidates were admitted to the benefit of the Fund, each year there were many others whose claims if not equal to those elected were very nearly so.

In replying to this toast, Mr. W. Marshall, President of the Committee, feared he had little new to urge on behalf of the Fund; but there were no cross words, and no complaints of the manner in which the business had been carried on; which was satisfactory. Then came a mild warning. Some of the children (said Mr. Marshall) who were elected to the Fund in 1887, are attaining the age at which they cease to be eligible for continued assistance. But there was a clause (and a very excellent one) that permitted the committee to give them a help to make a start in life, and many applications had been readily entertained. The Institution had purchased a set of tools, or had provided the money necessary to procure an apprenticeship. The Committee desired to do as much in this direction as possible, but Mr. Marshall foresaw that in course of time expenditure in this way might prevent them from placing so many children on the Fund as now, and even become a greater burden on the Institution than the younger children are at present.

Before resuming his seat, Mr. Marshall presented to Mr. A. F. Barron an illuminated Testimonial, in accordance with a motion moved at the last annual meeting by Mr. Harry J. Veitch, and seconded by Dr. Masters. Very few words were used by Mr. Marshall, but they were brim full of feeling and of appreciation of the work done by Mr. Barron in his capacity of Secretary to the Fund since its inception.

In response, Mr. Barron merely returned thanks for the honour thus conferred upon him.

The toast of "Gardeners and Gardening" was proposed by Mr. Arnold Moss, who said that there are gardeners, and gardeners; and was not at all tender in his description of the jobbing gardener, who is apparently a being to be held in the greatest fear. The Rev. S. B. Mayall made an appreciative speech in response to this toast, and spoke of the sentiment of gardening.

The toast of the Chairman was proposed by N. N. Sherwood, Esq., who said that Alderman Hanson was a personal friend of his own. He was Lord Mayor of London at the time of the jubilee of the greatest Queen, and was head of one of the City's largest mercantile establishments. But he found time amid his civic and Parliamentary duties to do an immense amount of work for the furtherance of charity. Then Mr. Sherwood made an exceedingly apt remark in relation to the Institution. He hoped, he said, that a time will come when it will not depend mainly for its finances upon the holding of an annual dinner, but upon its yearly subscribers. Our friends the Press, Mr. Sherwood added, "must advertise us more," and astonished the representatives of the Press present by saying that he had lately discovered a district in which the inhabitants had never heard of the Institution.

The Chairman, in reply, said that in gardening he believed that too much top-dressing might have the result of injuring what it was intended to benefit. Mr. Sherwood had used too much top-dressing. He thoroughly believed in the advantage of subscriptions over donations, and would have pleasure in becoming an annual subscriber of two guineas. The remaining toasts were those of "The Press," replied to by Mr. Gordon; "The Secretary," moved by Mr. Sherwood, who spoke of the great energy that Mr. Wynne had shown, and "The Treasurer" (Mr. Sherwood).

The Secretary announced that the following donations and collections had been received. The Chairman, 20 guineas; Sheriff Probyn, 10 guineas; Mr. N. N. Sherwood and family, £58; Mr. H. J. Veitch, £10 10s.; Mr. R. Dean, £10 10s.; Mr. G. R. Richards, £10 10s.; and others from Messrs. Rothschild, Baron Schroder, Thames Bank Iron Co., &c. From the Stewards' list the "Market-table," presided over by Mr. Assbee, was credited with providing the largest amount, namely, £100. Mr. Geo. Reynolds furnished £28 3s. 6d.; Mr. Jno. A. Laing, £17 1s.; Mr. Sanders, £10; Mr. Richards (nursery-foreman at Hassocks), £13 10s. Other substantial sums were from Mr. J. F. McLeod, Mr. Tom Morris, &c.

The total amount raised in connection with the dinner, was £590 3s. 6d.

Obituary.

MAJOR MASON.—We regret to have to announce the death, on July 14, of Major Mason, The Firs, Warwick, in his seventy-ninth year. At one time the Major served on the Council of the Royal Horticultural Society, and was well known among Orchid growers. In his early life he was in the service of the East India Company.

THE TROPICAL WEATHER.—Just as we go to press, a telegram from Mr. Miller, Ruxley Lodge Gardens, Claygate, Surrey, informs us that the thermometer has registered there 96° in the shade.

MARKETS.

COVENT GARDEN, JULY 20.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

OUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

s. d. s. d.	s. d. s. d.
Arum Lilies, dozen blooms	3 0-4 0
Asparagus "Fern," bunch	2 0-2 6

POTATOS.

Jersey, 80s. to 100s., Bedford, 80s. to 120s. Arrivals of all sorts falling market. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—Strawberries are nearly over; Raspberries still coming good; young Peas are a short supply; on Saturday, the 15th inst., they advanced considerably in price, and finished out well. Good Lettuces are also scarce, we have been getting some Cabbage-Lettuce remarkably fine, twenty-four well filling a bushel-basket. Vegetable Marrows and Scarlet-Runner Beans are now coming in fast, and reports state that Scarlet Runners look remarkably well. (In my last report, Dwarf Beans should have read "peck," not "sack.") Buyers of Walnuts for pickling should secure them immediately, as the shells get woody very quickly, and some varieties sooner than others. Essex Carrots are now very good; they are bunched of a different size to Bedford's. Home-grown Apples have commenced, and the Australians hardly cleared, which proves that we can have Apples all the year round.

SEEDS.

LONDON: July 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market bare alike of buyers and of business. Offers of new French Trifolium come lower, and English samples, of which there promises to be a fair abundance, are putting in an appearance. Full prices are asked for Mustard and Rape-seed. New home-grown Rye is expected next week. Canary-seed, following Liverpool's lead, has advanced a further 2s. per qr., whilst Hemp-seed is with difficulty obtainable. More money is also demanded for Millet-seed. The Linseed market is quiet. There is no quotable change in either Peas or Haricots, but Spanish Lentils are scarcer, and dearer.

FRUIT AND VEGETABLES.

LIVERPOOL: July 19.—Wholesale Vegetable Market.—Potatoes, per cwt., Early Regents, 2s. 6d. to 3s. 3d.; Jersey, 5s.; Kidneys, 5s. to 7s. 6d.; do., new, per 21 lb., 1s. 4d. to 1s. 6d.; Turnips, 6d. to 8d. per doz. bunches; Carrots, 6d. to 8d. do.; Parsley, 6d. to 8d. do.; Onions, foreign, 2s. 6d. to 3s. 3d. per cwt.; Lettuces, 4d. to 6d. per doz.; Cucumbers, 1s. 3d. to 3s. do.; Cabbages, 10d. to 1s. 10d. do.; Peas, 2s. 4d. to 2s. 8d. per bushel; Beans, 1s. 3d. to 1s. 6d. do. *St. John's*.—Potatoes, 10d. per peck; do., new, 1d. to 1½d. per lb.; Grapes, English, 1s. 6d. to 3s. do.; Pines, English, 4s. to 6s. each; Currants, red and white, 6d. per lb.; do., black, 6d. do.; Strawberries, 4d. to 8d. per lb.; Gooseberries, 3d. per quart; Peas, 1s. per peck; Cherries, 4d. to 8d. per lb.; Apricots, 1s. per dozen; Cucumbers, 3d. to 4d. each; Mushrooms, 8d. per pound and basket. *Birkenhead*.—Potatoes, new, 1d. per pound; Peas, 10d. to 1s. 4d. per peck; Cucumbers, 2d. to 4d. each; Strawberries, 4d. to 6d. per lb.; Cherries, 6d. to 10d. do.; Currants, black, 6d. to 8d. do.; red, 4d. to 6d. do.; Apricots, 1s. per dozen; Gooseberries, 2d. to 4d. per pound; Grapes, English, 1s. 6d. to 3s. 6d. do.; Mushrooms, 8d. to 1s. do.

CORN.

AVERAGE PRICES OF BRITISH CORN (per imperial qr.), for the week ending July 15, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	37 1	25 5	- 11 8
Barley	24 1	20 4	- 3 9
Oats	29 10	17 11	- 2 11

APPLES AND PEARS: *Pinus austriaca*. Prune soon after planting. November-planted trees should be pruned at the end of the month of February following. A good deal depends upon the condition of the roots. If the tree is dug up with all care in the garden and planted forthwith, the balance between head and roots will not be much disturbed; but nursery trees that have been headed back but once, need close pruning of the few leading branches they possess, so as to give a sufficient number of main branches for a start, and to relieve the strain on the mutilated and curtailed roots, and these branches must be cut back for the last time in one or two years afterwards.

APPLES ON PARADISE STOCKS: *Pinus austriaca*. If the budding or grafting has been performed at a point about 4 inches above the ground-line, then you may bury them to that depth; but it should be done by degrees, say, at two or three transplantings. There is no necessity to bury the point of union, nothing being gained thereby, the stock itself making roots freely.

AUSTRIAN PINES: *Pinus austriaca*. The only suitable aid to growth would be a 2-inch layer of leaf-mould and loam laid on the soil around the trees, first loosening the crust a little, and using a digging-fork for this purpose. Liquid-manure is inadmissible. Top-dressings may be afforded biennially.

BOUVARDIA: *C. G.* The Bouvardia seems to have suffered from too deep potting, the exterior covering of the stem having been killed at the base. Too fine soil would contribute to the injury. Bouvardias of this class make strong plants when propagated from root-cuttings.

CHIMONANTHUS FRAGRANS: *M. R.* The fungus, *Nectria cinnabarina*, comes after the death of the shoot.

ERRATUM: *Gardeners' Chronicle*, vol. xxvi., p. 58 (Orchid Committee Report, Royal Horticultural Society, July 11, 1899), for "Cypripedium × Phito," read "Cypripedium × Pluto."

ESPALIER APPLES AND PEARS: *Pinus austriaca*. The summer pruning consists in rubbing out all weakly and superfluous shoots whilst these are soft and green, but letting the other shoots grow without pinching or stopping till this season, when they may be cut back to 9 inches in length. The final cutting back to two or three buds, is performed in the winter. So that strength may be afforded in greater measure to an espalier-tree, a few of the current season's shoots may be left at full length; and for neatness sake, these may be tied in loosely in a horizontal position, or in the case of a fan-trained tree, then in the direction of the branches. These are also cut back at the winter pruning. Continuation shoots on all branches that have not reached the limits of the space allotted to the tree, should not be pinched at the point at this season.

FIELD MICE: *Brecon*. You might drive the creatures away by the free use of petroleum in their nests and runs, just as rabbits are driven out of their holes into the open for shooting purposes. We should advise surrounding plants that they mostly nibble with shavings dipped in the oil.

GRAPES DISEASED: *R. M.* The berries are affected by the so-called spot-fungus—*Gloeosporium keti-color*. Spray the bunches with the Bordeaux Mixture, or sulphide of potassium, half-an-ounce to 1 gallon of water, after cutting out and burning every berry showing signs of being infected. You should try to destroy every trace of the fungus, in order to avoid trouble another year.

GRAPES: *S. A. M.* The Grapes sent are over-run with the ordinary Vine-mildew, *Oidium Tuckeri*. We cannot say what causes mildew to appear on Vines where the cultural conditions are exactly proper. Perhaps it is due to atmospheric conditions, to the presence of the mildew on other host plants growing in the vicinity of the Vines. Where mildew is apt to attack the Vines, precautions should be taken in late spring, and not relaxed all through the season. One of the best of these is the use of sulphur in the form of wash, mixed with quicklime and milk, applied to the heating apparatus; the free use of flowers-of-sulphur, by means of the sulphuring bellows; syringing the Vines with sulphide of potassium, ½ ounce in a gallon of water; or with flowers-of-sulphur mixed in water. Of all the remedies, we prefer sulphuring the heating apparatus, and the sulphide of potassium. The Grapes are badly shanked, which points to unwholesome conditions of the roots and soil in which these are found. We should advise you to examine the state of the border, and write us again. See a letter from Mr. Smythe, in the present issue, p. 74.

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*W. P.* The trees in Palace Yard are *Catalpa bignonioides*.—*John E. Kistlingbury*. *Alocasia Jenningsii*.—*X. Y. Z.* 1, *Linaria purpurea*; 2, *Tradescantia virginica*; 3, *Lychnis chalcidonica*; 4, *Rivina humilis* (Rouge-plant); 5, *Ardisia crenulata*; 6, *Pitcairnia bromeliæfolia*.—*C. L.* *Lathyrus cyaneus*—not Lord Anson's Pea.—*A. Dryden*. *Asclepias curassavica*; not a native of Cyprus, but of the warmer parts of America.—*F. B.* The white variegated *Pelargonium* is *Bijon*, a very old garden favourite.—*Offerton*. *Lathyrus cyaneus*.—*A. W.* *Melilotus officinalis*.—*J. J.* *Periploca græca*.—*Grower*. *Achillea Ptarmica* flore-pleno, one of the plants which are termed Bachelor's Buttons.—*Cromdale*. *Empetrum nigrum*.—*W. O. W.* 2, *Sedum rupestre*; 4, not recognised; 5, *Scrophularia nodosa variegata*. The Roses were completely disintegrated; send them to some nurseryman. We do not undertake to name florist's flowers.—*G. D.* 1, *Alstroemeria pelegria*; 2, *Anthericum sp.*; 3, *Sedum spurium album*; 4, *Magnolia fuscata*; 5, *Ptelea trifoliata*; 6, *Spiræa Douglasii*.—*J. L.* 1, *Thalictrum minus*; 2, *Semprevivum montanum*; 3, *Genista anglica*; 4, *Sedum spurium album*; 5, *Sedum album*.—*A. T.* *Dendrobium suavisimum*.—*H. R. N. B.* The *Odon-*

toglossum is a singular form of *O. × Coradinei*; the *Cypripedium*, *C. × Ashburtonia superbum*.—*P. W.*, *Mageburg*. *Stanhopea Devoniensis*, by no means common; and *Cattleya granulosa Dubuyssoni*.—*J. F. M.* If the *Cattleya* was imported with *C. Mossie* it is very extraordinary. It appears to be a form of *C. Mendelii*.—*Lily*. 1, *Alstroemeria aurantiaca*; 2, *Sedum spurium*; 3, *Genista anglica*; 4, *Funkia ovata*; 5, *Campanula*, specimen insufficient.—*L. R. W.* 1, *Agrostemma coronaria*; 2, not found; 3, *Chelone barbata*; 4, *Sedum rupestre*; 5, *Saxifraga longifolia*; 6, *Eryngium campestre*.—*W. H. M.* *Eleagnus longipes*.

NOBLESSE PEACH: *Pinus austriaca*. The flower is large.

PEAS AND TOM-TITS: *A. Dryden*. Use the gun and dust-shot, with half charges of powder; or, better still, net the rows of Peas with fish-netting; or try chickens' feathers tied on lengths of string, and fasten these on the Pea-sticks.

POT POURRI: *Anxious*. There are several formulas for making these delicious scent-pots, and we give you a good one taken from D. McDonald's book *Sweet-scented Flowers and Fragrant Leaves*. Take the rind of two Lemons, cut thin, 1 lb. bay salt, 1 oz. of powdered Orris-root, 1 oz. Gum benzoin, 1 oz. Cinnamon, ½ oz. Cloves, 1 oz. Nutmegs, 1 grain Musk, 12 leaves of Sweet Bay, a few of Sage, Rosemary, and Lavender, cut small; 1 oz. Lavender-water, 1 oz. Eau de Cologne, and 1 oz. Bergamot. Mix all together in a pan, and add sweet flowers in their natural state as they expand; stir the whole often, at least once a day. It must be put into a stoneware pot provided with a cover, and a wooden spoon with which to stir the contents. At the end of two or three months this will be a sweet-scented mass ready to fill a number of ornamental jars. From time to time, throw in fresh petals of fragrant flowers.

RED CURRANT "THE COMET": *H. B.* The samples of this Red Currant sent for our inspection are very good, being large in berry and strap, and of a glistening bright crimson colour.

ROSE LEAVES: *A. P.* The injury is due to the larvæ of the Rose sawfly, *Hylotoma Rosæ*. These are full grown in July and August, and then descend into the earth, where they remain till the next summer. The same measures may be taken as with the Gooseberry sawfly, that is, dressing the Rose-bushes with hellebore-powder, and removing the upper crust of soil under the bushes and charring it, to destroy the chrysalids. The syringe should be freely used in June and July.

REMOVAL OF EXHIBITS: *J. C.* You should address your complaint to the secretary of the society.

VERBASCUMS: *D. & Co.* These plants hybridise freely in nature; yours seems a distinct cross.

VINE: *K. & B.* So far as we can tell from the specimen sent, this is a case of "browning," supposed to be caused by a slime-fungus, but the matter is still open to doubt. Cut off all the affected shoots and burn them, and carefully watch the Vines that are still unaffected, so as to destroy the shoots on the first appearance of the disease.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

(For Weather, see p. viii.)

THE

Gardeners' Chronicle

No. 657.—SATURDAY, JULY 29, 1899.

“ADAM OUT OF EDEN.”

THE above is the quaint and taking title of a little book composed of a variety of observations, some short, others longer, but none lengthy, on matters connected chiefly with husbandry, but also to some extent with gardening. It is a small work, containing 163 pages of about 12mo size, and the author was a Mr. Ad. Speed, who, according to the preface, had been accustomed to make notes on subjects of a rural nature, and afterwards to distribute them in manuscript among his friends. At length, after having “long been smothered in private hands, by the good nature of a public-spirited gentleman, they have blessed our eyes,” or, as we should express it now, they were printed. The book bears date 1659, just two years later in appearing than Cole’s folio on gardening, called *Adam in Eden*. In addition to the title, in the usual position, there is also printed in large characters on the last plain leaf at the end of the book, the words “Speed’s Husbandry.”

The contents, though largely original, are not entirely so, a few notes and recipes having been derived from previous writers. It possesses the no small merit of containing in narrow limits a really wonderful amount of curious information relating to the objects of which it treats; its condensed paragraphs saving the reader much unfruitful labour, wading through pages of irrelevant matter, an experience so common in the case of old works of this nature.

A long list of the values of various crops, as well as of rabbits, coals, &c., provides a notable means of estimating profits 250 years ago. Rents, according to our author, were very low—in some places, as low as a shilling per acre; while within 15 miles of the metropolis it was possible to acquire ground at a rent of 8s. an acre. A contemporary, however, names £6 as having been paid for land in Surrey for fruit-growing.

The profits derived from market gardening were even then very large, for it is here averred that “a gardener about London” in some instances derived so large a sum as £200 for the crops off an acre of land, “and exceeding great profits may be made thereby in most places of England.” The above is a remarkable return for the period, and the amount seems to have remained stationary for a very long time, for we find in 1802, in a footnote in Lord Lauderdale’s *Essay on Wealth*, £220 quoted as the value at that date.

The undermentioned are but a few of the crops mentioned by Speed, and they throw a not uninteresting side-light on the domestic economy of Old London. Red Roses and Clove-Gillyflowers, for 5 acres, £100; Tobacco, per acre, £30; Roman Beans, £50; 20 acres French Beans, £400; and Pompions and Cabbages, £20 per acre. The Roses were cut just previous to expansion, and were largely used by

apothecaries. After the crop had been gathered, the young shoots were shortened, in order that a second bloom might be produced towards Michaeltide. Clove-Gillyflowers were propagated from seeds, and were used for a variety of purposes. In medicine they, as well as Rue, were accounted invaluable as a “defence” against the plague and other infectious diseases, though the awful visitation experienced by London a few years later, must have shipwrecked faith in these and other popular specifics. Earlier in the same century the *English Housewife* contains a receipt for preserving in vinegar the flowers of Violets, Bugloss, Primroses, and Gilliflowers, all of which, along with the stems of Purslane, and slices of Cucumber, were employed in the construction of artificial flowers, which were laid out in dishes, and eaten as salads. Mention is also made in Beale’s *Aphorisms*, of Clove-July flower-water as “a most grateful cordial as it is infused by a lady in Staffordshire.” The flowers in addition were in request for garlands and nosegays, and they were one of the flowers which, when in season, were regularly hawked in London streets.

Pumpkins are commended as a good food for cattle as well as for men. Cabbages were cultivated in fields for “milch cattell,” and it is stated when the “Cabbages are cut up, there will be a crop of Coleworts,” but how these were utilised is not mentioned. A lengthy chapter, for this book, is that devoted to the cultivation of Turnips; the “Hackney” variety being recommended as the best. As well as being used as a vegetable they were also employed for bread-making. The ingenious Mr. Evelyn, in one of his pamphlets supplies interesting information about Turnip-bread, which was composed of Turnips and “Wheat-meal” mixed in equal proportions, and declares it was an “agreeable sort of bread of which,” he adds, “we have eaten at the greatest persons tables.” The same authority notes also that “some wrapt Turnips in a paper under the embers, and eat them with sugar and butter” (!). Speed on his part affirmed that as well as bread they “make very good syder,”—albeit with certain additions, not however communicated. Gay’s lines, therefore, appear to be written as sober fact—

“Leeks to the Welch, to Dutchman butter’s dear,
Of Irish swains Potato is the cheer;
Oats for their feasts the Scottish shepherds grind,
Sweet turnips are the food of Blowzelind.”

Our author’s estimate of Potatos is as follows: “The like benefit as with Turnips may be made with Potatos, which usually grow here in England. They will increase exceedingly, and are excellent good food several waies; they will make good bread, cakes, paste, and pyes, and both crust without and food within. They will hardly be destroyed, but increase of themselves in a very plentiful manner, with very little labour. They will, likewise, being cut in slices and so put into the earth, and the very threds coming from the roots will increase to great roots.” Ten years later, Worlidge mentions the Potato as being “very useful in forraign parts, and are usually planted in several places of this country to a very great advantage.” It was still, however, an uncommon vegetable, and forty years later, Evelyn mentions the green fruit as having been pickled; and how one way of eating the tubers was “with sugar together in the skin, which has a pleasant crispness.”

Sowthistle was, at the date of this book, still in cultivation. It was considered an excellent food for cows, its use, as affirmed here,

doubling the yield of milk, and producing cream of a better quality; while cheese made from thistle-milk exceeded in goodness all others. An improved way of growing Musk-Melons without the aid of manure is discussed. The Earls of Dorset and of Tenett (Thanet?) both pursued the method in their gardens, and the author’s information was not improbably derived thence. The necessary heat in this instance was derived not from hot dung, but from Barley-straw. Nothing, unfortunately, is said of its preparation; but, judging from the fact that holes had sometimes to be made in the soil of the beds in order to allow dangerous heat to evaporate, it is clear the material could not have been used in a dry state.

We might conclude from the position occupied by Melons in this and in other old works on gardening, that they were a not uncommon fruit, nor difficult to cultivate. Gerarde (1597), for instance, assures us they were grown on beds of hot dung without the protection of glass, and so hardy as to bear the “intemperance of the climat, although they were in the furthest parts of the North of Scotland”! a remark that almost inclines one to sympathise with Johnston’s strictures on the inaccuracies of the gossipy chirurgeon. Pepys, in 1661, presents the Melon to us as a fruit not at all common. Says that prince of diarists:—“Some Grapes and Millons from my lord at Lisbone. The first that ever I saw; but the Grapes are rare things.” That the Melon was extremely rare is borne out by what Evelyn states in *Acetaria*, how that in his earlier years it was “very rarely cultivated in England,” and the fruit cost 5s. or 6s. each. As to quality, Evelyn was told by the Earl of Sandwich that Onions brought him near the coast of Egypt were “little inferior in tasteto Melons” (!). This statement makes it quite possible to believe them to have been “an usual ingredient in our sallet.”

Passing over some curious information, note may be made of the following unlikely materials which were used in common with cow-dung in the preparation of liquid-manure. These are “Lyntseed, Oyl, Lees of Wine, Ale, Bear, Perry, Syder, Beef-broth, and Brine of Poudring-Tubs.” Among manures laid in a dry state on the land, rags are mentioned as having been carried from London to Herefordshire to the value of £3000 per annum; and it is remarked with a coolness that almost causes one to shudder, “though they (the rags) have been infected by the plague very often, they find benefit from them.” A more effectual way of diffusing disease can hardly be conceived. Other materials used as manure were “shaved rabbit-skins, shaved horns, and sheep’s trotters,” the last-named being best of all with the sole exception of sprats, which could be purchased at 1*l.* or 2*l.* a peck. Sixty years previously, saltpetre had been recommended by Markham as a valuable manure, but with it Speed was obviously unacquainted.

The difficulty of applying liquid-manures appears to have been much felt. One common method consisted in filling with the liquid, vessels, which were then placed close to the plants to be watered. One end of a rag having been immersed in the liquid, the other was placed near the neck of the plant, on which a slow but continuous supply resulted. Our author mentions among other wonderful crops produced by this treatment, one of Strawberries, or, in his words, “By vertue of this Liqueur white Strawberries 6 inches compass.” This is noteworthy as an example of first-rate cul-

tivation. But Speed was not confined to the above primitive method, for he acquaints us with an engine "in part like that they use in London when houses are on fire," for distributing the liquid over large areas; and adds "this engine is exceedingly convenient and commodious for gardens, which will likewise wash off caterpillars from all manner of fruit-trees, and those that grow against walls." The engine was carried from place to place "like a sedan chair by two men." Another method of destroying caterpillars was effected by the agency of ants; and thus, a nest of these lively insects having been procured, it was placed among the branches of the infested tree, the bole of which was encircled with a band of tar in order to prevent the ants leaving their aerial quarters until, overpowered by hunger, they had consumed every caterpillar!

The above, with some other old-fashioned notions, mar to some extent the symmetry of this little manual, but taken as a whole, it presents a very interesting view of rural economy in the middle of the seventeenth century. I am greatly indebted to the Earl of Haddington for an examination of the copy of this scarce book, contained in Tynninghame Library, and from it the material for the above remarks has now been extracted. *R. P. Brotherston.*

NEW OR NOTEWORTHY PLANTS.

LÆLIO-CATTLEYA ISABELLA (LÆLIA PURPURATA SCHRODERI × CATTLEYA LABIATA SCHRODERÆ).

A MOST remarkable and charming hybrid, which may be said to be the finest of the light-coloured Lælio-Cattleyas, and the result of the above-mentioned cross, has just flowered with J. Leeman, Esq., West Bank House, Heaton-Mersey (gr., Mr. Edge), who kindly sends a flower of it. The fine flower has the firm substance and delicate Peach-blossom tint of Cattleya Schroderæ, as well as a close imitation of it in the broad, crimped labelum. The influence of the other parent is noticeable in the long acuminate sepals, and in a tendency of both sepals and petals to reflex at the edges.

The sepals are each $4\frac{1}{2}$ inches in length, the expanded petals 8 inches from tip to tip; both sepals and petals are white, tinged with Peach-blossom. The lip is cream-white, with delicate purple pencilling at the base; the disc chrome-yellow, and the front-lobe and edges of the side-lobes rosy-pink in colour, with a slight purple marbling on the front-lobe about the middle. No other crosses of *L. purpurata* and *C. labiata* that we know of possess such delicate tints as this one. *James O'Brien.*

PHALÆNOPSIS DENISIANA, Cogniaux, sp. nov.*

Stem nearly wanting, emitting a small number of aerial roots, whitish, and much wrinkled. Leaves

* *Phalænopsis Denisiana*, Cogn.—Caule subnullo; foliis amplis, patulis vel deflexis, oblongis, abrupte acutis, inferne longe attenuatis; pedunculo communi robustiusculo, rigido, patulo vel leviter deflexo, teretiusculo vix ramosa foliis æquilongio vel paulo longiore, in dimidio superiore, 10–12 flora; bracteis minutis, carosis, late triangularibus, obtusiusculis; floribus majusculis, carnosulis, longiuscule pedicellatis; sepalis patulis, obovato-oblongis, obtusis, margine revolutis, lateralibus paulo majoribus leviter obliquis; petalis sepalis dorsali paulo brevioribus, elliptico-oblongis, apice rotundatis, basi breviter unguiculatis; labello sepalis lateralibus dimidio brevioribus, lobis lateralibus erectis conciniventibus, oblique quadrangularibus, apice emarginatis et acute bidentatis, dorso oblique carinatis, lobo terminali duplo longiore, obovato-suborbiculari, obtuso, satis concavo, inferne ad medium alte unicristato, basi squama transversa carnosae erectae apice acute biloba instructo, disco basi valde concavo, inter lobos laterales papillis 2–3 carnosius concis acuminatis munito; columna longiuscula, clavato-cylindrata, basi in pedem brevissimum producta.—Hab. in insul. Philippinis.

spreading or deflexed, broadly oblong, abruptly pointed, of a deep green colour, slightly undulated, attaining 30 cm. (a foot) in length, by 10 cm. (4 inches) in breadth. Common peduncle, rather stout, rigid, outspread or slightly deflected, scarcely branched, as long or rather longer than the leaves, bearing ten to twelve flowers on the upper portion. Bracts very small and fleshy. Flowers rather fleshy, from $3\frac{1}{2}$ to $4\frac{1}{2}$ cm. ($1\frac{1}{2}$ inch to nearly 2 inches) across. Sepals spreading, oboval-oblong, somewhat of a greenish-yellow colour, the lower half displaying a large irregular spot of brownish-red; the lateral sepals are rather larger. Petals resembling the dorsal sepal, but rather smaller and more rounded at the top. Lip fleshy and rigid, half the length of the lateral sepals; lateral lobes erect, connivent, obliquely quadrangular at the top, bordered with two pointed lobes bearing at the back a well-marked oblique keel, white, with a little yellow spot at the base, and sometimes lightly veined with purple; terminal lobe larger, somewhat erect, obovate-rounded, orange-yellow, with four longitudinal lines of bright brick-red, the lower part with a decided median crest; disc bearing between the lateral lobes two or three appendages conical and divergent, and at the base of the terminal lobe a transverse erect scale, having two pointed lobes at the top. Column somewhat club-shaped, yellowish, the foot very short.

This remarkable species was imported two years ago from the Philippine Islands by M. Fernand Denis, director of the wicker factory (Vaucluse, France), a well-known amateur Orchid-grower, especially fond of Phalænopsis. This species flowered with him last May, and he has kindly furnished materials which have enabled me to describe it, and shortly to figure it in the *Dictionnaire Iconographique des Orchidées*. *A. Cogniaux, Verriers.*

TILLANDSIA DUVALI ×.

The *Journal de la Société Nationale d'Horticulture de France* for June, gives the following account of the new Tillandsia Duvali obtained by MM. Duval & fils Versailles, from T. Lindenii major × T. Lindenii vera superba:—"Tillandsia Duvali is described by the raisers as being the result of a cross between T. Lindenii, known to the trade as major and T. Lindenii, sent out by Mr. William Bull as T. Lindenii vera, but the variety of it is called superba, which has already been before the Committee.

T. Duvali is the first specimen of a positive result obtained in Europe by crossing two varieties of Tillandsia. The Tillandsia are, in fact, extremely difficult to fecundate; the style and the stigmata are placed very deeply down the tube of the flower. The stamens are themselves so frail, so slender as to be bruised by a touch; the pollen is scarcely apparent, and it is necessary to operate at the very minute when it is in a state to be laid on the female organ, and this is hardly ever possible. It was after numerous efforts (more than sixty fecundations, and the spoiling of numerous flowers) that we were at last able to fecundate three blooms of T. Lindenii major by Lindenii vera superba. We obtained three capsules, in which were found several fertile seeds, which ultimately yielded eleven plants. The specimen brought forward is the first that has bloomed, and that six years after sowing.

Our object in effecting this crossing was well defined, as will be seen by comparing the two parent plants. T. Duvali was in every way what we desired, and is an acquisition which we, as raisers, consider to be the best we have hitherto attained, independently of the difficulty overcome in securing it.

Further, the plant shown was in flower, that is, the bracts were developed, on April 15 last, when it was on view at the exhibition at Mont Saint Amand, Ghent, then on view at St. Petersburg. It returned from the latter, being twelve days on the journey, and does not appear to have suffered in the least. The bracts have kept comparatively fresh, and it

is plain that if the plant had not been put in a somewhat dark place, the two surfaces of the bracts would have been equally rose-coloured.

The plant may be described as having leaves rather long, lightly streaked and flushed with violet; very closely sheathed at the base, and in the form of a graceful fountain; inflorescence supported by a stiff stem about 20 cm. (8 inches), and formed of bracts, close, much flattened, dentated along the edges, of very bright rose-colour on both sides; large blue flowers arranged, as was the case at Ghent, in opposite pairs."

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA SUPERBO-ELEGANS.

A FLOWER of this richly-coloured hybrid of Cattleya superba and Lælio-Cattleya × elegans, is sent by Mr. W. H. Young, Orchid-grower, Clare Lawn, East Sheen. In form and in substance, the flower has a resemblance to Cattleya superba, and also the hybrid of it *C. × Burberryana*. The sepals and petals are of a bright, rosy-purple tint, the inside of the base of the lip and side-lobes are white, the outside bright rose, and the front lobe dark crimson-purple.

A fine flower of that very darkly-coloured hybrid of Lælia Dayana and Cattleya Dowiana aurea, named *L.-C. × Ingrami*, and an inflorescence of a peculiar form of Cattleya × Hardyana, in which the yellow marks on the lip as in *C. Warszewiczii* appear, were likewise sent from the same garden.

CORYANTHES MASTERSIANUS.

By the kindness of Sir Trevor Lawrence we have received a flower of this curious species, originally described by Consul Lehmann in our columns, 1891, ii., p. 483. The flower was partially withered when we received it, but was evidently small for the genus, of a prevailing yellowish tint, the bucket velvety-purple. The relation to Stanhopea is very apparent.

CULTURAL MEMORANDA.

LAGERSTRÆMIA INDICA.

THE "Indian Crêpe Plant," Lagerstræmia indica, is now seldom found in gardens, and scarcely ever made mention of, because not generally known to gardeners. Those who possess large bushes of the plant should, at this season of the year, enjoy a magnificent display of bloom. The curious, crinkled, spreading petals are of a pink colour, and bear some resemblance to the fabric from which its popular name, the "Indian Crêpe Plant," is derived. It is a native of China, where it is said to be largely planted about the houses and gardens, it is named in honour of Lagerström, a former Director of the Swedish East India Company, and a great promoter of natural history in that country. It belongs to the natural order Lythraceæ, of which our beautiful, wild Loosestrife, Lythrum Salicaria, is also a member. It appears to thrive best when planted out in a well-drained bed of good loam, in a house having an intermediate temperature. The flowers are produced on axillary peduncles on the upper part of the current year's growths. When the former are over, the shoots should be half-pruned, and all useless and crowded ones removed. In winter, when the leaves have fallen, they may be cut back to within a few inches of their bases.

The Lagerstræmia grows quickly in the spring and early summer, and at that period requires a warm and moist atmosphere. When the flowers have faded, and growth has practically ceased, a cooler temperature and less water are necessary to its well being. The flowers do not remain fresh for long in a cut state, but when left on the bush, the plant, treated as a permanent decorative object, is an interesting addition to any collection of plants. In the Mexican-house at Kew there is a splendid specimen planted out, about 10 feet in height. *H. H. T.*

KEW NOTES.

CAMPANULA MIRABILIS is now fully out in a border in the Herbaceous Department at Kew. It is very striking on account of the number of its pale lilac flowers, which are freely produced on the stiffish central and lateral branches. The leaves of the stem are dark glaucous-green, smaller than the radical leaves, and heart-shaped, the margins being edged with stiff hairs. Before flowering, the lower leaves are arranged in a regular, flat rosette. The plant is biennial, and sometimes does not flower until the third year. It was discovered in the Caucasus by M. Alboff, a Russian botanist, and

stem are covered with rough hairs. Dr. Siebe introduced the plants by means of seeds into Europe, and there is a figure of it in the *Gardeners' Chronicle*, vol. xxi., p. 182. A figure has also been prepared for the *Bot. Mag.*

SCABIOSA CAUCASICA

is a hardy herbaceous perennial, and is the largest-flowered and most handsome of the genus. The flowers, which are 3 inches in diameter, are of a lilac-blue colour, borne singly on rather long stems. The lower leaves are almost entire, but the stem-leaves are finely divided. It is easy of cultivation, and is a useful plant for cutting purposes.

found in the South of Europe, and in cultivation prefers a light, warm soil, and is better raised annually from seeds.

MORINA LONGIFOLIA

is a native of the Himalayas, and is one of Dr. Wallich's discoveries. From its appearance one would imagine it belonged to the Acanthaceæ, but on closer examination it proves to be one of the Dipsacaceæ. It has numerous linear, spiny leaves, from which arises the stem, which bears the whorls of pink and white flowers. These are sub-sessile, with a long funnel-like tube, and enclosed by a hairy, cup-like, modified leaf, which is reflexed, and ends in a long point. It is figured in the *Bot. Mag.*, t. 4092. A. H.

MAXIME CORNU.

AMONG the foreign guests whom we had hoped to have seen in our midst at the time of the Hybridisation Conference, was M. Maxime Cornu, the Professor de Culture or Director of the Jardin des Plantes at Paris. The Jardin des Plantes is, as it were, the head centre of all the botanic gardens in France in intimate communication with all of them, and they are many. In addition to the superintendence of his department, M. Cornu has to deliver set courses of lectures, and now that France has set her mind on expanding and improving her Colonial Empire, M. Cornu's services are in constant request in supplying information with regard to Colonial products and the best way of obtaining them by cultivation. M. Cornu made a name for himself in his researches connected with the Phylloxera, and has distinguished himself in the field of Cryptogamic botany. He succeeded our old friend and correspondent, Decaisne, in the direction of the Paris Garden, the administration of which fully occupies his time.

THE LABURNUM.

It has often been a matter of surprise to me that so few of this fine spring-flowering tree are planted, especially in grounds of limited space, and where ornamentation with trees of medium growth is desirable; and it is not the less astonishing that more has not been done with it by way of hybridisation. But even as it is, there are several much varied in height, growth, habit, and blossom to choose from. The rearing of seedlings is not by any means a tedious process, and it is most interesting to note the different forms that one gets from seeds taken from the same tree. This has been my case. About five years ago, my brother, John Jenner Weir, F.L.S., gave me about a couple of dozen young plants that he found thriving under "an ordinary" Laburnum in his garden. In growth these have differed much, two almost refusing to become trees, and growing as bushes; others tall and tree-shaped, while some are short in stem, and with tops of a compact growth. These last have bloomed very freely, but the racemes of the inflorescence are very short, and almost oval while the taller are long, some above 5 inches, while the shrubby varieties all produced very medium-sized flowers as well as racemes. The foliage also differed in most, both in colour and size. If "variety is charming," then I ought to be charmed by my seedling Laburnums; but that or not, I am by no means disappointed with the result.

Now I wish to call attention to some of the most beautiful, and by the growing of which I derive much pleasure, and in some instances it is little short of delight. The first is the golden-leaved one, bright at all times but winter; but even then, though leafless, the bark has a somewhat orange appearance. Then there is the gay "common" Laburnum, the *Watereri*, a much improved type; but the grandest of all is *Parkesi*, a branching grower, with fine foliage, and racemes of bright-coloured flowers, 16 inches in length generally, but I have had a few 18 inches.

M. MAXIME CORNU.

flowered for the first time in this country last year, when it received a Certificate, and was figured in the *Gardeners' Chronicle* for July 9, 1898. The flowers last a long time, and if seeds are freely produced, the plant will probably be a great favourite.

MICHAUXIA TCHIHATCHEWI.

This plant is a native of Asia Minor, where it grows on the mountains in rocky *débris*. Like *M. campanuloides*, it is white-flowered, but lacks the rosy hue of the buds and young flowers of the latter species, and is not so quaint-looking. The flowers are almost sessile, and are set closely all the way up the stem, which is about 3 feet high. Flowers are also produced on lateral branches, which spring from near the base of the plant. The leaves, which are few and greyish-green, are also produced at the base of the plant, and they and the

SENECIO MACROPHYLLUS

is a very showy Composite. It has large, ovate, radical leaves, 2 to 3 feet long, of a greyish-green colour, entire, with serrated margins, and a conspicuous midrib. From the centre of these leaves arises the strong flower-stem, which at a height of 6 feet is surmounted by a large cone, from 9 to 12 inches long, of yellow flowers. It is a hardy herbaceous perennial, and a native of the Caucasus. It is easily propagated from cuttings of the roots.

CORIS MONSPELIENSIS

is a beautiful little alpine of procumbent habit, which resembles a Thyme at first sight, but is a member of the order Primulaceæ. The flowers are bright lilac with deep orange anthers, and are arranged in terminal heads. The leaves are small and linear, after the style of an *Æthionema*. It is

When in full bloom it is a marvellous sight, and being a rapid grower, soon furnishes "the station" where it is planted. As a strong grower, with very large leaves of a deep, rich, purplish-green, gigantea, or by some called magnifica, excels; its habit is sturdy and somewhat upright, and even without its flowers, with its rich-coloured foliage it is a very handsome tree. As a floral variety, it is not so good as some others, the blossoms being much concealed by the foliage; still, it is well worth growing; but for supreme beauty and elegance, planted on a lawn, where it can assert itself, there is none to equal the weeping variety. My neighbour has two, and this year they have been, as it were, "fountains of gold"; they being about 15 feet high; and the branches descending to and resting on the ground, and these clothed with a deep inflorescence of wonderful brilliancy. Among flowering shrubby trees I have never seen the equal. Even without its natural floral decoration, with only its green, prettily-shaped leaves, it is more than simply attractive. Nor should the curious, freaky Adami be neglected; neat in growth, and oddly interesting with its now a raceme of yellow, then one partly a dusky purple, then a number all purple—more of yellow, and so the tree is decked in two or more colourings. Even the very bark is longitudinally striped. How it came, why it is, and so persistent, is a matter that has been much discussed, and possibly will be again. Still, the "oddy" remains, and for the last twenty years at least, to my knowledge, has been varied, and is yet variable. Of the *Cytisus* I say nothing: some are very beautiful, grafted on tall stocks, others as bushes, but with me they have not been *lasting*.

In planting Laburnums, care must be taken to place them in such positions as to show themselves to advantage, with a good background, or none, or mixed among coloured foliaged trees or shrubs, or the centre of a bed on a lawn, and in such cases, the drooping or weeping variety is a "wonder" that baffles description. *Harrison Weir, Sevenoaks, Kent.*

HYBRIDS AND THEIR RAISERS.

(Continued from p. 46.)

THE BEGONIA.—The development of the various races of Begonias have been so well and exhaustively traced by Mr. F. W. Burbidge, and that of the tuberous-rooted in particular by Mr. B. Wynne, in his treatise published ten years ago, that there is no difficulty in arriving at the facts. No plant, perhaps, has been so rapidly improved, and has attained to such a high degree of popularity in a short space of time, as this interesting subject.

The Rex type, once so much grown for decorative and exhibition purposes, has largely gone out of cultivation. In recent years, some attractive, small-leaved varieties have come over from the continent, though at present there are no signs of returning popularity, though some of the old varieties are still planted in ferneries.

Fifty years ago, *B. fuchsoides* could be found in almost every collection of plants having a claim to be at all representative. The late Colonel Trevor Clarke was probably one of the first to cross *B. fuchsoides*, and other allied species and varieties, obtaining many hybrids which probably attached to themselves more of a botanical than a horticultural interest. The most useful of Colonel Clarke's hybrids was *B. weltoniensis* ×, which became very popular as a greenhouse and window plant, and which is still much grown in some parts of the country. An interesting hybrid, named *B. digswellensis*, was obtained by Mr. W. Earley, when gardener at Digswell, and was popular until superseded by the new tuberous-rooted varieties.

It was to the introduction of *B. boliviensis* (fig. 38, p. 87) by Messrs. Veitch & Sons, in 1864, that we owe the foundation of the tuberous-rooted section. This was followed by such imported forms as *B. Pearcei*, *B. Veitchi*, *B. roseiflora*, *B. Davisii*, and *B. Clarkei*; and it was by the use of such material

that Mr. Seden produced his first hybrids, though it does not appear there is any certainty as to the exact time when Mr. Seden commenced the work; but the first hybrid to be put into commerce was *B. Sedeni* ×, in 1870. A distinct species, named *B. Froebeli* introduced in 1872, was subsequently employed both as a pollen and seed-bearing parent, the seedlings frequently partaking to a great extent of the character of the type.

In 1871-72, as a consequence of *B. Sedeni* × and some others having been put into commerce, Mr. O'Brien, who was then at the Wellington Road Nurseries, carefully crossed some of the flowers of the Chelsea varieties, and obtained some which were deemed good enough to have among them a variety named *White Queen*, which with *Queen of Whites*, obtained by Messrs. Veitch & Sons, no doubt laid the foundation of the fine white Begonias which have since appeared. All Mr. O'Brien's efforts to obtain crosses between the new tuberous-rooted forms, and the *B. Rex* type, were failures. He was more fortunate in raising the first two double varieties, but they were unfortunately lost; also in conjunction with Mr. W. Bull, Mr. O'Brien raised several fine novelties. It is worthy of note that about the time Mr. O'Brien obtained his double-flowered varieties, a double-flowered form of *B. Sedeni* made its appearance in one of the public gardens of Lyons, and was successfully perpetuated; M. Victor Lemoine and Mr. John Laing were the earliest producers of the double form.

By this time Messrs. J. Carter & Co. and Messrs. Sutton & Sons were active in raising new varieties, the latter making rapid progress in developing new tints of colour. About this time Mr. J. Laing, at the Stansted Nurseries, Forest Hill, commenced cross-breeding *B. boliviensis*, *B. Veitchi* (fig. 37, p. 87), *B. Pearcei*, &c., but the first results were a little disappointing. He then secured all the best varieties he could of home and foreign production, and then began those improvements which will associate the name of Laing with the tuberous-rooted Begonia for all time. The enterprise at all times exhibited by Mr. Henry Cannell led him to throw himself with characteristic energy into the work of improvement, and the Swanley strain is known far and wide for its high quality and variety. Contemporary improvers were Messrs. B. R. Davis, of Yeovil; J. R. Box, Croydon; H. J. Jones, Lewisham; Messrs. Webb & Sons, Wordsley, Stourbridge; and T. S. Ware, Ltd., Tottenham—the last-named, at the recent Temple Show, staging varieties of superb quality, and especially of double-flowered forms. Their manager, Mr. S. Pope (p. 85), was the raiser of the first round-flowered tuberous-rooted Begonia, viz. *Begonia Woodmani*, out of *B. Veitchi* crossed with *B. Pearcei*. A native of Torquay, he was for many years with the late Messrs. Lucombe, Pince & Co., of the Exeter Nursery, and with Messrs. Laing & Sons, Forest Hill, and as manager of their Begonia Nursery at Bexley Heath. In other parts of the country excellent work has been done, especially by certain private raisers. The single Begonia is now nearly, or quite, a large symmetrical circular flower, with equal-sized petals; the double forms rival the Hollyhock in size, shape, and fullness.

The introduction of *B. socotrana* (fig. 36, p. 87), placed in the hands of Mr. J. Heal, of Messrs. J. Veitch & Son's material from which he has been able to evolve an invaluable race of winter-flowering varieties, both double and single. His first hybrid, *Socotrana* × *Viscountess Doneraile*, was appropriately named *John Heal*. Since then, wonders have been performed by this enterprising raiser; and it may be said of the flowering Begonia, that it need never be absent from our plant houses.

It is difficult to too highly appraise the important work performed by M. Victor Lemoine and others with the winter-flowering varieties and the shrubby section, which has culminated in *Gloire de Lorraine* and other splendid forms.

Messrs. Sutton & Sons' valuable achievements with the Brazilian *B. semperflorens* must not go unrecorded; for not only have they secured ever-

blooming sorts for pot-culture, but also for summer bedding, as, for instance, *Crimson Gem* and *Princess Beatrice*. Truly, what has been done with the Begonia during the past quarter of a century savours of the romantic, so important and far-reaching are the results. *R. D.*

[Portraits of the raisers mentioned above have been given in previous issues. Ed.]

DWARFED JAPANESE TREES.

THE Japanese genius in "dwarfing" trees and shrubs is so well known to horticulturists and botanists, that it would seem rather late in the day to dwell at any length on so obvious a fact. The art is exclusively a Japanese one, or, at all events, the Japanese are its most successful exponents. Nearly two dozen of these miniature trees, ranging from 6 inches to 20 inches high, and from thirty to eighty years old, attracted quite a small crowd on Wednesday last (July 19) to Messrs. Robinson & Fisher's, at Willis' Rooms, King Street, St. James' Square, London. They were described as "the property of a lady," and many of them were recently exhibited at the Royal Botanic Gardens, and were declared by the Council to be "the finest specimens of this peculiar art ever seen in this country." Every one of the little trees is the picture of health, and has been from two to seven years in England. More than half the number were Maples, and several of the examples had had three or four varieties grafted on one stem. The prices paid for the Maples ranged from £3 12s. 6d. up to £14 14s., which latter amount was paid for a specimen 20 inches high, and 53 years old, in an oblong, white, cracked china pot. The oldest Maple in the series measured 21 inches high, and its age is placed at 60 years; this realised 10 guineas.

There were three specimens of a tree named *Zelkova*, or "*Kelkova*," *Keaki*, and the most important specimen has a stem 19 inches high, and is 12 inches in circumference, its age being stated to be 83 years, and this realised £11 11s. A solitary specimen of *Lagerstromia indica*, the normal height of which varies from 6 to 10 feet, with a stem 12 inches high, and 17 years of age, sold for £2 2s. There was also a single specimen of the Cherry, the botanical name of which is given as "*Prunus Mume*," and this has been 82 years in attaining its height of 23 inches, and its circumference of 19 inches; in the spring, this little tree is covered with beautiful white blossoms, and specimens are said to be extremely rare in this country; it realised £12 12s. The specimen Larch (*Larix leptolepis*) is especially interesting, for in Japan it is often found 40 feet high, although on very high elevations it becomes a mere shrub of 2 feet in height; the "dwarfed" specimen, with its stem twisted and gnarled, is only 6 inches high, although its age is placed at 23 years; this sold for £11. The only Conifer in the collection is incorrectly described as "*Thuja obtusa nana*," or *Cupressus obtusa nana*; it has been eighty-five years in growing a stem 17 inches high, and a circumference of 16 inches; it is exceedingly vigorous, and has been in England for seven years, and is probably unique so far as this country is concerned. It realised 39 guineas, its purchaser being Mr. Owen, who bought a number of the other specimens, and who is understood to be acting for the Crystal Palace Company. The total of the twenty-two lots amounted to no less than £189 13s. *W. Roberts* [Several fine specimens may be seen in the Cape-house at Kew. Ed.]

THE FERNERY.

THE CROSSING OF FERNS.

ALTHOUGH it has become the fashion to speak of crosses and hybrids in order to discriminate between crossed varieties of the same species and crosses between different species and even genera, crossing

and hybridising are essentially the same process, and the terms should not therefore be used as implying two different ones. In both cases it is a simple question of transferring the fertilising element from one sex to another on different plants, and the mere extent of difference between those plants has nothing to do with the process itself, though it may justify a differentiation of the results.

With regard to Ferns, indeed, the similarity between the prothalli of nearly all genera is so great, and the area occupied by both classes of reproductive organs so small, that we have not even to deal with incompatibility of size such as may, in the case of different flowers, prevent the pollen from exercising its influence on the too distant ovary, a difficulty which the hybridist might experience, and not the simple crosser, introducing a difference in the process. Owing to this great similarity, and the extremely minute character of the floral organs of the Fern, coupled with their awkward position as regards manipulation on the under side of the prothallus, it is a practical impossibility to effect crosses in the same systematic way as with flowers proper. The whole history of Fern fertilisation is of comparatively recent date, their genesis being wrapped in mystery until, in 1850-53, Naegeli and Sminski lifted the veil, and proved conclusively that it ran on similar lines to the rest of organic creation, the equivalents of pollen and fertilisable seed being produced upon the tiny green scale (prothallus), engendered by the spore and the subsequent Fern plant arising by their interaction, and a resulting fertilised ovule, or seed. Naturally, this discovery led on to the assumption that if it were possible for a fertilising organism (antherozoid), to pass from one prothallus to another, it might there effect a union with the ovule or egg cell, at the base of the archegonium, and so effect a cross; but the difficulty of this was also seen, viz., that these microscopic antherozoids were ciliated organisms, free it is true, but only capable of travelling in the minute deposit of dew-like moisture, in which, under congenial conditions, they found themselves when ejected from the antheridium or containing sac, and in which also, a fraction of an inch away, were the clustered archegonia awaiting them. Under such circumstances, self-fertilisation seemed a necessary law. Then, too, it was seen that the transfer of the antherozoids artificially was fraught with endless uncertainties apart from the practical impossibility of handling them effectively. The generic, specific and varietal differences which undoubtedly exist in prothalli to a certain extent, are even now, quite unspecified; hence, with every care in collecting and sowing, there is no certainty of parentage of a prothallus until it yields a plant with fronds of characteristic type. This in itself discouraged and rendered impracticable any systematic attempts at crossing, the primary factors being always doubtful. In time, however, the appearance of Ferns of intermediate, and apparently combined characters, strengthened a conviction that crossing did occur, though how it occurred was unknown.

The value of these cases was, however, depreciated by the consideration of the great capacity of the Fern tribe to vary, and vary widely, independently altogether of sexual action. Several presumed natural hybrids, *Asplenium adiantum nigrum* var. *microdon*, *A. lanceolatum* var. *microdon*, and *A. trichomanes confluens* *Stablerii*, all three forms, barren, and imputed to the influence of *Asp. marinum* as one parent, are doubtful on this ground, and especially so owing to the fact that, in two cases at least, *A. marinum* was unknown in the locality of the finds. These questionable cases, therefore, did little to strengthen the impression that crossing was possible, despite the mechanical difficulty of transfer of the antherozoids. Eventually, however, it was conclusively demonstrated that cross-fertilisation could be effected by Mr. E. J. Lowe's success in imparting the distinct cruciate character of a form of *Polystichum angulare* to a plain but dense form of *P. aculeatum*, the result being a cruciate and only

slightly fertile *P. aculeatum*, both features together establishing hybridity beyond all reasonable doubt. These and other equally striking results were brought about by relinquishing the idea of individual treatment and transfer, and resorting to a crowded sowing of such distinct varieties as would, by their combination of characters unmistakably prove admixture. This crowding together of the prothalli, causes them to overlap each other, and hence increases the chance of accidental transference either by insect agency or by flooding, the latter probably being the better means of transfer, as a general wetting of a crowd of ripe prothalli would certainly cause a wide dissemination of any free antherozoids, and this contributes greatly to the chances of success. Mr. Schneider, however, obtained his remarkable hybrid, *Polypodium Schneideri* ×, by selecting prothalli from two pans, and placing them in juxtaposition, a plan adopted owing to the different periods of maturation of the prothalli of the two parental Ferns, native and exotic *aureum* and *vulgare*, which precluded simultaneous sowing

SAMUEL POPE.
(*Begonia* Hybridist, p. 84)

together. It has been also suggested that inasmuch as the two classes of organs are usually separated in the prothallus, this latter may be cut up, which it bears with impunity, so that the sexes are separated, thus hindering, on the one hand, that previous self-fertilisation which is always to be feared, and facilitating, on the other, the integrity of the subsequent union. There is here, however, an element of uncertainty; prothalli vary greatly, and often bear the organs most erratically, the antheridia especially being scattered broadcast. Hence, it will not suffice to simply cut the prothallus across just below the indentation, as figured in Mr. Lowe's *Fern Growing*, unless it has previously been closely examined under a lens to ascertain that the antheridia are confined to the lower half. Normally, the prothallus is a small heart or kidney-shaped green scale, about one-sixth to half an inch in diameter. This is attached to the soil by a great number of root-hairs springing mainly from the roundly-pointed end of the heart. In the centre, and close up to the indentation, is a thickened cushion of cells, upon which are some five or six tiny teat-like projections, called the archegonia, at the base of each of which, embedded in the

cushion, is an embryo plant. Among the root-hairs are a number of smaller, round-headed, pimple-like bodies, termed the antheridia, and these burst, when ripe, and emit a considerable number of minute tadpole-like corpuscles (antherozoids), which swim about freely, if there be moisture present, by means of motile cilia. These make their way to the archegonia, and penetrating them, fertilise the embryo seed, precisely as a pollen-grain would do in the case of a flower, though more directly. Abnormally, however, and very frequently, the prothallus, instead of developing in this orderly fashion, breaks out into all sorts of eccentric growths, bearing both classes of organs and root-hairs, and even bulbils and sporangia, or spore-capsules, and roots proper, in lieu of fronds; or it may develop into a cluster of prothalli, subject to like peculiarities. In any of its protean forms, it may be cut up almost *ad infinitum*, and each piece, hydra-fashion, will grow and develop any or all of the said products. This being so, it is clear that in cases of severance with a view to isolation of the sexes, arbitrary cutting across affords no scientific evidence of the facts, unless the parts be also examined before being replaced in the soil, and even then the subsequent growth which ensues, may mean subsequent development of fresh organs, reconstituting the prothallus as bi-sexual. I merely mention these details in order that lay experimenters may be on their guard. My own opinion is that Ferns, like flowering plants proper, are benefited by cross-fertilisation, and that provisions are made to that end; otherwise, why should one and the same prothallus, as I once witnessed myself, bear a well developed, rooted young Fern, at a time when its antheridia were bursting, and emitting a crowd of antherozoids? This is equivalent to pollen ripening at a time when seed has already perfected, which is certainly an indication that it is intended to reach other flowers. For reasons which are easy to gather from the foregoing facts, although no Fern-grower now doubts the possibility of crossing, the cases which are scientifically acceptable as proofs are very few in number as compared with those of which the Fern-fancier is sure. To those who are familiar with the British varietal forms, the union of marked but diverse characters suffices to convince. When, for instance, I see an *Athyrium* with the percruciate and tasselled character of *A. f. f. Victoriae*, but fringed all over with the peculiar translucent bristles of *A. f. f. setigerum*, I need no other proof of crossing; Lowe's cruciate *aculeatum*, Schneider's *P. Schneideri*, and Lowe's cross between *Ceterach officinarum* and *Scolopendrium vulgare*, wherein the dual fructification of *Scolopendrium* figures in a scaleless and somewhat confluent *Ceterach* frond, are all conclusive proofs. Not so, however, are examples gathered from mixed sowings of very variable types in themselves.

In one of Mr. Lowe's experiments (No. VI., p. 84, *Fern Growing*), eight forms of *Athyrium* are used, viz., multifidum (crested), *Victoriae* (cruciate and crested), *uncum* (lax), *Frizelliae* (lunulate), *truncatum* (truncate), *proteoides* (cruciate, with irregular pinnæ), *crucipinnulum* (cruciate in the pinnules), and *ramosum* (branched); and in some of the progeny it is claimed that the features of no less than seven parents out of the eight are discernible, implying multiple parentage as a result of crossing. Now, what are the facts?

<i>multifidum</i>	} are all tasselled, or ramosa, a form of tasselling.
<i>Victoriae ramosum</i>	
<i>Victoriae proteoides</i>	} are all cruciate.
<i>crucipinnulum</i>	
<i>truncatum</i>	} are truncate.
<i>Frizelliae</i> (apt to revert)	
<i>A. f. f. proteoides</i>	And finally, is, as its name implies, an eccentric, variable form.

We have here, consequently, two thorough-breds, *A. f. f. Victoriae* and *multifidum*, mated with a number of inconstant or erratic forms, and presenting traces of similar character. Obviously, a

cross between any two would display a lot of features common to all, to say nothing of the vitiation of the whole experiment by the introduction of an eccentric like proteoides, and the fact that the reproduced photos of the Fern with seven parents show precisely the sort of seedlings proteoides would yield by itself.

In my humble opinion this sort of crossing is an entire mistake; it convinces no one of multiple parentage, and by breeding a number of curious and mongrel types, lowers the general average of merit. In fact, unless crossing be pursued on systematic lines with definite ends in view, and with a firm determination to weed out and destroy all but thoroughly good forms, it does far more harm than good. The field is immense, and the material practically inexhaustible, considering the immense number of natural good "sports," and the possibility of alliances with foreign species; hence, there is no excuse for haphazard admixtures, and a serious risk of swamping the world with "monstrosities," properly so called, and not merely in the sense of the scientific botanists, by whom the term is too often misapplied. *Chas. T. Drury, F.L.S., V.M.H.*

NURSERY NOTES.

MESSRS. CARTER & CO.'S SEED-TRIALS AT MORTLAKE.

THE extensive seed-trials carried out by Messrs. Carter at Mortlake, with a view to testing various stocks of seeds, testify to the care, trouble, and expense to which the firm goes with a view to providing their customers with "tested" seeds of their respective kinds. When we state that the total of stocks of seeds now being tested amounts to 5756, some extent of the magnitude of the labour involved may be imagined, as every stock is carefully booked, with full particulars concerning each, and any improvement or variation from the type duly noted. Among the most important now in condition for inspection, are culinary and sweet Peas; of the first-named over a thousand distinct trials are made, and constitute an object lesson to those interested in this important vegetable. Besides these now in condition are Broad Beans, Lettuce, Parsley, and Carrots; while later a very extensive planting of 1000 Tomatos, a large breadth of Vegetable-Marrow, French and Runner Beans, Beet and Onions in great variety, each sown on the same day and under precisely similar conditions to ensure a fair trial, will prove most interesting and worthy of inspection.

PEAS.

Taking the culinary Peas first as of most importance, one is struck with the remarkable cleanliness and freedom from thrips maintained throughout the trial, notwithstanding that the soil is of a somewhat light, porous character, and in spite of the extreme heat of the past few weeks. The loose nature of the surface has here, no doubt, acted partially as a dry mulch in assisting to hold what moisture there was in the soil below. These Peas were all sown on March 28, under precisely the same conditions, and visited for inspection on July 14. Taking the earliest section of dwarf Peas, it is remarkable to note the progress made by selection and intercrossing, relating especially to the size of the pod, with Peas of the Marrowfat type, together with free-cropping qualities. One particular desideratum is also that the ends of the pod must not be pointed, but so filled with Peas that it may appear blunt at both ends, ensuring a well-filled pod. This was fully demonstrated by comparing the improvement made over earlier-raised varieties of somewhat similar habit growing close by for comparison. One of the best early dwarf Peas was found in Carter's New-forcing, a great improvement on American Wonder. Witham Wonder is a rather stronger grower than the preceding, but a few days later in podding,

William Hurst and Chelsea Gem are two well known dwarf Peas; while Premium Gem, an old prolific variety, still has its admirers, and finds a considerable sale. A selection, No. 47, represented a dwarf form of William I., and an improvement on English Wonder. The Stanley, 2 feet, is a variety of American origin, and bears pods of two shapes; while the Stanley Improved, of similar height, carries large pods of improved form, and is about four days later than Chelsea Gem. Early Moru represented one of the finest of early Peas of the Marrowfat type, like an improved Gradus, a very regular and abundant cropper, and on all points a Pea of the highest class. A dwarf variety known as Market Morn is in request by market-growers, and is a good early Pea for this purpose, growing to a height of 2½ feet. Carter's Daisy (2 feet), a cross between Lightning and Giant Marrowfat, and raised at Forest Hill, is a grand form of Pea, partaking of the Marrowfat type of the one parent, with the earliness of the other, and a free and regular cropper. Daylight represented a cross between Daisy and Lightning, resulting in a blue wrinkled Pea of 2 feet growth. In noting the rather taller-growing early varieties, Carter's Lightning held the position as the earliest Pea on the trial, being almost ripe and dried up, and the character of this early Pea is maintained by a selection of the earliest pods for seed purposes. Carter's Selected William I., was also in advance of the old stock growing alongside, the crop being much heavier. Kenilworth is a market Pea of this class, and most in request by German growers; while seed of Princess Royal, a good old Pea, is sent to France in quantity, where it is known as Glory of the Market.

In second early varieties, Carter's Pride of the Market was much in advance of several others; height 2½ feet, and bearing a profusion of fine pods of the Telegraph type, from which variety this was a dwarf selection. Stratagem, another well-known variety, was in fine form; it is rather earlier than the preceding variety, as the pods were somewhat old. Carter's Majestic, 2½ feet, sent out last year as an exhibition Pea, raised from Stratagen, was bearing very fine, well-filled pods. Danby's Stratagem is a fine selection with long pods, but growing rather taller than the type. Gladiator is a fine market Pea, 3 feet, and is much grown by the Essex market gardeners. Abundance is grown chiefly to supply the American and Continental markets; while Carter's Delicatesse, 3 feet, bearing long pods, freely produced and filled with small wrinkled Peas, is not much in request in this country, but finds a ready sale in France, where the variety is used for bottling, and in this form largely returned to the English markets. This method of preserving Peas for winter and spring use appears to be neglected by our home growers. Edible-podded Peas in several varieties are also among the trials, but these are little patronised by English consumers. A good stock of Prince of Wales represented a market Pea much grown in the Evesham district; it has the merit of retaining its sweetness when somewhat old, a very important point with growers for market.

Of taller growers, Telegraph still maintains its high reputation, and is largely grown; it was originally raised by Mr. Culverwell, and was the pioneer of large-podded Peas of this class. The trial rows here are in fine condition; and Telephone is almost similar, but with wrinkled seed. In this section, a new Pea, "The Carter," is in very fine form; it appears to partake of the Duke of Albany character, but with longer and better filled pods, and is a more regular cropper. Duke of Albany was present under other names besides the original—Hero of Trowbridge and Prodigy proving to be identical with this well known variety; while Duke of Norfolk represented a second stock of the Duchess—this latter was a good cropper, differing but little from Duke of Albany. Duke of York is a dwarf form of the last-mentioned popular Pea. Among

later Peas, Dwarf Monarch, a Pea of the Omega style, proved to be a free-bearing variety with large pods filled with deep green Peas; and Captain Cuttle, 4 feet, was a good late-bearing variety. The well-known Autocrat was doing remarkably well, proving its good character. Carter's Michaelmas claimed to be the latest Pea grown, was also here in good form. Three other late varieties were a tall selection of Latest-of-All, late and good; the old Ne Plus Ultra, which well maintained its character as one of the best late small-podding Peas; and St. Dunns, which also promised to be a good late variety.

BROAD BEANS, &c.

In a trial of about forty varieties, the best were Carter's Leviathan re-selected, a very fine stock of long-pod Beans; Masterpiece, a green long-pod, very good; Carter's Leviathan and Seville Long Pod; Beck's Green Gem, an old variety with small pods, and Beans produced in great abundance, was the best of its class. The Carrot-trials were scarcely forward enough for comparison, but attention was directed to the Carter Forcing, an admirable variety for cooking whole, the colour and texture of the root being similar throughout, and devoid of the yellow heart so often found in Carrots. Among Parsley, the Champion Curled and Fern-leaved were the best selections.

LETTUCES

were a strong trial. Carter's Jumbo Cos was a very fine variety, and easily first for size and weight; while Long-Stander, New York, and a selected form of All-the-Year-Round in the Cabbage section, were respectively good. Carter's Harbinger is highly recommended as a forcing Lettuce. A variety known as "American Gathering," has leaves of a dark red colour, with bright red tips, was more remarkable for its colour, and might be grown as a decorative variety. The dark-leaved Lettuces, although some are very good, as, for instance, Continuity, are not generally appreciated by the public at large, and appear to be little grown for market purposes.

SWEET PEAS.

Among flowers, the Sweet Pea is undergoing an extensive trial in some 200 varieties, and at the date of our visit they were just at their best. In a dainty little catalogue of Sweet Peas just issued, Messrs. Carter & Co. say:—"Much stimulus has been given to the culture of Sweet Peas by the phenomenal number of introductions of recent years. This has necessitated elaborate provision on the part of those whose business it is to satisfy the demand thus set up, and as we aim at being in the van of progress in all that we undertake, we have maintained our position as head-quarters for Sweet Peas by growing year by year, an up-to-date and complete assortment, including all the newest, as well as retaining all the original varieties. We have this year, in our grounds, upwards of 180 different-named selections, each claiming its own peculiar characteristic, whether in colours or blendings, form of flower, habit of growth, or earliness, the whole constituting a study of beauty worthy of the attention of all who take an interest in flowers. Among so many good varieties it is somewhat difficult to make a selection, but those mentioned were noted as being distinct and effective in their respective varieties. The best and purest white was found in "The Bride," and the best light-yellow was Primrose. The following were all very good: Venus, blush pink; Orange Prince, orange, pink, and scarlet; Rising Sun, orange and carmine, wings blush white, distinct; Meteor, salmon-pink; Lady Penzance, bright rose; Princess Beatrice, delicate carmine rose; Mrs. Gladstone, delicate shade of pink; Cardinal, crimson scarlet; Prima Donna, the best pink; Firefly, glowing crimson; Butterfly, white with blue edging; Countess of Radnor, delicate lavender; Emily Eckford, reddish-mauve; Duke of Clarence, large rosy-claret; Stanley, large deep maroon; Princess of Wales, white and mauve striped; Duchess of York,

FIG. 36.—*BEGONIA SOCOTRANA*: FLOWERS PINK. (SEE P. 84.)FIG. 37.—*BEGONIA VEITCHII*: FLOWERS RED.
(SEE P. 84.)FIG. 38.—*BEGONIA BOLIVIENSIS*: FLOWERS
SCARLET. (SEE P. 84.)

white and pink; Lottie Hutchins, cream, flaked with pink; Daybreak Coronet, white and rose, tinted orange; Mrs. J. Chamberlain, white, with bright-rose stripe; Aurora, pink stripe on white ground; Mars, deep scarlet; Red Riding Hood, a novelty only of hooded form, of rosy-pink colour.

A collection of dwarf bedding *Tropæolums*, in fifteen distinct colours, was very effective; those of mixed colours were also very bright. The Pearl is of a cream-colour, and the nearest approach to a white yet obtained; while in *Cœrulea rosea* there was a shade of blue; Empress of India, crimson-scarlet, with dark foliage; King of Tom Thumbs, scarlet with green foliage, may be mentioned. A large stock of Pansies, from seeds sown last August, of an excellent strain, were flowering profusely, although somewhat past their best, and selections in colours were being made for seed-saving.

COLONIAL NOTES.

"WEST INDIAN BULLETIN."

THE first number of this publication, described as being the Journal of the Imperial Agricultural Department for the West Indies, is now before us. The *West Indian Bulletin* is issued from Bridgetown, Barbados, where the head office of the department is located. The London agents are Messrs. Dulau & Co., 37, Soho Square, W. The first number of the *Bulletin* contains an introduction by Dr. Morris, Imperial Commissioner for Agriculture for the West Indies, explaining the motives for the appearance of the publication thus:—"The West Indian Royal Commissioners recognised that communication between these colonies is difficult, and with the outside world it is both tedious and expensive. The persons engaged in cultivation suffer from this state of isolation, and are often without any information as to what is being done elsewhere. The cultivator of one product is often quite ignorant of the best means of cultivating any other, and does not know whether his soil and climate might be better adapted for something else. These remarks have special reference to the small cultivators, but they are not wholly inapplicable to persons interested in the larger estates. . . . Although it is proposed to deal fully with scientific problems, and afford assistance in the improvement of Sugar-cane cultivation and manufacture, and of other established industries, the *Bulletin* will form an important means whereby the people generally will be educated in sound and scientific methods for cultivating the soil, and in the growth and preparation of economic products suitable to the varied circumstances of these Colonies. . . . A few years ago, in the whole of the British West Indies, there were only two botanical institutions (Jamaica and Trinidad). Now there are twelve. While the *West Indian Bulletin* will follow on the lines so successfully adopted in the *Kew Bulletin*, and more recently in the useful *Bulletins* issued by the botanical departments in Jamaica and Trinidad, it is hoped it may be possible to add a few new features, especially in the number of illustrations."

The *Bulletin* further chronicles the first Agricultural Conference held in the West Indies (Barbados) last January, reporting the presidential address of Dr. Morris, referring to the inquiry made by the royal commission in 1896 into the Sugar-growing industry of the Colonies, and further papers as follows:—"Sugar-cane Manurial Experiments," by Professor J. B. D'Albuquerque; "Field Treatment of the Diseases of the Sugar-cane in the West Indies," by J. R. Bovell; "Central (Sugar) Factories for the West Indies," by William Douglas, and again by Francis Watts; "Cost of Growing Sugar-canes in Barbados," by J. R. Bovell; "Agricultural Education," by Rev. W. Simms; "Teaching of Agricultural Science at Colleges," by Professor D'Albuquerque; "Agricultural Instruction in Jamaica," by William Fawcett; "Practical Field Instruction in Jamaica,"

by the same author; "Suggestions for Agricultural Development in the Leeward Islands," by Dr. H. A. A. Nicholls; "Improvement in Agricultural Methods in the West Indies," by J. H. Hart; "Prevention of the Introduction and Spread of Fungoid and Insect Pests in the West Indies," by William Fawcett; and "Suggestions on Colonial Industries," by Professor P. Carmody.

Altogether, the new *Bulletin* may be described as being worthy of the important centre whence it comes, the first (a double) number giving good promise of a vigorous future for the publication.

PLANT NOTES.

MORISIA HYPOGÆA.

This very pretty new alpine plant, belonging to the Cruciferae, has been recently introduced from Sardinia, and it is named in honour of Professor Moris. It is well adapted for planting in shady recesses on the rockery, growing and blooming freely. Its characteristics are intense green, prettily-cut leaves, and flowers of bright yellow, and of the size of a shilling, projecting from the axils of the former. The plant is very dwarf, and the flowers appear in the month of May.

RUDBECKIA GOLDEN GLOW.

The Cone-flower, as the Rudbeckias are sometimes called, especially such species as *R. speciosa*—often called *R. Newmanni*, whose flowers have golden yellow florets and black disc, and appearing late in October when flowers are scarce, are extremely useful. Much as perennial Sunflowers are valued, they cannot be said to possess as much merit as Rudbeckias; besides, they have been long past when Cone-flowers are at their best. A recent introduction from America, with double flowers of a very bright yellow, named Golden Glow, is deserving of a place in every herbaceous border. It is vigorous in growth, reaching 5 feet and more in height. It is seldom that one now sees Rudbeckia purpurea (Don's Echinacea), introduced 300 years ago, with large crimson-coloured flowers that appear in September. All of these species thrive best in partially-shady positions.

INULA GLANDULOSA.

It would be imagined in these days when Marguerites and Sunflowers are so much in fashion, that *Inula glandulosa* would have long ago come to the front. This may be due to the fact that it is not well-known. A native of Georgia, it is allied to *Helenium*, it possesses long and large leaves of a pleasing shade of green, and large blooms with great discs borne on stems some 2 feet in height. The deep yellow-coloured petals are narrow, and the flowers gyrate. The plant was introduced almost a hundred years ago. *W. Earley*.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIOAN, Bart., Clare Lawn, East Sheen, S.W.

Lælia tenebrosa.—In most cases this free-flowering species makes new growth at the time the plant commences to flower, and before the flowers are past, the fresh growths may be showing roots from their base. But before such roots have grown it is best to afford the plants what new material they may require, either as a surface-dressing or by repotting them. In the latter case carefully break the present receptacle, pick away all decayed matter, cut off any dead portions of roots, and insert the ball with the clinging potsherds into another pan, sufficiently large to accommodate the plant for two seasons. Place more crocks around the mass in an upright position, and surface with peat and sphagnum-moss in equal proportions. Return the plants to the lightest and warmest position in the Cattleya-house, where the syringe may be used amongst the pans during the summer months. This species is not easily injured by an excess of moisture at the roots, but it is inadvisable

to afford water in a haphazard fashion, especially for some time after root disturbance; and for the present, if the sphagnum-moss be kept alive, this will be sufficient. A small white scale which infests these plants can only be removed by means of a stiff-bristled brush and a strong solution of soft-soap. *L. grandis* and *L. xanthina* may be treated similarly to *L. tenebrosa*.

Cattleyas velutina and *Doriana*.—In whatever receptacles either of these species may be cultivated, a very small quantity of peat or sphagnum-moss need be placed about their roots, but an abundance of crocks. The peculiar stem-like pseudo-bulbs are now in course of development, and when flower-sheaths appear the pseudo-bulbs will emit roots from their base. Whatever attention the plants may require, should be given them before these roots have become of much length. Although the pseudo-bulbs are small, a moderately dry condition appears to suit them better than a wet one. They should be placed in the Cattleya-house, and where the air will circulate freely around them.

Stanhopeas.—Contrary perhaps to general experience, I find *Stanhopeas* comparatively easy of cultivation, and this, it may be, is due to my practice of disturbing the plants as little as possible. With one or two exceptions they will all thrive in a well-regulated Cattleya-house if planted in shallow baskets. Instead of crocks use a few rods of charcoal, laid at right angles to the bottom bars, and pack some lumps of good fibrous peat around the base of the pseudo-bulbs. If the plants are not then secure, they should be made so by means of some copper-wire. Excepting when the plants are making roots freely they need but little water, and this should be supplied most carefully, so that none may lodge among the young leaves. A continental grower once remarked to me that *Stanhopeas* were partial to rotten wood, but my own experience has been distinctly opposite to this, for when plants have been removed into new baskets their health has considerably improved. It is useless to try to confine the plants to their respective baskets, but leave them alone until the baskets can be broken away piece-meal. It is a suitable time to re-basket any plants that require this attention immediately they have flowered.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Affording water to the borders.—The lack of rain and the great heat of the past few weeks has rendered the application of water to fruit-trees a pressing necessity, any lack of moisture at the root greatly reducing the size of the fruits and the amount of wood-growth. This will apply with great force to gardens the soil of which is light or shallow. Pyramids and bushes of the Apple on the paradise stock are those most affected by long periods of dry and hot weather, and orchard standard trees worked on the crab stock, less so—although these, if carrying good crops of fruit should be supplied with water copiously twice or thrice on successive days to ensure it reaching the lowermost roots. Previous to the last application, a mulch of partly decayed stable-manure should be applied to the soil. Even should rain set in, the soil is now so dry that, unless it is unusually heavy, it would fail to reach the roots in time to assist the swelling of the fruits.

Pears, and especially bushes and cordons on the Quince-stock, should be afforded water. It will assist the trees if the surplus growths be now removed, going over all of the trees. The leading shoots should be secured betimes to the fence or wall, so as to avoid breakage from any cause.

Apricots now approaching ripeness, should be afforded sufficient water at the root to thoroughly moisten the soil. The branches of this tree frequently die off suddenly in hot weather, and this mischance may be reduced by applying water freely at the root and following it with a mulch. Where none of the fruit is ripe, the garden engine may still be plied night and morning. The Peach and Nectarine trees need similar treatment. The great heat has hastened the ripening of the early Peaches, and I was enabled to gather good fruits of Amsden June and Waterloo about the 15th of the present month.

The Fig.—The roots of Fig-trees being usually restricted to a small space, the need of an occa-

sional application of water will be very obvious. Keep the young growths thinly trained in, removing all laterals while in a young state.

Apple-thinning.—The trees of such early culinary varieties as Lord Grosvenor, Ecklinville Seedling, Grenadier, Potts' Seedling, &c., which may be carrying heavy crops may be gradually thinned, and the thinnings sent into the kitchen for immediate consumption. Nothing adds so much to the size and appearance of the fruits left on a tree as this early thinning of heavily-cropped trees, and the more severe the thinning the larger the fruits. Apply liquid-manure after first affording clear water to the trees that are in bearing, but not necessarily to those which, having no fruits, are running greatly to wood.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to the Right Hon. W. H. LONG, Rood Ashton, Trowbridge.

The Early Peach-house.—Where the varieties comprise Waterloo and Alexander, the utmost care must be taken to keep the atmosphere rather cool at all times, so that the development of the buds may proceed slowly. If the roof-lights are portable, it is better to remove them. Where this is not possible, the most ample ventilation should be afforded, and a slight shade of fish-netting laid on the roof, or lime-wash sprinkled on it with the syringe. Concentrated sunlight, like that occurring under a glass-roof or over, is apt to cause the premature development of the buds, which usually ends in bud-dropping later on. We do not think that this is the cause in less sunny parts of the country, or when shoots are allowed to grow, and thus draw sap away to distant parts of a tree. A mulch may be applied to keep the soil moist. Red spider is prevalent this season, and timely measures must be taken to clear the trees of them by syringing with water once or twice a day; or where this is impracticable, by covering the leaves with flowers-of-sulphur, applied as a wash with the syringe—but the trees cannot be rid of the creatures by one application. If from any reason the wood that has borne fruit this year has not been removed, or at least a sufficient quantity to admit of the season's growth being evenly distributed over the trellises, no time should be lost in getting this sort of work done. Old trees are usually benefited by applications of liquid-manure, especially if they have borne heavy crops of fruit, or been weakened by infestations of insects.

Succession Peach-house.—The foregoing remarks apply generally to the succession-houses, and a reference to earlier Calendars will indicate what has been recommended for the second Peach-house in regard to summer-pruning, laying in weed, &c. If scale be found on any of the trees, and these are cleared of fruit, they may be dressed with petroleum emulsion and water at 140°, well stirring it during use. Trees on which the fruits are swelling should have the shoots neatly tied in, and every fruit exposed as much as possible to the sun, and not the base, but the apex. There are various methods of doing this with bits of lath, bands of matting, &c. Ventilation and shading must be modified to suit the various houses, some fruit being required soon, others later, and no rule can be laid down that would meet all requirements. Let the borders be kept moist when a crop of fruit is on a tree or trees swelling finally, the tax on the resources of the plant being then the greatest.

Pines.—Plants which have fruited should be carefully attended to in the matter of water at the root till the suckers are sufficiently large for removal; and if neatness be a consideration, they may be taken out of the fruiting-house and placed in a heated pit, and their places filled with plants of fruiting age. Having got to a fit size, twist the suckers off the stems, and lay them aside, to allow the wounded end to dry somewhat, then pot them in clean, well-drained 7-inch pots, and plunge them in a pit or frame close to the glass, and where a bottom-heat of 78° to 80° can be maintained with leaves or tan for a period of five or six weeks. Keep the frame rather close till the suckers are rooted a little, then afford air during the warmer parts of the day, and afford slight shade for three or four hours during bright sunshine. The frames or pit must be kept fairly moist, with top heat of 75° max. Those suckers which were potted early in the summer, having now made roots freely, should be repotted. Queen and Black Jamaica Pines being moderate growers, succeed in 10-inch pots, and the larger-

fruiting varieties in pots 2 inches larger. Do not pot any Pine-plant without first affording it water; and if the new soil is dryish, let them have a fairly heavy application after replugging them in the bed. Do not crowd the plants, or the foliage will get weakened and drawn. The bottom-heat should range from 80° to 85° for succession plants, and 5° to 6° higher for fruiters. If tanner's bark be employed to afford bottom-heat or for plunging the plants in, the present is a suitable season to renew it wholly or in part. If the latter, then sift out the decayed particles, and preserve the siftings to mix with the new bark. Plants with swelling fruits are benefited by applications of weak guano-water.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener to the DOWAGER LADY HOWARD DE WALDEN, St. James's House, Malvern.

Nerine sarniensis, *N. recurva*, &c. — These autumn-flowering bulbs having been dried off since May, will soon show their flower-spikes, and any of them which may require to be repotted should receive attention forthwith, that is, while the plants are in a dormant state. The usual practice is to repot as seldom as possible, the idea being that the bulbs flower more profusely when the roots are restricted. It is not often that a large percentage of the bulbs can be induced to flower, and therefore plants which flower in a satisfactory manner when treated in the above manner, should be left undisturbed beyond removing the surface-soil an inch or two in depth in order to afford as much fresh compost. In the case of bulbs which have not flowered satisfactorily, the whole of the soil should be shaken from the roots, and the bulbs repotted singly in relatively small pots, placing the largest bulbs in 4-inch pots, and others in smaller sizes. Let the pots be well drained, and a compost of three parts loam, one part flaky leaf-soil, and a liberal allowance of silver-sand be employed. The bulbs should not be afforded any water before leaves or flower-spikes become visible, when a good application may be made, and afterwards in increasing quantities in accordance with the growth of the foliage and roots. As the plants cease flowering, place them in their winter quarters, that is on a shelf near the glass in a temperature of between 50° and 55°, where they will continue to grow, and where they may remain till the foliage dies down in the month of May.

Richardia Elliottiana and *R. Pentlandi*. — The yellowing of the foliage of these plants at this season, is an indication that less water is necessary at the roots, and the quantity should be gradually reduced, until by the time the foliage has quite died off, the ball of earth has become dry. When this stage is reached, store the plants in a place safe from drip until the spring. These *Richardias* winter safely in a temperature of from 45° to 50°. Seeds of *Richardias* sown as soon as ripe, germinate freely if the seed-pots are placed in the stove or plunged in a hot-bed.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt, Tetbury, Gloucester.

Iris. — At this season it is prudent to remove the seed-vessels and stalks from the Spanish and English varieties, and in gardens that have been well drained, and the soil warm, the bulbs may remain undisturbed; but in retentive ones, it is better to lift the bulbs carefully as soon as the foliage has died down, and dry them off gradually in a cold frame. The German *Iris* should be kept well supplied with moisture during the next month.

Plants on Walls. — The pruning, thinning, and regulating of the shoots should have attention this month, thereby exposing the season's growth to the sun, so that it may get matured whilst warmth endures. In pruning the shoots, do not impart to the plants a flat surface, but only shorten them if growing too far from the wall. Such berry-bearing shrubs as *Crataegus pyracantha* and *C. Lelandi*, or *Cotoneasters*, if heavily laden with berries, should be relieved of some of the bunches and shoots, laying-in other shoots that will be likely to flower next season. *Eucynimus* and *Elæagnus* in variety, *Azara microphylla*, *Griselinia littoralis*, *Escallonia macrantha*, and others, *Myrtles* and wall plants of a tender nature, should be so pruned that the growths may protect the main stems from frost. *Jasminum nudiflorum*,

Forsythia suspensa, *Bigonias*, and *Banksian* *Roses* only require the points to be thinned out where they are growing too thickly. *Pyrus japonica*, *Chimonanthus fragrans*, and *Wistaria sinensis* should have the summer growths cut back to within 2 inches of the spurs, so that strength may be directed into next season's flower-buds now forming. The summer-flowering *Clematis* will require little pruning, but as many shoots as possible left at the base of the stems.

Magnolia grandiflora. — Both this and the free-flowering *Exmouth* varieties require that all lateral growths pushing out from the base of the flower-bud and those on flowerless shoots should be broken out, as if left they deprive the stems and leaves of nourishment, and tying them in alters the character of the plant by giving it a leafless appearance, and accounts in a great measure for scarcity of bloom.

Deutzia scabra, and the varieties *candidissima*, *discolor*, *purpurea*, *flore-pleno*, *Walteri*, and *Wallisii*, are excellent summer-flowering shrubs that succeed in most kinds of soil. They require, when making growth, to be well supplied with moisture at the roots; and now that they have just passed out of flower, the greater portion of the wood which has flowered should be cut out, in order to encourage the young retarded growths. Remove all root-suckers, these being injurious to the chief stems by robbing them of sap.

Colchicum speciosum and other species of *Colchicum* are handsome autumn-flowering bulbs, and here they are planted in the grass under tall trees in dry, exposed parts of the garden, and flowers are profusely produced by the bulbs each year. The bold-looking foliage is 18 inches high, and in the spring months it is very effective. Bulbs should be obtained and planted at once if flowers are wanted this next autumn. In planting them, select trees whose feeding roots are at a good distance from the stem. Prepare holes 1 yard apart, and of irregular outline, digging out the soil 1 foot deep, and filling-in with some sandy loam and leaf-mould. Then replace the turf, and in the centre make a hole with a dibber, in which one bulb should be placed not less than 4 inches deep. *C. Parkinsoni* is a very pretty flower, tessellated and barred with purple colour on a white ground—a gem for the rock-garden; *C. umbrosum* succeeds well in shade; *C. luteum* has delicate yellow flowers, but is rather tender, and requires to be covered with Cocoa-nut-fibre refuse, &c., in the winter.

Sternbergia lutea is another lovely late autumn-flowering bulb, that requires to be planted at this time of year. Choose a dry position exposed to full sunshine in the rock-garden, or on a border close to a south wall, placing the bulbs about 4 to 6 inches apart; they then may remain in the same position for at least five years, by which time the bulbs will have increased a good deal, and be in need of lifting. *S. macrantha* is in colour a brighter yellow than the former, and the leaves shorter and more glaucous; it should be similarly treated. *S. Fischeriana* resembles *S. lutea* in growth, but the flowers come in the spring; a deep, open soil of a light nature suits this class of bulb the best.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Cabbages. — Two good sowings of some approved varieties should be made, one about the 30th of the present month, and another fourteen days later. Choose an open position for the seed-beds which is in good heart. The seed may be put into drills made 1 inch deep, and 10 inches apart, on light and hot land, and rather less deep on heavy land. By sowing in drills, it is so much easier to keep the land stirred, and to eradicate weeds. If no rain has fallen recently, apply water to the drills before sowing, and afterwards when it is needed. If the Cabbage crop is to follow Onions, and the land for the latter was deeply dug and heavily manured, digging for the Cabbages will not be required, but the surface should be loosened with a digging-fork, and the lumps of soil broken, and then all should be made moderately firm; after which, draw drills—4-inch drills—and set out the plants when these are sufficiently large enough. Land which has to be deeply dug must be well manured, and if it be now vacant, no time should be lost in preparing it, so that it may have time to settle a little before being planted. Sow largely seeds of

Ellam's Early, and also a pinch of Red Cabbage. It is always prudent to sow three or four varieties of Cabbage, in the event of any variety bolting.

Carrots. — Sow a large bed, or beds, on a sheltered border of some of the Shorthorn varieties for drawing whilst young, a later sowing being made in September. These late sowings will prove useful throughout the winter and spring, and will fill the place of early forced roots, if taken up, and placed thickly in trenches in a cool spot.

Winter Greens, &c. — Let all gaps be now filled up, and ascertain if a sufficient quantity to meet the demand has been planted.

Tomatos. — The leading shoots should be stopped when a good set has been obtained, the side-shoots removed and the leaves tipped if the plants are growing very strongly. Afford moisture to and mulch the roots on warm, dry soil, with short dung.

Miscellaneous Hints. — Let the hoe be kept going amongst all kinds of crops; afford water when required to plants till they have got well over the removal, to encourage root growth. Broccoli for late use, or such as were transplanted into nurse-beds, should now be planted out, and if on Strawberry-land, merely grub up the plants, prick up the surface, and plant out, and if necessary, make use of a pointed bar of iron in making the holes. Broccoli-plants should have ample room to grow, and the land should be firm and in good heart.

THE APIARY.

By EXPERT.

Swarming. — For the straw-skepiest the season must be a poor one, seeing that so few skeps were ready to swarm, and consequently the sudden influx of honey stopped progress, as it did in frame-hives. Therefore swarms have been scarce everywhere; apiaries of over twenty hives have only had swarms from a fourth part of them. In one place where forty hives are kept there have only been four swarms. This is, of course, a serious matter, as the owners will have to reduce stock to secure any "take" this year. Yet these swarmless apiaries have shown symptoms of swarming every day, large clusters of bees hanging idly out around the entrances, whereas had the owners known that the swarms were not coming off, supers would have been given, and surplus-honey secured. But the bee-keepers watched and hoped in vain for the hives to swarm. Can we blame them? Nay, rather let us acknowledge that it is easy to be wise after the event. The cold weather in May also retarded queen-breeding, at least in my hives; then came the rush of work involved in securing the honey-flow, together with the packing and dispatching of swarms. In consequence of all this extra labour, a fine lot of queen-cells were lost by an over-sight of a few hours. This meant work to be done over again, and a loss of a fortnight in getting them tested. The tendency amongst advanced apiarists is to supersede towards the end of the honey-harvest, this plan giving the opportunity of testing the capabilities of the queen after introduction, and also a chance of making sure that the colony is going into winter quarters headed by a young queen, and thus laying the following year. The many enquiries that come in the spring for queens to introduce to queenless colonies, proves that many die in the winter season, or that the colonies supersede late in the year, either by excessive swarming or otherwise, and often in cold weather the young queens fail to become fertile; this means the loss of the colony the following spring.

Removing sections. — Honey in sections when fully sealed, should be at once removed from the hives. This prevents the face of the comb being travel-stained. I also advise that second racks of sections should be set below those already on; this also prevents travel-stains. It also assists in the same direction if the combs in brood-nests are moderately new, i.e., not more than four years old. Swarms that have travelled a long distance by rail, should be fed on arrival; and if the weather should be cold and chilly, put them in a warm room for an hour or two while they are feeding. This treatment will put the bees in good form for hiving, and enable them to start "comb-building." Good syrup for feeding in this way may be made by mixing two parts of sugar to one part of water, or honey thinned with water will do as well.

APPOINTMENTS FOR AUGUST.

TUESDAY,	AUG. 1	Scottish Horticultural Association, Meeting.
WEDNESDAY,	AUG. 2	Midland Carnation and Picotee Show, at Edgbaston Botanic Gardens, Birmingham (2 days).
MONDAY	AUG. 7	Bishop's Stortford Horticultural Society's Show. Northamptonshire Horticultural Show at Northampton (2 days). Workshop Floral and Horticultural Society's Exhibition. Atherstone Horticultural Society's Exhibition.
TUESDAY,	AUG. 8	Flower Show and Gala at Abbey Park, Leicester (2 days). Horticultural Show at Weston-super-Mare.
WEDNESDAY,	AUG. 9	York Florist's Exhibition of Carnations, &c.
THURSDAY,	AUG. 10	Royal Botanic Society (Anniversary Meeting). Taunton Deane Horticultural Society's Show.
SATURDAY,	AUG. 12	Coniston Horticultural Society's Show.
TUESDAY,	AUG. 15	Royal Horticultural Society's Committee.
THURSDAY,	AUG. 17	Royal Horticultural Society of Aberdeen: Show in Duthie Park (3 days).
FRIDAY,	AUG. 18	Devon and Exeter Horticultural Society's Exhibition.
SATURDAY,	AUG. 19	National Co-operative Flower Show at the Crystal Palace.
TUESDAY,	AUG. 22	Brighton and Sussex Horticultural Society's Show (2 days).
WEDNESDAY,	AUG. 23	Shropshire Horticultural Society's Exhibition at Shrewsbury (2 days). Hastings Horticultural Show. Harpenden Horticultural Show.
THURSDAY,	AUG. 24	Swansea Horticultural Show. Ellesmere Horticultural Society's Show.
FRIDAY,	AUG. 25	Royal Horticultural Society of Ireland, Show.
MONDAY,	AUG. 28	National Chrysanthemum Society's Executive Committee Meeting.
TUESDAY,	AUG. 29	Royal Horticultural Society's Committee.
WEDNESDAY,	AUG. 30	Dumfriesshire and Galloway Horticultural Society's Show in the Drill Hall, Dumfries.

SALE FOR THE ENSUING WEEK.

FRIDAY,	AUG. 4	Imported and Established Orchids, at Protheroe & Morris' Rooms.

Remarks.—The weather during the week has been very hot, the temperature on five days exceeding 80°. Friday, July 21, was the hottest day this year. Rain fell on the evening of the same day, and a heavy storm, accompanied by thunder and lightning, on July 22.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—63.2°.

ACTUAL TEMPERATURES:—

LONDON.—July 26 (6 P.M.): Max. 82°; Min. 61°.

PROVINCES.—July 26 (6 P.M.): Max. 74°, Home Counties Min. 54°, Orkneys.

Fine, warm; slight rain; wind.

The New Charter of the Royal Horticultural Society.

On a very hot afternoon (July 21), the petition to HER MAJESTY in Council to grant a new charter to the Royal Horticultural Society was, after some little discussion, adopted unanimously. The Council was, of course, strongly represented on the occasion, the general body of Fellows more than sufficiently so to form a quorum.

The President, always to be found at his post when work has to be done, explained that some doubts existed as to the legality of certain procedures connected with the election of new members of Council, and other matters which it was desirable to clear up. It will be remembered that at one of the late annual meetings, the proceedings were challenged by Mr. SMEE, and that the Council then undertook to look into the matter. The result has been that the doubts expressed have been seen to be probably valid; whilst, owing to the lapse of time, and the evolution of different conditions, circumstances have so changed that much of the old charter is now a mass of obsolete or irrelevant verbiage. The new charter, the draft of which was read by the solicitor, and approved by the meeting, will simplify matters very much. It contains, as was stated by the Council, nothing that was not fundamentally essential in such a document. So far as possible, the government of the Society will henceforth be effected, not by the charter, but by the medium of bye-laws which will have to be reconstructed and carefully considered. The great advantage of these bye-laws is that if they are not found to work well, or if otherwise they require modification, the necessary change can be effected by the will of the Fellows, in meeting assembled for the purpose, at any time, after due notice has been given.

In the discussion that followed, Mr. GORDON hoped, that so far as the election of new members of Council is concerned, there would be no departure from the plan of periodically introducing "fresh blood" into the Council at the annual meetings, a practice sanctioned by the experience of ninety-six years. In reply, the President, while mainly, if not entirely, agreeing in principle with the remarks of Mr. GORDON, alluded to the difficulty experienced of getting men willing to sacrifice the necessary time, labour, and expense in the service of the Society. Some gentlemen, with the necessary business capacities, were otherwise so much engaged, that they could not attend to the business of the Society, and scarcely ever attended its meetings.

Ultimately, the President proposed the resolution that the draft charter as read be approved. This was seconded by one of the Vice-Presidents, Sir JOHN LLEWELYN, supported on behalf of the non-official Fellows by Dr. MASTERS, and carried without a dissentient vote. It was explained that the revised bye-laws would be circulated among the Fellows in time to give them an opportunity of studying them before the meeting. We trust this may be done in such a way as to enable the Fellows readily to compare the new with the old.

It was also stated that, in all probability, owing to the near approach of the vacation, some months would elapse before the new charter was granted. The meeting concluded with the usual vote of thanks to the President, who adroitly shunted the compliment on to the Sub-committee of Council chiefly concerned in the work.

Riverside Gardens.

It may be remembered that last year a syndicate of some importance proposed to "take over" that portion of Westminster lying between Old Palace Yard and Lambeth Bridge, with the object of turning the area into a new "quarter," made up of a riverside garden with piles of "mansions," and with sites for public buildings, &c. It all looked very pretty, but the House of Commons thought that either the Government or the London County Council should take in hand the proposed improvement, and the Bill was thrown out, the Council undertaking to put forward a scheme worthy of the magnificent situation. Mr. SHAW LEFEVRE'S Committee has considered the whole matter, and it now remains for the County Council to overhaul the report now before it, and take such steps as may be determined upon—first securing an Act of Parliament for the purpose. The scheme provides for the purchase of all the property, Government or otherwise, between Old Palace Yard and Lambeth Bridge; and between these points a 70-foot wide road is proposed to be constructed, the ground trending to the river being turned into an embankment-bordered garden, giving a fine promenade east and west; that lying to the north of the road-line it is proposed to lay out in wide streets, suitable for all kinds of high-class buildings—all of these roads to be planted, with, we believe, special points here and there for planting displays. It will be necessary to attend afresh to the main-drainage schemes; and though the cost will necessarily be somewhat large, still there can be little doubt but that large sums will be recouped by the lease of eligible sites for long terms.

In as few lines as possible, we believe we have indicated the scheme about to be considered by those who have now charge of a great deal of the ratepayers' money. Should this improvement be carried out, the view from the bridge or the river, ending with the Victoria Tower, will be very fine; and it is to be hoped that power may be retained by the London County Council as to the nature and elevation of the buildings to be erected, so that no undue or any dwarfing or shabbiness may be allowed.

NEPENTHES BALFOURIANA ×. — The very handsome *Nepenthes* illustrated at fig. 39, p. 91, formed part of the remarkable exhibit made by Messrs. JAMES VEITCH & SONS at the recent Hybridisation Conference. Messrs. VEITCH, as is well known to our readers, have achieved many successes in hybridising *Nepenthes*, the species of which lend themselves readily to the gardener's art. The present pitcher is the outcome of a cross between *N. mixta* ×, Mast., and *N. Mastersiana* ×, Veitch; *N. mixta*, Mast., is itself a hybrid between *N. Curtisii* and *N. Northiana*, Hook. f., and *N. Mastersiana* × is the result of a cross between *N. sanguinea* and *N. Khasyana*—so that the present plant is the descendant of four distinct species.

DISASTROUS HAILSTORM NEAR MAIDSTONE.

—From the following intelligence, supplied us by Mr. GEO. WOODWARD, Barham Court Gardens, Teston, we fear that the fruit crops around Maidstone have suffered severe damage: "On the morning of the 21st inst. we experienced the most destructive hailstorm I have ever seen. So far as one is able to judge, the whole of our Apple-crop is ruined. Hundreds of the fruits are cut as if sharp flints had been thrown at them, and these fruits are commencing to decay; the rest have from three to a dozen bruises upon them. Some of the fruits which were fully exposed are quite pulped on the uppermost side. In one section of the glass-houses 150 panes of glass have been broken; and in

FIG. 39.—NEPENTHES BALFOURIANA × : HORT. VEITCH. (SEE P. 90.)

another section, where English glass of 21 oz. is used, scarce any is broken. The hail, fortunately, did not extend over a very large area, certainly not more than 2 miles in length, and $\frac{1}{2}$ mile in width. Begonias in the beds are completely stripped, and Chrysanthemums, of which I have about 1500, present a sorry appearance. The stones were of enormous size, similar to ordinary lump-sugar, though I hear of many larger having been seen. The lawn in front of my cottage was completely covered, two or three layers deep, and in some places it had frozen together in lumps, so that one could pick up masses a foot or two across, and 2 inches deep." [

THE OLD CHISWICK ARBORETUM.—Old Fellows of the Royal Horticultural Society who have still pleasant recollections of that portion of Chiswick Gardens formerly known as the arboretum, will learn with sorrow that this once charming spot, for some years the gardens of Mr. Watts' fine house, has been sold, and may soon be covered with the inevitable houses. It is reported that lofty ranges of flats for residential purposes are to be erected there, and as these are to immediately touch the wall which now divides the gardens from the old arboretum, it is but too evident that Chiswick will suffer severely. This fact serves to make all the more pressing the need for a new trial-ground, and the Council can hardly secure the needful area for that purpose too soon.

"BOTANICAL MAGAZINE."—The July number comprises figures of *Yucca Whipplei*, Engelmann, t. 7662. This is described as a native of the Rocky Mountains in California from San Bernardino to Monterey, extending thence eastward to North-west Arizona. It is a very stately species, attaining twice the height of an ordinary man, with copious bright-green foliage, a stout bracteate scape, and a noble panicle of large subglobose flowers. The drawing was made at Commander HANBURY'S garden at La Montola by Lady THISELTON-DYER. It was figured in our columns in 1876, ii., p. 197, fig. 42.

Acacia sphaeroccephala, Chamisso & Schlechtendal, t. 7663.—A Mexican species, with stout thorns, bipinnate foliage, and globose heads of flowers in branching panicles. Some of the leaf-pinnæ bear on their tips fleshy oblong appendages, that supply food to stinging ants, which nest in the spiny stipules.

Masdevallia muscosa, Rehb. f., in *Gard. Chron.*, 1875, i., p. 460, t. 7664.—Remarkable for the sensitiveness of the lip, as pointed out by Mr. W. J. BEAN. By this agency an insect is entrapped, detaches the pollen, is released by the falling back of the blade, and flies off to another flower, and thus effects cross-fertilisation.

Crassula pyramidalis, Linn. f., t. 7665.—Burbidge, in *Gard. Chron.*, 1872, p. 289.

Rosa xanthina, Lindley, *Mon. Bot. nomen*, t. 7666.—This is the Rose discovered abundantly in the Kuram Valley of Afghanistan by the late Dr. AITCHESON, and described by him under the name *R. Ecæ*. It is, however, stated to be identical with a Central Asiatic species of wide dispersal. It is a species with small leaves, stout conical prickles, and small yellow flowers, solitary at the end of small branches; sepals entire.

SCARCITY OF INSECTS.—SIR JOSEPH HOOKER, writing from Sunningdale, Berks, notes the scarcity of insects this summer. He has not seen a wasp, or a bluebottle or a house-fly. The Brimstone butterfly has been very scarce, and very few of the white Cabbage-butterflies, and never two in a day have been seen. The Peacock and Admiral are generally not rare, but this season they have not put in an appearance. On the other hand, birds are more abundant than usual. Blight is very rare on Roses.

BACTERIAL DISEASE OF THE TOMATO.—Among many diseases treated of by P. H. ROLFS (*Florida State Bulletin*, No. 47) that attack the Tomato, the bacterial blight is alluded to, and the results of

meeting the attack by fertilisers that push on the growth of the plant, so that it does not succumb. No special fertiliser was singled out as the best by the experiments, but one that would strengthen the stem and make the plant woody rather than succulent would, if any, have the advantage. The distance of the plants apart has an effect upon the rapidity with which the disease spreads.

OSMANTHUS AQUIFOLIUM IN FRUIT.—Sir JOSEPH HOOKER sends us from Sunningdale, Berks, a branch of this shrub bearing an abundance of fruit. The berries are borne on short, slender axillary stalks, about the length of the leaf-stalk; each measures about 16 mill. (rather over half-an-inch) by 8–9 mill. in breadth, cylindric-oblong, deep purple, with a grey bloom upon it. The stone occupies nearly the whole of the berry, is curved, and marked with purplish stripes from end to end.

WELSH HONOUR TO A SCOTS GARDENER.—The well known gardener at Cardiff Castle, Mr. A. PETTIGREW, has been granted an honorary degree by the National Eisteddfod, which recently met at Cardiff. The name associated with this particular degree is "Gwinnlanydd Yoys Prydain."

GREENHOUSE RHODODENDRONS.—With a persistency only equalled by the appearance of *Acalypha hispida* (= *Sanderi*), the greenhouse Rhododendrons of Messrs. VEITCH appear regularly at the meetings of the Royal Horticultural Society. They are excellent illustrations of the valuable results obtained by hybridisation, as they are in bloom all the year round, flower in small plants, have a wide range of colour, and are not affected by fog.

THE VICTORIA MEDAL.—We understand that Mr. JAMES DOUGLAS has been awarded by the President and Council of the Royal Horticultural Society, the Victoria Medal in place of the late MALCOLM DUNN. Mr. DOUGLAS was one of those originally selected, but as he was a member of the Council at the time, he was debarred from accepting the honour that everyone who knows him recognises as his due.

WAXED TAPE FOR BUDDING.—The *Bulletin of the Botanical Department, Jamaica*, for June, contains the following recipe for preparing budding-wax: To every pound of bees-wax add a lump of rosin the size of an egg, and 1½ table-spoonful of raw linseed-oil. Boil, and then dip the tape in.

CIGARETTE SMOKING IN JAPAN.—The prevalent European habit seems to have taken root in Japan, judging from the following paragraph in the British Consul's report from Yokohama. The development of the cigarette trade has, during the last few years, been quite phenomenal; and the local transaction of one English firm alone amounted to over £50,000. The import of tobacco in 1898, mostly Virginian, to be used in the manufacture of cigarettes, amounted to 8,391,715 lb., of the value of £97,136; whereas, in 1897, the import appears only as valued at £11,264, an increase in 1898 of £85,872. The small Japanese pipe is said to have almost disappeared, and that cigarette-smoking is universal.

WHAT IS PRUNUS INSITITIA?—If we had been asked off-hand to answer this question, we should have said it was the Latin name for the Bullace. Professor WAUGH, after discussion of the literature of the subject, concludes that there is no such species as *Prunus insititia*. Professor WAUGH refers it to *P. domestica* as a variety—*P. domestica* var. *damascena*. ASA GRAY included it under *P. spinosa*. HOOKER, in the *Student's Flora*, adopts *Prunus communis* of HUDSON as the species with three sub-species—*spinosa* = the Sloe, or Blackthorn; *insititia*, the "Bullace," and *domestica*, which is marked as "not indigenous," though called the "wild Plum." To this latter we presume the Damson belongs. HOGG, in the *Fruit Manual*, ed. 5, p. 688, says the Damson and the

Bullace originated from the same source, and that the difference between them is little more than a name, the round ones being called Bullaces, and the oval ones Damsons. HOGG also mentions black Bullaces, which are probably referable to *P. spinosa*, the true Bullace being yellow.

HYBRID DROSERAS.—Among the exhibits in the Great Vinery at Chiswick, at the time of the Hybridisation Conference, were some plants of a hybrid between *Drosera filiformis* and *D. intermedia*. They were sent by our correspondent, Dr. MACFARLANE, but from their small size may have escaped general observation. A history of these plants is given in the *Contributions from the Botanical Laboratory of the University of Pennsylvania*, a copy of which has lately reached us. Detailed comparison of the leaves, flower-stalks, inflorescence, flowers, and period of blooming, confirmed the opinion formed by general inspection, whilst histological investigation demonstrates a minute blending in all parts of the hybrids of the histological peculiarities of *D. filiformis* and *D. intermedia*. *D. rotundifolia*, which grows with the others, does not appear to hybridise with them.

ANNE PRATT'S FLOWERING PLANTS.—The re issue of this old favourite book, under the editorship of Mr. STEP, proceeds with regularity. Its illustrations, which are free from exaggeration, and, so far as they go, characteristic of the plants they represent, will be of great service to beginners and others desirous of knowing the names of our wild flowers.

"BOLETIM DA SOCIEDADE BROTERIANA."—The first part of the volume for 1899 contains a classified enumeration of the species of *Salix* and of *Populus* inhabiting Portugal, by Señor COUTINHO. The clavis and the descriptions are in Latin, the annotations in Portuguese, so that the monograph is available for other than natives of the peninsula. *Populus canescens* is, following Krause, treated as a hybrid between *P. alba* and *P. tremula*.

SWEDISH FRUIT.—Under the title *Scenska Fruktorter*, a series of coloured illustrations of fruits, accompanied by descriptive text in Swedish, is being issued by Messrs. AXEL PIHL & JAKOB ERIKSSON. The publishers are P. A. NORSTEDT & SÖNERS, Stockholm. The plates are of quarto size, and coloured. The representations are accurate, but the climate of the northern kingdom is responsible for what we should consider the small size of the specimens. The Apples figured in this first fascicle are Gravenstein, Grägylling, Gul Richard, Ribston, Sienkyrkeapple, and Akerö-apple.

DWARFED CONIFERS.—These Japanese curiosities represent sometimes a century of work and care, so that the prices asked are not extravagant. Plants of *Pinus parviflora* a foot high and a foot in spread of branches are offered at 2 yen each, a yen being the equivalent of 2s. Trees measuring 2 feet each way are priced at 10 yen, that is £1. A set of such plants is offered by TAKAGHI & Co., of Tokyo, for 25 yen. The plants most used are *Pinus parviflora*, *P. densiflora*, *Podocarpus macrophylla*, *P. Nageia*, *Thunya* (= *Cupressus*) *obtusata*, *Pinus Thunbergi*, and *Sciadopitys verticillata*.

ST. PETERSBURG EXHIBITION.—A large Gold Medal was awarded at St. Petersburg to the *Revue Horticole* in recognition of its long and valued services to horticulture. There can be no question but that the compliment has been well earned, and we tender our cordial congratulations to our honoured contemporary.

CANCER IN HUMAN BEINGS AND IN TREES.—M. BRA has published in the *Comptes Rendus* of the Académie des Sciences a paper, wherein he suggests an analogy between Nectria and its effects on trees, and a similar organism which, according to the author, is associated with the production of cancer. We publish this under all reserves.

PELARGONIUM.—We are indebted to Mr. BLISS, of Tulse Hill, for a photograph showing a fine truss of a zonal Pelargonium "Phyllis." The truss is not only a fine one, but it has produced by prolification a second stalked truss. The entire inflorescence measured 11½ by 8 inches. Such formations are not uncommon in vigorously-grown plants.

A BOUQUET OF "ALEXANDRA" ROSES.—On the occasion of the opening of the new Alexandra Hospital Buildings in Bloomsbury by their Royal Highnesses the Prince and Princess of WALES on the 20th inst., a bouquet of Roses was presented to the Princess by Lady KATHERINE HOWARD. This bouquet was given by Messrs. WM. PAUL & SON, of Waltham Cross, and consisted of buds and blossoms of the Alexandra Rose, a new buff-coloured variety raised by them, and named after the Princess by H.R.H. the Prince of WALES at the Royal Botanic Society's fête in June of last year. The bouquet was tastefully tied with a broad, mauve-coloured silk ribbon, which bore the words, "The Alexandra Rose," with the date, in gold letters. Messrs. WM. PAUL & SON also furnished a beautiful bouquet of "Caroline Testont" Roses for the Princess VICTORIA of WALES on the same occasion.

BEE-KEEPING IN CONGESTED DISTRICTS MAY BE A NUISANCE.—Our attention is drawn to a case reported in the *Morning Leader*, which was heard at the Bath County Court on the 20th inst. A lady sued her next-door neighbour for £50 caused her by defendant's bees. She was badly stung twice, and the bees frequented her garden to such an extent that she had to let it go practically out of cultivation. The jury awarded her £10, and the judge granted her an injunction, with costs on the higher scale.

TEMPERANCE DRINKS.—The following recipes are recommended for use in the home, the hay and harvest-field, the workshop, or the laundry. It is not claimed that they will be all that expensive drinks would be, but that they are nourishing, thirst-quenching, palatable, cheap, and easily made. All of them are nourishing, none of them are in any sense injurious, and they may be freely partaken of. The "Barlikos" is, in especial, a drink suitable for any table.

BARLIKOS.—2 ozs. Robinson's Patent Barley, ½ lb. of sugar, one lemon. Mix the barley to a smooth paste with a little cold water. Add the sugar and the juice and thin rind of the lemon, then pour over it a gallon of boiling water. Stand till cold. Cost, 3d. per gallon. Many people will prefer rather more lemon, but this is according to taste. N.B.—It will be noticed that this recipe avoids the necessity for boiling the barley.

STOKOS.—4 ozs. of fine oatmeal, 6 ozs. sugar, one lemon. Mix the oatmeal to a smooth paste with a little cold water; add the sugar and the juice and thin rind of the lemon, then pour over it one gallon of boiling water. Stand till cold. Cost, 2d. per gallon. Half the quantity of oatmeal may be used.

COKOS.—4 ozs. of fine oatmeal, 2 ozs. of Cadbury's cocoa,* and 6 ozs. of sugar. Mix the oatmeal and the cocoa with a little cold water into a thin batter, then add the sugar, and pour over it a gallon of boiling water. Stir while the water is being added. Cost, 4d. per gallon. Half the quantity of oatmeal will be preferred by many. Rev. G. B. Charles, Sec., C.E.T.S., 94, Oakfield Road, Croydon.

FLOWERS IN SEASON.—We have received from Mr. M. CUTHBERTSON, of the Sunny Park Nurseries, Rothesay, N.B., a very beautiful form of *Eurothera*, selected, as he tells us, from a batch of plants of *G. Fraseri*, the seeds of which were obtained from M. BENARY, of Erfurt. The plant

* If other cocoa is used, care should be taken that it is pure, or a larger quantity will be required.

is a real novelty, of erect growth and branching habit. The leaves and stems are of a deep-red colour, and the flowers yellow, numerous and continuously produced. It is excellent for planting in beds and borders, or in window-boxes. The variety, which is to be called *Cuthbertsoni*, has been

Warrant of July 4, 1899, awarded to M. C. A. COGNIAUX, Professor at the École Normale de l'État at Verviers, the prize for the best botanical work accomplished from 1892 to 1898. The value of the award is 5000 francs, and the work for which it is awarded relates especially to Orchids, in-

TOMATO SPORTING.—Amongst the varieties of Tomatos that may be regarded as singularly acceptable for dessert purposes, is the one now being largely grown at Chiswick for distribution amongst the Fellows in seed form next winter. This sported in the gardens last year from the Red Peach. Its foliage and fruit are singularly distinct; the former is small, the fruit round, of quite medium size, handsome, and of a pale lemon colour, carrying a dense bloom. The fruits are of excellent flavour. From out of the stock has come a variety that is of a rich yellow colour, and without bloom; also a red one, smaller, and diverse from the original Peach, and also devoid of bloom. We thus see how one variety can break into several diverse forms so speedily. It is hoped that the new Lemon Peach variety will be associated in name with that of Chiswick.

PLANT PORTRAITS.

ANEMONE CORONARIA.—1, *Leverrier*, rose; 2, *Rosette*, petals white, stamens rose; 3, *Sir Joseph Paxton*, sepals white, stamens violet; *Florilegium Haarlemense*, t. 30.

APPLE STURMER PIPPIN, a cross made by Mr. Dillistone between Ribston Pippin and Reinetta Nonpareilla, the latter being the pollen parent, *Bulletin d'Arboriculture*, &c., June, 1899.

BEGONIA HYB., GRAF JOHANN HARRACH, one of the B. rex section, with dull purple leaves, claret-red on the under surface; *Wiener Illustrirte Garten Zeitung*, June, 1899.

TULIPS, single early varieties.—1, *Mon Tresor*, yellow; 2, *Van der Neer*, purplish; 3, *Rembrandt*, deep red; *Florilegium Haarlemense*, t. 29.

STRAWBERRY "MENTMORE."

GARDENERS are again indebted to Messrs. Laxton Brothers, of Bedford, for having raised a new variety of Strawberry (fig. 40) of large proportions and pleasing colour. It is a cross between the much-over-rated Noble, a variety the same raisers introduced in the eighties, and British Queen. The fruit possesses much of the brisk and luscious sweetness of Royal Sovereign, comes of a large size, and is flatly pyriform. It is borne in loose trusses very abundantly, and is in colour of a deep shining crimson.

Large quantities of Mentmore were exhibited at the Royal Horticultural Society's meeting on June 27 last, and it received an Award of Merit on being shown in 1897. Messrs. Laxton inform us that the plant forces well, and is not attacked by mildew.

HOME CORRESPONDENCE.

THE PARSNIP-FLY.—Whilst on a matter relating to ordinary observation I differ from Mr. G. Masee, with all due modesty, yet I feel bound to say that, having been of late engaged day after day in all parts of Surrey in inspecting allotments and cottage-gardens, from which at this season a crop of Parsnips is never absent, I have been specially struck with the absence from the leafage of the fly-grub or maggot; indeed, I have not seen Parsnip leafage more free from attacks, or Celery either, than is the case this season. Not only does this observation apply to all parts of Surrey, but it equally applies to several hundreds of diverse beds or crops. It also applies to sand, chalk, and clay equally, for if one day I have seen beds on soil so hard-baked and cracked that fissures 2 inches wide in all directions were visible, next day I have been on sand like that of the sea-shore. Of all places where insect-pests may be looked for, large groups of allotments are the most likely. A. D.

FIG. 40.—STRAWBERRY "MENTMORE."

From a cross between British Queen and Noble.)

several times certificated at northern horticultural shows. It would be preferable not to give it a specific name which would be misleading, but to call it *Cuthbertson's* variety, or simply "*Cuthbertson*."

M. COGNIAUX AND HIS WORK IN THE ORCHIDS.—We are informed that the Decennial Congress of Botanical Science of Belgium has, by Royal

cluding principally the monograph of Orchids in the *Flora Brasiliensis* and the *Dictionnaire Iconographique des Orchidées*, with its supplement, *La Chronique Orchidienne*. The Dictionary has therefore to be considered as one of the books which have obtained from the Belgian Government the highest distinction that can be awarded for botanical science.

LIME-TREE.—I should be glad if I could learn anything of the history of the magnificent old Lime-tree which stands in the garden of the New Bath Hotel, Matlock, and remains grand in its decay. The trunk, though it has had a large piece rent from it, measures about 13 feet round at 3 feet or so from the ground, and is 4 feet 6 inches across at the widest part; the branches on its best side extend to 45 feet from the trunk; the leaves are decidedly small, but the tree is full of blossom now. *Philodendrist*.

THE ORIGIN OF THE RIBSTON PIPPIN.—One often finds matters of great interest in gardening books of a past generation or two, and when recently making a reference to the volume of the *Florist* for 1857, I came across a cut of the original Ribston Pippin Apple-tree as it stood in 1828. As represented, it is only the shivered remnants of the once famous tree, what remains of the trunk, nearly snapped off, apparently 3 feet or so above the soil, resting upon supports placed in the ground, and having as its termination one attenuated branch supported in the same way. It is seen that the tree is in *extremis*, here and there a few leaves, the almost expiring efforts of an arboreal existence. In the account which accompanies the figure, it is stated that the information extant respecting the origin of this Apple is contained in a part of a letter preserved at Ribston Hall, Knaresborough, written by a descendant of the introducer; consequently its authenticity may be relied upon. A great portion of this letter is almost indecipherable from wear, but the following portion is legible: "My grandfather, Sir Henry Goodrich, being at Rouen, in Normandy, in ye year 1707, he eat an Apple of very superior flavour, and saved ye seeds, which he sent to Ribston, where they were sown, and ye produce planted in ye park. Out of ye trees planted, five proved bad, and two proved good. They are growing yet, and never were grafted, and one of these trees is ye celebrated Ribston Pippin which," &c. The old stem of the Ribston Pippin was blown over, as is shown in the cut, during a severe storm in 1815, after which only one branch remained, which was carefully propped up, and while in this state it bore fruit for many years. It lingered until 1835, when it died, and was cut down. Mr. Thos. W. Abbutt, who in 1857 was gardener at Ribston Park, wrote to say that "a young shoot had previously been put forth from the old stem, about 4 inches below the surface of the soil. This has been encouraged, and is now a tolerable tree, from which I have gathered as fine fruit, both as regards size and colour, as I ever saw in any part of England. The old man who cut down the original stem is still at work on this place; he vouches to me that the young shoot was never either budded or grafted, and he has seen the tree almost daily ever since. The situation is a very cold and exposed one, consequently I do not expect the tree to be long lived." Mr. John Lindley, in his *Orchard and Kitchen Garden* (1831), states that the pips from which the Ribston Pippin was raised were brought from Rouen about the year 1688, but he admits that this is according to traditionary account. But he adds:—"I visited Ribston Hall in 1789, and found the tree in a very healthy state. It was, however, in a violent gale in 1810 thrown down, and five years afterwards still continued to bear fruit, although lying on the ground." Dr. Hogg in his *Fruit Manual* states that the gardener at Ribston Hall, by whom the Apple was raised, was the father of Lowe, who during the last century was the fruit-tree nurseryman of Hampton Wick. *R. D.*

"BLADDER-RUST" OF PINUS STROBUS.—In last week's *Gardeners' Chronicle*, it is stated that "specimens of the so-called Bladder-rust of the Weymouth Pine were sent to the Imperial Sanitary Institute Office (Berlin), in the beginning of and middle of May last," but as long ago as March 28, 1893, the present writer submitted both specimens of this fungus, as well as a short communication to the Scientific Committee of the Royal Horticultural Society (London), in which it was pointed out that Klebahn's observations on the life-history of the fungus were confirmed, inasmuch as the *Peridermium strobis* then sent had grown in the garden of Mr. F. C. Boyes, at Oakwood House, Tottenham, near King's Lynn, where, the previous autumn, the leaves of the Currant-bushes were observed to be badly affected with *Cronartium ribicolum*. The account of the meeting will be

found in the *Gardeners' Chronicle*, April 8, 1893, p. 425. It may interest your readers to know that through the kindness of Mr. Boyes, I was able to repeat and confirm Klebahn's cultures. On March 31, 1893, I applied the acidospores of *Peridermium strobis* on *Pinus Strobus* from Mr. Boyes' garden to three healthy Currant-bushes which were growing in my garden at King's Lynn, and on April 18 I had the satisfaction of finding the uredo of the *Cronartium* was produced upon each, this in due course was followed by the teliospores. I should not have troubled you with the present communication had it not been for the concluding sentence of your note on p. 73, in which you say, referring to *Peridermium strobis*: "We have received no information regarding its appearance in these islands." So much work has been done during the last few years with regard to the life history of the Uredineæ, that we hardly know where we are, and it is quite excusable for even the editor of the *Gardeners' Chronicle* to have overlooked the advent of *Peridermium strobis*. I would suggest, however, that he, as well as all others interested in this subject, should attend the meeting of the British Mycological Society, which is to be held early next October, somewhere in the New Forest; as I have reason to know that a paper will then and there be read with the avowed object of bringing our knowledge of the Uredineæ up to date. *Charles B. Plowright, M.D., King's Lynn, July 23, 1899.*

HOME-GROWN PINE-APPLES.—The older generation of gardeners who have handled Queens, Cayennes, Providence, and Black Jamaica, which were varieties well grown by Paxton, Fleming, Barnes, the Thomsons, and many more, will heartily sympathise, and in the main agree with Mr. Coomber in his letter in a recent issue of the *Gardeners' Chronicle*, in praise of this king of fruits. In colour, flavour, and perfume, no imported Pine-apple comes up to the well-grown and ripened home-grown fruit. I can recall the impression made upon me by my visits to the ripe Pine-rooms at Chatsworth and Bicton, where the air seemed to be steeped in the luscious odours of the ripe fruits, waiting their turn to appear on their owners' tables. The memory of these stately fruits suggests to me the more general use of ripe Pines as ornamental plants in entrance-halls and corridors of our staircases, dining, and drawing-rooms. Some who know little about the Pine-apple will hasten to tell me that thus to make them subservient to decorative purposes would prove fatal to their quality. But it would not. Most country mansions are warm enough for the long and safe keeping of ripe Pine-apples. They are also sufficiently dry for the purpose; and if a plant be removed from the fruiting-house in good time, it is surprising for how long a time a Pine may remain as a decorative object without losing in quality. These ripe Pine-apples need little or no water at the roots, and if any should be needed, the leaves and stems should not be touched with water. To grow Pine-apples well was considered in these days the acme of good gardening, and there seems no good reason why we should not have a renaissance of Pine-culture. I agree with Mr. Thomas Coomber, that neither the development of steam, nor any difficulties of soil and climate, nor any lack of skill in modern cultivators, stand in the way. Home-grown Pines have simply got out of fashion, and have, therefore, dropped largely out of cultivation. They are still, however, grown rather extensively in some large gardens, as, for instance, at Dalkeith, and in Sir Chas. Tennant's gardens at The Glen, Innerleithen. One of the late James Barnes' Pine-growing experiments was to ripen the fruit in the open air, which he did in the following manner:—Queen Pines that had set their fruits were early in June planted out in trenches something like Celery, and ripened, or lifted again about the middle of October. Bottom-heat was afforded from stable-manure. If my memory serves me aright, Queen Pines of excellent quality, and some 6 lb. in weight, were thus grown in the open air. These who have filed their volumes of the *Gardeners' Chronicle*, will find all about this and other successful modes of culture, as carried out by Paxton, and other famous growers down to current times. *D. T. Fish.* [We fear that the large size of the pots used for fruiting Pines, the prickly edged leaves of most varieties, and the large size of the plants, would deter many from putting them to the uses suggested by our correspondent. And then, to

have the aroma of the Pine-apple penetrating into the best rooms of a country house, would not be quite to everyone's taste. The dining-room seems to be the most suitable place for them, provided sufficiently large vases can be found into which the pots might be dropped. *Ed.*]

AMERICAN BLIGHT ON APPLE TREES.—I am anxious to ascertain whether readers of the *Gardeners' Chronicle* who are interested in the cultivation of fruits agree with me in assuming that American blight is alarmingly on the increase in this country. My observations on this subject have been chiefly made in Sussex and southern parts of Surrey; but I suppose that it is the same everywhere. In old orchards and on old garden trees, on which ten years ago scarcely any blight was discoverable, it now hangs in clusters on the shoots. To clean these trees seems to me to be almost impossible, or, at least, to most of the owners of them, who have neither the time nor labour required for so great a task. I have seen many methods recommended in books on fruit-growing, but none which seemed to be practicable for very large trees, which perhaps have never been pruned since planted. Working in a large nursery I notice that it is getting more troublesome to keep under every year; and I am told that in the same nursery, six years ago, no American blight was to be found. That it increases rapidly I feel sure; but whether it is due to the succession of dry summers, and a check would be given to the scourge by some wet ones, I am unable to say. It seems to be a question that cannot be lightly treated by fruit-growers. *P. Fry.*

IMPROVEMENTS IN COVENT GARDEN MARKET.—There is now approaching completion a covered market adjoining and contiguous to the structure built in recent years at the corner of Russell Street. The new market is chiefly iron and glass, with a substantial wooden fence surrounding it. There is a road running through it from the old market into Bow Street, which road will probably be used only for the purpose of unloading or loading, and not for stands. The ground-plan of the structure is in the form of the letter L, the longer limb running from E. to W. This market will be a great benefit to those who have hitherto had to stand out in the open. The stands are already fully occupied. *T. P., July 19.*

A SURE AND HUMANE METHOD OF CATCHING FIELD-MICE.—In a garden of 8 acres, in which fruit, flowers (mostly bulbous), and vegetables are grown, and which was originally waste land attached to a farm that would not keep a sheep, but now gives employment to two men and pays for the labour, the men catch field mice by the hundred by sinking 2 and 3-lb. glass marmalade-jars level with the earth, fill them three parts with water, and then smear the inside of the neck with grease of some kind, such as beef dripping or suet. I have seen the men pull out nine or ten dead mice from one jar. *R. M., Newbury.*

HOT WATER AS A CURE FOR MILDEW.—In the last issue of the *Gardeners' Chronicle*, Mr. W. Smythe explains that the reason he would not employ hot water on Vines for curing mildew is, that to do so would disfigure the Grapes, and also set up a tendency to scalding. I cannot agree with this. I have to-day forwarded you two bunches of Grapes (unripe), one Black Alicante, and one Gros Colmar, both of which have been subjected to the hot-water treatment; and would like you to say whether they are disfigured or spoiled. As far as I can see they were on the way to finish off in every respect, as though hot water had never touched them. Mr. Smythe also thinks that no practical man would ever employ hot water; but in my opinion, it is just these practicals who would employ it. Another correspondent during this discussion, stated that no well managed vinery would suffer from the malady, but this statement I beg to differ from; mildew not arising from one cause only, but from several, and let the man be never so skilful or careful, if the local climatic conditions are not all they should be, he will find it is not all bad management which is responsible for mildew attacks. Two of my vineries and my Tomato-houses here have a westerly aspect, and I am always troubled more or less with mildew, both on the Vines and Tomatoes, but in every one of my houses that face full south, I am never troubled with anything of the kind. The former get the stiff, south-westerly winds off

the sea. I do not wish to deny that sulphur has not had the desired effect on Mr. Smythe's Vines, &c., but I would call his attention to the *Gardeners' Chronicle* for July 8, p. 40, in "Answers to Correspondents," where sulphur has again failed. My opinion is, that Mr. Mallett has brought forward a cheap and efficient remedy in the hot-water cure. Perhaps he would inform us how his Grapes are looking that have undergone the treatment. *G. Littlewood, Stratton Vineeries, Worthing.*

FLAVOUR IN MELONS.—Your correspondent, "D. T. F.," on this subject is interesting reading, but rather optimistic. I fear, were he to sit at the table of the Royal Horticultural Society's Fruit Committee for one season (and I for one should appreciate his company), he would, at the conclusion, have to admit that so far as Melons are concerned, they, amongst fruits, are very deceitful, if not desperately wicked. How much his fervid description of the Beechwood variety, so rarely heard of now, makes me long to taste the fruit! How many others of my colleagues must long for similar experience. How many of us who have had to taste perhaps a dozen, perhaps more, diversely named and coloured Melons, either at the Drill Hall or at fruit shows frequently, but have realised how very inconstant and unreliable they

ture practised in producing the fruits, after the manner of the Veitch prizes for flavour in Apples and Pears. *R. M., Newbury.*

TWO CROPS OF STRAWBERRIES IN ONE YEAR.—Replying to the note of "A. D." whether any gardener has had experience of the second fruiting after forcing of the variety Royal Sovereign Strawberry, the following incident may, perhaps, be interesting as well as amusing, and useful to growers, and especially to those who are in loud praise of the abundant bearing of Royal Sovereign. It was in the spring of 1897, when, at Combe Abbey, after having forced a number of plants, they were turned out of doors; and about that time an intelligent Scottish farmer happened to call on me, to whom I offered some of these plants. "Mon," said he, "I knew nothing about gardening. I would not know how to manage them;" but knowing the man to be a first-class cultivator of Potatoes, being the foremost enterprising farmer in Warwickshire, I was pretty sure his intelligence as a cultivator would guide him to a successful issue. I had intended the plants only as a stock of a good variety for his garden. It was some time in autumn when I again saw my farmer friend. His speech was short, but it gave convincing proof how well he had succeeded:

long, oval, white tuber (Bradley, Peterborough); Hibberd's Seedling, yellow-flesh Kidney, good crops (Hibberd, Bitley, Hants); Norbury Park, singularly like the preceding (Solomon. Norbury Park, Dorking); Caradoc Seedling, very white, round (Caddick, Caradoc Gardens, Ross); and Johnson's Prolific (Johnson, of Boston). All these were of high cooking excellence. Pride of Toobridge, Triumph, Snowdrop, St. Lawrence, and a few others well known, had previously been dealt with, or were left to be tried again later.

KIDNEY BEANS AND TOMATOS.

A large collection of dwarf Kidney Beans was next seen. Some were only suitable for forcing; some others were late, and not yet in form. A few seemed to have been much affected with spider. The following were selected for three marks: Ne Plus Ultra, Stringless, Veitch's Progress, Sutton's Perfection, Covent Garden, Tall Negro (Watkins & Simpson), and Everbearing, a great cropper. There were fifty-five diverse stocks sown. Three marks were given to Tomatos Chiswick Peach, a primrose coloured form of fine flavour; Cherry Ripe, much like the Red Dessert, but of rich flavour; and Comet, large red; Golden Gem, Chemin Rouge, Young's Eclipse, and Golden Drop were excellent.

(DRILL HALL, WESTMINSTER.)

JULY 25.—An ordinary meeting of the committees was held, in the Drill Hall, James Street, Westminster, on Tuesday last.

The number of visitors present was only moderate, and the hall was not quite full of exhibits, but there were many novelties shown, and a large number of distinctions were granted by the several committees.

The ORCHID COMMITTEE recommended the awards of three First-class Certificates, and one Award of Merit. The Floral Committee distributed one First-class Certificate, and thirteen Awards of Merit; and the Fruit and Vegetable Committee recommended First-class Certificates in the case of a new Grape named The Lady Hastings, a sport from Muscat Hamburgh that occurred in Lord Hastings' garden; a new Strawberry named Lady Suffield, was shown by Mr. ALLAN, of Gunton Park Gardens; a new Cherry named Noble, from Messrs. RAY & CO, Teynham, Kent; and several Awards of Merit to varieties of Potatos, Tomatos, and French Beans, that had been tried at Chiswick. In the afternoon, a lecture was delivered by Mr. Boulger upon the "Dispersion of Seeds."

Floral Committee.

Present: Geo. Paul, Esq. (Chairman), and Messrs. Owen Thomas, H. B. May, R. Dean, Jas. Hudson, C. J. Salter, J. D. Pawle, Jas. Walker, W. Bain, Geo. Gordon, Herbert J. Cutoush, E. H. Jenkins, H. J. Jones, E. T. Cook, D. B. Crane, H. Selve Leonard, J. Jennings, and W. Bain.

ROSES.

Messrs. GEO. COOLING & SONS, Bath, made an exhibit of garden and decorative Roses, showing about ninety bunches. Some of the more decorative as shown were *Blanche de Coubert*, large semi-double white, with thick, deeply green leaves; *Grand Duc de Luxembourg*, magenta shade of rose. Cooling's *Yellow Rosette*, *Allister Stella Gray*, a very well known double white *Polyantha* or *Noisette*; *Felleberg*, a showy pale purple Rose; *Duchesse d'Anerstadt*, coppery-yellow; *Paul's Single White*, *Gustave Regis*, a large white semi-double Rose, centre flushed with yellow; *Aimée Vibert*, pure white, double; *Marquis of Salisbury*, crimson; *Rosa rugosa fimbriata*, with single flushed pink flowers, with fimbriated petals, &c. (Silver Banksian Medal).

Mr. W. RUMSEY, Joyning's Nurseries, Waltham Cross, showed a nice group of cut Roses in considerable variety, conspicuous amongst them being that of H. P. Mrs. Rumsey (Silver Banksian Medal).

MESSRS. PAUL & SONS, Old Nurseries, Cheshunt, showed a pretty group of cut Rose blooms in variety; also flowers of show varieties of herbaceous Phlox, one of which is described under "Awards." Sprays of some of the more decorative of flowerlog and other shrubs were also exhibited by Messrs. PAUL (Silver Banksian Medal).

HARDY TREES, ETC.

Mr. ANTHONY WATERBEN, Knap Hill Nursery, Woking, showed *Arundo Donax macrophylla*, a robust variety, larger in all its parts than the type, leaves exceedingly glaucous, and 2½ inches in width; *Andromeda arborea*, a tree-like shrub, with long flower-spikes freely produced, the flowers, not open in this instance, are small, and white; leaves 5 in. long, narrow, and folded inwards at the edges. Flower-sprays of *Kelreuteria paniculata*, from a tree 40 feet high; *Abies concolor* var. *violacea*, with cones cut from another tree; *Fagus sylvatica* var. *purpurea pendula*, very fine dark tint, the plant of continental origin; *Vitis Coignetiae*, V. Thunbergi, a splendid form, with leaves 9 inches wide, and of a dark green tint—the leaves had five or six lobes; *Ulmus campestris* *Louis van Houtte*, with a leaf of lemon-yellow, having the faintest trace of chlorophyll in it, the shoots showing robust growth, but it did not appear from what part of the tree they were taken; *Robinia neomexicana*, resembling *R. hispida* in leaf and flower; *Quercus pedunculata purpurea*, a handsome variety of the Oak, with leaves purple-brown on the upper surface, and purplish-green beneath; *Abies Douglasii pumila* (First-class Certificate), a dwarf variety, with light-green, short needles. Messrs. J. VEITCH & SONS, Ltd., King's Road, Chelsea, S.W., showed cut shoots of *Clethra canescens*, having white flowers in thin drooping panicles; *Asculus (Pavia) macrostachya*, a handsome Horse-Chestnut, with long drooping racemes of

FIG. 41.—A CROSS-BRED RHODODENDRON, SHOWN AT THE HYBRIDISATION CONFERENCE AT CHISWICK.

After sixteen years' very careful cultivation is now only about 3 in. high.

(See *Gardeners' Chronicle*, July 15, 1899, p. 57, col. A.)

are. "D. T. F." seems to think that when I assert that in the same variety, or even in a fruit from the same plant, only one fruit out of several may be good, and the others tasteless, or nearly so, that I mean the fruit will have changed in appearance. But I mean nothing of the sort. I refer to the presence or absence of flavour; and over and over again rich odour has been found in fruits quite disappointing to the taste. There is plenty of time yet for new Melons, as they are called, to crop up this season; but so indifferent generally have been results for the past few years, that probably growers are getting tired of interbreeding them. In very many cases interbreeding has simply resulted in spoiling two generally regarded good varieties by seeking to combine them. If anyone can secure us such a wonder as a Melon that is always constant and rich flavoured [Under correct cultivation. Ed.], they will merit all praise. Of course, "D. T. F." may say, "Why, you have it already in the Beechwood." If that be so, then this wonderful Melon cannot be too speedily made a special object of cultivation, and be by the Melon-growers in universal demand. *A. D.*

—One is pleased to see your able correspondents, "D. T. F." and "A. D.," recently discussing this matter; and in such a case, when doctors differ, it shows the need of the Royal Horticultural Society's Fruit Committee taking up the matter. It might easily demand from exhibitors of Melons a brief statement of the method of cul-

"Mon," said he, "you remember yon Strawberry-plants you gave me. I planted them just as you recommended me to do; they grew, but we were more surprised to see them come into flower. Yes," he continued, "and they fruited splendidly, fine, luscious fruit, and we did enjoy them during harvest time, I can tell you. I never saw anything like it." From this incident need it surprise anyone if my Scottish friend, who showed the Warwickshire farmers how Potatos should be grown, could also give them a "wrinkle" and a lead in cultivating Strawberries in the field; as a variety for this purpose, the fruitfulness of Royal Sovereign has much to recommend it. *W. Miller, Berkswell Nursery, near Coventry.*

SOCIETIES.

ROYAL HORTICULTURAL.

(CHISWICK, JULY 24.)

A MEETING of the Fruit Committee was held here on the above date, Messrs. Balderson (chairman), Wythes, Farr, Bates, Barron, Fife, Reynolds, and Dean being present.

POTATO TRIALS.

A considerable number of early Potatos was first seen. Some were at a disadvantage, because the tops had been cut down by late spring frosts, materially weakening their growth. Nine varieties were selected for cooking, having shown good, clean crops when lifted. These were Early Peter,

white flowers; and *Hypericum Androsæmum* in fruit, and in that state very showy. They also showed sprays of *Magnolia macrophylla*, *Cornus macrophylla*, and *Hydrangea quercifolia*; this latter plant has very large-lobed leaves, and brown-coloured pubescent growths. The inflorescence as shown bore a few sterile flowers, consequently was less showy than would be the case if some of the fertile flowers had been sterile. It is a bold-growing, handsome-flowering shrub.

CACI, &c.

Messrs. CANNELL & SONS, Swanley, Kent, had one of the most remarkable exhibits in the hall, in the shape of a very interesting group of succulents, representing 100 distinct varieties. There were some fine pieces of *Echinopsis* (Cereus) included, such as *E. Grisebii* (the Golden Cactus), *E. cylindraceus versicolor*, with very long and formidable spines of a reddish-purple tint; *E. chrysocanthus*, *E. Emoryi*, &c. There might also have been noticed good plants of *Cereus peruvianus*, commonly known as the "Rock of Ages"; *Pilocereus senilis* (or Old Man's Cactus); *Opuntia ursina* (Grizzly Bear), a species covered with stiff grey hairs; the paper-skin *Opuntia*, *O. papyracantha*; *Mammillaria elephantidens* (Elephant's Tooth), and others. Seldom now-a-days is so good a collection of these interesting plants exhibited (Silver Flora Medal). Messrs. CANNELL had also a pretty group of their "pigmey" strain of *Antirrhinum* in various colours. Golden Gem appears to be a fixed variety, and is a good golden-yellow-flowered *Antirrhinum*, growing only a few inches high.

GLADIOLI AND BEGONIAS.

Messrs. KELWAY & SON, of Langport Nurseries, Somerset, adorned a very considerable space with an exhibit of cut spikes of GLADIOLI, there being 112 of these in about seventy varieties. It is too early at present for Gladioli to be shown at their best, and probably Messrs. KELWAY will show finer spikes and flowers at the next meeting. Nevertheless, the collection was very pretty, and an earnest of the Gladioli displays that are always made at these shows in August. No Awards were made to novelties on this occasion, but the varieties, Mrs. G. W. Willard, very large, warm pink, with deeper throat; Sir W. Scott, a very deep, velvety-like crimson self; Margaret Irvil, and others, were of commendable merit. Messrs. KELWAY had also choice varieties of *Coreopsis*, double and single-flowered Hollyhocks, *Liatris elegans*, and other good border-flowers, in fine condition.

Messrs. R. HARTLAND & SON, Cork, exhibited a group of flowers of varieties of double-flowered tuberous-rooted BEGONIAS. There were about 200 of these, and generally they were of exceedingly high quality. As a collection they were admirable, and two of them are recorded in our list of awards (Silver Banksian Medal).

HUMEAS, FERNS, &c.

Humea elegans, shown so well at a recent meeting of the Drill Hall by Sir C. Pigott, Bart., Wexham Park, Slough (gr., Mr. J. Fleming), was again the principal feature in a large group of miscellaneous plants from the same establishment. There were upwards of a dozen plants of *Humea*, most of them more than 8 feet in height, and almost in full flower. Then there were also a fine lot of plants of blue-and-white-flowered *Campanula pyramidalis*, *Carnations*, *Canas*, *Codieums*, *Lobelia cardinalis*, *Palms*, *Ferns*, &c. The *Gloxinias*, with which it was intended to brighten the face of the group, were spoiled through an accident that overtook the van whilst on its way to the hall. But the group had a very pleasing effect, and was much admired, the *Humeas* attracting considerable attention (Silver-gilt Flora Medal).

Messrs. J. HILL & SON, Burrowfield Nurseries, Lower Edmonton, exhibited a large bank of Ferns, consisting mostly of large specimens. Mention may be made of *Davallia epiphylla*, *Gymnogramma chrysophylla*, *Pteris tremula Smithiana*, a finely and densely-tasseled variety; *Asplenium marginatum*, a handsome species, with light-green pinnae, 6 inches long, by 2 inches wide; *Nephrolepis rufescens bipinnatifida*, *Davallia tenuifolia Veitchii*, *Osmunda palustris*, *Pteris aspericulis*, a plant in fine form; *Cibotium Schiedei*, *Adiantum elegantissimum*, *Todea barbara*, *Pellea hastata*, *Stenochlena scandens*, &c.—a very fine group indeed (Silver-gilt Flora Medal).

MISCELLANEOUS EXHIBITS.

Messrs. JAS. VEITCH & SONS also showed *Diaria Barberæ*, a serophularinaceous annual, that grows about 1 foot high; the flowers are deep rosy pink, and double spurred; it is a useful plant for bedding purposes, and was figured in the *Botanical Magazine*, t. 5933.

The same firm again made a lovely display of their Javanico-Jasminiflorum and multicolor hybrids of *Rhododendron*, which were noticed in some detail on p. 57, from a collection shown at Chiswick. Also a most effective group of hardy flowers, annuals, and sprays of flowering shrubs. The flowers in this group were arranged and set up beautifully, and though nothing very novel was included, the general effect of these finely-grown popular species was excellent (Silver Flora Medal).

Messrs. DOBBIE & CO., Rothesay, N.B., and Orpington, Kent, showed a number of varieties of Pansies, which they describe as their Wallflower-coloured strain. The predominant colour of these flowers is very similar to the red-brown common in the Wallflower, and marked variously with deep brown.

Mr. R. C. NOTCUT, of Wood's Nursery, Woodbridge, showed a nice collection of Sweet Peas.

Messrs. WALLACE & CO., Kilnfield Gardens Colchester had a very pretty group of cut flowers, consisting mostly of summer-

flowering Lilies. A new variety of *L. auratum*, at present unnamed, reminds one of *L. auratum vittatum*, but has a broader band of red through each petal. *L. chalcedonicum*, *L. Humboldtii*, *L. canadense*, *L. Thunbergianum* in several varieties, *L. pardalinum*, *L. Browni*, &c. *Iris Kämpferi* was shown well also in several fine varieties, *Gladiolus*, *Calochortus* in variety, including *C. macrocarpus*, with very narrow sepals; *C. Plumierii*, &c. (Silver Flora Medal).

Sir TREVOR LAWRENCE, Bart., Burford, Dorset (gr., Mr. Bain), exhibited a plant of *Michauxia campanuloides* in flower. The blooms are white but for a very faint tinge of pink. It is an old plant, and grows from 3 feet to 7 feet or 8 feet in height. Some excellent varieties of *Canna*, *Pentstemon*, *Gladiolus Nanceanus* were also shown from this remarkable garden, but no award was made to any of them.

Some lovely bunches of *Carnations* were shown by T. B. HAYWOOD, Esq., Woodhatch Lodge, Reigate (gr., Mr. C. J. Salter). The varieties included the fine self-coloured *Isinglass*, raised in these gardens.

Messrs. BARR & SONS, King Street, Covent Garden, showed a table of hardy cut flowers in season in much variety; we noted *Brodias* in variety, *Pentstemon barbatus Torreyi*, *Alstromeria chilensis*, *A. psittacinus*, *Eupatorium ageratoides Fraseri*, a neat, white flower in small corymbs; *Coreopsis*, *Japan Iris*, *Phlox* in variety, *Platycodon Mariessii*, and *P. m. alba*, &c.

Messrs. CUTCUSH & SON, The Nurseries, Highgate Hill, N., showed forty-five distinct varieties of Ivies. The collection contained the choicest of green and variegated-leaved varieties, and was richer in those with small than with large leaves (Silver Flora Medal).

AWARDS.

Abies Douglasii pumila Colorado var.—From ANTHONY WATERER. (First-class Certificate). See col. 3, p. 95.

Acer californicum aureum—A small group of plants of this very ornamental golden-leaved Sycamore was shown by Messrs. Low & Co., Bush Hill Park Nursery, Enfield (First-class Certificate).

Arundo Donax macrophylla.—From ANTHONY WATERER (Award of Merit). See col. 3, p. 95.

Begonia Mrs. Jno. Canfield.—A tuberous-rooted variety with very bright red double flowers that show several centres, but are very large and showy. From Messrs. R. HARTLAND & SON, Cork (Award of Merit).

Begonia M. Wainot.—A tuberous variety, with large salmon-pink double flowers, the petals being particularly fine. From Messrs. R. HARTLAND & SON, Cork (Award of Merit).

Caladium Madame Jean Dybowski.—A large red-leaved variety, with bronzy-green margins, and the same tint occurs on the surface of the leaf. This and several other choice *Caladiums* were shown by Messrs. JNO. LAING & SONS, Forest Hill Nurseries, London, S.E. (Award of Merit).

Campanula × Mayi.—This would appear to be a hybrid from *C. isophylla* and another, or possibly a variety of *C. isophylla*. The habit and growth is stronger and more vigorous than that of *C. isophylla*; and, moreover, the foliage, &c., is distinctly glaucous in tint, more fleshy, numerous and very regularly toothed, and very pubescent. The flowers are about 1½ in. across, and in shade are mauve-blue. When staked from the pots, the growths were nearly 2 feet high, and in this form, or drooping around the pot, the plant was a most decorative one. Mr. H. B. MAY, of Dyson's Road Nursery, Upper Edmonton, showed a group of plants, many of them from cuttings struck five months ago (Award of Merit).

Campanula "Warley".—Described as a natural hybrid. As shown, the growths were not more than 1 foot high, very slender, with narrow, lanceolate leaves. The small flowers are generally semi-double, of a pretty lavender shade of blue, 1 inch across, apparently the same as a very old form known to botanists. From Miss WILSON, Warley Place, Essex (Award of Merit).

Cornus macrophylla.—A very strong-growing, handsome species from the East, with large ovate, oblong acuminate leaves, paler on the under surface, and numerous small, whitish flowers in terminal panicles. From Messrs. JAS. VEITCH & SONS (Award of Merit).

Delphinium José Maria de Heredia.—A singular variety, by reason of its very finely-formed, double flowers. Each bloom combines shades of purple, blue, and white. From JAS. VEITCH & SONS, Chelsea (Award of Merit).

Nicotiana sylvestris.—A new species of vigorous and branching growth, that will be very valuable as a subtropical plant. The flowers are pure white, tubular, sweetly-scented, and pendulous, but expand during the daytime, and at evening they assume a horizontal position. The slender tubes of the flowers are ¾ inches in length, and the flowers but half-an-inch across when fully expanded. The corymbs are produced very freely, both terminally and laterally. Shown by Mr. JAS. HUDSON, Gunnersbury House Gardens, Acton (Award of Merit).

Phlox Fiancé.—A herbaceous variety with pure white flowers, produced exceptionally freely in large trusses. From Messrs. PAUL & SON, Old Nurseries, Cheshunt (Award of Merit).

Rose J. B. M. Camm.—A very pretty pink-flowered Rose with darker centre; in form, somewhat suggestive of *La France*. From a cross between H. P. Madame G. Luizet and Bourbon Mrs. Paul. From Messrs. PAUL & SON, The Old Nurseries, Cheshunt (Award of Merit).

Vitis Thunbergii.—From ANTHONY WATERER (Award of Merit). See col. 3, p. 95.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. De B. Crawshaw, H. Little, S. Courtland, W. Cobb, J. G. Fowler, J. Colman, H. T. Pitt, E. Hill, H. J. Chapman, W. H. Young, H. Ballantine, J. Gabriel, F. W. Moore, and Jas. O'Brien (Hon. Sec.).

As usual at this season, the number of exhibits was restricted; but if only to see the beautiful and extraordinary novelty *Sophro-Cattleya × Queen Empress* (*Cattleya Mossiae* ♀, *Sophronitis grandiflora* ♂), raised and exhibited by Messrs. JAS. VEITCH & SONS, no lover of beautiful flowers would regret a visit to the show. In *Sophro-Cattleya × Queen Empress*, which secured a First-class Certificate, is seen the highest example of the several pretty crosses of *Sophronitis grandiflora*, and as its rich and uncommon colour is accompanied by a much larger flower than in other crosses of the class, and that too on a very small plant, it seems to foretell for the future a large-flowered hybrid with the bright reddish, rosy-crimson tint, for which hybrids of *Sophronitis grandiflora* are admired (see Awards).

Messrs. VEITCH also staged a pretty group of other good things, for which they were awarded a Silver Flora Medal, and among which were *Cypripedium Alice superbum* (Stonei × *Spicerianum*), a really handsome form of a rather slight hybrid; *C. × Astrea* (*Spicerianum* × *Philippine*); *C. Euryale* (*Lawrenceanum* × *superbiens*); *C. orphanum* (*barbatum* × *Druryi*); *C. Morgania*, in fine form; *C. × Harrisianum* superbum, and other *Cypripediums*; *Laelio-Cattleya × callistoglossa ignescens*, *Laelia Olivia* (*xanthina* × *crispata*), *Cattleya × Atlanta*, *Disa × Veitchii*, *Epidendrum × elegantulum*, &c.

Messrs. HUGH LOW & CO., Bush Hill, Enfield, had a good selection of *Orchids*, including two fine white forms of *Cattleya Eldorado*, a good *C. Leopoldi*, with twenty-six flowers on a spike; the fine yellow *Phaius* × *Ashworthianus*, the showy red *Dendrobium sanguineum*, the handsome and rare *Cattleya × Prince of Wales*, *Cattleya Dowiana*, &c.

T. B. HAYWOOD, Esq., Woodhatch, Reigate (gr., Mr. C. J. Salter), showed cut spikes of the large pure white *Miltonia vexillaria* *Daisy Haywood*, and some good coloured forms.

Sir TREVOR LAWRENCE, Bart., Burford (gr., Mr. W. H. White), showed *Stanhopea aurantiaca*, of the S. Wardi class, with rich orange flowers, bearing some nearly black blotches on the lip.

ELIJAH ASHWORTH, Esq., Harefield Hall, Wilmslow (gr., Mr. Holbrook), showed the fine *Dendrobium × formosum* Lowi, with handsome yellowish-white flowers, with reddish-orange lines on the lip, and for which Sir Trevor LAWRENCE had previously received an award.

Franz IDA BRANOT, Riesbach, Zurich (gr., Mr. Schlecht), sent *Zygopetalum* (*Bollea*) *Lelandi*, with purplish-rose flowers, having a singular, fleshy, yellow labellum; also *Phalenopsis Esmeralda antennifera*.

Messrs. F. SANDER & CO., St. Albans, showed six distinct hybrids of *Cypripedium* *Rothschildianum*, the finest being a fine hybrid between *C. callosum* and *C. Rothschildianum*, with large white upper sepal, with purple lines, and broad greenish petals, with large purple spots. Messrs. SANDER also showed a curious *Bulbophyllum*.

T. A. REHDER, Esq., Gipsy Hill (gr., Mr. Morris), showed *Cypripedium × Miss Rehder* (*Argus* × *hirsutissimum*), a delicately tinted hybrid profusely dotted with purple. Lieut.-Col. SNEYWAY, Grove House, Chiswick (gr., Mr. Walters), showed a fine specimen of *Cattleya Warszewiczii*, and a species of *Gongora*. J. GURNEY FOWLER, Esq. (gr., Mr. Davis), showed *Renanthra Storei*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Disa × Diorea var. Clio superba (Veitchii × *grandiflora*).—This is one of the most brilliantly-coloured of hybrid *Disas*. Flowers glowing magenta-crimson, with yellowish and purple markings in the centre. From Messrs. JAS. VEITCH & SONS, Chelsea.

Sophro-Cattleya Queen Empress (*Cattleya Mossiae* ♀, × *Sophronitis grandiflora* ♂).—A most charming hybrid with flowers much resembling *Cattleya Mossiae* in form, but smaller. Sepals bright rosy-crimson, petals broad and well displayed bright rosy-crimson, with a dark reddish-crimson veining. Lip yellow at the base, with showy dotted purple lines, the front lobe reddish rosy-purple, the margins of the side lobes of the same hue as the front, but with a yellow margin. From Messrs. JAS. VEITCH & SONS, Chelsea.

AWARD OF MERIT.

Tanda teres, Gunnersbury Park var.—A singular and pretty light-coloured form, with the general appearance of the hybrid *V. Miss Joaquim*. Flowers white, tinged with bright rosy-pink on the outer halves. Base of the lip yellow, front lobe bright light rose. From Messrs. DE ROTHSCHILD, Gunnersbury Park (gr., Mr. Geo. Reynolds).

Fruit Committee.

Present: Philip Crowley, Esq. (Chairman), and Messrs. Jas. Smith, Geo. Reynolds, Robt. Fife, W. Poupard, A. F. Birron, M. Gleeson, Jas. H. Veitch, A. H. Pearson, Alex. Dean, S. Mortimer, J. W. Bates, G. Wythes, R. Balderson, F. Q. Lane, W. Wilks, and Joseph Cheal.

Messrs. JAS. VEITCH & SONS, Chelsea, showed a grand collection of Gooseberries in about a hundred varieties; also about a score that had been lifted and planted in pots, which represented the different methods of training employed (*Gardeners' Chronicle*, July 31, 1897, p. 78). Red, yellow, and green varieties were each represented by all the best

varieties, including the new ones, Langley Beauty, Yellow Champagne (see *Gardeners' Chronicle*, August 8, 1898, p. 155), and Langley Gage, a green or white fruit of very fine flavour and moderate size. In this large collection, the following were some of the most noticeable varieties:—Green or white fruits: Telegraph, Surprise, Progress, Eagle, Green London, Clifton, Matchless, Hedgehog, Tom Joiber, and Green Overall. Yellow: Leveller, Pretty Boy, Tiger, Pilot, Gipsy Queen, and High Sheriff. Reds: Clayton, Dan's Mistake, Industry, Bollin Hall, Highlander, Beauty, Registrar, Lancashire Lad, Eskander Bey, Early Red Hair, Lomas' Victory, Ironmonger, Red Champagne, and Forester. A Gold Medal was awarded to this exhibit, and we may remark that the bushes lifted from the open ground would indicate a first-rate lot of Gooseberries at Langley this year.

Messrs. VEITCH & SONS also exhibited fruits of the Loganberry, and a pleasantly acid preserve made from this fruit. The Loganberry is said to be a cross between the Raspberry and the Auginbaugh Blackberry, and to be thornless; but Messrs. VEITCH's plants have many thorns.

Mr. CHAS. JENNINGS, Walkhouse Gardens, Barrow-on-Humber, showed fruits of a Raspberry "Eclipse," and of a good-looking Pea, "Competitor."

Messrs. HARRISON & SONS, Leicester, showed a collection of eighty sorts of culinary Peas, including a number of excellent and well-tried varieties. Many, too, of their own introduction, such as Leicester Hero, Fascination (with very pretty pods), Jno. Harrison (a good late sort), Emperor of Japan, Gradus, and Beatrice. The last-named grows but 18 inches high, and is an excellent dwarf Pea (Silver Knightian Medal).

Mr. G. Norman, gr. to the Marquis of SALISBURY, Hatfield House, showed a collection of fruit, including Strawberries Waterloo and British Queen, Royal George Peach, Brown Turkey Figs, Nectarine Lord Napier, Raspberries Hornet and Superlative; Bigarreau Napoleon, May Duke, and Black Tartarian Cherries; Whitesmith Gooseberry, and White and Red Currants.

AWARDS.

Grape The Lady Hastings.—A first-rate Black Grape of fine appearance, that originated as a sport from Muscat Hamburgh in 1886, in the gardens of Lord HASRINGS, Melton Constable (gr., Mr. W. Shingler). It is said to ripen as early as any Grape, and to keep good till the turn of the year. The bunches are disposed to shoulder considerably, and are heavy. The berries are large, moderately round in form, and are highly coloured, and covered with a dense "bloom." It is described as very free, and a good "setter," and the foliage and growths shown were certainly very strong. The fruits are pleasantly sharp and rich, and have a slight Muscat flavour, as is possessed by the variety Madresfield Court. It was stated that the best results had followed when the roots were moderately restricted, and the canes treated upon the extension system. Shown by Mr. Shingler (First-class Certificate).

Strawberry Lady Suffolk.—A deeply-coloured fruit, of long and rather tapering form; flavour good. Shown several times previously for Certificate, but unsuccessfully until Tuesday last. From Mr. W. ALLAN, Gunton Park Gardens, Norwich (First-class Certificate).

Cherry Noble.—This fruit in appearance is very similar to the Morello, but in taste is quite sweet, and of pleasant flavour. The flesh is firm. From Messrs. RAY & Co., Teynham, Kent (First-class Certificate).

Potatoes Early Peter, Curadoc Seedling, Norbury Park, Prolifer, and Hibbert's Seedling.—These five varieties of Potatoes were exhibited from Chiswick, where they have been under trial. Awards of Merit were recommended in each case. The varieties are described in column 2 and 3, p. 95.

Tomatoes Cherry Ripe, and The Comet.—These are described in column 3, p. 95. Recommended Awards of Merit, after trial at Chiswick.

French Beans.—Everbearing, Veitch's Progress, Stringless, Ne Plus Ultra, Covent Garden, Early Negro, and Sutton's Perfection. All of these varieties were recommended Awards of Merit, after trial at Chiswick. See column 3, p. 95.

Lecture on "Seed Dispersal."

Prof. G. S. BOULGER delivered an interesting lecture upon "Seed Dispersal," Prof. Geo. Henslow, F.L.S., presiding. The lecturer dealt pretty fully with the subject, and explained how certain seeds were adapted for transportation by natural and varied means, such as by sea, by wind, by floods, animals, &c. Many plants, too, were capable of distributing their seeds over a more or less wide area without any external help whatever. The squirting Cucumber may be instanced, and it was one of the plants to which attention was drawn by Prof. Boulger.

NATIONAL CARNATION & PICOTEE (Southern Section).

JULY 21.—The twenty-third annual exhibition of this Society took place at the Crystal Palace on the above date. The dry weather has acted unfavourably on the flowers, especially those from the south, from which most of the blooms at this exhibition are drawn; and not only were the blooms generally small and thin in petal, but they lacked purity of the ground colour. The selfs, yellow-grounds, and fancies, larger in size, and later in blooming, were shown in much better form. What is required is two separate exhibitions, with an interval of about ten days between them; the first for the white-ground bizzars, flakes, and Picotees; the other for the later selfs, &c.; but this would be, perhaps, difficult of arrangement. The heat was very great, even in the spacious Palace.

Judging from the length of unoccupied tables, many would-be exhibitors were unable to be present. The blooms lost much from the large size and the colour of the tables, and from their being undraped. There was a decided want of effective arrangement of the exhibits, which is, perhaps, inseparable from the kind of table employed. An attractive feature of the show was the decorated dining-tables, eight of which were provided, but seven only were covered. It is a vexatious matter to managers of shows when an entry of this sort fails, an empty table detracting from the harmony of the whole. Some of the tables were in the full sunlight, an accident which ought to be avoided in the future. The important task of selecting the premier blooms was delayed until the afternoon, but this selection should certainly be done before any adjournment to luncheon.

BIZZARRES AND FLAKES.

Despite the great heat, there were seven stands of twenty-four blooms competing, and the task of making up this number of flowers was rendered all the easier as there was to be not fewer than twelve dissimilar varieties. The 1st prize was awarded to Mr. MARTIN ROWAN, Manor Street, Clapham, who grows his flowers very near to the Clapham Station of the L. C. & D. Railway. He had, for the season, pure and well-marked blooms of S.B.'s, Admiral Curzon, Robert Houlgrave, and Robert Lord; C.B.'s, J. S. Hedderley and W. Skirving; S.F., Sportsman and Thetis; R.F., Mentor, John Buxton, and Mrs. Rowan; P.F., James Douglas, Gordon Lewis, and George Melville. Mr. C. TURNER, Royal Nursery, Slough, came 2nd, with larger and fuller flowers, but some of them a little passed; he had of S.B.'s, R. Houlgrave, Duke of York, and Admiral Curzon; C.B., Arline, Thaddens, and Master Fred; P.F., C. Henwood and Prince George of Wales; S.F., Guardsman; and R.F., Mrs. Rowan.

SELF.

There were eight stands of twenty-four selfs, not fewer than twelve dissimilar. Mr. C. BLICK, gr. to Mr. R. SMITH, Esq., Hayes Common, Kent, took the 1st prize, with some highly-developed blooms; of yellows, Cecilia, Miss Edith Harbord, and Michelet; white, Ensign (very fine), Much the Miller, and Helmsman; blush and pink, Blushing Bride, and Her Grace; buff, Benbow, Rose, Bomba, Mrs. A. Gilbey, Commander, and Conqueror; crimson, Etna and Dudley Stuart; maroon, Sir Bevis, Kara, Prosperine, and Agnes Sorrel. Mr. C. TURNER came 2nd also with some very good blooms, chief among them Agnes Sorrel, Zachara, Zampa, Much the Miller, Mrs. Buchauo, Anna Boleyn, Miss Julia Harbord, and Benbow; Mr. J. DOUGLAS was 3rd.

FANCIES.

A Fancy Carnation is anything which may not compete in the two foregoing classes. With twenty-four blooms, in not fewer than twelve varieties, Mr. BLICK was again 1st, also with very fine flowers, chief among them, Lily Duchess, Monarch, Goldeylocks, Bedemere, deeply edged with crimson maroon; Aglata, Falka, The Dey, Electra, Galileo, deeply edged with crimson-purple; Guinivere, delicate amber, flaked with pale and deeper pink; Heroine, Alexandra, Queen Bess, Hidalgo, Cervantes, clear yellow, with slight pencilled lines of carmine; Ossian, Voltaire, Chas. Martel, yellow veined, and pencilled with carmine, &c. 2nd, Mr. C. TURNER, who had very good blooms of the following: Vespasian, Lady Bristol, Palemon, Golden Eagle, Galileo, Pagan, Potentate, Hesperia, &c.

Picotees, white ground.—With twenty-four blooms, not less than twelve distinct, Mr. TURNER was first, having fairly good flowers but showing stress of weather; among them were red Etna, Heart's Delight, and Mrs. Gorton; P. E. Mary; Rose E. Favourite, Lady E. Van der Weyer, Madame Ritcher, Duchess of York, Little Phil, and Mrs. Payne. 2nd, Mr. W. ROWAN, who had as his best flowers, Little Phil, Lady Louisa, Miriam, Nellie, and Morna.

Yellow ground.—With twelve blooms in not less than six varieties, Mr. BLICK was 1st with very good blooms of Argosy, Badminton, Dinorah, Duke of Alva, Anthos, Fenella, Empress Eugenie, Lady Bristol, Childe Harold, a perfect yellow-ground Picotee, having a wire edge of rose-red; Busy Body, and Alcimus. Mr. C. TURNER was again 2nd, having in good character, Anther, Lady Bristol, Onda, Galatea, Volage, and Hesperus.

A class for six blooms of any variety of self Carnation was a happy innovation, and out of eleven competitors, Mr. F. A. WELLESLEY, Woking, was 1st with the fine white self, Mrs. Eric Hambro; Mr. C. PHILLIPS, Blacknell, Berks, was 2nd with a yellow self—probably Britannia; Mr. J. DOUGLAS coming 3rd with Trojan, also a white self.

The best six blooms of any variety of Fancy Carnation came from Messrs. THOMSON & Co., Sparkhill, Birmingham, who had Voltaire in fine character; Mr. F. A. WELLESLEY came 2nd with Monarch, and Mr. BLICK 3rd with Hidalgo.

The best six blooms of a yellow-ground Picotee were those of Lady St. Oswald, from Mr. C. BLICK; Messrs. THORNTON & Co. came 2nd with Golden Eagle.

Single Blooms.—Scarlet Bizzars: 1st and 2nd, Mr. J. J. KEEN, Southampton, with Admiral Curzon; 3rd, Mr. C. TURNER, with Robert Houlgrave; and 4th, Mr. R. SYDENHAM, Birmingham, also with Admiral Curzon. Crimson Bizzars: 1st, Mr. C. F. THURSTON, Wolverhampton, with J. S. Hedderley; and 2nd, with Master Fred; 3rd, Mr. R. C. CARTWRIGHT, Birmingham; and 4th, Mr. R. SYDENHAM, both with Master Fred. Pink and purple bizzars: 1st Mr. R. SYDENHAM, and 2nd, Messrs. THOMSON & Co., with William Skirving; Mr. THURSTON was 3rd, with Saml Payne, and Mr. SYDENHAM 4th, with Arethusa. Purple flakes: Mr. R. C. CARTWRIGHT was 1st and 3rd, Mr. SYDENHAM 2nd, and Messrs. THOMSON & Co. 4th, all with Gordon Lewis. Scarlet flakes:

a very fine scarlet flake named John Wormald won all four prizes; Mr. R. C. CARTWRIGHT was 1st and 2nd, and Mr. R. SYDENHAM 3rd and 4th. Rose flakes: Messrs. THOMSON & Co. were 1st and 2nd, with a new variety named Merton; Mr. C. F. THURSTON was 3rd, with Mrs. Rowan.

Sels.—The best white, a grand flower, was named Ensign, from Mr. BLICK; Mr. A. W. JONES came 2nd, with Dick Donovan; Mr. C. F. THURSTON was 3rd, with the same; and Mr. R. C. CARTWRIGHT 4th, with this. Rose: 1st, Mr. SYDENHAM, with Exile; 2nd and 3rd, Mr. BLICK, with Anne Boleyn. Scarlet: The Sirdar was placed 1st, from Mr. R. SYDENHAM; Mr. THURSTON was 2nd and 3rd, with Mrs. J. Douglas; and Mr. BLICK 4th, with Burra. Maroon: Mr. BLICK came 1st, with Sir Bevis; Mr. C. PHILLIPS was 2nd, with a flower unnamed; and Mr. R. SYDENHAM 3rd, with Highgate (?). Yellow: Mr. R. C. CARTWRIGHT was 1st and 2nd, with Lady Dora; and Mr. BLICK 3rd, with Cecilia. Buff: Mr. BLICK was 1st, with Benbow, a decided acquisition of this colour; Messrs. THOMSON & Co. were 2nd and 3rd, with Mrs. Colby Sharpin. Yellow ground: 1st, Messrs. THOMSON & Co., with Voltaire; Mr. C. TURNER, was 2nd, with Vespasian; and Mr. CARTWRIGHT 3rd, with the same.

Other Fancies.—Mr. A. R. BROWN, Handsworth, Birmingham, was 1st and 2nd, with Artemis; Mr. BLICK 3rd, with Black Prince.

PICOTEES.

H. R. E.: 1st, Mr. R. SYDENHAM, with Isabel Lakin; 2nd, Mr. R. C. CARTWRIGHT; and 3rd, Mr. J. J. KEEN, with John Smith; 4th, Messrs. THOMSON & Co., with Isabel Lakin. L. Red E.: 1st, Mr. BLICK, with Thomas William, and 2nd, with Mrs. Gorton; the latter, shown by Messrs. THOMSON & Co., was 3rd; and Mr. C. TURNER 4th, with Acme. H. P. E.: 1st and 2nd, Mr. R. SYDENHAM, with Miriam; 3rd and 4th, Mr. THURSTON, with Amelia. L. P. E.: 1st, Mr. R. SYDENHAM; and 2nd, Mr. F. A. WELLESLEY, with Harry Kenyon; and 3rd, Mr. C. TURNER, with Seeding H. Rose E. A variety named Mrs. Foster was placed 1st and 2nd, but no exhibitor's name was given—it was probably from Mr. T. LOUD; Mr. A. R. BROWN was 3rd; and Mr. F. A. WELLESLEY 4th, with Madeline, L. Rose E.; Mr. R. SYDENHAM was 1st with Fortrose; and Mr. THURSTON 2nd with the same; Mr. TURNER coming 3rd and 4th with Seedlings. Yellow-grounds H. E.: Mr. BLICK was 1st with Gertrude, and 2nd with Aldebaran; Mr. R. SYDENHAM 3rd; and Mr. KEEN 4th, with Mrs. R. Sydenham. Yellow-ground L. E.: 1st, Mr. BLICK, with Childe Harold, and 2nd with Speranza; Mr. WENT was 3rd with Mrs. Douglas; and Mr. C. TURNER 4th with Fanforela.

Premier Blooms.—Bizarre: C. B. Master Fred, from Mr. R. C. CARTWRIGHT; Flake: S. F. John Wormald, from Mr. R. SYDENHAM; Self: Ensign, white, from Mr. C. BLICK; Fancy: Hidalgo, from Mr. BLICK; H. E. Picotee Lady Louisa; H. Rose, from Mr. M. ROWAN; L. E. Picotee Fortrose, from Mr. R. C. CARTWRIGHT; yellow-ground Picotee Gertrude, from Mr. C. BLICK; L. E. Childe Harold, also from Mr. BLICK.

White-ground Carnations.—There were six exhibitors of twelve Carnations, bizzars and flakes; and Messrs. THOMSON & Co., who showed uniformly good flowers in all the classes, were 1st with P. F. Gordon Lewis, S. F. John Wormald, P. P. B. Wm. Skirving, R. F. Merton, C. B. J. S. Hedderley, P. F. James Douglas, R. F. Merton, C. B. Master Fred, C. B. Martin Rowan, S. B. R. Houlgrave, C. B. R. Bealey, and S. F. Sportsman; Mr. R. SYDENHAM was 2nd, having in good character S. F. John Wormald, C. R. Lord Salisbury, P. F. Gordon Lewis, C. B. Master Fred, P. P. B. Sarah Payne, and S. F. Guardsman; 3rd, Mr. C. PHILLIPS, Bracknell. Selfs: with twelve selfs, Messrs. THOMSON & Co. were 1st out of nine competitors, having Exile, Britannia, J. Douglas, Mrs. E. Hambro, Miss A. Campbell, Seagull, Nabob, Manemian, Dick Donovan, &c.; 2nd, Mr. C. PHILLIPS with Nabob, Britannia, Mrs. A. J. Palmer, and Seedlings.

Fancies.—1st, Messrs. THOMSON & Co. having in good character Voltaire, Monarch, Golden Eagle, The Imp, The Gift, Eldorado, Gossip, Romance, Ladass, &c.; 2nd, Mr. C. PHILLIPS, whose leading blooms were Don Juan, Cardinal Wolsey, Czarina, Romulus, The Gift, Brodrick, &c.; 3rd, Mr. F. A. WELLESLEY.

White Ground Picotees.—Once more Messrs. THOMSON & Co. came to the fore with twelve blooms, having H. P. E. Amy Robsart, L. P. E. Mrs. Gorton, L. P. E. Pride of Leyton, H. red E. Brunette, L. ro. E. Favourite, H. red E. Isabel Lakin, H. P. E. Miriam, H. P. E. Mrs. Openshaw, L. ro. E. Fortrose, L. P. E. Elizabeth, H. ro. E. Mrs. Payne; 2nd, Mr. F. A. WELLESLEY, whose best blooms were H. ro. E. Clio, L. P. E. Jessie, L. P. E. Her Majesty, L. P. E. Pride of Leyton, and H. ro. E. Little Phil.

Yellow Grounds.—The best six blooms were also from Messrs. THOMSON & Co., who had in good character Empress Eugenie, Gossip, Badminton, May Queen, Doris, and a seedling; Mr. F. A. WELLESLEY was 2nd.

None of those showing in the previous division could compete in this, which is a wise arrangement, as it gives the growers of small collections an opportunity to come to the fore as 1st prize winners, which is the natural ambition of every grower for exhibition.

White-ground Carnations.—Mr. R. C. CARTWRIGHT, of Birmingham, took the 1st prize, having S. F. John Wormald, C. B. J. S. Hedderley, C. B. Master Fred, P. F. Gordon Lewis, &c.; 2nd, Mr. A. R. BROWN, his leading blooms being C. B. Lord Salisbury, R. F. Merston, and S. F. Sportsman; 3rd, Messrs. W. PEMBERTON & Son, Walsall. There were fourteen stands in this class.

Selfs.—In the class for six varieties there were twenty-two exhibitors, Mr. R. C. CARTWRIGHT again taking the 1st prize with Her Grace, Minerva, Mrs. J. Douglas, Regina, Mrs. E. Hambro, and Endymion; 2nd, Mr. A. CHATWIN, who had much the same varieties; 3rd, Mr. A. R. BROWN.

Fancies.—There were eighteen stands of six fancies, Mr. S. A. WENT, Thames Ditton, taking the 1st prize, with Perseus, Czarina, Brodriek, M. March, Olivia, and Dervish. Mr. A. R. BROWN was 2nd; and Mr. R. C. CARTWRIGHT, 3rd.

Picotees, white-ground.—Messrs. W. PEMBERTON & SON came 1st with six blooms, having H. ro. E. Little Phil, L. ro. E. Favourite, L. red E. Mrs. Bower, H. P. E. Amy Robsart, H. ro. E. Clio, and H. red E. Isabel Lakin.

Yellow-grounds.—With four blooms, Mr. A. R. BROWN took the 1st prize, having Voltaire, May Queen, Dervish and Ladass; Mr. A. H. BEADLE, Sydenham, was 2nd; and Mr. A. SPITALING, 3rd.

Selfs.—With three blooms of one variety, Mr. CARTWRIGHT was 1st with Regina, yellow; Mr. A. R. BROWN, 2nd, with Dick Donovan, white; and Mr. WENT, 3rd, with Mrs. E. Hambro, white.

Fancies.—The best three of one variety were Brodriek, from Mr. S. A. WENT; Mr. A. R. BROWN came 2nd, with Eldorado; and Mr. CARTWRIGHT, 3rd, with the same.

Yellow-grounds.—The best three blooms of a Picotee were those of Mrs. Douglas, from Mr. H. W. SELLEM; Mr. CARTWRIGHT came 2nd with May Queen; and Mr. J. J. SHELTON, 3rd, with Eldorado, which was also shown in the previous class as a fancy.

Exhibits without Dressing or Cards.—There were eight classes for these, the blooms shown in twelves, sixes, and threes, and mainly in bottles, each flower having a spray of Carnation foliage backing it. Some of the blooms were named, and some not. Those named were mainly repetitions of those shown in previous classes. It was to be noticed that but very little public interest seemed to be aroused over these classes. Those having the dressed blooms are always the most attractive, no doubt because the possibilities of the flowers are brought out to their utmost. There is a great deal of truth in the remark of an old florist, made fifty years ago, that "he who can dress flowers well—that is, fairly—has a better chance of winning prizes than he who cannot." There was also a class for those who had never won a prize at the exhibitions of the Society.

Plants in Pots.—The best twelve were staged by Mr. BLICK, finely grown and bloomed, the leading varieties, Hesperus, Alcinous, Agnes Sorrel, Goldlocks (delicate salmon-buff, heavily edged with bright red), Lucella, &c. Mr. JAMES DOUGLAS was 2nd. Mr. BLICK had the best single specimen; and Mr. DOUGLAS the next.

Groups.—In the class for a large group, Mr. BLICK made an effective display, with finely-grown and bloomed plants of fancies and selfs, finishing his group by an edging of Ferns. Mr. T. CARRUTHERS, Reigate, was 2nd; and Mr. C. TURNER 3rd. The latter had decidedly the best plants, but the flowers had suffered from the long, close journey from Slough to Sydenham. With a smaller group, Mr. J. DOUGLAS was 1st, and Mr. E. CHARRINGTON, Chislehurst, 2nd.

Table Decorations.—These consisted of dinner-tables for twelve persons arranged for flowers by Miss and HENRY ANSTEV, Knight's Hill, who had three centre pieces arranged with yellow Carnations and foliage. The MORTER STOVES, LTD., came 2nd, with Miss Jolliffe Carnations and foliage; and Mr. J. DOUGLAS 3rd, with a bright combination.

Mrs. HEDLEY, Reigate, had the best vase of Carnations; Mr. A. C. CHARRINGTON was 2nd; and Mr. H. ROGERS, Woodbridge 3rd. Sprays and button-holes were also shown, some of the former rather uncouth in appearance.

In the way of miscellaneous collections, Messrs. W. CUTBUSH & SONS, Highgate, had a large group of Malmaison and other Carnations. Mr. FORSTER, the manager of the Brockhampton Nurseries, Havant, had a large and imposing collection of Sweet Peas; and Mr. G. W. PIVER, Uckfield, blooms of his fine new Tea Rose, Sunrise.

DEVON AND EXETER GARDENERS.

The following notes of two interesting gardens in East Devon were taken on the occasion of the annual outing of this Society that occurred recently:—

STRETE RALEGH, the seat of Mr. H. M. Imbert-Terry.—The estate at one time belonged to the Buller family, and when, about fifty years ago, Mr. Wentworth Buller owned it, he planted in the parks and woods many rare trees. Before the property came into possession of Mr. Imbert-Terry, the estate was much neglected, and it is only within recent years that many fine and rare specimens of Conifers have been given breathing-space by thinning the rank underwood and surrounding trees.

Among the trees pointed out to us by the owner, who showed an intimate knowledge of them, was Larix Griffithi, about 30 feet high, and about thirty years old. It is a stately and picturesque specimen, and is in full vigour from the leader to the ground. There is a specimen of this variety at General Trelawney's, Coldenick, in Cornwall, but it has not the fine proportions of the tree at Strete Ralegh, which is probably the best specimen in the country. Another fine specimen is a Saxe-Gotha conifer, which is probably the only arborescent specimen in this country. Near by was a handsome spreading Tsuga Brunoniana, planted about fifty years ago, and now about 40 feet in height. A splendid specimen of Pinus Montezumae was much admired; it was

about 40 feet in height, and was planted in 1850. This year it coned, but a gale blew the cones off prematurely. A fine Fern-leaved Oak was noted; Pinus australis, 30 feet; Cupressus macrocarpa (C. Lambertiana), 60 feet, and at least 35 feet through; Abies concolor (A. lasiocarpa, A. Lowiana, and A. Parsonii), a good A. nobilis, a very fine Cedrus atlantica of the glaucous-leaved variety, with a rare trio of Araucaria imbricata, whose long, pendulous branches, healthy, and dark glossy-green, swept the turf. Last year one of them, a female tree, bore a male cone. The trees are in fruit now.

LIDBURY MANOR, the seat of Sir Charles Cave, Bart., the gardener being Mr. J. Reynolds. Although the farm on the estate dates back to early in the seventeenth century, the mansion, the drives, and the glass-houses are all modern, and the buildings have been constructed on the latest principles. On the lawn is a fine clump of Arundinaria anceps, 10 feet high, and 12 feet to 15 feet through; a tree of Eucalyptus Gunnii, of 35 to 40 feet; Paulownia imperialis, just gone out of flower, and surrounded at the base by a mass of the white Rose Aimée Vibert; Cedrus Deodara, and Pinus Pinsapo, not large, but grand in foliage, and very handsome.

On the terraces were nicely-trained standard Heliotropes, 4 feet in height, springing out of circular beds of Margold Legion of Honour. The Grapes in the vineries were very good. In the conservatory was a fine bank of Adiantum, and over a trellis on the terrace was the Rosa simplex, doing well. The vegetable garden was in fine condition, and the place generally had the appearance of being under able and judicious management. There are about a dozen men employed under Mr. Reynolds. When the improvements are completed, Lidbury Manor will be a very fine place.

CARDIFF HORTICULTURAL.

JULY 19, 20.—The eleventh annual show was held in the Sophia Gardens, Cardiff, in beautiful weather. As is usual at Cardiff, the groups of miscellaneous plants and the table decorations were the principal attractions of the show, and the table exhibits, which are becoming every year more numerous and interesting. In the cut flower section, Roses, which are usually very good at this show, were decidedly inferior—undoubtedly owing to the climatic conditions prevailing during the last two months. Sweet Peas were conspicuously to the fore, the display of these lovely flowers excelling anything ever seen before at Cardiff.

Fruit and vegetables were not more than usually good, and need no special remark.

GROUPS.

In the open class a prize of £12 for the best group of miscellaneous plants arranged for effect within a space of 100 feet was won by Mr. J. CYPRER, Cheltenham. This group, in shape a parallelogram, was arranged in that airy style peculiar to Cypher's exhibits, and which has gained for him all over the country so many premier prizes. In this particular group a light cork bridge-like structure, surmounted by a Palm, which rose gracefully and magnificently, formed the centre piece, while at the four corners were pedestals of rockwork covered with Ferns, Cattleyas, &c., upon which were fine specimens of Humea elegans. The rockwork forming the base of the entire group was planted with miniature Cactaceae of excellent colour, small Palms, Enlalias, Feras, &c. Mr. RALPH CROSSING, nurseryman, Penarth, took 2nd place with a nicely arranged group, in which Lilium auratum, Fraxinas, Bamboos, and dwarf large-flowered Cannas were conspicuous—the latter being seedlings of his own hybridising.

For the best group occupying a space of 40 square feet, Mr. W. CARPENTER, gr. to W. BUCKLEY, Esq., Llanelli, was 1st with a very tastefully arranged exhibit composed of well-grown Humeas, Acalypha hispida, Liliums, &c. J. RUTHERFORD, Esq., Llandaff, was 2nd. Mr. REX, gr. to C. WALDRON, Esq., Llandaff, took the 1st prize for the best group occupying the 25 square feet.

STOVE AND GREENHOUSE PLANTS.

For the best six stove or greenhouse plants in bloom, Mr. LOCKYER, gr. to J. C. HANBURY, Esq., Pontypool Park, won 1st prize, with particularly fine specimens of good species.

A. T. ROBINSON, Esq., Whitechurch, took the 1st prize for the best single specimen plant in bloom.

Mr. CARPENTER, Llanelli, carried off 1st prize for the best six stove or greenhouse Ferns, with splendid specimens of Adiantum gracilimum, A. Williamsii, Microlepia hirsuta cristata, Dicksonia antarctica, and Cyathea dealbata.

In the open class for six Fuchsias, Mr. HILLAND, an amateur, won 1st prize.

CUT FLOWERS AND DECORATIVE CLASSES.

In the Rose section Mr. RALPH CROSSING took the 1st prize for twelve varieties of H.P. Roses, three blooms each. The varieties were Victor Verdier, Ulrich Brunner, Horace Hugo, Jean Souper, Mrs. John Laing, Fisher Holmes, Horace Vernet, A. K. Williams, Heinrich Schultheiss, Alfred Colomb, Duchess of Bedford, and Duke of Wellington.

For Tea Roses, twelve varieties, three blooms each, Mr. JOHN MATTOCK, of Oxford, beat Mr. PRINCE, also of Oxford. Messrs. TOWNSEND & SONS, Cirencester, were the winners of a class for twenty-four H.P. varieties.

For twelve distinct varieties of Carnations and Picotees, Mr. W. TRESEDER, Cardiff, was 1st, and also for an exhibit of Carnations arranged for effect.

In the competition for a collection of hardy flowers in varieties, Mr. W. TRESEDER was 1st, and Mr. GODFREY, Exmouth, 2nd.

For the decorative and dessert tables the chief award in the open section went to Messrs. CASE BROS., Cardiff, for a beautiful table showing grand fruit, with a lovely floral effect of Iceland Poppies in two shades of colour. Mr. A. E. PRICE, Cardiff, was 1st for the hand-bouquets; and was the winner of the Silver Medal of the Royal Horticultural Society offered to the winner of the largest aggregate of prizes in the decorative classes.

TRADE EXHIBITS.

Mr. WILLIAM TRESEDER, Cardiff, made a very pretty exhibit of a collection of plants extending the whole width of the end of the group-tent. The irregularity and informality of its formation was exceedingly pleasing. In the foreground were Carnations, Lilium speciosum, Humeas, and bunches of Sweet Peas emerging out of the damp rock and Moss which were used as a groundwork, giving in combination an air of coolness to a pretty scenic effect. Mr. TRESEDER very deservedly was awarded a special prize and a medal for this valuable contribution to the show.

Messrs. CUTBUSH & SONS, Highgate, London, showed a splendid collection of Ivies, forty-five distinct varieties in baskets.

Messrs. ECKFORD of Wem, JONES & SONS of Shrewsbury, and DAVIES of Yeovil, showed very beautiful collections of Sweet Peas, which added much to the attractiveness of the show.

H. A. P.

THE PEOPLE'S PALACE HORTICULTURAL.

JULY 21 to 22.—This exhibition was one of the best the Society has hitherto held, the Queen's Hall was full of exhibits, and a very large number of plants contributed by the children in their section, found a place in the Winter Garden.

On the previous Saturday, the flower gardens in the more crowded districts were judged, and some very pretty and neat ones were seen in unexpected localities. Those who reside in the crowded parts compete in a section apart from those who live in the more open parts of the district.

The improvement in the plants and cut flowers was remarkable. Chief among flowering plants were Fuchsias, zonal Pelargoniums, Plumbago capensis, Lilium Harrisii, and Begonias. The leading foliage plants were Latania, Kentia, Ficus elastica, Aspidistra, Draecena, &c. One exhibitor in the class for a flowering plant, had an excellent example of Peacock Fancy Dahlia, growing in a large pot, carrying some remarkably good blooms. Sweet Peas made a very pleasing feature, being shown as light and elegant bunches, arranged with their own foliage. There were collections of vegetables also, and many good Cucumbers and pretty table decorations.

The President of the Society, the Duke of FIFE, furnished a fine group of plants; and a superb collection came from Mr. GRO. REYNOLDS, of Gunnersbury Park. There were also interesting collections of cut flowers, Cacti, &c. In the evening, the Duke and Duchess of Sutherland attended and inspected the exhibition, where there was a large concourse of members and their friends, who gave them an enthusiastic welcome. The Saturday's attendance for the show, continued over three days, is always a very large one, the admission being one penny.

MEARNS ROSE.

JULY 22.—The third annual show of this Renfrewshire society turned out a great success.

Roses.—There was a considerable increase in the number of entries, while the quality of the flowers of both Roses and Pansies was above the average. In the open class for forty-eight blooms of Roses, Messrs. CROALL, of Dundee, were 1st. They also led the way with twenty-four Teas and twelve blooms of one variety, the latter being very perfect specimens of Mrs. J. Laing. For twelve blooms Messrs. A. DICKSON & SONS, Newtonards, were 1st, the same firm coming 2nd for forty-eight with a very fresh stand of richly coloured and well-formed flowers. Messrs. HUGH DICKSON were also successful competitors for Roses, and were 1st for twelve blooms Begonias.

In the gardeners and amateurs class, Mr. MELVILLE, gr. at Hazelden, succeeded in winning 1st for twenty-four blooms, White Lady, La France, Caroline Testout, and A. K. Williams being of remarkable merit. He was closely followed by Mr. PARLANE, of Paisley, with Mr. JOHN RUSSELL, The Mearns, making a good 3rd.

In the Pansy and Viola section Mr. SMELLIE, of Busby was the leading prize-winner with flowers of great size and substance, and wide range of colour, Pansy blooms of seedlings, Mrs. W. J. Cupples and W. J. Cupples, being specially fine. Messrs. BAOWS, of Blantyre, and Mr. PAISLEY of East Kilbride, were also in the winning lists with capital stands. Of exhibits not for competition, Mr. CAMPBELL, of High Blantyre, was awarded a Certificate of Merit for a fine display of over 100 blooms of Carnations and Picotees, and sprays of Pompho and Cactus Dahlias. Mr. MICHAEL CUTBERTSON, of Rothesay, was also an extensive exhibitor of herbaceous flowers for which he was awarded a Silver Medal. In this stand was a very handsome spike of Lilium Martagon dalmaticum. Mr. CUTBERTSON also exhibited his new seedling herbaceous Oenothera Cutbertsoni.

This society during its brief career has been well managed and liberally supported, and there is every prospect of its annual shows becoming a very important event in the Rose world.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

JULY 20.—On the occasion of this meeting, THOS. STATTER, Esq., Stand Hall, Whitefield (gr., Mr. Johnson), exhibited a very handsome form of *Lælio-Cattleya Canhamiana* alba, to which an Award of Merit was made. The sepals and petals are of French white, and the flower is of nice appearance.

G. SHORLAND BALL, Esq., Wimslow (gr., Mr. Gibbons), showed a very good *Cypripedium* cross which the Committee decided to be between *C. Rothschildianum* and *C. selligum*, partaking of the finest points of both parents (Award of Merit).

JOHN LEEEMANN, Esq., West Bank, Heaton Mersey (gr., Mr. Edge), exhibited a few plants, including a very fine *Lælia xanthina*, to which an Award of Merit was made; as also *Lælia x Cattleya radiata*, an interesting hybrid between *Lælia purpurata* x *Cattleya nobilior*. A step in the right direction has been made here, as we have the dwarf growth of *C. nobilior* combined with the floriferousness of *Lælia purpurata*.

S. GRATRIX, Esq., Whalley Range (gr., Mr. McLeod), had, without doubt, the best exhibits at the meeting, including a fine form of *Cattleya Gaskelliana* alba, F.C.C.; a plant of *Cypripedium callosum* var. *Sanderi* raised from seed in this country, F.C.C.; and a very interesting crossbred *Cypripedium* Prince Edward of York, having for its parents *C. Rothschildianum* and *C. Sanderianum*, the flower having much resemblance to the latter: A.M. The best plant in the exhibit was *Cypripedium* x *Jansoni*, the parents of which are *C. Rothschildianum* x *C. Morganii*, its flower, a very fine one, in some particulars reminiscent of *C. Storei* var. *platytenium*, and Mr. GRATRIX preferred the Committee not to vote upon it until he exhibited the plant in a perfect state.

The Venerable Archdeacon RAWSTONE sent a form of *Cattleya gigas Sanderiana*, which received an Award of Merit.

JOHN RICHARDSON, Esq., Halecroft, Altrincham, showed cut flowers of a grand form of *Sobralia xantholeuca*, one of the best; it is very fragrant. Messrs. F. SANDER & CO., St. Albans, showed three cross-bred *Cypripediums*, viz., *C. x Premier* = *C. Beechense* x *C. Rothschildianum*, Award of Merit; *C. Garbari* = *C. Lawrenceanum* x *C. Rothschildianum*; and *C. Lord Derby* = *C. Veitchii* x *Rothschildianum*; the latter was not so good a flower as the original possessed by Mr. Statter.

Messrs. HEATH & SON, Cheltenham, staged the pretty and interesting little *Dendrobium Fytchianum*, and a crossbred *Cypripedium* called *C. x pendulum*, having for its parents *C. Hayoaldianum* x *C. Argus Moensii*, of no particular merit.

Mr. JOHN RONSON, Altrincham, exhibited *Cattleya Gaskelliana* var. *pallida*; and a plant of *Odontoglossum Pescatorei*, of which the lip, with its pretty violet markings, was the chief feature.

Mr. A. J. KEELING, Blugley, Yorks, exhibited a really good form of the rare *Cypripedium* x *Vipani*, a cross between *C. levigatum* x *C. niveum* and one of the oldest of the crosses of *niveum*. It received an Award of Merit. P. W.

NATIONAL DAHLIA.

JULY 25.—A meeting of the committee took place at the Horticultural Club on the above date, Mr. Ed. Mawley, Treasurer, in the chair.

The chairman made a feeling allusion to the death of Mr. T. W. Girdlestone, the President of the Society, and resolutions were passed by acclamation recording the deep sense of the members of the great loss sustained by the Society through his death, and affirming the fact that, as a raiser of Fancy single Dahlias, Mr. Girdlestone had placed the Dahlia-loving community under obligation to him. A suggestion made by Mr. Mawley, that some memorial of Mr. Girdlestone should be established, was referred to the Committee for consideration.

The Sub-Committee appointed to make arrangements for a second show to take place about the middle of September, announced that the same would be held at the Royal Aquarium on September 19 and 20; that a schedule of prizes had been prepared amounting to £22, all of which had been privately subscribed; the directors of the Royal Aquarium providing the necessary staging, &c. It was agreed that the schedule be printed and circulated, and that miscellaneous exhibits be invited so as to enhance the interest of the meeting.

THE EUCALYPTUS.

SOME interesting papers on Eucalyptus have recently appeared in the *Gardeners' Chronicle*, viz., one on March 18, by Dr. Bonavia, and another on April 3, by Mr. C. France. With your permission, I would like to make a few observations in regard to a few points touched upon in these letters.

Dr. Bonavia doubtfully quotes from an article in the *National Review* for February last, by H. C. Thomson, in which the writer says:—"Tasmania . . . in which it is difficult to feel ill, with Eucalyptus forests, in which fever cannot exist." This is mere drawing upon the imagination. In the *Proceedings of the Linnean Society of N. S. W.*, vii., 336, the late Rev. J. E. Tenison-Woods, one of our best naturalists, makes the following

statement. Speaking of Eucalyptus crebra, he says:—

"On the Peat Downs about Clermont and Coppefield it is especially plentiful, and all around the Hodgkinson Diggings. I mention this fact just to show that, whatever febrifuge properties the Eucalypts may possess, the mere presence of some species will not be enough to dissipate malaria. In the places I have mentioned fever and ague were common enough, yet the prevailing winds used to blow through hundreds of miles of these Gum-trees ere they reached the infected localities."

This is but one illustration, but it is very widely true. The good effects produced in planting this tree in malarial localities are mainly attributed to the power the rapid-growing species possess of absorbing moisture from the soil. The odour of Eucalyptus forests is not so great as many people imagine, and while breathing the pure air of the forest is undoubtedly beneficial to human beings, scientific men here never speak of it as a "fever-destroying tree." That is left to Italian and Californian friends, and we are glad that our national tree effects such cures in its new homes.

As to the suggestion made by Dr. Bonavia's informant, that flies do not alight on Eucalyptus leaves, I only wish it were true. We have countless numbers of Eucalyptus trees, and I am sorry to say we have far too many flies. These insects have no objection to perch on Eucalyptus trees.

Mr. France speaks of the extensive cultivation of *E. viminalis* in the Transvaal, and I know from other sources that he is correct in referring to this species. But it seems extraordinary to us to hear of *E. viminalis* being cultivated, as its timber is one of the most worthless of that of any of the Eucalypts. No one in Australia would dream of cultivating it for timber. I can only assume that rapidly-grown timber is required, irrespective of quality, for the Transvaal mines. It seems extraordinary to hear that *E. viminalis* timber is reputed to be tougher and more durable than that of *E. Globulus*. If that be really the case, it shows that the two species must have undergone alteration in their new home.

E. Globulus is a good second-class timber, one of the best produced by Tasmania and Victoria, but coming much lower down in the scale than such timbers as the Tallow-wood (*E. microcorys*), the Iron-barks, the Forest Mahogany (*E. resinifera*) of New South Wales, or the Jarrah of Western Australia. Timbers such as these are worthy of extensive planting; but planters must be content to pay a higher price for the seed than for such rapid-growing rubbish as *E. viminalis*, *E. amygdalina*, *E. piperita*, and some others readily bought by the unsophisticated. Eucalyptus seed should only be bought under some guarantee as to correctness of name.

Just another word in regard to Mr. France's observations *re* Acacias. *A. dealbata*, the Silver Wattle, is worthless as a tan-bark. The timber of *A. melanoxylon* (Blackwood) is excellent, but I never heard of the use of that of *A. decurrens* and *A. dealbata*, except for fuel, and the making of small articles which could be fashioned out of almost any other wood. In many treeless places, fuel is in great demand, and hence the value of rapid-growing Acacias and Eucalypts. J. H. Maiden, Government Botanist, and Director of the Botanic Garden, Sydney.

ENQUIRY.

GAS-MAKING AND PLANTS.—Mr. N. C. Shiach, Superintendent of a nursery, would be glad if information on the following matter could be kindly supplied by readers of the *Gardeners' Chronicle* having experience of the effects of gas-making on plants in the vicinity of the works. Will injury occur to Conifers, Roses, and general nursery stock situate near a gas-house? The Burgh Commissioners here (?) purpose erecting a gas-house, in which they intend to deal with the residual products of

gas. This, he expects will include the distillation of tar, &c. There are eight nurseries or market-gardens within a radius of 300 yards of the works, and the owners are alarmed at the prospect of having the gas-works so near to them, and are anxious to ascertain if damage has resulted to plants from gas-works, or good proof that no evils result from the same.

SEVERE THUNDERSTORM IN SOMERSETSHIRE.

—On the 22nd inst. the district of Bridgwater, in Somersetshire, was visited by a very severe thunderstorm, which was generally welcome after a somewhat prolonged drought. In the parish of Westonzoyle, however, the storm was most furious, and accompanied by a strong easterly wind, wrought much damage. A contemporary estimates the injury to growing crops as equal to £1500.

MARKETS.

COVENT GARDEN, JULY 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

OUT FLOWERS, &c.—AVERAGE WHOLESALE PRICES.

POTATOS.

Hebron, Puritan, Snowdrop, Up-to-Date, &c., 80s. to 100s. John Butch, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—During the past week Runner Beans have been very plentiful, causing prices to drop. Although many gardeners cultivate more than one sort, one grower of high repute has this season 30 acres of Runners, consisting of Scarlet, White Blossom, and Painted Lady (red and white). Good Lettuces are very short in supply. The Denia Grapes in barrels are coming very good. They are packed in cork-dust. The Peas and Plums quoted in above table are foreign.

SEEDS.

LONDON: July 26.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report but little inquiry as yet for Trifolium incarnatum. French quotations are somewhat lower, whilst English samples come forward more freely. New home-grown Rye is now offering; yield and quality alike promise well. There is more business passing in sowing white Mustard. Rape-seed, moreover, keeps very steady. The Canary-seed market is strong, at the recent advance. Liverpool now quotes 39s. 6d. per quarter for Turkish seed. Hemp-seed, owing to its extreme scarcity, tends upwards in value. There is no alteration this week in either Peas or Haricots. The new Spanish Lentils exhibit very choice quality.

FRUIT AND VEGETABLES.

GLASGOW: July 26.—The following are the averages of the prices recorded since our last report:—Cherries, English, 6s. 6d. to 7s. 6d. per half sieve; Gooseberries, 9s. to 10s. per cwt.; do., Sulphur, 5s. per half sieve; do., Crown Bob, 2s. to 2s. 3d. per quarter sieve; Grapes, Guernsey, 9d. to 1s. per lb.; do., English, 1s. 3d. to 1s. 9d. do.; Greengages, 3s. to 3s. 3d. per pound; do., Quantin, 3s. to 5s. and 2s. 6d. to 4s. per pad; Plums, 6s. per half sieve; Melons, Valencia, yellow, 24s. 6s. to 7s. per case; 30s. 6s. to 7s. do.; Peaches, home, 4s. to 5s. per dozen; Black Currants, French, £18 to £22 per ton; do., Dutch, £16 to £18, do.; Strawberries, Scotch (hampers), 2½d. to 3½d. per lb.; do., crates, 3s. 6d. to 5s. 6d. per dozen punnets; Tomatoes, Scotch, 8d. to 8d. per lb.; do., English, 4d. to 5d. do.; do., Guernsey, 3d. to 4d. do.; Valencia, 4s. to 5s. per case; Cucumbers, 3s. to 4s. 6d. per dozen; Peas, 3s. 6d. to 4s. per half bag; 8s. 6d. per bag; Cabbages, 1s. 6d. per dozen; Cauliflowers, Edinburgh, 2s. to 2s. 6d. per dozen; Onions, 4s. 6d. to 5s. per cwt.; Parsley, 1s. to 1s. 6d. per stone; Carrots, 9d. to 1s. per bunch; do., Dutch, 4s. to 5s. per hamper; Lettuces, round, 9d. to 1s. 3d. per dozen; do., Cos., 9d. to 1s. 3d. do.; Horseradish, 3s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroot, 6d. to 9d. per dozen; French White Turnips, 8d. to 9d. per bunch; Scotch, 3s. 6d. to 4s. 6d. per dozen bunches; do., Irish, 6s. to 12s. do.; do., English, 1s. 6d. to 2s. per dozen; Marrows, 6d. to 8d. per dozen.

LIVERPOOL: July 26.—Wholesale Vegetable Market.—Potatoes, per cwt., Early Regents, 2s. to 2s. 6d.; Kidneys, 3s. 6d. to 5s.; Turnips, 6d. to 8d. per doz. bunches; do., Swedes, 2s. to 2s. 6d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Parsley, 6d. to 8d. do.; Onions, foreign, 2s. 6d. to 3s. 6d. per cwt.; Lettuces, 4d. to 6d. per doz.; Cucumbers, 1s. 3d. to 1s. 6d.; Cauliflowers, 1s. 9d. to 2s. 6d. do.; Cabbages, 8d. to 1s. 6d. do.; Peas, 2s. 4d. to 2s. 10d. per bushel; Beans, 1s. to 1s. 3d. do. St. John's.—Potatoes, 10d. per peck; do., new, 1d. per lb.; Grapes, English, 1s. 6d. to 3s. do.; do., foreign, 6d. do.; Plums, English, 4s. to 6s. each; Currants, red and white, 4d. per lb.; do., black, 5d. do.; Strawberries, 6d. to 8d. per lb.; Gooseberries, 3d. per quart; Peas, 1s. per peck; Cherries,

4d. to 8d. per lb.; Cobnuts, 6d. per lb.; Apricots, 1s. per dozen; Cucumbers, 3d. to 4d. each; Mushrooms, 1s. per pound and basket. Birkenhead.—Potatoes, 1s. 2d. per peck; Peas, 10d. to 1s. 2d. do.; Cucumbers, 2d. to 4d. each; Strawberries, 4d. to 6d. per lb.; Cherries, 6d. to 8d. do.; Currants, black, 4d. to 6d. do.; do., red, 4d. do.; Apricots, 1s. per dozen; Gooseberries, 2d. to 4d. per pound; Peaches, 3d. to 4d. each; Grapes, English, 1s. 6d. to 3s. per pound; Mushrooms, 6d. to 1s. do.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending July 22, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	38 1	25 5	— 12 8
Barley	25 0	21 10	— 3 2
Oats	20 10	18 0	— 2 10

ANSWERS TO CORRESPONDENTS.

BOOKS: H. J. C., Hyge. The Amateur Orchid Cultivator's Guide Book, by H. A. Burberry, price 5s. net, Blake and Mackenzie, Liverpool. Our Orchid calendar, which appears in every issue of the *Gardeners' Chronicle*, contains a quantity of information on current operations.

CARNATIONS: W. P. We cannot undertake to name florists' flowers. Send them to some large grower.

CARNATION SEEDLING: J. E. From the specimens received we should not judge the variety to be of uncommon merit. Compare it with a specialist's collection. Other answer next week.

CHERRY: T. G. R. Black Circassian.

DAHLIA: G. F. Union of two flower-heads is by no means uncommon.

ERRATA: "Hybrid Ferns," *Gardeners' Chronicle*, p. 62, for "percentage," read "parentage"; "confluent lips and sori infused pairs," and "asporogamic," read "confluent tips and sori in faced pairs," and "apogamic."

HOT-WATER AS A CURE FOR MILDEW AND AS AN INSECTICIDE: D. T. F. In face of the evidence brought under our notice it is impossible to doubt the efficacy of hot water as a cure for mildew. That water at a temperature of 150° will likewise kill scale of all kinds, thrips, aphids, &c., has long been known to gardeners. Water at 150° is not injurious to leaves, flowers, or fruits.

INSECTS: A. C. The specimens are quite dried, and also incomplete. Can you send fresh ones in a small bottle?

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. T. Dendrobium superbiens, a very showy and lasting species, and not common.—A. T. C. J. 1, Cheilanthes hirta; 2, send a mature fertile frond. Impossible to name a young frond from spore; 3, Gymnogramma ochracea; 4, G. calomeanos; 5, Nephrolepis cordifolia.—Notul. 1, Equisetum arvense; 2, Oenothera Lamarckiana; 3, Salix rosmarinifolia; 4, Gleditschia inermis; 5, Cornus mas variegata; 6, Agrostemma cornaria.—J. S. Orchid, perhaps Gymnadenia conopsea.—Philodendrist. Lobed leaves are not uncommon in the Snowberry. The Elm is perhaps the Scampston, but there are two or three similar.—R. E. Br. The Lily disease is occasioned by a fungus, Sclerotinia sp. 1, Hemerocallis fulva; 2, Helianthus rigidus; 3, Solidago sp.; 1, Fern, Pteris serrulata cristata; 2, Adiantum concinnum latum.—T. G. Cypripedium Parishi.—H. J. E. Cattleya Mendeli, so far as we can judge by the lip, which got discoloured in transit.—J. R. Cattleya superba and Maxillaria nigrescens. The other little species had lost all its flowers.—P. E., Romford. We cannot undertake to name florists' varieties of flowers.—Cambrian. 1, Sonchus oleraceus; 2, Polygonum lapathifolium; 3, Geranium molle; 4, not recognised; 5, Crepis hieracioides, vigorous; 6, Lamium purpureum. Have you been experimenting? The

plants are all out of character.—A. M. 1, Galega officinalis; 2, Veronica Teucrium; 3, Valeriana sp.; 4, Hyoscyamus niger; 5, Chrysanthemum Serotinum; 6, Monarda didyma; 7, Silphium sp.—W. T. Digitalis lutea.—S. J. Origanum dictamnus.—W. G. Davallia canariensis.—C. J. The whole of the names you give are good ones.

PEAR LEAVES: W. W. The injuries to the leaves are caused by the slug-worm, the larva of the Pear saw-fly (Tenthredo cerasi). Fresh-slaked lime repeatedly dusted on the leaves will destroy the larvae, as will heavy syringings with the garden engine. In the winter, take away the surface-soil for 2 feet distant from the wall, and char or bury it deeply in a remote part of the garden.

PEA PLANTS GOING-OFF AT THE ROOT: W. R. and C., Ochertyre. The probability is that the land, through being constantly cropped with Peas and other legumes, is "Pea-sick," just the same as land becomes Clover-sick from carrying a succession of crops of that plant. Instead of top-dressing it with soot, which is merely a vehicle for conveying ammonia to the plants, afford it nitrate of potash three times during the growth-period, at tri-weekly intervals, and no other manure. The stable-manure you have hitherto afforded the land is useless, or worse, for Peas and Beans, the plants deriving their nitrogen from other sources than the soil.

RASPBERRY SEEDLING: A. C. The fruits are of good size, but does the variety possess merits superior to those of Superlative? You should exhibit fruits and cane before the Fruit Committee of the Royal Horticultural Society. Address, the Secretary, 117, Victoria Street, Westminster.

SECOND CROPS FROM FORCED STRAWBERRY PLANTS: W. R. and Foreman. That forced plants, if well taken care of after forcing, and planted out betimes on a warm border, will crop more or less satisfactorily in the months of September and October is a matter of common knowledge. We know of no variety that will not bear fruit if the cultivation is of a suitable kind.

STINKING FUNGUS: J. H. The fungus is probably the Stinkhorn, Phallus impudicus, which is not easily to be got rid of if the land be not cultivated. Try to extirpate the fungus by removing the soil, or by applying nitrate of soda 2 to 3 oz. per square yard, or even common salt to that amount once or twice in three months; that is, if trees or shrubs grow round about the spot.

VINE LEAVES INJURED: X. Y. Z. Not fungus, but "scalding," the result of faulty ventilation of the vinery. This mishap frequently occurs from not affording air early in the day, or on sudden outbursts of ardent sunshine. Afford air by degrees, beginning at 6.30 or 7 o'clock; and if the day be uniformly warm, let the maximum amount of ventilation be afforded by 11.30. Even where unripe Grapes are hanging, do not close the vinery on hot days before 3.30 P.M.

COMMUNICATIONS RECEIVED.—S. A.—G. M.—J. D. H.—J. C.—J. E. R.—C. B. P.—H. W. E. V.—R. I. L.—F. W. B.—G. C. A.—C. Verviers.—D. T. F.—J. D. H.—W. M. W.—C. H. V.—Sander & Co.—M. C. H.—W. J. B.—H. F.—W. Catterell.—T. E. Henwood.—A. O'N.—R. P. B.—T. M.—R. C. B.—S. H.—J. M. R.—M. H.—R. C. G. (next week). C. K.—M. W.—D. T. F.—J. O'B.—G. B. M.—H. W.—G. H.—E. A. W.—R. D.—T. B.

SPECIMENS, PHOTOGRAPHS, &c., RECEIVED WITH THANKS.—N. C.—R. L.—M. G. H.—W. T. H.—Marsh (Henley).

DIED.—At his residence, Whinmoor Villa, Seacroft, suddenly, JAMES FOWLER, aged sixty-nine, for thirty-six years head gardener to the late Earl of Harewood, and for the last seven years in business for himself. Friends please accept this (the only) intimation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

MORE THAN DOUBLED.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, and ALL CLASSES OF GARDENERS' and GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal libraries.

(For Weather, see p. ix.)

THE

Gardeners' Chronicle

No. 658.—SATURDAY, AUG. 5, 1899.

THE TYING UP OF PLANTS.

WHY do we tie up the flowering stems of garden plants to sticks? Answer: To prevent them from trailing on the ground and looking untidy. That is one reason; but there is something of more importance still. We must think of our plants as if they were animals, not from any idea of their being injurious, like a savage dog which must be chained, but because their phenomena of growth are so closely akin to that of our own. We go through a course of athletic exercises to strengthen our muscles, and the bones which support them. If our arm is subjected to repeated strains, as is that of a blacksmith, the living power which permeates the arm, responds to the mechanical force exercised upon it, and then builds up tissues to meet it. One who could not lift a certain weight before he began his exercises, soon finds himself able to raise twice the amount. It is precisely similar with plants.

There is ample evidence to prove that the protoplasm of plants so far resembles that of animals, that it responds to the influence of external mechanical forces, and strives to acquire and to sustain an equilibrium with them. The so-called "mechanical" or "supportive" tissues are the results of this effort. It need hardly be observed that plants cannot do this suddenly, like a man using his muscles to prevent himself from falling if he has lost his balance; but the result is no less effective though it be executed by the slow method of growth.

On the contrary, in submerged water-plants, this effort is not required, and consequently the supportive tissues fail to appear; for such plants are of much the same specific gravity as water itself, and therefore miss the external stimulus of any strain to which they can respond. Experiments were made by Herr R. Hegler, in which he found that the stem of a seedling Sunflower, which would have been broken by a weight of 160 grms. (say 5 oz.), bore a weight of 250 grms. (say 8 oz.) after having been subjected for two days to a strain of 150 grms. The weight was subsequently increased to 400 grms. (14 oz.) without injury. Other experiments corroborated these results. Similarly, the weight of the petioles of leaves growing on the underside of a bough of Horse-Chestnut weigh about double as much as those on the upper side, as they have to carry the blade to a greater distance to reach the light, and are subjected to a greater strain at the point of attachment.

If a plant has to expend a certain amount of energy in any one direction, so much energy is deducted from some other. Hence, if the stem and branches be supported, the plant finds itself relieved of the necessity of adding additional mechanical tissues, such as woody-fibre, bast, sclerenchyma, and collenchyma, requisite for overcoming gravity and other strains. It can, therefore, either spend more

energy on its branches, or else [in flowering. As an example of the first, it may be pointed out that it is customary to grow *Wistaria sinensis* in the United States as standards, having, of course, a strong upright stem, bearing a large "head" on the top. In this condition the plant has to support itself, and consequently has not sufficient energy at its disposal to make long branches as well. If, however, it be trained on a trellis, it is relieved from the necessity of adding wood to the trunk, sends out annual shoots 20 to 30 feet in length. This is why some climbing Palms, as the Rattan-cane, extend to a length of 300 feet, but are little thicker than the finger; whereas, the Gum-trees of Australia and the *Sequoia gigantea*, of a similar height, but being self-supported, have enormous trunks.

Applying this principle to garden plants, as Sweet Williams, &c., Nature says, tie up the stems as soon as possible. They grow more vigorously, and end with several large trusses of flowers. Neglect to do so, and the main stem lies on the ground. It makes a great effort to lift up the terminal shoot in opposition to gravity, and a much poorer result follows in the flowering process.

I take it, therefore, to be a wise thing to relieve plants from making superfluous efforts whenever possible. It involves a waste of energy in merely a mechanical strengthening of the stem to resist strains, which would be otherwise better disposed in an additional flowering. *George Henslow.*

NEW OR NOTEWORTHY PLANTS.

OLEARIA NUMMULARIFOLIA.*

MR. R. LINDSAY, Murrayfield, Midlothian, obligingly sends us flowering specimens of this New Zealand shrub, which is quite hardy in this country, growing to a height of a foot, with minute leathery, spoon-shaped leaves, recurved at the margins. The upper surface is green, the lower covered with cream-coloured felt down. The flower-heads are solitary, near the ends of the branches, about half an inch long, linear-oblong, with imbricating oblong, leafy bracts, increasing in size from below upwards. The ray-florets are scanty, white, or yellowish. We append in the footnote a fuller technical description.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUMS. LIST OF.

MR. R. H. MEASURES, with the assistance of Messrs. Sander & Co., has published a complete list of the species and varieties in the collection at the Woodlands, Streatham. The arrangement is alphabetical; in the first column is the name of the plant with its synonyms, if any; then an indication of the name of the authority for the name; the native country; the name of the discoverer or raiser, and the introducer. All this information is compressed into so small a space that the book will easily slip into the waistcoat pocket. We are heartily glad to get such a list,

* *Olearia nummularifolia*, Hook. f.; *Eurybia*, *Fl. N. Z.*, i., 118.—A rigid, erect shrub, 1 to 10 feet high, more or less viscid. Branches stout, erect, often glutinous. Leaves close-set, erect, spreading or reflexed, $\frac{1}{2}$ to $\frac{3}{4}$ inch long, orbicular oblong or obovate, obtuse, quite entire; margins recurved, very hard and coriaceous, reticulate and shining above, below white or yellow, covered with appressed down. Heads solitary, on peduncles longer or shorter than the leaves, $\frac{1}{4}$ to $\frac{1}{2}$ in. long, $\frac{1}{2}$ broad; involucre turbinate, scales appressed, imbricate, broad, obtuse, nearly glabrous or the outer pubescent; florets eight to ten, rays rather broad; pappus white, unequal. Achene pubescent. Alps of the Northern and Middle Islands, alt. 4000 feet. *Handbook of the New Zealand Flora*, by J. D. Hooker (1867), p. 127.

so much so that we deprecate the idea of being either captious or greedy when we express a wish that the next edition be made too large for the waistcoat, but not too large for the coat pocket. Such a book would be more convenient also on the book-shelf, and it would allow of the addition of a few more details. For instance, we feel sure that many of the present generation of gardeners would not know the significance of the abbreviation "Ait.;" but if the reference were given to Aiton, *Hort. Kew.*, ed. i., iii., 303, the meaning would be clearer. Incidentally, it may be pointed out that *acaule* (not "Acaule") is suppressed in the *Index Kewensis* in favour of *C. humile* of Salisbury; and that "North America" is too general, as neither *acaule* nor *humile* is mentioned in the flora of California, and, so far as we know, neither occurs in Florida, Texas, or Mexico. It is also desirable to know the date of introduction; while reference to an authentic figure would be a great boon. All these particulars could be got into a book a very little if any larger than the present one, and would, at the time of compilation, necessitate the expenditure of but little more time or trouble. No attempt is made in this list, which is purely utilitarian, to classify the species and varieties, or to break up the old genus *Cypripedium* into *Paphiopedium*; and even *Selenipedium* is not recognised. There is thus no indication that *C. Reezli*, to which in this list five synonyms are allotted, is a *Selenipedium*. We cannot help feeling that this sort of comment may be thought ungracious, but we do not mean it to be so. We are merely so appreciative that, like Oliver Twist, we venture to ask for more. In this case, at any rate, it is about the highest compliment we could pay.

LINDENIA.—The number of *Lindenia* (April, May, 1899), just issued, contains illustrations of the following plants:—

ZYGOPETALUM BATEMANNIA MASTERSIANA X, *Lucien Linden*, t. DCLVII.—This is a remarkable hybrid obtained between *Zygopetalum crinitum* and *Batemannia Colleyi*, by M. Linden. It was shown early in the year at the Royal Horticultural Society, and a figure was given in the *Gardeners' Chronicle*, 1899, vol. i., pp. 77 and 99.

LELIO-CATTLEYA GUITTOIANA X, t. DCLVIII.—A natural hybrid supposed to have originated between *Lelia grandis* tenebrosa and *Cattleya labiata* Warneri. The segments are deep rose-lilac, and the undulate lip rich purple. It flowers in October.

CYPRIPEDIUM VILLOSUM, t. DCLIX.—DCLX.—A double plate containing representations of eleven varieties, showing considerable variation in the colouring of the segments and lip, and which will come as a surprise to orchidists.

CATTLEYA TRIANELI VAR. *LUCIDA*, t. DCLXI.—A very elegant form with broad, spreading flowers, light lilac segments, and the front lobe of the lip with a central blotch of purple between a whitish edge on the outside, and a large yellow blotch on the throat.

ODONTOGLOSSUM CRISPUM VAR. *FENAMULUM*, L. Lind., t. DCLXII.—Flowers stellate flat, segments broad, acute undulate, white, with chocolate-purple blotch.

CATTLEYA SCHILLERIANA, *Rehb. f.*, VAR. *SUPERBA*, *Hort.*, t. DCLXIII.—Anterior lobe of lip rounded with a central rosy-purple blotch, surrounded by a narrow white border, throat with a large yellow blotch.

COMPARETTIA MACROPLECTRON, t. DCLXIV.—Flowers in loose racemes, segments white, thickly sprinkled with violet dots, lip rounded, two lobed, with a long slender spur. The flower is $2\frac{1}{2}$ in. long by $1\frac{1}{2}$ in. wide.

THE SEED TRADE.

PROSPECTS OF THE SEED CROPS.—It is at this season of the year that some reliable forecast can be made of the character of the harvest of agricultural and garden seeds. So far the weather has been favourable to the production of good samples, and though the effect of the drought in some cases will help to produce a moderate yield, yet the samples will be generally well ripened and satisfactory in appearance.

Turnips.—The Turnip crop is now being harvested, and a short yield will result. Owing to the dry weather of last summer many seed plants were killed, consequently smaller breadths than usual were put out, hence a restricted crop. Of Swede Turnips there were also short breadths

planted for seed, much smaller than in the case of the white-fleshed Turnips, excepting perhaps in Lincolnshire, the same cause as in the case of the white-fleshed Turnips operated to restrict quantities of plants put out for seed. While there will be less than the usual average quantity of seed harvested of all Turnips, the quality of the seed will be good.

Mangel Wurzel.—Breadths of Mangel Wurzel look very promising, the plants are healthy, and a full average crop of seed may be looked for, but as in the case of the Turnips, much smaller breadths than usual were put out.

Peas.—In reference to Peas, the prospects of the various crops are good, and unless the later varieties should suffer from drought or too much moisture, the yield will be an average one, and the samples good. On some light lands shorter crops are probable.

Broad Beans.—The crops of these in Essex and Lincolnshire are looking exceedingly well; indeed, both north and south this appears to be the case. There is an absence of the Bean-weevil, and the black smother-fly is not so troublesome as is sometimes the case. Good bright samples should rule.

French Beans.—Both the climbing and dwarf types are looking well, and promising a good yield. Much will depend upon the character of the weather during August.

Carrot.—It is greatly to be feared that the home-grown seed crop of this popular vegetable will be practically *nil*. Much smaller breadths than usual were put out for seed, and but very few, and those only small, plantations can be seen in the seed-growing districts.

Onion.—Bedfordshire is the county from which the main supplies of Onion seed are drawn. So far the prospect is encouraging; but a great deal may happen between now and the time of harvest.

Parsnip.—Parsnips are doing well; and it may fairly be said of the present appearance of the crop that it is decidedly favourable.

Cabbage.—This crop at one time promised to be very good, but blight settled upon the plants, and the yield must be small. A great many plants intended for seed were, owing to the drought, not planted out at all; and so there are much smaller breadths than usual from which to secure seed. Brussels Sprouts and Savoy Cabbages will be a short crop from the same reason. Of Broccoli, good quantities were put out in Essex, but they became much blighted, though they improved somewhat under the rains which fell some weeks ago. The crop does not appear to have suffered so much as that of the common white Cabbage.

Radish.—This crop is doing pretty well, though the plants are not so strong as usual.

Beet is looking only indifferently well, as the seed plants are weak. An average crop can scarcely be expected.

Spinach.—This is a Kent crop, and is largely grown for seed in the neighbourhood of Margate. So far there is a promise of a moderate yield.

Potatoes look well generally. Early crops are in some cases ready for lifting; the main and late crops are well furnished with haulm, and an average yield is looked for. *Pisum*.

CORTADERIA JUBATA.

I CONSIDER this most graceful and free-blooming grass to be by far the most beautiful of all the handsome group known to me. The plant here illustrated (fig. 42), though by no means a large one, produced forty-six spikes of bloom, averaging 10 ft. in height. It was introduced into European gardens from Chimborazo by the well-known firm of French nurserymen, Messrs. Lemoine, of Nancy, to whom seed of it was sent by the celebrated botanical collector, Benedict Reel. I had it soon after it was sent out, and have bloomed it every year since, though it is unfortunately the least hardy of its family, and is killed, or only saved with great difficulty, when anything more than 15° of frost is experienced. *W. E. Gumbleton*.

THE BULB GARDEN.

TULIPA MACROSPEILA.

THE season for purchasing bulbs being now at hand, I would like to call attention to this grand Tulip, which seems to have fallen into neglect of late years. With the exception of *T. Greigi*, I consider this to be the best of all species of Tulipa; the massive crimson flowers, deliciously fragrant at evening, render this plant most desirable for permanent bedding. A bed of this at Isleworth, associated with Bamboos and Lobelias of the

segments each measure $\frac{1}{2}$ inch in width, 7 inches in length, five of which are ascending, recurved, and interlaced, forming a singular mass; the lower segment is quite straight, half enclosing the filaments, which are in three ranks of two each, the longest filaments reaching to the tip of the segment; the style being equally long. The general aspect of the flower is that of *Griffinia*. The flowers are singularly beautiful, and emit a faint perfume in the evening. They collapse on the second day after opening. This plant has not matured seeds. *H. Worsleyi* differs from *H. Gardneriana* in having a two-flowered umbel, a much longer flower, and much wider segments. *Hyline* may be distin-

FIG. 42.—CORTADERIA JUBATA.

Ornamental Grass from the Garden of W. E. Gumbleton, Esq.

cardinalis group, made a fine display last season. By reason of its late flowering, it would not be suitable for planting in beds destined to receive summer bedding plants; it is, however, just the thing to plant with the hardy subjects now largely used for bedding purposes. The bulbs will increase tenfold if left undisturbed for two or three years.

HYLINE WORSLEYI.

This new species has recently flowered here, bulbs having been imported from Brazil in a case of miscellaneous *Pancratiums*. The leaves are distichous, 1½ ft. in length and 2 inches in width, glabrous green in colour, with an acute apex. The scape is 15 inches high, bearing an umbel of two white flowers, each 8 inches long. The perianth

guished from *Hymenocallis* (which they much resemble out of flower), by a peculiar crackling sound given out by the leaves when handled. They require the same treatment as that afforded to *Hymenocallis*. *Geo. B. Mallett*.

METROPOLITAN OPEN SPACES.—A movement has been started to purchase part of the old Hampstead Green, on Haverstock Hill. One part of the Green is already public property. The centre portion (nearly an acre in extent), containing some fine trees, has been privately purchased for some £7500, and we believe the movement referred to will be successful at a not distant date.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS.]

The words "average," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

* * Fuller comments will be given in the following numbers. See also Leading Article on page 110.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	AUG. 7	Bishop's Stortford Horticultural Society's Show. Northamptonshire Horticultural Show at Northampton (2 days). Workshop Floral and Horticultural Society's Exhibition. Atherstone Horticultural Society's Exhibition.
TUESDAY,	AUG. 8	Flower Show and Gala at Abbey Park, Leicester (2 days). Horticultural Show at Weston-super-Mare.
WEDNESDAY,	AUG. 9	York Florist's Exhibition of Carnations, &c.
THURSDAY,	AUG. 10	Royal Botanic Society (Anniversary Meeting). Taunton Deane Horticultural Society's Show.
SATURDAY,	AUG. 12	Coniston Horticultural Society's Show.
SALE.		
FRIDAY,	AUG. 11	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period July 23 to July 29, 1899. Height above sea-level 24 feet.

Remarks.—The weather has again been hot and dry, with strong winds from the north and west.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—62.9°.

ACTUAL TEMPERATURES:—

LONDON.—August 2: Max. 82°; Min. 34°.

PROVINCES.—August 2 (6 P.M.): Max. 78°, W. Ireland; Min. 54°, Shetland.

Fine, warm; some rain.

UPWARDS of three hundred and fifty of our correspondents, dispersed from John of Groat's to Jersey, have favoured us this week with the result of their observations as to the condition and prospects of the fruit crops in their several districts. On the part of our readers we tender them our hearty thanks, for although the labour and expense of condensing and tabulating the details are very considerable, we hope they are not out of proportion to their value. The reports are singularly uniform in their general character, betokening that the climatal conditions must have been similarly equal. Diversities of locality, soil, aspect, elevation,

which must necessarily be considerable, do not seem to have affected the general result. We can only lay the responsibility on the weather for the generally unsatisfactory nature of the crops.

Perhaps, someday, some diligent meteorologist, with more leisure than falls to the lot of a journalist, will endeavour to co-relate the records we have given for a very long series of years with the climatal data for the same period. There is an enormous mass of material now at the disposal of the statistician and meteorologist, and, as year after year we laboriously pile up these details, we can but long for the time when some enthusiast will analyse them, and endeavour to secure results of permanent importance.

Enough for us is the labour of the day. Enough for us to have to chronicle one of the worst fruit crops on record; enough for us, at least as consumers, to remember that we are not dependent on our own resources, and that our fellow-subjects in the colonies can largely piece out deficiencies—a task in which foreign countries will also be glad to participate. As to our home fruit-growers, they may seek consolation for deficient crops in enhanced prices. Strawberries have been retailed at very high prices; and Apples, and especially Plums, will probably command high rates.

The annexed table shows the total number of records for each of the crops mentioned in the several divisions of the kingdom, and the amount as expressed in the terms "average," "over," and "under." These, no doubt, are vague terms, but considering the number of the reports, and the experience of the reporters, most of whom have favoured us in this way for many years, they are surely accurate enough for practical purposes.

The failure in Apples is extraordinary. Pears are worse still, but these have not the same commercial significance as either Apples or Plums. No fewer than one hundred and ninety-nine correspondents in England (out of two hundred and thirty-eight) note the Plum crop as below average, and only two record it as over. Cherries are a little better. Small fruits, including Currants, Gooseberries, and Raspberries, better still, with the respectable average of one hundred and forty-four out of two hundred and forty-six for England. Strawberries show for England a total of averages of one hundred and eight out of two hundred and forty-six, which cannot be considered satisfactory, the less so as no fewer than one hundred and one are recorded as under. Nuts are less than half a crop.

We may leave the table to tell its dismal tale. At the approaching fruit shows at Shrewsbury and at the Crystal Palace, there will, we suspect, be few traces of this deficiency, and the quality will, doubtless, as usual, and in spite of these drawbacks, excite our patriotic complacency.

The History of our Wild Plants.

At this time field botanists are indulging in their holidays, and keenly enjoying the display of floral beauty and interest that the season brings. The botanist has the advantage over the average gardener that his pursuit is less limited in its range. It is not only the beauty of the flower, or the excellence and market value of the product that attracts his attention, but it is also the life-history and the endless problems and subjects for research and investigation which plants offer to the student. Of course, these subjects are as fully, or even more fully,

at the disposal of the gardener as of the botanist and some there are who are happy enough to be able to combine the sensuous love of beauty with the intellectual appreciation of comparative structure and of methods of action, but for most others the daily routine is all-engrossing.

Those who are happy enough to be able to go "herborising" at this season, must surely ask themselves the question as they traverse the fields and woods, lounge along the river's bank, or climb the mountain-side—Where do all these little beauties come from? How is it they are here? Why are they not to be found there? What is the meaning and purpose of this conformation? What the significance of that variation? The questions that may be put are endless; and if direct replies are not immediately forthcoming, the labour involved in seeking them is not lost, but rather affords a healthy stimulus to enquire further, with the certainty that much will be gained in the search, even though the direct response is not readily forthcoming. Mr. CLEMENT REID, of the Geological Survey, is one of those who is not dismayed by the problems connected with the *Origin of the British Flora* (DULAU & Co.). He has long been known as a diligent worker, and a frequent contributor to societies and journals, so that it is highly convenient to have in small compass a summary record of facts, and an exposition of views and opinions derived from the author's long practice in the field.

Mr. REID looks at the question from a geologist's point of view. He shows how, within a geologically speaking, short period—a period which, reckoned in years, is vaster than can be readily conceived, this Britain of ours—this so-called *terra firma*—has been subjected to numerous climatal and physical changes; now to sub-tropical, now to arctic conditions; now to upheaval, now to submergence. Some of these changes have favoured the spread of plants, others must have effected their destruction. Thus, we have not one flora, but a series of different floras to be considered. So comparatively recently as what geologists call the Middle Tertiary epoch, sub-tropical plants grew in Hampshire, and constituted a flora wholly unlike the existing one. The more recent Miocene period affords no evidence that is available, for in this country we have no fossiliferous deposits of that age. More recent still is the Pleiocene period, in which the glacial era first began. Only in the latest deposits belonging to the Pleiocene period can we find, says Mr. REID, a copious land fauna and flora; and so far as the plants now inhabiting Britain are concerned, history begins with the Cromer forest-bed—all before is pre-historic and speculative. At that time, probably the Straits of Dover did not exist, and Britain formed an integral portion of the continent of Europe. At that time also, to judge from the fossil remains, the climate was much the same as it is now; the cold of the glacial epoch had not then swept off the numerous large mammals, nor transformed the character of the vegetation. After that came a succession of intensely cold periods, alternating with milder intervals, sufficiently long in duration for the temperate plants to re-appear.

Mr. REID sketches succinctly the general course of events as they appear to him to have occurred, but he is candid enough to point out that his opinions are not fully shared by other geologists—a fact that in the circumstances is not surprising. These differences in points of detail must be settled by the geologist; they do not affect general principles. The changes in

the limits of sea and land have been numerous, but relatively small in amount. The climatic changes, on the other hand, were most thorough and sweeping; inevitably they must have been accompanied by corresponding changes in the flora.

To get at the history of our native plants, we must study such records as are available. These are scanty and discontinuous, and consist of impressions of leaves and seed-vessels or seeds. These occur scattered in various deposits, which Mr. REID classifies according to their supposed age, as pre-glacial, early glacial, interglacial, late glacial, and Neolithic. A full list is given of all the localities wherein plant remains have been found; and then follows a descriptive list of all the species that have been identified, and a sketch of their distribution. That so many species should have been identified is surprising, as our herbaria are often defective in the very elements which are most common in a fossil state. Mr. REID must have spent much labour and pains in comparing the fossil seed-vessels and seeds with their living representatives. The species, of course, at this late geological period, are mostly the same as those which now inhabit our isles; but *Acer monspessulanum*, which once existed here, is now quite extinct, and Mr. REID asks if seedlings come up spontaneously in such numbers in this country as to be likely to re-establish the species as a native? We cannot answer the question, but we should be glad if some reader could do so. We are enabled to say that *Acer insigne*, from the Caucasus, seeds freely and produces a profusion of seedlings—but this is hardly to the point.

Trapa natans occurs at Cromer, but is not now found living in this country, though it occurs wild in South Sweden. *Pinus sylvestris* was abundant throughout Britain in the Neolithic period, and while still wild in Scotland, shows signs of re-establishing itself in the South of England. We mention these few points in order to induce collecting botanists to be more particular than they are in collecting seed-vessels and seeds of our native plants, which, as we have said, form most interesting points of comparison with the records of the rocks.

We leave Mr. REID's book with a great respect for his laborious perseverance, and admiration of his sagacity, but at the same time with the conviction that the subject is hardly more than broached, and that there is great need of helpers. Few indeed can hope to do much personal investigation of the various fossil deposits, but all can help in observing and collecting recent forms for comparison with those accumulated by the geologists, and placed in our museums.

TROPICAL FERNERY AT KEW (Supplementary Illustration).—The collection of Ferns cultivated at Kew is by far the most comprehensive ever got together. It forms one of the three principal features of the indoor gardening in that establishment, the other two being Palms and Orchids. But whilst the Palms are rivalled by the collection at Herreuhausen, and the Orchids by that at Glasnevin, the Kew Ferns stand unrivalled. The history of its formation was published in the *Kew Bulletin* in 1895; it also forms the preface of the *Hand List of Ferns and Fern Allies* cultivated in the Royal Gardens (1895). It is there stated that "the collection owes its completeness very largely to the zeal and assiduity with which the veteran pteridologist, Mr. JOHN SMITH, Curator of the Royal Gardens from 1841 to 1863, watched over it for more than forty years." Fifty years ago the

number cultivated was 378. It now comprises about 1200 species and varieties, exclusive of British Ferns, of which over 500 are in cultivation. In addition to these, the Fern allies (*Selaginella*, &c.), number nearly 100. With few exceptions, the whole of the tropical Ferns are grown in the large house here figured. It is 130 feet long, 34 feet broad, and 15 feet high, with a wing on the south side 40 feet by 33 feet, and 19 feet high. The collections of *Adiantums*, *Davallias*, *Acrostichums*, *Polypodiums*, *Gymnogrammas*, *Aspleniums*, and *Selaginellas* are remarkable for their comprehensiveness, and also for the large size of some of the specimens. The collection of Filmy Ferns, most of which are accommodated in an adjoining house, is also remarkable for its extent, and the general good-health of the plants. Tree Ferns, *Angiopteris*, and *Marattias* also find a congenial home in this house. Botanists will find in it good examples of such text-book favourites as *Lycopodiums*, *Psilotums*, *Fadyenia*, *Helminthostachys*, *Ophioglossum*, *Thyrsopteris*, and *Danae*. The fine collection of *Platyceriums* recently figured in these pages also deserves mention in this connection. Within the last ten years the whole house has undergone reconstruction, and untinted glass has been substituted for the green glass previously used to glaze the Fern-houses at Kew, and a considerable improvement in the health of the plants generally has been remarked.

CONFERENCE ON HYBRIDISATION, CHISWICK, JULY 11.—List of Awards made by the Council of the Royal Horticultural Society on the report of a Committee of Experts:—

Gold Flora Medal.—To Messrs. Jas. Veitch, of Chelsea.

Gold Medal.—To M. Duval, of Versailles; M. Maron, of Brunoy; Sir Trevor Lawrence, Bart., Burford Lodge; Leopold de Rothschild, Esq., Gunnersbury House; Messrs. H. B. May, of Edmonton.

Silver-gilt Flora Medal.—To M. Morel, of Lyons; Messrs. Jackman, of Woking.

Silver-gilt Banksian Medal.—To C. T. Drnery, Esq., V.M.H., Acton.

Silver Banksian Medal.—To Professor Macfarlane, of Philadelphia; Herr Van Tubergen, of Haarlem; Dr. Wilson, of St. Andrews; Sir Frederick Wigan, Bart., East Sheen; De Barri Crawshaw, Esq., of Sevenoaks; Messrs. Wallace, of Colchester; Messrs. Paul & Son, of Cheshunt.

Veitch Memorial Medal.—To M. Duval, of Versailles (Class No. 6).

Williams' Memorial Medal.—To Leopold de Rothschild (Class No. 9).

OTHER AWARDS.

First-class Certificate.—To *Kalanchoe flammea*, Royal Gardens, Kew.

Silver-gilt Flora Medal.—To a group of *Kalanchoe flammea*.

BOSTON HORTICULTURAL SHOW, we are informed, will be held on the 24th inst. This is in addition to the fixtures for August, given in our last number.

AN AMERICAN BEDDING PLANT.—A recent *Bulletin* of the State of Indiana deals with the possibilities of making some of the native plants useful for bedding purposes. Mr. J. C. ARTHUR takes up the cudgels for a "white bedding plant," *Cerastium arvense oblongifolium*, or Starry Grass-wort, which has several advantages: it forms a close mat of foliage; is not deciduous; the blossoms may also be used as "cut-flowers." The plant in question has been under observation for several years, and has been found to vary sufficiently to make it a fit subject for selection, with a view to its improvement from a horticultural point of view.

FORESTRY IN INDIA.—Wednesday, July 12 last, was prize day at the Royal Indian Engineering College, Cooper's Hill, when Sir DONALD STEWART presided, awarded the prizes, and addressed the students. The work done in the forestry, as in the other departments, would appear to be of an excellent and progressive character; as to that already done, Sir DONALD said it was wonderful what had been done in thirty odd years—barren places were now covered with fine trees. Briefly, the contrast between "then and now" was notable. Sir DONALD desired for the natives employed in the work the same treatment as would be given to workers in the same field at home; it paid to treat the natives as men like themselves. The operation

of "good-will towards men" was commended to the young foresters about to leave for India, and to those desirous of working in that field.

THE SEIZURES OF FRUIT.—At Southwark Police-court, Monday, the hearing was begun of a number of summonses against LIPTON (Limited) and seven other firms, in connection with the recent seizures of fruit by Mr. H. THOMAS, sanitary inspector to the Bermondsey Vestry. The only case gone into was that of Mr. E. MORGAN, trading as WIX & Co., jam manufacturers, of Bermondsey, who was charged with having in his possession twenty-one tubs of bad Strawberries. Mr. THOMAS gave evidence to the effect that the Fruit was rotten and unwholesome. For the defence it was contended that the Strawberries, though crushed, were quite sound and suitable for jam, and several witnesses gave evidence to this effect. Eventually the defendant was committed for trial at the London County Sessions, and it was arranged that the other cases should be dealt with next week.

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—About fifty members of this body of gardeners recently paid a visit to Gunnersbury and Kew, leaving Reading at 8 A.M. The Water-lilies and fruit-houses at Gunnersbury House afforded the visitors matters of great interest, and the floral decorations in the front of Gunnersbury Park were much admired, as were the large, well filled vineries and Peach-houses. Leaving Gunnersbury, the party broke up into groups and proceeded to Kew Gardens, where some hours were spent in inspecting the glass-houses and gardens. The arrangements for the outing were carried out by Mr. WOOLFORD, the Chairman of the Association, and Hon. Secretary *pro tem*.

THE OPEN SPACES OF LONDON.—In his annual address to the members of the London County Council, on the 25th ult., the Chairman (Lord WELBY) made allusion to the work of the Council in approving terms. Since 1889 to 1890, he said, the number of open spaces under the Council's care had increased 100 per cent., and the acreage by 40 per cent.; nearly 70 acres were added during the preceding twelve months. He endeavoured during that term to draw attention to the more important of these additions.

A MEMORIAL TO DR. TRIMEN.—A correspondent writing to the *Ceylon Observer* mentions that the brass tablet in memory of Dr. TRIMEN, and formerly placed in the Thwaites' Memorial summer-arbour, has been removed to the verandah of the Garden Museum. This is a more appropriate position, as Dr. TRIMEN was instrumental in forming and developing this Museum. Further, the Planters' Association, by whom the above-mentioned tablet was contributed, propose to erect a further memorial in the form of an arbour in Peradeniya Gardens "as a recognition of his services to the planting community." There are already arbours made in memory of Drs. THWAITES and GARDNER, and these shelters are very generally appreciated. The correspondent from whose letter we quote suggests, as an alternative, the erection of a fountain dedicated to Dr. TRIMEN's memory, there being at present no such ornamental water in Peradeniya Gardens. The memorial tablet could be permanently fixed on the stone work of the fountain.

MIMICRY.—PROF. TOKUTARO ITO, who, it will be remembered studied at Cambridge, calls attention in the *Botanisches Central Blatt*, No. 28, 1899, to the close resemblance between *Bischofia javanica*, Blume, an Euphorbiaceous plant, and *Turpinia pomifera*, D.C., a Sapindaceous plant. The resemblances, are of course, superficial, but sufficient to deceive even an experienced botanist when the leaves only are seen. "How may the above resemblances, then, be accounted for? Sir JOHN LUBBOCK, in *Flowers, Leaves and Fruits*, p. 128, believes that the cases of mimicry, which are so commonly met with in animals, might exist

as well in plants. He made an interesting reference to what he calls a case of true mimicry, or, as it is called, homoplasy, to the close general resemblances between the common Stinging-nettle (*Urtica dioica*, L.), and the white Dead-nettle (*Lamium album*, L.), by explaining that the latter is preserved from injury by being mistaken for grazing animals for the former. Sir JOHN may, says Prof. Iro, be pleased to hear that in the far East, viz., in Satsuma, in Southern Japan, *Urtica dioica* is called Ira, or Wo-Ira (Ira means Stinging Plant, and Wo a male, in reference to its stinging habits), whilst *Lamium album* is called Me-Ira, or Female Stinging Plant, alluding to its more tender habits as well as to its flowers. But in the case of the resemblances between *Bischofia javanica*, BL., and *Turpinia pomifera*, D.C., is it possible that the one plant may derive some benefit by imitating the other? A suggestion might be made with reference to the fact that, as *Bischofia javanica* belongs to Euphorbiaceæ, which is remarkable for the innumerable examples of poisonous plants it contains, that *Turpinia pomifera* would derive some benefit by adopting its habits. But the fact must be proved."

WART ON PINE-TRUNKS.—A huge outgrowth is not unfrequently met with on the trunks of Pines. Prof. M. SUGRAI, at a meeting of the Tokyo Botanical Society, attributes this to the work of a fungus, *Peridermium giganteum*.

BIG SQUASHES.—The *Canadian Horticulturist* for July, 1899, gives a figure of three large Pumpkins, which weighed 388½ lb., 353½ lb., and 344 lb. respectively. The principal details of cultivation seem to be high manuring, abundance of water, and disbudding. Artificial fertilisation is practised.

A COLOUR DICTIONARY.—This publication is prepared by Mr. B. W. WARHURST, and issued by STANLEY GIBBONS, Ltd., 391, Strand, W.C., principally for the use of stamp-collectors. There is in it an account of colour, and an attempt to define and tabulate different tints and shades. The want of some fixed system of colour-terms is felt by botanists, florists, and many other workers, as well as by philatelists; and if the code before us, or some other could be universally adopted, much trouble would be saved by reference to it.

CACTUS HEDGES FOR PINE-FORESTS.—The Pine-forests in the Departments of the Landes and La Gironde having last year suffered much from fires, kindled by accident or mischievous design, M. ROLAND-GOSSELIN proposes, according to the *Revue Horticole*, to surround such tracts with hedges of Cactus (*Opuntia*). He remarks that in Algeria a hedge of *Opuntia Ficus indica* or of some other species of considerable size, and largely cultivated by the Arabs for the sake of the edible fruits, proves a complete barrier to the brushwood fires, which are arrested on contact with the Cacti. M. ROLAND-GOSSELIN has himself seen on the road from Nice to Villefranca the brushwood fires completely checked by the clumps of *Opuntia*. The *Opuntias* do not burn; even the young tips are not destroyed by fire. A week later new shoots are put forth, the flower-buds open, and the mischief is repaired, while everything else around is burnt, leaving no trace of vegetation. If *Opuntias* could be acclimatised in sufficient luxuriance, they would, therefore, make an efficient guard against fire in plantations surrounded by them.

FLORA OF JAPAN.—As a precursor to a more elaborate publication, which it is estimated will take "tens of years" to complete, Prof. MAKINO, of the Botanical Institute, in the University of Tokyo, has commenced the issue of a series of plates representing Japanese plants. The title of the work in Latin is "*Phanocrogama et Pterilophyte japonica iconibus illustrata*." The text is in Japanese; but the figures, which are very good,

appeal to botanists of all nationalities. In the number before us are figures of *Rhododendron pentaphyllum*, and of various species of *Poly-podium*. The *Cryptogams* are illustrated in another similar publication issued by Mr. J. MATSUMURA. Botanists should address their communications to the Botanical Institute, Tokyo; whilst letters on commercial business should be addressed to KEIGYÔSHA & Co., 1, Urazimbôchô, Kanda, Tokyo.

PARAGUAY PALMS.—The Director of the Botanic Garden at Rio de Janeiro has published an account of sundry Palms not previously described in Paraguay, accompanied by lithographic illustrations of *Trithrinax bifidellata*, *Cocos paraguayensis*, *C. sapida*, various species of *Diplothemium*, *Bactris Anizitzi*, and *Scheelia tetrasperma*.

PUBLICATIONS RECEIVED.—Publications of the University of Pennsylvania, *Contributions from the Botanical Laboratory*, vol. ii., No. 1. This includes:—Observations on *Conopholis americana*, by Lucy L. W. Wilson; Recent Observations on *Amphicarpaea monolepis*, by A. F. Schively; Water Storage and Conduction in *Senecio praecox*, from Mexico, by J. W. Harshberger; Internal Phloem in *Gelsemium semper-virens*, by C. B. Thompson; Roots of some Rosaceous genera, by M. Bunting, &c.—*Boletim do Museu Paraense*, May and October, 1897, and June, 1898.—*Morphologische Studien*, Von Prof. Dr. K. Schumann, heft ii.—*Bullettino della Società Botanica Italiana*, for February and March, and for April.—*Nuovo Giornale Botanico Italiano*, April.—*Svenska Fruktarter* under redaction of Axel Pihl and Jakob Eriksson (Stockholm).—*Bulletin of the Botanical Department, Jamaica*, June. This contains articles on Methods of Preparing Rubber, R. H. Biffen; Ginseng, Cinchona, Bark, and Quinine, by C. M. & C. Woodhouse; and Importation of Colonial Produce, by E. M. Holmes.—From the Michigan Agricultural College, *Bulletins* 169, 170, and 171. The former contains Fruit Reports, and Notes from the South Haven Sub-Station; the other *Bulletins* chronicle Vegetable Tests for 1898, and Bush Fruits for 1898.—*Agricultural Gazette of New South Wales*, June. This contains the following among many papers: Weeds of New South Wales (first of a series), by J. H. Maiden; a variety of *Panicum compositum*, by the same writer; the Sultana Grape, by W. J. Allen; and Red Gum Forests of New South Wales.

SOPHRO-CATTLEYA "QUEEN EMPRESS."

(SEE FIG. 43, P. 113.)

This is a charming bigeneric hybrid Orchid that was shown by Messrs. Jas. Veitch & Sons at the last meeting of the Royal Horticultural Society, when the Orchid Committee recommended the Award of a First-class Certificate. The flowers much resemble *Cattleya Mossiae* in form, but are smaller. The sepals and petals are bright rosy-crimson in colour, and the petals are veined with a dark reddish-crimson, and they are broad and well displayed. The lip is yellow at the base, with showy dotted purple lines, and the front lobe is reddish-rosy-purple, the margins of the side-lobes possessing the same hue as that of the front lobe, but with a yellow margin.

KEW NOTES.

BRAVOA KEWENSIS x.—This is a new hybrid raised at Kew from *B. geminiflora* and *B. Bulliana*. The former is a well known summer flowering bulbous plant from the highlands of Mexico, and has been in cultivation fifty years. It has the habit of the *Tuberosa*, its near relation, and slender, erect, elegant racemes of salmon-scarlet, tubular flowers; it is nearly hardy at Kew, where it is now nicely in flower. *B. Bulliana* was imported from Mexico, and flowered by Mr. Bull in 1884, when Mr. Baker named and described it in the *Gardeners' Chronicle*. It flowered in 1894 at Kew, when a figure of it was made for the *Botanical Magazine* (t. 7427), where it is called *Prochyanthus* by Mr. Baker, following the American botanist, S. Watson. It has oblanceolate leaves 1 foot long by 2 inches wide, and a tall, erect spike of brown and green flowers arranged in pairs, and remarkable in having an abrupt bend in the tube, the upper part of which is bell-shaped and nearly an inch across. The hybrid has leaves 2 feet long, 1 inch wide, bright green, tufted and deciduous as in the

Tuberosa. The flower-scape is 4 feet high, leafy and bears at the top about fifteen pairs of tubular flowers, 1 inch long, curved, dilated at the mouth and coloured dull brown-red outside, yellow inside. Whilst the characters of both parents are easily perceived—the hybrid, they are present in the proportions of two to one in favour of the female parent. The plant is not of any horticultural value, but hybridists may be interested in it as a "bigeneric" hybrid. It is self-fertile, and is ripening seeds.

CHILDSIA WERCKLEI, OR "TREASURE VINE."

Mr. J. L. Childs, of Floral Park, New York, has distributed this year a climbing Composite which he has named as above, and which promises to be a useful garden plant. There is little doubt that it is a species of *Hidalgia*, a small genus of climbers, closely related to *Dahlia*, and so far as herbarium specimens show, much larger in flower than any of the species known. At Kew it has grown freely in a greenhouse, and flowered when quite small. The flowers are like those of a single *Dahlia*, bright scarlet in colour, and nearly 3 inches across. The habit of the plant suggests *Vitis tricuspidata*, but the leaves are bipinnate, bright green with brownish margins, and 2 to 3 inches across. A good figure of the plant is given on the cover of Mr. Childs's *Catalogue of Rare Flowers*, &c., for 1899, where it is described as a new discovery made by Mr. Carlo Werckle in the mountains of Costa Rica, which grows in shady situations to a height of 10 feet, blooms profusely, and "is so hardy and vigorous that it will stand any amount of abuse." It is called *Treasure Vine* on account of its great value. A figure of it will shortly be published in the *Botanical Magazine*.

DENDROMECON RIGIDUM.

Two distinct forms of this variable Californian Poppy shrub are now in flower against south walls at Kew, one of which was figured in these pages a few weeks ago, and the other was noted by Mr. Gumbleton as a superior plant. This latter has stout, erect, willow-like shoots, bearing irregularly-lobed glaucous-green leaves, 3 inches long, and flowers 2 inches across. It was at first thought that this was a distinct species; it has also been suggested that it was a hybrid between *D. rigidum* and *Romneya Coulteri*! There are, however, in the Kew Herbarium authenticated specimens of *D. rigidum*, which not only include these two forms now in flower at Kew, but show other forms as well; and Brewer and Watson remark in the *Botany of California* that this species is very variable in leaf characters, and in the size of the flowers. The smaller form is by far the more floriferous at Kew.

PELARGONIUM COTYLEDONIS.

Several very fine living examples of this remarkable species have lately been presented to Kew by the Governor of St. Helena, where only it is found, and one of them is now in flower. It has thick, gouty, branched, horizontal, smooth, dark-brown stems, hairy, peltate-ovate, dark-green leaves, and white flowers, not unlike those of *P. zonale* in size and form. There is a figure of it, a poor one, in Melliss's *St. Helena*, where it is described as a very scarce plant (the Kew examples were obtained only by a man descending a precipice by means of a rope). It is known as "Old Father live for ever," from its power of retaining vitality for months without either soil or water. It clings to the barren, exposed, rocky cliffs overhanging the sea-coast on the windward side of the island, where there is least soil and moisture, throwing out its leaves and flowers in May or June after the rains, and shortly afterwards losing them, so that for most part of the year it looks like a knotted mass of old fir-roots. This is the first time I have seen this species alive.

HAYLOCKIA PUSILLA.

This pretty little *Crocus*-like plant has been flowering freely for the last month or more in a greenhouse at Kew, a quantity of bulbs of it

having been presented by Dr. Cantera, of Montevideo, where it is a native. The bulb is globose, less than an inch in diameter, with a narrow neck an inch long, from which the flowers are pushed in succession before the narrow linear leaves appear; they are similar to those of *Sternbergia*, having a slender basal tube $1\frac{1}{2}$ in. long, the upper portion divided into six sub-equal ovate spreading segments coloured sulphur-yellow, with a few pale purple lines at the base. There is also a variety with milk-white flowers. The genus is monotypic and allied to *Zephyranthes*. It is a pretty garden plant, which may prove hardy in a sheltered corner of the rockery. *W. W.*

and producing seeds, but have never before ripened them until this season. The seed pods are of the size and shape of a walnut, and are yellow when ripe. They each contain about nine seeds of the size of Indian Corn; the seed pods now bursting are from last year's flowers." They add that they have exceptional opportunities for observing the flowers of *Aspidistra*, as they grow from twenty to thirty thousand annually. The fact of this firm having obtained ripe seeds being brought to the notice of Sir W. Thiselton Dyer, the Director of Kew, an application was made to Messrs. Stansfield for a fruit to be forwarded to Kew so that a drawing might be made of it. Is this the first time the *Aspidistra* has been known to mature its seeds in this country? *R. E.*

query has some pertinence in view of its known effects on scale insects and aphides; and might it not be tried on Peaches and Strawberries under glass culture, both of which are subject to attacks of mildew. Perhaps some brother gardeners will kindly give their experiences. *The Old Geyser.*

— The answer to me in the *Gard. Chron.* is the result of a mistake somewhere. For fifty or more years I have used water cold and hot as an insecticide. As to the latter, the temperature of the water must ever be a main factor. I began with 130°, and advanced to about 140°. Your correspondent starts at 212°, and now you have got down to 150° as a safety-point. Surely such differences are not opposition to the water-cure. As to boiling-water for mildew or aught else on plants, it is with our present implements unpractical, as well as dangerous, to most plants. A correspondent in the *Gardeners' Chronicle* also did his best to render the boiling-water-cure ridiculous by asserting that it killed mildew, because it was so small; and did not hurt the Vines, because they were so large! My letter dealt with these points, and was not in opposition to the water-cure, which I have used for a lifetime. *D. T. Fish.*

MORISIA HYPOGÆA.—In your recent issue, p. 88, Mr. W. Earley gives May the month of this pretty alpine plant flowering. My experience of the plant is that it flowers early in February and through March; in fact, I have seen it flowering before the "Winter Aconite," pushing its brilliant yellow flowers through the snow. It has a very pleasing effect when planted in masses, more so, indeed, than when a few *Chionodoxa* bulbs are dotted here and there. It likes the north side of the rockery in sandy, leam soil. It is a plant easily increased by dividing the off-shoots, inserted in some sandy soil in 3-inch pots, and placed in a cool shady spot. I find end of September or beginning of October the best time to plant. *Thos. Harris, Lower Graywood Gardens, Haslemere.*

EFFECTS OF GAS-MANUFACTURE ON VEGETATION (see p. 99).—There are extensive gas-works here within 150 yards of my house, and except now and then, though very rarely, when retorts are drawn, objectionable smells are not discerned; neither does vegetation seem to suffer. On the other side, the Canbury Gardens and promenade is about the same distance off, and there is not the least evidence there of harm. I often look at some small gardens close to the gas-works, and lying literally between the railway company's gas-works and those of the gas company occupied by railway employes, and do not find the crops on them in any worse case than are those on remote groups of allotments. Practically, where the process of manufacture is up-to-date, the harm done by gas-manufacture is nil. *A. Dean, Kingston, Surrey.*

FLAVOUR IN MELONS.—In order to obtain good flavour in Melons, the growth must be rapid, and the fruits finished off in a brisk heat, and when this is duly carried out there will be little to complain of with regard to flavour. Four or five fruits to a plant are sufficient, and if these attain to a fair size, say from 3 to 4 lb. apiece, they are large enough for all ordinary purposes. I have for some years been very successful with these fruits, and have invariably found but little difference in flavour with fruits growing on one plant when the last to ripen have been ripened in a similar temperature to these first changing colour. My plan is to sever them from the plants when the first sign of approaching ripeness is noticed, leaving the fruits to hang in the supports for a day or two, and the thin-rind varieties are then wrapped in tissue-paper, and placed in a rather warm, dry room, where the good flavour will be kept intact for a few days. To ventilate very freely as soon as the first fruits begin to colour is, so far as my experience goes, a mistaken practice; instead of improving the flavour, it frequently spoils it. A little air at the top and bottom, with some slight warmth on the pipes, is all very well, and serves to bring up the flavour. Varieties may differ, but the best, if not ripened quickly, will not, as a rule, possess fine flavour. *H. Markham.*

— Judges of fruit at shows will not dispute the fact that there is a great lack of flavour in all—or, at least, most—of the Melons staged nowadays; but why it is so is a question not easily answered by those unacquainted with the conditions under which the fruit was grown. I am inclined to think that this want of

FIG. 43.—*SOPHRO-CATTLEYA* "QUEEN EMPRESS" (SEE P. 112).

HOME CORRESPONDENCE.

PEA CHAMPION OF ENGLAND.—A few days since at Weybridge I had to determine most unusual competitions in rows of Runner Beans, and the same of Peas, on a large group of allotments. The rows of Runner Beans were very fine, well staked, and ranged to about 7 feet in height. The chief defect was found in rather too thick sowing. That defect was more marked in the Peas; for of the various rows brought into competition, some had double the quantity of seed sown than was desirable—some had three times too much. But the surprise of the examination was the finding the best row (one that just then not a gardener in the kingdom but would have been glad to possess) to be of that very old, and still one of the most delicious of Peas, Champion of England. The pods are not large, but the peas are soft, sweet, and of the best flavour. It is a variety that interbreeders might well employ to furnish quality. *A.*

FRUIT OF ASPIDISTRA LURIDA.—In a communication received from Messrs. F. W. & H. Stansfield, nurserymen, Sale, they say, "We have been experimenting with *Aspidistras* for the last ten years, and have succeeded in setting the flowers

THE HOT WATER REMEDY.—When in doubt, ask a policeman, well no—take a plant of not much value, and dip it in water at a temperature between 145° and 150°. If it is injured thereby discard the remedy, and fall back on insecticides and flowers-of-sulphur. A little experiment of this sort is worth more than columns of theories, and the unending castigation of Mr. Mallett, who has only brought to light an old means of killing insects and mildew for the benefit of the craft. Being always called upon to wage war with foes of both kinds, the gardener should rather rejoice that the virtues of hot water has been again brought to his notice, than endeavour to belittle this remedy. Of course, its use will not benefit the purveyors and inventors of insecticides, who sell for dear money that which costs but a small sum to make, and who are about to decry this cheap remedy, but that is a matter of no consequence to the gardener. The latter works only in a small way on plants in stoves, green houses, vineries, pineries, orchard houses, and may be on wall trees, and black Currant and Gooseberry bushes; whereas the market grower, working on a scale of greater magnitude, must still rely on manufactured insecticides in large measure, so that the latter will see his profit in that quarter. Has anyone tried the effect of water at 150° on the American blight and the Currant Bud-mite? The

flavour is entirely due to the system of culture adopted, which neither "D. T. F." nor "A. D." touches upon. Does not the want of flavour incline one to think that the fruit was finished off or ripened in a too humid atmosphere, and not sufficient attention given to details in the matter of heat, air, and moisture? I consider heat and air the two principal factors to give flavour. During the latter stage of the fruit, that is, the ripening, I allow a little air to blow over the fruit at night, at the same time keeping a temperature of 68°, and during the day afford air and artificial heat according to external conditions. Assuming that the foliage is in a healthy condition at the time the fruit changes colour, very little moisture will be required at the roots beyond what is derived from light sprinklings of the syringe. My first experience in Melon-culture commenced with the old three-light frame, and I can well remember the turnings and mixings it was considered necessary to give stable-dung and leaves before it was made into a botbed. At that time, Beechwood, Egyptian, Orion, and Scarlet Gem were considered our best Melons—true types of the green and scarlet-flesh sorts, and good they were too. H. F.

PAPAVER SOMNIFERUM.—I was much surprised the other day in driving along a lane just below Purley, to see growing amidst Wheat a great quantity of this French Poppy; the common scarlet Poppy was also plentiful. The French variety seemed to be quite at home, and possibly will now, much to the annoyance of the cultivator, naturalise itself. But one naturally wonders how it came there. Was the corn used to sow the field imported, and included the Poppy-seed? or had there been somewhere in years past grown a crop of the Poppy for commercial purposes? Possibly some years hence enterprising botanists lighting upon other progeny of the Poppy, may conclude that this form is of British origin. In any case, it helps to show how readily some imported plants may be naturalised here. A. D. [Papaver somniferum grows, or did grow, on the cliffs between Folkestone and Dover, Eb.]

LAWN WEEDS.—Of lawn weeds I find Hypochaeris radicans the worst, as a small bit of root left is sure to sprout. The best and easiest remedy I find is to drop sulphuric acid with a dropping implement into the crown. I want to ask whether the effect of the sulphuric acid on the soil is transient, or whether it permanently sterilises (for the growth of grass or of bulbs) the spot on which it is dropped? C. W. D.

HYBRIDISING, CROSS-BREEDING, AND RETROGRESSION.—Can it be true as stated by Mr. Henry Cannell, at p. 74 of the *Gardeners' Chronicle*, "that all fruits, flowers, and vegetables, were more perfect, larger, and finer when first created than they are at present?" What are "the numerous instances to support it?" I know that we find fabulous accounts in ancient history of giants and monsters, but is there any evidence to show "that plants have degenerated from what we found them?" The facts stated by Mr. Cannell respecting the improvement of the Strawberry, Tomato, Pea, Gloxinia, Chrysanthemum, &c., and which are obvious to everyone, prove in my opinion that they were created with a latent power capable of being developed, rather than that they are now reverting to their original forms. S. A.

SCARCITY OF INSECTS.—I observe in the *Gardeners' Chronicle*, on p. 91, Sir Joseph Hooker remarks on the scarcity of insects this year. Here, in the southern part of Oxfordshire, I observed numbers of the Cabbage-butterfly (*Pieris brassicae*) flying about, and on Friday last, July 28, I saw eight altogether; there were also a good many of the Brimstone variety seen the other day. Bluebottle and the common house-fly are not so numerous as last year. A few young wasps have been seen, and on July 31 I saw the first butterfly of the Admiral class. I suppose August is the real month for wasps. A. J. L., Wyfold Court Gardens.

ERICA CINEREA PURPUREA.—Many are familiar with the beautiful scenery and health-giving qualities of Matlock, which are enhanced at this season of the year by the floriferousness of the Heather. On the adjoining moors, Erica cinerea purpurea grows spontaneously, in great beauty, the beautiful clumps of purple flowers forming a pleasing contrast with the surrounding verdure. There are several beautiful varieties of this Heath, the finest of which are

E. cinerea alba minor, and E. c. a. major, the flowers of which are of a pure white. Heaths are most attractive plants for cultivation on a peaty soil, and justly may Heather be termed "the flower of solitude and purity." H. O.

HERESIES.

BULBS IN GRASS.—How inopportune and inappropriate do those lawns now look in which Daffodils and other plants have been allowed to flower in spring, and which have been allowed to remain unmown till now. Surely this delightful practice should be followed in the so-called wild garden, and similar places only. In the dressed garden it is out of place.

ROSE BEDS.—How very much better Rose-beds look when the surface soil is carpeted with low-growing spring flowers and Violas in their season than when the Roses have the beds all to themselves. A Rose-bush, unless in a hedge, and particularly a Rose standard, is not a beautiful object. We know one Rose-bed which, after yielding a good supply of Roses, is now a grand spectacle, numbers of *Oenothera lamareckiana* having come up in stately beauty. They smother the Roses, it is true, but they are removed when flowering is past, and liquid manuring and a mulch all the winter seem to provide food enough for the Roses, but then heretics do not exhibit and do not want to.

SINGLE HOLLYHOCKS.—How far more beautiful are the single Hollyhocks than the double monstrosities that were popular till the obliging Puccinia well nigh destroyed them. If it has served to refine and purify our tastes, it will not have lived in vain.

FERNS.—Is it not a mistake to grow hardy Ferns on the flat? They look so much better on a raised or undulating surface.

THE DRILL HALL SHOWS.—Would it not be better to reduce the quantity of exhibits by one half. We do not want to see dozens of the same plant time after time. If, for some special reason, collections are wanted, let them be requisitioned. When not wanted they are a nuisance. *Growler*.

MARKET GARDENING.

(Continued from p. 68.)

PTERIS CRETICA ALBO-LINEATA.

This is another useful variety which has come more in favour during the last few years. I remember the time when it was not considered worth growing; but at the present time it sells well. A few years ago Mr. Thos. Rochford grew a large quantity, and they were about as fine a lot of plants as ever were sent to market; and I think it was the means of bringing it into favour. I find it is one of the best Ferns for growing with any of the taller sorts. When potted together, the basal fronds being short, they furnish well below; and the tall green fronds of the serrulate varieties fill up the centre, and make a nice contrast. I have lately had some grown with P. Wimsetti, which have done well together. P. Wimsetti is perhaps the most popular of all the crested Pteris just now—one great recommendation is, that though the fronds are prettily crested, they are not too heavy, and do not drop over, as in many varieties. A good selection of P. serrulata cristata compacta is still worth growing. This should be grown singly, for when plants are bunched together, they are too dense to be pretty.

This bunching, or potting a number of plants together, has been much overdone by many growers; of course they are fit to come into market sooner, and some buyers like the dense dwarf plants; but grown singly, when well done, almost all Ferns are much more graceful in appearance; and if well cared for from the start, though taking longer, they will naturally furnish well if not

crowded up together. With Pteris tremula two or three may be started together, and one will generally take the lead, while the others will make smaller fronds, and form a nice base; but where two or more strong plants are potted together after they are established, they are far from being symmetrical or pretty.

ASPLENIUM NIDUS.

This has now become one of the most popular market Ferns. As a large specimen it is effective, but it is extensively sold of small size, as it makes a compact, symmetrical plant in 3, 4, and 5-inch pots. The variety finds much favour in this way of growing it. Spores do not germinate as readily as those of most market Ferns, and growth is very slow in the younger stages; but after establishment, progress is rapid. The spores should be collected from plants which have been growing in an exposed position. I always fancy those from large plants are more to be relied upon, and they should be collected before they become far advanced, the best spores falling soon after they are mature. Not any of the spores of Aspleniums germinate very readily, and much watchfulness is required on the part of the cultivator, to avoid being overrun and choked by others, which are almost sure to find their way to the seed-pots and germinate abundantly. This may be avoided to some extent by isolating the plant which is grown as the spore-bearer, or at least taking care that they do not come into contact with such as Nephrodium molle, Polypodium trichoides, and any of the Gymnogrammas, or others which germinate quickly. The young plants will make more progress in warm than in low temperatures, but afterwards a cooler position, with plenty of light, will ensure sturdy plants and broad fronds. A roughish, open compost should be used, and good drainage afforded; and an important item of their cultivation is to look carefully for slugs and small snails, which often find their way into Fern-houses.

ASPLENIUM LUCIDUM.

This has not as yet been grown in very large quantities, still I believe that, with care in selecting spores, it would germinate as freely as A. nidus, and prove even more useful for marketing. The fronds are of great substance, and of a bright, fresh green tint, and when grown from spores, the plant takes a very symmetrical form. It should, therefore, be well worth persevering with, as has been done with A. nidus; and I am sure that those fortunate enough to raise it in quantity will be well rewarded. I may mention that I have repeatedly sown spores, but the only time when I was successful was when I had an opportunity of collecting spores from large plants grown in a cool conservatory. The cultural requirements of this Fern are similar to those of A. nidus, but it succeeds under cooler treatment.

I omitted to add that there are several varieties of Asplenium nidus, that known as musciformis is the best for market work. There is some confusion as to which is australasicum; but that which I first knew under the last name had narrower fronds, which spread, and are of a deeper green. I find seedlings, though as a rule they come true from either variety, will sometimes vary; and I know of one with very narrow fronds which is quite distinct from any of the others, and came up in a batch of young plants. I may mention Asplenium Hilli, a very distinct variety of the bulbiferum type, with rather finely-cut fronds, and a plant of dwarf, compact habit. When I first saw it, I thought it would only be suitable for small pots, but after seeing a large batch in 48-size pots, I altered my opinion, for I certainly never saw a more useful lot of Aspleniums in that size, the plants well covering the pots with arching fronds, which were densely covered with bulbils. It is an advance on A. Colensoi, which at first sight it closely resembles. I understand that it was obtained from an importation. As young stock is produced so freely, it is

likely to soon be well known, and it will probably rank high among market Ferns.

It is rarely that plants of this section of *Aspleniums* are raised from spores, for in the first place these do not germinate freely, and stock is so readily increased from the bulbils. I once saw a large batch of seedlings of the true *Asplenium bulbiferum*, and very fine plants they made. It is remarkable that there are no crested varieties of this section. This may be accounted for from the fact that so few seedlings are raised. If we had to raise seedlings, other interesting varieties might be obtained. I find that seedlings of *A. pteridoides* which is closely allied to the above section (but does not produce bulbils), vary much in character. I have also found the same disposition to vary in seedlings of *A. Baptisti* and *A. novæ-caledoniæ*. These are all very desirable for collections, but are too

An adequate example of this method of utilising sunheat in a practical manner is seen in the common method of cultivating Vines for wine-making in central Europe, and up to the extreme limit of vineyard culture out-of-doors. In this region the Vine-stocks are kept to about 15 inches in height, so that the bunches of Grapes are very close to the soil. By this simple contrivance man is enabled to ripen the Grapes more completely in the average of years than could be done in any other manner. Moreover, the Vine-stocks are protected in winter by the snow against frost.

Our illustration (fig. 44) shows one of twenty Apple-trees trained in the form of a table, a method that is supposed to have been introduced into these gardens in Queen Elizabeth's time by the famous Lord Chancellor Bacon, who, at that time, was owner of Gorbambury, and of whom history speaks

of varied colouring as the various plants come into flower. Those now affording the display being Delphiniums, Roses, including York and Lancaster, and Crimson Rambler, Campanulas, Phloxes, Hemerocallis, Antirrhinums, Pentstemons, Carnations, Sweet Peas, Gaillardias, Godetias, and others. The herbaceous borders extend to the door of a well-cropped kitchen garden and some plant-houses, in which are Pelargoniums, Cannas, Achimenes, Gloxinias, and shrubby Begonias in capital bloom, two of the best Begonias being *B. fuchsioides* and *B. semperflorens*, which are grown in small pots. A great number of Chrysanthemums were noted in fine order; and the remains of a bed of *Calochortus* showed that Mr. Norman, the gardener, cannot only grow ordinary plants well, but that he succeeds with some that are reputedly rather difficult subjects to manage.

The conservatory was bright with showy flowering plants, arranged together with Ferns and Palms. At the end of this house a plant of *Lapageria rosea alba* was coming into flower. In the older range of glass-houses a small selection of Orchids which were thriving was found, and a few in bloom, notably an *Oncidium ornithorhynchum*, abundantly furnished with spikes. Another house contained plants of good tuberous-rooted Begonias in flower. In the same house were Tea Roses, excellent *Streptocarpus*, &c. The grounds of Kennet House are well furnished with fine trees, and the well-kept lawn is not marred by beds of Pelargoniums, &c., which certainly would not harmonise with the surroundings. J. O'B.

THE FERNERY.

ASPLENIUM FRAGRANS VAR. FENICULACEA.

THIS graceful little Fern does not appear to be at all common in gardens. It forms a compact plant about 2 feet across with arching fronds, and the finely cleft pinnae of a *Gymnogramma schizophylla gloriosa*. The pinnules are extremely slender, measure $\frac{1}{4}$ of an inch in length, and are of the same width throughout. Although I have tried several times I have not been able to raise it from spores, but have succeeded in propagating it by means of viviparous plants which occur occasionally on the extremities of mature fronds. The plant is as easy to grow as is *A. bulbiferum*, and, like that species, it will stand the atmosphere of living apartments without injury for a considerable length of time. It should find a place in any collection of choice Ferns. G. B. M.

A STRAWBERRY BARREL.

DIFFERENT devices have at times been adopted by cultivators in order to keep the fruits of the Strawberry free from grit and dirt. They have been grown on banks of soil overlaid with roofing tiles, and on terraces formed of low stone or brick walls. The use of barrels in which to grow the plant is a very old one. Mr. T. Statter, of Stand Hall, Manchester, in sending a photograph of his Strawberry barrel (fig. 45), wrote as follows:—

"I enclose you a photograph of my Strawberry-barrel. The plants are one year old Royal Sovereign, from which I gathered quite 6 lb.; and it would have been better had the plants been in longer, planted either out of pots—or got well rooted; they were taken out of a bed as they were showing flowers. The decided advantages are as follows: birds do not touch them except to a very slight degree; nor do slugs, which have troubled our beds much this year; the fruit ripens better and is of better flavour; no dirt on the fruit; fewer small fruits, and as a consequence, more good fruit; the flowers are better fertilised. The plants can be grown on waste land, on garden walks, on the wall of a Vine-border, or anywhere where the sun can penetrate. Plenty of water is required. There is a drain-tile running up the centre of the barrel, and the barrel revolves on a ball-bearing, but I do not think the moving round is a necessity."

FIG. 44.—TABLE-TRAINED APPLE TREES AT GORHAMBURY PARK, HERTS.

slow, besides which they are of a dark, sombre hue, which is not a recommendation for market work.

A few years ago, *A. laxum pumilum* was a general favourite, but within the last year or two a variety of *A. biforme*, which has fronds of a lighter shade of green, has superseded it to a great extent. I am still in favour of *A. laxum pumilum*, but it requires to be grown on freely from the start, and when well treated it makes a very handsome plant; the only point against it being that it is of rather a deep shade of green. A. Hemsley, Worthing.

TABLE-TRAINED APPLE-TREES AT GORHAMBURY, HERTS.

VARIOUS are the means taken to accelerate the ripening of fruits in the cooler parts of Europe, and these usually take the form of securing the trees to warm walls and fences, so that they may enjoy the higher degree of heat such positions afford. In the present instance, advantage is taken of the capability of the soil to take up the sun's heat, and disperse it slowly during the night.

as a great gardener. Mr. Newberry, the head gardener, tells us, in a note accompanying the photograph, that each tree is 20 feet in length, 6 feet in breadth, and is trained in table form at a height of 3 feet from the ground. These trees bear good crops of fruit, and they consist of some of the best varieties in cultivation. The fruits come of a large size, and possess high colour, owing to their free exposure to the direct sun's rays.

KENNET HOUSE, HARROW PARK.

FEW more naturally beautiful gardens exist in the neighbourhood of London than those of Mrs. J. P. Charles, which occupy the slope of one side of Harrow Hill, known as The Park. From the terrace beside the house, which is bright with summer flowers, the view extends over the green hill-side to the lake in the bottom. The latter is reached by a woodland walk, and is a very pleasant part of the garden, especially in summer. The walk along the brow of the hill is skirted by borders of herbaceous plants and annuals which, for a considerable part of the year, presents a mass

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 25.—Present: Dr. M. T. Masters, in the chair; Rev. W. Wilks, Mr. Mawley, and Rev. G. Henslow (Hon. Sec.).

A Monstrous Begonia.—Mrs. G. Soames, of Welton House, Davenport, sent a peculiar blossom, with white petals and a large tuft of stamens, apparently a male flower, with the stamens stigmatiferous. Dr. Masters undertook to examine it further, and report upon it.

A Proliferous Helianthemum autumnale.—Mr. Veitch sent specimens of this peculiarity, in which the heads had given rise to pedicellate smaller ones, the corollas being more or less virescent as well. It is remarkable that this species is peculiarly liable to this malformation.

Grapes with mildew—Cypripediums and Apple-trees diseased.—The three following communications on specimens sent to a previous meeting, were received from Dr. W. G. Smith, of the Yorkshire College, Leeds. A special and unanimous vote of thanks was recorded to him for his valuable reports. *Grapes with mildew*.—"The mildew is undoubtedly caused by the fungus *Oidium Tuckeri*, so well known in this country as the common Grape mildew. On treating the Grapes and leaves sent in various ways, the mildew continued to spread on the fruits, but never appeared on the leaves, which on receipt were very healthy. This supports Mr. Wright's opinion. Most of the authorities state that a dry heat is the chief predisposing cause. In the present case the sender believes that the outbreak was in some way related to the raffia fibre used in tying. A sample sent had a white scurf here and there upon it, but, under favourable conditions, this did not produce any fungoid growth. On examination with the microscope it was found to consist of fragments of plant tissues agreeing with the tissues of the fibre itself, and no doubt the dried remains of parts of the plant partially destroyed in the maceration and drying processes by which the raffia is prepared for market. The dry fibre is an unlikely source of infection, but, if any doubt existed, it could easily be sterilised by boiling, or by steeping for a time in a 2 per cent. solution of corrosive sublimate or otherwise. The universal remedy for mildews of the *Oidium* kind is sulphur. A discussion on a hot-water method of treatment of the Vine-mildew has been going on in recent numbers of the *Gardeners' Chronicle*.

Diseased Cypripediums.—"Some flowers were recently sent which were checked in opening, apparently due to a collapse of the lower part of the flower-stalk. There were distinct signs of the presence of fungi, but it was not easy to say whether a mycelium was present or not. A request was made to the sender for portions of affected plants. These arrived in excellent condition, and at first sight looked as hardy as one might wish. The older leaves were very fine, and showed no weak points. The older roots looked rather more dried up than one might wish, but new roots in various stages were coming on, and quite healthy. The younger leaves, however, seemed weak, with a tendency to become discoloured. Acting on previous experience, the e were allowed to dry up, and, as on some other occasions, they produced groups of tiny points—the "pycnidia" of a fungus. It is from the rosettes of young leaves that the flowers arise, so that there may be a connection. On one of the specimens sent the flower-stalk did not collapse, and the weakly younger leaves were absent from the shoot bearing this flower, though present elsewhere on the same plant. The fungus requires further investigation, but spores obtained were of the *Gleosporium* or *Colletotrichum* type. *Gleosporium cinctum* was described by Berkeley and Curtiss from Orchid material. The same species was recently worked through by Miss Stoneman, and placed amongst the Ascomycetes (*Botanical Gazette*, August, 1898). Mr. Massee described another Orchid fungus on the Vanilla (*Kew Bulletin*, 139, 1892). I have received various cases from the *Gardeners' Chronicle* of diseased Orchids, all indicating the presence of some form of fungus nearly related to *Gleosporium*. The disease is known as an "Anthracnose," and seems common enough, but we still lack reliable methods of prevention."

Diseased Apple Trees.—"Twigs of Apple with leaves and flowers were received in June. After being kept for twenty-four hours in a moist chamber, abundant conidia of the fungus *Monilia (Oidium) fructigena* were produced. This fungus is well known, and at present the subject of much investigation, since it causes a wide-spread disease of the fruit (also to a less extent on the leaves and twigs) of Cherry, Plum, and Peach, less commonly of Apple and Pear. All the parts sent were affected. The flowers were checked and withered; the leaves reddish brown, abnormally hairy, and somewhat crumpled. The young twigs were dry and brittle, with occasional patches of brown bark marked with darker bands running round the twig. Internal examination showed the mycelium in every part. In the twigs, the region just under the bark was killed and full of mycelium, which could be traced from old to young shoots, and into the flower stalks and leaves. In the absence of information we cannot suggest how the fungus gained access to the Apple-trees. The fungus is generally regarded as the same form so common on Cherry and Plum, causing the fruits to shrivel up, and remain hanging to the tree in a mummified condition. Keeping this in view, it would be well to pay attention to the trees already mentioned, to gather any dried-up fruits, and to burn them. Careful pruning and destruction of diseased twigs is also an excellent check. Spraying with Bordeaux Mixture

seems a likely mode of treatment, but the results as yet are not conclusive. A monograph on the fungus and disease is promised by Woronin in a recent note (*Botan. Centralblatt*, lxxvi., p. 145).

Stratiotes aloides.—A large specimen of this rare plant was sent by Mr. J. G. Rudd, of Copgrove Grange, Copgrove, Yorkshire, with the following observation:—"This plant grows in a pond on my farm, and is smothering the Water Lilies. One of my horses has eaten freely of it, and died from its effects, so I shall be glad to know if it is poisonous." It is not known to be at all poisonous, as it is a very rare British plant; but it is possible that the sharp-pointed projections down the edges of the leaf, such as occur on Aloes, &c., may have had a mechanically deleterious effect on the intestine.

Campanula, species and hybrids.—Rev. C. Wolley-Dod sent specimens of the flowers of *C. rotundifolia*, *C. rhomboidalis* and their hybrid progeny; as well as of *C. lactiflora*, both the typical flowers, and with an abnormal sub-polypetalous form. The following communication was also received from him:—"The form of corolla with narrow separated lobes, described and illustrated by De Candolle, *Monograph of Campanula*, pp. 11, 12, &c., and figured, plate ii., A, and also described by the late Professor J. S. Henslow (see De C., *Monograph*, p. 12), is commonest in *C. lactiflora* (M. Bieb.), in which it is always accompanied by narrow leaves. In *C. rotundifolia* it is commonest in broad-leaved forms, which I take to be hybrid, or are at least intermediate between *C. rotundifolia* and *C. rhomboidalis*. These abnormal forms of *C. rotundifolia* are fertile, and the seedlings come in part true, but always include many of the soldanelloid form—i.e., with a duplex corolla, which are also fertile. A study of *C. rotundifolia* and *C. rhomboidalis* (apparently quite distinct and good species), and their variously-named intermediate forms, which Godron in his *Flore de France* calls 'a little chaos of species,' leads me to think that *C. rotundifolia* may be a species gradually crawling into new species which are not yet sufficiently defined. In my garden the two species are united by imperceptible gradations, all of which are fertile. Forms having the characters of all the so-called species intermediate between these two may be picked out of them."

Sweet Peas, Malformed.—A curiously-flowered spray of Sweet Pea was sent by Mr. Pratt, Lion Gate, Richmond, every flower on the plant being similarly affected. An examination showed that the petals had remained crumpled up without having attained the usual subsequent expansion on blossoming. The stamens were twisted, but the anthers polliniferous, so that the stigmas were pollinated by "self-fertilisation," the flowers being, in fact, cleistogamous. The flowers were arrested in growth; but it was impossible to assign a cause for their abnormal condition.

Foliaceous Geranium.—A specimen of (apparently) *O. sanguineum* was received from Mr. Bunyard, in which the petals of the flowers were replaced by green leaves, the segments of which had remained conduplicate.

BECKENHAM HORTICULTURAL.

JULY 25.—A pleasant spot in which to hold a flower show than the public park of Beckenham can hardly be imagined. It is open, breezy, with a level pitch of turf; it is well kept, and bright with flowers, and readily reached. Evidently the people of Beckenham cheerfully give up their right of entry to their park for a day or two, and as cheerfully pay to see the charming display the Committee and energetic Secretary, Mr. W. T. THORNTON, provides for them.

Two commodious tents were occupied by the plants, cut-flowers, vegetables, &c., and a third contained the table decorations, collections of garden wild-flowers, &c. One tent was filled by Messrs. J. LAING & SONS, Stanstead Nursery, Forest Hill; with a messrs. a centre table of pretty floral decorations, and at the back a large collection of cut-flowers; while in another tent was a large collection of Roses, including bunches of garden varieties; while in the open air was a considerable circular group of ornamental foliage plants. The highest award made by the Society—a Silver-gilt Medal—was made to this contribution; a similar award being made to Messrs. J. PEEB & SONS, nurserymen, West Norwood, for a large group of well grown Caladiums; and also to Messrs. H. CANNELL & SONS, Swanley, for a unique collection of Cacti. A collection of charming Petunias from Messrs. J. CARTER & CO., seedsmen, High Holborn, was awarded a Silver Medal; and the same was made to Mr. J. R. BOY, nurseryman, Croydon, for a collection of Begonias and other plants. The Agricultural and Horticultural Association, Creek Road, Deptford, also had a collection of cut flowers of an attractive character.

The specimen plants were arranged down the centre of the principal stage, and stood on a very low stage covered with baize, while the groups were arranged on one side of it; and there was a table of cut flowers and fruit on the other. Groups were a leading feature; the best came from Mr. F. C. Cogger, gr. to H. POTTER, Esq., Lawn Road; *Humea elegans*, *Gloriosa superba*, and *Campanula pyramidalis* forming the background, with a foreground of bright *Codiceums*, *Cannas*, and *Gloxinias*. In addition, this effective group gained the Silver Medal of the Royal Horticultural Society; and Mr. G. E. Day, gr. to H. F. SYMONDS, Esq., 2nd, Orchids and Lilium speciosum being prominent. With a group of smaller size, Mr. E. HAWKINS, gr. to C. A. SMITH, Esq., was 1st; and Mr. W. BESWELL 2nd. Plants for the decoration of dinner-tables were bright and suitable.

Mr. COGGER had the best three stove or greenhouse plants

in flower, in a good *Crassulacoccinea*, a *Bougainvillea*, and a *Statice*; and the same exhibitor was 1st with three foliolated plants, having a handsome *Cocos*, a finely-developed *Caladium*, and a *Codiceum*, all of them with well-coloured foliage. Mr. R. ROBERTSON, gr. to W. CONNERT, Esq., was 2nd. There were classes for two plants and for one plant. Good specimen *Fuchsias* were also shown, and also *Ferns* in fours; and there was a class also for a trio. There were also flowering and Rex *Begonias*, *Fuchsias* in three classes, some very good *Gloxinias* for the season, especially a half-dozen from Mr. J. GALLEY, Hayes Road; and some capital bushes of *Coleus* from Mr. H. COLE. There were also good zonal and other *Perlargoniums*.

An open class for forty-eight Roses brought two collections, Messrs. D. PRIOR & SON, Colchester, taking the 1st prize with some very good blooms; 2nd, Mr. A. G. GREEN, Rose Nurseries, Colchester. Roses were also shown in other classes; Good *Cactus Dahlias* for the season of the year were shown. Those who depended upon the old decorative varieties were taught a very useful object-lesson.

Fruit was fairly good; and the most interesting were the hardy kinds.

A great many vegetables were shown, generally in round flat baskets, which do not show them off to the best advantage. Some of the best were shown in the class in which Messrs. SUTTON & SONS offered special prizes.

BRISTOL and DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.

JULY 27.—A large number of members assembled on the above date at St. John's Parish Room, Redlands, to listen to a lecture by Mr. W. Staddon on the "History and Cultivation of the Apple." Mr. W. Lock, the Chairman of the Society, some time ago offered a prize of 20s. to under gardeners for the best essay on any subject connected with horticulture. The competing essays were judged by Mr. W. W. Pettigrew, of Cardiff, who gave the premier honours to Mr. Staddon. The subject, which is full of interest to gardeners and others, was dealt with in a manner that showed the writer to be quite conversant with the right kind of treatment required by the Apple. A short discussion followed, and the meeting concluded with a hearty vote of thanks to Mr. Staddon.

NEWPORT AND COUNTY HORTICULTURAL.

JULY 27.—This society held its annual show in the King's Hill Field, Newport, Monmouth, on the above date, and it proved to be, both in the number and quality of the exhibits, the best the society has yet held. The excellence of the trade exhibits did much to further its success, while the table decorations, groups of plants, and cut flowers, which were numerous and of much merit, were very attractive features. Stove and greenhouse plants, Ferns, *Gloxinias*, *Caladiums*, &c., were splendidly shown, as were also vegetables; Gooseberries were fine in point of size and of flavour, and some of the Peaches, Melons, and Grapes were especially good and fine.

PLANTS (OPEN CLASSES).

The best six stove and greenhouse plants in flower were from Mr. CYPER, Cheltenham, who had as usual large, fresh, splendidly-flowered specimen *Erica lhyana*, *E. austriana*, *Stephanotis floribunda*, *Ixora Williamsii*, *Statice profusa*, and a *Bougainvillea*; 2nd, A. T. ROBINSON, Esq., Whitechurch (gr. Mr. McLew), with a good *Crassula coccinea*, *Allamanda Hendersonii*, &c.

The six exotic Ferns class was a good one, Col. WALLACE (gr. Mr. Powell) being 1st, and he was closely followed by W. J. BUCKLEY, Esq.

Four zonal Geraniums: 1st, J. LINTON, Esq. (gr. Mr. Wheatland), with fresh, well-flowered plants.

The Royal Horticultural Society's Silver Medal was awarded to W. J. BUCKLEY, Esq., for four stove and greenhouse plants in flower.

GROUPS OF PLANTS (OPEN).

These were circular, and of 11 feet in diameter. Here W. H. BUCKLEY, Esq., Llanelly (gr. Mr. Carpenter), was 1st with a lightly arranged, effective group, consisting of Lilies, Ferns, *Humea elegans*, &c. Mr. McLew was a good 2nd.

H. J. PILLENBER, Esq., was 1st for a group of tuberous-rooted *Begonias*, arranged in a space of 25 square feet.

CUT FLOWERS (OPEN).

Roses, Hybrid Perpetuals, twenty-four blooms.—Mr. CROSSING, nurseryman, Penarth, was 1st with good blooms, taking the season into consideration, A. K. Williams, Tom Wood, Mrs. J. Laing, Dupuy Jamain, Prince Arthur, and Earl of Dufferin being amongst his best; 2nd, Mr. W. TRESEDER, Cardiff.

Teas, twelve blooms.—Here again Mr. CROSSING was placed 1st with *Maréchal Niel*, *Edith Gifford*, *Comtesse de Nadailae*, *Madame Hoste*, *The Brille*, &c.

Carnations and Picotees were well shown by Mr. W. TRESEDER, who took the lead in both classes, and was followed by P. A. WILLIAMS, Esq., Usk (gr. Mr. Greeniog).

Sweet Peas, shown in bunches of twelve, were in splendid condition, and H. H. WILSON, Esq., of Penarth, secured the 1st place; R. JOHNSON, Esq., Cardiff, being a good 2nd.

In a class for twelve bunches of blooms of herbaceous plants, Mr. W. TRESEDER was 1st with *Achillea The Pearl*, *A. multiflora rubra*, *Montbretia crocosmiflora*, *Echinops rutheniensis*, *Liatris spicata*, *Monarda didyma*, &c.; and Col. WALLACE was 1st for twelve varieties in bunches of above and greenhouse blooms.

TRADE EXHIBITS

were welcome contributions to the exhibition, and deservedly merited the notice they received. Mr. BASHAM, Bassaleg, Newport, filled the central tabling of a large tent with numerous heavily-fruited trees of Apples and bushes of Gooseberries in pots, *Codiaeums*, *Dracenas*, zonal *Pelargoniums*, &c., arranged in groups, besides showing a collection of the leading varieties of *Cactus Dahlias*, &c. This fine exhibit was awarded a Gold Medal.

Mr. W. TRESEDER, Cardiff, also secured a Gold Medal for a beautifully-arranged large group of plants and cut flowers, similar to that which he exhibited last week at Cardiff.

The Messrs. HEATH & SON, of Cheltenham, staged a fine group of Orchids, *Cactus Dahlias*, Tea Roses, &c.; and Mr. H. ECKFORD, of Wren, some sixty varieties of Sweet Peas, amongst them being many beautiful new ones.

MIDLAND COUNTIES CARNATION AND PICOTEE.

AUGUST 2, 3.—In delightful weather, the annual exhibition of this Society was held in the Botanical Gardens at Edgbaston, Birmingham. There were several entries from growers, who subsequently were unable to compete owing to the hot, sultry weather.

There was scarcely an exhibitor from the South, but the leading flowers came from the Midland Counties, with the exception of two or three exhibits from further north. The quality generally was very good; and the yellow-ground and fancy flowers called forth from the judges the highest praise. It is perhaps not to be wondered at, that the splendid varieties in this section, together with the superb selfs in both sections, mainly the productions of Mr. MARTIN R. SMITH, should prove so attractive on account of their size and fulness; in fact, they are becoming a serious menace to the smaller bizzars and flakes.

It was an inversion of the usual order of things which placed the self and yellow ground flowers in the fore front of the schedule. Mr. A. W. JONES, an enthusiastic Birmingham amateur, carried off the 1st prize; the most attractive and finest varieties were *Britannia* and *Germania*, yellow; Mrs. Eric Hambro, a really superb flower; and Dick Donovan, white; *Isinglass*, scarlet, very fine; *Sea Gull*, bluish; and *Sadek*, rose.

In the class for six blooms, in which Mr. W. BELLAMY, Penkridge, won the 1st prize, some of the finest blooms were *Endymion*, rose; *Her Grace*, bluish; Mrs. Colby Sharpin, salmon; and Mrs. E. Hambro, white. Mr. R. C. CARTWRIGHT, another Birmingham amateur, took the 2nd prize, with flowers only a little inferior.

YELLOW-GROUND FLOWERS.

We have already alluded to the fineness of the yellow-grounds. Mr. JONES added to his triumphs by taking the 1st prize for twelve blooms; and Messrs. THOMSON & CO., Spark-hill, were a very close 2nd. Looking over the stands in this class the following were noted as very fine: *Voltaire*, *The Gift*, *Golden Eagle*, *Stanley Leighton*, *Eldorado*, the latter edged with red on a pale yellow ground; Mrs. Tremayne, *Dervish*, Mr. Nigel, edged with crimson-maroon on a pale ground; and Mrs. Mills, edged with bright reddish-rose. One of the judges said he had never before seen such a fine stand of six yellow grounds as that which won for Mr. BELLAMY the 1st prize.

FANCY VARIETIES.

It is a little difficult to strictly define a Fancy Carnation, but the section, which includes much diversity of marking, includes some very fine and striking flowers. The twelve blooms which won another 1st prize for Mr. JONES, were grandly developed, and included *Perseus*, bluish, edged and flaked with bluish slate and deep orange, selected as the premier Fancy Carnation; *George Cruickshank*, Miss Mackenzie, pale-primrose edged with pink; *Cardinal Wolsey*, *Monarch*, and *Brodrick*, cream, pencilled with slaty-rose. Messrs. THOMSON & CO. had *Perseus* and Miss Mackenzie, very fine; in fact these two superb varieties were foremost in most of the stands. *Pantaloon* should also be mentioned, cream ground, edged and pencilled with pinkish-lilac. In the class for six varieties, in which Mr. G. F. SPITTLE took the 1st prize there were also some grand blooms. In addition to the varieties named, *Cardinal Wolsey*, *The Dey*, and *Zingara* were very good.

PICOTEEES.

The white ground edged Picotees were so fine in character that much surprise was expressed at their quality in the face of such trying weather. Mr. ROBERT SYDENHAM took the 1st prize with twelve blooms, having well developed examples of *H. Rose E. Madame Richter*, *L. P. E. Jessie*, *L. Rose E. Mrs. Payne*, an old but still first-rate variety; *H. Red E. Ganymede*, *L. Rose E. Favourite*, and *L. P. E. Pride of Leyton*. Messrs. THOMSON & CO., had very fine blooms also, chief amongst them *L. Rose E. Nellie*, *L. P. E. Somerhill*, and *H. P. E. Amy Robarts*. In the class for six white ground Picotees, although seven prizes were awarded, stands were left undistinguished because of the general fine quality. It should be recorded that Mr. R. C. CARTWRIGHT took the 1st prize in the face of such a keen competition.

BIZARRE CARNATIONS.

Bizarre and flaked white ground Carnations did not reach the high level of quality of the Picotees, but for the season surprisingly good blooms were staged, Mr. SYDENHAM being 1st with twelve varieties, chief among them *R. F. Rob Roy*, very fine, selected, as the premium flake Carnation; *P. F. Gordon Lewis*, *S. F. J. P. Sharp*, *S. B. Robert Houlgrave*, and *P. P. B. George Rudd*. Mr. T. LORD was a close 2nd. The best six, and they were very good, came from Mr. R. C. CARTWRIGHT.

UNDRESSED BLOOMS.

The best six, and they were very good, came from Mr. R. C. CARTWRIGHT. Eleven classes were devoted to undressed blooms of Carnations and Picotees, shown singly and in threes. These classes, though interesting in their way, never attract the attention from visitors which is given to the more refined blooms shown on stands.

SINGLE FLOWERS AND PREMIER BLOOMS.

There were twenty-six classes for single blooms, in which a very large number were staged. Of Carnations, the best *S. Bs.* were *Admiral Curzon* and *Robert Houlgrave*; *C. Bs.*, *J. S. Hedderley* and *Master Fred*; *P. P. Bs.*, *W. Skirving* and *George Rudd*; *S. Fs.*, *Sportsman* and *Guardsman*; *R. Fs.*, *Merton* and *Christi Galli*; *P. Fs.*, *George Melville* and *Gordon Lewis*. Picotees: *H. Red E.*, *Mabel Lakin* and *Brunette*; *L. Red E.*, Mrs. Gorton (a very fine old variety) and *T. Williams*; *H. P. E.*, Mrs. Openshaw and *Muriel*; *L. P. E.*, *Nymph* and *Pride of Leyton*; *H. Rose E.*, *Lady Louisa* and Mrs. Rogers; *H. Scarlet E. Clio*, and Mrs. W. Barrow; *L. Rose E. Nellie*, *Y. G. Fancy Voltaire*, *Y. G. Picotee*, *Empress Eugénie*, and

FIG. 45.—STRAWBERRY PLANTS GROWING IN A BARREL.
(SEE P. 115.)

Mrs. Douglas; *Fancy Carnation*, *Perseus* and *Czarina*; *Fancy W. G. Car. Edith*, white edged and barred with bright reddish rose; and *Duchess of Portland*, edged and barred with pale rose. Selfs, white; Mrs. E. Hambro; *Blush*, *Sea Gull* and *Her Grace*; Yellow: *Germania* and *Britannia*, *Germania* winning four out of five prizes. Buff: Mrs. Colby Sharpin; Rose and Pink: *Asphodel* and *Exile*; Scarlet: *Endymion*; Dark Crimson: *Topsy* and *Heliotrope*, *Roseleigh Gem*.

The premier bizarre was *S. B. Robert Houlgrave*. Flake: *R. F. Rob Roy*; *H. E. Picotee*; *H. Rose Lady Louisa*; *H. E. Picotee*; *P. E. Mrs. Gorton*; *Y. G. Picotee Mrs. Douglas*. Fancy Yellow: *G. Voltaire*. Self Carnation: *Endymion*. Scarlet and Fancy Carnation: *Perseus*.

There were classes for six pots of Carnations; also for shower bouquets, a superb one winning the 1st prize for Messrs. POPE & SON; also for sprays and buttonholes. The best dinner-table was by Miss SYDENHAM, who had dark and salmon Carnations, very tastefully set up with appropriate foliage.

MISCELLANEOUS.

Two classes for bunches of Sweet Peas, one for nine and the other for twelve brought charming exhibits, some of the best varieties being shown in excellent character. Mr. V. B. JOHNSTONE, Tettenhall, took the 1st prizes in both classes. A floral arrangement in Sweet Peas for drawing-room, set up on small, round tables, was a delightful feature; also miscellaneous collections. These consisted of superb collections of hardy cut flowers from Mr. W. F. GUNN, Olton (*Silver Medal*). *Silver Medals* to Messrs. KELWAY & SON for a very fine collection of *Gladioli*; and to Messrs. HEWETT & SON, for *Floral Decorations*. Small *Silver Medals* to M. S. MONTIMER for a collection of excellent *Cactus Dahlias*; and Messrs. PERKINS & SON for *Cut Roses*; and *Bronze Medals* to Mr. W. SYDENHAM, for cut flowers and baskets of Roses; Messrs. PRICHARD & SON, and Messrs. CURTISH & SON, for Carnations.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Strawberry Plants for Early Fruiting.—The runners having been layered in 60's, or on bits of turf, a month ago, will have become nice strong plants, after removal from the beds a week or longer ago, and will be in a suitable condition for planting in beds to fruit next year. The best method of getting early fruit is to plant strong runners on a warm border which has been heavily manured and deeply dug for some previous crop of vegetables—say *Cauliflowers*, *Lettuce*, or *Tripoli Onions*. Such early-planted Strawberry plants ripen their fruits at the least ten days earlier than older plants. They should not be allowed to occupy the land more than one year, and may therefore be planted 1 foot apart in the lines, planting quincunx fashion. Do not bury the crown below the surface; on the contrary, keep it rather high, and make the soil thoroughly firm by trampling the whole area to be planted, and treading close round each after planting. Before planting, the ground must be cleaned and made level, which is about all that is necessary with land that was well prepared for the previous crop. The young plants should be well moistened before planting, and receive a copious application of water after planting. If planting can take place in cloudy or rainy weather, and the runners are in pots, scarcely any check will be inflicted; the case, however, is less favourable if the rooted runners have to be lifted from the ground. After trying several varieties, I have for the past two seasons depended entirely on *Royal Sovereign* for my first crop. *Vicomtesse H. de Thury* and *Noble* are equally early, but the former, although of excellent flavour, is small.

Budding Fruit-trees and Stocks.—During the next two weeks budding may be carried on. Although not extensively practised in private gardens, it may often be employed as a means of restoring the symmetry of a tree; *Pears*, *Plums*, *Cherries*, *Peaches*, and *Nectarines* being equally amenable to budding. Where unsightly bare spaces exist in the framework of a tree, these may be covered with shoots, and the due balance of the tree restored in a season or two. Where wilding stocks are grown for being grafted or budded, or as a means of inarching, which is seldom the case in private gardens, the method to employ is identical with that used by the *Rose-budders*, the young budded stem being left at full length till pruned back to within 4 inches of the bud at the winter season. By thus allowing an outlet for the sap by growth extension, the inserted fruit-bud remains dormant throughout the season, and does not make a move till the spring. With a view of enabling the bark to "run" freely, water should be copiously afforded the stocks to be budded a day or two before the work is to commence.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Laelia purpurata.—The autumn growths of this plant produce the larger number of flower-sheaths, and it is good practice to retard the growth after the plant has flowered for as long a time as possible, which is done by keeping the plant moderately dry in a cool-house. Often, however, sufficient growth has taken place to warrant repotting and top-dressing being performed as necessity may prompt. The plant being a vigorous grower, a larger pot should be used than is usually afforded other species of *Laelia*, but whilst affording a greater area of peat and sphagnum-moss, it should be shallow, and the drainage materials very abundant. The plant may be grown in the Cattleya-house under the usual kind of treatment afforded the occupants of that house. Just at the present time, and after being disturbed, the materials should be kept rather dry, affording a more liberal supply of water as the new growths advance and begin to emit roots.

Laelia pumila now pushing forth new growths may require repotting during August. For this purpose, pots or pans just about large enough to hold the plants comfortably should be employed, elevating the plants slightly above the rim, and using a large amount of drainage and some peat

and sphagnum-moss to pack about the roots. The plant should be grown with a moderate amount of shade in the intermediate-house, and once root activity has begun, it should be kept well moistened. *L. pumila præstans*, often confounded by gardeners with *L. pumila*, may be afforded like treatment, but *L. pumila Dayana* thrives better under cooler and moister treatment. The first two should be suspended from the rafters.

Lelia Jongheana, a species that has been recently rediscovered, would at first sight appear to belong to the *pumila* section, and it was accordingly treated by most cultivators similarly to *L. pumila*, but from constitutional or other cause the plant did not thrive, and thousands have been lost, and only one or two have flowered. At Clare Lawn, the plant has been tried in a variety of temperatures and positions; the one that gave the best results was to suspend it with *Odontoglossum citrosimum*, which is a plant that requires a fair amount of sunlight, and a temperature that rises considerably during the day and falls to about 55° at night. As soon as the plant began to make roots, water in quantity was applied; and although flowers have not been produced, pseudo-bulbs of a good size have matured, from which, as the plant becomes accustomed to artificial conditions, we hope to get flower-producing pseudo-bulbs.

The Resting of Dendrobiums.—Various species will have ceased to grow, and to ensure proper maturity and prevent a second growth, the treatment must now be changed. *D. Wardianum*, *D. crassinode*, *D. Findleyanum*, *D. Hildebrandti*, and *D. primulinum*, which were removed on the completion of growth to cooler quarters, and *D. aureum* and *D. superbum*, which remain in the East Indian-house, should be gradually afforded less water. The thyse-flowering *Dendrobies* should be afforded a drier air and plenty of water at the root when they have finished up their pseudo-bulbs.

General Remarks.—The tropical heat and strong sunshine of the past month have in most cases benefited the warm-house *Dendrobies*, and the shading may remain off the house for a longer period than would have been advisable at an earlier part of the season. This, however, will not apply to *Cypripediums* and other *Orchids* destitute of pseudo-bulbs, though even these may have too much shade during bright weather. The houses have been ventilated pretty constantly day and night, much to the benefit of the inmates. The lower ventilators in the side walls of the *Cattleya*-houses at Clare Lawn have been wide open since early in the month of June, and latterly the top ones have been opened an inch or two day and night. The cool-houses have been, and are, ventilated to the fullest extent.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. VIVIAN, Road Ashton, Trowbridge.

Figs in Pots.—These plants, which, having finished up their crops of fruit, have been afforded plenty of air and full exposure to sunshine, may now be stood out-of-doors, the pots being sunk in coal-ashes, or surrounded with straw litter or ploughed in the ground. Abundance of water during warm weather will be needed by these plants, in order to prevent injury to the leaves and young fruits. The pots being filled with roots, weak manure-water or dressings of artificial manure or of bone-meal should be afforded. Those *Figs* which have swelling fruits upon them should be kept under glass, and given a similar kind of treatment till the fruits are gathered, when they also may go outside. No more side-shoots should be permitted to grow, but all of them should be pinched back whilst still quite young.

Fig-trees in Borders.—Let the shoots be regularly stopped and secured to the wall or the trellis, taking care to avoid crowding them. Afford water freely before the border gets unduly dry, and manure water in accordance with the needs of the trees. While the fruit is ripening, afford air, in order that no moisture may condense on the fruit, and do not syringe the foliage. If fruits have to be sent to distant parts, let them be gathered before they have become dead ripe. Of course, fruit to be consumed on the place is better left on the trees till fully ripe.

Muscat of Alexandria Vines.—The Grapes on the first-started Vines will be fast taking on their final tint, and air should be afforded by both front upper ventilators so as to assist the colouring, a slight

warmth from the hot-water pipes being afforded as well at night. The amount of air should be reduced when the sun's rays have left the roof of theinery, and be increased in the morning before the temperature increases much from sun heat. The side growths should be frequently stopped. It may be necessary to pull aside the leaves, which may be shading bunches that are required early for the table, doing this gradually, or the berries may get scalded. The colour of white Grapes is clearer and freer from blemish when the colouring stage is allowed to proceed without undue haste. All shanked, as also the small seedless, berries should be removed as soon as detected. Should red-spider infest the leaves, syringe them carefully with pure rain-water, or wipe them with a sponge dipped in the same. The latter method may cost more time, but it is the more effectual. The floors of the vineries should be damped often during the hottest part of the day.

PLANTS UNDER GLASS.

By C. R. FIELDER, Gardener, St. James's House, Malvern.

Gesnera exoniensis.—The flowering-season of this showy winter-flowering plant may be extended into the early spring by starting the tubers in successional batches. It is, however, useless to attempt to start them into growth until they have been thoroughly rested, for the tubers, though repotted and placed in the stove, cannot be induced to start much before their proper season. It is, therefore, only by retarding a portion of the stock that the flowering season may be most readily prolonged, the latest portion being kept dormant until the tubers exhibit signs of voluntarily starting into growth. If any tubers which have rested since last spring are available, a number of them may be introduced into heat at this date, repotting the tubers singly in 3-inch flower-pots, the top of the tuber being sunk half-an-inch below the level of the soil. The latter may consist of loam, leaf-soil, and peat, in equal parts, with as much sharp sand as may be needed to give it porosity. This mixture should be passed through a ½-inch meshed sieve. Place the potted tubers upon a shelf in the plant-stove, and keep the soil in a slightly moist state until growth has commenced, when a little more water should be afforded, increasing the quantity as time goes on. The plant should be afforded a moist, high temperature, with much moisture in the air during growth. Syringing of the foliage should not be practised, as it spoils the beauty of the leaves. When the roots have reached the sides of the pots, the plants should be shifted into 48's, and subsequently into 32's.

Show Pelargoniums.—The shoots should now be cut back to within a few inches of the old wood, and the plants placed in a cool airy house or pit in order to break. They may be afforded water once, and afterwards be syringed overhead twice a day till the new growth begins. Usually the breaks are very numerous, and disbudding has to be performed, in the first instance the weak and badly placed shoots being removed, leaving those which are about equal in point of strength; and a little later, a less severe thinning of these may be called for. When the shoots are about an inch in length, shake off the whole of the soil from the roots, shorten the latter somewhat, and place the plants in flower-pots of a size just large enough to contain the roots comfortably, with a small quantity of soil. A suitable compost consists of fibry loam ¾, and leaf-soil ¼, with plenty of coarse silver-sand. Let the plants be potted firmly, and for a few days afterwards afford them light shading during bright sunshine. Water should be sparingly afforded till the plants are well established, much water causing the foliage to assume an unhealthy appearance. Cuttings if inserted at the present time, will make good decorative plants in the spring. Short well-ripened shoots of the current season's growth, a few inches in length, will strike readily if inserted singly in thumb-pots filled with sandy soil, and placed on a greenhouse-shelf, or in a cold frame.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt Tetbury, Gloucester.

If the arrangement of the flower-beds or the plants that till them do not please, or the borders of herbaceous perennials are unsatisfactory, now that they have all attained perfection for this year, notes should be made of contemplated improve-

ments. The most satisfactory way of setting to work is to make plans of the parterres, beds, or borders, writing in the names and numbers of the plants required to fill them, which become useful references when propagating bedding-plants, and prevent the common occurrence of having too many of one variety and not enough of others. When new plants are planted in the borders of herbaceous perennials, and they are found subsequently to be out of place by reason of unsuitability of height or of habit, it is wise to indicate more suitable spots for the plants, placing labels at these spots bearing the names of the plants, and a mark showing that they have to be removed thither. If this system were adopted generally, much trouble at planting-time would be saved; and it is the only means of making such borders perfect. Continue to remove dead leaves and faded flowers from the beds, and to peg down *Verbenas*, *Ivy-leaf Pelargoniums*, &c., and remove shoots which have grown out of bounds. Place stakes and ties to all plants requiring support, remove weeds, freshen and stir the surface with the Dutch-hoe, raking and making it neat. *Calceolarias* should now be afforded manure-water in order to maintain the flowering, and induce a good growth of shoots. *Lobelias* also suffer if allowed to become dry at the roots, or starved; moreover, the shoots which have flowered should be nipped off, thereby enabling fresh shoots to push up and produce flowers. Afford Stocks, *Zinnias*, *Salpiglossis*, *Marigolds*, and other strong growing annuals weak manure-water twice a week, and damp the foliage of *Asters* every evening in order to check the spread of red-spider and thrips.

Coleus, *Iresines*, *Ageratums*, *Alternantheras*, *Heliotropes*, and other tender bedding-plants, should not be topped, but the shoots left to furnish cuttings, which must be put-in in the earlier half of this month.

Roses.—When the flowers of *Crimson Rambler*, *Aimée Vibert*, *Madame Desprez*, *Fellenberg*, *Félicité Perpétue*, *Polyantha*, and other clustering *Roses* are past their best, the old wood may be removed or cut back to points where new growths have started, tying in the shoots loosely to the stakes or arches. If growth is weakly, apply water, and also manure-water well diluted with water; or sprinkle the earth with Clay's Fertiliser, and apply water afterwards. Side-shoots of last year's growth taken off with a beel and dibbled into sandy soil under handlights, and the soil kept moist, soon form roots. Tea *Roses* require liberal manuring either by means of mulches of rich manure or manure-water, so as to obtain strong growths that will bloom this month and September. Continue to bud *Roses*. *Crimson Rambler* forms excellent heads when budded on the Dog Rose, at 5 to 6 feet from the ground.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Cauliflowers.—These plants should be afforded water abundantly, and at fortnightly intervals liquid-manure. Good Cauliflowers can only be obtained in such a season as this by abundant applications of water to the land, which must be rich, and have been deeply trenched. In hot weather go over the rows of plants, and turn in or break down a few of the inner leaves over the curd, and run the Dutch-hoe between succession plants; also draw a little soil up to the stems, having previously afforded liquid-manure and water to the soil if it be dry.

Coleworts may be planted out thickly on firm land in good heart, affording the seed or nurse-bed water before lifting and after planting them; and if the soil is loose make it firm about the roots, and plant deeply on all light soils. The compact little Cabbages that grow under this kind of treatment will be found very useful in the winter, and of good quality.

Onions.—Keep the beds free from weeds, and if the soil is very dry afford it a copious soaking with clear water. Of such as show signs of ripening, press down the tops with a wooden rake. If large Onions are required, and the plants have been well thinned, soak the land with guano-water or some other approved artificial liquid, doing this thoroughly so that it may reach the roots. Do nothing to unduly hasten maturity.

Potatoes.—When the early varieties become ripe, dig up and sort the tubers, picking out the required

number of sets and storing them in a cool place. If tubers are left in the ground after the skin has got firm, they will quickly start into growth in showery weather. Let all the land occupied with Potatoes be freed from weeds, not permitting any to reach the seeding stage.

Rhubarb.—Now is a good time to preserve stalks of Rhubarb, these being now firm and less full of juice than earlier in the summer, and consequently the jam will keep well, and be of finer quality. Mark those roots intended for forcing, for which purpose the roots should be specially prepared.

Chicory, Dandelions, &c.—These plants should be grown to a large size, the hoe being frequently run alongside and between the rows, and water and liquid-manure afforded so as to encourage growth.

Globe Artichokes.—After all the usable heads have been consumed, remove all the stalks for the plants' sake, and for neatness. Copious applications of water and of manure-water, greatly tends to throw strength into next year's shoots and stems.

Lettuce and Endive.—Sow seeds of Lettuce and Endive in good quantity, and plant large breadths, to meet all probable demands. Hick's Hardy White Cos, and some of the hardy Cabbage are varieties that should be sown from now onwards. When sowing, pour water along the drills, and also when planting.

Turnips, Lettuce, Radishes, Spinach, and other kinds of salads and vegetables for summer supply, should, when convenient, be grown in shaded cool borders.

The term "accumulated temperature indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 29, is furnished from the Meteorological Office:—

"The weather, after the 23rd, when thunderstorms and heavy rains occurred in many parts of our eastern and southern counties, the weather over England was mostly fair, warm, and dry. In Ireland and Scotland, showers were rather frequent, but at the close of the week, the fair dry weather was extending also to those countries.

"The temperature was above the mean over the whole Kingdom, the excess amounting in most districts to only 1° or 2°, but in 'England, S.' to as many as 4°. The highest readings were observed at various times in the different districts, but mostly either between the 24th and 26th, or on the 29th. Over the central and south-western parts of England the thermometer touched 80°, and in 'England, S.' it rose to 85°; in the western and northern parts of the Kingdom as a whole, however, it went very little above 75°, and in 'Scotland, W.', only reached 70°. The lowest readings occurred on various dates in the latter half of the week, when the thermometer fell to 41° in 'England, S.' and 'Ireland, N.', and to 44° in the 'Midland Counties.' In 'England, S.' it did not fall below 50°, and in the 'Channel Islands,' only reached 54°.

"The rainfall was considerably less than the mean in all districts excepting 'Scotland, N.' and 'England, E.' In the former district the amount was considerably more than the mean, while in 'England, E.' it was just equal to it, the result in the latter case being due to the heavy thunder rains which occurred on the 23rd.

"The bright sunshine was in excess of the mean over the eastern, central, and southern parts of Great Britain, but was either normal or slightly deficient in other districts. The percentage of the possible duration, ranged from 68 in 'England, S.W.'; 64 in the 'Channel Islands,' and 59 in 'England, S.'; to 25 in 'Ireland, N.' and 17 in 'Scotland, N.'"

Obituary.

LADY DE WALDEN.—We regret to announce the death of Lady de Walden on Saturday, July 29, at St. James's House, West Malvern. Lady de Walden was an enthusiastic patron of horticulture, taking a personal interest in her gardens, and spending large sums of money upon her fancies, which embraced among others Orchids. She erected extensive ranges of glass-houses in the gardens of Mote Park, Maidstone, of which estate she was but the tenant; and paid, moreover, a heavy sum of money to be released of the tenancy, when obliged to go to Malvern on account of the illness of her daughter. The glass structures were then removed to Malvern and re-erected.

MRS. RICHARD PARKER.—Many of our readers who may have visited the ducal gardens at Goodwood, Sussex, will learn with regret of the death, recently, of Mrs. Richard Parker, the wife of the head gardener at that place. The funeral took place at Brompton on July 26, on the anniversary of her birthday.

MARKETS.

COVENT GARDEN, AUGUST 3

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Helbron, Punitan, Snowdrop, Up-to-Date, &c., £64 to 10s. John Bath, 32 and 34, Wellington Street, Covent Garden.

REMARKS.—The Apples quoted above are all home grown, for there are as now but few from Victoria on sale. Vegetable Marrows are plentiful and cheap. Strawberries had a short season, and are now at an end; of Raspberries, there is still a fair supply. A few English Plums are arriving, and next week a general supply of early varieties may be expected. The white Currants quoted are from the Sandwich district, which generally come in the oval gallon-basket, twelve of which go into a box. Gooseberries are nearly over for the season.

SEEDS.

LONDON: August 2.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's market presented quite a holiday appearance. New English Trifolium has this week been in improved demand, and at a substantial advance in value. For White Mustard there is a steady sowing request. Samples of new English Rape-seed are now appearing. There is some enquiry for new Rye and Tares. The market for Canary-seed exhibits less excitement; holders, however, express confidence as to a further upward movement shortly. Supplies of Hempseed seem nearly exhausted. There is no change in either Peas or Haricots. Linseed keeps firm.

CORN.

AVERAGE PRICES OF BRITISH CORN (per Imperial qr.), for the week ending July 29, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

FRUIT AND VEGETABLES.

GLASGOW: August 2.—The following are the averages of the prices recorded since our last report:—Gooseberries, 9s. to 10s. per cwt.; do., Sulphur, 5s. per half sieve; do., Crown Bobs, 1s. 3d. to 1s. 9d. per quarter sieve; Grapes, Guernsey, 8d. to 1s. per lb.; do., English, 1s. 3d. to 1s. 9d. do.; Greengages, 2s. 9d. to 3s. per round; ditto., 3s. to 5s.; per pad, 2s. 6d. to 4s.; do., halves, 6s. to 7s. 6d.; Plums, 6s. to 9s. per half sieve; Melons, Valencia yellows, 24s. 5s. 6d. to 7s. per case; 36s. 6s. to 7s. do.; Peaches, home, 4s. to 8s. per dozen; Currants, Black French, £18 to £22 per ton; do., Dutch, £16 to £18, do.; Strawberries, Scotch (hampers), 24d. to 34d. per lb.; do., crates, 3s. 6d. to 5s. per dozen punnets; Tomatoes, Scotch, 5d. to 8d. per lb.; do., English, 4d. to 5d. do.; do., Guernsey, 3d. to 4d. do.; Valencia, 4s. to 5s. per case; Peas, 3s. 6d. to 4s. per half bag; 8s. 6d. per bag; Carrots, Dutch, 4s. to 5s. per hamper; Cucumbers, 3s. to 4s. 6d. per dozen; Cabbages, 1s. 3d. per dozen; Cauliflowers, Edinburgh, 2s. to 2s. 6d. per dozen; Onions, 4s. 6d. to 5s. per cwt.; Parsley, 1s. to 1s. 6d. per stone; Lettuces, round, 9d. to 1s. 3d. per dozen; do., Cos., Horseradish, 3s. per bundle; Mushrooms, 1s. to 1s. 3d. per lb.; Beetroots, 6d. to 9d. per dozen; Spinach, 2s. to 3s. 6d. per stone; Turnips, French White, 8d. to 9d. per bunch; round new Carrots, 9d. do.; Scotch Turnips, 3s. to 4s. per dozen bunches; do., Irish, 6s. to 12s. do.

LIVERPOOL: August 2.—Wholesale Vegetable Market.—Potatoes, per cwt., Early Regents, 1s. 6d. to 2s.; Kidneys, 2s. 6d. to 4s.; Turnips, 6d. to 8d. per doz. bunches; Swedes, 2s. 3d. to 2s. 6d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Parsley, 6d. to 8d. do.; Onions, foreign, 2s. 6d. to 3s. per cwt.; Lettuces, 4d. to 6d. per doz.; Cucumbers, 1s. 3d. to 1s. 4d. do.; Cauliflowers, 1s. to 1s. 6d. do.; Cabbages, 8d. to 1s. 4d. do.; Peas, 2s. to 2s. 6d. per bushel; Beans, 10d. to 1s. 2d. do. *St. John's*.—Potatoes, new, 1d. per lb.; Grapes, English, 1s. 6d. to 3s. do.; do., foreign, 1d. do.; Pines, English, 4s. to 6s. each; Currants, white, 4d. per lb.; do., black, 5d. do.; Gooseberries, 2d. per quart; Peas, 1s. to 1s. 2d. per peck; Cherries, 6d. to 8d. per lb.; Cobnuts, 8d. do.; Cucumbers, 8d. to 1d. each; Mushrooms, 1s. per lb. and basket. *Birkenhead*.—Potatoes, 10d. to 1s. per peck; Peas, 10d. to 1s. 4d. do.; Cucumbers, 2d. to 6d. each; Cherries, 6d. to 8d. per lb.; Currants, black, 5d. do.; do., red, 3d. to 4d. do.; Gooseberries, 2d. to 3d. do.; Peaches, 3d. to 4d. each; Grapes, English, 1s. 6d. to 3s. per lb.; do., foreign, 6d. to 8d. do.; Pines, English, 1s. 6d. to 3s. each; Mushrooms, 6d. to 1s. per lb.

ANSWERS TO CORRESPONDENTS.

AMARYLLIS BELLADONNA: R. E. B. The flowers appear before the leaves, consequently it is not desirable to afford the bulbs water before the flowers have appeared and leaf-growth has begun, and even then the soil should be very sparingly afforded water at first. You seem to have afforded water far too early, and the result is decay of the bulbs, and of the few roots produced. It was right to pot the bulbs in June, but you erred in applying water before there were roots to take it up.

APPLES: G. W. The fruits sent show vividly how great was the damage wrought by the hail.

APPLE-TREES: J. M., and J. M. The insect is *Schizoneura lanigera* (American-blight), and very injurious to the trees. At this season you cannot do more than syringe the trees with petroleum emulsion; but in the winter stronger measures should be taken. At that season the trees should be pruned, then all the rough bark should be shaved off, and burned forthwith, together with the prunings, and the branches and stem cleaned with hot-water, and Gishurst Compound-soap, 4 oz. to the gallon of water. This washing with hot-water and soap may be performed thrice, but not later than the middle of the month of February. Having cleaned the tree in the manner indicated, uncover the roots, but do not otherwise disturb them, and saturate the soil with soap-suds and farm-yard sewage, replacing the soil thrown out with clean soil from the kitchen-garden quarters. It does good to put some smothering coating on the stem and branches consisting of strong clay, cow-dung, lime, and soot, made into a thick paint with water.

BEECH: Thos. Taylor. The insect is *Chermes Fagi*; most difficult to dislodge from large trees. You might syringe the tree with petroleum emulsion made by mixing petroleum at the rate of a wineglassful to 3 gallons of strong soap-suds, preferably made with good soft-soap. It should be kept well agitated whilst being used.

BEGONIA LEAVES SPOTTED: E. G. This is due, we think, in this case, to watery globules acting as burning-glasses under hot sunshine. It might easily occur on plants afforded water on the morning of hot days. No fungus was discovered on the leaves and shoots sent.

BULBS AND SPRING FLOWERING PLANTS: J. H. We must state at once that you cannot hope in this country to cut flowers all the year round. With glass protection it is different. There need then be no break in the supply. Out-of-doors in the winter months there are Winter Aconites, Snowdrops,

single and double flowered; then come Daffodils and Narcissus in long succession; Hellebores in variety; Dutch bulbs, Lily of the Valley, Early Gladiolus, *Doronicum plantaginum*, *Myosotis* in variety; Early Phloxes, Paeonies, Violas, Paeonies, herbaceous and shrubby, Gaillardias. Of shrubs, we may mention Lilac, *Philadelphus* in several varieties; Weigela, Magnolias, Rhododendrons, the many forms of Azalea, *Andromeda*, *Kalmia*, &c. The summer flowers are legion, and we advise you to consult a nurseryman growing hardy herbaceous plants in a large way.

CARNATION SEEDLING: J. R. We should judge your variety to be a valuable one for cultivation in the border. The flowers are good, and of a particularly pleasing tint of rose-colour. It is erect, and possesses long stems; whilst its habit, as described by yourself, is exceptionally good. Many of the new Border Carnations have not sufficient constitution to render their cultivation desirable.

CHRYSANTHEMUMS DISEASED: J. E. A strong-growing fungus is present in all brown parts of the leaves, and where it passes over to green parts, discoloration soon follows. All diseased leaves, and any which may fall off, should be collected and burnt; the same treatment may be given to any plants which are badly diseased. We should then isolate the healthy plants from the sickly, and keep the lots as far apart as possible. Give as much air as possible, and do not over-feed or over-water the plants. The remedy you are using is not suitable for this fungus. Try potassium sulphide (3 oz. to each gallon of water), or Bordeaux Mixture (see recipe, *Gardeners' Chronicle*, May 20, 1899, p. 328). In the same column you will see a reply dealing with a disease of somewhat the same nature as this you send. This disease of *Chrysanthemums* is fairly common; you would benefit growers generally if you carried out a few experiments with the above fungicides, and gave the results in this paper. Too little is known about suitable remedies.

CHRYSANTHEMUM-RUST: F. M. The larvæ of a small insect that you have noticed upon the leaves affected by "rust-fungus" may be instrumental in spreading this pest, but they could never produce it were there no fungus upon or near the plant.

CUCUMBERS: J. D. The roots are badly affected with eel-worm, often figured and described in these columns. Turn out the soil, and get fresh. To avoid mischance, you will do well to soak the new soil in boiling water; or, better still, to bake it before use.—H. V. S. Eel worms, probably; send roots.

DEATH OF FUCHSIAS, AGERATUM, &c., IN A WINDOW-BOX: Rose of Castile. The result of excessive moisture in the soil, the great richness of which helping to bring about the decay of the roots of the plants. Probably the drainage of the boxes was imperfect.

EARWIG: J. A. P. An Anglo-Saxon word, signifying ear-beetle. It is erroneous to suppose that these creatures have any special propensity to enter the ear.

GRAPES: B. A. J. The bunches have many shanked berries, due to a variety of causes, of which over-cropping, loss of roots from a wet, unsuitable soil, and a great check arising from the wholesale removal of shoots and leaves. The foliage was infested with red-spider. In reference to measures to rid the Vine of these unwelcome mites, see our "Fruits under Glass" calendar, this week's issue.

HEAD GARDENERS' ALLOWANCES: A. Z. These are taken as worth so much to the gardener in money, and if he do not obtain them, it is usual to pay him a higher wage, or provide a garden in which he may grow enough vegetables and hardy fruits as he may desire. Single men and married childless gardeners, require but little, and no rule can be framed that will meet all cases. Professional pride and self-interest will induce most gardeners so to cultivate the garden, that enough and to spare is produced to supply the master's table in abundance, so that no question of short supplies will arise. In order, however, to avoid friction between master and gardener, it is always better to have a written agreement, in which all such matters as perquisites and allowances are clearly set forth, and such documents should be stamped so as to give them legal value.

INSECTS: A. B. Your *Asparagus* is badly infested with the very injurious beetle, *Crioceris asparagi*. The grubs are matured from the eggs in about a fortnight; they then go into the ground, and return as perfect beetles in about an equal period of time. They multiply very quickly, and generations succeed each other rapidly. In the case of badly-infested beds, the process of hand-picking is slow and unsatisfactory. Miss Ormerod recommends that the *Asparagus* be syringed with water sufficiently hot to dislodge caterpillars and beetles from the *Asparagus* shoots. Another man should follow the sprayer, and tap or shake the plants, in order to remove any that have withstood the syringing. As this is being done, scatter upon the surface of the beds—and therefore upon the pests—a good dressing of soot or lime, or both, and, if necessary, repeat the whole process. Later in the season the plants should be cut over as soon as is practicable, and the growths burned. The surface should be raked from the beds also, and charred.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—P. B. 1, *Asclepias curassavica*; 2, *Pentas carnea*, *Centranthus ruber*, *Eleagnus reflexus*, shrub, a grass, and a Fern: labels detached and illegible.—Cambrian. 1, *Galium Aparine*; 2, *Polygonum aviculare*; 3, *Stellaria media*.—A. T. B. *Cimicifuga racemosa*.—R. C. B. A, *Eucalyptus Raveretiana*; B, *E. calophylla*; C, *E. microcorys*. Yes, you may prune them back in moderation.—X. Y. Z. 1, *Asplenium bulbiferum*; 2, *Nephrodium molle*; 3, *Athyrium filix-femina*; 4, *Adiantum formosum*; 5, *Polystichum coriaceum*; 6, *Adiantum Waltoni*, a garden form.—Bel. *Datura stramonium*, Thorn-apple—poisonous.—E. T. F. 1, *Eurothera bifrons*; 2, *E. grandiflora*; 3, *Ceanothus Gloire de Versailles*.—T. C. K. *Linaria purpurea*.

ONION: W. H. S. Your bulb has made a solid stem in place of a tuft of leaves, and this has produced the second bulb or bulbil, probably after receiving a slight injury.

ONIONS: S. H., Suffolk. The Onions sent are perfectly sound, with no trace of any disease. The withering of the leaves has probably been caused by the intense heat of the sun affecting certain examples. There is no fungus peculiar to the Onion on the leaves; the little specks of brown mould have followed the withering.

PEA: W. Kilgour. The variety is the Purple-podded Pea. The flowers are bluish-violet, not so deeply coloured on the standard as on the wings. The seeds have the defect of changing to brownish colour when boiled, like field Peas. It is more curious than useful.

PEAS DYING: C. K. We would refer you to the remarks made on a case similar to yours in our last issue, p. 100.

PLANTS FOR NAME: Amateur. Owing to lack of suitable packing, and the great heat, the specimens sent were unrecognisable.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATIONS IN HORTICULTURE: T. S. You should apply to the Secretary of the Society, whose office is at 117, Victoria Street, Westminster, S.W.

STRAWBERRIES: J. W. It is quite impossible for us to form an opinion upon the merits of the Strawberry you send, as they have arrived in exceedingly bad condition.

TENWEEK STOCKS FAILING TO GROW: J. M. If you have found maggots at the root, they are probably those of some species of weevil, common in turfy loam that is used in a fresh state. Can you send some for identification? Meanwhile, apply nitrate of soda at the rate of 2 oz. per square yard of ground. Stocks will fail to grow satisfactorily if removed from the seed-pots late, or the tap-root be injured in the removal.

WATER-LILY BLOOMS TO REMAIN OPEN AT NIGHT: W. C. As soon as the bloom expands, smear a little liquid gum upon the stigma.

THE

Gardeners' Chronicle

No. 659.—SATURDAY, AUG. 12, 1899.

SPRING IN THE DRY BELT OF BRITISH COLUMBIA.

TO see the Fraser River cañon in the month of March, near Lytton, one would never dream of the wealth of floral beauty squandered there during the next three months. Lytton is in the "dry belt." It is dry—very dry; it is also windy—very windy; so very windy that it passes anything that you have ever fancied in your flights of imagination. Not that the wind is tempestuous, but it is always present, pulling, pushing, tugging at you, and making life miserable. All one can see is dry, stony banks of gravel and sandy benches, and behind them steep, rugged mountains, covered with snow, and a growth of scrubby Pines and Firs. The last place in which anyone would dream of finding quite a carpet of flowers. Yet the land is fertile, as is evident where water has been brought from the creeks, and irrigation employed. The various ranches produce good crops. Even Tomatos, Melons, and Vines produce an abundant harvest of fruit; for the summer is hot, if somewhat short.

Our first flower is the diminutive *Fritillaria pudica*. At the end of March its nodding bells appear on the dry sandy benches. It is well named "modest," for it usually seeks the protecting shelter of some friendly Sage-bush. The bulb is found 4 or 5 inches deep, and dies down early, and has a long season of summer baking. I would suggest lifting the bulbs (in England) say in July, and placing them in a box of sand, left outside under a south wall, and protected from summer rains. Before this little gem has gone, a little *Dodecatheon* appears, highly coloured, but very dwarf—4 to 6 inches—with narrow lanceolate leaves, and very fine roots; not fleshy like the others. I have been unable to get this species named. It is now (June) in flower at 4000 to 6000 feet, and much larger—6 to 12 inches. Then a host of little flowers spring up everywhere, making the desert into a garden of Eden for the time being. A large *Fritillaria*, with purple-black flowers, and an unclean savour, occurs on the wet ranch meadows. My friend, Carl Purdy, of California, calls it the dark northern form of *lanceolata*, but at Kew it is named *lilacea*. It also is now in flower at 4000 feet on grassy slopes. *Anemone narcissiflora*, creamy-white, grows in the full sun near every stream or ditch, but not in wet ground. The "Olalli," Service-berry (*Amelanchier canadensis*), a beautiful, white-flowered shrub, grows along all the streams. A lilac *Pentstemon* grows on the driest spots of the driest banks in great gorgeous masses, often 3 feet across. A large, yellow *Helenium* grows on rocky ground, and flowers for many weeks, and can be found all through the summer at high altitudes. A *Delphinium* of a bright, dark blue is very conspicuous, an annual, I think; and a tall blue *Brodiaea*, probably *Douglasii*, is occasionally encountered; and about the last is an annual *Gaillardia* in

full flower now. Flowering shrubs are in evidence everywhere.

By the middle of May the snow has left the mountain sides to the height of 5000 feet, at any rate on the southern exposures, and flowers begin to peep up in the mountain woods and valleys. As soon as one gets out of that dry Fraser cañon, lo! everything changes. Go up any little valley to about 2000 feet, and the Firs and Pines take on a nobler shape, Ferns begin to appear, grass to grow, and the country might be old England again. Indeed, I can see no difficulty in growing anything from here at home. The woodland plants, of course, require shade and leaf-mould, but those that inhabit the open country, seem to grow in any soil or exposure.

Calypso borealis is the first one meets. It occurs from 1000 to 4000 ft. in glades and shady spots, but never in dense thickets or swampy ground and grows in clusters, never more than 1 inch deep in loose humus. Anyone who tries to grow this Orchid in ordinary garden soil, will, I fear, be doomed to disappointment, but it should be quite at home in our native woods, or as a denizen of an unheated shaded green-house.

The most lovely flower is *Erythronium grandiflorum*, as I found it on one trip up into a little valley surrounded with rolling grassy hills. It first occurs in patches about 3000 feet altitude, but about 4000 feet it is everywhere, covering the mountain slopes with a yellow mantle; there must be millions to every acre. I counted over a hundred in a square yard. This is the true golden yellow *Erythronium*, and has usually two to four flowers, but one often finds specimens with five and six, and one had seven. It grows also in glades and the edges of woods, but does best in the open; it is deep in the ground, 6 to 8 inches down. It has the colour of Daffodil Golden Spur. Our old friend, the dark *Fritillaria* is with them; also a fine *Thalictrum*, probably *adiantifolium*, is very abundant. Two *Smilacinas* are here; one of no account, but the other is a darling. I cannot find the "fly in the ointment," but fear there must be one, or this plant would long ago have been as popular for Easter decoration as *L. Harrisii*. It has large, bold foliage, like Solomon's Seal, grows 1 to 3 feet, with a terminal raceme of fragrant white flowers, resembling *Spiraea japonica*. The racemes are often 6 inches long, by as much wide. The roots resemble those of *Cypripedium spectabile*; it should make a handsome pot plant. It seems to grow anywhere—in sun or in shade, but best in shade.* A yellow *Cypripedium* grows lower down the mountains, and is scarce; and a brown-petalled, white-lipped one is plentiful a little higher. Of neither of these can I yet give the name. Some half-dozen kinds of *Viola*, all scentless, are here, and flowering shrubs in abundance. An orange-red Honeysuckle is very conspicuous. Strawberries are everywhere, and Gooseberries, Raspberries, Thimbleberries (*Rubus occidentalis*), Currants, and Chokecherries (*Prunus virginiana*) abound high and low. *Zigadenus venenosus* crops up occasionally. Among all this galaxy of beauty a *Castilleja* stands out prominently. It seems an annual, and has six to twelve stems a foot or so high, with a cluster of glorious vermilion or orange-coloured bracts, and flowers at the top of each. A ridge covered with these blue Larkspurs and yellow *Heleniums*, with a few *Olallis* about to tone it down, is a sight to remember in after years. *Edu. Alex. Wallace.*

* Since named at Kew *C. montanum* (Pursh), and *C. occidentale* (Douglas).

NEW OR NOTEWORTHY PLANTS.

ASPLENIUM FAWCETTI, Jenman, n. sp.*

THIS very interesting species, and beautiful addition to the *Trichomanes* group of the genus in Jamaica, was gathered last November by Mr. Wm. Harris, Superintendent of the Cinchona Plantations, and at his request is named after his chief, the Director of Gardens and Plantations. Its distinguishing features are the numerous pinnae (three doz. to five doz. on a side), their dwindling to nearly but not quite nothing at the apex of the frond, the very fragile rachis, and the markedly conspicuous, silver coloured involucre. The rachis, which is occasionally wavy, sometimes bears a bud in the axis of a leaflet an inch or so short of the apex. The plant is widely distinct from *A. monanthum*, L., as well as the other species of the group.

THE CYCLAMEN AND ITS CULTURE.

DURING a talk with a successful cultivator of *Cyclamens*, he said to me: "The *Cyclamen* is generally one of the first plants a gardener turns his attention to, and invariably proves one of the first to dishearten him."

I am sure it would be no exaggeration to state, that of the establishments known to any individual, those in which *Cyclamens* are really well grown, would not form a large proportion. It may be, as above mentioned, that eventually one becomes disheartened; for the *Cyclamen* if succeeding but indifferently, is certainly far from realising one's "beau ordeal" of a greenhouse plant in flower. The leaves are flabby, and wanting in chlorophyll, the petioles are weak and unable to hold themselves erect, and the flowers appear one by one, as though afraid to show themselves; so that altogether, the plants make an unsatisfactory figure. But when successfully grown, *Cyclamen latifolium* and its varieties are the most useful of winter-flowering greenhouse plants, and with proper treatment may be had in flower from November to April, that is, during the duller part of the year.

August is the month in which to sow the seed if plants are required to flower the following winter twelvemonths; thus, about fifteen months elapses between the time of sowing the seeds, and the season when the plants begin to bloom. Well-drained pans are filled with light sandy soil to within $\frac{1}{2}$ inch of the top, this latter precaution being taken so that the seedlings may be seized the more easily by the thumb and finger when the proper time arrives to prick them out. The seed must be thinly sown, and but slightly covered with soil. Place the pans, which are covered with pieces of glass, in a light position in the propagating pit, affording a temperature of 55° at night, and shade when the sun shines hotly. The seedlings will begin to appear in about six weeks, and when

Asplenium Fawcetti, Jenm., n. sp.—Root-stocks clustered, very small, fibrous, the centre densely clothed with fine, attenuated, castaneous scales; stipites in tufts, semi-erect, slender, wiry but fragile, margined, castaneous or darker, $\frac{1}{2}$ to 2 inches long; fronds spreading, linear, and much narrowed to the apex, but without a naked tail, a span to 1 foot long, 6 to 8 lines wide, narrowed at the base, thin, dark green, naked; rachis very slender, fragile, dark, glossy, channelled with scarious margins; pinnae very numerous, sessile, dwindling mostly to mere pinpoints in the outer part of the fronds, and reduced to aricles at the base, rhomboidal and subdimidiate, the superior base wide, but hardly auricled, the inferior base absent, 4 to 5 lines long, 2 lines wide, spreading, contiguous, but not touching, broadly rounded, and conspicuously bluntly toothed along the upper and round the outer and inferior margins to where the base is cut away; veins pinnate, at an acute angle, falling short in the teeth, three to a side, all simple, but the inferior one on the superior base, which is once forked from below the middle; sori on both sides of the mid-vein, two or three to a side, lateral on the veins, about one line long, distant from the margin, and usually short of the base; involucre conspicuous, bright silvery.

Blue Mountain Peak, 7300 ft. alt., Jamaica.

the first leaf has reached an inch or so in height, they should be potted off singly in thumb pots, filled with a similar soil to that previously used. At this period, it is a good practice to put up a small staging of boards and cover it with coal ashes, and resting on pots on the ordinary stage of a house for the little plants. The night temperature in this house should range from 50° to 55°. During fine weather, a slight syringing twice daily should be afforded, as it keeps the plants moist, and they grow fast. In order to prevent dryness, at each potting, the corm is kept well down in the soil, leaving rather more than the top visible; the object being to cover the corm sufficiently to keep it moist, but at the same time, so high that the leaves and flowers when pushing forth will not be liable to damp off. Shading will now hardly be necessary, but by the beginning of the month of February, the plants will be ready for a shift into large 60-pots, and a compost of $\frac{1}{2}$ loam, $\frac{1}{2}$ leaf-mould, with plenty of silver-sand, should be afforded at this stage.

The plants may remain in the same house till the month of April, air being admitted whenever desirable without exposing them to draughts or unduly lowering the temperature. Syringe them lightly in fine weather once or twice daily; afford water judiciously, not making the soil too wet so as to cause the leaves to damp off, and, on the other hand, not keeping it too dry so as to cause a check to growth. Towards the end of the above-mentioned month, the final potting should be performed; the best and strongest plants being put into 32-sized pots, and the remainder into 48's. Fibrous loam and leaf-mould in equal quantities, with a good proportion of silver-sand, and a little of Clay's fertiliser added, are found to meet their requirements at this stage. When potted, stand them on a bed of coal-ashes in a cold frame, keep close and syringe, and shade them for a few days. When fairly rooted in the new compost, it will be necessary to shade them only for a short time in the hottest part of the day. Throughout the summer they must have cool treatment; affording plenty of air to the house or pit, and even leaving a little on at night. Cleanliness is much aided by freely using the syringe as opportunities occur. Afford abundance of water when the plants are growing fast, and occasionally apply liquid-manure.

At the commencement of October, those which appear to be the most forward should be removed to a span-roofed pit, having a night temperature of 50° to 55°. These form the first batch, and may be had in flower in the month of November. To have the plants near to the light, and to allow a free circulation of air between them, it is advisable to stand them upon a second stage, or singly on flower-pots. As the weather becomes cold, the remainder of the plants may be brought into a house or pit having the temperature given above. With proper attention—airing when possible, using manures, carefully affording water, and strict attention to cleanliness—a succession of flowers may be secured the whole winter through.

In the opinion of many cultivators, Cyclamens are at their best when two years old; they are then stronger than those of one year's growth, and consequently able to produce a better display of flowers, although we find that, after the second year, a straggling growth is developed, and the flowers deteriorate in quality. When the first season's plants have finished flowering, if seed is not required, all the blooms should be removed; the former are then gradually dried off, and finally placed out in the full sun. If shaken out and repotted in July, they may be expected to commence flowering by the month of November.

The fumigating compound XL is proved to be of great service in keeping Cyclamens in a clean and healthy condition. I am well aware that the above method of culture may differ considerably from that followed by many experienced growers, and simply give it for what it is worth; adding only that it has proved itself to be a good one. *H. H. T.*

SOUTH AFRICAN NOTES.

JOHANNESBURG.

THE EUCALYPTUS AS TIMBER TREES.—Last June I cut down a particularly fine specimen of *Eucalyptus viminalis*, planted ten years ago. It was a street tree, one of six in a row, 15 feet apart. It was 135 feet high, and measured 6 feet in girth next the ground; height when planted, about 1 foot. Nearly half the timber was sold for £2 as firewood. Not a leaf even of the young growing tops had been touched by frost, of which we had 8° on the night of May 26. The same cold has nearly bared large trees of *Eucalyptus robusta* of their leaves; *E. citriodora* is killed to the ground. It is proposed to test gum-wood grown near here—mostly *E. Globulus* and *E. viminalis*—for street-paving. The age of the trees from which blocks have been sawn and are now seasoning is from eight to ten years. These trees may be supposed to have produced only unmaturing wood; but owing to our elevation of 6000 feet above the sea-level, and severe climate, young timber is very dense and hard in texture. I have often observed many young trees seed more abundantly here than in Natal and such-like moist, warm climates. In other parts of S. Africa, *Acacia melanoxylon*, at the age of from fifteen to twenty years, bears very little seed; but here, trees five years old yield plenty of good seed.

VEGETABLES AND FRUIT.

In spite of the very dry weather—only 12 inches of rain from May 11 to July 9—the market is well supplied with splendid vegetables. Such first-class Cauliflower, Cabbage, Lettuce, Celery, Carrots, Turnips, and Beet, I do not think will be found in any other market in S. Africa. Our growers are mostly clever, hard-working Italians and Portuguese, and their secret is plenty of stable-manure, and adequate irrigation. Large, well-coloured Tomatoes come in from the Rustenberg District, some 60 miles from here, where frost is unknown. From the same locality come first-rate Oranges; but we draw our supplies of Mandarin Oranges, Pine-Apples, and Bananas from Natal—though there is no reason to doubt that the Transvaal is able, when once our political question is settled, to produce first-rate fruit of every possible description. Tasmanian Apples in good condition are being retailed at 3s. per dozen. Comment is needless.

TRADE IN FLOWERS.

The flower market is rather bare, and prices rule high. The beautiful *Acacia dealbata* is a mass of golden bloom in the open; but in town, dust soon settles on the flowers, and spoils them. I saw last week bunches of fine *Clanthus Dampieri*, *Marguerite-Carnations*, Violets, Pansies, single and double *Pelargoniums*, white Candytuft, and a very few Tea Rose buds for sale. Poinsettias are fairly well grown in pots, but these flowers come up in quantity from Natal very cheap, where *Camellias* are now very plentiful; but experience has taught our florists that they will not endure the journey here. *Cinerarias* are beginning to come in, to be followed later on by *Primulas* and *Calceolarias*. A few belated *Chrysanthemums* are still to be seen. From the Cape we get Heaths in variety, *Richardia aethiopica*, and *Proteas*—all cut blooms.

A BOTANIC GARDEN FOR JOHANNESBURG.

I am meditating the establishment of a botanic garden in this park; but, as Goethe said, "Beginnings are always difficult," and to lay right foundations for the first thing of its kind in the country requires a good deal of thought. Looking at the botanic gardens in S. Africa, there is only one, so far as I know, which combines the scientific and practical, i.e., Durban; the other gardens are really little else than public nurseries, whose aim is to sell as much as possible.

As regards tree culture, and the right choice of flowers and flowering shrubs, we have done a little

to educate Boer and Uitlander; but modern fruit culture and orchard work are almost untouched. I propose to set apart a plot of ground, and plant it with a properly-named selection of the best hardy fruit-trees, climbers, and shrubs which we may expect to succeed on the High Veld, such as Apples, Pears, European and Japanese Plums, Prunes, hybrid American Grapes, Persimmons, Quinces, Spanish Chestnuts, Almonds, Strawberries, Figs, and perhaps *Rubus laciniatus*. Cuttings and grafts to be distributed hereafter. We are much too cold here for tropical fruits; and, on the other hand, too dry, it would seem, for Raspberries, Currants, and Gooseberries, though these last have not had a fair trial, so far as I have seen. I put forward this scheme with some diffidence, and ask the readers of the *Gardeners' Chronicle* for suggestions and advice. *R. W. Adlam, Curator, Joubert Park, Johannesburg.*

HERESIES.

(Continued from p. 114.)

It is a pity to see good varieties of Strawberries, which in years gone by were thought much of, falling out of cultivation, and their places filled with inferior, if larger-fruited varieties. It scarcely seems the correct thing for the gardener, and still less so for the amateur cultivator, to prefer mere size to good form, colour, and flavour. We seldom find *La Constante* in gardens now, although the plant and the fruit possess notable properties. It is rather late, ripening when the glut of other varieties is over, and has not to compete in public favour with Cherries, Gooseberries, Currants, and foreign Peaches and Apricots, as have the mid-season Strawberries. *La Constante* is a vigorous grower, has a strong, stiff stalk, that carries the fruit well above the soil, and is a great bearer. It is admirably adapted for preserving, and being firm of flesh, the fruit is, as it were, made for travelling without damage.

Peas.—That which has been here written of Strawberries holds good in many instances of culinary Peas. We have discarded very generally such fine old Peas as *Champion* of England, *Veitch's Perfection*, and *Criterion*, for others of less fine flavour and cropping properties. We know of no Pea of as fine a flavour as the first-named; and the second runs it very closely in that respect, and growing less than 3 feet high, is an admirable variety for small gardens. If never allowed to get dry at the root, the plant is not liable to attack from mildew. *Criterion* is a variety which, whilst having good flavour, a full pod, Peas of nice colour, bears a heavy crop of pods, and if the land is copiously afforded water and a manurial mulch, flowering laterals shoot out from the stems, affording quite a half-crop of pods, of as good a size as the first crop. No other Pea that we know of does this. A good instance of this double-bearing of *Criterion* was to be seen at Wrotham Park recently.

Lettuces, &c.—Our gardeners, in hot seasons like the present, rely upon north borders for their Lettuces, and Cauliflowers, and Radishes; but north borders are of limited area, and fall short of the requirements of the gardener, and he must needs plant in the open quarters, and in full sunshine. This should help him to procure that which he wants, viz., succulent salad-plants, quick-growing Cauliflowers, and tender, juicy, but not acid-tasting Radishes—but the water fails him, or the labour to apply it.

Now, in level gardens, or those in which dead-levels can be made readily at little or no extra expense, why should not summer quarters be made in full sunshine for these crops when they are required for consumption in July, August, and September? All that are wanted are a main ditch of say, 6 inches deep, along one side, and cross-drains running out of this one at right angles, and at 6 feet apart. Let water be admitted by means of a hose or pipe, filling the drains, and then let a

man or two, furnished with tin-scoops having long handles, throw the water from the drains over the beds. The men might do this bare-footed, or with clogs on their feet. Besides being afforded water in this manner, there is percolation out of the drains into the soil on either hand. The idea is to keep the plants growing without check, and this can only be done in the manner stated. After September is out, there is no further need to let water into the drains. These can be made fairly water-tight by beating the sides and bottom with the spade, or treading the soil whilst in a moist state. "It is not quite English you knew;" neither is the present weather, we retort.

Water-meadows are not unknown in this country. Why should irrigated summer quarters in our kitchen-gardens down south be unknown? In the

roots slowly and with difficulty, by means of long, bare surface-roots, which twine and twist in every direction, and anchor the tree to the ground like wire cables. It is an undoubted fact that either growth on comparatively poor soil, or circumstances which induce a slow and irregular growth, seem to have marked the career of most of our very old forest trees, and in not a few cases mutilation in the shape of pollarding or disbranching has been their lot at some time or another. It is supposed by many that pollarding tends to quicken the growth in circumference of a tree, and when pollarded in early life it probably does so. But when we reckon the age of a pollard by centuries, it is evident that any advantage in the way of growth to be attributed to the operation, must be confined to the first century or two, when

the rocky slopes of ravines in hilly districts are probably of great antiquity, although there may be nothing about them to attract the attention of the ordinary observer. We believe the Japanese grow miniature Oaks by systematically pinching back the roots, and these plants are kept alive for many years without adding appreciably to their height.

A circumstance we have frequently noticed in the case of pollards, and which may possibly account for their ability to grow when the boles which carry them are merely thin shells, and scarcely able to bear the weight of the crown, is the sending out of roots from the base of the crown-branches and limbs into the decayed heartwood, and which ultimately reach the ground. In such cases, the limbs become independent of the original root-system to a great extent, and the thin layer of sapwood becomes covered with an intercal as well as an external cambium and bark. Many of the old trees in Burnham Beeches are provided with these adventitious sets of roots, and enable the trees to carry crowns which appear little short of miraculous when the extremely thin nature of the shell is considered. To the uninitiated, these roots are frequently a source of astonishment, as they ultimately become covered with bark closely resembling, and practically identical, with that of the exterior of the tree. We remember seeing an old Oak in the Forest of Dean, which exhibited a similar peculiarity, and which had the appearance of a stem growing within a stem. A. C. Forbes, Bowood, Wilts.

(To be continued.)

INCARVILLEA DELAVAYI.

In the numerous communications I have perused relating to this plant it seems to me that though much has been said in its favour, it has not been awarded the praise it deserves. The photograph taken in my garden on June 16 last (fig. 46) shows what *Incarvillea Delavayi* will attain to in a difficult climate close to the east coast, and very different to the sunny south or even to more sheltered spots in Scotland.

My experience extending over about four years may be of some little value. I procured the subject of the photograph from Mr. T. Smith, Newry, in September, 1895, planted it on a border facing south, and partially sheltered at least from north, east and west.

Shortly after planting I placed over the plant a cap-glass with a hole in the top, which I have repeated in the autumn of every succeeding year, removing the glass as soon as growth became visible in the spring. In 1896 the plant produced two flowering spikes with six and four blooms, and year by year it has been more floriferous than in the preceding year, till this season it has fifteen flower-spikes with an average of ten blooms, about three inches diameter, of a rich rose colour on each spike. Notwithstanding this demand on its constitution, I have ripened seed, and hope to bloom many seedlings next year. The seed germinates very freely in a little heat, and after one winter in a cold frame I adopted similar outdoor culture to that of the parent plant. I have seen specimens in pots, but with no good results. The blooms opening as they do successively, keep the *Incarvillea Delavayi* gay for several weeks, provided the weather is not too stormy, as the petals are somewhat thin, and dislike boisterous winds or very heavy rains. W. T. H., Alnwick.

THE ROSARY.

SOME OLD SCOTTISH ROSES.

Of all the Roses at present or lately in bloom, none is possessed, historically, of a greater interest than the "Jacobite" or "Prince Charlie" Rose, the buds of which, along with the white cockade, formed the badges worn by the adherents of the young Pretender in 1745. The variety which, in the north of Scotland, is known as the "Jacobite" is a form of *Rosa alba*, with

FIG. 46.—*INCARVILLEA DELAVAYI*.

(From the Garden of W. T. Hindmarsh, Esq., Alnwick.)

old market gardens, now fast disappearing, of the south-west suburb, Fulham, the Thames-water used to be let in through sluiced drains to flood the land under Celery, Lettuce, and what not. *Grower.*

FORESTRY.

(Continued from p. 66.)

THE DECAY OF TREES.

UNDER ordinary conditions, soil has a great deal to do with the age attained by trees, as well as with their size and health. Rich alluvial or peaty soils rarely carry trees to a great age, although they usually grow rapidly in them for a time. The timber of such trees is of too soft and porous a nature to resist the organic agencies of decay, or the destructive force of strong winds; while the root system of trees growing in such soils is usually less extensive, and confined within a smaller area, than where plant food has to be collected by the

the tree is still in a vigorous condition and able to throw out stout adventitious shoots to replace the removed crown. Such an increase in growth can only be temporary, and gradually becomes reduced as the new crown begins to appropriate the larger share of the elaborated sap formed by the leaves. Such increases in girth, however, render it very difficult to arrive at the approximate age of such trees by calculations based upon the average width of the wood-ring. When pollarded early in life, it is probable that a period of fifty or sixty years is long enough to increase the girth of a pollard to three or four times the size to which it would have attained under ordinary conditions, and size or girth alone is rarely a safe criterion by which to judge of the life of a tree.

In the case of trees which have never been pollarded, but which, like them, are short in bole and wide and low in crown, size is generally a safer indication of age, especially if the soil and situation are not conducive to rapid growth. Those gnarled and stunted Oaks which grow on

flowers composed of two rows of white petals. Like so many single, or all but single Roses, the yet unexpanded buds are exquisite in form, the open flowers, with anthers yellow-brown or black, according to age, being scarcely less beautiful. The plant is vigorous of habit, and forms an upright bush 6 or 7 feet in height. When strongly grown, this very old Rose ranks with the foremost decorative sorts; it is, however, open to question if the above is the variety that supplied blossoms in that eventful summer of the Forty-five. At any rate, the bush (also a form of *R. alba*), which by popular tradition bears the name of the unfortunate Prince, occupies to-day the position where tradition again avers he planted it. This is in a border of the quaint old garden of The Grange, now situated within the precincts of the city of Edinburgh. Fact is, perhaps, even more romantic than tradition in this instance, the truth being that one of the daughters of The Grange household presented the young Prince with buds from the bush, while he on his part unfastened the silver cockade from his bonnet and gave it to the young lady. The cockade is still preserved as a heirloom by the Dick-Lauder family.

This, like other double forms of *Rosa alba*, grows less strongly than the semi-double already referred to. The bud is blush, and the expanded bloom impure white, and as a decorative subject it is altogether inferior to the other. Both, however, are very old Roses, and are mentioned by Parkinson; while it is not unlikely that the double form was in the mind of Shakspeare when he penned the scene in the Temple Garden. It is a very common Rose in cottage gardens; sixty or seventy years ago quite a number of varieties of *alba* Roses were cultivated. The only variety that is now largely grown is Maiden's Blush, which carries us back into the eighteenth century; and Celestial, with lovely buds of purest pink. There is also a very good double white.

Less effective than the above are the Roses which for centuries have been known as "Velvet." They have been referred to the holosericea of Pliny. Gerarde figures a flower having two rows of petals; Parkinson mentions single, double with two rows of petals, and more double with sixteen or more petals; and the single and double are figured in Andrews' *Monograph*. Several distinct Roses are grown as the double, mostly Gallica, but also China. The one mentioned by "E. V. B." in one of her books is very closely allied to the Tuscan Rose, itself interesting as having been the reputed parent of the earlier varieties of *Rosa gallica* raised in Holland. As a matter of fact, though the Velvet Rose was in general cultivation till the present century was well advanced, it is now difficult to find. The "double" of Gerarde I have not yet seen; the single I am a little uncertain about.

We have a very beautiful Rose in Scotland called The Tartan. It grows, so far as I have seen, less strongly than either York and Lancaster or Gloria Mundi, to which it bears a close resemblance. The two latter, it may be noted, though belonging to different sections, seem to have resolved themselves into the Damask variety. Of the latter, a much bewritten variety of the last century, known as Mr. Hart's Rose, seems also to have passed out of cultivation. Though there are numbers of old and interesting Roses now (or lately) in bloom, I shall refer only to one more, the Rose du Roi, known also as Lee's Perpetual and Crimson Perpetual. Though a neat flower, rather rosy-crimson than true crimson in colour, it is difficult at the present day to comprehend the furore it created during the thirty or forty years following its introduction. It cost its raiser his situation as gardener to the French King, who was advised to have it named Rose du Roi, while the gardener insisted it should bear his own name down to an admiring posterity. Lee of Hammersmith is said to have netted a large sum by its sale; and it was so popular even in the thirties, that one grower forced annually more than a thousand plants. *B.*

NOTES FROM A SCOTTISH MANSE.

NATURE has of late been very capricious in her dealings with her floral children. Not seldom she has almost destroyed her fairest treasures with thunder-showers, followed by the desolating blast of north-east winds. And then, when almost too late for atonement or amendment, she would suddenly repent, and smile upon them with an aspect of benignant peace.

"Nature never did betray the heart that loved her," says Wordsworth; but I think the great poet would have known much better if he had been, like myself, an assiduous cultivator of climbing flowers. What would Nature do with our Eckford Sweet Peas, *Tropæolum speciosum* and *canariense*, aspiring Roses, and even Violas, not to speak of Oriental and American Lilies, if they were not, in most instances, very strongly secured? Even with every possible barrier against her impetuous atmospheric attacks that human ingenuity can devise, they often suffer much.

The only Lilies in my garden (and I have a sufficiently extensive collection) that by reason of their vigorous growth did not require strong supporting, were *Lilium Henryi* and the great *Lilium giganteum*. Both, however, had been cultivated in strongly-sheltered places, and the Himalayan Lily, which was the grand result of four years' development, reached a height of nearly ten feet. Its portrait has been taken by Mr. Douglas McDonall, of Logan House, in this parish. Mr. Logan has also photographed the noblest specimen of a La France Rose I have ever seen in my garden, or anywhere else. Perhaps I may be able to exhibit it—if not at the Crystal Palace, at least in the artistic regions of the *Gardeners' Chronicle*, should the photographic result prove entirely successful.

I have been much gratified by the splendid flowering of my *Ixias* and *Calochorti* during the present season. The former, which are of African origin, have been in bloom for fully five weeks. Of the latter, the first to flower were those pertaining to the extremely interesting *Cyclobothra* section, and bearing the names of *C. alba*, *C. amœnus*, and *C. pulchellus*; also *C. Purdyi* (which more properly belongs to the "Star Tulip" department), the most attractive of them all. Of the last-mentioned variety, Dr. Wallace says: "Coming from a cold, wet climate, it is particularly suitable to our own. Starting late into growth, it throws up a flower-stem from 9 to 15 inches in height, carrying from four to nine flowers, large, and fully 1½ inch across, covered with long, white hairs." The latest, and by far the largest and loveliest forms of those supremely fascinating Californian flowers, comprised under the classification of "*Calochortus venustus*," are, just at present, in glorious bloom. Many years ago I tried them with indifferent success; but the reason of their comparative failure was that I did not give them a sufficiently dry, or adequately drained situation during the winter months. Mr. R. Wallace, of Colchester, is unquestionably right in his affirmation, which is the result of extensive experience in their culture—that their nature demands a sunny exposure, and a light, porous soil. Early planting in such positions is also highly advantageous. From eighteen bulbs of the *Calochortus venustus* I had nearly 100 large and richly-coloured flowers. My *Ixias*, with similar treatment, were equally prolific. Not one of them has failed to flower well this year. I find them quite as hardy in their nature as those brilliant autumnal flowers, the *Montbretias*, and that is saying much; for however greatly the foliage of the latter may seem to suffer from the vernal frosts, they invariably recover their characteristic freshness ere they reach their period of exquisite bloom.

Many of my Lilies have flowered luxuriantly during this summer, especially *Lilium giganteum*, to which I have already incidentally referred; *Lilium dauricum*, a native of Siberia, of which the finest form is *D. incomparabile*; *Lilium dal-*

maticum, familiarly known to amateur cultivators as "the Black Martagen," whose colouring, dark purple, and the miniature size of its clustering flowers makes this variety quite unique; *Lilium Washingtonianum*, a Californian Lily of the most refined and delicate fragrance and beauty; and, above all, the noble *Lilium Szovitzianum*, which, in addition to its impressiveness, has this great qualification, that, wherever well established, and not wholly neglected during dry and burning seasons, it grows stronger and grander in aspect year by year. Lilies are undoubtedly great lovers of moisture, in which respect they resemble their fair cousins, the Irises, of which I am also a loving cultivator; and I greatly fear that for lack of attention in this special direction, during my absence from home, several of my finest Madonna Lilies, which were pictures of graceful beauty this time last year, have suffered deterioration. This to me is a matter of deep regret; but *Lilium auratum*, *L. Browni*, *L. odorum japonicum*, and *Lilium speciosum*, whose decorative value can hardly be over-estimated, will make amends. These, at least, have not been neglected, and will undoubtedly ere long amply repay any attention they may have received. The few Madonnas ("*rari nantes in gurgite vasto*") that have remained healthy, have also flowered well.

The Rose has reached the confines of its intermediate season, and such fine varieties as A. K. Williams, Viscountess Folkestone, L'Idéal, Captain Hayward, and Clara Watson are assiduously preparing, with my assistance, for their second period of beautiful bloom. Meanwhile, my Violas, Phloxes, and Sweet Peas have attained the climax of their beauty; as also have those richly ornamental *Tropæolums*, *speciosum* and *canariense*. *David R. Williamson, Wigtownshire.*

NURSERY NOTES.

CAMBRIDGE NURSERIES, WORTHING.

WORTHING may be likened to Ghent in the extent of glass-structures devoted to plant culture. They form the salient feature when viewing the town from a distance; and when traversing its roads, one scarcely seems to be clear of one block of glass-structures before another presents itself. But Worthing differs from Ghent in that its industry is chiefly devoted to produce for the table, such as Tomatos, Cucumbers, Grapes, &c., instead of Palms and other decorative plants which mainly occupy the attention of the grower in and around the Belgian town of Flora.

It was a desire to break the monotony of the existing state of things, and to test whether Worthing could not be induced to produce good and profitable results in a nursery having a large department devoted to a general collection of plants, together with all the novelties procurable, that actuated Mr. W. Goodliffe to embark in the undertaking which he is now bringing to something like a successful issue, the immense amount of work entailed in re-modelling the old part of the establishment, and building a still larger block of new houses having been accomplished, the finishing touch of perfecting the heating by the addition of two large check-end saddle boilers to work in unison, being the last operation, until the proposed further enlargement by the addition of another block of houses is commenced.

FERNS.

In the older part of the nurseries, which occupies one side of the Northcourt Road, as the newer does the other side, Ferns are extensively grown, and in that branch the recently-appointed manager, Mr. Hemsley (late with Mr. H. B. May, of Edmonton), already begins to make a fine show. A good general collection is grown with batches of the rarer things, and quantities of the best kinds useful for market purposes. Of these the market varieties of *Pteris* form the bulk, and the main stock are in

cold, shady frames, the smaller ones, from the little plants just being potted off, being brought on in heat to be ready to take the place of the larger ones when sold.

The different genera are kept together as much as possible, and this arrangement is both effective and instructive, for it reveals the great variation to be found in a single genus, and also in many cases in a species. For example, the gold and silver Ferns form an interesting study, and it is curious to note the variation in *Gymnogramma chrysophylla*, its representatives ranging from the plain old form to the fine, tall-growing, heavily-crested *G. chrysophylla grandiceps superba*—the finest of the crested gold Ferns.

In one long house the coloured-frooded and variegated forms were strongly in evidence, a beautiful contrast being formed by the various delicate tints of the batches of *Pteris rubricaulis*, *P. tricolor*, *P. argyræa*, *P. baurita argentea*, *Aspidium aristatum variegatum*, &c., contrasting with the ruby-tinted young fronds of the *Adiantums* of the *A. rubellum* class, and others bearing coloured young fronds. *Adiantums* are well-represented, the forms of *A. cuneatum* and its allies, which the skill of the market-grower has evolved, being bewildering. *A. Hemsleyanum* is one of the prettiest and best for general purposes; and *A. ciliatum*, a very effective plant for basket-work, and much freer growing than the type of the section *A. caudatum*.

Davallias are grown in many species, and all are pretty; the forms of *D. fijiensis*, very elegant; and the smaller *D. dissecta Mariesii*, which is here grown into pretty pot-plants, as well as in the quaint forms, such as pagodas, tortoises, and other designs as they are imported from Japan. A stand of rustic cork-work at the end of one of the houses, gives a beautiful example of what may be done in displaying a varied collection in a small space.

The greater part of the older houses is taken up by well-grown Cucumbers, Tomatoes, and Black Grapes, and outdoor Carnations and other hardy flowers appear. On the other side, the large block of houses is connected at the entrance end by a lofty and broad corridor, the back-wall of which is being covered with *Allamandas*, *Gloriosas*, *Bougainvilleas*, and other warm-house climbers, producing showy flowers; the other side having Tea Roses and various decorative plants. In this house a plant of zonal *Pelargonium* exhibits a singular variation. The original plant, which has two strong branches nearest the pot, is a silver variegated kind, bearing several trusses of white flowers; from it comes up a strong branched shoot of the ordinary green leafed zonal *Pelargonium* with scarlet flowers. Apart from their being on one plant, there seems but little resemblance between the original and the sport, except that both the white and the scarlet flowers have a precisely similar purplish veining in the upper segments.

THE ORCHIDS

are in the first house leading out of the corridor, their scope embracing most of the ordinary showy-flowered kinds, together with some of the rarer varieties, and a larger leaven than usual of pretty botanical things. The group in flower at the end of the house, made up of *Lælia tenebrosa*, *L. xanthina*, *Cattleya Loddigesii*, *C. Gaskelliana*, *Cœlogyne Massangeana*, *Odontoglossum citrosum*, *Dendrobium longicornu*, two good examples of *Phrysosiphon Loddigesii*, and various *Cypripediums*, including *C. Curtisii*, *C. × supercilare*, and other hybrids bespeak the kinds of things grown.

The cool Orchids are in a fine house in the course of re-staging in the old block. *Masdevallia bella* and a few others are in bloom. The *Odontoglossums* are the least satisfactory, probably on account of being in too bright and airy a situation. In the second house the plants of *Dendrobium Phalaenopsis Schroderiana* are suspended overhead and throwing vigorously; also *D. aureum*, a quantity of *D. atrovioleaceum*, and other showy

Dendrobiums; the staging of the house being filled with *Dracæas*, *Asparagus*, variegated *Aralias*, *Eucharis*, *Phrynium variegatum*, *Anthuriums*, &c.

The third is a large span-roofed house, containing *Kentias* and other Palms, &c.; the fourth, *Gardenias*, flowering and variegated *Abutilons*, *Asparagus tenuissimus*, *Eulalia variegata*, and *E. zebrina*, &c.

BEGONIAS, ETC.

The next house has a very fine show of Tuberous Begonias, raised on the place, both doubles and singles, giving some remarkable variations. The pure white varieties are superb, and the *Picotée*, or coloured-edged class, charming, the most beautiful being *Begonia Rosa Goodliffe*, a grand flower, with fine substance, and well-rounded segments. The ground-colour is white with silvery veining, and a delicate blush tint towards the well-defined coloured margin, which is of a bright crimson-scarlet colour, and displayed as in a *Picotée*-Carnation.

The other houses have good batches of *Bouvardias*, *Fuchsias*, *Browallia speciosa major*, *Liliums*, *Rhododendron Princess Royal*, and a great variety of well-grown decorative plants of all classes.

The garden outdoors is arranged for *Chrysanthemums* in quantity, *Carnations*, and other profitable flowers; and the office, potting-sheds, and other buildings, are well arranged, the whole presenting evidence of a successful venture, and one likely to increase the love of gardening in the surrounding district.

DOVER HOUSE GARDENS, ROEHAMPTON.

A CONSIDERABLE addition has been recently made to these well-known gardens, belonging to Mr. J. Pierpont Morgan, whose son is now residing at Dover House. The plant-houses hitherto existing, though admirable structures for the cultivation of moderate-sized plants, were insufficient in height to accommodate larger specimens. There has now been erected, however, a very elegant Palm-house at the east end of the main fruit range; and the older range opens into the Palm-house. The new house has been built by Messrs. McKenzie & Moncur, the wood-work being of teak; and the rest of the building of the very best materials. Its dimensions are 45 feet long, 33 feet wide, and 25 feet high. It has a very pretty lantern roof, and the height just stated includes this.

Now that Mr. McLeod has completed the furnishing of the interior, this addition to the "glass" impresses one very favourably. In the centre is a magnificent plant of *Kentia Belmoreana* 18 feet high, and two good plants of *K. Fosteriana* about 10 feet high; also a pretty and remarkable plant of *Cocos Bonnetti*, a species seen very much more frequently in continental gardens than in this country; *C. plumosa*, *C. flexuosa*, *Hyophorbe lutescens*, *Phoenix rupicola*, *Livingstonia rotundifolia*, *Raphis flabelliformis*, *Seaforthia elegans*, *Musa Ensete*, &c. All of the above plants, with others, are arranged in a centre bed upon the ground level, and stand upon shingle. The front stage is about 4 feet wide, made of Welsh slab, and runs round one of the sides and one end. This provides accommodation for moderate-sized plants of *Cordylines*, Palms, *Pandanus*, *Codiaeums*, and other foliage plants, which in this garden are always to be seen in the best condition possible.

The character of the conservatory attached to the dwelling-house, and which was used for the housing of Palms, &c., has been modified. The structure has been rebuilt, and the floor entirely relaid with fancy tiles. It is regarded now as a show-house, occasionally for flowering plants, and again for species whose attraction is in their foliage. At the present time, the house contains a very choice group of *Caladiums* and Ferns, the collection of the former plants being an exceedingly up-to-date one. The erection of the new house has made necessary a new entrance from the dwelling-house

into the garden, which is also a great gain in appearance and convenience.

Beside the above addition to the glass structures, a very great improvement has been made in the grounds. Formerly, the boundary immediately in front of the house was screened by a shrubbery, in front of which was a narrow and insufficient border planted with herbaceous plants. The whole of this has been removed, and the site—about 1 acre—has been turfed over. Beds of various and pleasing shapes have been formed at very close distances, there being just sufficient room to walk amongst them. In these have been massed choice varieties of herbaceous plants, generally one variety in a bed; pleasantly interspersed with these are flowering and ornamental-leaved shrubs, also in beds. The effect has been to make this spot by far the prettiest and most pleasant in the grounds; and, moreover, the plants chosen will supply an abundance of choice flowers for cutting purposes.

The work has been done in Mr. McLeod's usual thorough fashion. The ground was deeply trenched, and a large quantity of fresh loam added, which has raised the whole of the beds considerably above the ground level. Though the plants have been in this new situation but a few months, they are looking healthy and vigorous, and despite the drought, very few indeed have failed to survive. *Vitis Coignetiae* and many others of the newer decorative hardy plants we noticed amongst the new comers.

A spacious Mushroom-house is now in course of erection.

The fruit crop promises to be extremely good, if we except Plums. Apples are an "over" crop, and Morello Cherries hanging from a north wall upon untied shoots are extremely abundant, and Pears will not be scarce.

Violas, that are also a feature in the summer bedding, and some of the other plants out of doors, have suffered from excessive dryness; but an excellent strain of *Celosias* is making a gorgeous display. Indoor fruits are abundant, and "frame Melons" have given particularly good results, including the variety *Earl's Favourite*.

Carnation layering is nearing completion, and in such a Carnation garden as that at Dover House the task is not a light one. Of the American sensational variety, *Mrs. Thomas W. Lawson*, there is just one small plant that has been rooted from cuttings that were brought over from America along with some flowers. It has fallen a prey to disease, and is very weak, but Mr. McLeod is extremely likely to make a specimen of it.

THE FERNERY.

BRITISH POLYSTICHUMS.

As thoroughly evergreen decorative Ferns, possessing a wide range of varietal form, the species of *Polystichum* indigenous to Great Britain rank second to no Ferns in the world. Of the three species, *P. Lonchitis*, the Holly Fern; *P. aculeatum*, the Hard Shield Fern; and *P. angulare*, the Soft Shield Fern, the last-named has afforded by far the greatest number of varieties, and among these rank beyond all doubt some of the most beautiful Ferns the world possesses. It is therefore a curious fact that practically only one form is popularly used, and that of a comparatively inferior kind. *P. a. proliferum*, thanks to its capacity for bearing bulbils in profusion upon its fronds, and consequent easy propagation, is occasionally seen in florists' windows for sale, but there it ends, and although many far better forms are also bulbil-bearing, they are ignored. With regard to our deciduous species, such as the Lady Ferns, most of the *Lastreas* or Buckler Ferns, it is easy to understand that the dying down of their fronds in the autumn, and their consequent invisibility throughout the winter, is a drawback in many ways to people who merely buy for decoration sake, and

know little or nothing of plant life. In the first place, apparently tenantless pots are eyesores, and even if the owner be wise enough to know that the Fern is still alive, and will rise again in the spring, there are five or six months during which they are put out of sight, are most likely out of mind as well, and drought and neglect give them too often their permanent quietness.

With the Shield Ferns, however, there is nothing of this. The old fronds, under glass, remain quite green until the new ones are rising, hence there is no gap, with its consequent risks, and the marvel is therefore emphasised that a tribe of beautiful plants like these should not hold their proper rank, and be as popular as exotics. In an airy, shady conservatory, a collection of Shield Ferns might be housed, and present within the range of two species only, *P. aculeatum* and *P. angulare*, an almost infinite diversity of cutting and tasselling, as well as of size. *P. aculeatum* pulcherrimum, for instance, with a splendid circlet of 4-foot fronds, forming, as it were, a huge vase of frondage, each frond delicately cut into long, sickle-shaped, glossy divisions, and the terminal ones curved in upon each other in the uniquely beautiful fashion of this variety, has absolutely no parallel in the Fern world. It has not even the demerit of being common, for it is perfectly barren, and is only propagated by offsets. Contrast this superb upright chalice with the best of another section of this multiform species, the plumose, wherein the broad spreading *Todea superba* itself is mimicked and equalled, if not surpassed, in infinitely delicate cutting. To see the new fronds of these forms rise in itself a delight to the eye, the snow-white scales with which they are clothed, the graceful pendulousness of their side division and tips, curved first inwards, and then falling backwards with their own weight, are all elements of beauty peculiar to the tribe, and in which, again, to our knowledge, no exotic can form a parallel.

Then among the larger growers we have splendid crested or tasselled forms of both species, Abbott's and Talbot's grandiceps of *P. aculeatum*, and a score or so of pretty tasselled types of *P. angulare*, some pendulous, some rigid, some bold in habit, some small, but all beautiful, for we are dealing with the select, and excluding the "rogues."

Then there are the densely-congested forms, *P. a. congesto-crispatum*, *congestum*, and others, ranging down to the diminutive little gem *P. a. Lyelli*, 3 inches high, as a foil to the 4-footer with which we started. In another direction we have the curious revolvens forms, the fronds having their divisions symmetrically rolled backward almost into tubes, but with a spiral twist in each, preventing overlapping, and imparting a singularly graceful look to the plant as a whole. In another direction again we have *P. ang. lineare*, with all the divisions neatly reduced to mere laminated midribs, affording the strongest contrast conceivable with the best of the plumose section, wherein the fronds are elaborated to the utmost, the divisions lying three or four deep upon each other, as in the well-named "densum" *P. ang. plumosum densum* (Jones & Fox). The proliferum section, consisting of the ordinary trade form, *P. a. prolif.*, *Allechin*, has other worthier members in *Wollastoni*, *Crawfordianum*, and *Henleyæ*, all of which, from their lax habit of growth, require plenty of room, but are rarely grown to perfection, even if grown at all; though an established plant of any one of these, spread out like a huge star-fish, and with a dense moss-like growth of youngsters down the middle of each frond, is quite as pretty as many a rare and costly plant imported from abroad, and eventually killed with coddling, as these native plants often are with neglect.

As plants for north windows, the Shield-Ferns are particularly well fitted, those of lax habit especially, unless the light is particularly good, and the plants can be placed close to the glass. One point, however, must be insisted upon with window-plants; they are always one-sided, and

incurably so, but it by no means follows that this detracts from their beauty—the point is to recognise the fact that they will grow towards the light, and spread themselves out in such a fashion as to catch the maximum quantity. They are so adjusting themselves every moment as they grow, and if left alone, that is, not interfered with by twisting and turning about, they will adapt themselves to matters to a nicety, and form a fine spreading circlet of radiating fronds, straight-stemmed and graceful; while if, on the other hand, they are turned about to help the process, every turn means a fresh kink in the foliage, and the end result is disastrous.

The Holly Fern (*P. Louchitis*) does not lend itself kindly to culture, and succeeds best if planted in the open, with a north aspect and in soil which is moist, but well-drained. Its native habitat is on the mountain shoulder, in the region of the clouds, but nevertheless, it can be grown at lower levels if its need of water be not forgotten. This has given us a good crested and even a grandiceps form, both very pretty plants of medium size. With the Shield Ferns, as with other crown-forming species, by far the best effect is obtained with single crowns. Many of the forms produce bulbils rather freely at the base, and these in time reach adult size, and transform the plants into a dense bush of small fronds and confused appearance. Starting with a single crown, these offsets should be persistently removed when young, thus affording at once a means of propagation, and a relief to the parent, which then, not having to struggle for existence with a horde of youngsters, very speedily fattens up and produces fronds of double or treble the size, and consequent enhancement of character, sometimes resulting in quite a transformation, due to greater vigour. The young offsets, if dibbled round the edges of other pots or pans, soon establish themselves, and form acceptable gifts to those who may admire the parent. The Shield Ferns are easily raised from spores in the usual way, but unless aided by warmth in their initial stages, it is a matter of several years before characteristic plants result; whereas a bulbil taken off in the spring will produce a nice plant the succeeding year. *Chas. T. Druery, F.L.S., V.M.H.*

APPLE CULTURE AT BATTLE ABBEY GARDENS.

THE new gardener at Battle Abbey (Mr. Camm) can show this season a very fine crop of nearly every kind of Apple he grows. The form of tree is cup-shaped, dwarf, with six to ten main branches, and these had been stopped so as to produce quantities of fruiting-spurs; but the trees had got very foul with moss, lichen, and in a few cases scale and American-blight. To get rid of this, winter-washing with caustic soda and common potash was used, and when the trees were cleansed they were headed back, and fresh clean growth resulted. This was left; the only pruning consisted of removing superfluous shoots, and those that showed a tendency to grow to the centre of the crown. The result was, that the next season these branches were furnished with numerous short fruiting-spurs, which, where they came thickly, were thinned in number. These natural spurs are now carrying quantities of promising fruit, and they will merely be slightened, leaving in some cases two fruits, or only one, but all look growing and clean, and likely to take a good place on the exhibition-table (Mr. C. was a prize-winner last year in the five counties competition). I enumerate a few of the varieties grown, many of which are classed as shy bearers, but under his treatment were exhibiting a fair crop, proving in part that this particular system suits them:—Old Dutch Codlin, Lord Suffield, Bismarck, Cox's Pomona, Cox's Orange Pippin, Sturmer Pippin, Frogmore Prolific, Emperor Alexander, Reinette du Canada, and Stirling Castle; but it did not seem to answer for Blenheim Orange, Cornish Gillyflower, Boston

Russet, Royal ditto, Adams' Pearmain, Northern Spy, or Dutch Mignonne.

Mr. Camm continues:—"In fact, all varieties I have tried have done well on it, except two trees of Stirling Castle, which are very old and full of canker, and therefore they offered no criterion. I firmly believe that too much pruning has something to do with canker."

The stock used seems in all cases to be the wilding Crab, and the trees are root-pruned every other year, the border being left entirely to the trees, not even annual crops, as Spinach, Radishes, &c., being sown on it. The trees are dressed in mid-winter with the solution of caustic soda, &c., of the strength frequently given in the gardening papers. The method may not lay claim to novelty, but this year, at any rate, is giving such a load of fruit all along the branches, that he likens them when fully grown out, to ropes of Onions, and their weight bends the branches down, thus exposing the fruit to the sun, giving good colour and flavour.

It will be as well to mention the fact that the trees are mostly about twenty-five years old, having been planted by Mr. Burgone, Mr. Camm's predecessor, and were treated on the old plan of short-spurring till Mr. C. had the charge of them. *Thomas Bunyard.*

CAMPANULA MAYI ×.

THIS pretty plant (see fig. 47, p. 127), apparently the result of a cross between *C. isophylla* and an unknown species, was shown by Mr. H. B. May, of Dyson's Road Nursery, Upper Edmonton, on the occasion of the meeting of the Committees of the Royal Horticultural Society, on Tuesday, July 25. It is an excellent plant for windows, greenhouses or hanging baskets.

Fuller details of the plant will be found on p. 93 of our issue for July 29.

HYBRIDS AND THEIR RAISERS.

(Continued from p. 86.)

THE PETUNIA.—Time was when the Petunia was a leading florist's flower, when varieties were named, and large and handsome specimens grown for exhibition. But latterly it is a subject which by reason of having to compete with newer introductions, has fallen into a degree of neglect; and yet it is of great service in the summer flower garden, where it can be effectively employed in various ways.

The present race of small-flowered Petunias have been derived from *P. nyctaginiflora*, a white-flowered species introduced from South America in 1823; and *P. violacea*, introduced from the same quarter of the globe about 1831. It was soon found, when these plants came into cultivation, that there was a certain variation in the seedlings, and crosses were made between them and seminal varieties, fine striped and edged forms being produced, allied to compact habits: the florist took notice of them, and the raising of seedlings became general. A person named Walters, of Hilperton, Wilts, some forty years ago, made himself famous for the beauty and variety of his strain; George Smith, a well-known nurseryman at Hornsey, was a noted raiser; Messrs. E. G. Henderson & Son, then of the Wellington Road Nurseries; C. Turner, of Slough; Baroes, of Stowmarket; Watson, of Hadley, and others, were foremost as improvers of the flower. About this time Donald Beaton produced his Shrubland Pet, a rosy-pink variety, with a white throat, which still finds a place in flower-garden arrangements, and which was later in time improved upon by a variety named Countess of Ellesmere.

Messrs. James Carter & Co. have for years made the Petunia a specialty, developing a compact-growing strain of well-formed striped varieties, which are excellent for pot-culture and general decorative purposes, and also of double forms. Mr. J. Burley, Brentwood, and Messrs. Hender & Co., Plymouth, have given their names to strains of like character.

The continental florists have apparently favoured

a strong-growing strain of somewhat loose habit, many of them bearing large, loose blossoms, lacking in shape, and which, when employed in the flower garden, are apt to suffer from the effects of storms. What is needed is a return to the small-flowered English strains, both double and single. If the corollas are less in size, they are of better form, and much more freely produced, and being of more compact growth, recover themselves quicker from the effects of storms.

Petunias as exhibition plants are rarely seen in good character; but there are places in the West of England, such as at Trowbridge, where fine named single varieties are still grown trained to

its pure white form, which has become practically invaluable for floral decorations and for pot-culture. *G. floribundus*, which was a popular species a half century ago, is now rarely seen, but it has been found useful by cross-breeders. A race of early-flowering varieties, grown in Holland under the name of *ramosus*, and its progeny, are of great value for early flowering, and do well in pots; of the actual origin of *G. ramosus* there appears to be no record.

One of the remote parents of the present groups of hybrid *Gladioli* is no doubt the African *G. psittacinus*. By crossing this with *G. cardinalis*, M. L. Van Houtte, of Ghent, originated *G. ganda-*

perhaps a little of the blood of *G. psittacinus* and *G. ramosus*, a rosy Cape species introduced in 1838." (*The Propagation and Improvement of C. Cultivated Plants*, by F. W. Burbidge.)

Two English-raised varieties put in an appearance somewhat early, viz., *Bowiensis* and *Brenchleyensis*, raised by Mr. Hooker, nurseryman, Brenchley, bright crimson in colour, and still much grown as a border variety. The introduction of *C. cruentus* from Natal in 1868, and others, afforded the late Mr. John Standish an opportunity to cross it with some of the best of M. Souchet's varieties, and he raised many handsome varieties; and it may be said he anticipated to some extent the brilliant results obtained by Mr. Lemoine, of Nancy, later on. The races known as *Lemoinei*, *Nanceianus*, *Saundersii*, and *Childsii*, are all more or less new developments, and they have added materially to the riches of our home collections. The late Mr. James Kelway, when quite a lad, saw for the first time *G. psittacinus* at a flower show at Glastonbury, and was fired by the sight with an ambition to improve it. From Langport have come hundreds of glorious varieties; and from M. Souchet comes annually, through Messrs. Vilmorin, Andrieux & Co., a constant supply of improved forms. Messrs. J. Burrell & Co., at the Howe End Nurseries, Cambridge, also grow and raise extensively, and have sent forth from time to time many beautiful varieties of high quality. In Scotland and Ireland also, fine forms have been raised, and many amateur cultivators throughout the United Kingdom, grow and exhibit the flower in its best character. *R. D.*

NORMAN C. COOKSON.

Men engaged in commercial or manufacturing pursuits usually have some hobby or pastime, and Mr. Cookson's hobby is gardening, in which he is all the more successful, seeing that it is heartily joined in by his wife and family.

Oakwood, at the little village of Wylam-on-Tyne, some five miles from Newcastle-on-Tyne, has many natural beauties, which have been enhanced by planting flowering and evergreen shrubs, Roses, hardy herbaceous perennials, Carnations, &c., which harmonise with the surrounding stately Oak, and grassy glades.

Gardening under glass is an important part of Oakwood, and the block of plant-houses erected was filled with such plants as are usually grown for decorative purposes, including a few Orchids, some of the longest cherished, of which their owner can show to-day a proof of the skill and care bestowed upon them by himself and his gardener, Mr. Murray.

Early in his Orchid-growing days, Mr. Cookson, who had made a study of plant-life, turned his attention to cross-breeding Orchids, and the rules which he laid down at the start, which have resulted in many fine and a few indifferent plants, might well be accepted by others similarly engaged. These were, "never to make a cross which does not promise good results." "Always use the best possible types as parents, and if either parent is of an indifferent form, abstain from making the cross until better material can be obtained."

HYBRID ORCHIDS.

Space does not here permit of more than a few of the details of the good work done at Oakwood to be mentioned; suffice it therefore to refer to a few of the principal genera, on which crossing has had good results. Of deciduous *Calanthes* crossed in 1881, we find *C. Alexanderi*, *C. Cooksoni*, and later *C. Clive*, *C. Bryan*, *C. Win Murray*, and *C. Oakwood Ruby*, the last named with an almost entirely blood-red flower, and affording a very remarkable instance of the good results following continuity of effort in one strain. This variety was evolved by continually crossing the best form of *C. vestita*, which has white flowers with a blood-red eye, but which in Oakwood Ruby is a blood-red flower, with a scarcely perceptible light eye.

FIG. 47.—*CAMPANULA*, MAY'S VARIETY: FLOWERS PALE BLUE. (SEE P. 126.)

sloping oval-shaped wire frames, which they cover with a dense mass of bloom, and are really very effective. This strain of Petunias are also of value as summer-flowering plants in the greenhouse. *R. D.*

THE GLADIOLUS.

"The hybrid *Gladioli*," says Dean Herbert in his work on *Amaryllids*, "flower about the same time as the Roses, and contribute quite as much in general effect to embellish the garden by their fine colours and profusion of bloom." It was the early-flowering varieties which the Dean took in hand; he made crosses, to use his own words, "between *G. cardinalis*, *blandus*, *carneus*, *inflatus*, *angustus*, and *tristis*, and they vary with every shade of colour from white to scarlet." *G. Colvillei* is a hybrid said to have been raised between *cardinalis* and *tristis*, but it is completely overshadowed by

vensis ×, naming it after the city in which he dwelt. This, crossed with others, in due time produced improved varieties, and the work then entered upon is still carried on in our own country and abroad.

"M. Souchet was one of the first continental raisers who set about the improvement of the *Gladiolus*, and his hybrids were principally obtained by cross fertilising *G. cardinalis*, a red-flowered Cape species, introduced in 1789; *G. pulcherrimus* and *G. blandus*, a flesh or rosy species, introduced as long ago as 1744; *G. natalensis*, a scarlet and yellow-flowered species, introduced in 1830; and *G. floribundus*, a yellow-flowered Cape species, introduced in 1788, have also been employed by hybridisers, and from these five species fused together through these varieties, our races of modern show *Gladioli*, have been derived, with

Then let us take the genus, Phaius. Here we find the beautiful *P. Cooksoni* (Wallichii ♀ × tuberculatus) appearing in 1890, which is still a standard plant. In 1895 came *P. Cooksoni* (grandifolius ♀ × Humbloti), and quite recently an improvement upon it in *P. Phoebe* (Sanderianus × Humbloti). In 1897, *P. Norman* and its beautiful varieties came out, and though each of these seem to say that nothing better can be obtained, it is hoped at Oakwood that others will come that will surpass them.

In the genus *Dendrobium* the results have been very satisfying, and despite the many workers in the same field, some species have been crossed and plants raised, where all others have failed. We may mention a few of the most remarkable, viz., *D. Sibyl* (bigibbum × Linawianum), *D. Bryan* (luteolum × Wardianum), *D. Murrayi* (nobile × albo sanguineum), *D. Kenneth* (McCarthy × Bensoni); and among other fine crosses raised are *D. Venus* (Falconeri ♀ × nobile), which perhaps caused more admiration than any previous cross; *D. Owenianum* (Wardianum × giganteum), *D. Harold*, *D. Doris*, and some others.

Cypripediums have been also skilfully crossed, and in these, even with known crosses, the satisfactory results secured by crossing only the best parents have resulted in gains far surpassing in several cases the works of others in this section. In uncrossed seedlings, too, Mr. Cookson has given a remarkable instance of what may be done in reproducing desirable forms by reproducing from home-raised seeds the coveted *C. Lawrenceanum* var. *Hyeannum*.

We may mention a few other crosses: *Lalio-Cattleya Clive* (*C. Dowiana* ♀ × *L. praeatans*), one of the handsomest and most gorgeously tinted hybrids; *Cattleya Harold* (Gaskelliana × Warszewiczii), *C. Wm. Murray* (Mendeli × Lawrenceana), and the reproduction of the natural hybrid *Cattleya Hardyana*.

Some of these crosses have been found easy of accomplishment when due care and attention have been given to the work; and others were difficult, as, for instance, *Odontoglossum*, in the crossing of which Mr. Cookson is making headway; his fine *O. crispum* (Halli leucoglossum × crispum Cooksoni), indicating a beginning which in its direction will not be easy to surpass.

Perhaps the gardening amateur will ask what of hardy plants of Roses, Daffodils, Carnations, and other early favourites? Well, they have never been deposed! When a man is at heart a gardener, he is not to be "cornered" by Orchids or any other specialties to the exclusion of other plants which he regards as equally beautiful (see portrait on p. 130).

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Oncidium sphacelatum.—In this plant we have a decorative subject of great beauty, more especially when it is of large size, but like most Orchids, it is then difficult to cultivate, the roots having a tendency to decay in a few days when by any chance the materials about them get into a sodden condition. In order to prevent this, a renewal of materials should take place annually, at this season. Large specimens may be broken up, all of the decayed material and dead roots removed, and be re-made up in pots or pans of a suitable size, which should be filled to within an inch or so of the rim with crocks, and the plants so fixed that the centre is raised considerably above the rim of the pot, &c., using peat and sphagnum-moss mixed together in equal parts as a rooting medium. It is an accommodating plant so far as temperature is concerned, growing equally well in the East Indian or the Cattleya-house; the chief point to observe being to carefully afford water to suit the needs of the plant.

Epidendrum prismatocarpum.—This species stands unrivalled for exhibition, being attractive

and pretty, for notwithstanding the fact of the flowers being insignificant, they are, when seen in the mass, decidedly effective. When once established, little is necessary beyond the annual renovation of the surface materials; but when the peat and sphagnum-moss have much decayed, and the plant has outgrown its pot, the time has come when it should be afforded a fresh start. Any plant that has got into this state may now be safely repotted, beginning the operation by removing as much of the old material as possible, and then arranging the plant in a clean pot, almost filled with crocks, and packing some lumps of good fibry peat round the base of the rhizomes, and a few patches of living sphagnum-moss; a place should then be found for it at the cooler end of the Cattleya-house. Afford the plant water in sufficient quantity to keep the materials moist; but when growth has finished for the season it will seldom require water. *E. Brassavola* being of a similar nature, though not so good from a decorative point of view, succeeds under the same kind of treatment.

Epidendrum macrochilum and *E. Randii* are species which may be grown in shallow, well-drained pans suspended from the roof of the Cattleya-house, and as at the present time growth is sufficiently advanced, re-potting may be performed if necessary. The materials should consist chiefly of crocks, consequently the plant may be supplied with water more frequently, as its retention is of short duration. Once the small pyriform pseudo-bulbs have reached their full size, only sufficient water should be applied as will prevent shrivelling.

PLANTS UNDER GLASS.

By O. R. FIELDER, Gardener, St. James's House, Malvern.

Begonia socotrana.—Prior to the introduction of the newer varieties of winter-flowering Begonias, the gardener was always trying to induce *B. socotrana* to flower in the early part of the winter; but the necessity for doing this no longer exists, and he is now content to have it in bloom at its natural season, which is from the middle to the end of the winter. A portion of the stock may be started at the present time, and the remainder in a month's time. Let the clusters of bulbils be divided into smaller clusters of about six or eight, and pot these in loam, leaf-soil, and sand, using well-drained small pots. This species of *Begonia* enjoys a high temperature, and moist atmosphere, and should be grown near the glass in order to prevent the plants becoming unduly drawn. A shelf in the stove, or in a low moist pit where a stove-temperature is maintained, will afford the required conditions perfectly. When the plants are well rooted, re-pot them in 5 or 6 inch pots, in which sizes they may be allowed to flower. The stock of this plant may be readily increased by means of single bulbils inserted in thumb-pots, and also by cuttings. The latter should be taken when the new growth attains a length of 4 inches, inserting them in thumb-pots, and placing them under a handlight in the stove, or in a propagating-frame.

Roman Hyacinths and Polyanthus Narcissus.—No time should be lost in potting up these bulbs if it be desired to bloom them at the earliest opportunity. Let the Hyacinths be potted to the number of three or four in a 5-inch pot, and the Narcissus, three in a 5-inch, or five in a 6-inch pot. A porous moderately-rich soil should be afforded consisting of three parts fibry loam, ½ part leaf-soil, ½ part rotten manure, together with a liberal allowance of coarse sand. The bulbils when potted should be afforded water, and afterwards covered with 4 or 5 inches of finely sifted coal-ashes. At this season it is the practice to stand the pots on the north side of a wall, or in some other cool and shady position, in order to screen the bulbils from the sun, which would cause them to start into growth before the roots were sufficiently formed. Later batches, when the weather has become cooler, may be placed in a more open position.

FRUITS UNDER GLASS.

By W. STRUONELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rod Ashton, Trowbridge.

The Cucumber-house.—In order to obtain a regular supply of fruits, close attention must be paid to the ventilation of the house or pit, as well as to affording water and syringing the foliage, the

latter being required twice or three times on hot days. Unless this be followed up, the plants soon become over-run with red-spider, which ruins the foliage, and, once established, is difficult to destroy. Green or black aphides can be destroyed by fumigating or vaporising. Let the stopping of the shoots be attended to once or twice a week, according to the amount of growth made, pinching these at one joint beyond a good fruit. If the fruits set too freely or in clusters, a good deal of thinning is called for. The air of the house can scarcely be kept too humid for Cucumber plants at this season, and manurial aids to growth should often be applied either in liquid form or otherwise. That the supply of Cucumbers shall last till late in the autumn, strong plants should still be planted in pots and houses in the manner described in earlier Calendars. Older plants may have their fruitfulness restored by affording light dressings of new soil at fortnightly intervals. In planting for late autumn use, bottom-heat should be provided. Warm water only should be used when moisture is needed by the roots.

Cucumber-plants in Frames need the same cultural treatment as that generally afforded the house-plants, particular attention being paid to closing the frame early—say 3 to 3.30—in the afternoon, in order to utilise the sun's heat. While the hot weather lasts, no coverings are required on the frames at night.

Winter Fruits: Cucumber-plants.—From the middle to the end of August is the usual time for sowing seeds. This early start may, however, be modified when the Cucumber-house is very light, and well provided with bottom-heat. In providing for winter, the plants ought to be allowed to become of a considerable size and strength ere they are allowed to carry many fruits. The winter plants should be in readiness to supply daily wants as soon as the summer and autumn plants are exhausted.

The Latest Melons.—Those which do not show much vigour must not be shaded, or they will not fruit satisfactorily, and bottom-heat will be necessary after this date, or the plants may collapse at a time when the fruits are far advanced towards maturity. A lighter rather than a heavier crop of Melons should be taken now that the days are shorter, and two, or at the most three fruits form a sufficiently heavy crop.

Pot-Vines.—Let Vines that have filled their pots with roots and are intended for early fruit have every encouragement. No waste lateral growth should be permitted; and, on the other hand, they should not be rigid-pinned, for then there is danger of the basal buds bursting into growth. Red-spider must be kept in check by regular syringing morning and afternoon. Where the Vines are being prepared for planting, a newly-built vinery, and the borders indoors are ready for their reception, there is a gain in planting at once, rather than deferring it till the spring. Except under special conditions, it is advisable to plant in outside borders where the Vines are dormant. There is still time for inarching young Vines in mid-season and late-houses, if a young cane has been allowed to extend for this purpose. The union will be more secure if the scion and stock be tongued, and the work is more satisfactory if the wood is in the green state.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt Tisbury, Gloucester.

The Shrubberies.—Any tree to which stakes were placed for support should be examined at this date, in order to see that the ties are not cutting into the bark. Where this is found to be the case, the ties should be removed, and new ones substituted on another part of the tree. Trees of Cupressus, Taxus, Thuja, Juniper, and other Conifers, which must be kept in pyramidal form, should have the outer branches fastened to the main or principal stems; and to preserve the specimens of a certain size, the inner shoots should be pruned away, and the outer branches drawn into their places. Laurels and other evergreen shrubs, growing too high for their positions, may have the longer shoots shortened to within three buds. On such as these the knife or sécateur rather than the hedging-shears should be employed, clipping spoiling the appearance of the shrub, and the flat surface produced by the latter excludes light and air, causing the

death of the inner parts of the shrub. Deciduous trees that were spring-planted are apt to drop their leaves early; and to prevent the buds starting which should remain dormant, the trees should not suffer lack of moisture at the roots. If time can be afforded, and water is plentiful, the stems and leaves should be damped over-head of an evening.

Lilium candidum.—When the leaves and stems turn brown and wither, it is a sign that they are attacked by the Lily-fungus, and the bulbs should be lifted. If the attack is serious, burn them forthwith, and start with fresh and healthy bulbs. If, however, the bulbs are not much affected, the strongest may be saved, washing them in a weak solution of the Bordeaux Mixture, and when quite dry, placing them in a bag containing flowers-of-sulphur, which should be well shaken so as to work it into the scales of the bulbs. The bulbs should then be planted without delay in a position far removed from the old station. When replanting, add some heavy loam to the staple, in which plant them not less than 4 inches deep. A partially-shaded position seems to suit the Lily best, but they should not be placed where trees overhang them, and exclude the light.

Anemone fulgens is the hardiest of spring-flowering plants, and it thrives in almost any kind of garden-soil, though a heavily-manured loamy soil suits the plant the best. This variety is equally at home planted in a sunny border in the rock-garden if well drained, or in a position with a northern aspect, and partly shaded by trees. Propagation by seed is not satisfactory, the flowers seldom coming true; and it is much easier to increase than by division. From the middle to the end of the present month will be found the best time to divide and replant the tubers, thus they will be enabled to get well established, and flower early next spring.

Miscellaneous Work.—Preparation should now be made for the propagation of bedding-plants, by making a compost of finely sifted loam and leaf-mould, with river-sand or sharp grit from off the high roads, and mixed in about equal proportions. Cutting boxes should be repaired, or new ones made. Those made of larch-wood, 3 feet long, 1 foot broad, and 4 inches deep, are best for Pelargoniums, reserving those of half the size for the smaller and more tender class of plants. Boxes are preferable to pots, as it takes less time to dibble in the cuttings, and they are less troublesome to move about.

Fritillaria imperialis.—These bulbs, if properly planted at the first in a deep, rich, drained soil, require but little attention afterwards. Where the bulbs have been in the same place for some years, and the stems do not grow strong, and flowers are scarce, these are signs that the bulbs are overcrowded and the soil is exhausted. Now is the season to lift and replant. Take up the bulbs carefully, select the strongest, and if to be planted in the same position add some turfy-loam, a quantity of leaf-mould, some small quantity of wood-ashes or old plaster, mix and place this in the hole, and having made the soil firm, plant the bulbs 4 inches deep, and six inches apart. The bulbs should not remain out of the ground for any length of time, or growth will be poor the following year. Of the varieties grown at Westonbirt, *lutea* and *maxima lutea* are the best yellows; *rubra* and *maxima rubra*, the best reds. The golden and silver variegated-leaved varieties do not succeed out-of-doors, but they are pretty when grown as pot-plants in a cold frame. The dwarf species are numerous, and pretty when grown in borders or in the rock-garden, and succeed in the same soil as *F. imperialis*. Manure-water assists them when growing, but in removing and replanting avoid planting them in soil which has been recently afforded manure.

THE HARDY FRUIT GARDEN.

By C. HEERIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Strawberries for Main and Late Crops.—Following up the planting of well-rooted runners for the production of the earliest crops, the main and late fruiting plants should be set out, or immediate preparations made for doing this. The quarters where these will be situated should have been by preference prepared long ago, but where this has

not been seen to, a piece of ground should be chosen that requires but little preparation, and if it have carried some light kind of crop since it was trenched, it will suffice to dig it with a fork after affording it a dressing of decayed stable-manure. If the land is dry, apply water in sufficient quantity to moisten it thoroughly, and having waited a day or two for the surface to become dry, let it be trampled evenly all over. Assuming the runners are strong, and they have been layered in 60's, a good crop of fruits may be expected next year, provided proper attention is paid to affording to the plants water in dry weather during this month and the next. Having planted the piece of land, mulch it with Mushroom-bed manure. As the plantations of main-crop and late Strawberries are not destroyed till they have fruited for two or three years, 2 feet apart each way will not be too much to afford them; another foot space being given at every third row to serve as an alley.

Varieties.—Royal Sovereign, besides fruiting early when given a warm position, is a good all-round variety for planting anywhere. The fruits are firm, therefore they travel well. President is another variety of excellent flavour, bearing very abundantly; and Sir Joseph Paxton is an old market favourite, and a good cropper. When looking recently through a large collection at the Royal Nursery, Slough, it was easy to see that Laxton's Leader was a wonderfully heavy fruiter, and the fruit well flavoured. Veitch's Perfection, a lightly-flavoured, rather late variety, was also fruiting well. The new perpetual variety, Louis Gauthier, bore an abundant crop of white berries, tinged with pink, and as a perpetual bearer, fruiting well into autumn, it is a desirable variety to plant for home consumption. The runners should be allowed to establish themselves, and these, as with the variety St. Joseph, produce the second crop of fruits. Empress of India, a fine dark fruit, with a slight Pine flavour, is also worthy of a trial, and the two new varieties recently certificated, namely, Lord Kitchener, and Lady Suffield, promise to be useful additions for general planting. Two good late varieties that have been well tried are Elton Pine and Frogmore Late Pine; these should be planted on a north border, or the coolest aspect available, so as to prolong the Strawberry season.

Insect Pests.—The hot, dry weather has caused insect pests of various kinds to increase with rapidity. Wasps are great pests in the fruit-garden, but this year, up to the time of writing, they have not been at all plentiful at Dropmore. As soon as any wasps are noticed, they should be tracked to their nests, and the latter destroyed by pouring gas-tar into them. This may be done at any time of the day, as the absent wasps are sure to trap themselves in the tar on their return. A lump of wadding soaked in a solution of cyanide of potassium and pushed into the entrance of the nest on a pointed stick, is another means of destroying them, but the cyanide being a very deadly poison, must be used with extreme care, and not brought near to the nose or mouth. Earwigs are very troublesome here among wall-fruits; they may be trapped in large numbers in pieces of dry Bean-stalks, about 6 inches in length, stuck behind the shoots, and emptied of the earwigs every morning into a bottle of water.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Tomatoes.—The plants which were planted on a sheltered border early in June, and others planted against a south wall, should at this date be ripening their fruits, the hot weather having hastened the process, especially on such of the plants as have had the stems and laterals stopped and the leaves tipped. The plants in all but very rich ground may be afforded liquid-manure twice or thrice a week. Remove the fruits when fully coloured, not waiting till they ripen, and place them in a warm, dry place to ripen thoroughly. Let the side shoots be pinched back, and expose the fruit by removing some of the foliage where this is dense. The leaders should now be stopped in every case, in order to encourage the latest trusses to ripen before we get cold nights. Succession-plants in pots should be kept growing out-of-doors, re-potting them as the state of the roots may demand. When a quantity of fruit has set, place these plants in glass-houses when the nights begin to grow cool.

Some of the dwarf-growing, corrugate-fruited varieties fruit abundantly both out-of-doors and under glass, but there are smooth-skinned varieties which do equally well if the cultivation is of the right sort.

Scarlet Runners.—The ground alongside the rows of Beans should be mulched with rich manure and water copiously applied, repeating the application as the weather and the state of the soil may demand. Do not allow any of the pods to ripen, but set apart a part of a row for seed purposes.

Cabbage.—An ample sowing of Cabbage-seed should now be made; sowing on land that is moist with rain, or which has been afforded water some hours previously. When the seeds are sown broadcast or in drills, let the beds be covered with mats till the young plants appear, then remove them forthwith and put a net over the bed at about 1 foot from the ground. Let the earlier seed-beds be well supplied with water. A small quantity of the red variety may now be sown.

Cauliflower.—Those who winter their Cauliflower-plants in frames and under hand-lights should make two sowings during the present month, earlier in northern counties and later in the south and south-western ones, the difference between the two being from fourteen to twenty-one days. The Walcheren is a useful variety, it being hardy and less subject to "buttoning." The seed may be sown similarly to Cabbage-seed, that is, thinly, so that the growth will be sturdy from the first. There are some good varieties of late Broccoli which, in favourable seasons, fill up the gap between the Broccoli and the spring sown Cauliflower, but as the winter weather cannot be forecasted, it is well to be on the safe side by preparing plants, both autumn and spring sown, in case of a mishap occurring.

THE APIARY.

By EXPERT.

The Temperature of Hives.—How to increase our hives without causing the bees to stop working, is what we all want to know. Somehow, the change very often results in the work being either wholly or partly stopped for a few days. The important point to observe in making any addition to the accommodation of the hives, is to be careful to conserve the heat of the colony. A man cannot keep warm in a cold house; the heat from his body escapes into the air, which surrounds him on every side. This is simply an illustration. My inference is, that if the air surrounding the bees be much colder than their bodies, the insects will lose their intense vitality by degrees, till they are quite benumbed and inert. If the colony, to use a popular expression, catch cold, we are not justified in believing that the baneful influence is removed when some extra coverings have been heaped on. The effect of cold generally on the circulation is to drive the blood from the surface to the interior of the body, and so gorge the vital organs. The temperature of the body itself is much lowered, and the heart contracts slowly with weak pulsation. It must be observed that, if bees are thoroughly benumbed, they may probably suffer permanently. This is particularly the case where the bees are aged and emaciated, and where the vitality is considerably less than is the case with younger insects. The bees are injured in three ways—by cold, by evaporation, by the condition of the air, and by radiation. Where there is a dry coldness, the evaporation is greatest. When the air is filled with moisture, it is at its minimum condition; and is very considerable when the air is moist, so that cooling takes place either when there is a dry, cold air, or a cold, moist air. Our study should be to keep the bees at such a temperature as will permit of a healthy but not an excessive radiation of heat. We have spoken of the effect of excessive cold, but excessive heat is slightly less hurtful in its operations. Heat, when it approximates or exceeds the temperature of the living body, is hurtful. It has an enervating power. Everything animate is listless; and if not incapable of, at least disinclined, to make any considerable exertion were it not that living bodies sweat. When a certain extreme point is reached, it would almost seem certain that creatures would die when the heat equalled or exceeded that of the blood. How shall we protect our bees from the cold without interfering with the proper ventilation of the hive? Can any one tell us?

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

increased during the last quarter of a century, so much so that it may almost be said that a new industry has sprung up. The prosperity of this undertaking naturally depends upon cheapness of glass and fuel, moderation in the matter of wages, railway carriage, and rates and taxes. So great is now the competition, and so narrow the margin of profit, that if any one of the items we have mentioned becomes excessive or disproportionate, the success of the enterprise becomes seriously menaced.

According to the provisions of the Agricultural Rates Act (1896), land used for agricultural purposes is rated to only half the amount demanded from land with "buildings" on it. Glass-houses, though not utilised for residential purposes, are none the less "buildings." "Agricultural land," as now decided, must have no buildings upon it. This seems a very clear distinction, but when it is remembered that according to the terms of the act "market-gardens, nursery-grounds, orchards and allot-

Probably the framers of the original Act had not in view market-gardens of the character above described. They were more concerned with agriculture proper, and the object was to relieve the farmer. As things are, we must take the law as it is for the time being. The manifest injustice to the market-gardener, however, seems to render it essential that the Act should be modified or a new one passed, so as to exempt the market-gardener from this serious impost. Agriculture is in a distressful condition; market-gardening and commercial gardening generally, are prosperous, and many agriculturists have very wisely turned their attention to more profitable undertakings. That they should now be checked by the law is a great misfortune, particularly as the agriculturist is not specially benefited by the increased toll taken from the market-gardener.

We hope to give our impressions of this great annual event a week later; but this will necessarily be after the event. This week we wish to take time by the forelock to induce our readers to go and see for themselves, and to chronicle some of the novel features in this year's show, which promises to be the largest of the series. The Co-operative flower-show has advanced until it has taken a distinguished place among the notable events of the year. At the start, a single table was sufficient, and a few hours began and ended the whole affair. Now, not only the working masses but the cultured classes are deeply interested. Society and the peers are moved, and the Palace is crowded for a week. The festival and shows crowd the entire week, from Monday, August 14, to Saturday, August 19.

Dr. LORRIMER, the great American orator, is the festival President of the year, and his eloquence and oratory are expected to give attraction to the meetings; but the merest summary of the proceedings would unduly encroach on our space. It will be best, therefore, in our first notice to confine ourselves chiefly to the more notable horticultural features of the great gathering.

During the winter, the question of how to make these great gatherings more useful for the extension of the knowledge and love of horticulture among the masses has been discussed in the pages of the *Agricultural Economist*. The first fruits of this appeared in the announcement of a series of educational lectures during the festival and show week. They will begin on Monday, 14th, at 2.30 in the Palace by the judges. The first by F. W. SANDERS, Esq., on "Worker's Gardens"; the second, on Tuesday, 15th, by Mr. GEORGE GORDON, V.M.H., subject, "Vegetables for Small Gardens"; the third, on Wednesday, Aug. 16, "Fruits for Cottagers," by D. T. FISH; the fourth, by RICHARD DEAN, V.M.H., on "Flowers for Workmen." The last and concluding lecture of the series will be given by Mr. JOHN WRIGHT, on "Allotment Cultivation."

There is also a new educational class for collections of fruit, flowers, and vegetables; judged by points—the absolute possible number and the actual points taken by the different exhibits being noted, so that every exhibitor may read as he runs the reasons of his success or failure. The prizes in the point-judged classes are liberal, including a first prize of a water-colour drawing by Miss MARIE LOWE (Mrs. HEMSLEY), and five guineas in cash; second of three guineas; and a third of one guinea.

N. C. COOKSON, Esq.,
OF OAKWOOD, WYLLAM-ON-TYNE.

(See p. 127.)

ments," are to be considered as agricultural land, the difficulty of distinction becomes more apparent, for most nursery-grounds, even if they have no greenhouses, contain an office, toolshed, frames for sheltering plants, and other "buildings" used for purposes of business only.

The question raised, therefore, was, whether land covered with glass-houses was or was not entitled to exemption as agricultural land. The Court of Quarter Sessions said one thing, the judges in the Divisional Court were divided in opinion; the Appeal Court, presided over by the Master of the Rolls, upheld the distinction between "land" and "buildings." And, now, the Lord Chancellor, together with Lords Watson, Macnaghten, and Morris finally agree with the judgment of the Master of the Rolls, with the result that market-gardens under glass are in future not to be rated as agricultural land, but are to be assessed on the same scale as land on which immovable buildings are constructed.

Agricultural
Land Rating
Cases.

SOME months since we published the judgment of the MASTER OF THE ROLLS, in the Appeal Court (see *Gardeners' Chronicle*, p. 168, March 19, 1898). That judgment was favourable to the Surveyor of Taxes, but as some differences of opinion were manifest on the part of the judges, it was resolved to appeal finally to the House of Lords. The culture under glass of plants, fruits, and vegetables for market purposes has enormously

FIG. 49.—CRINUM "VAN TUBERGEN." (SEE P. 133.)

As it would be now too late to enter the field for these and other prizes, it would be useless to burden our columns with details. Suffice it to say, that these exhibits are to be shown on tables eight feet wide and four hundred and seventy-two feet long, and to consist of seven dishes of fruit and seven dishes of vegetables; and ten points, the highest possible given to any exhibit, are to be allowed for table plants; ten for cut flowers and foliage; and ten for tasteful arrangement. Another very important art development, full of hopeful arrangement for the culture and taste of the open century so near at hand, may be seen in the advance of the photographic exhibitions.

Originating in the happy thought of gardens of taste, placed in contrast to gardens run to waste, it has become a free school of art, and provides demonstrations of great usefulness to thousands of the masses. Fine arts, whether on canvas or in horticulture, or in the cottagers' homes or gardens, can only be taught by example. Already the culture of fruit and flowers, the illustrations of the finest samples through photography, have done much to rub off the sharp angles of cash and profits, and to mellow and enrich the character and lives of the million through this gentle art of horticulture in our gardens and homes. While waiting for our photographic pictures in colour, we as horticulturists welcome every advance in the science and practice of photography, which has proved such a useful ally to horticulture.

Perhaps no part of the labours of the One-and-All Movement has been so fruitful in prompt and powerful result in bringing the charms of Nature and art into the hearts, homes, and gardens of the working classes as its photographic exhibitions of what to choose and what to avoid in homes, gardens, windows, rooms, back-yards, &c. Hitherto, horticultural merit has been the main object, but the time has now come to illustrate the highest science in photography as well. Hence the division of the Photographic Exhibition into two—the horticultural section, to be judged by Messrs. SANDERS and FISH as usual; and the highest section of scientific photography, by Messrs. SNOWDEN WARD and E. ZAMBRA, of the Crystal Palace. Mr. SNOWDEN WARD, one of our great authorities on high art photography, will also repeat his lantern lecture on horticultural photography, and many things may be seen and heard that cannot fail to prove most interesting and instructive.

In the words, however, of one of our well known correspondents, by running our horticultural landscapes abreast of our highest science and finest examples of perfect photography as a fine art, it will be more likely to sustain the fine art of gardening, furnishing an illustration at its highest level.

Landscape photos need lack neither light nor shade, proportions nor harmony, perfect finish nor workmanship. Still, this lesson should be for gardeners, to show them how best to help them in the furnishing and filling the garden and home.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will be held on Tuesday, August 15, in the Drill Hall, James Street, Westminster, from 1 to 5 P.M. At 3 o'clock a lecture on "Pruning, what for, How, and When," will be given by Mr. R. P. BROTHERSTON.

RATING OF NURSERIES, ETC.—We have received the following letter from the solicitor to the

Nursery and Seed Trade Association:—"Overseers of the Parish of Worthing v. Richmond (Surveyor of Taxes), Agricultural Rates Act, 1896.—I enclose you a copy of the judgment of the House of Lords delivered in this case on the 3rd inst., as reported in the *Times*, affirming the judgment of the Court of Appeal, which decided that glasshouses in or on a market garden, if buildings, must be rated as buildings and not as agricultural land, thereby confining the benefit conferred by the Agricultural Rates Act to agricultural land. Believing that the majority of the Court of Appeal were right in their judgment, and that their decision in this case did not affect the decision of the Court of Appeal in *Purser v. The Worthing Local Board of Health*, I took the opinion of counsel, and was advised that such was the case. Market gardeners and nurserymen are liable to be assessed for the district rate in the proportion of one-fourth part only of the net annual value of their nurseries and market-gardens. It may be advisable for you to remind your subscribers of this, and that the decision of the House of Lords does not deprive them of the benefits of the Agricultural Rates Act in respect of Poor-rates so far as regards land used independently of, and not covered by buildings.—Yours truly, CHARLES BUTCHER, Solicitor to the Nursery and Seed Trade Association, Limited, 30, Wood Street, Cheapside, E.C."

THE BOARD OF AGRICULTURE AND COMMONS, ETC.—The recently published annual report of the Board of Agriculture is a splendid advertisement for the Commons Preservation Society, for we learn that no order for the enclosure of a common was made last year—nor is there under consideration any application for such. An application—the last, we believe—was made in the year 1895, and it deserves notice because the lands proposed for enclosure (2685 acres) in Northants was mostly fields, meadows, and pasture, worked by the parishes in which they lay, therefore not quite common. Of this lot 42 acres were turned into field gardens, 44 acres into recreation-ground, and an open heath of over 100 acres was let alone. Last year two metropolitan commons were given over to a district council; a third (Harrow Weald Common) is now being alluded to in the House of Commons. This land is part of an enclosure made in 1803—in fact it was an allotment made in that year for supplying gravel, &c., for highways and private roads. It is intended to turn it into an open space, under proper care, and so will be a great boon to a fine suburb.

THE UNIVERSITY OF LONDON.—The transfer of the University to the Imperial Institute will be of great advantage to the University, and together with the proposed institution of a teaching department to the examination centre already existing, will increase the reputation of the University. It is not generally known that the standard set up by the University is in some, if not in all departments much higher than in the older universities, where the culture of athletics, and the development of the body are in practice considered more important than the development of the mind.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—At a meeting of the Directors of this Society, held at the office of the Secretary, on 5th inst., Mr. PYPER, of Hillhead, presiding, it was intimated that arrangements are now complete for the forthcoming show of the Society to be held in the Duthie Public Park, Aberdeen, on 17th, 18th, and 19th inst.

REJUVENATING PORTMAN MARKET.—We understand that a proposal is now on foot for re-habilitating this market under the title of "Portman Market, Limited." The company is to acquire the benefit of an agreement for a lease to be granted by Viscount PORTMAN of the site named, and erecting in the place of the present buildings an improved and enlarged market building, with cool storage

and offices. The market, we believe, dates from 1830, and its fortunes have been "various," though it might surely be predicted of such a scheme in the Paddington district, that success must attend a well-directed effort to supply fruits, roots, and vegetables to a somewhat dense population.

PRESERVATION OF COMMONS, ETC.—Those who for many years past have banded themselves together to preserve the commons, "greens," &c., in this old England, must be gratified with the success of their endeavours. Applications for the enclosure of commons have dwindled to the vanishing point, and quite lately there has passed both Houses of Parliament a Bill for preserving commons and open spaces to the people. The Bill consists of twenty-four clauses and two schedules, and makes the district council the authority for drawing up the necessary regulation schemes, when there is agreement among the parties interested, thereby avoiding the expensive machinery of a scheme and inquiry by inspectors sent from London. The district council can assume powers of management in respect of a regulated common under a scheme, and can delegate them to a parish council. A county council may also invest a parish council with all the powers of the Open Spaces Act, 1877 to 1890. We may note that Part I. of the main object of the Bill is to provide simpler and less expensive machinery for regulating commons. At present a common cannot be regulated or placed under local management without a provisional order or a scheme confirmed by Act of Parliament. Part II. makes some minor amendments in the Enclosure Acts, and in the enactment relating to open spaces and recreation grounds, and repeals certain enactments relating to commons which are either obsolete or inconsistent with modern legislation. The lord of the manor is relieved of certain responsibilities, and the modern machinery of district and parish councils, as stated, will now take over all the duties.

"BLIND" GAILLARDIA.—Messrs. BARR & SONS have sent us what they call "blind" flowers of a Gaillardia. The "blindness" consists in the entire absence of the ray florets, whilst the central ones are tubular, cylindric, closed at the apex (cleistogamous), or occasionally with traces of five divisions at the apex. In many cases they are studded with multicellular hairs, a purplish pigment occurring in alternate cells, so that a banded appearance is produced. The two stigmas are more or less leafy, the other parts of the flower are not specially altered. A flower so changed has no attractions for the average gardener, who, however, is apt to ask inconvenient questions, such as "Why does this happen?" To this the botanist can only shamefacedly say, "I do not know." If he had been present at the beginning of things instead of at the end, he might have been able to explain why these particular flowers were arrested in their growth; as it is, he can only chronicle the results of a *post mortem*.

PURLANE SEEDLINGS.—We have been interested in watching the behaviour of some seedling Portulacacae grown in a cold frame for salad purposes. The two ovoid, fleshy, green cotyledons, are borne on the top of the "hypocotyl," or caulicle, and in the daytime they spread at right angles. As darkness comes on, they become erect, and appressed one to the other, thus protecting the young leaves. These leaves, which are in "alternate" pairs, show the same movements, spreading to avail themselves of the sunlight, raising themselves as temperature and light go down, to avoid the effects of radiation.

STOCK-TAKING: JULY.—The general conditions of trade during the past month has prepared us for a satisfactory report by the Board of Trade in connection with "Trade and Navigation." The Board of Trade figures for July show an excess of imports over those for July, 1898, of £4,032,333,

gained thus:—1898, £35,903,039; 1899, £39,935,372. Of this great increase, nearly £1,811,000 is placed to the account of food and drink, including live animals and tobacco." Our usual extract from the "summary" table is as follows:—

IMPORTS.	1898.	1899.	Difference.
	£	£	£
Total value ...	35,903,039	39,935,372	+4,032,333
(A.) Articles of food and drink—duty free ...	13,258,826	14,091,228	+1,432,402
(B.) Articles of food & drink—dutiable	2,043,863	2,239,201	+195,338
Raw materials for textile manufactures ...	3,474,294	3,445,455	-28,839
Raw materials for sundry industries and manufactures	5,327,559	5,832,130	+504,571
(A.) Miscellaneous articles ...	876,344	1,084,574	+208,230
(B.) Parcel Post ...	88,339	88,242	-127

We come now to our little table recording imports on fruit, roots, and vegetables, as follows:—

IMPORTS.	1898.	1899.	Difference.
Fruits, raw:—			
Almonds ... cwt.	1,972	8,193	+1,221
Apples ... bush.	30,739	117,835	+87,096
Cherries... ..	190,878	104,026	-86,852
Grapes	51,509	104,394	+52,885
Lemons	176,891	217,484	+40,593
Oranges	7,931	91,625	+83,694
Pears	13,621	49,823	+36,202
Plums	67,715	135,435	+67,720
Unenumerated... ..	455,159	483,615	+28,456
Roots and Vegetables:—			
Onions	367,133	454,268	+87,135
Potatoes ... cwt.	588,969	681,572	+92,603
Vegetables, raw, unenumerated ... value	£201,129	£215,002	+£13,873

The figures here are certainly very striking, bearing in remembrance the table recording the fruit harvest of the year. What may have been the amount of foreign fruit destroyed by atmospheric and other conditions in transit we have no means of learning, but doubtless the foreign exporter has learnt a lesson we trust he will take to heart. The imports for the seven months of the year have reached the total of £276,639,107, as against £271,881,490, or an increase of £4,757,617. Not a bad account to date. Coming now to the past month's

EXPORTS.

we find still another increase to record. The figures for July are £23,195,958, compared with £20,089,878 for the same period last year, or a gain of £3,106,080. The increase is spread over nearly every item of importance, and the total gain in the seven months is £17,119,795. We note that the Franco-American tariff has been arranged after heavy work; the latter country is now on the same footing as England and Germany. With wages advancing in certain important trades, it will be admitted that, on the whole, the "show" for July is a very good one indeed.

PETER LAWSON & SON, LIMITED: NURSERY AND SEEDSMEN, EDINBURGH.—We learn that the directors of this old-established concern will submit a statement of the Company's affairs as at June 30, 1899, being the close of the financial year, showing a profit upon the year's trading of £1874 16s. 6d., of which sum the directors recommend, for the approval of the shareholders, that a dividend at the rate of 5 per cent. per annum on the paid-up capital, free of income tax, be paid on September 1 next, thus absorbing the sum of £575, and that the balance, viz., £999 16s. 6d., be carried forward to the current year. The directors who now retire by rotation are Mr. LYTLE and Mr. SOMMER, who are eligible, and offer themselves for re-election; and

it is recommended that the auditors, Messrs. A. & A. PATERSON, C.A., be re-appointed. The accounts will be open to the shareholders for examination at the registered office of the company, No. 1A, George IV. Bridge, during business hours, for a week before and a week after the annual general meeting of the company.

ISLE OF WIGHT.—The monthly meeting of the Isle of Wight Horticultural Improvement Association was held at Newport on Saturday, August 5, Dr. J. GROVES, B.A., J.P., presiding over a fair attendance of members. Mr. T. ROBINSON, of Hildyard, Sandown, read a very interesting and profitable paper on the "Cultivation of Vines," which evoked a good discussion.

INTERCROSSING AND HYBRIDISING.—PROF. J. C. EWART sends us the following note: "Having read with much interest the reports in the *Gardeners' Chronicle* of the Hybridisation Conference recently held, it has occurred to me that a résumé of the main results already obtained by crossing plants, would be extremely helpful to all interested in the subject of heredity. From what takes place when animals are crossed, I would expect plant hybrids and crosses in their structure, coloration, habits, constitution, fertility, &c.—

1. To be nearly intermediate between the two parents.

2. To closely resemble either the seed or pollen parent.

3. To resemble a recent, an intermediate, or a remote ancestor.

4. To possess all, or nearly all, the characters of one of the parents, plus one or more of the characters of the other parent, or one of its ancestors.

5. To exhibit in an undiminished form, the more striking characters of both parents.

6. To closely agree in some respects with one of the immediate parents, and in other respects with the ancestry; or

7. To neither resemble the parents nor any of their known ancestors.

If a table were prepared giving examples of these and like results, it would, I am satisfied, prove most useful; and its utility would be augmented if an attempt were made to account for the form &c., of the hybrids—to explain, e.g., why a hybrid resembled the pollen more than the seed parent. Perhaps it would simplify matters if hybrids (i.e., crosses between species or still higher grades) are placed in one table, and crosses (or to use a more distinctive term, crosslings), i.e., the offspring of well marked varieties, races, or strains, are arranged in a second table. *J. Cossar Ewart, University of Edinburgh, Aug. 8. 1899.*

RAILWAY CONCESSION FOR CRYSTAL PALACE VISITORS.—Numerous horticulturists in particular and the public generally who have, in the course of a year, so many inducements to visit the Crystal Palace, will be gratified to learn that the directors of the Crystal Palace have arranged with the District and Metropolitan Railway Companies to provide tickets, including return railway fare and admission to the Palace, from all Inner Circle stations for 1s. 6d. On all lines within a radius of twenty-five miles of the Crystal Palace a considerable reduction on combined fare-and-admission tickets has been effected. To get from (say) Notting-Hill to the Crystal Palace with admission for eighteenpence is a surprising offer, which speaks volumes for the enterprise of the new directorate.

TRADE IN PLANTS, ETC.—If one is desirous of learning what is the value or extent of our foreign trade in nursery and garden products, it will be useless for him to look up the monthly returns issued by the Board of Trade—imports and exports alike. The word "miscellaneous" covers quite a host of items, but is useless to the average inquirer. Customs bills of entry are not very inviting pieces of literature—besides, life is short, and though we have occasionally indirectly suggested the abolition of the item "miscellaneous," and the substitution of the separate or more im-

portant items, it has not been found possible to take notice of the suggestion. The Secretary of the Board of Trade has been approached on the subject, and no later than July 25, in answer to an inquiry, wrote that the "exports of plants from the United Kingdom are not separately recorded;" but as to the imports, "if"—there is much virtue in an "if"—we did so-and-so, then we could get at the total value of our imports of plants, &c., from all foreign countries and British possessions. These figures the writer obtained in the library of the London Chamber of Commerce, in a huge Blue-book, under the heading:—

Imports of Plants, Shrubs, Trees, and Flower Roots entered for Value only.

Imports for four Years.	1895.	1896.	1897.	1898.
	£	£	£	£
Germany	30,187	39,465	42,020	43,889
Holland	184,025	203,390	213,653	221,793
Belgium	38,433	40,271	44,780	49,872
France	46,515	46,237	41,591	49,708
Japan	10,352	12,100	18,954	18,147
United States of America	17,377	18,922	18,373	13,335
Mexico	3,251	1,816	2,204	319
Republic of Colombia ...	8,735	9,896	9,008	10,425
Brazil	8,639	5,002	3,715	6,250
Other foreign countries .	4,448	4,117	4,607	3,410
Total, foreign countries	346,962	381,216	398,875	417,217
Channel Islands	6,352	7,441	10,356	10,363
Cape of Good Hope ...	753	359	317	304
Natal	745	269	1,182	514
British East Indies ...	7,078	7,266	4,786	4,865
Hong-Kong	157	407	2,983	171
Australasia	804	486	871	780
Canada	123	699	1,212	1,151
British W. India Islands	509	625	944	543
Other British possessions	467	277	962	704
Total from British possessions ...	17,653	17,830	23,613	19,598
Grand total	364,615	399,046	422,488	436,815

These figures speak for themselves; not a line is necessary to show further elucidation. Incomplete as the information may be, we live in hope that by-and-by we may not only achieve some details as to the nature of exports apart from value, but also some data as to the other side of the account.

PLANT PORTRAITS.

STRAWBERRY JARLES.—In the issue of *Le Jardin* for May 5 this year, there appeared a coloured figure of this new French variety of Strawberry; and in the *Revue Horticole* of May 1 it was stated that Jarles is an improved Docteur Morel, which has been introduced to commerce by the fruit-cultivator, M. L. Jarles. The variety is much sought after in the markets, and the first that were sold in 1898 fetched 28½ marks the basket of eighteen fruits! This year, quite recently, several fruits were sold at 65 pf. to 1 mark each. The fruit is flattish, kidney-shaped, much larger than Docteur Morel, and colour more brilliant. The creinations of the leaves are rounded, not pointed. At the meeting of the Société Nationale d'Horticulture de France on April 13 last, the raiser of the variety, stated—"that since April 1 he had sent to the Markt Halls baskets containing twenty-four fruits each, which fetched at auction 15 to 19 marks per basket. A woodcut of this variety is found in the *Deutsche Gärtner Zeitung* for August 5.

CRINUM "VAN TUBERGEN"

(Lynch).

I APPLY the above name, for garden purposes, to one of the finest of hardy Crinums, which hitherto has been known only by an incorrect name. It came from Myn. C. G. Van Tubergen, junr., of Haarlem, as *C. crassifolium*, and until this note required to be written for the accompanying fine illustration (fig. 49, p. 131), that was supposed to be its true title. On comparing it with the description, however, in Mr. Baker's *Amaryllideae*, considerable doubt arose, and by the kindness of Sir William Threlton Dyer, Director at Kew, a specimen was examined at the Herbarium there, with the result that it was queried as a variety of *C. longifolium*. Later,

when Myn. John Hoog visited Cambridge, as representative of the firm, he informed me that specimens had before been sent to Mr. Baker, who had not been able to supply a name. It is evident, therefore, that a name is required, and I have pleasure in calling it after the gentleman who presented the plant to the Cambridge Botanic Garden, and to whom the gardeners in this country are indebted for many fine plants, examples of which have been seen at the Temple shows.

C. (Van Tubergen) is a fine stately species—if such for the present purpose we may call it, at once commanding attention, whether in flower or not, and certainly very distinct, from at least a garden point of view. It is so far unlike *C. longifolium* that no relationship with that species suggested itself, as they grew together. The height of the plant is about 3 feet, the leaves are about 5 feet long and 5 or 6 inches in breadth, or about double the width of those of that species. Moreover, they differ conspicuously in not being glaucous. The plant differs also in habit, the crowns being fewer and stronger, not forming so dense a mass of foliage. Unfortunately, a careful and minute description cannot be given, as the plant was too soon out of flower after its desirability became known. The dense inflorescence, however, is well shown by the illustration; and contrasting with *C. longifolium*, it may safely be said that the spathe valves are decidedly green, as is also the tube of the perianth, and that the scape in section is hardly compressed, but very nearly terete. There are, no doubt, evident similarities with *C. longifolium*, as well as distinct differences, but however these may be regarded, the greater substance of the flowers, and the much finer inflorescence, combine with stately habit to form a much more desirable plant. Myn. John Hoog informs me that it has long been cultivated in Holland, and that its history is now lost. I have, I believe, a hybrid between this and *C. longifolium*, but until it flowers this of course cannot be quite certain. I expect to flower the plant next year. *R. Travin Lynch*. [We venture to call this "*Van Tubergen*," and not "*Tubergeni*." In Latinising names for botanical purposes, prefixes, like "*Van*, *de*, *O*," &c., are better omitted. When it is better known and more fully described, it will be easy to add an "*i*" to the name of this *Crinum*, and thus give it specific rank. Ed.]

HOME CORRESPONDENCE.

THE HOT-WATER CURE.—The "*Old Geyser*," p. 113, who is not destitute of the sense of humour, is down like a sledge-hammer on the inventors and purveyors of insecticides. He then exclaims: has any one tried the effects of water at 150° on the American-blight, and the Black Currant bud-mite? As to the exact temperature there may be differences. But to the hot-water cure hosts of growers are ready to attest its cleansing-killing power. But why heat the water to 150° when 130° will do? There is no merit in mere number, whether odd or even. It is the cleansing efficacy, the killing power of the water we need to be assured of. Water at 130° kills American-blight prompt, and kills in battalions, of this there is no doubt or question. I know the force and volume a stream has are factors in the cleansing-killing force of the water. But leaving the "*Old Geyser*" to formulate his facts and theories on such points, as well as to inform us how to get hot baths to the Black Currant-mites protected by the overlapping scales of the leaves of the Black Currant. It might be wise also for the "*Old Geyser*" and others to bear this fact in mind that if we lower our hot water 100°, and apply it as near the freezing temperature as may be without freezing, with sufficient force, the living American-blight shrinks into dead pulp before our eyes[?]. One more point is of importance in determining the temperature of the water, viz., the age and texture of tissues to which it is used. Almost certainly the younger and more porous the plant, the lower the temperature of the safety point of the water. *D. T. Fish*.

— I can quite agree with what the "*Old Geyser*" says respecting hot-water in the *Gardeners' Chronicle*, p. 113. Twenty years ago I took charge of the gardens at Marden Park, Caterham Valley, Surrey, and the Peach-trees and Vines were in a very bad state indeed with mildew; the Peach-trees were also had with white-scale. When the Peach-trees shed their leaves I gave them a thorough syringing with hot water. I put a house-flannel round the hand-syringe, and syringed the Vines and Peach-trees, and the next season mildew and white-scale were things of the past. During the fourteen years I was there, I was never again troubled with either white-scale or mildew. *G. C., Aston Rowant, Tetworth*.

THE SPARSITY OF HARDY FRUIT CROPS.—May it not be well to make a note of the fact, that the dearth of hardy fruit crops this season is not so much due to injurious frosts, which injured or destroyed the blooms, as to the long continued low temperatures experienced whilst the trees were in bloom and for some weeks subsequently? At least this was so as regards the district wherein I reside. The wood formed during the year 1898 was perfectly ripened, and the display of bloom, especially upon Pear and Apple-trees, was such as I had never seen before in my long experience. The former were sheets of individually perfect blooms, yet how sadly under-average the crop is, your lucid summary plainly proves. Hitherto, I must confess, I had imagined these hardy fruits could withstand all low temperatures short of actual frost. Evidently this is not so, because a persistent low temperature between 32° and 38° has now told its tale. The blooms and embryo fruits perished, though a dry period prevailed at the time, from sheer inability to grow. Actual frosts generally destroy the most exposed blooms, leaving others amid branches uninjured. Not so low temperatures; they destroyed all, so that upon more tender varieties not a fruit remains—this as regards sundry Pear-trees in my garden and round about. On the other hand, strange as it may appear, I have large trees of Ribstone Pippin and Bleuheim Orange Apples laden with noble fruit, though small ones of Price Albert, Warner's King, Golden Spire, &c., bear very few. One fact I noticed during the period the trees were in bloom, only a few solitary bees left their hives in search of pollen or nectar on three days. Our short fruit crop may be due to this simple fact. *William Earley*.

RASPBERRY SUPERLATIVE.—It may be interesting to many readers of this journal to know that this valuable variety, which of late years has come so much to the fore, was raised at Waldershare Park in the year 1881 by Mr. Merryfield, for many years gardener at that place. It is a cross between the White Antwerp and Fastoff. In 1883 the stock of it had increased to thirty canes, which formed a single row in the kitchen garden. In 1885 some fruits were sent to the Royal Horticultural Society, but as it was then thought to be identical with the variety called Hornet, no award was made; later, however, it received a certificate, and rightly so, too, for it is one of the best Raspberries in cultivation. *H. Markham*.

LAWN WEEDS (see p. 114).—In the absence of direct experiment it is impossible to state definitely whether the use of strong sulphuric acid as a weed-killer sterilises the spot of soil upon which it is dropped, for any considerable length of time. It is probable that, on most soils, the very small quantity used is quickly neutralised by the lime present usually as carbonate, and so rendered harmless. Has any reader tried hydrochloric acid (commercially known as muriatic acid or spirits of salt), and if so with what result? This acid, unlike sulphuric, is volatile. *C. W. H. G.*

A TOOL FOR LIFTING POTATOS.—As an amateur gardener, mostly doing my own digging, I should like to say a few words as to the best tool to use, especially for lifting Potatos—for the difference between a good tool and a bad one means all the difference. Till the last half dozen years or so I used a spade, but finding a fork work much more easily than the spade I was using, I discarded it for the fork. Now I find I leave a lot of small Potatos in the ground, and these, much to my annoyance, spring up amongst the other things everywhere, giving the beds a very untidy appearance. They seem to slip through the fork and bury themselves entirely, till they begin to shoot up in the spring,

I cannot remember this happening so much when I used a spade; and though all the spades I have ever used are harder to work than a fork, I should return to the spade if I was certain it made so much difference in turning up the small Potatos (of which I have plenty this year owing to the drought). Has any of your readers noticed such? I think a spade means death to the weeds more than a fork, by cutting up the roots. *C. Mullins*. [The tool-makers and village smiths used to make a three-tined fork, with the tines about 1 inch wide, $\frac{1}{2}$ -inch thick, and the entire fork of a width of 7 to 8 inches. This fork is a better tool than the steel digging-fork, injuring fewer tubers. Ed.]

THE APRICOT CROP.—In a return I made for the *Gardeners' Chronicle* about the fruit crop, I omitted Apricots, intending to add a special note. These were in full flower from March 20 to 25, during which time the frosts were very severe, averaging 15° below freezing every night. The Apricot flowers out were all turned quite brown, and I despaired of the crop, but the result is a better crop than I have had for many years, and the fruit finer. I have for many years given up all attempts to protect the flowers, finding by experiment that the trees protected by the insertion of Fir branches generally produced a worse crop than those left bare, owing, I believe, to the wet which the evergreens collect and hold. *C. Wolley Dod, Edge Hall, Malpas, Cheshire*.

SCARCITY OF INSECTS.—In last week's issue of the *Gardeners' Chronicle*, Sir Joseph Hooker, residing at Sunningdale, says that insects were scarce there. I wish it was so here, for though they may be a little late, the air is filled with the white Cabbage-butterfly. Wasps are in evidence, these pests having begun to eat the Grapes in the vineries. Both wasps and the Peacock-butterfly are mostly autumnal in their visits, and I expect by the time Sir Joseph's Plums are ripe he will, I fear, have to deplore their large numbers. *H. M., Newbury*.

SINGLE HOLLYHOCKS.—"Growler" is quite right in referring to single Hollyhocks as more beautiful than are the double ones, but he is wrong in thinking that the warty fungus has well nigh destroyed the latter. [It was so till lately. Ed.] When annually raised from seed, doubles are found to be remarkably alive. But beautiful as the singles are, they also are not exempt from the ills which beset Hollyhocks, for the fungus preys upon them also, though not so severely as on the doubles. But unless some wonderful remedy can be found, I fear the fungus will in time prove to be too great an enemy to these apparently more robust plants. We want in single Hollyhocks a rather dwarfer race, as when long stems are produced it is rare to see them coated with flowers, as is the case with the doubles. Perhaps it would be a good plan to pinch out the points of the stems, and thus compel them to branch freely. Certainly something is needed to make the flowers retain hold of the stems much longer than they now do. The charm of the flowers lies in their pleasing form, silky texture, and wondrous variety of colours and markings; indeed, so varied, so soft, and so beautiful are the colours thus produced, that few hardy flowers can rival them. A fine field for active and useful operation is open to the breeder if the single Hollyhock be taken in hand. Whether gardeners look upon them with disdain or not, I do not know; but they are seldom seen in large gardens, the best displays that come under my notice being at railway stations (where they are invariably greatly admired), in suburban cottage gardens, and occasionally in seed grounds. The plants produce seed all too freely. Did they not do so, no doubt they would retain their flowers longer. All the same, no admirer wishes to see the flowers doubled. *A. D.*

SWEET PEAS.—It has been suggested that in view of the marvellous advance made in the production of beautiful varieties of these flowers, that a conference and special exhibition might well be arranged for at Chiswick next July. The proposition is an attractive one, and might even go further and include every section, and so far as possible known, members of the great Pea family. In such case there would be ample to employ and interest not only the Royal Horticultural Society's Committees, but many of the Fellows. Sweet Peas are especially in need of such selection as a conference

and exhibition of them could furnish. Like culinary Peas they have their special points, and whilst we understand those of the culinary section very well, the desired features of Sweet Pea flowers are less understood. Probably were a rigid examination of every variety of Sweet Pea instituted, it would be found that many of them suffer from floppy or weeping standards, that are as much a defect as burst flowers are in the Carnation. Raisers should work hard to give us stout, erect standards, with large flowers and beautiful colours. The raisers and admirers of edible Peas might find enough to talk about also, and then there would still be the numerous beautiful hardy perennial section which so much merits greater development. One special feature of the conference might be prizes for the most tasteful method of exhibiting Sweet Peas as art flowers. *A. D.*

TYING PLANTS.—Prof. Henslow's article on this subject hardly comes within the range of practical horticulture as applied to plant growing for market, yet it opens up a discussion from which much interest and benefit may be derived. I can hardly follow Mr. Henslow's suggestions with regard to the theory of saving strength, and diverting it to other sources; yet in practical horticulture it is quite evident that a little artificial assistance is necessary, and plants are benefited by being tied to some support to keep them in their proper position, for when a plant which, naturally, should grow erect, falls over, the flow of sap is checked, and consequently diverted to another direction, generally to making new growths from the lower portion of the plant, to the detriment of the main growths which should produce the bloom. But to come to the more practical results of tying plants, it keeps them in shape, and when done properly does not detract from the natural beauty of any plant; but it often occurs that unsightly stakes are used, and the plants instead of being supported in their natural habit are tied "out of shape" and their natural beauty destroyed. I remember the time when it was suggested that all plants put before the Committees of the Royal Horticultural Society should not be tied, but it was found that this stipulation could not be carried out; for although when a plant left in one position would keep in good shape, after being shaken about on a journey it would not hold up in its natural position without some kind of support. The great point in "tying plants" is to do it in a slightly manner. I object to a plant which naturally would present an uneven outline, being tied into a formal, though symmetrical shape. The craze for formal-shaped flowers and distorting plants by tying and clipping them into unnatural shapes is fast dying out, but it will always be necessary to give some assistance to various plants. What I am most surprised at is that many who excel in culture pay so little attention to "tying." Many of the best grown plants that are sent into our markets are distorted and made ugly by being clumsily tied, and by the use of thick ugly sticks. I have often heard complaints from those who use plants for decorations, that the growers use large unsightly sticks, which have to be replaced by neater sticks or dispensed with altogether. Some growers, I may say a good many, use split laths which have not been shaved up at all, and are in a rough state. Of course, this is economical; but if neater sticks were used, and a little more attention given to tying, a slight advance in price which they would be sure to command would fully compensate for the extra trouble. One of the greatest faults I have noticed has been in tying Pelargoniums, three or four clumsy sticks being used, and these spread out, leaving the centre of the plants hollow, or without a leading shoot. Now with regard to the necessity of tying plants, there are two cogent reasons. The first is, as I have previously remarked, that plants which remain in one position will stand up well, but when moved and shaken about, as is unavoidable when moving them about, they are sure to fall over and get out of shape. The second, and perhaps the most important, is, that all cultivated plants are grown more or less under artificial conditions, and consequently require artificial assistance to keep them in shape. The abundance and weight of flower too often require that a support be afforded. The great point, therefore, is to tie as neatly as possible, and while supporting the plants in a natural shape, to avoid over-tying or twisting the plants out of their natural shape. It requires some practice to tie plants well. I have generally found that a man who could tie well and quickly, could do most work well. If young men were to

pay more attention in starting, to do this work in a proper and systematic way, it would benefit them quite as much as giving their minds to theories which are difficult to bring into practice. When a young man starts tying, it does not take long to see if he has ever learnt to handle a plant properly. Some are naturally quick, and can get through their work expeditiously without exertion; while with others it seems to be impossible to tie properly, much more to get it done expeditiously. *A. Hensley.*

PAPAVER SOMNIFERUM.—Why does "A. D." call this a French Poppy? Its origin is supposed to be *P. setigerum*, a cornfield weed of South Europe. It would be interesting to know if the plant in question be not this true wild species and not *P. somniferum* of cultivation. *George Henslow.*

QUALITY GRAPES NOT TO BE JUDGED BY TASTING.—Perhaps this is the most startling innovation proposed by Mr. Buchanan in his review of the present methods of Grape judging, and showing a suggested improvement. I quote his exact words to prevent the possibility of mistakes: "The quality class to read thus:—Four bunches of Grapes distinct varieties. Quality to be the first consideration." So far clear and good. But the annexed sentences follow: "The flavour *not* to be determined by tasting, as this, while men's tastes differ so, such is a most unsatisfactory way." Besides it would open the door to miserable looking bunches with no cultural merit to recommend them. The quality should be determined by the judges knowing the varieties. Another aid to judging the quality class would consist in choosing them, to begin with six, eight, or twelve varieties well known as high flavoured varieties, or in other words partially at least rely on schedule-made selections instead of wholly on the judgment of the jurors, then the anti-tasting argument for quality will not hold water at all. The judges rely on memory, the previous knowledge of what was known of varieties, instead of the more direct, more recent and powerful appeal to the palate, and the senses with which we smell besides taste induce us for our purpose to test the qualities of our fruits and foods. Nor does it also appear how the light of other days, and the Grapes of previous times, are to give us the sounder or more just decisions as to quality of Grapes or ought else than the up-to-date demonstrations of the living present. As the quality classes are not to be judged by their appearance (at least not primarily) they need hardly be judged at all. For the proposed selections from quality sorts and the glowing memories of jurors of the Grapes of other days may be totted up at home or assessed by telephone. *D. T. Fish.*

FLOWERING OF MORISIA HYPOGÆA.—It is possible your correspondent Mr. T. Harris has an early blooming variety of this pretty plant? My experience is that it blooms *en masse* in the month of May, and I find on referring to botanical dictionaries, the months of April and May are given, respectively, as its season of flowering. The delightful district from whence your correspondent writes may have its influence, however, on his particular plants. From the manner his plants seem to thrive, it may not be out of place, to ask, has he yet seen an illustration of its seed burying characteristic? *William Earley.*

THE FLAVOUR OF MELONS.—The key to this is mostly in their culture, of which more anon. I do not, however, agree with "H. L.," that there is any general lack of flavour in modern Melons. Mr. Markham's hints on the development and preservation of flavour in Melons will be generally endorsed by growers. A sudden lowering of temperature at the finish through excessive ventilation, as this writer says, is more likely to mar than enrich the flavour. These writers give useful hints as to the readiest and easiest means of developing the highest flavour in Melons, a subject that might be profitably re-discussed. Purposely and to make the matter more definite I left all this out of the special points referred to, and which I insisted on—viz., that under good culture the entire produce of a Melon plant will be good alike, true to type, and that fragrance is a true index as to flavour. Both your correspondents in last week's *Gardeners' Chronicle* endorse these views in other words, and I may have more to say as to cultural relations to flavour after the One-and-All Flower Show. *D. T. Fish.*

REMARKS ON THE FRUIT CROPS.

(See *Tables, ante*, pp. 103 to 109).

0, SCOTLAND, N.

SUTHERLANDSHIRE.—Apples, Pears and Plums are the worst crop we have had for many years. Rain, easterly winds, and occasional cold or frosty nights prevailed during May, followed in the early part of June with scorching winds, bright sunshine and drought, and the effect on the fruits named above has been disastrous. Small fruits promise well, although they are only an average crop. *D. Melville, Dunrobin Castle Gardens.*

1, SCOTLAND, E.

ABERDEENSHIRE.—The fruit crops this year are under an average, and in nearly all cases there was a splendid show of blossom, but the late frosts we had in May and early in June caused great damage among fruit-trees in flower. With us Raspberries and Black Currants are the only crops that are a good average, and it is only on some of the free fruiting varieties of Apples that have anything like a remunerative crop upon them. *J. Brown, Delgaty Castle Gardens, Turriff, N.B.*

BANFFSHIRE.—Peach trees were very badly ripened as regards the wood of last season, and blossoms were scarce. Apricots were much the same, and owing to the continued cold and frost during the flowering season there is no fruit worth mentioning. The cold cutting winds affected the growth of the trees, and the foliage was much blistered. Strange to remark, Figs grown here on the open wall make an excellent appearance, and give evidence of finishing well. Plum blossom looked remarkably promising, but the continuous bad weather affected the setting of the crop, and fruits are thin. Plums on standards, owing to their flowering much later, have set a fairly good crop. All the better varieties of Pears on walls were rather short of blossom, and have therefore a thin crop. Standards, such as Hessel and Bergamots, show a good crop. Apples looked remarkably well early in the season, having an extra fine display of blossom, but owing to the drought the fruit dropped off very much. Small fruits generally are a good crop throughout. Strawberries being extra good, especially Royal Sovereign, which continues to maintain its good name. *J. Fraser Smith, Cullen Gardens.*

BERWICKSHIRE.—There was an abundant blossom on all our fruit trees, but we had a spell of cold wet sunless weather in May which prevented the fruit setting, and many that had every appearance of swelling dropped off. Among Apples, what we have as Aitkin's No. 2, otherwise in the south named "Seaton House," never in any season misce a crop. Newton Wonder is a most excellent and reliable sort. Pears are a scarce crop. Doyenné Boussoch is one that never fails here. Czar Plum is a grand cropper, and otherwise good variety. Strawberries suffered very much with the drought in June, but when the rain came picked up wonderfully. *Wm. Cairns, The Hirsell Gardens, Coldstream.*

CLACKMANNANSHIRE.—The fruit crops in some districts are a fair average; Apples and Pears are however not up to expectations on account of the cold east winds that set in when the trees were in flower. There was a good set on some varieties of Apples which always do well in this shire, such as Cellini, Loddington Seedling, Stirling Castle, Duchess of Oldenburg, Worcester Pearmain, and King of the Pippins. The Pear crop is the worst I have seen for years. Cherries are a complete failure; both May Dukes and Morellos; Plums have a fair average crop of some varieties, viz., Victoria and Pond's Seedling. Strawberries on heavy soils are a heavy crop, the dry weather in the month of May not having affected them. Small fruit, Currants, Gooseberries, and Raspberries are average. All fruit is swelling out well after the recent rain. *Alexr. Kirk, Norwood Gardens, Alloa.*

HADDINGTONSHIRE.—Upon the whole the fruit crops here and in the district generally are very satisfactory. I never remember to having seen such an abundance of blossom on all kinds of fruit trees, testifying to the beneficial effect of an abundance of sun and ripened wood of the previous year. Apples when in flower were favoured with the best of weather, ensuring a good set. The following bear heavy crops:—Cox's Orange Pippin, Kerry Pippin, Mr. Gladstone, James Greive, King of Pippins, Blenheim Orange Pippin, Lords Suffield and Grosvenor, Ecklinville, Tower of Glamis, Bailie Keilson, Bismarck, East Lothian Seedling, Cellini, and Warner's King, &c. Pears are a good average crop, the best being Williams' Bon Chrétien, Louise Bonne of Jersey, Triomphe de Vienne, Mdme. Treve, B. Hardy, B. Diel, B. Easter, Dr. Jules Guyot, Marguerite Marillat, and Catillac. Plums with the exception of Victoria and Cox's Golden Drop are very poor. Apricots are an average crop of good fruit. All small fruits very good. *T. H. Cook, Gosford Hall Gardens, Longniddry, N.B.*

— The fruit crops this year are not good. Apples are a light crop, the best crops are of the Codlin type. Pears are almost a failure. The trees looked very promising in the bud, but the weather we experienced at the time of flowering proved very disastrous. Of Strawberries Royal Sovereign has been very fine. *G. Taylor, Broommouth Park Gardens, Dunbar.*

FIFEHIRE.—The fruit crop is variable this year. In a few places within a radius of twenty miles, the crop is fairly good all round, while within the same area the crop will be light in the majority of places. Apples are the best in the large fruit section, and yet certain varieties have completely failed. The Codlins of sorts are good, as well as Lane's Prince Albert, Cox's Orange Pippin, King of the Pippins and many others; while, Cellini, Ecklinville and Blenheim Orange are thin. The warm moist weather we have lately experienced, has been swelling the fruit well which promises to be of good size and form. *W. Williamson, Tarvit, Cupar.*

FORFARSHIRE.—The fruit crop in the gardens here is not up to the average taking it all round. Pears had a fine appearance when in bloom, and although there seemed to be a good set of fruit, it mostly dropped later on. Apples are a fair crop on most varieties, Stirling Castle, Beauty of Moray, Tower of Glamis, Ecklinville, King of Pippins, Warner's King, Lord Grosvenor, Duchess of Oldenburg and Worcester Pearmain being the best. Strawberries are fair but not a heavy crop, a good many fruits moulding and rotting with the wet weather; Royal Sovereign has been worst in this respect. Black and red Currants are scarcer than usual. *W. McDowall, Brechin Castle Gardens.*

PEEBLES SHIRE.—There are some good crops of Apples of the following varieties, viz., Alfriston, Warner's King, Stirling Castle, Ecklinville Seedling, &c. Bismarck and some other shy setters are blank. *W. McIntyre, The Glen, Innerleithen.*

6, SCOTLAND, W.

AYRESHIRE.—The cold in May injured the Apple bloom badly, especially in the case of wall trees that were more advanced in flower than the standard trees. Black Currants and Gooseberries are of splendid quality and the bushes clean. The same may be said of Plums, which look very promising at the present date. Some varieties of Pears are cropping heavily, but the foliage of the Pears is much healthier than that of the Apples. *D. Murray, Culzean Castle Gardens, Maybole.*

DUMFRIESHIRE.—The crops of Apples, Pears, and Plums are the smallest and most insignificant crops which we have known for the past ten years, and this in spite of there being an enormous quantity of flowers. *J. Urquhart, Hoddon Castle Gardens.*

— In all probability you will receive very disappointing reports of garden crops generally from this part of the country this year. From a weather point of view it has been one of the very worst seasons we have passed through for many years, and fruit and vegetable crops have suffered very much thereby. The weather was unusually mild, with a very heavy rainfall; while through all the spring months there was a continuation of excessive damp, low temperatures, and a great lack of sunshine, which retarded the early growth of fruit-trees, vegetables, and crops generally. Without having any real genial spring weather, summer came upon us all at once; and the sudden rise of temperature and scorching sunshine experienced in the early half of June was very damaging to growth out of doors and under glass. In this district Apples and Pears are decidedly under the average, and the same must also be recorded regarding stone fruits, such as Peaches, Apricots, Cherries, Plums, &c. Even under the very best cultivation and attention the return is not satisfactory compared to recent years. Bush fruits, however, are giving a very good return all round about this district, Currants and Gooseberries being very good in quality, and the weight of crop all that can be desired. Strawberries and Raspberries are also a good crop, and we are getting fine weather just now to gather them. Early Potatoes, although ten days later than usual, are lifting well, and the quality is excellent. Field crops look well all over, and as yet no trace of disease has made its appearance. Vegetable crops under good cultivation are generally speaking looking well now, although we had to wait ten days longer this year for an out-door gathering of Peas, Cauliflowers, Carrots, Turnips, and such like. *John Mackinnon, Terregles Gardens.*

— Small fruits are a good average crop, and are ripening off well, the rain having come just in the nick of time. Strawberries are above the average, and especially on all young plantations where the ground was well manured and trenched. The fruits of Royal Sovereign and Noble are very large, but the latter is of very poor quality. *J. McDonald, Drifholm Gardens, Lockerbie.*

STIRLINGSHIRE.—The late spring frosts in first week in May—4° and 7° for eight days—destroyed to a great extent the Pear and Plum blossoms. Even Red Currants and Gooseberries suffered so much as to cause many of the young fruits to drop off. I notice Plums on walls (east and west aspects) are likely to cast much fruit at the stoning time. The Strawberry season will be short. *Alex. Crosbie, Buchanan Castle Gardens, Drymen, N.B.*

WIGTONSHIRE.—The fruit crops, with the exception of Gooseberries, Raspberries, and Currants, are considerably below the average of several years past. Pears, Plums, Figs, Peaches, and dessert Cherries are very lightly cropped. Apples, though below the average, may turn out fairly well, as both fruit and foliage have a healthy and clean appearance. Of Strawberries the late and mid-season varieties have done the best. *J. Day, Galloway House Gardens, Garliestown.*

2, ENGLAND, N.E.

NORTHUMBERLAND.—The fruit crops hereabout are somewhat variable, the confident hopes of a good all-round fruit-season being upset by the extremes of weather experienced. The earlier flowering fruits as Apricots, Peaches, and Gooseberries suffered in March from the frost and cold winds, and the crop of fruit is very thin. Strawberries have come in nearly a week earlier, but they are not fruiting well. Apples are good on young trees, and healthy and clean generally. *George H. Ackroyd, Howick Hall Gardens.*

YORKSHIRE.—The fruit crops in this district are very poor; we had fine bright weather during March which brought the bloom out too early, then the very cold weather in April and May spoilt the splendid promise of abundant crops. I never saw a better bloom. New plantations of Straw-

berries have been excellent, proving without a doubt the goodness of the practice of making annual plantations; the best varieties here are Black Prince, Royal Sovereign, Noble, President, Sir J. Paxton, Gunton Park, one of the very best. *Bailey Wadds, Birdsall, York.*

— We had a fine show of healthy blossom on all fruit trees. During the flowering period we experienced cold north and north-east winds (to which we are exposed), showers of rain, and frost, which seriously injured the crops. *G. Batley, Wentworth Castle Gardens, Barnsley.*

— The fruit crops this year in this neighbourhood are generally under average, through inclement weather during their blooming period. On high and sheltered positions they are slightly better, than in the lower and more exposed districts. Our best crops of Apples are Lane's Prince Albert, which has never failed to produce a full crop these last eight years. Warner's King, Ribston Pippin, Stirling Castle, Old Hawthornden, Worcester Pearmain, Cellini, and some few others are bearing heavy crops. Pears very thin. Plums a total failure. Small fruits are plentiful with the exception of Gooseberries, which were lightened of their crop by 10° of frost. *J. Easter, Nostell Priory Gardens, Wakefield.*

— The stone-fruit crops are very disappointing (though there was abundant blossom which suffered greatly from the late frosts). Strawberries have not turned out so well as they promised from the great amount of blossom. Apples and Pears are also only moderate. The following varieties of Apples are carrying the best crops, Yorkshire Beauty, Sturmer Pippin, Mère de Mœuge, Charlestown Pippin, Warner's King, Lord Suffield, Stirling Castle, Peasgood's Nonsuch, Potts' Seedling, Irish Peach, Ribston Pippin, Tower of Glamis, Small's Admirable, Lord Derby, Nancy Jackson, Leddington Seedling, Domino and Ringer. Pears, Louise Bon of Jersey, Beurré Diel, Beurré d'Amanlis, Souv. du Congrès, Clapp's Favourite and Winter Nelis. A friend, who is a large market grower, tells me his fruit crops have not been so poor for thirty years. *J. Snell, Elmet Hall Gardens, Leeds.*

— Apricots and Plums did not show much blossom hereabouts, which was due, I believe, to the drought of the summer of 1898. All other fruit-trees blossomed well, but failed to set their fruits, owing to continued prevalence of very cold, sunless weather, with occasional keen frosts. *J. P. Leadbetter, Tranby Croft Gardens.*

— The fruit crops in this neighbourhood are disappointing, especially Apples, Pears, and Plums. The crops are very irregular, a few trees carrying good crops, while others have scarcely any fruit on them. May was a very wet and cold month; to this, I think, we may attribute the failure of the fruit to set. Plums are almost a failure, and the same may be said of Apricots and Peaches. Strawberries and Cherries a good average crop. Small fruits abundant and very good. *J. S. Upex, Wiggan-thorpe Gardens, York.*

— There could scarcely have been a better promise of a fruit crop than there was last spring in most gardens and orchards, every tree being clothed in bloom, nor could there be a much more disappointing crop. Apples, certainly, are about an average crop; some trees have scarcely any fruit, while others have heavy crops. Pears and Plums are nearly a failure; of the latter, Victoria is the only variety bearing fruit. All Plum-trees are terribly infested with aphids. Cherries, Sweet and Morelles, are half a crop. Apricots are thin. *J. Hughes, Wentworth Woodhouse Gardens.*

(To be continued.)

PUBLICATIONS RECEIVED.—From the Proceedings of the Linnean Society of New South Wales:—*Notes from the Botanic Gardens, Sydney*, No. 3, by J. H. Maiden and E. Betcher; and *Observations on the Eucalypts of New South Wales*, Part IV., by Henry Deane and J. H. Maiden.—*Nature Notes*, August.

FOREIGN VEGETABLE PRODUCTS.

SOME very interesting notes on the vegetable products of the several countries represented by British Consular Agents have recently appeared in their official reports, from which the following are culled :—

NAPLES AND SOUTHERN ITALY.

Walnuts.—Although these nuts are exported to England and the United States in considerable quantities, the cultivation is not made a specialty of by any growers. Except a few patches in gardens at Sorrento, which can hardly be dignified by the name of orchards, the Walnut-trees are merely scattered among the Vines and other fruit trees, and form no special feature. Any estimate of the acreage

from Calabria, and forms the basis of many principal perfumes. The crucial test is the proportion of a substance called "Acetato di liniale," which is the ingredient which gives the odour to the essence. The essence has been frequently adulterated with lemon juice, thereby, of course, diminishing the proportion of the essential ingredient in the fluid put upon the market. The Chamber of Commerce of Reggio delegated the examination of samples to the Agricultural School of Palermo, and asked for information on the two points: first, whether they could suggest a method for discovering adulteration; and, secondly, whether the perfume of the essence of bergamot arose exclusively from the "liniale" contained in it. The replies obtained were unsatisfactory, as the tests proposed, such as the polarisation of light, are only suitable for a

PATRAS AND DISTRICT.

Currants are far and away the most important article produced in and exported from this district. The prosperity of the Morea in fact depends almost entirely on its Currant crops. For some years past the Currant growers have been suffering from the effects of over-production, the result of the great stimulus which the planting of Currant-vines received some fifteen years ago, when the French vineyards had suffered enormously from the ravages of the phylloxera, thus creating almost an unlimited demand for Currants for wine-making, at most remunerative prices for the Currant grower. But the partial reconstitution of the French vineyards, and prohibitive laws against Currants, have caused this demand to disappear almost entirely, and no other outlet for the surplus production has yet been found, excepting at ridiculously low prices, which barely cover expenses of cultivation. Under similar circumstances, most other crops would have been partly replaced by more paying products; but planting a Currant-vineyard is a most expensive operation to start with, and then it has to be carefully cultivated, manured, pruned and sulphured for five years without giving any return whatever to the proprietor. When the plant has attained its tenth year it bears fully, but by that time the amount expended on it by the proprietor is so great that he will undergo many reverses, loss and disappointment, rather than root up his vineyard.

The world's annual consumption of Currants for eating purposes under the most favourable circumstances barely reaches 120,000 tons, whereas the average crop of Currants, under normal conditions, amounts to about 150,000 tons. This annual surplus of about 30,000 tons was of course the root of all the evil; it had to be sold somehow or other, and experience has proved that in an article like Currants a reduction in the retail price only increases consumption to an infinitesimal extent. The only possible outlet, therefore, for this large surplus was to sell it to Germany and Austria for wine-making purposes, but wine makers in those countries could only afford to pay prices which do not pay cultivation expenses.

Up to the 31st December last, 102,078 tons of Currants were exported, 58,115 tons of which were taken by Great Britain. On January 1st of the present year the stock of Currants remaining in Greece and the Ionian Islands was estimated at 35,000 tons, which is considered very heavy for the season of the year. The various markets being well supplied, it is said to be difficult to see how this very large stock is to be disposed of except it be at ruinously low prices to Germany and Austria for wine-making purposes.

The total crop of Sultanias did not exceed 1,000 tons, but realised from £25 to £30 per ton owing to high prices ruling for the article in the Smyrna market. The Greek crop is shipped exclusively to the United Kingdom. In quality this fruit is almost equal to the Smyrna produce, and it is unaccountable that it should be so little cultivated in Greece, as it is an article which is unusually growing in favour in various markets of consumption, and under normal circumstances is infinitely more paying than Currant growing. *J. R. Jackson.*

(To be continued.)

VERONICA ARMSTRONGI.*

WE are indebted to Mr. Lindsay of Murrayfield, Midlothian, for the opportunity of illustrating this interesting little shrub (fig. 50), which is well adapted for cultivation on the rock-work, or in pots. It is

* *Veronica Armstrongi*.—A dwarf, much-branched shrub. 1–3 feet high. Leaves minute, dimorphic (1), linear patent, or sub-patent, $\frac{1}{16}$ to $\frac{1}{8}$ inch long, acute; (2), closely appressed, tumid, and coriaceous, adnate with the branch for half their length, broadly ovate, subacute, margins faintly ciliate. Flowers in terminal 3–8 flowered heads, sessile; sepals ovate-lanceolate, with a strong median nerve, ciliated, corollatube short, limb $\frac{1}{2}$ to $\frac{3}{4}$ inch in diameter, whitish; capsule ovate-acuminate, longer than the sepals, slightly tumid, and notched at the apex. South Island. T. Kirk, in *Trans. N.Z. Instit.*, xl. (1879), p. 461.

FIG. 50.—*VERONICA ARMSTRONGI*: FLOWERS WHITISH.

Diagrams of flower, magnified; and diagrams of young and old shoots, magnified.

devoted to this fruit is therefore impossible; and as to quality of soil, it may be said that the tree seems to thrive where other fruit trees thrive, namely, in good deep garden soil. In this climate the trees begin to bear in their tenth year, and reach their full productiveness when they are twenty years old. They are hardy, and do not require irrigation. From the age of twenty years a tree should produce fifty pounds of nuts per annum. The fruit is ripe in September, and when gathered requires to be seasoned by ventilation and exposure to the sun's rays. An excellent crop was secured in 1898, and shipped so as to reach England before the Christmas season, when the demand is greatest. The principal seat of export is from the little roadstead of Piano di Sorrento.

Bergamot.—With regard to this product, it is said, perfumers at home will be glad to note that great efforts are being made to secure the purity of the essence of bergamot, which is largely exported

scientist in a specially-fitted laboratory. In August, 1897, a law was passed by the Italian Government against the adulteration of essences; but as it includes sumac and other substances, it will be inoperative as to bergamot, on account of the present insufficiency of chemical methods to detect adulteration, and thus to set the law in motion. Consul Neville-Rolfe says:—"It is strange that the attention of the perfumery trade should never have been directed to South Italy. The flowers of the Orange and Lemon trees, so carefully collected in the South of France, are allowed here to rot upon the ground, and might be had in any quantity for the asking. Roses and many other scented flowers grow here in wonderful profusion. Alcohol used to be one of the main products of the district, and is still produced in large quantities. Bergamot, which is the active ingredient of many scents, is to be had in plenty, and it looks as if there were a good opening for perfumery works. The soapmakers alone would be large customers."

one of those species which produce leaves of two forms, and it is one of those plants which, as is alleged, affords an illustration of "mimicry," the supposition being that the plant is protected against injuries from enemies of one sort or another by "mimicing" some other plant which is not exposed to attack. The term is unfortunate, for no one, we presume, attributes to the plant any conscious attempt at "mimicry." The resemblance of form may possibly be accounted for by the fact that the plants mimicker and mimicked are exposed to the same conditions of growth.

CULTURAL MEMORANDA.

ARISTOLOCHIA GIGAS VAR. STURTEVANTI.

THE subject of this note is one of the giants of the vegetable kingdom, and although the individual flowers are of short duration, lasting only one day in perfection, their immense size, and the quick succession with which they are produced, together with the striking resemblance they bear when in the bud state to the pelican (hence its name, Pelican Flower), should be sufficient reasons for arousing the admiration of lovers of the curious. The flowers on first expanding, which is usually in the early morning, emit a very disagreeable odour, which, however, soon passes off, and after a few hours is not noticeable, and certainly should not prevent its becoming more generally cultivated. To grow it successfully, it requires, like most other hothouse climbers, to be planted out in a border, and trained to the roof, when it will continue to flower for many weeks. It is easily propagated by cuttings—an item which should not be neglected, as it is a difficult plant to keep through the winter months. *J. G., Liverpool.*

FOREIGN CORRESPONDENCE.

A RAT'S NEST IN AN ORCHID.

I NOTICE in your issue of July 1 a report by Messrs. Hugh Low & Co. of a bird's-nest in an Orchid. Perhaps it may be interesting to your readers to know that this season we collected a specimen of *Laelia majalis alba* with a rat's nest inside. The plant is one of the finest specimens we have seen, with over 140 bulbs, and when it reached us it contained 15 beautiful flowers. The nest was constructed inside with three entrances, and the plant was found on an *Oponia* (prickly Pear), a plant that rats often build their nests in. *J. A. McDowell, Apartado 167, City of Mexico, July 14.*

SOCIETIES.

BISHOP'S STORTFORD HORTICULTURAL.

AUGUST 7.—The thirtieth annual show of this Society was held on the above date in the beautiful grounds, The Grange, the residence of J. Barker, Esq.

A feature of this show that is made much of consists of table decorations, and though there were nearly thirty tables, there was great good taste displayed by the exhibitors, who were principally ladies, the colours being harmoniously blended, and graceful materials employed. The 1st prize fell to Miss H. M. CLAYDEN, of Walden, who had single red Carnations, various grass, Palms, and flowers of Pelargoniums and Gypsophila. Miss M. HICKS, of Standon, was 2nd, but the awards might, in our opinion, have been reversed, this being a very pretty table, the materials used being Carnation Ruby Castle, with Gypsophila paniculata. Six valuable prizes were awarded, but space forbids any description of the exhibits.

Decorated fireplaces and mantel-boards were features of the show, one side of the tent being set apart for them. Mr. J. RICHARDSON, Stanstead, was 1st, with a concoction of light-coloured Carnations, Caladiums, and Oplismenus (Panicum); and Mr. G. BEZCH was 2nd, Campanulas being used at the base of his exhibit, and grasses were used freely in it.

A considerable amount of space was devoted to groups of plants arranged to afford fine effects. The 1st prize fell to H. A. BLYTH, Esq., Stanstead, for a light arrangement, grasses being freely employed. There were also plants of *Clerodendron fallax*, and foliage plants in

much variety; the 2nd prize was taken by Sir J. BLYTH, Bart., the competition being very close; Lily of the Valley was used very freely, but although it is a favourite flower, it seemed out of season in the heat of an August day.

Stove and Greenhouse Plants, although not numerous, were of good quality. H. A. BLYTH, Esq., and C. GOLD, Esq., M.P., taking the prizes in the order of their names. The last named gentleman took 1st prize for several excellent specimen Ferns; Mrs. RIVIERE being a good 2nd.

Cut Flowers of Herbaceous Plants were largely shown in twenty-four and twelve varieties. Messrs. G. PAUL & SON, Cheshunt, were 1st; and A. PERRY & SON, Winchmore Hill, 2nd in the larger class. Cut Flowers formed a strong section of the show; several splendid plants of Ivy-leaved Pelargoniums was shown that were 6 feet in height, G. GOLD, Esq., taking 1st prize for them. For zonal Pelargoniums, Mr. HOLLAND was 1st with plants that were finely flowered. Table plants were well staged. Mr. H. A. BLYTH being the most successful exhibitor of them.

Fruit was less well shown than Vegetables; still, good Grapes were shown, and Mr. GEO. PAUL obtained a Certificate for the new Black Muscat Grape Lady Hastings, a valuable addition to the dessert. For White Grapes, Mr. J. BARKER and J. BAILEY, Esq., M.P., took the prizes in the order of their names, having capitally-finished bunches; indeed, Mr. BARKER took the greater number of the prizes in the fruit classes, being 1st for Black Hamburg Grapes, and for a collection of fruit, in which he had good Pears, Peaches, Nectarines, Greengages, and Plums.

Mr. DAVIS, Bishop's Stortford, had the best Peaches; Mr. J. BARKER was a close 2nd in this class, and the winner of a 1st prize for Nectarines, Mrs. RIVIERE being 2nd, with excellent fruits of Lord Napier. This was a class in which the competition was weak, and the committee intend in the future to make the fruit, flower, and vegetable classes more interesting by insisting on every exhibit being named, a thing that is rarely done at this show.

The vegetables were numerous, and mostly of good quality, Potatoes making a show of themselves. The collections were likewise very creditable; and of the cottagers' exhibits it may be truly stated that they were above the average in quality, a noteworthy fact in this season of great heat and drought.

HORNSEY HORTICULTURAL ASSOCIATION.

AUGUST 7.—The fourth annual exhibition of the Hornsey Horticultural and Allotments Association was held on Bank Holiday, and a very large number of people availed themselves of the opportunity of spending a pleasant day in the exhibition field.

In point of numbers there was a slight falling off, but this was accounted for by the fact that there were fewer exhibits of extremely poor quality. Competition was very keen, and especially so in the vegetable classes. In one of the collection baskets, twenty-six varieties were counted. In the open classes, the best subjects were Gloxinias and the foliage plants, and groups of foliage and flowering plants. Tubers, Rootstocks, Eschalois, and Cabbages were very good indeed, in both allotment holders and cottagers' divisions, and, considering the extreme drought, so also were the Scarlet Runners, French and Broad Beans, and Marrows. Roses in this division were conspicuous by their absence, but the table decorations, hand-bouquets, button-holes, and baskets of cut-flowers were very meritorious.

NORTHAMPTON HORTICULTURAL.

AUGUST 7.—The tenth annual show was held at Delapre Park, by kind permission of John Cooper, Esq., who is President of the Society; and, considering the very dry season experienced, a very creditable display was made.

SPECIMEN PLANTS.

For twelve stove and greenhouse plants, Mr. CYPHER was, as usual, 1st with grand specimens of *Kentia Belmoreana*, *K. Forsteriana*, *Latania borbonica*, *Codiaeum Sunset*, very fine in size and leaf-colouring; *C. angustifolium*, *C. Cheloni*, *Statice intermedia*, *Bougainvillea glabra*, *Stephanotis floribunda*, *Ixora Williamsii*, and *Erica Marnockiana* and *E. Actoniana*. Mr. FRISCH, Coventry, was 2nd with excellent plants of *Kentia Forsteriana*, *Cycas circinalis*, and *Codiaeum Sunset*.

STOVE AND GREENHOUSE PLANTS, OPEN TO THE COUNTY.

Mr. Wm. Woods, gr. to JOHN COOPER, Esq., Delapre Abbey, was 1st, his best being *Hydrangea*, *Thrinax species*, *Areca Verschaffeltii*, and *Plumbago capensis*. Mr. SODEN, gr. to F. G. ADNITT, Esq., Northampton, was 2nd, having a very finely-flowered plant of *Lilium lancifolium roseum*.

Mr. REEVES, gr. to Mrs. CORLSON, Northampton, had the finest *Fuchsias*, doubled flowered tuberous, and single flowered tuberous *Begonias*; and Mr. SODEN was 1st for three well-trained plants of *Coleus*.

FERNS.

For six Ferns, Mr. Wm. Pearce, gr. to S. LODER, Esq., Floore House, Weedon, was a good 1st with splendid specimens of *Platycerium alcicorne*, *Davallia Mooreana*, *Dicksonia squarrosa*, *D. antarctica*, *Davallia filiensis*, *Adiantum variety*. Mr. HOLLAND, gr. to L. BOSTOCK, Esq., was 2nd with fine specimens, having very nice *Gymnogramma sulphurea*.

Mr. S. COLE, gr., Althorp Park, received a 1st prize for a beautiful collection of Sweet Peas in twenty-four varieties.

GROUPS.

There were only two groups arranged in a space of 20 feet by 12 feet, and after much discussion, Mr. VAUSE, of Leamington, and Mr. CYPHER, Cheltenham, were the exhibitors declared equal. Mr. VAUSE's group consisted of a *Thrinax reclinata* in the centre, and from each corner to the centre a small bridge of cork was erected, and *Ferns* and other plants, the whole being a very pretty conception; it contained *Lili*s, *Hydrangeas*, *Codiaeums*, *Abutilons*, *Caladiums*, *Cattleyas*, *Ananas sativa* (variegated), *Humeas*, *Panax Victorica*, *Asparagus prostrata*, *Gloxinias*, *Odontoglossums*, *Acalypha hispida*, *Colens*, *Fuchsias*, and many small decorative plants and *Ferns*. It was a shade heavier than that of Mr. CYPHER. The group staged by the latter consisted of a tall *Kentia*, with two bridges running from the side; *Bambusas* in variety, *Humea elegans*, *Codiaeums* in variety, *Oncidiums*, *Strobilanthes*, *Lycopodiums*, *Sedums*, *Aralia Veitchii*, *Asparagus*, *Lilies*, *Fuchsias*, *Eulalias*, and *Cocos*.

ROSES AND DAHLIAS

were well shown, especially the latter. The chief prize-winners being Messrs. T. PERKINS & SON, and Messrs. J. PERKINS & SON, both of Northampton.

FRUIT (OPEN).

For a collection of eight distinct kinds, Mr. Goodacre, gr. to the Earl of HARRINGTON, Elvaston Castle, was 1st, with Canon Hall Muscat and Black Hamburg Grapes, Fine-apple Nectarine (very fine in colour), a Queen Pine (a rather small fruit, but well coloured), grand Negro Largo Figs, a Melon (Hero of Lockinge), Peach Exquisite (very good), and a dish of fine Pears. Mr. S. COLE secured the 2nd prize, his best dishes being Harrington Peach, Countess Melon, Madresfield Court Grape, and Lord Napier Nectarine (good).

For six dishes of fruit, distinct, open to the county, Mr. H. Kempshall, gr. to Capt. ISHAM, Lamport Hall, was 1st, having Madresfield Court Grapes, beautiful in berry and colour, but small bunches; good Brown Turkey Figs, Sea Eagle Peach, a seedling Melon, small but a nice-looking Moor Park Apricot, and Morello Cherries—a small collection, but fresh and well finished. The Royal Horticultural Society's Silver Medal is added to the 1st prize for this collection. Mr. S. COLE was 2nd in this class; his best dishes were Harrington Peach and Ingestie Hybrid Melon.

The single dishes of fruit were well contested. In the competition for three bunches of Black Grapes, Mr. KEMPSTALL was placed 1st with well coloured bunches of Madresfield Court, fine in berry, but lacking in size; Mr. A. CHILD, gr. to H. ATTENBOROUGH, Esq., Cat Sly House, Daventry, was 2nd.

For three bunches of White Grapes, Mr. A. CHILD was 1st, with good specimens of Muscat of Alexandria; and Mr. Dymock, gr. to B. WESTWORTH VERNON, Esq., Stoke Bruerne House, Towcester, was 2nd.

Messrs. COLE, HOLLAND, and KEMPSTALL was 1st, 2nd, and 3rd respectively for six Peaches; and Mr. BATEMAN took 1st honours for some well-coloured Nectarines; and Mr. HOLLAND had the best-flavoured Melon.

VEGETABLES.

In the open class for twelve varieties, Mr. DYMCK, gr. to Stoke Bruerne Park, was 1st with a good collection in considering the dry season, having Celery Giant White, Tomato Perfection, Pea Duke of Albany, Onion Ailsa Gray, Cauliflower Autumn Giant, Artichoke Paris New, Potato Windsor Castle, Turnip Jubilee, Carrot Perfection, and Scarlet Runner Jubilee; Mr. S. COLE was 2nd, his best varieties being his Beetroot, Cauliflower, and Tomatoes. For nine varieties Mr. DYMCK was again 1st; followed by Mr. COLE, 2nd.

For eight table-plants Mr. COLE, gr., Althorp Park, was 1st. Mr. OWEN SODEN had the best Cockscombs; and Mr. KEMPSTALL, gr., Lamport Hall, was 2nd for these plants.

Mr. VAUSE, Leamington, was the most successful competitor for the table decorations, having a nicely-arranged table very lightly arranged, consisting of Carnation Ruby Castle, Montbretias, Gypsophila paniculata, Ferns, and *Asparagus deflexus*. Mrs. BUBY, of Northampton, was 2nd, with an arrangement that was much less light.

CASTLE ASHBY FLOWER SHOW.

AUGUST 7.—This pleasant annual event came off in fine weather in the grounds of Castle Ashby on the above date.

The exhibits, mostly those of cottagers, were very creditable to the growers, in particular Potatoes and Carrots.

The vegetables and fruit came from the Marquis of NORTHAMPTON's garden, and Mr. Hayes, his lordship's gardener, arranged a fine group of plants to add to the attractions of the show; Messrs. PERKINS & SON, Northampton, showed Sweet Peas in quantity, and other flowers, as likewise fruit; and Messrs. H. E. & W. LACK, of Wellingborough, exhibited similar productions. The Marquis, assisted by his gardener, undertook to adjudicate upon the specimens of the bouquetists' art exhibited.

ST. NEOT'S HORTICULTURAL.

AUGUST 7.—This, the thirty-fifth exhibition of this Society, was held as usual on Bank Holiday, and on this occasion in the grounds of the Old Hall, in the centre of the town. Two spacious tents were filled with exhibits, and a third contained agricultural and market-garden produce, poultry, &c.

GROUPS.

The best of these, which were arranged for effect, was furnished by Mr. Redman, gr. to Miss GOODGAMES, E. Ashbury;

Mr. T. Lockie, gr. to A. J. THORNHILL, Esq., Diddington Hall, was 2nd. Both were very creditable arrangements, but that of Mr. Redman had rather a superior finish.

Zonal Pelargoniums in sixes were well grown and bloomed, Mr. LOCKIE taking the 1st prize, and Mr. REDMAN the 2nd. Mr. REDMAN had the best four tuberous-rooted Begonias, the plants well grown and bloomed; Mr. W. Last, gr. to F. DAY, Esq., was 2nd.

In the amateur's class some good specimens were staged in competition for the special prizes offered by Mr. H. J. JONES, of Lewisham. The best six plants in bloom came from Mr. REDMAN, a very good lot, including Bougainvillea glabra, Allamanda cathartica, Stephanotis floribunda and Clerodendron Balfourianum. Mr. REDMAN also had the best specimen, a fine bush of Bougainvillea glabra; Mr. LOCKIE coming 2nd, with a very fine Fuchsia Venus de Medici Improved. Some capitally-grown and flowered specimen Fuchsias were shown by Mr. REDMAN.

Foliage Plants were represented by Ferns, some good examples coming from Mr. REDMAN, who had a fine piece of Platycerium alcicorne. There were some capital bushes of Coleus from Messrs. LOCKIE and REDMAN, and the two were bracketed equal 1st. There were also pretty plants for table decoration.

Cut Flowers were represented by Roses and Dahlias; a stand of twelve blooms of the latter from Mr. LOCKIE were very good for the time of year; but while Asters were poor on account of the drought, African Marigolds and Zinnias were particularly fine, as were also zonal Pelargoniums and bunches of flowers of hardy herbaceous perennial plants, which, shown in stands of eighteen bunches, made a fine display; and Sweet Peas in bunches formed a pretty feature.

FRUIT.

Mr. Stone, gr. to R. A. COCHRANE, Esq., had the best collection of eight dishes of fruit, run very close by Mr. Carter, gr. to Captain DUNCAN, Waresley Park. There were fairly good dishes of Peaches, Nectarines, and Apricots. Black Grapes were represented by Black Hamburg and Muscat of Alexandria; any other black, by Gros Maroc; and white by Foster's Seedling and Buckland Sweetwater. Rivers' Prolific was the best dessert Plum; and Washington the best culinary shown. Striped Juneating and Irish Peach were in good form as dessert Apples; and Lord Sufield and Warner's King as culinary. Bush fruits were generally in good character; and some of the Melons were excellent.

VEGETABLES.

The best collection of nine dishes of vegetables came from Mr. LOCKIE, all in his usual style; and his brace of Royal Windsor Cucumbers were perfect, and though sent out some years ago, the variety serves as a model of an exhibition cucumber as well as for use. Potatoes were good, especially a collection of six dishes from Mr. CARTER; and all other vegetables, with agricultural and market-garden produce, had a great interest for visitors.

A very fine collection of Cannas and two dozen spikes of Gladiolus came from Messrs. WOOD & INGRAM, of Huntingdon; while Mr. LOCKIE had six superb specimens of Cockscombs of large size, and finely finished.

The arrangements at St. Neot's made by Mr. W. Ratchelous are always excellent, greatly assisting both exhibitors and judges. St. Neot's is essentially a show of the country-side, and includes poultry, rabbits, pigeons, cage-birds, bread, eggs, honey, &c.

MARKETS.

COVENT GARDEN, AUGUST 10.

[We cannot accept any responsibility for the unjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOS.

Hebron, Paritan, Snowdrop, Up-to-Date, &c., 70s. to 90s.; best Kent Snowdrops, 110s. to 120s. John Bath, 32 & 34, Wellington Street, Covent Garden.

REMARKS.—During the past week Runner Beans have daily been coming down in price, and on Saturday, the 5th inst., some were sold at 1s. 6d. a bushel. Frame Cucumbers are abundant, and the demand is small. The ridge Cucumbers are appearing more plentifully than they have done for a number of years. No Pine-apples are on sale, and Bananas are a short supply. Potatoes advanced in price. The holidays always seem to disorganise trade.

SEEDS.

LONDON: August 9.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market as quite of a holiday character, with but little doing. Trifolium commands late rates; there is no change in either Mustard or Rape-seed. New Rye comes forward slowly. Winter Tares shortly expected. Canary-seed keeps firm at the late advance; dwindling stocks and short crop prospects strengthen holders views. Blue Peas, Haricot Beans, and Lentils, show no alteration.

FRUIT AND VEGETABLES.

GLASGOW: August 9.—The following are the averages of the prices recorded since our last report:—Cherries, English, halves, 7s. to 8s. 6d. per half sieve; Gooseberries, hard greens, 10s. to 16s. per cwt.; do., Sulphurs, 8s. to 11s. do.; do., red, 16s. to 18s. do.; Grapes, Guernsey, 9d. to 1s. per lb.; do., English, 1s. 3d. to 1s. 9d. do.; Plums, 7s. to 10s. per half sieve; Melons, Valencia yellow, 24s. 5s. 6d. to 6s. 6d. per case; 36s. 6s. 6d. to 7s. 6d. do.; Peaches, home, 4s. to 8s.

per dozen; do., small, 1s. 3d. to 2s. do.; Currants, Scotch, Black, 4d. to 5d. per lb.; do., English, 3½d. to 4d. do.; Green-gages, quarters, 5s. to 6s.; do., per pad, 4s. to 5s.; do., halves, 9s. to 11s.; Peas, 3s. 6d. to 4s. per half bag; do., 7s. per bag; Carrots, Dutch, 3s. to 4s. per hamper; Tomatoes, Scotch, 6d. to 8d. per lb.; do., English, 4d. to 5d. do.; do., Guernsey, 3d. to 4d. do.; do., Valencia, 4s. to 5s. per case; do., French, 2s. 6d. per crate; Cucumbers, 3s. to 4s. 6d. per dozen; Raspberries, 4d. to 5d. per lb.; Dutch Peas, 2s. 8d. per small sieve; Dutch Beans, 3s. 6d. per hamper; Onions, 4s. per bag; Mushrooms, 10d. to 1s. 6d. per lb.; Cabbages, 9d. to 1s. 3d. per dozen; Cauliflowers, Edinburgh, 2s. to 2s. 6d. per dozen; Parsley, 1s. to 1s. 6d. per stone; Lettuces, round, 9d. to 1s. 3d. per dozen; do., Cos, 9d. to 1s. 3d. do.; Turnips, French White, 8d. to 9d. per bunch; Carrots, new round, 9d. per dozen; Marrows, 6d. to 8d. do.

LIVERPOOL: August 9.—Wholesale Vegetable Market.—Potatoes, per cwt.: Early Regents, 1s. 9d. to 2s. 3d.; Kidneys, 2s. 6d. to 4s.; Turnips, 6d. to 8d. per doz. bunches; Swedes, 2s. to 2s. 6d. per cwt.; Carrots, 6d. to 8d. per dozen bunches; Parsley, 6d. to 8d. do.; Onions, foreign, 2s. 6d. to 4s. per cwt.; Lettuces, 4d. to 6d. per dozen; Cucumbers, 1s. 3d. to 3s. do.; Cauliflowers, 1s. to 2s. do.; Cabbages, 10d. to 1s. 8d. do.; Peas, 2s. 4d. to 2s. 8d. per bushel; Beans, 1s. to 1s. 2d. do.; Scarlet Runners, 1s. 3d. to 1s. 6d. do.; Kidneys, 1s. to 1s. 3d. per peck. St. John's.—Potatoes, 1s. to 1s. 2d. per peck; Grapes, English, 1s. to 3s. per lb.; do., foreign, 4d. to 5d. do.; Pines, English, 4s. to 6s. each; Currants, red and white, 4d. per lb.; do., black, 5d. do.; Gooseberries, 3d. per quart; Peas, 1s. per peck; Cobnuts, 8d. per lb.; Cucumbers, 3d. to 4d. each; Mushrooms, 1s. per lb. and basket. Birkenhead.—Potatoes, 4d. to 10d. per peck; Peas, 10d. to 1s. do.; Cucumbers, 2d. to 4d. each; Cherries, 6d. to 8d. per lb.; Currants, black, 6d. do.; do., red, 4d. to 5d. do.; Gooseberries, 2d. to 3d. do.; Grapes, English, 1s. 6d. to 3s. do.; do., foreign, 6d. to 10d. do.; Mushrooms, 8d. to 1s. do.

CORN.

AVERAGE PRICES of British Corn (per imperial qr.), for the week ending August 5, and for the corresponding period of 1898, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	35 7	24 10	- 10 9
Barley	26 11	20 9	- 6 2
Oats	20 7	18 0	- 2 7

THE WEATHER.

[The term "accumulated temperature indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E. 4, Midland Counties; 5, England, including London Principal Grazing, &c., Districts—6, Scotland, W. 7, England, N.W.; 8, England, S.W.; 9, Ireland, N. 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 5, is furnished from the Meteorological Office:—

"The weather during this period was generally fine and dry, but towards the close of the period thunderstorms were experienced in most of the southern and western districts, the accompanying rain being very heavy in some places, slight in others.

"The temperature was again considerably above the mean, the excess ranging from 3° in 'England, E.' to as much as 6° in the 'Midland Counties' and 'Ireland, S.' and to 7° in 'England, S. and S.W.' and the 'Channel Islands.' The highest of the maxima occurred during the earlier half of the period, when they varied from 89° in the 'Midland Counties,' 88° in 'England, S. and S.W.' and 87° in 'England, N.E.' to 81° in 'Scotland, N.' and 80° in 'Scotland, W.' The lowest of the minima were registered about the middle of the week at most of the English and Irish stations, but towards its close in Scotland; they ranged from 43° in 'Scotland, N. and E.' and 47° in 'England, E.' and 'Scotland, W.' to 53° in 'England, N.E. and N.W.' and to 58° in the 'Channel Islands.'

"The rainfall slightly exceeded the mean in 'Ireland, S.' but was much less elsewhere. In all the more northern and eastern districts the fall was scarcely appreciable. The amounts towards the end of the week varied greatly in different localities, the largest, occurring at Dublin during Saturday night, being 2.23 inches.

"The bright sunshine was very abundant, the percentage of the possible amount of duration varying from 73 in 'England, E.,' 73 in 'England, S.,' 69 in the 'Channel Islands,' and 65 in 'England, S.W.,' to 42 in 'Ireland, N.' and 41 in 'Scotland, E.'"

THE HERBACEOUS BORDER.

CODONOPSIS OVATA (BENTHAM).

THIS Himalayan hardy perennial is of elegant habit, and flowers abundantly in June and July. It also reproduces itself from self-sown seedlings, every flower being succeeded by a pod full of seed. The inside of the flower is more remarkable for beauty than the outside, but the pendulous habit prevents the inside from being readily seen without gathering the flower. Then the strong foxy smell of the whole plant is objectionable, and detracts from its merit as an ornament. I have noticed that the flowers are visited exclusively by wasps of more than one species, and have on several occasions watched in vain for a visit from any other insects. After entering one or two flowers the wasps become as white with pollen as a miller in his working dress. *C. Wolley Dod, Edge Hall, Malpas.*

COLONIAL NOTES.

A MARKET GARDENER IN VICTORIA.

In your issue of April 13, you were calling attention to the fact that there are still openings in the colonies for fruit-growers, dairy-men and others with small capital. I am much indebted to my father, of Yattendon Gardens, Newbury, for the regular weekly arrival of the familiar *Gardeners' Chronicle*, it is the link that connects me with the old life of a private gardener, which I relinquished to come out to Victoria, some few years ago, to commence market-gardening.

I would just like to say that I believe if young gardeners who are drudging along with the hope of gaining some day one of those nice snug head-places, knew of the opportunities here, that could be taken advantage of by smart men, they would grind on no longer on low wages in private establishments on the expectancy of something they may never get, but come out here, and go in for fruit-growing on their own land.

I am not advising those who have only their willing hands to go to work with—that means many years of hard work and waiting. The would-be colonial fruit-grower should have two or three hundred pounds at command to put his land under fruit-trees straight away.

Allow me to give you some of the quick returns from fruit-trees in this, the Bendigo district of Victoria. Peach-trees budded on seedling stocks, will carry comfortably 40 lb. of first-grade fruit three years from the bud—of course,

providing attention and irrigation be given. It may be interesting to my old colleagues to know that "Brigg's Red May" (American origin), is our first on the market; then Alexander, and Early Rivers; then as to mid-season varieties in this district, curiously enough, Hale's Early, I should say, is generally immediately preceded by Royal George, the season being filled up by Merri Merri, Lady Palmerston, and Winter Cling. I have never known real good "first-grade" Peaches sold at unremunerative prices here, and though there is a short season of glut, there are very few good Peaches sent to the canning works.

Grapes are produced in this district by the 100 tons, and the Vines seem to revel in all descriptions of soil, from ironstone-gravel, heavy clay, to pure sand. Vineyards are generally planted with two-year-old Vines; in five years from the cutting they will give handsome returns, and will carry and mature to a finish a case of Grapes (40 lb.) without injury to the Vines for the next season. It would surprise the home-growers to see the fine, heavy, well sheltered bunches of Black Hamburg, Red Prince, or Waltham Cross hanging from these young Vines, and above them ripe canes by the yard. The Vines are mostly grown on low trellises, and with no other treatment than disbudding, and the first tying. The majority of the growers here are just blundering along, gaining their experience by the mistakes they make. There are few such men as young gardeners are when about ready to take places as foremen in private gardens; and few men with a fair knowledge of the plant they are growing, but the climate and the virgin richness of the soil help them along. Lately it has been amply demonstrated that Victorian Apples can be safely landed in Covent Garden. I have now before me two samples—a Sturmer and a Scarlet Nonpareil as good and firm as ever Berkshire clay or Kentish loam produced, and at the same time you at home are glad to pay up to 16s. per case for these same varieties. Now we have got thus far with fruit, why not further, and most certainly you will soon see Victorian Grapes in good condition in Covent Garden Market, and doubtless there will be plenty of people to buy them without injury to the home-grower. Our colonial taste is not a cultured one, and your connoisseurs will be horrified when I say that Waltham Cross Grape realises more than Muscat Hamburg. In this quarter Waltham Cross is the ideal market Grape, it colours up splendidly, and travels well.

We have had a terrible phyloxera scare; but here the State fosters everything, and it has even fostered this scare to the detriment of vineyards and growers, and to the glorification of the Vine-louse. Ex-postmen and one-time Government officials have been transformed as by a magician's wand into horticultural experts, and have been improving right and left; and the very latest idea is wholesale planting of American resistant stocks, but in spite of all this legislative interference, Vines are still being planted, and are giving wondrous yields.

Tomatoes are a very paying crop, and are largely grown, and I suppose form the most popular fruit here. I have tried many varieties, but I have had nothing to surpass Sutton's Eclipse for good all-round merit.

I could go on and on, and still. I think, be interesting to gardeners, but perhaps I have now written more than you can find space for; still, I would like to state that freehold land can be bought from £3 to £6 per acre, commanded by the irrigation-channels. Land can still be selected in 21 acre blocks, and after six years' occupation, it can be purchased outright. Artificial manures are about the same prices as at home, though labour is dearer. Implements and horses are very cheap, and all the latest American labour-saving implements in use; and above all, living is cheap. If you think anything further on the subject would be acceptable, please say so, and I will give you of my experience. *A. F. M.* [We sincerely hope our correspondent will carry out his intentions. Ed.]

ACER CALIFORNICUM: *H. L. & Co.* Our list of awards was furnished by the officials of the Society, and if you are in doubt as to its correctness, it would be well to apply to the Secretary, 117, Victoria Street, Westminster, for further information.

CATERPILLAR: *J. H. and R. M.* The caterpillar of the Death's-head moth, *Sphinx atropos*. It is destructive to Potatoes.

CATTLEYA GIGAS: *P. H.* A fine variety, with the outer segments deeper in colour than usual. The lip is not remarkable.

EEL-WORMS IN SOIL: *J. D.* Certainly it would not be safe to use the soil for the purposes named, unless you can in some way sterilise it; or as you have such a large quantity, you might keep it in stack for two years, keeping the sides and top free from all herbage, when the warmth of fermentation, the lack of air, and of food will annihilate these pernicious worms and all other insects.

LEAVES OF PEAR AND APPLE DAMAGED: *D. H.* This injury is caused by the Apple and Pear leaf-miner moth, *Cemostoma scitella*. It is too late to attempt any preventive methods this season, but next season, if the pest makes its appearance, spray with Paris Green, 1 oz. dissolved in 20 gallons of water. *E. M.*

NAMES OF PLANTS: *Correspondents not answered in this issue are requested to be so good as to consult the following number.*—*W. B.* *Calystegia pubescens*.—*G. W.* 1, *Rhus Cotinus*; 2, *Ginkgo biloba*; 3, *Rhus Toxicodendron*.—*J. C.* *Echinops sphaerocephalus*.—*J. U.* A species of Saxifrage, we do not know which one.—*J. B.* *Elodea canadensis*. The American water-weed, once a great pest, but it seems to be dying out.—*A. C.* *Acer Negundo variegatum*.—*P. C.* *Gaut.* *Cheadle*. Probably some Chinese variety of *Phaseolus vulgaris*.

POPLAR: *E. C. B.* The leaves are affected by a gall-fly, *Cynips*.

ROSE GALL: *H. & Sons.* The "Robin's Pin-cushion" is caused by a gall-fly, and is extremely common; but it is astonishing to find how many Rose growers, as we know by experience, have never noticed it.

SPOTS ON LEAVES OF CYPRIPEDIUMS, &c.: *J. Gibbons.* The fungus forming minute black spots is *Asterina orchidis*, a tropical species often introduced with plants into this country. It is not injurious, and will probably soon disappear. Sponge with dilute solution of potassium permanganate. *E. M.*

TOMATOS: *A Constant Subscriber* does not read his *Chronicle* very diligently, or he would recall the oft-repeated figure and description of the Tomato-disease. It is due to a fungus. The diseased fruits should be destroyed by fire, and the plants syringed with Bordeaux Mixture or sulphide of potassium, half-an-ounce to a gallon of water.

TWIN CUCUMBERS: *R. K.* Due to the union of two flowers at a very early stage of growth. By no means uncommon.

WHITE LILY: *G. McK.* You have got a very old variety called the double White Lily, in which the true flower is not formed, but only a number of white bracts. The other plant is *Campylobotrys*.

IMPORTANT TO ADVERTISERS.—*The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,*

MORE THAN DOUBLED.

Advertisers are reminded that the "*Chronicle*" circulates among COUNTRY GENTLEMEN, and ALL CLASSES of GARDENERS' AND GARDEN-LOVERS at home, that it has a specially large FOREIGN and COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

THE

Gardeners' Chronicle

No. 660.—SATURDAY, AUG. 19, 1899.

THE PAST ROSE SEASON.

IF it be difficult in writing beforehand to give a correct forecast of what the season is likely to be, it is equally difficult to declare what it has been when it is over, although we have the record of all the facts to enable us to form an opinion. This arises from various causes. There comes first of all the question from what point of view we regard it—that is, whether we have the eyes of an exhibitor, or of those who love their garden, of which Roses form a special and cherished feature, but who never dream of placing flowers on the exhibition-table; and then, if one is an exhibitor, his judgment is apt to be swayed by the number of prizes he has obtained, or the contest in which he has failed. Then the climatic conditions of the localities in which our Rose-growers live are so varied, and in our fickle climate so changeable during the flowering season, that in some places all is favourable, and in others utterly disastrous. As an example of this, we may take the effect of thunderstorms: I have known during the past season that hailstorms have passed over a district where every Rose-tree was stripped of its foliage, and of course the flower utterly ruined, while a short distance off there was nothing but bright sunshine and clear sky. Now, ask two Rose-growers thus situated what they thought of the past Rose season; one would say, "Simply horrible!" while the other would reply, "Oh! it was a very good one." But on the whole, I should say that, so far as the enjoyment of Roses at home was concerned, the past season has been a delightful one. There was bright sunshine, and during the flowering time the thermometer did not go up so high as it has done since; there was little or no wind, so the flowers were not battered as they very often are by both wind and rain.

There was in some gardens (as in my own) complete absence of aphids, and I never syringed once, and consequently the plants have not that messy appearance which they have when you are obliged to use Gishurst or any of the various insecticides which are offered now for the purpose. Neither did mildew nor orange-fungus make its appearance until the Roses were out of flower; so that, after all, perhaps the best way to judge of the character of the Rose season is to look at the exhibitions, especially those of the National Society.

I have been forcibly struck by what has been mentioned to me by more than one grower—that a Rose exhibition, pure and simple, of itself will not attract the public; and that in most places, if not in all, something has to be added to the show to make it attractive. Of course, in every place you will doubtless find a certain number of enthusiasts who will rejoice in discussing the merits of the flowers, especially if there be any novelties; but the general public want something more. Supposing it is a hot day, and the tent but indifferently ventilated, which is often the case, a visitor goes in,

say, at 2 o'clock, to look at flowers which have already been there a few hours, and present many of them a sorry spectacle; and therefore, if there be no other attraction, they growl to their heart's content. The Crystal Palace is of course, unique; the place itself is an attraction. The best Roses that the country can produce are all there; the Rose-grower meets with those from north, south, east and west, who come to do honour to the queen of flowers, and to support loyally the society which has done so much to encourage the culture of the Rose. What, then, do we learn from the exhibition held there?

Every one must be struck by the prominent position assumed by East Anglian Rose-growers, especially by those in the trade; the public has been accustomed for many years to see the prominent position held by the two great firms of the Cants, Mr. B. R. Cant, and Messrs. Frank Cant & Co., and now they have a third one closely treading upon their heels, Messrs. Prior & Son; and in some places taking the prizes from their grasp. The record of the old veteran, Mr. B. R. Cant, and of his two worthy sons, is a remarkable one, and although he himself is now unable to take any active part, it must have very much gladdened him to see how his sons were keeping up the honour of the house. His record of 1st prizes this year is as follows: from June 21 to July 22, he took fifty-one 1st prizes, including all the big classes he showed in; also the Challenge Trophy, N.R.S.; the Jubilee Trophy, N.R.S.; the Queen's Cup, the Richmond Cup, the Woodbridge Cup, and the Brentwood Cup; two Gold, and five Silver Medals. It is not to be expected that any amateur should be able to have such a record as this; some of them can only compete well at early shows, and others at late, while few of them can incur the trouble and expense of frequenting so many shows. To the trade-grower, however, it is a matter of business, and therefore from the beginning to the end of the season he likes to be found in the forefront of the battle. The Rev. Joseph H. Pemberton does, however, make a very remarkable record each year, and although this season was much against him at the earlier shows, as his Roses were not in flower, yet he is able to say that he exhibited at ten shows, staged in forty-four classes, won twenty-six 1sts, eight 2nds, and seven 3rds. Nor were the amateurs in East Anglia behindhand; it is true that none of them were able to snatch the laurels from Mr. E. B. Lindsell, who still remains our champion grower. But Mr. Orpen, the Rev. Foster-Melliard, and the Rev. F. Page-Roberts showed in fine form, especially in the Tea classes; while Mr. Orpen, of Colchester, secured the Tea Trophy. In the nurserymen's division Messrs. Frank Cant & Co., Mr. B. R. Cant, and George Prince shared the chief honours, East Anglia again asserting its supremacy.

Another most encouraging feature is the fact that so many new growers and exhibitors are coming forward; it will, of course, be a long time before any of those who have recently entered the lists will be able to compete successfully with some of the Goliaths amongst amateurs, but it is not given to everyone to possess the extent of garden and the amount of means for that purpose; nor is it wise for an amateur to go beyond his strength. I have seen many a case in which a too ambitious exhibitor has missed his chance by endeavouring to exhibit in a larger class, when he ought to have been content with a smaller one. Another feature

occasioned by the lateness of the season, and one much to be deplored, was the absence of northern growers. We used to have in former days exhibits from Cheshire and Durham, in the persons of Mr. T. B. Hall and Mr. Whitwell, but they have retired from the field; but even Mr. H. V. Machin, that enthusiastic grower, was unable to put in an appearance. Messrs. Harkness & Son exhibited of course as they always do, well, but they are not purely northern growers as they have established a nursery at Ledbury.

Among the noticeable features in the exhibitions both at the Crystal Palace and at Colchester, was the entire absence of absolutely new Roses. This was shown by the fact that the only gold medal awarded was for a Rose already exhibited, and to which had been awarded a certificate of merit, and which was now shown by Messrs. Piper, of Uckfield. Sunrise is a very beautiful garden Rose, striking in colour, and apparently a good and constant sport from Sunset (see *Gardeners' Chronicle*, May 20, 1899, p. 319, fig. 117). Last year there were three gold medals awarded, so in this respect there was a great falling off. Everybody wanted to know what Roses Messrs. Alex. Dickson & Sons had brought forward, and great disappointment was felt that they had none; for during the last few years they had obtained twelve Gold Medals for new Roses, and their flowers have appeared in nearly all the winning stands.

Again garden Roses have come very much to the front; the lateness of the season was certainly in their favour, and groups of visitors were constantly round the stands where they were exhibited. As usual, Messrs. Paul and Son of Cheshunt, and Messrs. Cooling & Sons of Bath, ran each other very close; but I must not forget other exhibitors. The amateurs made a brave show, and Mr. Tate of Leatherhead, Mr. Orpen of Colchester, the Rev. J. H. Pemberton, and Mr. Champion of Reigate, all showed excellently well; while in the smaller class, Mrs. Perkins, Miss D. Nesfield, and Miss Beatrice H. Langton, had well-arranged stands of good flowers. Mr. Champion was also awarded a prize for nine vases of Sweet Briar, making a very attractive exhibit. It is pleasant to find that small amateurs are coming forward to compete in the classes for garden Roses.

It generally happens that some one Rose comes forward so as to mark it as the Rose for the year. I should be inclined to think that honour falls to Marquise Litta; the bloom of it exhibited by Miss Langton, which obtained a Silver Medal for the best hybrid Tea was one of the finest Roses exhibited this year. The newer Roses seem to have carried off the lion's share of the medals, although such old flowers as Françoise Michelon and Princess Beatrice claimed the like honours.

It was perhaps an unfortunate thing that as the show at the Crystal Palace was held on as early a date as it could be, July 1, the season should have been an especially late one, and consequently there has been much disappointment in many quarters; but, on the whole, I think that growers have borne themselves manfully under what, to many of them, must have been a grievous disappointment. The decisions of the judges have been acquiesced in with cheerfulness, and there has been an entire absence of those unfounded growls which used to mar the pleasure of some of our exhibitions. As usual, there was the friendly meeting of rosarians from various parts, although there was a very sad blank occasioned

by the recent death of that accomplished rosarian and keen critic, Mr. T. W. Girdlestone. I trust that we may look to a more straightforward course of events for the ensuing year, and that exhibitors will be spared the many disappointments they have had during the present season. *Wild Rose.*

POTATOS.

OF Plums, we have the large, the small, the long, the round, the black, the purple, the red, the yellow, and other colours; and in flavour, the acid, the rough, the smooth, the sweet, and the rich, fine Gages. Varieties to please the eye, suit the purpose, and the palate. And so with our Pears—varieties for all, from the hard, perry-making, to the scarcely less hard baking Pear, the musky, the vinous, the sugary, the buttery, and juicy; some large, some small, some round, some oval, and some pear-shaped; but, like the Plum, each so differentiated from the other as having among them something to suit the most fastidious. And again, in the Apple, what a multitude of sizes, colourings, shapes, and textures, some semi-sweet, some semi-acid, some with just "a thought" of bitterness, some soft, some crisp, some hard (so much so that they might well be called the Dentist's Favourite), some rough to the eye, as russets, with a pineous flavour; some smooth and brilliant in skin, pleasant to look at, but only just a little good, and some with not much quality but beauty. This is the "eye-taster," and these are called *good market* Apples; as though the public bought twice when they had been taken in by appearance once. Now, this brings me to my subject. If with all these varieties, fine, luscious, and delightfully-enjoyable fruits, different form, colour, and flavour to suit all eyes, palates, and tastes is offered, and fruit-lovers are not made to eat all sour, all acids, or all sweets, either one or the other, with no change or interchange; but such is the pomologist's catering, that it must, indeed, be a continuous indulgence to the fruit-lover in trying to select amongst the many, where no two are alike, that which pleases him the most.

But with the Potato, how changed is all this! We are told, but I am loath to believe it, that one that boils to "a ball of flour" is the right thing, and it must be white, and not yellow; why, I know not. I was praising a Potato a short time since to a grower, when he said, "Yes, it is pretty good; but it won't sell, mind you, for it is yellow-fleshed." "Oh!" said I, "then colour has something to do with it?" "Just so," said he; "they (the Potatos) must boil white, and be 'balls of flour.'" "Oh," said I—"but why? I hate a mere tasteless ball of flour in my mouth. I want a Potato with some flavour." Why not have different flavoured Potatos as we have different flavoured fruits? I own in the shape of the Potato there is an advance, but the texture, taste, and flavour, are gone. Why is the "ball-of-flour" man to be catered for entirely to the exclusion of those who will not have such a kind of Potato on their table? Why are yellow Potatos not "the right thing?" When I was young, and that is a very long time ago, my brother, John Jenner Weir, F.L.S., &c., and myself, used to look forward to the coming of the new Potatos. How we loughed for the time. How eagerly we looked for "the coming dish" of the then bright yellow new Potatos; and for our dinner we wished for, wanted not anything else but these, and—butter; firm in texture, but slightly mealy, and then there was a flavour—a flavour that was not in any other vegetable; a genuine, fine mellow Potato-flavour. Oh! how we and others used to enjoy them with a never satiated appetite. "Oh, those were days!" But now for some time I have asked for my table some new Potatos; yes, and have had them! They, "the young" of "the balls of flour" outvie their parents in their want—tastiness. Some were like pulp of an undistinguishable kind in one's

mouth, with only the knowledge that it was "nasty;" others with a sort of semi-transparent sickly, tallowy look like a consumptive's cheek, and these were at the "improved" price of 4d. a pound. No, there has been nothing nice or "potatory" about them! Who eats these I do not know, nor do I care, so long as they are not put before me again as—food. I daresay they are very good croppers, so are called "good market Potatos." Not they. A good tradesman must now cater for the public's appreciable taste; rubbish may be bought once or twice, but not often. As it is with me, so with my friends. We will not eat the present sorts of Potatos when—"new." What I ask is, let us have a variety of flavour, flesh, or what not; let us enjoy our different textures, tastes, and not be "jumped upon," as it were, when we say we do not like insipid, dry, tasteless, powdery, balls of flour. We do not want such hot flour, but *Potatos*, and the real quality of the Potato, with a fine and delicate though slight perfume, giving a pleasurable feeling on the palate—that from a tasteless "ball of flour" is non-existent. *Harrison Weir, Sevenoaks, July 21.* [Many—ourselves among the number—will endorse our correspondent's opinion. The same holds good of the Tomato. *Ed.*]

ABBOTSBURY CASTLE, DORCHESTER.

ABBOTSBURY is situate 9 miles from Dorchester, and about an equal distance from Weymouth. The castle is the seat of the Earl of Ilchester, and is a fine residence commanding a beautiful view of the bay. The climate is uncommonly genial, and the grounds are so well sheltered that many exotic plants succeed in the valley in which the estate is situated far better than when grown in glass-houses. Abbotsbury has a proprietor who takes a great interest in outdoor gardening, and especially in completing the adornment of his extensive estate and in experimenting with any and every new plant that can be obtained. Mr. J. Benbow, the gardener, has had charge of the estate for the past eight or nine years, and he most heartily enters into the labour connected with the planting and cultivation of the numerous exotic and sub-tropical plants that here exhibit such evidence of vigour. An experience gained in North Italy, where for some years Mr. Benbow had charge of a fine garden, may have developed in him an appreciation for this style of gardening, but taste and inclination are of slight value unless they can be turned to practical account.

On my visit to Abbotsbury, my attention was first directed to a site recently enclosed for the culture of new varieties of trees and shrubs. This portion is well protected by existing parts of the ground on the S.W., and by rising land on the E., and in addition, each plot is enclosed with reed hurdles and interlaced wattles, which permit some wind to pass through, but effectually break the force of the strong gales that sometimes sweep up the valley. *Acacia dealbata* in a young state, is here growing freely. *Spiraea grandiflora*, a shy bloomer in most cases, is here being given a fair trial. There are *Aralia manchurica*, *Cytisus purpureus*, the Judas tree, *Cercis Siliquastrum*, *Calycanthus floridus*; also plants of the variegated Tulip tree, a very attractive plant. Seedling plants of *Magnolia tripetala*, *M. grandiflora*, and *M. macrophylla*, were very healthy, and will be placed in permanent quarters when large enough, and spaces occur for them. *Cercis canadensis*, *Catalpa syriacifolia*, and *Quercus pyramidalis*, all appeared well. Near at hand was a long row of the Abbotsbury Clove Carnation, a very strong and erect grower, with bright pink-coloured flowers. One of the divisions here contained a row of the new hybrid China Rose, *Laurette de Messimy*, which is proving a strong and vigorous grower, and an abundant bloomer. *Deutzias*, in many varieties, occupy a considerable space, many rare forms being amongst them; and the same remarks apply to

Weigelas, *Spiræas*, and *Cytisus Andreanus*. A quantity of *Eucalyptus occidentalis* is growing very vigorously, and the distinct glaucous hue is very noticeable. *Citrus trifoliata*, a small shrub, is very free and pretty; intermixed with these are breadths of herbaceous plants. I noticed a splendid plant of *Phygelius capensis*, bearing quantities of scarlet blossoms. Presently we passed a fine row of Walnut trees, bearing an unusually heavy crop of fruits; numerous plants of *Rhus Cotinus*, with its singular feathery flower-stalks; whilst of the *Berberis*, the varieties are very numerous.

A new departure has been made here in outside Grape-growing, and already a border 150 yards long is planted, so that an avenue will ultimately be covered with canes. The Vines have been planted 10 feet apart, with some fourteen varieties of the new French and American hybrids, and it is anticipated these will succeed and ripen their fruit in this position. The border faces the south-east, and is 12 feet wide; the canes at the back have already reached 10 and 12 feet in height, and on many of these some eight or ten bunches of fruit, about the size of red Currants, looked well. The whole of the border has iron standards fixed at regular distances, which are just 8 feet above the ground, and on these iron arches are fixed. The canes are trained up the standards, carried over the arches, and in a season or two the whole will be completely covered.

In close proximity to these are veritable hedges of Bamboos, 4 to 6 feet in height, giving such an impression of tropical vegetation as is seldom seen in an English garden. *Bambusa khasyana* is also much in evidence, with large plants of *Chamaerops Fortunei* growing amongst them. In the Bamboo garden, we are surrounded by a grand collection of some forty species. Some three years ago, an importation was received from Japan. *Arundinaria gracilis*, from the Himalayas, is small, though neat and pretty. *Phyllostachys quadraangularis*, with growths 10 feet high; *Arundinaria chrysanthra* is a dense bush with leaves of a very dark-green colour, some 6 or 8 inches in length, having lines of a paler hue running the whole length of the leaves. *A. auricomma* forms an erect bush some 4 feet high, whose pale-green and yellow foliage is very distinct. In borders adjoining, *Paulownia imperialis* is represented by healthy and large trees, and closely associated is *Cæsalpinia japonica*. *Beschorneria yuccoides* is represented by two magnificent specimens in flower at the time of my visit; the spikes have reached a height of 12 feet, and at the juncture of the numerous laterals to the spike, the large bracts of a bright cherry-colour, add much to the singular beauty and interest of the plants. *Rosa Carolina*, which is here an evergreen, is represented by a fine plant.

The Dell (fig. 51, p. 143).—This is a most charming spot, and the picture gives a capital idea of its beauty. The winding character of the water, and rarity of the plants on its banks, would allow of a number of scenes equally beautiful.

In this dell through which there is running water, there are many novelties. This portion is well protected, and the most has been made of the boggy piece of ground. By the side of the ponds and streams, plants of *Bocconia cordata* are very numerous, the leaves some 18 inches across, were very handsome. Here also were plants of *Zizania latifolia*, the Japanese Rice, looking vigorous and inviting. Seedling *Phormium tenax* and *P. Colensoi* are freely distributed in this dell, and grow well. At the pond sides, where the water is shallow, quantities of *Richardias* are planted, and have flowered very freely (fig. 52, p. 143). We here get a view across the Dell, with *Arundo Donax*, and *Hydrangeas*, *Phormiums*, &c. Just from the pond edge, sometimes creeping down to the water, are masses of herbaceous Musk, these evidently enjoy to the full the moist situation, as they are masses of gay colours.

Eucalyptus, in many varieties overhead, impress themselves upon one's notice, *E. eugenoides*, with

FIG. 51.—THE DELL, RUSTIC STEPS AND SERPENTINE WATER, ABBOTSBURY. (SEE P. 142.)

FIG. 52.—VIEW ACROSS THE DELL, SHOWING *ARUNDO DONAX* IN THE BACKGROUND, WITH *HYDRANGEAS*, ETC. (SEE P. 142.)

leaves of a singular crinkled habit; whilst the glaucous *E. coccifera*, raised from seed, is thoroughly at home, making fine long shoots. Still pursuing our way, and nearing the ponds, I noticed grand clumps of *Eulalia gracillima* and *E. japonica variegata*, whose light, feathery sprays, some 5 and 6 feet high, were singularly graceful.

In another very sheltered site, remodelled a few years since, are Bamboos in abundance, from a foot to 12 feet in height; Palms, *Eulalias*, *Beathamia fragifera*, in numerous specimens; *Dracena indivisa*, 8 and 10 feet high, some in flower, others having fruit ripening on them; thirty species of *Eucalyptus*, and every conceivable variety of the Himalayan *Rhododendron*. *Acacia armata* is a large shrub here. *Ozothamnus rosmarinifolia* from South Australia, with its yellow blossoms, is most beautiful.

Now we come again to the Bamboos, not as isolated specimens, but as immense clumps and in great numbers; *Phyllostachys aurea* made growths 15 feet in height in ten weeks. In a shady dell are masses of *Onoclea sensibilis*, and remembering the size this is usually met with, it was a matter of surprise to find fronds 3 feet in length and proportionately wide; associated with this were grand plants of *Osmunda regalis*. *Cortaderia Quila* (carmineum), one of the Pampas-grasses, is in fine condition; it is a choice species, the rose-coloured plumes develop considerably earlier in the season than those of *C. argentea*, and are light and feathery. Here the ground is almost covered with *Heuchera sanguinea*, dwarf and compact; its numerous deep scarlet-coloured flowers are an attraction, and even a relief among so many shades of green. *Magnolia Campbelli* is represented by a very large plant.

On banks by the pond sides, again, are masses covering spaces of 30 and 40 feet in length of *Mesembryanthemum edule*. Many of its Fig-shaped fruit were noticed. *Cedrela sinensis*, with lengthened sprays of white flowers, were common, and the same may be said of *Acacia dealbata*, 20 feet high. A hybrid *Verbascum*, with spikes of white flowers, was very distinct in the border. *Hypericum punctatum* was spreading very freely, and is distinct in growth and appearance.

A bank in a sheltered spot is filled with many distinct and beautiful varieties of *Athyrium filix-femina* and *Lastrea filix-mas*. These it is not necessary to enumerate; they are beautiful, and in the most robust health. A grand plant now appears of *Arnoldia Simoni*, whose growths are 30 feet high; this is a most conspicuous object, and arrests one's attention immediately. Near by are clumps of *Salvia Horminum*, with deep purple bracts, with paler, somewhat hidden flowers; the terminal portion of the spike is often quite destitute of flowers, the bracts only being developed. *Fatsia japonica* (*Aralia Sieboldi*) is about 15 feet in height, and its branches spread out, covering a space just 50 feet in circumference. This specimen has flowered many times, and ripe seeds have been obtained from it.

There are some beds cut in the grass that contain fourteen species of *Yucca*. I noted *Yucca superbiens* with a tinge of scarlet in the young growth. By the side of this garden is a bank of *Cistus florentinus* with pure white flowers; whilst on the another side is another hedge of Bamboos, 70 yards long. In front of it were border Carnations in quantity; with these, Violets are planted, and spreading out have covered the ground, so that the Carnations which are not tied to stakes, but resting on the Violets, are kept clean, and are always fit for cutting.

In a large pond, regularly supplied with water, and which is surrounded by tropical vegetation, are numerous plants of *M. Marliac's* new forms of Water-Lilies, and most beautiful do they appear. *Silene Armeria* close by is pushing up its bright crimson flowers. *Fagus asplenoides*, with its peculiar leaves, arrest attention, and *Lapageria rosea* on a wall is healthy and strong.

Our illustration of the rockery steps and water-basin (fig. 53, p. 145) presents but a small portion of this interesting piece of work.

In a part of the grounds which was planted first, *Azalea indica alba* grows so strong and so dense that they act as shelter to many other subjects. *Magnolia grandiflora* Exmouth variety, or as it is here named *M. ferruginea*, is met with as trees, with foliage of large size and grand colour. I noticed *Berberis nepalensis*, very strong and distinct; *Eugenia myrtifolia*, covered with its pretty white flowers; *Musa Ensete*, with immense leaves; *Acanthus mollis*, with many spikes of bloom, &c. And so among beds and borders full of Camellias, Azaleas, Aralias, *Eucalyptus* of sorts, and Himalayan *Rhododendrons*, many reaching 20 to 30 feet in height, one naturally looked up to see the dimensions of the imaginary glass structure covering these fine plants, so much does the whole appear like an immense winter-garden. *Rhododendron Thompsoni* is represented by large specimens, its deep red flowers are much esteemed; *Eucalyptus cordata*, raised from seed saved on the place; *Acacia dealbata*, 20 feet high; *Magnolia Soulangeana*, as real trees. Turning for a moment from these specimens to an enclosed space, we notice just a thousand young plants of the Pampas-grass, *Gynerium* or *Cortaderia argentea*; *Oxydendron arboreum*, a tree 20 feet in height, has sprays of white flowers which are very effective.

On a high wall were several distinct plants, including *Psoralea glandulosa*, in flower; *Vitis heterophylla purpurascens*, in fruit, the leaves of which in autumn become deep purple in colour; *V. h. variegata*; *Salvia crispa*, also fixed to a wall; *Catalpa syriugefolia aurea*, &c. Young Cork-trees raised from seed are here at home; and close by is *Ginkgo biloba*, 40 feet high. Low down are broad patches of *Hypericum brevifolium*, a small, neat grower, full of yellow blossoms; *Spiraea Douglasii*, with clusters of pink flowers. And then we are brought round to a variety of *Arundo Donax*, with plumes reaching a height of 15 feet—a most conspicuous object; *Chamerops excelsa*, 15 feet high; *Paulownia imperialis*, growing in many positions; *Spiraea flagelliformis*, with plumes of white flowers; *Crataegus glandulosa*, with a stem 12 feet in circumference, whose pendulous branches cover a space 35 yards round—the spines on this tree are, many of them, 2 inches long. Hedges of *Fuchsia Riccartoni* and avenues of *Myrtles* call for special mention, and so beautiful is this part, that through such groves, the old church of St. Catherine's is distinctly seen standing prominently on the top of the hill. The illustration on p. 147 (fig. 54) conveys a fine idea of these two avenues. The *Quercus Ilex* are noble specimens; and the *Myrtles*, when covered with flowers, are of singular sweetness and beauty.

Colutea arborescens, with its inflated pink and pale green seed-capsules; *Hypericum pyramidatum*, a distinct St. John's Wort; and banks of *Mesembryanthemum edule*, and *Saxifragas* of sorts, are all noteworthy features.

Passing through an avenue of Tamarisk (fig. 55, p. 153), well in keeping with other portions of these grounds, we enter a recently-formed garden near the mansion, where Agaves and Aloes by the score are planted out in rockwork, with *Mesembryanthemum* in almost every conceivable variety amongst them. Close by were *Plumbago Larpentæ*, *Echinops Ritro*, *Medicago arborea*, *Statice macrophylla*, *Veronica elliptica*, and *Eleagnus reflexus*. We then pass *Pittosporum bicolor*, 30 feet high, with a stem 3 feet round; *Erica arborea*, 10 feet high; and *Nertera depressa* on the rockery, was covered with its scarlet berries. Here, too, was *Eucalyptus cordata* raised from seed; *Pittosporum undulatum*, also from seed; *Diospyros kaki*, the Japanese Apple, and *Diospyros virginica*; also *Senecio macrophyllus*, with large spikes of yellow flowers.

On one of the garden walls I noted the *Physanthus albens*, an evergreen Peruvian climber, with fruit as large as a goose-egg; *Cobaea scandens*,

Passifloras, *Solanum jasminoides*, *Roses*, and *Begonia radicans*.

Fig. 56, p. 153, shows that portion of the new rockery where alpine, succulents, and a few Agaves are planted. That portion of the rockwork devoted entirely to the Agaves, Yuccas, Aloes, &c., is not included in this picture.

In an enclosed space in front of the two glass-houses (which are all the erections devoted to plant or fruit culture), are numerous beds filled with herbaceous plants, and in some of the beds are large Bamboos 6 feet high. These were covered with a temporary dome-shaped wire trellis, and over these *Tropæolum Lobbianum* Firefly had freely grown, so that the whole was a mass of intense scarlet colour. Close by was *Datura Wrighti* fl.-pl.; and another most remarkable plant was *Clerodendron trichotomum*, full of its white flowers—this plant was 18 feet through, and was most showy. On the wall at the back of the lean-to vinery, one of the glass-houses just referred to, running 40 feet long by 10 feet in height, one of the prettiest sights imaginable was to be seen—*Tropæolum speciosum* covered the whole of the space, and was blooming with profusion; the lovely flowers seemed to revel in the shade and moisture of this particular spot. *Indigofera Gerardiana* was covered with its rosy-purple flowers; while *Ceanothus Gloire de Versailles*, with its pale blue clusters, was equally attractive.

The robust health of everything that came under my notice was most remarkable; and every view seemed to rival its neighbour in attractiveness.

After a ramble of several hours, I sat down for a moment or two on one of the lawns; immediately overhead was a large Tulip tree, and in front and surrounding were *Eucalyptus Globulus* 20 feet high, and *E. coccifera* 30 feet; immense *Phormium tenax*, *Aralia Sieboldi* as trees, *Dracena indivisa* 20 to 30 feet high, Camellias, Poinsettias, Palms, as well as many of the varieties already mentioned. The whole of the extensive garden, so full of marvellous and interesting things, is in excellent keeping. S.

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 103 to 109).

(Continued from p. 136.)

3, ENGLAND, E.

ESSEX.—Apples, Pears, and Plums showed well for bearing good all-round crops, judging by the profusion of blossom with which the several trees were clothed of the above-mentioned fruits. But the frosts which put in an appearance before the blossoms had "set," spoilt this bright prospect; the result being that the crops of Apples, Pears, and Plums, where not protected from the north and east, are very light indeed. I may mention that some young cordon trees of Keswick Codlin Apple, standing in the open, are studded with clean, healthy-looking fruit. During the many years that I reported on the fruit crops in South Wilts, I was, in every case, able to report favourably on this sure-bearing Apple. H. W. Ward, Lime House, Rayleigh.

LINCOLNSHIRE.—Heavy rains, followed by sharp frosts, made sad havoc with the Apple crop. Pear and Apple blossoms shared a like fate, and the embryo fruits, unable to withstand the long-continued low temperature, dropped. It is many years since we had such a poor Pear crop. Peaches were only saved by covering up with thick canvas, there being 17° of frost when they were in full flower. Strawberries were worse than we have ever had them; Royal Sovereign was the best, but three dull, wet days caused them to decay very much—it is a variety that does not seem to stand wet weather. H. Vinden, Harlaxton Manor Gdns., Grantham.

—In these parts the fruit crop, on the whole, is not very good. Plums are rather scarce, although the Victorias are bearing the most fruit this season. Pears are comparatively a failure, no doubt owing to the late frosts and the prolonged cold weather of

the spring. The Strawberry crop has been a remarkably good one, both in quantity and quality. *J. Rowlands, Manor Gardens, Bardney.*

— We had a splendid show of bloom all round. Plums suffered severely from the damp, cold nights. Early Apples of the Codlin type are carrying a splendid crop of fruit, but many of the later varieties are only moderate. Pears are much more regular, and we shall have some very good fruit. American-blight and the Currant-mite are our worst enemies. *J. Coward, Haverholme, Sleaford.*

SUFFOLK.—The very inclement weather prevailing in April, did great damage to Apricots, Peaches, Nectarines, and Pears; and in the case of Apricots it nearly destroyed the entire crop. Pears are exceedingly poor, both in quantity and quality. Cherries are not much grown in this part, but what trees there are have been quite loaded with fruit, and free from the black aphid. Strawberries have been very good, but the early bloom was destroyed with frost, therefore the crop has not been heavy. *B. Marks, Hardwicke House Gardens, Bury St. Edmunds.*

and nearly in full leaf at the same time, we rarely get a good crop. Cherries both on standard and trained trees are fairly good. Plums are partial. Gooseberries nearly all dropped off when small, owing to continual frosts, the foliage at the time not being sufficiently forward to protect the young fruit. Strawberries, Raspberries, and Currants, are plentiful and good. *H. Fisher, Flinton Hall Gardens, Bungay.*

4. MIDLAND COUNTIES.

BUCKINGHAMSHIRE.—We had a fine show of bloom on all kinds of fruit-trees; cold east winds cut most of it off after it was set and swelling. Apples are very thin; no Blenheims, although we have over 500 young trees. Very few Wellingtons, and only a crop of Cox's on young trees. The following varieties of Apples have a good crop:—White Transparent, Worcester Pearmain, Ribston Pippin, Washington, Yellow Ingestre, Seaton House, Lady Sudeley, Lane's Prince Albert, Duchess of Oldenburg, Cockle Pippin, Lemon Pippin, Keswick Codlin, Stirling Castle, &c. *J. Smith, Mentmore Gardens.*

— The failure of the crop of Strawberries this year is remarkable. I never, in my experience of over fifty years, remember it being so bad in general. Doubtless the deficiency in bloom on the plants this year may in some measure be ascribed to the want of water last year. This year also the plants suffered considerably from the same cause at a time they most needed it. These effects, combined, and the mischief done by frost when the plants were in flower, have brought about one of the worst crops of this delicious and greatly-esteemed fruit within my recollection. *Geo. Thos. Miles, Wycombe Abbey Gardens.*

— The fruit prospects at the beginning of the season were good, orchard and other trees showing an abundance of bloom; the late and severe frosts, however, almost completely destroyed the blossom and small fruit. No such damage has been known in this locality for a number of years, in some instances the results having proved most disastrous to the owners and occupiers of fruit-orchards. *W. Hedley Warren, Aston Clinton Gardens, Tring.*

— The choicer kinds of wall-fruit suffered from the severe frost we had during the time they were in bloom. The Peach and Nectarine-trees were covered up with mats and larger branches of Birch when in bloom, not removing them during the day, and then gradually exposing them to light, using nets, &c. We saved the bloom, and all the trees are now carrying a splendid crop. I believe the fish-nets prevented the blistering of the foliage, as we have been troubled with that pest in other years. Now the foliage of the trees is in fine condition. *John Fleming, Wexham Park Gardens, Slough.*

CHESHIRE.—We have very poor crops of fruit indeed here. Amongst Apples, only a very few varieties have full crops, of which Greuadiere, Cellini, and Pott's Seedling are examples. Not one variety of Pear with us has a full crop, and many trees are entirely barren. Red Currants and Gooseberries were injured in the winter by sparrows, which took the buds. The early flowers of the Strawberries were destroyed by late frosts, so that it seems of no great consequence trying for sorts too early when they are so liable to be hurt by late frosts. *Robt. Mackellar, Abney Hall Gardens, Cheshire.*

DERBYSHIRE.—Early varieties of the Apple have fair crops of fruit, but late ones are very much below the average. Pears Louise Boone of Jersey, and Beurré d'Amanlis are the only varieties that have good crops. *Thos. Keetley, Darley Abbey Gardens.*

— The Pear crop suffered very much from the late frosts that occurred on May 26 and 27, i.e., 6° on the 26th, and 7° on the 27th. Most of the trees were carrying an abundance of bloom at that time, but only a light crop of fruit survived. Early Strawberries also suffered a little, but not so as to

FIG. 53.—ROCKERY STEPS AND POOL, ABBOTSBURY. (SEE P. 142.)

NORFOLK.—I think this is the worst year for fruit I ever remember, for there is scarcely anything; a few trees of Pears, such as Louise Bonne of Jersey, Citron des Carmes, Marie Louise, and Vineuse, have a good crop, but the rest are nearly barren. Of stone-fruit, Apricots are quite a failure; Plums are nearly so; Nuts none, and altogether the outlook is a poor one. There was a good crop of Strawberries, but the fruit was small, and the season short. *H. Batchelor, Catton Park Norwich.*

— In this district, with but few exceptions, the fruit crops are very unsatisfactory. The blossom on Peaches, Nectarines, and Apricots, was completely destroyed by severe frosts which visited us from the 19th to 25th March, and which ranged from 20° to 23° at night. Three and four thicknesses of fish netting afforded but little protection against frost of that severity. Pears are only a light crop, and Apples the same. This year the latter were late coming into blossom, and I have observed that if the trees are in blossom

affect the yield much, and good crops are quite general. Royal Sovereign, James Veitch, and La Grosse Sucrée, are the best here. *F. G. Mills, Glossop Hall Gardens.*

HERTFORDSHIRE.—Fruit crops have suffered severely from late spring frosts. Apples are very few, and poor in quality; many trees are entirely fruitless. Strawberries, when in bloom, suffered badly from frost; and again, when the fruits were swelling, from heat and drought. Morello Cherries are good; and Raspberries more plentiful than last year. Pear-trees are yielding fairly, and the fruit promises to be good in quality. I do not hear of growers in general praising the fruit prospect for 1899. *W. Garman, Frythesden Gardens, Berkhamsted.*

—The fruit crops in this district are most disappointing. Apples generally are thin, and the trees very badly infested with American-blight. Pears, except on walls, are a failure; Plums, except on walls, are very poor indeed, in spite of every precaution; the bullfinches ruined the whole of our standard and pyramid, also such fruits as Medlars, Quinces, *Pyrus japonica*, and *Crataegus* of sorts, we had to net closely on walls, or these would have suffered the same fate. Gooseberries poor; Cherries of the dessert kinds are good, and Morellos under average. *E. Beckett, Aldenham House Gardens, Elstree.*

—Apples are a very partial crop in this neighbourhood, some trees being loaded, others are quite bare, and unfortunately many are falling off. Peaches and Nectarines promised well, but were cut off by frost. There are very few Plums except on walls, these promise to be good. *Thos. Nutting, Childwickbury Gardens, St. Albans.*

—The three most important of British fruits, viz., Apples, Pears, and Plums, are a poor crop, so much so here, that I have the worst crop since 1879. This result is unquestionably due to the very dry weather of last autumn, which prevented healthy formation of flower-buds to a large extent, and many that escaped this were destroyed by the late spring frosts. With the exception of Gooseberries, small fruits have been fine, Raspberries particularly so; the variety *Superlative* has been by far the finest. *G. Norman, Hatfield House Gardens.*

—Apples are much under the mark in this part of Hertfordshire. Here and there, as might be expected, trees are to be seen with a good crop of such varieties as Bramley's Seedling, Lane's Prince Albert, Grenadier, Lord Suffield, with a few other sorts; but to take this part round for miles, Apples are very much under the average. On the second Tuesday in May and two following nights our thermometers registered 14°, 11°, and 9° of frost. *C. E. Martin, The Hoo Gardens, Welwyn.*

LEICESTERSHIRE.—The fruit crops in this district are rather disappointing. There was abundance of bloom, and everything looked promising up to the last week in May, when a succession of frosts and cold rains caused so much destruction to the blooms of Apples, Gooseberries and Strawberries, as to rob me of half the crop. Apples are now swelling fast, and what there are, promise to be excellent. Pyramidal Pears seem most effected by the frosts. Stone fruits generally, are much below the average. *D. Roberts, Prestwold Gardens, Loughborough.*

—Seldom has there been a better prospect for a heavy crop of fruit than was presented here this spring at the flowering period. Apple and Pear trees in the orchards were huge masses of flowers; a few of the earliest were destroyed by the frost on May 4 and 5, when the thermometer fell to 27° each night, and cold N.E. winds prevailed up to the 14th, and are partly responsible for the failure. But the chief cause, in my opinion, is the extreme drought and heat of Sept. 1898, which affected the trees much, while they were carrying a good crop of fruit; those that were afforded water, and those in the most vigorous health, have the best

crops this year. Plums on walls are a good crop in most instances; the failure of standard Plums here is largely owing to the depredations of bullfinches and other birds which take the buds, often before the leaf has fallen in the autumn. Strawberries had some of the earliest flowers killed by the severe frost on May 28, when the thermometer on the grass fell to 27°, and much of the fruit decayed owing to continued wet weather during the last ten days of June, and July 1, 2, and 3. Apricots and Peaches suffered much from severe frost on March 19 to 25, when the thermometer fell to 15° and 22° on several occasions. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

NORTHAMPTONSHIRE.—The late frosts in this district completely wrecked the fruit prospects for this year; the early varieties however escaped, whilst late ones are a failure. Keswick Codlin is good, and Lady Henniker have good crops, but the better varieties were destroyed. Black Currants were very fine, the best we have had. Strawberries have been very fine in quantity and quality; we grow chiefly Royal Sovereign and President. *H. Kempshall, Lamport Hall Gardens, Northampton.*

NOTTINGHAMSHIRE.—Apples form an average crop, the best being Red Astrachan, Lady Sudeley, Irish Peach, King of Pippins, Ribston Pippin, Court of Wick, Worcester Pearmain, Bramley's Seedling, Bismarck, and Duchess of Oldenburg. We had a splendid show of Pear-bloom, which was destroyed by the late frosts; and Plums fared no better. Strawberries have been a splendid crop, and the best were Royal Sovereign and James Veitch. My best Royal Sovereigns were gathered from plants put out in August, 1898. *A. McCulloch, Newstead Abbey Gardens.*

—The flowering period was the most trying for fruit trees generally that I remember. Very low temperature, with north-east and east winds, prevailed all through the month of April, and far into May. Trees on south and west walls are fairly fruitful; on east walls quite a failure. Apples are dropping freely, but a fair crop remains. A fine autumn is needed to ripen the fruit. Trees generally are making very healthy growth this season. *J. Roberts, Welbeck Abbey Gardens.*

OXFORDSHIRE.—Apples of the better dessert kinds considerably under the average. Early cooking plentiful. Pears good on walls. Victoria Plums on north walls a heavy crop, on open trees thin. Cherries poor. Peaches and Nectarines promised well, but leaves blistered a good deal. The early kinds—Waterloo, Amsden's June, and Alexander—have been gathered, and were of good quality, and a fair crop. Good crop under glass. Small fruits were the worst we ever had, except Raspberries, which, owing to the heat, were soon over. Strawberries were very good, but a very short season. Royal Sovereign excellent; President and Latest-of-All good. *G. Stanton, Park Place Gardens, Henley.*

—In this neighbourhood, elevation above sea-level 530 feet, on a retentive heavy loam, overlaid the oolite; so that in a season like the present we are better enabled to withstand the drought than others less fortunate. Respecting our Apple and Pear crops, we are better off than many of our neighbours, as most trees have a liberal sprinkling of fruit, notably the Codlins, Tower of Glamis, Ecklinville, Cox's Orange Pippin, and Ribston Pippin; the same remarks apply to Pears, Williams' Bon Chrétien, Souvenir du Congrès, Pit-maston Duchess, Doyenné du Comice, Durondeau, and Monarch (Knight's), are bearing the best crops; we have one exception in Conseiller de la Cour, generally a reliable bearer with us; this year out of six trees it is fruitless. Gooseberries received a severe check from frost in their early stage of growth. Strawberries resisted the drought and attack of red-spider which has been prevalent, by being well mulched and watered. Red and Black Currant bushes are vigorous and healthy. *James A. Smith, Sarsden Gardens.*

SHROPSHIRE.—Apples are a disappointing crop

with us. Trees that were set before the frost in the end of May are carrying full crops, while those alongside of them that were caught in bloom have none. Pears are much the same. One of the best crops of Apples that I have is Saltmarsh's Queen; Tower of Glamis, Duchess of Oldenburg, King of the Pippins, and a few others are also good. *James Loudon, The Quinta Gardens, Chirk.*

—The spring frosts with cold winds spoiled the early Apple blossom; but we have a fair crop all round of later varieties, such as Bramley's Seedling, Lane's Prince Albert, Normanton Wonder, Mère de Ménage, and Dumelow's Seedling. *W. Weeks, Cheswardine Gardens, Market Drayton.*

—If it had not been for the spring frosts, there would have been an abundant crop of all kinds and varieties of fruit. All the tenderer varieties of Pears and Plums were very much damaged; and the late varieties of Strawberries suffered much more than the early varieties. I gathered the first outdoor Peaches, early Alexandra, and Waterloo, on July 10; they were of very good quality. *G. Pearson, Attingham Hall Gardens, Shrewsbury.*

STAFFORDSHIRE.—The fruit crop in this locality, with few exceptions, is very unsatisfactory; in some places there is a good crop, and in others scarcely any. The following kinds and varieties have done the best in these gardens:—Apples: Early Nonpareil, Blenheim Orange Pippin, Dutch Mignonne, Lord Suffield, Lord Grosvenor, Mère de Ménage, Ribston Pippin, Sturmer Pippin, Stirling Castle, Lamb Abbey Pearmain. Of Pears, Beurré Capiaumont, Hessel, Green Pear of Yair, Broompark, Jargonelle, Louise Bonne of Jersey. *G. H. Green, Enville Gardens, Stourbridge.*

—Thanks to the general dryness of the atmosphere, the fruit-blossoms did not suffer so severely in these parts as might have been expected considering the many sharp frosts experienced from the middle of March to the end of May. Stone fruits have suffered the most. This year the whole of the hardy fruit-trees and bushes were well covered with blossom, but the continued frosts, which on seven successive nights from March 19 to 25 inclusive, culminated in 17° of frost on March 16; and on April 17, 18, and 19, when there were 10°, 12°, and 7° respectively; also as late as May 26, 27, and 28, when 6° were registered on each night. Had we escaped these late frosts, the thinning of Pears and Apples would have been a big job; but under present circumstances, with some few exceptions, as Bergamot d'Esperen among Pears, and Duchess of Oldenburg, Keswick Codlin, and Alfriston among Apples, all of which set heavy crops, very little thinning has been needed. Plums and Damsons have suffered greatly, Denyer's Victoria and Dove Bank being the only varieties which have a fair crop; and Damsons are a failure. Peaches, Nectarines, and Apricots escaped damage better than was anticipated, and most of our trees are carrying good fruits, but not a heavy crop. Cherries, both the sweet and Morellos, were partially affected, and are slightly under the average; while Strawberries have been exceptionally good, especially Royal Sovereign, which we find satisfactory on this cold stiff soil. Of Raspberries, *Superlative* is still the best. The branches of both Red and White Currants are literally clothed with bunches of fruit, of good size and quality; the black variety are not so heavily laden, but the bushes have been well furnished with fruit, the berries being of a larger size than usual. Blackberries, "*Rubus laciniatus*," are showing well, the fruiting-wood being strong and a mass of flowers. Filbert and Cob nuts are not quite so plentiful as in previous years, owing in a great measure to the paucity of male catkins. Walnuts are a very heavy crop. Medlars are again a poor lot, but Quinces are well furnished with young fruits. The various and numerous insect pests which prey upon fruit trees, have been much in evidence this season, but the Plums were not attacked so early in the season as last year,

which gave the trees an opportunity of perfecting their basal leaves; the younger leaves towards the tips of the shoots, on some of the varieties are badly curled up. Black fly, "*Aphis cerasi*," was very prevalent on the points of the young shoots of the Cherry earlier in the season, but by dipping the points of the shoots infested in XL insecticide, using it at the strength of twenty parts soapy water to one of insecticide, we soon cleared the trees, and without damage to the young leaves. Queen wasps were very plentiful during May and June, but they were very lively, and difficult to capture, so I shall not be surprised if wasps are troublesome later on. *Geo. Woodgate, Rolleston Hall Gardens.*

— The fruit crop in this district is very satisfactory, the best I have known for years. Apples are mostly heavily cropped, the best among them being

south aspect have good crops, whilst those on others are under average, and of poor quality. *H. T. Martin, Stoneleigh Abbey Gardens, Kenilworth.*

— We had an excellent promise, wood well ripened, and blossom abundant, on all fruit trees, but the 10° of frost that occurred on May 4 killed them. Of Strawberries we have not gathered a good dish of fruit from any variety. *A. D. Christie, Rayley Hall Gardens.*

(To be continued.)

TOLLCROSS PARK, GLASGOW.

The Glasgow Corporation is well known for its enterprise in all departments of municipal life. Its public parks are numerous. Quite recently an important addition was made in the Richmond Park, named after the present Lord Provost, Sir

range of glass is in course of erection by Messrs. Simpson & Farmer, who are now engaged in carrying out some £12,000 worth of work for the corporation of Glasgow. The new range here consists of a large public conservatory and propagating-house; also a house for *Odontoglossums* and one for *Cattleyas*. The plants for the Orchid-houses are the gift of ex-Bailie McDonald, of Glasgow.

In front of the old greenhouses there is a very fresh bit of bedding; pink *Pelargoniums* and yellow *Calceolarias* being very effective in front of *Gladioli* and *Dahlias*. White *Antirrhinum*, "Queen of the North," is true and good; but we were surprised to be told that most of the *Violas* had failed and had to be removed, their places being filled with such plants as *Lobelia*. It ought to be kept in mind by all who wish for effects with *Violas* that

FIG. 54.—*QUERCUS ILEX*, AND HEDGE OF *ESCALLONIA*, ABBOTSBURY. (SEE P. 142.)

Lord Suffield, Ecklinville, Bramley's Seedling, Stirling Castle, Ribston and King of the Pippins. Some of these varieties have been very light for some years previous to the present one. *E. T. Gilman, Alton Towers Gardens, Cheddle.*

WARWICKSHIRE.—Apples in this district are rather partial; some have a full crop, others hardly any. Blenheim Orange Pippin with us is abundant, and we are much better off than last year. Apricots and Peaches had a severe time when in flower, and afterwards; still, there is only one tree which is without fruit. Crimson Gallant, Hales' Early, Sea Eagle, Grosse Mignonne, Early Louise, Early Alfred, and Barrington, have fair crops of fruit. Plums, except on walls, are nearly a failure. *James Rodger, Charlecote Park Gardens, Stratford-on-Avon.*

— Apples in this neighbourhood have better crops than last year, and the trees are healthier. Such early varieties as Frogmore Prolific is well studded over with clean fruit. Several large trees in this garden of Cox's Orange Pippin are loaded with fruits. Peaches and Nectarines on walls having a

David Richmond. Tollcross Park was acquired in 1897 at a cost of £29,000. It extends to 82½ acres, and may well be considered a good bargain for the community. How Scotchmen love a good bargain! Tollcross is in the extreme east end of the city, and therefore the park is one for the east-enders, and its popularity on Saturday afternoons and Sundays is extraordinary. Taken as a whole, this park is remarkable for its natural beauty; there is nothing artificial about it. There is a charming natural glen, through which wanders Tollcross-burn for half a mile of its course. The banks are wooded; Ash, Beech, Elm, Oak, Plane, Hawthorn, and fine Chestnut-trees are abundant, and they are no mere modern specimens, many being from 80 to 100 years old, a few picturesque old Elms being decidedly much older than even the latter figure. The undergrowth is not crowded; it is made up of Hollies and Rhododendrons.

Tollcross Park, previous to its being acquired by the Corporation, was the home of a private gentleman, and the old glass-houses are still standing. They are filled with *Pelargoniums*, *Fuchsias*, *Caladiums*, *Dracenas*, and *Ferns*. An extensive new

they must be planted in March. Many gardeners court disaster with *Violas* by planting them in May. When put out then they cannot be expected to succeed. We omitted to ask when they were planted at Tollcross.

In a bed of seedling *Carnations*, Mr. Wilson pointed out a wonderful "freak" or development. I never saw or heard of anything similar. A plant is producing double and single flowers; on each flower-stalk there is a very double flower and several single ones. I advised Mr. Wilson to put down all the layers to see if such a rare occurrence can be perpetuated. [Not very uncommon in our experience. Ed.]

Mr. Whitton is the Superintendent of all the Glasgow parks, and that they are well managed goes without saying. He has a manager or foreman in each. Tollcross Park is under the management of Mr. David Wilson, who was formerly the well-known gardener at Westmount, Kelvinside. Mr. Wilson has here every opportunity of increasing his reputation, and the collection of Orchids could not be in better hands. Mr. Wilson left many seedlings at Westmount, but a few he got permis-

sion to bring with him to Tollcross. They will all be interesting by-and-by; particularly so will be those from *Dendrobium nobile elegans* × *D. Owenianum*, the latter itself being a hybrid between *D. Linawianum majus* and *D. Wardianum*; others are from *D. Cooksoni* × *D. nobilium* and *D. n.* × *Farmeri*.

Within a few hundred yards of this park there are iron and steel-works, breweries, potteries, and chemical-works in abundance; but inside the park, where everything is fresh and green, one forgets all about such things. *William Cuthbertson.*

ORCHID NOTES AND GLEANINGS.

LÆLIO-CATTLEYA ELEGANS VAR. HOUTTEANA.

FLOWERS of a very fragrant and showy variety of this natural hybrid, which agrees well with the fine form originally described by the late Professor Reichenbach as *Lælia elegans Houtteana*, are sent by Mr. Edge, gr. to J. Leeman, Esq., West Bank House, Heaton-Mersey, in whose garden it has just flowered. The sepals are of a dark tint of rose, with a greenish tinge at the base, and the petals are of a purplish-rose; the base of the lip and lower parts of the side-lobes bluish-white, with rose-coloured veining, ending in a purplish-rose blotch at the apex of each side-lobe, the broad and flatly displayed front-lobe being ruby-red, with a slight purplish shade. It is an exceptionally fine form of a class much favoured by collectors of good Orchids.

THE HERBACEOUS BORDER.

CAMPANULA MIRABILIS.

ON p. 83 of *Gard. Chron.* it is remarked that if seeds are freely produced the plant is likely to be a great favourite! Not if others find it as difficult to flower as I have done. I have a plant which has now made a good rosette of leaves for three seasons, but shows no sign of intending to flower. It is growing in a warm border beneath a south wall, in a similar place to that in which I saw a plant in bud at Kew a month ago. [We have a fine photograph of the Kew plant, which we hope to reproduce later on. Ed.] Other stemless plants were by the side of the one in bud. Two or three of my friends who have had the plant for two years are disappointed in their expectation of flowers. *C. Wolley Dod, Edye Hall, Malpas.*

GILLENIA TRIFOLIATA.

This is a graceful plant, suitable for the herbaceous border, and the flowers when cut are excellent for furnishing epergnes, contrasting effectively with heavy self-coloured blooms. It is a native of North America, and closely related to *Spiræas*. Being hardy and blooming in the month of June, and growing to the height of 2 feet, it is a plant that deserves notice from gardeners. The plant is three-leaved, as the name suggests, and the blooms, though generally described as pink, appear to the casual observer of a shaded white. *William Earley.*

HOLLAND HOUSE.

THIS is truly a wonderful place. We are not speaking of the house, as that is known to the literary man, the archaeologist, and the average Londoner. We are thinking of the garden—a garden, be it remembered, within 4 miles of Charing Cross, and packed in between Notting Hill, Kensington, Hammersmith, and Earl's Court—in other words, in the centre of a dense population, and in a characteristically London atmosphere. On one side, it is true, it adjoins Kensington Gardens, and these are continuous with Hyde Park. But who, knowing the locality, would think of a profusion of Roses! or would dream of beds of hybrid Tea Roses, or expect to see La

France and Caroline Testout asserting themselves as they do among many others. The last-named is a special favourite, its colour leaving nothing to be desired. Rhododendrons, considering the circumstances, do excellently. They have not the advantage of peat to root in, nevertheless the foliage is bold, deep in colour, and thick in texture, and there is enough to show that the flowers were abundant. But the interest of Holland House, so far as its gardens are concerned, consists in their infinite variety. It is not long since we alluded to the principal features of this garden, and gave a series of illustrations of this historic residence (figs. 85 and 86, pp. 227, 229 *Gard. Chron.* for April 15, and figs. 99 and 100, pp. 267 and 269 for April 29, 1899). A still more recent visit affords us an opportunity of speaking of it again, and the interest is such that we need not fear tiresome repetition.

Holland House is placed in an old, well-timbered park; some of the trees have attained their life-limit, and are gradually decaying. They suffice, however, to banish the thought of London; the town is not seen, the roar of traffic is scarcely heard. Woodland glades, avenues, and breadths of turf call up visions of deer and rabbits, and we did actually see a pheasant, and more than one misletoe-bough, one on a Pavia! London might, for all one sees and hears, be miles away except—except for the Great Wheel that obtrudes itself objectionably here and there, but it is quite possible to wander in the grounds and never see it.

Holland House is the London residence of the Earl and Countess of Ilchester, and the secret of the great interest of the gardens lies in the fact that both the Earl and the Countess are enthusiastic plant-lovers. The park contains a delightful arboretum; the selection of trees and shrubs, which betokens taste and knowledge, are massed in groups—Lilacs here, Weigelas there, Philadelphus in one place, *Ceanothus* still in flower, *Thorns* in another, avenues of Birches, avenues of Limes, Ashes, Maples, Birches, Oaks, Alders, in astonishing variety, arranged with knowledge, and disposed with taste; Purple Peach, Golden Privet, and Golden Elm, with other like combinations, lending colour and lighting up the whole. *Catalpa Bungei* is pointed out by Mr. Dixon, who has charge of the garden, as remarkable for its rounded head, like a round-headed *Acacia*, and suggesting its fitness for a street-tree if it could be obtained in sufficient quantities.

In the garden proper, herbaceous plants, bulbous plants, alpine plants, bog plants, all find a place. There is a series of tanks placed at various levels. These tanks are filled with *Latour-Marliac's* Lilies or other water-plants; their rocky sides shelter Saxifrages, Campanulas, Dianthus, and other rock plants. A tiny rivulet connects one tank with the next, the overflow from the one feeding the little streamlet which meanders from tank to tank, now rushing sinuously through a rocky valley jewelled with alpine plants, then merging on what might be an alpine meadow in miniature, an "alp"—then threading a swampy morass, with Bulrush and Japanese Iris, *Butomus*, *Eulalia*, and glaucous *Elymus*, and other noble water-plants, again winding amid clumps of Bamboos, of which *B. Simoni* makes the greatest show, but is not quite hardy, other varieties are smaller, but models of grace, and then the rivulet plunges into the wood where one loses sight of it for a while. And in all its windings the streamlet passes through and amongst plants of such interest that one wonders whether the beauty or the interest makes the greater impression.

Mixed herbaceous borders in which Roses are interspersed, Rose-beds carpeted with *Violas* such as *Grouler* might approve of—while in another case *Wichura's* Rose itself carpets the ground, a collection of hardy Vines, and of *Clematis*, Sweet Peas, and flowers for cutting, all these serve to impress one with the variety of this charming garden, and of the careful overlooking necessitated on the part of the gardener.

Of course in such a garden, and such a pleasure, there can be few days in the year, if any, in

which something of interest may not be observed. It must not be thought that this "wild" yet skilfully regulated style of gardening, monopolises the attention. It is not so. On the architectural terraces associated with arcades, parapets, oriels, battlements, and other architectural features, are glorious patches of colour, framed by the dark green of the rich creepers by which the grey walls are everywhere draped. Even carpet bedding is not entirely neglected, and clipped Box reminds one of Chautilly and other places where a little formality is in harmony with the surroundings. Majestic Cedars add dignity to the terraces, but, alas! it is but too evident that their life is well-nigh run out. A London atmosphere is not so conducive to longevity as the slopes of Lebanon. And yet, as we have already said, there can be nothing less like London than Holland House and its gardens.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Cypripediums planted out.—There are oftentimes places in Orchid-houses where, owing to a variety of circumstances, it is undesirable to place plants in pots, and as a consequence they remain unoccupied. It is in these that the commoner species of *Cypripediums* might be planted. Again, where large quantities of cut bloom are required of the gardener, a portion of a stage might be used solely for planting-out purposes, the plants occupying less space when planted out, and growing and flowering better than in pots. It is essential that the stage should admit of moisture draining freely away, to which end a layer of crocks might first be placed upon the stage. The *Cypripediums* could be planted about four inches apart, in a thin layer of peat and sphagnum moss, mixed in the same proportions as for potted plants; so long as the plants stand erect it is enough, and the compost should not be made very firm, as then the roots soon penetrate the soil, finding their way amongst the loose materials. Being in such a thin and loose layer, water may be abundantly applied soon after planting without an injurious effect being apparent. Plants of *C. barbatum*, when treated in this manner, flower twice a year, and increase so rapidly that they have to be taken up and re-planted at wider distances apart at the end of two years.

Potting other Cypripediums.—It is an established fact that many of the warm-house *Cypripediums* make the most growth at the end of the summer and in early autumn, hence it is good practice to examine the collection of these plants, and re-pot or top-dress such as are not in good condition as regards the rooting medium, selecting however for renewal only those that are not expected to flower for some time to come. Re-potting is a matter of importance to these plants, as they soon suffer from a soured soil; moreover, the roots not clinging to the sides of the pots are not injured by re-potting. I cannot here specify which species should be operated upon at this season, and in regard to idiosyncrasies I can only advise that those whose roots go down well into the drainage should have a deep body of materials, and that shallow-rooting species should have only a thin layer. Bearing these peculiarities in mind, water should be afforded in inverse ratio to the depth of the compost. I have already given particulars of how I grow *C. bellatulum*, and the compost now given is a suitable one for this plant.

Sophronis grandiflora.—*S. g. coccinea* and *S. g. rosea*, now making growth, should have water applied more frequently. These plants, when cultivated in the cool house, have thicker and more highly coloured flowers than when they are afforded high temperatures. Any of them which stand in need of new pans or fresh material may receive attention at this date. Let the pan be broken carefully, not attempting to detach adhering roots from the fragments; but placing these intact in the new pan, affording plenty of drainage, and surfacing the pan with a small quantity of equal parts of peat and sphagnum moss.

Celogyne cristata requires much water at frequent intervals, alternated with diluted farm-yard drainings. In affording the latter, put the spout of the watering-pot amongst the leaves so that no deposit is left upon them.

Rain-water being essential for the successful cultivation of Orchids, its storage and economical use become matters of importance in such weather as that that we are experiencing. If the quantity of rain-water is not equal to the demand, it should be used solely for applying to the plants at the root and syringing, other water being used for damping-down, &c. In the event of rain failing, provision should be made that the water substituted for it should be exposed to the sun for a few days before making use of it; and to further fit it for use, a bagful of fresh soot should be immersed in the vessel, and twirled round in it once or twice when taking water for use.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Summer Pruning of Apple-trees.—The surplus growths of bushes and pyramids may now be shortened back to four or five leaves, in order to let in the sun to colour the fruits and ripen the new shoots. If the trees were disbudded in June, the amount of pruning required now, will be much less than would otherwise have to be done. Partial disbudding, especially of the inner branches of an Apple tree, has much to recommend it, and in gardens where the time can be found for the job, it is much to be preferred to the wholesale reduction of the growths at this season. Barren trees making gross shoots should not have the lateral growths pruned too closely, otherwise, and more particularly if continued wet weather should occur, a free second growth would follow. The laterals on such trees may be cut back to five or six leaves, and at the end of as many weeks root-pruning should be carried out (to be referred to again later on), with a view to inducing fruitfulness. If exhibition fruits are required, water must be afforded the trees, for no rain that we are likely to get at this season will have much effect in increasing the size of the fruits. Let the soil be afforded a good soaking with clear water, and afterwards one of weak liquid-manure, or scatter a small quantity of fish-manure or guano on the surface, and then apply water abundantly. A mulch of half-rotted manure is a great help this year, and it is not too late to apply it. An occasional overhead syringing will do the trees much good.

The Fruit-room.—As the storing of early fruits will shortly begin, the fruit-store should be thoroughly cleansed forthwith, the woodwork being scrubbed with soap and water, and rinsed with clean water afterwards. To make sure of removing all germs of decay, and to render the place wholesome and sweet, limewash the walls, and scrub the floors. When the work is finished, throw open doors and ventilators. An equable temperature is not always possible in fruit-rooms from lack of packing materials between the ceiling and the roof, if this consists of tiles or slates, and this is a matter that should now be remedied. The best kind of roof is one of reeds or of wheaten straw, which has been threshed with a flail. Straw or dry bracken makes good non-conducting materials wherewith to fill the space between the ceiling and a roof of tiles or slates. If the space be not filled, the straw, &c., should be, at the least, 2 feet in thickness, laid evenly, and kept close together by placing boards or poles upon it.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt Tisbury, Gloucester.

Zonal Pelargoniums.—The propagation of these plants should not be commenced later than the middle of the present month; and as at this season the plants have covered the ground, one or two cuttings may be taken from each without disfiguring them. A little care is wanted in taking cuttings, as the risk of damping off is considerably lessened if they are not bruised in any way, all are well matured, and not less than 6 inches in length. In preparing them make a clean cut with a sharp knife through the lowest joint, cutting all leaves close to the stem as far as the third joint, and removing the little stipules at the base of the leaf stalks. The cuttings are then ready for dibbling into the cutting-boxes, the compost for filling which was alluded to in last week's Calendar. The holes made with the dibber should be of a little larger diameter than the cutting, so as to prevent bruising when inserting the latter. Do not place the cuttings thickly together, fifty per box

being as many as boxes of the size described last should properly hold. In a crowded box the cuttings take a longer time to strike, and they are apt to damp off during the winter. As soon as the cuttings are placed in the boxes, sprinkle them with a fine rose watering-pot, and remove to a position fully exposed to the sun, where they may remain till the end of September. The boxes are best placed on ashes, bricks, or wooden rails, so that worms cannot enter them. Remove dead leaves from the cuttings, and apply very little water, thus inducing a hardy, sturdy growth.

Variegated and Bronze-leaved Pelargoniums.—Although these are rather more delicate in constitution than the zonals, they may be propagated successfully in the same manner. The tricolor section should be struck in 6-inch pots, which should be well-drained by placing small crocks 2 inches deep at the bottom, covering these with moss, or the rougher siftings of the soil. A compost of rich leam and leaf mould, together with some coarse sand, should be well mixed and passed through a sieve having a $\frac{1}{2}$ -inch mesh, and with this the cutting pots should be filled, six or eight cuttings being placed in each. Sprinkle the cuttings with a fine rose watering-pot, and remove to a cold frame fully exposed to the sun. In this position they may remain till the middle of the month of October; and however strong the sun may shine, it will not be necessary to shade them, but they should be protected from heavy rains by tilting the lights at the top and bottom. The cuttings often damp off if they have too much or too little water, an even degree of moisture in the soil necessary to success in striking them.

Heliotropes, Iresines, Ageratums, Alternantheras, Petunias, and other tender plants may be propagated in store pots, and kept intact for affording cuttings in the spring. They require bottom heat, and where there is not a special propagating house or pit they may be struck under hand-lights in a Cucumber or Melon-house. A compost of finely-sifted loam, leaf-mould, and sufficient silver-sand to make it porous, should be pressed firmly into 5 or 6-inch pots, placing in these from six to eight cuttings, which in the case of the free-flowering varieties should be taken from the base of the stem; while in the case of ornamental foliage plants, these are taken from the points of the shoots. If shoots are plentiful, choose those with the shortest joints; and in dibbling them into the pots, arrange them so that they are a uniform height. The pots should be plunged up to the rims in either Cocoanut-fibre refuse or fine coal ashes. After sprinkling them slightly with water, place the lights over them, and shade from bright sunshine.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

Strawberries.—Many growers prefer to layer the runners into 60's, and repot when well rooted, using as the fruiting-pots small or large 32's, the small for the earliest fruiters. The repotting of the runners will, in many gardens, be finished ere this; those who have not potted the plants should do so forthwith, because when the roots of Strawberry-plants become cramped in a 60-pot, there is a danger of not obtaining a strong and early matured crown before the winter. If turfy loam of good quality is obtainable, scarcely anything else is needed; but when the loam made use of is rather deficient in nutriment, charred garden-refuse and decayed manure may be added, also bone-meal in the proportion of a 6-inch potful to one wheelbarrowful of loam. A few crushed bones spread over the drainage will provide food for the roots that reach part of the pot. Clinkers from the stovehole, if broken into small pieces, are as good as crocks for affording drainage. The stacks of loam are now so dry that it would be advisable to prepare the necessary quantity of soil a day or two beforehand, moistening it so as to make it bind together when used, but not making it so wet that it forms a pasty mass. The plants of Royal Sovereign, Auguste Nicaise, Leader, and James Veitch, should be put into 7-inch pots; 6-inch may be adopted for any variety, but finer berries come from plants in larger ones. The soil should be made fairly firm in the pots with the ramming-stick, in order to prevent the roots passing too quickly into the drainage, and to ensure sturdiness of growth. When potted, stand the pots in a fully open area, crowding of the pots being avoided as far

as possible. The drainage is kept more perfect when the plants are stood on thin boards, coal-ashes, or lattice-work. If stood on coal-ashes, these should form a layer thick enough to exclude worms; and the plants must be turned round every fortnight, so as to hinder rooting into the ashes. Clean water only should be afforded the plants, and an overhead sprinkling at the close of hot days is of benefit to the plants, besides keeping red-spider in check.

Tomatos.—The plants raised from seeds sown about a month ago being ready for potting off, this should be done singly, that is in the case of their being sown in ordinary seed-pans or boxes; but when the seed is placed to the number of two or three in small pots, it only remains to remove the weaker ones, and keep them rather close for a few days. When re-establishment is assured, a shelf close to the glass in a cool-pit will be the better place for them for a time. Tomato plants when placed at the sides of a flower-pot, appear to emit roots more quickly than when surrounded with soil. Firmness of the soil is not needed in the earlier stages, besides there is danger of the stems being bruised if the soil be pressed very tightly into the pots. If the plants are drawn owing to being crowded in the seed-pans, bury the stems up to the seed-leaves in the course of potting. Where a constant supply of Tomato fruits is required in the winter, more seed may now be sown, and the plants brought on under cool conditions, this being preferable to sowing later in heat; cool-grown and sturdy plants coming into fruit quicker than those unduly hastened. Cuttings may be rooted for winter fruiting if such a course is considered necessary, but seedlings are usually the more fruitful. The plants now in bearing, which are intended to supply fruit in the winter, should receive periodical surface-dressings of soil.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Celery.—Great attention must be paid to early and late planted Celery, copiously applying water to the plants three times a week, weak liquid-manure being used alternately with pure water. The surface will in most cases have got impervious to the air, and should be stirred with a short hand-hoe, not damaging the roots by going deeply, and some of the soil from the sides of the trenches may be broken down with much advantage to the plants. The earliest crop of plants may receive the first earthing up, but it should be a slight one. Before beginning, twist off a few of the lower leaves and suckers, then soak the soil, and wait a few hours before beginning to earth up. This kind of work should be done at intervals, never putting too much soil to the plants at one time, nor in stiff land pressing the earth too severely, otherwise the heads will become deformed. If any leaves are infested with the mining-maggot, remove them, and dust the leaves frequently with soot as a preventative against the fly settling on them.

Turnips.—The last sowings have made but little progress, notwithstanding the repeated applications of water and the frequent dusting of soot and lime they may have had, it will be of little use sowing again before we get rain, and then three or four varieties may be sown at one or two sowings. Extra early Milan, Snowball, and Yellow Globe, or Chirk Castle being suitable.

Herbs for winter should now be gathered up for drying, tying them in small bunches, and hanging them in an airy shed.

The Drought.—The protracted drought is telling on all vegetables, especially on light or shallow-cultivated land, and water should be afforded in quantity where it is plentiful. If the gardener has trenched and heavily manured his land, putting the manure down to a good depth, say two spits, the plants will suffer but little even if water has to be sparingly applied. This, in fact, is the only method by which good vegetables can be obtained in the summer months, and I would advise every gardener to carry out a good lot of trenching every year, commencing in October or November, or as fast as land is cleared of the summer crops. Until the rain comes, water must be afforded vegetables on fleet soils, especially to Peas, French Beans, Cauliflowers, Lettuces, &c.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

TUESDAY,	AUG. 22	Brighton and Sussex Horticultural Society.
WEDNESDAY,	AUG. 23	Shropshire Horticultural Fête, at Shrewsbury. Hampden Horticultural Society. Hastings Horticultural Society.
THURSDAY,	AUG. 24	Ellesmere Horticultural Society. Boston Horticultural Society.
FRIDAY,	AUG. 25	Royal Horticultural Society of Ireland, at Dublin.

MEETINGS.

SATURDAY,	AUG. 26	Dutch Gardeners' Society, at Richmond.
-----------	---------	--

SALES.

MONDAY,	AUG. 21	Great Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
WEDNESDAY,	AUG. 23	Important Sale of Lillium Harrisii, Roman Hyacinths, Palm Seeds, &c., at Protheroe & Morris' Rooms.
THURSDAY,	AUG. 24	Great Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	AUG. 25	Imported and Established Orchids, at Protheroe & Morris' Rooms.

METEOROLOGICAL OBSERVATIONS taken in the Royal Horticultural Society's Gardens at Chiswick, London, for the period August 6 to August 12, 1899. Height above sea-level 24 feet.

Remarks.—The weather during the week has been bright and very hot, with high winds, mostly from the east. A small quantity of rain fell on the morning of the 6th inst.

AVERAGE TEMPERATURE for the ensuing week, deduced from Observations of Forty-three Years, at Chiswick.—61.3°.

ACTUAL TEMPERATURES:—

LONDON.—August 16: Max. 79°; Min. 60°.

PROVINCES.—August 16 (6 P.M.): Max. 75°, Channel Islands; Min. 53°, Sumburgh Head.
Fine, warm; no rain.

The Co-operative Festival.

WE are inundated with "copy," printed and manuscript, relating to this great institution, and did we publish it all, we should have no space left for anything else for weeks to come. We feel ourselves precluded from entering upon the political and commercial aspects of the case, but in spite of the pressure on our space, we may appropriately allude to some of the principal features of this great organisation. The flower-show, which will be held mainly on Saturday, will be alluded to in our next issue. For the present we confine ourselves to the exhibition of photographs. An inspection of these deepens our sense of their importance as object-lessons.

The exhibits this year are said to exceed a thousand in number, all more rather than less perfect. Such perfect reproductions of natural and artificial beauty must exert a most beneficial influence. Take for example the one class of thirty-three. For a set of four photographs entitled Spring, Summer, Autumn and Winter, in which, singularly enough, there were thirty-three entries expressing a degree of expression, and a variety of beauty, which must be seen to be appreciated. We venture to think this the most useful, as it is the most useful class of all the collections of garden views, of sylvan scenes of Lime Trees, and agricultural subjects. Collections of named flowers, &c., numbered a baker's dozen.

There were also eight excellent collections of fruit and vegetable subjects; nine curious collections of British birds and insects; eight for a pair of photos of an old and young gardener, &c. In the photos for horticultural merit there were thirty-three exhibits for florally-adorned railway stations, lessons of beauty and pleasure to all that travel; fifteen of workmen's town gardens, ten of cottagers' country gardens, fifteen large country gardens, fifteen window-gardens, twenty floral porches or archways, thirteen backyards rendered beautiful, and fifteen examples of rockery, arbours, or summer-houses. There are others for interiors of greenhouses or conservatories, Fern-cases, hanging-baskets, table decorations, watergardens, water-fountains, &c.; fountains, streams, &c. Neither must the number of entries be mixed or confounded with the number of exhibits, a dozen or more photographs being often included in one exhibit; and the views come from all quarters, as well as in the most profuse variety. For example, M. CRICKORN, of Arbroath, sends nine garden Ericas, Mrs. MARY MACLAUCHLAN of Blairgowrie sends six collections of flowers. Mr. J. MUNROE of Dingwall sends studies of six suites of birds, &c., of Ross-shire, as curious as interesting; three collections of garden-views of winter in the North, and a flower-study. Mr. GIBBON of Dunnaton sends four photos of parts of his uniquely large and beautiful golden Lily of Japan, *L. auratum*, with 500 blooms in bud or blossom this year. Last year the numbers were 438 blooms; in 1897 there were 291 blooms. The photos of this wonderful Lily are by Mr. STEEL of 227, Stirling Road, Glasgow. The loan collections of photographs are also rich and varied.

Another feature of the present exhibition consisted in the delivery of lectures on horticultural subjects by Mr. GORDON, of the *Gardeners' Magazine*; Mr. SANDERS, of *Amateur Gardening*; and Mr. D. T. FISH. Reasons of space alone forbid our publication of these excellent addresses, but in future numbers we may be able to lay before our readers some portions of these voluminous documents.

THE LOQUAT (*ERIOBOTRYA JAPONICA*) is amply worth growing in the southern counties against a wall, as may be seen at Kew (see Supplementary Illustration). Its handsome foliage renders it very attractive. The leaves are oblanceolate, toothed, leathery, deep green above, covered with fawn-coloured felted down beneath. The white, hawthorn-like flowers, which are rarely produced except under glass, are in terminal panicles, and have a hawthorn-like perfume. The fruits shown in our illustration are of a pale orange colour, with an agreeable sub-acid flavour. It is not commonly ripened in this country, but might be produced in a warm orchard-house. It is largely grown in

Japan and Southern China for its fruits, which are also sometimes met with in Covent Garden Market, under the name of Loquat.

THE ENGLISH ARBORICULTURAL SOCIETY.—The annual meetings of the English Arboricultural Society were held in London this week. The Society, the objects of which are the advancement of scientific and practical arboriculture in all its branches, and the dissemination of a knowledge of such branches of natural history as are connected with it, was formed at Hexham, near Newcastle, some eighteen years ago. This is the first occasion on which the annual meeting has been held in London. About 100 members, mainly from Northumberland and Durham, arrived in the city on Monday evening, 14th inst. Tuesday was devoted to an excursion, which embraced a visit to Osterley Park, the seat of Lord Jersey; Syon House, the Duke of Northumberland's residence; Kew Gardens, and Richmond Park. The business meeting was held at the Manchester Hotel, Aldersgate Street, last evening, when Mr. GRAHAM (Durham), president of the Society, occupied the chair. The report of the secretary (Mr. J. DAVIDSON) showed that the membership of the society was 439, as compared with 417 last year.

GLOXINIAS WITH DOUBLE COROLLA.—A correspondent sends us a photograph of a Gloxinia, in which the corolla bears on its outer surface petal-like outgrowths. These are not very uncommon, and to such a degree does the change occur sometimes, that two perfect corollas, one within the other, result. Figures are given in *Masters' Vegetable Teratology*. At one time it seemed as if the race were fixed, but of late years we have only seen incomplete forms, such as are represented in the photograph before us.

THE WEATHER in London on Tuesday, Aug. 15, was overpoweringly hot, 90° in the shade, and most oppressive. There was every appearance of a thunderstorm about 5 p.m., but the only storm was one of wind and dust. In Buckinghamshire and some of the Midland counties the storm was terrific. At Amersham the tents at the Horticultural Show were overthrown.

THE "JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The first part of a new volume (the twenty-third), is before us. It is principally remarkable for the change in size, which is now a large 8vo. The appearance is certainly more imposing, and it will allow of the insertion of larger illustrations, but we do not think librarians will accord their benediction to the innovation. The present part, among many interesting papers, contains Mr. SPENCER PICKERING'S account of the Woburn experiments, Mr. NORMAN'S paper on the culture of Asparagus, Mr. HOOPER'S narrative of a year in the orchards of Nova Scotia, together with an abstract of the proceedings of the Society.

THE MISSOURI BOTANICAL GARDEN.—The tenth annual report, to March 30, 1899, of the Missouri Botanical Garden, is now before us, and is a highly satisfactory record. The papers included in the publication are:—"Grasses in the Bernhardt Herbarium," by F. LAMSON-Scribner; "Sclerotoid Disease of Beech-roots," by HERMANN VON SCHRENK; "Biographical Sketch of EDWARD LEWIS STURTEVANT (with portrait)," by C. S. PLUMB; a list of publications issued and received, and a full index. The volume is illustrated with handsome and accurate plates.

THE "KEW BULLETIN."—Nos. 145 to 148 of the *Bulletin of Miscellaneous Information from the Royal Gardens, Kew*, have been recently issued. The contents deal with:—Cacao Disease in Trinidad, Nectria Baini (with plate), Coccid Pests on Sugar-cane, and Moss Flora of the Royal Gardens, Kew, by Mr. E. S. SALMON; a descriptive notice and an illustration of *Agaricus melleus*, by Mr. MASSEE, is given. A short note is given on the artificial production of India-rubber by Professor TILDEN, which, though at present of scientific interest only,

may ultimately prove of commercial application. Other articles are not only intrinsically important, such as that showing that the percentage of sugar in the cane varies, and may be selected independently of reproduction from seed, but also noteworthy as showing the multiple interests served by the great establishment at Kew.

THE "JOURNAL OF THE KEW GUILD."—We are delighted to receive the number of the Journal, dated May, 1899, because we think it calculated to form an admirable bond between past and present workers in the garden. The remembrance of old friendships is renewed by it, new ones are formed, and the garden itself, of which Kewites with justice are so proud, cannot fail to benefit by this association and this journal. The present number opens with an excellent portrait of Mr. HEMSLEY, now the keeper of the herbarium, but who has worked his way up without adventitious aid, and in spite of drawbacks, from the position of "young gardener" to the keepership of the most important herbarium in the world, and to the fellowship of the Royal Society. The portion of the report most interesting to the home reader, already more or less familiar with what is going on at the present time in the garden, is that devoted to the doings and sayings of old Kewites in various parts of the world. Some of these were obviously not intended for publication, and should have been "dressed" by the editor. A fine illustration shows the whole length of the temperate-house as now completed, having a length of 628 feet, and a width of 164 feet, thus constituting the largest plant structure in the world. The entire number is most interesting, and may be read with pleasure, not only by old Kewites, but by outsiders.

ROYAL BOTANIC SOCIETY.—The annual report of the Society states that the establishment of a club, like the Welcome Club, within the gardens has proved a source of increased strength to the garden. It may be so, but for how long? We know by bitter experience the probable result of such undertakings. A proposition was made that the teaching of botany should be undertaken; but this was met by a statement, very extraordinary as coming from a Royal Botanic Society, that it was impossible to teach botany in London, as many of the commoner plants would not grow in London. We should have thought that the commoner plant, that is, the better adapted to varied conditions, more likely would it be to succeed in London. Besides, we take it there are, and always have been, more botanical students than anywhere else in the kingdom; and the report before us shows that 50,000 specimens were distributed in the past year among students from the garden itself, which surely has many facilities for teaching purposes. There is no objection *per se* to clubs and fêtes and amusements of any kind, even to the dressing of donkeys at proper places; but these are surely not the proper work of a "Botanic" Society with a Royal charter, nor do we think that the property of the Crown should be devoted to such ends.

A HORTICULTURAL UNIVERSITY.—M. VAN HULLE, in alluding to this matter, which formed a subject for discussion at the late meeting in Ghent, says very decidedly a horticultural university is not to be desired. For one learned theorist that is turned out, there should be hundreds of skilled practitioners. From M. VAN HULLE'S point of view, it would indeed be undesirable to turn out a race of half-educated men. The more highly educated the pupil, the poorer horticulturist he is commercially speaking. This is M. VAN HULLE'S opinion, and it is one with which most practical men will sympathise. We may nevertheless point out that there are other points of view. The man that, having been educated, and specially the one that has been trained, but who cannot apply his knowledge when the time comes, has either been badly taught, or he is mentally defective. The skilful practitioner that M. VAN HULLE wants to see, and that in a sense we all want to meet, is

only useful as a practitioner. He is simply a hewer of wood and a drawer of water. No progressive improvement in the art of horticulture can be expected from him, not even the reception of new ideas, nor the adoption of new methods. It is no part of the functions of a university to turn out "practitioners;" but it is the duty of a university to equip its students, that they may become when opportunity offers not only practitioners, but pioneers.

EXPORT OF JERSEY POTATOS FOR SEASON 1899.—The following table of exports from Jersey during 1899 will impress our readers with the great importance of the tuber to the inhabitants of that island. Statistics of the total weight, value, &c.:

Weekly Shipments.	No. of Packages.	Tons.	Average Weekly Price per ton.	Weekly Totals.	Year.	Comparative Statement.
May 1 to May 6	609	15	£ 8. 4.	£ 8. 4.	1883	36,408

EXAMINATIONS FOR YOUNG GARDENERS.—Very frequently we hear these decried as of no use to practical men, or at least we hear the demand for a practical test as well as for a written one. Does it ever occur to these objectors that the use of education, and of examinations, is to develop a youth's mental powers so that he may not only gather knowledge, but know hereafter how to apply it? Purely practical work demands practice, and necessitates experience. How can you expect a tyro such as those who come up for examination, to be experienced? You must wait for that, and in the meantime do the best you can to ensure that the experience when it comes, shall be turned to account. There are some people who always want to move round in the same track, in the same way, and at the same pace. These men can be no better than their predecessors—not so good, indeed, for they are not able to avail themselves of their improved opportunities.

SALE OF POISONOUS WEED-KILLER.—Recently, before the Worcester County Court, the Council of the Pharmaceutical Society were the plaintiffs, and JOSEPH H. WHITE was the defendant, in an action in which the Society claimed a penalty under the Pharmacy Act against the defendant

for having "sold or kept open for the retailing, dispensing, or compounding of poisons," arsenic contained in and forming part of a compound known as "Climax Weed-killer. During the hearing of the case it was shown that the weed-killer was not directly sold by the defendant, but ordered by him from a company in Liverpool, by whom it was sent direct to the customer. The judge (Sir R. HARRINGTON) pointed out that the defendant was only an agent for persons at a distance, and did not himself stock or deliver the goods in question, nor hand any part of it over the counter to a customer; therefore, he (Mr. WHITE) had not subjected himself to any penalty. It was the Chemical Company who had broken the law, if anyone had done so. Leave to appeal was asked, but his Honour said he would consider that matter.

RENNES.—A good many people feel considerable interest in the proceedings now taking place in this city. We are not less human than our fellows, still, it is not for us to comment on the "affaire;" but we may remind our readers that the experiments on grafting, of which we have frequently spoken in our columns, were made in this city by M. DANIEL, a professor in the Lycée. The record of M. DANIEL'S experiments and inductions have been published, with numerous illustrations, by Messrs. MASSON, of Paris. Probably we shall again allude to the subject.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The annual garden fête, by kind permission of A. MORDAN, Esq., on behalf of the above, was held recently in the gardens of Stone House, Reigate, and we are glad to hear that the handsome sum of £31 10s. was realised, which has been forwarded to the Institution by Mr. GEO. STEER, to whose exertions the success of the fête was mainly due. A sum of £5 5s. has also been received from the Sandringham Flower Show Committee, through Mr. A. McKELLAR.

"BOTANICAL MAGAZINE":—

Aloe Schweinfurthi, Baker, t. 7667.—A magnificent species with tufts of fleshy, lanceolate, acuminate leaves, remotely toothed at the margin, and tall, much-branched, many-flowered panicles of orange and yellow flowers. The species was found in the Nyam-Nyam district of north-east tropical Africa, on the confines of the Bahr el Ghazal (see *Gardeners' Chronicle*, 1898, i., p. 197, fig. 76). It flowered in the gardens of Commander HANBURY, at La Mortola, in the Genoese Riviera.

Heliophila scandens, Harvey, t. 7668.—Almost, if not quite, the only twining Crucifer known. The leaves are simple, lanceolate, and the whole plant has much the appearance of *Solanum jasminoides*. It is a native of Natal, but flowers in the succulent-house at Kew.

Aster Piccoli, Hooker f., t. 7670.—A new species of *Aster*, native of Northern China, with cauline leaves, sessile, oblong, coarsely toothed, and lilac flower-heads with a yellow disc. Native of Shen Si, in Eastern China, where it was discovered by Father PICCOLI, and flowered at Kew.

Ephedra altissima, Desfontaines, t. 7671.—See *Gardeners' Chronicle*, 1890, vol. i. p. 791, f. 129.

Mussaenda capsulifera, Balfour, t. 7962.—A stove shrub, with leaves sessile, lanceolate entire; flowers white, in terminal heads; corolla-tube long, slender (1 to 1½ in.), expanding into a circular flat, 5-lobed limb; the lobes obovate, narrowed at the base, notched at the rounded apex. Discovered in Socotra, by Prof. J. B. BALFOUR.

"CONGO" STICKS.—According to a recent number of the *Kew Bulletin*, the sticks so called are only saplings from the sweet Chestnut, *Castanea sativa*, the bark of which is lacerated to produce the markings, for which the sticks are valued. The sticks come mostly from Croatia.

STRAWBERRIES.—A correspondent of the *Journal of Greengrocery* gives his experience as to the productiveness of Strawberries grown in the open after having been forced. He planted out a

bed of Royal Sovereign immediately they came out of the forcing-house in April, and they bore in due season a good crop of fine fruit.

ANOTHER HORTICULTURIST HONOURED.—We are informed that Mr. H. E. MILNER, the eminent landscape-gardener, has been created by H.M. the King of Sweden and Norway, a Knight of the Order of the Northern Star. Mr. MILNER has carried out important work for the King at the Djur-gaard at Stockholm, and it is very satisfactory to his countrymen to find him honoured in this way. Mr. MILNER is also engaged in carrying out several works in Denmark.

RECORD FRUIT SALE.—At Paddock Wood, on Wednesday, August 9, Mr. W. R. TOMPSETT held his thirtieth annual sale. There was an enormous attendance of buyers from all parts, and the competition was almost unlimited. Some of the orchards realised from £50 to £60 per acre, while several large growths made £50. Mr. ISAAC READER'S celebrated Old Hay growth again created great attraction, finally realising £2500. Almost every lot found a purchaser, making a grand total of £7000.

THE TRIANON.—The *Daily News* French correspondent says:—"I was sorry to hear that a short time since a magnificent Lombardy Poplar, planted 110 years ago by JUSSIEU, was blasted. It was the only survivor of the Poplars that he planted at the Trianon, in November, 1789. He and MARIE ANTOINETTE marked the spots destined for them on the very day that the market-women of Paris marched on Versailles to take the Royal Family to Paris as hostages. The heat was 104° F. just before the storm broke. In a few minutes the thermometer fell 15°."

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION IN BRISTOL.—Thanks to the kindness of Mr. FRANCIS TAGART in allowing his gardens at Old Sneed Park to be opened to the public on Wednesday afternoon and evening, August 10, the funds of the Gardeners' Royal Benevolent Institution will benefit appreciably. A small charge, in aid of the Institution, was made for the admittance of visitors to the grounds, which, in an unostentatious way, is doing a valuable work. During the sixty-one years the parent Institution has been in existence, it has distributed no less than £80,000 in the relief of distressed gardeners and the widows of gardeners. The Bristol Auxiliary was formed six years ago, and Mr. J. H. LOCKLEY is the president, Mr. GEORGE HARRIS (of the Zoological Gardens) being the secretary. Gatherings such as that of Wednesday not only have a value peculiarly gratifying to the Treasurer of the Society, but they afford the opportunity of viewing under pleasing conditions some of the most charming gardens in and around Bristol. This was the third time Mr. TAGART had thrown open his grounds, and, with brilliant weather prevailing, there was a large attendance. [The following letter is addressed to the craft and general public of Bristol and Bath and the neighbourhood, by Mr. W. A. GARAWAY, of the Durdham Down Nurseries, Clifton, and chairman of the Bristol Auxiliary of the Gardeners' Royal Benevolent Institution:—

"GARDENERS' ROYAL BENEVOLENT INSTITUTION, BRISTOL AND BATH AUXILIARY.

I am desirous of calling your attention to the claims of the Gardeners' Royal Benevolent Institution. If you subscribe 21s. per year (6d. per week), for fifteen years to the Charity, you will at sixty years of age, if incapable through illness or accident, of earning your living, be eligible for a pension of £20 per annum, and if the funds of the Society permit, will be granted that amount without any election. You may say, "I cannot afford 21s. a year." Very well then; become a member of the Bristol Auxiliary, a subscription of only 2s. 6d. per annum. This Auxiliary has been in existence six years, it is the first that was founded, and during that time it has enabled over forty gardeners to become life-members of the parent society, and a life-member of fifteen years' standing is in the same position as an annual subscriber of 21s. for fifteen years. Our way of working is this: about October or November, when we think we can correctly estimate our income, we let all the subscribers know that we are ready to elect a certain number, those who wish to be candidates send in their names voting papers are sent

to all subscribers; those who receive the greatest number of votes are informed that if in two months' time they can find £5 5s., our Auxiliary will find the other £5 5s., and so make them life members of the Gardeners' Royal Benevolent Society. The subscription is not burdensome; if you do not think you are likely to want the Society's help, you will, if you subscribe, have the satisfaction of knowing that you have helped those who have needed it. I believe that if every gardener in England subscribed 21s. a year, all the candidates for the pension could be elected (this year there are thirty applicants waiting). It is too much to expect that all should subscribe this amount, but I do think that every gardener in this neighbourhood should pay his 2s. 6d. per year to the Auxiliary. Read Mr. OWEN THOMAS'S letter to the *Gardeners' Chronicle*, which I enclose; and not only join the Society yourself, but try to get any of your friends who are not members to join too, and bring the Society's claims under the notice of your employer."

A GIGANTIC CARPET-BED.—A huge carpet-bed is the chief decorative feature of the lawn at Old Sneed Park, Bristol. The bed, 37 yards in circumference, contains about 20,000 plants, thirteen distinct species and varieties being used in outlining and shading an elaborate device, which includes the Tagart coat-of-arms; while over the centre of the bed towers a mass of flowering plants grouped within a huge vase.

LANDING OF DOGS FROM IRELAND.—The Board of Agriculture, 4, Whitehall Place, S.W., has lately issued a memorandum as to the conditions prescribed for landing dogs from Ireland in Great Britain to prevent the introduction of rabies. As these conditions "require the detention of the dog for a period of six months on some suitable private premises to be specified by the owner and approved by the Board," and further necessitate a certificate from a veterinary surgeon that the dog is not affected with or suspected of rabies, it is a livable that all persons purposing to travel with, or to send a dog from Ireland to Great Britain, should announce their intention to the Board early, that they may receive a copy of the regulations, and have time to comply with their requirements.

PARIS EXHIBITION.—The regulations and programme of the permanent and of the periodical horticultural shows to be held in connection with the Paris Exhibition in 1900 are now ready, and can be obtained on application at the offices of the Royal Commission, Paris Exhibition, 1900, St. Stephen's House, Westminster, S.W. The Secretary, Mr. HERBERT JEKYLL, announces a meeting to be held at the Crystal Palace on September 28, at 3 o'clock, with a view to further the success of the horticultural section, and to make its objects generally known.

M. MICHEL.—H. M. the King of the Belgians has conferred the honour of Chevalier of the Order of Leopold upon M. MARC MICHEL, a gentleman who is at once a learned botanist and a skilled cultivator. His garden at the Château du Crest, near Geneva, is known to many, and its treasures have been enumerated in an excellent catalogue arranged with scientific precision.

THE STAR ANISE.—Mr. FORD points out that Sir JOSEPH HOOKER'S correction has not generally been attended to. The plant yielding the Star Anise of commerce is *Illicium verum*, Hooker f., not *I. religiosum*, Siebold. See *Bot. Mag.*, tab. 7500.

RHODOLEIA CHAMPIONI.—Until last year, says Mr. FORD in his Report for 1898 of the Hong-Kong Botanical Department, this tree was only known to grow on one of the hills in Hong-Kong. But among Dr. HENRY'S specimens gathered near Mengtse, in Yunnan, are specimens of this beautiful tree, which is not so rare as it was supposed to be.

AN OLD SERVANT.—Mr. J. C. GOULD, director of CHARLES SHARPE & Co. (Limited), Sleaford, completed on the 8th inst. his fifty years of continuous association with the firm, having been apprenticed on August 8, 1849, to the founder of the business, the late Mr. CHARLES SHARPE'S father, who commenced business in a small way in Sleaford in the early part of the century, and was succeeded in 1852 by his son the late Mr. CHARLES SHARPE,

whose business qualities, energy, and force of character raised the firm from the position of a small country house to that of one of the leading seed firms in the world. Mr. GOULD, who will be sixty-five in November, and who has just been through Canada and the United States on behalf of the firm, promises to have yet many more years of usefulness.

PUBLICATIONS RECEIVED.—*Catalogue of the African Plants collected by Dr. F. Welwitsch from 1853–61*, vol. ii., part 1; Monocotyledons, and Gymnosperms, by Alfred Barton Rendle (London: Printed by order of the Trustees, British Museum, Cromwell Road).—*Anne Pratt's Flowering Plants*, vol. vii., Nos. 8 and 9. Edited and revised by Edward Step. (Warne & Co., Bedford Street, Strand).—*Bulletin of the Botanical Department, Jamaica*, July, includes communications respecting Rice in Jamaica, Sugar-cane industry, and supply of Clachona-bark.—*Proceedings of the Academy of Natural Sciences of Philadelphia*, 1899, part 1, January to March. This includes a paper by Thomas Meehan on the Life-history of Plants, and dealing with Sex in Flowers; *Corylus rostrata*; *Clethra alnifolia*, in relation to its Morphology; *Sanicula*, a biological study; *Rosa rugosa* in connection with the evolution of form; *Viola*, in relation to pollinisation and fecundation; Stipular glands of *Isardia palustris*; Parthenogenesis; *Lactuca scariola*, variation and vertical position of its leaves; Stigma of *Asclepias*; Influence of Fungi on the forms and characters of plants, &c.—*Transactions of the Massachusetts Horticultural Society for 1898*, part 2. This contains the reports of various meetings, and of the committees on plants, flowers, fruit, vegetables, and gardens.—*Phanerogame et pteridophyte Japonica iconibus illustratae* (Tokyo), June 8, and *Cryptogame Japonica iconibus illustratae* (Tokyo), June 10.—*Toogood's Vegetables out of Season in every Garden*, and *Toogood's Beautiful Beds for every Month*. These are two useful pamphlets, price 6d. and 2d. respectively, containing many valuable hints.—*Fruits suitable for the Low Country, and for Moderate Elevations*, by H. F. Macmillan, Curator, Royal Botanic Gardens, Peradeniya, Ceylon, June, 1899.—*Department of Agriculture, Sydney, New South Wales, Miscellaneous Publication, No. 301, Weeds of New South Wales* (systematically arranged), by J. H. Maiden; and *Miscellaneous Publication, No. 302, A variety of Panicum decompositum*, by J. H. Maiden.—*Fifth Annual Report of the Fruit Experiment Stations of Ontario, 1898* (Toronto).—*Thirtieth Annual Report of the Fruit-growers' Association of Ontario, 1898* (Toronto).—*Kew Bulletin*, May and June.

PLANT PORTRAITS.

BIDENS CONNATA, *Mechan's Monthly*, t. 7, July, 1899.
DIMORPHOTHECA ECKLONI, *Revue de l'Horticulture Belge*, August.

KEMPFERIA ROTUNDA, *Revue de l'Horticulture Belge*, August.
PHYLLOCACTUS TRIOMPHE DES AUTHIEUX.—A splendid variety of *C. speciosissimus*, raised by the late M. Schlumberger at Des Authieux, near Rouen. Flowers red and crimson. *Revue Horticole*, August 1.
TULIPA SAXATILIS, *Garden*, August 5.

HYBRIDS AND THEIR RAISERS.

(Continued from p. 128.)

LYCHNIS WALKERI.—In the interesting series of articles appearing in the *Gardeners' Chronicle*, the Rev. C. Wolley-Dod referred to this hybrid *Lychnis*, known to many as *Agrostemma Walkeri* ×. Although I have saved seed from it I have not flowered any seedlings, so that, like your contributor, I am unable to tell whether or not its seedlings come true, or revert to one or other of the parents—*L. coronaria* and *L. Flos-Jovis*. As a garden plant the hybrid is a very useful one, flowering as it does for a considerable time, and giving a number of its bright pink flowers. These are in general appearance very like *L. coronaria*, but the leaves are more woolly than that species, and more closely resemble those of *L. Flos-Jovis*. Mr. Wolley-Dod kindly sent me this plant several years ago, and recommended me to propagate it by cuttings, which I have done. These are usually easily obtained at the base of the plant. With me *L. Walkeri* is not quite so tall as *L. coronaria*. (See *Gardeners' Chronicle*, July 16, 1887, pp. 79 and 101.)

MR. J. C. LEY'S HYBRID POPPY.

One often observes offered so-called hybrid Poppies, but these are generally either seedlings of *Papaver orientale*, or crosses with the variety *P. o. bracteatum* and thus not true hybrids, but cross-bred

FIG. 55.—THE TAMARISK AVENUE, ABBOTSBURY. (SEE P. 142.)

FIG. 56.—NEW ROCKERY, ABBOTSBURY, FIRST YEAR AFTER COMPLETION. (SEE P. 142.)

plants. This remark is not made with the intention of belittling these Poppies, many of which are not only beautiful, but are of great interest as showing the variations which may be raised by simple seedling-raising or cross-breeding. The Poppy raised by Mr. J. Carrington Ley, and which, so far as the writer is aware, has no other name than that which heads this note, is apparently a true hybrid. It was referred to by Mr. Wolley-Dod, who spoke favourably of it. Here it has that characteristic which was, erroneously, at one time said to be a mark of hybrid origin, i.e., it does not produce seeds; while the so-called hybrids do so with freedom. I have frequently examined the capsules, but have never seen fertile seeds. As Rev. C. Wolley-Dod has indicated, this Papaver is better when it has grown into good-sized plants. The first year it flowered here, one felt disappointment with regard to it, but now that the plant has grown to a good size, one appreciates it highly. The colouring is much like that of a light-coloured *P. orientale*, but its other parent, *P. rupifragum*, seems to have taken away the blotch at the base, which is nearly always apparent in the varieties of *P. orientale*. The habit is dwarf, and is, upon the whole, good.

MIMULUS BURNETII.

This is a hybrid which I have not grown, but which I recently saw in the garden of Mr. Robert Lindsay, at Kaimes Lodge, Edinburgh. It was raised, I believe, by Dr. Burnet, of Aberdeen, and has for its parents the Chilean *Mimulus cupreus* and the North American *M. luteus*, which in some districts by escapes from gardens, has become quite naturalised. To the former, it seems to owe its dwarf habit and some of its colouring; while to the latter is due its greater hardiness. It apparently grows a little taller than *M. cupreus*, and the colour is a rather nice orange-yellow. In Mr. Lindsay's garden, *M. Burnetii* looks a capital grower, and as if it would prove a plant of great value in the many gardens where the Chilean *Mimulus* is not hardy enough to stand the winter in the open.

VERONICA LINDSAYI.

There are already several garden hybrids of the shrubby Veronics, but this, which was raised by Mr. Robert Lindsay, is of considerable interest by reason of a number of seedlings from it having retained the pink colour of their parent. The parentage of *Veronica Lindsayi* is not known with certainty; but Mr. Lindsay, who, as many are aware, has made a special study of the New Zealand Veronics, is of opinion that it is the result of a cross between *V. amplexicaulis* and *V. pimeleoides*. As indicated, *V. Lindsayi* is pink in colour, and from it a large batch of seedlings have been raised, with similarly-coloured flowers. There is some difference in habit, but not so much as might be expected. It looks as if the shrubby Veronics would, in course of time, give as much trouble in their nomenclature as the herbaceous species and their varieties have done. Several other hybrid hardy flowers have come under my observation from time to time; but probably I have said enough at present. *S. Arnott, Carsethorn by Dumfries, N.B.*

(To be continued.)

NURSERY NOTES.

THE BRIGHTON AND SOUTH COAST HORTICULTURAL COMPANY.

This successful nursery may be described as a typical Worthing establishment, with the addition of good showy Orchids, devoted to fruits, of which Peaches are made a specialty, Tomatos grown to perfection, Cucumbers which seem to come on in their season almost as fast as they are cut, showy flowers which can be produced in quantity, such as the Carnation, and some other hardy flowers

and Chrysanthemums, of which the white and yellow varieties of *C. Marie Desgranges* (principally white) are represented by some 37,000 fine specimens. Experience has taught Mr. Grogan, the clever and genial manager of the establishment, that these things well grown never fail to pay.

In the earlier days of the establishment, provision was made to give greater variety to the stock, and to introduce innovations in the Worthing culture, and other things were grown with varying success; but each in turn has been abandoned in favour of the old favourites, which produce "the nimble ninepence," except the showy Orchids, useful for cut flowers, and these, although tended in the manner usual with large batches of stock kept for market purposes, are in the finest condition possible, and promising a magnificent display of flowers, each in its season. The main house, a long, broad, span-roofed structure, contains principally *Cattleya Trianaei* for the greater part, and *C. labiata autumnalis* in smaller quantity. Both are pleasant to behold, and especially the great quantity of *Cattleya Trianaei*, with their stout pseudo-bulbs, and hard, thick leaves, each of the leading ones bearing a flower-sheath, the whole equal to anything of the kind in cultivation. Equally good are a smaller lot of *Cattleya Dowiana*, *C. aurea*, and other showy kinds, all of which are grown in comparatively small pots. The plants are closely arranged together, and so situated, one would hardly expect them to thrive so well; but Mr. Grogan finds no trouble from the close arrangement, as a clear light on all sides seems to counteract any bad results in that direction. The house is a large one, and airy in itself, but great care is taken in ventilating to avoid causing currents of air, consequently the top ventilators are seldom opened, and the lower ones very carefully adjusted. There is little doubt that a too free use of the ventilators, especially the top ones, causes the unsatisfactory state of things seen in some collections of Orchids. A fine batch of *Laelia purpurata* is also in grand condition; a quantity of varieties of *Laelia anceps* profusely sending up spikes. So also a batch of *L. albida*, *L. autumnalis*, *L. Perrini*.

In the cool-house is a good lot of *Odontoglossums*, the *O. crispum* contributing a number of good spikes.

LAW NOTES.

SALE OF PLANTS BY A GARDENER.

At the Chichester County Court, on Wednesday, his Honour Judge Martineau had before him the case of *Abraham v. Mrs. W. Cox*, of Bognor, which was an action brought by a gardener for the recovery of the sum of £13 2s. 6d., made up as follows: Two weeks' wages, £2 10s.; month's wages in lieu of notice, £5; amount received by the defendant in respect of plants sold by plaintiff, £4 15s.; at half cost of removal of furniture from Runcton to Bognor, 17s. 6d.

In opening the case, Mr. Gregory, solicitor, stated that his client answered an advertisement, and was engaged by Mrs. Cox as gardener in September last. His weekly wages were to be 25s., with a month's notice on either side, and there was no agreement that plaintiff in his own time might not do business on his own account. It was also alleged that there was a promise on defendant's part to pay half the cost of removing the gardener's furniture when he went to Bognor. In April last, a gentleman named Rawson, who had recently come to reside at Bognor, went to Mrs. Cox's garden, and wished some plants to be supplied to him. He was seen by Abraham, who told him that Mrs. Cox had no such plants on hand. He undertook, however, to supply them privately on his own account, and, having received an order from the gentleman in question, procured the plants from a Chichester florist, and supplied them to Mr. Rawson for £4 15s.

Plaintiff bought the plants with his own money, but later on, when he sent in his bill, Mr. Rawson gave a cheque for the amount to Mrs. Cox.

The defence set up by Mr. Staffurth was that there was a deliberate breach of trust on the part of plaintiff. The gentleman (Mr. Rawson), to whom he supplied the plants, was a stranger to Bognor, and did not know but what he was dealing with the proprietor of the gardens. When he found out that the plaintiff was merely a servant, he forwarded the cheque to the mistress for the plants, who had retained it, pending the decision of the Court. As to the removal of the goods, Mr. Staffurth altogether repudiated any agreement on the part of his client.

Mr. Rawson, a member of a firm of solicitors practising in London and Yorkshire, who had recently taken the residence known as Graigwell, Aldwich, was called to give his version of the affair, and said that at the time he bought the plants, he had no idea that he was dealing with a servant. Being a stranger, he did not know that Mrs. Cox was the proprietor of the gardens, and the plaintiff said nothing to him about Mrs. Cox. When he found out the true circumstances of the case, he came to the conclusion that it was a most improper thing for a man to do. He wished, emphatically, to state that he should not have given an order knowingly behind the back of a principal. He was entirely opposed to such a course. At the time he called at the garden he supposed that Abraham was the master. There was no name over the garden.

In giving his decision, the learned judge said he had no doubt whatever about the matter. It was the duty of the plaintiff, as a servant, to do the best for his employer, and, if possible, to expand the business, and not to enter into transactions which would interfere with, or deprive his employer, of business. When Mr. Rawson found out whom he had been really dealing with, he was perfectly justified in paying the money to the owner of the gardens where he had ordered the plants, and plaintiff's only claim against Mrs. Cox could be for the value of the plants, which he paid for out of his own pocket. He considered that plaintiff was entitled to no wages when he had been acting irregularly, and he disallowed entirely the claim for the month's notice. It was one of the worst kinds of misconduct for a person trusted to do business for his employer's benefit, to transact things on his own account, and deprive his employers of a customer. Indeed, he thought it was the worst sort of misconduct, short of actual dishonesty, that anyone could be guilty of. It was treachery. He had come to the conclusion that the plaintiff was properly dismissed, and he should disallow his claim from beginning to end. His Honour, however, intimated that plaintiff should have refunded to him the money he had paid out of pocket for the plants, &c., and it was understood that this would be done.

Judgment was then entered in favour of the defendant, with costs, the money in court to be retained until the costs had been taxed.

HOME CORRESPONDENCE.

APPLE GREENUP'S PIPPIN, OR YORKSHIRE BEAUTY.—Having seen how finely this Northern Apple fruits at Ruxley Lodge, Esher, on a stiff clay soil for the past three years, I have been surprised not to find it mentioned under either designation in either Messrs. Veitch's or Bunyard's lists. Yet such faith have I in the variety, as has also that fine old gardener, Mr. J. Miller, that were I putting down on stiff land Apples largely, I should certainly plant more of this variety than any other. The trees, some three or four dozen, planted some eight years since with several hundreds of others, in variety, are moderately high standards, healthy, but not strong growers. Every tree of the variety is fruiting well, some remarkably so; no other variety is fruiting so generally. Were this produce of one season only, less could be said; but after

seeing the trees for three years, I am assured that it is one of the best general main crop Apples in cultivation. In the *Fruit Manual*, Dr. Hogg refers to the variety as doing well on the Hastings sands, and from that fact draws the conclusion that it should be strongly recommended for light soils. The soil at Ruxley Lodge is of the stiffest clay in the county of Surrey, but is probably well drained, as all the varieties of Apples and Pears growing in the great orchard do well, the only evidence of canker being on a tree of Lord Suffield. But if Greenup's Pippin may be assumed, in a somewhat low-lying yet exposed position, to owe its fruitfulness during successive seasons to the hardness of its blooms, how is it that so tender a variety as Cox's Orange Pippin is one of the next best croppers this season? However, I am assured that the Yorkshire Apple is a first-rate variety as a consistent cropper here in the South. *A. D.*

THE SPARSE FRUIT CROPS.—Those who undertake the labour of explaining the causes for the comparative thinness of our hardy fruit crops this year, will find they have a difficult task. On every hand one is met with variations and inconsistencies which baffle the best mind to explain. It is very easy to assume that some varieties of Apples, Pears, or Plums may have blossoms of a tenderer nature than those of other varieties. On the other hand, there is no proof whatever that one flower, or the flowers of any one variety, all being botanically and physically alike, are less hardy than those of another. If it can be shown that from some subtle cause—say from exceeding dryness at the roots, for instance—there is a great deficiency of pollen, then some good reason may be furnished. But when it is assumed that the flowers of some varieties are more tender than are those of others, how is it, for instance, explained that amidst the comparative dearth of Plums, Damsons, the hardest of all the family as generally understood, have the poorest crop of all? Then, how is it that with both Apples and Pears, the heaviest crops generally are found on tall or old trees, standards especially? The absence of bees or other insects at flowering time does not explain that. Does it arise from the deeper rooting, enabling the trees to perfect the fertile organs of the flowers, producing pollen in abundance? or were the flowers less exposed to injury from frosts, or a long prevalent low temperature, because so elevated above the ground? But then again, why, with Pears, Plums and Cherries blooming simultaneously, were Cherries such a fine crop and the other fruits so poor? Again, has it ever been the case that a perfect mass of bloom, such as we have seen during two springs, and I fear will see again next spring, has been productive of a good crop of fruit? We ascribe the chief cause of our poor fruit crop to the spring. But if so, why have some trees a great crop and others beside them, usually well bloomed, have no fruit at all? *A. D.*

FINE PEACH, PRINCESS OF WALES.—I am sending two fruits of Princess of Wales taken from a tree carrying close upon 200 fruits, the smallest of which will weigh 9 oz. I sent four fruits into the house yesterday which weighed 3½ lb., the largest weighing 15 oz. I am having the tree photographed, and will send one on to you when I receive them. *John Dinwoodie, Buckland Gardens, Betch.* [Uncommonly fine fruits, of very fair flavour. *Ed.*]

MORISIA HYPOGÆA.—Your correspondent, Mr. W. Earley, at p. 135, conveys the impression that an early-flowering variety of this plant exists, which is probable. When I had charge of some gardens in the vicinity of Rugby, in which alpine were extensively grown, plants of this species used to flower during the months of February and March; and I have also seen it flowering as early as far north as Nottingham. It would be interesting to know at what month the plant commences to flower with Mr. T. Smith, of Newry. Having always increased my plants by division, I have not observed minutely the peculiarity of the plant. In burying its seeds in the earth, will Mr. W. Earley kindly explain the process shortly? *Thos. Harris, Lower Grayswood Gardens, Haslemere.*

VERONICA ARMSTRONGI.—One is pleased to see that Mr. Lindsay has carried out his intention of sending you the flower of this pretty little New Zealand Veronica, which I had the pleasure of seeing when in bloom in Mr. Lindsay's garden. I have to thank you for giving so excellent an

engraving. Mr. Lindsay's collection of New Zealand Veronicas is unique, but it was with special pleasure that he pointed out *V. Armstrongi* in bloom. One only wishes that Mr. Lindsay would give some notes on his experience of these interesting shrubs. Since his paper on the shrubby Veronicas was contributed to the Edinburgh Botanical Society in 1891, he has, doubtless, learned something more about them. *S. Arnott.*

ASPIDISTRA IN FRUIT.—It may be of interest to recall the fact that an *Aspidistra* bore a single fruit at St. Andrews in 1891 (see *Gardeners' Chronicle*, January 2, 1892). This fruit split open transversely as shown in the enclosed drawing (fig. 57), nine or ten months after fertilisation, by the pressure of the swelling seeds, just before maturity was reached. At this stage it was, accidentally I understand, removed from the plant. It was no doubt the outcome of artificial fertilisation which was resorted to with the object of securing fruit; but unfortunately an exact account cannot be given of the case, because no notes relating to experiments with individual flowers were kept. Ten years ago, in *Trans. Bot. Soc. Edinb.*, vol. xvii., 1889, p. 495, I stated my belief, after a careful study of the structure of the flower, that small slugs are instrumental in fertilising *Aspidistras*. Perhaps Messrs. Stansfield will be able to throw light on this point? *John H. Wilson, D.Sc., St. Andrews.*

FIG. 57.—FRUIT OF ASPIDISTRA SCARCELY MATURE. (NAT. SIZE.)

VEITCH'S CLIMBING RUNNER BEAN.—Having tried this variety with the Mammoth Scarlet, and the Princess, we gathered the former a week before the others. Veitch's Climbing Runner developed fine long pods, while the others dropped off as they flowered, on account, probably, of the extreme drought and burning sun-heat, the temperature being more than once 134°. The plants did not appear to suffer in the slightest, while other varieties looked miserable, but kept up a vigorous growth. It is a reliable variety, a sure cropper, of excellent quality, and very prolific; also "tender and true," as described in the selection for the season. *N. S., Hampton-in-Arden.*

LADY HASTINGS' BLACK MUSCAT GRAPE.

THE raising of new varieties of Grapes goes on but slowly, and it is seldom that we are enabled to chronicle any new comer which is as good in all points as those we already possess. In Lady Hastings' Muscat (fig. 58, p. 157), a sport from Muscat Hamburg, originated in Lord Hastings' garden at Melton Constable, we have a Grape which is a good setter, possesses a slight Muscat flavour with a pleasant sharpness; which will ripen as early as any variety in cultivation. The bunch is of a desirable form, and the bloom on the berries very dense—altogether a very desirable addition to table Grapes. The variety received a First-class certificate from the Royal Horticultural Society on July 25, last; see *Gardeners' Chronicle* for July 29, p. 97.

Vines are to be sent out by Messrs. Paul & Sons, Cheshunt.

SOCIETIES.

ROYAL HORTICULTURAL.

AUGUST 15.—The Drill Hall, James Street, Westminster, on the last occasion or the meeting of the Committees, was filled almost to overflowing with plants, flowers, and fruit and was as much filled with colour as we remember it any time this year, herbaceous plants, Dahlias, Gladioli, May's new *Campanula* and Begonias, as cut-flowers or plants, helping largely in the display.

Onchios were shown in fair quantity for the season, and among them were several notable plants, to wit, a *Laelio-Cattleya*, with a magnificently-coloured lip, &c.

FRUIT consisted of early Apples, Melons in quantity, Tomatos, and a few Grapes of fair quality. Visitors were not so numerous as usual.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. H. B. May, R. Dean, J. H. Fitt, W. Howe, C. E. Pearson, J. Walker, E. H. Jenkins, H. Cutbush, E. Cook, H. Turner, C. T. Drury, G. Paul, H. Selfe Leonard, J. F. McLeod, and J. Fraser.

GROUPS OF FLOWERING AND FOLIAGE PLANTS GROWN WITHIN TWO MILES OF CHARING CROSS.

Mrs. ABBOTT (gr., Mr. G. Kelf), South Villa, Regent's Park, showed a group 3 yards wide, and extending half the length of the building; it was simple in arrangement, and consisted of plants of low growth, placed together in small masses, and topped with Palms, 5 to 10 feet in height; *Celosia plumosa*, together with *Draenas*, *Lilies*, *Crotons*, and *Caladiums* in smaller numbers, afforded desirable colouring; small *Adiantums* and other Ferns, *Fitonias*, &c., forming the bordering along the front. It was extremely good for a London garden situated 2 miles from the heart of London (Silver-gilt Flora Medal).

A group of similar length and width, displayed by Messrs. J. LAING & SONS, Forest Hill, filled the remainder of the space facing against the wall on that side of the Hall; it consisted of *Caladiums* set off with Ferns, &c. We remarked several novelties in *Caladiums*, viz., M. Chaber, Golden Queen, both of yellow tints; Raymond Lemoine, Orphée, Madame Imbert Kœchlin, John Laing, and Lord Penrhyn, and as a bit of colouring well arranged in contrasts, it was a success. The plants were of small size, and ranged from 1 foot to 3 feet in height (Silver Flora Medal).

PURNELL PURNELL, Esq., Woodlands, Heather Hill, displayed on a table a group of plants of tuberous-rooted Begonias and of Fuchsias, in bush form, set off by Cocos, several species of *Adiantum*, &c. As a group of mixed plants, it was effective (Bronze Banksian Medal).

PLANTS.

Mr. H. B. MAY, Dyson's Lane Nurseries, Edmonton, showed thirty plants of their new *Campanula isophylla* Mayi (figured in our last issue), in capital bloom. The plants have continued to produce hundreds of flowers for four months; and they formed a conspicuous feature. The same exhibitor had arranged underneath his pyramids of *Campanula* a fitting carpet of choice Ferns, that set off the former to perfection (Silver Banksian Medal).

MESSRS. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, exhibited a table of sixty *Adiantums*, consisting of many choice species and varieties, of which we specify *Adiantum reniforme*, A. Hendersoni, A. macrophyllum albos-tristatum, A. Fergusonii, A. Bausei, A. excelsum, A. Paotii, A. Bessonianum, A. curvatum, A. Henslovianum, A. Rochfordi, &c. The plants showed the perfection of good culture (Silver Flora Medal).

MESSRS. CANNELL & SONS, Swanley, exhibited a new variety of *Nemesia* named *compacta alba*, the plant dwarf, and extremely floriferous.

MESSRS. HILL & SON, Barrowfield Nursery, showed trained specimens of *Lygodium japonicum* macrophyllum, a graceful neat habited variety; well adapted for a number of purposes in decoration.

Mr. G. Reynolds, gr. to Messrs. DE ROTHSCHILD, Gunnersbury Park, Acton, showed a number of *Carnation* Mrs. Leopold de Rothschild, a free-flowering variety with cherry-bloom. The height of the stems was 3 feet, and the grass of great vigour.

MESSRS. HUGH LOW & CO., Bush Hill, Enfield, showed a yellow-leaved *Acer*, named *Californicum aureum*, previously certificated this summer.

CUT-FLOWERS.

THOS. WARE, LTO., Hale Farm Nurseries, Tottenham, showed three stands containing 120 blooms of tuberous-rooted Begonias, both single and double, and in much variety, including some of wonderful beauty, but being unnamed we are unable to specify those that most pleased us. The same firm exhibited a large quantity of Cacti, and other varieties of the Dahlia, *Lilies*, *Galtonia candicans*, *Gladiolus Gandavensis* and *Lemoinei* varieties, and other flowers in season (Silver Banksian Medal).

MESSRS. BARR & SONS, 12 and 13, King Street, Covent Garden, showed likewise flowers in season, consisting, however, of different plants to those in Mr. WARE's lot. There were noted the pretty *Pentstemon barbatus* Torreyi, with tubular-shaped scarlet flowers; P. b. Scarlet Gem, a pale pink coloured P. The Lady; many bright-coloured Phloxes, mostly with massive corymbs of blossoms; *Gladiolus dracopcephalus*, flowers of dull yellow tint, crimson spotted; forms of *Gladiolus Nanceianus*, *Phygelius capensis*, *Gaillardias*, and *Helianthus* in variety.

Mr. S. MORTIMER, nurseryman, Rowledge by Farnham, put up three effective stands of show, fancy, decorative and Cactus Dahlias. Of pleasing colour and desirable form among Cactus varieties, mention may be made of Capstan, salmon-pink; Arachne, of a lighter tint; Ebony, a fine dark variety; John Goddard, Starfish, a brilliant scarlet; Earl of Pembroke, of a rich purple tint. The newest show Dahlias were Archie Mortimer and J. R. Tranter, the latter a flower of a reddish-terra-cotta tint; both were perfect in form. The

remainder of the Dahlias consisted of standard varieties (Silver Flora Medal).

Messrs. WEBB & BRAND (late Chater), Saffron Walden, showed seventy-two double-flowered Hollyhocks, very prim looking, but withal full flowers, and furnished with, in most cases, those very desirable guard-petals which in others were sadly missing. There was a large range of colour in the collection (Silver Banksian Medal).

Messrs. J. CHEAL & SONS, Crawley, showed some useful decorative grasses, viz., *Elymus glaucescens*, which has blue-green foliage; *Glyceria stipitabilis* fol. variegata, *G. japonica* zebrina, *Eulalia gracillima* and *E. variegata*. They showed also *Acacia Neo-mexicana*, in bloom; *A. semperflorens*, and *Colutea arborescens*, well furnished with its light, pink-tinted seed-pods; and a quantity of Dahlias.

Messrs. R. WALLACE & Co., Kilnfield Gardens, Colchester, exhibited Gladiolus in much variety, showing, as probably was intended, how this flower looks under ordinary cultivation. Many beautiful varieties were remarked, viz., *M. Leveque*, dark crimson; *Turicensis*, deep cherry-red, with a white flame on the lower segments; *Masque de Fer*, Captain Binger, Madame Desbordes Valmore, Silvio Pellico, Mrs. Beecher, a very fine soft shade of carmine; and besides these were *Lilium auratum* in variety, *Delphinium cardinale*, *Montbretia* in variety, *Tritomas*, and *Gaillardia* (Silver Banksian Medal).

F. W. CAMPTON, Esq., Coley Manor, Reigate (gr., Mr. Fitt), showed a flowering branch of a single white-flowered Oleander, and double and single flowers of rose-coloured varieties (a Vote of Thanks).

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, exhibited an extensive group of Phloxes in fine varieties, some of the prettiest of which were Huxley, lilac, with a white starry eye; Evénement, of a cherry-red tint; Eclaircieur, purple; Bayadère, white; Claudot, pink, of a deeper colour in the eye; W. Ramsay, rich purple; Regulus, crimson; Esquilicot, brilliant scarlet; and Argon, palest lilac (Silver Banksian Medal).

Messrs. KELWAY & SON, Langport, Somerset, had a very extensive array of spikes of seeling Gladiolus, of which few were furnished with names. Needless to remark, the spikes were large, and the blooms in fine condition; the total number amounted to sixteen dozen.

Messrs. W. PAUL & SON, Royal Nurseries, Waltham Cross, showed Roses flowering for the second time this season, such as Marie Van Houtte, W. A. Richardson, Mrs. Sandford, Aurora, Panachée de Bordeaux, Mrs. P. Oger, Maman Cochet. There were two show boxes full of blooms of *Maréchal Niel*, a quantity of Duke of York (China), G. Nabonnand, one of the best of the Teas, and one that flowers freely at this date as well as earlier—the colour is delicate bluish, with just a tinge of yellow; *Marquis of Salisbury* (H. T.), of a deep crimson tint; the new Tea, *Empress of Russia*, of a pleasing cherry-red colour; *Perle d'Or*, Marie Lavalley, *Souvenir de Catherine Guillot*, &c. The firm also showed Phloxes in fine varieties, of which were Lord Rayleigh, a blue purple; Albatre, white; Fernand Cortez, Acropole, &c. (Silver Flora Medal).

Mr. H. J. JONES, Ryecroft Nursery, Lewisham, exhibited a small collection of Begonias, in single and double-flowered varieties, some of which were named.

Messrs. J. VEITCH & SONS, LTD., Royal Exotic Nursery, Chelsea, showed a varied collection of named varieties of Pentstemon; but these, like many other flowers, showed the effects of the heat and drought. Noteworthy were the varieties *Pardusa*, crimson, with a throat striped with white; Lord Cromer, a similar flower; *Latona*, rosy-purple self; *Fabia*, crimson; *Minerva*, pale purple, and a white throat; *Flying Fox*, a white and pink bloom; and Lord Kitchener, rosy-purple. Messrs. VEITCH likewise showed a big branch of *Clerodendron trichotomum*, densely furnished with flowers; also plants of *Clematis Davidiana*, in bloom; *Vitis heterophylla variegata*; *Apera arundinacea*, well furnished with awns—a pretty grass, forming dense masses of brown stalks and awns, and slender green leaves; lastly, a plant of *Andromeda arborea* in bloom.

This firm again afforded visitors a view of their beautiful *Rhododendron javanico-jasminiflorum* hybrids; also showing several small-flowered Begonias, viz., *Boule de Neige*, *Gloire de Montit* and *Nancy*, all of which are equally good for pots or bedding; *Cypripedium Lawsoniana* Wisseli, with light green foliage and compact growth; *Plaius guineensis* albo-striata, a plant previously shown; and *Rhaphis flabelli formis* variegata.

AWARDS.

FIRST-CLASS CERTIFICATE.

The fine *Nepenthes Balfouriana*, a cross between *N. mixta* × *N. Mastersiana* ×, was shown by Messrs. J. VEITCH & SONS, LTD.; its pitchers are about intermediate in colour, but they are larger than either. The colour is copper-red, splashed with crimson, the opercle unsplashed, and of a red-brown colour.

AWARDS OF MERIT.

Phlox Le Mahdi, a deep rich purple flower, good truss, circular flower. Shown by W. PAUL & SON, Waltham Cross.

Rose Gruss aus Töplitz, a hybrid Tea, of a deep crimson colour, flatish form, and a fairly full flower, is a very desirable novelty; it is evidently free flowering. Shown by W. PAUL & SON, Waltham Cross.

Messrs. J. VEITCH & SONS, LTD., showed *Gladiolus Henri Vandrier*, a flower of a purplish-crimson tint, and extra large size.

The following Gladioli were deemed worthy of an Award: *F. Poynter*, orange-scarlet, a large perfect bloom, and well finished spike; *Burne-Jones* possessed dark, tender, crimson-coloured flowers, of which a dozen were expanded; and *Lady*

Montagne, a pale yellow, the lower segment flushed with crimson on bright canary yellow. The spike in this instance was short, but the flowers were large. Shown by Messrs. KELWAY & SONS.

Messrs. BURRELL & Co., Howe House Nurseries, Cambridge, exhibited a number of Cactus Dahlias, of which *Sylph*, an orange-scarlet; *Antler*, a rich crimson; and *Ajax*, orange-scarlet, received awards.

Messrs. WEBB & BRAND showed *Hollyhock Black Knight*, a flower of good size, and full, and of an intensely dark crimson tint.

Messrs. CANNELL & SONS, Swanley, showed flowers of *Centaurea americana* alba, *Sweet Sultan*, with creamy-white flowers, the plant evidently of vigorous, not to say coarse, habit of growth.

Gladiolus Lemoinei Jane Dieulafoy, rose-pink in colour, of fair size, the two lower segments having a scarlet flame on primrose-yellow ground. Shown by R. WALLACE & Co., Colchester.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair), and Messrs. Jas. O'Brien (Hon. Sec.), J. G. Fowler, W. H. Protheroe, De B. Crawshaw, J. Douglas, E. Hill, A. Ontram, F. J. Thorne, W. H. Young, H. J. Chapman, A. H. Smee, H. Ballantine, H. M. Pollett, and T. B. Haywood.

The show of Orchids was not extensive, though some very interesting exhibits were staged. The largest group was staged by Messrs. Hiron Low & Co., Rush Hill, Enfield, and in it was seen the usefulness, at this season of the year, of the showy and fragrant varieties of *Cattleya* *Eldorado* and *C. superba*. Of the former there was a good selection, varying from the white form with orange tube, and purple front to the lip, to the rose-pink variety with no other colour than orange on the lip. Also in the group was a splendid plant of *Cattleya Gaskelliana* pallida, with ten flowers. This variety opens pure white, with pale primrose disc to the lip, and matures with a slight blush tint. The back of the group had six fine varieties of *Vanda* *coerulea*, and one of the natural hybrids of it, named *V. × Charlesworthii*, a very pretty white flower, tinted with rose. With these were the pretty *Dendrobium × Lecanum* *enfieldense*, *Laelio-Cattleya × elegans* *Turneri*, *L.-C. × Novelty*, *Cattleya Warscewiczii*, *Cypripedium × macropterum*, *C. × Schroderae*, *Odontoglossum Pescatorei*, *O. crispum*, *Oncidium Marshallianum*, &c. The group was awarded a Silver Flora Medal.

Sir FREDERICK WIGAN, Bart., Clave Lawn, East Sheen (gr., Mr. W. H. Young), showed *Cattleya Acklandiae* nigrescens, a singular form with the sepals and petals almost wholly of a dark chocolate colour, with a narrow yellowish margin. The side lobes of the lip folding over the purple column were bluish-white, the front lobe dark rose-purple; also *Cattleya × Atlanta* (Leopoldi × *Warscewiczii*), a showy hybrid, bearing some resemblance to *Laelio-Cattleya × elegans*. The sepals and petals were greenish, tinged and veined with rose-purple; the base of the lip pale rose, the front lobe and tips of the side lobes bright purple. The plant had been excellently well grown, and a Cultural Commendation was awarded. Sir F. WIGAN also showed *Laelio-Cattleya × Aurora*, and the plants named in the list of Awards.

From the Marquis of SALISBURY's gardens, Hatfield, Herts (gr., Mr. G. Norman), came a noble plant of *Acridas Sanderianum* (the yellow-tinted *A. Lawrencei*), with four spikes, each about 3 feet in length. The plant bore thirty-five leaves, and appeared never to have lost any since being in Mr. NORMAN's hands (Cultural commendation).

The Rev. F. PAYNTER, Stoke Hill, Guildford (gr., Mr. Cooke), sent a pretty hybrid, said to be between *Laelia crispata* and *Cattleya Warneri*, but more probably between *C. velutina* and *C. labiata* *Warneri*. The flowers were of a delicate buff-tinted rose, with the orange blotch in the centre of the lip as in *C. velutina*, the rounded front lobe being pale rose of colour with purple veining. Mr. PAYNTER also sent cut spikes of *Laelio-Cattleya × Henry Greenwood*, *Cattleya Harrisoniana*, and *C. Gaskelliana* *virginialis*.

Mrs. MASON, The Firs, Warwick (gr., Mr. Lambert), sent cut spikes of *Cypripedium Curtisii* *superbum*, *C. × Fran Ida Brandt* (lo grande × *Youngianum* ♂), *Cattleya Warscewiczii*, *C. × Fowleri*, *Dendrobium McCarthiae* and *Laelio-Cattleya × Berthe Fournier*.

M. JULES HYE-LYSEN, Coupure, Ghent, sent a spike of the fine *Cypripedium × Massianum* (uperciliare × *Rothschildianum*), excellently grown.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr., Mr. S. Cooke), showed *Odontoglossum Uro-Skinneri* *Crawshawianum*, a fine flower with the large labellum beautifully spotted with dark rose colour; *Odontoglossum crispum*, Miss F. M. Bovill, a pretty variety with white flowers tinged with purple, the sepals bearing some showy brown blotches; and *O. crispum* *Trianeii*, a sparsely blotched form.

C. B. CHIMES, Esq., Selwood, Rotherham (gr., Mr. Mark Watts), sent *Cattleya × Hardyana* Mrs. C. E. Chimes, a pretty form, with marbling of cream colour on its rose-coloured sepals and petals, the front lobe of the lip being of an intensely dark crimson.

W. MACDONALD, Esq., Atholl Hydropathic, Pitlochry, Aberdeen, sent a *Cypripedium* said to be between *C. Elliotianum* and *C. Godefroyae*, but in which there was no perceptible trace of *C. Godefroyae*.

Capt. THOS. A. JULIAN, Woodside, Plymouth, showed a spike of a very dark and brightly coloured *Cattleya Harrisoniana* *violacea*, and a large light form of *C. Eldorado*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Laelio-Cattleya × Wiganiana, a hybrid supposed to be between a dark form of *L. purpurata* and *L.-C. × Dominiana*.

One of the largest and most richly-coloured hybrids yet shown. The habit of the plant is that of a tall, slender *L. purpurata*. Flowers very large, the long, acuminate sepals and petals of a pale rosy-lilac hue. The fine lip is almost entirely of a dark claret-tinted purple down to the base, where a slight marbling of orange-colour appears. From Sir Frederick Wigan, Bart. (gr., Mr. W. H. Young).

AWARDS OF MERIT.

Schomburgkia Lyonsii.—A beautiful species, originally described by Dr. Lindley in the *Gardeners' Chronicle*, 1853, p. 615, but which has not before been shown before the Orchid Committee. The plant bore a tall scape of many white flowers, prettily spotted with purple, and each about 2 inches across. The flowers are borne on long foot-stalks, and each have a narrow lanceolate bract as long as the foot-stalk; it is the handsomest of its class. From the Rt. Hon. Lord Rothschild, Tring Park (gr., Mr. E. Hill).

Stauropsis lissochiloides var.—A brilliantly coloured form of the old plant, known as *Vanda Batemanni*. The flowers were yellow, spotted with red, and the reverse of the younger flowers and buds was bright dark rose. From the Rt. Hon. Lord Rothschild (gr., Mr. E. Hill).

Cattleya × Whitei, Wigan's variety.—A natural hybrid between *C. labiata* *Warneri* and *C. Schilleriana* (Rchb. f., *Gardeners' Chronicle*, 1882, p. 586). A very rare plant, in growth and flower intermediate between the parents stated. Flowers nearly as large as those of *Cattleya labiata*, but much firmer in texture, of a uniform warm rose tint, the rounded front lobe of the lip darker than the other parts, and well indicating *C. Schilleriana*. From Sir FRED. WIGAN (gr., Mr. W. H. Young).

Laelio-Cattleya × Berthe Fournier (L.-C. × *elegans* var. × *C. Dowiana* aurea).—Raised by M. CHAS. MARON for M. L. FOURNIER, Marseilles. Sepals and petals cream white, with a lilac tint. Lip dark reddish-purple, with some fine orange lines at the base. The presence of L.-C. *elegans* is doubtful, as the labellum indicates no departure from the *Cattleya* form. From Mrs. MASON, The Firs, Warwick (gr., Mr. Lambert).

Fruit Committee.

Present: Mr. P. Crowley, chairman; and Messrs. J. H. Veitch, J. Cheal, M. Gleeson, W. Pope, S. Mortimer, A. Dean, W. Bates, W. Farr, W. J. Empson, F. Q. Lane, G. Reynolds, G. Norman, and G. Bunyard.

There were more exhibits than usual at this season for this committee, including especially good mixed collections of fruit, and fine Apples. If the latter indicate what will be seen later, then the autumn samples should be very fine indeed.

Mr. G. Kelf, gr. to Mrs. Abbott, South Villa, Regent's Park, staged a fine collection of fruit, remarkable because grown within two miles of Charing Cross. It comprised excellent Black Hamburgh and Buckland Sweetwater Grapes, fine Barrington Peaches, Green Gage, Jefferson, Kirke's, Cue's Golden Drop, Reine Claude, and Comte de Atthens; also fine and well-fruited pot-trees of Early Transparent, Jefferson, and Cox's Emperor Plums, all first-class fruits; several good Melons, Lord Suffield Apples, and numerous scarlet, red, and yellow Tomatos, Golden Queen and Chemin de Fer, being specially fine. A Silver-gilt Banksian Medal was awarded.

Mr. J. Miller, gr. to Lord Foley, Raxley Lodge, Esher, had a capital representative collection of eighteen dishes, including finely-coloured Alexander, and also good *Violette Hâtive*, *Alexandra Noblesse*, and Royal George Peaches, superb Early Rivers' Nectarines from outside, Guigne de Wintolor, Bigarreau, Blanc d'Espagne (pure yellow), and fine Morello Cherries; Kirke's Plum; fine Yorkshire Beauty, Lord Suffield, and other Apples; several Pears, Figs, and some good Archie Henderson Melons (Silver Knightian Medal).

From Mr. Walters, gr. to Lord GARARD, Eastwell Park, Ashford, Kent, came a good collection, inclusive of six bunches of Black Hamburgh, and the same of Foster's Seedling Grapes; seventeen diverse Melons, including Comtesse, Holborn Favourite, Hero of Lookinge, Frogmore Seedling, a Highcross Hybrid, and others; Sea Eagle, Gross Mignonne, and *Violette Hâtive* Peaches, Pine-apples, Downton Nectarines, &c. (Silver Banksian Medal).

Messrs. G. BURNARD & Co., Old Nurseries, Maidstone, put up a collection of twenty dishes of Apples, all beautiful samples, showing no evidence of stress of weather. Rich in colour, of desserts, were Beauty of Bath, Lady Sudeley, Red Quarrenden, Mr. Gladstone, Worcester Pearmain, and Red Juneating; also of kitchen varieties, very fine Stirling Castle, Lord Grosvenor, Gold Medal, Grenadier, White Transparent, Lord Suffield, Ecklinville, The Queen, and others (Silver Knightian Medal).

Messrs. JAS. VEITCH & SONS staged a fine collection of thirty dishes of Apples, four of Pears, one of fine Morello Cherries, one of that superb red Currant *La Versailles*, and one of Lee's Prolific Black Currant. The Pears were *Burré Giffard*, *Jargonelle*, *Colmar d'Ete*, &c.; and the Apples included very fine samples of Lord Grosvenor, Grenadier, Pott's Seedling, White Transparent, Stirling Castle, Lord Suffield, Domino, and Frogmore Prolific, kitchen; and Early Strawberry, Lady Sudeley, Beauty of Bath, Red Quarrenden, Red Astrachan, and Irish Peach, desserts (Silver Banksian Medal).

From Messrs. S. SPOONER & SONS, Hounslow, came a collection of thirty dishes of Apples, including good Gold Medal, Pott's Seedling, Grenadier, Kruger, Lord Suffield, Ecklinville, New Hawthornden, and Bismarck, kitchen varieties; Red Astrachan, Kerry Pippin, Beauty of Bath, Red Quarrenden, and Red Margaret, dessert varieties (Silver Banksian Medal).

A very interesting new fruit came from Messrs. JAS.

VEITCH & SONS, in the form of a hybrid Raspberry, the product of crossing Belle de Fontenay Raspberry with the common Blackberry; of ordinary Raspberry growth, a most prolific fruiter, ripening after ordinary Raspberries are over. This novelty has fruits about the size of those of good Baumforth's Seedling Raspberry, but of a deep purplish-red hue. They are very like Raspberries in flavour, and part freely from the stem. It should make a valuable variety for cooking and for dessert. An Award of Merit was unanimously granted.

Messrs. J. VEITCH & SONS, Ltd., sent sample plants in fruit of various Dwarf Kidney Beans grown on poor ground.

From the Royal Horticultural Gardens Chiswick, came Tomato Chiswick Peach, a lemon-coloured sport at the gardens from the Red Peach. It is very distinct, very free

of Merit" specially as a market variety was awarded, but it seems to be equally good for all ordinary purposes. Mr. S. LAMB, Forest Hill, sent several huge Californian Navel Oranges, like Citrons, thick of rind, and devoid of quality (Vote of Thanks).

From Mr. A. Corby, gr. to J. THOMESON, Esq., Hawkhurst, Kent, came branches of Red and Black Currants, Raspberries, and some Gooseberries (Vote of Thanks).

Mr. G. CROOK, gr. to Miss EVANS, Forde Abbey, Chard, sent up plants of both Veitch's Cheltenham and Ne Plus Ultra Peas, both tall, to show the effects of spraying with the insecticide, Improved Spiro. The lower portions of the plants had been eaten with thrips, whilst the upper portions where sprayed were quite green and vigorous (Vote of Thanks). This material merits a trial at Chiswick next year.

in the plant and cut-flower classes, had to be considerably crowded in order to find space—in fact, a sixth tent of large size could have been filled, and yet the others would have been well furnished. The exhibition took place as usual in Vivary Park. So far from the exhibition having lost any of its old prestige, there were twenty more exhibitors than last year, and 150 more entries.

The specimen stove and greenhouse plants shown by Mr. JAMES CYPHER, and the Orchids shown by the President, WILFRID MARSHALL, Esq., were the features of the show in the open classes. The exhibits of Vegetables made by cottagers were very numerous, and marvellously good in such a season.

SPECIMEN PLANTS, OPEN.

For twelve stove and greenhouse plants in flower, Mr. J. CYPHER, Cheltenham, was an easy 1st, staging superb examples of *Phenocoma prolifera* Barnesii, *Ericas Austiniana*, *cemula*, and *retorta* major; *Bougainvillea Sanderiana*, *Staticea intermedia* and *profusa*, *Allamanda nobilis*, &c.; and Mr. W. FINCH, Coventry, was 2nd. Mr. CYPHER was also 1st with six very fine specimens. In the Amateurs' Division, Mr. ROWLAND was 1st with twelve specimens, consisting of *Bougainvillea glabra*, *Clerodendron Balfourianum*, *Dipladenia amabilis*, &c.; 2nd, W. MARSHALL, Esq., who staged a very fine example indeed of *Acalypha hispida*, finely-grown and bloomed, making a most effective exhibition specimen. Miss TODD, Shirley, Hants (gr., W. Peel), was 1st with six specimens, and they were also exhibited in fours. Some eight classes were set apart for specimen plants, but they contained nothing calling for special mention.

The best eight specimens of Begonias came from W. MARSHALL, Esq., finely-grown and flowered, even and of good quality. The Rev. J. D. PRING was a close 2nd. In the amateurs' division, the Rev. J. PRING was the leading prize-winner, with Begonias, Pelargoniums, single and double Fuchsias, Coxcombs, and Lilies; the latter shown in fours were good, the Lilies especially, being the type *L. speciosum*; while some good specimens of *L. auratum* were also staged. Some Gloxinias from Mr. W. MARSHALL were remarkably good; and it was pleasant to see some fine pans of *Achimenes* from Mr. STEPHEN BENNETT. Petunias, Balsams, and Coxcombs, were also good; and we find that these old-fashioned things are more cared for in the West of England than in other parts of the country.

FOLIAGE PLANTS, OPEN.

These were shown in eights. Mr. J. CYPHER was placed 1st with three magnificent Kentias and a large *Latania borbonica*, and the following brilliantly-coloured Crotons:—*Cheloni*, *Flambean*, *Queen Victoria*, and *Montefontaineensis*. Mr. W. ROWLAND was 2nd. Miss TODD was 1st, with some good specimens, in the amateurs' class for six plants.

Ferns were a very good feature, and they came in useful as breaking up the banks of flowering plants. The best eight in the open division came from Mr. H. S. BAILEY, Glastonbury (gr., E. Merrett); Mr. ROWLAND was 2nd, the specimens in each case were freely grown.

Miss TODD had the best four, Mr. BAILEY taking the 2nd place. Coleus were in the form of attractive bushes.

The best four Orchids came from Mr. W. MARSHALL; they consisted of *Cattleya gigas* Sanderiana, *C. Leopoldi*, *Cypripedium Parishii*, and *Grammatophyllum multiflorum tigrinum*. Mr. CYPHER was 2nd; he had *Cattleya gigas* in good character, *Lelia crispata*, and two others.

In the amateurs' division for four plants, Mr. W. MARSHALL was again 1st; and Miss TODD 2nd.

GROUPS OF PLANTS ARRANGED FOR EFFECT

were shown in a tent by themselves, being placed down the centre. In the open classes, Mr. W. FINCH came 1st, with an effective arrangement, but confined to too restricted a space to do the exhibitor full justice; and Mr. ROWLAND was 2nd. In the amateur's division Mr. ROWLAND and Miss TODD were 1st and 2nd. The space assigned to each of these groups might be enlarged with advantage.

CUT FLOWERS.

Roses, owing to the hot, dry weather, were small, but Mr. J. MATTOCK brought from Oxford some nice, bright flowers, taking the 1st prize in the class for thirty-six varieties; Maman Cochet, Maréchal Niel, Ernest Metz, Comte de Raloband, Dupuy Jamain, Fisher Holmes, and Caroline Testout were among the best. Mr. G. GARRAWAY, Bath, was 2nd. Mr. MATTOCK was 1st with eighteen varieties; and Messrs. JARMAN & Co., 2nd, and also with eighteen Tea-scented Roses.

Dallias were good considering the season, the best twelve show varieties coming from Messrs. J. CRAY & Co., Frome. The best twelve fancies were from Mr. G. HUMPHRIES, Chippenham. The Cactus varieties in bunches were very good for the season, the best coming from Messrs. J. CRAY & Son, who were also 1st with nine bunches of pretty Poinsettias; Mr. G. HUMPHRIES being a close 2nd.

Phloxes, Asters, Carnations, and Hollyhocks were in fair character. Collections of bunches of Phlox Drummondii were very pretty, and have quite displaced the Verbena on the exhibition-table. Gladioli were good, Messrs. F. H. FOX and J. MATTOCK showing good spikes. Mr. W. MARSHALL had the best twelve bunches of stove and greenhouse cut flowers. Cut Begonias from the Rev. J. D. PRING were very fine, and hardy perennials were a good feature. Mr. R. SYDENHAM's special prizes for Sweet Peas brought several very pretty collections.

In the amateurs' and gardeners' division there was a similar series of classes for cut blooms, and, on the whole, they were filled, and satisfactory subjects staged. Cut flowers are generally well shown in the West of England.

FIG. 58.—LADY HASTINGS BLACK MUSCAT GRAPE. (SEE P. 155.)

fruiting, and of the highest flavour, a capital dessert variety (First-class Certificate). A cultural commendation was given to Mr. A. H. GIBSON, gr. to J. RICKETT, Esq., Pinner, for good examples of Tomato A. H. GIBSON, very like Duke of York or Perfection, or numerous other varieties. Mr. E. SMILES, gr. to the Hon. E. HUBBARD, M.P., sent three Melon seedlings from Blenheim Orange × Dickson's Favourite, all scarlet flesh, and much alike. Flesh in all cases soft but lacked flavour. Mr. HARRISON, Merrow House Gardens, Guildford, sent a small scarlet flesh Melon, stated to have been grown quite outdoors, without protection, since June. This was delicious in flavour; an award of merit was granted subject to further information as to its culture, and a name being furnished. Mr. F. W. CROSS, Wisbech, sent a quantity of a fine conical kitchen Apple, Early Victoria, said to have originated by crossing Lord Grosvenor with Keswick C. dlin; the fruit resembles both parents, and as branches sent to previous meetings have shown remarkably prolific, an "Award

The Lecture.

Mr. Brotherston's paper on "Pruning" was read by Mr. DOUGLAS. It consisted of a general review of the reasons for pruning, the methods employed, and the time when the operation is best performed. Some comments were offered by the Chairman, W. MARSHALL, Esq., Mr. A. DEAN, Mr. GEORGE BUNYARD, and Dr. MASTERS. The paper will be printed in the *Journal of the Society*.

TAUNTON DEANE HORTICULTURAL.

AUGUST 10.—This Society, which was established as far back as 1866, maintains both its vitality and also the high character of its exhibitions; and though on this occasion four very large tents were set up, and in addition two smaller ones for table decorations and groups, the exhibits, especially

TABLE DECORATIONS.

These filled a good-sized tent, and attracted much attention from the visitors. The best dinner-table of fruit and flowers came from Mr. J. CYPHER, lightly done with chaste Orchids and appropriate foliage, and greatly admired; Mr. T. Wilkins, gr. to Lady T. Grest, Henstridge, Blandford, was 2nd, with a light combination of mauve and yellow. Mr. CYPHER had the best Epergne richly arranged, but closely followed by one from Mr. G. Sutton, gr. to Mr. W. A. Todd, Bristol. Hand-some bouquets, buttonholes, sprays, and charming baskets and bouquets of wild flowers were also shown. The President's special prizes for wild flowers in two classes brought good competitions, and that in which the competition was confined to twenty-four species found in Somerset or Devon was represented by interesting contributions.

FRUIT.

Fruit fell rather below the Taunton mark, but that appears to be the general experience. The best collection of eight dishes came from Mr. W. STRIGGELL, The Gardens, Rood Ashton, and consisted of Muscat Hamburgh and Madresfield Court Grapes, Goshawk Peaches, Hunt Tawny Nectarines, Moorpark Apricots, Figs, Melons, and Plums; 2nd, Mr. J. Lloyd, gr. to V. STUCKEY, Esq., Langport, who had the same variety of Grapes, Humboldt Nectarines, Sea Eagle Peaches, &c. With six dishes, Mr. J. W. FLEMING, Rousey (gr., W. Mitchell), was 1st with good fruit. Mr. Mitchell had the best three bunches of Black Hamburgh Grapes, well balanced and finished. Mrs. TALBOT GAEAVES, Stoke Bishop (gr., T. Wilkinson), was 1st with three bunches of Muscat of Alexandria. The best three bunches of any other white, were Buckland Sweetwater, from Mr. W. A. Todd; and of any other black Madresfield Court from Mr. MITCHELL. Melons were numerous; the best Peaches were Stirling Castle and Hale's Early. Apricots, Moorpark, very fine from Mr. J. KENTISH; Nectarines Lord Napier and Pine Apple; Good Pears, represented by Jargonelle and Beurré d'Harid; Dessert Apples by Beauty of Bath, Red Quarrenden, and Astrachan; culinary Apples by Peasgood's Nonsuch, Lord Suffield, and others; Plums, Cherries, Gooseberries, and Currants, were in good character.

VEGETABLES, &c.

The soil in the Taunton district is evidently favourable to the production of good vegetables, though owing to the drought, they generally fell somewhat below their usual quality in the open and amateurs' classes. The best collection of eight varieties came from Mr. T. WILKINS; Mr. T. Harrison, gr. to Major ALDORTH, was 2nd. Mr. JOHN BLACKMORE, The Gardens, Holnicote, had the best six dishes of Potatoes; and as round and kidney varieties are required, and there is room for suspicion that the same variety can be shown in both characters, it is becoming requisite the distinction be abolished. Potatoes were well shown in several classes. Special prizes were offered by several firms for vegetables; the most spirited competition being in the case of the handsome special prizes offered by Messrs. SUTTON & SONS, Mr. T. WILKINS being 1st, and Mr. W. MITCHELL 2nd.

One cannot speak too highly of the cottagers' productions; plants, cut flowers, fruits and vegetables. They filled a large tent, making a high-class show in themselves.

In the way of miscellaneous collections, Messrs. KELWAY & SONS, Langport, had one of their fine collections of Gladioli, embracing a few distinct and novel varieties; Messrs. W. TUPLIN & SONS, Newton Abbot, had Gladioli, Dahlias, and other subjects; Mr. JOHN MATTOCK had pretty Roses; Messrs. JARMAN & CO., Taunton and Chard, had Dahlias, Begonias, and other interesting flowers; Mr. W. J. GODFREY, Exmouth, had an imposing bank of Cannas, Dahlias, hardy flowers, zonal Pelargoniums, &c.; Messrs. CLARKE & SONS, Taunton, Gladioli, Sweet Peas, Roses, &c.; and Messrs. R. T. VETTON & SONS, Exeter, choice hardy plants, including Gerbera Jamesoni, and other novelties, Carnations, and other cut flowers, &c.

BRITISH PTERIDOLOGICAL.

AUGUST 14.—The annual meeting of this Society took place at the Institute, Bournemouth, on the above date, under the presidency of Mr. CHARLES T. DRURY, F.L.S., V.M.H., and both as regards numerical attendance and practical results may be chronicled as the most successful yet held.

After a short address from the president, the usual formal business was rapidly despatched. The secretary's and treasurer's reports were both highly satisfactory, and a hearty vote of thanks was accorded to them, and to the officials generally for their conduct of affairs. Several new members were proposed and elected, and the only sad note which was struck was the announcement of the death of one of the vice-presidents, Mr. G. B. Wollaston, who, as one of the foremost authorities on British Ferns, and the possessor of one of the finest collections existing, could ill be spared from the ranks of the pioneers of native Fern-culture.

A large number of very beautiful fronds were exhibited; and also some splendid photographs, simple and stereoscopic, were shown by Messrs. Gott, Edwards, Troughton, and Lovelady, with a view to perpetuating in pictorial form some of the best types of Ferns, old and new. A new and very beautiful variety of Lady Fern was produced by Mr. Garnett, the raiser, and the name of *Athyrium filix-femina* var. *imbricatocristatum* was given to it. [Five words to a name!]

Subsequently the meeting practically resolved itself into a committee for the consideration of the best means of bringing the practical knowledge of the members into concrete record form in the shape of a list of the best varieties formulated under the auspices of the Society, and supplemented, as far

as possible, by reproductions of photos of selected forms. To this end, Messrs. Drury, Stansfield, Whitwell, Smithies, Forster, Phillips, Troughton, Wilson, and Edwards were elected as a committee; and Mr. C. T. Drury agreed to edit these fresh compilations, with a view to its issue to the members and others interested. The idea is to compile from all existing lists and catalogues a careful selection of really fine symmetrical forms, eliminating entirely those faulty ones which now constitute the majority in many collections and some lists; and the Secretary of the Society, Mr. Whitwell, of Serpentine Cottage, Kendal, or the President and Editor of the projected lists, Mr. C. T. Drury, 11, Shaa Road, Acton, London, W., would be happy to receive any contributions to this very desirable end.

Two very interesting papers were read by Mr. W. H. Phillips and Mr. C. T. Drury, on respectively "Lastrea filix-mas, its Past and Present Divisions," and "Own Finds and Specialties of British Ferns." An animated discussion followed their presentation, in which many of the members participated.

KIRKCUDBRIGHT HORTICULTURAL.

AUGUST 11.—The second annual show under the auspices of the Kirkcudbright Horticultural Society since its resuscitation was held in the Bontree Park, Kirkcudbright, the use of which was kindly granted by Captain John Hope, R.N.

The entries were so numerous that the committee, of which Mr. John Gibson, Town Clerk, was secretary, were obliged to extend their space beyond the limits provided. There was a fine floral display, and the effect was considerably increased by a choice selection of plants sent for exhibition from St. Mary's Isle, Balmac, and The Grange. Messrs. SMITH & SONS, Stranraer, showed a fine collection of Rose blooms.

In the open class, Mr. W. McGUFFEE, Balmac, took 1st prize with a fine table of pot plants; Mr. A. McHARDIE, Grange, being 2nd. Mr. JAMES ALLAN, Arundell House, Dumfries, was 1st for black and white Grapes; and Mr. W. THOMSON, Calby, 2nd.

ABBAY PARK FLOWER SHOW, LEICESTER.

AUGUST 8.—The executive of the Abbey Park Flower Show at Leicester did wisely when, instead of having their show on Bank Holiday, as last year, they, on this occasion, reverted to the old practice of holding it on Tuesday. Some who had entered did not put in an appearance, nor did they have the courtesy to inform the secretary they could not do so, hence empty tables were to be seen. This lack of courtesy, saying nothing about duty, appears, unfortunately, to be on the increase, and, as Mr. John Harrison observed at the luncheon to the judges, needs to be combated in some way.

Very large and roomy tents are needed at Leicester; there were some six in number, and despite the defect alluded to, they were generally well filled. Miscellaneous collections, which were both numerous and varied, occupied a great space.

GROUPS OF PLANTS (OPEN).

arranged for effect, were remarkably good; two of the best ever staged at Leicester competed. Mr. C. J. MEE of Nottingham was placed 1st, and Mr. ARTHUR DALE, Sheffield, 2nd. Both were rich in *Codiums*, *Dracenas*, flowering-plants, &c., each having a central cone surmounted by a noble Palm, and then radiating to the four points of the compass.

SPECIMEN PLANTS.

These are never strong at Leicester; the prizes are too low to bring big plants from a distance. Mr. H. Blakeway, gr. to P. A. MINTZ, Esq., had the best six; Mr. MEE was 2nd.

In the class for six Ferns the positions were reversed, some bold and striking specimens being staged. Tuberos-rooted Begonias were represented by fair specimens; single zonal Pelargoniums made a fine bank of colour, especially the plants shown by Mr. JAMES WRIGHT of Leicester. *Colerus* were bright; and *Fuchsias* consisted of small, well grown, and flowered specimens.

ROSES.

There is always a good Rose show at Leicester, and there were nine entries of thirty-six varieties, some seven putting in an appearance. It was the day of Messrs. ALEXANDER DICKSON & SONS, of Newtownards, Belfast, who descended upon the Midlands on an avalanche of success. They had good, clean, bright, well-developed blooms; Messrs. V. D. CROLL & SONS, representing Scotland, were 2nd. The same positions were observed in the class for twenty-four varieties; here again some brilliant red Roses and some glorious Teas were staged. The white *Maréchal Niel* was seen to the best advantage in one of the stands.

With twelve Teas or Noisettes, Messrs. DICKSON & SONS and CROLL again took leading honours. With twelve Roses of one variety, the Newtownards firm came in 1st with excellent *Her Majesty*. The best twelve Teas of one variety were Mrs. E. Mawley, also from Newtownards; Messrs. HARKNESS & SONS coming 2nd with *Maréchal Niel*. The best Rose in the show was a very fine one of *Maréchal Niel*, from Messrs. HARKNESS & SONS. Other cut-flowers comprised Begonias, Carnations. Messrs. CAMPBELL & SON, of Blantyre, being 1st with twelve Carnations, and also with twelve Picotees; and Mr. A. W. JONES, Handsworth, was 1st with twelve Fanny Yellows, which were so fine as to be a revelation to the Carnation growers of Leicester; Messrs. CAMPBELL & SON were 2nd. Carnations and Picotees were also shown as single blooms and in bunches.

TWELVE BUNCHES OF STOVE AND GREENHOUSE CUT-FLOWERS.

Mr. BROWN, Knighton Feth, Leicester, was 1st; and he also had the best twelve bunches of hardy annuals, placing a fairly wide interpretation upon the term, which the judges thought themselves justified in accepting. Fancy Pansies were shown in excellent character by Messrs. CAMPBELL & SON for the season of the year; and they also had a stand of twelve charming sprays of *Violas*, Show and Fancy, and *Cactus Dahlias* were also to be seen in good character.

One important feature was the huge bank of collections of hardy herbaceous flowers, each filling a space of 75 feet. There were five entries, Messrs. HARKNESS & SONS taking the 1st prize with a superb collection, only too much crowded to display the subjects to the best advantage; Messrs. J. COCKER & SONS, Aberdeen, were a good 2nd; but the others fell off somewhat in the matter of quality.

FRUIT AND VEGETABLES

was exhibited in some twenty classes. The best eight dishes came from Mr. Goodacre, gr. to the Earl of Harrington, Elvaston, who had fine Black Hamburgh, Muscat Hamburgh, and Muscat of Alexandria Grapes, Princess of Wales Peach, Pine-apple Nectarine, an excellent Queen Pine, fine Pear, and exquisite Lady Sudeley Apples; and 2nd, Mr. J. READ, The Gardens, Bretby Park, who had very good fruit.

In another class for the same number, Mr. GOODACRE was again 1st, having good Canon Hall Muscat and Black Hamburgh Grapes, Peaches, Nectarines, &c., and a highly-finished dish of Lady Sudeley Apple; Mr. McCULLOCH was 2nd, and Mr. READ 3rd. The four best bunches of Grapes were from Mr. McCULLOCH, and consisted of good-finished examples of Gros Maroc, Gros Guillaume, Muscat of Alexandria, and Madresfield Court Grapes—the latter well-finished. We think it was Mr. GOODACRE who was a close 2nd.

There were classes for a Pine-apple; also for Grapes, four classes being devoted to them. Peaches, Nectarines, Melons, Cherries, &c., with Tomatos, which is here included among the fruits; but the crowd was much too dense to ascertain particulars.

Vegetables were also shown in several classes, and generally in fine character; special prizes being offered by Messrs. SUTTON & SONS, HARRISON & SONS, C. WARNER, and others.

AMATEURS AND GENTLEMEN'S GARDENERS, AND FOR COTTAGERS.

Some very remarkable exhibits were staged in this section. There were prizes for plants, for fruit, for cut flowers, and for vegetables. It is doubtful if better vegetables are grown by cottagers in any other part of the country; and their bouquets of wild flowers were worthy of presentation to the family members of the Royal family.

MISCELLANEOUS.

Contributions were numerous and varied. Messrs. VEITCH & SONS sent from Chelsea a really superb collection of plants, which, through the limitation of space, was too much crowded; Messrs. W. CUTBUSH & SON, Hightgate, had a delightful collection of Iris in baskets; Messrs. HARRISON & SONS had vegetables and cut flowers; Messrs. DOBBIE & CO., Rothesay, Dahlias, Gaillardias, Sweet Peas, Pansies, &c., all very attractive; Mr. MORTIMER, of Farnham, had superb Dahlias; Messrs. CREAL & SON, of Crawley, had the same; Messrs. W. & J. BIKENHEAD, Sale, had one of their extensive collections of Ferns; Messrs. R. WALLACE & CO., Colchester, a bank of rare hardy flowers; Messrs. KEYNES & CO., Salisbury, Dahlias; Mr. W. BENTLEY, Leicester, Roses; Mr. J. WHITBY, Leicester, hardy cut flowers; Mr. A. W. JONES, about twenty bunches of charming yellow ground Carnations; Messrs. W. CLAPHAM & SON, portable rockwork, quite a useful object-lesson; Mr. G. H. ELLIS, Knighton Hayes, a charming group of plants, and probably others, unobserved through the crowded state of the tents. The weather being gloriously fine, the attendance was enormous.

SCOTTISH HORTICULTURAL.

JUDGING AND SHOWING GRAPES.

At the August meeting of the Scottish Horticultural Association, Mr. James Grieve presided, and there was a good attendance. The lecturer, a well-known expert in Grape-growing and judging, was present in person, and at once plunged into his double subject, either of which suggested topics enough for many lectures and discussions. Without going into many minute details, the lecturer touched on a few outstanding grievances which affect judges and exhibitors alike, and often force themselves into notice at our great shows. The exhibit at most of our shows have greatly improved of late years, while the classification and arrangement of the Grape classes have changed but little for twenty years, either in character or numbers. The Royal Caledonian, London, and nearly all other societies, adhere to their old rules, and it was left for Shropshire, at Shrewsbury, last year, to offer the largest prizes for Grapes, on the new plan of having these judged for the first time on the principle that every bunch is to be judged on its merits as a bunch of Grapes, irrespective of variety.

Mr. Buchanan's advice to all exhibitors was, always to show his very best Grapes. Never show a wretched bunch in the hope of picking up a 3rd prize. During the last twenty

* A paper read by Mr. D. Buchanan, Forth Vineyard, Kippin, August 1, 1899.

years he had seen many fine Grapes in the Waverley Market, and I had also seen some wretched examples in important classes. One of the first lessons exhibitors need to learn is the general appearance and features of a prize bunch. Once learn the lesson of ideal perfection, then might there be some chance of growing the bunches into prize form. As to mounting show bunches on boards, and carrying them safely long or short distances, choose firmly-built bunches to start with. Loose bunches are bound to sprawl about and get rubbed, bruised, or have their bloom swept off. The bunches should be placed at rather a steep angle on the boards, so that the weight of the bunch rests rather on the stem than on the shoulders. Then there is a right and a wrong way of placing the boxes in a railway-van. A railway-carriage moves and shakes sideways, rarely endways. If the boxes are placed so that the backs of the bunches are either to the engine or end of the train, the side-shaking of the carriage will set the bunches swinging like the pendulum of a clock, causing the side bunches to strike against the sides of the box, or otherwise damage them. The safest way to set the boxes is to put the backs of the bunches to the sides of the van.

We often see coloured paper put on the boards for yellow Grapes. This seldom does any good, and often gives the paper a greener shade than when pure white paper or cloth is used. White paper is the best ground colour for all Grapes. Yellow Grapes should never be placed at the end of a stand, but rather between two blacks.

Principles of Grape-judging.—These chiefly affect exhibitors, judges, and the manner of prize schedules. Many of our classes are a sadly mixed lot, and have been humorously compared to the pitting of race-horses against cart-horses. The highest quality Grapes can hardly compete fairly with those of larger size and deeper colour. Mr. Buchanan thinks that few judges can please themselves or do justice to the Grapes in these mixed collections; also that too much scope is left for the individual whims of judges. The judges are known to have antipathies to certain Grapes. Exhibitors despair of justice for such varieties. Judges are often named colour, size, finish, or flavour-judges, &c. Perhaps the greatest faddists are flavour-judges. He frequently gives 1st prizes to collections of Grapes beginning to shrivel, their footstalks already black, but being judged by quality-men; and Muscat Hamburg, they were placed first over fresh, highly-finished Alicante, Gros Maroc, Lady Downes, and others. Mere appearance is a lottery in regard to quality; such Grapes as Alouick Seedling being often less ripe than appearance would warrant.

Mr. J. Wright, writing of the difficulties of judging the race-horse and cart-horse Grapes together, advises some equitable mode of getting out of the difficulty, that neither late Grapes, Apples, or Pears, can be judged by flavour at our late summer or early autumn shows. They can, however, be judged by cultural excellency, and those that have the fewest faults should win.

Societies should still encourage the growth of the best Grapes, while also bearing in mind that for every hundred-weight of these there is probably a ton of Gros Maroc grown, perhaps the worst-flavoured Grape in cultivation. Each two or more sections of Grapes might be judged by themselves, and compete with its peers.

Some years ago at the Caledonian Society's autumn show a prize was offered for a white Grape different from Muscat of Alexandria. A bunch of Bowood Muscat took the prize, which Mr. Buchanan and others say is the same as the Muscat of Alexandria. At the next show an exhibitor was disqualified for having the Muscat of Alexandria and Bowood Muscat in his stand for four bunches. All the so-called varieties of Muscats, and Hamburgs, and Gros Marocs, and Cooper's Black, are one and the same things, or classes under different names. Some closer classification seems needful to prevent what seems like capricious disqualification.

Mr. Buchanan suggested the following changes in the chief classes of the Caledonian Society's chief Grape-classes:—

First, six bunches of Grapes, in not fewer than three varieties; and four bunches of distinct varieties. Now one of these collections should be shown and judged for quality only; and the other for appearance. Four distinct varieties for quality, and the other for appearance; or the flavour-class might be chosen from a list of eight or a dozen sorts well known for flavour. The quality, however, not to be determined by tasting, but through the special knowledge of the judges of the qualities of the flavour-classed Grapes. The six bunches class might be thus scheduled: For six bunches of Grapes not fewer than four varieties, superior cultivation and finish to be the first consideration.

This would still allow the quality Grapes to compete in this class, and enable such fine Grapes as Madresfield Court, Muscat of Alexandria, &c., to hold their own with the eye as well as palate class. Mr. Buchanan also suggested four varieties instead of not fewer than three, as at present. Also six bunches, three varieties, two of each, or eight bunches in four varieties. All these collections to be judged by points, for the education of young gardeners of the deeper interest of the public generally. Besides, the point method compels the judges to look more variously into the merits and demerits of each individual bunch. Where the point mode of judging is adopted, the maximum number of points allowed for the respective varieties should never be left to the judges to determine, but should be clearly stated in the schedule. Ten points ought to be allowed for Muscat of Alexandria, nine for several high-class varieties, such as Madresfield Court and Muscat Hamburg; while eight could be the highest for all others.

One advice as to the selection of judges. It may be thought this is not needed, as societies will surely select the best men. This is not always so. Judges are sometimes chosen

for the position they hold in their profession rather than for any merit or ability they have shown in the particular branch they are asked to judge. As well ask a man to judge your Chrysanthemums who has never grown one, as to judge Grapes who has never been known to grow or fruit a single perfect bunch in his life. The delicate art of Grape-judging can only be learned in the school of successful practice and ripe experience.

A most interesting discussion, and cordial vote of thanks, followed the reading of this fresh and informing lecture on Grape judging and showing, which may cause further discussion.

ANCIENT SOCIETY OF YORK FLORISTS.

UNDER the auspices of the above society, a floral service was held on Sunday evening, 13th inst., at Shipton. The church had been extensively and tastefully decorated with flowers and plants, kindly contributed by members of the society.

A large number of members and friends journeyed from York, and there was a crowded congregation. The pulpit was occupied by the Vicar, the Rev. Gordon Salmon, M.A., chaplain to the society, who preached an excellent sermon appropriate to the occasion, taking for his text, Isaiah, Chapter 61, verse 11—"For as the earth bringeth forth her bud, and as the garden causeth the things that are sown in it to spring forth, so the Lord God will cause righteousness and praise to spring forth before all the nations." He touchingly mentioned the sad loss the society had sustained through the terrible death of Mayor Barstow. The offertory was in aid of the Gardeners' Benevolent Institution. Flowers and other produce from the children and parishioners were given to the York County Hospital.

[The term "accumulated temperature indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London.

Principal Grazing, &c. Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending August 12, is furnished from the Meteorological Office:—

"The weather was rather disturbed over England and Ireland at the commencement of the period, some rain, thunder, and lightning occurring in the former country, and sharp thunderstorms and heavy local rains in the latter. After Monday, however, the conditions became fine and dry

in all parts of the kingdom and continued so throughout the week.

"The temperature was just equal to the mean in 'Scotland, E.' and 'England, N.E.', but above it again in all other districts, although the excess was much less striking than that of the preceding week. The highest of the maxima were recorded on varying dates in the different districts, and ranged from 83° in 'Scotland, E.' and 82° in 'Scotland, N.' and the 'Midland Counties,' to 76° in 'England, N.E.' The lowest of the minima were registered, as a rule, on the 10th, when they varied from 35° in 'Scotland, E.' (at Braemar), and 49° in 'England, N.E.' to 48° in 'England, S.' and to 60° in the 'Channel Islands.'

"The rainfall was again less than the normal, the fall being extremely slight except in 'England, S.W.' and over 'Ireland.'

"The bright sunshine was again very prevalent and much in excess of the normal, excepting in 'England, N.E.' The percentage of the possible duration ranged from 72° in the 'Channel Islands,' 49° in 'England, S.,' and 59° in 'Ireland S.,' to 41° in 'Scotland, W.,' and 31° in 'England, N.E.'"

MARKETS.

COVENT GARDEN, AUGUST 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.]

POTATOES.

Hebron, Puritan, Snowdrop, Up-to-Date, &c., 80s. to 100s. John Bath, 32 & 34, Wellington Street, Covent Garden.

REMARKS.—A consignment of Californian Pears in cases, consisting of Bartlett (Williams' Bon Chrétien) and Beurré Hardy, met a ready sale. These fruits were packed separately in paper, and arrived in good condition. Raspberries and Currants are nearly over. Runner Beans are slow trade, and prices have a downward tendency; the same may be said of all sorts of fruit now coming in, the supplies of which are plentiful. Excepting Gages, all other Plums quoted are of English growth. There were a few punnets of nice bright Strawberries on sale on Tuesday last, but there was no demand for them; the Pine-apples come from Madeira.

SEEDS.

LONDON: August 16.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's seed-market poorly attended, with but little business doing. Some general and copious rains are now greatly needed, to permit the sowing of catch-crops for forage. Meantime, Trifolium continues in short supply, and firm in value. Fair prices are asked for Mustard and Rapeseed. New Winter Tares and Giant Rye show good quality, and meet a fair inquiry. The Canary-seed market is firmer, whilst Hempseed keeps very scarce. Samples of new Blue Peas are now arriving. There is no change this week in either Spanish Lentils or Haricot Beans.

FRUIT AND VEGETABLES.

GLASGOW: August 16.—The following are the averages of the prices recorded since our last report:—Gooseberries, hard and green, 10s. to 14s. per cwt.; do., Sulphurs, 8s. to 11s. do.; do., red, 14s. to 18s. do.; Grapes, Guernsey, 7d. to 9d. per lb.; do., English, 1s. 3d. to 1s. 6d. do.; Almeida, 9s. to 14s. 6d. per barrel; do., Denia, 4s. to 8s. do.; Plums, 7s. to 10s. per half-sieve; Melons, Valencia yellow, 24s. 5s. 9d. to 6s. 6d. per case; 36s. 6s. 9d. to 7s. 9d. do.; Apples, American, 20s. to 22s. per barrel; do., English, 15s. to 21s. per cwt.; do., 7s. to 9s. per bushel; Peaches, home, 4s. to 8s. per dozen; do., small, 1s. 3d. to 2s. do.; Currants, Scotch, Black, 4d. to 5d. per lb.; do., red, Dutch, 10s. 6d. to 18s. 6d. per cwt.; do., English, 3d. to 4d. lb.; Greenhouses, quarters, 6s. to 7s.; and 5s. to 6s. per pad; do., halves, 10s. to 12s. (d.); Tomatos, Scotch, 6d. to 8d. per lb.; do., English, 4d. to 5d. do.; do., Guernsey, 3d. to 4d. do.; do., Valencia, 4s. to 5s. per case; do., French, 3s. 6d. per crate; Cucumbers, 2s. to 3s. cd. per dozen; Pears, 2s. to 3s. per sieve; Bananas, 9s. to 14s. per bunch, good; Lemons, Palermo, selected, sound, 12s. to 16s. per case; Messina, 14s. to 16s. do.; Naples, sound, 24s. to 30s. do.; Carrots, Dutch, 3s. 6d. to 4s. 9d. per hamper; Onions, white, 2s. 9d. per tag; do., Valencia, 4s. 3s. 9d. to 4s. per case; do., 5s. 4s. 6d. to 5s. do.; Cabbages, 9d. to 1s. 3d. per dozen; Cauliflowers, Edinburgh, 2s. to 2s. 6d. per dozen; Parsley, 1s. to 1s. 6d. per stone; Lettuces, round, 1s. 3d. per dozen; do., Cos, do.; Horseradish, 3s. per bundle; Mushrooms, 9d. to 1s. per lb.; Beetroot, 6d. to 9d. per doz.; Peas, 1s. 6d. to 2s. per stone; Potatoes, 8s. to 12s. per cwt.

CORN.

AVERAGE PRICES OF British Corn (per Imperial qr.), for the week ending August 12, and for the corresponding period of 1893, together with the difference in the quotations. These figures are based on the Official Weekly Return:—

Description.	1898.	1899.	Difference.
	s. d.	s. d.	s. d.
Wheat	33 8	24 8	- 9 0
Barley	27 5	22 6	- 4 11
Oats	20 9	17 9	- 3 0

CRICKET: "GARDENERS' CHRONICLE" v. SYON HOUSE GARDENS.—The return match was played at Syon on Saturday, August 12, and resulted in a win for the Syon House Gardens team, the scores being respectively 71 and 30.

TRADE NOTICE.

TRANSFERENCE OF NURSERY BUSINESS.

THE nursery business carried on at Larchfield, Dumfries, by the trustees of the late Mr. William Learmont, has been transferred to Mr. Learmont's only son, Mr. John Learmont, who will continue to carry on the business under the name of William Learmont & Sons. R. J. Arnott, "Standard" Office, Dumfries.

VARIORUM.

WE read that recently the lightning struck a rookery in Ireland, with the result that over 500 birds were killed.

ANEMONES: W. Price. If you mean A. coronaria—the Poppy Anemone, and A. hortensis a near ally, lift and divide the roots when the foliage dies down, and plant from September to February, if a succession be wanted.

BOOKS: S. W. Mr. Upcott Gill, 170, Strand, London, W.C., publishes a number of small manuals on the kinds of fruit usually grown on walls, at the price of 1s. each.

BOWLING GREEN: J. Harrison. The usual practice is to make the grass plot a dead level. We should think, that, with the "bias" always given the balls any deviation from the level would act injuriously on their intended course. The proposed hanging levels of 3 and 10 inches respectively, would certainly tend to make the bowling difficult.

CARNATION DISEASE: Brockley. The leaves are infested with eel worms which come from the soil. Another year sterilise the soil before using it by baking, or pouring boiling water upon it.

CARNATION ST. ANNIE: W. W. & Sons. We find little to admire in the colour of the flower, although ladies in search of a flower to harmonise with certain tints in dress materials might fancy it. The flower is full, and the petals are smooth and rounded, but in consequence of the heat its good points were not prominent.

DELPHINIUM PROPAGATION: Old Subscriber. Cuttings of the young shoots taken in spring or in autumn, after cutting down the old flower stems, and potted singly, will root freely if placed in a cold frame. The old plants may be cut down after flowering, when growths will proceed from the root stock; the whole may then be lifted and divided. Seeds may be sown in slight warmth in early spring, or in the open air in May.

FIGS DROPPING: D.M. The result probably of dryness at the root.

GAZANIA: F. H. Cuttings may be struck in pots of sandy soil placed in a close frame at this season, and in the spring in moderate top and bottom heat from soft cuttings taken from stock plants. For this latter, if no other exists, plants may be potted up from the flower beds.

GOOSEBERRIES WITH RED AND YELLOW BERRIES: R. Such sports are not uncommon. We frequently see black and white Grapes on the same cane.

INSECT ON CHRYSANTHEMUM: J. A. Only a fragment of your insect from Chrysanthemum arrived. It is some Hemipteron (plant-bug), in an immature state. Certainly more or less injurious, and may produce imperfectly formed leaves or flowers if it attacks buds.

INSECT: W. S. The caterpillar is that of one of the hawk moths. You can assure your lady that no harm will accrue from the presence of the creature on her arm.

IS LILIUM AURATUM AN HERBACEOUS PLANT?

M. We have received a telegram which is, of itself, perfectly unintelligible. On further enquiry, we conjecture that the original question was as to whether Liliun auratum is an herbaceous plant. Our answer is that depends. We have not the schedule before us (if there was a schedule), but, speaking generally, we should say Liliun auratum is an herbaceous plant. The telegram in question, owing to the cause above mentioned, could not be answered at once as requested.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—F. F., The Gardens, Broomhill, Mount Park, Harrow. No numbers affixed to specimens. Centranthus ruber, red; ditto, white variety; Spiraea Douglasii, pink-flowered shrub; Eschscholzia californica, yellow annual; Monarda didyma, red flowers; Centaurea montana, blue; Tradescantia virginica, blue. Copy of paper sent, money returned.—J. B. A good ordinary form of Cattleya labiata, and Odontoglossum Halli.—J. E. H. Cattleya granulosa.—S. E. A., Yorks. 1, Ceanothus azureus; 2, Lycium barbarum (Tea Tree); 3, Clematis flammula; 4, Inula glandulosa.—W. D. 1, Dicksonia antarctica; 2, Adiantum formosum; 3, Adiantum trapeziforme; 4, Davallia hirta cristata; 5, Adiantum cardio chlaena; 6, Cyathea dealbata.—J. M. L. The garden names of the Begonias sent are: 1, B. Prince Wallenstein; 2, B. incarnata purpurea; 3, B. Dregei; 4, B. Digswelliana; 5, B. Ingrami; 6, B. ascotensis. H. A. B. 1, Fuchsia coccinea; 2, Acer composte; 3, a hybrid Berberis—perhaps Neuberti; 4, Syringa Josikea; 5, Populus tremula—the Aspen; 6, Populus.—G. P. 1, Kolreuteria paniculata; 2, Spiraea Lindlei; no number, Gloriosa superba.—A. P. F. Anagallis cerulea.—R. K. Artemisia maritima, Hordeum maritimum.

ONIONS AND LEEKS IN COLLECTION OF SHOW VEGETABLES: P. W. These may be shown in the collection without risk of disqualification.

PAINT TO PRESERVE TOMATO AND CUCUMBER BENCHES OF WOOD: S. T. Gas-tar; anti-corrosion paint (Carson's), or red lead and boiled Linseed oil (no driers). Gas-tar is not injurious when mixed in the soil in which Melons are planted, and it was at one time in use in gardens, so that it is not likely to injure the roots of Cucumbers or Tomatos.

ROSEMARY AND LAVENDER PROPAGATION: Old Subscriber. Cuttings of new growth taken off with a heel forthwith will root in sandy soil, under a hand-glass placed in a partially shady place, not, however, choosing the north side of a wall. The soil should be kept moderately moist, and no air should be afforded till the cuttings are rooted, unless there are indications of damping off, in which case wipe the glass and afford air for a quarter of an hour on dry days once or twice a week. The cuttings may remain in the hand-light till the spring, protecting them against hard frost, and affording plenty of air in mild weather; or they may be potted up as soon as well rooted, and kept in coal ashes in a cold frame. Young plants will not stand much frost.

SENECIO: Old Subscriber. Propagation by means of seeds, division of the root stock, and cuttings of the roots and shoots.

VERBENA VENOSA: F. H. The plant may be struck under cool close treatment under a frame or handlight, and from the young growth taken from old plants started in heat, and by division of the roots. It may be grown from seeds sown in early spring. For propagating purposes, and to ensure a stock of the plant, some of the roots should be taken up in October, and placed in soil in shallow boxes, keeping them in a cold pit.

THE

Gardeners' Chronicle

No. 661.—SATURDAY, AUG. 26, 1899.

"MIMICRY" IN PLANTS.

IT seems to me that scientists are trying to "put the cart before the horse," in looking at "Protection" as the *rationale* of mimetic resemblances in animals and plants (see p. 111). Such may be a result in some cases, as among insects; but the feature occurs to so great and wide an extent in the animal and vegetable kingdoms, where no protection is possible, that one must look for a far wider cause than the one usually assigned. To take an example from among animals. The Marsupials of Australia, having been the sole group in that island-continent, have become differentiated into carnivorous, insectivorous, graminivorous, "flying," and other kinds of quadrupeds, imitating groups which belong to quite separate types of mammalia in other countries. Thus, the tiny, insectivorous, and pouched "Kangaroo-mouse" is indistinguishable in outward appearance and form from a true mouse, which is a rodent.

The interpretation appears to be, generalising from a vast array of facts, that similar habits of life have produced similar results, within the capabilities of the creatures' typical structures. Thus, a slow-worm resembles a snake in form and method of progression, but it is a "lizard," and no true snake at all. Again, all animals of sandy deserts are sandy-coloured, as may be seen in the large glass case in the entrance-hall of the Natural History Museum. Another collection illustrates the prevalence of white in arctic animals. These are brown in summer, but lose their colour in winter, clearly a result of the lowering of temperature, &c. The white fur may be said to be a protection, as it resembles snow; but then it applies equally to the prey and its foe, so that it is not easy to see where protection favours one more than the other.

With regard to plants, a study of their habits soon proves that outward resemblances are merely due to their growing in similar conditions. This is best seen in plants inhabiting districts with very marked features, such as deserts, in water, the arctic and alpine regions, &c. Plants of such well-defined regions are often characterised by having a certain common *facies*, or superficial similarity, though they have no affinity between them. Thus alpine plants are dwarf, prostrate, or often tufted, &c.; and where lowland plants are grown in high alpine regions they soon acquire a similar habit of growth.

In deserts a succulent or spinescent character prevails. Thus, the stems of Cactaceæ of Mexico resemble the fleshy-stemmed Euphorbias of North Africa and the Stapelias of South Africa; while Agaves are like Aloes, &c.

In aquatic plants the finely-divided submerged leaf of the Water Crowfoot is imitated

by that of Cabomba, Myriophyllum, some aquatic Umbelliferae, Ceratophyllum, &c.; but this is simply the result of living under water. Another aquatic type is ribbon-like. This is characteristic of Monocotyledons; it is really a phyllode or flattened petiole, as seen in the Arrow-head, which develops the sagittate blade on reaching the surface of the water. This type is seen in some Dicotyledons, as Lobelia Dortmanni and Hippuris.

In insectivorous plants the trap of Dionæa Muscipula, with the glands of Utricularia, are imitated in Aldrovanda; while the pitcher of Cephalotus, which is constructed out of the leaf-blade, is in outward appearance precisely like that of Nepenthes, which has issued out of an hypertrophied water-gland! There is apparently the same "lid," involuted margin, fringed external "guides," and glands sunk in the tissue of the inner walls of the pitchers.

Similarly in climbing-plants, the tendril of a Pea looks like that of a Vine; but while the former is made out of a compound leaf, the latter is a metamorphosed flowering branch.

The grass-leaved type of foliage is common to many plants besides Grasses and Sedges. It is familiar to all in Pinks and Thrift, and is found in the grass-leaved Pea, &c. It is simply the result of the habit of growth. Being crowded, the leaves are compelled to grow erect, and the linear form and internal anatomical structure follows, and thus the natural resemblance results.

Again, the minute adpressed leaves of Thuya, Cupressus, &c., are "mimicked" by alpine Veronicas of New Zealand, as well as by plants of the antarctic regions. The cause is the similar climatic conditions supplied by the localities where they grow.

Floral imitations are not infrequent. These vary according to their own laws, and are more or less independent of climatal conditions; but the same principle applies, of similar external causes giving rise to similar effects, whatever they may be, since it is now believed that the forms of flowers have largely depended upon the visits of insects. If the insects visit different flowers, the latter will assume similar shapes within the limits of their structure. Thus, the Labiatae resemble the Scrophularineæ; but the ovaries are so distinct in form, that this feature alone is sufficient to shut off any true affinity. The papilionaceous corolla of the Leguminosæ is more or less imitated by Polygala, the corolla of which has been styled "falsely papilionaceous." It is also seen in Collinsia bicolor, and Schizanthus, belonging to Scrophularineæ, and in some wild forms of Pelargonium.

Again, white or coloured bracts often do duty for a corolla; thus, species of Cornus with four large white bracts, having numerous minute flowers in the middle, look just like a Clematis; Darwinia tulipifera of similar structure, resembles Tulips, as the name implies. Lastly, Euphorbia jacquiniiflora has an involucre cup, with five scarlet appendages, which can readily be taken for a corolla. So, too, in fruits. The deadly Manchineel resembles a Pear; the fruit of the Egg-plant, of a Passion-flower, and a yellow Plum, look just alike, &c.

One might multiply these resemblances *ad infinitum*, and call them "mimetic;" but it is obvious that any notion of one kind protecting another which it may resemble, is quite out of the question. *George Henslow.*

NEW OR NOTEWORTHY PLANTS.

STANHOPEA FUERSTENBERGIIÆ, Krz.,
n. sp.*

A NEW Stanhopea is undoubtedly a matter to speak of. The new species is a sweet little thing, the flower being a little smaller than those of a medium-sized Stanhopea oculata. The whole flower is white, with only two rather large deep-crimson blotches at the very base of the lip. The two-flowered spikes and some other peculiarities put this plant very near to S. tigrina; but neither the overwhelming smell, nor the tiger-like colour, will attract attention. Being more showy than even the best forms of S. Martiana, the flower is perhaps the most attractive of all in this phantastic genus. The plant seems to be of free-flowering proclivities.

I received fresh materials from Baron Max von Fuerstenberg, Schloss-Hugenpoet, near Düsseldorf; and the head-gardener, Mr. Cremer, stated that the plant (and it is not a vigorous one) flowered several times successively in the months of May and June. Stanhopeas, speaking generally, are not in fashion, but that is not the case with a pure white-flowering species; and few persons will deny that this plant has its peculiar chaste charms. I dedicate this lovely plant to Baroness Mathilde von Fuerstenberg, the Baron's sister. *F. Kränzin, Berlin.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA GASKELLIANA.

A REMARKABLE form of Cattleya Gaskelliana, exhibiting peloria of a very marked kind, and which promises to prove constant, is sent by H. Cary Batten, Esq., Abbot's Leigh, Bristol, who says of it: "The flower I send is taken from a strong plant, imported by Messrs. Stanley-Mobbs & Ashton, of Southgate, and which has now produced ten flowers, all similar to that I send." The flower, which is large, has upper sepal and petals of the usual character, and of a bright, light rose colour. The lip, which is abnormal, is orange-coloured at the base, veined with white, and with the usual fimbriated purplish front. The lower sepals are each nearly as large as the lip, the upper halves of the usual character, and the lower halves orange and purple, and crimped like the labellum. Like all forms of the variety, it is very fragrant.

CATTLEYA LEOPOLDI.

A good example of the Pernambuco variety of this variable and floriferous species is forwarded by Mr. T. Parkin, Stackstead, near Manchester, who remarks that he obtained it as C. × Victoria Regina, the natural hybrid known to have been imperted with this form of C. Leopoldi. It has large, showy, well-shaped flowers; and the sepals and petals of olive-green tint, rose-tinged, and spotted with dark-reddish chocolate. The front of the lip is of amethyst-purple colour, the side lobes paler on the outside, and bluish-white inside. The plant bears a long succession of flowers.

* *Stanhopea Fuerstenbergii*, Krz., n. sp. (Eustanhopea).—Scapo bitoro, squamis et bracteis rhachin et ovaria aretissime cingentibus; sepalis dorsali oblongo-ovato obtuso leviter concavo, lateralibus ovatis subobliquis acutis, petalis paulo brevioribus semi-alatis acutis margine undulatis; labelli hypochilii late cymbiformi pectore obtuso; carina per totam longitudinem utrinque addita una carina semilonga; margine superiore hypochilii arguto, his omnibus in apicem hypochilii convergentibus; canali amplo lamellula parva transversa in orificia antice canalis; mesochilii brevis brachiis compressis aristatis; epichilio latissimo ovato-triangulo s. rhombeo medio excavato apice brevi triangulo deflexo; alis gynostemii late semioblongis cum alulis triangulis acutis continuis; anthera satis ampla antice apiculata.

Flores primum nivei deinde pallide straminei; hypochilium basi utrinque macula violacea ornatum; flores inter minores generis; sepalis 5.5 cm. longa, dorsale 2.5 cm., lateralia 3 cm. lata; petala subquadrilonga 2 cm. lata; cornua mesochilii 3 cm. longa; epichilium 2.5 m. longum et latum, hypochilium 2.5 cm. altum et latum. Patria?

ONCIDIUM DASYLE.

Although known in collections since 1872, when it was first imported from the Organ Mountains by Messrs. B. S. Williams & Son, of Holloway, this pretty species is seldom seen in as large numbers as the other species, such as *O. concolor*, &c., coming from the same region. It flowers at different times, but usually in the autumn and winter, at which season its graceful slender sprays of flowers are very serviceable. A fine example of it is sent by Mr. Wm. Murray, gr. to Norman C. Cookson, Esq., Oakwood, Wylam. The flowers in this example are about one and a half inch across; the sepals pale yellow barred with red-brown, the lip which is the prominent feature sulphur-yellow, with a prominent nearly black crest, giving a contrast which is very striking. The cool-house suits it best. *J. O'B.*

STRATHFIELDSAYE.

AMONG the numerous trees in the Park in which the Duke and Duchess of Wellington take great interest, there are some of such proportion and symmetry as to deserve mention, more particularly so as there is no record of the Conifers to be found in the report of the Conifer Conference.

Sequoia gigantea (*Wellingtonia*).—A noble specimen of the *Wellingtonia* is to be seen here. It was planted by the Duchess of Wellington on April 24, 1857. Measured in 1868, it had then attained the height of 24 feet 6 inches, with a spread of branches 44 feet in circumference, and a stem girthing 6 feet at 6 inches from the ground, and 4 feet 10 inches at 2 feet up. On January 12, 1872, it measured 30 feet in height, 8 feet 7 inches in girth at the base of stem, and 5 feet 4 inches at 4 feet from the ground, with a spread of branches 54 feet in circumference. It was measured in September, 1895, and found to be 71 feet 4 inches in height, 21 feet 6 inches in girth of stem at base, and 16 feet 5½ inches at 4 feet up, with a spread of branches 110 feet in circumference. Measured in August, 1899, it attained the height of 78 feet 10 inches, with a girth, at 4 feet up, of 19 feet 5 inches, with a spread of branches 115 feet in circumference. It is regularly pyramidal from the base. Some of the lower branches are bent downwards to the ground, and have taken root. In one or more instances the young layer has become detached from the parent trunk. It is to be hoped that these will be retained, as they add much to the beauty of the tree, and prevent it getting bare at the base. It is in the fitness of things that so noble a tree of this species should be flourishing at Strathfieldsaye. There is also a group of *Wellingtonias*, each about 25 to 30 feet high; as well as a fine avenue of these trees in other parts of the ground.

Cedar of Lebanon.—A fine Cedar in the pleasure-ground, much injured by storms, now measures 99 feet 11 inches in height, the girth of the stem at 3 feet from the soil being 17 feet 10 inches.

The Bentham Pine.—A noble specimen of the Bentham Pine, *P. ponderosa* (*Benthiana*), is in general outline very like *P. macrocarpa*, but the foliage is, of course, quite different. It is 70 feet in height, with a girth at 3 feet up of 4 feet 11 inches. There are also fine specimens of the Scotch and Weymouth Pines, and Silver Firs.

Abies Nordmanniana.—Height 69 feet 10½ inches; girth 4 feet 1 inch.

Taxodium distichum (*deciduous Cypress*).—Height 70 feet 7 inches; girth, 3 feet up, 11 feet 4½ inches.

The Silver Lime.—Among the deciduous trees at Strathfieldsaye is a tree of *Tilia argentea*, of fine proportions and symmetry. It measures 69 feet 8 inches in height, and at 3 feet from the ground girths 6 feet 2 inches. The under surface of the leaves is covered densely with milky-white down, and the young seed vessels are distinctly ribbed. This is the tree often called *alba* or *Americana alba*, but none of the American forms of *Tilia* figured by Sargent correspond with this

species, which is a native of Eastern Europe. *T. petiolaris* (including as synonyms *T. alba pendula*, *T. americana pendula*, and *T. argentea pendula*), is distinguished, according to Nicholson, by its warted fruits.

The Tupelo (*Nyssa sylvatica* var. *biflora*).—This is a beautiful tree of 70 feet in height, with a circumference of 14 feet 10½ inches at 3 feet from the ground, with slender pendulous branches and glossy leaves, about 4 by 1½ inches, paler beneath. In form, they are broadly lanceolate, or tending to oblanceolate, acuminate, and gradually tapering to a slender stalk about half an inch long. In autumn the leaves assume a brilliant orange and crimson tint. Reference to Sargent's monumental *Sylva of North America*, t. 218, vol. v. (1893), shows, so far as the leaves go, that the Strathfieldsaye tree belongs to the variety known as *biflora*, the *Nyssa biflora* of some writers, such as Aiton and Loudon. Sargent thus speaks of it:—"This is a tree 30 to 40 feet in height, with a tree gradually tapering upwards from a swollen and much enlarged base, many erect thick roots rising above the surface of the water, smaller and usually narrow acute or obtuse leaves, and flattened stones, with more strongly-developed ridges than usually occur on plants growing further north. . . . In habit, the Tupelo is one of the most distinct, variable, and picturesque trees of eastern North America; the autumn colouring of its lustrous foliage equals in brilliancy that of the Scarlet Maple, . . . while its immunity from the attacks of disfiguring insects and serious fungoid diseases heightens its value for the decoration of parks." It flourishes in wet, undrained soil, and on well-drained uplands. The tree is known also as Sour-Gum, Black Gum, and Pepperidge.

Fagus sylvatica asplenifolia.—Height 49 feet, girth, 3 feet up, 6 feet 10 inches. Viewed from a little distance this tree, with its delicately-cut leafage, may be compared to a huge Maidenhair Fern.

White Poplar, in new grounds.—Height 122 feet; girth, 3 feet up, 14 feet 10½ inches.

For information relating to these trees, we are indebted to His Grace the Duke of Wellington; whilst the measurements have been kindly furnished to us by Mr. McLattie, His Grace's able gardener. The Duchess has an interesting series of photographs of the above-mentioned trees, as well as of many others. *M. T. M.*

DAVENHAM BANK, MALVERN.

ON visiting this place, the residence of C. Dyson Perrin, Esq., a short time ago, I observed a very fine group of *Souvenir de la Malmaison* Carnations arranged on the floor of the conservatory. The plants ranging from one year old with one flower, to three years old with upwards of thirty flowers; the group showing upwards of 570 expanded ones. The plants were the picture of good health, and they had been grown in a span-roofed house, which was formerly occupied by Azaleas, where during the winter, they get plenty of light and air. Adjoining the conservatory is a stove, with a well-arranged fernery, having a mirror at the back, and water falling over the stones. This house contained some capital plants of *Adiantum Farleyense*. Since Mr. Charlton became gardener at this place many changes have taken place, Mr. Perrin being much interested in his garden. The cultivation of Pine-apples has been discontinued, and the pineries planted with Figs, Neetaries, and Frontignau and Royal Muscadine Grapes; the berries of the first-named Grape are exceptionally large for the variety. Melons are largely grown. The Madresfield Court Vines showed large, well-coloured bunches, with big berries. Some new Muscat Vines that have taken the place of the worn-out Vines are this year affording some capital bunches of Grapes.

In the Peach-cases good crops were remarked on young trees which have been planted within the

last four years. Orchids, which at one time were largely grown at Davenham Bank, have been curtailed in numbers, those which are the most serviceable for cutting being retained; including Tree Carnations which were laden with bloom at the time, and had been in flower since the winter. In an adjoining house were remarked *Streptocarpus* and *Gloxinias*, and hanging from the roof some well-flowered plants of President Carnot Begonia. In the kitchen-garden, old or worthless varieties of fruit have been cleared away, and better substituted, many being cordons. A capital fruit-cage, in which Cherry-trees and bushes of Gooseberries and Currants are cultivated, was noted. The Cherries are cordons with two and three stems apiece, loaded with ripe fruit. The Gooseberries, likewise in cordon form, were loaded with fruit. In the cool fernery at the end of the lawn, some fine clumps of the Killarney Fern, *Trichomanes radicans*, grow like weeds under the shade of Tree Ferns.

This garden, situated as it is at the foot of the Malvern Hills, is a charming place, and the manner in which it is kept reflects much credit on Mr. Charlton and his assistants. *W. S. H.*

HYBRIDS AND THEIR RAISERS.

(Continued from p. 154.)

THE HERBACEOUS PHLOX.—It is perhaps not easy to accurately determine the parentage of the two races of herbaceous Phloxes found in our gardens—the early flowering and the late flowering. The late Mr. John Downie, of Edinburgh, held that the former, with their more spare growth and glistening foliage, came from *P. suffruticosa*, which the botanists declare to be a form of *P. glaberrima*, an American species, which has bright green leaves glossy on the surface; and *P. decussata*, which we are told is properly *P. maculata*, also from America. *P. ovata* and *P. paniculata*, also American species, were probably remote ancestors in some part of the fine Phloxes of our day. The supposed descendants of *P. maculata* are of taller and more robust growth; the leaves thicker and rougher, though there are signs in some of the modern seedlings that the two races have become much blended.

About fifty years ago, Mr. Thomas Rivers brought before the public two varieties of *P. suffruticosa*, raised on the continent, which were figured in the September number of the *Florist* for that year, quite small in size as compared with the splendid varieties of our time. Six years later, Messrs. E. G. Henderson & Son, St. John's Wood, and Downie & Laird of Edinburgh, were putting new varieties into commerce, and among those which came from the Edinburgh house was Countess of Howe, a charming white variety of the early flowering section, which made a great reputation, as did also another white variety named Beauty of Pilrig.

From that time onward new herbaceous Phloxes have been constantly produced, mainly from abroad; and those who have had an opportunity of examining the collection in the Chiswick Gardens of the Royal Horticultural Society, cannot fail to be struck with the beauty of the new forms originated by M. Victor Lemoine, and others, and particularly to note the dwarf habit of growth of many of the later productions.

THE SWEET WILLIAM.

One can only imagine what *Dianthus barbatus* was like when introduced from South and Eastern Europe in 1573. Forty years ago, George Glenny said of the Sweet William grown in those days, that they had two faults—the flowers were mostly speckled all over, as though dusted with flour; and the edges of the petals were much serrated. More than sixty years ago Glenny published his properties of the Sweet William, but the florists of that time appeared to be of opinion that the flower was incapable of improvement.

Mr. Joseph Hunt, an amateur florist of High Wycombe, was one of the first to take in hand the

raising of improved varieties; and, adopting Glenny's properties as a basis, he originated the strain known as Hunt's. Some seed which Mr. Hunt gave to a neighbour, who was a cobbler, produced such fine varieties, that when shown by Mr. Hopwood at one of the meetings of the Royal Horticultural Society, they were awarded a Banksian Medal. This inspired Mr. Hunt with a desire to do something even better, and the result was Hunt's strain, with noble trusses, large smooth-edged pips, and the colours dense and pure. Later in time, the late Mr. William Dean introduced his Auricula-eyed strain, having the bold white centre peculiar to it. Since then improved strains have become common, and it is not difficult to meet with flowers of great size and substance, in a striking variety of colours. Messrs. James Carter & Co. have a very fine strain known as the Holborn Giant, and every seedsman of note has his peculiar productions also.

THE PENTSTEMON.

This fine plant, which for general garden purposes is more frequently treated as a biennial than it is as a perennial, has during the last quarter of a century been so greatly improved, that it is difficult to see wherein the present strains can be excelled, except in the direction of new colours and their combinations. The fine varieties of the present day represent the improved progeny of *P. Hartwegi* (*gentianoides*) and *P. Cobæa*. Fifty years ago, *P. Hartwegi* and its varieties were popular plants in gardens; but it is difficult to say who first commenced to improve the forms then grown. The Scotch florists have been active for years past in improving the strains, and M. Lemoine, Messrs. Vilmorin, Andrieux & Co., and others at home and abroad, have been equally active in the work, which improvements have, no doubt, resulted more from selection than from cross-breeding. *P. speciosus*, probably a form of *P. azureus*, which is blue-flowered, may, perhaps, be appropriately crossed on to the finer forms which are now to be found in gardens with advantage, only that the more tender character of the former might affect the constitutional vigour of the offspring. Strains of seed are now so high in quality, and the seedlings so fine, that naming in the case of English-raised seedlings is rarely resorted to. In Scotland, some of the leading raisers still name their seedlings, but in fewer numbers than formerly. *R. D.*

CH. VUYLSTEKE.

THERE are no keener cross-breeders than our Belgian friends, and no better judges of the merits or demerits of cross-bred products.

Among the more distinguished raisers, we may mention the name of M. Ch. Vuyksteke as one always to the fore. Crosses between *Azalea mollis* and the hardy Ghent *Azalea*, crosses between *Rhododendrons* in abundance; hybrid *Cypripediums*, such as "Zampa," raised between *C. Leezanum* superbum and *C. hirsutissimum*; "Jupiter," between *C. Boxalli atratum* and *hirsutissimum*; "Erato," between *C. Sallieri* and *C. hirsutissimum*; "Eucharis," between *C. insigne* Chantisi and *C. Lawrenceanum*; *C. villosum violaceum*, between *C. villosum* and *C. hirsutissimum*; *C. "Murillo,"* between *C. Boxalli atratum* and *C. Argus*; *C. loochristiense*, probably between *C. Harrisianum* superbum and *C. Hookeri*; "Zephyr," between *C. barbatum* and *C. Spicerianum*, these and many others, including a novelty named *Talma*, seen at the great show at St. Amand, Ghent, this year, testify to his zeal and industry.

Among *Odontoglossums* may be mentioned *O. loochristiense*, Rolfe, between *O. crispum* and *O. triumphans*. Of this there are many varieties, varying much in colour, and some very beautiful. *Odontoglossum Rolfei* was raised between *O. Pescatorei* and *O. Harryanum*; *O. crispum*, between *O. crispum* and *O. Harryanum*, which obtained a First-class Certificate at the Temple Show in 1898.

A series of very fine varieties, differing in colour and form, raised between *O. crispum* and *Harryanum*, and the inverse cross; *O. Pescatorei* and *O. Harryanum*, and inversely, may also be mentioned. Among these varieties may be named *O. spectabile* ×, *grandiceps* ×, *bellatulum*, *magnificum*, *zebrinum*, *carissimum*?, *urophyllum*, *reginum*, *salmonium*, *hirsutum*, *gratiosum*, *præstans*, *summum*, *supremum*. Many hybrid *Cattleyas* are about to flower, &c.

We only regret that M. Vuyksteke did not honour us with his presence at the Conference, nor enrich its records with the details of his experience.

TREE CARNATIONS.

In this section are included all the varieties most suitable for winter flowering. The term "tree" is rather misleading, as many of the varieties are of dwarf habit, and some of them are so nearly allied to the ordinary border Carnations that it is difficult to draw the line between them. I believe the varieties formerly grown were all of very tall

M. C. VUYLSTEKE
LOO-CHRISTI, GENT.

growth, branching freely up the stems. In selecting the most distinct types, there is a wide difference; the border varieties, though they may have long flower-stems, produce the side-shoots from the base of the plant only, and under ordinary conditions these side-shoots do not flower until the following season, while those of the "tree" section branch out all up the stems, and throw up flower-stems much sooner, the side-shoots being produced in succession, a longer flowering period is kept up. Even in the dwarf sorts this characteristic is noticeable. They are sometimes called perpetual, and though some flower for a long period, and by growing a succession of young plants of the same varieties, they may be made to flower throughout the year, but a succession of bloom from the same plants cannot be expected.

Some reference was made in the *Gardeners' Chronicle* a short time ago as to the origin. I believe that formerly the two sections were more distinct than those grown at the present time; and I find that those with the branching habit may often be found among seedlings from the

border varieties. I have also found many with exactly the border habit among seedlings raised from the tree section. Within the last few years a considerable number of new varieties have been added, yet it seems difficult to supplant some of the old varieties, particularly the useful pink variety, *Miss Joliffe*; this does not always prove satisfactory, but with a clean, healthy stock to work from, there is no other variety of the same shade of colour that gives such a long succession of flowers. *Mdlle. Thérèse Franco* is perhaps the next best of the same shade. Some growers have discarded the first named in favour of this, and I have seen it doing very well, but it does not produce so long a succession of bloom, and some who have grown it have now discarded it.

Of scarlet varieties there are a great number, out of which it will be quite safe to recommend *Winter Cheer* and *W. Robinson*. *Winter Scarlet* is very free and bright in colour, but the flowers are small. Of whites, it seems difficult to get a variety that will last many seasons. When Mrs. Moore came out, it appeared a promising variety, but after about three years it gradually weakened, and I have not seen it good now for several years. *La Neige* is a very free-flowering variety, but the flowers are small, and I find the plants are much inclined to die off, especially after heavy rains. *Deutsche Brant*, a newer variety, appears to have a better constitution.

Crimsons.—Since the introduction of *Uriah Pike*, a number of others have been added, the above being the pollen-parent of many of them. Countess of Warwick I should place first, the flowers being of a rich clear claret-crimson, with growth similar, though a little taller than *Winter Cheer*.

Yellow Varieties.—It is more difficult to recommend a good yellow than any other colour. When I first grew *Andalusia* nothing could have been more satisfactory, but it is now a long time since I saw it in good condition. *Pride of Penshurst*, though more nearly allied to the border section, is often grown for winter flowering, and I have seen it do well, and flower in mid-winter. I have also seen *Primrose Day* do well; and I thought when it was raised that it would prove the best yellow. I find, however, that many growers who gave it a trial soon discarded it. I find with all the varieties that they vary in different localities, and all are inclined to get weaker. The only way to keep up a vigorous and healthy stock, is to select the strongest and best for propagating from; and these should be grown out-of-doors through the summer, but taken under glass before the heavy rains come on in the autumn; and after they are taken indoors, plenty of air should be afforded, plenty of light and air, with just sufficient fire-heat to keep out frost, or to dry the atmosphere in wet weather, is all that is wanted. The only time a little extra warmth may be given is just before taking the cuttings (or pipings as they are usually called). Any that are not branching out may be stopped back; and a little heat will ensure some good pipings later on.

Propagation.—This section may be propagated February, as doing so affords time to establish at any season of the year, the chief thing being to get good pipings. I prefer to propagate early in good plants for flowering the following autumn and winter; and they usually root well at that season, as bottom heat can be given and the surface kept cool; but with care they may be done with equal success at midsummer. I have just had a batch potted off, it was not a very large batch, but almost every cutting had rooted. In one instance I find over 160 young ones from three stock plants (this was *Mdlle. T. Franco*). Although not the best time to start propagating, it is by looking after the stock at this season that good cuttings are obtained early in the year.

Success in propagating Tree Carnations depends in a great measure on paying attention to small details. Before starting to take cuttings, I like to have the house thoroughly fumigated, for if insects infest the cuttings, the latter are weakened very

much; care should also be taken that the plants are not dry at the roots, for if only slightly withered before they are put in, the cuttings take much longer to root, even if they root at all. I have always made a practice of using 48-size pots, and put twenty cuttings in each pot. I like to fill the pots nearly half full with drainage, and then fill them up with fibrous loam, peat, and sand in equal parts, with a little extra sand on the surface; the compost should be passed through a small-meshed sieve, and pressed moderately firm. If the soil is pressed too firmly, or it is used in a coarse state, the roots are liable to be broken off when potting off singly, which should always be done before the roots get matted together. The cuttings root best where there is a moist, cool atmosphere and a moderate bottom heat. For winter propagating, the ordinary indoor propagating-pit may be used, but during the summer a hot-bed is best, and if this can be placed under a north wall all the better. The frame should always be opened, and left open for a little while early in the morning, but must be closed and shaded before the sun gets on it.

Potting is a great item; the cutting-pots should be moist, but not too wet. When too wet the roots are liable to be broken off, and if very dry, the soil will all fall off. After being potted-off, they require to be kept close and shaded for a few days, after which air may be afforded, and after they are well established the more light the better. When repotting, a good, rich, loamy compost may be used; if the loam is devoid of fibre, a little peat may be added, but this is only necessary where the loam is close and heavy. In potting, care should be taken that the soil is pressed equally firmly from top to bottom of the pots, and left rough on the surface. I find there are many who, when potting plants, press the surface down firm, while underneath it is loose. It would be much better to reverse this, for pressing the surface firm prevents water and air passing freely. I may here add, that when using liquid-manure, it should be clear; one of the greatest difficulties I have ever had is to get men to use manure-water in a clear state. After taking care that it has been made long enough to settle down, I have found someone has been stirring it up before taking it for use. The harm the thick matter does is to form a coating on the surface of the soil, which effectually prevents air and water entering freely.

During the summer the plants should be grown in the open, but if provision can be made to protect them from heavy rains, it will be all that is necessary. Clear soot-water may be used frequently for syringing with; this will go a great way towards keeping the plants free from insects, and also strengthen them; the evening is the best time to use this.

By growing successive batches of plants, or stopping them at various intervals, Carnations may be had in flower throughout the year, but it is a mistake to suppose they can be forced into bloom. They may be hurried on a little by giving extra heat when they are in bud, but this weakens the plants very much. *A. Hemsley.*

REMARKS ON THE FRUIT CROPS.

(See Tables, ante, pp. 103 to 109).

(Continued from p. 147.)

5, SOUTHERN COUNTIES.

BERKSHIRE.—The Strawberry crop has not been such a poor one for many years; this is due, I believe, to the severe drought of last summer and autumn. The plants were on this account unable to make growth till very late in the autumn. I also think the scarcity of Apples, Plums, and Pears is due more to the drought than to frost. *A. J. Long, Wyfold Court Gardens, Reading.*

— Apples average crop, some trees heavy, others scarcely any; same applies to Pears. Many fell off during drought and great heat from May 24

to June 18. Cherries very heavy crop, clean, and of fine quality. I commenced picking outdoors June 10. Peaches and Nectarines heavy crops. I ought to state that my Peach-walls are covered with canvas blinds on rollers; this protection from spring frosts and wet invariably ensures a good set of fruit. Apricots rather thin—they were in full flower early in March; 10° of frost on two nights thinned them considerably. Raspberries a heavy crop, and finest fruit I have seen, "Hornet" and "Superlative" especially; these have been much appreciated this season for dessert. Strawberries generally a poor crop; this I conclude is owing to the dry season last year, the foliage being almost burnt up, and crowns failing to mature. Royal Sovereign and Noble were valuable as early crops, and being a dry time (middle of June), the flavour was delicious. Many of the newer varieties were very poor; and in making new plantations, I would advise that only proved sorts should be planted to any extent—Waterloo, Aromatic, Countess, and V. Héricart du Thury have done best here. St. Joseph is now (July 26) very useful; fair flavour and size. Bush fruits in abundance. Filberts rather thin; Walnuts cropping heavily. *O. Thomas, Royal Gardens, Windsor.*

— The present season has again proved disappointing in regard to the fruit crop. Of Apples we have a complete failure on orchard trees, but have a fair crop on small espaliers in gardens. Pears and Plums showed abundant promise, but were cut off by late frosts, as also were the earlier flowers of the Strawberry. Apricots are the worst crop that we have had for the past ten years, but they showed but little flower. Among small fruits, Raspberries were a heavy crop, but of short duration, owing to the drought. *J. Howard, Benham Park Gardens.*

DORSET.—Apples which at one time had the appearance of being a very light crop will, after all, prove to be an average one; whilst such free-bearing sorts as Prince Albert, Frogmore Prolific, Lord Suffield, &c., have required hard thinning. Pears on walls on warm aspects have a sprinkling, but scarcely any are to be found on pyramids and bushes. Victoria Plums on north walls are bearing good crops, but other varieties on all kinds of aspects are very scanty, and on trees in the open the crop is quite a failure. Sweet Cherries are but little grown, but Morellos are an average crop, and the fruits very fine. Peaches and Nectarines are a light crop, the strongest blossom being killed in March; and the same remark applies to Apricots. Gooseberries are the worst failure I have ever experienced. Strawberries were good, but required heavy root waterings. Cobs and Filberts good, and the bushes are very healthy. *T. Turton, Castle Gardens, Sherborne.*

HANTS.—The Apple crop in this district is a very good one. Trees clean, and not so many caterpillars as usual. Pears and Plums are much under average, owing to the cold winds and rain prevalent during the flowering period. Peaches and Nectarines very good here on open wall, and free from fly. We gathered the Waterloo Peach in the middle of the month of July. Now, as I write, Hales' Early are coming in fine fruit, measuring 9 inches; this is a grand Peach. *Arthur Lee, Palace House Gardens, Brockenhurst.*

KENT.—The feature of the year in this district is the Cherry crop, which has been magnificent. Apples are perhaps thin, but they promise to grow out and colour up, making excellent quality. Plums are nearly a failure, and Damsons will be very short; probably the shortest crops on record. *B. Champion, Mereworth, Maidstone.*

MIDDLESEX.—Apples and Pears are very good crops in places, while in others there are scarcely any. The late frosts we had in this neighbourhood may account for the failure in places, but I attribute the greater part to the crippling the trees had last season through the excessive drought. Most trees bloomed well, but the flowers were not perfect; in the Pears especially, a great many of the

flowers had no pistils. The failure of the Strawberry crop may be put down to the same cause. Trees and bush-fruits are making good, healthy growth, that augur well for another season. Heavy crops of Walnuts everywhere about here. *W. Watson, Harefield Place, Uxbridge.*

— Peaches and Nectarines never showed for flower better than this year; many blossoms, however, were imperfect, being void of the female portions, and to add to this failure, the severe frosts did great damage. Plums also showed well, but frosts again did the work of destruction. Cherries on our walls were never finer than this year, both in crops and quality. Pears again showed well, but were cut off; Apples, however, escaped. A very trying season on the whole. *James Hudson, Gunnersbury House, Acton, W.*

SURREY.—Although the bloom-promise on all fruit-trees was so great in the spring, yet again, as so often has been the case in the past, the fruit result is relatively poor. But because we have now a very good Apple crop, it seems right to assume that the primary cause of the poverty of the crop on Pears and Plums in particular was the exceeding coldness of the spring and many sharp frosts—weather which less affected Apples and bush fruits. Of the latter, there has been a fine crop, and Apples are fairly abundant and good. The Strawberry crop suffered first from spring frosts, and later from heat and drought, which cut it short. Raspberries have been abundant. Wall fruits are a very sparse crop generally, but there are some good exceptions. Small nuts are thin, but Walnuts are plentiful. *A. Dean, Kingston-on-Thames.*

— The fruit-crops in this district looked very good at one time, but the frosts in April and May ruined our hopes, Peaches, Nectarines, Pears, and Apples all being more or less in bloom at the time. Small fruits were a good crop. Of varieties of Apples which have good crops with me are Red Juneating, Lady Henniker, King Pippin, Grenadier, Fletcher's Prolific, Keswick Codlin, Lane's Prince Albert, Astrachan Red, Schoolmaster, Lord Suffield, Mr. Gladstone, Cox's Pomona, and Annie Elizabeth; others are more or less bare. *T. Osman, Ottershaw Park Gardens, Chertsey.*

— Pears are a very middling crop, whereas Apples are cropping fairly well, viz., the varieties Stone's or Loddington, which has never missed here, and is a grand autumn Apple; Wellington, Stirling Castle, Manx Codlin, Lord Suffield, Tower of Glamis, Lord Derby, Warner's King, Hormead's Pearmain, Golden Noble, Prince Albert, Allen's Everlasting, Bess Pool, Blenheim Orange Pippin, and Duchess of Oldenburg. *C. J. Salter, Reigate.*

— Apples, some trees loaded, others have not a fruit. The best are King of the Pippins and Codlins; Wellington, Sandringham, Lord Suffield, Bedfordshire Foundling, Prince Albert, Tower of Glamis, Gloria Mundi, Cellini, Duchess of Oldenburg, and Yorkshire Beauty extra loaded (same cropped heavily last year); both new and old Hawthornden, old trees of Blenheim Orange, Claygate Pearmain, an old stump, loaded. Orchard Pears a bad crop; cordons good, on walls extra; Durondeau, Pitmaston Duchess, Knight's Monarch, Winter Nelis, Josephine de Malines, Beurré Rance, Beurré Diel, Doyenné du Comice, Beurré d'Aremberg, Baronne de Mello, Louise Bonne of Jersey, Bergamotte d'Esperey, Beurré Duval, Fondante de Cuern, Vicar of Winkfield, including other sorts. *J. W. Miller, Rusley Lodge Gardens, Esher.*

— Apples are clean and good. Pears made a good show of flower, but weather partly ruined them at setting time. Plums showed flower in great abundance, but now there is scarcely a fruit to be seen. Gooseberries were frozen when the size of Peas. Currants of all sorts about average. Raspberries more abundant than usual, but flavour poor. Everything suffering for want of rain. Orchard trees are flagging in some instances. *W. E. Humphreys, The Grange Gardens, Hackbridge.*

— There was an abundant show of all kinds of hardy fruits, but the late frosts proved most

disastrous. May 26 the thermometer registered 27°; 27, 25°; 28, 27°; 29, 27°; this destroyed all the first flowers of Strawberries, and on June 15 the thermometer registered 27°; this destroyed the prospect of an average Strawberry crop. Orchard Apples are very good, the fruit being evenly distributed accounts for this, especially Wellingtons, Blenheim's, Warner's King, Keswick Codling, Duchess of Oldenburg, &c. *George Kent, Norbury Park Gardens, Mickleham, Dorking.*

SUSSEX.—Apple trees are more than usually clean, and the fruit good; many varieties are carrying a heavy crop. Pears—Trees clean, and crop of fruit clean and good. Plums—Trees far from clean, and many are fruitless. Cherries—Standard trees have carried a capital crop. Peaches and Nectarines—where kept clean, are a good crop. Apricots—Crop spoilt by frost when in bloom. Early Strawberries—Early blooms spoilt; and later, the dry weather has rendered the fruit small. Bush-fruit—Good and clean crop. *F. Geeson, Midhurst.*

— The scarcity of fruit in this district is the result of repeated frosts during the time the trees were in flower, together with the dry time which followed. The same remarks apply to Strawberries, but undoubtedly the plantations suffered severely by the excessive drought of last summer. Young plants growing on deeply-cultivated land have done very well indeed. We never had a finer lot of outdoor Peaches, they, too, being clean and healthy. *Richard Parker, Goodwood Gardens.*

WILTSHIRE.—Apples and Plums here, though the trees blossomed well, are quite a failure, the blooms being killed by frost. Strawberries, Gooseberries, Raspberries and Currants were an abundant crop. Peaches that were in full flower, and had 13° and 14° of frost for a week, have a fair average crop, and yet they had no protection whatever. Stone fruit-trees are making a strong healthy growth. *J. Trollope, Longleat Gardens, Warminster.*

— The prospects of the fruit crops generally in the beginning of March, were exceedingly fine; but the severe and ungenial weather, which set in on the 14th of that month, and continued till the 25th, the thermometer on several occasions indicating 17° and 18° Fah. Again, from the 16th to the 20th of April, the temperature receded to 25°. And again on the 5th, 6th, 27th, 28th and 29th of May (when the temperature declined to 27°), quite destroying all hopes of a prolific fruit year. The kinds which suffered most in this locality, were Plums, Strawberries, Apricots, Pears, and Apples. The trees of some of the more tender kinds of Apples and Pears were injured to such an extent as to become now almost leafless; and a great portion of the fruit that remains on some of the trees, is much disfigured. The cause of the crop of Apricots suffering more than that of Peaches, although equally protected, would appear to be due to the different stages of growth at the period of the inclement weather. The former had just set their fruit, and were consequently more susceptible to injury; while the latter had scarcely unfolded their blossoms. *T. Challis, Wilton House Gardens, near Salisbury.*

7, ENGLAND, N.W.

LANCASHIRE.—Strawberries as usual with us have been a heavy crop, and the fruit fine, the plants not having been affected by frost or drought. The first Royal Sovereign were gathered June 16, and the last of the same variety on July 26 under a north wall. This, Latest-of-All, and a local variety (Barne's Prolific), are the only sorts grown this year. Some large market growers complain sadly of the state of their crops. *Wm. P. Roberts, Cuerdon Hall Gardens, Preston.*

WESTMORELAND.—Apples of the following kinds are good, viz., Stirling Castle, Annie Elizabeth, King of the Pippins, Northern Greening, Keswick Codlin. Shy-bearing sorts have very few fruits. Small fruits and Plums are a failure, owing to the bullfinches; nets are no use against these vermin.

Strawberries were very fine, particularly Royal Sovereign, Empress of India, and Dr. Hogg. *W. A. Miller, Underley Gardens, Kirkby Lonsdale.*

8, ENGLAND, S.W.

CORNWALL.—The cold winds and late frosts during May did great damage to the Apple and Pear crops in East Cornwall. The promise was good, trees in many cases being well flowered, but blasting winds by day and frost by night spoiled what otherwise would have been a good crop. Amongst the varieties here carrying crops are Manx Codlin, one of the best; Blenheim Orange Pippin, King of the Pippins, a heavy crop. Cider Apples scarce. Strawberries have been good, especially Royal Sovereign. *Chas. Page, Boconnoc Gardens, Lostwithiel.*

DEVONSHIRE.—The promise of a fine fruit crop was destroyed by severe frost; on March 22 my thermometer registered 14° of frost. The first Strawberry bloom, Pear, and Peach, suffered alike; the Peach-tree leaves also suffered from blister. No doubt, the light crops are in some way due to unripened buds, and to two years of heavy cropping. The Gooseberry crop was an absolute failure in this part. Raspberries, Red and Black Currants are abundant, and good. *Geo. Baker, Membrand Hall Gardens.*

— With the exception of Strawberries, all kinds of fruit are plentiful with us and around the locality. The first-named kind of fruit was seriously injured by keen, cutting winds and frosty nights, and not more than one-third of a crop set. Royal Sovereign Strawberry is again fruiting nicely with me, after being forced, hardened, and planted out 2 feet apart each way. I have noticed this tendency the past three years, but not to so great an extent as this season. It is here a most remunerative Strawberry for forcing or outdoor cultivation, and I intend to increase the stock considerably. I have given Sir Joseph Paxton a fair trial, but it has proved a poor cropper, and I shall discard it, though in pots it is all that can be desired; President is a standard variety that never fails, and the flavour is excellent. Apple-trees are remarkably clean this year. Plums on walls are laden with fruit, and the trees free from spider, even on south walls. The same applies to Peaches and Nectarines on an east wall, from which I gathered ripe fruits of Alexander on July 13. *James Mayne, Bilton Gardens.*

— There was abundance of bloom, but a stormy day while the trees, &c., were in flower, followed by 10° of frost, almost spoilt the crop, and only trees in sheltered positions are carrying fruit. Peaches have suffered badly from blister, and some varieties from mildew—Dymond very badly; Royal George outside here is worthless, owing to mildew. *T. H. Slade, Poltimore Gardens, Exeter.*

GLOUCESTERSHIRE.—The fruit crop in this locality is only a partial one, owing mainly to the late frosts, and continued cold east winds. Apples are on the whole satisfactory, both in quantity and quality, our best are Keswick Codlin, Ecklinville Seedling, Hawthornden, Warner's King, King of the Pippins, Cox's Orange Pippin, Court Pendu Plat. Pears are in our own garden poor, but I have seen some fairly good crops in neighbouring gardens. Plums are nearly a failure in the open, and bad reports reach us from Pershore. Jefferson Gages, and Coe's Golden Drop on trees and walls are good. Peaches are a better crop than for some years past. The bloom was subject to 22° of frost on March 22, but the trees were protected by tiffany. *Geo. W. Marsh, Arle Court Gardens, Cheltenham.*

— I have had charge of these gardens for twenty years. The fruit promise this season was excellent—quite a good bloom in every respect, but the continued sharp frosts and cold winds have made it quite a short crop. The best Apples this season are—Blenheims, Flanders Pippin, Stirling Castle, Lord Suffield, Lord Grosvenor, the old Keswick Codling, Potts' Seedling, and Northern

Dumpling. Dessert—King of the Pippins, Worcester Pearmain, Early Margaret, Irish Peach, Tewkesbury Barron. Pears—Beurré Diel, Knight's Monarch, Chanmontel, Hesse, Bon Chrétien. In the villages round here, there is an average crop of cider and perry fruit. *Alfred James, Woolstone Rectory Gardens, Cheltenham.*

HEREFORDSHIRE.—The outlook in these gardens and about here for a general good all-round fruit crop is very good, especially so with regard to cider Apples in the orchards, notwithstanding that most of the trees are very old and very uncared for. Cordon Pears on south walls are a heavy crop, but are not so good in the open. Nuts, and especially Walnuts, are abundant. Early kinds of Strawberries were a fortnight later than for the past three years. Gooseberries and black Currants carried exceptionally heavy crops. *Thos. Plumb, Shobdon Court Gardens.*

MONMOUTHSHIRE.—Fruit-trees of all kinds blossomed abundantly, but the unfavourable weather experienced at that time crippled the bloom on Apple-trees in exposed places, and the greater part fell off. Such varieties of Apples as Duchess of Oldenburg, Mère de Ménage, Yellow Ingestre, Hawthornden, Cox's Orange Pippin, and Ecklinville Seedling are carrying heavy crops. Upon pyramid Pear-trees there are good crops of the following: Louise Bonne of Jersey, Easter Beurré, Williams' Bon Chrétien, Beurré Rance, and Beurré Diel. Peaches, Nectarines, and Apricots are very good, and required much thinning of fruit; trees clean and healthy. Plums have a fair crop on walls. Small fruits have been plentiful. Strawberries were excellent in every way. *W. F. Woods, Llansfreccha Grange Gardens, Caerleon.*

— Most of the blossoms of Apricots and Peaches were destroyed by 16° of frost, although protected with fish-netting. Plums upon walls are almost a complete failure, but as bushes, Victoria, Early Prolific, Early Transparent, and Jefferson carry good crops, while some others have fair crops. Pears are best upon walls, although some pyramid trees have good crops, viz., Bellissime d'Hiver, Beurré d'Amanlis, Beurré Fonqueray, Beurré Hardy, Emile d'Heyst, and Conseiller de la Cour. Apples in orchards are plentiful, and as pyramids the following are the most heavily loaded, Cox's Orange Pippin, King of the Pippins, Sturmer Pippin, Duchess of Oldenburg, Wealthy, Worcester Pearmain, Belle Pontoise, Bismarck, Bramley's Seedling, Cellini, Dumelow's Seedling, Grenadier, New Hawthornden, Lane's Prince Albert, Lord Derby, Lord Grosvenor, Nilton House, Sandriogham, Schoolmaster, The Queen, and Warner's King. Bushes of May Duke Cherry have heavy crops of fine fruit, some other kinds being thin. Strawberries were not so good as usual, doubtless owing to drought last season; Royal Sovereign, Leader, Gunton Park, and Latest-of-All were the best. Bush fruits are abundant; Superlative Raspberry and Gooseberries being exceedingly fine. *Thos. Coomber, The Hendre Gardens, Monmouth.*

SOMERSETSHIRE.—In early spring there was a good promise of all kinds of fruit; the cold and severe frost destroyed Apricots to a large degree. Pears appeared to set when the fruit attained a fair size; a large portion dropped off, and now there is a very small crop. The same may be said of Plums. It is strange to say we have the best crops of both these fruits on our north walls. Strawberries suffered from last season's drought. *J. Crook, Forde Abbey Gardens, Chard.*

WORCESTERSHIRE.—The Apple-crop is somewhat partial—heavily-laden trees in many places, in others none. Pears are a fair, clean, healthy crop, but now suffering from drought, and will probably be small. Apricot trees healthy, and fruit clean and good. Outdoor Peaches and Nectarines are a full average, with good foliage, and very satisfactory. Cherries have immense crops, of good quality—Morellos abundant. Strawberries the

worst crop for years past, chiefly owing to the drought of last season interfering with the development of the plant. Small fruits average crop and quality, but Raspberries soon over. The Loganberry and the Japanese Wineberry bid fair to be real acquisitions. *Wm. Crump, Madresfield Court Gardens.*

— It is many years since all kinds of fruit-trees were so healthy in growth. Apples are a good average crop generally, and the quality good. Some varieties are short of fruit, but others make up for any deficiency. The severe weather in March is accountable for the shortness of the Pear and Peach crops. Here, again, some varieties are carrying fine crops. Alexander Peach was gathered on July 12; Bellegarde and Dymond set splendid crops, although the weather was so unfavourable. Plums are variable, some of the varieties being laden, whilst others are carrying very few. Cherries and Strawberries, also all kinds of small fruits, are excellent. *A. Young, Willey Court Gardens, Stourport.*

WALES.

GLAMORGANSHIRE.—The fruit crop in this district is quite up to the average. Apples are very partial. In some gardens the crop is very poor, and in others it is over the average; moreover, the trees are clean. Pears looked very promising when in bloom, but owing to the cold winds prevailing at the time, a large quantity failed to set, and the crop as a consequence is under the average. *Richard Milner, Penrice Castle.*

— Most kinds of fruit-trees flowered well this year, but the cold winds and frosts prevailing at the time injured the Pear and Plum blossoms, and the crops of these are almost a failure. Apples, which were later in coming into flower, set well, and the crop is good in this district. Strawberries were good; but the season, owing to the drought, was much shorter than usual. *A. Pettigrew, Castle Gardens, Cardiff.*

MONTGOMERYSHIRE.—All fruit-trees are very free of blight. The fruit crop promised in the spring to be very heavy, but Pears and Plums are very thin. Peaches and Nectarines are the best crop outside I have known for years, and yet we had very sharp frosts at the flowering season. *Jno. Lambert, Pwlls Castle Gardens, Welshpool.*

PEMBROKESHIRE.—Apples are a splendid crop here this season, all varieties alike. The Pear crop was ruined by a sharp frost of 11° when the trees were in bloom, and but a few of the best-protected trees set an under-average crop. Plums are a failure from the same cause. Small fruits were also much injured by the sharp spring frosts. Black Currants were a very heavy crop. *Geo. Griffin, Slebeck Park Gardens.*

9, IRELAND.

DERRY CO.—We expected a good crop this year, as the season was rather late; but the frosts in May injured the flowers of both Pears and Apples. On some trees there are none, while on others there is an average crop; and I fear the quality will be but middling, as the spring was very unseasonable, with frosts and hail showers. *Jas. Lindsay, Drummond Gardens, Ballykelly.*

DUBLIN CO.—Very poor crop of all kinds of fruit in this neighbourhood except Peaches, which are plentiful, and promise well. The crops of Strawberries were good, especially such varieties as Royal Sovereign and Leader; the latter is an abundant bearer, splendid in size, and finely-coloured. *James Doran, Clontarf Castle Gardens.*

KILDARE CO.—The worst fruit year here for seventeen years. Apples, Pears, and Plums are almost a complete failure; and what fruit there is, is of poor quality. The continued east winds during May constituted the whole cause of failure here. Strawberries were ruined by rain, 4 inches of which fell in the first twenty days of July. *Frederick Bedford, Straffan House.*

LIMERICK CO.—Severe late spring frosts spoiled our good show for stone fruits as well as Pears. On March 22, 23, and 24, we had 11°, 14°, and 15° of frost respectively; also on April 16 and 18 we had 5° and 7°, with the wind N.W.; and on May 5, 6, 7, and 8, 2°, 4°, 4°, and 3° respectively, with the wind S.E. Much of the growth was injured by these frosts, and in many cases it was cut back; this was very marked in the case of Raspberries, whose canes were damaged at the tips, but the bottom growth escaped, and threw grand fruit. *W. A. Bowles, Adare Manor Gardens.*

TYRONE CO.—The fruit crops in this neighbourhood have been disappointing on the whole. In the early part of the season the prospect was very promising, the quantity and strength of blossom buds giving hopes of a heavy crop. This however has not been realised, owing principally to the inclement weather experienced during the following period. Early varieties of Apples, such as Duchess of Oldenburg, Stirling Castle, and the Codlin family, are carrying excellent crops; the same applies to a few early varieties of Pears, but the later varieties are not carrying more than half a crop. Plums and Cherries are only grown in small quantity. *Fred. W. Walker, Sion House Gardens, Strabane.*

WESTMEATH CO.—So far as the Apple crop in this district is concerned, it may be said to be almost a total failure, all standard trees are barren, a few dwarf trees on Paradise-stocks are however an exception, and promise to have an average crop of good fruit; Cox's Pomona, and Cox's Orange Pippin, being exceptionally good. All small fruits with exception of Gooseberries, are well over average, and are very good. *R. Anderson, Watertown Gardens, Athlone.*

WICKLOW CO.—Such varieties of the Apple as Ecklinville, Lord Suffield, Warner's King, Tower of Glamis, Golden Spire, Mère de Ménage, and other standard varieties, are carrying good crops of fruit. Plums, especially Victoria, Kirke's, and Denniston's Superb, are a good crop, but some of the newer varieties are sparsely fruited. All small fruits were abundant, and good. *D. Crombie, Powerscourt Gardens.*

CHANNEL ISLANDS.

GUERNSEY.—The past season was not a good one generally for fruit, and many trees which showed abundance of bloom have scarcely any fruit. There has been a great lack of good growing conditions, and as a consequence, insect pests have had a much better innings than would otherwise have been the case. The land was dry and unkindly for a long time, till good rains fell, which produced a good effect on vegetation. *G. Smith & Son, Caledonia Nursery, Guernsey.*

JERSEY.—The trees in the spring produced one of the finest shows of blossoms I have observed for some years, but a very scanty setting resulted; partly owing to the very cold nights with easterly winds prevailing at the time; and probably, also, owing to the effect of the dry season of last year upon the development of the fruit-buds. *H. Becker, Jersey.*

FOREIGN VEGETABLE PRODUCTS.

(Continued from p. 137.)

PAKHOI, CHINA.—*Liquid Indigo* is said to have been an important article of export during the year, amounting to 4,085 tons, valued at £40,610. The following is given as the mode adopted in the preparation of indigo in China, which is practically the same as the Indian practice. The plants, stems, leaves, and twigs, are thrown into tanks, which are filled up with water; in five days partial decomposition takes place, and they are all removed. About thirty caties of lime are now put into the green-coloured water, and mixed by means of brooms. Four men, now with rakes, begin to beat the liquid very gently for about half-an-hour, and as it goes on the colour changes

to a dingy yellow; but the froth, which thickly coats the tank, is bluish. A few drops of Cabbage-oil are poured into it, and the froth disappears on stirring. After standing a few hours, about two-thirds of the liquid is drawn off as useless, and the rest decanted into a smaller tank, where it settles in three or four days, till the colouring-matter is left at the bottom in the form of a thick paste of a beautiful blue colour. It is sold in jars containing 90½ lb. each, and fetches from 11s. to 13s. per cwt., according to quality. It goes chiefly to Shanghai.

CURAÇOA AND DEPENDENCIES.

Aloes.—A trifling quantity of Aloes came from the island of Aruba, and was re-shipped to New York, the only market where anything near the cost price of manufacturing could be obtained for the indifferent quality. Aruba, Bonaire, and Curaçoa could produce very clean and high grade Aloes were the price for such quality any better than that obtainable at present on foreign markets, where buyers give preference to the dirty or low grades on account of cheapness, and because those who handle this article abroad are able to obtain, by means of suitable machinery and process, the exact grade desired at a far lower cost than is possible in these islands. The low prices for this article have been yielding less, owing to the higher duties levied by the Curaçoa Government, and the producers and exporters have suffered greatly. In the island of Bonaire, where there are large tracts of land planted only with Aloes, the producers are unable to export any quantity for the above reasons, and the same is to be said as to Curaçoa. *J. K. Jackson.*

(To be continued.)

THE HOT-WATER CURE.

As occasion offered, I have experimented with heated water on a variety of plants, and have been able to determine the safe and efficient degree of heat for many kinds of plants. The degrees of heated water given below may be accepted as the lowest killing power at close quarters; the degree to be raised in proportion to the distance the operator stands from the subject under treatment. The water has been applied with a syringe fitted with a fine rose. The temperature given is that of the water in bulk.

AS AN INSECTICIDE.

American-blight on Apples	150°
Red-spider on Peaches and Nectarines	140°
Black aphid on Peaches and Nectarines	140°
Black aphid on Chrysanthemums	140°
White-fly on Tomatoes	130°
Green-fly on Roses	130°
Caterpillars of sorts on Brassicas	140°
Blight on Brassicas	130°
Asparagus-beetle on Asparagus	150°
Larvæ and eggs of same on Asparagus	140°
Blight on Beeches	140°
Hop-louse on Humulus	135°

STOVE AND GREENHOUSE PLANTS.

For thrips on Crinum, Eucharis, Alocasias, Hippeastrums, and numerous hard-wooded plants	140°
White-scale and other examples of scale insects in a young state on Phaius grandifolius, Lælia purpurata, Palms of sorts, and numerous hard-wooded plants	140°
Green-fly on Melons (mature plants), Cyphomandras, Withanias, and Mandevillas	130°
Mealy-bug on Mandevillas and Plumbagos	145°

The only insect I have not succeeded in killing is the "Blue Flea," infesting Brassicas; this pest, being provided with wings, and possessing extraordinary jumping powers, does not wait long enough for the spray to reach it.

AS A CURE FOR MILDEW ON VINES.

A slight attack of mildew was totally destroyed on a two-year-old seedling Vine growing on an open wall, with water heated to 180° F. The leaves and berries, which had just stoned, were quite free from injury. The berries are swelling freely. Some Muscat Vines, raised from last season's eyes, were syringed with water heated to 180° as a preventative of mildew, and they are also uninjured.

The killing degree of heated water for Vine mildew is far too high for most plants to bear unharmed; there is still what I may term a stopping degree, which, applied several times at intervals of a few days, may prove equally effectual in killing mildew on other plants by cutting off the means of propagation by spores. This, however, is only surmising. Notwithstanding the weighty opinions of many correspondents that hot-water (say 180° to 190°), is dangerous to Vines, I must establish the fact that that is not so, and this

GROOTFONTEIN.

I AM sending you several photographs which I have taken in the neighbourhood of Grootfontein, where I have been staying for five weeks. Although Grootfontein is situated under 19½° S. Lat., it is very cool now here; yesterday morning the grass was white with frost, and no wonder, as the whole district is situated 1200 mètres above the sea-level. I hope, therefore, that all the plants I send to Europe from here will succeed well in the open air in the warmer

FIG. 60.—*ABUTILON VITIFOLIUM*, IN MR. HARTLAND'S GARDEN, AT CORK.

Melhanian, the wonderful *Sclerocarya Schweinfurtiana* [Anacardiaceae], *Olea* species (I cannot distinguish it from *O. europaea*), *Laportea* sp., an enormous *Ficus*, *Erythrina*, *Cissus Cramerianus*, a large *Euphorbia*, very closely allied to *E. canariensis*, and several shrubs and fine trees, which I cannot determine, because I do not possess a single publication on the flora except Harvey & Sonder's *Flora Capensis*, which is, of course, no use here. The most interesting plants in this district are *Hyphene ventricosa*, which wonderful Palm forms a large forest three hours south of Grootfontein; *Cissus Cramerianus*, a vegetable monster, which not even the most learned botanist would recognise as a *Cissus* without seeing its flowers or fruits. The stem has often a diameter of 2 feet, and is 8 feet high, and as soft as a Beet-root. The third plant is the subject of photo No. 1. It has a soft stem 18 feet high, and is armed with brown spines, three together; the sparse branches look almost like those of *Euphorbia splendens*, and the leaves also are the same. The plant has no milky juice, neither flowers nor fruits are to be seen. No. 2 shows a group of *Sansevieria* sp., an excellent and the only fibre plant of the whole country; it is especially common in Otjozondjupa, but the longest and best leaves are yielded by those plants that grow in the half shade of bushes. Under cultivation, in fields properly worked, I dare say they would exceed 4 feet; a ton of clean fibre is worth £12 to £15, as a London house informed Missionary Eich in Otjozondjupa. The fibre is much easier to extract than that of *Agave rigida* (sisalana). I am sure that the production of this fibre will become a very important industry. No. 3 represents the above-mentioned *Ficus*, with a Termite building on the ground to the right of the stem. This *Ficus* always grows upon a dead tree, and is especially frequent upon *Combretum primigenium* (?). When young, it is completely parasitic. I found here an *Acacia*, which at 4 feet from the ground bears about a dozen *Ficus* suckers, which have evidently broken through the bark of the *Acacia* (as small offshoots of *Viscum* do when an old plant is removed without cutting also the branch upon which it lived). I never heard of or saw an example of parasitism of *Ficus* before, but I have not the slightest doubt that this is true parasitism.

The fourth object is a very hard-wooded tree, the *Omomborombonga* of the Hereró, *Combretum primigenium*, a sacred but most common tree, from which the Hereró nation and their oxen are derived, as they believe.

The fifth picture shows a group of the beautiful Fan Palm, *Hyphene ventricosa*, which forms an extensive wood, that necessitates twelve hours to traverse in its length, and six or seven hours in its breadth. The soil in which the Palm grows is a deep sandy soil. I believe that it will stand the mild winter of the Riviera if thorough drainage is provided. I have sent a great quantity of seeds, some in their shells, some without them, to Messrs. Haage & Schmidt, Erfurt, for sale. I wish to add only, that the five subjects of the photos are all plants characteristic of the flora of the Hereróland. There are several others (*Birchemia discolor*, *Copaifera Mopane*, *Diospyros mespiliformis*) which I have not seen yet; they grow further north, and you shall receive photos of them later. I intend to go before the beginning of the summer in a northeasterly direction over the Okavango, and to accompany one of our elephant-hunters, Mr. Erikson, to a district in the interior, where a Kautschouk plant is growing. *Karl Dinter*. [We greatly regret that the photographs alluded to are not suitable for reproduction. Ed.]

ABUTILON VITIFOLIUM.

IN the spring of the year, Mr. Hartland, of Cork, sent us, as has been his wont in former years, specimens of this beautiful shrub. It is a native of Chile, but is hardly enough in the south-west of Ireland, as it forms a bush 30 feet in height and

matter can be proved by anyone who cares to experiment upon a Vine or any portion of one.

Since the above was written, I have copiously syringed some Roses with water heated to 160° on three occasions. The mildew has ceased to spread, but I am not sure that it is quite dead. I enclose some of the leaves of Roses thus treated, apparently uninjured. Perhaps the Editor will venture an opinion upon them? [Slightly injured. Ed.] The mildew has not turned brown and black, as was the case with the Vine-mildew. Should the mildew prove to be dead, it may be hoped that others will be induced to conduct further experiments. *G. B. Mallett, Isleworth.*

spots of the Riviera. This country, the Hereróland, is one of the most excellent in South Africa for cattle-farming and agriculture; in comparison with it, the central and southern Namaland is a desert. Here all cereals can be grown in the rainy summer season, and to any extent, because the average rainfall is 450 mm. (in Namaland 180 mm.), and consequently sufficient to ripen even Kaffir-corn (*Sorghum*), without any artificial watering. Almost the whole country consists of flat, grassy plains of deep sandy humus soil, and here and there are ranges of densely-wooded limestone hills. The forest vegetation is a most interesting one. It consists of three species of *Combretum*, *Terminalia prunioides*,

25 feet in diameter. The whole plant is covered with soft velvety down, as is the case with so many of the Malvaceæ, and the leaves are deeply and sharply lobed, whence the specific name. The flowers are lavender-blue, very freely produced, as our illustration shows (fig. 61); so that the shrub is one of the most desirable for sheltered localities in the western and southern counties. We have no experience of it near London.

DIANTHUS KNAPPI.

Of recent introduction to our gardens, this little species will rank as a welcome addition to the rockery. Being of dwarf habit, and scarcely ever exceeding nine inches in height, it is admirably adapted for small rockeries, for which its unusual colour and free-flowering habit are sufficient recommendation. The individual flowers, which are about $\frac{1}{2}$ inch in diameter, are in colour of a clear sulphur-yellow, slightly fringed, and possessing an agreeable fragrance. They are borne in terminal clusters of from five to nine flowers, on long slender stems. Its leaves are linear lanceolate, and of a glaucous green colour. The plant can be grown in any good garden soil, and be readily increased by means of cuttings or from seeds. *E. S., Woking.*

HERESIES.

(Continued from p. 123.)

I wish, Mr. Editor, you would have put forward the little fiction, "Space is very scarce this week" [It always is, Ed.], when I might have rested, at least for a time, from heresy-hunting. What lots of old-fashioned varieties of vegetables, fruits, &c., we have put away in our lumber-rooms never to be brought out again—no, never; and yet their ghosts, or the memory of the things themselves haunt us intermittently as the seasons come round. Concerning Potatoes, many persons whose memories are, unfortunately, portentously lengthy, who go back to the forties and fifties more readily than to the day before yesterday, can call to remembrance the true Ashleaf Kidney and the next best, the Walnut-leaved or Egyptian Kidney, a little less early than the first-named, with foliage resembling the Walnut, glossy and bright green, whose tubers were "knobly," a variety that very certainly knew not Egypt. For flavour and nice firm consistency, the true Ashleaf tops the list. Somebody said at last, as a new discovery of course, that it was a "light cropper," and light cropping in Potatoes had begun to be looked upon in much the same way as original sin, only with more immediate consequence, and in the course of a few years the gardener who grew the Ashleaf was dubbed a person incapable of properly appreciating the grand qualities of the new race of Potatoes then coming along to supply the markets. These last were certainly sadly needed in those days, in view of the increased consumption of the tuber, and the disease-resisting constitutions of the new varieties. But why cast out of the private garden our tried friends, the varieties I have named, and others besides almost as excellent, namely, the Lapstone Kidney, Early Shaw, York Regent, and, I might add, Hundredfold, a productive variety, coming into use in September, keeping well, with flowery, rather firm flesh, of good quality? Some of my critics will say that the colour of the skin is against it, and the eyes are deep; but as we do not eat the skin, or even serve up the tubers unpeeled, and as a handy maid can clean out the eyes of a tuber without much loss of its flesh, these things are of no account. Some of us who confess to a liking for Potato-salad, as made in Germany, which is a more wholesome way of consuming cold Potatoes than frying them, should obtain the Vitelotte Potato, or the Fir cone, a violet-coloured cylindrical tuber with very deeply-set eyes, that rather detract from its usefulness. The flesh is firm when cooked, and a tuber may be cut up in thin slices like a Cucumber. The white Sausage-potato of the French, has flattened tubers,

sometimes broader at the base than at the top; flesh yellow and firm, and equally useful for making salad. It is good from September onwards, and is more economical in use than the preceding one. These varieties, where Potato salads are enjoyed, might be grown in moderate quantities in any private garden.

Raspberries.—Almost everyone is fond of Raspberries as dessert, and those who can afford the space should grow the fine yellow-fruited varieties, Sweet Yellow Antwerp (not Yellow Antwerp), and October Yellow (Merveille de Quatre Saisons Jaune). There are other yellow Raspberries, but they are inferior to these two.

Apples.—It is many a year since the writer tasted a fruit of the Summer Golden Pippin, a delicious little Apple, bearing abundantly as a standard in the neighbourhood of London. The variety does not seem to be much cultivated. Why is this?

If I were planting an Apple-orchard I would plant two trees of Keswick or of Maux Codlins for one of Lord Suffield and Lord Grosvenor, the first two being the more regular bearers, although they are probably not such great fillbaskets as those. In my opinion, no orchard of any size should be without a tree or two of the Margaret Apple (early Red Margaret, Striped Juneating, &c.). It is a first-rate dessert fruit, ripe in the beginning of August. It is not to be confused with the Joaneting. The tree is quite hardy, and crops well. Many persons would prefer the fruit to that of the showier, but more acid Worcester Pearmain. *Growler.*

(To be continued.)

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By G. R. FIELDER, Gardener, St. James's House, Malvern.

Hipecastrans (Amaryllis).—Plants that flowered early will now have completed their growth, and shading should be discontinued, and the plants exposed to the full sunshine in order to mature and ripen the bulbs. Although the bulbs should not be prematurely dried off, it is necessary to note at once when a plant has quite completed its growth, and is preparing to go to rest. This is indicated by the absence of young leaves in the centre of the plant, and by the oldest leaves beginning to turn yellow, and when this is seen, the amount of water should be gradually reduced, and ultimately withheld altogether until the plants are started into growth again. Later plants which are still in full growth should be afforded plentiful supplies of water, and an occasional application of liquid manure. A good syringing morning and evening will help to keep Thrips in check, and afford the necessary atmospheric moisture.

Carnations.—The earliest plants which were layered in frames in accordance with instructions given in a previous calendar, should be examined, and if the layers are found to be sufficiently well rooted, they should first be severed from the plant with a sharp knife, and then carefully lifted and potted into small pots, affording them a compost consisting of two parts good turfy loam, one part flakey leaf soil, and some sharp silver sand. After potting, the plants should be afforded water, and be placed in a cold frame, and kept somewhat close until they begin to make roots in the soil, when the shading may be discontinued and the lights removed.

Richardia africana.—Plants which have been dried off and rested out-of-doors, should be repotted forthwith. In doing this, turn them out of the pots, shake the soil from the roots, and re-pot the largest rhizomes singly in 6-inch pots in a compost consisting of three parts loam, and one part rotted manure. The smaller offsets must be removed, and if necessary, may be utilised to increase the stock, either by potting them singly in small pots, or placing three or four in a 6-inch pot. After being potted, place them in a cold frame or pit, and afford sufficient water to keep the soil moist till the plants are rooting well, after which they may receive water more freely.

Euphorbia (Poinsettia) pulcherrima and *E. Jacquiniflora*.—These plants should be fully exposed to the sunshine from the present time onwards, in order to mature the growth. Poinsettias should be turned round occasionally, in order to prevent the plants growing in one direction only, which would compel stakes to be employed. The latest plants should be placed in their flowering-pots which for the largest plants need not exceed 6 or 7 inches in diameter; while useful decorative plants may be grown in 5-inch pots. *Euphorbia Jacquiniflora* is most useful and floriferous when in small pots, and need not be grown in larger than 4½'s; or several cuttings may be struck in an 8-inch pot, and treated as one plant, not separating them.

THE KITCHEN GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet.

Mushrooms.—Any beds made in a cool-shed, or on the north sides of walls and buildings, should be examined three times a week, and the useable esculents gathered, leaving none at this season to grow to a large size, as these are sure to get fly-blown. The beds should be afforded plenty of tepid water, and the place, (or at the least the beds) darkened. With these attentions good crops may be grown in and out of doors, during the warm weather. After this date, a quantity of stable-dung should be thrown into a heap, which must be turned over several times in order to allow some of the ammonia to escape, but by no means all, and then a bed or beds may be made up in the Mushroom-house. It is very necessary that the materials should not get dry and mouldy, but these should be made into a bed whilst they are still fresh and capable of becoming heated to 98°. That point being reached, but not exceeded, the beds may be spawned and covered over with loamy soil, a thermometer being inserted for ascertaining the temperature. If the heat should rise above 98° after spawning, no covering should be placed on the bed, but a few holes should be made with a smooth stake all over the bed at about 1½ ft. apart. The heat will then decline to a safe point, and that stage reached the holes must be plugged up again with horse-dung quite to the bottom, and if necessary some clean straw may be laid on the bed. The warmth of the house ought to be kept under 60°.

Growing Crops.—The only thing which the gardener can do whilst the drought lasts, is to afford as much water to the crops as time and labour will allow. The plants most in need of water are Lettuce, Endive, Cabbage, Celery, Celeriac, Cauliflowers, plants whose roots do not go far down in the soil; Dwarf Beans not being overlooked. Late sowings of these should be heavily mulched, and occasionally afforded liquid manure. Autumn Giant and self-protecting Cauliflowers are standing the dry weather very well, but early varieties have suffered greatly.

Potatoes.—All early crops should now be lifted and stored in a dark, cool cellar, or in a shed in a shady place. The sets should be laid out thinly for the time-being in any cool place, not omitting to label each lot correctly, and to make notes of the best varieties, having regard to cropping and flavour.

Peas.—All spent crops should be cleared off, and the sticks packed away if possible in a dry shed.

Salading.—Seeds of Corn-salad, Mustard, Cress, and Radishes may still be sown weekly, first affording water copiously to the soil, and again when the seeds are sown, covering the beds with mats till germination takes place. Chervil is a herb much in demand in some gardens, and a bed may now be sown on a warm border, the soil being kept moist. It is advisable to sow in drills at 9 inches apart, and not very thickly. Of Corn-salad, a good breadth should be sown forthwith; it will prove a useful addition to the salad next spring. The drills should be drawn 8 inches apart, and the seedlings thinned to a distance of 6 inches apart.

FRUITS UNDER GLASS.

By W. STRUGNELL, Gardener to Lieut.-Col. RALPH VIVIAN, Rood Ashton, Trowbridge.

Peach-Trees in Pots.—Where convenience exists for forcing Peach-trees in pots, such trees afford an easy means of securing an early crop of fruits—more easy, in fact, than from trees planted in borders. Those trees which fruited last spring, and are now maturing their growth outdoors, will

soon be in a condition to be re-potted if necessary. It is better for the repotting to be carried out while the foliage still remains on the trees, as then early re-establishment is certain. The first thing to do is to remove the crocks, and disentangle as many of the roots as possible without bruising or breaking them, shortening any that are long and thong-like. The new pots should be large enough to permit of a lining of new soil of about 1 inch in thickness all round, which should be made very compact with the potting-stick as the work of filling proceeds. The best kind of soil for this purpose is turfy-loam, with a small proportion of charred garden-refuse and old plaster broken into small pieces. After potting the trees, syringe them every day once or twice for a month. These, as well as others not requiring to be potted, should be carefully afforded water in accordance with their needs. The trees should be turned round once weekly, to prevent the roots that may have penetrated the soil, or the coal-ashes on which the plants stand, from getting a strong hold of the same. Let sufficient space be afforded for the sun to reach every part, therefore do not place them in shady places, or under trees, but in the open.

Trees standing in Borders that have ceased to grow, must still be kept clean by frequent syringings, applying dressings of flowers of-sulphur, as a remedy of use against red-spider and mildew. If scale infests the trees, water heated to 140°, with a small quantity of petroleum added, will annihilate the pests, and by destroying them at this season, nothing further will be needed in the winter. Before syringing the trees, let all superfluous shoots which may have escaped the earlier prunings be removed forthwith. Unless the syringing of the foliage is well directed, red-spider congregates on the upper surface of the leaves, and some force is necessary to dislodge it, and this is an important matter. If on examination the border is found to lack moisture, afford clear water copiously, as a good deal of root-growth takes place at this season; moreover, a dry soil favours the spread of red-spider and mildew on the foliage.

The Grape room.—The bottles used to keep bunches of Grapes in should be cleaned and got in readiness, and the racks on which they are placed rendered clean and sweet. A Grape-room is handy even at this date for storing the remains of an early crop of Grapes when a partial pruning of the Vine is called for, or wasps are troublesome in the vineary.

THE FLOWER GARDEN.

By A. CHAPMAN, Gardener to Captain HOLFORD, Westonbirt Tisbury, Gloucester.

Propagation of Trees and Shrubs.—From the middle to the latter end of this month is the best time for the propagation of trees and shrubs from cuttings and layers; and if the former method is adopted, young shoots about 1 foot long of the current year's growth should be made and placed in beds or borders which have previously been well dug over; some leaf-mould and sharp sand being worked in during the digging. The cuttings may be placed rather closely together, and plenty of sharp sand strewn along the drills. It will be advisable to afford the beds a slight sprinkling of water occasionally, and they will then root freely, and will, in consequence, withstand the severities of the winter well; most cuttings should be taken off at a joint, or with a heel of older wood. The golden, silver, and variegated forms of most of these are too delicate in constitution to winter in borders, and should be struck in boxes or under hand-glasses, and protected in some manner, or be placed in cold frames. Cuttings of Juniperus, Retinosporas, Thuyas, Thuyopsis, Cryptomerias, and other evergreen species, should be taken from last year's growth, with a small portion of the previous year's wood, and they should come from the outer branches of the trees, or the wood will not be sufficiently mature, and will damp-off or die. A cool position, or a north border, suits Conifers; but for greater safety, they should be put into cold-frames or hand-glasses, frosts heaving the cuttings out of the ground. Magnolias, Cotoneasters, Berberis, Dogwood (Cornus), &c., are easily propagated by layering shoots growing conveniently near the ground, all buds being removed excepting a few near the top of the stem. Tying these layers on the under-part helps the rooting, as does a sharp twist; and this operation being carried out, peg down the layers firmly, and cover with soil to the depth of 3 or 4 inches.

Pentstemons.—As these varieties that possess the prettiest colours are not capable of standing much frost, it is advisable to take cuttings not later than the end of this month, these being struck under hand-glasses or cold frames, remaining undisturbed therein till March. A good compost for the cutting-bed consists of rich loam, leaf-mould, and sand, which should be mixed altogether, and passed through a sieve having an inch mesh. Let this soil when put into the frame, &c., be pressed firmly, and made smooth, and over all sprinkle some sharp sand. Take cuttings of the short side-shoots which possess no bloom-spikes, and make them 4 to 6 inches in length. Let the cuttings stand 2 to 3 inches apart, and when the frame is filled, afford water to moisten the entire bed of soil, and put on the lights. During the heat of the day, shade from the sun is required. The lights must be kept close till rooting has taken place generally, when air may be admitted gradually to harden them off.

Carnations and Pinks that were layered or struck from pipings last month, will require daily sprinklings to encourage growth, so that at the end of this month or the beginning of the next they may be separated from the parent plants. The old double crimson and white varieties of Cloves are hardy and vigorous in growth, and therefore they do not require to be layered and replanted so often, but may remain in the same spot for three years; they will then flower freely, form fine plants, and the calyx of the flower will not be so apt to burst as in the case of younger plants.

Miscellaneous.—The weather has occasioned much labour to be expended in affording water to herbaceous and other ornamental plants, and the borders still require to be well looked over, and such plants as Sweet Peas, Mignonette, Dahlias, Salpiglossis, Malvas, Scabiosa, &c., should have their seed-pods removed, in order to prolong the flowering season. Take the first opportunity after rain falls to plant Wallflowers, Sweet Williams, Brompton and other Stocks, so that they may become well established before the winter. All spring-flowering plants should be kept well watered; and if red-spider is making its appearance, a wine-glassful of petroleum mixed thoroughly with 4 gals. of water heated to a temperature of 90° will, if occasionally syringed on the plants, exterminate the spider.

THE HARDY FRUIT GARDEN.

By C. HERRIN, Gardener to J. B. FORTESCUE, Esq., Dropmore, Maidenhead.

Peach-Trees of the early fruiting varieties, Waterloo, Amsden June, and Condor, being cleared of fruit, may have the fruiting-shoots of this year, not required for another year, removed; and this year's shoots laid in thinly. I would lay stress on this operation being done thinly, seeing that it favours the better ripening of the wood, and consequently tends to the formation of large numbers of flower-buds. The trees should be afforded an occasional syringing with the garden-engine or the water-hose, and the border should have an application of clean water, sufficient in quantity to penetrate to the lowermost roots. Should red-spider be detected on the foliage, apply Gishurst Compound-soap, or other insecticide, applying it to both sides the leaves, and syringing it off a day or two later. Although the weather has been hot and dry, the out-of-doors Peach-trees look well, and where the syringing of the foliage with clear water has been carried out systematically, they are very free from red-spider and other pests.

Apricots.—The crops having generally been very light, a good deal of wood has been made, and on which the sublateral shoots should be kept pinched back to one leaf each. Old wood, which, in the ordinary course would have to be removed at the winter pruning, may be cut away now, and young growths fastened in thinly, to cover the otherwise blank spaces; the doing of this now makes gumming and loss of branches much less probable than if the pruning were carried out in the winter. See that the borders receive sufficient moisture to prevent the foliage drooping, or much injury to the trees will accrue. In other particulars, the treatment of the Apricot is identical with that required by the Peach.

Apples and Pears.—Such early Apples as Mr. Gladstone, Beauty of Bath, and Irish Peach, now in use, being eaten direct from the trees, need little or no storing. Devonshire Quarrenden is a

favourite variety that may be kept in season for several weeks. This is usually seen in the best condition in the south-western counties, where the pulp and rind becomes of rich red colour, and the flavour finer than in other parts of the country. In the midlands it does best grown as a bush on the paradise stock.

Pears.—Of these, Jargonelle is a variety that keeps but a very short time after being gathered, and is often found to be decayed at the core when apparently sound. A fine all-round early Pear is Williams' Bon Chrétien, which, by growing the tree on various aspects and as a standard, and gathering a few at a time as they become fit, may be had in season for a month. Fruits from bushes of standards possess the highest degree of flavour.

THE ORCHID HOUSES.

By W. H. YOUNG, Orchid Grower to Sir FREDERICK WIGAN, Bart., Clare Lawn, East Sheen, S.W.

Sobralias.—Of late years the members of this genus have become more popular than was formerly the case, owing to the introduction of varieties differing from *S. macrantha*, though they are probably natural crosses between it and other species of *Sobralias*. The flowering season extends from April to October, so that where a collection of these plants exists, one or other may be found in flower during that period. The first one to flower is *S. macrantha*, a strong-growing, easily-cultivated plant; then follow the albino forms of that species, and after them the yellow-flowered *S. leucoxantha* and *xantholeuca*, and the hybrid named *Veitchi*; and still later in blooming are *S. Wiganæ*, *S. Sanderiana*, *S. Lucasiana*, *S. Lewi*, *S. Holfordi*, *S. sanguinea*, and *S. virginalis*. With one or two exceptions the different species require similarity of treatment, viz., to be planted in large, well-drained pots or pans, in a mixture of one part fibry loam, one part lumpy peat, and one part sphagnum-moss, small crocks, sand, and a very small quantity of dry cow-dung, broken to a fine condition. They all produce, more or less, a matted mass of fleshy roots, which, if they do not find space to extent themselves, form a complete covering on the soil, hindering the young growths from making their way through, and as a consequence these oftentimes come out through the lower perforations of the pot, the majority getting injured and lost in the process. The cure for this mishap is large pots or pans, these being about half filled with drainage, and over this a layer of rough sphagnum-moss, to prevent the percolation into the crocks of the fine particles of soil. The Cattleya-house is the best place for most of the species, though, where possible, a separate compartment should be devoted to them, so that during the summer months more air may be afforded, and a lower temperature maintained. Any necessary repotting may be performed in September and October, first taking in hand those which have been longest out of flower. After root-disturbance, water must be withheld for a week or longer; and afterwards, for some considerable period of time, it should be given very sparingly. Undisturbed plants, on the contrary, should receive frequent and copious applications, and occasionally liquid farmyard manure in a much-diluted state. In order to admit light into the middle parts of large plants, the old reed-like stems which have borne flowers should be removed.

Pleiones will now, as the leaves decay, need much less water, and to be exposed fully to sunlight in a cool-house, excepting *P. maculata*, which grows best in the Cattleya-house. It will improve the appearance of the plants that are in flower if small spore-raised Ferns be inserted amongst the pseudo-bulbs.

Cycnches chlorochilum, *Mormodes*, and *Catantemum*.—These different species, as the pseudo-bulbs reach full size, and the leaves show signs of decay, should be afforded water in gradually diminishing quantity, and be exposed to full sunshine.

Chysis aurea, *C. bracteosa*, and other Species, growing at the present time in the warm-house, having finished their growth, should be removed to a cooler and less moist house, or to the Cattleya-house, otherwise a second growth will start, which will have no chance of developing properly. The supply of water at the root must be gradually diminished until the pseudo-bulbs are quite mature, when only a very small quantity will be needed to keep them in a firm condition.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.
Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY,	AUG. 28	National Chrysanthemum Society's Executive Committee.
TUESDAY,	AUG. 29	Royal Horticultural Society's Committee.
SATURDAY,	SEPT. 2	Isle of Wight Horticultural Improvement Association. Worsley and District Horticultural Improvement Association.

SHOWS.

WEDNESDAY,	AUG. 30	Dumfriesshire and Galloway Horticultural Society's Show in the Drill Hall, Dumfries.
FRIDAY,	SEPT. 1	National Dahlia Society's Show at the Crystal Palace (2 days).

SALES.

MONDAY,	AUG. 28	Great Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	AUG. 31	Great Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
FRIDAY,	SEPT. 1	Imported and Established Orchids, and Cacti, at Protheroe & Morris' Rooms. Sale of Dutch Bulbs, at Protheroe & Morris' Rooms

The One-and-All Flower Show, August 18 & 19, 1899.

NOTWITHSTANDING the trying character of the season for many horticultural products, it is pleasing to note that the great show that has recently closed was by far the biggest and the best that has yet been held. We have already referred to some of the more important new educational and artistic features that claimed the attention and excited the admiration of so many visitors to the Palace during the festival week. The lectures by Mr. SNOWDEN WARD on photographic art, several times repeated, and illustrating through lantern slides,

the latest developments of lovely gardens and plant forms, and colours of Crotons, Caladiums, Cinerarias, &c., excited much interest, and drew good audiences as they proceeded. Samples from those exhibited in the Palace induced many to have another look at the twelve hundred photos shown for their horticultural or photographic merit. Already horticulture is feeling the stimulus of fresh inspiration through photography.

Not a few, especially in crowded towns, cannot as yet find room for living trees, shrubs, fruits, or flowers; but all may find space on their bare walls for one or more photos of all that is beautiful in nature. And it is to be hoped that the pictures that are already to be seen in some houses and gardens will create and strengthen a laudable ambition among thousands more of the masses through co-operation or otherwise, not to rest content until they have filled their gardens with richer plenty, and wreathed their dwellings with higher beauty.

Another general and very pleasing feature of this great annual show and other exhibits near, or in the heart of our great towns, is the distinguished place held in the prize-lists by town growers. Physicians tell us, that with a healthy, vigorous circulation of the blood, or, as Dr. EDWARD JOHNSON puts it "vigorous contractility," the human body is in the best condition to be disease-proof. So it would appear that armed with skill, the water-pot, or, better still, the hose or spray attached to the water-pipe, the town cultivator within some of our densest metropolitan areas can, does, and has within the last two days competed successfully against his rivals through a season of most severe drought. As to the latter, we have known the Crystal Palace from its formation, and have never before seen the grass so wholly burned up as during the week ending August 19, 1899. And yet we are assured, on the highest authority, and found out for ourselves by visiting the residences of the prize-winners, that a very creditable proportion of them grew their winning productions within the metropolitan area, smuts, dust, and yellow fogs above, the riddling of the earth with sewerage, water, and gas-pipes beneath notwithstanding. Fired with a good stock of enthusiasm, no grower need despair of winning prizes. An union of skill, perseverance, patience and love is bound to conquer in the end. The exhibition, however, is large, covering a mile in length of tables, and the competition wide and keen, the prize Potatoes alone, neatly dished on plates of nine tubers each, nearly weighing a ton. The Show, which occupied a single table some fourteen years ago, with some three hundred entries, has expanded this year into five thousand two hundred entries, in addition to late arrivals not counted.

The character and quality of the Show has improved in as great or greater ratio than its growth in quantity. At first it was mainly a show for the utilitarian side of horticulture for the working classes—Potatoes, Cabbages, Broad Beans, Parsnips, Onions, Carrots. While not neglecting these, Peas, Runner Beans, French Beans, Tomatoes, fruits and flowers of all sorts, dinner-table decoration, bouquets, tasteful arrangements of flowers are now shown, and specially liberal, and numerous special prizes have also been offered to women and children competitors. In fact, nothing seems to have been omitted that could stimulate the interest or foster the taste of the industrial masses. There are prizes galore—Silver Cups, Medals, Certificates, &c., apparently for all. In the crowded state of our columns it would be as

impossible as unfair to enter into any particulars of prizes or merits of management; the latter under the able Secretary, Mr. EDWARD OWEN GREENING, his son, Mr. WAUGH, Mr. BELL, and others, is as perfect and smooth as can be, considering its magnitude. Alike in the quality and quantity of the show, it is the finest the Society has yet brought together, notwithstanding the frost-bites of last May, and the prolonged drought of the summer.

Two of the most important lessons of the season most heard of at this show, are the necessity of availing oneself of the supplies of water in the soil by means of capillary attraction, produced by deep tillage during long and severe droughts; and the husbanding these supplies for their proper work of affording water to the roots through a surface-mulch of loose soil, which prevents much loss of water through evaporation.

We cannot conclude without expressing our regret, which will be generally shared by our readers, at the absence, through illness, of the well-known and greatly-respected horticulturist, Mr. JOHN WRIGHT, of the *Journal of Horticulture*; and of Mr. A. F. BARRON, late of Chiswick. We can ill spare such men from our ranks, even temporarily.

Our latest news of the great people's show on Saturday, Aug. 19, was, that up to 2 o'clock the turnstile records of admissions were fourteen thousand five hundred and thirty-four, as against thirteen thousand six hundred and twenty-five last year. Of course, many more entered for the concert of seven thousand voices, conducted by Mr. G. W. WILLIAMS.

At the great closing open-air demonstrations on the terrace on Saturday evening, the following resolution, in which justice was done to horticulture, was moved by Mr. MADISON, M.P., and seconded by Mr. COOK, of the Banbury Co-operative Society:—

"Resolved, that this final meeting expresses its gratification at the distinction which has again attended the festival. We recognise that the Rev. Dr. LORIMER's three speeches were a triple benediction; while the presence and address of the Right Hon. GERALD BALFOUR, gave added prestige to the co-operative movement, which, we are glad to know, is extending in the form of co-operative dairies. To all the eminent workers in science and horticulture, and those who have made brilliant and useful our six days' festival, we tender the best thanks in our power. That of resolving that the co-operative principle of equity and industry shall attain yet more diversified, influential, and progressive development in the future before us."

In passing from this meeting, we found that the greatest and best One-and-All Flower Show had already vanished, and the tables were being piled out of the way for the next event at the Palace, which seems growing in interest and popularity.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Fruit and Floral Committees of the Royal Horticultural Society will take place on Tuesday, August 29, in the Drill Hall, James Street, Westminster, from 1 to 5 P.M. At 3 o'clock a lecture on "The Soil considered as Plant-Food, and its Exhaustion," by M. GEORGES TRUFFAUT, will be read.

SHROPSHIRE HORTICULTURAL SOCIETY.—Some very striking figures for the years 1875—1898 inclusive, relating to this great show which is in progress as we write, are now before us, from which we may take a few extracts. In 1876 the annual subscriptions were at their lowest, £259 10s. 6d. In 1895 they were at a maximum of £449 2s. 6d., and

they have kept near to that sum in succeeding years. The receipts from cheap tickets varied from £77 10s. in 1875 to £667 4s. 8d. in 1892, and are quoted at £478 5s. 9d. in 1898. The takings at the gates on the first day have fluctuated from £65 8s. 2d. in 1879 (a very wet year) to £852 11s. 9d. in 1898. On the second day, the gate-money has

ROYAL GARDENS, WINDSOR.—During the past week the Royal Gardens and Park of Windsor have been quite besieged by horticultural societies. On Monday, the 14th, the members of the Cardiff Gardeners' Association, numbering over eighty, journeyed from South Wales for their annual outing for the purpose of visiting the Castle and its

enjoyable way of spending the evening. The 17th witnessed the arrival of the president, vice-president, and members of the English Arboricultural Society, more particularly for the purpose of visiting the Parks and Forest. After having been conducted through the Castle, they proceeded by way of the Slopes and Home Park to Frogmore

FIG. 61.—*ABUTILON VITIFOLIUM*; FLOWERS LAVENDER-BLUE, ANTHERS YELLOW. (SEE P. 167.)

varied from £107 9s. 8d. in 1875 to £1825 in 1897. "Sundry receipts" vary from 19s. 3d. in 1875 to £1007 19s. 5d. in 1898. The total receipts 1875–1898 amount to £60,458 0s. 9d., an average of about £2519 per annum. The proceeds have enabled the Society to help forward various local undertakings with substantial donations—in particular, the Darwin Statue—and to contribute small amounts to one of the gardening charities.

gardens, as mentioned on p. 174. On the same day the Lee and District and West Kent Horticultural Society also visited the Royal domain, the members first making their way through the slopes, flower-garden, Home Park, and Frogmore; the Castle and its surroundings were reserved for the afternoon. Some of the members took advantage of the opportunity which offered itself of going for a trip on the Thames by steam-launch—a most

where luncheon was provided for them by H.M. The QUEEN. In the afternoon brakes were commissioned for a drive of quite 30 miles, in the course of which the arboriculturalists were taken through Windsor Great Park and Forest, past Ascot race-course, by Bagshot Park, and back again by way of Virginia Water. Mr. O. THOMAS, Capt. SIMMONDS (deputy-surveyor), and other officials, kindly acted as guides over their several departments.

WELWITSCH'S AFRICAN PLANTS.—The first part of the second volume of the catalogue of Dr. WELWITSCH'S plants collected in western and south-western tropical Africa, has just been published under the authority of the Trustees of the British Museum by Messrs. LONGMANS & Co., and other publishers. It comprises the Monocotyledons and the Gymnosperms elaborated by Dr. RENDLE. The Orchids occupy only about sixteen pages, including the magnificent *Lissochilus giganteus*. Grasses are largely represented, occupying no fewer than one hundred and twenty pages, which indicates the nature of the country, and the patient industry of the compiler. For the now universally recognised name *Welwitschia*, Dr. RENDLE substitutes the name of *Tumboa*, *Welwitsch*, in *Gardeners' Chronicle*, January 26, 1861, p. 75, in a Report of the meeting of the Linnean Society. It would have been better in the circumstances to have considered this as a mere provisional name, a *nomen nudum* in fact, though there is little chance of any mistake in identification being made. Moreover, the plant is not to be called *Welwitschia mirabilis*, Hook. f., see *Gardeners' Chronicle*, 1862, p. 1194, but *Tumboa Bainesii*, Hook. f., in *Gardeners' Chronicle*, November 16, 1891, p. 1008. It results that the name given in the splendid monograph of Sir JOSEPH HOOKER, and taken up in the whole or almost the whole of the literature pertaining to the plant is to be set aside in favour of one which it would, in our opinion, have been better to have left as a synonym. "*Id facere laus est quod decet non quod licet.*" In any case, botanists will cordially welcome this new instalment of a most carefully completed volume.

PHENOLOGICAL OBSERVATIONS FOR 1898.—We suspect—indeed, we know—that many people are of opinion that the letter "r" should be inserted before the "e" in the above title; but the phenomena of climate, as they affect animals and vegetables, are not quite the same as the investigation of the prominences of the skull, supposed to indicate similar projections from the brain, to each of which a special office is assigned. Plant cultivators are under great obligations to Mr. MAWLEY for the pains he takes to record and classify the reports he gets from numerous stations (127) in Great Britain. The winter was mild as a whole, and it was not till Feb. 21 that snow fell to any extent. Owing to this mildness, the early-flowering plants came into blossom much in advance of their usual time. The following spring was cold, and north-easterly winds and frosts injured the fruit blossoms. The summer was of an average character, but the rainfall was everywhere deficient, especially in the south-west and south of England, conditions unfavourable to the gardener. The autumn was unusually warm and dry, the drought roughly speaking having extended from the beginning of June till the middle of October. The record of this present year, it would seem, will not be unlike that of 1898. These incidental comments will, we hope, convey at least some notion of the scope of Mr. MAWLEY'S most useful labours, and induce some who have the opportunity, to assist him in his work.

DELPHINIUM STAPHISAGRIA.—Mr. E. M. HOLMES directs attention to the fact that the true *Delphinium staphisagria* is practically unknown in botanic gardens in this country, and that the plant which passes under that name is in reality another species—viz., *D. pictum*, Willd. The two species are distinguished as follows:—*D. staphisagria* has very hairy stems, glandular hairs being mixed with the long spreading soft hairs, flowers that when well developed have an ultramarine blue tint, and a calyx with a very short or almost obsolete spur, and carpels containing only four or five large seeds. *D. pictum*, Willd., has shorter soft hairs, but no glandular hairs on the stems, and the flowers are of a pale lilac colour, the spur is as long as the calyx segments, and there are in each carpel ten or twelve seeds, which are only half the size of those of *D. staphisagria*, Linn. His experience in growing

the plants showed that it is almost impossible to grow the true plant from the *Stavesacre* seeds of commerce, which will not germinate, or only very rarely indeed, and that the plant requires shade and warmth and a damp atmosphere; whilst *D. pictum* grows well in sunlight and in the open air, and in the south of England, at all events, is quite hardy. He recommends that in the next *Pharmacopœia* the figure given by NEES VON ESENBECK, *Pl. Med.*, tab. 394, should be referred to, unless a better one be published before the appearance of the next edition. *Pharmaceutical Journal*.

HALF-A-TON OF HONEY.—The Ardmore Estate at Parkstone, near Bournemouth, which was the residence of the late Dr. J. G. ALLMAN, has just been sold by auction, and a curious fact was mentioned by the auctioneer. Some ten years ago a swarm of bees settled in the roof, and Dr. ALLMAN would not have them disturbed. It is estimated that there is now an accumulation of half-a-ton of honey there.

JAMAICA FRUIT TRADE.—A correspondent in Jamaica remarks of the increasing fruit trade of the island. The fruit trade of Jamaica is assuming immense proportions. It is nearly all in the hands of the Americans, and the bulk of the profit I suspect falls into their hands. They give 6d. up to a 1s. per 100 for oranges, and on an average 1s. per bunch for Bananas. It is not much, but it is a good deal more than nothing at all, and that is all our Oranges brought before the fruit trade sprang up. Most of the money goes into the hands of our peasantry, and the Jamaica negro can do what few others can—it matters not how small his income is, he can generally manage to live on it, and put something by. In this respect, at least European working men might well imitate him with advantage. I have taken much pains in endeavouring to find out the best kinds of Grapes for our climate, and some of my experience proves that not all the kinds considered good in Europe, are of any use here. Gros Colmar is worthless here; it bears freely, sets its fruits well, and winds up by bursting every berry. Gros Guillaume is barren; so is White Tokay. Muscat Hamburgh makes splendid canes, puts out fine blossom, and plenty of it, but the bunches are skeletons of a few straggling berries, no larger than Peas. The Frontignan and Chasselas kinds do fairly well, but no one here cares for small Grapes, no matter how good the quality. Royal Ascot does grandly with me; the clusters are small; never much over half-a-pound each, but the Vine when in fruit looks like a solid mass of Grapes, and when well thinned, and well ripened, are all that could be desired.

A GARDENERS' OUTING.—At the invitation of LEOPOLD SALAMONS, Esq., and Mrs. SALAMONS, about forty gardeners belonging to the well-known districts of Leatherhead, Ashted, Fetcham, Mickleham, Box Hill, and Dorking, assembled together on the 16th inst., at the beautiful mansion in Norbury Park, Mickleham, the residence of that gentleman. Under the guidance of Mr. KENT, the head gardener, the company were conducted through the picturesque, extensive, and well-kept grounds. The lawns and terraces being at a considerable elevation above sea-level, grand views were obtained of Box Hill and the surrounding neighbourhood. Although no rain has fallen here for an unusually long period, the skilfully designed flower-beds and herbaceous borders were exceedingly gay and fresh-looking. To have attained such healthy growth and floriferousness, a great amount of time and labour must have been spent in affording water, and in other ways. It is well worth climbing up the slopes leading to Norbury, if only to see the splendid old Beeches, Oaks, and Cedar-trees which offer such an admirable background to the scenery around the estate. During the afternoon a cricket-match was arranged between some of the gardeners present, several of whom showed exceptional skill in that pastime. Mr. and Mrs. SALAMONS kindly provided high tea for the

visitors at the mansion, and before the party separated, Mr. MEANE, the head gardener at Downside, Leatherhead, desired Mr. KENT to convey their best thanks to Mr. and Mrs. SALAMONS for the many acts of kindness the gardeners of the locality had received at their hands.

"THE CENTURY BOOK OF GARDENING."—The conductors of *Country Life* announce that they are about to produce immediately the first part of the *Century Book of Gardening*, which is to come out in twenty-six parts. The present work is practical, and, it is believed, complete; it is written entirely by experts and specialists, and, to a large extent, by specialists who are acknowledged also to be skilled writers. Its numerous illustrations are in that beautiful style which excites admiration in *Country Life*.

HOME CORRESPONDENCE.

GRAPE JUDGING.—Mr. Buchanan seems to be a stickler for the old doctrine, that no man can be a proper judge of anything he has not grown. His proposition is very much like the old saying, "He who would breed fat oxen should himself be fat." It far from follows that because a man is a grower, good or indifferent, that he is therefore the best judge of the merits of the thing as presented in competition. One of the great needs for a judge is a capacity to determine merits readily—in fact, to have a thoroughly judicial mind. Then he should have no bias, and none is so likely to have bias for or against certain products, kinds or varieties, as a grower of them. How many of our best judges are there who are other than growers; or if they have been growers, have not been so for years, yet have judicial capacity to determine merit in the highest degree? Why, in the case of Grapes, growers like to surround the question of judgment with a halo of sacred limitation, but the man in the street, in this case the crowds in the tents, are as keen to distinguish points as are the smartest of growers. If there are judges who entertain such egotistic notions with respect to their own exclusive capacity, let them mix, when a show is thrown open, with the crowd, and listen to the people's comments. It will do much good in helping to tone down complacency. I have, in a wide experience of shows, extending over some forty years, found more mistakes of judgment made by pure growers than by those not so, and having far wider general knowledge and more liberal ideas. After all, it is the general and not the specific judge who brings to the consideration of his labours, as such, the least biased mind. *A. D.*

FLAVOUR IN POTATOS.—I have read Mr. Harrison Weir's growl about Potatoes with amused interest. All readers of the *Gardeners' Chronicle* who have been privileged to know the famous artist, must be pleased to learn that, though now seldom seen at the Drill Hall, he is yet very much alive. But whilst I have some sympathy with him over his craving for higher flavour in Potatoes, I have all the same some doubts as to whether his experience of varieties, in a cooked or uncooked state, has been large enough to render him an impartial critic. That there are numerous good-flavoured Potatoes in commerce I am assured, but then none of them belong to the great cropping section, and hence they do not get the cultivation they deserve. Without doubt, the Ashleaf Kidney owes its wide popularity yet to its great earliness primarily, but still largely to its undoubted high flavour, in regard to which no other variety has excelled it. But then even the Ashleaf is generally a somewhat close-eating Potato, a feature which Mr. Harrison Weir delights in, but which the many Potato consumers object to, just as they object to its yellow flesh, and yet that coloration and flavour seems to be in the Potato indissolubly associated. Of all the old Potatoes, none are better remembered for flavour than Patterson's Victoria, which had flesh strongly tinged with yellow. Nearly all modern Potatoes have quite white flesh, obtained in so large a degree from American parentage; but a few which gave some nice flavour and some yellow flesh—Woodstock Kidney, Reading Russet, Radstock Beauty, The Dean, and a few others—are very little grown, because not abundant croppers. Even in connection with varieties in general cultivation, it must not be overlooked that it

is very rare a person enables the tops of the plants to endure sufficiently long to cause the tubers to finish or entirely mature; and where such is the case, flavour is not created after all. With the majority of Potato consumers a pinch of salt supplies their desired flavour, and generally they have a great preference for flaky over solid flesh. A. D.

— Yes, many will endorse all that Mr. Harrison Weir has stated on page 142 of the *Gardeners' Chronicle*. How very frequently do we hear the remark, "When young we used to look forward to the coming of the 'new' Potatoes, but 'new' Potatoes now-a-days do not seem to have a bit of the same flavour"! The introduction of the American varieties is responsible for the present lack of flavour. Some twenty years ago, when the Yankee introductions were in the height of their

Both are heavy croppers under indifferent cultivation, but it would be difficult to name two varieties more deficient in flavour. Eclipse is soft, spongy, and very seedy; whilst the other is hard, seedy, and flavourless, in fact all that a Tomato should not be. Why are not the flavour and texture of Cucumbers considered more than they are? Firm and cropping qualities are the chief points, flavour going for nothing, but there is more difference in the flavour and texture of Cucumbers than many think. W. J. Godfrey, Exmouth.

— What Mr. Harrison Weir says of Potatoes, at p. 142, and the Editor of Tomatos, is perfectly true, for though you can still get good Potatoes if you grow them yourself, you can hardly find such a thing in England now as a Tomato with real Tomato flavour. Most of the growers do not know

cropper, and liable to disease. As for Tomatos, I should be glad if someone can tell me of a good sort which will ripen in England under glass. H. J. Elwes, Colesborne, Gloucestershire.

CAMPANULA MIRABILIS.—The Rev. Wolley Dod may console himself about the caprices of this prehistoric plant by the information that others have not fared better. I was instrumental in its distribution, but I had this season out of 120 strong plants only three which flowered, and two of these were planted horizontally in my rock-garden, a position which the plant very much prefers. Its counterpart, *C. betulifolia* is easier of cultivation, and has white flowers. Max Leichtlin, Baden-Baden.

FLOWERING OF MORISIA HYPOGÆA.—Mr. W. Earley appears in a note on p. 135, to question the early flowering of this plant, suggesting that Mr. T. Harris, who has contributed to the same subject, may be the possessor of an early flowering form of this plant. The chief value of many hardy flowering plants is their earliness to show flower, and it will doubtless interest Mr. Earley to learn that for several years past the plant has been in good flower by the middle of the month of February. If it were necessary to stretch a point as to earliness, I might add that at Kew for some past seasons it has begun to flower even earlier than this; and I have noted it flowering at such time as *Galanthus Elwesii*, *Anemone blanda*, the earliest of the *Hepaticas* (*Anemone hepatica*), and other such well-known subjects. I believe it is now two years ago that I noted the earliest flowers, even before January was out; and, of course, it is well known that this *Morisia* is in flower as soon as it moves at all. At Kew, there is certainly nothing in the open in winter-time to incite earliness to flowering—rather the reverse; and if Mr. Earley's plants do not flower till so much later in the year, something must be wrong. Near London the plant may be seen in fine condition in the open nearly two months earlier than the date given by your correspondent, viz., the middle of May. At this time flowering-plants are legion; and though *Morisia* may still be found in flower, being indeed one of the most profuse in this respect, it is certainly a long way from being in its prime, or even good representative form. At Kew, quite early in the year, it is ever a most charming thing in the rock-garden, before scores of May-flowering plants have made a move at all. E. H. Jenkins, Hampton Hill.

— Both Mr. Earley and Mr. Harris are correct in their apparently conflicting statements regarding the time of flowering of *Morisia hypogæa*. Before reading Mr. Earley's note in your issue of August 12, it had occurred to me that there might be two varieties. That I have here does not bloom until May, but I know of several gardens in which the *Morisia* is one of the earliest plants of the year to flower. I have been inclined to attribute this to a difference in the soil or other conditions, but this may not be the cause, and it may be that there are two varieties. One cannot detect any difference in the appearance of the plants which one sees early in bloom. A rather moist soil is that in which it blooms most freely. I may say that I have grown it now for several years, and have not had it in bloom until long after Mr. Harris notes as its flowering time. It can be readily grown from root cuttings as well as by division. S. Arnott, Carsethorn by Dumfries, N.B.

HYBRID BEGONIAS.—In your interesting article on this subject on p. 84, I see it is stated that Mr. O'Brien failed to obtain any successful cross between flowers of the *Rex* type and the tuberous-rooted kinds. It may interest you to learn that some years ago (about 1884) I succeeded in obtaining fertile seed by inoculating a red-flowered (seedling) tuberous-rooted variety with the pollen of the ordinary form of *Rex*, which was grown so extensively about that time, or rather before, for the Covent Garden and other markets. I obtained, I believe, five plants from the one small pod of seed, and there could be no doubt of a true cross having been effected. One plant had beautifully-marked leaves, with a distinct zone of silver, and intermediate in form and size between the two parents, with nice blooms of a deep scarlet or light crimson colour, and 2 to 3 inches in diameter. Another promised to prove better still, but dropped its first flowers, and I never saw it in character. Another pushed up a number of small variegated leaves

MR. WALTER W. NAUNTON.

(Joint-Secretary of the Shropshire Horticultural Society. See p. 176.)

popularity, I was much struck with the system of judging Potatoes then in vogue. The tubers were cut in halves, and only the very whitest stood the least chance of being a prize winner. A variety known as *Climax*—a very insipid thing—was the favourite in these parts, and I have known the more globular tubers take "first" as "white round," and the tapering or oblong shape the same position among "white kidneys." One of the best shaped finest flavoured varieties in those days was the yellow fleshed *Emperor*. Unfortunately—although a model in form, this seems to be lost, no doubt owing to its liability to the disease. The editorial footnote to Mr. Weir's article on Tomatos is also to the point, and the Royal Horticultural Society would do well to take flavour into consideration when making its awards. Some two or three years ago a trial of Tomatos was held at Chiswick, and two varieties out of the very few which were awarded the maximum number of marks were *Eclipse*, and *All-the-year-Round*.

what it is, as it has been sacrificed to appearance, like so many other things. We are always told that the public will not buy anything that does not look pretty, but I cannot believe that the public are all fools, and I for one am ready to give a prize for Tomatos for flavour only, if I was sure that there were among the members of the committee any judges who know what the little rough corrugated Tomatos you get in India, Mexico, or Turkey, taste like. I do not say that it is necessary they should be small or rough looking, but I say that flavour is the first quality in fruit or vegetables, and that they are often judged as though they were not meant to be eaten at all. I would recommend Mr. Weir to grow the old English *Ashleaf Kidney*, for his main crop, which, if planted at intervals, will last him from June to January; and for a late crop, the *Old Fluke*, the *Skerry Blue*, and dark skinned Irish variety, which was brought over here by Irish labourers many years ago, and is still one of the best late Potatoes I know, though a bad

from the base, but no flowers, and the rest appeared to be not very good growers. Unfortunately, the place had to be disposed of the succeeding autumn, and the above plants, with some other promising stock, passed into the hands of one "who cared for none of these things." You do not notice the B. discolor-Rex hybrids produced by a continental firm. From what I have seen of these, I should consider them to be a decided acquisition. B. C. Ravenscroft, *Laxey, Isle of Man.*

A NEW SALADING.—I shall be glad if you can obtain information for me regarding a new salad, because when travelling in the South of Europe I partook of a salad, a specimen of which I send you in the size in which it is used. On my return I planted the young plants, and I send you specimens showing the size to which it has grown, but I have not had time yet to flower it. On looking over my notes when I returned, I sent off specimens of this salad to Messrs. Vilmoren, Andrieux & Co., also to Messrs. Carter, and to other houses, but up to the present time I have not found anyone who can recognise it, or who knows anything about it. As far as the salad is concerned, I may say that I thought it was rather insipid, but it is greatly improved by the addition of the blue flower pinched from the stem of *Borago officinalis*, which is the common borage found in gardens and on commons. This has a very pleasing appearance in the salad, and greatly adds to the pleasure of eating it, owing to the sweet flavour imparted to the salad. I need hardly say that this borage flower is also used with Lettuce-salad, and improves it. I sought to account for the use of this grassy-looking plant as salad, and I attributed it to the fact that Mustard-and-Cress was very little used, and the English call for salad with their food in the large hotels they frequent. *Thos. Christy.* [The plant sent is not a bit like Purslane, has the appearance of a flattened tuft of leaves, such as is formed in a coarse-growing grass, like *Dactylis glomerata*, but it is evidently not a grass; the sample of "salad" is not more than 1 or 2 inches in height, and correspondingly slight. Ed.]

THE TOMATO UNDER GLASS.—It is quite true what your correspondent, "Growler," says about the want of flavour in our present-day Tomatos, and they are all alike in private and in market gardens. The stupid plan has made its way everywhere of reducing the plant to a single stem, by removing its lateral shoots; and, to make matters worse, the leaves as well, thus a few clusters of fruits are forced to attain to a large size by means of abundance of water and liquid or other manures being applied at the root. Now, I have grown the Tomato on outside walls facing west and south in a country with a much warmer and longer summer than ours, and my practice was to train the main shoots, say, to the number of six to ten per plant, in fan-shape, suppressing only the secondary laterals. Such plants set capital clusters of fruits in long succession, and afforded half a bushel per plant; and because the plant was allowed to carry plenty of foliage, the sap became properly elaborated, and the flavour in consequence was excellent. I will give examples in other plants. We know what happens to a field Vine when the frost destroys the leaves, say, in the early half of September, that is, before the fruit is quite ripe—the Grapes are uneatable, and will not make a palatable wine, although they may be perfectly coloured, each according to its kind. The same lack of flavour occurs in Melons when the foliage, or most of it, dies before the fruit is ripe, or the plant is deprived of much of it; and so with many other kinds of fruits. It may suit the man who grows out-of-door Tomatos to denude the plant of its leaves, and then feed it inordinately; but that only helps to prove that the existing varieties of Tomatos do not suit our climate, or that he is blindly following somebody's dictum instead of bringing his own common sense to bear on his practice. When the plant is cultivated under glass in this country, it is under the same conditions as my plants against a wall, only rather more favourable. The methods of culture appear to me to have more to do with flavour than has variety. Then why, I ask, should not the gardener allow the plant to extend in a manner consonant with its habit, and why confine it to a single stem, and cultivate five plants where one would suffice? The benefits to be derived from a change to more natural methods are too obvious to mention here. The best flavoured Tomato that I know of is Hathaway's Excelsior. *A Traveller.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

GRAFTED POTATOS.

AUGUST 15.—Mr. A. W. Sutton sent up to the Royal Horticultural Society, on the above date, some specimens of the haulm and tubers of various Potatos upon which he had been experimenting. Unfortunately, the Committee was not sitting, but the specimens were examined, and the following notes are placed on record. It will be remembered that Mr. Sutton, on January 31, 1899, exhibited numerous tubers, the character of which appeared to have been modified in consequence of the plants from which they were grown having been grafted with Tomatos, &c. The plants now exhibited show that the modifications alluded to were not confined to the tubers alone, but were noticeable in the plants generally, and that there had been no reversion to the original form. The specimens exhibited were the following:—

No. 1.—Potato "Victoria," typical plant, showing normal growth and produce.

No. 2.—Plant grown from tubers which were the result of grafting, in 1895, Tomato "Maincrop" on Potato "Victoria." Each year since 1895 a crop has been grown and tubers saved (resulting from this graft)

NOTES.—All the plants in this row are alike, but the growth is only about one-third the height of No. 1, and the tubers few and small. (Haulm much dwarfed and produce diminished, form of leaf not altered.)

No. 3.—A similar experiment to last, except that in 1895 another variety of Tomato, viz., Sutton's "Perfection," was grafted on to "Victoria" Potato.

NOTES.—All the plants in this trial are also very uniform, exactly corresponding with one another, but they are rather stronger than No. 2, and more bushy, and yet quite distinct from No. 1. N.B. No. 3 is the produce of one set only.

No. 4.—A similar experiment to Nos. 2 and 3, but in this case, instead of a Tomato, the common garden weed, *Solanum nigrum*, which produces seed-berries so plentifully, was grafted on the Potato "Victoria," in 1895.

NOTES.—The plants in this row correspond more nearly to those in No. 1, but whereas in neither No. 1, 2, nor 3, are there any seed-berries, in this row (No. 4) the plants produce seed-berries abundantly.

Three plants of No. 4 are sent to show its seed-bearing tendency. N.B. It will be seen that the tubers vary little, if at all, from those of No. 1 (this was the case also when shown in January last). A. W. S.

[Victoria foliage unaltered; haulms bear numerous berries of the size of marbles. Ed.]

A very similar experiment was made in 1895 with another Potato, Sutton's "Supreme," the character and constitution of which appears to have been modified by Tomato-grafts, just in the same way as Victoria Potato was.

No. 5.—Typical plant of Potato "Supreme."

No. 6.—Plant grown from tubers which were the result of grafting, in 1895, Tomato "Ham Green Favourite" on Potato "Supreme." Each year since 1895 a crop has been grown and tubers saved (resulting from this graft), as in the case of plants Nos. 2 and 3.

It will be seen that here also the plants are much dwarfed, though the tubers do not differ much [except in their smaller size].

AXILLARY TUBERS.

No. 7.—An interesting experiment was made in 1895, as follows:—Tomato "Earliest of All" was grafted with Potato "Woodstock Kidney." The Potato-foliage produced axillary tubers, nourished, of course, by the Tomato roots. The axillary tubers were planted, and a crop has since been grown annually. No. 7 represents the ordinary plant of Potato Woodstock Kidney. No. 8 represents the plants grown from the axillary tubers of 1895, and successive years.

NOTES.—Perhaps No. 8 is stronger, and taller, and more upright in growth, but there is no very marked difference between the two as regards foliage; the tubers of No. 8, however, are very poor in every way, and very few in number [and the quantity of fibrous roots relatively large]. A. W. S.

CARDIFF GARDENERS' ASSOCIATION OUTING.

AUGUST 14.—The members of the Cardiff Gardeners' Association, to the number of eighty, had their annual outing to Windsor on the above date.

Leaving Cardiff at 6 A.M., and travelling via Bath and Reading, under the guidance of Councillor J. M. Gerhold, the members were met at Windsor station by Her Majesty's head gardener, Mr. Owen Thomas, and his son. After proceeding to the hotel for light refreshments, the party left to view the State apartments at the Castle, and were afterwards conducted through the Home Park to Frogmore. They

returned by another route across the park to the hotel, and later were conveyed to the gardens of Baron Sebroder, at The Dell, Englefield Green, where one of the finest collections of Orchids in the world is to be seen. The head gardener (Mr. H. Ballantyne) welcomed the party. The party were then driven to Cumberland Lodge, the residence of Prince Christian, to view the historic 100-year-old Vine, which is carrying at the present time, 2000 bunches of Grapes. The party then returned to Windsor via Virginia Water, partook of supper, reaching Cardiff at 5 o'clock on Tuesday morning!

TROWBRIDGE HORTICULTURAL.

AUGUST 16.—Trowbridge celebrated the Jubilee of its Horticultural Society with great gusto on the above date. The Society began in 1849 by holding a flower-show in aid of a local institution, then much in debt—the Mechanics' Institution. A flower-show was suggested as a means of discharging the debt, and everything was arranged, and tents erected, &c. The night before the flower-show day a strong wind wrecked the tents; but they were re-erected, and filled with exhibits, and success followed. That was the beginning of the Trowbridge flower-shows. It then became an institution of the town, and an annual exhibition has since been held in unbroken sequence. Some of those who assisted at the first took part in the Jubilee Exhibition on the 16th inst., when it could be seen, both from the extensive display of garden-produce and the immense attendance, that the flower-show is as popular as ever. The weather was brilliantly fine, and everything conspired to make the Jubilee Celebration highly satisfactory all round.

The interest of the competitions was much enhanced from the fact that the Veitch Memorial Medal and money prize was offered for competition in the class for—

Twelve stove and greenhouse plants, which are locally grown with remarkable success. The original intention was to offer the Medal for Fuchsias, for which Trowbridge has so long been famous, but as some of the most successful growers are compelled to declare themselves traders, it was found necessary to make a change, and the Medal and prize was transferred to the above class. It was well won by Mr. H. Matthews, gr. to Sir W. R. Buwens, Trowbridge, who had a good level collection; the chief subjects being *Anthurium Scherzerianum* superbum, *Clorodendron Balfourianum*, *Bougainvillea Sanderiana*, a fine piece of *Rondeletia speciosa* major, *Allamanda Hendersoni* and nobilis, *Erica Eweriana elegans* and *E. Austriana*. Mr. G. TUCKER, Hilberton Marsh, was a very good 2nd, having *Dipladenia Brearleyana*, awarded a special silver medal as the best flowering stove and greenhouse plant in the show; *Stephanotis floribunda*, *Bougainvillea glabra*, very good; *Statice Gilberti*, &c.

Six specimens.—Those from Messrs. MATTHEWS and TUCKER were so evenly balanced, that equal 1st prizes were awarded. The former had *Allamanda Hendersoni*, *Ixora amabilis*, *Erica Tu bulli*, *Eucharis grandiflora*, in very good character; the latter had *Bougainvillea glabra*, *Ixora Fraseri*, *Stephanotis floribunda*, *Allamanda nobilis*, &c. Mr. TUCKER was 1st with three specimens, having *Allamanda Hendersoni*, *Bougainvillea Sanderiana*, and *Ixora Tuckeri*, in fine form. Mr. H. MATTHEWS was 2nd. The best specimen flowering plant was *Dipladenia Brearleyana*, finely grown, from Mr. G. TUCKER; Mr. H. MATTHEWS was 2nd, with a fine *Allamanda nobilis*.

Fuchsias, the pride of Trowbridge, were in very fine character. Mr. GEO. TUCKER, was 1st with six specimens, tall, stately, finely grown and bloomed, they included Charming, a really superb specimen, some seven feet high from the pot, well proportioned, grandly grown, and freely bloomed. This was awarded a special silver medal as the finest Fuchsia in the show. Fial, and Doel's Favourite, dark varieties; Mrs. Bright, Arabella, and Tucker's Favourite, light. Mr. J. Lye, Easterton, Market Lavington, came 2nd with smaller plants, but well grown and bloomed, he had Charming, Doel's Favourite, and Elegance, dark; Jubilee Queen, a beautiful light variety, wonderfully free; Wiltshire Beauty and Pink Perfection, light.

Cockscombs and Zonal Pelargoniums came from Mr. Chislett, gr. to Mr. E. T. D. Foxcourt, Hinton-Charterhouse; the latter were particularly good, fine examples, carrying large heads of bloom.

Some excellent *Gloxinias* were shown by Mr. G. TUCKER and Mr. H. KIFF. With eight single as well as six double *Begonias*, Mr. G. TUCKER was 1st, showing finely-grown and bloomed specimens of high quality. Mr. H. MATTHEWS was 1st with four Orchids, showing a very good selection. Lilies in pots made a good feature, finely-grown examples of *L. speciosum*, &c.

Foliage Plants and Ferns were shown in twelves, and remarkably good they were. Mr. TUCKER was 1st with the best twelve, having medium-sized specimens of *Adiantum*, *Gymnogramma*, *Chelidanthus*, &c., and in the pink of condition; and Mr. Mitchell, gr. to A. P. STANCOMB, Esq., was 2nd, also with excellent plants. Mr. H. MATTHEWS was 1st with nine specimen foliage plants, having a fine *Keotia Forsteriana*, *Phoenix dactylifera*, a fine piece of *Theophrasta imperialis*, *Croton Weismanni* and *Reidi*. *Caladium* and *Coleus* were shown in sixes; the latter in the form of even, well-coloured bushes, from Messrs. J. CRAY & SONS, Frome.

Groups arranged for effect in two classes, and being in the centre of a tent, were seen to the best advantage. Messrs. E. S. COLE & SONS, Bath, took the 1st prizes in both classes, with tasteful arrangements.

CUT FLOWERS.

These always form a leading feature at Trowbridge. Mr. A. WALTERS, Kensington Nursery, Bath, was 1st with twenty-four blooms of Quilled Asters, showing them in much better condition than might have been expected. Mr. F. HOOPER, Bath, was 1st with the same number of flat-petalled varieties, having very fine blooms of the Victoria type.

Roses were shown in several classes, and in these Mr. J. MATTOCK, New Headington, Oxford, who generally shows finely in the autumn, carried everything before him. He was 1st with twelve trebles, with thirty-six, twenty-four, and twelve varieties; and with twenty-four and twelve Tea-scented. Some remarkably good flowers for the season were staged by Mr. MATTOCK, among them Mrs. J. Laing, Reynolds Hole, Maman Cochet and its white variety, Perle des Jardins, Madame Hoste, A. K. Williams, Charles LeFebvre,

Messrs. CRAY & SON, Frome, were 1st, with twelve blooms; and Mr. F. LINDSAY, Frome, 2nd.

With twelve fancies, Mr. G. HUMPHRIES came 1st, having a neat stand of bloom; and Mr. J. WALKER was 2nd. Pompon Dahlias were very good; the season appears to refine them, there being an entire absence of coarseness. Messrs. J. CRAY & SONS were 1st with twelve bunches; and Messrs. KEYNES, WILLIAMS & CO., 2nd. The Cactus were also very good, shown in bunches of three; Messrs. J. CRAY & SONS were again 1st, showing well developed blooms of the leading varieties; Messrs. KEYNES & CO., were 2nd.

Gladiolus, &c.—Collections of twenty-four spikes each were well shown by Messrs. J. MADDOCK, and G. HUMPHRIES.

Some fairly good Pansies were staged by Mr. F. HOOPER, who also took the 1st prizes with Carnations and Picotees. Sweet Peas in charming bunches were shown by Mr. BLACK-

Duke Cherries, &c.; 2nd, Mr. W. STRUGNELL, The Gardens, Rood Ashton, also with a good collection.

With six dishes, Mr. STRUGNELL was 1st, having Black Hamburgh and Muscat of Alexandria Grapes, Sea Eagle Peaches, Pine-apple Nectarines, Apricots, and Melons. Mr. J. DAVIS, Stockton, was 2nd.

The best two bunches of Black Grapes were Groa Maroc, from Mr. W. T. DOUGHTY, Steeple Langford; Mr. T. JONES, Coombe Down, was 2nd, with Black Hamburgh.

The best two bunches of white Grapes, Muscats excluded, were very fine Buckland Sweetwater, from Mr. W. A. TODD, Stoke Bishop; Mr. H. CLACK, The Gardens, Roundway Park, Devizes, was 2nd, with the same.

Black Muscats were represented by good Madresfield Court, from Mr. E. J. PEACOCK, Bath; Mr. CLACK was 2nd with the same.

Mrs. TALBOT GREAVES was 1st with two bunches of white Muscat, having Muscat of Alexandria; Mr. T. JONES taking the 2nd prize with the same.

Melons were shown in two classes, and these were good. Apricots, Plums, Cherries, Peaches, and Nectarines were all in good character. The best dessert Apples were Red Quarrenden, Duchess of Oldenburg, Beauty of Bath, and Irish Peach. Peasgood's Nonsuch, finely shown, took a decided lead among the culinary Apples. Pears were fairly good.

VEGETABLES.

The exhibits of vegetables are generally very fine here, but this was not so on this occasion; still, there was a very good display in many classes.

The amateurs have several classes allotted to them for plants, flowers, fruits, and vegetables, and also for *bonâ-fide* working-men, who generally show remarkably well, there being some 36 acres of allotment-gardens provided by the generosity of a resident, and they are generally very well tilled, but the land had suffered from the drought.

ROYAL HORTICULTURAL OF ABERDEEN.

A HURRICANE.

AUGUST 17, 18, 19.—The old adage that "Man proposes but God disposes," was never more truly verified than in the case of the annual show of this Society. On the eve of the show—Wednesday, 16th inst.—preparations were begun, and by nightfall numerous exhibits were arranged in the three spacious marquees, erected in Duthia Public Park, Aberdeen. The entries were up to the average generally, and the quality of more than average excellence.

As usual, a feature of the show was the display made by 16 al nursermen, in separate tents; and as this year a gold medal was offered for the best exhibition, there was keen rivalry among such well-known firms as Messrs. BEN REID & CO., Messrs. JAMES COCKER & SONS, Messrs. WILLIAM SMITH & SON, &c., all of whom had forwarded floral designs, cut-flowers, pot-plants, table-decorations, &c., as well as a large number of costly mirrors, vases, and such like. The wind was pretty rough in the afternoon, and about half-past eight those about became alarmed for the safety of the marquees and their contents, the wind having increased to a hurricane, and soon the centre-pole of the cut-flowers and fruit tent snapped, and in a twinkling the canvas was flapping about wildly, the tables with their valuable freights being swept bare. The marquee devoted to pot-plants was the next to go, and to add to the confusion clouds of dust from the walks obscured the vision, and hampered the work of rescue. Valuable Palm-trees and other exotic plants were tumbled indiscriminately, to the despair of the owners. But the spectators were practically powerless to avert further disaster; and in quick succession Messrs. COCKER and Messrs. SMITH & SON's tents were wrecked, as was also the secretary's tent.

There were now only the tent of Messrs. BEN REID & CO., and the luncheon-marquee, which stood in a less exposed situation, left standing; and, in order to save the former, the top-canvas was lowered. An exciting scene was witnessed in connection with the collapse of the cut-flowers' tent. The lamps inside had been lighted, and when the crash came the canvas caught fire. A number of people were below the fallen tent, and it was feared that the flames, fanned by the wind, would spread so rapidly, that it might be impossible for everyone to escape in safety. No sooner was the danger apprehended, however, than many willing hands assisted in rolling up the canvas, and thus smothering the flames, with the result that the people below managed to crawl out uninjured. A large force of police had now arrived, and were told off to keep watch on the fruit. It was now seen that little more could be done; and it being now 11 p.m., the spectators gradually dispersed.

In the case of professional gardeners the loss is very serious. From many of the castles and mansions in Aberdeenshire beautiful exhibits were forwarded, and in some cases they were nearly all destroyed. Mr. James McDonald, gr. to Mr. T. W. CHROMIE, M.P. Balgowrie Lodge, Aberdeen; and Mr. John Proctor, gr. to Sir WILLIAM HENDERSON of Devanha, were perhaps the worst sufferers in this respect, their losses amounting to from £30 to £50 each. The most serious loss of all, however, fell upon the smaller exhibitors, who had carefully prepared their collections in the hope of securing some of the awards.

Taken altogether, the incident is the most deplorable that has ever happened in the annals of this Society, and it was founded in 1824.

MR. H. W. ADNITT.

(Joint-Secretary of the Shropshire Horticultural Society. See p. 176.)

Princess of Wales, Etoile de Lyon, Medea, Maurice Bernardin, Duchess of Albany, Souvenir de la Malmaison, Cornelia Hook, &c. Mr. GEORGE GARRAWAY, Nurseryman, Bath, took the main of the 2nd prizes.

Twenty-four bunches of Stove and Greenhouse Flowers.—Mr. H. MATTHEWS was 1st, and Mr. G. TUCKER 2nd, both having excellent collections.

Hardy perennials and biennials in twenty-four bunches made an excellent feature, Mr. W. T. MATTOCK taking the 1st prize; Messrs. W. J. STOKES & SON, Bristol, were a good 2nd.

DAHLIAS.

Like the Fuchsias, Dahlias have long been a feature at Trowbridge, and it may be said to open the Dahlia competition. With twenty-four show varieties, Mr. JOHN WALKER, Thame, was 1st, having a very good lot of blooms indeed, including Goldsmith, John Walker, Rosamond, Eclipse, R. T. Rawlings, Diadem, Victor, John Hickling, Duke of Fife, Miss Camell, Mr. J. Harris, Rev. J. Godday, Harrison Weir, &c.; 2nd, Mr. G. HUMPHRIES, Chippenham.

BUNNE, of Bath, and Mr. F. LINDSAY; the latter taking the 1st of Mr. R. Sydenham's special prizes for nine bunches; Mr. F. HART being 2nd. Cut flowers of zonal Pelargoniums were very fine.

Floral decorations were exhibited in several classes; Messrs. E. S. COLE & SON were 1st with a dinner-table arrangement, having a soft and pleasing combination of Orchids, Francoa, white Carnations, &c.; and Miss KATE MORRIS was 2nd. The best centre-piece for a dinner-table also came from Messrs. COLES & SON. Mr. E. FISHER had the best table decoration in wild flowers. The best centre-piece in fruit and flowers was also from Messrs. COLES & SON; and bouquets were also exhibited. There were also special prizes for wild flowers.

FRUIT.

The entries were numerous and good in the fruit-classes, though not equal to those of previous years. Mr. G. FYNN, gr. to Mrs. GOULDSMITH, was 1st with a collection of ten varieties, having Black Hamburgh and Muscat of Alexandria Grapes, Dymond Peaches, Lord Napier Nectarines, Apricots, Late

THE SHOW.

Notwithstanding the havoc among the exhibits, a most meritorious collection of plants and flowers was displayed, thanks to the exhibitors, the majority of whom allowed what was saved of their entries to remain on exhibition, and to nurserymen, gardeners, and others, who forwarded a large number of flowering and foliage plants. The result was that when the opening ceremony came to be performed by the Countess of Aberdeen, who was accompanied by the Earl, there was much for visitors to admire; and by the evening of the opening day a really splendid display was to be seen in the erected marquees.

In the principal marquees were fine collections of Araucarias, Dracenas, Palms, Crotons, and Ferns, while near these was a fine group of plants and flowers sent by Mr. JAMES McDONALD, gr., Balmownie Lodge, his collection including some remarkably fine Crotons, Liliiums, Begonias, Chrysanthemums, and a much admired *Lapageria alba*. Mr. HARPER, Custodian of the Duthie Park, kindly furnished a large group which was placed in the centre of the marquee; the most prominent features of which were Liliiums, Begonias, and foliage plants. Mr. PROCTER, gr. to Sir WILLIAM HENDERSON, of Devocha, supplied a third group, which consisted of Orchids, Ericas, Orange-trees, and foliage plants. Round the sides of the marquees were tables well laden with flowers; among the chief features of which were fine and well-chosen collections of flowers and plants sent by Messrs. BEN REID & Co. Mr. ROBERT SIM, Aberdeen, sent a superb collection of wreaths, sprays, and shower bouquets, all tastefully arranged and designed. Messrs. KNOWLES, florists, also showed wreaths of Lilies, Lily of the Valley, Gardenias, and Assters, made up with Asparagus Ferns. Pompon, Cactus, show, fancy, and single Dahlias were numerous and good.

In a second marquee, the remains of the fruit made a very creditable show, some wonderfully good Strawberries for the season being a feature. Baskets of splendidly-cultivated vegetables were shown by Mr. A. PATERSON, gr., Ruthrieston; Mr. WILLIAM LAWSON, gr., Oakbank School; and Mr. F. KINNEAR, gr., Broomhill.

The display made by Messrs. BEN REID & Co. and others was highly creditable, considering the inconvenience to which they were put by the wreck of the tents. Messrs. JAMES COCKER & SONS rose to the occasion, they having re-erected their tent during the course of the opening day, and filled it with wreaths, bouquets, sprays, and floral designs. They also showed a large collection of Roses.

Thanks are also due to the exertions of the Chairman of the Society, Mr. PYPER, of Hillhead, who was on the ground at 4 a.m., and to the courteous secretary, Mr. J. B. RYNNETT, advocate, Aberdeen.

DEVON AND EXETER HORTICULTURAL.

AUGUST 18.—After sixty years, the place of exhibition has been changed from Northernhay to Bury Meadow public grounds. The change was made for reasons given in the *Gardeners' Chronicle* some time ago; and although it has not tended to increase the attendance of visitors—rather the contrary—there is better accommodation of every kind. The entries were about the average number.

OPEN CLASSES.

For twenty-four double Dahlias (open), Mr. W. B. SMALE, Torquay, was 1st, and Messrs. JARMAN & Co., Chard, 2nd. For twenty-four Cactus, Mr. C. ELMS, Teignmouth, was 1st, and Mr. W. B. SMALE, 2nd. For forty-eight spikes of Gladioli, F. FOX, Wellington, was a good first, and A. KNEEL, Exeter, 2nd. Messrs. JARMAN & Co., Chard, was 1st for twelve Tea Roses, showing some fine blooms.

DINNER-TABLE DECORATIONS.

This class filled well, and was the cause of much interest to visitors. Miss LOCK, daughter of Mr. G. LOCK, gr. to Mr. HILL, Newcombe, Crediton, won easily, with a very pretty table, dressed lightly with Orchids, *Odontoglossums*, *Oncidiums*, *Laelias*, *Carnations*, *Adiantum*, and *Smilax*, the arrangement being light and effective. The table was 8 feet by 4 feet, and laid as for dessert for eight guests.

GROUPS.

The 1st prize for an oval group, 11 feet by 15 feet, arranged for effect, was easily won by Mr. B. H. HILL, Crediton (gr. to Mr. LOCK), the arrangement having more grace and brightness than any of the others. The plants used in the design (arch shaped) were *Campanula pyramidalis*, *Humea elegans*, *Gloriosa superba*, *Tuberose*, *Codlins*, *Francia ramosa*, *Oleanders*, *Dracenas*, *Cocos Weddelliana*, and *Lilium auratum*. This group took the Silver Cup.

For a smaller group, 11 feet by 8 feet, in which similar plants were used, 1st, Lady DUCKWORTH (gr. to W. R. BAKER).

SPECIMEN PLANTS.

For twelve stove and greenhouse (six in flower and six foliage), 1st, Mr. W. BROCK, Parkerswell, Exeter (gr. to W. Rowland), with nice specimens of *Dipladenia ananilis*, *Colletium Andreanum*, *C. Warreni*, *Alocasia Veitchii*, *Clerodendron Balfouriana*, *Allamanda Hendersonii*, *Ixora Williamsii*, *Cycas revoluta*, and *Areca lutescens*, taking the Silver Cup; and he was further successful in winning 1st for six stove and greenhouse plants in this class, showing other species of the same genera. Mr. BROCK was 1st for six stove and greenhouse flowering plants, six stove and greenhouse Ferns, and six Fuchsias, showing nice plants of each. *Gloxinias* were very good; the Rev. COLEBRIDGE, Alington (gr. to E. Rewe),

being 1st with six well grown plants, all, of course, being of the erect type. Liliiums were fair, and Cockscrobs only middling. Lady DUCKWORTH showed some fine *Caladiums*, and was awarded 1st prize. In *Pelargoniums* nothing of special merit was shown. Mr. BROCK staged some finely coloured and well grown *Colens*. The Rev. HAMILTON-GELL, Winslade (gr. to G. J. Barnes), was 1st with good *Dracenas*. Lord POLTMORE (gr. to T. Slade), sent—but not for competition, a collection of fruit, including some fine Black Alicante Grapes, with large well coloured berries. He also showed a very fine Melon, and other fruits.

FRUIT.

The Premier prize for a collection of ten dishes, was taken by Mr. W. SANFORD, Nyohead Court, Wellington (gr. to S. Kidley), his collection consisting of very fine Black Hamburg Grapes, middling Foster's Seedling, Stirling Castle Peaches, very fine Transparent Gage Plums, Humboldt Nectarines, Beauty of Bath Apples, Jargonelle Pears, Morello Cherries, Holborn Favourite Melon. For six dishes the 1st prize was awarded to Rev. HAMILTON-GELL. The Muscat of Alexandria Grapes with which Mr. C. EADY, Q.C., Weybridge (gr. to J. Lock), took the 1st prize, were very fine in colour and in other points first rate. In the "any other variety" of Grapes, Mr. C. EADY was 1st with fine bunches of Alnwick Seedling, being closely followed by the Rev. HAMILTON GELL, with Black Alicante.

The fine variety, Madresfield Court Muscat, was extraordinarily fine in form and colour, as shown by the Rev. H. CLERK, Exmouth (gr. to G. Pike), who was easily 1st.

Mr. JOHN GARLAND, gr. to Sir THOS. ACLAND, Bart., Killerton Park, Exeter, showed a dish of seedling Peach, fine in size, as in colour. It is a seedling from Dymond, and resembles that variety in the blossom and fruit, but Mr. Garland says it is about ten days earlier. The tree is budded on a Burgoyne Nectarine.

VEGETABLES.

For the eighth time in succession, Sir JOHN SHELLEY, Bart., Shobrooke Park, Crediton (gr. to R. Mairs), has won the Silver Cup with an exceptionally fine lot, each sort being so good that it would probably have been 1st in the single-dish classes. The collection included Satisfaction Potato, Renton's Monarch Leek, Veitch's Garden Globe Turnip, Dobbie's Invincible Celery, Veitch's Intermediate Carrot, Autumn Giant Cauliflower, Sutton's Best-of-All Runners, and Peerless Cucumber. Mr. B. H. HILL was a good 2nd; and in the collection for six kinds Lady DUCKWORTH, Knightley's, Exeter (gr. to W. R. Baker), was placed 1st for similar kinds, shown in fine form.

The Veitch's Scarlet Model Carrots, shown by Mr. MAIRS in the single-dish class, were perfect in shape and fine in colour, and his Excelsior Onions average 2½ lb. each. Vegetables generally were very fine; Cauliflowers only being less good than other kinds.

TRADE EXHIBITS.

The trade collections included those of R. VEITCH & SON, Exeter; W. B. SMALE, Torquay; JARMAN & Co., Chard; SELDON NURSERY CO., Sowton; DEVON CHRYSANTHEMUM NURSERY, Teignmouth; JAMES WALTERS, Mount Radford; W. J. GODFREY, Exmouth; TUPLIN & SONS, Newton Abbot; and JADOO, Ltd., Exeter, who, in a very fine miscellaneous collection of conservatory plants, showed Apples in pots, bearing very heavy crops for their size.

The DEVON AND EXETER BEEKEEPER'S ASSOCIATION had a fine exhibit, the largest and best they have yet had.

SHROPSHIRE HORTICULTURAL.

AUGUST 23, 24, and 25.—There are few readers of the *Gardeners' Chronicle* but have some interest in the annual shows held at Shrewsbury. Nothing commands attention sooner than success, and for this reason the Shrewsbury show, like the Temple Show, of the Royal Horticultural Society in London, excites at least a passing interest in many to whom flower shows as a rule do not appeal.

On p. 170 a few particulars are given, showing the growth each year since 1875 of the financial receipts of the Society, which in that year were £791 12s., and in 1899 no less than £4389 1s. 10d.; the total income for the twenty-four years being £60,458 0s. 9d. A sum very much exceeding £1000 has been spent during the same period upon improvements to the well known "Quarry" grounds in which the shows are held. Then in 1897 the Society did honour to Shrewsbury by erecting in a prominent position in the town, an admirable statue to the late Chas. Darwin, the most illustrious of Shrewsbury's sons. This was done at an expense of £1086 9s. 3d. Local charities have also benefited largely from the society, and for several years past donations of ten guineas have been made to the Gardeners' Royal Benevolent Institution. The deserving nature of this Institution, and of the Royal Gardeners' Orphan Fund, we feel sure will commend both to the increased liberality of the society in the future.

How much of the success that has followed the Shropshire Horticultural Society is due to the skilful and untiring efforts of the popular joint secretaries, Messrs. Adnitt and Naunton, is known to those only who have been more or less intimately associated with its management. But exhibitors, judges, and representatives of the press are unanimous in their appreciation of the work these gentlemen have done, and it gives us considerable pleasure to present to our readers their photographs on pp. 173 and 175.

The Shropshire Horticultural Society, though successful as we have shown, has not demonstrated that large horticultural exhibitions can be made to succeed financially when the attractions provided are purely horticultural. Doubtless

there are thousands who go to Shrewsbury mainly to see the sports and to hear first-class music, but who, nevertheless, make an inspection of the horticultural exhibits. It is by the help of such people that the Society has been and is able to offer such substantial encouragement to excellent cultivation of horticultural produce. This is the object for which most of the prize-money is given. Whether in the remarkable Grape class of the present year, or in the remaining fruit classes and in the plant section, the chief requirement is first-class cultivation; but in some cases, of course, it is necessary that excellent quality be accompanied by tasteful arrangement.

THE EXHIBITION.

At the outset we may say that the Show opened on Wednesday, was a magnificent one, probably the finest that has ever been held; and it is certainly one that has caused most interest. Shrewsbury's specialty, fruit, was shown splendidly in the Great Grape Class, in the Decorative Dessert Class, and in the Collections of Fruit, and Grape Classes. There was abundance of choice indoor fruits of the very highest quality. Scotsmen will be proud of the fact that the 1st and 2nd prizes in the Commemorative Grape Class have gone North of the Tweed, and English growers will doubtless re-double their efforts to get alongside their Scottish brethren on a future occasion, but Mr. Lunt is of English parents. Plants, Cut Flowers, and Vegetables contributed to make the Exhibition a very large one, and most attractive. Particulars of the principal classes are given below; but there are many minor ones, and a large number of Amateur and Cottagers' exhibits, of which we are quite unable to make note.

THE GREAT GRAPE CLASS.

To mark the occurrence of the twenty-fifth annual show, the committee arranged a remarkable Grape Class, offering prizes in the aggregate to the amount of £100. The money was divided into six prizes, the 1st of which consisted of the Society's Gold Medal, and £26. Each exhibit included twelve bunches of Grapes, two, in six varieties, and at least one white variety. The judging was done from the standpoint of "superior cultivation and finish," but a greater number of points was allotted to Muscat of Alexandria, than to any other variety. The exhibits were decorated by non-flowering table plants and loose foliage, which were interspersed between the bunches. Never has so much money been offered in a class for Grapes, and the chief interest (at least to fruit cultivators), in the exhibition, was naturally centred upon this contest. There were six collections staged, and there were six prizes.

The judges were Messrs. O. Thomas, W. Crump, and J. W. McHattie, and they had a great difficulty before arriving at the conclusion of their work. The following are the varieties staged by Mr. T. LUNT, gr. to Capt. STIRLING, Keir, Dumblane, N.B., and the points awarded to each bunch. There were six varieties, and two bunches of each:—

Cooper's Black	6½ and 6 points.
Muscat of Alexandria	9½ and 9½ "
Muscat of Hamburg	8 and 8 "
Mrs. Pince	6 and 7 "
Alnwick Seedling	8 and 8 "
Black Hamburg	7½ and 7 "
For decorative staging	5 "

The points possible were 106, and the points obtained 96.

As may be judged from the points given above, the Grapes were extremely good, and Muscat of Alexandria were nearest perfection, getting 9½ and 9½ points out of possible tens. Muscat Hamburg and Alnwick Seedling were also of much excellence.

English Grape-cultivators must look to their laurels, for just as the 1st prize was won by a Scots grower, so the 2nd was awarded to Mr. A. KIRK, gr. to J. THOMSON PATON, Esq., Norwood, Alloa, N.B., whose maximum points amounted to 89½. One bunch of Madresfield Court was awarded 8½ points, from a possible nine, and was the bunch most nearly perfect.

Mr. J. H. GOODACRE was 3rd, obtaining 79½ points. Mr. J. CAMPBELL was 4th with 76 points; Mr. J. Langley, gr. to the Rev. T. M. BULKELEY OWEN, Telsmore Hall, West Felton, 5th, with 69 points; and Mr. J. BUNNEMAN, gr. to Lord BAGOT, Blithfield, Rugeley, 6th, with 63 points.

DESSERT TABLE OF FRUIT.

This class for a table of fruit so arranged as to represent a table of dessert fruit, has been a feature of much interest at Shrewsbury shows for several years past. Not more than fifteen dishes, selected from a published list of varieties, may be shown. The prizes were awarded according to the point-value system.

The 1st prize was won by Mr. J. H. GOODACRE, and a very excellent exhibit he made. His decorations were not heavy, but consisted of three large but elegant glasses, and more numerous smaller ones, tastefully filled with *Crocasmia aurea*, *Francia racemosa*, relieved with light Fern-fronds, &c. The Grapes were supported in elegant baskets, and were of the varieties Muscat of Alexandria, Canon Hall, Madresfield Court and Black Hamburg, all of them very fine. His Peaches were capital, of the varieties Royal George and Sea Eagle; Nectarines Prince of Wales and Stanwick Elruge; Brown Turkey Figs, Countess and Hero of Lockinge Melons, Transparent Gage Plums, Williams' Bon Chrétien and Souvenir du Congrès Pears, and Washington Apples. This exhibit was awarded 118 points. The 2nd prize was won by Mr. J. McINDOE, gr. to Sir J. PEASE, Bart., Hulton Hall, Guisborough. In this exhibit, from one of the most renowned competitors, the fruit generally was very fine from the point of view of size; but in quality, some of the dishes were not superlative, notably the dish of Souvenir du Congrès Pears. The Grapes were excellent, and his Peaches and Nectarines

were highly coloured and good, but the aggregate number of points obtained was 98. The 3rd prize was won by Mr. G. Mullins, gr. to Lady HENRY SOMERSET, Eastnor Castle, Ledbury, who so closely followed Mr. McIndoe as to obtain 91½ points. Mr. J. EDMONDS, Bestwood Gardens, Notts, and Mr. S. BREMMELL, gr. to H. H. FRANCE-HAYHURST, Esq., Overley, Wellington, were unplaced, there being five exhibitors.

COLLECTIONS OF FRUIT.

There were seven or eight exhibits in the class for a collection of twelve dishes, and in the aggregate a large amount of first class fruit was staged. The 1st prize was taken by Mr. J. H. GOODACRE, gr. to the Earl of HARRINGTON, Elvaston Castle, Derby, who had ground for considerable satisfaction. His Grapes were Muscat Hamburg, Canon Hall Muscat, Muscat of Alexandria, and Madresfield Court, all of them of first-rate quality and moderate size; he had a fine Queen Pine, Countess Melon, Barrington and Royal George Peaches, Victoria Nectarine, Brown Turkey Fig, Dr. Jules Guyot Pear, and Lady Sudeley Apple; the 2nd prize exhibit was naturally very good, and close to the 1st. It was shown by Mr. G. Mullins, gr. to Lady HENRY SOMERSET, Eastnor Castle, Ledbury. He had three varieties of Grapes, all good, the varieties being Muscat of Alexandria, Black Alicante, and Gros Maroc. His Peaches and Nectarines were of moderate size and high colour; and very large, handsome fruits of Bigarreau Cherry were shown. The 3rd prize was won by Mr. T. C. NEED, York House, Malvern; and the 4th by Mr. W. Pilgrim, gr. to Sir Geo. MEYACK, Bart., Bordogan, Anglesey. Mr. J. McINDOE, an opponent worth beating; Mr. J. EDMONDS, Bestwood Gardens; Mr. D. MURRAY, Culzean Castle Gardens, Maybole; and Mr. F. JORDAN, Impney Hall Gardens, Droitwich, were unplaced.

In the competition for nine dishes there were engaged five competitors, the chief honour being won by Mr. J. Langley, gr. to Rev. F. M. BUCKLEY OWEN, Tedsmore Hall, West Felton. He had Black Hamburg and Foster's Seedling Grapes, Grosse Mignonne Peaches, Shipley and Kaisha Apricots, Hero of Lockinge Melon, Prince Englebert Plum, Jargonelle Pears, and good Cherries. The 2nd prize was won by Miss WRIGHT, Halston, Oswestry (gr. Mr. C. Roberts); and 3rd, Mr. S. BREMMELL, gr. to H. H. FRANCE-HAYHURST, Esq., Overley, Wellington.

GRAPES.

The best collection of four dishes of Black Grapes was from Mr. A. Kirk, gr. to J. THOMSON-PATON, Esq., Norwood, Alloa, N.B.; the varieties staged being Madresfield Court and Hamburg. The bunches were large and well-finished in size and colour of berry; the latter variety especially so. 2nd, Mr. J. Campbell, gr. to C. E. NEWTON, Esq., Michleover Manor, Derby, with Gros Maroc and Black Hamburg. 3rd, Mr. A. H. Hall, gr. to J. C. WATERHOUSE, Esq., Prestbury, Macclesfield. There were nine competitors in the class.

For four bunches of White Grapes, there were five competitors, and again Mr. J. A. GOODACRE won the premier prize with the choice varieties, Canon Hall and Alexandria Muscats. Mr. THOMAS LUNT was 2nd; and showed very large but not perfectly-finished bunches of Muscat of Alexandria and Foster's Seedling; 3rd, Mr. T. Lambert, gr. to Lord HARLEIGH, Brogityn, Oswestry.

The best two bunches of Black Hamburgs among five collections, were from Mr. A. Ruddock, gr. to E. A. YOUNG, Esq., Tanybryn, Bangor; 2nd Mr. J. H. GOODACRE; 3rd, Mr. J. CAMPBELL. The Grapes in this class were good, but not exceptional.

Madresfield Court was shown best by Mr. A. H. HALL, who had two very pretty bunches of beautifully finished berries of moderate size; 2nd, Mr. W. NEILL, Holmes Chapel; and of the other three exhibitors the 3rd prize was won by Mr. W. Shingler, gr. to Lord HASTINGS, Melton Constable, Norfolk.

The best two bunches of Black Alicante, were shown by Mr. W. SHINGLER, whose bunches were very heavy ones, and the berries of large size and good finish. Mr. A. H. HALL, was 2nd, and Mr. J. LANGLEY, 3rd.

The best Gros Colman or Gros Maroc, in collections of two bunches, were from Mr. W. SHINGLER, with Gros Maroc of extraordinary berries as large as moderate-sized Gienanges, and good in finish. Of six other exhibitors, Mr. J. CAMPBELL was 2nd, with the same variety; and 3rd, Mr. G. GRIMMER, gr. to W. G. PHILLIPS, Berriek House, Shrewsbury, who had also exceptionally large berries, but they had been considerably rubbed.

The best two bunches of white Grapes (Muscats) were from Mr. T. LUNT, who had long, tapering bunches, of fine finish, and uncommon merit. There were nine others, and the 2nd prize was won by Mr. W. NEILL; and 3rd, Mr. T. BANNERMAN, gr. to Lord BAGOT, Blithfield, Rugeley.

In the "any other white" class, the variety Buckland Sweetwater was well shown by Mr. R. Lawley, gr. to Mrs. DABY, Adeote Hall, Baschurch; 2nd, Mr. A. KIRK; and 3rd, Mr. F. JORDAN.

LOCAL CLASSES FOR GRAPES.

The best two bunches of Black Hamburg Grapes, to be shown by Salopians, were from Mr. A. Salt, gr. to J. W. WILSON, Esq., The Grove, Market Drayton; and the best pair of "any other black," by Mr. W. Ashwood, gr. to R. A. NEWITT, Esq., Admaston, Wellington, who had good Madresfield Court. There were eight or nine exhibits in each of the two classes. The best Muscats from the County were shown by Mr. T. LAMBERT, there being eight exhibits. The best

"any other white" was Buckland Sweetwater, from Mr. R. LAWLEY. The best black Grapes from local amateurs were Madresfield Court, from Mr. W. Ashwood; and the best white were Muscats from the same exhibitor.

OTHER FRUITS.

Peaches generally were very good and of fine colour. The best dish of six fruits was from Mr. C. Tyler, gr. to C. A. JONES, Esq., Bron, Hendre, Carnarvon, who had deeply coloured, excellent sized fruits of Bellegarde; 2nd, Mr. J. McINDOE, gr. to Sir J. PEASE, Bart., Hutton Hall, Guisborough, with Sea Eagle; and Mr. T. BANNERMAN, was 3rd, with Royal George. There were as many as seventeen exhibits in the class.

Nectarines.—There were twelve exhibits in the class for a dish of six fruits, and those of Pine-apple (1st prize) from Mr. J. Howard, gr. to Sir B. SUTTON, Bart., Benham Park, Newbury, were of unusual quality. In size and colour they were really first-class. Mr. J. H. GOODACRE was 2nd, with finely-coloured Elruge; and Mr. A. H. HALL, 3rd, with Lord Napier.

Apricots.—The best dish of six fruits, out of seventeen exhibits, was from Mr. ISAAC COOKE, Corner Farm, who had the variety Moor Park; Mrs. DABY, 2nd.

Plums were good in quality, but there were not so many exhibited as is usual at Shrewsbury. The best dish of twelve fruits, green or yellow varieties, was from Mr. J. L. NOLFEY, who had good fruits of Transparent Gage; 2nd, Mr. J. Risebrow, gr. to Col. KENYON SLANEY, M.P., Shifnal. There were ten exhibits.

The best dish of purple or red Plums was shown by Mr. J. H. GOODACRE, who had Kirke's, very fine in quality; 2nd, Mr. J. Bowerman, gr. to C. H. HOANE, Esq., Basingstoke.

Melons.—There were as many as twenty green-fleshed Melons shown in competition, and the best varieties after the judging were Countess, from Mr. DAVIES, gr. to the Rev. F. ALDERSON, Frankton, Oswestry; Hero of Lockinge, from A. HENDERSON, Esq., Buscot Park, Berks; and the same variety from Mr. Jno. Durnell, gr. to R. L. KENTON, Oswestry.

Of scarlet-fleshed varieties, the best was from T. F. KYNNESELY, Esq., Leighton Hall, Ironbridge. There were sixteen other exhibits; and the 2nd prize went to Sutton's Scarlet, from Mr. J. HOWARD; and the 3rd prize was won by Mr. J. DURNELL.

Cherries.—There were eleven dishes of this fruit, and all of them were good. 1st, Mr. J. Robinson, gr. to R. W. D. HARLEY, Esq., Brampton Brian Hall, Hereford, whose fruit were like little Plums.

Hardy Fruits in Salop.—The best collection of six dishes of hardy fruit grown in Salop was from Lieut.-Col. LOYD, Aston Hall, Oswestry. He had good Figs, Goosecherries, Currants, Pears, Apples, and Cherries. J. B. WOOD, Esq., Henley Hall, Ludlow, was 2nd.

There were classes also for cooking and dessert varieties of Apples, Pears, and Plums grown in the county, and some excellent produce was staged.

GROUPS OF PLANTS.

The groups of plants at Shrewsbury have been one of the greatest features of the show for some years past, and almost fill the centre of the exceptionally large + shaped marquee.

There were classes for miscellaneous plants, in or out of bloom; and for a group of ornamental foliage-plants; in both cases the space allotted to each exhibitor is 300 square feet. It requires some practice and resource to win the 1st prize in either of these classes, for the arrangement of such groups has now become quite a fine art, and the quality of the plants used in them is equally important.

The 1st prize for the group, in or out of flower, is £25, and it was won on the present occasion by Mr. Peter Blair, gr. to the Duke of SUTHERLAND, Trentham Hall, Staffs; and we believe this is the first time Mr. Blair has won this distinction at Shrewsbury. His exhibit was certainly a worthy one. In the centre was built a kind of basket with jagged margins, 4 feet to 5 feet high, of some material, but it was so smothered, and naturally smothered, with the choicest stove-trailers, and dwarf-growing plants and moss, that the material was not in the least visible. In this was planted a fine Palm, and under it were very choice Orchids in flower, Odontoglossums and Masdevallias especially. This centre object was supported by mounds of lesser height at the corners and elsewhere, generally surmounted by a Palm or highly-coloured Codium, and the variety of plants used, together with such arrangement, produced a picture full of light and shade; exquisite from whatever point judged. As far as flowering plants are concerned, the group owed nearly all to the exquisite Odontoglossums.

The 2nd prize was awarded to Mr. J. CYPHER, Cheltenham, who has won so many 1st prizes. This group differed in arrangement from Mr. BLAIR'S. The prominent object, a very fine Palm, was at the back; and from the front corners there stretched towards the centre, but not reaching it, two cork bridges, having a maximum height of about 3 ft., and supporting plants of Humex elegans, Asparagus, Ferns, Odontoglossums, &c. The groundwork of the group was composed of exceeding choice plants, Ixoras, Cattleyas, Aralias, &c., and was much admired. Mr. W. VAUSE, Leamington Spa, was 3rd.

The 1st prize for a smaller group of miscellaneous plants

was won by Mr. C. A. Roberts, gr. to Miss VAUGHT, Halston Oswestry; and the 2nd prize by Mr. F. Tugwood, gr. to F. F. KINNENSLY, Esq., Leighton Hall, Ironbridge, each exhibit being commendable.

Foliage Plants.—Mr. J. CYPHER won premier prize in this class, again using, and in greater degree, the kind of cork bridges described above. Those running from the front corners towards the centre were repeated, and at the extreme back also there was a tall bridge that spanned the group, and this as well as the others was beautifully furnished with Palms, and other choice foliage plants, and trailers. It is needless to specify the plants used in the group, as so many were represented, and they were of ordinary well-known kinds, but all were thoroughly well grown, and good of their kind. A Codium under the highest bridge was exceptionally well coloured. The 2nd prize (also £25) was won by Mr. C. J. MEE, Floral Depot, Nottingham, whose plants were exceptionally fine specimens, but there was not the necessary study shown in arrangement. 3rd, Messrs. ARTINDALE & SONS, Sheffield.

SPECIMEN PLANTS.

The premier class in this section was one for twenty-stove and greenhouse plants, either blooming species, or others with ornamental foliage, providing at least twelve were in bloom. Mr. J. CYPHER, generally the favourite in such cases, was the winner of the best prize (£25), with enormous plants, of the greatest possible quality. It would be an easy matter to enumerate the varieties, but there was not so little from those shown in recent years that it is unnecessary. Suffice it to say, that we noticed no species not previously shown in such a class, and that the Palms and the specimens of Ixora DuRoi, and some others, have never been excelled. Mr. T. S. TIMMIS, Allerton, Liverpool, was a good 2nd.

Thirty-stove or greenhouse plants in pots not exceeding 10 inches, Orchids excluded, were excellent, from Mr. J. CYPHER. His Ixoras were again noticeable for their fine quality. Mr. T. Lambert, gr. to Lord HARLEIGH, was 2nd, and well deserved the prize.

The best Caladiums in sixes were from Mr. B. Cromwell, gr. to T. S. TIMMIS, Esq., Allerton, Liverpool, who had fine plants.

Zonal Polargoniums were shown fairly good; the best collection of six plants of double flowering varieties coming from Mr. A. BATEMAN, Abbey Foregate, Shrewsbury; and the best single ones from Mr. A. MYERS, Shrewsbury.

Cordylines were shown in several collections, but the best were from Mr. T. Lambert.

Tuberous Begonias in the competitive classes were not of great merit.

Fuchsias are not a great feature at Shrewsbury. The best were from Mr. A. BATEMAN, Abbey Foregate; and Mr. A. MYERS, both of Shrewsbury.

Ferns were not present in great quantity outside the miscellaneous groups, but the best collection of six exotic species was from Mr. E. JONES, gr. to A. M. BARBER, Esq., Field, House, Wellington, and included fine specimens of Adiantum and Microlepia birta cristata.

Coleus were not numerous; Mr. J. Carter, gr. to W. J. SCOTT, Esq., Berwood House, Shrewsbury, had the best. The plants were about 5 feet high, and pyramidal.

CUT FLOWERS.

As usual at this exhibition, the section devoted to cut flowers made a brilliant display. Both bouquets and baskets arranged for effect were fully equal in quality to former years, whilst the competitors were much closer to each other in the chief classes, scarcely any difference being apparent in several instances. It is gratifying to note this, and it clearly reflects credit upon those exhibitors who, in these arrangements for effect, take note of the designs of their most successful antagonists. The bouquets in the several classes are of an exceptionally high standard, and the competition very keen. The method adopted at Shrewsbury of providing classes for groups of cut flowers of Dahlias, Roses, and Carnations, as well as of hardy herbaceous flowers, is commendable, and far preferable to the old stereotyped idea of so many varieties in so many classes. In this way many kinds find admittance which in the older methods would be excluded. Roses, for instance, are thus made a most interesting feature at this season; the same applies to Gladioli and Dahlias, which, in this particular instance, made a splendid display, illustrating their value from a decorative standpoint far more than the old-fashioned flat boards and their prim effect. Carnations in this way also, when set up in vases, produce a better display than when decorated with paper-collars. The hardy herbaceous and bulbous flowers produce a brilliant effect; some bunches of immense size, others small relatively in proportion, however, having regard to the variety staged. Better quality is rarely ever seen than in this class. The tender (i.e., the stove and greenhouse) cut flowers were not so well arranged; more latitude in this section should be allowed, as in the other classes. Being limited to so many varieties, those kinds of which only a few flowers, perhaps, are obtainable are not staged.

HARDY HERBACEOUS FLOWERS.

The 1st prize (to occupy a space of 15 feet by 5 feet for a collection) was awarded to Messrs. HARKNESS & SONS, whose exhibit comprised all the best things in season, notably of Gladioli, as G. Aurors de Feu, Madame Palmer (extra), Lafayette, and Mrs. Beecher; Montbretias, Lilies, Helianthus, and Galtonia candicans were represented by huge bunches

so also was *Chelone barbata*, *Lilium Batemanni*, *Phloxes*, and *Gaillardias*; and smaller bunches by *Scabiosa caucasica* and *Tigridias* in variety. The 2nd prize was awarded to Messrs. GUNN & SONS, Oton, Birmingham. The bunches here were also fine, but the varieties scarcely so good, the best being of *Montbretia Golden Sheaf*, *M. rosea*, *Erigeron planum*, *Phlox Elva*, *Echinops Ritro*, *Gaillardia grandiflora*, and *Achillea Eupatorioides*, the arrangement being very good.

Dahlias.—For a collection of Dahlias, any varieties, Messrs. KEYNES, WILLIAMS & CO., Salisbury, were 1st, with a fresh, attractive exhibit, in which the Cactus varieties were quite prominent, show and fancy, as well as Pompons, being well represented, but the singles, which lend themselves to this form of arrangement, were almost absent; nevertheless, it was a fine display, and the arrangement good, with the exception that the Pompons, where mixed with the Cactus, detracted somewhat from each other; the quality throughout, for thus early in the season, was first class. Mr. Wm. TRESEDER, of Cardiff, was 2nd, with a smaller arrangement, but with more massive stands, the Cactus varieties again predominating; a few single specimens here and there between the large stands would have been a distinct advantage, instead of so much dyed moss. Mr. SEALE, Vine Nursery, Sevenoaks, was 3rd. Singles here were the best, show varieties good, but Cactus deficient.

For a collection of Cactus var., Messrs. KEYNES, WILLIAMS & CO., were again 1st; the selection being excellent, and the flowers very fresh; some being in boxes upon moss, others in bunches, and others in masses. Messrs. POPE, King's Norton, Birmingham, were 2nd in this class, their arrangement also being good, but the varieties not so wide in point of colour, so many dark colours being included. Mr. M. CAMPBELL, Blantyre, N.B., was 3rd, with a smaller, but bright arrangement.

Roses.—The best collection was from Messrs. D. & W. CROLL, of Dundee, who had brought their flowers from the North in a remarkably fresh condition. The Tea-scented varieties were the best, including the decorative kinds; a few good blooms of the Hybrid-perpetuals were also staged. Messrs. POPE & SONS were 2nd with smaller exhibits.

Gladioli.—Messrs. HARKNESS & SONS staged the finest set in this class for a collection, and in their usual high-class quality; the best were Mr. Admitt (new, distinct, very bright), Mr. Naunton (distinct and fine), Horace Vernet, Madame Palmer, and Aurore de Feu were also good, and the spikes fine. Mr. MORREN, florist, Leominster, was 2nd with smaller spikes.

Carnations.—Mr. M. CAMPBELL, Blantyre, was easily 1st for a collection; having large individual bunches of Mrs. McNish, soft pink; Germania, yellow; Crimson Pearl, dark crimson; and Jessie Stevens, and smaller ones of other kinds; the whole effect being excellent. Messrs. LAING & MATHER, were 2nd with good selections, the heat had, however, told upon the flowers. Many novelties were to be seen here, the best on the whole being Dundas Scarlet, Primrose League, Duchess of Westminster, and Mr. R. Mather; 3rd prize to Messrs. CROLL & SON.

BOUQUETS AND BASKETS OF FLOWERS.

For six bouquets and six baskets, arranged with a few plants and foliage, Messrs. W. JENKINSON & SON, florists, Newcastle, were a comparatively easy 1st; the bouquets were on the whole a little too prim and neat, otherwise no fault could be found. Orchids predominated largely; excellent use in the bouquets being made of *Oncidium flexuosum*, with *Cattleya Harrisoni* and *Epidendrum vitellinum majus*, *Oncidium Forbesii*, with *Cattleya labiata*, and *Odontoglossum crispum*, with *Phalaenopsis amabilis*.

The baskets were scarcely so good as the bouquets, but nevertheless quite meritorious. Messrs. JONES & SON, Shrewsbury, were 2nd; their arrangements were light and effective, but in some cases the wire mounting was too conspicuous. Orchids again predominated, being more mixed in the various arrangements than in the 1st prize exhibit (these two exhibits were the centres of great admiration).

For one Bridal and one Ballroom bouquet, Messrs. JONES & SON most deservedly won the 1st prize with light arrangements, every flower telling well, the ground-work in each case being of *Asparagus plumosus*; Messrs. POPE & SON were 2nd with well finished examples, but slightly too heavy, otherwise a very close 2nd; 3rd, to Messrs. W. ARTINDALE & SONS, Sheffield.

For two similar bouquets, but without Orchids, Mr. W. TRESEDER, Cardiff, was 1st, with two capital and very tasteful designs, both alike good; Messrs. GUNN & SONS, were 2nd, with beautifully finished examples, but a trifle too prim and neat; 3rd, to Messrs. POPE & SONS.

For a bouquet of Dahlias, Mr. TRESEDER, was well to the front with an arrangement of one variety only, viz., "Harmony" (or one very similar); this bouquet well demonstrated the utility of the Cactus Dahlia in such purposes. Messrs. POPE & SONS, King's Norton, Birmingham, were 2nd with a larger bouquet, a beautiful combination, but rather too large. Mr. SEALE, 3rd, chiefly with *Arachal*.

For a bouquet of Roses, Mr. TRESEDER, was again 1st, with a dark crimson and Wm. Allen Richardson, in combination, very tastefully done; 2nd, to Messrs. POPE & SON, who had Catherine Mermet with Niphetos, the whole rather too large; 3rd, to Messrs. CROLL & SON, Dundee.

For a "Featherweight" bouquet (a novel class), the 1st prize went to Messrs. JONES & SONS, Shrewsbury, who showed in strict accord with the schedule, and won easily with *Francoa amosa*, *Calliopsis grandiflora*, and *Asparagus plumosus*, tastefully blended; 2nd to Messrs. GUNN & SONS, who had *Francoa ramosa*, *Statice Bondueli*, and a

blue variety, lightly put together; 3rd, was to Mr. SEALE, whose design was of a yellow-and-blue *Statice*, in light sprays, with gauze-like ribbon, only lacking colour to make it effective. (Two other exhibitors in this class showed well, but they had evidently not read the wording of the schedule strictly.)

Basket of Cut Flowers.—The 1st prize was easily taken by Messrs. JONES & SON—a light, tasteful, and inexpensive arrangement, composed of a yellow Cornflower, *Montbretia* (dark var.), Lily of the Valley, and *Pancratium fragrans*; 2nd to Mr. TRESEDER, who had *Montbretia Gloire d'Or*, *Francoa*, *Lilium speciosum album*, tastefully blended; 3rd, WILLIAM LASHMERE, Market Drayton.

For a stand of cut flowers, Mr. SEALE was 1st with a light arrangement, composed of *Mina lobata*, yellow *Statice*, and *Montbretia*, with appropriate foliage, amongst which *Asparagus deflexus* told well; 2nd to Messrs. JONES & SON, whose arrangement was extremely light—too much so, in reality, to be effective, and addition of foliage at the base would have added to its beauty; 3rd to Mr. VAUSE, Leamington, who showed well.

For six buttonholes and six sprays, Messrs. JONES & SONS were quite easily 1st with extremely light and tasteful arrangements, better than which, if a trifle smaller, could not be desired; 2nd to Messrs. JENKINSON & SON; and 3rd to Mr. F. H. NORRIS, Handsworth.

DISTINCT CLASSES.

Sweet Peas.—These produced such a display, that a tent might well have been devoted to their special benefit. For Mr. ECKFORD'S Special Prizes, THOS. ALDERSEY, Esq., was well to the fore with eighteen varieties, which might well be considered as typical of the best kinds of the present day. The bunches were light, and tastefully arranged, the individual flowers very fine, and the colours well blended; the best were Prince of Wales, Duke of Westminster, Silurian, Lady Grisell Hamilton, Queen Victoria, Emily Eckford, Venus, Lady Mary Currie, Blanche Burpee, Chancellor, Lovely, Mrs. Eckford, Countess of Radnor, and Countess of Powis (these names are given as indicative of the best kinds to grow). 2nd, Mr. BOLTON, Walton, Camforth, a capital lot, but not so well arranged.

For thirty-six varieties, in which class a Silver Challenge Cup was offered, Mr. BOLTON was 1st, with a selection of the best kinds now grown, amongst which besides those already enumerated were *Shahzade*, *Princess Beatrice*, *Miss*, and *Black Knight*; 2nd to Mr. A. BESSELL, of Ludlow, whose arrangement was better, if the quality was not quite so good as in the former exhibit.

For *Stove and greenhouse* cut flowers, the 1st prize was awarded to Mr. McDonald, gr. to G. H. KENRICK, Esq., Edgbaston, Birmingham, who made quite a feature of the *Javanico-Jasminiflorum* hybrids of the *Rhododendron*; these were *Princess Frederica*, a soft pale shade of terra-cotta; *Lord Wolsey*, *Duchess of Connaught*, and *Princess Alice*; the other bunches of various flowers being also good. Mr. Hall, gr. to J. C. WATERHOUSE, Esq., Prestbury, Macclesfield, 2nd, for an exhibit of first-rate quality.

For a similar class for six vars., Mr. Huxter, gr. to J. B. WOOD, Esq., Henley Hall, Ludlow, was well to the front, and Mr. Dawes, gr. to Lord Trevor, Bryn Rinalt, Chirk, 2nd.

Roses, twenty-four vars.—1st, to Messrs. D. & W. CROLL, Dundee, who showed the best of the well-known late vars., as *Madame Joseph Bonnaire*, *Caroline Testout*, *Her Majesty*, and *John Stuart Mill*. Messrs. HARKNESS & SON were 2nd, being well up to the 1st-prize winners.

For twenty-four vars., open to the county of Salop only, Mr. Squibbs, gr. to Dowager Lady WILLIAMS WYNN, was 1st, with good blooms.

For twenty-four show and fancy Dahlias, Mr. SEALE was a most creditable 1st, with well-developed blooms in good variety; Mr. S. MORTIMER being 2nd with another good exhibit.

Gladioli in eighteen varieties.—Messrs. HARKNESS & SON were again 1st, with first-rate spikes in good variety; Mr. R. MORREN, High Street, Leominster, being 2nd.

For twelve spikes of Gladioli, Captain T. A. M. DICKING, Loppington House, was 1st; and Lieut.-Col. LLOYD, Aston Hall, Oswestry, 2nd, each staging well.

For twelve vars. of ornamental grasses (a most commendable class), Mr. Seabury, gr. to the Rev. J. M. BULKELEY OWEN, was 1st, with a charming exhibit, the best of which were *Melica altissima*, *Pennisetum longistylum*, *Lagurus ovatus*, *Gymnethrix latifolia*, and *Eragrostis elegans*; this exhibit was well staged. 2nd, Mr. Salt, gr. to J. W. WILSON, Esq., Market Drayton.

Cactus Dahlias.—Twelve vars.; 1st, to Mr. MORTIMER, who staged well with the best kinds; Mr. Keeble, gr. to F. W. SHARPE, Esq., Twyford, Berks, was a close 2nd, having the best of the newer kinds in good form. Messrs. KEYNES, WILLIAMS & CO., 3rd.

For the best collection of hardy cut flowers, Mr. SQUIBBES was 1st, the selection a good one.

For twelve bunches of cut flowering shrubs, 1st to Mr. SCABURY, who amongst other things had *Kolreuteria paniculata*, *Indigofera floribunda*, and *Clerodendron trichotomum*; 2nd to Mr. Huxter, gr. to J. B. WOOD, Esq., Ludlow.

VEGETABLES.

These products were shown in unusual abundance, the season apparently affecting for the worse Cauliflowers only; generally, the quality was remarkably high, and in the larger collections competition was wonderfully keen.

The chief interest in the large classes centred in the one for nine dishes in competition for prizes offered by Messrs. SUTTON & SONS, of Reading, there being twelve entries. Here the 1st place was taken by Mr. Bowerman, gr. to Mrs. C. HOARE, Hackwood Park, Basingstoke, who had good Cauliflowers, Superb Onions, Leeks, Perfection Tomatoes, Ideal Potatoes, Best-of-all Runners, Superb White Celery, New Intermediate Carrots, and beautiful Ne plus Ultra Peas. Mr. J. Gibson, gr. to R. W. HUNSON, Esq., Daneshield, Marlow, was 2nd, having capital Onions, Red Celery, Windsor Castle Potatoes, Best-of-all Runner Beans, Autocrat Peas, &c. Mr. W. POPE, gr. to the Earl of CARNARVON, Highclere Castle, was 3rd.

There were four entries for the prizes in plate offered by Messrs. JAS. CARTER & CO., High Holborn, London, for nine vegetables. Mr. POPE was here 1st, having good Cauliflowers, Tomatoes, Snowball Potatoes, Parsnips, Red Onions, Jubilee Beans, Intermediate Carrots, and Model Cucumbers. Mr. Wilkins, gr. to Lady THEODORA GUEST, Henstridge, Blandford, was 2nd, having good Ailsa Craig Onions, Peas, Carrots, Cauliflowers, Leeks, Tomatoes, Potatoes, Celery, and Runner Beans. Mr. Ashton, gr. to the Earl of LATHOM, Ormskirk, was 3rd.

There were eight collections each of eight dishes in competition for Messrs. WEBB & SONS, Wordsley, Stourbridge, excellent prizes. Here Mr. BOWERMAN was again a good 1st; Mr. POPE was 2nd, with a similar kinds; Mr. WILKINS 3rd.

There was a very large competition in each case for Mr. Sydenham's prizes, chiefly in single dishes; in addition to money prizes, there was a handsome silver tankard awarded to the taker of most prizes or points.

Mr. POPE won the cup for the second year with forty-four points in this competition, and it therefore becomes his property.

Prizes offered by the WITH'S CHEMICAL MANURE COMPANY for nine vegetables.—This was taken by Mr. Martin, gr. to A. Henderson, Esq., Buscot Park, Berks.

For prizes offered by Messrs. C. FIOLIN & CO., Reading, for four vegetables, the 1st was taken by Mr. Abbott, gr. to Mrs. GRISSE, Stadhall.

Messrs. MERRILL & CO., Shrewsbury, had classes for twelve dishes and six dishes respectively. The best in the four was taken by Mr. Robinson, gr. to B. W. HARLEY, Esq., Hereford, having capital samples.

In the smaller class the 1st prize fell to Mr. ABBOTT.

Mr. BOWERMAN had the best dish of Messrs. Webb & Sons Jubilee Tomatoes.

Messrs. JONES & SON had a class for eight vegetables. Mr. Dawes, gr. to Lord Trevor, coming 1st; Mr. McKINNOY, 2nd, and Mr. TOWNSEND 3rd.

SOCIETY'S SINGLE CLASSES.

Mr. A. H. Hall, gr. to S. C. WATERHOUSE, Esq., Prestbury, was 1st with a single dish of Tomatoes, also with a handsome brace of Exquisite Cucumbers.

Mr. TOWNSEND had in Autocrat the best Peas. He was also 1st with Canadian Wonder Dwarf Beans.

Mr. Birch, gr. to Captain H. J. BULTER, Shrewsbury, had the best Runner Beans.

Mr. ASHTON was 1st with three Cauliflowers, and Mr. ABBOTT had the same position with Giant White Celery.

The best six Parsnips came from Mr. Riebbow, gr. to Col. KENYON SLANIV, Shifnal, that root being some thirty inches long.

Mr. Hunt, gr. to Sir COLLEY SUTLAND, Shrewsbury, had the best Chirk.

With six Turnips Mr. HUXTER was 1st, having handsome Snowball.

Mr. BOWERMAN staged the finest autumn-grown Onions, and Mr. HUXTER the best Spring Onions.

Potatoes.—In the Potato classes there was great competition. Mr. POPE was a good 1st with handsome Supreme, Perfection, Satisfaction, Ideal, and Windsor Castle. Mr. ASHTON was 2nd with Monarch, Snowball, Holborn Reliance, and Goldfinder. Mr. Riebbow was 3rd with very handsome samples.

With three dishes Mr. Taylor, gr. to Lord KENYON, was 1st, having unadorned whites none too distinct. Mr. E. CUMBERBATCH, Silverdale, 2nd.

Mr. POPE was first for a single dish with Windsor Castle, Mr. GITTENS, West Felton, 2nd, with Snowdrop.

MISCELLANEOUS EXHIBITS.
