On our way to Nunziatella we passed the Papal frontier. The invisible barrier had scarcely been gone over when I saw a cap thrown in the air, and heard a joyful cry of "Viva Vittore Emanuele!" I put my head out of the window and cried "Viva" too; and had it not been for the carriage roof and luggage I do believe my bonnet would have followed the "cap of liberty," such a relief was it to feel that one might grow in peace without a spy at one's elbows, or the vision of a passport before one's eyes.

While waiting for the train at Nunziatella I had an hour's flower-hunting in the fields around. The prettiest specimens I found were those of the *Vetch* tribe—one of pale yellow, *Vicia lutea*; one of blue, *Vicia uniflora*; one of red, *V. angustifolia*; and one of dark red, almost black, which I suppose was *Orobus niger*. There were some others, but I only kept a few; yet they were all beautiful from the tender grace of their delicate foliage. The total absence of any Ferns on the entire route was most remarkable. I felt all day that something was wanting to complete my satisfaction; it was as though I missed the kindly greeting of old friends amidst a bevy of passing acquaintances. At night we were in Florence.—*FILIX-FEMINA.*

## ARCHERFIELD.

(Continued from page 401.)

THE hot-houses occupying the north wall of the kitchen garden, it has been already stated, are of unequal width, the central houses being wider than those at the ends, and the border in front of the range has been made to correspond, the central portion of the border extending 8 feet, or more, farther into the garden than the ends. The continuity of the walk in front of the range is consequently broken to suit the outline of the border, and the latter being necessarily divided into three, the opportunity is afforded of planting each part separately. This has been done in a manner differing in many respects from the usual practice, Mr. Thomson being an advocate for what has been designated panel planting, a plan which gives scope for great variety. The border in front of the houses, as well as that on the opposite side of the walk, has been so treated this year with perfect success. Perhaps the only fault that any one would be disposed to find is the planting such heavy crops of flowering plants on Vine-borders. The good condition of the

Grapes, however, proves that they lack nothing to make them perfect, and yet the lines of hedding plants form a dense mass up to within 4 feet of the wall of the houses. The projecting central part of the border, 100 or 150 feet long, is planted differently from the two ends, both of which are of about the same length. The border next the cropped part of the garden is 18 feet wide, the portion planted next the house is not quite so wide, and the whole presented a mass of bloom rarely equalled anywhere, and in no instance, that I am aware of, has it been excelled.

- The arrangement was as follows :—  
 Border A.—1st row next Box edging, Geranium Mrs. Pollock.  
 2nd row.—Lobelia speciosa.  
 3rd row.—Geranium Stella variegata, a silver-edged variety of that popular Geranium, raised by Mr. Thomson about three years ago.  
 4th row.—Oxalis, with dark foliage, the specific name of this I do not know, but the plant is dwarf, quite hardy, and in colour most resembles the *Amaranthus melancholicus ruber*.  
 5th row.—This was broken by conical masses of a bright Scarlet Geranium planted in raised tubs about 12 feet apart, with the base of the tub hidden by masses of Geranium Paul L'Abbé, planted round it, and a double line of the same Geranium between each mound.  
 Border B.—1st row, beginning next the edge of the walk, Lobelia Paxtoniana, two lines.  
 2nd row.—Geranium Mary Ann, a silver-edged variety, one row.  
 3rd row.—Verbena venosa in a mass about 5 feet wide, with patches of a yellow Calceolaria 2½ feet in diameter, alternating with like patches of Geranium Vivid (scarlet), about 12 feet apart.  
 4th row.—Geranium Bijon, a silver-edged variety.

- 5th row.—Dahlia Prince Arthur, a good crimson variety, dwarf, alternating with *Tritoma uvaria*, the latter growing most luxuriantly.  
 Border C.—1st row or edging, next the walk, composed of *Gazania splendens* and blue Lobelia, mixed.  
 2nd row or panel of Verbena Purple King, about 3 feet wide, with tufts of *Centaurea candidissima* in the centre, and 15 feet apart.  
 3rd row.—Double line of Scarlet Geranium, having tufts every 15 feet, alternating with those in the preceding row, and composed of a large single plant of Trentham Rose Geranium, surrounded with Christine. These tufts were elevated considerably above the other plants, and being covered with bloom looked extremely well. A vacant space behind this row was left to afford access to the fronts of the houses, and also, perhaps, for the benefit of the Vines, &c.  
 Border D.—1st row next the walk, *Arabis lucida anreo-variegata*.  
 2nd row.—Lobelia speciosa, in panels 3 feet wide, with single plants of *Polemonium cœruleum variegatum*, of which something will be said hereafter, planted 8 feet apart in the centre of the panel.  
 3rd row.—*Calceolaria canariensis*.  
 4th row.—Verbena Purple King.  
 5th row.—Geranium Christine.  
 6th.—Geranium Stella, in panel 7 feet wide, with circles of *Centaurea* about 3 feet in diameter raised on pebbles every 10 feet, which had a rich effect.  
 7th row.—Geranium Christine.  
 8th Dahlia Zehnda, purple.  
 9th row.—Dwarf white Dahlia, just sufficiently tall to be seen distinctly above the last row. Plants of *Humea elegans* were interspersed in this row at regular intervals.

KITCHEN GARDEN AND FORCING-HOUSES AT ARCHERFIELD.

I ought to state that the width of this border, D, was 18 feet, and being composed of both broad and narrow lines it looked remarkably well. The broad mass of Geranium Stella, 7 feet wide, with masses of *Centaurea* rising above it at regular intervals, with the single line of Christine at each side of it, formed an excellent picture of itself, while a similar panel of Lobelia nearer the front, with corresponding plants of *Polemonium cœruleum variegatum* at regular intervals, had a rich effect, difficult to describe, and certainly still more so to excel. The whole of the plants were in excellent bloom, and looked very brilliant and rich.

The corresponding borders to C and D at the opposite end of the line of hothouses were planted in much the same way, the outer border having the single line, intervening between the broad panel, of the most brilliant colouring, enlivened by corresponding tufts, or rather gems, set at regular distances. I believe there was a difference in the materials used, but the design was the same.

We now come to the cross borders, one or rather both of which face the most usual entrance to the garden, and their appearance was not less striking than those above described. There being much similarity in the planting of both of the borders facing the cross walks, a description of one will suffice.

- Border E.—1st row next Box edging, *Cerastium tomentosum*.  
 2nd row.—Verbena Crimson King, a seedling of Mr. Thomson's, having all the good properties of its purple namesake, and it is not too much to predict that it will play an important part in general flower gardening, when it shall have become sufficiently known and distributed. I understand that it will be sent out next year by an Edinburgh nurseryman. Too much cannot well be said in its favour; its habit is upright, not quite so tall, perhaps, as Purple King; the colour is a bright crimson, with a small lemon eye, and it appears to flower abundantly, and to keep up a good succession of bloom.  
 3rd row.—Geranium Flower of Spring, silver-edged.  
 4th row.—A large variety of Stock, somewhat branched, though not so much so as the kind commonly called the Queen Stock. The flowers were mostly double, and looked well.  
 5th row.—Dwarf Apple trees at regular distances of 20 feet, alternating with standard Roses, and the spaces between them were occupied with Mignonette.  
 Border F, on the opposite side to that last described, was planted in the same way. The line of Verbena Crimson King, having lines of white-leaved plants on each side of it, was very conspicuous.—J. ROBSON.  
 (To be continued.)

WINTER FLOWER GARDEN.

MUCH has been said, and much remains to be said, about winter and spring flower gardening; every succeeding generation wishes to improve on the doings of the past, and my

object at present is to write a few words in favour of a system that deserves more attention. Whenever the flower garden is mentioned, the idea is at once

conveyed of a nicely kept piece of ground, near the residence, and disposed to the best advantage, so as to be pleasing to the eye and refreshing to the mind. To have this, it is necessary to adhere to some mode of laying out the ground, so as to give it, if possible, a diversity of appearance. There are many ways of doing this, but it is unnecessary for me at present to enter into details respecting each; but, whatever mode be adopted, the garden should be complete in itself, and arranged so as to have suitable places to receive different flowering plants and bulbs all the year. Plants and bulbs should have each their own place independent of the other, and by giving them this we would avoid any clashing between the two classes of plants, for bulbs are often taken out of the ground before they have properly matured their growth, in order that they may be replaced by bedding plants in May.

Now, I will take May to be the first flower gardening month in summer; we in general bed out in that month, after that we nurse and coax the plants for five or six months, then comes autumn, and their beauty fades away. We have then to clear away the plants which we loved so much, and dress and clean the beds, which, nine times out of ten, are left empty until the May of the following year, with the exception, perhaps, of a few bulbs in a bed or border in front of the windows.

It should be the same with the flower garden as with the drawing-room—that is, always fit to be looked at in the depth of winter as well as in the height of summer, no matter with what materials it is furnished. In order to have such an interesting garden, my notion is that a nice pattern laid with Box is the most eligible, as the beds can be of any width, and all in a group with gravel between them. There can also be alloys and

other places for bulbs, permanent plants, and different coloured materials, of which I can recommend three—viz., red, white, and black—burnt flintstone for white, coals for black, and red brick ends for red. They are the most distinct materials I know of for giving effect.

To show more clearly what I have said I send a copy of a flower garden that I recently laid out here, and which is much admired by all who have seen it. It will suffice to say that the beds are at present planted with *Alyssum saxatile*, *Arabis*, *Pansies*, *Stachys lanata*, *Crastium tomentosum*, and a

few dwarf variegated *Holly* plants introduced to give effect: also in the outside line of Box next to the grass edge, there are some nice Box plants planted 8 feet apart, which help to define the figure very much. The small circles outside the semicircle, or the top of the figure, represent plants of *Aucuba* and *Thuja* *Lebbi* alternately, and which contrast well with each other. *a* Indicates the places covered with flints, coals, and bricks, these materials being arranged so as to produce the best effect. Were bulbs planted in these places there would be a grand display in spring. *b* Indicates the beds, and *c* the common gravel.

The circle in the centre is grass, and the square in the circle represents a cast-iron stand, with a glass globe placed on the top of it. It is much admired by all who have seen it, all the surrounding scenery is reflected in it. *d d* Are two vases 5 feet high. The space between the two outside lines of a box is entirely covered with red bricks broken in small pieces, and the places marked *l* are boxes; also, the two figures between the trefoils, *a a*, at the top of the engraving.—M. O'DONNELL.

## PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

**IONOPSIS PANICULATA** (Panicked Ionopsis).—*Nat. ord.*, Orchidaceæ. *Limn.*, Gynandria Monandria. Finest of the genus. Imported by Messrs. Low & Co., of Clapton, from Brazil. Flowers white, with purple blotch, blooming in October.—(*Bot. Mag.*, t. 5541.)

**CALATHEA TUBISPATHA** (Tubular-spathed Calathea).—*Nat. ord.*, Marantaceæ. *Limn.*, Monandria Monogynia. Imported by Mr. Veitch, Chelsea, from South America. Leaves blotched symmetrically with black.—(*Ibid.*, t. 5542.)

**PACHYPODIUM SUCCULENTUM** (Succulent Pachypodium).—*Nat. ord.*, Apocynaceæ. *Limn.*, Pentandria Monogynia. Native of South Africa. Same as *P. tuberosum* and tomentous of some botanists. Flowers white stained with pink.—(*Ibid.*, t. 5543.)

**ABRONIA FRAGRANS** (Fragrant Abronia).—*Nat. ord.*, Nyctagineæ. *Limn.*, Pentandria Monogynia. Imported by Mr. Thompson, Ipswich. Native of sand hills near the Missouri, and the eastern flank of the Rocky Mountains. Flowers white.—(*Ibid.*, t. 5544.)

**BEGONIA PEARCEI** (Mr. Pearce's Begonia).—*Nat. ord.*, Begoniaceæ. *Limn.*, Monœcia Polyandria. Introduced from La Paz, by Mr. Veitch. Flowers bright yellow, contrasting well with the foliage, which is dark velvety-green above, and dull red beneath.—(*Ibid.*, t. 5545.)

**ZONALE GERANIUM** *Wiltshire Lass.*—Pink, with lower half of two upper petals white. Exhibited by Mr. Keynes, of Salisbury, and declared by the Royal Horticultural Society's Floral Committee to be "one of the finest of the pink-flowered bedding varieties yet seen."—(*Floral Mag.*, pl. 265.)

**GLADIOLUS** *Sir James Clark.*—Raised by Mr. Standish. Salmon rose, scarlet-feathered in lower petals, and scarlet spot in the throat.—(*Ibid.*, pl. 266.)

**BIGNONIA ARGYREA VIOLESCENS.**—Stove climber introduced by M. Linden, of Brussels, from South America. Leaves very beautiful, purplish green when young, midrib and veins bordered with purplish pink; when matured bright green, marbled with white, and purplish crimson beneath.—(*Ibid.*, pl. 267.)

**AZALEA** *Princess Alexandra.*—Raised by Messrs. Ivery and Son, Dorking Nursery. White, striped and spotted with pink.—(*Ibid.*, pl. 268.)

**NARCISSUS JUNCIFOLIUS.**—"A beautiful dwarf-growing hardy bulb, from stony pastures of the Pyrenees, having neat rush-like foliage, and comparatively large bright yellow flowers, from one to three on a scape, and remarkably showy." Such is the description of this plant published in the Report of the May Meeting of the Royal Horticultural Society, at which it was exhibited by Messrs. Backhouse & Son, of York, to whom we are indebted for the opportunity of figuring it. The plant, as will be seen, well merits all that is said in its favour."—(*Florist and Pomologist*, No. 47, 233.)

## WORK FOR THE WEEK.

### KITCHEN GARDEN.

WHEELING out manure, composts, earths, &c., trenching, draining, making new walks, and repairing old ones, are amongst the principal operations at the present season in this department. Always make choice of suitable weather for performing each, with a view to cleanliness and good order. *Asparagus*, another bed should be prepared in the end of the week if a succession is required. *Celery*, it is necessary to take advantage of every favourable opportunity to earth-up all that requires it; rather let it remain as it is than attempt to do this while wet, as the stalks will afterwards rot in a very short time. *Cucumbers* will require constant attention in stopping and tying to the trellis. During very dull weather the plants should not be excited to so great a degree by heat and water as in clear weather, neither should they be allowed to swell off so many fruit at one time. *Herb-beds*, if they are not

yet cleaned and done up for the winter, should be attended to without delay; a slight coat of very rotten dung should be laid on them for the purpose of protecting the roots from frost, and to enrich the soil. *Lettuce*, the Cabbage varieties planted in frames, intended for winter use, will not require much air if the soil is light and dry; should they require a little water, give it to each plant from a watering-pot without a rose. Never expose the plants to heavy rains. *Sea-kale*, a little leaf mould, tan, or cinder-dust should be laid over the crowns of the plants, pots may then be put over a portion of the plantation, and be covered with leaves as these are collected; if required for use in a short time, stable-dung to be used. *Spinach*, in gathering the leaves the beds to be trodden as little as possible, as the growth is injured by having the soil consolidated about the roots. If sufficiently light and dry the surface of the soil to be loosened. The heavy autumn rains, probably, retarded the progress of trenching and other ground operations, but the present weather offers abundant opportunity for continuing such works.

### FRUIT GARDEN.

Continue to prepare for fruit-tree planting by draining, trenching, and pulverising the soil, and after planting stake, tie, and mulch the trees securely in good time. Too little importance is in general attached to mulching; for whether we consider the immense utility of shutting in, or rather arresting the departure of the remaining ground heat of the past summer, or imparting nutritious principles to the soil for the ensuing year, the operation is one not to be neglected. It ought to be well considered that the soil has nothing in the way of temperature to gain between this period and the end of February, but, on the contrary, a progressive loss must ensue for the next two months at least, unless we resort to the practice of mulching. Clear away dead leaves from the wall trees, and remove the green fruit from the Figs. The established strong-growing fruit trees that are tardy of producing fruit should undergo the operation of root-pruning. This must be performed according to circumstances. If the trees are planted too deep, or the soil has been raised above or about them since planting, by all means fork the roots out carefully, and plant them again with care on the surface, spreading them out judiciously, and then mulch. If trees to be operated upon are planted high and dry, fork about them at a reasonable distance, and prune back the main or strongest roots as you discover them. Raspberry plantations may be cleared of the dead canes and superfluous wood; the suckers to be taken off, and the strongest should be at once planted for a succession.

### FLOWER GARDEN.

Alterations, planting, &c., will be carried on this autumn with much comfort, as far as the weather is concerned, and those who have employed additional labour to carry out these affairs will have little to regret in the spring. All tender or half-hardy shrubs should have some protection planned forthwith, and especially the tender kinds of Roses. Standards of the latter may have a bunch of dry moss, a wisp of hay or straw, or some dried fern, bound round the head, and the whole well fastened to a stake. A fortnight's really fine weather in November, while it seems to prolong the autumn, by permitting us the enjoyment of the fading glories of vegetation, affords the always-appreciated opportunity of proceeding with the various important operations connected with the garden. A little care may preserve Chrysanthemums, particularly those trained against a wall, for some time; the simple protection of a net will ward off the excess of frost likely to injure them. Take up and store *Marvel of Peru*, *Dahlias*, and *Salvia patens* if not already done, and finish planting bulbs and Anemones. If the beds have not been yet filled with spring-flowering plants, we would suggest to plant some beds with an edging of Crocus, followed by Hepaticas, double Primroses, Scillas, Hyacinths, and Narcissus in successive rows. If a portion of the garden is devoted permanently to plants calculated to render it gay at a cheerless season, plant the bright-berried *Pernettyas*, hardy *Ericas*, *Daphne*, the winter-blooming *Jasminum*, the old *Sanguinaria canadensis*, *Adonis vernalis*, Winter Hellebore, *Anemone apennina*, *Myosotis intermedia*, the charming little *Veronica alpestris*, which covers the ground with its green compact foliage like a carpet, the elegant little *Saxifragas oppositifolia major* and *minor*, *Ambretia deltoidea*, *Orobis vernus*, and *Arabis verna*. These, with bulbs, render a garden gay at a very early season.

### CONSERVATORY AND GREENHOUSE.

Every decaying leaf should now be instantly removed from these houses, for at this season when the plants are in high

health, covered with dark green foliage, and bending beneath gorgeous flowers, the contrast is more delightful than at any other period, and whilst the wreck outside is daily increasing, the art of gardening becomes more manifest within. We need scarcely urge thorough cleanliness in all other points. Drip must be studiously avoided in these structures, not only on account of the flowers, but the comfort of the proprietors. The stock of plants to bloom at Christmas, consisting partly of stove plants grown for that purpose, and partly of forced bulbs and shrubs, should now receive some attention, particularly the former, which should be undergoing a slight amount of forcing to bring them into bloom at that time. Chinese Azaleas and Oranges may be assisted by a little extra heat, being careful, however, to apply it gradually. At the same time, if a forcing-house is at command, a portion of the stock of Roses, Lilacs, Syringas, Deutzias, and other hardy shrubs from the reserve pit may be placed in the cool end of it, or in a light situation in an earlyinery or Peach-house; if they can be afforded a slight bottom heat all the better. A few of the more easily forced American plants, including some of the earliest-flowering Rhododendrons should be added, they will greatly enhance the display in January. Bring forward Hyacinths and early Tulips in a gentle bottom heat. Double Roman Narcissus, Crocuses, Neapolitan Violets, Mignonette, and Cyclamens bloom early without much forcing, and answer best placed on shelves at the back of vineries to catch every ray of light and to insure them from damp.—W. KEANE.

### DOINGS OF THE LAST WEEK.

GENERAL work very much the same as in previous weeks, being regulated by the weather. The frosty mornings, heavy rains, and high winds promise to bring down the leaves from deciduous trees sooner than we expected. The same causes have taken away the beauty of the flower-beds, though as yet suffering little from frost; and the clearing them off, owing to the great vigour and thickness of the plants, has been attended with extra labour. To our mind the beauty of the flower garden is on the wane when the tree leaves begin to fall at all freely; but in moister climates, as in Ireland, not only do the trees retain their foliage longer, but the flower-beds also continue longer in full bloom. From some notes made at Woodstock in Ireland a week ago we learn that the flowers looked nearly as well then as in summer; masses of Sweet Peas, *Anemone japonica*, scarlet Pentstemons, *Salvia fulgens*, scarlet Lobelias, Phloxes, Fuchsias, *Veronica Andersonii*, *V. virgata*, Tagetes, Dahlias, Hydrangeas, &c., being still very fine. Mr. McDonald prefers the Golden Chain to all other of the yellow-leaved Geraniums, and finds that Cloth of Gold flourishes only when treated to comparative shade and supplied with rich leaf mould.

#### KITCHEN GARDEN.

Gave abundance of air, but kept out the rains from Cauliflower, Endive, Lettuce, &c., under protection. Took up some Rhubarb and Sea-kale to put in the Mushroom-house. Made preparations for sowing Radishes on a slight hotbed, using fresh sandy loam; and for the second bed or piece in the Mushroom-house, chopped up some dry litter and straw to mix with the dung. As it was rather wet for our purpose, mixed also a little dry chaff with it, but we like the chopped straw best. It takes a long time for damp droppings and dung to be dried sufficiently in a shed at this season. When mixed in a heap not too large, with a little chopped dry litter, the fermentation produces dryness; and though we know that the fermentation thus encouraged deprives the heap of a portion of its enriching qualities, yet we submit to this cheerfully in order to have the dung in a more suitable state as respects dryness. When over-moist the spawn will be wasted and run to nothing. It will always run best when the material is dryish rather than wet; but if all the bed is dry the Mushrooms will be poor.

#### FRUIT GARDEN.

The wet and frost have finished the crop of out-door Strawberries, but a lot of Black Prince potted for forcing having shown flower rather early, were placed in a pit where there is a little dry heat, and have furnished several nice small dishes of good-flavoured fruit. Some twenty years ago we had good crops of the old Roseberry in November and December, treated in the same way—that is, the plants showed trusses late in autumn, and were slightly encouraged with a little dry heat, not forced with a high temperature, and there being a good deal of sun in these usually dark months, the flavour was better than Straw-

berries generally possess in February, and the beginning of March. Plants out of doors in pots were protected with a little straw placed over them in frosty nights, but as yet they have not needed it much. As soon as possible we will place them under protection of some kind. Many failures are the consequence of the soil being alternately soaked and frosted in pots exposed, as the bare pot cools the soil inside to a great extent in a frosty night, and thus injures roots and incipient flower-buds, when both would be quite safe if the plants were growing in the ground in the usual way. We have still a number of plants in small pots that were not repotted, and these we shall plant as soon as possible, in a border with rich loam round them, placing them about 8 inches apart, and lift and repot, or place in a bed under glass, after March and April. They will do well after that time. If potted now they would be of no use for early forcing, but if potted and plunged they would do very well after the middle of March, as by that time the roots would be round the inside of the pots.

Apples and Pears in fruit-rooms want looking over now frequently, and when all are sound and the weather at all moderate, a very little air should be left on night and day, and not a great quantity at any time, as if the air is moist too much will damp the fruit, and if dry it will cause them to shrivel. We shall proceed with pruning Vines in the earlier houses as soon as we can find time. The earliest, in a pit, have been pruned some time. As soon as we can we will also proceed with Apple and Pear tree pruning, to finish the nipping and stopping in summer; but the putting away Geraniums, and even rough-cleaning pleasure grounds, will require all our labour-power for some time when the weather is sufficiently favourable for out-door work. Those who begin vineries and Peach-houses now, should commence with a low temperature and raise it gradually, being satisfied with from 55° to 60° in theinery, in the fourth or fifth week after commencing at 45°, and never going above 60° until all the buds are broken, and at least 1 inch in length. Commencing with 45° in the Peach-house, 55° will be hot enough with artificial heat until the trees are in bloom, and even then 55° will be enough at night, raising it to 60° and 65° during the day with air, and 10° more from sunshine; but the increase from sunshine should rise gradually with air on, and never with the house shut in the early part of the day.

Figs.—We mentioned clearing off all our Figs from the little Fig-house or pit, and also taking off all the leaves at the same time, in order to cause the plants to rest. "FRUTEX" finds fault with our treatment and says, "Her Figs were very good on the 10th of November and likely to continue so, and she could not see why, if she chose, by extra heat, she should not have Figs all the winter, and thus make the Fig an evergreen and an everbearer." Nor do we know the least reason why she should not do so, and carry out her proposed plans, and for encouragement we would say, that we have done so, especially with Figs in pots; but, on the other hand, justice and honour compel us to state, that though we thus had a Fig at times all the year through, we never had many at any one time, and so far as we are concerned, we never thought the fruit worth more than for looking at from November to March. That is no reason why those who are willing to give the necessary heat should not have them at Christmas and the new year if they like. We would ourselves take as kindly to a raw Turnip, but we find no fault with those whose tastes are different from ours. We have also found, that to have a good crop in May and June the plants should not bear, at the farthest, beyond the end of October. It is scarcely possible to obtain every advantage from any one system of management. Of course, as we intend merely to keep out frost during the winter, it was of less use to keep the hundreds of young fruit, so all above the size of small Pears were cut off along with the leaves. Cutting off is better than pulling off, as if something like the eighth of an inch is left of the stalk of the fruit, a young one will often form at its base.

Out of doors a few Fig trees have done very well this season; but we ripened only two or three of the second crop on the current season's growth, though many attained a large green size, and so far just wasted the strength of the tree unnecessarily. But for the trouble and the time it would take, it generally would be better to cut off when very young every fruit that shows on the current year's wood before the end of September. After that they may be small enough to stand the winter without protection. We presume that the wonderful season is to be thanked for a second crop of Figs out of doors, except in the most favourable circumstances. We have never noticed such a thing, except as an out-of-the-way curiosity.

Out of doors, it is generally the small fruit that stand the winter, or those that show at the points early in spring, that ripen in the following autumn.

#### ORNAMENTAL DEPARTMENT.

**Wormcasts on Lawns.**—We have just managed to keep tidy near the mansion. Care should be taken that the first look-out should not be associated with the morbid and the melancholy. There the broom and the roller must frequently be used for the lawn, as after the heavy rains worms are coming to the surface and throwing up their earthcasts. In small places these heaps may be prevented by watering with clear lime water. The best way to use the water is to roll well a day or two before, and as soon as the worms have opened their fresh holes to give the ground a good soaking, when the water at once runs down the tubular openings and scorches up the tender skin of the worm. Those who dislike such cruelty and yet dislike the wormcasts, must keep on with the roller. A light wooden one is best for the purpose, so that an active boy could draw it, and when it becomes clogged up a little the earth collected must be scraped off. A good roller for this purpose is formed of the bole of a tree, or any other piece of wood, say oak, made round, and 12 inches in diameter, and from 3½ to 4 feet in length. If there are no leaves or litter, such rolling will give a fresh, smooth appearance to a lawn. It does best when the ground is moderately dry. Clear lime water is easily made by throwing a good shovelful of quicklime into a hogshead of water, stirring it well, and then allowing it to stand from twelve to twenty-four hours before using it. Nothing else is so safe, though other things are equally destructive to worms. In places where worms plough up the sides of walks next the grass verges, removing the most of the heaps, and strewing a little salt along close to the grass, will generally prevent the throwing-up of such earth-heaps for that season, and a little salt may now be strewn along the sides, when it would not be advisable to apply a bit to the walks generally, as that would most likely make them soft and moist for the winter. Confined to 8 inches or so close to the sides, the moisture would be of less consequence if the drains are all right. In undrained walks such salting, even at the sides, will prevent rains passing off so freely as they otherwise would do.

In other places we satisfied ourselves merely with raking off the bulk of the leaves at present, and will follow ere long with the scythe, when we hope the rest of the leaves and clearings of beds may all be swept up and carried away, and the ground pretty well cleared for a month or two.

**Dahlias.**—These we went over, cutting over the tops where frosted a little and decayed, and placed them over the stems in case frost should come; but the weather looking uncertain, we had the most of the tubers taken up, labels fastened to them, and when they were dried a little, packed them in dry soil in a shed. So treated we scarcely ever lose a tuber.

**Gladiolus.**—Cut off the flower-stalks that were decayed; some are still showing fine spikes, and on the whole the general bulk is still too green to warrant lifting the bulbs, unless these should be lifted with less or more of ball, and be packed in pots or boxes, so that they may be sufficiently matured. In cold, strong soils it will generally answer best to lift the bulbs, class them according to size and strength, and plant them afresh by the time the fresh fibres and fresh stems begin to move. The very smallest offsets may be sown in rows, like Peas, in spring, and in a short time good-sized bulbs will be produced. Did these fine flowers continue to bloom all through the autumn they would be still more admired.

**Violets.**—Those out of doors should now be pretty well cleaned of fallen and withered leaves, as otherwise damp will be apt to injure them. Stirring the surface of the ground frequently, and even strewing on the surface rough cinder ashes, are good for keeping the plants healthy, and driving slugs away from them. It is not pleasant to smell them after a worm has left even its slimy trace upon them. Neapolitan Violets in pots or frames should have every runner or offset nipped off as it appears, leaving nothing but the old crown of the plant, and from that blooms will come all the more freely if the strength of the plant is not allowed to waste itself on fresh runners.

**Pentstemons.**—If cuttings have not been taken of the best and most desirable kinds, the plants had better be taken up and potted, and be kept in a cool airy place from which much frost is excluded. In dry light soils they will stand very well out of doors if little cones of ashes or dry earth be raised about

the stem just above the ground, and a few evergreen branches stuck among and around them.

**Fuchsias.**—All except the more tender kinds will stand out of doors in most places, when well established, if the stems are now cut down to the ground, and a heap of ashes, or better still a couple of inches of moss, be placed over the stool. Even when the climate is mild enough for the Fuchsia to stand the winter without the above cutting down, it is rarely, either as masses, or groups, or hedges, that these Fuchsias bloom so freely next season as those that have been cut down in autumn. In the latter case it is necessary that the young shoots should be thinned in May and June, and then those left will grow very freely and bloom in fine order in summer and autumn. We have no longer masses of these plants, but we must gradually introduce them again, as even when cut down in autumn, the summer shoots were pretty well as useful for sticks and stakes as a piece of osier or willow.

**Salvia fulgens.**—These fine scarlet flowers will generally stand in the ground all winter with very little protection over the roots, but even then they should be taken up and replanted in April or May, as the plants, though they keep alive in winter, will grow so vigorously in summer that they will scarcely bloom before autumn. Plants raised from cuttings and afterwards treated much as we have described for Calceolarias, will bloom sooner and more freely than these old plants; but managed as above they can be enjoyed by those who have neither pit nor frame.

**Salvia patens.**—The best beds of the most magnificent blue we ever saw were formed by strong plants that had not been moved for a number of years. The plants were cut down after frost, and the bed, after surface-stirring, was covered with 2 or 3 inches of rough leaf mould; and sometimes, over that, to keep birds from scratching, were placed a few evergreen branches, which were removed in April. Such beds were a dense mass of colour from the middle of July until frost came; as, though the individual flowers did not last long, there was always a plentiful succession of fresh flowers and fresh shoots.

**Lobelias** of the tall kinds of scarlets, and lilacs, and purples, may be kept in the ground much in the same way, but though they can scarcely have too much water when growing in summer, they suffer easily from too much moisture when in a state of rest in winter. A good plan for them is merely to stir the surface of the beds when the flowering-stems are decayed, and rough-hoop the bed with evergreens, so as to keep off the greatest severity of frost, and yet allow a free circulation of air. It is best to lift the roots and divide them in spring. To make sure with the least labour, the best plan would be to take up a portion and plant or place them thickly together in a cold pit, and then as soon as the suckers are above ground in spring, to divide them, pot them singly, and grow them to a good size before planting out. These will bloom earlier than those that stood in the ground all the winter, and were merely divided in April or the beginning of May.

As general routine, we finished putting in Calceolaria cuttings; went on stumping-in Scarlet Geraniums; gave plenty of air in fine days to greenhouse plants; took Primulas out of a place where they were too damp; potted Mosses and Ferns; regulated climbers in small stove; washed off all that remained of the shading of the glass, and though soft soap and soda were used in moderation, the whitening that was put on as shading, mixed with milk, required a little trouble to take it all off. In fine days gave all the air possible to plants at all hardy, and in dull days and wet weather gave a little fire heat where it was possible to do so. Damp and still foggy air are the great enemies to plants this month, and hence the superiority of most places where a little fire heat can be used, over cold pits and frames. The fire heat will always produce a motion of the air, and will change foggy visible vapour into that which is invisible, and yet always on the move. If a little heat is given to frames from fermenting material inside, that, in dull weather especially, will only increase the damp. Neglect of judicious air-giving in such a case will often be ruinous.—R. F.

**THE LANGUAGE OF FLOWERS AND FRUITS.**—The Lilac in April—"Give me leave." The Rose in June—"Well, I'm blowed." The Asparagus in July—"Cut and come again." Peas in August—"Shell out." The Apple tree in September—"Go it, my Pippins." The Cabbage in December—"My heart's my own."

COVENT GARDEN MARKET.—NOVEMBER 18.

Quotations remain nearly the same. Pines are in much better supply, and Grapes have slightly advanced in price. The Potato trade is dull, and large quantities are on hand, both at the waterside and other depôts.

TO CORRESPONDENTS.

**RHEUMATISM (A Young Gardener).**—We cannot venture into the domains of the medical profession.

**FRUIT AND VEGETABLE SHOW AT KENSINGTON (W. M.).**—Fruit may be exhibited alone.

**GREENHOUSE HEATING (G. J.).**—The stove you mention, having no flue, injures plants by the fumes emitted from the fuel. The hot-water apparatus you mention answers. We have heated a greenhouse for years by means of a gas stove, with a tube to carry away the fumes into the outside air.

**GRAPES DAMPING OFF (W. Ewart).**—We presume that you mean that the ripe berries become mouldy. If so, a little fire heat and a free circulation of air during the day will be your best course of proceeding.

**PROBABLE AGE OF ELM (G.).**—The amount of annual growth varies much, according to the soil and climate where the tree is growing. Your Elm, growing near Hereford, 3 feet 6 inches in diameter at 4 feet from the ground, we should estimate to be from ninety to a hundred years old.

**VINE LEAVES (Tyrol).**—The leaves sent us exhibit slight traces of having been recently infested with thrips, otherwise they appear healthy, though very thin, like tissue paper. The thrips may be destroyed by fumigating with tobacco, and the want of substance in the leaves remedied by giving more air.

**BOOK—PROPAGATING CISSUS DISCOLOR (A Subscriber, Galway).**—Thompson's "Gardeners' Assistant" contains instructions for both indoor and out-door gardening. We do not know the plant by the leaves sent. *Cissus discolor* is best struck from cuttings when the new shoots are from 3 to 6 inches in length, taking them off close to the stem with a sort of heel. Remove the leaves from the part to be inserted in the soil, which is to consist of two-thirds sandy peat, one-third light loam, and an equal quantity of silver sand. In this insert the cuttings singly in small pots, and plunge the pots in a hotbed of from 75° to 85°, preserving a moist atmosphere, and shading from bright sun. It may also be propagated from eyes, and cuttings of the wood of the previous year, the best time to do which is early in March. For established plants, a compost of equal parts of turfy peat, loam, and leaf mould, with a free admixture of sharp sand, will answer well.

**BOOK (T. C. Inquirer).**—We do not know the book you mention.

**POINSETTIA PULCHERRIMA AFTER BLOOMING (J. W.).**—Keep it near the glass, and diminish the supply of water at the root. Cut-in in February to two or three eyes, and, when the new shoots are a few inches long, repot. During the winter, keep moderately dry at the root in a temperature of 50°. Whilst growing it requires a stove temperature. If you wish to increase your stock, the cuttings may be put in when the plant is cut down. The plants will bloom all the better if raised from wood well ripened, which you will secure by keeping them near the glass, dry at the root, and in a temperature of 55° by night.

**TEMPERATURE OF FERNERY IN WINTER (Pond-ahn).**—If your Ferns are a mixed collection of stove and greenhouse kinds, a temperature of 45° from fire heat will meet the requirements of both as well as it is possible to do. If they are stove kinds only, then a temperature of from 50° to 55° should be afforded, and if greenhouse sorts a night temperature of 40° to 45° will be preferable, allowing a rise of 5° on dull days, 10° on those which are cloudy with clear intervals, and 15° on clear days. These temperatures apply to the months of November, December, January, and February. Air may be given with advantage at this season, taking care to avoid draughts, and the admission of cold, frosty, dry air. Air during mild weather is indispensable for the preservation of the plants in health.

**SKELETON LEAVES (Constant Reader).**—We know of no mode of skeletonising leaves except keeping them in water until decayed. There is no reliable work on aquariums.

**ROSES FOR EAST, NORTH-EAST, NORTH-WEST, AND WEST ASPECTS (A Subscriber, Galway).**—Duc de Cazes does not grow sufficiently for a wall, nor do any of the others named, except Jules Margottin; that and the following will do on the east and west aspect—viz., Hybrid Perpetuals, La Reine, Eugène Appert, Glory of Waltham, Baronne Prevost, Lord Raglan, Madame Julie Daran, Red Rover, and William Jesse; Bourbons Acidula and Sir Joseph Paxton; Hybrid Bourbon, Comte d'Hebe, Charles Duval, and Paul Perras; Hybrid China, Bluir No. 2, Madame Plantier, Vivid, Chénédole, and Brennus. For the north-east and north-west aspects, climbing Roses would do best. Of these, choose Ruga, Thora-byana, and Dundee Rambler of the Ayrshire class; and, of others, Fortune's Yellow, Myrianthes Rémoncule, Hampant, Williams's Double Yellow, Jannatré, and Madame d'Arley. For your south wall, in addition to those you have, as you wish for red shades, you may plant Fellenberg, Nisida, and any other good Noisette kind.

**APRICOT TREES UNFRUITFUL (Idem).**—Peaches usually come into bearing before Apricot trees, which grow vigorously whilst young. We should not advise their being discarded for Peaches, unless you particularly wish it. Give them a trial another year, and if they do not show fruit, or if you can now distinguish the bloom buds from wood buds, and find none of the former, we advise the trees to be taken up now, and replanted with the stem slightly elevated, and the roots spread out upon the border, and then covered with 6 inches of fresh earth. If your soil is a strong deep loam, deficient in calcareous matter, we also advise the border to be covered with an inch of old mortar rubbish, or, failing this, lime riddings worked into the soil before the trees are planted, and lay a flagstone a yard square, 1 foot below the surface, where the tree is to be planted. We think that the unfruitfulness of the trees is due to their vigorous growth, induced by a rich deep soil. On our gravelly soil young trees, even, bristle with blooming spurs, and, if anything, our wall trees promise to produce too much bloom next spring. Your trees will fruit in due season, only keep their vigour under, and do not prune severely, but stop to four leaves the side shoots not wanted to fill vacant space, and to one after the first stopping. The leading shoots must not be stopped. Tolerate no winter pruning, we have given it up with Apricots as being a bad practice, and summer-prune instead, leaving nothing then that is not wanted to fill vacant space, and to produce fruit and fruit spurs another year.

**JOINTS OF HOT-WATER PIPES (Con. Sub.).**—We presume the truss joints you speak of as applicable to hot-water pipes, are those patented and supplied by Mr. T. S. Truss, 53, Gracechurch Street, London. There can be little doubt of the joints answering, though we have not worked them ourselves.

**RELAYING AND LEVELLING A LAWN (Weston).**—Your lawn needing relaying and levelling, we should advise its being done. Nothing looks more unmonumental than a bad uneven lawn, whilst nothing is more pleasing than a level lawn of good turf well kept. Now is the time to do it. Take off the turf, cutting it from 1 1/2 to 2 inches thick, and this is more expeditiously done with a paring knife or plough. Roll the turves, grass side inwards, in lengths of from 2 to 3 feet, and lay them clear of the ground to be levelled. Level the ground next, which, we presume, you understand, and if the lawn is extensive you may only remove a part of the turf; level that part, and relay the turf afterward proceeding with another part until the whole is finished. In doing the work in pieces you must calculate the general level of the whole, and lay the first piece so that the last may be on the same level with it when the work is completed. With-out this, you may so lay the first piece as to make the lawn less level than it is at present. Having taken off the turf, where hollows exist take off an even thickness of soil over the whole. Where hollows exist take off the surface soil, fill up with poor soil, and then place from 6 to 9 inches of good soil on the top; and in like manner when high parts have to be taken down, a similar depth of good soil should be placed at the top, the original soil being taken out deeper, so that the good may be substituted for it. Your soil being a strong clay, it may well be drain it, and to render the surface dry the turf may be raised on 2 inches of coal ashes, but do not use more than 3 inches of ashes under the soils, or the turf will burn in summer. Spread a little soil over the whole, beat firmly, and after the first rain beat again, rolling well. Give a dressing of short manure in February, and roll twice a-week after the manure has been brushed in.

**TREES NEAR A HOUSE (Eastbourne).**—We do not clearly understand what you mean by "What trees or shrubs ought to be planted near a house for sanitary reasons?" All trees and shrubs are sanitary agents, they inhale gases noxious to animal life, decompose them, and emit oxygen, the vital air of man and animals. If planted very close and thickly near a house, trees and shrubs sometimes retain too much damp in the soil, otherwise thick belts of Conifers, and other trees, afford shelter, and they and all others promote health. Even the Upas tree is a health-promoter, its alleged deadly influence is all a romance; we have sat under its shade, gathered its leaves, and handled its bark often. Ivy covering the walls of a house acts most effectually in preserving and keeping them dry.

**MAKING A FERNERY OF A SUMMER-HOUSE (P. E.).**—We should retain the battlemented stone coping at the front. It will not shade the interior to any great extent. Too much light would certainly be injurious to the Ferns, but, as you will need all the light possible in winter, it is easy to shade the house from the sun in summer by stretching thin canvass over the glass. The rough plate glass, we think, will be sufficient to protect the Ferns from the sun without having to resort to shading the roof, especially if they are some distance from the glass, but that can only be determined from experience.

**FELLMONGERS' REFUSE (Subscriber, near Dublin).**—The scrapings of skins, hair, &c., are an excellent manure. We should only employ it for kitchen-garden crops, or as a top-dressing in the spring to your old pasture. It would be valuable also for your Turnips and Mangold Wurtzel. About 12 cwt. an acre would be enough.

**PEACH PRUNING (Beach Lawn).**—If you enclose five postage stamps to our office with your direction, and order "Fruit Gardening for the Many," you will receive it free by post. In that you will find all the directions we can give, with illustrations. Any special questions on any point you do not clearly understand we will readily answer.

CONVERTING A SUMMER-HOUSE INTO A FERNERY (*P. B.*).—A south front will answer, with the roof sloping towards the north. Whatever part of the glass the sun's rays fall upon between 9 a.m. and 4 p.m. from March to October will require to be screened, or the Ferns under it will suffer. If you could so contrive that the Ferns would receive light without the direct rays of the sun, the necessity for shading would be done away with; but in winter you would experience a loss of sun heat and light, and at that season Ferns cannot have too much of either. We should endeavour to make the house look as well externally as we could, and if we found it necessary to shade we would do it. There is no objection to a door in the east wall.

PRICE OF GRAPES (*A Poor Gentleman*).—We are sorry that, from our own experience, we cannot give more definite information as to the price to be obtained for Grapes in September than that supplied at page 285. On sending a quantity to Covent Garden to a salesman, much depends on the state of the market, and the demand for such things—as seems to be instanced by your receiving only 6d. per lb. at one time and 1s. at another time. We think it would be well to try more than one salesman. The best prices are generally obtained from salesmen when they take the crop, and send for the produce as they particularly want it. We shall be glad if some correspondent will give more definite information to this inquiry. You would obtain better prices if you ripened the Grapes earlier. We would plant two Vines of the Royal Muscadine in such a small space as forms the roof of the hen-house, considering that the place is shaded except at mid-day.

HEATING A RANGE OF PITS (*R. H. L.*).—We do not think you will succeed in heating your pits from the house, and just from dipping down 24 feet under the pathway that separates the house from the pits. Could you have carried the pipes across into the pits on a similar, or a higher level, there would have been no difficulty. To succeed, by the mode you have tried, two things are desirable, almost essential: first, the top of the boiler must be on a lower level than the pipes that now come under the pathway; and, secondly, the highest point of the pipes in the pit, instead of being the same height as the level of the pipes in the house, should at least be from 12 to 18 inches higher. The whole would be better if the highest point of the pipes in the pit were just as much above the level of the pipes in the house as they go under that level below the pathway, and even then, as said above, the boiler must be lower than the lowest pipe. If the boiler is low enough for the water to circulate beneath the pathway, your easiest plan would be to beat house and pits separately at once from the boiler. If you send us a section, showing the position of the boiler, and pipes in the house, and pipes in the pit, exactly as respects height, we might be able more effectually to advise you. Even now, supposing the boiler to be sunk low enough, you had better rise at once in the pits a little higher than the level of the pipes in the house, and place your air-pipe or valve there, the open small pipe carried out of the house being better than a valve. Some time ago, we noticed the successful working of two houses belonging to Mr. William Fells, nurseryman, of the Market Place, Hitchin. The lower house was heated in the usual way, and from the end of that house, pipes were taken, with valve-connections, and lowered under a pathway, and taken into the other house. But, in this case, the pipes were fully 2 feet higher in the second house than the first, and there was an open cistern at the highest point, and the boiler was considerably below the lowest point of the pipes under the pathway.

IMPROVING A GRASS FIELD (*Clericus*).—Most likely your field would be the better of being well drained; at the same time dig up all those coarse tufty pieces of grass which no animal will eat, and which, as you say, the scythe will not cut. Give the land a good dressing of manure or compost, as early in the winter as you can, and it will have time to mellow down before spring, when it may be brush-harrowed, all stones picked off, and then rolled. If there are any open ditches, let them be cleared out, and the scourings, together with the tufts of coarse grass, carted to a heap where they may rot; and the whole, if mixed with about one-sixth of its bulk of quicklime, will form an excellent dressing for the ground another year. If the grass is exceedingly poor, and a too large proportion of it consists of this coarse grass, it would be better to have it ploughed up, and put the land under tillage for two or three years. In general, however, such pastures may be improved by the means recommended above. A liberal allowance of manure is one of the best of remedies. Mowing for hay seldom improves the bottom, but pasturing by sheep, on the contrary, is one of the best modes of doing so, cutting out, at the same time, all thistles, dock, and those coarse tufty stems of grass, which are useless for all purposes. Mowing off the seed stems in August, which is sometimes done for appearance, is of no benefit to the grass, but the contrary. A little grass and clover seed sown over it in spring will do good.

PROTECTING CHERRY TREE FRUIT BUDS FROM BIRDS (*C. C. E.*).—Black worsted strung from point to point of the branches, so as to have the appearance of a net with two-inch meshes spread over the trees, we find effectual in preventing the attacks of sparrows and other birds. A composition of soot, sulphur, cowdung, and soft soap will not injure the buds, if the soft soap be not used in a greater proportion than 3 ozs. to the gallon.

COST OF A Vinery (*W. C. W.*).—Unless on the orchard-house plan, having no moveable sashes, you will not, even having the back wall already there, put up such a house, 50 feet by 15 feet, for £35. With seventeen Vines up the rafters in such a house, we advise having nothing at all planted against the back wall, but a shelf or two might be placed there, the highest for Strawberries, the lower one for Beans, &c. We cannot say in how many years the crop of Grapes out in June would repay the outlay, that would be regulated by many circumstances, but, if the house cost so little in erecting, we should imagine in the third and fourth years after planting, provided all went on favourably.

NAMES OF FRUIT (*R. J. N.*).—The Apple is Franklin's Golden Pippin; Pears: 1, Beurre Diel; 2, quite rotten; 4, Easter Beurre; 5, Belle après Noël; 6, Baronne de Mello; 7, Glou Moreau; 8, Jean de Witte. (*L. P. C.*)—1, Scarlet Nonpareil; 2, Golden Winter Pearmain; 3, Braddock's Nonpareil. (*A Subscriber, Putney*).—Pears: 1, Marie Louise; 2, Swan's Egg; 3, Vicar of Winkfield; 4, Beurre Diel. Apples: 1, Kerry Pippin; 2, Winter Greening; 4, Pearson's Plate. (*W. Meredith*).—1, Jean de Witte; 2, Glou Moreau; 3, Knight's Monarch; 4, Beurre d'Arceberg; 5, Passe Colmar.

NAMES OF PLANTS (*B. Waites*).—A very good form of Polystichum angulare multidentatum, if permanent; but others equally good are known to be inconstant. (*L. W., a Subscriber of Many Years*).—1, Gymnogramma ochracea; 2, G. calomelanos; 3, Nephrodium molle; 4, Blechnum corcovia dense; 5, Pteris longifolia; 6, Platyloma flexuosum; 7, Athyrium Filix-femina; 8, Polystichum angulare, young—probably; 9, Cheilanthes hirta. (*H. E.*)—1, Adiantum assairole; 2, Lastrea dilatata collina; 3, Microlepis sticticha. (*W. H. M.*)—Cystopteris dentata. (*P. H. G.*)—Your tree is the Hornbeam.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

GAME JUDGING AT BIRMINGHAM.

As "JUSTITIA," when referring to the Birmingham arrangements in his present dispute with your correspondents "OLD COCHAN" and "AN EXHIBITOR," seems so scrupulously desirous that all remarks should be entirely limited to the judging of Game fowls at the Birmingham Show, any reasonable explanation of the following well-known facts would remove those fixed impressions, that even until this very hour so generally prevail among, not "one or two," but many scores of exhibitors respecting (to use the words of "JUSTITIA" himself), "A certain peculiar notoriety obtained in Birmingham in the Game department."

Can "JUSTITIA," who professes to have this subject so perfectly under his own command, therefore explain for the benefit of those less informed, how it was that the Game fowls exhibited at Birmingham two years back by a gentleman as his own Game fowls, after being awarded the prizes were recognised by

one of the Game Arbitrators there as being his own identified property, and consequently "disqualified?" Also, how it occurred that these particular pens of fowls were afterwards publicly advertised for sale by the individual who at first exhibited them, and that this offer of sale was made subsequently to their being actually sold and delivered up, quite independently of both the Arbitrator and original exhibitor? This was done by a third person, who, at the time of payment, gave a stamped receipt in his own name to the purchaser of the disputed pens, which unerring document still remains in existence.

A satisfactory solution by "JUSTITIA" of this at present somewhat complicated enigma, would release from doubt the minds of very many others of your readers besides—COCKSPUR.

CALNE AND OTHER POULTRY SHOWS.

I HAD intended writing a few words on Mr. Heath's reply to "WILTSHIRE RECTOR," and the "TURKEY PRISONERS." I fear now I am somewhat late. All of us are well assured that in "WILTSHIRE RECTOR'S" remarks he intends no possible

unkindness, but to sow broadcast a little of that love towards our feathered pets which he feels so warmly himself, and we exhibitors feel that in any show he visits, if our pets are not properly attended to, he will kindly point out the errors. The complaint of the Turkeys is a very serious one; they require very much larger pens than they generally have. As to the size of the Calne pens I know nothing, as unfortunately I was not there to see; but the imprisoned Turkeys would appear to have been very wide awake, and to have taken a note of the varied doings of the officials. It cannot be too much impressed on poultry show officials, that to cause any disfigurement or unnecessary damage to the plumage of exhibited birds is exceedingly unfair to the owners. I imagine that most of us think—certainly I do myself, that having paid the required entrance fee we may place some faith in the regulation generally found in schedules, that "Every possible care will be taken, &c." Can this regulation be carried out in good faith when the pens are too small? As regards the Dark Brahmas, "WILTSHIRE RECTOR," even as understood by "AN EXHIBITOR," was partially correct, for although shown in the "Any age" class, my prize pen contained two pullets. My pen in the chicken class was shown for sale.

I do not know whether the concluding portion of Mr. Heath's letter applies to me or not. He says, "As an instance of how ready some people are to find fault, one successful exhibitor has already complained at not receiving his prize money; but surely a fortnight after the Show is not unreasonably long." I was writing to the Secretary as to the return railway carriage, with which I had been unexpectedly charged, and whilst writing, I said Calne was not so punctual in paying prizes as formerly, when, if I recollect rightly, three or four days only elapsed; this was, if I mistake not, under Mr. Heath's management. I do not think I complained more than this. But now I will state what I think ought to be done by every poultry committee. The prizes are debts justly due from the committee to the successful exhibitors; this, I presume, is acknowledged; it follows, therefore, that without waiting to see what may be the profits or otherwise of the show, the Secretary might, within three days of the close of the show, take his prize list and dispatch the various amounts, with any sale money, to the several destinations. This, it seems to me, is the fair way of transacting the work. To keep shows going, it is of paramount importance to keep exhibitors contented, and any dilatory payment is apt to make a bitten exhibitor suspicious. I agree with remarks that I have seen in previous Numbers of your Journal, that exhibitors should be treated with more courtesy than they often receive. I hope Mr. Heath will not think I am speaking of Calne—there, I know from past experience it is the reverse, and we all feel it a comfort to our pets that a fellow-"maniac," as we used to be called, is on the committee. Any remarks I may have made are intended for poultry committees generally. J. HIXON.

### NORMANDY FOWLS.

As the name implies, these birds were obtained from Normandy. They have a very striking appearance, being snowy white, free from colour, strikingly contrasting with the crimson red comb lying down on part of the bill, and the red face and wattles. The plumage contrasts also very remarkably with their light blue legs. The attitude of the male bird resembles that of the Flamingo, with the exception of the length of the neck and legs. As a table fowl scarcely any other breed can compete with them. My male bird, five months old, weighs 6 lbs. 6 ozs., being 1 lb. 6 ozs. beyond a pound per month's growth.

I may add that the bones are very fine, and the interior parts of the fowl light. The skin is thin, and pure white, the flesh is juicy and very high flavoured. As layers they are first-class, laying about forty eggs before showing any wish to incubate.—H. LEWORTHY.

[We insert this at the request of Mr. Leworthy, but not having seen the fowls, we cannot form a judgment as to their novelty or merits.—Eds.]

OUR BRITISH SONG BIRDS.—Some time ago I remember an inquiry in this section of the Journal, as to whether the notes of our English birds had ever been musically rendered. A very ingenious book, "Gardiner's Music of Nature," contains what your correspondent asks for; and not only the songs of birds, but the sound of most animals, and the use made of them by

the great composers, especially Beethoven and Mozart. I am sorry that it has always escaped my memory at the proper time, and if this should meet the eye of your correspondent, I think he will be pleased with the book.—F. H. WEST.

### DUCK-FOOTED GAME FOWLS.

I perfectly agree with Mr. Hewitt as to the desirability of proving by adduced facts, whether duck-footed birds inherit this failing by hereditary descent or otherwise.

My own opinion is that it is an inherent defect in some birds, although in the *British Sportsman* I find the following remarks:—"When your chickens want to go to roost, let the perches you provide for them be round and covered with woollen cloth, which will prevent their growing crooked-breasted, neither should they be thicker than they can grasp with ease, as that would occasion them to be duck-footed. This last article, when it happens, is a great detriment to them, by reason of their not being able to stand so firm in their battle as they otherwise would do were their claws in a proper direction." Now I have kept Game fowls some years, and have tried experiments to prove whether I could counteract the tendency to be duck-footed or crooked-breasted by different forms of roosting, warmth, high feeding, a good grass run, and a clean run of water, but could never eradicate this failing when the parent stock were deficient.

Perhaps you may be able to counteract an indented breast by judicious care, instances of which I have witnessed. I would caution all breeders of Game fowls to be particularly guarded and circumspect in selecting their brood stock, and would recommend them to destroy all defective chickens; by so doing they will bring their breed to a greater state of perfection. Exhibitors of this noble bird ought to see that the birds are in all respects free from glaring imperfections, for occupying walks with defective birds is not only an increase of expense, but a great disappointment when the birds are disqualified by the judges; indeed, notwithstanding all our efforts and care in breeding, they are not always crowned with success.

I will now quote from an old work on the Game fowl the imperfections we should guard against:—"Flat-sided, short-legged, thin thigh, crooked or indented breast, short thin neck, imperfect eye, duck and short-footed, long and loose-feathered, and unhealthful."—SKETCHLEY.

Mr. Hewitt having invited amateurs interested in the discussion on the deformity in Game fowls, known as "duck-footed," to communicate any facts in proof of its hereditary tendency or otherwise, I will, with your permission, give my own experience of the occurrence of the deformity, having paid some little attention to it.

I little thought when I wrote to you to ask the precise nature of the affection that it would have raised so much discussion on the subject, and I think amateurs generally must, with myself, feel much indebted to Mr. Hewitt for his sensible and well-grounded opinions, the result of an amount of experience which few can bring to bear.

In some Black-red Game chickens which I bred this year from a cock which had "a tendency" to duck-footedness, the hen's back toe being perfectly straight, one out of thirteen chickens was decidedly duck-footed, and another had a tendency to it; in the other eleven the back toe is quite straight. The mother of the cock from which the thirteen chickens were bred had a greater tendency to the deformity, and the grandmother of the cock was quite duck-footed. In this case, I imagine, there was little doubt about the deformity being produced from hereditary tendency, becoming less and less from interbreeding with fowls not so affected. Again, in the Duckwing chickens, bred from birds in which the back toe is perfectly straight, one has a tendency to it, and another is decidedly duck-footed; also in some Brown-reds, from parents quite free from the deformity, two chickens show a great tendency to it. In both these cases, as far as I have the means of judging, there is no hereditary tendency, neither the parents nor grandparents, to my knowledge, being malformed. How far the kind of perch which is used may be the means of producing the deformity I cannot say, some of my chickens having roosted in trees, others on perches made from oak saplings, about 3 inches in diameter, split, and placed with the round side uppermost. Since this subject has been under discussion I have made some dissections of the feet and legs of fowls affected with this deformity, and I find the hind toe drawn forward by an unnatural amount of contraction of the flexor, or grasping-muscle and tendon of the

deformed toe, somewhat analogous to what is met with in club-foot in the human subject; and you might as well expect to see a man with the latter deformity win a foot race, as a duck-footed Game cock hold his own in an encounter with a bird not so affected. Although Game fowls may not always be bred for fighting-purposes, yet in an exhibition pen, I think they should certainly come up to the standard of birds so required, for in other respects they have to be shown as fighting birds, and I cannot but agree with Mr. Hewitt in his verdict of disqualification for duck-footedness.

From my investigations I have come to the conclusion, which I hope will be confirmed, or if wrong disproved by other observers, that duck-footedness may arise both from hereditary tendency, and also where there is no hereditary cause (the former, I believe, being more frequently the case), but that it may also be induced by causes acting detrimentally on the health of the growing chicken, especially unwholesome and indigestible food, damp, &c. The long continuance of such causes tends to lower the bird's vital powers, and acts as an irritant in some cases to the nervous centres and nerves, causing contraction of certain muscles, which may exhibit itself in duck-footedness or wry tail, or some other deformity, especially where the constitution of the parent birds is not good. I have only treated the theoretical part of the subject very cursorily, as it requires further investigation; but as I believe that all cases of deformity cannot be traced to hereditary causes, I have attempted a solution of them by the aid of scientific research and reasoning, in the hope that others better able than myself to give an opinion, may be led to add their experience.—MAN OF KENT.

#### CHELMSFORD AND ESSEX' POULTRY EXHIBITION.—NOVEMBER 15TH.

THE Poultry Show just closed is the first that has been held in this district, and we are glad to announce that the entries numbered more than three times as many as the most sanguine promoter of the Exhibition had anticipated. It was held in connection with a show of chrysanthemums, in the Corn Exchange, a building most excellently suited to the purpose, for, the whole roof being of glass, the light is equally dispersed throughout the entire area. As so many more fowls were entered than anticipated, recourse was had to a small tent raised in a yard at the rear, for the accommodation of the Turkeys, Geese, and Aylesbury Ducks. All things progressed most satisfactorily; the whole building was bedecked with a most profuse display of banners, and music was introduced as an addendum; though the introduction of music at a poultry exhibition, in too near proximity to poultry, is open to a second opinion, as it unquestionably alarms many of the birds exceedingly. The Committee men stood well to their respective appointments, and, from present results, no doubt another season would add most materially to the number of pens exhibited—a matter, however, that need not cause a moment's anxiety, as the Corn Exchange would accommodate, with comfort, from five to six hundred pens, if devoted exclusively to a poultry exhibition.

In Coloured *Dorkings*, the want of perfect condition was most conspicuous throughout the greater portion of the class, though there were several excellent pens. In fact, the entire restoration of feather this season, throughout all kinds of birds, seems both tardy and very difficult of attainment, and we hear great complaints of losses of exhibition birds in consequence. Not a single specimen of White *Dorkings* was shown, though the Silver-Greys were good. In *Spanish*, the evidence of the intense frosts of last winter was conspicuous in more than one instance. A cock, that had been an exceedingly good one, had evidently been so frost-bitten as to have lost about one-half of the serrations of his comb, a hopeless defect in an exhibition bird. No *Spanish* fowls should be turned out at an early hour in the day in very cutting frosty winds, more particularly if roosted in a warm situation, or frost-bite is almost inevitable. The *Game* classes were not so good as might have been wished for. *Buff Cochins* were well shown, though, unfortunately, several pens were here entered "not for competition,"\* from a false delicacy of not exhibiting for prizes by Committee men. Were this plan to be generally followed, few shows could be upheld; for it is the inherent love of the pursuit that alone can make any Committee unmurmuringly pursue the laborious duties of carrying out a poultry show creditably. The prize *Buff Cochins* were birds of very considerable merit, and of excellent colour, and age will tend much to their improvement. Three beautiful birds were highly commended in this class, but they were very badly matched, the cock being a very fine clear strong buff, and the hens of the lightest possible straw-colour. The class for Any other variety of *Cochins* contained a very respectable pen (first prize) of Partridge-coloured, the rest being all white ones, and "falcon-hocks" were universal. In the class for Pencilled *Hamburghs*, Silver-pencilled were victorious; whilst in the Spangled class, Golden headed the list. The dark *Brahmas* were very good, the light-feathered not being well shown. The *Game Bantam*

class was one of the best classes of the whole meeting. Here Mr. John Crosland took his customary position with a superior pen, in faultless condition, and, if these birds are to be regarded as evidence of the strength of that gentleman's yard this season, for they are early young birds, he will prove an awkward antagonist to shake off at most of our large meetings. The second-prize birds, belonging to the Rev. G. Raynor, were also no mean claimants to distinction. In the Any other class of Bantams, an excellent pen of Cuckoo-coloured Japanese (well matched) took first honours, Black's second. Here again—"not for competition"—Mr. Manning exhibited a pen of Gold-laced *Sebrights*, the heroes of many an exhibition, a long detail of their achievements being presented to the inquiring visitor on a card at the front of their pen, also a photograph of the late Sir John Sebright. It was really grievous to see the hens in this pen eating off the immature feathers from each other, as every unnaturally forced reproduction tends to ensure plumage faulty in colour. Some splendid *La Fleche* fowls were shown, also some dwarfed Black *Hamburghs*, as "Forest Fowls" six months old. The cock had, without doubt, enjoyed existence for very many years past, and possibly months was simply a misprint for years. Some Ring-necked common *Pheasants*, and also some Silver and Golden *Pheasants* were shown, but their excessive wildness, under strange inspection, detracted much from the pleasure of visitors.

Some first-rate *Turkey* ponies were shown, and also some splendid *Geese*, but not matched so well in feather as is necessary for exhibition. *Carolina Ducks* were shown in superior feather, and a couple of pens of *Pen-fowls* were very attractive. At Chelmsford a good proof was afforded that the love of natural history leads directly to the love of pets, which, now-a-days, as inevitably leads on again to that of exhibition poultry. Miss Mary Manning, the daughter of one of our most spirited and well-known exhibitors, sent to Chelmsford a most singular group, entered in the catalogue as "The Hare with many friends." The Hare's present associates were evidently not precisely the counterparts of those represented in the old well-known fable. They were all evidently friends, and a "happy family." The pen in which they were enclosed was of glass, scrupulously clean, and so arranged as to afford perfect ventilation. Amidst her incongruous visitors the Hare sat as unconcerned as the master of a household, but, most rudely, not forgetting to insure a liberal appropriation of the viands provided to "No. 1:" for she ate as constantly as Hares always can do, and in quantities few persons would believe but those who have kept them in confinement. She was obviously in full enjoyment of the best of appetites, and most unpolitely looked exclusively to self, leaving a Silver-Grey Rabbit and a Himalayan Rabbit to enjoy as best they could the remnants of her feast. Nor were these the only friends compulsorily invited. A white cat with a bell on her neck sat harmlessly among them, but evidently absorbed in deep thought, whilst a pair of *Game Bantams* strutted without injury wherever fancy led them. A by no means inferior Yellow Jacobin Pigeon was also present, which at intervals pertinaciously eared its remembrances of "Auld Lang Syne" into the very ears of its newly-formed acquaintances. This bird's noisy intrusions remained apparently quite unheeded, nor was it personally molested in the least by any of them. They proved the greatest of favourites with the sight-seeing public, and were the constant objects of attention. An extra prize of 5s. was allotted to them.

The day proved very favourable, and the attendance was so good, that we are informed a greatly increased prize list will be issued for another year. This, in connection with the good management of the present year's Show, will, undoubtedly, increase greatly its success as to poultry, and if the exchequer would admit of classes for Pigeons also, it would be an improved arrangement, over a class for every variety of Pigeons exhibited indiscriminately for the same premiums.

**DORKINGS (Coloured).—**First, H. Lingwood, Needham Market, Norfolk. Second, F. Parlett, Chelmsford. Third, R. B. Postans, Brentwood. Commended, G. Griggs, Romford; J. Frost, Parham, Wickham Market; Rev. J. Papillon, Lexden Rectory, Colchester; W. H. Walker, Shenfield.

**DORKINGS (White or Silver Grey).—**Prize, Dr. Campbell, Essex Asylum, Brentwood (Silver Grey). Highly Commended, J. R. Hicks, East Bergholt, Colchester (Silver Grey). Commended, F. Parlett, Chelmsford (Silver Grey).

**SPANISH.—**First, R. B. Postans, Brentwood (Black). Second, Mrs. Pattinson, Maldon (Black). Commended, S. H. Deal, Chelmsford (Black); J. A. Townsend, Old Brompton (Black).

**GAME (Reds).—**First, J. Jcken, Eltham, Kent (Black-breasted). Second, W. W. Pyne, South Lancing, Sussex (Brown-breasted).

**GAME (Any other variety).—**First, J. J. Hazell, Great Bromley, Manningtree (Duckwing). Second, T. Dyson, Halifax, Yorkshire (Duckwing). Commended, J. J. Hazell (White).

**COCHIN-CHINAS (Buff).—**First, H. Lingwood, Needham Market, Norfolk. Second, W. H. Walker, Shenfield, Brentwood. Highly Commended, J. W. Rust, Hastings, Sussex.

**COCHIN-CHINAS (Any other variety).—**First, J. H. Upson, Rivenhall, Witham (Partridge). Second, R. Maskell, Tillingham (White).

**HAMBURGH (Gold or Silver-pencilled).—**First and Second, T. J. Saltmarsh, Chelmsford (Silver). Highly Commended, W. Maryon, Chelmsford (Silver).

**HAMBURGH (Gold or Silver-spangled).—**First, J. F. Loversidge, Newark, Notts (Gold). Second, C. Turner, Baddow House (Silver). Commended, Mrs. Pattinson, Maldon (Silver).

**BRAHMA FOOTRAN.—**First and Second, E. Sheerman, Chelmsford (Dark). Highly Commended, E. Pigeon, Lymptone, Exeter; Rev. T. C. Hose, Wymondley, Stevenage, Herts (Dark). Commended, E. Sheerman (Light); C. Cork, New Shoreham, Sussex.

**GAME BANTAMS (Reds).—**First, J. Crosland, Wakefield, Yorkshire (Black-breasted). Second, Rev. G. Raynor, Kelvedon Hatch Rectory,

\* All Mr. Manning's pens were so shown.

Brentwood (Black-breasted). Highly Commended, Rev. G. Raynor (Black-breasted). Commended, Rev. G. Raynor (Black-breasted); W. H. Walker, Shenfield, Brentwood (Black-breasted); R. B. Postans, Brentwood (Black-breasted); Rev. T. C. Hose, Wymondley, Herts (Black-breasted).

GAME BANTAMS (Any other variety).—First, Rev. G. Raynor (Red Piles). Second, R. B. Postans, Brentwood (Duckwing). Highly Commended, Rev. G. Raynor (Red Piles); J. Crosland, Wakefield, Yorkshire (Duckwing).

BANTAMS (Any other variety).—First, E. Pigeon, Lymington, Exeter (Japanese). Second, E. Cambridge, St. Philip's Works, Bristol (Black). Highly Commended, G. Griggs (Old-English feather-legged Spangled).

ANY OTHER VARIETY NOT PREVIOUSLY MENTIONED.—First, E. Pigeon, Lymington (La Fleche). Second, R. Warner, Broomfield (Forest Fowls).

PAIR OF PUEASANTS.—First, Miss M. Manning, Springfield (Gold). Second, J. G. Grave, Chelmsford (Gold). Highly Commended, J. Dixon, jun., Chelmsford (Silver). Commended, J. R. Hicks, East Bergholt, Colchester (common lute).

TRAEYS.—First, A. Hutley, Terling, Witham (Cambridge). Second, A. Durrant, Chelmsford (Cambridge). Highly Commended, A. Hutley (Cambridge); A. Durrant (Cambridge).

GREENS.—First, J. Bott, Hatfield Peverel, Chelmsford. Second, T. H. Upson, Rivenhall, Witham (China).

DUCKS (Aylesbury).—First, Mrs. Pattison, Maldon. Second, Rev. M. R. Burnard, Margaretting Vicarage. Commended, F. Parlett, Chelmsford.

DUCKS (Any other variety).—First, R. Warner, Broomfield, Chelmsford. Second, F. Parlett, Chelmsford (Rouen). Commended, T. C. Harrison, Hull (Brown Call).

PIGEONS (Any variety).—First, H. Bruce, Walworth, Surrey (Almond Tumblers). Second, E. Disney, the Hyde, Lugatstone (Pouters). Highly Commended, W. Cottiss, Witham (Blue Fantails and Priests). Commended, W. Cottiss (Japanese); Mrs. Townsend, Hatfield Peverel (White Fantails, Yellow Fantails, Archangels, and Red Jacks).

SELLING GLASS.—First, Dr. Campbell, Broomfield (Coloured Cochins). Second, F. Parlett, Chelmsford (Silver-Grey Dorkings).

EXTRA CLASS.—First, Mrs. Mayhew, Galloleywood Hall (Peahen and three young birds). Extra prize of 5s., Miss M. Manning, Springfield "The Hare and many friends."

Mr. Edward Hewitt, of Eden Cottage, Sparkbrook, officiated as Judge.

## GLOUCESTER BIRD SHOW.

THE fourth grand annual Exhibition of Canaries and British and foreign Cage Birds took place on the 11th and two following days, and very great praise is due to Mr. G. Cummings, the indefatigable Secretary, for his perseverance and endeavours to make the Show worthy of being seen. Although there were not quite so many birds exhibited as at the previous show, still there were many very choice birds on the stages, which also contained many fine plants in pots. The Norwich birds, especially the first prize Buff belonging to Mr. Gayton, Northampton, were pretty good, and the Belgians, both clear and variegated, did the exhibitors great credit. The Lizard classes, although somewhat weak in number, contained three or four excellent birds; and the Mules, especially the two Jouque birds shown by H. Ashton, Esq., Manchester, had no difficulty in being placed first and second.

The foreign birds were in stronger force than usual, and were generally in capital plumage; the Grey Parrots were very good.

The classes for British birds also contained many choice-planned specimens, and there was no great difficulty in placing the Goldfinch belonging to C. H. Fisher, Esq., of Stroud, Gloucester, first, although the bird that won second honours, shown by Mr. J. Mayo, Gloucester, was very fine. The following is a list of the awards:—

NORWICH (Clear Yellow).—First, H. Sawkins. Second, Miss K. Skay, Very Highly Commended and Commended, H. Sawkins.

NORWICH (Clear Buff).—First, H. Sawkins. Second, J. Mayo. Very Highly Commended, H. Sawkins. Highly Commended, J. Mayo. Commended, W. Shenton.

NORWICH (Variegated).—First, G. Cummings. Second, G. Rawlinson. Very Highly Commended, J. Mayo. Highly Commended, G. Rawlinson; H. Sawkins. Commended, H. Sawkins.

LIZARDS (Golden-spangled).—First and Second, Mrs. Jessop.

LIZARDS (Silver-spangled).—First, Mrs. Jessop. Second, H. Sawkins. CUNNAMON.—First, Mrs. Monsell. Second, H. Sawkins. Commended, Mrs. Monsell.

BELGIAN (Clear Yellow).—First and Second, J. Mayo. Very Highly Commended, W. Shenton.

BELGIAN (Clear Buff).—First, W. Shenton. Second and Very Highly Commended, J. Mayo.

BELGIAN (Any variety).—First and Second, J. Mayo.

HALF-BRED BELGIAN.—Yellow.—First, G. Clapham. Second, H. Sawkins. Buff.—First, Mrs. H. Monsell. Second, G. Cummings. Variegated.—First and Second, H. Sawkins.

GOLDFINCH MULES (Mealy).—First, T. Woodman. Second, R. Stone. Very Highly Commended, F. Wilton. Commended, G. Cummings.

COMMON YELLOW.—Prize, Mrs. G. Parry.

COMMON BUFF.—Prize, G. Smith.

COMMON MARKED.—First, G. Clapham. Second, G. Smith.

YELLOW-CRESTED.—First, H. Sawkins. Second, G. Cummings.

BUFF-CRESTED.—First and Second, H. Sawkins.

GOLDFINCH.—First, C. H. Fisher. Second, J. Mayo. Very Highly Commended, C. H. Fisher. Highly Commended, R. Stone.

BULLFINCH.—Prize, G. Clapham.

LINNET.—First and Second, R. Stone.

SMALL BRITISH BIRDS (Any other variety).—Prize, W. G. Cummings.

THURSH.—First, J. Gale. Second, W. Shenton.

LARGE BRITISH BIRDS (Any variety).—Prize, H. Jeffs.

GRASS PAROQUETS.—First, C. H. Fisher. Second, Mrs. Jessop.

SMALL FOREIGN BIRDS (Any other variety).—First, F. Wilton. Second, J. James.

GREY PARROT.—Prize, W. Burnet. Very Highly Commended, C. H. Fisher. Commended, J. Chick.

ANY OTHER VARIETY.—First and Second, Mrs. R. Allan. Very Highly Commended, Mrs. Jessop.

The above competition was confined to the neighbourhood of Gloucester, and the following were open to all England:—

NORWICH (Clear Yellow).—First, G. Moore, Northampton. Second, J. Wynn, Northampton.

NORWICH (Clear Buff).—First, G. Gayton, Northampton. Second, G. Moore.

LIZARD (Golden-spangled).—First, H. Ashton, Manchester. Second, B. Pointon, Basford.

LIZARD (Silver-spangled).—First, B. Pointon. Second, W. Phillips, Basford.

GOLDFINCH MULE (Jouque).—First and Second, H. Ashton.

GOLDFINCH MULE (Mealy).—First, W. L. Chapman, Northampton. Second, B. Pointon.

BEST COLLECTION OF CANARIES IN ONE CAGE.—First and Second, H. Sawkins, Gloucester.

CASE OF STUFFED BIRDS.—First, T. White, Cheltenham. Second, N. Skelton, Cheltenham. Third, J. James, Gloucester. Very Highly Commended, Rev. A. F. Ford, Gloucester.

EXTRA PRIZES FOR POULTRY.—W. Stephens, Gloucester (Silver-spangled Hamburgs); Rev. E. Mansfield, Highnam (Black-breasted Game Bantams); Mrs. G. Parry, Gloucester (Ducks); W. Stephens (Ducks). Highly Commended, Mrs. Parry; W. Stephens.

The awards were made by Mr. George J. Barnes, of Derby, and gave great satisfaction.

## SUNFLOWER SEED FOR FOWLS.

I HAVE regularly grown a few sunflower plants for the last five or six years for my fowls, and have always found that they eat the seeds greedily, whether these are in or out of the flower, provided only that they are ripe and have a kernel inside, which many of the smaller and immature heads have not; such seeds, consisting only of skin, the fowls will leave untouched. They seem to prefer the black to the light-coloured seeds. They are to be used only as an addition to the other food.—W. D. P.

## ROUP.

HAVING been annoyed several times with that arch-enemy roup among my fowls, I tried every nostrum I could lay my hands upon, but always with considerable loss, till this season I hit upon the following, which has proved successful, not having lost one bird.

Give one table-spoonful of castor oil. My mode of administering this is, perhaps, new. Take a strip of white blotting-paper, 2 inches broad and 3 or 4 inches long, roll this on a pin half an inch in diameter; closing one end like a cartridge paper, withdraw the pin; pour in the oil, close the top with your fore finger, or open the bird's mouth with your left hand, turn the cartridge upside down into the throat and push the whole over with the fore finger. Thus the plumage of the fowl is kept clean. After the oil has operated give twice daily, in the morning early and after the birds have gone to roost, one pill each, consisting of one grain sulphate of iron and three grains of the finest Cayenne pepper, mixed with salt butter into a firm pill. To each pint of drinking water, which must be fresh every morning, put three grains, bruised, of cochineal, and about the size of a nut of camphor. Wash the mouth, nostrils, and eyes with tepid vinegar daily morning and evening.

For chickens I put three grains of cochineal to the pint of water, with a bit of camphor, once a-week, giving bread and ale every second day. Young birds thus treated have never shown symptoms of any disease, moult well, and are very strong.—THOMAS SHORT.

## NUTT'S HIVES.

It is common, doubtless, with others, I am glad to find some one who has had experience of Nutt's hive standing forward in its defence. It is clear that your correspondent, Mr. Sedgley, is satisfied with it, as he uses no other. May I ask, if he would kindly give us a little further information? Does he not find the hive troublesome to manage? or after once drawing the ventilators does he leave the bees pretty much to take their chance? Does he find in a series of years any difficulty arising from their non-swarming, and that the queen will perversely die at the wrong season? And, especially, would he have any objection to state the amount of his honey harvest from each hive, say for the last two seasons? From being at one time quite the rage, Nutt's hive has fallen somewhat into disrepute, and as there is a good deal in fashion, it may be that the existing prejudice against it is unreasonable.

Nevertheless, I imagine that the principle is wrong. The natural instincts of the bee, like those of political reformers, seem in favour of vertical and not lateral extension. When a swarm escapes, a hollow tree, or a chimney, is the favourite

selection, forming a long and narrow hive. The arrangement of the comb is, however, far stronger evidence,—“honey above, and brood below” and this, notwithstanding lack of room. If a hive of, say, seven combs, with an overflowing population, is transferred to a longer box, the additional comb will not be used exclusively for storing honey, but will contain brood like the rest; whereas if the habits of the insect are in accordance with the collateral system, we should expect to see the brood cells carried upwards in the middle combs, while the side combs were pure honey. It will be said that the side combs are generally pure honey, but in a non-swarmling stock where the space is overcrowded, the side combs, if not already occupied, will certainly be filled with brood rather than the queen will ascend. As to the saving of labour to the bees, and the resemblance in a storified hive to a man carrying a load up two or three pair of stairs, instead of depositing it on the ground floor, there is an obvious fallacy. Men do not go on all sides, and bees do. Bees like to ascend, and many persons fix their landing-boards at a steep slope. Some of the American hives have landing-boards 8 or 9 inches square, and standing at a considerable angle, so that the bees have almost the height of the hive to climb before they enter it. Not having wings one cannot very well say, but it always seems to me that the bee carries her load much easier climbing than flying, especially when the load is pollen. The weight in flying seems out of the centre of gravity, and to hang. The frequent exhaustion of the pollen-carriers is some sort of evidence as to the great labour involved. But certainly any time lost in storing the honey is more than made up by the comparatively rapid building of the combs.

Mr. Sedgley touches a real defect in Nutt's hive, when he says, “Be sure to keep the ventilators closed in the sides boxes till the bees have begun working in them for a few days.” The secretion of wax is mainly a question of temperature. Lower the temperature, and the secretion becomes difficult, lower it still further and it becomes impossible. Has Mr. Sedgley any notes showing the rate of progress in the collateral before and after giving ventilation? And also of his difficulties if he does not pay very close attention to his thermometer? I am only seeking information, and suggest that a genuine record of results would be very welcome to many bee-keepers.—F. H. WEST.

#### FEEDING AND TRANSFERRING.

I HAVE a weak stock of bees, now weighing 16½ lbs., in a common straw hive, which I have been feeding every night for the last few weeks with a bottle at the top of the hive, to stimulate breeding (using 3 lbs. of loaf sugar to one pint of water, simmered over a slow fire till dissolved), and when I go in the morning to remove the bottle I always find a quantity of the syrup running out at the entrance of the hive, and some of the bees looking as if they had been spotted with a whitewash brush. I am at a loss to account for this, as it is not the case with any of my other hives, and it has not been so with this until lately. I think there is no fault to be traced to the bottle, as I have used different bottles of various shapes and sizes, with necks varying from 1 to 2½ inches in diameter, and found them all act in the same way when placed over this hive; nor do I think it is the fault of the perforated zinc, upon which I place the inverted bottle, not being perfectly horizontal, in which case I should always find it empty in the morning, but I do not.

Will it now be too late in the season to transfer the bees and combs into a Woodbury frame-hive (I am a pretty good hand at doing this), and then to give them one or two frames of broodcomb from a very strong stock? or I can purchase a stock, which is too weak to survive the winter, from which I can drive the bees, and unite them to the transferred bees, instead of, or as well as, giving them the broodcombs.

Will you tell me how long I may continue, or when to discontinue, feeding for the purpose of stimulating the queen to breed?—A. R.

[The mystery of your bottle is a puzzling one, but something must evidently be wrong somewhere, as the food should not even drop on the floor-board, much less run out at the entrance. Test the bottle by filling it with water, tying its mouth over with net, and then inverting it in mid-air. Held steadily in this position not a drop should fall after the first rush is over. We are, however, inclined to think that in the case in question the sponge is saturated, and will hold no more; or, in other words, that the bees, having filled their combs to repletion, are too few to attempt to extend them, and in this

event, every cell being already filled to overflowing, continued feeding cannot even promote breeding, which is thus rendered impossible. We should, therefore, at once stop the supplies, which appear to do more harm than good.

It is too late in the season to transfer a stock of bees with much probability of success. We cannot, therefore, advise a course which is so likely to end in total disappointment.

Bees should now go into their winter quarters, and be disturbed as little as possible. All feeding, therefore, had better be discontinued forthwith.]

EGG OF THE MOA, OR DINORNIS.—We have been requested by Mr. Stevens to draw attention to the sale of a nearly perfect egg of this extinct bird, which is to take place at his Rooms on Friday next, the 24th. According to the Wellington (New Zealand) papers, it appears that a man at Kai Koras was digging the foundation of a house, when on the side of a small mound he suddenly came upon the egg in question, and the skeleton of a man, supposed, of course, to be a Maori. The body had evidently been buried in a sitting posture, and the egg must have been placed in the hands, as when found the arms were extended in such a manner as to bring it immediately opposite the mouth of the deceased. This, it is assumed, was in accordance with the Maori custom, and was done for the purpose of giving the individual who was buried an opportunity of sustaining himself if he thought proper, or if, in the course of things, he required sustenance. Between the legs of the skeleton were found numerous tools, cut from green stone, including a spear, axe, and several implements. The egg itself is about 10 inches in length and 7 in breadth, the shell being of a dirty brownish colour, and rather better than the thickness of a shilling coin. The inside is perfectly clear and free from all traces of decayed matter.

#### OUR LETTER BOX.

MENDING A SICKLE FEATHER (J. C.).—If the mending of the feather is detected, as it most likely will be, the bird will be disqualified. We believe you joined the feather that broke off to the stump from which it came, but if this were once admitted, less scrupulous persons would break off a white and substitute a black sickle feather. It is not very unusual for a Toulouse Goose to lay now. There is no limit to their laying.

COCHIN-CHINA COCK (A Subscriber, Hastings).—As you have tried without benefit bread and ale, and other stimulating food, to strengthen the bird and promote his moulting, we fear that he has ulceration of some of the chief viscera. Do not give castor oil; cod-liver oil might benefit him, and so might four grains of citrate of iron daily, mixed up with the bread and ale, which you had better continue.

CHICKENS CRAMPED (Constant Subscriber).—Keep them in a warmer and drier place, give them bread soaked in ale, and one grain of citrate of iron each daily.

HEATING INCUBATOR (T. M. L.).—As you cannot have gas, try one or two argand oil lamps. They require abundance of air to support their combustion.

ULCERS IN RABBITS (R. R.).—You cannot do better than to open them when nearly suppurating. Then wash the wound with warm water, and apply acetate of lead ointment. The hair should be previously shaved off, so that the ointment may be applied to the skin.

RABBITS (Rabbit Breeder).—We recommend you to adopt the Silver Greys—they are good for table, and their skins valuable. Look in our advertising columns, or apply to any of the dealers in birds, &c., in St. Martin's Lane and elsewhere.

NATIVE HIVES.—We have a letter directed to “M. D.” which we will forward if he sends us his address.

PREVENTING HONEY CANDYING (W. H. P.).—We cannot tell how to prevent honey becoming candied during winter, but it may even then be readily rendered available for feeding-purposes, by subjecting it to a moderate degree of heat, and adding, at the same time, a little water to render it more fluid. It is only in cases of absolute necessity that we should resort to feeding so late in the season, and, therefore, unless in such a case, would advise its being deferred until the spring.

UNITING AND SHIFTING STOCKS (Idem).—There is no reason why stocks should not even now be successfully united, but, if they require feeding, no time should be lost about it, as the ultimate success or failure of the experiment must, in this case, depend upon the state of the stocks when winter sets in. Do not move your hives at this season, when the slightest doubt or hesitation on their return home must be fatal to multitudes of the tired and half-chilled little foragers. Gradual shifting should be practised only when bees are in full activity, with sufficient health and strength to remain on the wing until they can find out their home in its new position.

PARTHENOGENESIS (J. Carr).—Von Siebold's experiments were repeated and verified by Mr. Woodbury, as related by him in page 77 of the second volume of THE JOURNAL OF HORTICULTURE.

LIGURIAN BEES—TRIFOLIUM INCARNATUM (S. E. B.).—Write to T. Woodbury, Esq., Mount Radford, Exeter, respecting Ligurians. We do not believe the Ligurian has a longer tongue than the common bee, and, therefore, doubt its ability to collect honey from any flowers in which it is out of the reach of the ordinary hive bee. Trifolium incarnatum is a first-rate bee-flower. Its increasing cultivation in this country has, we believe, not been without its effect on the excellent honey harvests of late years.

ENTOMOLOGY (G. W.).—The “Journal of Entomology” is published monthly by Messrs. Taylor & Francis.

WEEKLY CALENDAR.

From observations taken near London during the last thirty-eight years, the average day temperature of the week is 47.7°; and its night temperature 34.9°. The greatest heat was 62°, on the 1st, 1857; and the lowest cold, 14°, on the 30th, 1856. The greatest fall of rain was 1.21 inch.

METEOROLOGY AND VENTILATION OF ORCHARD-HOUSES.

LL your readers must feel interested in the observations of your correspondent "G. II.," but as he seems a little doubtful of my record of the maximum temperature of my

large orchard-house in summer, I have looked into my memoranda.

On August 27th, 1861, I was engaged in watching the ventilation of my large orchard-house, hanging pieces of cotton wadding inside under the apex of the roof, to observe the different currents of the highly rarefied air—it was a hot sunny day—wishing to observe at what part of the house they divided in their egress, the only apertures for which are a triangular space at each end under the gables, the bases of which are about 20 inches in diameter. In doing this I took very accurately the maximum temperature in the shade, in the open air, and in dense shade in the orchard-house. I may observe that my thermometer out of doors is placed 5 feet from the ground, on the north side of a Beech hedge, fully exposed to the winds from the N.E. To make the shade more effectual, some coarse bags several times thick are placed as a cap on the top of the post. I am sometimes inclined to think that it is owing to this densely shaded exposed place, that I find the maximum temperature here lower from 5° to 7° than that given at Chiswick and other places; yet it must be correct as far as this place goes. The maximum temperature of the past summer here was 83° on June 21; at Chiswick, on the same day, it was 89°. Is it that the thermometer at Chiswick is placed among the walled enclosures, with large spaces of gravel reflecting much heat? To return to my experiment on August 27th, 1861; the maximum here in the shade in the open air was 81° on that day. In my large orchard house in the shade, 5 feet from the ground, it was 88°; at 12 feet from the ground in the shade, just under the apex of the roof, it was 96°. I impute the moderate temperature at 5 feet from the ground to the efficiency of the low side ventilation, the shutters, 20 inches wide, opening downwards, and the comparatively cool air rushing in so rapidly as to make the air of the house, although so hot, quite agreeable to breathe.

It will thus be seen that there were only 7° of heat difference between the open air and the large orchard-house. I think as a general rule 10° will be found the average. I believe I have seen it as high as 15°, but I suspect that the thermometer in the house was then under the shade of the foliage only, and not covered with thick bagging, as it was when I made my observations in August, 1861. I was then very careful.

Such, then, have been the results of my experiments on the temperature of an orchard-house 100 feet long by 12 feet high and 24 feet wide. For the register of the ripening of the fruit I must refer your readers to No. 237.

To the assertion that narrow houses, which "G. II." refers to, are retarding-houses, presuming that he means span-roofed houses 14 feet wide, which I have made the minimum of such houses, I can only give in reply bare facts as to the ripening of Peaches and Nectarines in a house of that width. In that house I have half-standard Peaches and Nectarines planted in the borders. I made it in the past season a Cherry-house for trees in pots; and I may, *par parenthese*, mention that no fruit culture has ever given me more pleasure. The Cherries began to ripen in the first week in June. The side shutters, 1 foot wide, opening downwards, were then thrown open, nets placed over the apertures to keep out the birds, and in that state they are to this day, never having been closed all the summer. Well, this, according to "G. II.," should have been a retarding-house, and so it was to a small extent. Let us see. Early York and Early Victoria Peaches ripened a week after those in the large orchard-house. Grosse Mignonne and Galande Peaches, and Violette Hâtive and Elruge Nectarines, a most abundant crop of beautiful fruit, all ripened by the end of the third week in August, and were finer in flavour than any I ever ate.

For amateurs with moderate means, living in the climatic district I have named at page 291, the "small span-roofed house"—(in my little book I so named it, because I soon found that in my narrow houses the draughts were too sharp for continuous summer ventilation; still, I must candidly admit that Peaches ripen well in my span-roofed houses 12 feet wide)—is a cheap and most useful structure. It should be 10 feet high in the centre, 5 feet high at sides, and 14 feet wide; the roof fixed; rafters 20 inches, or with 21-oz. glass, 24 inches asunder; the side shutters or sashes 1 foot wide, on hinges opening downwards. A few words as to how a house of this size should be planted may be acceptable. The method is adapted to those who do not keep a gardener, and consequently wish to abridge labour. In a house of this width a central path should be marked out 6 feet wide; on the edges of this path half-standard trees should be planted 5 feet apart, so that when finished there will be two rows of trees 6 feet apart row from row, and 5 feet apart in the rows. If the house is of any considerable length, say 50 or 60 feet, these two rows of trees will give a good supply of fruit; between the rows and the sides of the house there will, of course, be a four-foot space. This may be appropriated to Apricots, Plums, &c., as bushes, either in pots or planted out in the borders—the latter, if water is not abundant. My house of the dimensions I have described is 60 feet long. In this about six or seven years since I planted two rows of trees, half-standards—i. e., stems from 2½ to 3 feet—on one side twelve Nectarines, on the other twelve Peaches. Although they are fine trees and bear large crops—how beautiful was the Violette Hâtive Nectarine with nearly two hundred fruit on it!—I had plenty of space for a large crop of Cherries, in pots. I have recently removed a few of the Peach trees

but those left show plainly what can be done in "a small span-roofed house" with very little care. The truth is, orchard-house culture is so simplified here, that no extra care was required; everything in the shape of a fruit tree bears well and does well. Ventilation and syringing, like cold water and diet at Malvern, are two great points, to which must be added the summer surface food of malt dust and manure. What power there is in the compost! Our G G's, which may mean great guns or great gardeners, do not, I fear, appreciate it.

While reading about retarding-houses by your correspondent "G. H." and Mr. Fish, and thinking of what our forefathers would have said if any one had proposed to build a glass-roofed house to retard fruit; and if he had done so, and succeeded in keeping back a Noblesse Peach a month or five weeks by planting the tree in a glass-roofed house, he would have been scorched and have had his thumbs squeezed, to have made him confess his obligation to some dabbler in witchcraft—in thinking of these old days of scorching and thumb-squeezing—(I suppose they were necessary to bring about our present happy state; "We are a great people, sir-ee," as the Americans say)—I had nearly forgotten my retarding glass-roofed houses. There are four of them, lean-to's, each about 50 feet long and 12 feet wide. The back walls are fine Beech hedges about thirty years old, carefully clipped; the front walls are ditto, the hedges much younger. In these houses there are dwarf bushes of Peaches and Nectarines planted in the borders to supply shoots for budding in unfavourable seasons. They grow with healthy vigour, require no syringing, and bear fruit in seasons when spring frosts are not too severe. The last season brought out the retarding principle so strongly, that although the idea was old—for had I not written it in my book?—I could not help feeling much interested in it. I now call to mind that the Early York Peach, which ripened in my large houses August 7th, was not ripe in these hedge houses till the second week in September. It was the same with the midseason Peaches; they ripened from a month to five weeks later than those in the houses I have mentioned. Peaches in the open air on dwarf bushes ripened before those in these hedge houses, a very curious fact—rather witchcrafty. I hope my thumbs are safe.

With reference to my notice of "G. H.'s" article in No. 235, I fear I mistook his remark to his French friend respecting the premature rest of his orchard-house trees as a sarcasm, and did him injustice. I also understood him to say that he opened his forcing-house in July night and day, which was certainly most peculiar practice, and I wrote strongly on the subject.

I sometimes think I am like an old horse, accustomed for years to jog along a straight smooth road, with the bridle on his neck, and whenever this is taken in hand with a seeming intent to turn him into a narrow lane, he shakes his head and becomes a little restive, or "rusty" as the people say here. I have no intention of quoting Dr. Bennet or Morton, wishing to keep to orchard-house temperature only as being more to our purpose. In June last, from the 13th to the 18th, we had cold and cloudy weather here, the thermometer more than once sinking to 33° at night in the small span-roofed house which I have mentioned it descended to 40°. In July the minimum temperature out of doors was 40° for some few nights; in the house it was 48°. In August, the lowest temperature out of doors was 35°; in the house—the span-roofed house—it was 43°. Now, then, let us look at the results of these low night temperatures. The Cherries ripened gradually and were of the finest flavour, the trees keeping their leaves till last week. The Peach trees are now (Nov. 16th), full of leaves of a ripe yellow hue, dropping off by thousands when the tree is touched. Now, what can be more perfect success in fruit culture than this, abundance of fine ripe fruit and the trees in the healthiest state possible? They were not syringed after the middle of July, and yet all through August and September their foliage was green and beautiful. Yet according to "G. H.," my recommendation of ventilation night and day in summer has done much mischief, and puts fruit trees to premature rest, from the great inequality of temperature. If I remember correctly, Mitchell and other Australian explorers found in tropical Australia the day temperature from 100° to 120°, hoar frosts in the mornings, and yet the most vigorous tropical vegetation. Depend upon it if we can command such sunny weather in summer, we need not fear our fruit trees being open all night. Black Hamburg Grapes grown here in a house with latticework of laths in front, so as to be always open, are the finest of all, their skins so tender as to melt, and their richness of flavour remarkable.

"G. H." generally goes by far too much, and half insinuates

that the 27th of last September was an unfortunate day by which to judge of temperature. I keep closely to my experience gained here, I know of no better mode of acting. As to calculations without experience, they are, as we used to write at school, a "great sea" of conjecture. At Chiswick, on that day the maximum was 78°, minimum 32°. Here it was 69° and 33° (Negretti's instruments are used), out of doors, and 80° and 41° in my large orchard-house. It is curious that the maximum at Chiswick is always above mine, and the minimum below. The last three summers when I have read of the "tremendous heat" in different localities, varying from 90° to 96°, I have always felt strong doubts about where the thermometers were placed. I could never come near by 10° or 12° to these wonderful records of great heat, and have never believed them. In taking the maximum temperature, no walls, no gravel walks, should be near, all should be free exposure, and the thermometer densely shaded.

I have just observed, page 403, the paragraph in which "G. H." gives the great change his trees were subjected to—"95° in the day to 45° at night"—and quotes my being surprised at their not being killed. He has forgotten that he was alluding to his forcing-house, as I understood him. In my houses the very best ripening effects are induced by the great extremes of temperature. If I could control Nature I would have bright sunny days all through June, July, August, and September; the thermometer in my orchard-houses 80° to 90° by day, and 40° to 50° by night. I fully believe such a climate would be perfect in its growing and ripening powers.—THOS. RIVERS.

#### THE NATURAL ORDERS OF PLANTS.—No. I. THE LEGUMINOSÆ.

It seems a little strange that out of the large number of Natural Orders of plants so few should be selected by cultivators as worthy of special collection. When Orchids, and Ferns, and Crasulaceæ, perhaps, have been named, there is scarcely another family represented in our gardens except in the most fragmentary manner, and even then it is without any care or thought having been taken to obtain the species because they were of this or that family. Geraniums are grown not because they belong to the Geraniaceæ, but by reason of their specific qualities; Caladiums are grown not because they are Araceæ plants, but for the sake of their leaves; and so with nearly everything else. A Fern, on the other hand, oftentimes of the most insignificant pretensions, is cherished simply because it is a Fern; and many an Orchid that will not compare for beauty with a spring Crocus receives a select place because of the general honour in which its race is held. Cannot something be done for other large and beautiful families? How delightful it would be, instead of incessantly hearing the cry, "Come and see my fernery"—as if it were something so unusual to see Ferns that our eyes must sparkle with delight at the very thought of a fernery—how delightful it would be, on visiting some new place, or a friend's little floricultural retreat in the country, to hear, instead of the above, some such unaccustomed call as, "Come and see my Epacrids!" Every one loves Ferns, just as every one loves music, but even the Irish melodies played five hundred times running on a piano would become rather tiresome at the last. Let there be ferneries by all means, and Orchid-houses as many as there can be had plants to fill, but it would give more pleasure in the long run if our plant-lovers would try to be more different from one another in their floral hobbies. The advantage to science and to practical horticulture would be immense, since it is only by growing many plants of similar structure side by side, as is done with Ferns and Orchids, that clear and definite knowledge is obtained as to their various likings and requirements. What a charming spectacle a collection of Leguminosæ plants would make! Every possible variety of habit is found among them; every conceivable diversity of inflorescence and of colour in the corolla; scarcely any two species have leaves exactly alike, and one set of forms or another is to be found in bloom whatever the season of the year. The Leguminosæ present the *beau idéal* of a botanical family. Upon our lawns, mingling with the grass, often springs up that delicate little plant the Bird's-foot (*Ornithopus perpusillus*), so small as to be well nigh hidden among the grass; at the other extreme of dimensions, without leaving the garden enclosure, we have the Robinia and the Wistaria, the Laburnum and the Sophora. In the tropics there are Mimosas so prodigious as to compete in bulk of stem with the Wellingtonias of California! These,

however, I may dismiss with the bare mention, since they do not come within the scope of my present remarks. The simple leaf, the trifoliate, the pinnate, the digitate, all have their illustrations in this beautiful family. Tendrils, spines, thorns, wings, stipules, all may be seen and studied here to perfection: so may the endless modifications of the papilionaceous or butterfly-shaped corolla, and of those of the legume which follows on the demise of the many-hued flowers. Delicious odours, eatable seeds, and an incredible variety of secretions are also found in the Leguminosæ, as witness the gum arabic, Liquorice, Senna, Peas, Beans, lentils, and Brazil-wood; and though last, not least, we have among their varied species some of the most curious examples known of vegetable irritability, as in the Sensitive-plant and in the Humble-plant. If these be not sufficient recommendations to the culture of this race of plants with any one who wants variety, a man must be hard to please indeed.

Beginning with the hardy herbaceous species we shall find a Leguminous plant in the first rank of our spring favourites—namely, the *Orobis vernus*, with pinnate leaves formed of two pairs only of large and pointed leaflets, and racemes of purple flowers. Summer will crowd our borders, if we will, with Lupines in a score of kinds, blue, white, yellow, and pink, and an endless variety of plants belong to such genera as *Astragalus* and *Lathyrus*. The last-named includes the well-known Everlasting Pea and the ubiquitous Sweet Pea. Lupines have several odd features about them. When the seeds of the annual species, and probably of the perennials also, are newly above the soil, and their great fat cotyledons are falling apart, instead of sustaining transplantation, as most other seeds do, they are so averse to it as generally to be destroyed by the attempt—that is, unless effected with the greatest caution. A similar impatience of removal is observable in Peas when coming up, though not in Beans, or at least not to the same extent. Grown up, and with foliage well developed, the Lupine shows a very elegant kind of "vegetable sleep," the leaflets not merely folding upon the midrib so as to bring the margins in contact, and shut in the surface, but drooping also, each upon its own hinge, so that the leaf while in this state of nocturnal repose, reminds us, in its figure, of a lady's half-opened parasol. One of the old Roman poets calls these plants *tristesque Lupini*—melancholy Lupines—a name that seems odd for plants ordinarily so gay and cheerful. Tasting the seeds, however, we find them bitter. Those of the white Lupine were anciently cultivated in Italy as pulse, and largely consumed by people of the poorer classes, the corners of whose mouths being drawn down by eating so much bitter food, their faces acquired a dejected appearance, and hence the poet's epithet.

Peas, in all their forms, are lovely. A collection of British Leguminosæ alone would make a charming flower-border for the grandest garden in the country, for at the head would stand that magnificent plant the good old-fashioned *Lathyrus latifolius*. Whether a good "species," whatever that may be, as definitions now go, or only a sumptuous improvement, originally developed upon the continent, of that lovely ancient Briton the *L. sylvestris*, so plentiful and so graceful in the woods at Portishead, at the mouth of the Bristol Avon; whatever its descent and history, we may search for many a mile before a worthy rival can be found for it.

Then, how lovely are our native Lotus and the Hippocrepis that associate so prettily with the Coronillas in representing one of the most elegant forms of inflorescence known to botany. Books call it a "depressed umbel," correct technically, perhaps, but ugly enough to bring another reproach on nomenclature. It should be called the "coronet," the circlet, so often golden in hue, being in many cases almost mathematically true, and the proportions of breadth and depth so admirably symmetrical. It is fortunate for one section of botanists that, by the authority of the learned President of the Linnean Society, Genetyllis and Hedaroma are to exist no longer, and that Darwinia is to include both. Would that, conversely, Lotus could be exchanged for something else, in two out of the three applications it now bears. The Lotus of the Nile—that famous tree of fable, which yielded the enchanting berries—and our little golden-tufted pasture-plant are so totally unlike and unconnected, that it may well disconcert beginners, who are often as much perplexed by such echoes as the unfortunate Frenchman was by the endless "box." Speaking of the Lotus, have you noticed in reference to the specific difference between *L. corniculatus* and *L. major*, both very beautiful plants for garden rockwork, that while the unopened buds of the former are often, indeed ordinarily, deeply suffused

with red, those of the *Lotus major* are always pure yellow? Colour, as we all know, is of little value in establishing specific distinctions among flowering plants, though of considerable use when we dive into the realms of the Fungi, &c.; yet it is strange that if these two Lotuses be only one species, as thought by many, there should be so odd an extra tinting in the one, and so total a want of it in the other. Every lover of Shakspeare should know these plants; for are they not the curious little spreading clusters of legumes that are intended by him in *Crow-toes*?

The legumes of the Medicagos and the various species of *Scorpiurus*, I may mention in passing, are quite enough to reward the cultivator of curious plants. If Grasses be grown for their delicate panicles and spikes, as reasonably may these be for the quaint similitude their varied produce gives in relation to caterpillars and so forth. What does a person totally unacquainted with plants surmise, I wonder, when on going into a seedsman's shop to make some casual purchase or inquiry, he sees among the names of seeds that are painted on the tiers of little drawers behind the counter, caterpillars, snails, and hedgehogs!—things likely enough to be found in a garden, but not exactly what it would seem either necessary or usual to raise from seed.

Then what lovely shrubs among the hardy Leguminosæ! *Cytisus* in its hundred kinds, *Genistas*, and *Caraganas*, keeping the garden in cheerful heart for months together. Trees, also, are represented in the glorious old *Laburnum*, well-named in the south the "Golden Chains;" with its counterpart in white, the *Silver Chains*, or *Robinia*; and again, with its counterpart in purple, the incomparable *Wistaria*. What more can an enthusiast in flowers desire? As for the *Spartiums*, loaded with their golden butterflies, no plants in nature are more showy when fully out; nor is a more powerful contrast afforded by any plant than we find in the universal old *Portugal White*; the plant, I believe, intended by Cowper, though spoken of by a widely different name, when he describes—

"Hypericum, all bloom, so thick a swarm  
Of flowers like flies, clothing its slender rods;  
That scarce a leaf appears!"

No species of *Hypericum* answers more than very indifferently to this really picturesque description, whereas *Cytisus multiflorus* it fits exactly. When a writer so recent as Cowper is so little careful in his use of names, we may well find ourselves hampered in discovering what was Milton's "Hamony," or old Homer's "Moly." This year that queer of lawn trees the *Sophora japonica* has, in the south of England, shown its flowers; and the long-continued autumn has in Lancashire ripened the pods of the *Acacia*, here an unusual circumstance.

In-doors the Leguminosæ are even more varied than in the borders. That inexpressibly lovely tribe made up of such genera as *Eutaxia* and *Pultenæa* leads the way. Then come the odd Holly-leaved *Chorcemas* and their allies; then the *Swainsonias* and a host of others with pinnate leaves. All the *Acacias*, likewise, belong to this family; for although the golden yellow globes may possess little resemblance to a Pea flower, in the matter of legumes there is no organic difference. A good collection of *Acacias* is as great a treat in early spring as one of *Azaleas*. For cutting, moreover, they are unequalled; colour, perfume, delicacy of foliage, and long endurance, all being here found in company.

I trust accordingly that the day is not far distant when the hint thrown out above may be somewhat extensively acted upon. A man might have five hundred Leguminosæ for the same money that it costs him to procure miscellaneous plants, and, nicely dispersed, they would be quite as lovely a spectacle as an equal number of Ferns or *Oreliids*; other plants need not be excluded. It would be like a picture-gallery in which works of art in all departments are admitted.—LEO.

#### WHO FIRST FRUITED THE MANGOSTEEN IN ENGLAND?

I HAVE read with great interest the articles of "J. H." on the fruiting of the Mango and Mangosteen. At page 381 "T. N." says "He was not aware that the latter had been fruited more than once in this country, and that once at Sion House." "J. H.," in answer to "T. N.," says "I have seen it growing at one or two places, and, many years ago, I saw a tree at Allestree, near Derby, covered with blossom, and which afterwards, I believe, bore some fruit. The tree at Sion House, to which 'T. N.' alludes, I only saw once, and then it

was not in flower, but it appeared to me remarkably like *Garcinia mangostana celebica*, a sort which will not fruit in England." Now, as regards the tree at Sion House, about midsummer 1855, a drawing of the Mangosteen appeared in *The Illustrated London News*, where it was stated that it was "considered by those conversant with the difficulties attending the labour, as one of the greatest triumphs of modern horticulture; this being, we believe, the only successful attempt made since the introduction of the plant into England in 1729. It is to the care and skill of Mr. Iveson, head-gardener to the Duke of Northumberland, Sion House, that this successful result of exotic-fruit culture must be mainly attributed."

How many years ago was it that "J. H." saw the tree at Allestree? I will suppose there are those amongst your readers who may have known Walcot Hall, Salop, some thirty-five years ago; if so would they be good enough to assist us with their memory as to whether the Earl Powis of that day was not the first person who fruited the Mangosteen there about that time, and did he not present one of its fruit to T. A. Knight, Esq., of Downton Castle, the then President of the Royal Horticultural Society, as being the first of "all the fruits of the East" ever brought to perfection in England? Such was the fact, I believe; and to all who know what an enthusiast the then Earl was, and to what a practical extent he entered into horticultural experiments at Walcot, they will cease to wonder at any extraordinary achievement having been arrived at there.—UPWARDS AND ONWARDS.

[The Mango was fruited at Walcot in 1826, but we are not aware that the Mangosteen ever was at that place.—EDS.]

## ALPINE PLANTS.

(Concluded from page 357.)

*OXALIS TROPEOLOIDES*, leaves deep purplish brown, flowers bright yellow; effective for rockwork and as an edging plant; loam on gravel.

*OROBUS VERNUS* forms a compact tuft with showy purple flowers, appearing in spring; sandy loam.

*PAPAVER ALPINUM*, leaves finely cut or divided, flowers yellow, on long slender footstalks. *P. nudicaule*, with beautiful clear yellow flowers, may be found effective for grouping in masses; moist turfy loam, peat, and grit.

*PHLOXES*.—Of these *Nelsoni*, white; *frondosa*, pink, with dark centre, and *verna*, rose, are very effective; loam, peat, and sand or grit.

*PLUMBAGO LARPENTE*, with blue flowers, produced in autumn, though usually grown as a tender plant is certainly hardy; loam on gravel, or peat, loam, and grit, well drained in sunny exposures.

*POLYGONUM VACCINIIFOLIUM*, a pretty creeping plant, with erect spikes of pink flowers in autumn; sandy loam.

*POLEMONIUM HUMILE*, dwarf and pretty, flowers purplish; loam on limestone. *P. cœruleum variegatum*, excellent for edging borders.

*POLYGALA CHAMÆBUXUS*, evergreen, flowers yellow, produced in spring, fragrant. *P. vulgaris* forms a showy tuft, with purplish flowers; loam and limestone, and a sunny aspect.

*PRIMULAS*, suitable for rockwork, are numerous. *P. formosa* forms tufts of silvery leaves, and the flower-stems are covered with a white powder and surmounted with clusters of pink, rose, and sometimes crimson flowers. Of this there is a white variety (*alba*), also a stemless form (*acaulis*). Of all the *Primulas* this is the prettiest for ledges of rockwork, kept constantly moist in summer by filtration from above, with perfect drainage at all seasons. *P. viscosa* is a remarkably tree-flowering rosy kind. *P. marginata* has fine large heads of lilac flowers. *P. nivalis* differs little in its general appearance from *P. ciliata*; the flowers, however, are a little less in size and white; and *P. scotica* is nearly like *P. farinosa* but dwarfier, and the flowers have a purple eye. *P. integrifolia* is very dwarf, and has rose-coloured flowers tinged with purple. *P. ciliata* is a dwarf *Auricula*-like plant, having purplish crimson flowers with a yellow eye, and *P. calycina* is likewise dwarf, and has purplish pink flowers. The *Alpine Auriculas* are also fine, and the double varieties of *P. acaulis* of various colours are well known, and do excellently on the moist and rather shady parts of rockwork. All do well under the treatment recommended for *P. farinosa*, except *P. marginata*, which requires to be grown in a somewhat dry situation.

*PYROLA ROTUNDFOLIA*, flowers large, fragrant, rose-coloured. Only adapted for moist ledges of rockwork. *P. media*, evergreen, flowers creamy white; sandy leaf mould with good drainage, but kept moist, and a shady situation.

*PRUNELLA GRANDIFLORA*, large heads of showy purple flowers; loam and limestone on sunny slopes.

*RANUNCULUS MONTANUS*, flowers large bright yellow. The plant forms a compact tuft, and blooms in spring. *R. alpestris*, flowers white, solitary. The plant forms a dwarf tuft of glossy deep green leaves. Peat, loam, and sand kept moist.

*RHODODENDRON FERRUGINEUM* and *RIESETUM* are low, shrubby, evergreen species. Fine for rockwork. *R. chamæcistus* is a bushy evergreen, not exceeding 6 inches in height, and has pink flowers.

*SALVIA ARGENTEA*, a fine silvery-leaved bedding plant.

*SANTOLINA ALPINA* forms a dense, prostrate, silvery-grey tuft; light loam and sand, and a warm aspect.

*SAPONARIA OCTYMOIDES*, with pink flowers produced in abundance; and *S. cœspitosa*, rose; require to be grown in sandy loam kept moist.

*SAUSSUREA ALPINA*, flowers purple, fragrant, leaves silvery beneath; loam, peat, and grit, well drained, but kept moist.

*SAXIFRAGAS* are numerous. I may name *aizoides*, yellow spotted with orange; *S. caryophylla* with large white flowers, plant dwarf and dense; *S. ceratophylla*, white, foliage deeply divided; *S. cymbalaria*, Ivy-like leaves, and sulphur-yellow flowers spotted with orange, produced in long succession; and *S. oppositifolia* with purplish rose flowers, a beautiful plant for the slopes and ledges of rockwork. It likes moist but well-drained loam and gravel, or grit, and a sunny aspect. There are white, rose-coloured, and crimson varieties. *S. palmata* is a fine dwarf species, having large and effective white flowers. *S. cotedelon* produces fine long racemes of white flowers. *S. juniperina*, with yellow flowers, forms a dense tuft; and *S. pectinata*, with silvery-edged foliage, is neat for edgings. Of the other *Saxifrages* the following are well worth a place, as they will grow almost anywhere, forming fine masses of foliage when not in bloom, and being sheets of yellowish or white-spotted flowers at other times—*Saxifraga Aizoon*, *Andrewsii*, *agilops*, *aretioides*, *Bucklandii*, *capillaris*, *cœspitosa*, *cristata*, *gum*, *glacialis*, *hirta*, *hirsuta*, *hypnoides*, *icelandica*, *intacta*, *nervosa*, *nivalis*, *polita*, *pulchella*, *Rhei*, *rotundifolia*, *spathulata*, *tenella*, and *umbrosa* (*London Pride*). They require moist loam and grit, but they soon leave this material and run over rockwork in all directions.

*SEDUM*.—These, with *Saxifrages* are the most useful of rock or alpine plants. They love the rock, but it must be very porous, and then they quickly fill the chinks and hollows though there may be scarcely a particle of earth. What there is should be sandy loam well drained, and the aspect should be warm. I may name—*album*, *anglicum*, and *albicans*, white; *cœruleum*, lilac; *Forsterianum*, yellow, a plague on our gravel walks here in the Principality; *glaucum*, white (there is another kind called *glaucum* which is yellow, the first being properly, I believe, *Andersoni*); *pallidum*, pale rose; and *pallidum roseum*, a trifle deeper in colour; *purpureum*, purplish rose; *populifolium*, white; *reflexum*, yellow; *rupestre*, yellow; *spurium*, pink; and *virescens*, greenish yellow.

*SEMPERVIIVUM ARACHNOIDEUM*, netted like a spider's web, hence its name; *S. californicum*, forming green rosettes, tipped with reddish brown, *globuliferum*, *montanum*, and *tectorum*, require loamy soil and a dry situation.

*SENECIO INCAUS* forms dwarf, dense tufts of very silvery leaves, whiter even than those of *Centaurea candidissima*, and would make the dwarfest and whitest edging plant known, if it would succeed with the same treatment as bedding plants. Sand with a little loam kept moist.

*SILENE ACAULIS* forms on the Welsh mountains large, dense masses of pink or rose flowers. There is a white variety. *S. maritima alpina*, and *S. alpestris*, are fine, and another of the same type as the last is *S. saxifraga*, both having fine white flowers. *S. Schafra* has numerous pretty pink flowers in autumn. Loam and grit.

*SOLDANELLA MONTANA*, very close to *S. alpina*, but the leaves are larger, and the flowers of a purple, with more blue in it. *S. alpina* has deeply-fringed drooping bells. The leaves are small, roundish, and evergreen. Peat, loam, and grit, well drained, but kept moist.

*STATICE ALPINA*, *caspica*, *sinuata*, and *tatarica*, are pretty for fissures of loam and sand.

*SYMPHYTUM CAUCASICUM*, of dwarf and creeping habit, flowers blue, in spring; loam and sand in fissures.

*Thalictrum anemoneoides plenum* is quite a gem, and not less so are *T. alpinum* and *T. aquilegifolium*. Peat, loam, and sand, with grit, in moist fissures.

*Trifolium alpinum*, habit dwarf, and prostrate; flower-heads large, rose-coloured. Loam and grit well drained.

*Veronica candida*, leaves white, fine alike for rockwork and ribbon borders. It will become a favourite. *V. saxatilis*, procumbent, flowers blue; *alpestris*, alpina, bellidifolia, and *maritima* are fine. Loam and grit kept moist.

*Vicia argentea* is another hardy white or silvery-foliaged plant, with whitish flowers veined with purple. *V. sylvatica* is common enough, but very beautiful, rambling over rockwork, and festooning trees, and producing an abundance of white flowers pencilled with purple or blue. Loam, leaf soil, and grit.

*Vinca herbacea*, *V. major*, and *V. minor*, in varieties, are suitable for partially shaded places.

*Viola*.—In this genus we have *V. biflora*, yellow; *V. calcarata*, lavender; and *V. cornuta*, variable in colour, in some soils slate-coloured, in others blue, whilst in others again it is more or less of a bluish purple. It is a neat plant for edging beds, continuing in bloom from spring to autumn. Loam and sand, partially shaded.

*Wulfenia carinthiaca*.—Purple blue; loam, leaf mould, and sand kept moist.—G. ABBEY.

#### FAILURE OF GOLDEN-EDGED GERANIUMS IN 1865.

I am glad to see that Mr. Fish and others of your correspondents have recorded their experience with golden-edged Geraniums during the past season, and I now send my mite of information on the same subject. Unfortunately, I am obliged to join the list of those who feel disappointed with these Geraniums, for they have not been at all satisfactory, although the season has been favourable for almost everything else, and the situation where many of them were planted was what I expected would have insured too rank growth, rather than the reverse. Such, however, has not been the case, and like one of your correspondents, I found several of the plants little or no larger when taken up in October than when they were planted in May. Nor can I attribute their failure to planting out too soon, for we seldom had such a favourable time for doing this work, the month of May being showery, and most plants succeeded well; in fact, I think what little growth they did make was made in June, which was an exceedingly hot and dry month; but in July and August we had showery, though warm, growing weather, yet golden-leaved Geraniums certainly made less progress than anything else. This want of vigour seemed to be common to all the kinds which I grew—viz., Golden Chain, Golden Fleece, and Cloth of Gold, with one or two others differing but little if at all from Golden Chain. They were planted in all situations, many in beds of fresh maiden loam that had been excellent meadow land only twelve months ago, and yet they did no better than the others. Two rows of Golden Chain, each about 600 feet long, consisting of old plants that had not been forced or otherwise exhausted before planting out, and which I expected would have grown on rapidly and afforded a good batch of cuttings by the end of August, scarcely gave any. Cloth of Gold and Golden Fleece were much the same. Now, I ask, To what is this to be attributed? Other Geraniums by the side of them grew almost too vigorously, and the same may be said of other plants. Of course, we do not expect the same luxuriance from a variegated Geranium as from a plain-leaved one, but when the latter flourishes more than usually well, we expect that the less robust varieties should not succeed worse than in ordinary years. In the present, I am constrained to say that the golden varieties have done worse than generally, while the silver-edged ones have done well.

It is somewhat difficult to suggest a reason for the failure, it is, perhaps, hardly fair to call a case like mine a failure, still they did not succeed so well as they ought to have done, some plants in less favoured situations absolutely becoming smaller. Can it be that new varieties are wanted? Golden Chain is certainly an old one, and I should like some one to give its history. I have occasionally seen a golden-edged Geranium for thirty years and more. Was it the golden Geranium of the present day? If so, its term of years may be safely said to be expiring fast; yet, usually, there is no disease, even in the past summer few plants died, their growth only remained stationary, as if there was something at fault either in the soil or atmosphere; in my case it must have been in the latter, and

yet other plants did very well. I have on former occasions expressed my opinion that this class of Geraniums do best in a soil where Ithodendrous flourish, but that should not have prevented their growing tolerably well in 1865 where they had done so years before.

In conclusion, I expect that some of us will live to see the golden Geraniums, which form so useful a section for flower garden decoration, superseded by something else equal in habit and colour and more hardy, something that will not annoy us with the inclination to flower, which *Cineraria maritima* has, and which forms so serious a drawback to its use. A compact low-growing plant with foliage somewhat of the colour of the leaf of the common Laurel when well ripened, would be an acquisition. Could not some of the *Viola* or *Ajagas* be coaxed into this condition?—J. ROUSE.

#### CYCLAMENS.

My attention having been repeatedly called to Mr. G. Abbey's paper on the above tribe in your Number for October 10th, in which he speaks of me as the late Mr. J. Atkins, I beg to assure him and my distant friends that I am still in the land of the living, and might possibly have penned a few remarks on his paper (differing in opinion as I do very materially from him on some points contained therein), had I not good reason to believe that a paper on the same subject was in preparation by a more able hand. In reply to "A PRACTICAL INQUIRER" in your Number for November 7th, I beg to say that I have for many years past grown *Cyclamen repandum* in the open air without further protection than choosing a spot sheltered from keen, cutting, or boisterous winds, and not exposed to the mid-day sun. Thorough drainage is indispensable for this as well as all other *Cyclamens*; the tubers should be buried in light friable soil some 3 or 4 inches deep, according to the nature of the soil.

As regards odoratum, what is meant by that term? there being no botanically recognised species under that name that I am aware of; but the delightfully-fragrant true *Cyclamen europæum* frequently passes under that name, also true *latifolium* and *græcum*, also some varieties of *persicum*. All except the last, which require some protection, are perfectly hardy, and will thrive in a similar situation to *repandum*. Whilst on the subject I would say that, from my own observations, I can fully confirm the remarks of your correspondent "W. X. W." in the same Number of your Journal, as to the native habitat and condition in which *Cyclamens* are found. Why, therefore, are the tubers subjected to exposure to the atmosphere under cultivation? I have long endeavoured to imitate Nature in this respect by covering the tubers, and with perfect success. It is high time the old traditional mode were exploded.—JAMES ATKINS.

I can confirm your correspondent "W. X. W." in all the points named by him. I was lately in Corsica, where the *Cyclamen* grows abundantly in its wild state, and most flourishes on steep rocky banks, below deciduous trees, in a soil composed of decayed leaves, especially the needles of the Larch. The corm (which is like a flattish Turnip Radish, about 1½ inch in diameter) is usually, though not invariably, covered 2 or 3 inches; but I think it had always sown itself on the surface and become covered by the shifting soil and falling leaves.

I am satisfied that the *Cyclamen* would grow well in similar situations on a south bank in any of our southern counties.—D. STEWART.

#### AMERICAN BLIGHT ON BEECH HEDGES.

My old garden is crossed by two Beech hedges planted upwards of eighty years ago, and which are about 12 feet high; these are the principal ornaments of the garden, and add to the interest of it by making separate compartments. The originally-planted Apples suffered so much from canker and American blight, that I have been obliged gradually to remove them, and supply their places with about two hundred dwarf and espalier young Apple trees, which are in a very flourishing condition, and, with the exception of one which I immediately burnt, they are free from blight. I could scarcely believe my gardener when he told me that the Beech hedges were full of this American blight, which I had imagined to be only found on the Apple tree; but on examination I found it but too true—the identical blight has occupied, dried up, and killed many branches. It will be impossible to plaister them up or

uae turpentine, as one does with Apples. I am afraid that if I cut in the hedges close to the stems so as to get at the bark they would scarcely recover such treatment, and I cannot bear the idea of losing the hedges, which have been the ornament of the garden since my grandfather planted them; neither do I like to lose my Apples. Will care enable me to keep this enemy from them? or is there any way of fumigating the hedges so as to kill the American blight and not kill the hedge? The experience of others might help me to decide what I ought to do.—G.

[We hope this case will meet due notice from our readers. We have not noticed the American blight on the Beech, but we have seen it on Pears, Quinces, Thorns, Privet, &c. We cleared it from Pear trees by washing with quicklime whitewash. We should be inclined to do the same with these favourite hedges. We would cut them in considerably, not going, however, into the old wood; and then we would make up barrels of lime whitewash as we wanted it, and squirt the whole fence from a syringe having a nozzle valve. If the lime whitewash go through a fine riddle there will be no difficulty in applying it. If the white colour is disagreeable, add soot and fresh cowdung. If applied now these materials will not hurt the hedge, and we have strong faith that the application will clear away the insects. It would be difficult to attempt anything in the way of fumigating; but a piece might be tried, covered with a cloth. If tobacco were too expensive laurel leaves might be tried, burning them, but without flame, so as not to injure the fence. We have more faith in the limewash from fresh lime forcibly applied from a syringe, as then it penetrates among the woolly matter, and either kills or smothers. We shall be glad if our correspondents will state their modes of proceeding in a similar case. The insect descends to the roots in winter; laying these bare and putting quicklime over them might help to destroy the enemy.]

#### GRAPE-GROWING IN THE OPEN AIR.

As you have had some very interesting and, as I hope they may prove, profitable articles on Grape growing in the open air, especially "A SURGEON'S NOTES ON GRAPES," in your Number of October 24th, I have just sent off by rail a small box of Grapes addressed to you. All the Grapes which it contains, with the exception of the Verdelho, were grown here on the open wall, without any assistance from glass, up to the 10th of October, when I had some spare lights, 7 feet long, laid over the border on some wood, the object being to keep the roots dry and warm, and to reflect the light and heat on to the wall.

The sorts sent are

- 1 and 2—two bunches Black Hamburgh.
- 3 and 4—Esperione, two bunches, grown on a wall.
- 5—Esperione, grown on a trellis 1 foot or 14 inches from the ground, without any glass, up to the 10th of October, when two short lights were put on a slight framework over them. There were twenty-three bunches in the first year of the Vine's fruiting.

6—Madeira Verdelho, grown in ainery under Muscats, although very small, is yet a delicious, juicy, rich, and racy Grape. The Vine is very hardy, an immense bearer, admirably adapted for pot culture, and, I should think, for growing out of doors.

The Hamburgs and Esperione Vines (the name of the latter I am not sure of), although of some age, had not, until last year when we came here, given any fruit approaching at all to ripeness. We have had little short of five hundred bunches, averaging nearly, if not quite, half a pound each in actual weight when sent to table, and with some berries of a quarter of an ounce by scales, on less than 50 feet of wall. This is no doubt an extraordinary year, but, I believe, with a little protection, very much may be done in many years.—G. B., *Wotton-under-Edge*.

P.S.—I must correct an error in the preceding as to the length of wall covered. I find that it measures 22½ yards, or less than 70 feet, not 50, as I stated it, as I forgot to compute the walling taken up by the Royal Muscadine, although the number of bunches named included those and the small trellis Vine. The Muscadines were used by the middle of October; the Hamburgs and Esperione were at their prime three or four weeks ago; we had these and the remainder picked a few days since. I wished to have sent them before, but constant wet has prevented. This, with the cold weather in this high situation (for we are on the Cotswold range, and very nearly the highest ground in Gloucestershire), has injured their

flavour; we have had them for breakfast, lunch, and dinner for a long time, as I quite agree with "J. H. H.'s" remarks as to their excellent, healthful, and nutritious qualities, especially when eaten at the earlier meals.

The few leaves sent with the Grapes and the joint or two of wood were from the Black Hamburgh. Some of the former measured 11 inches across, and in 1864 we had them even larger. I should have had the Esperione thinned, but did not take much trouble about them, not expecting much from what the Grape was in 1864.—G. B.

[No. 1 and 2, Black Hamburgh, are remarkably well ripened; the colour is perfect, and the flavour excellent. Nos. 3, 4, and 5, Esperione, would have been better if they had been more freely thinned, you would then have had not only larger bunches but much larger berries. Verdelho is not up to the mark; the berries should have been very much larger, nearly as large again. It is a fine early Grape.]

#### ROYAL HORTICULTURAL SOCIETY.

NOVEMBER 21ST.

FLORAL COMMITTEE.—Although the entries of plants were few on this occasion, the Society may well congratulate itself upon the interesting exhibition. It is most satisfactory to find these fortnightly meetings, even at this time of the year, so well supported by collections of beautiful plants sent by various exhibitors. Thanks to Messrs. Veitch and Ivery, the tables were very well furnished with plants, which made up a very pretty show. Mr. Veitch sent two collections, one consisting of Orchids and other flowering plants, the other a group of several varieties of *Lycaste Skinneri*, and a special certificate was awarded to each collection. Among the Orchids Mr. Dominy's hybrid *Calanthe Veitchii* was very conspicuous. Its beautiful rosy spike of flowers was much admired. Among the *Lycastes* four were selected for notice: *L. superba*, shown on a former occasion and in much better condition, received a first-class certificate; the other three—*grandiflora*, *pallida*, and *purpurata*, were not considered sufficiently distinct. Messrs. Ivery sent a large and beautiful collection of British Ferns; and although most of them had been before, they still formed a very attractive feature of this meeting. Among them were some very fine specimens. A special certificate was awarded them. Messrs. Ivery also sent two new varieties of *Athyrium Filix-femina*, of which *Applebyannum*, a crested or tufted form of *Frizellia*, received a first-class certificate; also *Polystichum parvissimum*. More was said about the specific name than the plant itself. We were taught to form the superlative degree of *parvum* in our juvenile days in quite a different manner. Has the poet's license been granted to the botanist? Mr. Earley, Digsweil, brought a pretty plant of *Thunbergia*, *nova species*—at least it was not recognised at the meeting; the flowers were beautifully white, and the foliage bright green. A second-class certificate was awarded to it; when better grown this will make a very useful plant. Messrs. Low, Clapton, exhibited four of the recently introduced *Odontoglossa*. *O. bluntii* and *O. gloriosum* received first-class certificates in the spring. *O. Alexandra* and *O. radiatum* received first-class certificates at this meeting. There seems to be some confusion as to the specific names. *O. bluntii* is by far the most beautiful of the four exhibited. Mr. Bull sent a seedling *Imantophyllum* inferior to *miniata*, also a seedling *Hibiscus*—two small plants with one flower on each plant, deep rose petals, the base of which was marked with dark blotches. The plants were too young for any opinion to be formed of their merits. A nice collection of *Draecenas* came from the Society's garden, consisting of eleven varieties; these formed an interesting group with their varied and graceful foliage. Mr. Graham exhibited a plant of his new *Violet* *The Czar*. The exquisite scent of the flower seems to be the great recommendation. The habit and foliage were coarse and rough in the extreme. Mr. Graham also sent a *Violet* producing two flowers on the footstalk. Perhaps if it continue this habit it may merit the name of *Viola biflora*.

FRUIT COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. At this meeting a series of prizes was offered for exhibitions of fruit. Class A was for the best three dishes of dessert Apples, distinct kinds, for which there were seven competitors, who sent twelve exhibitions. The first prize was awarded to Mr. Earley, gardener to Felix Pryor, Esq., Digsweil, for Cox's Orange Pippin, Sam Young, and Ribston Pippin; and the second to Mr. Charles Turner, Slough, for Rosemary Russet, Cox's Orange Pippin, and Cornish Gillyflower. The other exhibitors were Messrs. Ivery, of Dorking, Mr. Whiting, of the Deepdene, Mr. Westcott, Dulwich House, Mr. John Cox, Redleaf, and Mr. Ruffett, Brockett Hall. In the collection of Mr. Cox, Sam Young and Golden Harvey were very excellent; but the Old Nonpareil, not sufficiently ripe, militated against the success of the collection.

In Class B, for the best dish of Knight's Monarch Pears, there were three exhibitors; but in every case the fruit was so out of condition that there was no award made. In Class C, for the best dish of Hynshe's Prince of Wales, Mr. Turner, of Slough, was the only exhibitor, and the fruit was so excellent that a first prize was awarded. In Class D, for the best dish of Hynshe's Victoria, Mr. Turner again took first prize with some very good specimens. In Class E, for the best dish of

any other variety, there were twenty exhibitions; and Messrs. Ivory, of Dorking, took first prize with Winter Nelis, while Mr. Ruffett was second with Chaumontel. Mr. Wilson, the Chairman, exhibited a dish of magnificent Chaumontels, very beautifully coloured and of perfect flavour. They were produced on a tree grown in a pot, and kept in an orchard-house till the fruit was fairly set, and afterwards plunged in the open ground, and the result of this treatment was clearly shown to be most successful. Mr. Turner, of Slough, sent a box of very handsome Cox's Orange Pippin, large and beautifully coloured, and the flavour delicious; also fine specimens of Cornish Gilliflower and Blenheim Pippin. Some remarkably fine Shallots were exhibited by Mr. Earley, of Digswell. Messrs. Lucombe, Pince, & Co., of Exeter, sent a fine specimen of that excellent winter Pine, the Smooth-leaved Cayenne. Mr. George Lee, of Clevedon, near Bristol, sent fine specimens of Bon Gustave Pear and Clifton Nonsuch Apple.

SCIENTIFIC MEETING.—J. Bateman, Esq., in the chair. The Chairman of the Floral and Fruit Committees having reported the awards, the Rev. M. J. Berkeley proceeded to comment on the subjects exhibited. At the last meeting a letter was read from Mr. Young, gardener to Earl Fitzwilliam, stating that a branch of a Black Frontignan Grape bearing a bunch of white and another of black Grapes was to have been sent, but the branch had arrived too late; it had, however, been kept, and the meeting would see that there were, as stated, two bunches of different colours, produced by different eyes, on the same branch, and both having the Frontignan flavour. The Vine, he had been assured both by the late and present gardener, had never been grafted. Such sports were not uncommon in the Chrysanthemum, and Mr. Berkeley instanced white Beverley becoming Golden Beverley, and Queen of England becoming Striped Queen, &c. Or *Monstera deliciosa*, fruit of which had been shown at the last meeting, from Lady Dorothy Nevill's, at Dargstein, it was remarked that the flavour was somewhat like that of a Banana, but not so flat; everybody who had tasted it, however, had complained that little prickles were left in the throat and on the tongue. This, it was thought, might arise from little bundles of raphides or crystals, which were very abundant in the fruit; but on closer examination it was found that there were really bundles of woody tissue, like double-edged swords—not what were generally understood by double-edged swords, but swords having two parallel blades, which, on touching a spring, opened outwards; magnified drawings of these bodies were exhibited to the meeting. A *Thunbergia*, from Mr. Earley, was stated to be the same as *Thunbergia fragrans* of Roxburgh, or very little different from it; and a seedling *Limnaphyllum*, from Mr. Bull, to be the same as *L. Aitoni* (*Clivia nobilis*).

Mr. Bateman said that, as an old orchidist, he could not but feel much gratified to see that Orchids formed so large a proportion of the winter-blooming plants shown, for take them away and what remained? Of *Oncidium ornithorhynchum*, or the Bird's-beak *Oncidium*, Mr. Bateman remarked that when he first flowered it he was much surprised, on turning over Humboldt's great work, to find there an exact representation of it, but with yellow instead of pink flowers, which the species actually has. This was only an instance of what errors travellers might easily fall into when they came to arrange at home the materials they had collected abroad; and when the number and diversity of the specimens gathered, the haste with which this had to be done, and when in arranging there was often only the memory to trust to,—when all this was considered, occasional mistakes could not be wondered at. Another instance was cited in which the flowers of one plant were associated with the leaves of another. *Dendrobium Tatonianum*, which came from the northern coast of Australia, and was named after Lord Egerton of Tatton, was then adverted to. Although not apparently very attractive at present, unless examined closely, its blooms were twice as good as they were when first shown, and would, no doubt, be still finer when the plant became larger. The flowers were peculiar in colour, very agreeably fragrant, and the plant could be kept an indefinite length of time in the drawing-room, where he had had a specimen for six weeks without its being any the worse. *Calanthe Veitchii* next occupied attention; it was not a species, but a hybrid, and though all knew what hybridising could effect, still he had hoped that there was a preserve into which the hybridist could not enter, for Orchids were a royal race, and he always rejoiced when any of Mr. Dominy's marriages did not turn out happy. In this *Calanthe*, however, they had really a beautiful winter-flowering plant, as might be seen by the specimen before them, and, Mr. Bateman added, Mr. Rucker's houses are extremely gay with it at the present moment. In reference to *Odontoglossum Alexandra*, sent home by Mr. Weir, the Society's collector, Mr. Bateman remarked that when he saw that it was new and beautiful, he was delighted to name it after the Princess Alexandra; but on visiting Messrs. Low's, at Clapton, whose collector was in the same country as Mr. Weir, he saw *Odontoglossum Bluntii*, a still more beautiful kind, which had been named and described by Professor Reichenbach. He (Mr. Bateman) fearing that the two *Odontoglossums* were the same, wrote to Professor Reichenbach, and was assured that they were perfectly distinct; but after all, the opinion of most of those who had seen the two at the meeting that day was that they were mere varieties of the same species, and if that proved to be the case he would have to fall back on the chivalry of the Germans and the loyalty of the English to preserve the name of *Alexandra* instead of *Bluntii* for the species. Mr. Bateman, in conclusion, called attention to the collection of *Lycaste Skinneri*, from Mr. Veitch, who had

assured him that it had been grown all the year without fire heat; and Mr. Bateman further remarked that a plant of this *Lycaste* had been grown in his gardener's kitchen for two years, and at the end of that period was even in better health than those in the glass-houses. Hence it was a suitable plant for room-decoration.

## INTERNATIONAL HORTICULTURAL EXHIBITION AND BOTANICAL CONGRESS.

We have great pleasure in being enabled to announce that the eminent botanist, Professor De Candolle, of Geneva, has been unanimously elected President of the Botanical Congress to be held in conjunction with the great International Horticultural Exhibition that is to take place in London next year. Such an appointment cannot fail to shed lustre on the proceedings.

## THE CHRYSANTHEMUMS AT MR. FORSYTH'S, STOKE NEWINGTON ROAD.

MR. FORSYTH is well known as a most successful exhibitor of Chrysanthemums, both large-flowering and Pompons, and it was only in our last week's Number that we had to speak in terms of commendation of the numerous fine specimens which he exhibited at the Guildhall show, several of which have suffered severely from the gas and exposure on that occasion. Notwithstanding this drawback, his show-house, 50 feet long by 20 wide, was very gay when we visited it last week. The centre was filled with a mass of various-coloured blooms, whilst all along the side shelves were ranged excellent specimens of *Christine*, *Golden Christine*, *Alfred Salter*, *Oliver Cromwell*, *General Bainbridge*, *Bernard Palissy*, and others, together with *Pompons Cedo Nulli*, *General Canrobert*, *Mr. Wyness*, &c. There were also several fine standard Pompons, among which *Bob* was remarkable for the fine mass of bloom which it presented; *Firefly*, a scarlet *Anemone*, was also very striking, besides which there were *Cedo Nulli*, *Miss Nightingale*, another fine *Anemone* variety, blush, with a white centre, and several others grown in the same way, and proving very effective. Among the new large-flowering kinds were *Virgin Queen*, perhaps the purest of all whites; *Prince of Wales*, with magnificent blooms; *Sam Weller*; *Venus*, very beautiful; *Mr. Erumlees*; *Lady Carey*; *Golden Dr. Brock*, a very fine bright golden yellow; *Golden Ball*, another remarkably fine variety; *Eve*, a pretty sulphur; *Albert Helyer*, a large rosy purple; *King of Denmark*, a fine rosy lilac; *Mr. Wyness*, *amaranth*; *Rannunculus*; *Lady Carey*; *Mrs. Kaines*; *Pink Pearl*; *Blanche of Castle*; *Prince of Anemones*, large, lilac blush; and *Miss Margaret*, a fine pure white *Anemone* variety. Of older kinds, *Bella Donna*, *St. Patrick*, *Bouquet de Fleurs*, *Jardin des Plantes*, *Gluck*, *Orange Perfection*, *Noupareil*, *General Slade*, *Oliver Cromwell*, and many others, were very fine. Among Pompons were *White Treveuna*, a great acquisition, and *Golden Anrore*, a fine golden sport of *Aurore Boréale*.

Besides Chrysanthemums, Mr. Forsyth is an extensive grower of bedding plants, and his pits and other glass structures are just now crammed with a large and healthy stock of these. There is a large stock of *Christine*, *Stella*, *Alma*, *Mrs. Pollock*, and other popular bedding *Geraniums*, *Verbenas*, *Aurea floribunda Calecolarias*, *Lobelias*, *Cinerarias* and *Mignonette* coming into bloom, *Intermediate Stocks*, &c. Altogether the area covered with glass amounts, we are informed, to nearly an acre, and this extent is likely to be considerably increased next year. However, the great attraction is the Chrysanthemums, and to see these in good condition there is no time to be lost.

## METEOROLOGICAL NOTES.

I THANK your correspondents, Mr. Ross and Mr. Read, for their report at page 421 on the rainfall of their respective districts, in both of which it was short of the quantity that was registered here in October. I find from Mr. Symons's monthly register of rainfall that there are only two or three stations in the kingdom at which so large a quantity has been recorded; and I should have felt uncertain whether some error had not crept into my report had not that report been in a great measure confirmed by the registers of others only a few miles from here. A person living five miles off records 9.28 inches, while in an opposite direction, but somewhat farther off, 7.86 inches are said to have fallen, the gentleman who reports it having for many years done so with great accuracy. At Ashford, about twenty miles from here, 10.45 inches were stated to have fallen during October and the first day in November; while at another place only four miles from us but 5.20 inches are said to have fallen. These discrepancies can only be accounted for by the fact that much of the rain that fell had the appearance of thunder showers, and these might easily fall more plentifully at one place than another. It is most probable that not more than 7 inches fell as a general average over the county, otherwise the floods would have been higher than

they were, and that was higher than for some years. The ground, too, at the commencement of the rainy period, was exceedingly dry, and I think evaporation must have been going on very rapidly at the time the rain fell, or rather between showers, for some excavating that was going on here in a pasture field having a thick sward on the top, revealed the fact (a certainly unusual one), that after 6 inches of rain had fallen the rain had not penetrated that depth into the ground; its progress downwards was afterwards more rapid, even apparently when there was no rain, and since the ground has been thoroughly saturated, the rainfall necessary to create a flood is not more than one-fourth what it was.—J. ROBSON.

### TAKING IMPRESSIONS OF FERNS.

In an article which appeared in your Journal of the 14th, copied from the *American Gardeners' Monthly*, a plan is recommended for making impressions of Ferns by means of paper sensitised with nitrate of silver.

It does not there state that the paper ought either to be salted or albumenised. If any person wishes to try to albumenise the paper himself, instead of buying it ready prepared, let him take the white of three or four hen's eggs, and to every ounce of white of egg, add half an ounce of water, beat it all up together till it is all frothed, adding ten grains of common salt to every ounce of solution. Previous to beating it up, pour it out in a flat porcelain dish to settle. When all the froth has settled, and there are no hubbles left, take a sheet of paper by two opposite corners and float it on this solution, taking care that the middle part of the paper touches the solution first, then gently lower the corners, leave it on for five or six minutes, then hang it up to dry. If kept thoroughly dry it will last good for a long time.

To sensitise it, dissolve 1 oz. of nitrate of silver in from 8 to 10 ozs. of distilled or pure filtered rain water; float the paper, the albumenised side downwards, for five minutes, taking great care to allow no bubbles to intervene between the paper and the sensitising bath. Hang up to dry in the dark, and place in sheets of blotting paper to press it flat previously to using it. It ought not to be kept more than twenty-four hours before using it. Sparging, or brushing the solution of silver on the paper with a camel's hair brush, does not answer, as it is almost sure to leave streaks, and it washes some of the albumen off before it gets fixed by the nitrate of silver. Print, tone, and fix, as recommended by the *American Journal*; only it is better to take a second impression from the paper, the first being a negative—(i. e., the Fern appearing white on a dark ground)—by printing from it again you obtain a dark Fern on a white ground.

The above process is, however, far more troublesome and costly, and less artistic and durable, than the following:—Obtain some oil paints in tubes. The proper colours can be obtained from F. H. Searle, Stationery Court, Crystal Palace; the most useful being chrome yellow No. 1, Antwerp blue, and burnt sienna. Gum or pin a sheet of foolscap paper on a board. Squeeze from one of the tubes about as much colour as would cover a sixpence of chrome yellow, and about half the quantity of Antwerp blue, and add a few drops of sweet oil (Lucina salad oil). Make a dabber of some cotton wool tied up in a rag of cambric or fine calico, and rub the colour over the paper till it is well mixed, and is about the consistency of printer's ink. Then take a Fern leaf, or any other leaf which you wish to copy, lay it on the colour, and dab it well with the dabber on both sides till the colour seems to have covered the leaf all over without looking too wet. Take some plain white paper without any size on it—the best is good white demy, or lining paper used by paper-hangers for ceilings and walls—double the paper, and place the Fern flat between the folds of the paper, rub it carefully with the finger firmly all over, not allowing the leaf to move, then open the sheet of paper and you will find a perfect impression of the leaf. The same leaf will do over and over again if it is only fresh dabbed with colour, and more colour and oil added when the colour is too dry. Of course, by a careful selection of blue and yellow, and toning with red or sienna if required, it is easy to match the exact colour of every leaf, which can be readily told when the colour is first laid on the leaf.

I have used this process with great success in making ornamental paper borders for rooms. It is exceedingly quick work when once the proper consistency for the colour is found, and a few experiments will enable any one to do this. Stems can be painted in afterwards to join the foliage together, and any

imperfections can be filled in with ordinary water colours, if a little oxgall is used. Very beautiful effects can be produced, too, by printing lightly and painting in shadow with water colours, or, if a leaf is much veined, printing in a dark colour, then washing the impression over with a light colour in water colours. By printing leaves in varieties of colours, tipping the ends of Ferns with brown or sienna, and painting in the stems artistically, very striking effects may be produced.

The great advantage of this over the photographic process is, that being printed in oil the impression is quite permanent, no washing, fixing, or after-toning is required, and with three tubes of colour, costing 6d. each, and wall-lining paper from 1s. to 1s. 6d. per piece of twelve yards, many hundreds of impressions can be taken, and any size or shape of paper can be used, whereas in photography you are limited by the size of the porcelain floating-bath. It is of great advantage in wood or stone carving where an accurate shape of leaf is required, as one can take specimens during the summer of any kind of foliage, and they are much easier to carve from than dried leaves, as they are much less perishable.—X. Y. Z.

### MRS. PINCE'S BLACK MUSCAT GRAPE.

THREE years ago Mr. Pince, of Exeter, sent us a bunch of a seedling Black Muscat Grape, which we noticed at the time as being a great acquisition even to our present numerous varieties. Last week we were favoured with another bunch, and, if possible, we are even better satisfied with the character and merits of this excellent Grape than we were on the former occasion. It is a true Black Muscat, producing berries and bunches as large as those of the Muscat Hamburg; but the skin is thicker and more tough than in that variety, and the berries are borne on much more rigid, robust, and short footstalks. The whole aspect of the Grape leads one to believe that it possesses an exceedingly hardy constitution; and its stout, thick, green stalks, and tough membranous skin indicate that it is one that will hang as long as the latest. The Muscat flavour is as powerful as in any other Muscat.

### WHAT MAY BE SEEN IN VILLA GARDENS.

It is very interesting and instructive to walk through some suburban neighbourhoods and see how the residents turn their little gardens to account. It is to me a source of never-ending study, and I am free to confess that I have derived many very useful hints from what was done in these humble but attractive gardens.

In gardening we have our large marketing establishments, which are managed generally upon strictly commercial principles, and, again, we have many private gardens, which are, to a certain extent, expected to prove remunerative; but I apprehend, when we come to villa and cottage gardens, that we in them see a source of more pleasure than is afforded by any of the others to which I have just referred. As it is on the banks of the smaller streams throughout the country, away from the seats of ceaseless industry, that we generally find the beauties of nature most fully displayed; so in the gardens of villas, whose occupants for the most part have retired from active life, we find a greater variety of taste and decorative ingenuity than in larger gardens, and those managed more according to the practical and scientific rules of horticulture.

I will here attempt to describe how a few of these villa gardens are decorated. The variety of taste which exists is often very amusing, if not at times instructive. I know one villa garden which is scarcely one-eighth of an acre in extent, and the cottage is nearly in the middle of the garden; at one side are a few Lombardy Poplars to screen the view of adjoining premises; then there are a few Weeping Willows, which overhang a good part of one side of the garden; and along the side next to the street, growing entwined in the palings, and overtopping it, is a hedge of Laurustinus, intermixed with some Sweet Briars, which greatly assist in giving a sweet refreshing air to the little place, and remind us of rural scenes.

Now, this small garden, of which about two-thirds is more or less overhung by trees from 25 to 40 feet high, would be regarded by many as a hopeless position for successful flower gardening, but not so with the occupant of this snug retreat; and his case is one of a series of instances which I hope to describe, of how one person often overcomes difficulties which to another would appear insurmountable, and finds a source of pleasure and contentment in doing so. The little hedge of

Laurustinus is upon the south or entrance side, and about 6 yards from the porch of the thickly-covered thatched cottage, of which the bedroom windows have a small but deeply-thatched ridge roof of their own. A space near the door, and a small portion of the walk, are laid down in small pebbly stones of various colours and sizes, the rest of the walks are gravel. Some of the small beds have Box-edgings about 1 foot high, but for the most part the walks are edged with shells. Here are several circular beds, in which are grown during summer Geraniums, and other gay-flowering plants, and in winter some Wallflowers, edged with Crocuses, &c. Fastened in the soil of some of these circular beds are three iron rods meeting over the centre of the bed at 4 feet high, and surmounted by a vase containing gay-flowering plants all summer, and Wallflowers, or Periwinkles, and Crocuses in winter. These supports of iron are ornamented with different ornamental shells, fixed on with cement, and the vases likewise are curiously ornamented with various-coloured shells; and upon the shell-encased iron supports, during summer flowering plants are trained up, such as *Tropaeolum canariense*, or common Nasturtiums, with a few *Convolvulus* intertwined.

Looking a little beyond we see a figure in shells of a man not much larger than Tom Thumb, and having his arms stretched out, and for a hat a vase covered with curious and interesting shells artistically arranged, and filled with Tom Thumb Geraniums, their green foliage and bright scarlet flowers contrasting well with the white shells sparkling in the sun. Upon little pedestals, but not in beds, are placed at some corners shell vases very tastefully ornamented, care being always taken to have a great variety in the colour of the shells. Then, again, farther back in the shade of the trees are figures in shells of some birds and small animals; the owl, the peacock, &c., roosting upon a low branch. At each end of the garden, under the shade of some shrubs, is an arbour-like summer-house decorated with shells, and its sofa-like arms, are also thus ornamented. The occupant has often told me how he enjoys sitting in this shrub-covered, shell-adorned alcove during summer, and seeing what numbers of persons look over the low front hedge at his curious and interesting handiwork. The various remarks which are made by the passers-by give him much amusement. By the aid of iron, cement, shells, &c., this style of ornamentation might be carried to any extent, and small as the garden is, I scarcely ever saw children pass by it without looking in.

In the same neighbourhood, but not overshadowed by trees, I have often admired a small garden which seemed to give the owner great pleasure and amusement. Here the boundaries are composed of various shrubs, which are allowed to grow rather high, 10 or 12 feet, but all are neatly kept. The ground is in grass, excepting a small walk for convenience in wet weather. The occupant here seems to delight in smoothly-kept grass, and well-kept shrubs, and has a fair practical knowledge of the more useful and common sorts, and their seasons of flowering. Such a garden may be more appropriately termed a winter garden than a summer one, for in the cold winter months evergreens and grass can be made, and generally are, nearly as attractive as in summer.

Among evergreens suitable for planting in gardens such as that above referred to, are the various sections of the Hollies, the foliage of which gives such a diversified appearance when judiciously introduced among other shrubs. The *Aucuba japonica*, with its deep green and yellow-blotched leaves, looks well under the shade of high trees; and the *Laurustinus*, which is easily kept low by cutting-in about the month of May, will continue flowering from October to April, and is quite a treasure during winter. Besides these a few of the more upright-growing kinds of shrubs may be planted, to give a pleasing variety and contrast; and among such I may name the Chinese Junipers, some Cypressess, and a few plants of *Cedrus deodara*. Until I had seen how graceful an appearance the Deodar had in its young state in many villa gardens, and the pleasure which it gave the proprietors, especially when it was planted among evergreens, I was rather unfavourable to the planting of forest trees in the gardens of villa residences. It must, however, be borne in mind that these gardens are not planted or decorated for the generations to come, but for the pleasure of the present one, and should these evergreens grow too large let the next generation cut them down, or remove them to where they can fully develop themselves. The gracefully drooping branches of the Deodar Cedar make it a great favourite with every one, and in every stage of its growth.

The occupier of the villa above referred to, and which is

situated at the junction of two streets, may be seen during some portion of every fine day deriving health and pleasure from attending to his little favourites. The extent of the garden may be about one-twentieth of an acre, and the walks are very narrow and low for the beds, some of which are banked up along the sides from 12 to 18 inches with stones and soil, but all over-grown with Stonerops. Other portions of the walks have Box edgings holding up the soil in the small beds, which are none of them more than 4 feet wide. Here are strangely-shaped little vases, some having old men's faces upon them, as well as other figures, and all are filled with some variety of *Sedum*, generally grown hanging down over the sides of the vase. A great number of flowering plants are grown considering the small space which the beds occupy, in consequence of the ground being so rich and so carefully cleaned, watered, and otherwise attended to. Splendid Balsams, Marigolds, and Asters, are grown from seed in the small beds, and when I went past the garden in the end of October it was very gay with *Chrysanthemums*. These are all closely tied to one stake, forming before flowering a close green mass, but are now all more or less displaying the various colours of their flowers.

The possessors of the gardens which I have described, had, no doubt, spent the more active portion of their lives in business, but are now enjoying the quiet of their villa residences, and pursue horticulture on a humble scale as a means of recreation.—G. DAWSON.

## THE MODERN PEACH-PRUNER.—No. 18.

### ORCHARD-HOUSE PRUNING AND TRAINING.

It is evident that this summer stopping of the shoots to four leaves is not only well adapted to trees on the open wall, but, as it economises space, time, and labour, it is also equally well suited for wall trees in orchard-houses. To show that this is possible, and easy to accomplish in either case, is one main object of this work. To reduce Peach-pruning to its simplest and most natural elements, is to do away with all the needless and wasteful appliances which have hitherto been such hindrances to amateurs. In orchard-houses, especially, it is desirable to make use of a system combining simplicity of detail with a saving of time and physical labour, both of which amateurs have not always at their command.

Considering the immense advance in Peach culture which those invaluable structures, orchard-houses, have produced, and how many of them are chiefly managed by amateurs, it is evident that such laborious contrivances as ties, and such needless complications as disbudging (too often insisted on, even by excellent pruners), must end in wearying and disgusting many to whom the orchard-house would prove a pure and innocent enjoyment. Neither would it be advisable to have one method of pruning, close, for in-doors, and another, long, for the open air. This would create confusion, and hinder progress. It is a mistake to suppose that wall trees and espaliers under glass, or in the open air, require any substantial difference in their mode of treatment.

The case of potted trees, such as bushes, flat-topped or pyramids, presents no greater difficulty. The shoots on all bush trees in pots should be stopped at three leaves—*i. e.*, one leaf shorter than on more developed forms on walls, as soon as five full-sized leaves have been formed. The object is to allow the sap to habituate itself to this, its natural channel, and thus permit the shoot to become somewhat hard before it be shortened. The upper buds will soon burst forth into a second growth. Generally, only the upper two buds will thus burst, but, in the case of strong vertical shoots, all three may do so. This is no great matter for trees under glass, where they are sheltered from atmospheric changes, and especially saved from any rank growth caused by a sunless and rainy summer. In the open air it would not be desirable to cause all the buds thus to burst, as was the case in the original system, because, in cold and humid climates, we could not depend on a crop formed entirely on the junction buds; and we thus require, in addition, to have a good triple group lower down the shoot, which is obtained by pruning to four leaves, as before said. In the case, however, of bushes, restrained in their growth in pots, and under complete control in their root-development, pruning to three leaves will be found the best.

Soon afterwards the second growth will push forth, and it will be necessary to arrest it somewhat abruptly, so as to con-

centrate the invaluable spring sap upon the lowest buds for a week or two. This space of time ought, in the orchard-house, to constitute them well. The second growth then should be stopped at two leaves, as soon as three leaves are formed.

Stopping the third growth is not very important. It may be checked at two leaves if the shoots prosper; but should the tree appear generally too feeble, arising from undue cropping or from attacks of insects, it would be best to allow the third growth to extend in proportion. The pruner will soon know when to check and when to allow growth. It is also evident that the shoots on the lower portions of the bush trees, and especially under the branches, will not be so vigorous as those near the extremities, which receive so much sap, and are so much nearer to the glass; therefore on these lower parts the pruner will expect only cluster spurs, which must not be touched, and, in the central portions, barren spray. This last disagreeable type of shoot should be removed whenever possible. It is considered by some as a proof of degeneration in the tree; by others it is considered as able to bear. It cannot, however, be utilised, having no terminal leaf bud, which it is necessary for every class of shoot left to have. Shoots well placed on the lower portions of bush trees, if not crowding towards the centre, which should always be left open to the sun and air, are very valuable, and should be carefully looked after. In lofty houses, however, from the tendency of the sap to ascend, the lower portions of bush trees of a certain age and size cannot be depended on. All Peach growers agree that fruit on the lower branches is not of the best quality. The shoots, therefore, placed low down must be as well exposed to the sun as possible. Bush trees in low houses, having their centres well exposed, ought, however, to produce fair crops. Advantage should be taken of shoots springing low down to remodel the tree, and, of course, these shoots must not be pruned.

Fig. 20.

Bushes appear to most advantage when symmetrical and well balanced. Training *en gobelet*, or U-shaped, allows a large number of leading branches to spring as low down from one central main stem as is practically useful. Another excellent form is to develop three strong branches, and, when these have reached to about 12 inches, to group on each a sufficient number of lateral branches so as to form a good circle. From these lateral branches other vertical ones may be carried upwards. Several seasons being required for this form, the tree is kept well under command.

Flat-topped trees in pots form a valuable class. Slightly pendulous, which is natural to some Peaches, they bear fine fruit. Intermingled with bush trees they allow these last more lateral scope, and they suit the loftier portions of the house. The pruning of their shoots is similar to that of bushes. The only difference consists in keeping down those shoots inclined to be vertical, and in watching to cut out gross shoots.

Pyramidal trees in pots are the trees most under command. They should not be carried very high, about 6 or 8 feet is the most manageable height. The lower parts are always apt to

languish. As the object is also to form these portions, the first pruning of the shoots, on the upper third of the pyramid, might be to three leaves, the middle third might be allowed one leaf more, and the lowest third be pruned to five leaves. The second stopping, in all cases, should be more abrupt, and be at two more leaves of the second growth. The point of the pyramid should never greatly predominate. All this pruning is easy to accomplish, and the summer and winter work can be done with a pair of scissors, kept as sharp as possible. This is much the best way of shortening such close-lying shoots. Old-fashioned pruners will not readily abjure the use of the fatal knife, which is only useful to trim those larger branches which must sometimes be sawn away. When this is done let the pruner remove the branch entirely, and quite close to the part left. With this exception, a pair of scissors kept very sharp, and about 4 inches long, have served for the whole of my trees of every kind for years, both in-doors and in the open air.

Fig. 21.

In figs. 20 and 21 we have three types of shoots which are most common on bush trees, after being several seasons in pots. They are taken from photographs. In either of them we readily recognise the shorter shoot, a certain fruit-bearer in the orchard-house, class 5. In fig. 20 we have, besides, the shoot called fruit spray, class 7. This is also a common and productive type, having single fruit buds and a terminal leaf bud. It is common on old trees to see whole branches whose office seems only to be to carry these fruit-bearers, which must not be pruned. Fig. 21 is given mainly to show the short and beautiful shoot of class 2, fruit shoot properly so called. In long pruning this is the mainstay of the system. It is rarely seen so short out of doors, but being photographed from the Stanwick Nectarine, which is a very strong-growing tree, it seems like fruit spray passing into another type, through the vigour of the sap. In all these specimens the pruner will notice with pleasure that there is a terminal leaf bud, and also a good bud well placed low down the shoot, so that it is easy to secure new wood for next season without extending the shoot too much. This is the very closest style of pruning possible in the Peach.—T. C. BRIDGEMAN.

#### ARCHERFIELD.

(Concluded from page 426.)

MANY other objects in the kitchen garden deserve attention. The border fronting the long Peach-house was also ornamented with bedding plants, *Tritoma nvaria* being very conspicuous, but as time presses, and there is another garden still more brilliant in its massing, we make our way to Dirlerton Castle, which is distant from the kitchen garden nearly two miles.

Dirlerton Castle, like many similar strongholds in Scotland, and in the English border counties, has a history of its own, and was inhabited at a time when the site of the present mansion was used as a place for the practice of archery; but as a defensive position it was less assisted by Nature than its more famous neighbour, Tantallon Castle, which stands on the coast a few miles off. Dirlerton, however, occupies a slightly elevated position, and though now a ruin, there are traces of a

moat and other defences, massive stone walls, a large hall, or rather the site of what was one, and some smaller arched recesses, with the remnants of a staircase, &c. Surrounding this

remnant of a former age, are some of the best examples of modern flower gardening, together with others of a style some two centuries old, and the whole is in the best possible keeping.

FLOWER GARDEN AT ARCHERFIELD ADJOINING DIRLETON CASTLE.

BEECH HEDGE, WITH AN ELEVATED WALK.

Masses of Trees and Shrubs enclosing bowling-green, surrounded by Yew edge.

however, of the plants which occupied the beds made full compensation for the want of symmetry in the figure. This garden, it is necessary to state, is completely shut in by high boundary lines, and, possibly, may have been the kitchen garden to the Castle many generations ago. A wall 220 feet long runs along the northern boundary, where it is covered with Roses, Myrtles, Magnolias, Wistarias, &c., as well as along the western one. There is a round tower at the north-western corner, and the entrance is a little to the south of this and from a sort of public green sufficiently large for all athletic sports, without being an ugly waste. A number of dwellings are scattered around this green, being, in fact, Dirleton village. The entrance to the garden, as shown on the plan, is where the two flower garden compartments unite, but it will be better to describe the northern one first. I believe but few could enter the door without being struck with the extraordinary blaze of colour spread out before them; even those who are well versed in the art of bedding for effect, and have followed it for years with success, have been compelled to confess they never saw the like before. The plants employed, as will be seen, were kinds well known and generally used elsewhere, but here they seemed to be possessed of more than ordinary powers of furnishing bloom, for excepting in some cases where annuals of a certain class have produced a mass for a very limited time, I never saw so much bloom on any other class of plants, and the arrangement as to height and harmony of colour was faultless. Subjoined is the planting of the northern garden:—

- No. 1. Geranium Little David (scarlet), edged with Cloth of Gold Geranium.
- 1a. Geranium Perfection (scarlet), edged in like manner with Cloth of Gold.
2. Verbena Purple King, with a double row of Geranium Silver Queen round the edge.
3. Calceolaria Aurantia multiflora, edged with Perilla.
4. Intersection of the bed Centaurea candidissima, or, as Mr. Thomson has it, C. ragusina. The quarters, A A, are planted with Geranium Christine; and B B, with Calceolaria Ambassador, a crimson variety; and around the whole is a band of silver-edged Geranium, Queen of Queens, and outside of that Golden Chain Geranium, with an edging of Lobelia speciosa.
5. Verbena Charlwoodii, an old plum-coloured variety, far exceeding many newer ones in habit and brilliancy of colouring. A large breadth of this occupied the centre of the bed, and around it were a band of Variegated Alyssum, and two rows of Lobelia Paxtoniana as an edging.

The plan of the garden, as given above, shows a piece of ground irregular in its outline, and divided on the north side into a set of beds, having gravel walks between them of the uniform width of 3½ or 4 feet; but the irregularity of the plot prevents the beds assuming that uniformity of outline which gives beauty to this class of ornamental gardening when seen from an eminence, or when laid down on paper. The brilliancy,

- No. 6. *Geranium Glendinning's Scarlet*, a somewhat strong grower, edged with *Ageratum* in two rows; and in the other *Geranium Vivid*, also scarlet, edged in the same way.
7. *Geranium Bijou*, silver edged, in the centre; a band of five rows of *Lobelia* and *Gazania* mixed, with a margin of *Golden Chain*, and a specimen plant of *Centaurea* at every 8 feet in the line.
8. *Calceolaria Aurantia multiflora*, edged with *Perilla*.
9. *Geranium Christine* in the centre, with an edging of three rows of *Verbena Charwoodii*.
10. *Verbena Purple King* in the centre, edged with two rows of *Geranium Flower of Spring*, a silver-edged variety.
11. *Geranium Stella* in the centre, with one row of *Geranium Flower of Spring*, and a row of *Lobelia speciosa* and *Gazania* mixed next the *Box* edging.
12. *Geranium Stella* in the centre, with two rows of *Geranium Madame Vaucher* next the *Box* edging.
- 12a. *Geranium Tom Thumb* in the centre, with three rows of *Variiegated Alyssum* as an edging.
13. *Verbena Crimson King* in the centre, then two rows of *Variiegated Alyssum*, and one row of dark-leaved *Oxalis* next the *Box* edging.
- 13a. *Verbena crimson seedling*, the same as the above, with two rows of *variiegated Polemonium*, instead of *Alyssum*, and one row of dark *Oxalis*.
14. *Centaurea ragusina* in the centre, then a line of *Lobelia speciosa*, and an edging of *Geranium Cloth of Gold*.
15. *Geranium Trentham Rose* in the centre, with two rows of *Purple King Verbena* as an edging.
16. *Calceolaria Aurantia multiflora*, edged with *Perilla*.
17. *Geranium Flower of Spring* in the centre, with five rows of *Lobelia* and *Gazania* mixed around it, and an outer edging of *Golden Chain Geranium*.
18. *Lobelia*, a good blue seedling, speckled with *Gazania*, and an edging of *Cerastium*.
19. Border next boundary wall, which, beginning at the *Box*-edging, was planted thus:—
- 1st line.—*Arabis lucida aureo-variegata*.
- 2nd, 3rd, 4th, and 5th lines.—*Lobelia*, a pale blue variety, forming a broad mass, having single specimen plants of *Centaurea* at 8 feet apart.
- 6th line.—*Geranium Mrs. Pollock*; and in the same line *Irish Yews* are placed at 24 feet apart.
- 7th line.—*Geranium Little David* (scarlet).
- 8th line.—*Geranium Christine*, alternately with silver-edged *Geranium Flower of Spring*.
- 9th line.—*Geraniums Vivid* and *Madame Chardine* alternately; both strong growers.
- 10th line.—*Tritoma uvaria* in fine flower.

The southern boundary to this garden is a fine *Beech* hedge, clipped as closely and as truly as a wall could be built. At the east end are the remains of the old Castle; the sloping turf forms a good finish to the garden in this direction, and from the elevated position of the building the flower-beds have a magnificent appearance. The view in the opposite direction commands an extensive range of well-cultivated country, of the rocky mound of *Berwick Law*, some 110 feet high, and beyond that of the *Bass Rock* about the same elevation, while all the intervening country is level, and smiling with the most productive crops of grain. Looking westward the view is over an equally fertile district extending to the hills which encircle the *Scottish metropolis*; southward the *Lammermuir hills* may be seen in the distance; while northward the broad estuary of the *Forth*, and the opposite coast of *Fife*, form the most imposing features. Leaving to antiquarians the task of describing the Castle and its history, and making our way to the entrance, let us describe the flower garden, on turf, on the west side. This garden has the advantage of being more regular in outline than that just described, and presents a more pleasing aspect on paper. It is also surrounded by features defining it clearly from other objects, and, as will be seen, its arrangements are purely geometrical. Beginning with the flower-beds as numbered on the plan, they are planted as follows;—

21. *Geranium Sutton's Perfection*, edged with *Geranium Madame Chardine*.
22. 23. *Geranium Bijou*, edged with blue *Lobelia speciosa*.
24. *Calceolaria canariensis*, edged with *Lobelia speciosa*.
25. *Geranium Little David*, edged with *Golden Chain*.
26. Same as No. 25.

27. *Verbena Purple King*, edged with *Geranium Flower of Spring*.
- 29, 29. *Calceolaria canariensis*, edged with blue *Lobelia*.
30. Intersected with a line of *Centaurea ragusina*, and right and left of this a line of *Geranium Christine*; the remainder is filled in with *Scarlet Geraniums*.
31. Same as Nos. 25 and 26.
32. Same as No. 27.
33. Same as Nos. 25, 26, and 31.
34. Same as No. 24.
- 35, 36. *Geranium Queen of Queens*, edged with *Lobelia*.
37. Same as No. 21.

A. A. Two vases in a recess of evergreens, with a seat between them.

- D, D. *Araucaria imbricata*, each 30 feet high.
- E, E. *Cupressus Lawsoniana*.
- F, F. *Irish Yews*.
- G, G. *Cedrus deodara*.
- H, H. *Araucaria imbricata*.
- I, I. *Irish Yews*.

The oblong gardens above described both abut on a wilderness or shrubbery adjoining the *Beech* hedge. This wilderness is intersected by walks curving in various directions; but there is an open space partly surrounded by a piece of old *Yew* hedge, where a bowling-green is formed, and no better place could be found for it. The remainder of the ground is more or less covered with trees and shrubs, with a fair sprinkling of *Ferns*, running up to the base of the old castle. Some aged *Yews* must have seen several generations of the human family pass away since they erected their sombre heads; nevertheless, they were probably planted subsequent to the troublesome times when such fortified dwellings were necessary. I find, however, that I must take leave of *Dirlerton*, and again casting a wondering look at the many-coloured parterre on the north side, I leave this enchanting spot. I made, however, notes of a few plants, which Mr. Thomson grows most successfully, and of those of which he has a greater stock than most people, and these notes I now offer.

*Centaurea ragusina*.—Leaving it to botanists to decide whether the specific name above given, or *candidissima*, is the right one, there seems no doubt but they are both the same. The plant seems to thrive remarkably well here, and whole lines of it are uniform in shape, and the leaves are free from that curling-up and dying to which they are subject in so many places. It is one of the greatest acquisitions to the garden, and by its convenient habit suits any combination of plants.

*Polemonium œruleum variegatum*.—This plant, as Mr. Thomson has elsewhere described, resembles a *Fern*, its fine pinnated leaves gracefully falling over each other; and each being tipped with a broad margin of white, occupying fully two-thirds of the leaf, it has a neat and handsome appearance. In habit it will assort with *Lobelias* and plants of similar growth, and Mr. Thomson states that it rarely runs to seed. The liability to do this is a great defect with *Cineraria maritima* and some other ornamental-foliaged plants. It cannot fail to be popular wherever it is known.

*Arabis lucida variegata*.—Seems to thrive remarkably well with Mr. Thomson. Its clear green leaves are margined with a broad band of yellow, occupying fully two-thirds of the surface. The plant, as is well known, is very dwarf, perhaps more so than *Arabis caucasica variegata*, which seems to elongate more into stalk, and its foliage is very different, and tipped with a creamy white instead of the yellow of *A. lucida*. It is somewhat remarkable that the latter will not thrive with me, although the other has done so for a dozen years or more. Mr. Thomson thinks *Arabis lucida variegata* as graceful as the golden *Geraniums*, which it resembles in colour.

*Tritoma uvaria*.—Masses of this as healthy and vigorous as *Sedges* by the side of a swamp, and sending up flower-spikes 5 feet and upwards in height, with plenty in succession, were to be met with in great abundance. Mr. Thomson also has the improved variety, for it can hardly be called a distinct species, but considers that the old one is the more abundant bloomer; as a backing to some of the borders this plant looked very fine.

*Geranium Queen of Queens*.—A silver-edged variety, with the marking very clear and good; its habit was more spreading than *Bijou*.

*Verbena Crimson King*.—A fit companion to *Purple King*, resembling that popular variety in all its features, excepting in the colour, which, as the name implies, is a bright crimson,

somewhat of the same tint as *Stella Geranium*; and perhaps nothing more need be said in its favour, than that on comparing masses of each the palm of merit was accorded to the *Verbena* by several very good judges, who happened to see them. The latter may, perhaps, be a trifle more dwarf than *Purple King*, but, like it, throws its flowers well upright, and there seemed to be a good succession of these coming on.

*Verbena venosa*.—This old species was in fine condition at Archerfield, better than I have ever seen it elsewhere, and its health was clearly proved by its foliage, which in too many places is very shabby; but here it was healthy, and there was promise of a longer succession of bloom than we often meet with in this plant.

*Orealis*.—A low-growing trailing or creeping plant, quite hardy, with foliage of a deep crimson. In the young state it is not inferior to any of the plants of its class. I am not acquainted with its specific name, but it is not so much used as it ought to be; it seeds freely, and grows on the gravel walks like any weed.

*Fuchsia, The Baby*.—A very dwarf variety, which for some purposes might be invaluable, but unfortunately the flowers of *Fuchsias* are all of a pendant character, and unless the plant can be viewed horizontally, or from beneath, the flower is not much seen, otherwise this neat little plant might be of great service. As it is, the compact habit and dwarf uniform character of the plant render it deserving of a place.

I cannot conclude this article without acknowledging the courtesy with which every information connected with Archerfield and its gardening was furnished by Mr. Thomson; and the readers of this Journal who have benefited by the very able practical articles from his pen, may rest assured that such information was at all times sound. As a proof of his skill, it is only necessary to refer to the prizes taken for fruit by Mr. Thomson at the Edinburgh International Show, and the condition of the flower garden was such as surprised some of the most successful cultivators from England. With means far from ample, he manages to prepare from 50,000 to 55,000 plants each year for the flower garden display, one-half, or nearly so, being wanted for the kitchen garden borders, and the other for the flower-beds just described. Long may he live to impart such useful information, and may his success each year equal that of 1865.—J. ROXBOROUGH.

P.S.—At page 400, the width of houses No. 4, 5, 7, and 8, is 14 feet instead of 11, and No. 11 had been widened to 12 feet. A more important error has crept into flower-border B, at page 426, where a belt, 3 feet wide, of *Scarlet Geranium*, *Little David*, should have been inserted between the first and second rows, making the border thus:—*Lobelia Paxtoniana*, one row as an edging; *Geranium*, scarlet, mass of 3 feet wide; *Geranium*, silver-edged, one row, then the bread mass of *Verbena venosa* of 5 feet, with circular patches of yellow *Calceolaria* and a *Scarlet Geranium* 2½ feet in diameter at every 12 feet in the centre of it, then another row of silver-edged *Geraniums*, and finally the whole backed up with a dwarf crimson *Dahlia*, called *Prince Arthur*, alternating with *Tritoma nvaria*.

## WORK FOR THE WEEK.

### KITCHEN GARDEN.

As long as the present wet weather continues we would strongly advise that all digging and trenching should be deferred until a more favourable opportunity. *Brussels Sprouts*, when the head is cut the dead leaves should be removed, but none of the green ones, as they protect the young side sprouts. The same may be said of Scotch Kale, and other winter greens. *Cabbage*, when a favourable opportunity occurs take advantage of it to earth up the autumn plantations, it not only invigorates them, but prevents their being loosened by the wind. *Cauliflowers*, never neglect giving air daily to those under hand-glasses and in frames, except during severe frost; if the plants are now drawn by an insufficiency of air, they will be very liable to button off. *Cucumbers*, we purposely say but little on the winter treatment of plants growing in frames, as there are but few persons who go to the trouble and expense of this mode of cultivation who have the convenience of a stove or *Cucumber-pit*, as plants may there be cultivated with much greater certainty. *Endive*, any that may have been placed in frames should have air freely admitted to them, to prevent their rotting. *Mushrooms*, the beds out of doors to have a thick covering of straw, over which should be placed mats to protect them from wet and frost; the straw when wet to be re-

placed with dry. *Parsley*, as most families require a large supply, frames should be placed over a portion to protect it from frost; some roots should also be potted and placed in one of the houses where they will be protected from frost, and, when wanted, can be placed in a house where forcing is going on. *Potatoes*, when the weather is favourable, ground intended for *Potato* culture should be rough-dug and exposed to the action of the weather as much as possible, and manure, if employed at all, should be most sparingly applied. *Radishes*, as soon as they come up in the frames give air at every favourable opportunity, to prevent their drawing.

### FRUIT GARDEN.

Do not let Pears become over-ripe before being used; also look over the whole stock as often as time can be spared, removing any fruit that exhibit symptoms of decay, and put them aside for immediate use. Apples are keeping very badly this year. Any of the more choice varieties of Pears that do not ripen properly in the fruit-room should be removed to a warm place for a few days, which will be found to greatly improve them. Keep all fruit as cool and dry as possible; if frost is excluded from the house it can scarcely be too cool when the object is to preserve fruit plump and sound as long as possible. Where orchard trees have been for some years left unpruned, the hand-saw will be required to thin out the larger branches; keep the middle of the trees open to admit air, and to promote the formation of fruit-buds on the interior branches. It is, however, a bad practice to leave any description of fruit tree to itself, as it would in all cases pay the cultivator to prune once a-year at least. If hitherto delayed *Strawberry-beds* should be dressed with short rich manure, we are not partial to the practice of digging between the rows; the manure may remain on the surface until the spring, when it can be slightly pricked in with a fork. Remove all unnecessary runners if they have been negligently allowed to remain. Finish pruning *Currants*, some of the larger kinds will repay the attention of superior culture; trained to a wall, and spurred as *Vines*, they approach some of the varieties of these in the size and weight of their bunches.

### FLOWER GARDEN.

Let lawns be well rolled when sufficiently dry for the purpose, every part of the turf should be frequently swept during the winter. Nothing adds so much to the enjoyment of pleasure-ground scenery as well-kept turf, and when connected with evergreen shrubs an agreeable relief to the dreariness of the season is afforded, which renders the loss of more attractive plants less to be regretted. At the same time see that the walks are kept dry and firm, in order that they may be traversed with comfort at all times. While the weather continues mild the planting of deciduous trees may be proceeded with, provided the state of the ground will permit of the operation being profitably conducted. Deciduous trees and shrubs may be pruned whenever there is time, except during severe frost. Valuable plants, as variegated *Hollies*, *Rhododendrons*, &c., if not growing so freely as it is desirable that they should do, would be benefited by a liberal allowance of rotten manure or well-decayed leaf soil applied as a top-dressing, covering it with a little fine soil, and working it into the ground around the ball towards the extremities of the roots. *Rhododendrons* and what are generally termed *American plants* bear removal so well that these when not growing satisfactorily should be taken up, the ground well prepared by a liberal addition of peat or leaf soil, and replanted.

### CONSERVATORY AND GREENHOUSE.

Attend carefully to specimen hard-wooded plants which it may be necessary to winter in the conservatory; many of these are impatient of fire-heat and a confined atmosphere. Use no more artificial warmth, therefore, than is absolutely necessary, and endeavour to counteract its drying effects either by means of evaporating-pans or by sprinkling the borders, &c., in order to prevent anything like a dry parched state of the atmosphere. It is in many cases difficult to maintain a sufficiently moist atmosphere without causing drip, as the moisture in the house becomes condensed upon the glass, and unless provision is made by means of inside-gutters and pipes to catch the condensed moisture and carry it off, it is nearly impossible in frosty weather to preserve the beauty of flowers for any length of time, and in cases where there is no provision made against this kind of moisture falling upon the plants, the temperature should be kept as low as may be consistent with safety, avoiding moisture in the atmosphere as far as possible whenever the glass is affected by frost.

## STOVE.

This will require a very liberal ventilation now, increasing fire-heat if necessary; in order to accomplish it still apply moisture to the air, although in a diminished degree, but withhold moisture entirely from the roots of deciduous Orchids, or those sinking into a state of repose. Any late specimens, or importations of Orchids making late growths, should have the highest situation in the house, and still receive a little moisture at the roots occasionally; light, however, is the great desideratum in order to produce those secretions on which alone depends their power of passing through a long winter successfully. If there is any prospect of a scarcity of bloom next May, a portion of the Achimenes and Gloxinias should be potted at once and placed in a warm part of the stove, choosing such as have been the longest at rest; and a few Clerodendrons, Allamandas, a plant of *Echites splendens*, and one of *Dipladenia crassinoda*, may also be started; but unless plants of these with well-ripened wood are at command, and that have been some time at rest, there will be nothing gained by attempting to start them into growth at present, for in most cases it is difficult at this season to maintain a sufficiently warm temperature to secure anything like free growth from these unless they have been well prepared for an early start. Let *Ixoras* and all other hard-wooded plants that have made sufficient growth be kept rather dry at the root in order to check growth and induce a tendency to form bloom-buds, but do not let the soil in the pots become so dry as to affect the foliage.

## PITS AND FRAMES.

With the assistance of a garden-frame, and stable manure or tan to furnish a gentle heat, Hyacinths may be had at Christmas, and with a good stock of bulbs the display may be kept up till April or May. For early flowering the bulbs should be planted in September, as advised at that time; those to flower in spring to be planted during the months of October, November, and December. It may be well to state that three bulbs grown together in a six-inch pot (thirty-two's) produce a much finer effect than single bulbs. The soil used for potting should be as rich as possible, such as one-half turfy loam and well decomposed cow or horse manure, with a small portion of clean sand intermixed. If, however, this cannot be obtained, then the lightest and richest at command must be employed instead. Fill the pots lightly with the prepared compost, and place the bulb upon the surface, slightly pressing it into the soil. After giving the newly-planted bulbs a liberal watering, set the pots out of doors on a place where perfect drainage is secured, and cover them with about a foot of old tan, ashes, sawdust, or any other light material. After remaining there for a month or five weeks the bulbs will be sufficiently rooted to render it safe to remove them to a gentle bottom heat of about 55°, introducing the pots in numbers proportionate to the demand at intervals of about a fortnight. We would caution the amateur when forcing the Hyacinth to be careful not to allow the roots to penetrate into the fermenting material. A sitting-room window forms a suitable situation for Hyacinths while in bloom, and their beauty will be longer in fading there than in most situations. In no instance should they be removed from a close atmosphere, or suddenly exposed in a sitting-room window, until they have been previously hardened in a suitable temperature to withstand cold drying currents.—W. KEANE.

## DOINGS OF THE LAST WEEK.

WET and stormy up to Thursday. On Wednesday we were visited with a hurricane of wind, which snapped off the heads of some Pine trees, and tore off a piece of zinc roofing from a verandah, rendering it necessary to place heavy planks along it, and to wedge every moveable sash about the place. We escaped as respects glass with one or two broken squares; but without the wedging there would have been endless work for the glazier. We recollect running out very early one morning, years ago, during a similar hurricane, which levelled many of the finest trees, and being startled at seeing on the walk something white, which proved to be a sash, which had been carried by the wind some dozen of yards from the house to which it belonged, and laid down so carefully that not a square was broken. In a few minutes more the house would have been unroofed. It would have been of little use then to bewail a catastrophe. Twice besides have sashes been more or less moved from that house, but in no other instance without a fair amount of breakage. Whenever winds are expected, there is nothing like fastening and wedging. A person may then sleep

comfortably. The winds will otherwise have done us a service and an injury. Less sweeping and raking of leaves will be required, but then we lose the leaves that have been whisked off miles away, and that to us, with great shortness of manure, is a loss indeed.

## KITCHEN GARDEN.

Here outside nothing whatever was done. As soon as the weather is quiet and dry we shall move the ground on the surface among all young crops, as it is now battered firm and hard by the driving rains. The loose surface will do much to keep out the intensity of the frost, if it come. Carrots, Beet, &c., in sheds were also examined, and a piece of a Mushroom-bed was spawned and left. The bed was shallow, and the heat on the decline, though rather too hot 3 or 4 inches from the surface to suit the welfare of the spawn. The spawn, therefore, was placed pretty near the surface, so as to be cooler, and as the heat declines we shall place another inch of droppings on the surface, beat firm, and then, if in a day or two the heat be all right, we shall earth and beat it down. From the damp weather, and the damp from the manure, the house altogether became too damp, and we put a little fire heat on, and gave air to secure a drier atmosphere. They are well off who have now enough of shed room to spread out the materials for Mushroom-beds, before making them up into beds, but when this cannot be done, and yet succession-beds must be made, some of the modes which we have previously mentioned must be resorted to to counteract the extra dampness. Examined the Sea-kale and Rhubarb to see that the heat was not too strong for them.

## FRUIT GARDEN.

Examined fruit in fruit-room, removing the spotted and decaying, and gave a little extra air on a dry day to sweeten and dry the place. A little air constantly in mild weather is best, but so given that mice and rats cannot enter. These vermin are threatening to be very annoying. We believe that where game and rabbits, and especially the latter, are strictly preserved, rats will multiply. Their perseverance is most astonishing. If in some places a thorough rat battue does not take place they will become as impudent as in the moorlands of Braemar, where, it is reported, men have had to run for their lives, and where nothing eatable escapes them. We mean to tar the first one we catch alive, and send him off to strike terror into the hearts of his companions and cause them to shift their quarters. We only once saw a migration of rats. It was on a moonlight night, and in the most direct track from one large farmyard to another. There were scores if not hundreds of them. In the case of bulbs potted for forcing we were obliged to cover every pot with an inverted pot, and a piece of brick over the hole. Those not covered in this way, though surrounded and covered with chopped furze, were turned out and partly eaten by mice, and very likely rats, the very first night. Trapping and destroying seem to make little difference as to the supply. The gardener's valuable assistant, the cat, has nearly disappeared from gardens. So long as cats are playful kittens they are pretty safe; but by the time they are able to mouse and rat they get trapped and shot, even close to their own domicile.

The weather being so unsuitable for out-door work, the chief employment has been in the *Peach-house* and *vineeries*. Pruning the trees; washing with soap and water trees, glass, and woodwork, syringing well into every hole and corner with water about 150°; scraping off an inch or more of the surface soil; forking up, and replacing with fresh loam, a little soot, and dry Mushroom-dung from an old bed; painting the trees with a mixture of sulphur, clay, and soot; and tying them after washing down the walls with hot water, and then white-washing these with fresh lime toned down with some black and sulphur. The sulphur and black were wrought up into a thickish paste before being added to the whitewash. The addition of a little blue or lampblack takes off the bright white appearance which the lime would give—too bright to suit some plants if the sun shines brightly and its rays are reflected from the walls. The mixing of about a pound of sulphur in about a gallon and a half of limewash will cause slight sulphur exhalations to be given off for some time whenever there is sunshine. We will secure this longer in the season by painting a couple of feet or so at the top of the wall in a couple of months with sulphur paint, made by beating up the sulphur into a paste, and adding enough of strong soft-soap water to make the paint. This will give out strong fumes for some time, and will hurt nothing if air be given before very bright sunshine. No insects like such treatment, and in the case of all insects it is better to keep them away than to kill or drive them away

after they have come. In addition to all this, when there comes a quiet, foggy, drizzly afternoon, we shall smoke the houses when dry with bruised laurel leaves. If the houses are damp, and especially the woodwork, the smoke will change the colour of the paint; but even that, if let alone long enough, will return to its original colour. These houses as soon as thus cleaned, will be filled with bedding plants, &c. until, on commencing to force, the plants must be removed when the heat becomes too strong for them. As we have several times stated, the labour of moving plants about is great; but if bedding plants can now be placed in such houses for a month or two they will enjoy the greater amount of air than can be given them in pits and frames, and the greater circulation produced in that air by a little fire heat in damp foggy weather.

Moved a lot of *Strawberries* in pots where they can be protected from wet and severe frosts; will soon bring all that are in pots under such protection into the orchard-house, &c. In these cold houses, have cleared off all the leaves, and scraped off a little of the surface soil, and when thoroughly cleaned and top-dressed, there will be room for many little things out of the wet, and dryness alone will be a great protection from frost. A number of Black Prince *Strawberries* are showing bloom strongly in a Vine-pit, where there is just a little heat, and others are swelling pretty freely on shelves in a pit hot enough for *Kidney Beans* coming into bloom. We have noticed many failures with this nice little *Strawberry* from over-heating, and over-watering. There should not be dryness, but there should be no soaking, nothing like standing water until the fruit is set; in fact, no standing water in saucers or otherwise at any time, and as for heat, from 50° to 55° is quite high enough until the fruit is swelling, and 60° is quite high enough when ripening. Some 10° more may be added in bright sunshine, with air. Under such treatment the fruit will be dark and well flavoured. In a higher temperature it is apt to come red, soft, and tasteless. As soon as we have some leaves and litter hot enough, we will make up some beds for frames, and in a mild heat, and on the surface of the bed, we shall stand a lot of Keens' Seeding, and make up other beds for *Radishes*, *Asparagus*, &c. We must depend on the cleaned-out fruiting-houses for clearing some of these frames of their present occupants, for just now we have not a frame or pit of any kind that is not more than filled.

ORNAMENTAL DEPARTMENT.

Chiefly as in previous weeks, and regulating and fresh setting stove; cutting down *Ferns*, chiefly of the Maiden-hair kinds, the fronds of which were showing signs of decay, and keeping the fresher ones until those cut down shall be making their fresh fronds. Placed *Gesnera zebrina*, and plants of that description, where they would be warmer and drier. Will report and divide the *Ferns* spoken of, when they begin to move afresh. Small pots of the Maiden-hair, &c., are useful for table decoration. Small plants of *Solanum capsicastrum*, and *Ardisia crenolata*, are also very useful, along with variegated plants of all kinds. Small plants of different kinds of *Mosses* in small pots are also useful for making up vases of flowers—either in the pots, these being hidden, or taken out, and repotted when done with. Clear manure water, or rich top-dressing, is also now useful for *Chrysanthemums* and *Camelias*, and *Cinerarias*, *Primulas*, and other soft-wooded plants, as soon as the roots reach the sides of the pots, and the flower-stems appear. Young plants in pits and frames require plenty of air, but given so as to keep the wet out. The weather up to Thursday being so wet, the chief work among plants has been looking over *Geraniums*, *Fuchsias*, &c., and examining all bedding plants taken into the plant-houses, removing all signs of decayed leaves, stirring the surface soil, &c. A great deal of this can be done in wet days by choosing a favourable time, and taking a good lot in barrows or sieves into a comfortable shed, and removing them also at the most suitable times, so that the men may not get soaked. With a little forecast, there should always be plenty of work in-doors in wet weather in moderate-sized gardens. We have worked with others until the cold rains would gurgle out at our shoes at every step, and then go home at night to lodgings, where clothes could not be dried. But what or where was the benefit? We are sure that the employer would have gained more if we had been under shelter and idle; but, as said above, idleness is never necessary; there are always plants to clean, walls of houses to whitewash, glass to mend, tallies to make, sticks to point, pots to wash, covers for protection to make and mend, &c. Even with this little care and forethought, men will be ill, will have lumbago, rheumatics, and other troubles; but it is a satisfac-

tion to feel that such troubles are not brought on or intensified by our carelessness, our wilful neglect, if not wilful cruelty. One thing is certain, that good garden-men generally tire of their shed work before it is nearly exhausted, and are quite as anxious to get out as the head-gardener can be that they should go, and when they do go out in their dry comfortable clothing, they work with an energy and a will which you might in vain expect to find among men who turn out after sitting in a cold fireless place at their meals, and with their wet-drenched garments flapping about them. In our course through life we have always found that a little consideration for the circumstances, and the comforts of others, always brings with it its own reward. At this trying time of the year we trust we may be excused for thus, in passing, alluding to this subject.—R. F.

COVENT GARDEN MARKET.—NOVEMBER 25.

The late boisterous weather has rather thinned our supplies, and prices for rough goods have slightly advanced; but with a few days of favourable weather no doubt they will recede again, as there are abundant crops to come in. Large cargoes of St. Michael's Oranges are to hand, and after very rapid passages are in fine condition. Pines are more than sufficient for the demand.

TRADE CATALOGUES RECEIVED.

André Leroy, Angers, France.—*Descriptive Catalogue of Fruit and Ornamental Trees, Shrubs, &c.*

W. Barron, Elvaston Nurseries, Borrowash, Derby.—*Select Catalogue of Ornamental Plants.*

Dreghorn & Aitken, 79, King Street, Kilmarnock.—*Catalogue of Herbaceous and Alpine Plants.*

B. L. Pierrepont, Horsemarket, Warrington.—*Descriptive Priced Catalogue of Dutch and French Flower Roots, Roses, Fruit Trees, &c.*

TO CORRESPONDENTS.

\*.\* We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

LATIN AND ENGLISH NAMES OF PLANTS (*A Constant Subscriber, Sussex*)—The names in Latin and English are in London's "Hortus Britannicus;" and the names, and culture in addition, are in Johnson's "Cottage Gardeners' Dictionary."

BOOKS (*A Subscriber*).—We think Johnson's "Science and Practice of Gardening," will exactly suit you. It details the functions of plants, as well as explains the reason of all cultural operations in simple language. You can have it free by post from our office for forty stamps. (*K. Atresford*).—The price of Hogg's "Vegetable Kingdom," free by post, is 10s. 6d., and of Johnson's "Science and Practice of Gardening," 3s. 4d.

**TRADESCANTIA ZEBRINA** (*J. Bowley*).—The specimen enclosed is so called commonly, but it is *Cyanotis vittata* of botanists. It might live in a border during summer. If you send four stamps to the office with your direction, and state the Number you want, it will be sent free by post.

**VINES OVER POTTED FRUIT TREES** (*S. W. G.*).—We would say, let well alone; but you may have the Vines—say six or seven, and place nothing directly below them. We would confine the sorts to Royal Muscadine, Buckland Sweetwater, Black Hamburg, and Esperione.

**WHEN TO USE A MOWING-MACHINE** (*W. D. P.*).—Our experience is, that the machine cuts the grass as well again when the latter is dry as when it is wet. During very dry weather, however, the work is done better with the grass a little damp. The question is easily decided: mow a piece wet, and another piece dry, and ask a stranger for his opinion of the two pieces.

**ADDING LIME TO THE TAN IN HOTHOUSE-PIT** (*M. W.*).—If you fill your pit in your stove division with tan, a little fresh lime mixed with the tan now and then will destroy worms, but it will have little effect on other insects. Tan is about the best thing you can have, and everything thrives in it, but there is some labour involved in keeping it nice, and taking out cold and putting in new. We should think if you had heat enough in the place, you might dispense with filling the pit altogether, and place a platform over it. If you preferred bottom heat in the pit, it would be much cleaner and give you less trouble to take some pipes through it. Place clinkers and stones over the pipes to the depth of 4 inches, and then a layer of clean-washed gravel or rough cinder ashes to set or plunge your pots in. Pots of Vines would do well in such a bed. If you intend to plant your Vines out, and yet have stove plants, you could hardly keep up stove heat in winter without taking the Vines out, as described the other week.

**SUPPLY CISTERN FOR HOT-WATER HEATING** (*A. S.*).—Provided your supply cistern is higher than the highest part of the pipes, it matters little where it is situated. It may be close to the boiler, or it may be at the farthest and highest point of the flow-pipe, before that bends to form the return. If close to the kitchen boiler, as is generally the case, a small open air-pipe would be necessary at the highest point of your flow-pipe. If the position given of these pipes with respect to the boiler is correct, there may be a hitch in the circulation, as your return-pipe is shown considerably below the level of the bottom of the boiler, and then there is a sharp rise to the boiler. It will be safer to have no such rise, but have every pipe above that level.

**FIGS ON THE BACK WALL OF A VINERY** (*R. C.*).—They will succeed in proportion to the light they receive through the Vines. Without a fair share of sunlight they will not do much in the way of fruiting. They will succeed all the better from being confined to a narrow border of from 3 to 4 feet in width. We would make that border of nice, mellow, fibry loam, with a little sweet decayed leaf mould, or hotbed dung added, and but little of that, as strength can easily be given by manure waterings and surface-dressings. The Figs are sure to grow strong enough in plain loam at first.

**CENTAUREA CANDIDISSIMA IN WINTER** (*Idem*).—The Centaurea will only stand the winter, so far as we have seen, in dry warm places. It is easily affected by damp. It is advisable to take a lot up, as young plants from cuttings in spring are the best for edgings. See "Doings of the Last Week," lately.

**VENTILATING A GREENHOUSE** (*Tetelist*).—In your greenhouse 23 feet long, the openings at each end, 2½ feet square, just beneath the apex, will be quite enough for top ventilation, if you can give enough in front. Last summer we found a house about the same size did well enough with about half the size of the openings you speak of left open night and day in summer. With openings 2½ feet square, we would divide the shutters into two pieces, so as to give only a little air when the weather was cold, or, at least, have the power to regulate the quantity. We have proved that with these openings there is no necessity for openings at the apex in the roof for such houses. We would decidedly advise you to have a door opening into the dining-room. If kept clean, dry, and ventilated, there will be no unpleasant smell in the room. It would be well to have a door or a moveable window besides, for dressing, moving, and bringing in fresh plants. There would be no danger from expansion if you laid your glass edge to edge without laps, on Mr. Beard's plan. So placing the glass, however, is only part of Mr. Beard's plan. To carry it out wholly you would, we suspect, infringe his patent. Of this we are sure, that if you place the glass edge to edge, glaze rather tightly, and use putty in the usual way, many of your squares will be cracked by expansion.

**HEATING A GREENHOUSE WITH GAS** (*W. Turner*).—If you use Hartley's coloured ribbed glass, you will not want any shading for the roof, and it will suit plants admirably. As you propose to have four Vines, however, we would for them prefer the 21-oz. sheet glass, obtaining thirds or seconds, and fourths. We have heated a greenhouse, 20 feet by 12, with gas. There was a circle of pipe about 1 foot in diameter, perforated with small holes, and the gas coming through burned in small flames, regulated by a tap. An iron stove enclosed this circle, and from the top of it an iron pipe, or flue, rose to the top of the greenhouse, passed along its whole length, and terminated outside so as to convey all noxious fumes into the open air. There is no advantage in using hot water with such an apparatus. The quantity of gas consumed must depend upon the season. The tap must be turned on more fully in cold than in milder weather.

**RAINFALL**.—"Rain fell here on only twenty days in October, and not on twenty-eight days, as stated in last week's JOURNAL OF HORTICULTURE. If the mistake was mine I am very sorry for it.—CHARLES ROSS, Welford Park."

**ADVANTAGES OF BUDDING PEACHES ON THE PLUM** (*W. M.*).—The advantages of growing Peaches on the Plum stock are—1st, The Peach takes more freely upon the Plum than on its own stock. 2nd, It grows more freely. 3rd, The stocks are more readily procured. 4th, The Plum being harder than the Peach, it is calculated that the latter will do better on it than its own roots. 5th, The trees are more prolific and bear at an earlier age, as do most fruits upon a stock of another genus or species.

**LEAF MOULD** (*A. B. C.*).—This is formed of leaves kept moist and in a heap, frequently turned over, until completely decayed, and reduced to a dark brown, moist powder. It usually takes two years to complete this process.

**RHEUMATISM**.—The following is from a medical correspondent—"I strongly advise 'A YOUNG GARDENER,' to use the following remedy, taking care to keep himself warm the following day—a warm bath with sufficient water to cover the body with the exception of the head. Let the warm water be maintained at a temperature of 96° or rather higher. Into this stir half a pint of good mustard, place a blanket over the bath, remain in half an hour, then roll up the body in the same blanket, get into bed, and cover up so as to perspire profusely. The mustard causes a continued and pleasant excitement of the skin. I constantly use it with patients to induce sleep and relieve the brain of too much blood. A partial cure of rheumatism can be effected by the following means:—Take a large spoonful of good mustard and ten of linseed meal, mix well with warm water, spread this on a sheet of thick paper, cover with muslin, and apply to the part affected. Keep this on from eight to ten hours. This is also a good remedy in neuralgic pains, it cures by acting gradually and continuously as Nature points out.—CONSTANT READER."

**KEEPING WALNUTS AND COB NUTS** (*G. T.*).—The Cob Nuts should be kept in their husks. Both Walnuts and Nuts are best kept in stone jars, covered at the top with sand, and the jars placed in a cold damp cellar. You keep your Nuts too dry.

**MANUFACTURERS OF RUSTIC POTTERY**.—*J. Anderson* wishes for the directions of some manufacturers of jardinières, Fern vases, &c., in pottery.

**NEGLECTED FIG TREES—STRIKING CUTTINGS** (*A Subscriber, near Portsmouth*).—You had better let your neglected Fig trees alone now, until the end of March. Then the young fruit will be peeping, and you can thin out liberally the thicket of wood that show least fruit. The Fig, like all other fruit trees, should have the wood no thicker than the leaves can be exposed to the sun and air. Some fasten the young shoots close to the wall, but it often happens that it is better practice if the bearing shoots dangle a little from it. We suspect that you will have to root-prune as well as branch-prune. Cuttings of stove and greenhouse plants are best inserted after February, and cuttings of hardy plants after May and June. Cuttings of Camellias do best when taken off in autumn, using well-ripened wood, and making every bud with its wood a cutting, kept close in cold pits, and then in spring placed in bottom heat. The best Rhododendrons may be struck in the same way, choosing the points of stubby well-ripened shoots, and if with a small piece of the older wood all the better. Grafting is, however, preferable to cuttings. From *Azaleas* select, after February, nice little shoots with no flower-buds—say 2½ inches long, with about the sixteenth of an inch of the older wood—dress, insert in sand, cover with a bell-glass, shade, and, in about a month, plunge the pot in a sweet bottom heat, and harden off gradually as the cuttings strike. You may divide *Chrysanthemums* now with great propriety, the smallest bit with a root will make a good plant next year, or you may delay parting until March. If you want more definite particulars, you should ask about one thing at a time, as to go into the minutiae of propagation would require pretty well a Number. As you have not had much experience we would refer you for particulars to "Window Gardening for the Many," which you can have post free for ten stamps.

**COMMENCING GRAPE-FORCING** (*O. P.*).—With respect to your vinery which has never been forced, and which you wish to force as soon as you can, and the leaves of the Vines are now turning yellow and falling, we would proceed as follows:—Clear off all the leaves, then clean the border outside in which the Vines are planted, fork it over, and place on it from 15 to 18 inches of leaves and litter, less for producing heat than for keeping cold from the roots. Then go inside, prune the Vines, wash them, wash and clean the glass and woodwork. Lime-whitewash all walls (see "Doings of the Last Week"). Shut up your house about the 18th of next month, and commence about Christmas or the new year with a heat of 45°; raise that gradually in the second week to 50°; in the third week to 55°, and in the fourth week to 60°, and never exceed 60° until the buds have broken and pushed at least an inch, when you may gradually rise to 65°, and then to 70° when the Vines are in bloom, and when set return to 65° gradually. This temperature is by artificial heat. Allow from 10° to 15° more in bright sun with air on.

**SITUATION OF ASH-PIT** (*Inquirer*).—The least depth for the ash-pit to be below the lowest pipe would be from 9 to 15 inches. In cases where water prevents going down the boiler need be little lower than the pipes, but it acts better if lower. But for single houses there is a fair circulation when the top pipe is a few inches below the top of the boiler, and the lower return-pipe enters close to the bottom of the boiler. The *Lageria rosea* requires a good deal of surface room, and plenty of moisture, with good drainage, and to be pruned in pretty closely if to be kept in a pot or little room. Though wanting a moderate depth for the ash-pit, we have had them not more than 6 inches below the boiler. They only require clearing out oftener.

**PROPAGATING CYANOPHYLLUM MAGNIFICUM—WINTERING CISSUS DISCOLOR** (*J. J. H.*).—This *Cyanophyllum* is best propagated in spring when the shoots are a few inches in length, those with three joints being eligible for cuttings. Cut the shoots transversely below the lowest pair of leaves, remove these, leaving another pair of leaves at the next joint, and a growing point; drain a small pot well, and fill it to within half an inch of the base of the cuttings with sandy peat, mixed with a little loam, made very sandy by the admixture of silver sand. Fill up to the rim with silver sand, insert the cutting in the centre of the pot, and down to the second joint; give a gentle watering, and plunge the pot in a bottom heat of from 85° to 90°. The structure should have a moist atmosphere, and slight shade should be afforded from sun and strong light. A bell-glass placed over the cuttings will facilitate their rooting. Guard against too much moisture, otherwise the leaves and the stem of the cutting will damp off. When rooted, gradually withdraw from the hotbed, and remove the bell-glass. *Cissus discolor* should now have very little water, just enough to keep the foliage from flagging, allowing it to fall off mature of its own accord. Most of the leaves will now be off; no water, therefore, should henceforth be given beyond what is necessary to prevent the wood shrivelling. In a temperature of 50° it keeps safely, and even with 45° if the soil is dry.

**CHRYSANTHEMUMS FOR GREENHOUSE** (*A. C. C. H.*).—*Large-flowering*.—Prince Albert, Lady Harding, Beverley, Golden Christine, Christine, Alma, or Duc de Conigliano. *Pompons*.—Boh, Golden Aurore, White Treveda, Lilac Cedo Nulli, Duraflet, Florence. We do not recollect such an advertisement.

**CINERARIA SEEDLING** (*J. P. Cathcart*).—It is pretty, but in no quality equal to a multitude of others.

**GREEN ROSE (T. G.).**—There is a green rose, and it was introduced about eight years since, by Messrs. Guillot & Clement, of Lyons, under the name of *Rosa viridiflora*. Five years since we know it was cultivated in this country, and looked like a China Rose, all the petals bright green, but those in the centre paler than the outer. It was then called *Rosa Bengale* vert.

**ROSES FOR BEDS (Idem).**—It would be better if you have dwarf Roses, only to have them on their own roots, as there will then be no mistake made about creepers as is often the case. We have such kinds as Général Jacquemont, Jules Margottia, Mrs. Kivers, Géant des Batailles, Caroline de Sansal, Baronne Provost, Chenedole, Souvenir de la Reine de l'Angleterre, and others in the most robust health on their own roots. We have not pegged them down, but simply cut away early in the season any rampant growth, so as to give the plants a tidy bushy appearance, only the very coarse shoots were cut out in summer as they rob the rest. In winter the Roses are pruned in close, and when wanted we can add manure. Roses delight in a deep soil, so that any extra pains taken before they are planted will be sure to benefit them. They can be pegged down, and if this be done in summer while they are growing they will strike root, but, in our own case, we prefer to let the Hybrid Perpetuals

grow as bushes, but some beds of strong-growing Bourbons and others are pegged down and look all the better for it.

**NAMES OF FRUITS.**—(*Pomona*).—2, Fearn's Pippin; 3, Cox's Orange Pippin. (*B. B.*).—1, Easter Beurre; 2, Glou Morceau; 3, Beurre d'Arenberg. (*W. L. Pashley*).—1, St. Germain; 2, Jean de Witte; 3, Belle de Noél. (*A. B. Y. Kent*).—Pears.—1, Beurre de Blanc; 2, Glou Morceau; 4, Passe Colmar; 5, Bergamot Esperen. Apples.—1, King of the Pippins; 2, Striped Lincolnshire; 4, Scarlet Nonpareil. (*S. E.*).—1, Beurre Diel; 2, Ne Plus Meuria; 3, Moccus; 6, Passe Colmar; 17, Lewis's Incomparable. (*O. S.*).—2, Nelson Codlin; 4, Russet Nonpareil; 6, Golden Harvey; 8, Noneseuch; 9, Londou Pippin; 11, Drap d'Or; 15, Ord's.

**NAMES OF PLANTS (D. C. Edgthorpe).**—1, Davallia canariensis; 2, Athyrium Filix-foemina; 3, too imperfect; 4, Ficus scryphifolia. The leaf is that of *Begonia argyrostigma*. (*J. B.*).—1, Adiantum capillus-Veneris; 2, Blechnum occidentale; 3, Adiantum curvatum; 8, Davallia canariensis; 9, Adiantum pubescens. We cannot spare the time to puzzle over such scraps as the rest are. Correspondents requiring our help should not give unnecessary trouble. The numbers should be fixed to each specimen so as to be at once legible. (*A Young Gardener*).—Eriostemon myoporoides, Callistemon coccineus. (*Annie*).—1 and 2, Pelargonium petals, fallen; 3, Linum trigynum; 4, Philonis fruticosa.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the Week ending November 25th.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

JUDGES OF GAME FOWLS AT THE BIRMINGHAM SHOW.

As to who "JUSTITIA" or "EXHIBITOR" may be, I will not even hazard a conjecture, more particularly when the latter party in his reply denies directly the correctness of "JUSTITIA's" assumptions as to personal identification. These two gentlemen, therefore, had, perhaps, better be left to enjoy their different opinions, so long only as facts are not violated. Should, however, "EXHIBITOR" ever indulge in mis-statements as to facts of similar stamp to those of "JUSTITIA," the duty would at once be involved of pointing out with equal certitude such error, regardless of the soreness of any one.

It must, however, be evident to every candid reader, that "JUSTITIA" invariably evades and shrinks from facts without consideration, though he himself throws out postulations most unreservedly—a habit which "EXHIBITOR" describes as pithily as he does truthfully, when he writes, "That it not infrequently happens, that persons most ready at insinuating charges against others, are guilty of the alleged practices themselves." "JUSTITIA's" former statement, that dissatisfaction with the Game judging at Birmingham merely existed with "one or two disappointed exhibitors;" and, again, in his last letter, that "Had the Game Judges been at fault, would a solitary complaint have been made?" is quite opposed to facts, as day by day becomes more and more conclusively evident.

In my former letter I willingly gave credit to "JUSTITIA," that he had fallen into this "mistake, no doubt, unconsciously;" but admit that his present persistence in error, and undaunted determination to support at all hazards a statement so distinctly controverted by facts, considerably shakes so favourable a construction; for an obstinate continuity in error, by any individual, surely betrays but little inclination for its correction.

No doubt, a very few weeks hence, events will enforce a far more palpable refutation of the "solitary complaint of one or two disappointed exhibitors," referred to by "JUSTITIA" in his last letter, than he has any conception of, as, presupposing the Birmingham arrangements to remain the same as hitherto, the meeting held two years back on the subject will be recapitulated, with a vast accession of numbers; for the public opinion of poultry exhibitors is now so determinately fixed against the dictatorial appointment of the Judges for so important a Show as the one at Birmingham, at the caprice of any single individual, that it will be no longer tolerated. It is not persons, but the system, that is the sole cause of complaint,

and, beyond question, this plan of appointing arbitrators has long since become obsolete in all other of the general appointments of society, wherever conflicting interests are in operation. The decree by a single irresponsible individual as to the Birmingham Judges, to whom the all-important duties of awarding valuable premiums is ultimately entrusted, is an error that crept in, at the earliest institution of the Birmingham Shows, and remains a practice of all others the best calculated to shield intrigue.

Speaking of the Manchester Show, "JUSTITIA" expresses his opinion, that "Mr. Jennison is reputed to be a shrewd man of business, and that he wishes his enterprise every success;" and adds, "it is to be hoped he will not accept any nominee, but select judges of known ability and integrity, and at all events, not recur to the memorable Birmingham régime of 1862." "OLD COCHIN" re-echoes this wish most heartily. "JUSTITIA's" mind, however, may rest perfectly assured on these points, that Mr. Jennison is a "shrewd man of business," and, consequently, desires to satisfy, not oppose, the wishes of his best supporters. Mr. Jennison's mode of ascertaining the desires of poultry amateurs as to the selection of the Manchester Judges, was at once "shrewd," rational, and of very easy application, for Mr. Jennison's printed instructions to his exhibitors, to vote on their "entry returns" for whatever gentleman each exhibitor thought most suitable to act honourably, uprightly, and satisfactorily as umpires, formed the firm basis for his future operations, and certain it is, that the obloquy now so universally prevalent at Birmingham never yet attached itself to the Belle Vue Shows.

On the other hand, however, I cannot for a single moment agree with "EXHIBITOR," in even a desire that the Manchester Exhibition should ever supersede the mother show at Birmingham. Let Birmingham alone, she is now quite able and as certainly willing, upheld in so doing by the full force of popular determination, to work out her own regeneration, without discourtesy to any one. Whether the results should prove favourable or unfavourable, so far as Bingley Hall only is concerned, it certainly will obviate any repetition of these unseemly annual disquisitions, though it will never jeopardise the ascendancy of the good old Birmingham Poultry Exhibition. It will, on the contrary, insure its permanence, abrogate altogether the present unnecessary mystery in the appointment of umpires, by enlisting universal public confidence, in lieu of the present distrust, and result in the still further advancement of the Show at Birmingham.—OLD COCHIN.

WEST CUMBERLAND AND NORTH OF ENGLAND POULTRY SOCIETY.—We are informed that the Committee of the above

Society intend this year having two Judges for Poultry, one for Pigeons, and one for Canaries, and these gentlemen are to be chosen, regardless of expense, from amongst the best judges the kingdom can produce. We are further informed that the building at Whitehaven, in which the exhibition will take place, is a very large, well-lighted, and well-ventilated structure, obligingly lent for the occasion by the Earl of Lonsdale, so that exhibitors may rely upon having their specimens well judged, properly attended to, and carefully housed in a good building.

### CHIPPENHAM POULTRY SHOW SEEN UNDER DIFFICULTIES.

It had been my intention to inspect the poultry at Chippenham on the morning of the second day, because the Show not being opened to the public on the first day until three o'clock, there is not much chance in dark November of seeing the birds plainly so late in the afternoon. Indeed, the early morning is the best time to visit a poultry show. The fowls are lively, they step round their pens with a proud air, sometimes approaching you in the hope of getting food; in short, on a fine morning they look to perfection. Judge, then, my extreme dismay to find at the very last moment that it was but a one-day's Show. I was aware, indeed, that no cattle would be exhibited on account of the "rinderpest," but we all expected the Poultry Show would, as usual, last two days. I hurried down to Chippenham unwilling that a Wiltshire Show should take place without "WILTSHIRE RECTOR" having the pleasure of seeing it.

I arrived at four o'clock, and raced frantically from pen to pen. Fortunately two friends, able judges of poultry, had been present all the time since the opening, so I was able to avail myself of their opinion formed, not at twilight like my own, but in broad daylight, for the Show this year was opened earlier than usual. There being no cattle show, no catalogues had been printed, so that if I make any mistakes, darkness, and the want of a printed guide and remembrancer, must be my excuses. I mention this, as there is an immaculate letter-writer who sees spots very plainly ('t is a shame to pelt the poor man with a pun involving a Latin derivation'). My first inquiry was about the *Game* classes, for they are generally very good at this Show. This year the Black Reds, especially, were excellent, much better than last year; the cocks were finer birds, and yet most of them not coarse, nor not "little bits of things," mere symmetry without power; this is well. Mr. Waller's pen (first prize) were very noble birds. Mr. Stevenson's single cock ("the prize") is an extremely fine bird. *Spanish*, Mr. Heath, of Calne, first as usual. *Cochins*, Miss Milward, first prize, with a very pretty pen of Buffs. This lady's birds are excellent in colour, abundant in fluff, short-legged, and well-shaped. If she could breed them larger she would be a very formidable antagonist, even at our foremost shows. I was glad to see a greater number of *Hamburghs*; the Golden-pencilled were, however, the best. *Polands*, first prize, Mr. Hinton. In regard to *Game Bantams* I must notice the first prize, they belonged to Mr. Dowding, of Chippenham, and, unless I greatly mistake, they will win further laurels; also a pen of Silver-laced Bantams (Sebrights) appeared, from what I could see of them, to be better than usual. I must not forget to notice that Lord Cowley sent in a pen of Frizzled fowls, which looked as if the ladies of Draycot Park had carefully done up their feathers in curl-papers the night before, and only taken them out just before the Show began. Honoured "Frizzled" going off. I saw, in an earl's carriage. An odd thing happened in regard to the two best pens of *Geese*—they weighed exactly alike, hence the prizes were divided. There was also an excellent pen of *Aylesbury Ducks*, I dare not say whose, for alas! no catalogue. As I proceeded in trying to see the birds, my labours in the dark were interrupted by the squalling of fowls being caught and thrust into hampers, and little boys chasing an escaped Game cock. But, as far as I could judge of the Chippenham Show, seen (?) under the above-named difficulties, I must say it was a very nice little exhibition; my county paper says, I see, "It was the best ever held at Chippenham." Why should we not have more shows in Wilts? What say the good people of Devizes? Surely Calne and Chippenham should not beat the county town Devizes!

"Awake, arise, or be for ever fallen."

Cattle, and sheep, and pigs appear no more, and poultry hold up their heads above all just now, for I saw Game cocks crowing yesterday at Chippenham on the very spot where for thirty years mighty, fat bulls had bellowed.—WILTSHIRE RECTOR.

### EXHIBITION OF BIRDS IN THE ATHENÆUM ROOMS, DERBY.

THE eighth annual competition of birds took place in the above room, on the 6th inst., and the number exhibited far exceeded that at any previous show. The greater portion of the birds were Canaries, shown by members of the Derby Society, but we noticed many fine British and foreign specimens. In addition to the above there were choice Dogs, Fowls, Rabbits, Pigeons, and cases of stuffed birds, the whole of which tended to form the show into one of an interesting and attractive kind, and the best the Society has held. There were here and there excep-

tionally rare specimens, for instance a pure white Blackbird, belonging to R. Cox, Esq., a pair of Linnet and Canary mules, shown by Mr. G. J. Barnesby. A pen of Game Bantams, exhibited by Mr. J. Langley, Mickleover, commanded much notice, as did also those shown by Mr. Draycott, Messrs. J. Bennett, Eyre, Keys, and others. Mr. Harpur's birds were very attractive, especially for their length and breadth of ears, and other points forming prize animals, more especially considering their ages. The Canary classes were generally admired, there being a few good Belgian birds, and many of the Norwich breeds exceedingly rich in plumage. The two classes of Lizards, although strong in competition, were not, except in two or three instances, so fine as formerly. The mule birds were not generally so good as last year, and the first prize in each class of the young birds was easily gained. Altogether there were about 700 birds shown.

The awards were:—

#### BIRDS HATCHED IN 1865.

BELGIAN (Clear Yellow).—First, J. Martin. Second, S. Dunting. Third, J. Spencer. Fourth, H. Adams.  
 BELGIAN (Clear Buff).—First, R. Whiteacre. Second, J. Martin. Third, J. Spencer. Fourth, S. Bunting.

### DYSENTERY IN BEES.

WHAT CAUSES IT, AND WHAT IS ITS EFFECT UPON BEES?

As the time is coming for bees to be affected with this complaint, would you put it to your apianian readers to be so kind as to give their experience of this plague among bees, and to say what they consider is the cause, as we may by these different views of this disease arrive at its cause and cure? It is evident that it cannot be caused by the hive, as out of five or six straw hives, you will sometimes have only one affected, and at other times two or three out of this number. Now, what is not the hive that causes it, what is it? Will your correspon-

dents say what they think of the matter, and we may then find out a remedy?—A. W.

[We shall be glad of information on these points.—Eds.]

## TWO "DEVONSHIRE BEE-KEEPERS."—AN OLD APIARIAN SOCIETY.

WE extract the following sketch referring to two "worthies of Devon," from an article entitled "Sixty Years' Changes," which recently appeared in "All the Year Round." We have little doubt that we are correct in attributing the article itself to the pen of Sir John Bowring, late Her Majesty's Plenipotentiary-Extraordinary in China, who, after many years of official travel and adventure on the outskirts, and even beyond the confines, of civilisation, has at length settled down to the enjoyment of his retiring pension, and as much of rest and leisure as his active and untiring disposition will admit of, in the vicinity of his native city Exeter, and in the immediate neighbourhood of our valued contributor Mr. Woodbury, whom our apiarian readers will have little difficulty in recognising in the bee-keeper whose fearless and dexterous manipulations of his obedient little subjects appear to have been but recently witnessed by the septuagenarian chronicler of "Sixty Years' Changes."

Speaking of the town of Moretonhampstead, usually abbreviated to Moreton (Moor-town), situated on the borders of Dartmoor, and some twelve miles west of Exeter, Sir John says, "The Baptist congregation was under the care of a gentle Welshman, named Jacob Isaacs. His father may have been Isaac Jacobs, for shiftings and transpositions of Christian names and surnames were then, and may still be, a Cambrian *naogo*; but he was not without his renown. He had written a book called *The Apiarian*, and was very fond of a quiet joke, declaring that he was one of the most ancient of monarchs, being king of the *Hivites*, though their associations with the patriarch Jacob were not of a very creditable character. On grand occasions a cupboard was opened for his guests, and the produce of the hive introduced—honey, mead, metheglin—and he carefully explained the essential differences between the two drinks, which I believe are absolutely the same, the one being the Saxon, the other the Welsh name. However, he insisted that the bee furnished the classical ambrosia and the nectar of the gods, and that neither gourmand nor gourmet could have tasted anything superior to either. Yet, strange to say, though so much of his life and his thoughts were devoted to his bees, they exhibited no affection, no partiality, but much ill-will towards him. Instead of a protector and a friend, they deemed him an intruder and a foe; and when he approached his hives he always covered his hands with gloves and his face with a veil, and did not hesitate to call his subjects unjust and ungrateful. Have bees no more discernment? Have they their preferences and their prejudices? For I have lately seen a bee-master open his hives, take out every separate comb, lay them on the ground, hunt out the queen, and, having discovered her amidst the bustle and the buzz of thousands, restore the combs to the hive, and again close it, unstung and unmolested by any of the community."

Under correction of Sir John Bowring we may state that the surname of the "gentle Welshman" was not Isaacs but Isaac, whilst his book, which was first published in 1793, and reached a second edition in 1803, was entitled "*The General Apiarian*," being dedicated to the Western Apiarian Society, of which the author himself was the Secretary and master spirit.

This Society, which appears to have been the first of the kind which existed in England, was established at Exeter in 1797, and consisted of between forty and fifty members, who subscribed their annual guinea or half guinea each, met twice—namely, in the spring and autumn of each year, and offered prizes for the largest quantity of honey and wax taken without destroying the bees, as well as rewards at their discretion for any useful invention or discovery relating to the apiary. These meetings seem to have been held regularly for about a dozen years, whilst an account of the Society's transactions was first published in 1800, and continued annually, being sold, we believe, for 2d. These "Transactions," of which so far as we know, only one copy is now extant, are well worth reading, and in them may be found some very interesting contributions and episodes in the task to which the Society, under the guidance of its enthusiastic Secretary, seems to have sedulously applied itself—viz., the improvement of apiculture, and investigation of many points which at that time remained obscure in the natural history of the honey bee.

Among them we find a communication from Bonner the Scottish apiarian, to which was awarded "the premium of the third rate" for "several methods of ascertaining whether a hive has a queen or not." These methods are—First, To watch if the bees carry loads on their thighs. Second, To turn up the hive, blow a little smoke among the combs, and see if there be any brood or young bees in the cells. If upon rubbing the covers off a few of the sealed cells whitish fresh maggots are found, it may be relied on the hive has a queen. Third, If bees kill drones in autumn, it is certain the bees have a queen. Fourth, To drive the bees into an empty hive and search among them for the queen. On the contrary, it may be suspected that bees have no queen—First, If a hive have drones when others in its neighbourhood have none. Second, When a hive in autumn has no young, while others around it have them. Third, If the bees in a hive carry no loads in autumn while the neighbouring hives are busily employed.

In the "Transactions" of 1801 is printed a translation of Huber's first three letters, the entire work having been published at Geneva in 1792. For these contributions, which excited no little attention at the time, the Society were indebted to Mr. Henry Allnutt, of Great Marlow, Bucks, who, however, accompanied them with a full description of his own theory regarding the production of queen bees, which he believed to proceed from mature workers, which at a proper age and state were immured in royal cells, whence in due course they emerged perfect queens! It is not a little curious that in the spring of 1806 this fanciful theory seemed to receive confirmation, from Mr. Isaac believing that he had found in a hive forsaken by the bees "three royal cells, with common bees sealed in them." This appearing to him (as well it might) "a strange circumstance," he presented an account of it to the Apiarian Society, who, being equally impressed with the novelty of the occurrence, caused an advertisement to be inserted in several public prints, with a view to obtain an elucidation of it, when Mr. Allnutt again wrote a letter of some length, applying the occurrence in support of his own peculiar views. Upon this Mr. Isaac was directed by the Society to investigate the point, which he accordingly proceeded to do, by means of a unicomb hive, rather primitive construction, which he possessed, and which he quaintly styles "The Discoverer." Full details of the investigation are given, and the result was, as was to have been expected, tolerably conclusive as to the fact that "the young queen bee is produced from an egg laid by a queen." Notwithstanding all this, the redoubtable Mr. Allnutt rejoined, and stoutly upheld the correctness of his theory. This produced a second investigation, conducted with the aid of two "discoverers," and the results were so conclusive, that Mr. Allnutt succumbed to the inexorable logic of facts and attempted no further reply.

## LIGURIANISING AN APIARY.

Would you inform me whether, when a virgin queen leaves her hive for a wedding flight, she is attended by drones from her own hive, and if she, being a Ligurian, mates with a Ligurian drone rather than with a black drone; or, in other words, whether she would mate with a black drone only in the absence of a Ligurian drone? My reason for making the inquiry is, that at present I have only black bees, and am desirous of converting all my hives into hives of Ligurians, making the black bees instrumental in expediting the change, and I wish to estimate the amount of risk, as nearly as I can, of keeping both kinds of bees so long as may be necessary for carrying out the object I have in view. Would it be advisable to cut the drone-cells out of the combs in the hives of black bees early in the spring? I think if I can succeed in establishing the Ligurians without a cross I may probably afterwards be enabled to keep them pure, as I am not aware that bees are kept elsewhere in my neighbourhood.—M. S.

[We very much doubt whether a virgin queen is ever "attended" during her wedding flights by the drones of her own or any other hive. So far as our observations extend, the meeting seems quite left to chance, and neither Italian nor common queens appear to manifest the slightest preference for drones from their own hives, or even of their own colour. The best mode of Ligurianising an apiary is, in our opinion, to be content the first season with putting young Italian queens at the head of all young stocks, destroying neither black drones nor drone-brood, nor taking any trouble about them. All these queens will, for reasons which we need not enter into here,

breed pure Ligurian drones the following season, when all black drones should be kept at as great a distance as possible; and young queens bred from the original will then stand a good chance of true impregnation, and should be substituted for those of the first-year's queens as have proved to be hybridised.]

### THE ENEMIES OF MY BEES.

In the "Quiver" for November the "Times' Bee-master" contributes a characteristic paper entitled "The Enemies of my Bees." Could none of our southern friends, therein styled "the fantastic and professedly scientific apiarians," on finding themselves classified amongst the "chief enemies," along with "spiders, toads, wasps," &c., draw from this "Quiver" some sharp arrows to pierce the absurdities of the learned "master"? Is the uncomb-hive "a system of cruelty to animals?" the "bar system" "chains and slavery?" Will the earnest student, it matters not of what branch of science, say in the present day that "further information is really supererogatory?"

The "Times' Bee-master," has evidently never perused the adventures of "One-eyed Toady," or he would not say, "that the only way to get rid of him (the toad), is to seize him by the hind leg and pitch him to the greatest possible distance;" nor yet had a severe "attack of the Blues," and afterwards be able to write, the evil the toadit perpetrates is "very limited."

Whatever the readers of the "Times" or "Quiver" may think of the following masterly system of bee-feeding, I feel pretty confident those of "our Journal" will not readily adopt it. "It is wise policy, and never a loss, to feed them, by placing opposite the hives a deep soup-plate filled with sugar and beer well boiled, and placing on the surface for the bees to rest on a circular piece of paper the size of the plate, perforated with holes each the size of a pin-head." Do none of Dr. Cumming's neighbours keep bees? Possibly he may not yet have learned how to distinguish his own from theirs. What a pity some one did not procure a colony of Ligurians, assuming the little marauders would deign to sip the nauseous mess, he would speedily discover that his system of feeding was anything but "a wise policy," on the contrary a very great "loss." Take the case of a friend, on driving a hive of bees this autumn, at "our village," fully a mile distant, and while sweeping out some odd stragglers at the close, first one and then another of my indefatigable yellow-jackets appeared upon the scene, and having fairly scented "the carrion from afar," most determinedly sought to share in the booty, but he, being fully alive to Italian brigandage, beat a precipitate retreat into the house.

When the "Times' Bee-master" publishes a second edition of "The Enemies of my Bees," it is to be sincerely hoped he may include in the list of "chief" those inexperienced authors, who, by reproducing, perpetuate the blunders and exploded notions of their predecessors, thereby detracting from the happiness and well-being of our little favourites.—A RENFREWSHIRE BEE-KEEPER.

### BEE-FEEDING EXTRAORDINARY.

The following story, for which I am indebted to a clerical friend, is so characteristic of the ignorance and self-conceit of many rustic bee-keepers, that I deem it worthy of a place in the columns of "our Journal."—A DEVONSHIRE BEE-KEEPER.

"I have been trying to teach some of the cottagers better ways as to bee-keeping as well as to higher things, but find it difficult to make them follow my advice, so wedded are they to old and odd ways, &c. A short time ago I looked over a villager's little stock of bees consisting of some three or four hives, two of which I found very light indeed, only a few pounds each, some comb, little or no honey, and few bees, swarms of this past season. I, of course, advised him to feed at once, gave him proper instructions, and placed some pickle-bottles at his disposal.

A few days days since, going my rounds, I turned into my friend the tailor's cottage. "Well, S., how get on your bees? do they take their food kindly?" The man looked rather strange, and after a little hesitation replied, "Well, sir, I have just fed them." "Let us see how you have managed it?" "Well, sir, I bought them a penny currant bun each, put the buns in saucers, poured beer upon them, with a little dust of sugar, and put the saucers under the butts; and I am told that now they have enough to take them through the winter." Put this into the Devonshire dialect, and when you read it aloud, you shall hear what I heard.—W. L.

### BEE AND BEE REQUISITES AT THE TORONTO PROVINCIAL SHOW.

AMONG the many improvements going on in this country, as developed in the late exhibition at Toronto, we were much interested in those presented in connection with the keeping of bees. Twenty-five years ago the humming of the honey bee was seldom heard, and honey in the comb was nowhere to be obtained; but now we cannot travel many miles without meeting from his ingenious, and learning lessons of industry and skill from his ingenious and persevering family. Thanks to the new "bee-observing hives," fast multiplying among us, we can familiarise ourselves with the previously hidden mysteries of the hive. Among the hives was one which will soon be patented, called the "people's hive." This is a moveable comb hive, which indeed has become an essential feature of any really good hive, giving, as it does, full control of both comb and bees. These hives, with the large and small boxes of beautiful honey shown in other departments of the exhibition, cannot fail to have given an impetus to this branch of rural economy. It is manifest that the keeping of bees is becoming more general in Canada, and we take some credit to ourselves for this, as being, to some extent at least, the result of the constant and urgent recommendation of bee-keeping in these columns.—(Canada Farmer.)

BEES.—In reply to Mr. S. Brierley's letter in THE JOURNAL OF HORTICULTURE, October 31st, I shall be glad to show him my apiary if he is in this part of the county. I have several kinds of hives, including Woodbury's bar-and-frame hive, Nutt's, also Huber's book or leaf-hive. I think mine an improvement on that kind of bee-keeper's hive. I have taken several bell-glasses of honey this season, also a splendid super from the top of one of Woodbury's hives. I have also a glass hive made after the style of Woodbury's bar-and-frame hive, which has done well this season.—A SOUTH LANCASHIRE BEE-KEEPER.

### OUR LETTER BOX.

OUTRAGE FOR POULTRY, &c. (L. S. D.).—Apply to Mr. Agate, Slougham Mills, Crawley, Sussex. You had better have ground oats, not merely the meal. They are much more nourishing.

SWALLOWING WITH DIFFICULTY (A.).—To our hen which swallows hard food with difficulty, sits with her neck drawn back and bill pointing upwards, showing that she is in pain after eating, we advise you to continue the castor oil in good doses. Follow it with bread and ale given freely twice every day. Let the bird have no whole food, only meal and bread, and let all its water be strongly impregnated with camphor. Any preparation of iron is a good medicine for the disorder.

FOOD FOR PIGEONS (Evelyn).—Your Pigeons being of the common sort you may feed them on barley or Indian corn once a-day in the yard. There are times when the Pigeons cannot find anything in the fields, as when the ground is frost-bound or covered with snow, or in summer when covered with growing crops.—B. P. BRENT.

BREEDING GREEN CANARIES (A Subscriber).—A green cock and green hen will breed green young ones; but if you desire to improve the green colour it is advisable to cross with a good rich Jonque. I do not know of a better book on Canary breeding than the one you mention; but you will find some notice about them in "Bechstein's Cage Birds."—B. P. BRENT.

RED LICE IN BIRD CAGE (S. D. A. H.).—Keep the cage clean; brush all the joints, cracks, and crevices with linseed oil, and dust flowers of sulphur over them and in them.—B. P. BRENT.

ERRATUM.—Page 436, line 17., for "men do not go on all sides," read "all sizes."

FOREST FOWLS (Ornis).—That you purchased the fowls of the party you name we have no doubt, and it may be that they came from the forest of Exmoor; but they may have been Hamburgs originally notwithstanding. We are quite sure that there is no original breed there, and our reporter is a gentleman who knows as much about fowls as any one in this country.

HEAT OF INCUBATOR (Bristol).—Whether the eggs be large or small the same temperature is required—105°.

ILLUSTRATED POULTRY BOOK (J. Jenner).—It will be published in a few days, advertised, and the price announced. It can be had from our office.

FEEDING OUT OF A BOTTLE (W. W. W.).—Fluid honey or any other kind of liquid food, may be administered to bees by means of the inverted bottle; but what we ourselves have long used, and find an efficient substitute for honey, is lump sugar and water, in the proportion of three parts by weight of sugar to two parts of water, boiled & quinte or two.

VENTILATING (A. R.).—We do not ourselves ventilate Woodbury hives further than by never screwing down the crown-boards, which permits a slight degree of side ventilation at all times.

SENDING A QUEEN BY RAIL (Idem).—Queen bees may be transmitted by rail in light wooden boxes, 5 inches long by 4 inches wide, and 3 inches deep, although the exact size is not very material. Ventilation must be duly cared for, and a bit of sealed honeycomb, two or three inches square, should be inserted, and firmly fixed in its place by way of provision during the journey. A hundred workers will form a sufficient suite of attendants.

WEEKLY CALENDAR.

Day of Month	Day of Week.	DECEMBER 5—11, 1865.	Average Temperature near London.			Rain in last 38 years.	Sun Rises.		Sun Sets.		Moon Rises.		Moon Sets.		Moon's Age.	Clock after Sun.	Day of Year.

11	M	Wallflower flowers.	45.7	32.6	39.2	16	58	7	49	3	50	0	41	0	23	6	25	345	

From observations taken near London during the last thirty-eight years, the average day temperature of the week is 46.8°; and its night temperature 34.6°. The greatest heat was 60°, on the 10th, 1848; and the lowest cold, 14°, on the 5th and 6th, 1844. The greatest fall of rain was 1.02 inch.

PLANTS FOR DINNER-TABLE DECORATION.

HERE is nothing, perhaps, in which the present age stands out in such bold relief from those preceding it, as in the attention which is bestowed on the comforts

and luxuries of life, and on the combination of these with ornament. In fact, appearances in many instances take precedence of utility, and the legitimate object that ought to be studied only obtains a secondary place. Thus, the outer polish of an ordinary pencil is put forth as a compensation for the very indifferent quality of the black lead it is, or ought to be, made of; and other things have in like manner changed their character. New wants have arisen; and as they, like those which preceded them, require attention, the field of operation is continually widening. In the gardening world advances have been made in certain channels for some years with more or less rapidity, and with now and then a divergence to take in a fresh subject, like the progressive growth of a tree. On the great usurping position held by the bedding system it is not my intention to enter; suffice it to say that it has not absorbed the whole attention of those who preside over the ornamental department. Plant-growing still receives its meed of attention, and the cut-flower department is perhaps more patronised than ever, especially in its relationship to ladies' bouquets. Good taste is, perhaps, in no instance so completely ignored as in these ugly bundles; but I fear that in touching on this subject I am treading on dangerous ground, and I will therefore leave it for one not less fashionable at the present day, but which has certainly more of the merit of appearance with infinitely less of the inconvenience of the other. A few hasty notes on dinner-table decoration in so far as gardening is concerned, may be of some service to those who are called on for the first time to undertake the duty of providing the necessary materials.

The decoration of the dinner table with plants or cut flowers has of late years come to be considered indispensable, and when well done perhaps nothing adds more to the general effect of the table. The arrangement of such decorations has been more than once discussed in the columns of this Journal, and the prizes given for the purpose at the Royal Horticultural and other shows have done much to direct the public taste. There has been some diversity in the appliances used; but in general the design first of all exhibited by the Misses March has, with some little variation, been approved of, other designs following in much the same track. Now, with all deference to the opinions of those who are justly regarded as public jurists, I yet hope to see the views which I put forth at the time this class of table ornament first attracted attention

become more generally adopted. What I contended was, that all objects of this kind placed on a table should stand either below the line of vision between the countenances of persons sitting on opposite sides of the table, or that they should be above that line—in other words, that a clear space of from 14 to 24 inches upwards, measuring from the tablecloth, be left free of all impediments. Assuredly there is sufficient scope for the decorative art below the one limit and above the other, without introducing the floral screen. On this point, however, I will not at present say more; and as the character of the framework of the flower-stands in most cases determines the height, I will suppose the stands to be either of glass or china, or a combination of the two; or, probably, a silver stand or frame with appendages may be appointed for the purpose. The hints here given for their dressing with flowers can only be few, as it is not easy to describe how it should be done, although a few notes of the class of flowers and foliage best suited to the purpose may be of service.

The flowers for furnishing such a stand may consist of two classes, upright and pendant, the latter being for the outer rim of a dish or stand; of this class Fuchsias present one of the best examples, while Roses represent the other, and perhaps there can be nothing better than these two. As, however, both cannot always be had, such flowers as Pinks, Chrysanthemums, Verbenas, Calceolarias, and a host of others answer very well the purpose of supplying the bulk of those wanted to fill a cup, dish, or bowl, and they can easily be made to stand well if some damp sand be put therein. There is, perhaps, no objection to these flowers presenting a sort of regular flattened appearance, as that will be sufficiently broken by the projecting dressings, which in most cases I would recommend to be of foliage. Assuming, therefore, that a circular pan or bowl has to be filled with flowers, these may present a sort of semi-globular or mushroom-headed appearance, with pendant ones hanging round the sides, the whole not by any means crowded, and with foliage intervening. Some more foliage of a graceful character may be introduced to break the outline, and, as it were, throw a thin veil over the beauty below. Such sprigs, however, ought to be very light, and not by any means stiff. Maiden-hair Fern is one of the loveliest of plants for this purpose, but some ornamental Grasses are likewise very suitable, not the least useful being the old Ribbon Grass. One or two leaves of the Bambusa are also good, as well as Cyperus alternifolius and its variegated variety. Some other Ferns may also occasionally be introduced, but in general the Adiantums are the best. Whatever is used should have a light, graceful, easy character, and be placed in the same position as when growing. Of course, great variety may be obtained in this way, and it would not be desirable on any account to have the decorations alike on two consecutive occasions. For a change flowers terminating in a spike, such as Delphiniums, &c., may be used, but they are less effective than others, such as those described above; but where great height has to be obtained they may be indispensable.

I have been supposing that a shallow bowl has been operated on, and that it is to be elevated more or less on some stand or frame which forms part of the feature, and that it is not destined to be hidden, although an intermixture of foliage with its parts may be advisable. Assuming the stems or supports of the stand or frame to be glass, china, or white metal, a twist round with some small-leaved creeper will improve the general effect. Sprigs for this purpose are perhaps one of the most scarce objects in the whole list of wants, as by far the greater number of creepers have too large a foliage, or sprigs with small leaves are so thinly scattered over the branch as to fall short of the requirements of the case; and it is not advisable to unite twigs of other things if it can be avoided, as it is not easy to conceal the junction. In some cases the smaller-leaved *Vinea* has been used with advantage, or some of the greenhouse *Kennedias*, and in cases of necessity a plant not of a twining habit, *Tradescantia bicolor*, may be employed. There are many plants that look worse than the common Ivy when the leaves are small and numerous, and we have often enough cut twigs from an out-door Passion-Flower that had been hanging loose; and its foliage, not being in contact with anything else, was stiff, and presented a more natural appearance than it is possible to give to foliage that has been entangled. Sometimes a few branches of Ice-plant are united for the purpose referred to, but they look better when employed for the decoration of the fruit-dishes. The materials for partially clothing the stems of such stands will suggest themselves to the operator in many ways; but in most cases I would advise him to arrange them as much as possible in the position in which they have been growing, and the less distortion in foliage by their being reversed the better. This, however, is not easily done with any branches but those which either grow or hang free of all others, or of anything else fettering their growth or confining it to a certain direction.

Stands of the above description also sometimes require a sort of bottom or mat, which forms an important feature to the whole, the white tablecloth setting off to every advantage whatever foliage may be placed in contact with it. A very good mat for such a purpose may be made by sewing a number of carefully selected Portugal Laurel leaves on paper, with their points all outwards in a circular or star-shaped manner, taking care to have the leaves flat; these look very well in this way. Other foliage may also be made to perform the same office. One of the very prettiest materials is the tip ends of branches of fine-leaved Pinuses, as the Weymouth Pine, or *Pinus excelsa*. Laid carefully around a circle, and spread neatly and not too closely together, they have a very graceful and neat appearance. The sturdy-leaved Pinuses do not answer so well, but I have for a change used small sprigs of common Yew or of *Arbor Vitæ*; while, perhaps there is nothing in the whole round of foliage that looks better than the extremities of the fronds of the most common of all Ferns, the common Brake, Male Fern, and *Polypodium*. Materials for this purpose are, however, more plentiful than creepers for the stem, and the above examples are merely given to show what is likely to suit the object in view.

Another, and in some respects a more creditable, class of table ornaments are well-grown plants of the proper size. The preparation of plants for table decoration has become one of the requirements of the day, and as the art is yet in its infancy it is likely that many plants not yet tried may be found useful for the purpose, or those who have tried them may not have made their experience sufficiently known. The conditions under which such plants are employed preclude the use of many of the most showy ones, nevertheless much may be done to modify and accommodate a large number to the purpose. One of the principal difficulties to be surmounted is to select a class of plants that will attain a respectable size in a small pot, as there is generally a dislike to seeing a large pot on the table; uniformity of growth is also requisite, all sides being expected to look well. The foliage, too, should, if possible, droop over, so as to hide the pot a little, although the latter, I expect, is concealed in some of the fancy coverings now so plentiful, or by a vessel on the table to receive it. Whether or no this be the case, it is desirable that the foliage hang over a little; a scanty upright growth, like that of the *Hyacinth*, *Amaryllis*, &c., looks poor. Perhaps of the most ornamental plants for this purpose are the *Adiantums* of the Maiden-hair class, and many other Ferns, of which *Lomaria gibba* is a very good type. Plants of a symmetrical habit with plentiful foliage are the best for this work, and the same requirements seem to be equally essential in flowering-plants as

in these whose beauty is derived from their foliage. Another point must be considered well, and that is the class of plants that look well in the artificial light that is generally used where dinner-table ornamentation is wanted. Yellow flowers, as a general rule, do not look well; while, on the contrary, those which are scarlet, rose, mauve, and purple having a strong crimson tint, do. Blue is not showy under such circumstances, but a clear white is good when surrounded by a good healthy mass of green; and under the same circumstances the yellow of a *Cytisus* looks tolerably well, and as a change may come in useful. In general flowers having a circular outline look best at night. Whether there be any affinity between star-shaped plants and the celestial lights it is needless here to inquire, but blooms of that outline, such as *Cinerarias* and Chinese *Primulas*, are as good as anything I know of, and the nearer their flowers are to a good crimson or rose colour the prettier they look, although light-coloured ones are by no means ineligible; and the habit and general features of the plants in other respects fit them for occupying the foremost ranks among flowering plants.

Another class of plants adapted for table ornament consists of these ornamental by their fruit; this class, though not a numerous one, is increasing, and may eventually become the most popular. It has the merit of being the first that was used for dinner-table decoration. A pot of Grapes placed on the table is by no means uninteresting, especially if the fruit be good. Strawberries in like manner are in request at the right season, and good pots of them excel any fruiting plants with which I am acquainted. There are, however, many plants grown expressly for the beauty of their berries, and most of these may be turned to account in dinner-table decoration. I expect that in time their number will be increased, and probably some of the Japanese *Aucubas* may be induced to furnish berries on plants sufficiently small to suit the purpose.

A short list of the fruit-bearing and other plants which have been used for dinner-table ornamentation will, perhaps, enable the reader to suggest additions, which no one will be more glad than myself to see recorded in THE JOURNAL OF HORTICULTURE.

*Skimmia japonica*.—Healthy plants look well when the foliage is ample and good.

*Ardisia crenulata*.—The upright habit of this plant is somewhat against it, nevertheless the fine colour of its berries, and their long continuance in perfection entitle it to a place.

*Solanum capsicastrum*.—This is indispensable, and a taller species with berries of a similar size is also good; the variegated form is no improvement for table decoration.

*Strawberries*.—No comment is required on these, as, for the end in view, they come nearer perfection, when well managed, than any other plant.

*Grapes*.—The size of the pot and bulk of the plant is an objection. Sometimes, however, two plants united together, so as to form an arch, look well.

*Oranges*.—There are two or three kinds, as the *Otaheite*, *Mandarin*, and *Tangierine*, which bear well in a small state, and the variegated forms are also available, but do not fruit so well as the plain-leaved plants.

*Capsicums*.—Some fancy varieties of these look well; a yellow-berried one is ornamental at all times.—J. BOBSON.

(To be continued.)

## CULTURE OF THE CHRYSANTHEMUM.

I SEND you my practice in cultivating the *Chrysanthemum*. I find, on looking over my doings of the garden (and, by the way, I may say that every gardener ought to keep a journal of garden work, it is so useful for referring to and comparing the effects of seasons), that I potted the cuttings on January 10th, and on March 14th repotted them into 36-sized pots, one in each pot, and placed them in a cold frame till April 26th, when I turned them out of doors, along with bedding plants, where a little protection might be given in case of frost.

On the 26th of May I gave them their final shift into their blooming pots, from 8 to 13 inches in diameter, and plunged them in the kitchen garden in a plot of ground set apart for them, and which was situated between two rows of Peas, so as to afford shelter. The plunging I consider a very important point in their culture. I plunge them to the rim of the pot, the rim resting on the surface of the ground and bearing the weight of the pot and its contents, for the hole is made 3 inches deeper than the pot, so as to permit of the escape of water

through the hole at bottom. By this means the lower leaves are kept green and the plants vigorous.

On the 28th of June I gave the plants their final stopping. On the first appearance of bloom-buds I give soot-water once a-week until the plants are in full bloom.

From many years' experience with soot I find it to be a cheap, safe, and effective stimulant; almost any plant enjoys a dose of it while in a growing state. My mode of preparation is to put about two bushels into a tub, fill it with rain water, and then work the soot into the water. It requires stirring a little for three or four days, and then the surface to be skimmed in three or four days more, and you will have it as high in colour and as clear as Burton ale.

I have this day measured a few flowers of my Chrysanthemums—Golden Queen of England is 5 inches in diameter, White Queen of England 4½, and other sorts in proportion. I should like to know how these sizes will compare with those grown by others.

I take no buds off, there being large quantities of cut flowers required for decorative purposes here, and also to have a good show in the conservatory. On the 4th of November I cut the first full-blown bloom, being three weeks earlier than last year.—S. BALDWIN, *Lancashire*.

### THE CULTURE OF THE VINE.

We have had another valuable paper on the Vine from Mr. Wills. Persons who have experience in the cultivation of that valuable dessert fruit must endorse, or nearly so, every statement that excellent article contains. Nevertheless, there are two remarks to which I cannot agree; one of them must be met solely by myself, as to the other I think I need not be quite so selfish, for I think one or two could be found to row in the same boat with me. I am exceedingly pleased to find that my invitation has been accepted by Mr. Wills, and I candidly confess, when I have the pleasure of seeing that gentleman here, I will do all I can to convert him to the prolongation of the syringe practice, and I have a strong impression that I have some battering rams that have done good service in battle, yet if stronger come into the field, why the weak must give way; yet the points must be watched. Who can tell what a visit to Bush Hall might do? Of course, this old ulcerated wound is my first exception, and it is also partly the ground of our argument; but I fancy that I hear Mr. Wills saying, "Well, I will wait another year, at all events, before I pay friend Whittle a visit. By that time he will have found out his mistake with the syringe." Well, he it so, if such should be the case I will frankly own it in these columns. I will either convince him that I am right, or I will myself side with the ministerial benches. Now, seeing the distance that Mr. Wills is from here, I can scarcely expect his friendly visit this winter. Our last house, however, has some good bunches, and I think would prove to Mr. Wills that the syringe has done no injury.

I am endeavouring this year to lay on my employer's table Grapes every month in the year, and to do so I have recourse to pot culture, and all who have had experience of that mode of culture will agree with me, I think, that it is a most excellent plan for early and late forcing. We have now ripe in pots some Grapes kept back as long as the season would allow—the usual number of bunches which ought to be allowed on each cane, I believe to be from six to nine (we have had, however, as many as seventeen bunches on one cane—Foster's White Seedling; but that number is too many, and the berries are naturally small)—these I hope we shall keep good until February. We have in one house started pot Vines, which I have no doubt, if all go on well, will be ripe by the end of next March, so that we shall be able to link the old to the new year.

I said at the outset, that Mr. Wills makes some very excellent remarks, just one I will notice—namely, that on the use of scissors in pruning; that system ought to be, and I think nearly is, discontinued by all experienced pruners in all pruning, and not in that of Vines alone.

I now come to the second exception, and here I must draw sword in self defence. Mr. Wills says, "I think if my memory serve me right, Mr. Whittle said he would give us a paper on the cultivation of the Vine in pots, &c." No, Mr. Whittle did not say so; but Mr. Wills did, and I replied in my former article that I was sure that I should read it with great interest. Now, our friend shows us that he is an excellent knifeman, as for the syringe we will say nothing about it, probably I can say that as well as himself; but one thing I am sure I cannot do

so well, and that is, use my pen. His articles have been throughout thoroughly good and practical, well worthy the attention of all Vine-growers, and I am certain that if he will favour us with an article on pot Vine culture, I shall, for one, hail it with delight. I will go so far as to say, that if he will first enrich your columns with his system of propagation and cultivation, I will then (probably my system may vary a little) give a few particulars of our management here. He has shown us that his rafter system is good, and I have no doubt that his pot culture will be equally useful, therefore, we cannot let him off without a good article.—A. WHITTLE, *Bush Hall, Hatfield, Herts.*

### TRITONIA AUREA CULTURE.

In answer to "A CONSTANT READER," *Crococoma*, or *Tritonia aurea* is one of many bulbous plants which, though not hardy, will survive our winters with a moderate amount of protection. Planted 3 inches deep in moderately light rich soil, well drained, and warmly situated, a mulching of 3 inches of short dry litter in autumn is sufficient to prevent the frost injuring the bulbs. The first mulching may remain on, adding a little fresh soil in spring to take away the appearance of untidiness. This will cause the bulbs to be 6 inches below the surface, which is not too deep for them in order to be safe from frost. During the summer the plants will be much benefited by watering overhead on the evenings of hot days, and by occasional waterings during dry weather. When the foliage decays cut away the bloom-stems, and before frost cover with a few inches of dry short litter, which is to be removed in spring. The mulching should not be placed over the roots until December, for the bulbs immediately throw up the succeeding year's growth, and the shoots push through the soil, showing themselves before severe weather sets in. Should severe frost set in the shoots will perish as far as the frost penetrates into the ground, and if covered early the shoots will push through the protecting material, and be exposed. Early in December is a good time to cover the roots over for the winter, as the shoots will not grow much after that time, and the covering being removed in March the shoots will not have become long and blanched. It is best, however, to put on the protection before, and remove it after, frost at whatever season it may be required or not required, as the case may be. Under these circumstances this very fine late summer-blooming plant is hardy; but treated as an ordinary border plant I have found it hardy only in very warm dry situations, blooming later every year, and growing less strongly until its growths were so late as to be cut off by the autumn frosts, the flowers, foliage, and bulbs perishing. The first plant I put out was turned out of a pot in May; it bloomed finely in August, and withstood the severity of the succeeding winter unharmed, blooming well the second year, but a month later, and though it lived two more seasons it became much less, and did not flower, and in the fourth winter it perished.

It is as a pot plant that the *Tritonia* is most desirable, at least when so cultivated it is more certain of blooming finely. The best time to pot it is when the bloom-stems turn yellow. A compost of turfy loam, peat, and leaf mould in equal parts suits it well, adding sand liberally. All the old soil is to be removed so far as it comes away freely from the roots, and the pot being well drained, the bulbs are placed about 2 inches from the surface. After potting give a good watering, and plunge the pot in coal ashes in a cold frame, where little water will be needed, but the soil should not be allowed to become dust dry. Indeed, I have had pots of these plants in ashes in a cold pit with the soil moist enough up to March, and the shoots just showing above the soil, without having to water at all except at potting. Protection from frost should be afforded by a covering of mats over the glass. As the plants grow, water should be liberally supplied, and an abundance of air should be afforded, or they will grow up weak; give also a sprinkling of water from the syringe every evening in bright weather to keep down red spider, to which they are subject. In June the pots may be placed outside in a situation sheltered from wind, and being watered the plants will bloom finely, and form a succession to those kept under glass. When the flowering is past less water should be given, until the stalks turn yellow, when they are to be cut away, and the plant potted. To prevent the flower-stalks falling, neat stakes should be provided, and the flower-stems neatly fastened to them. During the winter the pots may be placed on the floor of a cool house just free from frost, care being taken not to allow

the soil to become very dry nor, on the other hand, very wet, and they should not be kept there after the young shoots show above the soil, and have grown an inch or two. The plants require light after that, and will bloom earlier by a fortnight than those in the frame, and the latter a fortnight earlier than those placed out of doors.—G. ABBEY.

### RIPENING THE MANGOSTEEN.

IN vol. xi. of the "Botanical Magazine" (third series), in the Number for May, 1855, will be found a full description of the Mangosteen alluded to by "UPWARDS AND ONWARDS," in his letter last week, together with a well-coloured plate of the flowers and fruit, which are certainly those of the true *Garcinia Mangostana*. My plants had, however, much larger blossoms of a beautiful crimson colour, and the fruit was generally brown, or reddish brown, spotted with yellow or green. There are many varieties of this splendid tree, no two raised from seed being exactly alike in either flowers or fruit. The one mentioned above seems to me from the picture to have had very inferior blossoms to most which I have seen.

I have no idea who first fruited the Mangosteen in England, although I believe it has been done several times previous to 1855. It was the Mango, not the Mangosteen, which was ripened at Walcot Hall, in 1826, and afterwards presented to T. A. Knight, Esq., and a paper was read on the subject in the same year to the Horticultural Society.—J. H.

### POINSETTIA PULCHERRIMA CULTURE.

FEW, if any, of our stove plants are so attractive at this dull season of the year as the Poinsettia. It is, however, its usual fate to be tortured; for you rarely see it in a healthy condition. If the following rules be strictly followed out success will be almost certain:—Take in January or February eyes from stout well-ripened wood in the same way as for Vines, insert each singly in a small pot in a mixture of peat, loam, and sand; plunge the pots in a good bottom heat of from 70° to 75°. In about three weeks the eyes will start into growth and make roots, and as soon as these have filled the pots the plants should be shifted into the next size of pot, with the soil as before, and replunged. A dung-bed is the most suitable place in which to start them, and to grow them till they become too large for it, which they will very soon be, but after they are well started any ordinary stove will suit them.

When about 8 inches high they should be stopped, I shall presume it to be about May, at which time they should have their final shift into 10 or 12-inch pots. They should be kept as near to the glass as possible; the natural habit of the plants being lengthy, they are apt to become drawn.

To have them fine they should not be stopped after May. I would rather have three or four fine heads than six or seven small ones. The soil for the last shift should be rather heavier, adding a little more loam than for the first pottings. Give plenty of drainage, placing one large crock over the bottom of the pot, and the remainder should be charcoal. Some recommend cowdung to be mixed with the soil, but this I do not agree with, for it is then almost impossible to keep the soil from becoming sour. I find it much better to give them their manure in a liquid state; for I know of no plant that is so nice about water as the Poinsettia. If you give the plants only very little too much you turn them yellow, and if they are allowed to become dry off comes the foliage. They like, as most plants not aquatic do, a happy medium. Water should never be given without knowing their condition. I sometimes find it necessary to give them water twice a-day, and sometimes they will go two or more days without any, according to the weather. They like a good growing temperature, plenty of moisture, and constant syringing to keep down insects. I know of no plant that is so fond of the fumes of ammonia from the evaporating-pans, it seems to animate it and apparently it is almost impossible to keep the foliage entire without stimulants; I constantly keep my trough full of manure water from the dung-heap. All the stove plants seem to like it, especially fine-foliated plants. At shutting-up time I syringe it in amongst the pots. It will not do to keep it in the trough towards winter when strong fires are used, if it is it must be very weak. As the pots become well filled with roots weak manure water may be given three times a-week. Be sure not to give it too strong.

About November the plants will show signs of blooming, at

which time the points should be turned to the positions in which they can be best seen when entering the house. They may be turned in almost any direction, it is better to do it before they are fully expanded. Nothing can be more beautiful than about a dozen of pure scarlet points from 14 to 16 inches across, as I have them at this time. These, with some of the winter-flowering Begonias of a light colour, make the stove very attractive at this dull season.

As soon their beauty is over water should be gradually withheld, and about January they should be cut down to within two eyes of the bottom, and cuttings made if any are required. Unless a large number of flowers, or rather their showy bracts, are wanted on one plant, I prefer young plants to those that have been cut down. The old plants should be shaken out, repotted in small pots, and plunged like the young ones. Of course more heads are produced on the old plants.—CHARLES EDWARDS.

### CLOTH OF GOLD AND GOLDEN CHAIN GERANIUMS.

AS experience in different parts of the country when compared tends to confirm our estimate of the merits or demerits of plants, I think it right to answer the question put by Mr. Fish. We planted two beds with good established plants of Cloth of Gold Geranium where the sun, unobstructed, shone on them from 9 A.M. till 4 P.M. The plants began in the first week in June to retrograde, and by the end of July they had not more than two leaves on them. Golden Chain in the same place did tolerably. We planted the same number of beds where they had only two hours' sunshine the whole day; they were all that could be desired. I have seen Cloth of Gold planted in different gardens in different situations, but it will not stand the sunshine. Next year this would-be favourite must have its bed in the shade, and Mrs. Pollock must try the sun.—D., near Newark.

### GROWING STRAWBERRIES FOR THE MARKET.

I PURPOSE planting with Strawberries in July and August next, a field of about three statute acres, which has been for some years in grass. I do not enter into possession of the land until Christmas, and wish so to arrange that without horse labour I may employ as fully as possible the time of one man from January to July, with only occasional assistance. I have sufficient runners of the present year to plant half an acre in the month of March, and from these and my old plants will have enough in the course of the summer for the rest of the field. The land has been well drained and is a good loam, varying from 12 to 18 inches in depth, resting upon clay. I do not wish to have early Potatoes, or any other crop upon the land in the meantime, my only object being to have it in such condition as will allow of the planting of half an acre in March and the remainder in July, with as little additional labour as possible at planting-time.

Oblige me with such hints as will be of service in securing what I aim at. It would, I think, be of interest to your readers generally, to have a paper in the Journal descriptive of Strawberry-growing as practised in the great market gardens round London. In Lancashire the practice seems to be, to plant in spring in rows, with intervals of 3 feet between the rows, and Potatoes in the intervals. The runners are allowed to ramble, and when the Potatoes are taken up the intervals are kept clear with a light cultivator drawn by a pony. In September every alternate space is planted with Cabbage or Broccoli, and weeded by hand, the cultivator being still employed on the others. The fruit is taken to market almost exclusively in baskets of one dozen quarts, a quart weighing about 18 ozs. Pottles and punnets are almost unknown in the Lancashire markets, except in the employment of the latter for Plums of extra quality.—F. E.

[As you purpose to take no other crop off the land, we would trench down the turf surface, after forking or picking the clay subsoil and leaving it there, thus stirring the ground completely to the depth of the staple of from 12 to 18 inches. If the ground is in pretty good order, we would supply no manure, at the trenching, but depend chiefly on the sods at the bottom. Having thus rough-trenched we would give a coating of shor rotten manure on the surface, and point it in so as to give assistance to the young plants at once. For a continuance we would plant in rows 2 feet apart, and 1 foot apart in the rows. If the plants do not grow strong in the neighbourhood, we would be content with 20 inches from row to row; but in

general after the second year, 2 feet will be found not too far apart. Did we plant half an acre in March at the distance, of 24 by 12 inches, and purposed planting so much more in July and August, we would use the spaces between the rows for planting temporary rows at from 6 to 9 inches apart, and lift and plant them as we got more ground ready. We would clear all such ground in autumn, surface-stir, and manure between the rows in winter. If you contemplate cleaning and doing much of such work by means of a pony and cultivator, then you must have more space between the rows.]

## ROSES.

As "D." of Deal, asks about Belle Normande, I can give him the following information, though I do not possess the Rose:—At the Blandford Floral Show in August, I had a chat with Mr. Keynes on the novelties. He said, his experience was, that Madame Rousset, Madame Moreau, and Belle Normande were the best three, and grand Roses. He promised to write, and tell me the names of the best twelve, but he has not yet done so. As regards Belle Normande I saw a line of them at Mr. Gill's, Dorset Nurseries, Blandford; the blooms were overdue, but they appeared to be large and fine. The growth was moderate. The best full-sized Roses of light character that I have seen lately, are Elizabeth Vigneron and Belle Normande. "D." says, "As far as my memory serves me, we have only some second-rate Roses of Granger's." I have two foreign lists: one attributes Maurice Bernardin—a most magnificent Rose here, a very strong grower, a most abundant and continuous bloomer—to Levêque, and the other assigns it to Granger. Whether Levêque or Granger raised it I cannot say, but I beg to acknowledge the raiser's great merit.

I must now thank "D." for his kind expressions. They have been copied by the *Dorset County Chronicle*, accompanied by very kind expressions, for which I thank the editor. I shall leave Rushton in April. I have removed the *élite* of my Roses, amounting to some hundreds, to my north-east garden at Rawston, which the future rector has kindly permitted me to hold till I can fix on a residence. The garden is nearly full, and the Manetti plants are excellent. I have been obliged to give away my fine array of the choicest summer Roses. My three plants of Schismaker (slate), and Tricolor de Flandre (variegated), and Madame Zoutman (white), are all that I shall retain for want of room. It costs me a groan to give them up; they are so hardy, so handsome, so free-flowering, and so finely scented. Moreover, you may hack them for bouquets day after day without injuring the next year's prospects. I have offered them to Mrs. Farquharson, of Langton House. They are far better than when I bought them of Messrs. Cranston and Rivers some ten years ago.—W. F. RADCLIFFE, *Tarrant Rushton*.

## EARLY-BLOOMING CYCLAMEN SEEDLINGS.

SEVERAL interesting papers, on Cyclamens and their culture, having recently appeared in your Journal, and which have elicited some further information from your correspondent, "G. H.," showing that this beautiful tribe of plants can, by careful management, be induced to bloom in one year, I venture to give my own experience on the same subject, should you consider it likely to prove interesting to any of your readers.

This year I have obtained the same results as "G. H.," but without the assistance of artificial heat—an advantage to such as have not the means of forcing at their disposal. I began to cultivate Cyclamens about five years ago, having in the autumn of 1860 purchased a collection. Since then I have raised many hundreds of seedlings of the varieties of *C. persicum*, which are my favourites, though I also cultivate to a more limited extent the other kinds, including Atkins, conu, and vernum, and I have invariably succeeded in obtaining abundance of bloom in the second year from sowing the seed, which at the time I commenced, was, I believe, a step in advance of the ordinary mode of culture.

The course I then adopted, and to which I in a measure attribute my success this year, was to sow the seed, if possible, immediately after it was picked—say from the commencement to the end of July; the compost used being a mixture of rich garden loam, leaf mould, and a little sharp sand, and I have generally found that germination takes place in from six to eight weeks from the period of sowing; but if the seed is

allowed to dry up, which it does very soon after being picked, the period it takes to germinate is considerably increased.

When once the plants have shown their first leaves, I am careful that by frequent watering they should be kept in a growing state for about eighteen months—that is to say, till after the second spring, at which period they would naturally rest. The seed-pans, which had from the period of sowing been placed on the back shelf of my greenhouse, are then removed to a situation out of doors, where they only receive a small amount of the summer rains, although I am careful never to allow the soil to become hard and dry, which is the cause, I believe, of so many failures in the cultivation of this plant.

As soon as the bulbs which have been resting for three or four months show signs of returning growth, they are removed from the seed-pans, the old soil being carefully shaken from them, avoiding, as far as possible, breaking any of the numerous roots, and are potted off into 60-sized pots, in which they bloom in the following autumn, frequently as early as November. The compost used is similar to that in which the seeds are sown, with the addition of cowdung and small pieces of charcoal on the top of the drainage.

The only difference in the treatment I have pursued this year has been to supply the young bulbs, raised from seed sown in July, 1864, with additional nourishment, by means of occasional waterings of very dilute guano and water, the result being, as I at first stated, that I have at present on the back shelf of my greenhouse, a pan containing, I suppose, at least fifty bulbs of *persicum album*, almost every one of which shows signs of bloom, one having been expanded a fortnight, this being the 25th of November.—G. P. C., *The Vale, Jersey*.

## KITCHEN GARDENING.

### OCTOBER AND NOVEMBER.

THE first thing now to be considered is whether enough Cabbages have been planted, and, if not, they should be planted at once, as after this time the ground is rarely in good working condition. Give Cabbages intended to stand the winter in the seed-bed a good thinning and hoeing, and serve the Cauliflower-bed the same, but by all means make sure of plenty under protection of some kind. The Lettuce-bed should also be thinned, planting the thinnings on a part of the south border, say where the *Chrysanthemums* have been plunged, as that will be the only vacant spot in the garden.

The first dry day that we may have (and they have been few and far between lately), the earliest row of Red Celery should receive a final earthing-up, giving the late rows a little earth at the bottom, but not too much yet. The Asparagus-beds may be cleared of the ripe grass, and left just as they are till the first dry morning, when some of the best manure that can be had should be spread about 3 inches thick all over the beds and alleys, which dressing should be left on till spring, when the littery portion may be dug into the alleys, and the rotten part, which will by that time be as dry as dust, should be forked very lightly into the beds as it lies.

If it is intended to force Beans they should be started in November in gentle heat, though I think they are more useful and give more satisfaction when started immediately after Christmas. It is also a good time to provide the winter store of Potatoes, as they can be bought as good and as cheap this month as at any period of the year. I find that the York Regents do well before Christmas, and the Flukes after Christmas, till the early ones come in.

As the leaves will now be falling, it is a good plan as they are swept up to have them shot down with the stable manure, as a good heap of forcing material for the Rhubarb and Sea-kale will be formed without much trouble; the dead leaves, too, should be taken off both the last-mentioned, or at any rate that part which is intended to be forced for Christmas. I generally force them in the old-fashioned style, that of covering with pots and hot material about the middle of November; and in this month I generally wheel all the manure that is on hand into the garden wherever it is possible to lay a barrowful, as the barrows can be loaded back with the refuse of the crops, such as the decaying haulm of Dwarf Kidney Beans and Scarlet Runners, Colewort stumps, &c.

I may here mention that I have picked Beans this year without any protection whatever up to the middle of October. This autumn has been very favourable for the supply of vegetables; here we have had Spinach in capital condition, Turnips

the same, Savoys middling, Coleworts very good, Dwarf Kidney Beans and Vegetable Marrows a longer time than usual, and Brussels Sprouts first-rate, so that there has been as yet no necessity for beginning on the winter stock. I have previously mentioned that I keep my cropping as it were in two sections—for instance, taking at present the two squares of the garden, one is a counterpart of the other as regards the varieties and quantities grown, with this distinction that one-half is now ready for use, and will be cleared in time to prepare it for the spring cropping, while the other half will remain untouched till after Christmas, leaving the haulm of leguminous crops between the rows, and otherwise protecting the more tender sorts till about the middle of February.

As regards salading, the Celery will be in full yield, and the Endive blanched and protected, Lettuce the same, and Mustard and Cress will be grown under protection if required. I may mention that the Red Cabbage should be cut and more planted, if not already done.

I had hoped to have finished my subject in this article, but I find I must again return to it—that is, if your readers are not already tired of it at this dull time of year, and especially from such a dull pen as that of—BURNWOOD, P.D.

### PAULOWNIA IMPERIALIS.

A VERY fine specimen of this is growing in the nursery of Messrs. Bunyard, of Maidstone. It is about the size of a full-grown orchard Apple tree, the stem or bole being about 10 feet high below the branches, and its circumference at 5 feet from the ground is 34 inches. It seems to grow fast, for some branches that had been cut off had sent up shoots quite 6 feet long and 4 inches in circumference at the lower end. Every tip of the older wood contained a flower-spike, the buds swelling and evidently advancing too fast for the season they have yet to endure. I understand that it has once flowered well; but on the other occasion when it was preparing to do so the buds were destroyed or very much injured by the weather. The plant, however, is remarkable for the foliage, and possibly it may thrive in some sheltered spot on the coast. Those who are not acquainted with the plant may form some idea of it when I state that it most resembles the Catalpa, although it is of more robust growth and has larger foliage.—J. R.

### ORIGIN OF THE DALMAHOY POTATO.

In answer to "W. L.," page 382 of THE JOURNAL OF HORTICULTURE, this excellent Potato was raised by the late Mr. Joseph Smail, who was then gardener to the Earl of Morton at Dalmahoy Castle: hence its name.

I was one of his assistants in the gardens there at the time it was raised from seed, and planted the seedling plants when first turned out of the seed-pans. Tubers may be had true to name from Messrs. Lawson & Son, Edinburgh and London.—JAMES REID.

### RAIDS AFTER FERNS.—No. 3. DARTMOOR.

NEVER surely was hunter before so embarrassed by his gains as I was with mine on those Dartmoor hills. When a man shoots a partridge, I suppose he knows pretty well that it is a partridge, and whether it be young or old, well fed or lean, is nearly all the extra knowledge required. If he brings home a "good bag" he is content. I never yet saw a sportsman so keen as to carry game in his bag, in his pocket, and in his hands; yet this was often my pitiable condition. The cares of even grouse-shooters were nothing compared with mine. Let me confess the honest truth. I did not know my birds. I was not utterly ignorant, I did not mistake a barn-door fowl for a "hathefell," or a black cock for a grouse; but whether an extra feather or two in his tail made him a "variety," and if so what? that was my puzzle, and this sort of dialogue went on constantly.

"Hallo! wait a minute, I've found something."

"What is it?"

"A Blechnum."

"Yes, but what Blechnum?"

"I don't know, come and see."

"What's the use of my coming, I don't profess to know, and you do. Oh, ah, it's a sport."

"Well, if it is, it's a sporting neighbourhood, for there are several plants just alike."

"Oh, it's nonsense, I never saw such a thing."

But nonsense or no, out of the hedge we dragged some half dozen plants of Blechnum, with alternate pinnae divided from each other by a leafy margin like a notch, these pinnae suddenly contracting till they were no size at all to speak of. "Is it an anomalum? no, all the fronds are not fertile—variable?" "A fiddlestick," said my companion, going off quite offended, "but, no, it was not that."

Another time it would be, "What's this?" "Oh, a dilatata," dilatata doing duty for every large Fern not Filix-mas, or not undeniably Filix-femina. "No, it can't be dilatata, for the lower pinnae are the size of the upper; but it is very like it." "Why, I declare it's an Athyrium! This is a strange bird, some of the fronds are like a Filix-femina, and some very like a Lastrea, only the Lastrea-looking fronds have little or no fructification. What can it be? It has a purple stem, and the texture of the Lastrea-looking fronds is thick and leafy. What is it?" To this minute I do not know, it has thrown up some new fronds, some barren, some fertile, and each preserving its own peculiar characteristic.

Not far from Ashburton, is a beautiful little moorland village called Buckland-in-the-Moor, commanding one of the finest views I have ever seen in Devonshire. It has its church, its parish priest, but no shop, no public-house. With a hunter's fare of a few sandwiches, and a cordial in a flask, I went to Buckland on a raid, determined to follow, or rather to head the river upland. I went to a cottage to borrow a boy to carry my bag. I shall not soon forget that cottage, so remarkable was it for cleanliness, positive comfort, and well-to-do-ishness. The week's scanty stock of clothes (it was Saturday) lay neatly folded on the table. A clean, fat baby was in a cradle, while another toddler was at the door, playing at making dirt pies, with a grubby-faced brother. "Father" was gone four miles off to Ashburton market. Did I not see him with a little girl, "my eldest at home," just as I came in? "Your husband is a small farmer?" said I. "Oh, no, only a farm labourer, and we have eight children, but three are out at service." A farm labourer, whose utmost wages would be 12s. a week, five children to provide for, and all neatly patched and warmly clad! What could it be? A long experience of the lives of many poor neighbours answered the question. "No shop, and no public-house." So I borrowed the eldest boy, and went to the river, which flowed by the very door of the cottage, with a little, rippling, happy sound, as if content with all it knew of life there. We divided the sandwiches, sitting down on a stone draped with moss, and long pendant branches of *Lysimachia nemorum*, or the "Golden Star." It was a day of perfect beauty; one of those days so difficult for even a poet's pen to describe, because when we look on what is most fair on earth, there ever comes with the beauty, thronging unbidden over the heart, human thoughts of decay and death. We feel as good George Herbert felt, when he wrote—

"Sweet day, so cool, so calm, so bright,  
The bridal of the earth and sky,  
The dew shall weep thy fall to night;  
For thou must die."

It is in the essence of the very perfection of any earthly good, that with the satisfaction it gives a longing for something yet more perfect, and less fleeting. It is the immortal pleading for remembrance, lest in our fluttering joy we should forget its higher claims.

The little lad eating sandwiches, out of which he took the meat and gazed at it as at something out of the common, felt none of this. He knew when he was hungry, and when he was filled, and for the rest he opened his eyes, and wondered, if dull inanity can be called wonder. Presently even he was roused. We were on a lovely moorland slope, sunny, and shelving to the river. "They plants," he jerked out, "are Strawberries, and there are ever so many up long by that reave (stone boundary), and down long here basketsful." I found that I was, indeed, treading on beds of wild Strawberries, which grow in vast quantities on Dartmoor. Then we entered a wood, and my companion was lost in stamping on Chestnuts, and eating the fruit.

We found such Lastreas, such Athyriums, and such Blechnums, as I have never seen before or since; but nothing remarkable beyond the size. After a long search my heart gave a bound, for I saw beneath my feet not one, but many Athyriums with fronds—but how shall I describe them? The apex of both frond and pinnae had little endings like fishes' tails,

Were they apuæforme? I think certainly they were, and I shall so call them till I have found another name. I found two, as I believe, distinct varieties of *Filix-femina*, having these singular fish-tail-like terminations. Formerly I should contentedly have set them down as simply multifid varieties, thinking "a Rose by any other name would smell as sweet;" but if Shakespeare had lived now-a-days he would never have dared to have put that speech in the mouth of a Juliet, "what's in a name," indeed? Why, so-called immortality. My fish tails (some of them) have three points, if I am only quick enough I may have the honour of having added to *Athyrium*, *Filix-femina odontomanes apuæforme*, var. *Nimrodia*.

My Buckland discoveries were not solely confined to *Athyriums*, they extended to *Asplenium trichomanes*, with fronds a foot in length, the lower pinnae lobed and somewhat serrated, one frond being branched like a little tree; but though I brought away the roots, having never before met with such fine specimens, I put down the peculiar formation as owing to situation, because it only occurred in a marked degree here and there.

The moorland *Lastreas* vary as much as the *Athyriums*. I found *Lastrea oreopteris* with serrated pinnules; *L. Filix-mas* with the apex of the fronds and pinnae forked; *L. dilatata* in half a dozen marked varieties; also, if I mistake not, I found in a low wood by the river's side, a dozen or more fine plants of *L. uliginosa*. I detected them at once, and my acquaintance with *uliginosa* has been small, by their finer texture, and the peculiar look of the rachis and spinous pinnae. In the same wood I found a beautiful specimen of *L. Filix-mas crispata*, with the dark bright green pinnae overlapping each other like a well-tiled house. This variety is very pleasing, because it cannot well be mistaken for anything else: the density of the pinnae causes a sort of fan-like projection down the rachis, the effect of which is exceedingly pretty.

Ashburton was our market town, where once a-week old women and children bring in their pennyworths of garden produce, and sitting down demurely before their baskets await the half-finished visitors to the moor. A few joints of meat hang at unsavoury-looking stalls, and that is the market. But the magic hour of this market is three o'clock. The good genius is the omnibus, and the thing itself is fish. People drive in from the distance of many miles to meet the fish, friends are invited beforehand to eat it, and lo and behold sometimes there is none; but the old women and children sit demurely on, with a few Carrots, a Broccoli, an Apple, and an Onion before them, and so "squash pie" has to take the place of fish.

The country round Ashburton and Buckland is most beautifully wooded, and in this respect loses the peculiar characteristics of moor land. One misses the wide soft sweep of Gorse and Heather, and the melting grey of the granite tors. The impression of mystery and eternity that the true moor cannot fail to give is exchanged for the look of home, while the deep stillness breaks into the happy voices of little children playing about cottage doors, and the fresh breeze brings on its wings the murmurs of the neighbouring river.

I think my grandest day on the moor was that which I spent at Grimspound, a fortified aboriginal village, or primitive British town, situated on the north-west slope of Hamilton, and to which a moor boy steered my course by "reaves," and "riding bogs," in a masterly manner, discoursing meanwhile on the pleasures of rabbit coursing in winter time, and "hathefell" shooting when "mate" was scarce, interspersed with accounts of dangerous expeditions after "Harts," when "little sister and me lost our ways in a mist, and wandered hand-in-hand to a far-off village."

Speculation has been very active as to Grimspound, and learned heads have been put together to decide on the merits of the various suppositions. In themselves the remains are exceedingly curious; a large circle of immense stones piled on each other and covering nearly four acres of ground, encloses within its walls a number of the hut circles I have before mentioned. There are paved entrances opposite each other, and a stream of water rising on the spot, is cunningly hidden and built over by the wall, so that a supply of water was always at hand. The wall, or circumvallation, is in no part of any great height; indeed, it is so low, that the first feeling on seeing it is one of disappointment, which after examination gives way to intense interest, and you begin asking yourself, as the learned men do, "What can it have been?" Some answer, "A colossal Temple of the Sun." Others refer it to the seat of judicature for one of the early divisions of that part of Britain. Moor-men say,

Well, they stones be curious, and a biggish pound for cattle

sure enough." But the best-sustained theory seems to be, that Grimspound was built as a general place of protection for the people to assemble in, when threatened by a common danger. Hamilton beacon rises majestically above the ruined stronghold, commanding all the neighbourhood. A fire lighted there would at once be a warning of danger, and a guide to safety. The base of the rampart, in some parts, is said to be 20 feet broad, and the date given for the erection of the village, before Christ.

Most strange was the feeling that came over me, as I sat resting on the ruins of the ancient dwellings of my people. When Rome was building her majestic temples, her Colosseum, her fountains, and her palaces, my people were dwelling in the rude huts before me, the same glorious hill sheltering them, the same wild flowers and Mosses beneath their feet. A few feathers from a blackcock's wings lay on the ground by my side, and gave me visions of savoury messes eaten on the very same spot by my grand parents. As they ate did they quaff, I wonder, the famous drink made in days gone by, from Heather flowers? or had they the Russian receipt for Whortleberry wine? Sir Walter Scott states that in the memory of old moor-fowl-shooters, they were regaled in remote shepherd huts by a "light, lively, and pleasant liquor brewed chiefly from Heath flowers," and we read that in St. Petersburg a drink made from Whortleberries is commonly sold in the streets.

I cannot say that at Grimspound I felt altogether so proud of my ancestors as I could have wished; albeit, they displayed much cunning and ingenuity in their buildings, and, doubtless, they did the best they could.

Beneath the stones of the hut-circles I found the same *Lastrea dilatata* growing that I had found elsewhere, with the coal-black fructification. On the rocks were Lichens and Mosses of many varied kinds; amongst them, and by far the most lovely, were the Coral *Sphaerophoron*, of which I found three distinct kinds, coralloides, fragile, and compressum, each wonderful in its minute loveliness. The whole of Dartmoor abounds in Ferns, Mosses, Lichens, and the rarer shrubs. The *Lycopodium clavatum* and selago grow in abundance on Hamilton. The wild Cherry (*Prunus cerasus*), Raspberry (*Rubus idæus*), and Currant (*Ribes rubrum*), are to be met with; the Burnet Rose (*Rosa spinosissima*), and Downy-leaved Rose (*R. tomentosa*), with a thousand other shrubs and plants, tempting the tourist on from hill to hill, and valley to valley, in endless and varied successions of interest and beauty.—  
FERN-HUNTERS.

#### TODMORDEN BOTANICAL SOCIETY.—Nov. 6TH.

Among cryptogams, and especially among Filices, were many extraordinary things, a variety of the Hart's-tongue, for instance, with fronds of a creamy white, a thoroughly permanent variety, moreover. Surely no other "sport" of this sportful species may be compared with it. *Scopolopodium vulgare henionitoides*, also exhibited, has exactly the appearance of the novel *Asplenium palmatum* (*Hemionitis cristatum*! *Scopolopodium vulgare lonchoporum* ("spear-bearing!" how could any mild-dealing botanist ever think of approaching, much less handling, so dangerous a plant!) has fronds 12 to 15 inches long, and only half an inch broad, or less, throughout. It is a most curious sport, and we were informed, perfectly constant. Among other novel or rare British Filices were *Athyrium F.I. cornigerum* (M) a new Lady Fern of merit, *Asplenium Adiantum-nigrum microlon* (M) true, and *Lastrea dilatata Howardii* or *Howardiana* (Monkman), a magnificent variety of the Broad Buckler Fern, bearing the same relation to the type that *A. F.I. Fieldia* does to the ordinary type of Lady Fern, every pinnae on every pinna being distinctly cross-shaped! Among exotic Ferns were: *Nothochlæna Maranta* (most beautiful when well grown, with bright peacock-coloured fronds, furnished on the under side with richly-coloured scales, but usually grown in too much heat, protection from frost being alone required) a bifid form of *Lomaria glabra*, one of the finest of the Lomarias, and the new and beautiful *Adiantum Feci* (to be kept out of the stove and in the greenhouse). Mr. W. Hobson, of Philadelphia, U.S.A., a correspondent of the Society, sent examples of *Schizæa pusilla*, gathered in swamps near that city. This is one of the finest and rarest of Filices, certainly of North-American Filices; so tiny is it that only the keenest and most practised eyes could detect it, wild. Mr. H. announced also his discovery, after a long and patient search, of plants of *Lygodium palmatum*, beyond all question the most beautiful of North American Ferns. Mr. Hobson will report further at subsequent meetings. One of the Society's New Zealand correspondents sent the following, gathered chiefly in the neighbourhood of Auckland; *Polyopodium grammitidis* (Sm.), *Hymenophyllum rarnm* (Sm.), *H. crispatum* (Wall.), *Trichomanes humile*, *Nothochlæna distans* (?), and *Phylloglossum Drummondii* (Lycopodiaceæ). Mr. Barnes, of Milnthorpe, sent examples of two new and splendid forms of *Lastrea montana*, the one marvellously caudate, the other singularly narrow and

abbreviated, both very beautiful, lately gathered by him in Mardale. In the discovery of varieties of a Fern that is usually regarded as not at all "sporting," Mr. Barnes has had singular success, having gathered not less than half a dozen distinct forms within almost as many months. A variety of *Adiantum capillus-Veneris* was exhibited, from the Cornish coast, so much and so profoundly incised as hardly to be referable to the type. Mr. J. Hartley announced the discovery by Mr. William Pickles (Newbride, near Hebden-bridge), in the prolific Hebden valley, of a new habitat for *Osmunda regalis*, the royal *Osmunda* never having been previously found in that neighbourhood. Mr. B. Sykes submitted specimens of seedling *Athyriums*, amongst which was noticeable a multifid "excurrens." Apropos of Fern-sports, the learned and viva-

cious editor of "L'illustration Horticole," M. Ch. Lemaire, in a late Number of that periodical, referring to the many curious forms of indigenous Ferns exhibited at a recent show of the Royal Horticultural Society, by Messrs. Stansfield and Ivery, remarks, "And there can be no doubt that cultivation has done all this, for of the exotic Ferns that reach us, none, or almost none, show variations so marked!" &c. Cultivation has done but little of this. The major part of the vegetable curiosities over which M. Lemaire is so justly exclamative, were exhibited intact, precisely as they had been found wild. But now that the nature of the spores of cryptogams has been so closely looked into, now that hybridisation has been proved practicable, who shall say what cultivation cannot or will not do?

### HOUSE FOR GROWING THE MANGO AND MANGOSTEEN.

As my papers on the cultivation of the Mango, Mangosteen, and other tropical fruits would hardly be complete without some account of a house in which to grow them, I purpose this week saying a few words on the subject, particularly as a good deal more depends upon the house itself than most persons would suppose.

Abundance of light is the main thing to be considered in erecting a stove for these trees, as unless they have all the light our murky skies will afford, there is no chance of their fruiting, although the plants themselves may grow well and even flower. Some time ago I was asked by a lady to look at three Mango trees which she had, and which had been cultivated strictly in accordance with my directions, without, however, obtaining from them any fruit. On going to see the trees I found they were at the back of an old-fashioned and rather dark lean-to stove, half smothered with Pines, and shaded on one side by Banana trees. The moment I saw them I recommended their being removed into a new light house hard by, which could be kept warmer than the Pine stove, and where there were no other large plants. About twelve or fourteen months afterwards I received from the lady a letter, accompanied with two well-flavoured fruit, thanking me for my advice, and informing me that one of the trees had just borne fruit for the first time, although it had been in her garden for ten years and more. So much for light. But to return to our house.

I should recommend its being span-roofed, and as low as practicable, in order both to economise heat, a very important matter, particularly in winter, and also to keep the trees near the glass, which will prevent their becoming lanky and drawn, and will enable them the better to ripen their wood.

The accompanying engravings represent the house in which for some time I grew and fruited the Mango and Mangosteen, and which, for ordinary purposes, is, I believe, as good as any which could be devised, except that for large trees it would require to

be higher. Fig. 1 is a section of the house, and fig. 2 the ground plan, showing how the trees are arranged.

The house is a span-roof, running north and south. It may be of any required length, but 30 feet is a fair size for a beginning, and will accommodate ten fruiting trees. It is 16 feet

wide, 10 feet high in the centre, and 6 feet at each side; both the ends and sides are glazed, and rest all round on 2 feet of nine-inch brickwork. Down the middle is the bark-bed, 22 feet long, by 8 feet wide. It is 4 feet deep, 1 foot being below the ground level, and the walls are either of brick or thick slate. The house is heated by hot water in four-inch pipes, P P, which go all round excepting where the door is. There are two distinct sets,

Fig. 1.

both can be used at pleasure, the boiler and furnace, r, being outside at the north-east corner. There are sliding slate ventilators, v v, just below the hot-water pipes, three on either side, each being 2 feet long by 8 inches wide. There are also two other ventilators close to the ridge of the roof, one being in the north side, and the other in the south. As every ray of light is of consequence, the panes of glass both in the roof and sides are as large as possible, and the laps in the roof are very close. The top sashes I should advise being fixed, as sufficient air can always be obtained by means of the ventilators, and there is a great danger of chilling the trees if the roof-lights move.

I prefer tan, when it can easily be procured, for giving bottom heat, and for plunging the pots or tubs in, to heating the

Fig. 2.

middle bed by hot water. I always fancied (it may have been only fancy, however), that the trees seemed to thrive better in it than in anything else. Still, I have no doubt but that hot water in a tank under the bed would do as well, or nearly so.

In fig. 2 we see the arrangement of the bark-bed, showing how the trees are planted. The four trees, 1, 1, 1, 1, down the centre of the bed are the Mangos trained as standards, there should be at the least 5 clear feet between each. The other

ten should be at the least 5 clear feet between each. The other

ten should be at the least 5 clear feet between each. The other

six, marked 2, are the Mangostens, three on each side. The trees are all in pots or tubs, and planted in quinonx order, as no other form insures such an equal amount of light and air to each. Such a bed will hold ten fruiting trees, and more must not be put in, or there will be too much shade.

Anona (Sweet-Sop) bushes, however, may be grown in small pots and plunged in the tan between the plants, or placed on the shelves round the house. No creeper or climber of any description should be permitted, as the shade would be most prejudicial, particularly when the fruit was ripening. It is true, I have seen *Passiflora edulis* grown in such a place, trained up the north side, and as the temperature is just such as suits this Passion-Flower, it grew most luxuriantly, and fruited every year; still, I should not like to recommend this as an example to be followed, as all shade is injurious to the trees, and it should always be borne in mind that no sunlight, however powerful, will injure the Mango or Mangosteen.

The Mango, Mangosteen, and Sweet-Sop, do very well together in one house, and the Banana, too, thrives there amazingly, indeed, it soon become numanageable, owing to its large and shading foliage. The Durion, on the contrary, is better in a house by itself, where it can have plenty of heat and moisture while growing, and a lower temperature than would suit the Mango or Mangosteen, when at rest. It should also, as I mentioned before, be trained up under the glass like a Vine.—J. H.

## WORK FOR THE WEEK.

### KITCHEN GARDEN.

We have lately experienced such a continuance of wet weather that it has been almost impossible to proceed with out-door work every day; but we trust that there are few instances in which the labourers have been thrown out of employ. It is true there are some gardeners who can scarcely find sufficient for garden labourers to do for the space of one day; but we never yet knew one skilled in his profession who could not employ his men within-doors for weeks in various ways to forward work at a future time. Numerous articles which are now purchased at a distance from home might be made by them. *Asparagus*, if the soil in the frames in which the roots are planted should become dry, it will be necessary to water it with water of the temperature of the bed; but this is not often required if the bed heats moderately and the roots were properly watered when planted. There should be at least 5 or 6 inches of soil of a loose open texture, such as leaf mould or old tan, put above the crown of the roots after they begin to shoot. Admit air freely to the productive beds. *Beans*, where they have been planted in rows and have made their appearance, draw the earth in ridges on each side of them, so as to afford some little protection from cold cutting winds. *Peas* in rows should be similarly managed. *Cauliflowers*, watch narrowly for slugs amongst the young plants, and keep them free from dead leaves. If any are planted in pots for the purpose of protecting them during severe weather they must be carefully attended to with water, otherwise in spring it will be found that the time and trouble expended on them have been wasted. *Cucumbers*, those in pots or tubs in forcing-houses will require a little fresh soil over the roots occasionally; this will keep them in vigorous health. *Dearf Kidney Beans*, as they are very subject to the attacks of insects in forcing-houses, every known means should be used to keep these pests under. The plants should be frequently sprinkled with water, and if red spider become numerous a brisk syringing should be applied. *Herbs*, any that may be wanted in a green state should be taken up with balls of earth about their roots, and immediately potted and placed in a forcing-house. *Lettuce*, the young plants in frames should have all the air that can be given them in mild weather; keep them, and also those in the borders, free from dead leaves and litter of all sorts that is likely to harbour slugs. *Rhubarb*, take up and pot old roots for forcing, if a succession is required; or they may be laid in a Mushroom-house that is at work and slightly covered with soil. As soon as the weather will permit wheel the remainder of the rotten dung out of the framing-ground, so that all the pits and frames may be ready when wanted for use. Prepare stable-dung for forcing; mix leaves with it.

### FRUIT GARDEN.

Proceed with the planting of fruit trees in open weather, and if the soil is old let each tree have a good portion of the new soil about its roots. Pruning and nailing all sorts of fruit

trees, except Peaches and Apricots, must now be vigorously prosecuted. Leave nothing to the spring which can be done now, every day gained now will give greater liberty for extended operations in spring. Trees infested with scale should be loosened from the wall entirely, the bark well scraped, and painted with a mixture of a soft soap, cowdung, and lime, taking care to well work the composition into the crevices of the bark. Prune Gooseberry and Currant trees on frosty mornings, or when the ground is in a dry state. After pruning give the ground between them a good dressing of lime, which is useful as a preventive of their great enemy the caterpillar. Where the Raspberry grub is troublesome give a good dressing of gas lime before digging the ground, taking care to apply it regularly about the base of the canes. The ground amongst fruit bushes should be dug very lightly, especially in the case of Raspberries, which have their roots near the surface, and it is better in all cases to dispense with digging where it cannot be done without injuring the strong roots.

### FLOWER GARDEN.

At this season of the year a little labour will secure a valuable supply of material for enriching the flower-beds and borders. Leaves are generally everywhere at hand; they should be carefully collected and stacked in some out-of-the-way place, with a mixture of road sand, or light soil, rotten sticks, and decaying vegetable matter, and left to decompose, and in a season or two the result will be a most valuable compost, especially suitable for many of the shrubs and plants which decorate our gardens. Earth worms have been exceedingly active during this wet weather in throwing up their little heaps on the lawn, giving it, when neglected for a few days, a most untidy and disagreeable appearance. A stop may be put to their operations by watering the lawn with lime water, in a clear state, which will soon bring the worms to the surface, and at the same time destroy them. Take advantage of wet days to pack up *Dahlia* roots in dry corners of the store-room. Clean up flower and other seeds from the stalks, tie them neatly into packets, correctly naming each sort; also, make and write labels, prepare stakes, and tie them into bundles, and stow them away in a dry place until they are required; form protective frames of straw or other materials, to shelter tender plants and shrubs during severe weather.

### GREENHOUSE AND CONSERVATORY.

The winter flowers will now be making a splendid display in the conservatory; at least, when they have received special attention during the summer, with this object in view. The *Euphorbia jacquiniæflora* is one of the foremost of these beauties when properly cultivated. Unless, however, a healthy root-action is maintained, the leaves are apt to become yellow whilst the plant is in blossom, and this will at once spoil the effect. It requires a very moderate allowance of water at this season. *Poinsettia pulcherrima* is a fine conservatory plant, and indispensable at this time of year. Well-grown plants of *Gesnera bulbosa* and *lateritia*, are equally useful. These should be slightly pot-bound in order to blossom well early. *Gesnera zebрина* is a most beautiful winter flower, and equally desirable on account of the elegant markings of the leaf. *Plumbago rosea* and *capensis* are still amongst our best plants at this period. Some of the genus *Cytisus* are very showy and fragrant. Remove *Chrysanthemums* as their flowers fade. The earliest-started *Camellias* and *Epaerises* will be advancing into bloom, as well as the useful *Erica byemalis* and *Wilmorea*, *Oranges* and *Daphnes* should be introduced as they show bloom. *Neapolitan Violets*, *Mignonette*, and *Cyclamen persicum*, will assist, with the most forward Roman *Narcissuses*, in making the house agreeable till the more showy forced plants come into flower.

### STOVE.

Many things will be sinking into repose here, and from such water must be entirely withheld. Of these may be named the *Erythras*, the *Clerodendrons*, the *Achimenes*, the *Gloxinias*, &c., with various bulbs. These should have a shelf or division of the house to themselves forthwith, and it should be borne in mind that the *Gloxinia* family and the *Clerodendrons* are very impatient of low temperature, even when at rest we should not deem them safe below 50°.

### PITS AND FRAMES.

The stock of *Carnations* and *Picotees* ought now to be fairly established. The surface soil should be stirred, and a constant circulation of air kept up amongst the plants in all weathers, except severe frost. To accomplish this the frames ought to have sliding doors at the back and front, by which means a

current of air can always be obtained. Auriculas and Poly-anthus in frames require very little water, with the simple attention of removing decayed leaves.—W. KEANE.

### DOINGS OF THE LAST WEEK.

THE continuous wet, dripping, foggy weather has greatly hindered all out-door work in the garden. Where lawns would not be disfigured, planting all kinds of forest and ornamental trees and shrubs might be proceeded with to great advantage whenever it is fair enough above-head; but wheeling and weeding lawns, or even sweeping them in such weather, would almost make as much work as that which was done, and much of the clearing-up of leaves, &c., in the kitchen garden has been left until the weather be a little drier. Much of the indoor work of previous weeks has therefore been continued, and we need not recapitulate it.

#### KITCHEN GARDEN.

*Mild Hotbeds, and Fermenting Materials.*—Took occasion, when at all dry, to turn over, several beds covered with frames, and which had been used for Cucumbers and Melons. and then for bedding-stuff, taking out what earth was left, raising the beds at back, placing a piece of board beneath each corner, and then a block, or some three or four bricks above that, thus giving the frames a slope of from 65° to 70° or less, instead of 80° or 85°, so as to throw off the water better. Some frames from standing so long had nearly levelled themselves, and the weight of the old sashes, from which the paint had long gone, was considerable. With more of a slope they would not have had the chance of retaining the water about them. Then from the beds that were covered with the frames thus elevated at the back, we took away a little of the most rotten dung and leaves at the surface, laid a little aside to go on the surface again, and having turned over the bed to let the air in, so as to cause what was not thoroughly wasted to ferment, we filled up with tree leaves, that had been placed in a heap near at hand to prevent wheeling, the depth of these being from 15 to 18 inches at the back. Over the leaves a little of the more wasted material was placed, and then a little of the dry burned soil from the burning and charring heap, and then the beds were used for young Geraniums, &c., not yet fully rooted, and Cinerarias that were wanted to come on, keeping them cool by plenty of air, as the extra heat from the leaves was mild indeed, but useful for many things: and other beds were filled with Strawberry pots, just to set them going gradually, plunging them in the soil, &c., an inch or two to keep them level. To secure such frames from roasts, the sides were banked up with the stems of Ageratums, Phloxes, Verbenas, Variegated Alyssum, &c., brought from the pleasure grounds. Even such a little matter as the setting and fresh arranging of these frames required a little consideration. We had no more hot and fermenting leaves than would have been sufficient for one good bed, and that would have been too hot for such purposes as we required. With that quantity we have made eight or nine two-light boxes very serviceable for what we want for some six or eight weeks to come, the little mild heat below keeping the things safer in any emergency, and permitting of more air by tilting the glass in damp weather. Then the placing of the new leaves close to the surface is also of importance, as when these beds must be renewed ultimately for hotbeds, the new material is easily separated from the old, to be used again, whilst the well-rotted fermenting material comes in for other purposes.

As our Cauliflower plants are not quite so forward as usual, we potted a lot, and pricked-out others into boxes, placed them in one of these beds, and will continue them there for a month or six weeks to encourage them. Those saved over the worst of the winter in pots generally do so well, that this season we have placed some four plants round a six-inch pot; when established we will shift them into nine-inch pots, and when again established in these will turn them out of doors in a lump in well-aired rich soil, either with or without a hand-light over them. Some half a score of our early Cauliflowers buttoned last year, but there will be little chance of their doing so this season. We sowed a fortnight later than usual. The little extra care will make them early enough. If they had been a little earlier no care would have been necessary, except keeping them from slugs and severe frosts. Large plants at this season are apt to button—that is, present you with a flower the size of a button in spring, and every one that does so is so much time and labour wasted, and this has led us to sow later and later every year. The end of September, in a cool airy place, will gene-

rally be late enough. The plants become too strong with us when the seed is sown in August or the beginning of September.

Such beds might have done on an emergency for Asparagns, Sea-kale, Rhubarb, Radishes, early Carrots, &c., but the height of the old beds was rather against them, and there would not have been the continuous mild bottom heat which is required for such of the above as we could not well put in the Mushroom-house. To keep us going, therefore, we contrived to make a small space of fresh beds for some of the above by saving a few of the leaves referred to, turning a couple or so of these old beds to their bottom, placing all the rotten and thoroughly decayed materials on one side, to be wheeled away in the first favourable weather, and putting all that would yield heat from farther decomposition also on one side, and then mixed part of that with a heap of litter and refuse from the pleasure ground beginning to heat nicely, putting a covering of 3 or 4 inches of the half-decayed material over the surface. A nice mixing of such materials will furnish a genial mild heat for a long time, and then the material by the time the longest has heated itself dry will be used, with some addition, for hotbeds to carry us through the summer.

Circumstances have compelled us to make the most of our fermenting-heap, and thus everything not very succulent, be it clearings from the flower-beds or otherwise, is mixed with the fermenting-heap to give out the heat stored up in it before it decays; and the same circumstances have long compelled us to give up sweetening fermenting-heaps until they become quite sweet, and almost as dark and short as if a good spade could cut them. We find no fault with the system, it answers very well where material and labour are abundant; but we want the heat that is thus lost in the processes of preparation, and we want bulk rather than such fine quality, and therefore we resort to a careful mixture of rather fresh materials, and secure sweetness by a layer of old half-decayed substances at the surface, which keeps down all deleterious steams and gases. All the good dung we can procure in winter and spring would scarcely suffice for Mushroom.

A good many years ago, though only having the dung of two or three, never more than four, horses, we had almost as much fermenting material for beds, and of the best kind, as we could wish, and that is saying a good deal, and the garden and pleasure grounds reaped the benefit. A good part of the park had not been mown, nor had it been grazed heavily, and, therefore, it presented a very rough appearance, with its dried bents and tussocks of grass. The notion was entertained that these dry, withered tussocks, although they might shelter four-footed game, would injure the grass of the following year, and render it less fit for hay. We gladly took the opportunity of offering to clean them all off, and a nice job it was in the dark, wintry mornings, when it was not frosty, to turn out so many wielders of scythes to chop over these tussocks, not too low, and in regular swathes. We soon collected loads of this beautiful material, which, mixed with a few tree leaves, became perfectly sweet, and when built in a bed with a layer of dry litter, or of small tree branches every 9 or 10 inches, gave for a long time a gentle, continuous heat. We recollect with the help of such tussocks almost alone, we cut fine Melons in April, under a common frame, as early as ever we had them with hot water. After some seasons, however, it began to be perceived that the park was none the better for what we had taken from it, and therefore in this direction we were arrested in our willingness to oblige. No better material for a nice, sweet hotbed, however, can be found.

Almost the only other material not generally used, was moss, and that, too, is excellent, but not quite equal to the tussocks of withered grass. Sometimes good lots of this can be procured from the raking and harrowing of grass lands that rest on a clay bottom. We offered to clear a large bank with rakes, where in winter the moss grew so strong as completely to hide all appearance of herbage. We soon collected a number of cart-loads, and useful it was for many purposes, besides becoming a part of the heating fermenting-heap. Our own opinion is, that the grass in the following season was much improved, even from this clearing away of the moss, but those more and chiefly interested considered that the laying bare of the roots of the grass tended to hurt, and even to kill them. We believe that if a top-dressing had been given to the cleared part both the grass land and the garden would have been mutually benefited. We could not quite go that length about a continuance of clearing off the tussocky grass. We fear there was a little of "beggar my neighbour" in the question; at least it would be so if the cutting went too low, or was repeated frequently

It certainly made a great difference in the appearance of the park, and many a gentleman even on that account would consent to cutting, although there might be a trifle of ultimate loss. A very little soot mixture or other artificial manure would more than make up for the loss.

**Mushroom-beds.**—We have been requested to give an answer here to "Anxious" about the propriety and possibility of producing good Mushrooms without dung, and merely by using a fermenting heap of tree leaves; as he can obtain plenty of leaves and scarcely any of the latter—none at all, indeed, except a few bushels of such droppings as can be picked up by an old man on the roads and highways, but not enough even of them to make anything like a shallow Mushroom-bed, or create the necessary amount of heat. Now as to the impossible, that word must be pretty well discarded from the gardener's vocabulary. We have had some fair Mushrooms that were produced from beds of tree leaves, but by using much more and larger pieces of spawn; but the results were not favourable enough for us to recommend the plan. We have been more successful when a good lot of the withered grass alluded to above was mixed with the tree leaves, the former yielding more nitrogenous material, whilst the tree leaves chiefly consisted of carbonaceous matter. There was another difficulty: unless the leaves had previously been subjected to a high, almost burning temperature, there was a likelihood of numbers of Funguses being produced besides the true Mushroom. On the whole, then, though discarding the impossible, we do not recommend Mushroom-beds to be made solely of tree leaves, or of leaves and long dried grass, &c., combined; but leaves may form the great bulk of the bed, with a thin coating of droppings, which our correspondent can obtain, and such beds will be lasting and productive. We have often had fine beds thus made: Collect the tree leaves to be used into a heap—Oak leaves are the best, Beech and Elm next best. If dry, water a little, so that the leaves may heat rather violently. In eight days turn the heap, placing the top at the bottom, and the centre at the outsides, and the outsides in the centre; tread or beat rather firm, and then cover with about 6 inches of fresh leaves. By another eight days, if the weather is mild, the heap will be very warm, which is necessary to destroy all sorts of spawn and cause slugs, &c., either to die or to take themselves off. Then remove the outside leaves, and with your hot heap begin to make your bed from 18 to 36 inches deep, though the first will keep the heat a long time in a close place. Beat and tread the layers as you go, and thoroughly at the last, and then put in trial sticks 9 inches and 3 inches deep. As soon as the point of the upper stick, the one 3 inches or so deep, is no warmer than new milk, and the stick placed deeper shows the heat is on the decline, put on from 2 to 3 inches of your road-collected droppings. If a lot of drift is mixed with the droppings all the better; beat this also firm, and watch for a few days, say two or three, and if the heat does not rise again, but keeps pretty equal, then insert the spawn in pieces about the size of a walnut into these droppings, covering the pieces merely a quarter of an inch or so. Beat, and watch the trial sticks; and in a few days, if the heat continues regular, and is rather inclined to sink than rise, then place from half an inch to an inch more droppings all over the bed, beat again, and very shortly, if the heat continues regular, which it is almost sure to do, earth, beat firm, and treat in the usual way. The spawn placed so shallow can scarcely be injured if there be a slight increase of heat; but to guard against that increase is the reason why we advise doing the work by degrees. Two or three inches of horse-droppings will thus be sufficient for a rich plentiful bed. Most likely when the bed is done with you will find large strings of the spawn running freely among the leaves; but, nevertheless, the casing of more nitrogenous animal matter will be a great advantage.

Give all the air possible to salads, Cauliflower-pit for use, &c.

FRUIT GARDEN.

Took all Strawberry-pots under protection of some kind, so that they might be sheltered from heavy rains and keen frosts. Those who cannot do so should plunge the pots in the ground, or in ashes, and protect with straw hurdles, &c. A good many forget that a plant in a pot unprotected is in a far worse condition as respects casualties and changes, than if it were planted out in the ground. Placed a number of Keens' Seedling, &c., in the beds alluded to, where they will just have a little heat, previously taking away the faded and older leaves, scraping off a little soil from the surface, and adding a rich compost instead. At this season these plants, though within a

few inches of the glass, must have only the mildest heat. A fortnight ago we had some very fair Black Prince Strawberries, but the few gathered for eight days have been less dark in colour, and not so good, we presume, in flavour. Air in any quantity will not make amends for the absence of the sun's rays.

From tree pots in the orchard-house picked away a good bit of the surface soil, and supplied with fresh compost, consisting of fresh fibry loam and cowdung. These pots had previously been lifted to break any roots that had gone beyond the pots. This renders root-pruning an easy affair. The great objection to pots is the watering they require in summer. Other matters much the same as in previous weeks.

ORNAMENTAL DEPARTMENT.

Everything in pits and frames wanted looking after to prevent damping, and to secure a circulation of air. In some foggy days it was better to keep shut to keep the fog out. In such times the want of a hot-water pipe is felt, for that would cause the air to move, and also keep out fog, by converting the heavy thick fog into invisible vapour. Had to look sharp after mice among potted bulbs, and after rats among Violets in a bed under glass. One rat was caught in a trap after cutting off in mischief lots of flower-stalks, and tearing other plants out by the roots, and making part of the place like a ploughed field. Auriculas and Polyanthus under glass must be guarded from drip in such weather. Stocks, double Wallflowers, Pinks, and Carnations cannot be kept too dry and hardy. Young Mignonette should have all the air and light possible. Examined the roots of Dahlias and covered up with dry earth in a shed for the winter. Brought as many bedding plants into vineries, &c., as possible, where, in severe weather, for a couple of months they may have the help of fire heat when necessary. Had the rest fresh picked and fresh arranged in frames previously whitewashed, &c., inside, so as to be warmer and drier, and receive more light as already hinted at. Potted Humeas, Cinerarias, and many other plants. Gave as much light and air as possible to hardwooded plants. Put a few hardy things in heat for forcing, also Lily of the Valley and softwooded plants. Gave a slight heat to the forward Cinerarias, to bring them into bloom. Gave all the light and room possible to Pelargoniums, and watered all things with care, guarding alike against the extremes of moisture and of dryness. In the case of pits and frames in continued dull weather it is very handy to have two sets of sashes, taking off those loaded with moisture and putting on dry ones. In severe weather double sashes are also very useful, and the agreeable temperature thus secured prevents condensation of the moisture inside of the glass. This is a great annoyance in flat houses, as well as in pits and frames. There are many modes of preventing it, but all costing money to carry them out. To guard against damp, as little water should be spilt anywhere as possible. As soon as we can we will have Stanhopeas fresh-packed and other hanging plants duly looked at. A fire in plant-houses now, with air on, both during the day, does much to keep them sweet and comfortable for the inmates.—R. F.

TRADE CATALOGUES RECEIVED.

Ambrose Verschaffelt, Rue du Chaume, 50, Ghent, Belgium. —*Priz Courant (77) pour l'automne, 1865, et le printemps, 1866.* *Plantes nouvelles, recommandées, &c.*  
William Chater, Saffron Walden Nursery.—*Catalogue of Superb Double Hollyhocks, Roses, &c.*

COVENT GARDEN MARKET.—DECEMBER 2.

So little alteration has taken place here, that our last week's quotations indicate pretty correctly the condition of the market.

TO CORRESPONDENTS.

\*.\* We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

GARDEN PLANS (F. M.).—There is no special work on the subject "Flower Gardening for the Many" contains some plans. It may be had free by post from this office for five postage stamps.

FELLMONGERS' WASTE (Subscriber, near Dublin).—Obtain it now, and mix with the loam. Do not mix it with the farmyard manure. It will do very well for the Strawberry-bed, but we never heard before of putting manure at the bottom of 2½-foot trenches for Strawberries. Put both sand from the rabbit lutches and crushed bones on your adhesive loam.

PEARS (F. W.).—Only first-rate varieties and specimens are remunerative when sent to London. Inquire of Messrs. Webber & Co., Covent Garden Market.

VINES IN A GLAZED PASSAGE (Amateur).—The Vines would do well if you were to make a border, as you propose, 15 inches wide and 3 feet deep; place 6 inches of drainage at the bottom, and have openings in the lowest course of bricks to allow of the surplus water escaping. Place a layer of sods, grass side downwards, over the drainage, and fill in with turfy lightish loam, and if turves, cut 3 inches thick, and chopped with a spade pretty fine, all the better; and instead of Vines we would plant Oranges, as we presume frost does not penetrate into the passage. They would look well at all seasons. The Vines in such a narrow border could not be expected to do more than cover the wall, and they would be leafless in winter. If you were to make the trough or narrow border, secure its drainage as above, and fill it with a compost of one-third turfy loam, and two-thirds turfy sandy peat, you might plant Camellias, which would have a good effect at all seasons, and in winter be grand. The very handsome *Ceanothus dentatus*, floribundus, and rigidus, would also do exceedingly well. If all you wish for is to cover the wall, then *Cobæa scandens* would do so sooner than anything. *Hedera algeriensis* would also succeed well in such a position, and form a carpet of green all the year round. The same soils for Vines will answer for the *Cobæa* and the Ivy.

CORDYLINE IN DIVISA CULTURE (A Constant Reader, Colchester).—It does well in a war greenhouse; though it will succeed well in a cool temperature in winter, there is by far too much air given in summer for the plant to make good growth. To do this, it requires to be encouraged in spring and summer by a moist growing heat, as that of ainery, and when the growth has been made a greenhouse temperature is suitable. A compost of turfy peat two-thirds, and one-third turfy loam, with a free admixture of sand suits it well. Free drainage, plenty of pot room, copious waterings when growing, with a moist atmosphere, and a sprinkling from the syringe morning and evening to keep down red spider, to which it is rather liable, are what it needs, affording a temperature of from 50° to 75° from March to October, and 45° for the other six months of the year, during which period the soil is to be kept moist, but not wet.

DAHLIAS FOR EXHIBITION (J. A.).—The following are first-rate, and nearly all of them are very constant:—Leah, deep golden yellow; Ne Plus Ultra, bronzy rose; Charlotte Doring, white ground, edged and tipped with rosy crimson; Lord Derby, rosy crimson; Andrew Dodds, dark maroon; Bob Ridley, red; Miss Henshaw, white; Anna Keynes, white, tipped with blue rose; Willie Austin, buff; Criterion, delicate rose; Lilac Queen, lilac; and Beauty of Hilperton, purple.

RHEUMATISM.—A Lady, a constant reader of THE JOURNAL OF HORTICULTURE, sends the following excellent cure for rheumatism in answer to a notice which appeared a week or two ago:—Five drops of capjeput oil on a lump of sugar, dissolved in a tumbler of hot water, taken at bedtime and once besides in the day, and persevered in for a few days, will often cure rheumatism, if the complaint is real rheumatism.

"LIVE AND LEARN."—We have some plans for you from "G. H.," and will send them if you forward to us your direction.

FRUIT TREES FOR WALLS OF A NEW GARDEN (K. L.).—South-east aspect. This will be suitable for Apricots and the better kinds of Plums, ten trees at 21 feet apart. Apricots—*one Royal, one Knishu, one Hemskerk, and two Moorpark.* Plums—*Green Gage, Early Pacific, Jefferson, Guthrie's Late Green, and Coe's Golden Drop, one of each.* To make the most of this wall (12 feet high) standards should be planted between the dwarfs, to cover the upper part of the wall until the dwarfs grow up and require the space occupied by the standards. They may consist of *Victoria, Pond's Seedling, Kirke's, Purple Gage, and Prince of Wales* Plums, one of each, or any other good sorts that can be procured. Of Apricots, as standards, four will be required—*viz., one Shipley's, one Knishu, and two Moorpark.* The other side of the wall will, of course, have a north-west aspect, and though of stone it would, we should think, answer for Pears on the Pear stock. Any difficulty in training the trees may be surmounted by having one-eighth galvanised wire fixed horizontally at 9 inches apart, the wires being run through eyes in short, flat, iron pegs or hooks, 3 inches long, driven into the wall in the joints between the stones. The wire should be strained quite tight by fastening one end to an iron rod pierced to admit it, and drawing the wires tight, and fastening them to another iron rod at the other end. This is for trees to be trained horizontally; but if they are to be trained fan-fashion the wires should not be more than 4 inches apart. This done, the following Pears may be planted 21 feet apart:—*Doyenne d'Été, Williams' Bon Chretien, Beurré Superfin, Louise Bonne of Jersey, Marie Louise, Thompson's, Forelle, Knight's Monarch, Alexandre Lambré, and Beurré de Rance.* South-west aspect: *Peaches—Early York, Royal George, Grosse Mignonne, and Barrington, one of each; also one of Elrugo and Violette Hative Nectarines, with standards between on six-foot stems, consisting of Early York, Noblesse, Early Grosse Mignonne, and Bellegarde Peaches, one of each, and one Hardwick Seedling Nectarine.* We are by no means certain of Peaches doing well in your locality against a wall with a south-west aspect, but we would certainly try them for three or four years, when they would be fine trees; and if they did not bear we would cover the wall with glass, having a house 7 feet wide, and in it a row of Peaches in pots in addition to those against the wall. The other side of the wall, having a north-east aspect, would answer well for Cherries on the Cherry stock, two Tradescant's Heart, two Belle de Chaux, and two Morello, all at 20 feet apart. North-east aspect: The wall being only 7 feet in height, is only suitable for Currants, red, white, and black, Gooseberries, and the Cherries previously named, which would do well on the Mahaleb at 10 feet apart, to them you may add Kentish and Belle Magnifique. The Cherries may be on the Cherry stock, and planted 25 feet apart. The other side of the wall will have a south-west aspect, and will do admirably for Pears on the Quince stock, planted 12 feet apart, say one of each of the following:—*Brown Beurré, Beurré d'Areberg, Beurré Diel, Bergamotte d'Esperen, Gansel's Late Bergamot, Winter Nelis, Glou Morcean, Passe Colmar, Josephine de Malines, and Ne Plus Meuris.* North-west aspect:—On this we would plant Apples on the Paradise stock at 15 feet apart, as such trees will bear better on your seven-foot wall. They may consist of *Manks Codlin, Keswick Codlin, Gravenstein, Lord Suffield, Winter Pearmain, Alfriston, and Leucomb's Seedling;* these are kitchen Apples. For dessert we would have *Cellini, Court of Wick, King of the Pippins, Lamb Abbey Pearmain, Golden Harvey, and Searlet Nonpareil.* The other side of this wall will have a south-east aspect, and be useful for Plums, which may be *St. Catherine, Blue Imperatrice, Woolston Black Gage, Belle de Septembre, Early Favourite, July Green Gage, Red and White Magnum Bonum, Kirke's, and Jefferson,* at 21 feet apart.

WINTERING COLEUS VERSCHAFFELTI (P. P.).—It will live in a temperature of 50°, and even in one as low as 45° if the soil and atmosphere be dry. A well-ventilated part of the house is best, but not where there are currents of cold air. No more water should be given than is sufficient to keep the plant alive and prevent the wood shrivelling.

PRIMULAS (Idem).—We have not heard before of these with red flower-stalks and white flowers, and, though we grow Primulas largely, we have never had them with white flowers on red stalks. Those having white flowers have invariably green leaves and petioles, and green flower-stalks.

PEAS, AND TIMES OF SOWING (Idem).—Sangster's No. 1 and First Crop are two good early Peas. A sowing should be made in the beginning of December, if not done in the first fortnight of November, and another of Sangster's in February if the ground be open; a last sowing of the same and also one of *Advancer* and *Bellamy's Early Green Marrow* should be made in the first mild open weather in March. In the third week in March sow *Bellamy's Early Green Marrow, Pricetaker, and Champion of England.* Three sowings in April may be of *Champion of England, Matchless Marrow, Flack's Victory, Veitch's Perfection, and Ne Plus Ultra;* make three sowings in May of *Ne Plus Ultra, British Queen, and Hairs' Dwarf Mammoth,* a sowing of *British Queen and Ne Plus Ultra* in the first week in June, and a last sowing on or about the 15th of June of *Burbridge's Eclipse and Bishop's New Long-podded Dwarf;* you will then have Peas in succession with certainty.

GREENHOUSE ARRANGEMENTS (Marina).—Your house being so narrow would be best with a walk along the centre, and a table or shelf on both sides, that in front being 3 feet wide, and the back four, with a three-foot pathway. The roof is very steep as shown by the sketch sent, unnecessarily so. We would, if the house is not yet erected, have the front wall built higher, so as to allow of head room 3 feet from the front, and there have a table or stone shelf 2 feet wide, then a three-foot path, and a stage at back. Your proposed plan of having a border by the wall, and a wide shelf or table in front is not desirable, for the plants would for the most part be out of view, from the tallest plants being close to the path and the smaller ones in front. A fine along the front and both ends would afford sufficient heat, and its having the fire-hole in the courtyard will not interfere with the heating.

GARDEN PLAN (Idem).—Your arrangements seem to be in the right direction. We would have grass laid quite up to the house on the north side, extending from the house to the carriage drive. Borders adjoining buildings do not look well, and instead of having beds cut in the grass, plant, midway between the house and the carriage drive, silver and golden-leaved Hollies, alternately with Irish Yews, at 12 feet apart; the Hollies to be trained and cut as pyramids. Whatever plants you might employ in the beds, were these made, would not do well shaded as they would be by the house, whilst grass and the shrubs would always be green and ornamental.

**NETTING (Veno).**—Directions for making square-meshed netting are given in No. 292, first series, page 84, and a more rapid mode in No. 318.

**THUSNEBRIA, WINTERING (N. W.).**—You do not state whether it is the shrubby or herbaceous kind, but, whichever it is, it should have a light airy situation in a house with a temperature of 55°, and not less than 50°, from fire heat, and be kept dry at the root, though not dust dry, giving a little water now and then to keep the stems from drying up.

**PRIMULAS WITH SHORT FLOWER-STALKS (I. O. U.).**—The plants are, we presume, very vigorous, and what is called "lean-prond." Their being in a temperature of from 55 to 60 will not make the stalks grow any longer, and it is at least 15 or 20 too high. A temperature of 45 from fire heat would be more suitable. In such a temperature the flower-stalks will become long enough after a while. In autumn the flowers are usually produced on short flower-stems, but these become longer as the season advances.

**THRIPS AND BROWN SCALE (Idem).**—Filling the house with tobacco smoke on two consecutive evenings will kill the first—that is, all the perfect insects, but the eggs no amount of fumigation will kill, and that is why some people say tobacco smoke will not kill thrips. Our practice is to fumigate whenever we find one, for after the first comes another, and very often a third and fourth, generation before this troublesome insect can be effectually destroyed. We therefore recommend you to fumigate on two consecutive nights, filling the house with smoke so that a plant cannot be seen from the outside, always taking care to have the leaves of the plants dry, and choosing a calm evening for the operation. In a few days more thrips will make their appearance, then fumigate, and so on whenever a thrip is found. Brown scale on stove plants may be eradicated by picking off the insects whilst young and soft with the point of a knife. If left until they become brown and hard, this mode of destruction is only a means of augmenting their numbers. Wash the leaves with a solution of 8 ozs. of soft soap to the gallon of water, and syringe immediately afterwards with water at 140°, using a sponge, and a brush to go into the crevices. Persist in a course of cleanliness of this kind, and the scale will be gradually overcome.

**SHRUBS TO FLOWER FROM MARCH TO MAY (B.).**—In addition to those in your list are *Ledum latifolium*, *Kalmia glauca*, *Rhododendrons* of the Nobleman family, *Lyria japonica*, *Deutzias*, *Prunus triloba*, double-blossomed Cherry, *Kerria japonica*, tree *Paeonies*, *Weigela rosea* flowering as early as some of those in your list, *Forsythia viridissima*, and *Cistus* in variety.

**HERBACEOUS PLANTS TO BLOOM IN SPRING (Idem).**—You will find an extensive list at pages 367 and 385 of Vol. VII. New Series, a few of which are herbaceous *Paeonies*, *Trollius europæus*, and *T. americana*, *Anemone* vars., *A. apennina* and *A. uraliensis*, *Gentiana verna* and *G. acialis*, *Coronilla lberica*, *Cheiranthus cheiri luteus*, *C. Marshallii*, *Primula auricula*, and *Primulopsis* in great variety, *Adonis vernalis*, *Galium palustris plena*, *Aubrietia deltoidea* and *grandiflora*, *Alyssum saxatile*, *Draba aizoides*, *D. aizoides*, *Iris sibirica*, *Polemonium cœruleum*, *Hamonia pyrenica*, *Pulmonaria azurea*, *Scutellaria alpina*, *S. altissima*, *Vineas*, *Diclytra spectabilis*, *Pulmonaria officinalis*, and *P. grandiflora*, *Orobanch vernus*, *Tussilago fragrans*, *Phlox amœna*, *pilosus*, and *verna*, *Convallaria majalis*, *Dodecatheon meidii*, *Cerastium alpinum*, *Biebersteinii*, and *lomentosum*, *Iris pumila* and *sibirica*, vars., *Cardamine pratensis flore pleno*, double *Dianthus*, *Arabis alba* and *alpina*, *Trillium grandiflorum*, and various bulbs, with *Iberis sempervirens* and *Tenoraana*.

**PLANTS FOR VASES TO FLOWER IN SPRING (Idem).**—*Draba aizoides*, yellow; *Liaaria cymbalaria* alba, white; *Lotus corniculatus flore pleno*, yellow; *Cerastium tomentosum*, white; *Alyssum saxatile compactum*, yellow; *Arabis alpina*, white; *Phlox verna*, pink; and *Aubrietia deltoidea grandiflora*, bluish purple.

**FERNS (P. B.).**—None of the expensive books on Ferns contain directions for their cultivation. To meet your requirements buy Lowe's "Native Ferns," and Johnson's "British Ferns." The latter you can have free by post from our office for forty-six postage stamps.

**PROTECTING A HONEYSUCKLE (C. Repton).**—Your very sweet Honeysuckle is probably *Lonicera odoratissima*. It should be perfectly hardy, trained to the wall of your house with a south aspect, and require no protection; but you may, to make safe, protect it by mats during severe weather; the mats need not be removed every day, but remain on day and night so long as the frosts continue, taking them off, however, in mild weather. We think the taking-up of the plant and potting it would check its growth too much for it to do well in the following year.

**APHELANDRA LEOPOLDI CULTURE (A New Subscriber).**—Well may your plant not grow, and only have two or three leaves no larger than those of a Myrtle, when it is potted in a compost of equal parts of dung (poison to a plant without roots), turfy loam, and leaf mould. Turn the plant out of the pot, and shake away all the soil, preserving the roots if any, and pot it in a pot just large enough to hold it well, draining it properly, and using a compost of turfy sandy peat one-third, and two-thirds turfy light loam, adding about one-sixth of silver sand, the whole chopped with a spade and made fine, but not sifted. Give a little water to settle the soil, and if you could plunge the pot in a bottom heat of 75° instead of 65°, all the better. Give no more water than is sufficient to keep the soil just moist, but not wet, until the leaves are at least four times the size of those of a Myrtle, then give water more copiously, but none until the soil shows that it is required. It does well in a temperature of 60° in winter from fire heat, and requires a rather moist atmosphere when growing, a light situation near the glass, and a fair amount of air. We cannot name plants from such bruised scraps as those you sent us; good specimens in bloom ought to be sent.

**HOUSE SEWAGE (Z. Y.).**—It will injure, rather than benefit, fruit trees and Strawberries in any season of the year. Let it be thrown over vacant ground, where kitchen garden crops are to be grown next year.

**TREES SUITABLE FOR A CHURCHYARD (H. H. C.).**—All evergreens that will suit the soil and situation. *Laurustinus*, *Holly*, *Laurel*, *Berberis Darwini*, and *Conifers*.

**GRAFTING GERANIUMS (Culcena).**—A few hints on the subject will shortly be given.

**BOOK ON TREES (J. Robinson).**—No such work has been published since London's.

**ERRATUM.**—Page 440, 1st column, Alpine plants, *Primulas*, for "*Prinula formosa*," read "*P. farinosa*."

**TRANSPLANTING STRAWBERRIES FROM NURSERY-BEDS (O. D.).**—The plants or runners pricked off last August are none the worse of not being planted in autumn. Your making the bed now is right; be sure to dig it at least 2 feet deep, and to work in a liberal dressing of manure. The soil will be pulverised and enriched by exposure to the frosts of winter; we would therefore advise, if the soil is at all heavy, to throw it up in ridges, or at any rate roughly, to level it during dry frosty weather in February, and to plant early in March, and when the ground is in good working order. The runners may remain attached to the plants until these are planted out in the beds, and may be planted out at the same time. Though the runners will not fruit that year, they will, nevertheless, make strong plants for fruiting another season. March is the best of all seasons for planting Strawberries, and if done carefully with balls the plants scarcely sustain any check. Your old beds would certainly be improved by taking out every other plant if the plants are very close together; if not, then a good dressing of manure applied now or before March, and then pointed in without going so deep as to injure the roots, would, we think, help to make the fruit larger. Your proposal to do away with half the old beds now is beginning at the wrong end, and had better not be carried into effect until after the fruit has been gathered next year; then break up the beds at once, and after manuring the ground plant it with Broccoli or Winter Greens, and after being occupied with other crops for a year or two the same ground may be laid down in Strawberries again. Your *Black Prince*, *Keop's Seedling*, and *Sir Charles Napier* plants, planted in small beds last October, should be planted out in March, and they with the others will fruit well in the following year, and if in ancient numbers no loss will be experienced in consequence of the destruction of the old beds.

**VINES IN POTS (Idem).**—You have not read the "Vine Manual" aright. Your Vines being fruiting canes, extra strong, and 6 feet long, instead of being pruned to two eyes, should not be pruned at all if you intend to have fruit upon them next year; but if they are not strong enough for fruiting, then they should be pruned to two eyes, from each of which will come a shoot; the strongest only is to be retained, and the other rubbed off. The canes will not have side shoots, we think, or if they have these will only be laterals, which should be cut off quite close to the cane. If they have side shoots, which is not usual, then you may cut them in two eyes. They should be potted now into pots 15 inches in diameter, providing good drainage. Four or five stakes being put in just within the pot, the cane should be coiled round the outside of the stakes, taking care not to wrench the cane or break it, otherwise it will bleed. The Vines may be taken into the greenhouse in February, as you propose, though they would sustain no injury if taken there now, if the temperature from fire heat does not exceed 40°. If you keep them out of doors the pots must be protected from frost by a covering of litter, otherwise the roots will be injured, and wet will do them no good.

**PLANTING VINES (Idem).**—You have done wrong to pot the Vine you intend to plant in the border next March; the roots will be disturbed, and induced to emit fresh fibres, only to be broken when again planted. The other would be better if left where it is until next March, when it could be taken up and planted in the border. March is the right time to plant them. The "Vine Manual" will tell you how it is to be done. We are far from desirous of discouraging you, but we do not think coiling Vines at all desirable; but there is no harm in trying it, only it is a waste of time, space, and material.

**ROSES MILDEWING (C. Burk).**—It would be a step towards preventing your Roses mildewing if you were to trench the ground deeply, and work in a liberal dressing of manure, and if you could replace your poor sandy soil by rather strong rich loam, all the better. Your Roses, we presume, are on the Dog Rose stock, and those so worked are very subject to mildew on light, sandy, dry soils; to keep it down the waterings in summer should be frequent and abundant, and to keep the soil moist, as well as to enrich it, a mulching of short manure should be given in spring, renewing it in June. In light soils Roses are not so liable to mildew when on their own roots as when upon the Dog Rose and *Manetti* stocks.

**POTATOES FROM SEED (A. C.).**—You cannot buy the seed of any variety, you must buy tubers of it, plant them, and save the seed from the berries or apples when ripe. Dry the apples in the sun, place them in strong earthen jars or boxes, and bury them deep in the earth, secure from frost. In the spring have ready a plot of ground the same as you would prepare for Onions. Sow the Potato-apples thinly on the ground, covering them thinly with fine rich soil. Prepare a second plot of ground, and when the plants are strong enough to pull up without breaking, transplant them into your prepared ground, as they spring up in myriads and are liable to become entangled. Have your ground ready in the usual way, and when the plants are strong dibble them in, not too deep, taking care they get at the manure at once. When they have begun to grow, a top-dressing of diluted liquid manure is the best thing that can be applied. The first year the tubers of seedling Potatoes are very small, and never fit for table use. The second year some of the tubers are of a size about that at which forced Potatoes usually are cooked; but not until the third year are tubers produced of an adult size.

**PLANTING VINES (An Amateur).**—1. If the Vines you have had four years in pots in an orchard-house are strong, and if they have not produced much fruit, they would do very well for planting out for an unheated vinery. If they have fruited much in the pots, then we would prefer young Vines one or two years from the bud. 2. In either case we would prefer disentangling the most of the roots carefully, without breaking them, and spreading them out. In either case it matters little whether you plant now or in spring, but if now, some nice sired warm soil should be placed round the roots, and the ground protected by litter, so as to keep out the snows and frosts of winter. When this care is not given it would be better to defer till March, and give similar care then. In either case, whether old or young Vines are used, the Vines should be cut back, and nothing thought of excepting making wood the first year. 3. Much the same answer. In many cases a part of the centre of the ball may be left, and the rest of the roots spread out. The chief reason for spreading out the roots, is to prevent them running at once down into the border, instead of extending more horizontally, and plants turned out with balls are more liable to take the downward tendency. 4. You may have the rods in your vinery from 30 inches apart, if you have nothing but Vines in it. If you grow anything much below them, from 4 to 5 or 6 feet will be near enough, according as you give the preference to Vines or under-crops. The rods should be from 15 to 18 inches from the glass.

**FLOWER BORDER—TANK COVERS** (*Calcearia*).—We are hardly in a position to criticise your beautiful panel border, as some years ago we had one exactly the same, and the planting was also much the same. The only remark we consider it necessary to make is on the importance of having the Geraniums in the diamonds low, so as to be rather under the Verbenas and the Calceolaria, and some of those mentioned we are not sufficiently acquainted with. Christine would do, and alternate beds of that and Tom Thumb, or Little David, would be charming. With the height of the diamonds all right, the sloping border will be beautiful. Slate is the best covering for tanks. Where little weight is to be placed on them, the slate as used for houses, and even flat tiles as used for roofs, would do very well. A very cheap cover is thus made:—Place pieces of wood along or across, say 1 inch thick and 3 inches wide, and have openings between from 2½ to 3 inches. Stuff all these openings with pieces of tile, brickbats, furnace clinkers, &c., place a little pebbly gravel over that, covering all, and sand or ashes to plunge in. The cheapest tank for heating purposes would be one of wood, say 4 inches deep; and, when thus covered, the heat comes up through the clinker spaces. Covering with slate would be better, even if thin. We have also covered with zinc and plate iron.

**HEATING FROM A KITCHEN FIRE** (*T.*).—Your boiler apparently consists of a block of metal at the back of the kitchen grate, 14 inches long, 9 inches deep, and 3 inches wide, and in this block there are three openings or perforations that you call the water-way, forming at one end the flow, and at the other the return pipe, and these water-ways are connected together by the most acute angles possible. We are in doubt as to the capacity of the water-ways, which you say is a pint. Do you mean that a pint of water fills the whole of these three water-ways? If so, your water-ways must be exceedingly small openings in the block of metal, and quite insufficient to keep up anything like circulation in the pipes of a house 34 by 13 feet. We can imagine a block of metal so perforated with connected water-ways, each on the level, and connected together with rounded joints, semicircular, and not with these acute angle junctions, and holding a gallon or two of water, acting moderately well; but we should not expect such a contrivance to answer so well as the commonest small kitchen boiler. In such a case as yours, and with such a house to heat, the simplest boiler would act better than such a block of metal, where, if the metal become very hot, the water in small spaces has a chance of being turned into steam. Then the common boiler could be so set as to leave a small space underneath for the heat to play upon, and then at night the fire could be collected round it, and an iron plate placed in front of it. You may succeed with your present arrangement, though we see nothing of an improvement in it. Where is your supply-cistern? How about an air-pipe? Or do you take your pipes in the house from the level of the boiler?

**BOOKS ON ORCHIDS AND FERNS** (*E. A. G.*).—You can have, free by post from our office for thirty-two postage stamps, "The Orchid Manual," and for sixty-four stamps "The Fern Manual." They contain the information you need.

**BOOK** (*T. T.*).—The dictionary you mention is out of print.

**VINES IN POTS** (*J. Robson*).—If you wish your short-jointed Vines in 10-inch pots to fruit fully in the conservatory next season, we would not repeat them, but keep them as they are all the winter with merely the pot protected from frost, and the head too, if the weather is severe. Then in March we would set the pot into a drained saucer with some rich soil in it, top-dress with rich compost, and allow the plants to break naturally without any bottom heat. If you will be satisfied with little fruit next season, but wish the same pots to continue bearing several years, then we would advise shifting the plants now into 14 or 15-inch pots, just easing the fibres outside the ball, and then plunging the pots over the head in a bottom heat of from 70° to 75°, which can be easily secured in an open shed or other place, by a little litter and fermenting tree leaves, &c., the tops remaining exposed, except in severe weather. If the roots reach the sides of the pot before March, it will be better to cool the pot gradually, and not give bottom heat then, as you propose. Prune back, as you propose, before the sap begins to run. Pot Vines, to bear continuously, must not be heavily cropped in any one year—say four bunches are about a medium.

**NECTARINES WITHERING** (*Inquirer*).—As the tree is so healthy, the withering, or rather the shrivelling, of the fruit just before attaining maturity, we should attribute to the heavy crop, the extreme heat, and, perhaps, a temporary deficiency of water. Some tender Nectarines exposed to the full sunshine would have been helped in such heat by a slight shade. Very probably if you had taken a fourth or a third less of a crop you would have been more successful. We are glad you preserved them. When nearly full grown and swelled, Nectarines make a good preserve. When green and hard, we know of no real use to which they can be turned.

**WHAT IS A PROFESSION?** (*R. E. P.*).—Johnson defines it, "A calling; vocation; known employment;" consequently, employments of "a gardener and cook" come within the definition. Formerly Divinity, Law, Arms, and Physic were those vocations to which the term "profession" was confined, but this was an arbitrary distinction.

**MANAGEMENT OF GREENHOUSE AND STOVE** (*A Subscriber*).—"In-door Gardening" will suit you exactly. You can have it, free by post, from our office for twenty postage stamps.

**VARIETIES OF VERBENA VELVET CUSHION** (*A. S. S.*).—Apply to Messrs. E. G. Henderson & Son, Wellington Nursery, Wellington Road, St. John's Wood, London, N.W.

**NAMES OF FRUIT** (*W. Matthews*).—2, Winter Codlin; 3, Selwood's Reinette; 4, Veiny Pippin. (*G. S.*).—1, Passe Colmar; 2, St. Lézin; 3, Easter Beurre; 6, Norfolk Bearer.

**NAMES OF PLANTS** (*A Kerry Subscriber*).—1, *Fontinalis antipyretica*; 2, *Polytrichum undulatum*; 3, *Hypnum curvatum*; 4 and 5, *Sphagnum acutifolium*; 6, *Hypnum ruscifolium*; 7, *Dicranum adiantoides*; 9, *Bartamia fontana*; 8, not a Moss but *Lycepodium selago*. (*K., Alresford*).—1, *Columna*? (crushed); 2, *Thysacanthus rutilans*. (*A. H.*).—A variety of *Quercus ilex*. (*W. H. Hitchcock*).—Not *Physostigma*; send again when in flower.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the Week ending December 2nd.

DATE.	BAROMETER.		THERMOMETER.				Wind.	Rain in inches.	GENERAL REMARKS.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

RAILWAY CARRIAGE.

PERHAPS, of all friends, those with "a grievance" are those that we esteem the least. The grievance may be real, or it may exist only in the imagination of the victim, and, perhaps, the latter is the more hopeless of the two. Still, it has often struck me that railway directors having friends afflicted with the poultry mania, must find that some of them have "a grievance." I believe it to be no fiction, and therefore capable of cure under proper remedies. Can we apply them? The railway authorities might easily do so, and I think they would be benefited by the result. I presume that the greater the traffic on a line, the more likely is that line to pay a respectable dividend. There are some speculations, indeed, that collapse the more quickly in proportion to the largeness of their transactions, just the same as the danger of a soap-bubble's bursting is in proportion to its size and its *couleur de rose* complexion. Can it be that some of the railway companies are afraid of this? Possibly, were it necessary to put on fresh engines and trains for the conveyance of some hundred hampers. This, however, we know to be unnecessary. Extra trains may be put on, not, however, for the conveyance of hampers, but of passengers; and the

outside world have generally imagined that these excursion trains paid satisfactorily; perhaps this is a myth, perhaps it is after all simply a charitable idea on the part of the directors; if the latter, we poultry-fanciers simply say, Extend your charity, and receive, as you will deserve, our gratitude.

Believing, however, that the increase of traffic on any given line is considered a sign of corresponding success, we may ask, Why do railway authorities snub poultry-fanciers, who certainly have contributed not a little to this increase? What can be their object? Is it possible that the old Latin proverb applies to their case, and that "those whom the gods desire to destroy they first render insane?" Certainly the original shareholders in some of these companies, who, with anxious hearts have watched the present quotations becoming "small by degrees and beautifully less," must consider the sanity of their directors, in adopting measures that serve to lessen the revenue, somewhat doubtful! Do poultry shows add to the revenue of railways? There can be no question that they do. There is the carriage of the birds, the increased passenger traffic in consequence solely of the show. Is it not, then, evidence of doubtful sanity that railway authorities do not foster poultry shows? We could believe that money offered as a cup by a railway on which a show was being held, would be money well invested. Poultry-fanciers do not ask for this; they say, We send a number of packages by your line, we have already paid

a certain amount of entrance money to entitle us to exhibit our specimens; the large majority of us must spend our money receiving no returns, for all of us cannot take, even if we deserve prizes; even many of us find, that when successful, the speculation has been a losing game. Perhaps, like my "man Friday," who met me once on my return from a rifle meeting, where I had succeeded in winning a £1 prize, only it cost me 25s. to do it, they "do not seem to see the gude on't," and as this is a species of success that, if repeated, is apt to pall on the appetite, and make the victor exclaim, like Pyrrhus, "One more such victory, and I am lost," it would be well to devise some means of lessening this evil. All, I imagine, that an exhibitor would ask is that specimens unsold should be returned free, or at least as empties. Now, considering that any railway company would return an actual empty hamper at the rate of twopence or threepence, even though it occupy the same space as when full, and even if, as in the case of an ordinary parcel, it cannot possibly have augmented the traffic beyond the original journey, it does seem unfair, as well as unwise, to refuse this to unsold specimens at poultry shows, which indirectly have added to the ordinary traffic. The space occupied is the same, and the iron horse would not protest against the weight. The authorities, however, do; but with an inconsistency peculiarly their own, they allow this boon frequently to stock and implements, adding insult to injury by the words "except poultry;" yet the latter is the more popular portion of the show!

With the permission of our Editors I shall return again to this subject; meanwhile, I commend the matter to the serious consideration of my brother and sister exhibitors. Let us see whether we cannot by continual dropping make the evil understood. Possibly, then, the remedy may be applied.—Y. B. A. Z.

## THE BIRMINGHAM POULTRY SHOW.

THE annual Exhibitions in Birmingham, which attract so much attention, are now open; the Cattle and Poultry Show, in Bingley Hall, and the exhibition of Sporting and other Dogs, in the new Curzon Hall. The prevalence of disease amongst stock has been a source of considerable anxiety to the promoters of exhibitions this year, but, nevertheless, the entries do not appear to have fallen off materially. For the Birmingham Show the number of cattle entered was 135, but some of these have been withdrawn. There are ninety entries of sheep—a much larger number than on several recent occasions, and above the average amount; while of pigs, the catalogue contains a list of seventy-one pens. In the department for corn, there are forty-five entries; and although the season which has just closed has not been propitious for roots, the Judges had to decide upon the respective merits of about 110 different lots. The feathered tribes muster in greater force than usual, for the total of the pens of poultry entered are 1675, and of Pigeons 331, the latter display being the largest of the kind which has yet been witnessed. To all these the implements, seedmen's stands, &c., must be added, and when this is done, we have a bill of fare which can scarcely fail to satisfy the reasonable expectations of every class of visitors. The entries of sporting and other dogs are nearly eight hundred in number. The Fruit and Chrysanthemum Exhibition, in the Town Hall, which has now become one of the permanent attractions in the Birmingham Show Week, opened on Saturday, and will close this evening. The usual liberal arrangements for special trains from all quarters have been made by the railway companies.

Subjoined is a list of the Poultry awards, and a full report of the Show, and the commendations, will be given in our next Number.

**DORKING (Coloured).**—First and Second, Admiral Hornby, Knowsley Cottage, Prescott. Third, Capt. H. B. Lane, Berkshire. Fourth, Right Hon. Viscountess Holmesdale, Linton Park. *Chickens*.—First, Admiral Hornby. Second, Fourth, and Fifth, Mrs. Arkwright, Derby. Third, Right Hon. Viscountess Holmesdale. Sixth, Right Hon. Lady Egrot, Blithfield Hall, Rugby. *Hens*.—First, Right Hon. Viscountess Holmesdale. Second, Mrs. F. Blair, Inchtute, N.E. Third, Rev. E. Cadogan, Walton Parsonage, Warwick. *Pullets*.—First, C. Cork, Shoreham, Essex. Second, Mrs. Young, Stratford-upon-Avon. Third, T. B. Wright, The Quarry House, Great Barr.

**DORKINGS (White).**—First, J. Robinson, Vale House, Gurslough. Second, H. Lingwood, Barking, Needham Market, Suffolk. *Chickens*.—First and Second, H. Lingwood.

**SPANISH.**—First, H. Lane, Milk Street, Bristol. Second, A. Heath, Calne, Wilts. Third, A. Fenton, Crimble Hill, Rochdale. *Chickens*.—First, W. Koue, Park Street, Bristol. Second, W. R. Bull, Newport Pagnell, Bucks. Third, H. Lane. Fourth, G. Lamb, Compton, near Wolverhampton. *Hens*.—First, E. Draper, Primrose Hill, Northampton. Second, J. Smith, Bradford Street, Walsall. *Pullets*.—First, W. Nicklin, Hatherton Street, Walsall. Second, Miss Biggar, Braes House, Ecclefechan, Dumfriesshire.

**COCHIN-CHINA (Cinnamon and Buff).**—First, J. Cattell, Lime Villa, Bristol Road, Edgbaston. Second, T. Stretch, Ormskirk. Third, H. Tomlinson, Balsall Heath Road, Birmingham. Fourth, H. Bates, Vintage House, Yurdley, near Birmingham. *Chickens*.—First, J. Nelson, Heaton Mersey, Manchester. Second, T. Stretch. Third, Capt. H. Heaton, Lower Broughton, Manchester. Fourth, Mrs. R. White, Broomhall Park,

Sheffield. *Hens*.—First, J. Stevens, Walsall. Second, C. Jennison, Bello Vue, Manchester. *Pullets*.—First, H. Lingwood, Needham Market, Suffolk. Second, C. Jennison.

**COCHIN CHINA (Brown and Partridge-feathered).**—First, and Amateurs' prize of £3 3s., T. Stretch, Ormskirk. Second, Rev. W. H. Fell, Fleetwood. Third, E. Tudman, Ash Grove, Whitechurch, Salop. *Chickens*.—First and Second, and Amateurs' prize of £3 3s., T. Stretch, Ormskirk. Third, E. Tudman. *Hens*.—First and Second, Capt. H. Heaton, Lower Broughton, Manchester. *Pullets*.—First, T. Stretch. Second, E. Tudman.

**COCHIN CHINA (White).**—First, R. Chase, Tyndal Street, Balsall Heath, Birmingham. Second, H. Yurdley, Market Hall, Birmingham. Third, Rev. F. Taylor, Keastwick, Kirby Lonsdale. *Chickens*.—First and Second, Rev. F. Taylor. Third, R. Chase.

**BRAHMA POOTRA (Dark).**—First, H. Lacy, Lacy House, near Hebdon Bridge. Second, R. W. Boyle, Galfrim House, Bray, County Wicklow. *Chickens*.—First, T. Statter, Stand, Manchester. Second, Mrs. Hurt, Alderwasley, Derby.

**BRAHMA POOTRA (Light).**—First and Second, J. Pares, Childown Hall, Chertsey. *Chickens*.—First, J. Clark, Chiswick Mall, Middlesex. Second, F. Crook, Vine Cottage, Forest Hill, London, S.E.

**MALAY.**—First, Rev. A. G. Brooke, Rayton XT Towns, Salop. Second, T. Ballance, Sydney House, Homerton, near London. *Chickens*.—First, J. Hinton, Hinton, near Bath. Second, G. Hustler, Stillingfleet, York.

**GRIVE-COURE.**—First and Second, W. Blinkhorn, Waterdale, near St. Helen's, Lancashire. *Chickens*.—First, Mrs. Hurt, Alderwasley, Derby. Second, W. Blinkhorn, Waterdale, near St. Helen's, Lancashire.

**HAMBURGH (Black).**—First, R. Tate, Green Road Leeds. Second, R. F. Goodwin, Middleton, near Manchester. *Chickens*.—First, G. Lingard, jun., Snow Hill, Birmingham. Second, A. Woods, the Grange, Setton, near Liverpool.

**HAMBURGH (Golden-pencilled).**—First, J. E. Powers, Biggleswade, Bedfordshire. Second, F. Pittis, jun., Newport House, Newport, Isle of Wight. Third, A. O. Worthington, Newton Park, Burton-upon-Trent. *Chickens*.—First, J. E. Powers, Biggleswade, Bedfordshire. Second, T. Wrigley, Tonge, Middleton, Manchester. Third, Rev. R. Roy, Skirbeck, Boston, Lincolnshire.

**HAMBURGH (Silver-pencilled).**—First, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Second, J. Robinson, Vale House, Gurslough. Third, D. Harding, Middlewich, Cheshire. *Chickens*.—First, J. Preston, Alerton, near Bradford. Second, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Third, Right Hon. the Viscountess Holmesdale, Linton Park, Staplehurst, Kent. *Hens*.—First, J. E. Powers, Biggleswade, Bedfordshire (Golden). Second, W. Bradley, Severn Navigation, Worcester (Silver). *Pullets*.—First, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Second, J. Holland, Chesnut Walk, Worcester (Silver).

**HAMBURGH (Golden-spangled).**—First, W. Kershaw, Heywood, near Manchester. Second, S. H. Hyde, Ashton-under-Lyne. Third, H. Beldon, Bingley. *Chickens*.—First and Second, J. Buckley, Taunton, near Ashton-under-Lyne. Third, I. Davies, Harborne, near Birmingham.

**HAMBURGH (Silver-spangled).**—First, Sir St. G. Gore, Bart., Wirksworth, Derbyshire. Second, J. Fielding, Newchurch, near Manchester. Third, J. Robinson, Vale House, Gurslough. *Chickens*.—First and Second, G. E. Hardman, Rawtenstall, near Manchester. Third, A. Woods, Setton, near Liverpool.

**HAMBURGH (Spangled).**—*Hens*.—First and Second, J. Palmer, Wednesbury. *Pullets*.—First, G. Whitcombe, Kingsholm, near Gloucester. Second, G. E. Hardman.

**POLISH (Black with White Crests).**—First, T. P. Edwards, Lyndhurst, Hants. Second, J. Smith, Keighley, Yorkshire. *Chickens*.—First, Mrs. Proctor, Hutt Street, Hull. Second, J. Smith.

**POLISH (Golden).**—First, H. Beldon, Bingley, Yorkshire. Second, Mrs. Petat, Ashe Rectory, Easingstoke. *Chickens*.—First and Second, W. Silvester, Hampden View, Sheffield.

**POLISH (Silver).**—First, G. C. Adkins, The Lightwoods, near Birmingham. Second, H. Beldon, Bingley. *Chickens*.—First and Second, G. C. Adkins.

**ANY OTHER DISTINCT VARIETY.**—First, The National Poultry Company, Bromley (La Fleche). Second, Right Hon. Countess of Aylesford, Leamington (Cuckoo Dorking). Third, Mrs. D. Haig, Lichfield (Andalusians). Fourth, Right Hon. Earl of Aylesford, Coventry (Japanese).

**GAME (Black-breasted Reds).**—First, R. Serimimming, Failand, Lutterworth. Second and Third, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Fourth, A. B. Dyas, Madeley, Shropshire. *Chickens*.—First, W. Gamon, The Green, Thornton-le-Moor, near Chester. Second, Mrs. Hay, The Cottage, Sudbury, Derby. Third, J. Halsall, Ince, near Wigan. Fourth, R. Hewer, Fair Green, Chipping Norton, Oxon.

**GAME (Brown and other Reds, except Black-breasted).**—First, M. Billing, jun., Wood End, Erdington. Second, T. Statter, Stand, Manchester. Third, J. Wood, Moat House, Wigan. Fourth, M. Billing, jun. *Chickens*.—First and Cup, R. Serimimming, Lutterworth. Second, J. Crosland, jun., Wakefield, Yorkshire. Third, E. Aykroyd, Girlington Road, near Bradford, Yorkshire. Fourth, T. Statter, Stand, Manchester.

**GAME (Black-breasted and other Reds).**—*Hens*.—First, G. Clements, Newtown Row, Birmingham. Second, M. Billington, Wood End, Erdington, near Birmingham. *Pullets*.—First, J. Wood, Moat House, Wigan. Second, E. Aykroyd, Girlington Road, near Bradford, Yorkshire.

**GAME (Duckwings, and other Greys and Blues).**—First, T. J. Charlton, Salt Street, Manningham, Bradford, Yorkshire. Second, Col. W. Blackburne, Claremont House, Leamington. Third, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Fourth, J. Halsall, Ince, near Wigan. *Chickens*.—First, J. Crosland, jun., Wakefield, Yorkshire. Second and Fourth, Sir St. G. Gore, Bart. Third, J. Halsall.

**GAME (Blacks and Brassy-winged, except Greys).**—First, G. W. Dawson, Hylton Street, Birmingham. Second, Messrs. Bullock & Rapson, Upper Parade, Leamington. *Chickens*.—First, G. W. Dawson. Second, A. O. Worthington, Newton Park, Burton-upon-Trent.

**GAME (White and Piles).**—First, J. Sunderland, Coley Hall, near Halifax, Yorkshire. Second, Rev. F. Watson, Messing Hill House, Kelvedon, Essex. Third, M. W. Stobart, Middleton-One-Row, Darlington. *Chickens*.—First, J. Fletcher, Stoneclough, near Manchester. Second and Third, J. Sunderland.

**GAME HENS (except Black-breasted and other Reds).**—First, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Second, T. Mayhew, Temple Row, Birmingham. *Pullets*.—First, T. West, St. Ann's, Ecclestone, near St. Helen's, Lancashire. Second, J. Halsall, Ince, near Wigan.

## SINGLE COCKS.

**DORRING.**—First, Rev. E. Cadogan, Walton Parsonage, Warwick. Second, J. D. Hewson, M.D., Coton Hill, Stafford. Third, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Fourth, Mrs. Arkwright, Etwell Hall, Derby. Fifth, W. Parr, Patricroft, Manchester. Sixth, J. Beasley, Brampton House, near Northampton.

**SPANISH.**—First, E. Draper, Primrose Hill, Northampton. Second, H. Beldon, Goststock, Bingley, Yorkshire. Third, Miss Biggar, Brass House, Ecclefechan, Dumfriesshire.

**COCHIN-CHINA (Cinnamon and Buff).**—First, Mrs. R. White, Sheffield. Second, J. Cattell, Edglaston, Birmingham. Third, J. Shorthose, Newcastle-upon-Tyne.

**COCHIN-CHINA (Except Cinnamon and Buff).**—First, J. Rodbard, Wrynton, near Bristol. Second and Third, T. Stretch, Ormskirk.

**BRABMA POOTRA.**—First, T. Statter, Manchester. Second, Mrs. Hargreaves, Arborfield Hall, Reading. Third, J. K. Fowler, Prebendal Farm, Aylesbury.

**HAMBURGH (Golden-pencilled).**—First, T. Wrigley, jun., Middleton, near Manchester. Second, J. E. Powers, Biggleswade, Bedfordshire. Third, Rev. R. Roy, Boston, Lincolnshire.

**HAMBURGH (Silver-pencilled).**—First, Sir St. G. Gore, Bart., Wirksworth. Second, Viscountess Holmsdale, Linton Park. Third, E. E. M. Roys, Greenhill, Rochdale.

**HAMBURGH (Golden-spangled).**—First, J. Palmer, Wednesbury. Second, T. May & T. Blakeman, Bloomsbury Street, Wolverhampton. Third, S. H. Hyde, Ashton-under-Lyne.

**HAMBURGH (Silver-spangled).**—First, J. Fielding, Newchurch, near Manchester. Second, H. Beldon, Bingley. Third, J. Skinner.

**POLISH.**—First, Mrs. Procter, Hull. Second and Third, G. C. Adkins, The Lightwoods, near Birmingham.

**GAME (White and Blue, Dnekwings, and other varieties except Reds).**—First and Fourth, Sir St. G. Gore, Bart., Wirksworth. Second, J. H. Williams, Spring Bank, Welshpool. Third, J. Anderson, Meigle.

**GAME (Black-breasted Reds).**—First and Cup, Sir St. G. Gore, Bart. Second, J. Halsall, Ince, near Wigan. Third, A. B. Dyas, Madeley. Fourth, R. Swift, Southwell.

**GAME (Brown and other Reds, except Black-breasted).**—First and Second, T. Burgess, Burleydam. Third and Fourth, T. Statter.

**BANTAMS (Gold-laced).**—First, Rev. G. S. Cruwys, Tiverton, Devon. Second, U. Spary, Dunstable. Third, M. Leno, Dunstable.

**BANTAMS (Silver-laced).**—First and Second, M. Leno, Dunstable. Third, U. Spary, Dunstable.

**BANTAMS (White, Clean-legged).**—First, H. Draycott, Humberstone, near Leicester. Second, Rev. F. Tearlo, Collegiate School, Leicester. Third, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire.

**BANTAMS (Black, Clean-legged).**—First, T. Davies, Belmont Cottage, Stow Hill, Newport, Monmouth. Second, R. Swift, Southwell, Notts. Third, Mrs. J. & A. Briggs, Sisk Beek Farm, Rawden, near Leeds.

**BANTAMS (Any other variety except Game).**—First, T. Boncher, Bull Street, Birmingham (Cochin). Second, H. C. Woodcock, Kearsby, Leicester (Japanese).

**GAME BANTAMS (Black-breasted Reds).**—First, R. Hawksley, jun., Southwell, Nottinghamshire. Second, J. Crosland, jun., Wakefield, Yorkshire. Third, H. Shumack, Brook Cottage, Southwell, Nottinghamshire. Fourth, Miss Crawford, Hill House, Farnsfield, Southwell.

**GAME BANTAMS (Brown and other Reds, except Black-breasted).**—First, H. Shumack, Brook Cottage, Southwell, Nottinghamshire. Second, J. Anderson, Ruthven House, Meigle, N.B.

**GAME BANTAMS (Any other variety).**—First, R. Swift, Southwell, Nottinghamshire. Second, Rev. G. Raynor, Kelvedon Hatch Rectory, Brentwood, Essex. Third, J. Crosland, jun., Wakefield, Yorkshire.

**GAME BANTAM COCKS (Black-breasted and other Reds).**—First, J. W. Morris, Drake Street, Rochdale, Lancashire. Second, Miss S. N. Hill, Berrington, Shrewsbury. Third, G. Maples, jun., Wavertree, Liverpool.

**GAME BANTAM COCKS (Any other variety).**—First, Messrs. Smith and Cooke, Stavcley, near Chesterfield, Derbyshire. Second, H. Shumack, Brook Cottage, Southwell, Nottinghamshire. Third, P. Unsworth, Sandy Lane, Lenton, near Warrington, Lancashire.

**DUCKS (White, Aylesbury).**—First and Third, Mrs. Seamons, Hartwell, Aylesbury, Buckinghamshire. Second, J. K. Fowler, Prebendal Farm, Aylesbury.

**DUCKS (Bouen).**—First, T. Statter, Stand, Manchester. Second, S. Shaw, Stainland, Halifax. Third, J. Anderson, Ruthven House, Meigle, N.B. Fourth, J. Nelson, Heaton Mersey, Manchester.

**DUCKS (Black East Indian).**—First, Rev. W. Serjeantson, Acton Bunnell Rectory, Shrewsbury. Second, S. Burr, East Terrace, Whitby, Yorkshire.

**DUCKS (Any other Variety).**—First, C. W. Brierley, Rhodes House, Middleton, near Manchester (Carolina). Second, W. Stephens, Highnam Green, near Gloucester (Call).

**GEESE (White).**—First, Mrs. Seamons, Hartwell, Aylesbury, Buckinghamshire. Second, W. Lort, jun., The Cotteridge, King's Norton, near Birmingham. *Goslings.*—First, J. K. Fowler, Prebendal Farm, Aylesbury. Second, S. Lang, jun., The Shrubbery, Redland, near Bristol. Third, W. Winterton, Wolvey Villa, Hinckley.

**GEESE (Grey and Mottled).**—First, Mrs. E. Blair, Inchmartine, Inchture, N.B. Second, J. K. Fowler, Prebendal Farm, Aylesbury. *Goslings.*—First, Mrs. E. Blair. Second, Mrs. Seamons, Hartwell, Aylesbury. Third, W. Lort, jun., The Cotteridge, King's Norton.

**TURKEYS.**—First, Mrs. E. Blair, Inchmartine, Inchture, N.B. Second, —Holis, Broad Street, Reading. Third, Mrs. A. Gny, Eaton, Grantham. *Pouls.*—First, W. Wright, Fulbourn, Cambridge. Second, Mrs. A. Gny. Third, Mrs. Wolferstan, Statfold Hall, Tamworth.

## PIGEONS.

**ALMOND TUMBLERS.**—First, R. Filton, Duke Street, Deptford. Second, A. P. Leite, Rylaw House, Oxford Road, Manchester. Third, J. Ford, Monkwell Street, London.

**CARRIER (Black).**—*Cock.*—First and Second, T. Colley, St. Philip's Road, Sheffield. (*A good class.*) *Hen.*—First, A. P. Leite, Oxford Road, Manchester. Second, E. L. Corker, High Street, Croydon, Surrey.

**CARRIERS (Any other colour).**—*Cock.*—First, T. Colley, St. Philip's Road, Sheffield. Second, Messrs. W. Siddons & Sons, Lichfield Road, Aston, Birmingham. *Hen.*—First, T. Colley, Sheffield. Second, F. Else, Bayswater.

**POWTERS (Red or Blue).**—*Cock.*—First, A. P. Leite, Oxford Road, Manchester. Second, A. Heath, Calne, Wilts. *Hen.*—First, A. Heath. Second, A. P. Leite.

**POWTERS (Any other colour).**—*Cock.*—First, W. Harvey, Bank Street, Sheffield. Second, A. P. Leite, Rylaw House, Oxford Road, Manchester. *Hen.*—First and Second, A. P. Leite.

**BALDS.**—First, W. Chovey, jun., Sibson, near Atherstone, Warwickshire. Second, E. E. M. Roys, Green Hill, Rochdale.

**BEARDS.**—First, W. H. C. Oates, Besthorpe, Newark, Nottinghamshire. Second, F. Esquilart, Effra Road, Brixton, London. (*A good class.*)

**TUMBLERS (Mottled).**—First, R. Filton, Duke Street, Deptford. Second, A. P. Leite, Oxford Road, Manchester. (*An excellent class.*)

**TUMBLERS (Any other colour).**—First, J. Ford, Monkwell Street, London. Second, J. Fielding, jun., Yorkshire Street, Rochdale.

**RENTS.**—First and Second, T. J. Green, Saffron Walden, Essex, 4 lbs. 15 ozs. and 4 lbs. 6 ozs. Third, E. Pigeon, Lymington, near Exeter, 4 lbs. 3 ozs.

**JACOBS (Yellow).**—First, T. H. Ridpath, Poplar House, Rusholme, Manchester. Second, J. Owens, Villa Street, Waltham, London. S.

**JACOBS (Any other colour).**—First, M. Wicking, Blackheath Park, Kent. Second, T. H. Ridpath, Poplar House, Rusholme, Manchester (Black).

**FANTAILS (White).**—First, M. Wicking, Blackheath Park, Kent. Second, F. Else, Westbourne Grove, Bayswater. (*A very good class.*)

**FANTAILS (Any other colour).**—First, H. Yardley, Market Hall, Birmingham. Second, J. Baily, jun., Mount Street, London.

**TRUMPETERS (Mottled).**—First, S. Shaw, Stainland, Halifax. Second, J. R. Robinson, Nile Street, Sunderland.

**TRUMPETERS (Any other colour).**—First, R. Bulpin, Riverside, Bridge-water. Second, F. Else, Westbourne Grove, Bayswater.

**OWLS (Blue or Silver).**—First, J. Fielding, jun., Yorkshire Street, Rochdale (Blue). Second, F. Else, Westbourne Grove, Bayswater (Blue).

**OWLS (Any other colour).**—First, A. P. Leite, Oxford Road, Manchester. Second, W. Sanday, Holme Pierrepont, Nottinghamshire (White).

**NUNS.**—First, Rev. A. G. Brooke, Rayton IX Towns, Salop. Second, H. Yardley, Market Hall, Birmingham. Third, J. Thackray, Petergate, York.

**TURBITS (Red or Yellow).**—First, S. Shaw, Stainland, Halifax. Second, J. Thackray, Petergate, York (Red).

**TURBITS (Any other colour).**—First, S. Shaw, Stainland, Halifax. Second, W. Harvey, Bank Street, Sheffield.

**BARBS (Black).**—First, J. R. Robinson, Nile Street, Sunderland. Second, S. Shaw, Stainland, Halifax.

**BARBS (Any other colour).**—First, M. Hedley, Redhill, Surrey. Second, H. S. Salisbury, The Lawn, Kempsey, Worcestershire.

**DRACOONS (Blue).**—First, H. Yardley, Market Hall, Birmingham. Second, J. Percival, Clent Villa, Harborne, near Birmingham.

**DRACOONS (Any other colour).**—First, S. Shaw, Stainland, Halifax. Second, E. E. M. Roys, Greenhill, Rochdale (Yellow).

**MAGPIES.**—First, J. Thackray, Petergate, York. Second, M. Wicking, Blackheath Park, Kent. (*An excellent class.*)

**MAGPIES (Antwerp).**—First, S. A. Taylor, Wheeler Street, Lodels, Birmingham. Second, H. Yardley, Market Hall, Birmingham. (*A very good class.*)

**ARCHANGELS.**—First, J. Percival, Montpellier Row, Peckham Rye, London. Second, H. Yardley.

**MAGPIES (Any other New or Distinct Variety).**—First, A. P. Leite, Oxford Road, Manchester (Laced Fantails). Second, W. Harvey, Bank Street, Sheffield (Yellow Swallows). Third, F. H. Paget, Birstall, Leicestershire. (*A very good class.*)

**JUNGES.**—*Poultry.* The Rev. Robert Palleine, the Rectory, Kirby Wiske, Thirsk; G. J. Andrews, Esq., Dorchester; Mr. John Baily, Mount Street, Grosvenor Square, London; J. H. Smith, Esq., Skelton Grange, York; Mr. Joseph Hindson, Barton House, Everton, Liverpool. *Pigeons.*—Mr. Harrison Weir, Lyndhurst Road, Peckham, London; Mr. T. J. Cottle, Paltney Villa, Cheltenham.

## SOUTHAMPTON POULTRY AND PIGEON EXHIBITION.

This Exhibition was held at the Carlton Rooms, Southampton, on Tuesday, Wednesday, and Thursday last, and as this was the first time of holding a show of poultry in connection with the long-established exhibition of Canaries and British and Foreign Birds, the public interest was much augmented. No building could be named more suitable for the purposes of such a meeting, as it is large, light, and exceedingly well ventilated. The day of opening was unfortunately most unpropitious, for it rained incessantly from morning until nightfall. It proved, in fact, just such a day as prevented any one from voluntarily seeking out-of-door pleasures, and as the Carlton Rooms are situated some considerable distance from the centre of Southampton, the attendance was necessarily scanty.

The *Spanish* class was good, and the generality of the pens shown were in superior condition. The *Dorkings* of all colours competed together, some very excellent White ones in particular attracted the attention of amateurs, but the chances of success when contesting with Coloured *Dorkings* are sadly adverse to the White ones. A marvellously good White *Dorking* cock was shown, but suffering from deeply-seated disease. The Buff and the Partridge-coloured *Cochins* were far below the average of most local exhibitions; the White *Cochins* were, however, much better. The *Brahmas* were a good class, but beyond comparison the best pen was thrown out of competition from containing a hen suffering from confirmed vertigo. As usual, the dark-feathered *Brahmas* were infinitely superior to those of light colour. The *Game* classes did not prove of equal excellence to our anticipations, want of condition being an almost universal failing. Several exhibitors had evidently not paid any regard whatever to

matching the inmates of each pen as to the colour of the legs. Any decided variation on this point is invariably fatal to success. Mr. F. Pittis's Golden-pencilled *Hamburgs* were exceedingly good, and so much so, as to cause the winning of both prizes to be a mere "walk-over." We were told, however, that the great strength of this gentleman's yard was held in reserve for the Birmingham Show. To *Hamburg* fanciers, no doubt a great treat is in store, and it is a matter of congratulation, for this beautiful variety of poultry has been for the last few years much neglected. The Silver and the Golden-spangled *Hamburgs* were also excellent. Mr. T. P. Edwards, of Lyndhurst, exhibited a couple of pens of Black *Polands*, that would add credit to any show; but the other varieties of *Polands* were not well shown.

In the "Extra variety class," were some first-rate *Crève Cœur* fowls, some equally perfect *La Flèche* fowls, superior *Andalusians*, very good *Silkie*s, and unusually good *Malays*. Besides these, there were shown in this class a pair of young, well-grown birds, bred between the pure Indian *Jungle* cock, and the *Golden Bantam* hen. Their gait and plumage were of a very striking character, and lent much interest to the show. A cross between the real *Jungle* cock and a small Black Red Game *Bantam* hen would, however, be productive of a far more beautiful race of chickens, than could be hoped for from the intermixture with the *Golden Bantam* hen, the carriage of the latter breed being so dissimilar to that of the *Jungle* fowl, as to render hopeless the breeding back to the original characteristics of the wild male parent, which can, however, be done easily in a few generations by the plan just suggested.

The great feature of the show was its *Bantam* class, open to all breeds, and resulting in a double set of prizes being awarded at the request of the Committee, as thirty-six pens of excellent birds were in competition. These four prizes were taken by two pens of Black Red Game *Bantams*, a pen of *Birchen Grey Game Bantams*, and a lovely trio of Red *Piles*, the last being a somewhat scarce breed. It was one of the most interesting classes seen for some time past.

The *Turkeys*, though few, were very good. The *Ducks* were likewise good; but the *Geese*, with one exception, were all ill-matched, Greys and White ones being sent in the same pen—a feature always inadmissible.

A good collection of *Pigeons* was on the spot, but as each exhibitor of these birds provided his own pen in which to exhibit his birds, a more ill-assorted *Pigeon* show could scarcely be conceived. Some owners sent specimens in very excellent mahogany show pens, carefully French polished; others in almost every imaginable description of basket; and others, again, in baskets completely closed, so as to make the birds quite invisible to the public. It is, however, now arranged, that in future the Society shall provide the usual exhibition pens for *Pigeons*. Some of the largest *Runt Pigeons* ever yet shown in this neighbourhood, or perhaps in any other locality, were exhibited.

A lady of title exhibited in the classes for *Rabbits*, a pair of animals called "Leporines, from the Garden d'Acclimatation at Paris, stated to be by the breeder a hybrid between a hare and rabbit." We had supposed that this impression had been long since exploded. They were passed without comment of any kind.

**SPANISH.**—First, Rev. J. De L. Simmonds, Chilcombe Rectory, Winchester. Second, W. H. Walker. Highly Commended, Rev. J. De L. Simmonds. Commended, S. D. Forbes, Portsea; G. Wheeler, Southampton.

**DOBKING.**—First, W. H. Walker. Second, F. Parlett, Chelmsford. Highly Commended, C. Smith, Durnford, Salisbury; T. P. Edwards, Lyndhurst, Hants; W. J. M. Peacock, Wenston Manor, Micheldever. Commended, Mrs. Pettat, Ash Rectory, Micheldever, Hants.

**COCHIN-CHINA (Buff).**—First, S. Lang, jun., the Shrubbery, Redlands, Bristol. Second, W. H. Walker. Highly Commended, W. Mattiagly.

**COCHIN-CHINA (Any other variety).**—First, J. Gardiner, Bristol (White). Second, Mrs. Tayleur, Belmont, Parkstone, Poole. Commended, Mrs. H. Pigeon, Furzedown, Hythe, Southampton.

**BRAHMA POOTRA.**—First, G. Johnson, Farnham, Surrey. Second, E. Sheerman, Chelmsford. Highly Commended, E. Pigeon, Lympstone, near Exeter; J. Hinton, Hinton, near Bath. Commended, J. Fares, Childown Hall, Chertsey.

**GAME (Black and Brown-breasted Reds).**—First and Second, H. Bertram, Chale, Isle of Wight (Black Reds). Highly Commended, W. W. Pyne, South Lancing, Sussex (Brown Reds).

**GAME (Any other variety).**—First, W. W. Pyne, South Lancing, Sussex (Duckwing). Second, Mrs. Iremonger, Goodworth, Clatford, Andover (Cheeshire Piles). Commended, Rev. T. L. Iremonger, Goodworth, Clatford, Andover (Duckwing); W. W. Pyne (Duckwing).

**HAMBURGH (Silver and Gold-pencilled).**—First, F. Pittis, jun., Newport, Isle of Wight (Gold-pencilled). Second, F. Pittis, sen. (Gold-pencilled). Highly Commended, G. Edgar, the Terrace, Lancing, Sussex (Golden-pencilled). Commended, T. J. Salmarsb, Chelmsford (Silver-pencilled).

**HAMBURGH (Silver and Gold-spangled).**—First, Mrs. Pettat, Ash Rectory, Micheldever, Hants (Silver). Second, W. Hughes, jun., Highgate, near London (Gold). Highly Commended, W. Miller, Sherborne, Dorset (Silver); Mrs. Pettat (Silver). Commended, W. Hughes, jun. (Gold).

**POLANNE.**—First and Second, T. P. Edwards, Lyndhurst, Hants. Commended, R. J. Wright, Weston, Southampton.

**ANY OTHER VARIETY EXCEPT BANTAMS.**—First, Master Cummings, Bishopstoke, Hants (*Crève Cœur*). Second, E. Pigeon, Lympstone, near Exeter (*La Flèche*). Highly Commended, C. Coles, Fareham, Hants (Blue *Andalusian Spanish*); Sir J. R. Carnac, Bart., Herdlo Clyde, Lymington (Welch Smoky). A. Yates, Bishop Suttoe, Alresford, Hants (between the pure Indian *Jungle* cock and *Golden Bantam*); Mrs. J. Pares, Childown Hall, Chertsey (Silkies); J. Hinton, Hinton, near Bath (*Malays*). Commended, Mrs. Brandon, Chilworth, Southampton (Crevé *Cœur*).

**BANTAMS (Any variety).**—First, O. Nicholson, Landport (File Game). Extra First, G. Manning, Springfield, Essex (Black Red Game) Equal Second, J. W. Kellaway, Merston, Isle of Wight (Game); W. Triggs, jun.,

Landport (Grey Duckwing Game). Highly Commended, A. M. Lewis, Martyr Worthy, Winchester; H. Appleton, Fareham, Hants (Pile Game); O. Nicholson (Black Red Game); W. H. Walker (Game). Commended, E. Pigeon, Lympstone, near Exeter (Japanese); A. Yates, Bishop Sutton, Alresford, Hants (Golden-laced); Miss Waldy, Affydale Rectory, Dorchester, Dorset (Chinese Negro Silky); J. W. Kellaway, Merston, Isle of Wight (Game); G. P. Perkins, Southampton; S. Ayles, Bishop's Waltham, Hants; C. Dacre, Dunbridge, Hants.

**DUCKS.**—First, J. Adam, Fareham, Hants (Rouen). Second, Mrs. H. Pigeon, Furzedown, Hythe, Southampton (Rouen). Commended, W. Walter, Winchester (Aylesbury); A. Yates, Bishop Sutton, Alresford, Hants (White Call).

**GEESE.**—First, Lady M. Macdonald, Woolmer, Liphook, Hants. Second, withhold.

**TURKEYS.**—First and Second, Lady M. Macdonald, Woolmer, Liphook, Hants.

**PIGEONS.**

**POWTERS OR CROPPERS.**—First, G. S. Sainsbury, Devizes. Second, H. Yardley, Market Hall, Birmingham.

**TUMBLEDS.**—First, H. Hoare, Brownlow, Bitterne, Southampton (White Bald-headed). Second, withhold.

**BURNS.**—First, A. Yates, Alresford, Hants (Black). Second, H. Yardley, Birmingham. Highly Commended, E. Pigeon, Lympstone, near Exeter; A. Yates (Red).

**JACOBS.**—First, H. Yardley, Birmingham. Second, H. Simpson, jun., Whitby.

**FANTAILS.**—First, H. Yardley, Birmingham. Second, G. P. Perkins, Southampton.

**TRUMPETERS.**—First, Master H. Pigeon, Furzedown, Hythe, Southampton (White). Second, H. Simpson, jun., Whitby. Commended, A. Coleman, Cardiff.

**OWLS.**—First, H. Yardley, Birmingham. Second, G. C. Murton, Bishopstow, Warminster.

**TURBITS.**—First, H. Yardley, Birmingham. Second, C. Beauclerk, Southampton (Yellow).

**CARRIERS.**—First and Second, S. Harding, Fareham. Highly Commended, A. Yates, Alresford, Hants (Dun); H. Yardley, Birmingham; S. Harding.

**NUNS.**—First, G. Hill, Winchester. Second, H. Yardley, Birmingham.

**ANY OTHER DISTINCT VARIETY.**—First, G. P. Perkins, Southampton (Archangels). Second, F. Pittis, jun., Newport, Isle of Wight (Magpies). Highly Commended, E. Pigeon, Lympstone, near Exeter (Bunts); Mrs. H. Pigeon, Furzedown, Hythe, Southampton (Yellow Magpies); H. C. Dear, Millbrook, Southampton (Smurles, or Antwerp Carriers); G. P. Perkins (Magpies); H. Yardley, Birmingham (Labores).

**EXTRA STOCK.**—Highly Commended, E. Pigeon, Lympstone, near Exeter (Blue Runt and Mottled Runt); G. Beauclerk, Southampton (Black Beards, Black Bald Pates, and Blue Bald Pates).

**RABBITS.**

**FOR LONGEST EARS.**—First, G. Hill, Winchester (Blue and White Doe) Second, M. M. Beadon, Creech Barrow, Taunton (Patagonian Doe).

**FOR SELF-COLOUR.**—First, G. Hill, Winchester (Sooty Fawn Doe). Second, G. Maskell, Newtown, Southampton (Doe). Commended, W. Bishop, Dorchester (Brown Doe).

**FOR WEIGHT.**—First, H. Yardley, Birmingham. Second, G. Green, Southampton (Brown and White Doe). Commended, J. W. H. Pomeroy, Southampton (Fawn Buck and White and Grey Doe).

**FOR VARIETY TO INCLUDE ALL POINTS.**—First, J. Parr, Southampton (Grey and White Buck). Second, G. Hill, Winchester (Black and White Buck).

**FOR FOREIGN.**—First and Second, M. M. Beadon, Creech Barrow, Taunton (Himalayan Buck and Doe).

Mr. Edward Hewitt, of Sparkbrook, Birmingham, officiated as the Arbitrator for both the Poultry and Pigeons.

In the portion of the Southampton Exhibition devoted to the British and Foreign Birds, were some extraordinarily beautiful and unique specimens with the most brilliant plumage, and in robust health, including Golden, Silver, Versicolor, White, and common Pheasants. The Norwich Canaries were well represented, and altogether good birds; the Belgian classes were not so numerously filled as in former years. There were also exhibited a pure white Blackbird in perfect plumage, and a Song Thrush curiously pied throughout with white. Excellent living specimens of the Ivy Owl, Buzzard, Kittiwake Gulls, Storks, Eagle Owls, &c., formed a most interesting collection. Some large cases of stuffed Birds of Paradise of various species, and Parrots of great variety, all tended to attract the eyes of visitors; and the Committee were unceasingly anxious to do all they possibly could for the satisfaction of their supporters.

**PHEASANTS.**

**GOLD AND SILVER PHEASANTS.**—First and Second, Mrs. E. Harrison, Polygon, Southampton (Silver and Gold). Very Highly Commended, A. Yates, Alresford (Gold).

**ANY OTHER VARIETY.**—First and Second, J. W. Fleming, Chilworth Manor, Southampton (between Common and Japanese, and Chinese Ring-necked). Very Highly Commended, A. Yates, Alresford, Hants (White Pheasant). Highly Commended, T. Chamberlayne, Cranby Park, Hants (cross between the Versicolor and English Pheasant). Commended, J. W. Fleming (Common English).

**CANARIES.**

**NOSWICH (Clear Yellow).**—First, G. F. Welch, Derby. Second, W. Walter, Winchester. Very Highly Commended, G. J. Collinson, Thorpe Hamlet, Norwich. Highly Commended, W. Walter; S. Tomes, Northampton; G. Harrison, Southampton; Commended, J. Judd, Newington Butts, London.

**NOSWICH (Clear Buff).**—First and Second, J. Burnett, Derby. Third, G. F. Welch, Derby. Very Highly Commended, W. Walter, Winchester. Highly Commended, G. J. Collinson, Norwich; W. Shenton, Gloucester; J. Judd, Newington Butts, London. Commended, G. J. Collinson; G. Moore, Northampton.

**NORWICH** (Marked or Variegated Yellow).—First, G. J. Collinsou, Norwich. Second, W. Walter, Winchester. Very Highly Commended, S. Tomes, Northampton; J. Wynn, Northampton; G. F. Welch, Derby. Highly Commended, W. Walter.

**NORWICH** (Marked or Variegated Buff).—First and Second, G. J. Collinsou, Norwich. Very Highly Commended, W. Walter; G. E. N. Rawhinson, Gloucester; J. Heath, Landport. Highly Commended, G. Moore, Northampton; J. Judd, Newington Butts, London; G. Cummings, Gloucester. Commended, W. Walter.

**NORWICH** (Crested or any other Variety).—First and Second, W. Walter, Winchester.

**BELGIAN** (Clear Yellow).—First, O. Nicholson, Landport. Second, T. Moore, Fareham. Very Highly Commended, T. Moore; J. C. Walker, Whitby.

**BELGIAN** (Clear Buff).—First, T. Moore, Fareham. Second, O. Nicholson, Landport. Very Highly Commended, O. Nicholson; W. Phillips, Basford, near Nottingham. Highly Commended, T. Moore. Commended, G. Harrison, Canterbury.

**BELGIAN** (Variegated or Marked Yellow).—First, O. Nicholson, Landport. Second, R. J. Troake, Redlands, Bristol. Very Highly Commended, O. Nicholson; C. Coles, Fareham, Hants.

**BELGIAN** (Variegated or Marked Buff).—First, O. Nicholson, Landport. Second, W. Phillips, Basford, near Nottingham. Very Highly Commended, O. Nicholson; C. Coles, Fareham, Hants.

**GERMAN OR ANY OTHER VARIETY OF CANARY EXCEPT NORWICH OR BELGIAN**.—First, J. Waller, Finsbury, London (Jouque London Fancy). Second, J. Judd, Newington Butts, London (Yellow Manchester Copy). Very Highly Commended, J. Waller (Buff London Fancy); J. C. Walker, Whitby (Yellow Cinnamon Cock). Highly Commended, Miss H. Godden, Southampton (St. Helena Canary); J. Judd (German Cock in full song); J. C. Walker, Whitby (Marked Hen). Commended, S. Jones (Buff Variegated Cinnamon); J. Judd (Manchester Copy Cock).

**LIZARD** (Golden-spangled).—First, G. Harrison, Canterbury. Second, F. W. Fairbrass, Canterbury. Very Highly Commended, F. W. Fairbrass; G. Harrison. Highly Commended, W. L. Chapman, Northampton; G. Harding, Ashton-under-Lyne. Commended, B. Pointon, Old Basford, near Nottingham.

**LIZARD** (Silver-spangled).—First, W. Phillips, Old Basford, near Nottingham. Second, J. Waller, Finsbury, London. Very Highly Commended, W. Walter, Winchester. Highly Commended, Rev. V. Ward, Canterbury; B. Pointon, Old Basford, near Nottingham.

**JONQUE GOLDFINCH MULE**.—First and Second, H. Ashton, Manchester. **MEALY GOLDFINCH MULE**.—First, H. Ashton, Manchester. Second, B. Pointon. Very Highly Commended, H. Simpson, Whitby; H. Ashton. Highly Commended, G. Harding; J. Judd. Commended, W. Walter.

**LINNET MULE**.—First, J. Lingard, Ashton-under-Lyne. Second, G. Butler, Wallington, Fareham.

**ANY OTHER VARIETY OF CANARY MULES**.—First, W. Walter, Winchester (Siskin Mule Cock). Second, P. Nicholson, Landport (Greenfinch and Canary Cock).

**GROUP OF TEN NORWICH CANARIES**.—First, W. Walter, Winchester. Second, G. Moore, Northampton.

**GROUP OF TEN BELGIAN CANARIES**.—First, T. Moore, Fareham. Second, O. Nicholson, Landport.

#### BRITISH BIRDS.

**BULLFINCH**.—Prize, H. Vine, East Cowes, Isle of Wight. Very Highly Commended, A. W. Booker, Allerton, Liverpool. Commended, C. Carver, Landport.

**GOLDFINCH**.—Prize, G. Butler, Wallington, Fareham. Very Highly Commended, Capt. H. C. Fisher, the Castle, Stroud, Gloucester; G. Harding, Ashton-under-Lyne. Highly Commended, Miss Watson, Fair Oak Park, Bishopstoke, Hants; R. J. Troake, Redlands, Bristol; J. Judd, Newington Butts, London. Commended, Miss G. Lacy.

**LINNET**.—Prize, G. Cummings, Gloucester. Highly Commended, S. Simmonds.

**SKYLARK**.—Prize, W. Walter, Winchester. Highly Commended, J. Judd, Newington Butts, London.

**WOODLARK**.—Prize, W. Walter, Winchester. Highly Commended, M. Batchelor, Southampton. Commended, R. Noyce, Southampton.

**ROBIN**.—Second, W. Walter, Winchester.

**BLACKBIRD**.—First, H. Vine, East Cowes, Isle of Wight. Second, T. Bourne, Shirley, Southampton. Very Highly Commended, H. Kelsou, Southampton.

**SONG THRUSH**.—First, H. Vine, East Cowes, Isle of Wight. Second, R. Ridgley, Swathling, Southampton.

**STARLING**.—Prize, H. Vine, East Cowes, Isle of Wight.

**JAY**.—Prize, C. Carver, Landport. Commended, C. Dacre, Dunbridge, Hants.

**MAGPIE**.—Second, W. Walter, Winchester.

**SISKIN OR ABERDEVINE**.—Prize, J. Judd, Newington Butts, London. Very Highly Commended, J. Judd. Highly Commended, R. Bird, Southampton; W. Walter.

**ANY OTHER VARIETY**.—Prize, Master E. De L. Simmonds, Chilcomb Rectory, Winchester (Thrush, nestling). Highly Commended, R. J. Troake, Redlands, Bristol (Mule between Greenfinch and Goldfinch); O. Nicholson, Landport (White-crested Brown Linnet). Commended, R. Ridgley (Tawny Owl).

#### FOREIGN BIRDS.

**COCKATOO** (Leadbeater or Rose-crested).—Prize, J. Judd, Newington Butts, London. Highly Commended, F. Wheeler, Portsea.

**GREY PARROTS**.—First, W. H. Squibb, Southampton. Second, Mrs. H. H. Gibbs, Southampton.

**GREEN PARROT**.—First, Mr. A. W. Brooker, Allerton, Liverpool. Second, H. Cuff, Newtown, Southampton. Commended, H. Scrivener, Bitterne, Southampton.

**ANY OTHER VARIETY OF PARROTS, EXCEPT GREY OR GREEN**.—Prize, W. Walter, Winchester (Borrow Bullen).

**ROSELLE PAROQUETS**.—Prize, H. Scrivener, Bitterne, Southampton. Highly Commended, W. Walter, Winchester.

**PENNANT LORY**.—Prize, C. Dunn, Fareham, Hants.

**LOVE BIRDS** (in Pairs).—Prize, J. Judd, Newington Butts, London. Very Highly Commended, Miss Wheeler, Southampton. Highly Commended, W. Walter, Winchester.

**AUSTRALIAN GRASS PAROQUETS** (in Pairs).—Prize, J. Judd, Newington Butts, London. Very Highly Commended, W. Walter, Winchester.

**COCKATEALS** (in Pairs).—Prize, J. Judd. Very Highly Commended, Mrs. E. Harrison, Southampton.

**JAVA SPARROWS**.—Prize, C. T. Bell, Southampton. Very Highly Commended, W. Walter, Winchester.

**NONPAREILS**.—Prize, C. T. Bell, Southampton.

**WIDAH BIRD**.—Prize, Mrs. E. Harrison, Southampton.

**CARDINALS**.—Prize, Mrs. W. Lacy, Southampton.

**POPES**.—Prize, C. T. Bell, Southampton.

**BISHOPS**.—Prize, J. Judd, Newington Butts, London.

**ANY OTHER VARIETY OF WAXBELLS** (in Pairs).—Prize, W. Walter, Winchester (St. Helena).

**ANY OTHER VARIETY OF FOREIGN BIRDS**.—First, W. Walter (Madagascar Bird). Second, G. Watts, Southampton (Turon Paroquet, from Western Australia).

A. Willmore, Esq., and W. Goodwin, Esq., of London, officiated as Arbitrators in the above classes.

## FOREST FOWLS.

I FIND, by reference to the Journal, that Mr. Warner has won the second prize at an exhibition with the Forest Fowl. Your reporter has given them a new name—"Dwarf Black Hamburgs." Mr. Warner purchased adult birds and chickens of me for the express purpose of rearing young Pheasants. I keep them myself for rearing chickens, and the blue birds for the hackle feathers for fishing-purposes. Their habits are quite sufficient to prove the writer has made a mistake, it being well known that all pure breeds of Hamburgs will not incubate. There is not any strain of the Hamburg breed in the Forest Fowl; they derive their name in the usual way, the original stock being taken from the borders of the forest of Exmoor.—H. LEWORTHY.

## TAKEN TO BLACK BANTAMS.

TAKING them for all in all, after having kept nearly every variety of fowls, I do not think a more useful and ornamental or less destructive breed of fowls can be allowed to take their liberty as insect-foragers in a garden. Our poultry space here is circumscribed, and the quantity we keep the mere shadow of that which we had when we lived in Shropshire; still the yards here became so tainted, that we were fain to desist from the pursuit, and in two years afterwards we found ourselves overrun with woodlice, earwigs, and innumerable creeping things, notwithstanding a constant warfare against them. The rector was one of the first who was presented with some of Sir John Sebright's Bantams, after that breed had been originated, and we kept steadily to them for nearly twenty years, till from high keeping, &c., they became quite as fine as the generality of fowls then to be met with in a farm-yard; and now our minds again began to dwell upon the sort, but they had become much degenerated. Accident came to our aid by casting us on the Isle of Wight, where we were offered some Black Bantams, and we closed with the offer at once. They had been bred by Major Verner, and by him presented to a young lady, to become a constant source of vexation to her and her mother, on account of a lady who lived next door to them at Ryde, repeatedly complaining of the effect which Chanticleer's proclaiming the dawn had on her nerves. The quality of the birds was as good as it could be, but to provide against degeneration Mr. Baily was commissioned to procure a hen that he could strictly recommend; and when the rector called upon him in Mount Street, Lord Bolingbroke happened to be there making a purchase of some Rabbits, to turn out on his estate, and he added his approval with the rector's to Mr. Baily's selection.

From three such good judges the result is quite satisfactory. We do not aim at diminutiveness, but hatch early in June in order that the chicks may meet with no check, and attain their largest size. We keep those that grow the largest, although in this class of Bantams those who prefer them may easily choose small birds, the biputian appearing in most of the broods. We have a minute cockerel rejoicing in the name of "Dod." He was flattened like a pancake when hatched, and I threw him aside as being dead; but a female hand rescued the castaway and placed him in the foot of a woollen sock upon a warm hob. Soon lively chirpings made us aware of his vitality. "Dod" grew up to become a pet; he perches upon my shoulder at tea time and at breakfast, and makes complainings in my ear unless I frequently supply him with bits of toast or bread and butter. "Dod" is not to be parted with; I have a diminutive pullet for his harem. His big brothers are becoming very pugnacious.

I have an ulterior object in thus gossiping: I am a bee-keeper as well as a poultry-keeper, and can well understand the feeling of annoyance that your correspondent Mr. Edw. Cadogan, at page 245, experienced when he returned home after a three

months' absence, and found his improved cottage hives infested with thousands of earwigs. Allow a crop of these vermin to remain on the top of a hive for a week only, and notice how fat and plump they will have become as they scamper away on being disturbed. Certain enough it is that the bee grubs and the honey are the cause of that *embonpoint*, and it was one chief cause of our taking to Bantams again; for notwithstanding all the precautions which I have frequently detailed in these pages as having been taken against the entry of insects into my hives, earwigs are scarcely to be banished; but pray do not daub any dirty, damp, and cracky mortar about, to try by that means to eradicate them; it would make bad worse. By Black Bantams earwigs are the most sought for of morsels, and during this season, which has been a peculiarly favourable one for these insects, no woodlice or earwigs have had a chance of congregating with me. Along with them spiders, beetles, caterpillars, slugs, small snails, ants and their eggs, &c., have all been devoured by the untiring searchers for insects, and there is no variety of fowl that does the scratching more gently, or works less harm amongst flowers and plants. My system of netting over strawberries, gooseberries, &c., is so simple and secure that I am never concerned about the birds interfering with them. When I wig my hives—viz., take the pans and covers off the supers for the purpose of whisking away with a goose's wing insects that may be concealed there, the fowls instinctively know all about it, and are generally there on the look out. If they should not be, "Boys, boys!" is sure to bring them, and woe betide the marauders; but these fowls never touch a bee. I would earnestly advise Mr. Cadogan to take to Black Bantams. He informs us that his garden is a large one. Then what can be better for his bees than borage planted wherever the room can be spared? What a perpetuity of bloom it gives, and what a quantity of seed it will produce! There is no food that Black Bantams are more fond of. They will nearly subsist upon it, and search it out from the beds as zealously as the bees do the honey from the blossoms. I rather like the borage as a weed, for it is precocious, and compels one to be constantly stirring the ground to do away with it where it is not wanted, and so every other weed shares the same fate before it can well be seen, still less produce seed, and the soil is benefited. Then what capital and prolonged layers, and excellent sitters, without being inconveniently so, Black Bantams are. Besides, a couple, or even three of them, when well fed, properly cooked, and placed on a dish at one end of a dining table, with a pig's cheek *vis-à-vis*, might satisfy a more gastro-nomic individual than—UPWARDS AND ONWARDS.

### WOOD FOR HIVES.

I AM inclined to indorse the opinion of "A DEVONSHIRE BEE-KEEPER" relative to wood hives being best made from yellow pine; that known as St. John's is what ought to be used. Although there are some sorts of bleached pine little inferior to some sorts of yellow, yet I always consider that wood approaching in character to that of the pitch pine ought to be avoided in making hives, being by far too close in the pores, and too good a conductor of heat. Many hives are ruined by too close coverings, or rather covering them with too close a material. By covering wood hives with any kind of oil-cloth, slates, or slabs of stone—that is, when there is little else than these materials close to the hive, the steam that is generated and carried up through the pores of the wood, is condensed upon these coverings and falls back upon the hive, where it produces a most injurious dampness. Whenever any of these coverings are used there ought always to be a sufficient quantity of dried grass interposed between the hive and its cover to absorb all moisture; but the best of all hive covers where there is no house are those which stand free of the hive, with ventilation at top. A word, then, as to ventilation. It never should be given with a draught. A very good and safe plan is to open any orifices that exist in the crown, and place on the top some cleaned straw, thus imitating as much as possible a thatched-roofed cow-house, or to fill an empty box with clean straw and place it on the top, after drawing slides, or unstopping whatever openings there may be.—A LANARSHIRE BEE-KEEPER.

CURING HENS OF SITTING.—Mr. Duren, states in the *New England Farmer*, that he cures his hens of sitting by shutting

\* That is, that from which the turpentine has been extracted.

them in a tub with an inch or two of water on the bottom, during the day. He puts them on the roost at night, and if not cured, treats them to the water remedy for another day, and they will be glad to stand on their feet.

### THE DISEASES OF BEES.

I OWE an apology to "A. W.," for not having made an earlier response to the appeal which he made in "our Journal," for information on the subject of dysentery among bees, so long ago as the 11th of July last, and which he has repeated at page 451. My reason for keeping silence on the point was, that of dysentery proper I have seen but very little, and can, therefore, offer no information derived from my own experience of the malady. As, however, I happen to be able to refer to what the great German apiarist, Dzierzon, has written on the subject, I deem it worth while to transcribe his opinions regarding it, adding thereto the results of my own experience in respect of other diseases to which our little favourites are unfortunately liable.

"DYSENTERY (says Dzierzon), which frequently occurs towards the end of winter, is certainly an evil in bee-keeping in countries where the winters are long and severe. It consists in the inability of bees to retain their fæces beyond a certain time and measure; but it is not a proper disease because the evil is at an end as soon as they are able to empty themselves. The causes of dysentery are as follows:—Long and severe winters, unwholesome honey, or honey carried in or given too late in the season, and which, therefore, mostly remains unsealed, coldness of the hive and combs, frequent disturbances, superabundant moisture or extreme drought, premature breeding, or, in short, any circumstance which causes an unwonted consumption of food, and by which bees are deprived of the opportunity of voiding in the open air the fæces which then accumulate so rapidly. But, as under these circumstances, the bodies of many become so swollen that they are unable to fly, and can at most drag themselves to the entrance of the hive, the evil ultimately degenerates into a disease of which numbers perish both inside and outside the hive. Nay, the malady sometimes appears to become actually contagious, since it has been found that when a stock which had been reduced by dysentery was strengthened by the addition of healthy bees, the mortality continued until it became as weak as it was before. The queen alone is exempt from this disease, owing to her consuming only the purest honey and pollen, and because her excrement, consisting merely of an opaque watery fluid, is naturally voided within the hive. She, therefore, remains in good health even after the great majority of her workers have succumbed to the malady.

"He, therefore, who would bring his stocks clean and healthy through the winter, must avoid the above-mentioned causes of disease as far as lies in his power, and should keep only such stocks as are capable of wintering well."

Bees evidently suffer greatly from dysentery during the severe and protracted winters of Germany, and when this is the case, Dzierzon advises that they be brought into a warm room with but one window, and that facing the south. The hive being placed in the sun, a few feet from the window, its inhabitants are set in motion by a little food either inserted within the hive or injected into it. As the bees take wing and fly towards the window, many empty themselves, and the rest will do so when they reach and rest on the window-sill. Here the brown fæces must be sponged off as rapidly as they are ejected, lest the bees soil themselves with them, and when all have had the required opportunity they will joyfully re-enter their hive if the entrance be brought close to them.

It is more than probable that my bees owe their immunity from the ravages of dysentery in a great measure to the mildness of the climate of Devon. Fine and balmy days are generally so frequent late in the autumn and in the early spring, whilst they are not unknown during even the depth of winter, that it is rare indeed for bees to be confined to their hives during many weeks without the opportunity of recreating themselves on the wing in the open air. Added to this, flowers of some kind are always in bloom in our gardens, so that fresh pollen is within their reach whenever the weather and their own inclinations impel them to seek for it. I may, indeed, say with truth that there is not a single month in the year during which I have not at some time or other seen pollen-laden bees entering some of my hives.

My information, therefore, on the subject of dysentery, its

causes, and its effects upon bees, being merely secondhand, I hope other correspondents who may unfortunately have had personal experiences of its ravages, will respond to the inquiry of "A. W." In a future Number I intend advertng to other diseases to which our little favourites are liable, and which, I regret to say, have come under my direct observation as—  
A DEVONSHIRE BEE-KEEPER.

(To be continued.)

**THE REV. HENRY WARD BEECHER'S FARM.**

This farm is at Peekskill, West Chester county, New York, about two miles from the railroad station. It contains forty acres of excellent land, and is pleasantly situated with a southern aspect, commanding an extensive and most charming panoramic view of the Hudson river, the high and snrrounding mountains, such as no one knows better how to appreciate and enjoy than the rural-loving owner himself.

When Mr. Beecher purchased the place, a few years ago, there was scarcely a fruit tree of any value upon it. Now there are 2500 choice fruit trees, most of them already beginning to bear. He has erected a large model barn, but as yet occupies the humble cottage he found upon the place, though he has made important additions and improvements.

Mr. Beecher is converting the place, to a great extent, excepting an extensive lawn in front of the house, into a fruit and vegetable farm. He has nearly an acre filled with Delaware and Iowa Grape Vines; and as the trees are yet small, he has raised among them this year between seven and eight hundred barrels of Onions.

Around his little cottage Flora reigns in all her glory. There is the greatest profusion of all the choicest flowers, and the whole air is redolent with their sweet and mingled perfumes.

The barn and out-buildings are well stocked with fine horses, oxen, choice breeding cows, swine, fowls, &c. This autumn Mr. Beecher has been making many improvements in the drainage of his lands and the avenue to his house, all adding greatly to the value and attractiveness of the place.

The influence of a farm conducted like this, though all farmers may not be able to adopt all the improvements that have been there made, must be of the greatest benefit to the agricultural interest of any community; and Mr. Beecher is really a benefactor to all the farming as well as religious interests of the country.—(Boston Traveller.)

**MILES'S PATENT VERMIN TRAPS.**

THESE improved patent traps for catching foxes, martens, polecats, and other animals, either large or small, may be so arranged as to catch them alive and without injury, or so as to kill them instantly. The improvements consist principally in the parts used in setting and releasing the trap, which are set at an inclination from the ground. The setting parts consist of three pieces of wood or other material, two of which are put together and used in the form of a strut to support the trap when set; the third piece forms a clip to keep the strut-pieces in position, as also a support for the bait.

If the animal is to be killed, the trap is formed of a large flag-stone, or other weighty or weighted surface, which, on falling, will produce immediate death; on the other hand if the animal is to be caught alive, the trap is made of an inverted boxlike form, and furnished with two or more feet at the corners, or otherwise, so that the trap may rest thereon in falling, and obviate the possibility of cruelty, or injury to the animal's tail. Where the animals are to be caught alive, it is necessary to put the trap on a flat stone or other hard surface, to prevent burrowing. When it is desired to remove animals alive in the trap, it is supplied with a hingel flap on one side; this flap or lid is used, when inverted, as the bottom of the trap that is to rest on the ground. Being lined with iron, when the animal is caught, the trap may be locked or otherwise fastened, and the animal so secured and removed with it.

**OUR LETTER BOX.**

A CHAMPION NEEDED (Cock of the Walk).—Either a Cochon or a Brahma Pootra cock ought to knock the fight out of the invading Silver-sprangled Hamburg; but it depends upon courage more than weight. The Brahma Pootra may have the most of this desired quality if, as we dare to suspect, the breed has some Malay blood in it.

BANTAM'S LEGS PARALYSED (T. F.).—A blood-vessel has probably burst upon the brain, keep the bird quite quiet, away from other poultry, and feed upon soft food only. The extravasated blood sometimes is absorbed, and then, if no fresh oozing of blood occurs, the bird may recover, but recovery is of rare occurrence.

HENS NOT LAYING (Hugh).—This is the time of year when hens usually cease laying, in fact, only pullets usually lay in the winter months. A little ale and bread may be given daily, but no feeding will make old hens lay now. A lump of camphor is all that is needed to be put in the water as a preventive of gapes.

LA FLÛCHE'S WHITE FACE (A. C.).—The La Flèche is a breed in which the white deaf earis as essential as in a Hamburg. They might take prizes if all the competing pens were deficient in this particular; but a pen lacking the distinction could not be successful, against one that had it. A full-grown cock should weigh from 9 to 10 lbs., a hen from 6½ to 7½ lbs.

COCHIN CHINAS (A. C.).—The hen with a swollen abdomen would never have been useful. The fatness had caused diseased ovaries. Warded legs would not be a disqualification, but would lessen the chance of success. "A pen of fowls" is not limited to any number. A pen is the cage, and for the prizes offered is specified in the exhibition schedule how many birds; usually two or three hens and a cock must be exhibited in the class. A single bird, or two pullets, or any other number may constitute a pen. Neck hackle are the long feathers on the neck; saddle hackle are the long feathers hanging down from the back. Rats and mice eat the poultry food, but do no further harm at this season. The rice will kill young chickens. Your house is large enough for both Geese and Ducks if not numerous.

WAXY-EARED PIGEON (A Constant Subscriber).—For your Pigeon with hard waxy substance in the ear, try fomenting it with warm water, remove as much of the substance as you can, and then drop in a little sweet oil.—B. P. B.

PUMPKIN AND APPLE JAM, &c.—A Gardener's Wife will be obliged by receipts for making pumpkin jam and jelly and pies, also apple jam and jelly, and what apples are best, sour or sweet.

COOKING LEEKS.—In reply to "GEE" we would say that to cook leeks as a vegetable nothing is more easy, provided they are neither over-boiled nor under-boiled. In the one case the rich mild flavour of the leek is lost, in the other it is hard and unpleasant. In preparing the leeks, strip off one or two of the outside layers, and cut off as much of the bottom as will take away all the foundations of the rootlets. If the leek is much more than an inch in diameter, run the knife up the centre for 3 inches or so from the bottom end. If larger than that, run the knife up a little farther, or even twice, so as to quarter the lower part. According to taste, use only the white blanched part of the leek, or, as we prefer it, retain a little of the green of the top. The contrast looks so much better in the dish, and the lower part of the green head is nice and tender. Then wash carefully in cold water, in which a piece of salt is dissolved, which will bring out the smallest worm or any creeping thing that may lodge in the folds of the top. Have enough of boiling water, according to the quantity of the leeks, so that all shall be covered when slightly pressed down. Put the leeks, drained from the cold water, into the boiling water, into which you have put a small teaspoonful of the carbonate of soda, or the carbonate of potash. We prefer the former, as it softens the water and the leek, and keeps the top green. When they have boiled nicely and slowly about ten minutes, add a small tablespoonful of salt to the water. Generally in about five minutes more the leeks will be nice and soft; but one should be tried with the prongs of a fork, or evenly cutting it open. When nice and soft they are right; they must not be boiled to tatters, or rendered stringy. Turn them out into a warm colander, and slightly press the water from them. Then you may serve on toasted bread as you would do sea-kale, or merely turned out on a heated plate, and eat with a little pepper and gravy from roast beef or mutton put over them. They are also admirable when flavoured with melted butter; but for general use, cooked in this simple way, merely with a little gravy, and pepper or salt, according to taste, they make a delicious dish. They have long been a favourite dish in Wales, and form a principal ingredient in the Scotch dish Cock-a-Leekie, as also a component part in black puddings, and various stews and soups; but on these matters we do not enter. Treated merely as a dish of vegetables, as a change from various kinds of greens, the above simple mode answers well, and they will be found good all the winter, and better in the spring, if used before the seed-stalk begins to rise.

MOULDS FOR LEATHER ORNAMENTS (F. A. H.).—Our correspondent wishes to be informed where she can obtain moulds of the Pine Apple, and other fruits, for making leather ornaments.

ARGAND LAMP (D. C.).—Any one who sells lamps in Exeter, Plymouth, or other large town, will know what kind of lamp it is. Train oil or colza oil burns in it. It is one of the oldest of lamps, and is described in every encyclopedia.

TRIFOLIUM INCARNATUM (An Apiarian).—As cultivated it comes within the definition of a biennial. It is sown in the autumn and blooms in June. Perhaps if sown very early in the spring it might bloom late in the autumn, but we have no experience on this subject.

CARBONNIER'S INCUBATOR (J. W. W.).—The work you mention is probably a translation from the French. We never heard of such an incubator.

**LONDON MARKETS.—DECEMBER 4.**

**POULTRY.**

A large influx of Game has influenced the sale of poultry, which has been heavy during the past week.

From observations taken near London during the last thirty-eight years, the average day temperature of the week is 45.9°; and its night temperature 33.7°. The greatest heat was 63°, on the 12th, 1841; and the lowest cold, 7°, on the 16th, 1853. The greatest fall of rain was 1.24 inch.

HUNTROYDE PARK.

THE SEAT OF CAPT. LE GENDRE PAGE STARKIE.

**H**untroyde Park, an eminence on the north bank of the Calder, and sheltered from the north by the Clitheroe hills, is Huntroyde Park, and far away in the south are the Hamilton hills, which appear as if enveloped in the clouds. The scenery is grand in the extreme, and although the busy hum of the cotton mills can be heard after walking a mile or so across the park, scarcely a chimney is visible from the place. It is completely shut out from the busy valley below, through which passes the Calder, by a second series of hills. The Hall, as seen from the Lancashire and Yorkshire Railway, between the Blackburn and Hopton stations, presents a noble appearance. Behind it is an immense forest of trees; these also extend to a great distance right and left of it, and with their pleasing autumnal tints give to the scene at once a pleasing and impressive effect. The crest of the hill which completely hides the busy town of Padiham, is also covered with trees, but the ground on the opposite side of the valley over which the above-named railway passes being the highest, a complete view of the Hall is obtained, and from thence it appears nestled in the bosom of the wood, giving one at once an idea of comfort, rest, and sweet repose. The place has been for centuries held by the Starkie family, and so great has been their veneration for trees, that the woodman's axe has been seldom heard, although thousands and tens of thousands of these noble trees have been for years past falling to decay. With a judicious use of the axe a good fortune might have been made, and the scenery much improved.

The magnificent series of hills rising one above the other towards the north, present a very pleasing panorama. One of the highest of these, called Pendle Hill, seems to lift its head above the clouds. This hill is 1803 feet above the level of the sea, and from its summit the views are very extensive. On the 18th of August, 1669, this elevation discharged such an immense body of water from near its top, as to do great damage to the neighbouring country. It is described as having been a mighty torrent, gushing out in such quantities, and so suddenly, that it made a breast a yard high, and continued running for about two hours. The whole of the hills to the north seem charged with water, so that in the very driest season Huntroyde is well supplied with that essential to the success of garden crops.

Nature has done much for Huntroyde, but for centuries nothing has been done to assist Nature in beautifying the gardens and grounds, the previous owners not having a desire for gardens or gardening, for the wide expanse of

forest was their ideal of a garden. Its present liberal owner having placed its management in my hands, it will be my pleasing duty to devote the whole of my energy and abilities to the task of improving this beautiful place. It affords much scope for improvement, and Nature has provided everything the landscape gardener could wish for. As a description of the works as they are carried out may be interesting to the readers of THE JOURNAL OF HORTICULTURE, I shall describe them as time will permit, something after the manner of my friend and coadjutor, Mr. Fish's "Doings of the Last Week," and as it will be necessary to begin at the very beginning, my first paper will be descriptive of the all-important operation of draining.

Draining should be the first care of the gardener on entering on the duties of a place of the above description, and this should be borne in mind by every one about to commence the formation of a new garden, or the remodelling of an old one. Let your first care be to ascertain the condition of the soil you have to contend with. If the ground has been drained see that the drains are in an efficient state, and whether they are low enough; if they are not, lose no time in remedying the evil, for drains are worse than useless in most soils, if they are put in too shallow. There is also a right and a wrong way of putting them in; for instance, if a piece of ground slope to the south the main drains should be cut in that direction. I have mine dug to a depth of 4 feet 6 inches, or 5 feet, according to the soil, and from 60 to 80 yards apart, using for these drains three-inch tiles; between these main or carriage drains I have the smaller four-foot drains cut obliquely, as in the accompanying diagram, in which a represents the main drain running north and south, the smaller drains falling into it on each side. These are put in at intervals of 24 or 30 feet, according to the state of the soil, using two-inch tiles.

Care should be taken in digging the drains that they be not made unnecessarily large; there should only be just room for a man to work in them, and they must be nicely tapered down from the surface. The opening for a four-foot drain should never be more than 14 or 16 inches wide at the ground level, and it should gradually taper downwards to 3 inches, or so as just to afford room enough for the pipe. On the latter, in this description of drain I place 6 or 8 inches of broken stones; the clay should be put on next, so as to nearly fill up the drain, unless it is in the kitchen garden, or near the fruit-tree borders, in which cases no more should be put in than is necessary to settle down to the proper clay level or bed. The soil that is put into the drain should not be trodden very solid at first, but be allowed to settle gradually. It is necessary to visit the drainers frequently to see that they are keeping the proper depth, and allowing a proper fall. They are sometimes men who are rather greedy of gain, and not over-particular as to whether there is a proper fall for the water or

not so long as they can get paid for a certain number of rods per day. I must, however, say that the Lancashire drainers are a very fair-working set of men, they appear anxious to earn a fair day's wages, and to give satisfaction to their employers.

I found the case different in Cheshire three or four years ago, when I drained the gardens at Oulton Park. Either from ignorance or some other cause the men would not put the pipes in the proper way, and if I left them for ever so short a time when I came back something was wrong, so at last I was obliged to jump into the drain and lay the pipes myself. It was only by these means that I was able to get the gardens drained thoroughly. I stuck to the drainers three weeks, until I had the whole of the kitchen gardens inside the walls, four acres in extent, drained to my entire satisfaction. As the foundations of the walls were very deep, I found it necessary to go below them with my drains; I, therefore, had to put in drains, 6 feet deep, all round by the walls, and as I had a large quantity of old brickbats that had come out of some walls that had been pulled down, I had 18 inches of these laid on the pipes, and in such a manner that no two pieces should be flat together—*i. e.*, there was a space of an inch or more left between all the pieces. These, as well as the pipes, I laid myself for a length of drains altogether amounting to nearly a thousand yards. I must say I was heartily glad when the job was finished, but the results I obtained well repaid me for the sore hands and throat which I had from the job. It was wonderful to see the improvement the draining made in the growth of everything that was planted in the gardens. The fruit trees soon lost their mossy appearance, and instead of their, in some cases, making long and sappy shoots, and in others dying prematurely, they have been steadily improving in appearance in every way, and are now perfect models, being literally covered with bloom-buds.

The open quarters of the gardens at Oulton were drained with ordinary four-foot drains. During the process of digging our new drains, we came upon drains almost innumerable that had been put in perhaps centuries ago, and others of more recent date, but the only way in which they acted was to take the water from one spot where it was in abundance to another where it was not so. This was, of course, causing destruction right and left. As it had been the practice to dig deep holes for the fruit trees and to fill up partly with new loam and manure, these holes acted as basins for the water, and all the lower roots were decayed. The trees, had, therefore, to be constantly expending their strength in making fresh roots at the cellar or base, to make up for the loss of those which the water was killing, as it rose higher and higher in winter in proportion to the wetness of the season.

The whole of the trees, small and large, were lifted out of this "Slough of Despond," after the draining was finished, placed on the natural surface, a mound made round them, and to shield them from the drying winds of spring and the heat of summer, a thick coat of furze was placed all over the ground about the trees. There is nothing that will encourage the small fibrous roots to the surface so much as this when it decays, but one evil must be guarded against—the furze will be sure to encourage a large stock of mice, and if they are not well looked after by constantly trapping, they will very soon peel all the bark off the trees as high up the stems as these are covered. Two years ago I was afraid I should have lost some very fine trees in this way. As soon as I discovered the mischief that had been done, I had the part of the stems that had been injured painted over with a very thin coat of gas tar. This was not palatable to them, and, besides, by using the traps freely the depredators were caught, so that I afterwards had the happiness to see the trees grow as freely as if nothing had happened to them. Fortunately the inner bark was not injured, otherwise the trees must have been killed.

The system of removing fruit trees, the proper time to do so, &c., must form the subject of another paper. The whole of the trees just mentioned were replanted early in October when the leaves were quite green, and before the sap had begun to descend. —J. WILLS, *Huntroyde*.

### HIBISCUS COOPERI CULTURE.

This is one of the most beautiful of our ornamental stove plants; but it is rarely seen in good condition. Many refuse to grow it, on the ground that the foliage becomes quite green, losing every vestige of its beautiful pink variegation.

The mode by which I manage to have the foliage beautifully

coloured is to keep the plant rather stunted, closely stopped, and near the glass. I find that if I only allow the shoots to grow a few inches the leaves begin to become green, I therefore chiefly attribute my success in respect to their colouring to close stopping. I never allow the shoots to grow more than 3 inches long before stopping, and the lateral shoots which are produced on these are of a most beautiful pink and white. All who have seen my plant say that they have never met with one so finely variegated. I know of no plant better adapted than *Hibiscus Cooperi* either for exhibition or for the decoration of the dwelling-house on special occasions, it being so distinct from any other.

The soil which I use is peat, loam, and sand. The plant may be kept with advantage in the same pot for a long time, taking care not to allow it to suffer from want of water. Now that my plant has become very much potbound I give it a little weak manure water occasionally, otherwise it would not grow after having been so closely stopped. This *Hibiscus* may be grown large enough for any purpose in a 12-inch pot; my plant is in a nine-inch one, as I only want small plants. I hope that those who hold it in but little estimation may be induced to give it another trial, and if attention be paid to stopping I think that they will be pleased with it.—CHAS. EDWARDS.

### METEOROLOGY OF FRUIT-HOUSES.

SINCE I last wrote I have procured Dr. Bennet's third edition. I will therefore give you again the temperatures of the winter months at Mentone.

	Oct.	Nov.	Dec.	Jan.	Feb.	March	April.	May.
Maximum ....	67.3	60.8	56.1	55	54	57.2	66.9	68.9
Minimum ....	55.9	38	44.1	43	40.1	40.5	55.4	66.7

These are for the winter of 1864-65. The first night on which the thermometer went below 40° was December 24th, the last was April 1st; during these 122 days it was only thirty-one times below 40°, and only twice as low as 33°. With this temperature at Mentone the deciduous trees lose their leaves in December, and such cold nights are sufficient to retain them in a dormant state till April. Now let us turn to "The Orchard-House," and see what Mr. Rivers recommends under the head of "Forcing Orchard-House." "I commenced forcing Peaches and Apricots in this house about the middle of January." "In March the fruit was set and swelling fast." "In severe weather in February the fire was kept up with more care, just to keep the thermometer up to 35°." Again: "About the middle of January forcing may be commenced, the temperature by day kept up to 50° by fire heat, with sun to 60° or 70° for a short time; the night temperature may go down to 40°." "When the blossom-buds are fully open, which will be in about twelve days . . . if the weather be keen and frosty air must still be admitted, and a brisker fire kept up, so that the temperature may not be lower than 50° by day and 35° by night." "As soon as the fruit is set and begins to swell, a day temperature of 60°, and a night of 40° to 45°, should be kept up, and when sunny abundance of air may be given, for the thermometer will then rise to 80° and 90°." I think there must be some mistake about these temperatures; but be that as it may, he certainly says that, in spite of abundant ventilation, the sun at this early period of the year is able to raise the temperature from 60° to 80° or 90°. This is more than I supposed, and verifies the remark, that in the south of England, these large orchard-houses have the summer climate of Toulouse. May I not be permitted to ask Mr. Rivers if it is not more dangerous to submit trees that have only just set their fruit to a variation of temperature of from 40° to 90° than, in the case of trees going to rest, of from 45° to 90°?

Great care should be taken not to mix up questions of meteorology and geology with the relative powers of bothouses. I will give two instances that have come under my notice this year. Grapes have been ripened in the open air at Chester and at Aekworth. In both these cases the Vines were grown against the south side of a house, so that not only had they all the advantages of climate, but also what was equal to a flued wall; and therefore to say that this proves a span-roofed orchard-house would be successful anywhere in Cheshire or Yorkshire I must deny, both these places being exceptional in their counties.

We know that a crop of Grapes can be ripened in five months,

or it may take seven. Can any one tell me what advantage a south wall has over a narrow span-roofed house, from having taken its maxima and minima for a summer in a meteorologically favoured place? I would rather have my Grapes or Peaches, if I wished them to come in soon, resting against such a wall, and enjoying its radiation all night long, than be starved in an orchard-house with a temperature of from 40° to 45°. It is not a question of fresh air; and let me refer those who wish to know how nature does in favoured climes to the Mentone temperatures for April and May—in May there are only 2.2° between the maximum and minimum. By this I think Nature clearly shows us how to act. The low night temperatures are for autumn, to ripen our fruit and set the buds.

I had written thus far when your Journal arrived containing Mr. Rivers's letter. I will not rejoice that I am in so much happier a position than Job when he sighed, "My desire is that mine adversary had written a book." I began these letters with the hope of gaining information; and now I shall be very sorry to make Mr. Rivers an adversary, but I must remind him that he has written a book. Mr. Rivers has conferred far too much benefit on horticulture for any one to wish him any harm. May I not, then, count on the Editors of THE JOURNAL OF HORTICULTURE to join me in asking Mr. Rivers to confer another benefit on the gardening world by making a large collection of facts, and then publishing another volume of his work. It is evident that his standard of shade is a very rigid one; and I presume when he wrote the book he was a little enthusiastic in the opposite way—the best of us cannot help being biased by our feelings. I will explain. He says that his climatic world reaches as far as Perth, and that this proves that the orchard-house system is a success. I refer to pages 14, 15, 16, and think what I said is correct—that climate is far more potent than shape. In Lancashire, as a whole, a single four-inch pipe will not enable any shape of an orchard-house to succeed; the trees must be advanced a month, as I advised, so as to make August into their September. If this is done a large span-roofed house, or a lean-to with a brick back, will both succeed after June without fire heat.

Now let me return to the question of the power of sun heat. I will take what I consider is the order in which Mr. Rivers would put them. 1st. The back wall of a lean-to and a large span-roof as equal; 2nd. The front of a lean-to and a small span; last, a hedge orchard-house. Now, what makes this difference? Fresh air at the same temperature will not. The hedge-house cannot be lower than in the case of the forcing-house—35° to 45°, or the large span-roof, which he gives in his last article at from 40° to 50°. It must be the day temperature's gain by sun heat. In the same article he says in his large span-roof this is only 15°; in the book, at page 145, he says the hedge-house gains 15° to 20°. I have already noticed the case of the forcing-house, where he gives the difference as from 20° to 30°. These temperatures want going over again and bringing to one standard, which I hope Mr. Rivers will do next summer, and that he will give us the temperature in the sun as well as in the shade.

I think Mr. Rivers was taken by surprise when he read my paper, and perhaps I was a little "sharp and decisive," but I am new at the business. I have a letter from the gentleman whose orchard-house I mentioned, to say that his varies from 75° to 100°; he does not know the highest point reached. Mr. Rivers says he has seen his at 96°. Was I not justified in telling the owners of lean-to houses, from which the sun is kept out, that they lose more than the value of their pipes in summer time? for are not these temperatures forcing enough? and is it not possible that the Peach trees in these houses enjoy on some days a temperature as high as 110°, for they are not in the shade?

If Mr. Bréhaut will read his paper "My Orchard-House," No. 6, in your Journal of August 2nd, 1864, I think he will acquit me of any intention to misrepresent him.—G. H.

## PLANTS FOR DINNER-TABLE DECORATION.

(Concluded from page 458.)

PLANTS ornamental by their flowers may almost be said to be innumerable. Those of symmetrical growth, that are not too high, and that can be had in flower in a small state, are the best suited, and many hardwooded plants are available. The following list, a very meagre one, is merely given as a nucleus with which to commence a collection.

*Azalea indica* affords many of the most handsome plants that

we have, and these can hardly be excelled by anything for richness of appearance.

*Acacia*.—Some of the species are as remarkable for foliage as they are for their flowers. *A. armata*, *grandis*, and *Drummond* are about as good as any, while *A. affinis* and *decurrens* look well at all times.

*Cinerarias*.—These look well, and coming in at a time when flowering plants are scarce they are indispensable. The foliage has a good appearance, and the flowers are beautiful.

*Cytisus* being of a neat uniform growth is entitled to a place; the foliage, however, ought to be healthy, and as dark a green as possible in order to show off the pale colour of the flowers by night.

*Cypripediums* are rarely sufficiently showy to be attractive, but being singular, if placed where they have a chance of being closely examined and admired they may occasionally have a place.

*Cactus*, or *Epiphyllum*.—The dwarf winter-flowering varieties of the *E. truncatum* breed cannot be excelled for the purpose. There are several varieties all good in their way.

*Geraniums* or *Pelargoniums* are not inferior to any class of plants. The best varieties are those called Fancies, the intermediate class called French are also good. Comment on any of this family is unnecessary, as they cannot well be improved. *Geraniums* of the Zonale class also afford many useful varieties for the object in view, some being ornamental by their foliage as well as their flowers. In general, however, it will be found that the gold and silver-edged are less satisfactory when seen at night than in the day, but as a change they are worthy a place.

*Gardenia*.—Nice flowering plants look well, especially if the foliage has escaped the attacks of insects, and looks healthy.

*Gesneras*.—Some of the varieties present handsome foliage as well as showy flower-spikes.

*Gloxinias* being more dwarf than the last, and also flowering more abundantly, are certainly superior as a class; unfortunately, however, there is much difficulty in flowering them in midwinter.

*Achimenes* are also invaluable while they last, being suitable alike from the habit of the plant and the brilliancy of its flowers.

*Deutzia gracilis*, as a forced plant, with an abundance of flowers, is one of the most useful plants that we have in its season, from its compactness, and the graceful character of its flowers.

*Dichytia spectabilis* is, perhaps, a little too large for the table, otherwise it is fine in foliage, and in the colour and shape of its flowers.

*Weigela rosea* is also a plant that bears forcing well, and, like *Deutzia*, can be grown of any size, or rather it can be had small.

*Prunus sinensis alba plena*, a double-blossomed Cherry, is a forcing plant of similar merit to the last, the flower being a pure white.

*Deutzia crenata flore-pleno*.—This, like *Deutzia gracilis*, also forces well, and produces abundance of flower. The plant is more robust than *gracilis*.

*Dendrobium*s of several species are also useful. *Dendrobium nobile*, *fimbriatum*, and *speciosum* are sturdy growers, and when in bloom look well; of the others I have not had sufficient experience to give a correct opinion.

*Salvia*.—Small plants of *S. splendens* when nicely flowered look well, and as they come in when flowering plants are not very plentiful are generally acceptable.

*Heaths*.—All the species are good, the winter-flowering ones, such as *E. hyemalis*, *Wilmoreana*, *rubra-calyx*, and others being especially desirable.

*Primula sinensis*, as already stated, is one of the very best plants for table decoration, being low, compact, and the foliage sufficiently spreading to partially cover the pot. It cannot well be improved upon; the leaves ought to be healthy and green.

*Torenia asiatica* is less seen than it was twenty years ago, but when in nice trim forms a very good plant for the table.

*Cyclamens*, like Chinese *Primulas*, are good.

*Hydrangeas*.—Neat little plants look well, and as they can almost be flowered in pots of any size they are useful.

*Camellias* when in flower look well, and sometimes small ones come in handy.

*Orchids*.—Any that may be in flower at the time may be employed when their size will allow of its being done. Their peculiar structure and other features make amends for the

want of symmetry in the plant. *Lycaste Skinneri* is a fine plant, and still better are some of the *Cattleyas* and others.

*Vine rosea* and *alba* are both good, and being easily managed answer well.

*Poinsettia pulcherrima* and the white variety are good, especially the former, which, when clothed down to the pot with foliage, looks remarkably well on the table.

*Laschenaultia formosa* is a gem, the plant being dwarf and compact, with handsome scarlet blossoms.

*Radiæ profusa* and *micronata*, being dwarf, are good.

*Mimulus*.—Some of the dark-spotted varieties are very showy when well flowered.

*Fuchsias*, especially the smaller dwarf-growing varieties, as the old *globosa* and others with good foliage, are well adapted for table decoration. The flowers hanging mostly at the outside are seen to advantage.

*Veronicas* of the New Zealand class being mostly of a lilac colour do not look well at night; the variegated one, however, is useful for its foliage.

*Petunia*.—The doubled-flowered varieties, being more dwarf than the others, are preferable for this work; nevertheless, a well-flowered little plant of the rose-coloured class is a gem on the table.

*Variegated Geraniums*, though coming more properly under the next class, are nevertheless admissible here. Of the silver-edged kinds those having a dark zone, as *Countess of Warwick*, are to be preferred, and the same may be said of the golden-leaved varieties. *Mrs. Pollock* and *Sunset* are the best of the tricolor-leaved kinds.

We now come to the class of plants which is by far the most numerous, and the members of which continue their services the longest. It is also as much varied as the others, though not, perhaps, as regards colour, and certainly in outline exceeding all other classes. "Fine-foliaged plants," the term used to designate such plants, include denizens of the stove as well as of the wayside ditch, beauty in vegetation not being confined to any particular locality, and, in fact, the very expression beauty is so indefinite that it is no easy matter to say how far it may be stretched, but in the present case only such species of plants will be noticed as are generally approved. I may observe, that most symmetrically-grown plants well clothed with foliage, hanging at least as low as the collar, are admissible at times, in cases of emergency, for table decoration; but it is always better if such foliage be of a handsome outline and good colour. Pinnated leaves, like the fronds of most Ferns, are better than simple ones, excepting when the latter exhibit some remarkable colour. Very large foliage, however, cannot well be admitted, and plants requiring a number of sticks, or tying-up to a framework of any kind, are highly objectionable, a free and natural growth being wanted. Plants with variegated foliage look, perhaps, better in daylight than at night, unless a considerable portion of the colouring be dark. Where this is not the case some dark object should intervene between the plant and the tablecloth; generally the pot itself or its covering will do this. Plants with dark foliage look remarkably well, and nice little plants of *Coleus Verschaffelti* cannot well be excelled for the effect they produce, unless by similar plants of the best *Dracenas*; all, however, are good that approach this colour. Neat plants of uniform growth but with plain foliage, are also by no means to be despised. Annexed are the names of a few fine-foliaged plants that have been used, and, doubtless, others equally good may be added.

*Accacia metallica*, where it can be had in good condition and small enough, is pretty good, as are also the *A. macrolobiza variegata* and *Lowii*.

*Coleus Verschaffelti* makes one of the very best plants for the purpose in view, and an improved variety of it is also said to be good.

*Calceolarias*.—Most of the members of this large family are highly ornamental when in season; they also vary widely in character. *C. argyrites*, *Wightii*, *Belleymeii*, and *Chantini* have all been used with advantage, and most likely all the moderate-growing ones might be rendered useful.

*Dracenas*.—Unquestionably one of the very best plants for dinner-table purposes is *D. terminalis*, and all the dark or rather rich-foliaged species are good, while one or two plain green ones, as *D. congestum* and *carnefolia*, are by no means to be disregarded.

*Marantias*.—The smaller-leaved species, as *vittata*, *albocincta*, *bicolor*, *regalis*, and others look well. The larger class, as *M. zebrina*, &c., are in general circumstances too large. The whole family, however, are fine ornamental plants.

*Begonias*.—Some of the smaller-growing species look well, and even the larger ones when confined to a small pot may be worked in to advantage.

*Grevillea robusta* is a fine free-growing plant with Fern-like foliage. When a tall plant is wanted, this cannot well be excelled.

*Tradescantia*.—A good potful of *T. zebrina* (*Cyanotis vittata*), of the proper size looks well, and, as the plant is easily grown and strikes like a Willow, it is easily obtained. The other kinds are less valuable.

*Sansevieria japonica*.—A dwarf Sedge-leaved plant with finely variegated foliage. It is useful as a dwarf plant.

*Pandanus javanicus variegatus*.—A plant of fine form, but not always obtainable in a small state. It is also less easy of propagation than many others.

*Issolepis gracilis*.—Now and then this Grass might be introduced when its foliage is at its best. It is scarcely necessary to remark that it is dwarf.

*Crotons*.—*Pictum*, *discolor*, *salicifolium*, *variegatum*, and others are all good when well grown.

*Ficus*.—One or two species are remarkable for the size and sturdiness of their foliage, and such might be introduced as a change.

*Cyperus alternifolius variegatus* is a handsome plant, well suited for this work. Its plain green form may also be used, though more robust than the variegated one.

*Chamærops humilis* and *Fortunii* have fine foliage, and being unlike most others are desirable plants.

*Gesneria cinnabarina* and *Cooperi*, with various forms of *G. zebrina*, look equally well in foliage as in flower.

*Cineraria maritima* is not by any means the worst plant for table decorations, and its foliage having a frosted appearance looks well at night.

*Centaurea candidissima*, like the last, is also good when separated from the tablecloth by the intervention of some dark covering to the pot, or other similar device.

*Polemonium ceruleum variegatum*.—I have not tried this plant, but its fine habit and appearance elsewhere certainly denote its suitability.

*Hardy Shrubs*.—Small plants of *Arber Vita*, *Eunonymus*, *Eurybia*, *Escallonia*, and new *Aucubas*, all look well for a change. Plants that have been kept in pots and have rooted through may be taken up and be put pot and all into one a little larger, and the plant will do for a time.

*Aspidistra lurida variegata*.—A fine flag-leaved plant, looks well when healthy.

*Aralias*.—Some of these I believe to be well adapted for the purpose, but not having used them I cannot speak from experience.

*Agaves*, or the *Aloe* tribe, may be used at times. They are sturdy and well-formed plants.

*Arundo donax variegata*, though inclined to become tall, is, nevertheless, useful in its way.

*Lomatias*.—One or two of these are good.

*Ferns*.—This family alone will at all seasons furnish very respectable subjects for the dinner-table, and some, such as the *Adiantums*, *Lomarias*, *Gymnogrammas*, &c., cannot be surpassed for uniformity of growth and gracefulness of habit. Ferns never show their qualities to greater perfection than on the table, and as their name is legion, and their diversity of form so great, they are always acceptable. Even a good plant of the common *Hart's-tongue*, found commonly by the sides of most lanes and hedges, looks well when a little pains have been taken to insure the foliage falling evenly on all sides of the pot. I need not further comment on a race of plants so well known and so much admired.

*Lycopods* or *Selaginellas* are also useful, and the dwarf-growing ones, as *S. apoda*, can be made to assume almost any shape; and if some temporary framework is filled with soil for *S. apoda* to grow in, conical or other shaped mounds covered with it can be had in a very short time. Other kinds are also easily made to assume the proper shape, and, as a whole, the *Lycopods* are invaluable when dwarf plants are required. The deep green of the foliage, and its beautifully pinnated and sub-pinnated outline, give it a charm acknowledged by all.

Besides the above, there are many other plants that might with a little care in their cultivation be made suitable for dinner-table decorations, and most likely several have been omitted which some of the readers of this Journal have thought deserving of a place. It is only necessary to add, that the taste of those who require this description of decoration will (and most justly too), guide the operator; it is also generally

I thought best to vary the character of the plants used, and the more this can be done the better. Of course, when plants are wanted in pairs, let them resemble each other as much as possible, but on the next occasion let the pair be of something else. Plants with rounded tops are generally preferred to those with high-pointed tops, but a set of these sometimes stand in good stead after the others have had their turn. Made-up bouquets to answer the purpose of plants have already been alluded to, and in this class of decoration the last resort is to enlist artificial flowers, but it ought to be the last; and such dried flowers of *Gnaphalium* and *Helichrysum* should be tried with spikes of Pampas Grass, &c. This subject, however, almost deserves a separate chapter. Perhaps some one else will write upon it.—J. ROXBON.

MARTYRDOM OF PLANT COLLECTORS.

To the cases of Douglas, the Frasers, Cunningham, and many others, is now added that of Mr. Weir, and we solicit the attention of every Fellow of the Royal Horticultural Society to the following letter from its Assistant Secretary:—"I am desired by the Council of the Royal Horticultural Society to bring before you the case of Mr. Weir, late Foreign Collector of the Society.

"Mr. Weir was on his return journey from Bogota to Santa Martha, in October, 1864, when he was attacked by fever. Mr. Stacey, H.B.M. Consul at the latter place, writes on the 1st November, 1864;

"I am very sorry indeed to have to acquaint you of the serious illness of Mr. Weir. The following is an extract from a letter I have just received from Mr. John May, C.E., dated Henda, the 20th of October:—"Mr. John Weir desires me to write to you and inform you that on coming up the river he was attacked by fever, which after a few days went off, leaving him paralysed in all his limbs from the neck downwards. He has, however, some slight power of movement—the left leg and right arm are most affected; he is utterly helpless, and has to be moved and turned about with the assistance of two men who constantly attend upon him. He is certainly better than when I first saw him on the 15th instant. To-morrow or next day he will be removed to the house of Mr. Jenney. Mr. Weir desires you to settle his accounts; he thinks, poor man, that his collecting-days are over, and requests that you will be kind enough to write to the Royal Horticultural Society, apprising them of the deplorable condition to which he is reduced."

"After remaining for many weeks with Mr. Jenney he returned home, still suffering from almost total paralysis.

"He has now been some time in this country, and the Council, before informing the Fellows of his condition, have waited to see what effect native air and time might have in aiding his recovery. They regret to say, however, that his progress has not been encouraging, and that Dr. Seymour Haden reports most unfavourably of his case.

"The Council feel that they cannot apply the funds of the Society for any length of time for the support of Mr. Weir, but they have no doubt that the Fellows of the Society who have benefited so much by the beautiful plants sent home by their late Collector will not be unwilling to subscribe to provide for one who has lost his health in their service.—J. COCKERELL, Assistant Secretary."

NEW ROSES.

I FULLY intended to have finished my anatomy of the French Rose lists last week; but having through some carelessness mislaid the lists I was unable to do so, and now complete my task. As I suppose the said lists have all been sent out, we may in one sense congratulate ourselves that we are not flooded by the usual amount of Roses this year. Instead of the eighty or ninety of last season, we have about forty Hybrid Perpetuals, four Bourbons, and one Tea. But looking at the lists in another point of view even this bright spot is dimmed,

while what I may call inferior raisers—raisers who have never really given us anything first-rate, are still "to the fore," as our Irish friends would say. I miss the well-known names of Margottin, Charles Verdier, Levôque, Marest, and Portemer—men who have given us such Roses as Jules Margottin, Comte Cavour, Duchesse de Caylus, Due de Rohan, Cécile de Chabrilant, and Lord Macanlay. Their very absence is, however, a fresh proof of the confidence we may fairly repose in them. Had they had Roses which they pronounced good we should have heard of them, and I venture to say they had many as good as a large number of those in the lists. Indeed, I shall be very much mistaken if this season do not prove a comparatively barren one, giving us but few good Roses. The few remaining flowers are as follows:—

GAUTREAU.

34. *Camille Bernardin*.—Very vigorous. Seedling of Général Jacqueminot. (We have too many of this gentleman's babies already.) Flowers large, well formed, full, beautiful new shade of red, very fragrant. Has received a silver-gilt medal.

J. VERSCHAFFELT.

35. *Empereur de Maroc*.—Another of the Général's progeny, and, as it is said to be only newly full, I fear partaking not of the virtues but of the vices of his papa; nor do I see a word in the description that might not apply to the Général quite as well.

FONTAINE PÈRE.

36. *Fanny Petzold*.—Plant very vigorous. Flowers large, full, imbricated, opening well, beautiful clear rose, satined (i) with white.

37. *Gustave Persin*.—Plant very vigorous. Flowers very large, full, well formed, very rich colour—purplish red shaded with scarlet. This variety is said to produce as great an effect as Monte Christo—well, Monte Christo does not hold a very high place in our affections over here.

38. *Mademoiselle Marie Raby*.—Plant very vigorous, flowering well in autumn. Flower very large, full, and of perfect form, imbricated, and opening well, beautiful lively red bordered and satined with white. Very beautiful.

These all sound very nicely, but this, we know from sad experience, is no criterion of worth; nor do M. Fontaine's previous successes inspire us with a great deal of confidence.

SOUPERT ET NOTTING.

39. *François Goeschke*.—This has the merit at least of a queer name. Plant very vigorous. Flowers large, well formed, beautiful lively red passing to cerise red; bordered, or, as I should suppose we would say, back of the petals, lilac.

GONOD.

40. *Madame Fillion*.—Plant very vigorous. Seedling of Madame Domage. Flowers very large, full, well formed; petals beautifully rounded, lovely salmon rose, superb.

41. *Madame Hoste*.—Plant vigorous, very free-flowering. Flowers large, full, perfectly imbricated, in clusters, flesh colour, spotted with lively rose. Admirable.

BOURBON ROSES.

42. *Jules César* (E. Verdier).—Plant very vigorous. Flowers large, in clusters of from five to eight, very full, well formed, fine shaded cerise rose.

43. *Madame Charles Ballet* (E. Verdier).—Plant very vigorous. Seedling of Louise Odier. Flowers large, in clusters of five to eight, very full, perfectly imbricated, beautiful fresh tender rose.

44. *Le Florifère* (Soupert et Notting).—Plant vigorous. Flowers medium-sized, nearly full, lovely crimson red passing into satiny rose. An excellent variety for grouping, owing to its free-flowering character.

45. *Mademoiselle Jenny Gay* (Guillot fils).—Plant vigorous. Seedling of Louise Odier. Flowers medium size, very full, very well formed, flesh white, with tender rose on the reverse of the petals. A charming plant.

TEA ROSES.

46. *Madame Retornaz* (Guillot père).—Plant vigorous, very free-flowering. Flowers large, full, buff; centre copper colour.

I quite agree with Mr. Radclyffe that we have too many seedlings of Louise Odier, all very much alike, and all of them, with some few exceptions, different in size. They are very pretty, but do not come up to the standard of our requirements.

And now what shall we say to all these candidates for public favour? I believe that the favourites are to be found amongst Mlle. Marguerite Dombain, Alfred Colomb, Eugène Beaunarnais; and that next in rank are President Mas, Prudence

Besson, and Alba Mutabilis. As to the others I can predicate nothing, and time only can tell whether the "flattering tale" is all fancy's sketch or not.—D., Deal.

## ROYAL HORTICULTURAL SOCIETY.

DECEMBER 5TH.

**FLORAL COMMITTEE.**—This meeting, by the liberal aid of Mr. Veitch, and plants furnished by Mr. Eyles from the Society's garden, considering the late season of the year was made very interesting and attractive. Mr. Veitch's collections of flowering plants and Orchids were extremely beautiful, and both received special certificates. Among the former were a magnificent specimen of *Thibaudia macrantha*; *Phormium tenax variegatum*; some very pretty specimens of *Epiphyllum truncatum*; *Aucuba japonica vera*, with its elongated scarlet berries; *Aucuba longifolia*, which was awarded a first-class certificate in June, 1864; *Rhododendron Princess Alexandra*; the beautiful *Bertolonia pubescens* and *guttata*; the not less beautiful *Sonerila margaritacea alba nova*; *Eriocnema marmorea*; the Cuphealike *Libonia floribunda*, and other interesting plants. The varieties of *Lycaste Skinneri* among the Orchids were very beautiful, the extraordinary-formed flowers of *Angræcum sesquipedale* were very conspicuous, especially when compared with the small-flowering *Angræcum pertusum* in Mr. Wilson Saunders's collection. *Dendrobium Tattorianum*, *Barleria Skinneri*, and one or two varieties of the hybrid *Cattleya Dominiana* were also included in this collection. Messrs. Lacombe, Pince, & Co., Exeter, sent the parent plant of *Polystichum angulare parvissimum*, a dwarf-habited variety, for which a first-class certificate was awarded. Mr. Bateman exhibited cut specimens of *Thibaudia oceanensis*, a greenhouse plant, introduced by Mr. Linden from Grenada, having scarlet and white wax-like-looking flowers, with bright green foliage. This received a second-class certificate. Mr. Bateman also sent cut specimens of a *Gaultheria*, raised from seed collected by Mr. Skinner. The specimens were not in condition to afford any idea of its merits. Mr. Green, gardener to W. W. Saunders, Esq., exhibited a small group of interesting Orchids, consisting of *Cœlogyne* sp., name unknown, with curiously-formed flowers of a pale dull brownish hue; *Angræcum pertusum* with long narrow spikes of densely arranged white flowers, *Liparis spatulata*, and three *Oncidiums*. A special certificate was awarded this collection. Mr. Eyles exhibited a very nice collection of Orchids from the Society's gardens, consisting of a very fine variety of *Lycaste Skinneri*, three species of *Cypripedium*, *venustum*, *barbatum*, and *insigne*; the brilliant *Sophronitis grandiflora*, *Zygopetalon crinitum*, various *Draconas*, *Maranta albo-lineata*, fine specimens of variegated *Crotons*; also, several plants of *Poinsettia pulcherrima* with their brilliant heads of flowers. Mr. Eyles also brought before the Committee another of Mr. Weir's *Odontoglossums*, with dull green flowers marked with brown blotches, not unlike *O. gloriosum*, but differing from the latter in the remarkable position of the lip, which seemed placed at right angles with the centre of the flower. This variety was said to be *O. Lindleyanum*.

**FRUIT COMMITTEE.**—G. F. Wilson, Esq., F.R.S., in the chair. The subjects brought forward on this occasion were few. Mr. Parsons, gardener to W. Blake, Esq., Danesbury, sent some excellent Winter Nolis and *Joséphine de Malines* Pears, also Winter Crasanne; and Mr. Myatt, Deptford, a small seedling Pear, which was of remarkably fine flavour. The Committee deferred coming to a decision upon its merits till it had been seen again. Mr. Veitch, Chelsea, exhibited fruit of *Staantonia latifolia*, grown by Mr. Jack, gardener to the Duke of Cleveland, Battle Abbey; also, fruit of *Mandevilla suaveolens*, both of which fruits are noticed in our account of the Scientific Meeting. Mr. Vair, gardener to Lady Dorothy Nevill, again exhibited fruit of *Monstera deliciosa*, from the stoves at Dangstein, and was awarded a special certificate.

**SCIENTIFIC MEETING.**—W. Wilson Saunders, Esq., F.R.S., in the chair. The awards of the Committees having been reported to the meeting, the Rev. M. J. Berkeley briefly reviewed the subjects exhibited. Among these was the fruit of *Monstera deliciosa*, respecting which Mr. Berkeley said he had not much to add to what he had stated at previous meetings. The fruit when perfectly ripe was of fine flavour, and would be useful were it not for the disagreeable prickles which stuck in the throat; it was extremely luscious, but he might mention that a gardener who had eaten half of one, had in consequence become exceedingly ill. The fruit of *Staantonia latifolia* grown by Mr. Jack, and exhibited by Mr. Veitch, next came under notice. It was stated to resemble the fruit of the common Brinjal, a kind of Egg-plant, and the plant producing it belonged to the small and curious natural order, *Lardizabaleæ*, which was nearly allied to *Berberidaceæ*. The *Lardizabalas* were almost entirely confined to the east of Asia, and to America; a doubtful species, however, was found in Madagascar. The fruit of *Staantonia hexaphylla* was eaten in Japan, but was not held in much esteem, being like that of *Staantonia latifolia*, almost tasteless. Mr. Veitch had likewise brought the fruit or pods of *Mandevilla suaveolens*, which resembled two long horns. The Orchids were next touched upon. *Angræcum sesquipedale*, characterised by its extremely long spur, was contrasted with

*A. pertusum*, which, on the contrary, has a very short spur, and is less remarkable for beauty of colour than for elegance of structure. A *Cœlogyne*, from Moulmein, exhibited by Mr. Green, it had been suggested by some, approached *C. speciosa* in character, but it was more like *Cœlogyne Parishii*; still there was good reason to believe that it would prove to be perfectly distinct. An *Odontoglossum* sent to the Society by Mr. Weir, was also probably a new species, and offered a point of interest in the extreme lobe of the lip being in a perfectly vertical position, which was almost without a parallel in this tribe of plants. The similarity of *Thibaudia oceanensis* to a *Rhododendron*, exhibited in the spring, and to *Rhododendron Keyssii*, figured in the "Botanical Magazine," of 1855, was next pointed out; but this *Thibaudia*, however interesting it might be, was not comparable with *T. macrantha*, one of the most beautiful plants ever introduced into this country. Mr. Bateman had, in a lecture in the early part of the season, pointed out how well the graceful pendant habit of the *Thibaudias* fitted them for decorative purposes in buildings. A *Gaultheria*, from Mr. Bateman's, it was remarked, was graceful, probably hardy, and most likely merely a variety of *G. ferruginea*. *Polystichum angulare parvissimum* from Messrs. Lacombe, Pince, & Co., was spoken of as one of the most charming varieties of British Ferns, and although the word *parvissimum* had been objected to, an authority for it had been found in Lucretius. Mr. Berkeley concluded by calling attention to the charming collection of plants from the Society's garden, and especially to *Musa cocinea*.

Mr. Wilson Saunders said he wished to offer some observations on two or three Orchids which he had brought to the meeting. Among them were three varieties of *Oncidium carthaginense*, which he had brought to show the variation of species in their natural habitats, and all of which varied considerably in colour and marking, although coming from the same locality, Belize; the colour of the petals had nothing to do with the botanical distinctness of species, and whatever those not conversant with botany might think, colour was no criterion at all. Mr. Berkeley had made some observations on a *Cœlogyne* which he (the Chairman) had brought; its great interest lay in the side petals having vanished into hair-like appendages, and there was no doubt that it belonged to the genus *Cœlogyne*, the species of which were now becoming very abundant. Assam, Martaban, Tenasserim, and Singapore, were the countries of the *Cœlogyne*s. *Monstera deliciosa* had been mentioned; it was a plant most easily grown by those having a damp house with the requisite heat, and could then be fruited very easily. Cultivation might do much, but it was his belief that it could not be turned to account as an edible fruit. The way in which he grew and fruited it every year was to keep it close to a tank, so that the roots might find their way into it; and it was curious to observe how seemingly anxious they were to go into the water, passing down into the tank as a long thick root, and then branching out and divaricating in all directions. They sucked up water in an extraordinary way, and the plant then grows with great rapidity. The large leaves were pertuse, or cut in holes, and had a curious effect when held up to the light. The mode in which they were developed was also most remarkable, the leaf being turned backwards and rolled round the leafstalk, forming a sort of spathe; by degrees it begins to unfold and assume an ascending position, and in a week it becomes hardened. Mr. Saunders concluded by recommending the *Monstera* for cultivation on account of the interest attached to its growth.

## INTERNATIONAL FRUIT SHOW.

DECEMBER 9TH.

THIS was opened to the public on Saturday last, and will continue till the 16th. Although it was only considered as one of the minor shows, and the amount of encouragement held out in the shape of prizes was consequently limited, the result has been an extensive and generally excellent display, far exceeding the most sanguine expectations that had been formed of it. Home-grown productions are not in such plenty as we could have wished, and of foreign nations, Denmark and Belgium are the only ones that have come forward. On the other hand, the colonies are well represented by Nova Scotia, which takes the lead with a very large collection, consisting chiefly of Apples; by Victoria, Malta, and last, but not least, India.

Of the British part of the Exhibition, the most prominent feature is the magnificent collections of Mr. Lewis Solomon, and Messrs. Webber & Co., of Covent Garden. It is scarcely necessary to remark, that a large proportion of the subjects which they exhibit have been obtained at great cost from France and the West Indies; still there are, especially in Messrs. Webber's collection, some extraordinary Pears of English growth. Mr. Solomon exhibits twelve Fines—Jamaicas, Cayennes, and Queens; Bananas, Pomegranates, Shadlocks of the largest size, Pomeles, Prickly Pears, Medlars; Barbadoessa, Black Hamburg, and Sweetwater Grapes in bunches; fine baskets of Black Hamburgs and Muscats; also, of Tangerine, Mandarin, and St. Michael's Oranges. It is, however, the Apples and Pears that constitute the great feature of the collection; the latter consist of immense fruit of *Uvedale's St. Germain*, grown merely for show, it being a stewing Pear. Glon Morecan, Chaumontel, Easter Beurré, and St. Germain, all of the largest size; also, Black Worcester, another kitchen variety. The Apples comprise Ribston Pippin, the beautiful Lady Apple, Nonparcils, Reine d'Angleterre, a very showy French

variety, and very large specimens of Reinette du Canada, and Calville Blanche. In addition to the fine collection of fruit, Mr. Solomon has one of vegetables, in which are fine Perigord Truffles, Asparagus, green and blanched, Green Peas, Sea-kale, Kidney Beans, fine Cardoons, Globe Artichokes, and Lettuces.

Messrs. Webber have also wonderful Pears, especially the Uvedale's, eight of which of French growth weigh between 19 and 20 lbs., and twelve grown in Bedfordshire, 22½ lbs., these last measuring from 12 to 13 inches in circumference. The other Pears consist of magnificent specimens of Easter Beurré, Joaquinne de Malines, large and very fine; Catillae, St. Germain, and Passe Colmar, likewise very fine. Scarcely less remarkable are the Apples from the same firm, especially the Golden Noble, beautiful and clear in colour; Reinette du Canada; Striped Beefing, a showy and excellent kitchen fruit; Calville Blanche; Pomme d'Api; and Gloria Mundi. For Grapes there are Muscats and Black Hamburgs; of Pines, several of the Cayenne and Black Jamaica; and two excellent Scarlet Gem Melons. Tanguierine Oranges, Prickly Pears, Pomegranates, Shaddocks from the West Indies, Litchers from China, fruit of a Solanum from St. Michael's, Sapumia Nuts from Mexico, Coh Nuts and Monkey Nuts, Hickory Nuts and Pistachiu Nuts, complete the list of subjects forming this admirable collection.

Great credit is due both to Mr. Solomon and Messrs. Webber for their spirit in bringing forward such fine collections, constituting as these do the greatest attraction in the Show, at least for the bulk of the visitors.

The next most important feature is that exhibited in Class 1, which is for the best collection of fruit and vegetables grown in the garden of a Sovereign; and though Mr. Ingram, Her Majesty's gardener at Frogmore, had no concurrent to contend against, his collection well deserves the gold medal which was awarded for it, more especially as it was not grown specially for the occasion, but is a sample of the ordinary resources at this season of the garden which he superintends. It comprises six noble Smooth-leaved Cayenne Pines, ranging from 6 to 7 lbs. each, and very equally matched in size and appearance; Black Hamburg Grapes from the large Vine at Cumberland Lodge, a seedling late Black Grape, West's St. Peter's, Alicante, and Muscats; and beautiful dishes of Apples, among which we remarked Scarlet Nonpareil, Cox's Orange Pippin, Court-Pendu-Plat (beautifully coloured), Dutch Mignonne, King of the Pippins, a seedling called Nugget, another seedling taking somewhat after the Blenheim, Damocles's Seedling, Old Nonpareil, Cockle Pippin, and Downton Nonpareil. Pears consist of Prince Albert (an excellent variety raised by Mr. Ingram, and described in these pages some two or three years ago), large and remarkably fine, Fruit of Winkfield, Glou Morecan, Easter Beurré, No Plus Mouris, Boarré Diel, Forlelle, and Beurré Clairgean, &c. Vegetables are represented by Mohawk Kidney Beans, Asparagus, Hammersmith Hardy Green, Royal Cabbage, and Brown Cos Lettuces, finely blanched Endive, Broad-leaved Sorrel, Basil, Chervil, Mint, Mustard and Cress, Powell's Early Tomato, an early kind which we are informed requires little trouble in pruning; and Chilies. The coarse kinds of vegetables are shown in the Arcade.

Adjoining Mr. Ingram's collection, Miss Small, of Colnbrook, exhibits jam made from the Melon Vegetable Marrow, plain and flavoured; also, Tomato jam, brisk and excellent in flavour, and pickles.

From Mr. Whiting, the Deepdene, come fine samples of Court-Pendu-Plat, Fearn's Pippin, Adams's Pearmain, Cox's Pomona, and other Apples; from Mr. Webb, Reading, Coh Nuts and Filberts, among which are Webb's Peace, Emperor Cob, Princess of Wales, Corford, &c., also Apples and Pears. Of the former Scarlet Pearmain, Fearn's Pippin, Court-Pendu-Plat, King of the Pippins, Scarlet Nonpareil, and Golden Russet are beautifully coloured; the others principally consist of Reinette du Canada, Blenheim Pippin, Cockle Pippin, Golden Harvey, Old Pomeroy, Syke House Russet, French Crab, Beachamwell, Sturmer Pippin, Golden Pippin, Court of Wick, and Excelsior, a very showy variety. Comte de Paris, Van Mons Lion le Clere, and some other Pears are also well represented in this collection. Mr. Dixon, Holland House, contributes Cluster Golden Pippin, Rymer, Cox's Orange Pippin, Barcelona Pearmain, Beauty of Kent, French Crab, Royal Russet, and other Apples, together with Glou Morecan, Duchesse d'Angoulême, and Beurré Diel Pears; and from Mr. Ford, gardener to W. E. Hubbard, Esq., Horsnam, comes a very good collection of fruit, chiefly consisting of Apples and Pears. The former include excellent examples of More de Menace, French Crab of 1861 and 1865, King of the Pippins, Wadhurst Pippin, Adams's Pearmain, Flower of Kent, Royal Russet, Golden Reinette, Blenheim Pippin, Holland Pippin, Court-Pendu-Plat, Cornish Gilliflower, Pearson's Plate, and a seedling stated to be an excellent dessert Apple. The Pears comprise Glou Morecan, Easter Beurré, Broom Park, Beurre Diel, Duchesse d'Angoulême, Uvedale's, and Bequene Musqué. The same exhibitor also sends Ruby Castle and White Dutch Currants in good condition, Oranges, Limes, Calabrian Raisin Grapes, six cones of Picea Webbiana from a tree 29 feet high and eighteen years old, Tricolor India Corn, fruit of a Physalis, honey, and dried flowers. From Mr. Young, gardener to E. Barclay, Esq., Highgate, come excellent specimens of Alexander, Allriston, Blenheim Pippin, and Syke House Russet Apples; from Mr. S. Snow, gardener to the Countess of Cowper, Wrest Park, six Uvedale's St. Germain Pears, weighing 13 lbs. 13 ozs.; and from G. F. Wilson, Esq., fine Chaumontels from a

pot tree in an orchard-house moved out of doors to ripen its fruit. Mr. Smythe, gardener to Lord Soudes, has Apples and Pears. A similar exhibition comes from the Rev. G. W. St. John, the Rectory, Woodstock. In this are remarkably fine Easter Beurré Pears, Duchesse d'Angoulême, Doyenné d'Alençon, St. Germain Yanguelin, and Colmar des Invalides, French Crab Apples of 1861 and 1865, and Cox's Orange Pippin grown with and without house sewage, the former being much the finer.

Mr. Humau, gardener to R. T. Crawslay, Esq., Merthyr Tydvil, contributes four good Luville Pines and an Antigua; and Messrs. Rivers & Son a number of Orange trees in pots, and in fine bearing, consisting of the Tanguierine, St. Michael's, Maltese, Ampton, and variegated varieties, the last very useful for decorative purposes. From Mr. Downing, gardener to T. Griswell, Esq., come very fine Pomegranates grown in an orchard-house without artificial heat; from Messrs. A. Henderson & Co. Eucharis amazonica, remarkably fine; and from F. J. Grabam, Esq., Violets, charmingly interspersed with Maiden-hair and other Ferns, inserted in Custard Vegetable Marrows, thus forming very graceful table or room decorations. Among other miscellaneous articles are preserved fruits, pickles, &c., from Messrs. Fortnum & Mason, Burgess & Sons, and Mr. Beesley, Twyford Abbey.

In the foreign department M. Cappeneck, Ghent, Belgium, exhibits a numerous collection of Apples and Pears, and a very extensive collection of a similar character from the Horticultural Society of Copenhagen. In this Reinette du Canada and Court-Pendu-Plat are very good, and many of our well-known English varieties, as London Pippin, King of the Pippins, French Crab, Norfolk Beefing, No rusch, Claygate Pearmain, &c., are well represented. Besides these there are numbers of showy Apples, such as Pigeon Rouge, Nonnetitty, Princesse Noble, Wine Apple, &c., of which the only merit is probably their colour. One, almost white, with a pink cheek, had a very delicate appearance. The Pears from such a climate as that of Denmark could not be expected to be remarkable; among them are Seckel, Josephine de Malines, Winter Nelis, Vicar of Winkfield, Beurré de Rance, Uvedale's and Verulam, both small. The Fruit-growers' Association of Nova Scotia send an extensive and fine collection of Apples and a few Pears, the latter, however, not in good condition, owing to their long voyage. The Apples are for the most part very large and fine, though scarcely equal to those shown by the same colony at the former International Fruit Show. Besides many local varieties, Baldwin, Esopus Spitzenberg, Northern Spy, Ribston Pippin, Blenheim Pippin, Alexander, Gloria Mundi, Rhode Island Greening, Gravstein, and Dutch Codlin are very fine. We also noticed the old Golden Pippin, Pomme d'Api, and King Apple and Margaret Pippin, both of which are very showy. From Malta come preserves, several fine dishes of different kinds of Oranges, Lemons, Shaddocks, Pomegranates, Prickly Pears, Bananas, Bread Melons, Tomatoes, Cucumbers, very large Gourds, Water Melons, Artichokes, Turnips, Garlic, Peas, very poor Celery, and other vegetables, none of them remarkable for perfection. Victoria sends the models of fruits and vegetables lately exhibited at Dublin; and India, preserved fruits and vegetables, together with a book of drawings and photographs of edible fruit and vegetables dedicated by Dr. Short to the President of the Royal Horticultural Society, also a book of specimens of the leaves of vegetables eaten by the natives of southern India.

#### VEGETABLES.

Here again Nova Scotia exhibits, the subjects sent being thirty-eight kinds of Potatoes, Onions, Gourds, Parsnips, Carrots, Beet, and Kohl Rabi. Excellent collections of vegetables come from Mr. Ingram, gardener to Her Majesty, Mr. Whiting, the Deepdene, Mr. Budd, gardener to Earl Darley, Cobham Hall, and Mr. Ford, Horsnam. Potatoes are very well represented in collections from Mr. Whiting, Mr. Ford, and Rev. G. W. St. John, Woodstock, who out of sixteen sorts exhibited received certificates for twelve. In another column will be found an account of some of these by our correspondent "UPWARDS AND ONWARDS." Messrs. Cuthush exhibit eighty halves of the handsome and very productive Naucham Park Onion, also Cuthush's Crispson Beet; Messrs. Dewar, of Newcastle-on-Tyne, Northumberland Champion Celery and Dewar's Improved Short-top Beet, of which a highly favourable opinion is expressed at page 402; Messrs. Smart & Mein, Fairbairn's Pink Seedling and Smith's Early Potatoes; and Messrs. A. Henderson & Co., a collection of twenty-four Variegated Kale. Messrs. Barr & Syden, in addition to a large collection of Gourds, exhibits plant-cases, Webb's Imperial Kidney, and other Potatoes; and Messrs. Roberts & Sons tobacco tins for fumigation. To the above exhibitors numerous certificates were given, but we must defer entering into further details till next week.

The Show, altogether, is an interesting and good one of its kind, and well worth visiting.

### INTERNATIONAL HORTICULTURAL EXHIBITION AND BOTANICAL CONGRESS.

It is with much pleasure we announce that, besides Her Majesty and the other members of the Royal Family, His Royal Highness the Duke of Cambridge has given in his adhesion to

the International Exhibition of 1866; and that Professor De Candolle, of Geneva, has accepted the office of President of the Congress, to which he was unanimously elected at the last meeting of the Executive Committee.

### BOILERS.

I AM glad that "H." has followed up the remarks of our able correspondent "R. F." by detailing his experience with boilers, and I hope that others will adopt the same course. Although differing from "H." in the opinion he entertains as to fixed boilers, I am by no means sure that I am not in the wrong. It seems certain that perfection has not been reached in any boiler yet in use, and I am doubtful whether we must not go back to some of the early forms if good service and general utility be wanted. The boilers which we have here at work are the conical, tubular, saddle of two or three designs, and another not described in the general lists of such apparatus, and for simplicity of feeding and working the saddle boiler is the favourite. I do not mean to say but that the

tubular boiler does its work with quite as little fuel, perhaps less, but this is difficult to ascertain, as they do not heat equal quantities of pipe; but the fireplace will hold any description of fuel, and that is a consideration not to be undervalued. I confess that I have not had any practical experience with boilers standing out from the brickwork, but I cannot dispel from my mind the impression that they are better adapted to heat the shed or place in which they stand than the line of pipet with which they are connected, by reason of so much heat escaping from the boiler or its casing. Those, however, who have tried such boilers for heating a moderately large quantity of piping will be better able to inform us, and certainly the subject deserves every attention.—J. ROBSON.

**LIME IN THE SOIL FOR ORCHARD-HOUSE TREES.**—Although, as Mr. Rivers suggests, calcareous matter may be beneficial to stone fruits, it appears to be by no means necessary, from the fact that a friend grows Peaches, Plums, &c., in great abundance and excellence without having a particle of chalk or lime in the soil used.—A. E.

### CULTIVATION OF THE LIME, CITRUS LIMETTA, IN THE EXETER NURSERY.

I SEND you a photograph of a cluster of Limes and a portion of the case in which the plant is growing, also a rough plan of the case, its dimensions, and a few plain practical remarks upon the culture of this beautiful and highly desirable fruit. As you will readily perceive, nothing can be more simple than the method which we adopt. The case is attached to the end of a common greenhouse, and the Lime, which is planted out, is trained upon a plain lozenge-shaped galvanised wire trellis affixed to the wall, which is merely a continuation of the wall against which the greenhouse is erected. This trellis affords great facilities for arranging the flexible shoots symmetrically upon it, instead of nailing them against the wall, and nothing can exceed the unique and beautiful appearance of the case, covered as the plant always is with blossoms, green fruit in all their stages of development, and clusters of bright golden fruit at full maturity. No artificial heat is supplied by hot-water pipes or otherwise in the case itself, but an end sash of the greenhouse, before alluded to, is thrown open so as to admit the passage of warm air into the case when the weather is very severe; but, unless there is a prevalence of frost, this heat is not admitted, as the cool, steady, rather humid atmosphere of the case is much more congenial to the health of the plant than if recourse were constantly had to the warmth derivable from the greenhouse.

The border inside the case was excavated to the depth of 3 feet, and filled up first with rubble drainage, such as brickbats, &c., to the depth of 9 inches; then good sound turf, cut from a pasture field, was laid one sod thick neatly upon the top of the rubble, grass side downwards, and upon the sods was placed a compost of good sound turfy loam, well decayed dung, leaf mould, and coarse sand or grit in about equal quantities, the whole chopped roughly and blended together, but on no account sifted or beaten fine. On this soil,

inside the case, is placed a common wooden trellis for walking on, such as is commonly used in vineries and Peach-houses; this is highly desirable, for it prevents the soil from becoming close and sodden, and keeps the border free and open.

The Lime having been thus planted requires to be very cautiously watered at first, but as soon as the roots have worked into the congenial soil, and vigorous shoots are produced, a liberal supply of water should

be given, and the whole plant syringed occasionally in the evening; free admission of air during the day is also requisite. When the wire trellis is well covered the plant will commence bearing abundantly, and water must be administered copiously, which, as the border is well drained, will impart health and vigour to the plant, and the soil must never be permitted to become thoroughly dry. This point should be well looked to, for nothing is so pernicious to the general well-doing of the Lime as permitting the roots to get into this condition; occasional supplies of liquid manure in a very diluted state may also be beneficially given during the spring, summer, and autumn, not oftener, however, than about once a fortnight. I have alluded to syringing the Lime—this, however, should not be done during the time the plant is in blossom, as that process would damage the fertilising quality of the pollen, and thus prevent the fruit from setting freely.

Without going back to the mythic gardens of the

Hesperides, with the dragon guarding the golden fruit—  
"Aureaque Hesperidum servans fulgentia mala."

various species and varieties of the Citrus family have, with the glorious appearance and the refreshing health-bestowing qualities of their beautiful fruit, for ages attracted the universal attention of mankind; and the Orange, the Citron, and the Lemon, with their numerous varieties, are now, and have long been, appropriate ornaments in all gardens possessing any preten-

sions to horticultural eminence. From some cause, however, probably from ignorance of its comparatively hardy constitution and facile culture, the Lime (*Citrus limetta*) has not met with that general cultivation which it deserves; certainly it might and ought to be grown advantageously in every good garden, for not only are the immature green fruit (which are

I planted all my Potatoes on the 11th and 12th of April, and on May 5th they were appearing well above ground. About the middle of July the foliage began to be spotted with the disease, but luckily I had only planted the Brussels Sprouts and Walcheren Broccoli in the trenches between the early sorts. My late Broccolis I had deferred planting between the later Potatoes on account of the electric state of the atmosphere, which I regarded as a warning against the disease, and I adopted a plan I had never before thought of in order to save the plants from the disease. As I gave an account of this at the time, so that others might be enabled to prove the advantage, I must beg to re-introduce a passage here in order to render my present remarks more intelligible.

At the beginning of August I said, "I am in great anxiety just now about my Potatoes. The leaves became spotted three weeks ago, and the electrical state of the atmosphere since that time, along with prevailing rains, has kept me haymaking at the haulm at every opportunity—yes, haymaking, for I could not stand still and allow my Potato patches to become like a blackened fetid dunghheap, which they presently would have done; and as to cutting away the haulm entirely, that does more harm to the tubers than letting it alone, on account of the exuding sap from the close-severed stems running down and perpetually moistening the ground, and thus inevitably causing disease. Well, I cut away with the garden shears all communication between the foliage of the separate ridges, and cleared away the severed leaves; then with a Parkes's fork I turned and bore all the growing tops to the right-hand side of the ridges, and with the fork slightly scratched the bare or left-hand sides, as well as the bottoms of the trenches. When the sun had dried the surface of the ground and the uppermost side of the haulm, I immediately turned the haulm over to the left-hand side of the ridge, and again scratched the surface of the soil laid bare. Afterwards I took the opportunity, whenever the sun had again dried the surface of the soil and the foliage, to turn the haulm over. I believe that I shall save my crop from becoming diseased by the above method, and it makes me more in favour of the ridge and trench plan than ever. I could never have thought that Potato-tops would have borne so much knocking about with impunity; and the sun soon converts the mildew-affected leaves, when these are turned over to meet its scorching rays, into tinder, before the disease can be communicated to the stem. This rough mode of procedure as regards the top will, however, upset some nice calculations I was in hopes of being able to make this season to satisfy Mr. Abbey."

Before the above paragraph was printed I had taken up all my early kinds of Potatoes—viz., Mitchell's Early Albion Kidney, Shutford Seedling, Hogg's Coldstream, Daintree's New Seedling, and a new seedling which I have named the Bee-hive Potato—one of thirteen "seedlings of 1862 from Flukes," about the size of pins' heads, which were sent to me by an unknown "brother bee-keeper" from Scotland in an envelope, in a Stewarton bar-and-frame hive, along with some noted varieties of Scotch Potatoes; and if ever I find out the name of the sender I trust to have the pleasure of returning him one of his own seedlings, which I have proved to be an early kind, immediately following my first earlies. It has moderate foliage, is a good cropper, roundish, shallow-eyed, flesh white, firmly mealy, and it is a very desirable medium-sized, good-flavoured sort—the only one out of the thirteen that is worth perpetuating.

On the 24th and 25th of August, I took up Daintree's Seedling, which averaged between fifteen and sixteen tons per acre. It is the only kind that I measured and weighed for bulk of crop this year, although all the sorts appeared to be quite up to my usual averages; also, Fortyfolds, Lapstone Kidney (about a peck of diseased tubers amongst these, and super-tuberation had begun), Haigh's Kidney, and Fenn's Onwards Potato, a new seedling of my own, which I raised from a cross between Jackson's Seedling and the original Fluke. It is a second early, roundish, somewhat flattened, with moderate eyes, handsome foliage like its male parent, Jackson's Seedling, but much dwarfer, and an excellent cropper, of the fullest garden size; flesh perfectly white, mealy, and of a first-rate flavour. I am proud of it, as it is the only Potato that I ever raised to suit my ideas, though it does not do so quite, otherwise it would be symmetrically round, with eyes perfectly smooth, and without any indentation whatever. I have crossed it with a Potato which my brother gave me, having a perfect form, though lacking flavour, and I have obtained seed for sowing next spring. I have also seed from a cross between Hogg's Cold-

SECTION OF CASE.

- f Front, 6 feet 5 1/2 inches high from sill, 13 feet 8 inches wide.
- g Sill, 4 feet 9 inches.

thinned off by hundreds) delicious in a preserved state, but the ripe fruit are serviceable wherever a Lemon is required, to which the juice and rind of the Lime are in every respect vastly superior. The merits of Lime-juice as a specific for scurvy are too well known for me to do more than just in conclusion allude to the subject. We give air freely in summer by taking off part of the case, and stop all over-vigorous shoots by simply pinching them off at about 6 inches from the plant. —ROBERT T. PINCE, *Exeter Nursery, Exeter.*

RIDGE AND TRENCH POTATO CULTURE.

WHEN I read the unfavourable account which Mr. Fish gave of his Potatoes the other day it reminded me that it was time I sent you my annual paper on the subject. The disease has been very prevalent in this neighbourhood, more particularly in the part immediately surrounding me, the crops having been nearly destroyed; and the majority of the largest tubers of those which were stored have either rotted already or are gradually doing so. Now, why should I remain exempt from this evil more than my neighbours? This is just the observation which a tradesman in this borough made to me some years ago, and when I invited him to come and see my crop, and the system I worked upon, he simply declined doing so: therefore no more could be said. I have so frequently and minutely explained the plan in these pages that I feel it would be mere repetition to go over the subject again. Still there must be much in the system of management and cultivation favourable to the development of the tuber, and antagonistic to the disease; for I invariably obtain good, sound, and well-flavoured crops. I admit, however, that I was put on my mettle this year; for it has been about as trying a season as any that I remember since the fatal one of 1846.

stream Potato and Shutford Seedling. So here is another five-years prospect, for I never would introduce a Potato to the public under that time from the seed-apple, otherwise disappointment might be the result. For instance, last autumn I had a private seedling show, my Potato-fancier neighbours were invited, and one seedling was singled out from all the rest as being the handsomest and most to be desired. I thought so too; it was perfect to look at, but it turned out very badly this year, being the worst of the worst, and its tubers were no larger than nuts, having every one of them super-tuberculated. The Onwards is the only seedling out of thirty-seven resulting from the cross between Jackson's Seedling and the Fluke, that I think worthy of recommendation, although I have two more of the batch, one exactly like its mother the Fluke, and another intermediate in appearance between a Solanum and a Dioscorea, and producing the most diminutive top of any Potato that I know. I shall keep it as a curiosity for its ugliness, and, perhaps, another year may prove that it has good qualities.

At the beginning of September I took up the Flukes, British Queens, and a kind which I call the "Huntingdonshire Kidney," until further notice. I think it is the same that I saw at the Royal Horticultural Society's Show at South Kensington last December. It was sent to me late this spring by some unknown friend. It is not Daintree's New Seedling, which I took it to be at the exhibition last year; neither can I decidedly speak of its culinary properties, as it was planted too late. It is a very handsome Potato of the Lapstone strain, and as fair to look upon when turned out of the soil as if modelled in wax. I must for the future give up growing the British Queen here, for the ground is too good, causing it to produce enormous tops. It is a first-rate sort for stone-brash or poor garden soil. It has its associations for me; so, like the Rocks, Regents, &c., I must not altogether lose sight of it.

The mode of treatment which I adopted with the haulm was certainly one chief means of securing my present season's tubers from disease, although it prevented the early planting of the Broccolis in the trenches. The plants had grown tall and very strong by the time the Potatoes were off the ground. The trenches were then merely forked up, the plants were brought to them, and the roots and parts of the stems were laid in the trenches with their heads pointing towards the north. As each trench was finished, it was well soaked with sewage, and the roots and parts of the stems were then covered over with soil. They are now with their heads close to the ground, and, considering all things, flourishing. I shall for the future adopt this plan for late Potato trenches.

We had capital Walcheren Broccoli from the trenches between the early Potatoes, and I have now growing there Roseberry Brussels Sprouts, very fine, but too large to suit the fashion.—UPWARDS AND ONWARDS.

## WORK FOR THE WEEK.

### KITCHEN GARDEN.

TRENCH, dig, and ridge every spare inch of ground whenever the weather will permit of these operations being advantageously performed. This is particularly to be observed in gardens, the soil of which is of a clayey nature. If frost sets in let the manure necessary for the whole of the spring cropping be wheeled out, laying it in heaps either on the spot where it is to be used, or as near to it as possible. What is not intended to be immediately dug in should be piled in small mounds, and soiled over to prevent loss from evaporation. *Asparagus*, the most convenient plan of forcing it is to transfer it to a light-pit, provided with a moderate bottom heat, duly covering the crowns with light soil, and by allowing as much sunlight and air as possible, an abundant supply of excellent *Asparagus* may be obtained. This system of removal may be considered extravagant when the destruction of the roots is considered, but its adoption in many instances could not fail to be of use, as a system might be originated of substituting young and healthy stock for anciently established and worn-out plants, whose occupation of the land has continued for many years. *Celery*, take advantage of every favourable opportunity till frost of earthing up the late crops, both for the purpose of blanching and protection. *Cucumbers*, during the present dull dark weather water should be given very sparingly; less fruit should also be allowed to swell off than in clear weather. *Lettuce*, those in frames for present use must be kept dry, and free from dead leaves. *Mushroom-house*, where hot dung supplies the heat required a little air

should occasionally be given, if the beds are found to be getting too moist, but where fire heat is used pans of water should stand on the flue to create a moist atmosphere. *Turnips*, on the first appearance of severe frost it is advisable to bring some under cover. They may be laid in sand after the tops are cut off. *Sea-kale*, there is no question but that the best flavoured and finest *Sea-kale* is obtained from established plants, subjected to no system of forcing, but merely covered with light earth or sand, and brought forward by the natural warmth of the season. Still, *Sea-kale* is demanded at Christmas, and thus a more active mode of proceeding is necessary. The old plan of covering with pots, and supplying a stimulating heat with a body of leaves, is still preferred by many; and when the additional trouble of half filling the pots with wood ashes, or sand, can be afforded, good flavoured *Sea-kale* can be secured. The more recent plan of taking up the roots and forcing them in a Mushroom-house, or any dark place, has its recommendations, both in regard to economy and rapidity of production, only if the precaution of excluding light be not effectual the flavour of the *Sea-kale* will be deteriorated. *Rhubarb*, the last-mentioned plan is equally advantageous for it.

### FRUIT GARDEN.

If any transplanting or root-pruning of fruit trees has yet to be done, let this be attended to without further loss of time and see that those exposed to the wind are securely staked before leaving them; also prepare the ground for fresh plantations, and plant the trees as soon as possible. Take every opportunity of pushing forward pruning and nailing. The roots of all newly planted trees should be secured from the effects of severe weather by mulching. Fruit trees are injured by the accumulation of moss and lichens on their branches; where the hand cannot reach them a dusting of lime will effect their destruction. In the absence of frost old walls may be pointed and limewashed.

### FLOWER GARDEN.

Now that the leaves are off the trees let lawns and shrubberies have a thorough cleaning. Examine pillar and trellis Roses, and, if the weather is favourable, see if the soil wants renovating or the kinds changing. For choice sorts roomy holes should be made, capable of containing three or four barrowloads of well-prepared soil; turfy loam of good quality is the chief ingredient, to this add a portion of rich rotten manure, and, if at hand, a little sandy peat or leaf mould. Many object to planting shrubs or trees in winter, believing that the roots if injured at that season are liable to rot; and certainly early in autumn is a far preferable season, but with weather like the present we would not delay such work a single day, and if the soil is properly prepared by drainage where necessary, as should always be done before planting, there will be fewer failures from planting now than if the work were delayed until March.

### GREENHOUSE AND CONSERVATORY.

Many of the failures in plant-growing, and the sickly and drawn character of the inmates of hothouses or greenhouses, may be fairly traced to the attempt to keep up a degree of artificial warmth totally incompatible with the amount of light. No axiom is of greater importance in gardening than that heat, as well as atmospheric moisture, should at all times be regulated by a strict reference to the amount of light. For instance: a general temperature of 55° by day may be recommended for the conservatory through December, if it is, as a house of the kind ought to be, filled with blooming *Camellias*, hybrid *Roses*, and a host of other gay flowers; this recommendation will be very suitable while the weather continue open, if, however, frost suddenly occurs, the attempt to keep up even this moderate temperature will, from the construction of most houses, soon produce bad effects if the frost continue, more especially if accompanied by a dull and lowering sky. In such cases the experienced gardener will betake himself to the minimum amount of heat, and be content with an average of 45°. The attempt to maintain an unnatural amount of heat will, of course, require the assistance of a corresponding amount of atmospheric moisture, and this, under ordinary circumstances, will have a tendency to produce drip, or at least an unnecessary condensation of steam on the flowers, the delicate texture of which cannot, at this period especially, be trifled with: hence the spotting, not to say rotting, of the delicate corollas of some of our most choice winter flowers. Above all, I would protest against much night heat, as I am of opinion that this is excessive in most establishments, and even our early-forced vineries will bear a much lower amount than is

commonly imagined; for what real progress can be made in the night? The parts in the course of development may be lengthened, but of what advantage would that be? I imagine that night coverings are of more importance than has been commonly imagined. With these a lower temperature may be permitted; radiation being so well guarded against, no surplus amount of heat need be kept up to meet these sudden depressions, which must occur in very severe weather to uncovered roofs.

#### STOVE.

Some of the early-ripened tall Cacti may now be introduced either here or in the forcing-pit, and receive a liberal watering to commence with. If, however, the blossom-buds are not well matured it is of little use forcing them. Do not encourage any fresh growths among the plants at this season, rather aim at that kind of routine management which will serve to consolidate the growth already made, and to develop the blossoms of the late-flowering things in a proper way.

#### FORCING-PIT.

This is a capital period at which to introduce a considerable bulk of things for genuine forcing-purposes. Rhododendrons, Belgian Azaleas, Persian Lilacs, Moss and Provence Roses, Sweetbriars, Honeysuckles, Kalmias, Daphnes, Rhodoras, the more advanced Hyacinths, Narcissus, Tulips, &c., may now be fairly started. A sweet bottom heat of 80° maximum and an atmospheric temperature of 65° will be necessary, whatever the structure. One thing may here be observed, and that is, that it is vain to introduce anything unless properly set for bloom; this points to the necessity of a special summer's training as long since suggested in this calendar. The great secret of success, if the heat is wholly composed of fermenting materials, is to keep down accumulating damp and mouldiness by an almost constant ventilation, increasing the linings in order to raise the necessary temperature. Those who are fortunate enough to possess a pit heated by means of hot water will, of course, pursue a somewhat different course.

#### PITS AND FRAMES.

Look well to those containing stores for next summer, and have sufficient protecting material always in readiness with which to cover them whenever the weather is unfavourable.—  
W. KEANE.

### DOINGS OF THE LAST WEEK.

The drizzling foggy weather still continuing has prevented us varying much our usual operations. In the

#### KITCHEN GARDEN

managed to clean up where most unsightly from fallen leaves, clearing all the principal walks of them, and of any weeds that made their appearance. Threw a little wood ashes, burnt earth, and lime on young Lettuces, &c., to keep slugs from them. Must wait for the stirring-up the surface of the ground, and earthing-up Cabbages until the ground is drier. Sowed Radishes of the long-rooted kinds in such a slight hotbed as was alluded to last week, sowing them in rows alternately with Lettuces, which come in useful for spring planting. Filled one light of such a bed with *Asparagus*, and will follow with another light in a fortnight or three weeks. When well packed, as described last year, one light holds a great many plants. After packing them a surfacing was given of an inch or so of sandy leaf mould, and washed into every cavity by means of a good watering. One inch of leaf mould was put over all, and if the heat is all right—mild, and not too strong, and the buds begin to push, then some 3 inches more will be put over that. The object is to have the *Asparagus* tender, and a good part of the top sent to table green; if afforded too much heat, and then too much air, it will become hard and stringy. Grown thus on a common hotbed it will need little more watering beyond that given as above, though, of course, the roots must not be dry. Nothing is easier to force if too much heat is not given. We have forced it like *Sea-kale*—in the dark, and then cut it and stood it upon damp moss in a warmish light place, such as a sitting-room window, until it acquired the desirable green tint. In reply to "EMILY," we would say that it will come well in a small warm greenhouse, where the temperature ranges from 45° to 50°, packed firmly even in her shallow boxes, if the buds are covered from 1 to 1½ inch, but, of course, placed near the heating apparatus; it will require frequent watering, with water about 60° in temperature, and a little of any sort of manure in the water will be of advantage.

*Kidney Beans*, in bearing, gave a good deal of air to them,

and will syringed them overhead when there was a little sun, and will put some sulphur in the evaporating-pans, to make sure, though as yet there is no appearance of thrips or anything else, which we partly attribute to the walls being dashed with lime and sulphur. Potted a lot more that had been sown thickly in boxes to save room. A good plan is to sow in small pots, and then turn out into large ones. We would rather sow in eight and ten-inch pots at once, only they take up a good deal of room at first. It is for the making the most of every bit under glass that we do not sow in drills in beds at once. *Kidney Beans* are difficult to grow in winter without fire heat in some shape or other, as to have them in perfection they need an atmosphere not saturated with moisture, and a temperature ranging from 50° to 65°.

*Cucumbers*.—We had some nice plants, but from being unable to give them heat, owing to alterations, we are doubtful if they will do much good in the pit, which was prepared too late for them. Young plants are going on nicely, and will most likely beat the older ones. Some people like these all the year round, others would rather never see them from November to May, and then a *Cucumber* gives a relish. We have kept them in common frames all the winter, but that was when we had plenty of the tussocky grass referred to last week. The frames which we used for that purpose were deep, fully 18 inches in front, and from 36 to 42 inches behind. This gave plenty of room for introducing a rough trellis of wood and wire 15 inches from the glass, and though wood is one of our worst conductors of heat, yet it does conduct, and from keeping these frames banked up right to the top with the grass, dung, and leaves, we could command in general plenty of heat, and dry heat too, the boards inside, from the heat outside, being warm and dry. Except for the regularity of the heat, flat pits heated by hot water are little better for winter work than these frames. Both admit too little light in the dark season of the year, and, therefore, more elevated houses, with plenty of heating power, are better for *Cucumbers* in winter. They are also less likely to be bitter than when grown in flat frames and pits. We have cut from frames and pits in winter nice-looking young *Cucumbers*, and we would scarcely have believed it to be true, if we had not tasted them. In some cases you might as well have taken so much soot in your mouth. The worst of it was, that there was no outward sign by which you could distinguish the mild, sweet ones from the bitter ones, except cutting them and tasting them. We have tasted some half a dozen, and found them all right, and perhaps the seventh or the eighth would be as bitter as bitter could be. We have never noticed anything of the sort in *Cucumber*-houses that had plenty of light and heat—say width 8 feet, height in front 3 feet, height at back 9 or 10 feet, and *Cucumbers* trained—say 15 inches from the sloping glass roof. Span-houses would even be better than lean-to's, if there was plenty of heating power. One word more as to winter *Cucumbers*. There are three complaints lying before us, to the effect, that *Cucumbers* that bore well, heavily, in the end of October and November, are now showing signs of giving over, when they were especially wanted at Christmas, and in January, and the dark dull weather is assigned as being the chief cause of failure. We believe there is something in that, but the heavy cropping is the chief cause. Plants intended to bear heavily right on to Christmas, should not be expected to do much more. If the same autumn plants are to continue on until spring, then they should be sparingly cropped until near Christmas. When many are wanted about this season, another set of strong plants should be kept on, that have been allowed to bear scarcely any fruit, to take the running after Christmas. Scores of times we have seen plants loaded with fruit in November, and the first part of December, but it was rarely they were worth their keep after Christmas. The vital energies of the plants are often thus exhausted, and no coaxing, or pruning, or freeing them from fruit, will ultimately benefit them.

*Mushrooms*.—Just one memorandum as to the *Mushroom*-house. We are still having small gatherings from the bed in the open shed, and the first little bed in the *Mushroom*-house is coming rather faster than we like, owing to rather much heat and steam. The bed in question is on a shelf-bed, and below it on the ground, which may be made into another bed, is a lot of fermenting material undergoing a due preparation. The heat from this made the house rather warm; but worse than this, it threw up a good deal of steam in the shape of vapour, which was condensed against the sloping roof and dropped upon the bed, making the surface too wet. We remedied the extra heat by giving plenty of air; dissipated the

steam by putting on a little fire heat along with the air; and prevented the extra air affecting the bed, or the drops of moisture falling on it, or the Mushrooms being tinged by the vapour rising from the unsweetened manure, by fastening some sticks across the bed, about 6 inches from it, and throwing mats neatly along on the sticks. Though we threw some dry turfy soil over the heap of the fermenting material, and used these means to dissipate the steam, the upper surface of the mat on the first morning after it was put on was quite wet, but none went to the bed beneath it, and the Mushrooms came all the cleaner and nicer in consequence. In bright weather the steam and vapour from the manure would have done no harm—nay, often it would have done good in maintaining a warm moist atmosphere. But for scarcity of shed-room at the time we would not have put in the manure in so rank a state in a house where beds were in a bearing condition. In general it is as well to get rid of the rank steam before bringing the material to the house, and we have a heap in a shed now undergoing its preparation. We never recollect using a mat in the same way before, but it served the purpose admirably in preventing large white Mushrooms being discoloured by drops of condensed moisture not quite so pellucid as dew. The mat thus suspended over the bed also permitted of a more free admission of air than otherwise would have been desirable to dispel the rank steam; as when Mushroom-beds have been kept for some time in a still moist atmosphere, a keen draught of air over them is very much felt. This shows the importance of not exposing bearing beds too much when making fresh ones. In the present case we attribute the extra steam to the wetness of the dung and the closeness and wetness of the weather. In our lean-to shed-like house we have openings for air in the front or north wall of the house; but as for top air, there is only a brick ventilator at each end at the apex, and generally these have been sufficient; but in all cases where manure is used at all fresh there should be several openings at the apex of the roof, say 9 inches square, so as to allow all steam that is not wanted to escape. A little dry soil thrown over a fermenting bed will also do much to keep down extra steam.

FRUIT GARDEN.

Very much the same as in previous weeks. Birds have commenced in earnest with Cherry and Plum trees. As the weather is so mild it must be more for amusement than from any necessity or the pinchings of hunger. We have run several strings among the trees, and tied on it pieces of white paper, white rags, &c., anything white, doing the same among Currants, among which the devastators had also been busy, and it seems to keep them away for the present. We were threatened with a complete clearing of ripe and ripening Raspberries last summer, but after liberally adorning the tops of the rows with pieces of whitish newspapers, the fruit was allowed to hang and ripen. How long such a means will act as a preventive remains to be proved, for our experience teaches us that nothing will deter them long. We have coated the buds with as nasty stuff as we could think of, and have had the satisfaction of seeing sparrows, tomtits, and bullfinches carefully nipping off the nasty stuff with the points of their bills and dropping it, and then digging their beaks into the hearts of the fruit-buds. It quite surprises us to see and hear of places where the birds give little or no trouble from January to December.

ORNAMENTAL DEPARTMENT.

Wet as the weather was, felt under the necessity, when at all fine, of pruning plants, Roses, &c., in front of the verandah, and sweeping up the lawn, as scattered withered leaves on the green grass give a very neglected appearance when the deciduous leaves have all fallen from the trees. Worm heaps are more plentiful than ever we saw them, and may easily be got rid of in a small place by clear lime water, applied as lately detailed; but in a large lawn it is hardly worth attempting, except near the mansion. The unsightliness of the heaps may be kept down, unless when very wet, by means of a light roller. In cold pits the great point has been to give plenty of air without any wet finding its way in, and in all plant-houses to spill as little water as possible. *Justicias*, *Euphorbias*, &c., taken from the stove to the conservatory, should have the greatest care and the warmest places, and *Heaths* the airiest and the most exposed to light. Other hardwooded plants should stand in a medium position between airiness and stillness. Everything like damp should be avoided, and as houses can scarcely be secure now when open at night, the air should be given freely during the day, and fire heat given then to increase the cir-

ulation. Damped flowers and damped leaves now will soon taint the atmosphere; even washing and keeping the pots clean adds to the sweetness and healthiness of a house. In wet hours the surface of the soil in boxes and pots was stirred up with a pointed stick, and every fading leaf removed. More care of everything will be required until we pass the shortest day. After the day turns everything begins to prick up, and hence those who study economy do little in the way of forcing until that time. This does not apply to plants that naturally bloom at this time; all that is required further is to keep them in a healthy growing condition.

Bulbs that have filled their pots with roots may now be placed in more heat to force. Such things as *Snowdrops*, *Crocus*, and even *Tulips* bear no great amount of heat; but *Hyacinths* will stand almost as much as a *Cucumber*, but must be gradually hardened off before taking to the conservatory or the sitting-room. All hardy plants forcing will be better of a mild bottom heat, and to be brought on gradually at first.

All watering now should take place early in the day, that the surface of the soil may become a little dry before night. In the height of summer, the evening is the best time to water, so that the roots may thoroughly appropriate it before the next day's sun comes with its evaporating influences.—R. F.

COVENT GARDEN MARKET.—DECEMBER 9.

Quotations remain unchanged. The best dessert Pears comprise *Chauumontel*, *Gloin Morceau*, and *Jean de Witte*. Good Apples are scarce. *Rothsloe* Grapes and *Pines* continue plentiful. In the vegetable market the supply is ample. Potatoes continue to arrive in large quantities.

TRADE CATALOGUES RECEIVED.

Messrs. F. & A. Dickson & Sons, 106, Eastgate Street, Chester.—*Catalogue of Stove and Greenhouse Plants, &c.*—*Catalogue of Forest Trees, &c.*

TO CORRESPONDENTS.

•• We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

FORCING FRUIT, &c. (*Greenhorn*).—There is no work devoted to the subject, but if you consult "The Garden Manual" and "In-door Gardening," each of which you can have free by post from our office for twenty stamps, you will probably find sufficient information.

HOGG'S "FRUIT MANUAL" (*Rev. C. C. E.*).—It is now printing. The direction to our office is where the law directs us to put it—last on the last page.

**NAMES OF CHRYSANTHEMUMS (T. L. Mayo).**—Several of the labels were detached from the blooms when these reached us, and the flowers were so faded that it was quite impossible to make out what the colours of some of them were. The names of the varieties, so far as we can make out, are—1, Helene; 2, Madame Jaquin; 4, like Princesse Marie; 6, single flower; 7, Berthe; 9, Bijou d'Horticulture; 12, Bob; 13, Aigle d'Or; 15, Mustapha; 16, Auguste Mic; 18, General Canrobert; 20, Aimée Ferriere; 21, like Duke.

**GERANIUMS AND PELARGONIUMS DEFINED (Geranium).**—Botanists now divide the old genus Geranium into three genera, but all the bedding kinds are strictly Pelargoniums. The following will serve briefly to show the distinguishing characteristics. Pelargoniums are characterised by having usually seven stamens, and unequal-sized petals; Geraniums by having ten stamens, and equal-sized petals; and Erodiums by having five stamens.

**Book (J. B. S.).**—"The Vine Manual." It can be had free by post from our office for thirty-two postage stamps.

**WINTERING LILIUM LANCEFOLIUM (T. H. J.).**—Your pots of these Lilliums (rubrum and album), now in a frame, may be safely wintered there if you plunge them to the rim in soil or coal ashes, and cover the pots with from 3 to 6 inches of dry short litter. The soil being moist to begin with, they will need no water before March. You may if more convenient set the pots on the floor of any house from which frost is excluded, keeping the soil pretty dry until the shoots appear, when plenty of moisture and a light airy situation near the glass should be given.

**MUSHROOMS IN A CUCUMBER-FRAME (Idem).**—Mushrooms can be grown in an ordinary frame or pit. You may make the bed of stable-dung and leaves 18 inches thick as you propose, taking care to have these materials moderately dry, and especially the leaves, using none but oak or beech, and if they and the stable-dung were mixed and thrown into a heap, they would part with their rankness and much of their moisture if allowed to heat ten days or a fortnight; then form a bed as you propose. For three weeks or a month before making the bed, the droppings should be saved daily, or shaken from the litter, and they will be none the worse of having some of the short straws in them. The droppings are to be daily taken care of, and laid somewhere thinly, partly to dry and partly to prevent their heating. When a sufficient quantity has been collected to cover the proposed bed 5 inches thick, make up the bed and place the droppings upon it, beating firmly. The firmer, the more certain will be success. When the heat has risen, and if in ten days the temperature of the bed is not more than 90°, the spawn should be inserted about an inch below the surface, earthing the bed then with 1½ to 2 inches of light rich soil, making it very firm. On the other hand, if the heat be very violent defer spawning until it declines to a nice but not burning heat, and after spawning defer putting on the soil for three or four days, when, if the heat is still declining, earth the bed. You will require to keep the sides of the pit banked up with litter to keep out frost, and with the same object to cover the lights sufficiently with mats and straw. In six weeks from spawning the bed, according to the warmth of the pit, you may expect to see Mushrooms.

**TREES BARBED BY HARES AND RABBITS (A Man of Kent).**—Make a pint of lime mixed with gas liquor, and with this dab the stems of the trees with a brush so far up as the animals can reach, or take lime and gas tar in equal quantities, and fresh cowdung in quantity equal to both, and apply to the stems of the trees with a brush. If you do not care for appearance the stem may also be coated with a thick limewash. By the above means hares and rabbits may be prevented from barbing the trees, but traps and guns are the best remedies.

**PUNTING VINES—DIGGING-IN BEDDING PLANTS (F. S. C.).**—We use equal quantities of clay and sulphur, with sufficient water to make it of the consistency of thick putty. Instead of a good it is a bad plan to dig in the stems of Geraniums, &c., at this time, whether the beds are to remain empty or to be planted with border flowers in spring. The leaves may be dug in with advantage, for they rot, as do the stems in time, but these become food for vermin, and breed fungus in the soil.

**LADY DOWNE'S GRAPES NOT KEEPING (Constant Reader).**—From the house being full of plants, and the roots in an outside border, the cracking may be attributed to the wetness of the border, and the dampness of the house, which is, probably, deficiently ventilated. We have them very fresh yet in such a house. The moulding of the berries shows the house to be damp. Keep a fire by day and give plenty of air, letting the fire go out at night.

**INSECT DESTROYING FRUIT IN THE RED (Wm. Shields).**—There is no doubt about the insect that shows itself in the middle of the trusses of the bloom of your Cherry, Pear, and Apple trees being a small caterpillar. We recommend you to wash the trees with a mixture of sulphur 2 lbs., soft soap, 2 lbs., mixing them together in a gallon of warm water until dissolved. Boil 1 lb. of the strongest tobacco for half an hour in three gallons of water, then strain and add it to the other ingredients, as well as half a gill of turpentine. This is to be applied to every part of the trees with a brush. If a little clay were added so as to give it the consistency of thin paint, the mixture would adhere much better and longer. When the trees are untied the wall should be washed with soot and lime mixed with sufficient boiling urine or liquid manure, which cannot be too strong, in order to give it the consistency of limewash. Apply this wash to the wall, and what with the brushing and the nature of the ingredients many insects on the wall will be destroyed. When the buds begin to swell, syringe the trees with soapsuds, or, what is better, 2 ozs. soft soap dissolved in a gallon of water. Keep a sharp look out, and when you find the buds are eaten, examine the trusses, the inside of the flowers, and the under sides of the leaves, which are all likely places for the insect to lurk in, and if it appear curled up squeeze it, and by beginning early and persisting in this course you will be able to keep the enemy down. When the blooming is over syringe the trees with a soft-soap solution (2 ozs. in a gallon of water), continuing this once a week till the Cherries stone, and with the Pears and Apples up to July. Still keep your eye on the leaves, and whenever a curled leaf is seen, inside it a small grub may be found, or if the leaves are eaten, the grub that did it will not be far away, and may be found in a short time. The above is the only remedy we know of.

**HOUSE SEWAGE (A Reader).**—When we said that house sewage would injure fruit trees, it was in reply to a question whether it could be applied to them advantageously at this season. It should only be applied during their growing period.

**FERNS DYING OFF IN WARDIAN CASE (C. B.).**—From the Ferns growing and sending up fresh fronds which only grow a few inches and then die off, we should say that they are all right at the root, and, besides, they do well in cocoa-nut refuse, which is like mahogany sawdust, but they do not do at all well in cocoa-nut fibre, which is light, bristly, wire-like stuff. Perhaps if you were to give a little air—say half an inch or so, the moisture would not condense so much on the glass so as to require to be wiped off every morning, which shows that the atmosphere is very damp, and the young fronds would not go off but develop fully. We think a little air would make all the difference. There is no work that we know of giving minute directions for the management of a Wardian case. Sufficient directions for the culture of Ferns in glass cases are given in the "Fern Manual."

**SALT AND LIME (S. M. J.).**—The best proportions for an acre are thirty bushels of lime and fifteen bushels of salt mixed together. We should spread it on the surface by hand just before digging down the turf.

**BOOKS FOR A YOUNG GARDENER (T. W. H.).**—The "Cottage Gardeners' Dictionary," 5s.; Keane's "In-door Gardening," 1s. 6d.; Keane's "Out-door Gardening," 1s. 6d.; Johnson's "Science and Practice of Gardening," 3s. You can have them all free by post from our office if you add 2d. more to each for postage, except the last, which is 3s. 4d.

**VINES FROM EYES—WHITE GRAVES (A Subscriber).**—Vines from eyes are much better than those raised from hyers, because the roots and shoot are formed simultaneously. In the former case the shoot is formed first and the roots afterwards, and the wood of the shoot is never of that firm consistency and consequent early fruit-bearing character as in cases when the plant is raised from an eye. The following are ten of the less tender White Grapes that will do in your vinery. Early Summer Frontignan, White Frontignan, Chasselas Vibert, Prolific Sweetwater, Royal Muscadine, Chasselas Musque, Early White Malvasia, Foster's White Seedling, Due de Malbocq, Buckland Sweetwater, Early Smyrna Frontignan, and General della Marmorata.

**SELECT GOOSEBERRIES AND CURRANTS (Ballinacloe).**—Red.—Ironmonger, Warrington, Keen's Seedling, Red Champagne, Wilmot's Early Red, and Scotch Natmog. Yellow.—Early Sulphur, Glory of Ratcliff, Rockwood, Kumballion, Yellow Ball, and Yellow Champagne. Green.—Green Gascoigne, Green Prolific, Green Walnut, Heart of Oak, Hebburn Prolific, and Fitzmaston Green Gage. White.—Bright Venus, Crystal, Early White, Hedgehog, White Champagne, and Whitesmith. CURRANTS.—Black.—Black Naples. Red.—Red Dutch, Cherry, and Ruby Castle. White.—White Dutch.

**GLAZED SOUTH WALL (A Constant Reader).**—If the wall with the south aspect is high—say from 12 to 15 feet, the simplest plan would be to plant the Peach trees against the wall, and from 15 to 20 feet apart. Your pathway then might be some 3 feet from the wall, and you could have a few other things either in pots or planted out in front; but not sufficiently high to shade the wall. If you preferred a shady walk in summer, then it would be best to plant the trees in front, and train to a trellis 15 inches from the glass up to the apex of the roof; but in this case you could make little use of the back wall after the fruit trees filled their space. In either case the fruit would ripen well without any artificial heat. If you could make up your mind to give a little heat, then such a covered walk might be made very attractive by planting the Peaches in front, as stated above, and planting the back wall with Camellias and Oranges. These would not find fault with extra heat, and a good deal of shade in summer, and they would be very attractive in winter and spring when the Peaches were destitute of foliage. We have never done anything this way ourselves for want of an opportunity, but numbers of houses have been so done on our advice, and have given great satisfaction.

**ANTS—PEACH APRICOT (Inquirer).**—You could not pour boiling water down by the wall without killing the roots and stem of the tree if the boiling water touched them. We advise you to sprinkle granular manure over the nest now, and again in spring when the ants are on the move, and to pour a watering-potful of liquid manure once a week into the nest, heated to 120°, up to the time of the fruit changing colour, when, if the ants still remain, a little sulphur sprinkled over the nest will drive the most of them away. You may keep them from ascending the tree by a band of gas tar an inch wide along the bottom of the wall, and a similar ring around the stem of the tree. The Peach, or Gros Peche, Apricot is one of if not the finest of Apricots; the Moorpark is a seedling from it.

**TEMPERATURE OF STOVE—EVAPORATION-TROUGHS IN WINTER (Dunbartonshire).**—The temperature of the stove from October to March may be from 55° to 60° by fire heat or by night, and 65° by day without sun, 75° with sun and air freely given, and for the remainder of the year it may be from 60° to 65° by night, 75° by day on dull days, and 85° with sun and air. In March the temperature is to be gradually increased until the requisite degree shall be attained, an increase of 2° per week being sufficient, and in autumn the decrease should be gradual. The evaporating-troughs should be empty from October to March, unless you wish the plants to grow instead of rest, when, of course, a growing heat will be desirable, and they should have water in them.

**PRUNING ROSES (Tasmania).**—Your Roses planted last November should be pruned next February, or early in March during mild weather, the strong shoots to five, the moderately strong to three, and the weak to two eyes, cutting out the very weak, and those that cross each other quite closely. The mangleing of straw and leaves should have been removed in spring, it being now time to replace it by fresh, allowing it to remain until March, then removing it, and pointing the ground neatly over. Roses that have been established for years should be pruned in February, or March, to two or three eyes.

**REMOVING FIGS (Idem).**—Remove all the Figs larger than a hazel nut with the point of a sharp knife. Those now of full size will not ripen though they have begun to colour.

**TAXODIUM BARLESS ON ONE SIDE (Idem).**—You may remove the old rotten wood, but if not decayed it would be better to leave it alone, and to plaster the wound or wood over with clay mixed and kneaded to the consistency of soft soap with fresh horse droppings rubbed through a half-inch sieve, and fresh cowdung—of all three equal parts. Work them to the consistency of soft putty, or mortar, and with this plaster the scar level with the bark. It should be made smooth, and be gone over in three or four days, closing the cracks. When it becomes old replace it by fresh, and you will find the bark grow over the dead wood each year a little, until in time the part is completely grown over. The colour of the plaster is no eyesore.

**GRAFTING OLD APPLE TREES (An Amateur).**—Cut off the branches now at the point where you propose grafting, and when the sap rises in spring, which will be known by the buds of the other trees swelling, then pare the outer surface of the cut a little, and choosing a smooth part of the bark, make an incision 2 inches in length through the bark from the crown of the stock downwards, and which may be opened by thrusting in a thin piece of wood or with the point of a knife. The graft or scion should, in the first place, be cut transversely below a bud, and on the other side, 2 or 3 inches above the bud, place a knife and make a sloping cut downwards, bringing the knife out immediately below and quite close to it, or thin at the lower end. This is to be thrust in between the bark and wood where the incision is made in the stock, and down to the point where the sloping cut in the scion ends. If the crown of the stock is thick, another graft may be put in on the other side, opposite to and corresponding with the first. If the scion have two good eyes above the crown of the stock it is sufficient, moderately strong wood being the best for grafts. Bind tightly with a strip of bast matting soaked in water, and cover with grafting clay. This may be made of good clay, beaten and kneaded to the consistency of dough, horse-droppings passed through a sieve with half-inch meshes, and fresh cowdung, all three in equal parts, incorporating and kneading them together until uniformly mixed so as to resemble soft putty. With this composition cover the crown and the sides of the stock so far as the scions extend, closing nicely, smoothly, and evenly, as if the clay crack or have openings air will be admitted to the wounds, and the stock and graft will not unite well. Go over the clay in three or four days, afterwards closing the cracks, if any. When the grafts begin to grow, and have made shoots 8 inches in length, the clay and the bandage should be removed, tying to the stock a stake half an inch or so thick, and coming about 1 foot above the crown of the stock, and by the side of the scion or graft, which is to be tied to it to guard against the scion being blown out; it may remain for a year or two to maintain the graft in its place, until the latter shall have become firmly and immovably united to the stock. The grafts, if they do well, will make strong shoots the first year, and bear the third. The method above described, and cleft grafting are the best modes, when the crown of the stock is more than 3 inches in diameter.

**PROPAGATING CINERARIA MARITIMA (Idem).**—It strikes best from slips, or those shoots that come from the crown or base of the plant, which may be removed in April, or whenever they are to be had, potting them in light sandy soil, and plunging the pots in a mild hotbed—75°, and in a fortnight or three weeks they will be well rooted, and being hardened off, will make fine plants by the end of May if put in in April. The seed should be sown in the first week in March in a hoibed, and the seedlings, when large enough to handle, pricked off at an inch or 1½ inch apart, still continuing in heat; or hardened off and plant out in May.

**GRAFTING VINES (Idem).**—Your cutting back the Vines in pots to two or three eyes is right, growing them on for fruiting another year. Glendinning's Seedling Vine we do not know, but you say it is not so satisfactory as you could wish, and you, therefore, propose grafting it with Black Hamburg. Very well, we should advise you to keep two Black Hamburg Vines in pots, set the pots near the Vines to be grafted, measure the canes of the young Vines by placing these against the Vines to be grafted, and, choosing a smooth part of the stocks, place the canes so that they may fit that part. Cut off the beads of the young canes two eyes above where they fit the old Vines nicely, and take out all the eyes below except two at the bottom of the young Black Hamburg, from which two shoots will come in spring, one of which is to be allowed to grow, and the other should be rubbed off. The two eyes above will give two shoots, and when they and the Vines to be grafted have made shoots 6 inches long, take a slice of the smooth part of both, 2 inches long, exactly corresponding. Halfway along this cut in the stock, which may be one-fourth its thickness, place the knife and bring it downwards three-quarters of an inch, and in a sloping direction halfway through the stock. Withdraw the knife and place the scion by the stock, you will then see where the cut in the stock ends, from there make a slanting cut upwards corresponding to that in the stock, halfway through it and three-quarters of an inch in length. Join stock and scion together, slipping the tongue of the graft into the slit of the stock, making the two fit exactly and so that the edges may correspond, or, at least, on one side; bind tightly with bast matting, and if done neatly it will be sufficient to keep out the air, though a little moss may be placed over the graft after binding with matting. Tie the shoot of the scion to the rafter, cutting away the weakest shoot and retaining the strongest. Just below the point of union on the scion tie a piece of string as firmly as possible to arrest the downward flow of the sap, allowing stock and scion to grow, and so you may have fruit on the stock, and another kind inarched upon it growing up by it to take its place when the fruit is cut. The head of the stock is then to be cut away immediately above the union. In six weeks the union will be complete, when the scion or part of it below the union is to be cut off, and the bandage entirely removed. It should have been loosened at the end of three weeks, which we have omitted to mention before, binding it again, but not so tightly as at first. If the part of the stock above the union is not to remain for its fruit, then cut it off at once, and the vigour or strength of the stock being thrown into the graft it will make a very strong cane. The inarching should be done as near the bottom of the Vine as practicable. The Vine in the pot furnishing the scion will be as good as any for furnishing a cane to fruit another year, having the upper part cut away after the operation is completed. This mode of grafting Vines is so sure and so easily performed, and may be done without experiencing the loss of a crop, that we think it very suitable for amateurs not having much experience in grafting.

**ESPALEER TREES MOSSY AND BURBED (A. C.)**—It would be well to remove the moss by scraping it off without injuring the bark, and then paint them with a wash of lime and soot in equal parts, with sufficient boiling liquid manure to give the consistency of thick paint, applying the mixture at 160° with a brush to the branches, rubbing it well into every crack, hole, and crevice. Remove the old soil from about the roots, and replace it with fresh soil and half-reduced dung; tread it firm, but not at all if the soil be wet. This may probably give them another lease of life.

**PLANTS FROM THE CONTINENT (An Old Subscriber).**—*Ibiscus esculentus* produces capsules commonly used in the West Indies in soups and pepper pots under the name of Okro. Its sulphur-coloured flowers are handsome. It is an annual in this country. *Solanum melongena* is the Egg-plant, and you will find it in the "Cottage Gardener's Dictionary," which you say you have, under the head *Solanum*. We do not recognise the small pea-like seed called Kovi.

**SEAWEED FOR VINES, PEACHES, &c. (A Constant Reader).**—It may be used as a top-dressing on Vine and all fruit-tree borders, pointing it in in spring, or digging it in when fresh. As a manure its enriching qualities are soon exhausted, its effects not extending beyond the first year. We know of no bulbs that would flourish better than others in soil having sea sand mixed with it, all would do so fairly.

**REMOVING FIGS FROM TREE OUT OF DOORS (Idem).**—It is not too late to remove fruit from Fig trees. They should be cut off with a knife, which is better than pulling them off, and they are better removed than allowed to remain, as from your tree receiving little protection the fruit will perish or drop off in spring.

**GRAFTING ROSES (Roseana).**—The small spring prunings will do to graft, but shoots neither stronger nor weaker are the best. You may plant the stocks in the open ground, and graft them early in March, but for the grafts to take well out of doors it is desirable that the stocks should have been planted a year. As yours have not, we should advise your potting the stocks now, or you may defer doing so until after grafting. The scion is to be inserted in the main stem, and the nearer the soil the better, for it is desirable to have the union covered with soil. Whip-grafting is the surest mode of grafting Roses, but when the stock is much thicker than the scion, cleft grafting may be practised; but it is not so safe as the first. Being an amateur, you would, no doubt, like to know of an easy and comfortable mode of performing the operation. Proceed, then, as follows:—Lay the stocks in by the heels until the last week in February, and then make up a hotbed of well-sweetened dung and leaves, a yard or so high, and in a week the heat will be up, and be just so warm that if the hand be put into the bed the heat can be borne comfortably. A few inches of light dryish soil or sawdust should be put over the bed inside the frame, which may be an ordinary one, and whilst the plunging material is warming, graft before potting in this manner; cut off the head of the stock 3 inches above the roots transversely, and take a slice of bark and a little wood from one side of the stock where the bark is clear and free from knots. Lay this down, and take up a shoot of the Rose, about 6 or 7 inches long, and pare its lower end quite thin, till it fits exactly in length and breadth the place whence the slice of bark and wood was taken from the stock; join the stock and scion together, binding firmly with strong mat or bast soaked in water, and cover with clay so as to leave no crack. If the stock when potted, as it is now to be in its grafted state, will allow of the soil being brought so high as to cover the union of stock and graft, the clay may be omitted; in this case cover it firmly with mould, leaving but a couple of eyes of the scion above the soil. Place in the hotbed, and keep as close as possible. If the union is not covered with soil in the pots, then it is desirable after plunging, or at the time, to cover the union with old tan or sawdust, leaving two or three eyes or buds only uncovered. A temperature of bottom heat of 75° is suitable. Keep the frame close until the shoots are put forth, and when they are 2 or 3 inches in length air may be admitted by propping up the lights, and gradually hardening off; the plants will be fit to plant out in the end of May or early in June. If you proceed by cleft grafting, cut off the head, as in whip-grafting, without a tongue, transversely, immediately above a bud. On the opposite side cleave the stock an inch or so, and not through the stock. The graft, with three or four eyes, is to be cut at its lower end to fit the cleft in the stock exactly, leaving a bud on the thick side if possible; open the cleft with the point of a knife and insert the graft, being very careful, and it is a main point, that the barks of both stock and graft should be perfectly even. Bind with mat twisted, and cover with clay, or grafting wax (which is made of Burgundy pitch 1 lb., ½ lb. common pitch; beeswax, 2 ozs., and mutton fat ½ oz., melted, and applied warm with a brush), covering the side of the stock operated upon, and also the top of the stock. Afterwards plunge the pots in a gentle hotbed, as recommended for Roses whip-grafted. Cleft grafting is only desirable when the grafts are small.

**CALADIUMS, APHELANDRIA, CROTON, AND CYANOPHYLLUM IN VISERY (A Well-wisher).**—These will do very well with the pots plunged in the tan with which the pit has been or is to be filled, and which must be fresh or putty so in order to raise a bottom heat of about 95° at first. The pots should not be more than half plunged at first; afterwards increase the depth, or place more fresh tan about the pots. The plants should not be placed in the house until the temperature is 55° by night, which, as you commence with the Vines in February, will not be attained until the end of March, from which time the plants will do fairly until the end of September, when they must be removed to a house having a temperature of at least 55° or 60°, 5° more being none too high for Caladiums in winter.

**MANURING VINE-BORDER (Idem).**—As you will cover the border with 18 inches to 2 feet of dung a fortnight prior to commencing forcing, it will not be necessary to give the border a dressing of manure now, for the covering will enrich the border sufficiently. To help you to overcome the red spider, coat the Vines with sulphur and clay in equal parts, made to the consistency of thick paint with water in which soft soap has been dissolved at the rate of 8 ozs to the gallon; apply it with a brush rubbing it into every crevice. This, and syringing the Vines up to the time of their changing colour, will enable you to keep red spider under.

**RUSTIC POTTERY.**—"I see in your Number of November 28th, you ask for the names of manufacturers of rustic pottery. There is a man here (Castle Hedingham), who ought to be known more than he is. His ware is very good, and his designs are very well designed and very well executed, and his prices very reasonable. His name is Bingham, and his direction is, Castle Hedingham, Halstead, Essex, and as he is a neighbour of mine and, I think, a very clever fellow, I should be very glad to get him custom."

[This is no interested recommendation, but from a gentleman who wishes to serve a workman whom he considers meritorious.]

**HOTBED FOR STRIKING CUTTINGS (F. T. C.).**—You have not searched our back Numbers or you would have found at pages 376 and 442 of Vol. VIII., New Series, directions for making a hotbed, together with the mode of putting in cuttings of *Verbena*, *Lobelia*, *Petunias*, &c., and it is applicable to every other kind of bedding plant in spring, or at any other season; whilst at page 157 of the present Volume the striking of cuttings in cold frames is given; that of *Geraniums* without even a frame is furnished at page 167. *Geraniums* will strike well enough in a greenhouse in September without any extra heat, and if you keep your greenhouse so hot on account of the bedding plants as to force the Vines it is not good for either, but injurious to both at this season, it not being necessary to force bedding plants at all. We really do not see the cause

of complaint, nor what it is you wish to know, if at the pages named you do not find sufficient information.

WALL VINERY (*Springfield*).—We think your plan will answer well. A sketch and some comments shall be published next Tuesday.

NAMES OF FRUIT (*J. H., Malden*).—1, Easter Beurre; 2, Beurre Diel; 3, Dutch Mignonette; 4, Cobham. (*J. B.*).—The Pear, Easter Beurre; Apples: 1, D. M.; 2, Nonpareil; 3, Reinette Van Mons; 4, Golden Reinette. (*D. M.*).—1, Golden Winter Pearmain; 2, Christie's Pippin; 4, Golden Noble; 5, Toker's Incomparable; 6, Wormsley Pippin. (*H. E.*).—1, Flower of Kent; 2, Herefordshire Pearmain; 3, Lady's Finger;

4, Henry Morning; 5, Dutch Mignonette; 6, Golden Reinette; 7, Crasanne; 8, Beurre de France. (*N. M.*).—Pears: 1, Winter Nellis; 2, Beurre Diel; Apples: 1, Nonpareil; 3, Scarlet Nonpareil. (*R. H. A.*).—1, Glou Morceau; 2, Catillac; 3, Tressor; 4, Vicar of Winkfield. Apple not recognised. (*A. R.*).—1, Chamonville; 2, Beurre Diel; 3, Golden Reinette. The plants were destroyed by mistake. (*A. P.*).—4, Bergamotte de Printemps; 6, Urbaiste; 10, Beurre Derouillon.

NAMES OF PLANTS (*A Subscriber*).—Correspondents should send Orchid flowers in boxes—1 and 2, Calathea? crushed; 3, Eranthemum leucourum. (*J. B.*).—1, Abutilon; 2, Ceronilla omerus.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the Week ending December 9th.

DATE.	BAROMETER.		THERMOMETER.				Wind.	Rain in inches.	GENERAL REMARKS.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

THE POULTRY CLUB.

The annual Meeting was held at Birmingham. Some fresh members were elected. A Show, to be named "The National" is fixed for January 29th at Rochdale, under the auspices of the Club. A vote of censure on the Birmingham Committee relative to the Judges was proposed, but withdrawn. A Committee was appointed to inquire if it would be desirable for the Club to publish a fortnightly Journal.

THE BIRMINGHAM POULTRY SHOW.

WHILE most of the Shows that gave fair promise, some years since, of being annual, and of lasting out many of those who assisted at their start have ceased to be; the first of them all, the Birmingham and Midland Counties, has not only last week attained its seventeenth anniversary, but seems to get strength with age. In all particulars it improves. The zeal, knowledge, experience, and unflinching integrity with which all matters concerning this great Show are handled by the gentlemen who compose the Council, and who, without personal interest of any kind, devote much time to it, deserve no less merit. Many persons had doubted this year whether there would be any exhibition. It was feared that owing to the disease among cattle they could not be admitted, and then it was thought they would put off the poultry also. We can state authoritatively it was never intended to put off the poultry, even had the cattle been given up for one year. It required courage to hold an exhibition of cattle, while even small local markets were being closed, because of the danger of allowing animals to be brought in contact with each other; but fortune, as usual, favoured the bold, and although there was a falling off in the numbers of the beasts, there was none in their quality. The numbers that were there not only afforded a treat, and an assuring fact in these days of pestilence, but they showed that the owners appreciated, and were disposed to support those who trusted in them.

In that part of the Show with which we have more particularly to do there was no falling off. Nothing could be more gratifying than the numbers and merit of this great exhibition as they appeared last week before the public. A few facts will carry more conviction than any mere explanation or assertion. When this Show began it was considered a good Duck that weighed 5 lbs., 6 lbs. was a large one. This year the first-prize Aylesburies weighed 10 lbs. each; there were the exceptions, but there were many that weighed over 8 lbs. Roman Ducks were formerly neither numerous nor well understood; half of those shown were disqualified for glaring faults of plumage, and weight was never thought of; now, not only are they more numerous than the Aylesburies, but thirty or forty pens are shown without a disqualification, and, when the scales are brought into action, it is found that these have attained nearly to 9 lbs. each, while between 7 and 8 may be almost called an average. Improvement is not, however, confined to these birds, nor to weight. The beautiful Buenos Ayrean Duck was required to be smaller, and more striking in green metallic lustre, and again we have to note in a numerous class there was a close approach to perfection. Ducks will not, however, have all the honours. The Goose so intimately associated in anecdotes with our Virgin Queen and the Armada, which, according to report, was said by that glorious lady to be a stupid bird, "too much for one, not

enough for two," now reaches the comfortable weight of 29 lbs.; 9 used to be about the fair average. Now, no record is ever put against the name of those that weigh only 18 lbs. each; the very assistants turn up their noses, and condemn them as weighing nothing at all. What can be said of a dish for two, consisting of 20 lbs. of good Goose? In these classes we have to notice an event that has only occurred twice in our recollection—the White were heavier than the Grey. Turkeys are still in progress; a few years since it was necessary to show a cock and two hens. It was thought an exploit when the three reached 50 lbs. weight—such easily gained first prize. This year, however, when two birds only were shown, they weighed 47 lbs. It may not be amiss to call attention to this fact, that, thanks to the institution of poultry shows, by societies like the Birmingham and Midland Counties, opportunities for choosing stock, for gaining information, and the desire for success in competition, have resulted in the production of birds, accomplishing no less a desideratum than the same amount of food on two birds that was originally produced by three. This is no small exploit. Poultry is at last becoming a food question, not only as regards the carcases, but as providing delicious and nourishing diet in the shape of eggs. A million of eggs per day imported throughout the year, amount to a large sum of money, and there is no doubt that with proper painstaking much of it might remain in the United Kingdom. As a list of the prizetakers appeared in our columns last week, we shall now content ourselves with reviewing the different classes, making such comments as may seem to be called for.

There were 132 pens of *Boulognes*, forming a very meritorious class. Many of the cocks weighed upwards of 10 lbs. each, and we were glad to find there were few crooked breasts. There was but slight difference in the prize pens. Admiral Hornby's two; Capt. Lane's, and Viscountess Holmesdale's, all were very large all in perfect condition. Six prizes did not satisfy the requirements of the chickens; but there were no more to give. Admiral Hornby again stood first, taking precedence (for this occasion only) of Viscountess Holmesdale, Lady Bagot, and Mrs. Arkwright. Twenty pens figured in the prize sheet. Lady Holmesdale showed the best hens, and Mrs. F. Blair was prizetaker in this, as in several other classes. No man exploit. The pullets were not as good as the hens. We can speak most highly of the white birds of this breed, they had size and quality.

The adult *Spanish* were deficient in numbers, but good in quality. We miss, nevertheless, the high type of those shown formerly by Messrs. Bake and Davies. Mr. Lane's birds were good, and Messrs. Roué and Bull sent very favourable specimens. The classes for hens and pullets, especially the latter, were scantily filled. If they are not better represented it will be a question whether they should not be diminished.

The adult *Cochin-China* class was one of the best we ever recollect. Many of the birds had all the merits of old and young. The hens in Mr. Cattell's pen were really perfect specimens. The pen sold for £25. Mr. Stretch's birds, Mr. Tomlinson's, and Mr. Bates's were all most excellent. The chickens were not as good as the adults, nor as good as they have been some previous years. Messrs. Nelson, Stretch, Heaton, and White, deserved the success they met with; while many were in trouble owing to their vulgar; hocks. The hens and pullets of this breed mustered well, seventy-four pens; but vulture hocks were again numerous, and disqualified some otherwise good pens. Mr. Stevens and Mr. Jennison showed the best birds.

The *Grouse* and *Partridge* classes filled well with good birds; but the old difficulty of finding cocks with thoroughly black breasts still exists. Mr. Stretch was very successful in these classes, as was Mr. Tidman. Indeed, if we add the name of Capt. Heaton, we shall describe all the winners of the ten prizes offered.

*Whites* were very good, and by the side of an old exhibitor, Mr. Chase, a new name earned frequent mention—The Rev. F. Taylor.

*Brahma Pootras* are becoming large and important classes. Mr. Levy and Mr. Boyle showed beautiful pens of adults. The chickens were equally good, but in many of these there is a tendency to vulture hooks. Breeders must avoid them. Mr. Statter's and Mrs. Hurt's birds were very beautiful.

For the first time, there were classes for *Light Brahmas*, Mr. Pares, took all for adults; Mr. Clark, and Mr. Crook, for chickens. These birds will become favourites.

*Malays* were excellent, but they do not increase in numbers.

The next was a new class, and successful, inasmuch as it produced twenty pens—*Creece Cwars*. Mesdames Blinkhorn and Hurt took all the prizes.

Twenty-eight pens of *Black Hamburgs* justified the institution of the class last year. They were very good, but there were symptoms of white faces, as well as white deaf-ear in many of them. This must be avoided.

*Golden-pencilled Hamburgs* were beautiful, most beautiful, many of them were pencilled up to the tip of the tail, and their condition left nothing to desire. We are compelled to refer our readers to the prize list for the names of the successful, merely observing they deserved their honours.

The *Silvers* were very good, but not quite so good as their predecessors.

The *Golden-spangled Hamburgs* appear to have been lately bred with exceeding care, and, consequently, showed pens of great merit. The *Silvers* were good also. Sir St. G. Gore showed a good pen of adult birds.

The *Polands* were all good, but as usual deficient in numbers. We can except the *Silvers*, which formed a remarkable class. The varieties that took prizes were "La Flèche," "Cuckoo Dorkings," "Andalnsians," and "Japanese."

The *Game*, as usual, formed an exhibition of themselves. We thought we observed in very many of them a tendency to legginess, a length of thigh that would have been condemned by the old cockers, who only viewed them as fighting birds. The condition of all these birds was startling. The Brown Reds especially seemed made of heart of oak, and painted. They looked as though clothed with one feather, and their hard condition seemed to strive to break through it. There were, however, indications that it is hard work to win against such competition as Birmingham. We saw birds in the Black Red classes that had lost honours by the presence of a few red feathers on a black breast. The great contest is in Black and Brown Reds. Duckwinged are comparatively weak, and the other classes small. In calling attention to any more superior than usual, we must ask our readers to notice all the prizetakers.

The "single classes" were each of them more than many small shows. Thus twenty-three Dorking cocks were named in the prize lists, and nearly all were sold directly the show opened. Spanish were highly meritorious. Cochins-China very good. The most remarkable among the others, *Brahma Pootra*, and *Golden-spangled*, and *Pencilled Hamburgs*. Gold-faced Bantams were very good, especially the pen belonging to Rev. G. S. Cruwys. The *Silvers* were not as good. The *Blacks* and *Whites* were beautiful, especially the latter. We thought the first-prize White pen one of the best we ever saw. The competition was very severe in the class. The *Game Bantams* were many of them perfect. Thirty-seven pens in the different classes were distinguished by the Judges, and many others might have asked the same distinction.

Assuring our readers that the birds in the following classes were in every respect perfect, we will content ourselves with giving the weights of the different pens. Aylesbury Ducks—30lbs., 27lbs., 25lbs. Rouen Ducks—26lbs., 25lbs., 21lbs. White Geese—58lbs., 43lbs., 36lbs.; 35½lbs. Grey Geese—56lbs., 52lbs., 43lbs., 42lbs., 41½lbs. Turkeys, 47lbs., 46lbs., 45lbs., 40lbs., 36lbs., 35½lbs.

We shall have further details to give next week, when all the statistics will be prepared. At the time when we go to press everything had gone on as it always does at Birmingham. The different Stewards and members of the Council, Messrs. Luckcock, Matthews, Shackel, Wright, Lowe, Mapplebeck, Adkins, Sabia, and others, were all at their posts. They deserve the hearty thanks of all amateurs, and we sincerely hope that, as usual, they will reap a rich reward in the well-doing of the Show, and the benefit it conferred on their fellow townsmen.

**DORKING (Coloured).**—Highly Commended, Mrs. F. Blair, Inchmartine, Inchture, N.B.; E. Tudman, Ash Grove, Whitechurch, Salop; W. H. Denison, Hardwick Cottage, Woburn, Bedfordshire; H. Lingwood, Barking, Needham Market, Suffolk. Commended, T. Atham, Kingsthorpe, Northampton. *Chickens.*—Highly Commended, Duke of Newcastle, Clumber, Worksop; Mrs. Arkwright, Etwell Hall, Derby; Sir J. D. Wauchope, Bart., Newton House, Millerhill, Dalkeith, N.B.; The Rev. A. Kingscote Cornwall, Boneombe, Dursley; J. D. Hewson, M.D., Cotton Hill, Stafford; Lady Bagot, Blithfield Hall, Rugeley; J. Longland, Grendon, Northampton; O. E. Cresswell, Hanworth Rectory, Hounslow, Middlesex. Commended, Admiral W. Hornby, Knowsley Cottage, Prescott; J. White, Warby, Northallerton, Yorkshire. *Hens.*—Highly Commended, J. Robinson, Vale House, Garstang. *Pullets.*—Highly Commended, Rev. E. Cadezan, Walton Parsonage, Warwick; Lord Stanhope, Bretby Hall, Burton-upon-Trent; C. Cork, Shoreham, Essex.

**DORKING (White).**—Highly Commended, H. Lingwood, Barking, Needham Market, Suffolk. *Chickens.*—Highly Commended, D. Parsons, Cuden, near Preston.

**SPANISH.**—*Chickens.*—Highly Commended, W. R. Bull Newport Pagnell, Bucks. Commended, J. Shorthose, Shieldfield Green, Newcastle-upon-Tyne; Miss Douglas Pennant, Penrhyn Castle, Bangor. *Pullets.*—Highly Commended, W. Boué, 18, Park Street, Bristol.

**COCHIN-CHINA (Cinnamon and Buff).**—Highly Commended, H. Tomlinson, Balsall Heath Road, Birmingham; G. H. Perkins, Spark Hill, Birmingham; Capt. H. Heaton, Lower Broughton, Manchester. *Chickens.*—Highly Commended, J. Heape, Ladypool Lane, Sparkbrook, Birmingham; R. W. Boyle, Galtrim House, Bray, Co. Wicklow, Ireland; J. Shorthose, Shieldfield Green, Newcastle-upon-Tyne. Commended, Mrs. F. Blair, Inchmartine, Inchture, N.B.; C. Pease, Southend, Darlington. *Hens.*—Highly Commended, C. W. Brierley, Rhodes House, Middleton, near Manchester; Capt. H. Heaton, Lower Broughton, Manchester; G. Fell, Springfield, Warrington; J. Stephens, Walsall; Rev. C. Spencer, College House, Attleborough, Norfolk; J. Cattell, Lime Villa, Bristol Road Edgaston, Birmingham. Commended, H. Bates, Vintage House, Yaul v, near Birmingham. *Pullets.*—Highly Commended, T. Boucher, 106, Bull Street, Birmingham; Mrs. R. White, Broomhall Park, Sheffield; Rev. C. Spencer; E. Adams, Grosvenor Road, Handsworth, near Birmingham; Miss J. Milward, Newton St. Loe, Bristol; C. Pease, Southend, Darlington. Commended, G. Fell, Springfield, Warrington.

**COCHIN-CHINA (Brown and Partridge Feathered).**—Highly Commended, T. Stretch, Ormskirk. *Chickens.*—Highly Commended, Capt. H. Heaton, Lower Broughton, Manchester. *Hens.*—Highly Commended, E. Tudman, Ash Grove, Whitechurch, Salop. *Pullets.*—Highly Commended, W. Gamon, The Green, Thornton-le-Moors, near Chester.

**COCHIN-CHINA (White).**—Highly Commended, Rev. F. Taylor, Kenastwick, Kirby Lonsdale; R. Chase, Tyndal Street, Balsall Heath, Birmingham. *Chickens.*—Highly Commended, Rev. F. Taylor. Commended, Mrs. Williamson, Queenborough Hall, Leicester.

**BRAHMA POOTRA (Dark).**—Highly Commended, Rev. W. H. Fell, Stalmine, near Fleetwood, Lancaster. Commended, Rev. J. E. Young, Whitnash Rectory, Leamington. *Chickens.*—Highly Commended, Rev. W. H. Fell; Mrs. Hurt, Alderwasley, Derby; R. W. Boyle, Galtrim House, Bray, Co. Wicklow; Mrs. F. Blair, Inchmartine, Inchture; Capt. H. B. Linc, Lily Hill, Bracknell, Berks. Commended, J. K. Fowler, Prebendal Farm, Aylesbury; "Cactus"; Rev. W. H. Fell.

**BRAHMA POOTRA (Light).**—Highly Commended, Mrs. F. Blair, Inchmartine, Inchture. *Chickens.*—Highly Commended, J. Pares, Childown Hall, Chertsey; E. Pigeon, Lymington, near Exeter.

**MALAY.**—Highly Commended, G. Hastler, Stillingfleet, York. Commended, W. Wood, Fir House, Walkley, Sheffield. *Chickens.*—Highly Commended, Rev. A. G. Brooke, Bryton XI, Towns, Salop.

**CREECE-CWARS.**—Highly Commended, The National Poultry Company, (Limited), Bromley, Kent, S.E.; A. Dixon, Birches Green, Birmingham. *Chickens.*—The National Poultry Company.

**HAMBURGH (Black).**—*Chickens.*—Highly Commended, R. F. Goodwin, Middleton, near Manchester; E. Collinge, Boarshaw Clough, Middleton, near Manchester; C. Sidwick, Ryddlesden Hall, Keighley; G. Lingard, jun., Snow Hill, Birmingham.

**HAMBURGH (Golden-pencilled).**—Highly Commended, C. Tattersall, Myrtle Grove, Waterfoot, near Manchester. *Chickens.*—Highly Commended, C. Tattersall; E. Pittis, jun., Newport House, Newport, Isle of Wight. Commended, Hon. T. W. Fitzwilliam; Viscountess Holmesdale.

**HAMBURGH (Silver-pencilled).**—*Chickens.*—Highly Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. Commended, E. J. W. Stratford, Wombourne, near Wolverhampton; A. K. Wood, Burnside, Kendal; D. Hurdin, Middlewich, Cheshire. *Hens.*—Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. *Pullets.*—Highly Commended, F. Pittis, jun., Newport House, Newport, Isle of Wight.

**HAMBURGH (Golden-spangled).**—Highly Commended, R. Tate, Green Road, Leeds. Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire. *Chickens.*—Highly Commended, S. H. Hyde, Taunton Hall, Ashton-under-Lyne; W. Bayliss, Wednesbury Road, Walsall. Commended, Sir St. G. Gore, Bart.; J. Palmer, Wednesbury; A. K. Wood, Burnside, Kendal.

**HAMBURGH (Silver-spangled).**—*Chickens.*—Commended, Mrs. Pettat, Ashe Rectory, Basingsbroke; Rev. W. Serjeantson, Acton Burnall Rectory, Shrewsbury; J. Hope, Napier Street, Wemeth, Oldham; W. Parr, Patricroft, near Manchester; A. K. Wood, Burnside, Kendal. *Hens.*—Highly Commended, Miss A. M. S. Hurt, The Knoll, Derby; J. Leech, Newcastle, Staffordshire. Commended, I. Davies, Bull Street, Harborne, near Birmingham. *Pullets.*—Commended, Messrs. T. May and T. Blakeman, Bloomsbury Street, Wolverhampton.

**POLISH (Black with White Crests).**—Highly Commended, T. P. Edwards, Lyndhurst, Hants. *Chickens.*—Highly Commended, T. P. Edwards; P. Unsworth, Sandy Lane, Loxton, near Warrington. Commended, P. Unsworth.

**POLISH (Golden).**—Highly Commended, H. Beldon, Goitstock, Bingley, Yorkshire.

**POLISH (Silver).**—Highly Commended, G. C. Adkins, The Lightwoods, near Birmingham; H. Beldon, Goitstock, Bingley, Yorkshire; R. P. Williams, Glaslinn, Clontarf, Dublin. *Chickens.*—Highly Commended, G. C. Adkins, The Lightwoods, near Birmingham.

**GAME (Black-breasted Reds).**—*Chickens.*—Highly Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire; H. M. Julien, Whitefriar Gate, Hull. Commended, T. J. Charlton, Salt Street, Manningham, Bradford, Yorkshire.

**GAME (Brown and other Reds, except Black-breasted).**—Commended, S. Mathew, Chilton House, Stowmarket, Suffolk; W. Webster, Steely, near Workson. *Chickens.*—Highly Commended, J. Aykroyd, Girdlington Road, near Bradford, Yorkshire; W. Gamon, The Green, Thornton-le-Moors, near Chester; J. Wood; J. W. Kelleway, Merston, Isle of Wight. Commended, T. Robinson, Poolbar Grove, Ulverston; J. Anderson; T. T. Burman, Lady Lane, Heckley Heath, near Birmingham.

**GAME (Duckwings, and other Greys and Blues).**—*Chickens.*—Commended, Col. W. Blackburne, Clarendon House, Leamington.

**GAME PULLETS** (Except Black-breasted and other Reds).—Highly Commended, T. West, St. Ann's, Eccleston, near St. Helen's, Lancashire; J. Sunderland, Coley Hall, near Halifax, Yorkshire.

#### SINGLE COCKS.

**DOCKING**.—Highly Commended, Mrs. Hurst, Alderwasley, Derby; J. Smith, Henley-in-Arden; J. Shorthose, Shieldfield Green, Newcastle-upon-Tyne; Lord Bagot, Blithfield Hall, Rugeley; R. B. Postans, Brentwood, Essex; T. Tatham, Kesthorpe, Northampton; W. W. Barham, Henley-in-Arden; W. Endall, Beaudesert Park Farm, Henley-in-Arden; Rev. J. G. A. Baker, Old Warden, Biggleswade; J. Robinson, Vale House, Garstang. Commended, Lord Bagot; Mrs. Young, Elington Vicarage, Stratford-upon-Avon; T. Rushin, Ravensthorpe, Northamptonshire; Rev. J. G. A. Baker, Old Warden, Biggleswade; Rev. M. Amphlett, Church Leuch Rectory, Evesham; Lord Stanhope, Brethay Hall, Burton-upon-Trent.

**SPANISH**.—Highly Commended, E. Draper, Primrose Hill, Northampton; A. Heath, Calne, Wilts; W. E. Bull, Newport Pagnell, Bucks; J. Shorthose, Shieldfield Green, Newcastle-upon-Tyne. Commended, W. R. Bull.

**COCHIN-CHINA** (Cinnamon and Buff).—Highly Commended, R. White, Bromhall Park, Sheffield; T. Boucher, 106, Bull Street, Birmingham; R. Adams, Grosvenor Road, Handsworth. Commended, T. Stretch, Ormskirk; T. Tatham.

**COCHIN-CHINA** (Except Cinnamon and Buff).—Commended, Capt. H. Heaton, Lower Broughton, Manchester.

**BAHAMA POOPRA**.—Highly Commended, Mrs. Hart, Alderwasley, Derby; F. Sabin, Bull Street, Birmingham; R. W. Boyle, Galtrim House, Bray, Co. Wicklow.

**HAMBURGH** (Golden-pencilled).—Highly Commended, Rev. R. Roy, Skirbeck, Boston, Lincolnshire; C. Tattersall, Myrtle Grove, Waterfoot, near Manchester. Commended, C. Sidgwick, Ryddesden Hall, Keighley; T. Wrigley, jun., Tonge, Middleton, near Manchester.

**HAMBURGH** (Silver-pencilled).—Highly Commended, Rev. R. Roy, Skirbeck, Boston, Lincolnshire; J. Holland, Chesnut Walk, Worcester.

**HAMBURGH** (Golden-spangled).—Highly Commended, H. Beldon, Gaitstock, Bingley, Yorkshire; W. Kershaw, Heywood, near Manchester; J. Buckley, Tamton, near Ashton-under-Lyne, Lancashire. Commended, S. Mills, jun., Caldmore Cottage, Walsall; H. E. Emberlin, Hamberstone, Leicester.

**HAMBURGH** (Silver-spangled).—Highly Commended, Rev. W. Serjeantson, Acton Burnell Rectory, Shrewsbury.

**GAME** (White and Piles, Duckings, and other varieties except Reds).—Highly Commended, J. Halsall, Ince, near Wigan.

**GAME** (Black-breasted Reds).—Highly Commended, J. Fletcher, Stone-cloak, near Manchester; J. H. Williams, Spring Bank, Welshpool; C. H. Penacecke, Carragee-na-Graine, Dalkey, Dublin.

**GAME** (Brown and other Reds, except Black-breasted).—Highly Commended, M. Billing, jun., Wood End, near Birmingham; W. Webster, Steetley, near Workson; J. Palmer, Wednesbury; E. Aylroyd, Girdlington Road, near Bradford, Yorkshire; Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire; J. Wood, Moor House, Wigan.

**BANTAMS** (Gold-faced).—Highly Commended, M. Leno, The Pheasantry, Markyate Street, near Dunstable, Bedfordshire; G. Manning, Chapel House, Springfield, Essex.

**BANTAMS** (White, Clean-legged).—Highly Commended, Rev. G. S. Cruwys, Cruwys Morchard Court, Tiverton, Devon; H. Mapplebeck, Woodfield, Moseley, Birmingham; H. Draycott, Humberstone, near Leicester. Commended, C. W. Brierley, Rhodes House, Middleton, near Manchester.

**BANTAMS** (Black, Clean-legged).—Highly Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire; R. Swift, Southwell, Notts.

**BANTAMS** (Any other variety except Game).—Highly Commended, E. Pigeon, Lymington, near Exeter (Japanese); R. W. Boyle, Galtrim House, Bray, Co. Wicklow.

**GAME BANTAMS** (Black-breasted Reds).—Highly Commended, J. W. Kelleway, Merston, Isle of Wight; R. B. Postans, Brentwood, Essex; R. Swift, Southwell, Nottinghamshire; Rev. G. Raynor, Kelvedon Hatch Rectory, Brentwood, Essex; J. Crossland, jun., Wakefield, Yorkshire.

**GAME BANTAMS** (Any other variety).—Highly Commended, R. Hawksley, jun., Southwell, Nottinghamshire; C. W. Brierley, Rhodes House, Middleton, near Manchester; J. W. Kelleway, Merston, Isle of Wight; J. Percival, Glent Villa, Harborne, near Birmingham; Rev. G. Raynor, Kelvedon Hatch Rectory, Brentwood, Essex.

**GAME BANTAM COCKS** (Black-breasted and other Reds).—Highly Commended, Rev. A. K. Cornwall, Bencombe, Dursley, Gloucestershire; Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire; T. J. Charlton, Salt Street, Manningham, Bradford, Yorkshire; R. B. Postans, Brentwood, Essex; Rev. G. Raynor, Kelvedon Hatch Rectory, Brentwood, Essex; H. Shumack, Brook Cottage, Southwell, Nottinghamshire; R. Boddington, 176, Bristol Street, Birmingham; J. Munn, Shawelough, Newchurch, near Manchester.

**DUCKS** (White, Aylesbury).—Highly Commended, Mrs. Seamons, Hartwell, Aylesbury, Bucks; W. Fowler, jun., Wood End Cottage, Erdington, near Birmingham; S. Lang, jun., The Shrubbery, Redland, near Bristol; — Hollis, Broad Street, Reading.

**DUCKS** (Rouen).—Highly Commended, J. Munn, Shawelough, Newchurch, near Manchester; J. Holme, Knowlesy, Prescot; T. Robinson, Poplar Grove, Ulverston; S. Shaw, Stainland, Halifax; — Hollis, Broad Street, Reading; J. Robinson, Vale House, Garstang; E. Longton, Woolton Mills, Liverpool.

**DUCKS** (Black East Indian).—Highly Commended, J. Beasley, Brampton House, near Northampton; F. W. Earle, Edenhurst, Hayton, Liverpool; T. Ballance, Sydney House, Homerton, near London. Commended, Mrs. Wolferstan, Stafford Hall, Tamworth; Mrs. Hayne, Fordington, Dorchester.

**DUCKS** (Any other variety).—Highly Commended, Sir St. G. Gore, Bart., Hopton Hall, Wirksworth, Derbyshire.

**GESE** (White).—Highly Commended, J. Logan, Maidee House, Newport, Monmouthshire; J. Faulkner, Brethay Farm, Burton-upon-Trent.

**GESE** (Grey and Mottled).—Highly Commended, Col. North, M.P., Wroxton Abbey, Banbury; Mrs. F. Blair, Inchmartine, Inchture, N.B. *Goosings*.—Highly Commended, Mrs. F. Blair; J. K. Fowler, Prebendal Farm, Aylesbury.

**TURKEYS**.—Highly Commended, W. Winterton, Wolvey Villa, Hineckley (Cambridge); — Worthington, Temple Farm, Wolvey, Hineckley (Mixed); Mrs. A. Guy, Eaton, Grantham. Commended, J. Faulkner, Brethay Farm,

Burton-upon-Trent; G. P. Smith, Lower Eaton House, near Hereford. *Pouls*.—Highly Commended, Mrs. F. Blair, Inchmartine, Inchture, N.B. Commended, W. Lort, jun., The Cotteridge, King's Norton.

#### PIGEONS.

**ALMOND TUMBLERS**.—Commended, J. Ford, Monkwell Street, London. **CARRIER** (Black).—*Cock*.—Highly Commended, W. Sunday, Holme Pierrepont, Nottingham; A. P. Leite, Rylaw House, Oxford Road, Manchester; M. Hedley, Redhill, Surrey. *Hen*.—Commended, A. P. Leite, Oxford Road, Manchester.

**CARRIER** (Any other colour).—*Cock*.—Commended, A. P. Leite, Rylaw House, Oxford Road, Manchester.

**POWTER** (Red or Blue).—*Cock*.—Commended, G. A. Dickson, Watergate Street, Chester; M. Hedley, Redhill, Surrey. *Hen*.—Highly Commended, A. P. Leite, Oxford Road, Manchester.

**POWTER** (Any other colour).—*Cock*.—Highly Commended, A. P. Leite, Rylaw House, Oxford Road, Manchester. Commended, A. Heath, Calne, Wilts. *Hen*.—Commended, W. Choyce, jun., Sibson, near Atherstone, Warwickshire.

**BALDS**.—Highly Commended, F. Esquilant, Effra Road, Brixton, London, S.

**BEARDS**.—Highly Commended, T. H. Ridpath, Manchester. Commended, J. Fielding, jun., Yorkshire Street, Rochdale.

**TUMBLERS** (Any other colour).—Highly Commended, J. Ford, Monkwell Street, London.

**RENDS**.—Highly Commended, A. P. Leite, Oxford Road, Manchester.

**PANTALS** (White).—Highly Commended, F. Else, Westbourne Grove, Bayswater.

**TRUMPETERS** (Mottled).—Very Highly Commended, J. Baily, jun., Mount Street, Grosvenor Square, London.

**OWLS** (Blue or Silver).—Highly Commended, A. P. Leite, Oxford Road, Manchester. Commended, F. Esquilant, Effra Road, Brixton, London.

**TURBIS** (Red or Yellow).—Very Highly Commended, S. Shaw, Stainland, Halifax; H. Mapplebeck, Woodfield, Moseley, Birmingham.

**BARBS** (Black).—Highly Commended, M. Hedley, Redhill, Surrey.

**DRACOONS** (Blue).—Very Highly Commended, J. Percival, Montpellier Road, Peckham Rye, London. Highly Commended, H. Yardley, Market Hall, Birmingham.

**DRACOONS** (Any other colour).—Highly Commended, H. Yardley, Market Hall, Birmingham; T. H. Ridpath, Poplar House, Rusholme, Manchester. Commended, E. L. Corker, High Street, Croydon, Surrey; E. Pigeon, Lymington, near Exeter.

**MAGPIES**.—Highly Commended, J. N. Beasley, Brampton, Northampton; E. E. M. Roys, Greenhill, Rochdale. Commended, S. Shaw, Stainland, Halifax.

**ANTWERPS**.—Highly Commended, T. H. Ridpath, Poplar House, Rusholme, Manchester.

### YORKSHIRE SOCIETY'S EXHIBITION.

This was held at York on the 7th, 8th, and 9th instant.

**DOCKING** (Any colour).—First, J. White, Waraby, Northallerton. Second, C. Pease, Southend, Darlington. Highly Commended, P. T. F. Martin, Rawcliffe, York. *Chickens*.—First, M. Hunter, Green Hammerton. Second, C. Pease. Highly Commended, Mrs. Ledgard, Poppleton Hall.

**SPANISH**.—First, H. Beldon, Gaitstock, Bingley. Second, G. Jackson, Pearly Grove Street, York. *Chickens*.—First, H. Beldon. Second, T. Greenwood, Dewsbury.

**COCHIN CHINA** (Yellow or Buff).—First, H. Beldon. Second, T. H. Barker, Hovingham.

**COCHIN CHINA** (Black or White).—Prize, O. A. Young, Driffield.

**COCHIN CHINA** (Grouse or Partridge).—First, J. Wood, Brinscall Hall, Chorley. Second, J. Bell, Thirsk.

**COCHIN CHINA CHICKENS** (Any Colour).—First, L. Thompson, Sheriff Hutton Park. Second, H. Beldon. Highly Commended, L. Thompson.

**GAME** (Black-breasted or other Reds).—First, G. Ponder, Kirlymoor-side. Second, J. Darbyshire, Green Hammerton. Highly Commended, W. Bearpark, Ainderby Steeple. Commended, R. Tate, Leeds.

**GAME** (Duckwings).—First, T. Cleminson, Darlington. Second, H. Whiteley, Womersley, Pontefract. Highly Commended, T. Nettleton, Knaresborough.

**GAME** (Any other variety).—Prize, J. Hodgkinson, Hull. *Chickens*.—First, T. Cleminson. Second, M. Hunter.

**HAMBURGH** (Golden-pencilled).—First, G. Winterburn, Birks, Guiseley. Second, H. Beldon. Third, J. Eckett, Heslington.

**HAMBURGH** (Silver-pencilled).—First, H. Beldon. Second, S. Widdows, Chorley. Third, R. Sherwood, Claines, Worcester.

**HAMBURGH** (Golden-spangled).—First, H. Beldon. Second, R. Tate. Third, O. A. Young.

**HAMBURGH** (Silver-spangled).—First, H. Beldon. Second, C. Outram, Sheffield. Third, W. Bourmes, Crookes, Sheffield.

**POLISH** (Gold or Silver-spangled).—First and Second, H. Beldon.

**POLISH** (Any other variety).—First, R. Jessop, Hull. Second, H. Beldon.

**ANY FARMYARD, OR OTHER CROSS**.—First, E. Loit, Woodmansey, Beverley. Second, T. Jolly, Waraby.

**BANTAMS** (Game).—First and Second, E. Loder, Little Carlton, Notts. Third, W. E. Entwistle, Otley. Highly Commended, Lady Hawke, Womersley Park; G. Holmes, Great Driffield; A. Catty, Tower Street, York.

**BANTAMS** (Laced).—Prize, J. Thackray, Hessey, York.

**BANTAMS** (Any other colour).—First, J. R. Jessop, Hull. Second, H. Beldon. Commended, P. T. F. Martin, Rawcliffe, York.

**ANY PURE BREED, NOT PREVIOUSLY CLASSED**.—First, G. H. Roberts, Penwortham, Preston. Second, T. Jolly. Highly Commended, R. Loft.

**TURKEYS**.—First, J. S. Tonge, York. Second, Lady Hawke. Highly Commended, Mrs. Carr, Bossall. *Pouls*.—First, J. S. Tonge, Second, Mrs. Carr. Highly Commended, J. Warneford, jun., Dunnington. Commended, L. Thompson.

**GESE**.—First, O. A. Young, Second, H. Beldon. Highly Commended, The Ladies Wentworth Fitzwilliam, Harrowden House, Wellesborough. Commended, H. Saville, Rufford Abbey, Notts.

**DUCKS** (Aylesbury).—First and Second, M. Harrison, Warter, Pocklington. Highly Commended, O. A. Young.

**DUCKS** (Rouen).—First, H. Beldon. Second, E. Graham, Aldborough.

DUCKS (Any other variety).—First, T. C. Harrison, Hull. Second, W. F. Entwisle.

SELLING CLASS.—First, W. F. Entwisle. Second, H. Beldon. Third, G. S. Thompson, Moorlands, York.

EXTRA STOCK.—First, A. Cattley, Tower Street, York (Carolina Drake). Second, J. Bannister, Fridaythorpe (Geese).

#### PIGEONS.

A silver cup, value £5, given by the Pigeon fanciers of York, for the best pair of Carriers, Powters, or Short-faced Tumblers, First, J. Fielding, jun., Rochdale. Second, A. P. Leite, Manchester. Highly Commended, F. Else, Westbourne Grove, Bayswater; W. Massey, Fulford; J. Thackray, York; J. R. Robinson, Sunderland. Commended, H. Yardley, Birmingham.

CARRIER (Any colour).—Cock: First, W. Massey. Second, E. Horner, Harewood. Highly Commended, A. P. Leite; T. Colley, Sheffield. Commended, H. Simpson, jun., Whitby; R. Fulton, Deptford. Hen: First, A. P. Leite. Second, F. Else. Highly Commended, A. P. Leite; R. Fulton. Commended, H. Simpson, jun.; W. Massey.

POWER (Any colour).—Cock: First, S. Robson, Brotherton, Barton Salmon. Second, R. Fulton. Highly Commended, A. P. Leite. Commended, W. R. Rose, Cranley Hall, Ketting. Hen: First, R. Fulton. Second, W. Ashworth, Sheffield. Highly Commended, W. Ashworth.

TUMBLERS (Short-faced, any colour).—First, A. P. Leite. Second, J. Hawley, Bingley. Highly Commended, H. Yardley; H. Simpson, Newark.

TUMBLERS (Any other variety and colour).—First, G. Fletcher, Acomb Landing. Second, T. C. Taylor, Middlesborough. Highly Commended, J. Hawley.

FANTAILS (Any colour).—First, F. Else. Second, J. Taylor, Newark. Highly Commended, H. Simpson, Newark. Commended, H. Yardley; T. Hives, Nottingham.

TRUMPETENS (Any colour).—First, H. C. Oates, Besthorpe, Newark. Second, W. Else. Highly Commended, J. R. Robinson, Sunderland.

BARBS (Any colour).—First, W. Massey, Fulford. Second, J. Gell, Union Terrace, York. Highly Commended, A. P. Leite, Manchester; J. Gell, York; J. Thackray, Petergate, York.

JACOBS (Any colour).—First, E. Horner, Harewood. Second, T. Else, Westbourne Grove, Bayswater, W. Highly Commended, J. Thackray, York. Commended, W. H. Oates, Besthorpe, Newark.

PERIBS (Any colour).—First, Messrs. C. and E. Roys, Greenhill, Rochdale. Second, J. Fletcher, Acomb Landing, York. Highly Commended, A. Middleton, Newport.

OWLS (Any colour).—First, W. Ashworth, Owlerton, Sheffield. Second, J. J. H. Stockall, Broad Green, Liverpool. Highly Commended, T. Hives, Colgrave, Nottingham.

ANY OTHER NEW OR DISTINCT VARIETY.—First, J. R. Treman, Helmsley. Second, H. Beldon, Goitstock, Bingley. Highly Commended, C. J. Samuels, Longsight, Manchester; J. Parker, Oakworth Hall, Keighley. Commended, F. Key, Beverley; T. Watson, Heworth, York.

SELLING CLASS (Pigeons, cock and hen, of any breed).—First, J. Thackray, York. Second, W. Massey, Fulford. Third, C. J. Samuels, Longsight, Manchester.

#### RABBITS.

LOP-EARED (Buck).—First, G. F. Jones, Bootham, York. Second, R. Dobson, Holdgate Road, Yoad. Third, Messrs. C. and E. Roys, Greenhill, Rochdale.

LOP-EARED (Doe).—First and Second, T. Ridpath, Rusholme, Manchester. Third, M. Millington, Heworth.

HIMALAYAN.—First and Second, A. Cattley, Tower Street, York. Highly Commended, J. R. Jessop, Hull.

DUTCH.—First, T. Heppell, Spencer Street, York. Second, H. Ridley, Hall Field Lane, York. Highly Commended, S. Hall, Union Street, Margaret Street.

ANY OTHER VARIETY.—First, J. Mollett, Cattle Market, York. Second, J. J. Shouksmith, Micklegate, York.

EXTRA STOCK (Cross-bred Does).—Commended, G. W. Fall, Walmgate, York.

The Judges were, of Poultry, Mr. T. Dodds, Warren Cottage, Wakefield, and Mr. J. O. Jolly, Green Hammerton. Pigeons and Rabbits, Mr. J. Smith, Freedom Road, Sheffield, and Mr. W. Smith, Beech Hill, Halifax.

### THE BIRMINGHAM AWARDS.

I AM credibly informed that when the Game Bantams were judged it was no longer daylight. I presume that the awards were not made in the dark, though from what I know of them I could almost believe that; and I am perfectly sure of this, that the Council would not care a straw whether they were or not. But pray let me ask this most courteous, most obliging body whether they think it just, anything like just, to exhibitors so to limit the number of Judges as to render it certain that their labours cannot be concluded whilst daylight lasts. I maintain that to do so is simply robbing us of our entry fees, for it is utterly impossible to come to a just decision on the merits of fowls like Game Bantams by candlelight.

It is evident that the Council are determined to have their own way. Well, let them; we have the remedy in our own hands. I am not a member of the Poultry Club; but if the members of this will pledge themselves individually not to exhibit in Bingley Hall again until the legitimate wishes of exhibitors are attended to, I will do so too, and I doubt not that many others will join us. Why do not the Club start an opposition show? I am sure if they would do this, and guarantee that a sufficient number of efficient Judges should be engaged, that exhibitors would gladly send their birds where

they would be honestly and fairly judged. If any guarantee fund were required I would subscribe ten guineas towards it with pleasure.—P.

[For the present, and until we have further information, we shall refrain from all criticism on the awards our correspondent condemns; but we are reliably informed that no awards were made except by daylight, and that the only part of the Judges' duties performed by gaslight was weighing where this was needed.—Eds.]

### DORKINGS AT THE MANCHESTER POULTRY SHOW.

HAVING what I consider, a very fine Silver-Grey Dorking cock that I wished to enter for the above Show, in Class 1, which is for Coloured Dorking cocks of any age, I sent in my entry-form describing my bird, and was informed by the Secretary, Mr. G. Jennison, that he would be disqualified, and that there was no class for Silver-Grey Dorkings, and that I had better enter the cock with two hens (if I had them), in Class 51, for extra stock. Now, I have entered the same cock with two hens in some of the other leading shows as Silver-Greys, and they have been admitted into the class of Coloured Dorkings, as I reasonably expected they would be anywhere. The Secretaries of the Shows I allude to, which are those of Darlington and Kendal, have assured me by letter that they see no irregularity in thus entering my birds. These have also been accepted in the class of Coloured Dorkings at other places. How is this? What is allowed, I think I am right in saying, at all the leading Shows should be allowed at Manchester. If it cannot be done, I, for one, shall be glad to give my guinea, if others will do the same, in order to establish a special class for Silver-Grey Dorkings at the next Manchester Show.—Geo. R. SMITH, Scarborough.

[There can be no doubt that Silver-Grey Dorkings come within the comprehensive term "coloured;" but those well versed in poultry have considered them sufficiently distinct from Dorkings having the plumage characterising what are called "Coloured Dorkings" to give them a separate class. Thus, at the Birmingham Poultry Show just concluded, "Cuckoo Dorkings" were exhibited in the "Any other distinct variety" class. If the Committee of a Poultry Show determined to admit Silver-Greys among the Coloured Dorkings we do not think the Committee would be wrong, but the best authorities are for the contrary practice. We dare say that Mr. Jennison will readily have a special class for Silver-Greys, if a sufficient number of subscribers respond to your suggestion.—Eds.]

### BEE COMMOTIONS AND QUEEN ENCASEMENTS.

THE apiarian readers of the Journal, are, I have no doubt, in common with myself, greatly obliged to Mr. Lowe for the very interesting chapter which he gave us at the beginning of the year, entitled "Bee Commotions and Queen Encasements." He has graphically and truthfully described the different circumstances and conditions under which our hives are occasionally thrown into a peculiar state of movement and agitation. With these many of us are familiar, and, consequently, a statement of them had only to be made in order to command our assent. The hints which he has thrown out are invaluable to the inexperienced apiarian, and very refreshing to the better informed. They also show Mr. Lowe to be possessed of powers of acute observation, and to have an intimate acquaintance with the economy of the hive. In again advertising to the subject of queen imprisonments, I am aware that I can advance nothing new, and I am scarcely in a position, even if I desired it, to confute his arguments or contradict the conclusions at which he has arrived. On the contrary, I can endorse much of what he has advanced—but I believe it is as yet premature to take up decided views with regard to the cause of regicidal attacks.

In the first kind of commotions referred to by Mr. Lowe—that which takes place on the removal of a queen from a newly hived swarm—he says the bees ultimately desert the hive and return to the parent stock. This, no doubt, generally happens; but I have seen a little comb in the hive induce the bees to remain for about a week, and then, when desertion took place, it was not to the parent stock, but to any hive that would

receive them. The other two kinds of commotion coming under Mr. Lowe's first class—namely, those which arise from the removal of a queen in summer when there is brood in the hive, or in winter when there is none, are very accurately described.

It is, however, to what he calls the second-class of commotions, that the scientific apiarian's attention is chiefly directed. These, we are informed, are distinguished from other commotions by the agitation being comparatively local, by the prominent part taken in it by the younger bees, and particularly by the strange fluttering noise which may be distinctly heard in the interior of the hive. This peculiar noise, which in a glass hive sounds like a continuous half-suppressed wail of distress, no one who has heard it once can fail to recognise a second time. It is just the sound that is emitted in all circumstances in which a queen is encased by bees.

Now, as we have reached the season of the year when little can be found in the apiary to engage attention, it may not be uninteresting to take another glance at some of the statements advanced in Mr. Lowe's new chapter.

Regarding the queen, then, which was encased by her own subjects, after being released from imprisonment in a strange hive, I am inclined to think Mr. Lowe may, by mistake, have removed the wrong queen. If the introduced queen were ever lost sight of, or not distinctly marked, it would be impossible to identify her again. I have seen both a reigning and a strange queen encased on the floor-board of a common straw hive within a few seconds after the introduction of the latter and a small number of attendants. It is possible that a short period of imprisonment by strange bees may serve to imbue a queen with a particular odour so that her own subjects may not immediately recognise her, but this can only be expected to happen in warm weather. An injury to the queen is not likely to result in an encasement; for, as Mr. Lowe proves in his case 1, tattered wings and deprivation of a leg did not prevent one of his from being a prolific mother, and receiving all due homage. Nor do I believe the fact of a queen being reared artificially has anything to do with encasements. That queens produced naturally are much, if at all, superior to those raised artificially, is very questionable. In both cases I find those that first emerge from the cells faultless. I confess, however, that I am not in love with the youngest or last born of an artificial batch. They are sometimes unfortunate, and often diminutive.

As to the conditions or elements of success in artificial swarming, there must not be wanting, if I understand Mr. Lowe, the presence of drones in the young queen's hive. Now, I apprehend, the presence of drones in the apiary only, if there be fine weather, abundant food, and an overflowing population, is all that is needed towards successful artificial swarming; for Mr. Lowe knows very well that young queens are not prone to mate with the drones of their own hives. In the majority of cases, pure Italian queens though reared amid thousands of pure Italian drones, will go and contract marriage with those of the black species, if within reach. It is next to impossible to prevent Ligurian and common bees sited within a mile of each other from crossing.

There are two conclusions which Mr. Lowe arrives at—viz., that queens may be imprisoned when superannuated and infirm from age, from any natural defect in their procreative powers, or from being unfecundated beyond a certain age, and when in an abnormal condition. Encasements in such circumstances I am inclined to think are merely accidental. To my mind the cases adduced hardly warrant the inferences drawn from them; for in case No. 1, page 80, the queen, though unprolific and languid, is not stated to have been aged or even encased, and her successor may just have been an instance, like that of Mr. Woodbury, of a second queen, whose rearing began in inexplicable circumstances. In No. 9 the queen was four years old, but she does not appear to have been languid or unprolific. In No. 13 the queen was five years old and encased, but she turned out to be drone breeder. She being in a box hive, Mr. Lowe may not have been able to preserve indubitable proof of her age, and I can imagine his supposed aged queen to have been a supplanter, one that, unobserved by him, came into existence out of season, and that would, consequently, prove a drone breeder. These remarks will also apply to No. 5, but Mr. Lowe will, perhaps, explain by what means he ascertained the different ages of his queens.

The other conclusion come to by Mr. Lowe is this, that queens may be imprisoned or encased by reason of the en-

trance of stranger bees into the hive. In this conclusion I am at present disposed to agree, although I am aware that it meets with no favour from that talented and distinguished correspondent "A DEVONSHIRE BEE-KEEPER."

Here let me remark that by "stranger bees" I do not mean marauding or robber bees. With Mr. Woodbury I believe these characters are intent upon plundering only. Rarely, if ever, when destroying a hive do they put its sovereign to death, or even into durance vile. These, though strangers, are not the bees that obtain peaceable access to neighbouring hives—on the contrary, every attempt made by such to pass sentinels on the watch, meets with most determined resistance. By "stranger bees," then, I mean those bees which, without any intention of plundering, find their way into other hives than their own.

That bees, which are not plunderers, do obtain unchallenged entrance to other hives than their own can scarcely be disputed. The time spent in the new, but usurped, dwelling, may be longer or shorter according to circumstances, but if in their peregrinations over the combs, one or more of these bees approach the queen and find she is not their own sovereign, a regicidal note will be sounded, the regicidal frenzy will take possession of the hive, and the queen will be immediately imprisoned. That a marauding bee, as related by Mr. Woodbury at page 895, should have failed to excite the frenzy in its attack upon the queen is to me not surprising; for it will be observed that at the moment the marauder made the assault his bees were in another kind of frenzy—they were concerned about the safety of their queen. When once the regicidal mania is awakened it does not immediately subside, and during its continuance a sharp look-out is kept at the entrance of the hive. Dense knots of regicides may also be seen at a considerable distance from that in which the queen is encased.

It may be stated as a principle, that bees which are conscious of possessing a queen, or unconscious of not having one, will not tolerate the presence of a foreign sovereign; whereas bees that are conscious of being without a sovereign will readily and peaceably accept of any other. If a queen from any cause perish in winter, the bees for a long time may be unconscious of their loss, or, if conscious of it to-day, they may, by getting into a hibernating state, be unconscious of it to-morrow. In this condition it would be dangerous to present them with a new queen; but arouse the hive—make the bees run about and discover that their sovereign is gone, and they will readily receive any queen offered to them with demonstrations of joy. In an empty hive the absence of a queen is soon detected by the bees; but in a hive with combs the discovery may not be soon made, and if the loss be unfelt the labours of the hive will be continued. Now apply this principle. Present a queen to bees that are conscious of having a sovereign, or not conscious of being without one, and they will immediately encase her. Reverse the process, and you have the same result. Now, suppose bees, without any intent of plundering, enter a hive, and be the occasion of imprisonment and death to the queen, what will follow? These wanderers on returning home will communicate with their fellows, and knowing that a queenless hive offers but feeble resistance, will go back with others of their family and endeavour to carry off the stores of the victim of misfortune. Indeed, a hive in which a regicide has taken place may be known to be in this condition by the robbers that are continually hovering about it.

Various causes lead stranger bees into other hives; these have been referred to in the Journal, such as shifting hives, removing, or siting them too near each other. Last spring I found a very strong hive queenless from the simple circumstance, I believe, of having in the autumn previous inadvertently, and without any precautions, removed a small hive adjoining it to the distance of a hundred yards. Some of the removed bees returned, and entered what had formerly been their nearest neighbour, and, although I did not witness their proceedings, I have no doubt they occasioned a regicide.

Bees must recognise their queens by means of the odour or aroma from her person. Hence the benefit of peppermint water in ferming junctions. If the queen of A were held for some time in a warm perspiring hand, and if the queen of B were held immediately afterwards in the same hand, the bees of A would have some difficulty in discovering the queen of B to be a stranger, owing to the aroma of A having been communicated to some extent to B.

According to Mr. Woodbury's experience, attacks are often made upon young queens immediately after their return from

a wedding flight. Now, the sight of a queen in any circumstances, and particularly when returning from her aerial excursion, may be as attractive to stranger bees as to her own subjects. In approaching the hive after a wedding flight, I have seen her darted upon by bees, and even struck to the ground. These might be strangers, they might follow her into her dwelling unopposed, and be the cause and occasion of the regicidal results which we deplore. In a unicombe containing only black bees and a queen reared about the middle of August last, I was surprised to find several Ligurian bees about the time the young queen was taking her wedding flights. The black bees passed and repassed the Ligurians without taking any notice of them whatever. It would have been interesting to have seen them come in contact with the queen; but they never moved far from the extremity of the comb.

Will Mr. Woodbury kindly state whether he has ever observed the interchange of combs productive of effects? I have an impression that the sense of smell in bees is very acute, and I have often wondered whether bees would be differently affected towards their queen were she immediately to insert her body in the cells of a comb just removed from another hive.

In giving expression to my views and making the statements I have done, I shall have gained my end if it stimulate to farther inquiry, and lead to the development of truth.—R. S.

### NUTT'S HIVES.

In answer to Mr. F. H. West as to whether Nutt's hives are not difficult to manage, I can assure him that they are the most simple which I have had to do with; for in the spring, when the slides are once drawn, I let these remain so till the side boxes are filled, when they are again closed for the purpose of manipulation. This operation takes me about twenty minutes by administering a few whiffs of smoke under the ventilators in the floor-board, which induces the bees to make their exit, and seek admission at the entrance of the parent hive.

With respect to ventilation retarding the secretion of wax, it is very possible it may do so, but I never commence ventilating till the thermometer stands from 90° to 96° in the middle box; then I open the ventilators, admission having been given to the side boxes some ten or twelve days previously, so that the boxes are nearly full of comb by that time, and would soon be taken possession of by the queen for depositing eggs in did I not make it too cool for that purpose, and yet refreshing for the honey collectors.

In reference to overcrowding in a non-swarming colony, such a thing is not known in my boxes, there being at all times plenty of room during the gathering and breeding seasons. I cannot say that I have kept any notes showing the rate of progress in the boxes before and after ventilation, beyond the fact that the bees previous to being admitted to the boxes lose much valuable time, hanging about the hives as if waiting for more room, but as soon as let into the boxes they set vigorously to work building combs. I have not found that the queens of non-swarming hives perversely die off at a wrong season, or when the bees are unable to raise themselves another. The weight of one set of my collateral boxes in 1864 was 45½ lbs. of honey, not including the middle box; the weight of a second set was 39 lbs. of honey. In 1865 No. 1 produced 36 lbs., and No. 2, 40 lbs. of honey.

In conclusion I may remark that I do not find the moth get into boxes so much as I have done in straw skeps.—T. S.

### MY LITTLE APIARY.

As a sketch of operations is always interesting, perhaps I may be allowed to say in few words what have been my doings this season, and their results.

I commenced the year with three stocks, all in straw hives. Nos. 1 and 3 were moderately strong, No. 2 exceedingly so—crowded with bees and well provisioned. On the 13th of May I drove No. 3, which was the smallest hive, out of the combs, and transferred all safely to a bar and frame hive. This stock turned out very well indeed, after being strengthened from No. 2. It did not swarm, and filled a large wooden super with beautiful honey, containing, however, a portion of brood, the queen having made her way up through the adapter.

A week later I drove No. 2, but with some difficulty, from its

being eked. This hive also did not swarm, and worked wonderfully during the month of June. I took from it at different times three brood combs, and three outside combs filled with honey, besides which it filled a nine-frame super with most regular combs all filled and sealed.

No. 1 was let alone, except the fitting of a small board upon it for a super. This hive, after three parts filling a glass, threw off a swarm, and did nothing further.

No. 4 was a large purchased swarm, which, after filling a hive with comb, suddenly swarmed out upon the stand. Thinking this was from the intense heat, and several other stocks in the neighbourhood clustering out at the same time, I did not at first take any notice of it, and it was not until after a careful examination on the second evening that the real nature of the mischief was apparent. Disliking cross sticks, and intending the following season to cut out the combs, I had neglected what in so hot a summer would seem to be a necessary precaution. The combs had melted and fallen down, quite filling up the hive. They were one mass of brood, having broken off irregularly 3 or 4 inches from the top; some honey was also lost and many bees. If I had had a spare frame hive the combs might still have been turned to good account, but unfortunately this was not the case, and they wasted, which was certainly bad management. A part at least might have been fixed in glasses and placed over two hives to hatch out. The bees returned to their desolate habitation and for several days seemed to be disconsolate; but they afterwards set to work to repair damages, and having been liberally fed seem likely to get through the winter.

No. 5, a purchased swarm, has filled a large hive, and given four glasses of honey.

No. 6 was the swarm from No. 1, and was sent to the heather at the end of July. It was well stored when sent, and being very populous, would, doubtless, have gathered a large surplus had the weather been at all favourable. The hive was filled throughout, and work just commenced in the super. It is by far the heaviest hive in the apiary, and might very well have spared the two outer combs.

No. 7 was a second swarm, purchased for a trifle, and sent to the heather; combs worked about three parts down, and strong in population, the bees of a driven stock having been added to it. Indeed, most of the hives have been strengthened in this way.

Tabulated, the result is as follows:—

No. 1, a straw hive, has given 12	lbs. and a swarm
2, bar and frame	43 lbs. and three brood combs.
3, bar and frame	35 lbs. and two brood combs.
4, straw hive,	4 lbs. and then broke down.
5, straw hive,	15½ lbs.
5, bar and frame,	nothing.
7, straw,	nothing.
Total,	109½ lbs.

Thus of the three old stocks the two transferred to frame hives gave most satisfactory results, and had there been anything like a favourable season at the heather, I have no doubt that No. 6 would have done quite as well as either of them, showing, I think, the superiority of these hives when fairly tried.—F. H. WEST, near Leeds.

### OUR LETTER BOX.

WINTER SUPPLY OF EGGS (J. S.).—Winter laying depends on age, not on breed. Laying is a natural process, and intended to produce chickens. In a state of nature all hens would produce their chickens about the same time that Grouse, Pheasants, and Partridges do, when days are getting longer, nights shorter, and when the earth teems with natural food—i. e., in the end of April or beginning of May. By breeding fowls out of course, we get them to lay earlier, but the chickens, if reared, must be reared artificially. Fowls hatched in April will lay in the winter. Cochins and Brahmans are the best, especially the latter. They can be had of Baily, in Mount Street. Feed them on ground oats, slaked with milk, and with scraps of every kind from the table. To get thirty-six eggs per week at this time of year, you must keep at least twenty-four pullets, not hens.

ARTIFICIAL HATCHING (Nemo).—We are informed that the new incubator will be fully announced before the end of the month. The necessary experiments are being made, that failure with common attention shall be impossible. It is in the hands of a company of the highest respectability, and it is said will prove a boon for all poultry breeders.

BIRMINGHAM POULTRY SHOW.—First prize for Dorking Pullets was awarded to Mr. C. Cork, Shoreham, Sussex.

WORK ON BEES (S. D. S.).—"Bee-keeping for the Many," was written by the late Mr. Payne, a very good authority. It can be had free by post from our office for five postage stamps.

WEEKLY CALENDAR.

From observations taken near London during the last thirty-eight years, the average day temperature of the week is 44.3°; and its night temperature 32.7°. The greatest heat was 56°, on the 25th, 1827; and the lowest cold, 4°, on the 24th, 1860. The greatest fall of rain was 1.13 inch.

SOWING AND AFTER-MANAGEMENT OF PELARGONIUM, VERBENA, AND OTHER CHOICE SEEDS.

THE season is fast approaching when the lovers of new plants watch for the appearance of the germ of the seed they have fostered with so much care during the season of growth.

Only those who, like myself, are enthusiasts can know how much pleasure it gives—with what joy it fills us—to see our future pets just peeping through the soil, and how eagerly we watch them almost every hour to note what progress they have made since we last looked upon them. A short description of the way in which I treat the seeds of the above plants may, therefore, be acceptable to many readers of THE JOURNAL OF HORTICULTURE—may, I am sure that it will; for there are many amateurs who make their garden their only recreation, and who, having nothing else to engross their minds with, are constantly on the watch for the appearance of their pets. They know that after a certain number of days they may hope for the appearance of their seedlings, and as the time for this draws nearer and nearer the visits become more frequent, till at last some little hillocks are seen raised up above the surface of the soil; then come the little yellow leaves, and soon afterwards the young plants are fairly above the soil. The anxious watcher tries to force them on with all speed, so that he may hasten the time when he fondly hopes to realise the particular object he has in view. Often, however, it happens that the bright hopes he has formed respecting the future of his pets are dashed to the ground, and the airy castles are rent asunder from some unknown cause.

There are many evils which beset the path of the amateur, which can only be overcome by a long course of experiments, constant practice, and ceaseless watchfulness. Let us, then, consider what those evils are.

- 1st. The clumsy way in which the soil has been prepared.
- 2nd. There may not have been sufficient drainage put at the bottom of the seed-pans; or if there was enough put in, it may have been thrown in carelessly—that is, some large pieces may have been thrown indiscriminately into the pan, and the soil placed on these before anything had been put on the large crocks to prevent the soil trickling down amongst them.
- 3rd. After sowing, the pot may have been so thoroughly saturated with water that the soil could not again become suitable for the vegetation of the seeds; or if they have retained sufficient strength to push through the soil, the latter may have become so sodden and unpalatable to the young and tender roots that these perish, the leaves droop, and the bright hope flies.

4th. The seed may have been placed at a great depth below the surface of the soil, or it may have been sown too shallow. Either extreme will often prove fatal to the vegetation of many seeds.

5th. The situation in which the seed-pans were placed may not have been suitable. They may have been too far away from the glass, or the temperature may have been too high or too low. It is better to err on the side of the latter, for seeds will sometimes remain dormant in a temperature that is not sufficiently warm to cause them to vegetate, and no harm will result providing the soil is not in a wet state. On the other hand, if they are placed in a temperature too warm for them they are forced into a premature growth, and become drawn up so weakly that the first slight wind that blows upon them, or if the atmosphere is charged with too much moisture, away they go.

6th. All the foregoing evils may have been avoided; proper care may have been taken in preparing the soil, and the pots and pans; the latter may have been placed, after the seeds were sown, in a proper temperature; everything may have been done to ensure success; the seedlings may have come up well and be looking fresh and vigorous, and the first part of the battle may have been fought, and yet want of success may be the result. This may arise from want of time, or an idea that the seedlings had better stand in the seed-pans until they have made a second pair of leaves and are large enough to handle. This is often the rock on which the raiser of seedlings strikes; it is often at this stage that his hopes are shattered.

I have in some measure digressed from my subject, and have taken up much space in explaining the causes and probabilities of failures before entering more fully on an explanation of the system which I adopt, thinking that my mode of treatment may thus be made more clear, and be the more easily understood by that class of the readers of the Journal for whom these remarks are more especially intended.

PELARGONIUMS.—For these I use a mixture of good loam, peat, leaf mould, and silver sand in equal portions, taking care to use soil that is in a nice sweet state; by this I mean neither too wet nor too dry. The soil is well incorporated together, and then rubbed through a riddle with about a half-inch mesh. After the whole has been rubbed through this riddle, another with a still smaller mesh is used; but the soil is not rubbed through this as before, but only sifted. The siftings are carefully put by to be used on the top of the drainage; this prevents the soil from passing down amongst the drainage.

After the soil has been prepared, the next matter to be attended to is the cutting or seed-pans; these must be thoroughly clean and dry, and should be about 6 or 8 inches in depth. About 3 inches of large crocks should be placed carefully in the bottom of the pans, and in doing this care must be taken to put them in so that there may be a vacant space between every piece of crock; at the same time they must be so placed that, on tapping the pan on the bench, after it has been filled with soil, they will not shake out of their proper place; for when this is the case it will often upset the whole arrangement of the drainage, causing

serious mischief afterwards, as when the pans are watered the water is sure to find the open or damaged place in the drainage, instead of soaking in regularly all over the soil. Hence it often happens that one half of the pan is covered with seedlings that have come up nicely, whilst the other is bare. This is to be accounted for by the fact that the water has found out the weak place in the drainage and passes quickly away through it, leaving the soil in the other part of the pot or pan quite dry, and the seeds, in consequence, remain dormant. It should, then, always be borne in mind in crocking either pans for seeds or pots for plants, that the drainage must be put in so that the water shall be carried off regularly all over the bottom. Want of proper attention to this particular is often the key to failure in cultivating many kinds of plants, for if the drainage is not properly seen to, the soil, from being constantly watered, soon becomes soddened and sour; a sickly appearance of the foliage and decay of the roots follow; and eventually the plant dies, or dwindles to such a state of ill health, that the greatest amount of attention and skill cannot again reinstate it.

As soon the larger pieces of broken pots have been properly placed in the bottom of the pans, put in another inch of finely broken crocks, shake the pan so that every little piece may be firmly settled into its proper place, then use sufficient of the fine riddlings mentioned above to cover this layer of crocks; fill up the pan with the prepared soil, and with a straight-edge scrape the soil off level with the edge. The soil must not be pressed in any way into the pan, but be put in as lightly as possible; if this has been nicely done, by tapping the pan gently on the bench a few times, the soil will sink down regularly to about  $1\frac{1}{2}$  inch below the rim of the pan. On this surface the seeds should be sown.

The plan generally adopted is to prick the *Pelargonium* seeds into the soil with a small dibber after the pan has been filled up and levelled. This I have found to be a bad system, for this reason, the seeds cannot always be placed upon the bottom of the hole made by the dibber. The seed is also put in the wrong way upwards. I have found by experience, that as soon as the seed begins to vegetate the roots more rapidly strike into the soil, and the hulk of the seed, or leaves, more readily ascends through the soil to the surface when the seeds are sown instead of dibbled in.

Over the seeds I generally place a mixture of finely-sifted leaf soil and sand in equal portions, just enough to cover the seeds; this being rather more porous and more tempting to the roots than the rest of the soil, will cause the roots to work more freely, prevent their going down to the drainage, and will very much increase the number of small rootlets. The pan is then filled up with soil, which is scraped off as before, a few more taps on the bench are given, and a very slight pressing with the bottom of a small pot finishes the operation. If the soil is in the state before mentioned, neither too wet nor too dry, no water should be used for three or four days, the pans should then have a very light sprinkling, just sufficient to damp the surface to the depth of half an inch or so. The pans should be placed in an average temperature of  $50^{\circ}$ , and the atmosphere kept rather dry.

About the eighth day after the seed has been sown the pans should be again slightly sprinkled with tepid water, this time using rather more than for the first watering. On the twelfth or fifteenth day after sowing, some of the seeds will begin to vegetate, and will very quickly push their seed-leaves through the soil; water should then be withheld, and the atmosphere kept as dry as possible, the pans should also be placed as near the glass as possible. Lose no time in preparing small thumb pots, in which to prick out the young seedlings. Just the same care should be taken in crocking these, as for the pans; they should also be filled in the same way, and with the same sort of compost, and if anything a little more sandy. The soil must be put into the pots very loosely, and after taking the young plants out of the pots with great care, and with as little injury to their roots as possible, just make a hole in the centre of the pot with the forefinger, sufficiently large to admit the roots without cramping them. Hold the plant between the thumb and one finger of the left hand, and after inserting it sprinkle just enough soil to fill up the space about the stem of the plant, taking care not to plant it deeper than it was before it was moved from the seed-pan; then give the pot a few gentle taps on the bench to cause the soil to sink half an inch or so below the rim of the pot.

After they are pricked off they must on no account be watered for four or five days, by which time they will have sent some of their roots to the sides of the pot, when they may have a

light watering, but not unless it is a dry day, with plenty of air stirring; and even then they should be watered as early as possible in the morning, so that the air of the house may be dry before night comes; if this is not properly attended to they will fog off by wholesale.—J. WILLS.

(To be continued.)

## A PLEA FOR TREES, SHRUBS, AND SOME OTHER PLANTS IN FLOWER GARDENS.

(Continued from page 418.)

BEDS of low evergreen flowering shrubs, and detached specimens, may be introduced into geometrical gardens with good effect, and if flowering in spring or early in summer they would be all the more desirable on that account.

*ANDROMEDA FLORIBUNDA* is, perhaps, the handsomest of low white-flowering shrubs. It has deep green leaves, is of close and compact growth, and grows naturally in the form of a half-circle. The flowers are bell-shaped, drooping, fragrant, and produced profusely in March and April. Specimens from 2 feet to a yard in height form excellent rests for the eye, and are best distributed singly in beds from 3 to 4 feet wide, for the plants have too much individuality about them to group well. They need no cutting beyond removing the flower-stalks, and any irregular growth immediately after blooming. The plant requires peat soil.

*LAURUSTINUS* (*Viburnum tinus*).—Of this there are several varieties, but none, in my opinion, surpasses the old one. Specimens from a yard to 6 feet high, and as much through, are no mean objects, whether trained as cones of half spheres. They are easily kept in order by cutting in the shoots after blooming, or in May. They are only suitable for warm situations.

*KALMIA LATIFOLIA* has deep green leaves, and forms excellent groups. The variety *myrtifolia*, though less in size, is even finer in foliage than the species; the leaves are smaller, and the flowers are even larger, and of a delicate pink or rose. *Kalmia latifolia major splendens* has deep rosy flowers, approaching to scarlet. The flowers of all are delightfully fragrant. Peat soil.

*RHODODENDRON*.—What could we do without this, the prince of the out-door flowering shrubs? *R. hirsutum* has pink flowers, lightish green foliage, and forms a fine group. The variegated kind is pretty, and will, I think, prove useful. Of the other small kinds *R. azaleoides*, pink, is quite unique, and its fragrant variety, *R. azaleoides odoratum*, scarcely less so. *R. dauricum atrovirens* has purplish flowers. *R. ferrugineum*, with russet leaves and rosy scarlet flowers, and its white variety, are pretty, and are suitable for small groups or edgings to the larger kinds. *R. Wilsoni*, pale rose; *R. ovatum*, dark rose; *R. myrtifolium*, a fine rose, and its variety *hybridum*, of a more delicate rose, make fine low groups or edgings. *R. Govenianum*, light purple; *R. ciliatum*, white, shaded rose, and sweet; *R. daphnoides*, waxy rose; *R. fragrans*, pale rose; and *R. gemmiferum*, crimson, with white centre, are indisputably the finest of the dwarf *Rhododendrons*. To these may be added Cunningham's Dwarf White, or *R. caucasicum album*; and the hybrid *Marian*, which, from what I know of its dwarf compact habit and abundant blooming properties, promises to be useful as intermediate between the dwarf and tall varieties. Its flowers are pink with dark spots. The varieties of *R. Nobleanum*, of scarlet, rose, and lighter shades, are dwarf and free blooming. *R. Nobleanum superbum* is a fine dwarf kind. The varieties of *R. Nobleanum* bloom early, and are sometimes injured by spring frosts. They have been fine this season, whilst the hybrids have not done so well. The variegated form of *R. ponticum*—viz., *acubæfolia*, with the leaves blotched yellow like the *Acuba*, and lilac flowers, is very pretty, but will, I fear, grow too tall; small plants are handsome, how it will turn out is another question.

Of the Hybrid Scarlet, and other *Rhododendrons*, I have found the following do well until they became too high, then it was necessary to remove them, and replace with smaller plants, for they look best when about 2 feet in height:—Comet, scarlet; Madame Titiens, vivid rose; John Waterer, deep glewing crimson; *Blaudianum superbum*, light crimson, dwarf habit; *Album virginale*, white; *Coriaceum*, white, dwarf habit; Brilliant, crimson scarlet, dwarf habit; Jenny Lind, rose; Ketelerii, rose; Lord John Russell, rose, spotted; Gem, pale rose, deeper towards the centre; *Lefevreanum*, purplish crimson; *Brayanum*, rosy scarlet, extra fine foliage;

Paxtoni, rose, compact habit; and Towardii, rosy lilac. These are what have been used, and answered well, but there are others equally good, and there are many much superior to them, but they evidently have not the same claims for grouping as the above. It is best to have them in groups of one colour and kind, for the foliage differs in character and hue, as well as the flowers, and, if you plant a bed of crimson, the shades of that colour in the several varieties, though individually good, form a mixture far from pleasing as a mass.

The above are all the flowering evergreen shrubs that I have used, and known to be employed in geometrical gardens, except hardy Heath, but they should be in groups of one species, for I find mixtures are far from satisfactory, even if the plants do flower at one time, for the differences in their foliage and habit, and in the colour, nay, shape of the flowers, have a far from pleasing effect.

Evergreen shrubs not cultivated for their flowers are of two kinds, those that are cut into form, and those that receive no trimming beyond regulating irregular growths.

**LAURELS.**—Of the trimmed shrubs, common Laurel takes precedence, and is usually employed for covering banks, and as screens to the outer boundary of the garden itself. When employed to form a bank of green foliage Laurels are planted at about a yard apart, and allowed to grow a year. They are then pegged down, letting the shoots into the ground, and making fast with pegs. This is done in the spring of the second year. They usually shoot sufficiently to cover the surface by September; if not, the shoots are again pegged. The shoots root where let into the soil, rendering further pegging unnecessary. In subsequent years they are gone over in June, and the shoots cut-in, and again after the growth is made, regulating these so as to form an even surface. Banks of Laurel are fine objects, and that very often where the bank would be unsightly if not so covered.

Screens of Laurel are even finer than banks, and are formed like an ordinary hedge by planting closely for early effect, and in two or more lines, according to the width required. Sometimes they are planted so as to form terraces of different heights and widths, sloping or perpendicular. It is a work of time to obtain a screen of Laurel; one may be made to look well in about three years by laying the foundation of the form desired through stopping the irregular growths, and commencing low enough. Inattention to this very often results in a failure at last, for if allowed to grow up in order to produce a speedy effect, the shoots come strong and thin, but by stopping these are not less strong, and more numerous. It is, therefore, advisable to lay a good foundation, and increase the height annually, so as to make the plants dense and even as we go on. Such a screen will be pleasing even when small, and it will increase in beauty every year. All the Laurels require cutting back the irregular shoots once or twice during the summer, usually twice, and the earlier after the growth is made the better. When too large they should be cut-in or reduced before the growth takes place, and they will shoot from the old wood, and soon be as green as ever.

Sometimes a number of plants are planted together with a view to form squares and globes, and are treated like screens, which last are occasionally domed at regular distances, and sometimes have embrasure-like openings cut through the living green wall. Employed in any of these ways, Laurels are always ornamental, and only give place to Yews.

Yews are the best shrubs for screens, but take a very long time to form these, often, however, longer than otherwise would be the case, from being planted too far apart. Three feet is not too far, but they are often planted 6 feet apart, and the branches are then a long time before they meet; but in the other case they meet almost at once, and by trimming the sides only they grow up much more rapidly. Trees 3 feet high, planted 3 feet apart, meet in a short time. Yews bear cutting better than anything I know, and may be made to assume any figure. The finest tree that I remember stands in the garden of a farmer at a village seven miles from York. It is cut round to some distance from the ground in the form of an upright pillar; above this two branches go to opposite points of the compass, east and west, cut flat, and narrowing to a point; again above these other two arms branch out, one to the north, and the other to the south; the tree then tapers upwards for some feet and expands into a globe, surmounted by a cock, perfect even to spurs. In fact, there is not a shape that may not be imitated in Yew; but I am no advocate for cutting the trees into the figures of birds and animals. They look much better in some simple form. Yews are best cut in spring

before the growth is made. The foliage then comes very thick, and has a feathery appearance. When cut after the growth is made the trees are rendered too stiff. Any screen that has become too wide or large may be cut-in very closely to the main branches, from which it will shoot quite as freely as from the twiggy branches. This is best done in spring before growth takes place.

**TREE BOX,** planted a yard apart, makes an excellent low screen, and is of the most easy management; all it requires is cutting early in June to the desired form, and going over it again in September, removing the stray growths only. The use of Box for tracery-work is well known, and globes and cones of the green and variegated kinds are also well known, and justly appreciated. They form excellent centres for beds of bright colours.

**HOLLIES** also endure any amount of cutting, and as half circles and cones are fine at any season, more particularly in winter. They also make good screens. They are best cut in before growth is made, or in May; after this a slight regulation of the shoots is all that is needed, or cutting back the shoots that are straggling in autumn. A judicious distribution of the different varieties of Hollies regularly cut into form contributes vastly to the beauty of a symmetrical flower garden in winter, and Hollies are likewise useful in summer as a relief to the brilliancy of colour, and for breaking monotony.

**ARBOR VITÆ.**—The American forms the quickest-growing of screens, bears cutting remarkably well, and can be kept narrow; which is more than can be said of other screens. It does best in light soils, and needs trimming to the desired form in April, and again in August. The plants should be planted closely. I have seen a screen made in a couple of days by planting, in the first week in September, trimmed trees 6 feet high at 18 inches apart. The Chinese Arbor Vitæ makes a better hedge or screen than the American.

Shrubs of close, compact habit are very eligible for centres to groups of flowering plants, and of these few can compare with the dense, deep green *Taxus adpressa*. *T. ericoides* and *T. nana* (Foxii) are also desirable for the same purpose. *Cryptomeria japonica nana*, with dense light-green foliage, furnishes the centre of a bed well; and some of the Junipers are also useful for beds, as *Juniperus recurva densa*, *J. Sabina*, and its varieties *tamariscifolia* and *variegata*; also *Picea Fraseri hudsonica*. Then we have the pigmy Spruce, *Abies Clan-brasiliana*, *A. excelsa pygmaea*, and the very dwarf *Picea pectinata pygmaea*. These for the most part are pyramidal in growth, some with narrow and others with broad bases; but we must have globular forms to relieve the monotony. We will, therefore, take the Golden Arbor Vitæ that will show itself in spring an exact golden figure of the earth; but the plants shall not be spheres but cones until seven years have passed over them. We may also have monotony of foliage, and will therefore relieve it with plants of bolder foliage, of which the old *Ancuba japonica maculata* is very effective, and not less so will probably be the newly introduced varieties. I must not omit the Irish Yew, than which no plant is more employed in geometrical gardens; its close erect habit and dark foliage peculiarly fitting it for lines and detached specimens.

In addition to the shrubs already named, there remain some that are peculiarly well suited for forming standards, and which, when so grown, give a completeness to a garden not otherwise to be secured. They at once prevent monotony, and yet are in thorough keeping with the other parts of the garden. Probably nothing is so fine as standard *Rhododendrons*; half-standards are equally effective, and even more so in certain positions, where taller plants would not conform in height with their surroundings. These standards, from 3 feet to 6 feet high, and half-standards, from 2 feet to 3 feet high, take off the flatness by standing boldly out to the view, and are fine at all seasons. Next in order comes *Kalmia latifolia* on clear straight stems 3 or 4 feet in height, and with heads as much in diameter. Such are strikingly beautiful, and amongst the most elegant objects grown. After it ranks the Portugal Laurel. It makes one of the very finest of heads, on stems from 3 to 6 feet in height, and has the property of bearing cutting well. This should be done before growth commences, for I find the shoots are liable to suffer from frost when the plants are cut late, from the shoots not being matured. A slight trimming in the way of removing irregular growths is all that is needed to keep them in order after the growth has been made. When there is room the trimming may be limited to the removal of irregular growths, they then form magnificent objects; a walk with standard Portugal Laurels on each side is truly grand. They

are equally effective in tubs, whether as pyramids, bushes, or standards, and are far more suitable than Orange trees for terraces.

Standard Yews are quite unique; I do not know of anything half so tractable as these. They look equally well with square, round, or pyramidal heads. Standard green and variegated Hollies, on clean straight stems, cannot but be admired when once seen, and they may have pyramidal or globular heads according to taste. They bear cutting quite as well as Box, and may be kept so close in growth as to resist small birds. Perhaps there is no tree so much neglected as the Holly, nor one that is capable of being cut into such beautiful forms. I am no great advocate for cutting trees much, but I am compelled to own that untrained Hollies are the reverse of ornamental. Those in possession of thin ill-proportioned trees will be well rewarded by cutting them in in May to the form desired. The Weeping Holly (*Ilex pendula*), on a stem from 6 to 9 feet in height, and its silver-variegated form, which is also drooping, are handsome. Standard Box is the very reverse of handsome, according to my ideas, though I can scarcely tell why it should be so; and this closes my list of standards, for I omit those that have failed to impress me with their claims to honourable mention. I have purposely avoided deciduous shrubs; but I may remark that few plants are finer as standards than hardy Azaleas, Lilacs, and Ribes.

In geometrical gardens it is imperative to have the trees at least in pairs, there being no individuality except in the centre, which, of course, should be varied and distinct in itself. The taller shrubs should not be placed there, but near the margin, yet not so as to prevent the whole of the figure being seen at one time from a given point of view, yet if this be done as a rule the aspect presented will be equally monotonous as when they are all graduated in height like plants rising in borders from front to back. It is to do away with this monotony that shrubs are introduced, at the same time they must not interfere with the symmetry of corresponding parts; but when we plant shrubs we must distribute them throughout on the principle of general harmony. Symmetry requires that objects on one side be repeated on the other, the parts corresponding; and the repetition of various kinds of plants contributes vastly towards increasing the apparent extent. The masses of shrubs and flowers, and the isolated shrubs, though varied as to height, character of foliage, and flower, must be allied together, so that neighbouring masses may harmonise as dependant parts of the same whole. Thus a geometrical garden should be a whole in respect to outline, a whole in respect to the shrubs massed, or individually repeated, and a whole whenever viewed—in winter with the shrubs, and the regularity of their distribution and symmetrical forms, and in summer with the flowers. Thus if we plant a tree in one corner we must repeat it in all, and if we have a mass of flowering shrubs we must have another to correspond with it.

I do not feel at liberty to introduce merely graceful plants into geometrical gardens, but I may state that I have done so with, I think, good effect. They should be employed, however, somewhat sparingly, for they encroach on the symmetry of the whole. Beds of *Canna indica* are fine, but unless sheltered they are liable to be tossed about by the wind, and are then anything but desirable. *Wigandia caracasana*, with its immense foliage, stands out in noble relief to gorgeous masses of bloom. *Arundo donax variegata* is one of the very finest plants for the centre of any garden, and for detached specimens; *Bambusa metake* also contributes to give elegance. *Arundo conspicua* will, I am convinced, be more extensively grown than the Pampas Grass; *Gunnera scabra* is also effective. I must conclude with *Aralia Sieboldii*, a low shrub, clothed to the ground with Fig-like leaves of a glossy green; it is nearly, if not quite, hardy. The introduction of plants with ornamental foliage into geometrical gardens requires to be carried out cautiously. —G. ABBEY.

#### PLANTS FOR DINNER-TABLE DECORATION.

SEEING in No. 245 an article on "Plants for Dinner-table Decoration" by Mr. Robson, to whom I, in common with your readers, am much indebted for his excellent papers, I have ventured, as he asks for hints, to draw his attention to a plant, which, although at present almost unknown, is, in my opinion, one of the best flowers for the purpose; I allude to *Lewisia rediviva*, or "Spat'lum," as it is commonly called by the North American Indians and trappers, with whom it forms an important article of food. The plant is a low succulent, of close

habit, with leaves about 2 inches long, which have a peculiarly beautiful appearance by candlelight, and flowers of a lovely rose colour, about 3 inches in diameter, many being open on the plant at the same time. It derives its name from the marvellous tenacity of life which it displays. To kill it is almost impossible, and I believe the dried specimens in the herbarium at Kew are, or were until very lately, constantly throwing up new leaves, although many years old. Even if the roots are soaked in boiling water or spirits of wine they are not materially injured.

This flower I only saw twice used for dinner-table ornamentation, and the effect I shall not easily forget—indeed, I never saw before or since such a sight. It possesses the great merit of looking exceedingly well by candlelight, and the blossoms are not injured by being kept in a close, hot dining-room. It may also be had in flower at any season. The root, which is the part eaten, and which I have myself tasted, has a very agreeable flavour, and as an esculent alone this plant deserves extensive cultivation.

May I also call Mr. Robson's attention to the Egg-plant for decorative purposes? I have used a small variety at my own table for ornament, and its appearance was always remarked upon. I usually grew two plants, one bearing white and the other purple fruit, in one pot, and if carefully grown and pinched in when young, they have a very handsome and showy appearance.—J. H.

#### METEOROLOGY OF FRUIT-TREE HOUSES.

WHAT in the name—well, of all the trees on earth, can the even temperature of that mind-killing place Mentone have to do with orchard-house culture? As far as my observations have gone, such places as Mentone, Torquay, and Penzance, where the winters are warm, and new Potatoes ready for the market very early in spring, in short, in all climates like parts of Devonshire and Cornwall, with an even temperature and a moist climate, good fruit but rarely ripens well.

To the question of "G. H." I reply, There is no danger to trees in excess of temperature when their fruit is set if air is admitted. This excess by gleams of sunshine in spring is so transient, that the trees, less sensitive than the thermometer, do not appear affected—at least, I have never found such to be the case. What can I say more?

Without any mild discussion about "meteorologically favoured places" (I begin to feel quite practically hardened), I can in a few words tell "G. H." the advantage of a narrow span-roofed house—mind, my width is 14 feet—over a wall. Black Hamburg Grapes will *always* ripen here in a house, either lean-to or span-roofed. Against a wall, south, south-west, or south-east, they ripen about once in five years; so that "G. H.," with his wall-loving propensities would have, if he lived here, sour Grapes for four years, which would, doubtless, add to the enjoyment of the ripe ones in the fifth. I know that I ought not to treat this matter lightly, and yet one feels so strong in the power of glass over walls, that when it is questioned one cannot possibly think the questioner serious. I feel so with "G. H.," he seems to me to be pleasantly "chaffing" in all he says, and I daresay smiles and says, after writing a paragraph, "Wo'n't this draw the old fellow out!"

With respect to the temperature of hedge-houses, I am glad to have the opportunity of explaining why in my book—I am sure that my enemy is not glad that I have written one, I am—I have given a high degree, for the temperature of such structures varies to a great extent.

The first hedge-house of the kind that I erected was put up about twelve years ago, and was span-roofed, 18 feet wide, over two Yew hedges of thirty years growth, and very dense, being 2 feet thick. These hedges form its side walls, 2½ feet in height. This house stands endwise north-west and south-east; parallel to it on its north-east side is another house, which, of course, shelters it from north-east, and east winds. Well, from taking the temperature of this hedge-house 5 feet from the ground in its centre, I found it very warm, averaging from 15° to 20° above the open air. It is still one of my warmest houses, although a hedge-house. The house I referred to in my last as being remarkable for its retarding qualities, is of a very different build. One is so used to variation here in the structure of houses that trifles are forgotten. The houses, one of which I referred to, are lean-to's, with Beech hedges 8 feet high for back walls, and four-feet hedges for front walls. The Peach trees I mentioned are planted in the borders, on a level with the

soil outside. They are dwarf bushes, annually cut in closely to produce shoots for budding, so that the fruit they produce is close to their stems, and barely a foot from the surface of the border they are planted in.

I confess I was at first at a loss to account for their being so tardy in ripening, but I believe I have hit upon the cause. When the sun shines upon the glass the upper stratum of air becomes intensely rarified, and cool air with lead-like gravity rushes in at the lower part of the house, so that the rapid indraught neutralises to a great extent the effect of the glass roof, the fruit being in a constant draught. This must be the case, for when walking in these houses, my head being near their roofs, I have always found them very warm, and as I have thought, of a ripening temperature, but I never remember having ascertained their temperature on the ground to contrast it with that near the roof. In quoting the extreme temperature of my large orchard-house at "96°," "G. H." should have in fairness given the context. This heat was at the top of the house under the apex of the roof. It was 83° at 5 feet from the ground among the trees.

The accurate registering the temperature of houses is very amusing, and on paper seems of importance; to the experienced cultivator it is really of little consequence, one seems instinctively to know what is wanted, it is only as regards the extreme of cold which may be fatal to the blossoms and young fruit that it is of real importance. As to giving a close calculation of what the day temperature of a house should be, the weather is so fickle in our spring and early summer time, that five times a-day the thermometer rises and falls to a great extent, yet not enough to give rules about.

I cannot help thinking that "G. H." must have been very unobservant of the night temperature of brick walls,\* their "tender mercies," are the extremes of heat and cold. In May, a thermometer exposed to the full sun will often mount to 100° and 120°. A "May frost" will supervene freezing the young fruit and sending the register down to 26°. From the middle of August to the middle of September a thermometer in the sun on a south wall will show a temperature of the same height, but radiation during the long nights tells forcibly, so that in the morning the "tender mercies" of the wall have not prevented the thermometer going down to 45° or 40°, and this fully agrees with the experience I have gained in orchard-house culture, and which I gave in my last, not one word of which I can retract, because it is gained from my long practice. I repeat, that extremes of temperature are favourable to the well-ripening of fruit, without them we should have our Green Gages mawkish, and our Peaches insipid.

Nature is very kind in giving Mentone an even temperature in which poor invalids may exist, and Mentone may produce fruit of decent flavour; I hope "G. H." will give us full particulars; but depend upon it these soft, mild, sea-side places are not the places to give us very full-flavoured fruit. To find a favoured spot for Peaches and Apricots, we must go to some hill in the far east, where the air is cold and dry, and the sun hot beyond our comprehension. It would be highly interesting to learn from the United States, taking New Jersey for instance, where Peaches are grown so largely, how the day and night temperature varies in the ripening season, and whether it is ever as low as our brick walls and orchard-houses. Nature as she shows herself at Mentone is not, I think, an instructor of much account, as far as regards fruit cultivation here.

The exigencies of our climate seem to me to open a wide field of experimental fruit culture, into which we have barely entered. I may, for instance, mention, that a lean-to house 14 feet wide is being built here of the lightest, cheapest, yet most durable nature. It is self-ventilating, is about 10 feet high at back, and 5 feet in front. Its rafters are  $4\frac{1}{2}$  by  $1\frac{1}{2}$  inch, bevelled. They are placed 24 inches apart, and kept in their places by a bar of T iron, screwed to each rafter by their under surfaces. The back wall is of deal boards painted white, to a portion of which diagonal cordon Peach, Neetarine, and Apricot trees are trained so as to occupy the lower part, while standard-trained trees will occupy the upper part temporarily. Nothing in fruit-tree culture can be prettier or more productive than diagonal single cordon trees under glass, which, owing to their being under continuous summer-pinchings, they require. They are planted about 14 inches apart, and very rapidly make a wall or fence under glass very profitable. The portion of this house finished is 200 feet in length. It is in-

\* "G. H." seems to ignore the effect of radiation from the heated surface soil of an orchard-house. This is very great, and, moreover, it is arrested by the roof.

tended to carry it along in a straight line to 2000 feet, or, perhaps, 3000 feet in length, as the surface of the soil is level and adapted to the purpose. The area of the house will be devoted to the culture of trees planted in the borders, as espaliers or otherwise. Its cost is about three-fourths that of a brick wall, but I have not yet exactly estimated it. Not a brick is employed in its construction, yet it is as durable as a house built to a heavy brick wall, and so light and warm as to be a most agreeable as well as a profitable venture.

I must conclude by thanking "G. H." for his articles, they make one think and observe.—T. R.

### CYCLAMENS.

A I take a great interest in Cyclamens, and grow them largely, I have been much gratified with Mr. Atkins's promise of a paper, by a first-rate hand, more exact than Mr. Abbey's. My present communication is not, however, to criticise, but to ask those learned in Cyclamens, if the Cyclamen Peakeanum, figured in the work edited by "D." of Deal, be anything else than the Cyclamen europæum, found on the Italian slopes of the Alps, a little spoiled by being kept in a warm greenhouse? I and a friend have what seems to be the same thing, but under very different treatment. In my friend's warm greenhouse the bulbs are evergreen, and some are always in flower, or nearly so; in my own cold greenhouse they are just now about to go to rest. I gathered yesterday what seem to be the last blooms. Out of doors they have ceased to bloom for some weeks. The out-of-door plants are finer in colour, more robust, but the petals are shorter, and less divided. In-doors, according to the temperature, they become more and more like some varieties of Cyclamen persicum, but the petals are more divided, and less regular than the better varieties of persicum.

I find that all the Cyclamens will grow out of doors in the midland counties if properly treated, even *C. persicum* if covered with some leaves and branches in the winter; but all do better in a frame where they can be thoroughly drained, and well ventilated, but kept from rough winds, and too much sun.

I have some of the finest bulbs that can be grown of most sorts; but the gems, so far as the eye is concerned, are the Greek varieties; the foliage and flower leave nothing but perfume to be desired. Cyclamens are so easily grown and propagated that I hope to see them as largely cultivated as they deserve, and also improved, as every other flower has been, by careful selection.—S.

### THE ESPERIONE GRAPE DEFENDED.

I wish to rise up in defence of my Grapes. I feel wounded by "A Surgeon's Notes," at page 338. The wound is given by a masterly hand; still, can it be that three out of the four Grapes which I cultivate should be laid so low? "Not much need be said of the Black Hamburg." "The Muscat St. Laurent is a watery Grape." "I cannot say I care for the Esperione." A depreciation of the first two I could have borne, but of the Esperione never. Those which I submitted to the Editors were pronounced "very good," and I wondered whether "J. H. H." had the true Esperione?

There is a great uncertainty about this Grape. I was partly the cause of some articles in these pages, and much inquiry concerning it in 1857, and the result left no doubt in my mind that the Esperione is the Grape which was formerly cultivated on the slopes of Windsor Castle. Our late friend, Mr. Beaton, as with everything else that he took in hand, has given us a good insight into its history, &c., while treating on Vine pruning in Nos. 473, 477, and 481, and it was only the other day that I was asked my reasons for thinking that I possessed the identical sort. I do not intend to quote very extensively, but I will bring to my aid a few extracts from the above Numbers, and which seem to bear me out in my opinions; I will then trace my acquaintance with this Vine down to the present season.

In No. 473, Mr. Beaton wrote, "Mr. Grierson, of Ledbury, who retired from gardening in 1830, was the planner and planter of that new garden, and among other things he planted an Esperione Grape Vine, which he received from the late Mr. Williams, of Pimaston, near Worcester, the best authority at that time for such things, after Mr. Knight of Downton Castle. This Vine was the only authenticated one of that kind that I

ever knew. It was also the most productive Vine I had ever seen." In No. 477, Mr. Beaton thanks me for sending him some cuttings and specimens of the Esperione Grape, and pronounces that they "might pass anywhere as hothouse Grapes." In the article, in No. 481, there is a very interesting correspondence from Mr. Rivers, where the colour of the leaves is treated as a distinguishing mark, and both Mr. Rivers and Mr. Beaton seem wavering as to there being two kinds of Esperione, one with a leaf dying off yellow, and another with leaves dying off a variegated purple. The latter concludes with the inquiry, "Is there no old garden about Windsor where a plant exists, from the royal garden, which was, probably, levelled down when the present garden was made? Mr. Ingram must recollect the Windsor Esperiones, and what came of them at last." Now, the leaves are a most important point. I can show that against the unprotected walls of this house the Esperione foliage is dying off yellow, whilst in the case of the very Vines propagated from the out-door Esperione, and planted in a vinery without artificial heat, the foliage is for the most part dying off of a beautiful variegated purple. A Black Hamburg under the same circumstances, and in the very same house, has its entire foliage fading yellow. I have observed the same feature ever since I have had the Vines under glass. I never could feel decided till I found that out.

It is now some thirty-three years ago, when I was not far advanced in my teens, that on making my way towards the kitchen garden at Downton Castle, I stopped upon a raised embankment, intently viewing some fish in an artificial pond, when the late T. A. Knight, Esq., President of the Horticultural Society, came upon me almost before I was aware of his presence, so absorbed was my attention in the fish. He held two fine Potatoes in his hands, and he described them to me—he would converse with anybody—and from that very day I date my peculiar interest in the Potato. I told him that I wished to see the garden, and he said, "Go and see all that you wish to see." Perhaps I was too young for the gardener to notice; but I fancy I can yet see the experiments and productions in the garden as I saw them then. What more especially struck me, was a Vine with a beautiful bloom upon its fruit, and having pretty foliage. It was in a structure, which, if I remember aright, was neither a pit nor a house, and I thought if ever I came to grow Grapes I should like that variety. Years passed on, and I never saw that garden again, but whenever I came to where Grapes were growing, I searched for the wished-for kind.

It was either in the first or second year, I think, of the Vine disease (*Oidium Tuckeri*), that I was at the gardens at Stoke Farm, near Windsor, the late Dowager Lady Sefton's, and Mr. Oldaker's houses were poisoned with it. I was accompanying him in the garden, and we came to a sort of lean-to house in the framing ground, used for forcing flowers to cut, and lo! there was my long-sought Vine, growing against the back wall, in perfect health, and loaded with ripe Grapes, covered with the well-remembered and unmistakable bloom. I explained to Mr. Oldaker how I first became acquainted with it, and requested the name. "Esperionce," that is how I entered it in my pocket-book, was the answer. The stem of the Vine was large, old, and gnarled. Oldaker said it was a very old sort in the neighbourhood, and not usually met with, but he was very glad he had it, for otherwise he would not then have been able to have cut a bunch of Grapes fit to be presented at table. He sent me some Russian Violets and Vine cuttings in the autumn, and I never saw him alive again. I visited Stoke Farm again last autumn, and the first thing I did was to make a pilgrimage to the Esperione-house. I learnt that the Vine had been destroyed soon after Mr. Oldaker's death. Mr. Simpson has now turned the house into a peachery. The hole in the wall where the stem entered only remained to remind me of the existence of the Vine. The oldest workman, still in the garden, and who was there before Oldaker's time, could furnish me with no history beyond what I have written, except that the Vine was there long before his coming to work on the premises.

The last time I was at the Royal Horticultural Society's garden at Chiswick, the Vines in the conservatory were young. I hope to see them next year when the Grapes are ripening. They had the Esperione there in 1862, and I saw an unmistakable bunch of it exhibited in their collection at the first International Fruit Show, at South Kensington. It maintained the best bloom before the world, and it was a very nice bunch of Grapes. It is a wonderful and certain bearer; it sets its berries well, is as often shouldered as not, frequently

singly so, and the shoulders are longer and looser than those of the Hamburgs. The mere protection of glass adds to its quality greatly, by producing a sweet aromatic piquancy of flavour. Invalids have told me that they found it grateful when the best Black Hamburgs would cloy. Cultivated on the open walls, in nine years out of ten, I can prove that it makes good claret, and something better. It is altogether a better Grape for making red, or any other wine, than the Hamburgs, and I have bunches now in the vinery that would hang till the new year. It is my favourite Grape, and "I care" very much for the Esperione.—UPWARDS AND ONWARDS.

## GRAFTING GERANIUMS.

It is not customary to graft or bud Geraniums, nor, indeed, any softwooded plants; not that it is a difficult operation, but from the ease with which the most of them are propagated by cuttings. It has been considered by some that if certain kinds of Geraniums which do not do well as bedding plants were grafted upon kinds of harder constitution they would do much better. I have no doubt that some kinds might be increased in vigour by being grafted upon a hardier stock, where the soil is unfavourable to their growth upon their own roots. On the other hand, grafting would avail little where the climate is unsuitable, for no stock whatever can impart any portion of its own nature to resist cold, rain, or sun to the kind grafted upon it. There are some Geraniums that do not root well when planted in the open ground, scarcely growing, except during cloudy weather and when the air is moist. Such are all the golden-leaved and golden-edged Geraniums, as Gold-leaf, Cloth of Gold, and Golden Fleece of the golden-leaved kinds, and Golden Chain and Golden Harkaway of the golden-margined kinds. All these have very long roots, running very little below the surface, as do those of most of the white and yellow-edged and golden-leaved Geraniums, and on this account they are difficult to take up with balls in autumn; notwithstanding which they grow more freely after taking up than during the summer, excepting Golden Chain and Golden Harkaway, which are the very best of all the gold-margined kinds, and these do not grow much during the winter months.

Now, if there be any kinds of Geraniums that could be altered and have vigour imparted to them through the agency of a more vigorous stock, these are the kinds to operate upon. For my part I should not care to have Golden Chain any stronger than it grows with me at present; but I have a notion of grafting it on stems 1 foot and 18 inches in height, which I think would look extremely well at the angles of white lines in panel work, and be effective and novel judiciously placed where the surface is flat. What I particularly want is a good white, pink, and scarlet Geranium that will bloom continuously, and yet have the dwarf, compact habit of Golden Chain. At the same time I do not like to see Cloth of Gold go back instead of grow when planted, neither is it desirable to have all Geraniums of one uniform height, nor all of free vigorous habit. Cloth of Gold and Gold-leaf would be all the better if they would grow a little more, and there may be some who would like many of the others to grow more, though, for my part, I should be glad to learn a process to dwarf three-fourths of all bedding Geraniums, for notwithstanding the unprecedented drought and heat of the past summer, they grew by far too much. I want them to bloom like fancy Pelargoniums, to grow slowly, to be very compact, and to produce a bloom or truss from every joint.

In addition to the gold-leaved kinds, some of the tricolor-leaved sorts would probably be improved by grafting on a hardier kind of stock, which is desirable, as in their present state they are of little value for bedding-purposes, except Eastern Beauty, Topsy, and Mrs. Pollock, and even these would be none the worse of a stock that would grow in almost any description of soil.

Inasmuch as the kinds of Geraniums proposed to be grafted or huddled are not in themselves amongst the very vigorous, it would be contrary to sound principles to graft them on very robust-growing stocks, for assuredly the best results will accrue from grafting on stocks whose growth corresponds most closely to that of the kind to be grafted. Golden Fleece, for instance, should not be grafted on an erect-growing kind, as Lucien Tisserand, but on one of a corresponding habit, as Tom Thumb, which is the stock I would choose for it, Gold-leaf, and Cloth of Gold; and I would choose Little David for Golden Chain and Golden Harkaway; and Royal Dwarf as a stock of upright growth, free, and hardy constitution, suitable for varieties of

similar growth, but wanting vigour. Stella would also prove a good stock for Golden Chain when it might be desirable to make it grow more. Madame Vancher and Lady Middleton would do for the thick-stemmed kinds.

The most eligible mode of grafting is that known as whip grafting, and it may be either with or without a tongue, and when the stocks are much thicker than the scion, cleft grafting is a nice method, and so is wedge or crown grafting. At page 343 of the present Volume will be found an engraving and directions for whip grafting, so that it would be needless to repeat them. This kind of grafting, though it is the surest of all methods, has a tendency to weaken the stock too much, and for that reason whip grafting without a tongue is preferable. Stocks established in small or 60-sized pots, and having 2 or 3 inches of clear stem, are the right kind for grafting, and being brought to the potting bench, they should be turned out of the pot without disturbing the ball more than removing the loose surface soil down to the roots. The head is to be cut off immediately above the lowest bud, leaving from 1½ to 2 inches of clear stem below it, opposite which, on the other side, a thin strip of bark, 1 inch or 1½ inch in length, and a small portion of wood, should be cut off in an upward direction, about halfway through the stock at its upper part, more or less according to the thickness of the stock and that of the scion, for the stock should be so cut that when the scion is prepared the edges of both coincide or fit exactly. The scion is to be cut at its lower end to fit the cut on the stock, first cutting it transversely, as in forming a cutting, and removing the lowest leaf carefully so as not to injure the bud at its axil. Place a sharp knife against the scion on the other side to where the lowest bud is situated, and at the same distance above that bud as the cut on the stock is in length; bring the knife out just beneath that bud, and quite thin there. This cut must be smooth, and the scion must be pared so that it fit the cut on the stock to a nicety. If the scion has two, or at most three leaves above the one at its base it will be sufficient, it being immaterial whether its point remain or be pinched out, though I think if there is any difference that the grafts do best when the point is not pinched out but left, as in the case of a cutting. Join together the scion and stock and fasten them closely with a strip of bast matting soaked in water, but not very tightly, being very careful that the edges of stock and scion agree. The plants should now be potted into 32-sized pots, and so low if possible as to cover the union of stock and scion, but if not, the union should have some moss, not much, placed over it, and be bound moderately tight with matting. It is better, however, if the point of union can be buried in the soil, for this not only excludes the air but favours the emission of roots from the part of the scion immediately below the eye. If room be a consideration then instead of potting the plants into 32's use 48's, employing the moss, or, if preferred, clay may be put over the part. Remember that it will not do to take cuttings from plants in heat, for it is necessary, if that is the case, for the stocks to be in an equal state of growth, and though I here recommend the grafting to be done in March or early in April, I have done so in order that the grafted plants may be planted out at bedding-out time, otherwise the scion will take more freely in May and June. I have grafted Geraniums for the last thirteen years, but in this, as in all other modes of grafting plants, I have yet to learn the value of doing so, excepting always for those plants which do not succeed well on their own roots in consequence of the coldness, wetness, and general unsuitability of the soil.

The plants being potted and watered, plunge the pots in tan or sawdust over a hotbed at 75°, keeping close and shaded from bright sun until the scion commence to grow freely, then give air by propping up the lights, for a hotbed frame is best, and gradually harden off. In six weeks from the time of operating the union will be complete, and should the eye left at the upper part of the stock grow, remove the shoot by cutting it off closely with a knife, and unless this eye grow it is very likely the upper part of the stock will not heal but decay, and there is an end to the union taking place. It is imperative to have an eye at the upper part of the stock, for if united midway between the joints the stock very often dies to the eye next below it. Cleft and crown grafting are also nice methods.—G. ABBEY.

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.**—His Royal Highness the Prince of Wales has graciously consented to become the President of this Society in the room of the late Duke of Northumberland, and has presented the Institution

with the sum of twenty-five guineas. Sir C. Wentworth Dilke, Bart., M.P., has also consented to take the chair at the anniversary dinner, to be held in the ensuing summer.

### WINTER QUARTERS OF THE RED SPIDER.

I SHALL feel obliged if you will furnish some information as to the winter quarters of the red spider. Does it hibernate? or, if not, where are its eggs deposited during the winter? Are they placed like the eggs of the aphid at the base of the buds? if so, I cannot find them; or in the soil on decayed leaves? If either of the latter two it seems to me that orchard-house cultivators would act wisely if they scraped off the soil from the surface of their pots, and around them, as well as all the decayed leaves, and made an end of them all by roasting them in a good fire. In the *Manchester Guardian* of this morning there is a paragraph to the effect that carbolic acid, or coal tar, if applied in small doses will kill all the pests of the garden. Please to say what you know or think of the plan.—T. G.

[We believe it has neither been observed where the red spider hibernates, nor where it lays its eggs. The two plans you mention are excellent, and may be advantageously practised not only against the red spider but various other garden pests.—W.]

### ROYAL HORTICULTURAL SOCIETY'S INTERNATIONAL FRUIT SHOW.

IN resuming our account of this Exhibition, we take the opportunity of correcting a mistake at page 483, by which some remarkably fine Pears are attributed to the Rev. G. W. St. John, instead of I. Corbière, Esq., of Cerisy Belle Etoile, Normandy. Mention should also have been made of two cases of dried fruits contributed by R. Clarence, Esq., of Cape Town, and consisting of dried Apples, Pears, Quinces, Plums, Figs, Apricots, Peaches, and Currants; also, Almonds, Walnuts, Raisins, and Prunes.

A short account of the vegetable show has already been given, and it now only remains to add a few particulars respecting it. The subjects of which it was composed were arranged in the corridor on the western side of the conservatory, and, as a whole, had a much neater appearance than vegetable shows usually present. Mr. Ingram's collection consisted of nine sorts of Potatoes, very good London Flag Leeks, Strasbourg and James' Keeping Onions, Russian Shallots, Jerusalem Artichokes, Dioscorea Batatas, James' Scarlet Carrots, very fine; excellent Parsnips and Turnips, Beet, three kinds of Celery, Celeriac, very good Hamburg Parsley, Curled Parsley, Horseradish, Scorzonera, Salsafy, Cardoons, Spinach, Walcheren Broccoli, Coleworts, Brussels Sprouts, Savoys, and Scotch Curled Kale.

Mr. Ford, gardener to W. E. Hubbard, Esq., Horsbam, exhibited twenty-nine dishes of Potatoes, of which Myatt's Ashleaf, and Red Ashleaf, were very good, and Ford's Prince of Prussia, a seedling, was stated to be very prolific; Endive, Broad-leaved and Curled; Red and White Celery, Beet, four kinds of Turnips, Parsnips, Jerusalem Artichokes, Early Elm Savoy, one of the most useful sorts for small gardens. Ayton Castle Leeks, Nonpareil Cabbage, Brussels Sprouts, Curled and Variegated Kales, and Herbs.

Mr. Whiting furnished an excellent collection, consisting of good samples of the following Potatoes—viz., Dalmabay, Jackson's Ashleaf Kidney, Prince of Wales, beautiful and clean tubers, Paterson's Blue Round, Sussex Kidney (?), Early Shaw, Eugénie, Daintree's Seedling, Paterson's Victoria, Fluke, Ormskirk White Rock, Sutton's Early Racehorse, Rivers' Royal Ash-leaf, Early Handsworth, Myatt's Ash-leaf, Red Regent, and Napoleon, an excellent kind for table, there being but little waste. Mr. Whiting's other vegetables comprised excellent Carrots, Dioscorea, Cardoons, White Spanish Onions, and Scorzonera, Parsnips, Croucher's Beet, a local variety held in great estimation in Mr. Whiting's neighbourhood; Turnips, Brussels Sprots, Cabbage, Lettuce, and Endive.

The last general collection which we have to notice, is that of Mr. Badd, gardener to Earl Darnley, which consisted of Leeks, four sorts of Onions, Hollow-crowned Parsnips, Scorzonera, Salsafy, Merriott Scarlet Carrots, Beet, fine Turnips, Walcheren Broccoli, Fearnohgt Cabbage, Savoys, very good Black-seeded Brown Cos, and Brown Dutch Lettuce, Broad-leaved and Curled Endive, Celery, and Telegraph Cucumbers. The above were good almost without exception.

The Rev. G. W. St. John's Potatoes have been already briefly noticed. They had been grown on the system described at page 485, and consisted of Hogg's Coldstream, stated to be one of the best for forcing, and suitable where only one kind is required; Daintree's New Seedling, shown as a Kidney and a Round; Beehive, very clean, medium eyes, following the first earlies, "Huntingdonshire Kidney;" Shutford Seedling, and Mitchell's Early Albion, both excellent for forcing; Lapstone Kidney, Fortyfold; Onwards, described last week; Daintree's Seedling, British Queen, and Haigh's Kidney. In addition to the above were Hogg's Coldstream, Daintree's Seedling, British Queen, and Fluke, shown for size, and Brussels Sprots, grown be-

tween the rows of Potatoes by the aid of sewage, and in the open quarters, to show the superiority of the former in size and productiveness.

The prizes awarded were—the gold medal of the Society to Mr. Ingram, for the best collection of fruit and vegetables produced in the garden of a Sovereign; a similar medal to the Horticultural Society of Copenhagen, for the best collection of fruit grown by any botanic or horticultural society; a like award to the Fruit Growers' Association of Nova Scotia, for the best and most complete representative collection of fruit and vegetables from any of the colonies; the first Banksian gold medal to the Agricultural and Horticultural Society of Madras for the best and most complete representative collection from any of the Presidencies of India; the first gold Knightian medal to Mr. Solomon, as the exhibitor gaining the greatest number of first-class certificates; the second gold Knightian to Mr. Ford, for the greatest number of second-class certificates; the second gold Banksian to Mr. Whiting, for the greatest number of third-class certificates; and the first gold Banksian to Mr. Solomon, for the greatest number of marks.

### WHO SHOULD GATHER THE GARDEN PRODUCE?

I HOPE you will allow me space in your Journal for a few words on the above question. I happen to have the management of one of those gardens where the domestic servants cannot be prevented from going through it, as there is a direct footpath from the house to the stables; consequently the coachman or groom, or, in fact, any one going from the house to the stables has no other way than through the garden. This is not what I have to complain of, nor of such trifling matters as the kitchen maid running into the garden to pick a little Parsley for garnishing, or a sprig of Thyme, &c.; but in the summer when the fruit is ripe it is not a very pleasant sight to see the kitchen maid in the morning gathering a dish of Strawberries for breakfast, again about noon the cook after Currants or Strawberries for a tart, and at four o'clock in the afternoon the parlour maid is after a few for dessert. If you take notice you will see that they mostly eat two and put one in the dish, and another fact is they never eat the worst—no, but always the very best, and consequently the worst goes to the master's table! and another evil is, they tread on and spoil more than they take away.

Now, these things are very annoying and very degrading to any gardener, especially when he attends at the house every morning for orders, and is always on the premises during the remainder of the day, yet it was the manner in which I was treated last summer, and I have no doubt it is the case with many others.

Of course I was annoyed, but I said nothing, but thought the more, and the conclusion I came to was that perhaps it would work off best by my not saying anything, or, perhaps, some day an opportunity would offer itself for me to bring the question forward. I hope you will be kind enough to give us your opinion, or a few lines on this important subject, for I am sure there are others besides myself treated in the same way, and very often the master is entirely ignorant of such proceedings.—CONCORDIA.

[You are quite right in thinking the matter important. There can be no satisfaction when matters are managed as you represent. Now, first, we think it is a good plan, where the garden is near the house, to have some small bit of ground outside the garden walls or boundary, in which a little of all the herbs likely to be wanted are grown, and to which, not as a general practice, but in an emergency, the kitchen maid may repair for any little thing she may want, and which she may have forgotten. Such an arrangement is often very satisfactory to all parties concerned, and it saves a garden man making a journey to the house in working-hours. As a general rule, however, it is more satisfactory when all orders for the garden are given at one and a definite time. There are plenty of employers who are not over-liberal as to labour-power, and yet cause time to be uselessly wasted by not settling at a regular time what they will have for dinner, and the chief of the kitchen in consequence is often obliged to give extra trouble, and cause extra journeys, which it would better suit all parties to avoid.

Secondly, Scarcely any contrivance could be worse than having the direct thoroughfare from the house to the stables through the garden. Direct temptation should not be too glaringly put in the way of the most honest people. Efforts should be made to have another way to the stables. Do the carriages and horses also come through the garden to the house? if not, why cannot those persons who go from one place to another go the same

way as the carriages do? If there is only one road, and that through the garden, it would be well to divide the garden from it by a fence on each side of the road, even if it were a stout Privet hedge, with the requisite number of doors or gates in it.

Thirdly, As to cooks, parlour maids, &c., gathering fruit at any time and every time they think proper, that is so thoroughly out of the question, that we would advise you to take the first suitable opportunity of representing the case to your employer, and calmly but clearly showing that under such regulations it would be impossible for his table to be satisfactorily replenished. No one but yourself should gather fruit for the table, or some one with clean hands and a quick eye on whom you can rely. Such a system is just as subversive of all order and consistent regulation as if you were to go and do as you liked in the cook's larder, the butler's pantry, or the housekeeper's store-room.

Fourthly, We will go a step farther, and say, that although the proprietor and his family have a perfect right to what is their own, and may exercise that right in the case of fruit of all kinds, yet it will be prudent to exercise that right but little, and never without giving the gardener due notice. The gardener's aim is to send the best to table; but if there are several to pick and choose where they like, there will never be any best to find; besides, when so many pick at their pleasure there is a great temptation to garden men to imitate their example. When fruit is missed—"I saw Mr. C. and Miss M. there," will often come in as a nice excuse; and if even the gardener suspects the contrary, he is obliged to take the explanation, as he has no personal evidence on the subject. Where there are children, who may delight in picking for themselves, it should only be in the places that the gardener appoints, and from which he has taken the best. On the whole, then, if a gardener is to be responsible, no other servant must be allowed to interfere with the produce of the garden, and when several men or boys are employed the proprietors will act prudently in waiving their right to do so.]

### GLEANINGS FROM ROCK AND FIELD TOWARDS ROME.—No. 9.

"FLORENCE, the garden of Italy; Italy, the garden of the world." How often do we read those lines, little imagining how true they are—how in very deed, throughout every month of the year, Florence is a land of flowers! They spring up spontaneously on every side, requiring no fostering hand to bring them into beauty—by the dusty wayside, or amidst the fresh green of the springing corn—beneath the grey Olives, or crowning the high bank—turn where you may, and it seems as though Flora had that instant poured out her brightest treasures to gladden your sight.

Ten years had passed away since I last had hunted for wild flowers in the fair valley of the Arno. Ten years since, in the gardens of the Pitti palace, I had gathered brilliant Anemones and Tulips, the good-natured gardeners of the still more good-natured royal owners offering me help when the flowers were beyond my reach; but then I was accompanied by a dear friend of the Bourbon race, who now leaves Florence whenever the king enters it, and speaks of Napoleon III. as "Ce Monsieur."

Ten years ago, and I had stood in the Casene, the Hyde Park of Florence, with hands filled with Primroses and Violets, listening to an Austrian band playing the national airs of Tuscany; and the whole city seemed asleep, bound by some invisible spell, while the waters of the Arno flowed along under the goldsmiths' shops on the Ponte Vecchio with a lazy soothing sound, as if sleep and repose were all in all to Italy. And now? We will go to the gardens of the Pitti. The dark walls of the massively built palace are the same; the huge blocks of stone chamfered round the edges, the faces of the blocks hewn and chiselled into irregular surfaces, look as defiantly as of old, and the garden is the same, and yet not the same.

The Anemones are over, but there are wild flowers still—wild, yet guarded here and there and everywhere by Italian soldiers. On a grassy slope, looking down on which are beautiful white statues, I see some blossoms of Hawkweed, such as I have never before seen growing wild. I make a charge up the bank in the very eye of the sentinel. A prohibition in Italian is given. "Non parlato Italiano," I cry with as much truth as vehemence. "C'est défendu," calls out the sentinel. "Je suis étrangère," say I. Then follows a long French speech, at which I recklessly fling at the poor soldier a whole tirade of English, explaining the why I kept gathering the flowers, smiling and thanking in French between whites, as though we were on the most amicable understanding in the

world. Then the soldier, fairly beaten, passes muttering onwards—happily on the same beat, for a little further on I espy a bank of white Thyme, with here and there a plant of *Orchis morio* and *Ophrys aranifera*. I charge again, am again repulsed, and again victorious, bringing away not only the *Orchis* and Thyme, but other flowers, and amongst them the *Lychnis flou-euculi* (not a bit like our English Ragged Robin, in spite of the Professor), and the *Trifolium stellatum*. Then I pass on, still smiling and thanking the soldier for his extreme politeness to a stranger, till I find a quiet nook, where undisturbed I gather *Adonis autumnalis*, *Vicia sativa*, and a pure white *Orchis*, with many another tiny flower not very remarkable, perhaps, save as growing beneath that cloudless sky of such bright blue that it makes one's eye wink to look at it.

And after wandering up and down the long green alleys, peering through gratings into orangeries, and watching sedate little Italian children in their quiet walk by the side of their gesticulating parents, I sit down and gaze on the large mass of buildings that contain such a world of treasures within their walls.

I have never seen any picture gallery that could be at all compared with that of the Pitti Palace. The rooms in themselves are so charming, so like rooms in which one could sit down and make oneself at home; and amidst all the pictures there is not one that inspires you with horror—they are all beautiful, all gems. Fancy being at home with Raphael's *Madonna del Seggiola*, with the divine "Man of Sorrows" of Cigoli, with Fra Bartolomeo's *Pieta*, and with that new addition made to the galleries since the hurried flight of the good old Grand Duke, Raphael's *Madonna del Gran Duca*, one of Raphael's happiest embodiments of the Mother of the Lord. There may be no great depth of feeling, save, indeed, in the Mother's satisfied look of peaceful love and the Child's tender trustfulness, but yet it is irresistibly attractive.

One of the great charms of this gallery is the unquestioned way in which you enter and walk about, lounging from room to room and seat to seat; and it is pleasant to feel that the privilege of enjoying these glorious works of art, unquestioned, is accorded to the lowest artisan, no other ticket of admission being required than the wish that prompts you to enter. Ten years ago, sitting in the entrance hall was a Tuscan soldier warming himself over an enormous brazier of charcoal, and inviting you to do the same; but the brazier disappeared with the soldier, and the entrance hall felt a little cold.

Returning from the Pitti to the Lungarno we pass over the Ponte Vecchio, that wonderful street of jewellers' shops, built over the river which flows lazily along beneath. In the centre of the bridge there is a break in the shops, and an empty space left, where you may lounge at eventide, and watch the sun setting behind banks of cloud far away up the river. As he recedes he casts back a mantle of fire, which, lighting on floating clouds, reflects itself in the waters, while to the soft blue of the west is given a rosy flush.

My favourite walk in Florence used to be that which, passing over the Ponte Vecchio, led me up the steep ascent of the Via Crucis to St. Miniato, situated amidst groves of Cypress and Olive trees. As you rest at each station beneath its wooden cross, fresh views of extreme beauty burst upon you, till the whole of the fairest city of Italy, I had nearly said of the world, lies spread out at your feet, and you can define churches and palaces with minute exactness—the round domes of the Cathedral and St. Lorenzo, the square towers of the Palazzo Vecchio (the grand-ducal tower), and the Campanile, and the churches of St. Croce and St. Maria Novella, so celebrated each in its separate way. In St. Croce lies the dust of Michael Angelo, so great as sculptor, painter, and architect, with many another name known to fame. St. Lorenzo guards the wondrous chapel of the Medici, where Michael Angelo has wrought the "Night and Morning," which guard the solemn beauty of his matchless "Il Penseroso." The gates of the baptistery of the Cathedral have been likened to the gates of Paradise, so perfect is their workmanship; while the inlaid coloured marble façade of St. Maria Novella could hardly be excelled in beauty. To the right, the windows looking on the river, is another palace—the Uffizzi, which contains a justly celebrated gallery of art, the greatest gems being the sculptured *Venus de Medici* and Raphael's *Madonna del Cardellino*.

Ten years ago, and the fields around and below the little church of St. Miniato—called by Michael Angelo "Bella Villanelka," or pretty country lass—were full of Violets, Hyacinths, and Anemones; the gates used to stand invitingly open, and many a time have I wandered there gathering my basketful of

spring's fairest flowers, while my eye wandered far away over the glorious scenes on every side. But alas! I found all changed. The fair fields were being converted into a huge necropolis; and the church with its inlaid marble floor was full of graves, tawdry ribbon-decked *immortelles* lying untidily about, hiding even the slab on which is written, "These stones are given to Christ, who is prayed never to depart from them."

I shudder when I think of that necropolis. Half built, its hundreds of yawning graves stared horribly on every side. I tried to get away, but they fascinated me. Who would tonant them? One by one they would close, over which of the inhabitants of that fair city, who were unthinkingly awaiting their individual summons below? Like a devastating monster with open jaws ready to devour all who approach, these dreadful pits seemed to wait open-mouthed for the unthinking people. Yes, a burial-place in all its terrible nakedness, unhalloved by the sacred dust, by a cross, by aught that speaks of immortality, is a hideous sight. By the way of the Cross I had ascended to St. Miniato, and I knew that to all who followed that sacred way the grave would lose its victory, and that many a tired heart would look up to the little church upon the hill as a quiet haven where the weary would find rest.

It was pleasant to get away from this, my once favourite spot, and to stand on the Ponte Vecchio, watching a little child at play by the river's side, and listening to the hum of voices which spoke of life and life's happiness.

Less altered in its present from its past is the Cascine, where Austrian bands used to play to crowds of gay people who drove, or rode, or walked by the Arno's side. I found it much as I had left it. The silvery Birches waved in the air, the crowds were gathered, and the bands playing; nor did the music sound less sweet to me when I remembered that the soldiers who played were Italian, and that I was listening to their music in the capital of Italy.

And the flowers, let me not forget to mention them. I open my book, and the first specimen that greets my eye is the *Aristolochia*, a strange sort of Woodbine foliage, with a Pitcher-plant-looking flower. The next is a pretty white *Symphytum Zeyheri*. I hope I shall be excused if I spell the name wrongly, for I confess it is new to me, as I myself should have called the little specimen orientale. And then I come to the *Cyclamen europæum*. In some parts of the Cascine the ground is covered with the pink sweet blossoms and the darkly veined leaves of this pretty flower, whose bulbs are so difficult to arrive at; the fibre-like creeping stem running far away under ground, and being of so fine a nature that a hasty pull severs the frail thread and loses the clue to the bulb. I managed, however, to secure a small packet of them, which I hope will flower some day. I only found these *Cyclamens* growing beneath the shade of brushwood. Contrasting with this pink bloom were masses of the brilliant deep blue *Anchusa officinalis*; while here and there I came on the grand *Orchis pyramidalis*, with its full rich spike of crimson flowers and bright unspotted leaves. The shrubs were covered with Woodbine, which trailed from bough to bough, scenting the air; and all the time I was gathering the flowers the carriages went rolling by, enlivened every few minutes by the rattling speed of one of the little American (?) carts, that give you the impression of a mad horse running away with a mad driver, each trying to outvie the other in wild vehemence.

Emerge from the wood at whatever point you may, and there is a beggar, sweeping down upon you like a hawk upon its prey—blind and lame, old and maimed, the very skeletons of Nature's festal board. One day one of the old-lady beggars penetrated the wood, and helped us to gather the wild flowers; and when she found her presence rather agreeable than otherwise, somehow or other each day I went the same old lady popped up with her poor wizen hands graced with a floral offering. But floral offerings are the fashion of the Cascine. At every turn flowers are offered you, Roses and Lilies in every tempting variety; but woe betide you if in a sou-less hour you accept the gift. Thenceforth you become the giver's victim. You must grin when she grins, accept more gifts, but never again without sous to offer in return.—FELIX-FEMINA.

#### ARUNDO DONAX VARIEGATA CULTURE.

Few, if any, of our tropical plants are more beautiful than the *Arundo donax variegata*, nor do I know of any plant so well adapted for filling the centre of a flower-bed, for growing in tubs on lawns, or for the conservatory. In fact, no

collection should be without it, its fine variegated foliage and its graceful habit make it a special favourite. It will flourish in any greenhouse during winter, and in spring it can be divided if necessary.

I had, two years ago, two very large plants; the roots or stools were 18 inches through, but, not then knowing better, in the autumn, when I took them up, I was foolish enough to divide them into as many as twelve or more plants, and put them into a cold greenhouse. To my grief I lost them all but one. Had I left them undivided until spring I might have saved every one, if, after dividing, I had placed them in gentle heat for a few weeks to have started them, and gradually hardened them off before planting-out time.

My one plant has made a good stool again this summer, and I hope to make two or three of it in the spring.

The soil that I find suits it best is a mixture of loam, leaf mould, and a little rotten cowdung. When established in the bed plenty of manure water benefits the plant, and it should be kept well soaked with water; in fact, it will almost grow in water.

If well managed it will send up canes 5 or 6 feet high, and then nothing can be more beautiful than it is.

In autumn, before it is touched by frost, it should be very carefully taken up, and then the canes will last all winter, or nearly so, making a very beautiful object for the greenhouse or conservatory. In the spring the old canes can be cut off when the young offsets begin to come up from the bottom.

I should be obliged by your telling me what country it comes from, and by any information you can give upon it.—CHARLES EDWARDS, *Bristol*.

[It is called by botanists *Arundo donax versicolor*, and popularly Striped Reed Grass. It is only a variety of the *Arundo donax*, or cultivated Reed, a native of the south of Europe and elsewhere.]

#### PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

**PALUMBINA CANDIDA** (White-flowered Palumbina).—*Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monandria.—Native of Mexico. Flowers about an inch across, all but pure white.—(*Bot. Mag.*, t. 5546.)

**THIBAUDIA JESSICE** (Hon. Mrs. John Bateman's Thibaudia).—*Nat. ord.*, Vacciniaceæ. *Linn.*, Decandria Monogynia.—Supposed to be a native of Caracacas. Flowers in racemes of ten or twelve, fleshy, pale red, as well as the calyx tube and flower-stalks. Leaves large and handsome.—(*Ibid.*, t. 5547.)

**CALCEOLARIA HYSSOPIFOLIA** (Hyssop-leaved Calceolaria).—*Nat. ord.*, Scrophularinæ. *Linn.*, Diandria Monogynia.—Native of the Quitenian Andes, at an elevation of from 10 to 11,000 feet, whence seeds of it were sent by Professor Jameson to J. Anderson-Hemy, Esq., Edinburgh. A shrub from 2 to 4 feet high. Flowers pale sulphur yellow.—(*Ibid.*, t. 5548.)

**PALAFOXIA HOOKERIANA** (Sir W. Hooker's Palafoxia).—*Nat. ord.*, Composite. *Linn.*, Syngenesia superflua.—Native of Texas and Arkansas. Flowers an inch or more across, pale or bright rosy red.—(*Ibid.*, t. 5549.)

**TRICHOPILIA TURIALVE** (Trurialva Trichopilina).—*Nat. ord.*, Orchidaceæ. *Linn.*, Gynandria Monandria.—Native of Central America, and named after the mountain on which it was found. Flowers yellowish white, with a deeper yellow lip.—(*Ibid.*, t. 5550.)

**DIANELLA TASMANICA** (Tasmanian Dianella).—*Nat. ord.*, Liliaceæ. *Linn.*, Hexandria Monogynia.—Flowers drooping, pale blue, from half to three quarters of an inch in diameter, succeeded by an abundance of oblong berries of the above length, which hang for many weeks, and constitute the great beauty of the plant.—(*Ibid.*, t. 5551.)

**CATTELEYA EXONIENSIS**.—A hybrid raised by Mr. Dominy, from *Cattleya Mossiæ* impregnated with *Lælia purpurata*. Flowers bluish, the terminal half of the lip varying from rosy purple to crimson maroon, the lateral part white, sometimes margined with purple, the base yellow streaked with purple.—(*Floral Mag.*, pl. 269.)

**FUCHSIAS**.—*Day Dream*, lavender with crimson base, tube and sepals bright crimson. *Lizzy Hexham*, very dark purple, feathered with crimson at the base, tube and sepals crimson. *Catherine Parr*, tube and sepals white, corolla crimson. *Lady Dumbello*, very large, bright mauve; tube and sepals crimson. All four were raised by E. Banks, Esq., of Deal.—(*Ibid.*, pl. 270, 271.)

**STAURANTHERA GRANDIFLORA**.—Native of Moulmein. Flowers light blue, with a bright yellow throat.—(*Ibid.*, pl. 271.)

**PHALÆNOPSIS LUDEMANNIANA**.—Very much like *Phalænopsis rosea* or *equestris* in habit, but far more beautiful. The flowers are of considerable size, and very beautifully coloured, "the oblong spreading sepals and petals having a pale, almost white, ground colour, and being marked all over with crowded transverse bars, which in one variety are of a deep cinnamon brown, and in another are of a delicate purple. These coloured bars show also on the outer surface of the flower. The lip is three-lobed, the larger and prominent middle lobe of an intense violet, the lateral ones whitish with yellow markings." A native of the Philippine Islands, introduced by Messrs. Low & Co., and named in compliment to M. Lüdemann, of Paris, who first flowered the plant.—(*Florist and Pomologist*, iii., 257.)

#### WALL-TOP VINERIES.

I HAVE a wall with a due south aspect on which I am desirous of growing a few Grapes. The wall is a new one, and has been planted with wall fruit, but as the trees are quite young, and not more than 4 feet in extreme width of branch, I want to obtain all I can from the wall while they are growing. I send a sketch of the wall as now planted, only adding that the border under the wall is 12 feet wide.

a a, Portion of Wall, showing Vine proposed to be planted against but-  
tress b, and mode of training.

My proposal is to plant a hardy Vine against the buttresses, one of which is marked b, and train two rods to the top of the wall, then run them in opposite directions close under the

Section of Wall, showing proposed covering of glass over the bearing  
rods of the Vine. a, Wall, 8 feet 6 inches high. b, Buttress. c, Border,  
12 feet wide. d, Walk. e, Glass-covering. f, Vine.

coping, fixing to the coping a run of glass about 18 inches in depth, and supported at the lower edge 12 inches from the wall. Will this improve the quality or quantity of the bunches? —SPRINGFIELD.

[We think your plan will do very well, only we would make the base of the triangle 18 inches, or even more, instead of 12 inches. We presume you mean that to be open space, and if so, a strip of open muslin or hexagon netting fixed there would keep heat in at the ripening time, admit plenty of air, and keep flies and wasps out. We would plant two Vines instead of one at each buttress.]

## WORK FOR THE WEEK.

## KITCHEN GARDEN.

WHEEL manure upon vacant ground when the weather is frosty, so that the walks may not be broken up, and let all spare ground be trenched up as soon as possible, in order to expose it to the action of the weather. For land that has been cropped with vegetables a dressing of fresh loam would in many cases be preferable to manure, and where this is wanted and can be obtained, it should be procured in order that advantage may be taken of frosty days to wheel it on to the ground. Where fresh soil cannot be obtained, charred vegetable refuse, such as prunings of shrubberies, edgings of walks, and many things which turn up in the course of the season may be cheaply made to form an excellent substitute. *Broccoli*, the weather, up to the present time, having been so favourable to its growth, the means before recommended should be resorted to in order to check it, and to prevent the frost having direct influence on the heart of the plant. *Cabbage*, earth it up, if not done, the weather now being favourable for that purpose. *Carrots*, if young ones are wanted early, seed should now be sown on a slight bed. *Cucumbers*, dung should be prepared for beds for early crops; it should be well shaken to pieces and mixed, as on this being properly performed depends the length of time which the bed retains its heat. *Dwarf Kidney Beans*, another crop may now be sown, if a constant succession is required. *Endive*, take advantage of the present fine weather to tie-up and house a quantity. *Peas* and *Beans*, if severe frost should be likely to set in cover those that are up with partially-decayed leaves; under ashes should never be used for this purpose. *Radishes*, every fine day draw off the lights entirely, this will give them strength to form roots. *Sea-kale*, continue to cover a small portion at a time. When the first portion has been cut, and the pots taken off, cover the roots with a little litter to prevent their being injured by frost. It is the practice in some places to lay the gravel on the walks in a ridge, after all the manure is wheeled on, this may now be done, as it is not often there is much doing in the kitchen garden at this season.

## FRUIT GARDEN.

Prune all kinds of fruit bushes, clear off the prunings, and have the ground manured ready for digging; also take advantage of leisure time to thoroughly examine the fruit-stores, and remove any fruits that are found to be decaying. Of course the frost must be excluded from the fruit-room, but on no account use fire heat, unless the temperature cannot otherwise be kept above freezing. Admit air on mild days, especially after keeping the room shut for some time; but as the fruit will now give off but little moisture very little air will suffice to keep the atmosphere dry, and no more than may be necessary to do this should be given. Orchard trees of large size are much neglected about many places, the head being allowed to become so thick of wood that fruit cannot be expected, save from the points of the outside shoots, and, unless accidentally thinned considerably below an average crop, the fruit is small and indifferent in quality. See that standard trees which have been recently moved or root-pruned are firmly secured against wind, and also let any root-pruning or transplanting remaining to be done this season be executed before frost sets in. Push forward pruning, nailing, tying espalier trees, and similar tedious operations, as fast as the weather and circumstances will permit.

## FLOWER GARDEN.

If not already done, let all borders be neatly trimmed up for the winter; in doing this, places intended for *Dahlias*, *Hollyhocks*, &c., next summer should be prepared by deep digging and working in plenty of good rotten manure; there is generally as much time to spare now for that kind of work as at planting-time. See that the coarse-growing plants which may be encroaching upon their weaker neighbours are reduced, so as to occupy their proper places. At this season of the year the amateur's attention must be directed principally to the effectual protection of his plants, though it must be borne in mind that we are very far from being the advocates of the nursing system which many florists adopt, the effect of which is seen in *Carnations* with yellow and spotted leaves; *Auriculas* and *Polyanthuses*, which at their proper blooming season will not bear a truss of flowers; *Tulips* with the foliage not only cankered, but very far in advance of the season, &c. The great secret is to keep the plants secure in bad weather, but at all other periods to let them be freely exposed to the action of the atmosphere, so that they may grow up stiff and strong, and be

enabled to withstand severe weather of an ordinary character. Nothing is more prejudicial to florists' flowers than cutting winds, they will bear frost with impunity when unaccompanied with the rude wintry blast. When cutting winds prevail shelter is indispensable; and those florists who have a bed of *Polyanthuses* under a north-east hedge of Hornbeam (this we prefer, as it retains its foliage throughout a great part of the winter), will be able to bear testimony to its efficacy. Net and cover *Tulip*-beds with bast mats, and if possible do not let the surface be frozen. Turn compost-heaps, and expose them to the action of frost, &c., and use every endeavour to collect refuse vegetable matter for future use.

## GREENHOUSE AND CONSERVATORY.

Although we have many beautiful plants which either bloom naturally at this season or require but little artificial management to cause them to do so, a scarcity of flowers is, perhaps, more commonly experienced at this than at any other period of the year; and where the display is, to a large extent, dependant upon what we term forced plants, considerable forethought and attention will be necessary for some time, in order to maintain a regular supply, for plants are not so easily excited into bloom in the dead of winter as in the spring. In selecting plants for forcing, every possible care should be exercised to choose such as are not likely to prove failures, for of things which are suitable for forcing many will bloom but poorly, if they are subjected to a high temperature without having been allowed a sufficient time to recruit their energies after making their growth. Next to *Camellias*, *Azaleas* are, perhaps, the most showy plants that can be had in bloom at this season, and, where there is a good stock of these to draw upon, some of the most forward plants of the commoner varieties should be placed in heat at once, moistening them overhead two or three times a-day; but unless plants can be selected which have made their growth and set their buds early in the season, they can hardly be expected to flower so finely as under more natural circumstances in spring, and, unless the buds are plump, there will be some danger of the plants starting into growth instead of flowering. Dutch bulbs should be largely used for present forcing, and where hardy shrubs are forced for the decoration of the conservatory, these should be brought into flower as soon as circumstances admit; for although many of these are very showy when well bloomed, and acceptable enough when had in flower in winter, they hardly seem in place under glass in spring, after the weather becomes fine, and when more choice plants in bloom should be plentiful. Do not forget to introduce into gentle heat a good batch of *Roses*, choosing the most promising plants of *Teas*, *Bourbons*, and *Hybrid Perpetuals*, which are the best kinds for winter flowering. Damp or insects soon do irreparable damage among softwooded plants at this season, and these must be very carefully attended to if they are to be carried over the winter in first rate condition. *Pelargoniums* should be kept rather cool and dry, giving whatever water may be necessary on the mornings of fine days, so that the superfluous moisture may be dispelled before evening. Keep the shoots thin, rubbing off such as can be spared; and if green fly is perceived upon any of the plants apply tobacco smoke at once. *Herbaceous Calceolarias* require very similar treatment to the above, except that they are very subject to the attacks of thrips unless afforded a moist atmosphere; and they must be narrowly watched for this enemy, and smoked lightly on two or three successive evenings if this pest makes its appearance, keeping the atmosphere moist, and giving air on every favourable opportunity to prevent the foliage flagging. *Cinerarias* for late blooming must also be kept cool and airy, and should not be allowed to suffer for want of pot-room; but these should not be trusted in cold pits after this, for they are exceedingly impatient of frost. Forward plants of these intended for flowering early should be encouraged with a gentle heat, keeping them near the glass, and admitting air at every favourable opportunity. If not already done, train climbers, cutting back freely such plants as *Passion-Flowers*, and reducing the dimensions of all as far as can consistently be done, so as to admit as much light as possible. Remove decaying leaves daily, and re-arrange the plants in bloom occasionally.—W. KEANE.

## DOINGS OF THE LAST WEEK.

Thick mist and fog, with a high and rising barometer, gave signs of dry weather coming, terminating in a frosty morning and a bright sun on Wednesday, which will do much good in giving

strength to all little growing plants inside and outside. Fight as we will against it, the dull drizzling fog, making all things look dark during the day, and pretty well invisible at night, does depress alike mental and physical energies; and men insensibly get into an easy, jog-trot, lifeless way of going about, as if they felt little or no interest in anything they were doing, purely the result of physical circumstances, and not from any determination of will; but let the sky become clear, and the sun again come forth in his splendour, and there seems to be generated, as if by an electric touch, a new life of activity and energy. We have never known a garden, in which there was at any time a want of work to go to, a very pleasant thing to contemplate, and relieving the mind from a vast amount of care and perplexity; just as having a great deal too much to do loads the mind with anxiety, and involves a great deal of consideration as to attending to what is most necessary; whilst other work must stand in abeyance. However some other folks need reminding, it is rare that from want of work in a place the gardener requires it to be brought to his recollection that

"An idler is a watch that wants both hands,  
As useless if it goes as when it stands."

But it is very pleasant to see when, during a course of bad weather, there has been a little relaxation of energy, that at once, when the weather changes for the better, and without any reminder, there is a greater cheerfulness of demeanour, and a greater activity in feet and hands.

It is becoming the fashion to cry out about the carelessness, selfishness, and idleness of workmen and servants, but employers have often themselves to blame. Faithful attention to duty will not be long maintained at full stretch, if it is manifested only on one side. We once noticed a case of two neighbouring farmers who had a similar amount of corn crops, and engaged the same number of men for the harvest work. One farmer kept his men out of doors in a couple of very wet days in the beginning of harvest, the men eating their victuals as best they could under the protection of a bank; suffering more than, in their soaked clothes, than when at work. The other farmer kept his men doing odd jobs about the homestead, so that they were pretty dry and comfortable, and what was the result? Why simply this, that the last-named farmer finished his harvest work in three weeks and two days, and the first referred to had something to do after the month was out. When the behind-hand group of men were joked about it, they said they did their best, but they did not know how it was, they seemed to have a heaviness about them that even extra beer would not remove. We believe the soaking made all the difference. We believe if there were more considerate sympathy there would be fewer complaints. We also believe that considerate sympathy shown by an employer is not only pleasant to all concerned, but that it is also one of the best paying of investments. What comparison can there be between the mere working to pass the time, and working with a will and a resolution to make the best of the time and circumstances? No employer can obtain the latter result merely from acting up to what is just; there must be sympathy for a man's condition and comfort.

#### KITCHEN GARDEN.

In addition to what was said last week, the changes in the weather enabled us to fork the surface among Lettuces, young Cabbages, &c., as well as to look after coverings for Cauliflower in head, Lettuce and Endive for salad, and for banking up beds of Celery. Old stubble or other loose litter is better for this purpose now than extra earth, if the Celery is grown in beds. Ashes sifted from the furnace, and a little lime mixed with them, should be thrown over the bed, and a little into the head of the plant before the litter is applied, as a preservative against slugs and worms, that are otherwise apt to disfigure the heads. Of Mushrooms and Sea-kale we have an abundant supply, and for a change have had some nice dishes of blanched Turnip-tops; any place where there is a little heat and darkness will do for this purpose, and the Swede is the only one fit for this system. The tops will come of a bright yellow, and should be cut when from 6 to 7 inches in length. Many prefer them to Sea-kale. The bitterness is much moderated by the blanching.

*Asparagus*, just moving, we have given this a couple of inches more light soil. As we do not wish to have it before Christmas we will not hurry it, as we have run ourselves rather short. The roots can hardly be obtained for forcing unless you grow them. They are frequently advertised, but very often when you buy them they are of little use. Some time ago a nurseryman, wishing the space occupied by some old beds, told us we might

have them for a trifle; but the expense of carriage itself was a dead loss. A huge hamper came, enough for a couple of dishes a-week for a month if they had been worth anything. The takers-up knew nothing of the necessity of buds in the crowns, or, if they did, they managed to remove them, for none came with the roots. That all might be clear and above board, the plants were placed carefully in the ground, and covered over with 3 inches of leaf mould, and next summer they managed altogether to throw up three or four stems. Of course this is by no means always the case; but those who have a good bearing bed of *Asparagus* have generally so little desire to part with it, that when *Asparagus* must be taken up to be forced, it generally must be grown at home for the purpose. Although we have not such conveniences ourselves, a few beds or pits to be forced where they grow, would be a very economical plan for all the later crops before it came in the open air. To Cauliflower, Lettuce, Radishes, Endive under protection gave all the light and air possible by complete exposure in the clear mild days, and moved all the withered and decayed leaves, as well as stirred up the soil. Trapped lots of mice that had begun their depredations. *Rhubarb* in the Mushroom-house is now growing away nicely. We have often been puzzled as to the reason why *Rhubarb*, with leaves all dead and decayed long before the leaves of *Sea-kale* are withered, is yet so much longer than *Sea-kale* in starting, though placed in similar circumstances as respects heat. Our first *Rhubarb* will require quite another week, and we have been cutting *Sea-kale* for a fortnight. When the season is further advanced the *Rhubarb* seems as easily excited as *Sea-kale*. Some friends of ours have had first-rate *Rhubarb* after Christmas, by having a large root in a barrel close to the kitchen fire. It will do very well in any house where there is a little heat. *Sea-kale* does also very well by the side of a kitchen or scullery fire if planted in a pot or box, and covered with another so as to keep out the light. First-rate Chicory for salads may also be thus obtained.

Brought a lot of Turnips under cover to keep frost and devourers from them, taking them up rather small, not larger than a common-sized fist, as then they are juicy, and not liable to be spongy for a long time. Some of these little Turnips keep well in winter, and they are very sweet, and from their firmness more nutritious than the most of the whites, but it is of little use keeping them, or growing them for any purpose, until some great disciple of Soyer can bring them into fashion. At present there seems a necessity that Turnips shall be white at table. When bread is dear our labouring people know how sweet and nourishing a good well-boiled Swedish Turnip is, mashed by itself or with other vegetables.

Took up also a lot of Horseradish, Parsnips, and Jerusalem Artichokes, and packed some litter round the tops and roots of Globe Artichokes, to keep the frost from them. For soups, &c., *Jerusalem Artichokes* may remain for years in the same place; but when it is desirable to dress them as a vegetable, in lieu of *Asparagus*, Potatoes, &c., the crop should be grown and treated as Potatoes, taken up and planted every year. Then the crop will not only be heavy, but all the tubers will be equally fresh and tender to the centre, and boil thoroughly, without the outsides being wasted or spoiled by absorption of too much water. At one time we had a prejudice against these tubers, the sight of them used to be enough; but now, when boiled as above and dished with a little pepper and salt, and gravy, we have no doubt they would be relished by many of our cottagers, and if so, might occupy any out-of-the-way corner with propriety. Many an unsightly place, as a pigstye, a dunghill, &c., might be concealed in the summer months by planting round it these robust growers. We have often seen them produce their yellow flowers, but never so freely as this season. The place where ours grew was shaded by a high hedge immediately in front of them; but for that shade, they would have looked like a row of small-flowered Sunflowers.

#### FRUIT GARDEN.

The change in the weather enabled us to surface-fork the space between Strawberry-rows, and place some of the decayed hotbed dung between them; also, to surface-stir the ground over the roots of pyramidal Pear trees, and give a mulching of the same material, as the trees had produced very heavily for some years, and now need some nourishment. Went on pruning such trees as we could get at them. Gave all the air and light to pots of Strawberries under protection. Removed a few hundreds of Scarlet Pelargoniums from the orchard-houses, into the vineries and Peach-house, that the orchard-houses may be entirely empty of all such plants for a month or two, and, therefore, avoiding the necessity of keeping frost out, or from tender

plants, by having recourse to covering up, &c. Besides this, we think the trees are benefited by having a few degrees of frost. Injury in severe weather can be avoided by shutting the houses close, and then the dryness and stillness will prevent harm, even in frosts that are severe. But for the necessity of filling Peach-houses, vineries, &c., with tender plants, we would prefer that all should have a few degrees of frost before they are cleaned, as being a great help, alike for destroying insects and their larvae, and putting the trees at once in a state of rest. For the want of this frost to any extent, greater care must be taken in washing and cleaning trees and houses, and whitewashing the walls.

Our mixture, spoken of the other week, of blue or lampblack, or fine soot and sulphur, looks and stands very well, the addition of a little black just toning down what would otherwise be the fierce glare of the white limewash. This is also of importance, as the walls will mostly be covered with shelves of plants before there is any obstruction of light from plants on the roof, and in March and April the reflection of the heat and light from a white surface, would scorch tender plants near it. The toning down of the colour will cause a good deal of such sun heat to be absorbed. These shelves, however, help to dirty the wall again, and, therefore, it would be a good plan to wash again in summer with white material all the wall, say with the exception of 18 inches nearest the top, and then the white surface below would give more reflection of light to the house, whilst the darker colour at the top of the wall would prevent all danger of scorching. We have known some cases where glass was blamed for scorching and burning, when the bright white wall was the cause of the evil.

But for the advantage of the little frost referred to above, neither Peach-house nor vinery will be otherwise injured, if for the sake of plants in them frost is entirely excluded. They will come little or nothing before the usual time if the Peach-house with artificial heat does not rise above from 35° to 40°, and if the vinery does not rise higher than from 35° to 45°. When sun heat raises them higher the houses should have abundance of air, unless when the air is frosty, and in all mild weather plenty of air should be given. In starting any such houses 40° for a Peach-house, and 45° for a vinery is high enough for the first week, raising each 5° in the course of a fortnight. All the operations of Nature are performed gradually. Peach and Vine-borders out of doors, when the trees are intended to be forced, should now be protected with litter.

#### ORNAMENTAL DEPARTMENT.

Had the pleasure ground thoroughly cleaned up, walks swept, and lawn rolled with a light wooden roller, not because it is better than a heavy iron one, but because it answers the purpose of levelling all wormcasts, &c., and can be more easily done. A bole of a tree, equal at both ends for a four or five-foot length, and 1 foot in diameter, makes a capital roller for such a purpose, and does well for scattering the dew and levelling a lawn when ladies wish to play croquet early. The walks being rather smooth and fine on the surface we have not rolled, but merely swept them nicely, believing that the slight roughness on the top will cause them to be less influenced by frost than if they were smooth and hard; and just on the same principle as we wish the ground among all young Lettuces, Cabbages, Onions, Spinach, &c., to be rough and open now, instead of smooth on the surface, battered down by rain or otherwise. Our walks are not so rough as to let rains through them, instead of throwing off the wet to the sides, but we have proved several times that just a little roughness on the surface was better every way, and especially before frost in winter, than having them rolled smooth. Would our friends give us the results of their experience? as between the slightly rough and very smooth there is a great difference in the labour necessary, and in some gravels the smoother the surface the more will the walks be broken up by frost, and the more will they lift and clog when thaw comes. Proceeded with pruning shrubs, and will enrich and dig borders of Strawberries and beds as soon as we can.

Examined Dahlias and Lobelias in a shed, and find no signs of rotting or damping. Too much air, and too little moisture can scarcely be given to Auriculas, Polyanthus, Carnations, Pinks, Stocks, Wallflowers, &c., in cold pits, and in severe frost they should be cut close, and a little protection given if very severe. Bedding plants look all the better of being removed from cold pits and frames to roomy houses, where a little fire heat could be given. The greater body of air about them, preventing sudden extremes, is of itself a great advantage. Some of the Scarlet Pelargoniums that we faggotted in pots will want a little looking-over at the tops, to remove damped ends; but

they look as if all right below, little buds breaking, but requiring good glasses to be used to see them. Let us again remind all those who tried the plan to be very chary of the waterpot. If the pots stand on a moist bottom, and little or no artificial heat is used, no water will be wanted for a long time to come. Excess of water, and want of patience, are equally to be guarded against. Chrysanthemums are getting over, what are left need a fair supply of water. Pelargoniums of all the florists' kinds should be kept clean, rather dry, and have plenty of room, and should have every leaf dry before the sun touches them. Pruned a number of Fuchsias preparatory to their breaking, and potting and growing on. Cinerarias coming into bloom, and placed in a house where fire heat is used, should be kept as cool as possible, and as damp at the roots as they will bear, and yet be healthy. A good plan is to set them on moss kept dampish, rather than give so much watering at the roots. Chinese and double Primulas require more dryness and warmth to keep them healthy. If the Cineraria is kept moist at bottom, and in a temperature of from 40° to 45° at night, it will rarely show any signs of insects. A high temperature, and a dryish atmosphere immediately around them, are the worst things for the cleanly health of these and herbaceous Calceolarias.

For general greenhouse plants the night temperature should range from 40° to 45° with artificial heat, with a rise of a few degrees in dull days, and from 5° to 15° in sunny days, giving all hardwooded plants as much air as possible in mild weather, and a little only at the top of the house in preference to much fire heat in severe weather. Much excitement to growth in dull weather is not only unnatural but often promotes unhealthy extension, mere drawing out, instead of solid additions, as in true growth under the influence of sun. This should be kept in mind in forcing all kinds of hardy shrubs, and even Indian Azaleas, not to hurry on with too much heat at first, and especially in dull weather, as that will have a tendency to make flower-buds drop. When such plants as Justicias in bloom, Euphorbia jacquiniiflora, Poinsettia pulcherrima, Eranthemum pulchellum, Gesnera zebra, Epiphyllum truncatum, &c., are placed in a greenhouse or conservatory, then the temperature should rarely fall below 50°, scarcely ever below 45°; and if Cinerarias, Heaths, &c., are to be kept in the same house, these, and especially Cinerarias, must be kept lower by placing them by themselves, giving them a cool moist bottom to stand on. In plant-stoves, unless for particular things in bloom, from 55° to 60° will be quite high enough, the first for night, the second for day, with a rise from sunshine.

Here, in addition to other work, we collected our *Caladiums* which we had allowed to die down and rest, and in order to get them in little space, we turned out the corn-like roots, and potted them in small pots in sandy peat and loam, set them in a rather warm place beneath a stage in moss, and covered the pots with moss, so as just to maintain a little moisture in the soil without watering. These will be shifted into larger pots several times as they grow. We generally allowed them to start first before fresh potting, but the roots do not keep well if long below from 50° to 55°, and we turned them into fresh small pots now, chiefly to make them go into a third of the room; and, besides, there may be an advantage in not disturbing the fresh roots much as they begin to grow, which was apt to be the case when the corns were taken out of the old large pots, after the fresh roots and shoots had begun to come. Coldness, and wet when in a cold state, are very prejudicial to these roots. We have known them keep very well planted out, and in rather a damp state all the winter, and partly at rest too, when in a temperature of from 60° to 70°. In pots, resting and moderately dry, they should never be lower than the above, from 50° to 55°, and the closer to 55°, or a little above it, the better. These, like Gesneras, Gloxinias, Achimenes, &c., are fine things for summer show where winter room is scarce.—R. F.

#### TRADE CATALOGUE RECEIVED.

Sutton & Sons, Reading.—*Sutton's Spring Catalogue and Amateur's Guide for 1866.*

#### COVENT GARDEN MARKET.—DECEMBER 16.

THE market has begun to assume its Christmas appearance; Holly and other evergreens are arriving by the wagonload, and Christmas-trees of all sizes and prices meet one at every turning. Mistletoe is not forgotten, and it was only this morning that we noticed several railway

trucka filled with it. Grapes are sufficient for the demand. Pines are plentiful, but Apples are indifferent in quality and short in quantity. The best dessert Pears comprise Glou Morceau, Winter Nells, Chantamel, and St. Germain. Vegetables are plentiful; of Asparagus and Sea-kale there is a fair supply, and a few Kidney Beans have made their appearance, but are not yet regularly supplied.

TO CORRESPONDENTS.

\*.\* We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

AMPUTATION OF BRANCHES (*H. Stillwell*).—Common tar is not injurious, if applied to the surfaces of the cuts; it prevents wet settling in the cracks, which would promote decay. Do not add corrosive sublimate, and do not use gas tar.

KEEPING GRAPES (*J. C. J.*).—We know of no instance of Grapes cut from the Vine keeping for nine months.

PEAR AND PLUM ON WALL (*Old Subscriber*).—The Easter Beurré Pear on the quince stock will do very well on your west wall. It ought to outlive the planter, and a generation or two besides. We should prefer for your south wall Jefferson's Plum to either Kirke's New Blue or Prince Englebert.

CORDON TRAINING (*An Amateur*).—The Rev. T. C. Bréhant's book on Cordon training was published by Messrs. Longman & Co., Paternoster Row.

RAISING FLOWERS FOR MARKET (*H. M. B.*).—We answered you at page 371 of our Number published October 31st, but your initials were transposed to "M. H. B."

COVERS FOR OUR VOLUMES (*R. Ding*).—We supply them for each volume—two annually. Each can be had from our office, post free, for sixteen stamps.

IRENE HERBSTH LOSING ITS LEAVES (*W. H. S. D.*).—It is usual for the plants to lose their leaves in autumn in so high a temperature as 55°. We presume that is the mean of the day and night temperature; from 40° to 45° is sufficient from fire heat. The plants will regain their foliage.

DEATH'S-HEAD MOTH (*Trenallyn Gardens*).—The Death's-head Moth is scientifically known as *Sphinx* (or *Acherontia*) *Atropis*. Its caterpillar feeds on Potatoes, Jasmine, Tea Tree (*Lycium barbatum*), Thorn Apple, Spindle Tree, &c., but is generally found on the first-named plant in the autumn. The pupa state lasts about a month, and the moth appears in September and October; it flies but seldom, lodging on the trunks of trees and among plants by day, but instances are recorded of its flying across the sea, and being taken at considerable distances from land. Such caterpillars as are hatched late in the season pass the winter in the pupa state. The surface caterpillars, which attack the Turnips, are those of the Dart Moth, *Agrotis segetum*. They appear in the perfect state in May and June.—W.

AZALEA NEGLECTED (*A. C. C. H.*).—The plant should be potted at once in a compost of turfy sandy peat two-thirds, and one-third turfy light loam, with one-sixth of silver sand, the whole chopped and made fine. The ball should not be reduced beyond removing the old drainage, and the soil not occupied with roots; drain well, and pot with the stem slightly elevated in the pot. Water so as to make the soil moist but not very wet, and do not water again until it becomes rather dry. The soil should be kept neither dry nor wet. Sprinkle the plant overhead once a day with water of the same temperature as that of the house for a fortnight, and then discontinue the use of the syringe until growth is made in spring. We cannot say, with certainty, that this treatment will cause your plant to recover. Give it a light, airy situation in a cool greenhouse.

PLANTS FOR GAS-LIGHTED ROOM (*Randolph*).—The best of all plants for such a position is *Polypodium vulgare*, and the next best *Pteris serrulata*. *Selaginella denticulata* will endure for a long time, and so will *S. Willdenovi*, which is of Fern-like habit, and when the fronds become fully developed. Of British Ferns *Asplenium adiantum nigrum*, *Blechnum spicatum*, *Polystichum angulare proliferum*, *P. lobatum*, *Laetrea dilatata*, and *L. Filix-mas* do fairly, as do the following exotic kinds:—*Deodia lunulata* and *D. caudata*, *Blechnum australe* and *B. occidentale*, *Asplenium menantemum*, *Laetrea gabelata*, *L. pubescens*, and *L. acuminata* (*Rileyana*), *Lomaria magellanica*, *L. Patersonii*, and *L. alpina*, *Nephrolepis exaltata* and *N. pectinata*, *Niphobolus perstus*, *Phyatodes* (*Polypodium*) *pustulata*, *Onychium japonicum*, *Polystichum proliferum*, *Platyloma falcatum*, *P. rotundifolium*, *Polypodium rugulosum*, *Pteris eretica albo-lineata*, and *P. umbrosa*. These we have tried with fair success, but have found them very variable; at times they would do well, and at others not at all. The main point is to have the fronds fully developed before placing the plants in the room. Few flowering plants will do in such places from the extreme dryness of the air; most, however, do fairly for a brief season whilst in flower. None will grow in such situations as the centres of rooms.

SMELL FROM HOT-WATER PIPES (*A Constant Reader*).—Your pipes were coated with the right composition—linseed oil and lampblack, the smell from which would soon have passed off had the paint been put on when the pipes were hot. If you were now to heat them to 180°, or make the water boil, the smell would pass off and not trouble you again. We paint our pipes hot at first, and keep them hot until the paint dries, and we have no smell afterwards.

FLIES IN VINERY (*John Caldwell*).—The large blue or "flesh flies" will certainly spoil Grapes when they attack them, which they do sometimes when the skin is broken, pierced, or cracked. No one can guard against their attacks, and we do not consider you at fault for their sucking at the Grapes; but you may be blameable for not taking steps to prevent a continuance of the mischief they were doing. If hexagon netting had been nailed over the openings by which air was admitted, the flies could not have entered the house, and those that were already there might have been tempted to have drowned themselves in bottles containing a mixture of beer and sugar or treacle. Enclosing the Grapes in muslin bags would have shown that you meant to do what you could to save the Grapes from their attacks.

HEAVIEST BUNCH OF GRAPES KNOWN (*Eques*).—It would be difficult to state which is the heaviest of known bunches; but that of the Syrian variety, grown at Welbeck, weighing 19½ lbs., is the heaviest well-authenticated bunch that we remember. Its length was 19½ inches, and breadth across the shoulders 19½ inches.

JOURNAL OF HORTICULTURE (*H. R.*).—The cheapest mode for you to obtain the Volumes for 1865 is from Mr. Menzies, Bookseller, Edinburgh. They are bound in cloth, gilt. To have the Journal weekly and promptly you had better have it direct from our office. The postage on two copies would be 2s., unless two stamped copies were sent.

BEDDING GERANIUMS BLOOMING IN WINTER (*N. C. Nenagh*).—Their blooming at this season will not injure them in the least. Cut them in in March or April, and they will become fine plants again by bedding-out time if shifted in a fortnight or three weeks after cutting-in.

CATERPILLARS ON THORN HEDGE (*W. S.*).—Lime spread on the surface at the roots of the Thorns is not likely to prevent the occurrence of the caterpillars, for these spread themselves about the garden, fasten themselves to various plants and there pass through their chrysalis state, from which the white parent butterflies (very like the common Cabbage butterfly) emerge early in summer. These butterflies deposit their eggs on the Thorn hedge. Weak ammoniacal gas liquor syringed over the hedge in June, or the gas lime sprinkled over it, mixed with soot, might prevent the butterflies depositing their eggs on the hedge. You may obtain the *Lycuis* seed from any principal seedsman who advertises in our pages.

PRUNING GOOSEBERRY BUSHES (*P. P.*).—The side shoots along the main branches should be cut in to half an inch or an inch from the place from which they take their rise, leaving the buds closely studded at their base. These, and the short spurs, which should be left entire, bear the fruit in the following season. The leading shoots, or those at the extremity of the main branches, should be shortened to 3 inches if the trees are not intended to become larger; but if the trees are young such shoots may be shortened by two-thirds of their length. Keep the centres of the bushes open, the branches regularly disposed at from 9 inches to a foot apart, so that light and air may be admitted to every part alike.

COLEUS VERSCHAFFELTI SHOOTS DAMPING (*Idem*).—We told you a fortnight ago that this plant would live in a temperature of 45° in winter; but it was on condition that the atmosphere was well ventilated, and the soil only moist enough to prevent the wood shrivelling. In that way we have kept the plant successfully. Yours, however, has lost the points of the shoots in a temperature of 50°, and we have known the same results take place in a temperature of 60° at night, not in consequence of want of heat, but from a superfluity of moisture in the atmosphere, and a soil much too wet, and this, we think, is the cause in your case. Providing the stems of the plants remain fresh they will put out side shoots in spring quite as well as if the points were entire. We presume yours are old plants; they are not so safely wintered as cuttings struck in summer, and kept in small pots.

CRYPTOMERIA ELEGANS (*Hugh Strachan*).—We advise you to have a moveable cover for it as you propose, for although, like *C. japonica*, a native of Japan, yet this is not sufficiently hardy to endure a severe season. Mr. Veitch states that it is very fast growing, and grows freely on even the poorest soils.

**ASPARAGUS-BEDS MAKING (W. J. De Putron).**—The best time to make Asparagus-beds is during dry weather in October or November, but any dry time between September and March will do. The ground should be well drained by having drain pipes laid 4 feet deep, and 21 feet apart if the soil is porous, but only 15 feet if it is of a heavy tenacious nature. The whole of the ground to be planted should be trenched to a depth of 2 feet 6 inches, and if the subsoil is poor and bad it should be removed, retaining only the top soil, fresh soil being brought to supply the place of the bad. In that case an opening should be made the width of one bed, 4 feet 6 inches for the bed, and 2 feet for the alleys, two of which will be required for the first bed, but only one for the others. Lay the good soil on one side or both, taking out the bad soil and removing it at once. The soil brought to replace it should be of a good rich loamy nature, and it will be all the better if it contains sand. Throw in the old soil to the depth of 6 inches all over the bottom, then 6 inches of not very rotten manure, but at least half decayed; sheeping is the best if you can obtain it, but ordinary farmyard or stable manure will do well. Lay upon this 8 inches of half-decayed leaf mould, and then 3 inches of sand. Sea sand is excellent for this purpose, but good sharp sand is also eligible. Then put in 6 inches of the fresh soil, and mix the whole together well, stirring to the bottom. Any old soil that may remain should form the next layer, which may be 3 inches thick, and this will bring the soil up to its original level. To allow for sinking put on 3 inches of manure, leaf mould, sand, and fresh soil, and work all up together, mixing well down to the first layer of soil already mixed. The whole is to be done in this manner, calculating on the beds being 4 feet 6 inches wide, and the alleys between 2 feet wide. This done, leave the ground as it is until March, when, during a dry time, mark out the beds by driving in a stake at each corner to show where the beds and alleys are, and throw out the alleys over the beds, taking from them 6 inches of soil. Make the surface of the beds level, and plant three rows of plants, the two outside ones 9 inches from the sides of the bed, and the other exactly in the centre. The plants are best two years old, neither more nor less, and they should be planted 9 inches asunder in the rows, with the crowns so that they will be 2 inches below the surface. In planting, make a straight line by the line, taking out a trench, and spread the roots by the face of it against but beneath the line. Do not make the roots fit the opening made for them, but make it so deep that it will allow of their being spread out straight. Press the soil gently about them, level the surface, and the work is complete. If the soil is all good, then you will proceed as above, only omitting the fresh soil. The best time to plant Asparagus is a little before it begins to grow, which, in your locality, will be, we think, from the middle to the end of March.

**ORCHARD-HOUSE PLANTING (H. P.).**—We would plant the back wall with four trees; one at 64 feet from each end, and the other two dividing the space equally. You could hardly do better than have these: Noblesse, Royal George Peaches, and Violette Hative and Elrue Nectarines. We presume you mean the roots to go under the pathway. For the front you may plant against a trellis, height at back 34 feet, and going to the front, which would allow of enough of light to the bottom of the wall, if the trellis came no more than 5 feet on the base line; or you might have low standards in front, either planted out or in pots. The trellis would give the least trouble; for that you would find four plants sufficient, as one of Bellegarde, and one of Walburton Admirable Peach, one of Pitmaston Orange Nectarine, and any other you may fancy. In this front border you might have trees in pots, until the trellis was filled. You would see in "Doings of the Last Week" lately, and in articles by Mr. Rivers and "G. H.," what would suit you as respects ventilation.

**Book (T. T.).**—"The Cottage Gardener's Dictionary" gives the names of plants. It can be had from our office free by post for 5s. 4d.

**MAIDEN-HAIR FEAN DAMPING (E. M. H.).**—Moisture on the fronds is the cause of their damping at this season, when the old fronds of some

kinds for the most part die off preparatory to the appearance of fresh ones. We do not approve of keeping the fronds damp at this or any other season. The atmosphere should now be dry, and the soil just moist, and no more than that, unless the plant is growing, when it should be well and regularly watered.

**FLOWER GARDEN PLAN (A Devotee of the J. of H.).**—Your centre oval bed is far too large for the other beds, it will drown them. You will lessen the evil by planting the bed with various things. Your mixture of Golden Chain and Amaranth will do very well, if the Amaranth will bear pinching. Your border of Lobelia next the grass will not be telling; place it a foot farther back, and have 8 inches of Cerastium tomentosum. Then your four circles will do; but we do not like the four round parallelograms to be planted half with one thing and half with another. Better place one in the centre as Stella, and surround all sides with Alua, &c. The less you place in the four-foot-wide border in front of your greenhouse, in which Vines are planted, the better. The thicker the ground is covered the worse it will be, but you may have flowering plants of any kind if planted rather thinly, so that the sun may find its way a little between them. You may do much with your dung-frames, provided you manage, as detailed in "Doings of the Last Week," to prevent the noxious steam passing into them, and surround the frames with litter so as to throw top dry heat in through the boards; not only will bulbs come on nicely, but you may force hardy dwarf shrubs as Roses, Deutzias, Jasmines, Rhododendrons, Lilacs; and such herbaceous plants as Dielytra, Lily of the Valley, Musk, Violets, &c. Hardy annuals, Pinks, Carnations, Wallflowers, &c., may be brought forward; and Cinerarias, Primulas, &c., may be greatly forwarded by giving them plenty of air in winter, with a little bottom heat. They will also do for forwarding your bedding plants, forcing Asparagus, Sea-kale, &c. We will think of your case; but you cannot have read all in our late Numbers, or you would have received many hints to suit you.

**ROSES FOR THE NORTH OF ENGLAND (J. Hunter).**—An excellent list of Roses for the northern counties is given by the Rev. Mr. Radclyffe in No. 194, Vol. VII, page 468. The Tea Roses are too tender to succeed in your situation without the protection of a wall. Some of the hardiest might, however, do planted out, if a good thickness of moss or other non-conducting material were placed over the roots before winter, and branches of evergreens or furze stuck amongst them so as to afford shelter. You might, in addition to Gloire de Dijon, try Somhreuil, Abricoté, Bougère, Safrano, Belle de Bordeaux, Homer, and Nina. If the situation is not very bleak, and the soil is dry and warm, the free-growing Bourbons ought to succeed with the roots protected as above recommended. You may plant any of the Chrysantheums grown in the south, as the same degree of frost that would injure them there would do so with you.

**NAMES OF FRUITS (J. Chinery).**—1, Joséphine de Malines; 3, Beurré Claugrain; 4, Beurré Sterckmans. (J. Crofts).—Apples: 1, Flower of Kent; 3, Reinette du Canada. Pears: 1, Beurré de Rance; 2, Hayshe's Victoria; 3, Hayshe's Prince of Wales; 4, Eyewood. (Alpha, Acton).—1, Vicar of Winkfield; 2, Colmar. (G. R. Biagg).—1, Norfolk Beech; 2, Wermisley Pippin; 3, Beauty of Kent; 4, Winter Greening; 5, Fearn's Pippin; 7, Sykehouse Russet. Pear: Beurré d'Arcenberg. (G. R.).—Pears: 1, Uvedale's St. Germain; 2, Easter Beurré; 3, Chamontel; 4, Moccas; 6, Damclow's Seedling; 7, Golden Reinette; 8, Norfolk Bearer; 9, Claygate Pearmain; 10 and 14, Southampton Pippin; 11, Sykehouse Russet; 12, Winter Pearmain; 13, Scarlet Nonpareil. Apples: 2, Mere de Mécange; 3, Bleoheim Pippin.

**NAMES OF PLANTS (East Sussex).**—1, Boussingaultia baselloides; 7, Echeveria retusa; 8, Davallia naya-zalandia; 9, Pleopeltis lycopodioides; 10, Pteris tremula; 11, Polystichum coriaceum; 12, Maranta bicolor; 13, Pteris crenata; 14, Pteris hastata macrophylla; 15, Polystichum angulare coriaceum; 16, Sedum carneum variegatum. We cannot name Begonias from leaves.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the Week ending December 16th.

DATE.	THERMOMETER.						Wind.	Rain in inches.	GENERAL REMARKS.

POULTRY, BEE, and HOUSEHOLD CHRONICLE.

DARK COCHIN-CHINAS AT BIRMINGHAM.

In your report of the Birmingham Show, regarding the Grouse and Partridge Cochins, you say, "The old difficulty of finding cocks with thoroughly black breasts still exists." This I deny, as there was not a brown feather in the breast of any of the three young birds that I exhibited, and I defy your reporter to show one, on pain of my forfeiting a sovereign for every brown feather. I have no hesitation in saying, that they who so reported of my birds were as blind as I attributed the judges to be who awarded the prizes.

Every word your correspondent "P." states concerning "the Birmingham awards," you may hear endorsed on all sides.

The Poultry Club is quite prepared to carry out your correspondent's suggestions. The proposed Show at Rochdale at the end of January is merely preliminary to one to be held in the autumn of next year if necessary. The present guarantors will only be too happy to add to their number your correspondent "P."—EDWD. TUDMAN, Ash Grove, Whitechurch, Salop.

JUDGES AND THEIR JUDGES.

THE office of judge is not an enviable one, whether the duty consist in sentencing men to penal servitude, or to hard labour, or in awarding prizes to poultry. I have, however, been struck by one thing common to these last, and to many others. The fault-finders are energetic, whilst those who approve are supine. While ten or twelve, or, it may be, twenty dissatisfied exhibitors

are indefatigable in spreading their discontent, the numbers who are satisfied trust to time and to others to espouse the cause of the judges who made the awards that are favourable to them. The old proverb says, "Let the losers laugh, the winners are sure to do so."

The truth is, the prizes at the Birmingham Show are so important to all, and such a source of profit to many, that they cannot bear to lose. The four or five discontented in a large class congregate together and loudly make their complaints. Too often, like Mr. Primrose, they make up in clamour what they lack in argument. I have no doubt they are very sincere in their complaints, and, doubtless, believe they are hardly dealt by; but they would do well to recollect that few men are so happily constituted, or so capable of cool judgment in their own matters, as to justify them in impugning the awards of experienced and honourable men. Fewer still are able to overcome evil passions and prejudices, and to act dispassionately, when smarting under disappointment. Many, I hope, when they cool down, are sorry for the heat they have shown, and the unkind things they have said. I attend few shows, but I have often remarked when I have been at one, that the complaints I heard all day long, proceeded always from the same people.

It is wonderful what even one pertinacious man can do by perseveringly harping on one string. Nobody believes Solomon Eagle was a prophet, or that he knew more than others about the plague, yet by constantly running about the streets and screaming his denunciations, he became associated with the visitation; and the same may be said of those who run about a poultry show grumbling.

It is said in eastern tales, that sometimes an unpopular Pasha is beheaded as soon as he is in disgrace; at others he is more gracefully disposed of with a cup of coffee. So the malcontents vary their attacks, while some deal in innuendoes, not always delicate ones; others disguise their charge by saying there were mistakes, but the judges, poor men, had too much to do.

I am no exhibitor myself, and try to stand aloof from all influence. I have nothing to say about the Poultry Club, save that many of its members are very honourable men; but I can hardly see what they propose to accomplish, or how they mean to do it, when they talk of having no confidence in any but their own judges, and in blaming the conduct of every show that is not subservient to their mandates. Some people venture to doubt whether if they succeeded in substituting themselves for all other authority, it would be any improvement. Nothing they have yet done has been calculated to suggest improvement or to inspire confidence. Their denunciation of Birmingham is in bad taste. Poultry owes much to the men who have carried that show from its dark and trying days to its prosperity. Exhibitors cannot well do without Birmingham. Those who exhibit in the present day for the love of exhibition are but few compared to those who show for profit. These latter cannot afford to do without Bingley Hall. There is not only the fame that attaches to the prizes taken there, and the future profit, but there is also the actual sale during the show, that distributes hundreds of pounds taken by the sale of pens.—**BRAHMA.**

### FOREST FOWLS AND THE FLATS OF ESSEX.

THERE is a popular belief that in the land of the East Saxons the roads are raised between dykes, and that on Essex highways posts and rails are placed to guide the unwary during floods. There is no less an authority than the *Times* for this statement, and although the facts are to the contrary, yet as the *Times* holds the opinion, so much the worse for the facts. It must be admitted, however, that in the county of Essex are many flats, and that the neighbourhood of Chelmsford forms no exception to the rule.

At the recent poultry show held in the above county town, a pen of so-called "Forest Fowls" was exhibited, which, putting aside the first prize, a fine pen of La Flèche and a pen of Silver Polands, gained the second prize in the Any variety class, as the best of a mongrel lot. Your report described them as dwarfed Black Hamburgs, an opinion shared by others with your reporter. In your answers to correspondents on November 28th, you tell "ORNIS" you do not doubt that he purchased his so-called Forest Fowls from the party he names, and that they may have come from Exmoor, but that they may also have been Hamburgs originally, and that you are sure there is no original breed there. These statements in your paper called

from Mr. H. Leworthy another, that Mr. Warner purchased from him birds, which he, Mr. Leworthy, calls Forest Fowls, for the purpose of rearing Pheasants; that he, Mr. Leworthy, keeps blue birds of the kind for the hackle feathers, which he uses for fishing-purposes; that there is not any strain of the Hamburg breed in them, and that the original stock is taken from the borders of the forest of Exmoor.

It is evident that some one is wrong. The experience of your reporter, and your own statement, deny the existence of Forest Fowls. Opposed to these are Mr. Leworthy's statements. As you are not bound to prove a negative, it rests with him to bring forward satisfactory evidence that these birds are what he professes them to be: his own unsupported statement, however trustworthy, is not enough for proof. If a hitherto unnoticed and original breed of fowls has come to general notice, let us know all about them; if a new and useful cross has become accomplished let us adopt them, but not under a false description. Neither common sense nor common honesty will be served except by a straightforward statement of evidence. It is not, as with Brahmas, a matter of distant history difficult of proof. The proof can be obtained in our own country and at this time. It is the duty of Mr. Leworthy in putting forward birds which he calls Forest Fowls, to prove the truth of his statements before a mongrel race, may be of Hamburg or Andalusian blood, or of both, increase and multiply.

Without expressing an opinion either one way or the other as to the origin of the Brahma, I will attest its usefulness and admire the advocacy of that Alpha and Omega, &c., of initials "Y. E. A. Z." Nothing of the kind is needed here. A simple, well-substantiated, honest statement will set the matter at rest, and this, doubtless, Mr. Leworthy is prepared to give. At all events, until this is done it is quite certain that Forest Fowls will not thrive amongst Essex flats.—**ONE OF THE CALVES.**

[Since we received the above we have had the following sent to us, which seems to settle the question:—

"I see by the Journal, Mr. H. Leworthy takes exception to the paragraph in the report of the Chelmsford Show, that 'some dwarfed Black Hamburgs were shown as Forest Fowls six months old. The cock had, without doubt, enjoyed existence for very many years past, and possibly months was simply a misprint for years.' This correspondent now states, your reporter has given them a new name, 'dwarf Black Hamburgs.' I had no desire to express myself ambiguously, and regret that by saying they were 'dwarfed' Black Hamburgs, the misconception should have arisen, that I considered these fowls of any 'pure' breed, of either Hamburgs or any other variety, for I well knew to the contrary, and am equally aware with Mr. Leworthy, that these so-called 'Forest Fowls,' are by no means pure, but throw chickens of great irregularity of colour, the 'blue'-feathered ones being, as he says, in considerable demand for the artificial-fly manufacturer; but, on the contrary, to that purpose the Black ones, as shown at Chelmsford, are altogether inapplicable. The writer himself exhibited a very well matched pen of the 'Blues' (that is *state*-coloured) ones, bred from Black ones, at one of the earliest Birmingham shows, where they were unnoticed altogether by the Judges.

"These fowls are commonly to be met with in the Welshpool, Oswestry, and Ruabon markets, but are not favourites among general dealers, simply because of their 'dwarfed' (stunted and degenerated) proportions, consequently except the 'blue'-feathered ones among fishermen, such fowls mostly prove a heavy sale. I at once admit, like all the smaller fowls, they are excellent to rear Pheasants and Partridges, and sit most assiduously, as nearly all crosses with Hamburgs will do, though with 'pure' Hamburgs, it is well-known incubation occurs only as an extremely rare exception.

"The 'Forest Fowls' of your correspondent have existed for a long series of years, in the localities above named, being more especially retained for the suitability to the Game breeder, but have never settled down to regular traits of character, or been looked upon simply on account of their long standing, as a 'pure' breed, for they continually 'sport' in both colour, combs, and markings.—**YOUR REPORTER.**"]

### PIGEON JUDGING AT BIRMINGHAM.

I THINK it high time that some alteration should be made as regards the awarding of prizes at our poultry shows, some rules laid down for Judges to act up to in order that justice may be done to exhibitors, and judges themselves be freed

from the unpleasantness attending their duties, by repeated cause being given for complaint as to the manner in which the prizes are awarded. At the late Birmingham Show I exhibited a pair of Blue Dragons, admitted by really competent judges to be the best pair in the Show. They were honoured with a very high commendation, whereas the pair that the first prize was awarded to were both white-rumped, a defect, beyond doubt, quite sufficient to exclude them from taking a prize. The pair that the second prize was awarded to were, perhaps, rather better, only one of them being white-rumped.

Now, I think, I have just cause for complaint that the prize in this variety was not awarded to me; but, at the same time, I complain that the first prize, awarded to me for Archangels, was equally unjust, inasmuch as one of them is gravel-eyed, and the other pearl-eyed; quite sufficient to my mind to exclude them from prize-taking.

I fear that the great dissatisfaction caused by such gross blunders will very soon cause these useful exhibitions to be numbered among the things that have been.—JOHN PERCIVAL.

## DARLINGTON EXHIBITION OF POULTRY AND PIGEONS.

THE thirteenth annual Exhibition of the Darlington Society took place on the 13th, 14th, and 15th inst., and proved one of the most successful exhibitions yet held in this locality. It was at first apprehended, as cattle were not exhibited this year, as was the case hitherto, that a most serious falling off would take place in the number of visitors; but we are most happy to state that the attendance of poultry amateurs sustained no diminution, and the quality of the poultry exhibited was quite equal to that of former years. The Committee were equally unsparring of personal trouble and expense as heretofore, and fires were placed in suitable positions so as to warm the whole area of the spacious new covered market, than which it is rare to find a more suitable building for such an exhibition. This forethought on the part of the managers at Darlington is worthy of especial mention, as it was evident that many really excellent pens of fowls, previously broken down by too-quickly-repeated exhibition, without the opportunity of even a few days' intervening rest, would have suffered most severely had their requirements not been properly attended to. As it was, we were sorry to observe that a great number of pens were suffering severely from influenza at the time of their admission, and the restoratives of combined warmth and stimulating diet were evidently not wasted, for numbers of such pens would leave Darlington in far better condition and general health than when received.

The Darlington Show was rich in Grey Dorkings, Viscountess Holmesdale exhibiting a large number of pens of this breed, that would greatly increase the interest of any poultry meeting. We do not recollect her ladyship ever having exhibited a more praiseworthy collection. The first-prize pen of rosy-combed ones were extraordinarily good, and we must name the pen containing a pair of Dorking hens such as are only met with at very considerable intervals. All three of the principal Grey Dorking prizes were, therefore, obtained by Lady Holmesdale; but it must not be supposed that this triumph was gained without a vigorous competition, for pen after pen of most commendable birds were to be found in these classes. Black Spanish were very good, but evidently a considerable proportion of these pens were suffering from over-exhibition. In Cochins there was a very close competition, all the most noted breeders evidently being willing to try their strength at Darlington. Captain Heaton won the first prize in adults with a most magnificent pen, composed of two especially perfect hens, mated with the first-prize single cock at Birmingham. They are individually, perhaps, as good specimens as could be desired, but match indifferently, so much so as to cause the silver cup for the best pen of Cochins (without reference to age) to be awarded to chickens. The chicken class was uniformly excellent, and here Mr. Jenkinson of Manchester showed two very superior pens. Mr. Tomlinson, of Birmingham, exhibited in this class a most marvellous young cockerel, that was almost universally admired; but one of his pullets seemed a most unfitting companion. *Brahmas* mustered well, and seemed to excite considerable interest, as they have proved extraordinary winter egg-producers, even so far north as Darlington. *Hamburghs* were in all respects superior to the usual run, the Golden-spangled and Silver-spangled especially so; it is really wonderful how well the cup birds wear year after year without any apparent deterioration, for it is by no means common for very old hens to moult out for many consecutive years still true to feather. In *Game* fowls Mr. Fletcher of Stoneclough, near Manchester, stood pre-eminent amidst a whole host of powerful competitors; most of the birds were shown throughout the classes in excellent condition. The first-prize Black Red hen belonging to that gentleman being as near perfection as could be hoped for, though a pullet, as all ages were equally admissible. This bird ran with the first-prize single *Game* cock very closely for the extra silver cup given for the best *Game* fowl regardless of sex. By referring to the appended prize list it will be seen that Mr. Fletcher succeeded in taking two of the Society's silver cups exclusively with *Game* fowls. In *Sebrights* only a second prize was awarded, not on account, as would be imagined, of any paucity of

merit, but in accordance with the regulations of the Society's rules, which distinctly state that unless there are three entries only a second prize shall be awarded. The Arbitrators, to show their opinions, "highly commended" the other pen.

We do not ourselves at all advocate this arrangement as to deficient entries, although to award premiums when there is so little public support may be urged as bearing too heavily on the general funds; our impression, on the contrary, being, that if undoubtedly first-rate specimens are under consideration the want of competition should not militate against the success of those owners who have already incurred all the expenses of exhibition, and who cannot, we think, be fairly held responsible for the paucity of entries, which even had they been numerous would most probably not have at all affected their success. In this particular instance both pens were unusually good.

In *Game Bantams* the entries were very heavy, but the condition of the greater portion was not worthy of praise. Mr. Crossland, however, showed some excellent birds, as did Mr. Fletcher. Some of the *Game Bantams* were evidently still suffering from recent dubbing, it being well known that *Bantams* recover from this operation far less speedily than the more vigorous *Game* fowls. Some very good White and also Black *Bantams* were exhibited, the first-prize pen of Black ones at Birmingham being altogether *disqualified*, although so recently the winners of the amateurs' additional prize of £4, as well as the liberal one given by the Birmingham Council. Whilst this pen of Black *Bantams* was at Birmingham the objection was obvious not only to the careful, but on the contrary even casual observer, one of the hens being absolutely sprinkled with white on the saddle, the side coverts of the tail, and under the breast also. Some few of such spots were actually nearly equal in size to a silver threepenny-piece, constituting an entirely new feature in a Birmingham first-prize *Black Bantam*. The overtaxing of the physical powers of the Judges at Birmingham affords at once a very easy solution of the causes involving such errors. These gentlemen during the now brief wintry days are obliged to judge either long after nightfall, or, to avoid this fatal objection, they must rush onwards with their most responsible duties under a kind of follow-the-leader fashion; consequently such mistakes are certain to follow. It is to this compulsory pressure to "get done," that may fairly be attributed the greater portion of the loud complaints almost universally excited as to the Birmingham decisions rather than to the want of desire to do justice on the part of the Arbitrators themselves. The fact as to Birmingham is simply this, that there is no time to entertain a second opinion; and even the simple expression of such diversity, if courteously urged, proves only the direct herald of abrupt and offensive displeasure, the war-ery being to "get done."

In the class for Any variety not before mentioned, *Plumigand* and *La Flèche* fowls, both exceedingly good pens, were the winners.

In *Geese* Mrs. Seamous, of Aylesbury, stood highest with birds of great merit, and also with *Aylesbury Ducks*. This lady's heaviest pen of Ducks, however, were passed over from the fact of being so entirely overfed that they had nearly lost the power of locomotion, and their utter inutility as brood stock was palpable. The *Romen* class of Ducks was excellent, as was also the *Variety Duck* class, *Carolinas* and *Grey Calls* being here the prize-winners.

The only attempt at deception we noticed throughout the Show was exhibiting in the *Hamburgh* classes pullets for old hens, and *vice versa*, to the loss of several prizes by the parties attempting the imposition.

The *Pigeons* were evidently good, but time was not available to make a close inspection after the opening of the Show, which took place early in the afternoon. As the weather proved most favourable the Exhibition was well attended.

**SPANISH (Black).**—First and Cup, H. Beldon, Bingley. Second, Viscountess Holmesdale, Linton Park, Staplehurst, Kent. Highly Commended, A. Heath, Calne, Wilts. **CHICKENS.**—First, E. Brown, Sheffield. Second, Master A. Ridpath, Edinburgh. Highly Commended, Messrs. Bowman & Fearon, Whitehaven; A. Heath; J. H. Wilson, St. Bees.

**DORKINGS (Coloured).**—First and Cup, Viscountess Holmesdale, Linton Park. Second, H. Lingwood, Barking, Needham Market, Suffolk. Highly Commended, G. R. Smith, Scarborough; J. White, Warlaby, Northallerton. **CHICKENS.**—First, Viscountess Holmesdale, Linton Park. Second, M. Hedley, Redhill, Surrey. Highly Commended, J. White; M. Hunter, Green Hammerton Hall, York; T. E. Kell, Wetherby; Mrs. Dale, Scarborough; J. Bell, Thornton-le-Moor, Northallerton. Commended, C. Pease, Southend, Darlington; J. Graham, Witton-le-Wear.

**DORKING HENS (Any variety).**—First, Viscountess Holmesdale, Linton Park. Second, J. Gunson, Sandwith, Whitehaven.

**DORKINGS (White).**—First and Cup, H. Lingwood, Barking, Needham Market. Second, J. Robinson, Vale House, Garstang. **CHICKENS.**—First, H. Lingwood. Second, J. Robinson.

**COCHIN-CHINA (Cinnamon and Buff).**—First, Capt. Heaton, Lower Broughton, Manchester. Second, H. Bates, Yardley, Birmingham. Highly Commended, H. Tomlinson, Balsall Heath, Birmingham. **CHICKENS.**—First, Cup, and Second, C. Jennison, Belle Vue, Manchester. Highly Commended, H. Tomlinson; Capt. H. Heaton; Miss Aglionby, Grasmere, Westmoreland. Commended, J. Nelson, Heaton Mersey, Manchester.

**COCHIN-CHINA (Any other variety).**—First, Capt. H. Heaton, Lower Broughton. Second, H. Bates, Yardley. Highly Commended, W. Dawson, Hopton Mirfield; Rev. W. H. Fell, Stamine, Poulton-le-Fylde, Lancashire. **CHICKENS.**—First, Capt. H. Heaton. Second, J. W. Marshall.

**COCHIN-CHINA HENS (Any age or variety).**—First, H. Tomlinson, Birmingham. Second, Capt. H. Heaton, Lower Broughton. Highly Commended, J. Bell, Thirsk; Capt. H. Heaton; C. Jennison, Manchester; A. Perkins, Darlington. Commended, C. Pease.

**BRAHMA POTREAS (Any variety).**—First, R. W. Boyle, Wicklow, Ireland. Second, H. Lacy, Hehden Bridge. Commended, Rev. W. H. Fell, Stat-

mine. *Chickens*.—First, G. H. Roberts, Penwortham, Preston. Second, R. W. Boyle, Ireland. Highly Commended, Mrs. M. Seamons, Hartwell, Aylesbury; H. Lacy.

*GAME* (Black-breasted and other Reds).—First and Cup, J. Fletcher, Stoneclough, Manchester. Second, M. W. Stobart, Middleton-one-Row, Darlington. Commended, H. M. Julian, Hull. *Chickens*.—First, T. Bottomley, Shelf, Halifax. Second, W. J. Pope, Biggleswade, Beds.

*GAME* (Brown-breasted Reds).—*Chickens*.—First, J. Fletcher, Stoneclough. Second, M. W. Stobart, Middleton-one-Row. Commended, W. J. Cope, Barnsley; W. Whitwell, Stockton-on-Tees.

*GAME* (Any other variety).—First, T. J. Charlton, Manningham. Second, J. Fletcher, Stoneclough. Commended, M. W. Stobart, Middleton-one-Row. *Chickens*.—First, J. Fletcher. Second, T. J. Charlton, Manningham. Commended, W. Gamon, Thornton-le-Moor.

*SINGLE GAME HEN* (Any variety).—First, J. Fletcher, Stoneclough. Second, E. Aykroyd, Bradford. Highly Commended, J. Firth, Halifax. *HAMBURGS* (Gold and Silver-pencilled).—First, J. Robinson, Vale House. Second, A. R. Wood, Burnside, Kendal. Commended, H. Beldon, Bingley.

*HAMBURGS* (Gold and Silver-spangled).—First and Cup, A. R. Wood, Burnside. Second, H. Beldon, Bingley. Highly Commended, W. A. Hyde, Taunton Hall, Ashton-under-Lyne; J. Roe, Hadfield, near Manchester; J. Robinson.

*HAMBURGS* (Golden-pencilled).—*Chickens*.—First, J. Robinson, Vale House. Second, H. Beldon, Bingley. Commended, Viscountess Holmesdale, Linton Park; W. H. Dyson, Bradford.

*HAMBURGS* (Golden-spangled).—*Chickens*.—First, J. Roe, Hadfield. Second, W. A. Hyde, Ashton-under-Lyne. Highly Commended, J. Roe. Commended, J. Walker, Haya Park, Knaresborough.

*HAMBURGS* (Silver-pencilled).—*Chickens*.—First, H. Beldon, Bingley. J. Walker, Knaresborough.

*HAMBURGS* (Silver-spangled).—*Chickens*.—First, H. Beldon, Bingley. Second, A. R. Wood, Burnside.

*POLANDS* (Any variety).—First and Second, H. Beldon, Bingley. Highly Commended, H. Beldon.

*BANTAMS* (Gold or Silver-laced).—Second, T. Davies, Newport. Highly Commended, G. Manning, Springfield.

*BANTAMS* (White or Black).—First, E. Hutton, Pudsey, Leeds. Second, Messrs. J. & A. Briggs, Rawden.

*GAME BANTAMS* (Any variety).—First, Cup, and Second, J. Crossland, jun., Wakefield. Third, J. Fletcher, Stoneclough, Manchester. Commended, G. Maples, jun., Wavertree, Liverpool; D. Parsons, Cuxford, Preston; Miss Aglionby.

*DUCKS* (Aylesbury).—Prize, Mrs. M. Seamons, Hartwell.

*DUCKS* (Rouen).—First and Cup, A. Woods, Sefton. Second, J. Robinson. Highly Commended, J. Nelson, Heaton Mersey.

*DUCKS* (Any other variety).—First, J. Jennison, Manchester. Second, D. Parsons, Preston. Commended, E. Hutton, Pudsey.

*GEES* (Any variety).—First and Second, Mrs. M. Seamons, Hartwell. Highly Commended, W. A. Wooller, Darlington. Commended, J. Young, Seaton Carew.

*TURKEYS* (Any variety).—First, R. J. Wood, Chorley. Second, Mrs. A. Goy, Eaton, Grantham. Highly Commended, J. Smith, Breder Hills; Mrs. Dale, Scarborough; C. Pease, Southend.

*ANY OTHER DISTINCT BREED*.—First, R. Loft, Woodmansey, Beverley (La Fliche). Second, E. Pigeon, Lymington, Exeter. Highly Commended, H. Beldon, Bingley (Black Hamburgs).

*SELLING CLASS*.—First, G. Yeats, Studley, Ripon (Grey Dorkings). Second, Mrs. Marshall, Darlington (White Cochins). Third, T. Cleminson, Darlington (Brown Red Game). Highly Commended, Capt. H. Heaton, Lower Broughton (Partridge Cochins). Commended, J. Young, Seaton-Carew (Golden-pencilled Hamburg); T. Oliver, Darlington (Golden-pencilled Hamburg); H. Beldon, Bingley (Black Spanish); T. Todd, Darlington (Partridge Cochins).

#### SINGLE COCKS.

*SPANISH* (Black).—First, E. Brown, Sheffield. Second, Master A. Riddpath, Edinburgh. Highly Commended, I. Shortrose, Newcastle-on-Tyne.

*DORKING* (Any variety).—First, Mrs. Dale, Scarborough. Second, Rev. J. F. Newton, Kirby. Highly Commended, Miss Milne, Otterburn.

*COCHIN-CHINA* (Any variety).—First, Capt. H. Heaton, Lower Broughton. Second, W. A. G. James, Kirby Lonsdale. Highly Commended, Capt. H. Heaton; Rev. W. H. Fell, Stainme; J. W. Marshall, Darlington. Commended, J. Nelson, Heaton Mersey.

*BRABMA POOTRA* (Any variety).—First, R. W. Boyle, Ireland. Second, H. Lacy.

*GAME* (Any variety).—First and Cup, J. H. Wilson, St. Ees.\* Second, J. Fletcher, Stoneclough. *Cockerel*.—First, T. J. Charlton, Manningham. Second, R. Payne, Burnley. Highly Commended, J. Fletcher, Stoneclough. Commended, T. Burgess, Burleydam.

*BANTAM* (Any variety).—First, W. T. Robinson, Richmond. Second, W. Hodgson, Darlington. Third, T. Boucher, Birmingham. Commended, J. W. Morris, Rochdale.

#### PIGEONS.

*CARRIERS* (Any colour).—*Cock*.—First, G. H. Roberts, Penwortham. Second, W. Massey, Fulford, York. Highly Commended, F. Else, Bayswater, London; W. Massey. *Hen*.—First, T. CoKey, Sheffield. Second, F. Else. Highly Commended, G. H. Roberts.

*POWTER* (Any colour).—*Cock*.—First, J. R. Robinson, Sunderland. Second, W. R. Rose, Cransley Hall. Highly Commended, E. Brown, Sheffield. *Hen*.—First, J. R. Robinson. Second, W. R. Rose. Highly Commended, A. Heath, Calne.

*ALMOND TUMBLERS*.—First, F. Else. Second, J. R. Robinson. Highly Commended, J. Percival, Client Villa, Birmingham.

*TUMBLERS* (Any other variety).—First, J. Percival, London. Second, H. Yardley, Market Hall, Birmingham. Highly Commended, G. Westcumb, Sheffield.

*FANTAILS*.—First, J. R. Robinson. Second, F. Else.

*TRUMPETERS*.—First and Cup, M. Hedley, Redhill, Surrey. Second, J. R. Robinson.

*BARBS*.—First, J. R. Robinson. Second, W. Massey. Highly Commended, M. Hedley; G. H. Roberts.

*JACOBS*.—First, F. Else. Second, H. Yardley. Commended, H. Beldon

*TURBITS*.—First, E. E. M. Roysd, Rochdale. Second, J. J. Wilson, Darlington. Highly Commended, H. Yardley.

*OWLS*.—First, M. Hedley. Second, F. Else. Highly Commended, H. Yardley.

*ANY OTHER NEW OR DISTINCT VARIETY*.—First, H. Yardley. Second, H. Beldon. Highly Commended, J. Parker, Oakworth Hall, Keighley; H. Yardley; J. Percival, London.

A Silver Cup, value £5, offered by C. Pease, Esq., for the most successful exhibitor in the Poultry Classes, was awarded to J. Fletcher, of Stoneclough, but is claimed by Mr. Beldon, and not yet decided.

Mr. Hewitt, of Birmingham, and Mr. Teebay, of Preston, judged the general classes of poultry, assisted in the Game classes only by Mr. Smith, of Halifax. Mr. Smith also arbitrated for the Pigeons.

#### LEEDS SMITHFIELD EXHIBITION.

THE Poultry Show in connection with the Cattle Show was held in the Cattle Market, Leeds, on the 12th, 13th, 14th, and 15th inst. There was a numerous entry, both of Poultry and Pigeons, and this portion of the exhibition formed, as usual, one of the most attractive features for the generality of the visitors.

The Society's Silver Cup for the Best Pen of Poultry, E. Aykroyd, Gillington Road, Bradford.

*SINGLE GAME COCKS* (Any description).—First, C. W. Brierley, Middleton, Manchester. Second, E. Aykroyd, Gillington Road, Bradford. Third, H. C. Mason, Drighlington.

*GAME* (Black-breasted and other Red).—First, E. Aykroyd. Second, Sir St. G. Gore, Bart., Hopton Hall, Derbyshire. Third, W. Boyes, Beverley. *Chickens*.—First, E. Aykroyd. Second, Sir St. G. Gore, Bart. Third, G. Hopkieson.

*GAME* (White and Piles).—First, R. Butcher, Cresswell, Chesterfield. Second, J. Sunderland, Coley Hall, Halifax. Third, M. H. Hobart, Middleton One Row, Darlington. *Chickens*.—First, R. Butcher. Second, R. Whitam, Mount Pleasant, near Colne. Third, J. Snoderland.

*ANY OTHER VARIETY*.—First, Sir St. G. Gore, Bart. Second, E. Aykroyd, Third, J. Harrison, Dale House, Wakefield. *Chickens*.—First, J. Fell, Adwalton. Second, E. Aykroyd. Third, Sir St. G. Gore, Bart.

*DORKINGS* (Any variety).—First, Sir St. G. Gore, Bart. Second, H. Beldon, Giltstock, Bingley. Third, Lady Hawke, Womersley Park, Pontefract. *Chickens*.—First, Messrs. Brown & Greenwood, Harrogate. Second, Sir St. G. Gore, Bart. Third, T. E. Kell, Wetherby.

*SPANISH*.—First, H. Beldon. Second, J. Newton, Silsden. Third, Messrs. Thresh & Greenwood, Manchester Road, Bradford. *Chickens*.—First, J. Marchant, Hanson Lane, Halifax. Second, Messrs. Thresh & Greenwood. Third, N. Cook, Chawbent, Manchester.

*COCHIN-CHINA* (Cinnamon and Buff).—First, H. Tomlinson, Balsall Heath Road. Second, E. Smith, Middleton, Manchester. Third, T. H. Barker, Hovingham, York. *Chickens*.—First, C. Jenkinson, Belle-Vue, Manchester. Second, J. Nelson, Heaton Mersey, Manchester. Third, T. H. Barker.

*COCHIN-CHINA* (Any other variety).—First and Second, R. J. Wood, Pinnsell Hall, Chorley Junction. Third, E. Smith. *Chickens*.—First, R. J. Wood. Second, W. Dawson, Hopton, Mirfield. Third, J. Harrison, Dale House, Wakefield.

*HAMBURG* (Gold-pencilled).—First, W. H. Dyson, Soap Farm, Horton, Bradford. Second, Sir St. G. Gore, Bart. Third, H. Beldon. *Chickens*.—First, H. Beldon. Second, Sir St. G. Gore, Bart. Third, S. Smith, Northowram, Halifax.

*HAMBURG* (Silver-pencilled).—First, Sir St. G. Gore, Bart. Second, J. Preston, Allerton, Bradford. Third, W. Lawrence, Eaglescliffe. *Chickens*.—First, Sir St. G. Gore, Bart. Second, H. Beldon. Third, H. Pickles.

*HAMBURG* (Gold-spangled).—First, Sir St. G. Gore, Bart. Second, H. Beldon. Third, J. Newton. *Chickens*.—First, S. R. Ashton, Mottram, Cheshire. Second, H. Beldon. Third, J. Preston.

*HAMBURG* (Silver-spangled).—First, J. Fielding, Newchurch Manchester. Second, J. Smalley, Water Fall Villa, Blackburn. Third, J. Jackson, Bury, Lancashire. *Chickens*.—First, Sir St. G. Gore, Bart. Second, J. Jackson. Third, H. Beldon.

*HAMBURG* (Black).—First, H. Beldon. Second, R. Tate, Leeds. Third, J. Birbeck, Burmantofts, Leeds. *Chickens*.—First, J. Jackson. Second, G. Bennett, Staningley. Third, W. Worsley, Middleton, Manchester.

*POLANDS* (Any variety).—First and Second, H. Beldon. Third, H. Carter, Uppertong, Holmfirth. *Chickens*.—First, Mrs. Kell, Wetherby. Second, H. Beldon. Third, E. Hepworth, Norridge, Holmfirth.

*MALAYS*.—Prize, G. Huxley, Stilling Fleet, York. *Chickens*.—Prize, T. Jolly, Warley, Northallerton.

*FARMYARD CROSS* (Or any other variety).—W. H. Wheeler, The Cottage, Carlton, Nottingham. Second, E. Loft, Woodmansey, Beverley. Third, W. A. G. James, Kirby Lonsdale.

*BANTAMS* (Black).—First, S. Schofield, Heckmondwike. Second, R. Gedhill, Bradford. Third, J. & A. Briggs, Slack Beck Farm, Rawden.

*BANTAMS* (White).—First, Sir St. G. Gore, Bart. Second, J. & A. Briggs. Third, H. E. Emberley, Leicester.

*BANTAMS* (Game).—First, R. Tate, Leeds. Second, J. Crossland, jun., Wakefield. Third, W. Taylor, Albert House, Hunslet.

*BANTAMS* (Any other variety).—First, W. J. Cope, Barnsley. Second, E. Shaw, Plas Willmott, Oswestry. Third, C. W. Brierley, Middleton, Manchester.

*GUINEA FOWL*.—First, O. A. Young, Driffield. Second, Lady Hawke. Third, O. A. Young.

*TURKEYS*.—First, O. A. Young. Second, E. Leech, Greave House, Rochdale. Third, J. Brown, Sheepsbar, Leeds.

*GEES*.—First, O. A. Young. Second, H. Beldon. Third, B. Baxter, Elsnack Hall, Skipton.

*DUCKS* (Aylesbury).—First, E. Leech. Second, Sir St. G. Gore, Bart. Third, H. Beldon.

*DUCKS* (Rouen).—First and Second, J. Nelson, Heaton Mersey, Manchester. Third, H. Beldon.

*DUCKS* (Any other variety).—First, E. Hutton, Pudsey. Second, H. Beldon. Third, J. R. Jessop, Hull.

*SELLING CLASS*.—First, H. Beldon. Second, W. Massey, Fulford, York. Third, E. Smith.

\* This has been withheld, it being discovered that one of the sickle feathers was specked.

PIGEONS.

The Club's Silver Cup, for the best Pen of Pigeons in the Show ground, M. Ramsdon, Rose Cottage, Arnley.

**CARRIERS**.—First, A. F. Leite, Ryland House, Manchester. Second, T. Colley, Sheffield.

**POWTERS**.—First and Second, A. P. Leite.

**ALMOND TUMBLERS**.—First and Second, A. P. Leite.

**TUMBLERS** (Any other variety).—First and Second, A. P. Leite.

**OWLS**.—First, H. Ramsdon, Rose Cottage, Arnley. Second, A. P. Leite.

**FANTAILS**.—First, F. Else, Bayswater, London. Second, J. Thackray, Pelergate, York.

**BARBS**.—First, A. P. Leite. Second, H. Ramsdon.

**PERNITS**.—First, H. Yardley, Market Hall, Birmingham. Second, R. Wilson, Thirsk.

**JACOBIANS**.—First, E. Herner, Harewood. Second, R. Dodge, Sheffield.

**TRUMPETERS**.—First, F. Else. Second, F. Key, Beverley.

**NUNS**.—First, F. Else. Second, F. Key.

**NUNS**.—First, A. P. Leite. Second, S. Robson, Brotherton.

**DRAGONS**.—First, W. Massey, Fulford, York. Second, H. Yardley.

**ANTWERPS**.—First and Second, H. Yardley.

**MAGPIES**.—First, J. Thackray. Second, J. R. Jessop, Hull.

**SWALLOWS**.—First, E. E. M. Roys, Greenhill, Rochdale. Second, H. Yardley.

**ANY OTHER VARIETY**.—First, A. P. Leite. Second, R. Doge, Sheffield.

**RABBIT**.—*Longest-eared*.—First and Silver Medal, T. H. Ridpath, Rusholme, Manchester. Second, E. E. M. Roys, Greenhill, Rochdale.

**Yellow and White**.—First, T. H. Ridpath. Second, M. Millington, Ilworth Moor, York.

**Black and White**.—First, T. H. Ridpath. Second, A. Fifth, Cheshire. *Self-coloured*.—First, T. H. Ridpath. Second, G. F. Jones, York.

**JUDGES**.—For *Poultry*, R. Teebay, Esq., Fulwood; A. Sutherland, Esq., Burnley; and E. Bond, Esq., Leeds. For *Pigeons and Rabbits*, M. Headley, Esq., Claremont Green, Redhill, Sarrey.

DUBLIN POULTRY SHOW.

This was held on Wednesday and Thursday, the 13th and 14th inst., when nearly 120 pens were shown. The following is the prize list:—

**DORKINGS** (Silver-Grey).—First, Mrs. Warburton, Kill, Kildare. Second, R. Williams, Glasslin, Clontarf. *Chickens*.—First, F. W. Zurhorst, Belleville, Donnybrook, Dublin. Second, S. Mowbray, Killeany, Mountrath.

**DORKINGS** (Coloured).—Prize, R. P. Williams, Glasslin. *Chickens*.—Prize, F. W. Zurhorst.

**SPANISH**.—First and Second, Miss De Courcy Drevor, Rose Hill, Blackrock, Co. Dublin. *Chickens*.—First, Miss De Courcy Drevor. Second, D. C. Heron, Dublin.

**COCHIN-CHINA**.—First and Second, F. W. Zurhorst. *Chickens*.—First and Second, F. W. Zurhorst.

**GAME**.—First and Second, C. H. Peacock, Carrig-na-Greine, Dalkey. *Chickens*.—First and Second, C. H. Peacock, Carrig-na-Greine.

**HAMBURGH** (Pencilled).—Prize, R. W. Boyle, Galtrim House, Bray.

**HAMBURGH** (Spangled).—First, R. P. Williams. Second, S. Mowbray.

**POLANDS**.—Prize, Miss De Courcy Drevor.

**GREVE CŒUR**.—Prize, F. W. Zurhorst.

SINGLE COCKS.

**DORKING**.—First, F. W. Zurhorst. Second, W. Magrath, Blessington.

**SPANISH**.—First, Miss De Courcy Drevor. Second, R. P. Williams.

**COCHIN-CHINA**.—First, Miss A. Alexander, Acton House, Poyntzpass.

Second, F. W. Zurhorst.

**BRAHMA POOTRA**.—First, R. W. Boyle. Second, Mrs. Warburton.

**TURKEYS**.—First, F. W. Zurhorst. Small medal, W. C. Hamilton, Ballitore House, Kildare. *Poult*.—First and Second, A. Strahan, Timolin, Ballitore. Third, F. W. Zurhorst. *Single Cock*.—First and Second, F. W. Zurhorst.

**GESE**.—First, R. W. Boyle. Second, T. Butler, Priestown House, Co. Meath. Third, Mrs. Walsh, Kingswood, Saggard.

**DUCKS** (Rouen).—First, R. P. Williams. Second, R. W. Boyle. Bronze medal, R. P. Williams.

**DUCKS** (Aylesbury).—First, F. W. Zurhorst. Second, Mrs. Warburton. Third, R. P. Williams.

The Judges were Messrs. Stanton, Langton, and Hafield.

WALSALL POULTRY SHOW.

We have just received a prize schedule of an Exhibition of Poultry and Pigeons to be held in the Guildhall Assembly Rooms at Walsall, on Monday and Tuesday the 15th and 16th of January next. Its institution is hailed by exhibitors as supplying a want long felt in the district, and as the competition is open to all comers, a very heavy entry for a first show appears certain, particularly as the Committee are men of well known probity, themselves poultry fanciers, and enter on their duties determined to carry it to a successful issue by the combination of individual exertions. For an entrance fee of 5s. all the principal classes have prizes of £2, £1, and 10s. respectively, besides additional silver cups, nine in number, one of which will be gained by the lucky owner of the first prize in these divisions. The cups are presented to the Society by various lovers of poultry shows, and they will be of the value of three guineas each. The entrance for Ducks and Bantams is 3s. a-pen, in Bantams the prizes will be £1 and 10s., but to Ducks there will be three prizes—viz., 30s., 15s., and 7s. 6d. A "selling class" restricted to 30s. a-pen, for a 3s. fee, receives 30s., 15s., and 7s. 6d. also, which will produce a heavy

entry. The Pigeon classes have prizes of £1, and 10s. to each variety for which premiums are offered, the entrance fee being 2s. 6d. This Show will be continued annually; the Committee with open-handed fairness publish their names, and consequent responsibility, and we find it also stated on their prize list, that Mr. Edward Hewitt, of Birmingham, will be entrusted with the whole of the arbitrations. The entries close on December the 30th.

UPWARD WINTER VENTILATION,

A REMEDY FOR MOULDY COMBS AND DISEASED BEES.

NOTICING frequent complaints in the Journal about damp and mouldy combs and diseased bees in wooden hives, your readers may be interested to learn, how, after an experience with such hives, on a large scale, for nearly fourteen years, I am able to keep them dry and sweet, and the bees in good health during the frequent and severe changes of our winter climate.

To obviate the objections which might otherwise be urged against my plan, I will show briefly, before describing it, the fallacy of certain opinions which are still in vogue, even with the majority of scientific apiarists.

The honey-bee is, probably, the only warm-blooded insect known to man, living in a colony state during the winter. Its animal heat is, of course, supplied by the consumption of honey, the heat-producing qualities of which are known to be very great. A single bee, or even a small number, cannot, however generously fed, retain sufficient heat to preserve life in a low temperature; but a large number, by densely clustering among their combs, are able to bid defiance to a temperature lower than the freezing point of mercury. Now, bees do not, as many suppose, thrive in such low temperatures by warming the interior air of their domiciles, on the same principle that we in cold weather keep comfortable by heating the air of our abodes; but they retain in their dense clusters sufficient animal heat, very much as we preserve a proper temperature in cold apartments, in our comfortable beds. It is well known that bees, in a state of nature, live in hollow trees, in caves and clefts in the rocks, and in other dwellings where they cannot materially change the temperature of the air which surrounds their combs, any more than they can warm the large garrets where I have known them to thrive admirably in combs constructed under the rafters, when exposed sometimes to a temperature below zero. Even in the coldest weather, a strong stock of bees well provisioned will, in such a situation, maintain sufficient heat to be healthy and comfortable, breeding in midwinter in their central combs. Let bee-keepers ponder well these undoubted facts, and they will be prepared for the assertion, that if we could by any artificial arrangement enable the bees to warm to any considerable extent the air of their hives, the consequences instead of being beneficial would be highly disastrous, for as soon as the external atmosphere becomes warm enough to affect materially the interior air of their hives, the bees begin to uncluster and seek to fly abroad. The same effect is produced when a colony is carried into a greenhouse, or any place artificially heated; the bees immediately become uneasy and seek in every way to leave their hive, and if the entrance is closed they are forced to discharge their faeces, and often perish. It is very evident then, that if the bees in cold weather could be assisted to increase the temperature of their hives, so as to make it comfortable for them to uncluster and move freely about, there would be a great loss of bees tempted to sally out in ungenial weather, and, in addition, a largely increased consumption of honey, as it is a well-settled law of animal life, that every muscular effect presupposes the consumption of sufficient food to produce it.

The pertinency of these remarks will be seen, when I recommend, as the only reliable remedy for damp and mouldy combs and diseased bees in wooden bee-hives, a free escape from above in cold weather for the moisture generated in a strong stock, instead of allowing it, by condensing upon the interior surfaces of the hive and frames, to drip upon the combs and bees. Now, this remedy will never be adopted so long as it is considered a fundamental law of safe bee-keeping, that the animal heat of the bees must, if possible, be all retained in the hive; whereas the true principle is, that the animal heat over and above what they need for their health and comfort, ought not to, even if it could, be retained, any more than that human beings should try to retain the surplus heat of their bodies.

It may relieve the apprehensions of some of your readers

who have always regarded upward ventilation in winter as injurious to their stocks, to learn that where this is given the bee-entrance may be so nearly closed that, on the whole, the bees will be as warm as with the larger entrances which are necessary when no such ventilation is used.

At some future time I will detail some experiments which will more fully establish the truth of an assertion made by a German writer, one hundred years ago, when stating the necessity of upward ventilation in wooden hives, that it is not cold, but cold and dampness, that kill the bees.

To secure in the best manner this upward ventilation in wooden hives, I advise your readers to remove at once the board or cover which is over the bars or frames, replacing it with a straw mat or a piece of an old blanket, or any condemned woollen garment, contracting the bee entrance to half an inch. If the hives are exposed to the weather, I take it for granted that a tight box cover will be put over them.

At page 57 of Mr. Neighbour's excellent treatise on bees, a cut is given of a straw hive designed by Mr. Woodbury, in which bees would probably winter well, but by adopting the kind of winter-cover over the frames, or bars, recommended above, it will be found that bees will winter almost if not quite as well in wooden as in straw hives, thus enabling the apiarian to dispense with a material not only in itself too perishable, but very apt to become musty and to harbour vermin. The top cover is, after all, the essential point, as a straw hive with a wooden cover, on the cold surface of which the moisture from the bees will freely condense, is far inferior to a wooden hive with a straw or woollen cover.

I cannot close this article without expressing to Mr. T. W. Woodbury my thanks for the warm welcome he gave me to your columns. Having had an opportunity, quite recently, of reading more carefully his communications to your Journal since 1859, I find that to him, no less than to Mr. S. Bevan Fox, I am indebted for a generous appreciation of my apiarian labours.—L. L. LANGSTROTH.

### REGICIDE AMONG BEES.

WHEN "R. S." first mooted the theory, that regicidal attacks were initiated by stranger bees entering the hive unperceived, I stated that I deemed the suggestion well worth attention, and have since been on the watch to detect, if possible, any circumstance which might tend to confirm the accuracy of his conjecture. So far, I am bound to say, that with the exception of the occurrence related by me at page 355, I have never witnessed anything of the kind, and, therefore, still venture to doubt the accuracy of his conclusion. I have, moreover, another reason, and that is, that keeping, as I have been accustomed to do, bees of different species or varieties side by side in my apiary, I have become aware of the fact that there is far more of intermixture between neighbouring families of bees, than apiarians generally have had any idea of. To such an extent, indeed, does this intermixture take place, that it appears to me the species must rapidly diminish, and even ultimately become extinct, if the chance meeting of a wandering stranger with the queen of the hive into which it had accidentally strayed, were, as "R. S." supposes, sufficient to set on foot the regicidal frenzy.

I have never seen any theory published by the Germans respecting regicide among bees, with the exception of Dzierzon's statement, that if a queen wanders beyond the "brood-nest," she is liable to be stung to death by the workers; but in the course of a correspondence which I have recently had with another distinguished German apiarian, I incidentally mentioned the subject, and was informed by him that he had frequently had young queens imprisoned and killed on their return from successful wedding flights, and that he attributed it to the presence of the well-known sign of impregnation communicating to the unfortunate queen a peculiar odour, which prevented her being recognised, and caused the workers to treat her as a stranger. It is, of course, apparent that this hypothesis fails to account for the numerous instances in which princesses are imprisoned and killed prior to a successful ex-

\* Vide JOURNAL OF HORTICULTURE, Vol. VI., page 67.

+ I may here remark that "R. S." is mistaken in believing that the bees in this case were in a frenzy of concern for the safety of their queen. They were unquestionably thrown into much confusion by the attacks of marauders whilst they were being shifted into another hive; but they gave no indication whatever of having missed their queen (whose absence from among them was scarcely more than momentary), or of being under any concern about her.

ursion, as well as for those in which matronly queens fall victims to the seemingly insensate fury of their own offspring.

In reply to the concluding query of "R. S.," I may state that the partial, and sometimes even the entire, interchange of combs is so often resorted to for various reasons, that it is constantly occurring in my apiary all through the season, and that no effect of a regicidal character arising from this cause has come under the observation of—A DEVONSHIRE BEE-KEEPER.

### OUR LETTER BOX.

BOOK (J. W. Bristol).—"The Poultry-keeper's Manual." It will be published at our office in about a week. The price will be advertised.

BUFF COCHIN-CHINA FLIGHT FEATHERS (H. G. B. C.).—Light-coloured flight feathers are only a defect, not a disqualification. Your birds sneezing shows that they have had colds. Cochins are not subject to rump. Feed them liberally with bread and ale twice every day.

BRAHMA POOTRAS (A. O. W.).—We believe the light Brahmans stand quite an equal chance with the dark, if they are equally good. It is necessary to notice one thing—the fact of not being dark does not make a light one; these latter are birds of feather. Many of the dark ones in the single class were not only perfect in feather, they were very large and well shaped. We do not know that your bird was faulty; we only speak generally.

SEEBRIGHT BANTAMS (N.).—The Seebright Bantam is a composite bird, and for this reason will sometimes throw back to its forefathers, many of which were single-combed birds. Many good breeders of these run them together and breed both colours. We have done it ourselves; the result has been to make the silver creamy in colour instead of dead white. As it is very necessary to introduce fresh blood continually, we recommend you to make your walk next year of the silver cock, two of the palest of his daughters, and two fresh silver hens. You should take care of the cock, as many of this breed are not stock-getters.

GAME AND MALAY CROSS (W. J. D. T.).—The cross between the Malay and the Game makes a very hardy and exceedingly quarrelsome bird. They are good eating if killed very young.

SPANISH COCK'S FACE STAINED RED (W. E.).—If the cock in question, having only a red patch on his face, is put to a thoroughly perfect hen, you may, and probably will, breed some good chickens, but we believe it is hopeless to try for perfect produce from imperfect parents. No other qualities would induce us to keep a cock with red in his face or over the eye. A brown tinge on the body of a Brahma is a very serious defect. It is not a disqualification.

COCHIN-CHINA PULLETS (N.).—Our Cochins and Brahma pullets seven months old have been laying some time, and always do lay before seven months. We have Spanish now laying at that age. We know they do lay irrespective of weather, but not irrespective of condition, and unless they are and have been in good condition, they may, though seven months old, be not more forward than a pullet half their age.

COCHIN-CHINA CHICKENS (Beginner).—Your mistake was to keep your chickens in a room. It is, not, however, so much the room that is at fault as the flooring. It is impossible to rear chickens at this time of year on a wooden floor. It is damp and cold, and gives the chickens the cramp, of which they die. Put them in a barn, loose box, or any covered place with a floor covered with loose gravel, sand, or road-grit, and feed as you have fed.

VULTURE-HOCKED COCHIN-CHINAS (Inquirer).—A fowl is said to be "vulture-hocked" when the feathers of the thigh come to a point, and project as a kind of canopy beyond the hock or knee of the bird, as those feathers do in the vulture and others of the Accipitres.

GUINEA FOWLS (N. C. Nenagh).—There is no certain mode of determining the sex until they begin to utter their usual cries. "Come-back" is the cry of the hen only. The note of the cock is a kind of wail.

BLACK COCHIN-CHINAS (Tyro).—The plumage should in both sexes be uniformly black; but we can scarcely recollect of having ever seen a pen of adult birds of this variety in perfect feather, the cocks being almost invariably stained with red or copper feathers.

INCUBATOR (H. R. Hiley).—We saw a gentleman connected with the company who have patented the incubator we have repeatedly mentioned, and he said that it would be made public in a few days, but we can give no further information.

CANARY CEASED SINGING (—).—Your Canary is either asthmatical or too fat from eating hemp and rape seed; gradually leave off both the hemp and rape seed; do not give any sugar or cake; feed on canary seed, millet, and oat grits, with a little chickweed and groundsel. For a change he may have a little piece of bread soaked in milk, or a little piece of boiled carrot; and if his breathing is difficult, put some Spanish liquorice in his water. By following this course I have little doubt that he will regain his voice, and sing as sweetly as ever as the spring advances.—B. P. B.

### LONDON MARKETS.—DECEMBER 18.

#### POULTRY.

FRESH, cool weather has caused our markets to look up again, and has given a stimulus to trade, which, coupled with the approach of Christmas, has caused a cheerful tone. It is hardly possible to quote any price for Turkeys. As a rule, good quality being given, they are like roast beef, the more they weigh the more they are worth. There is the appearance of a good market.

From observations taken near London during the last thirty-eight years, the average day temperature of the week is 44.7°; and its night temperature 31.5°. The greatest heat was 58°, on the 23th, 1855; and the lowest cold, 1° below zero, on the 28th, 1860. The greatest fall of rain was 0.70 inch.

FAILURES IN TROPICAL FRUIT CULTURE.

FAILURES! an ominous word to begin a paper with!" I have no doubt most of your readers will exclaim; and certainly I must confess that it is not pleasant having to

write about one's own want of success, but thinking that, perhaps, even failures if recorded may help others to keep clear of them, or at all events to profit in some way from my experience, I have devoted this paper to the subject.

I have, I believe, at different times tried my hand at most well-known tropical fruits, but with the exception of the Mango, Mangosteen, and a few others, I have been unable to coax them into a fruiting state, or if I have obtained fruit it has been uneatable. I propose, therefore, to mention one or two of these failures, and, first of all, I will begin with the Bread Fruit (*Artocarpus incisa*).

This tree I was always most anxious to succeed in fruiting, and having had three healthy trees sent me, with full instructions as to climate and soil, I thought it a good opportunity to attempt their culture. I had them placed in a house where they could have the exact treatment they required, and where no other plants would interfere with them. They were planted in a sandy loam in very well drained tubs (drainage is most essential for this tree, as in stagnant soil it will not live many months); they grew uncommonly well, and in a year or two became very graceful objects, as the branches grow out in regular order from the main stem, becoming smaller as they reach the top, which gives the tree a cone-shaped appearance, and the leaves are nearly 2 feet long, of a beautiful green colour, and divided into lobes.

For some time, although one of the plants constantly produced flowers, nothing would induce it to fruit. I tried everything I could think of, but all to no purpose, and I was just on the point of giving it up as a bad job, when my efforts were at last rewarded by two fruit setting. These, it is needless to say, I watched with the most intense anxiety. Visions of a fruit filled with the most delicious breadcrumb, or, perhaps, even superior to bread, floated before my mind's eye. It is true that as time passed on my vision was somewhat disturbed by the appearance of the fruit itself, which when about as large as a small Turnip stopped growing, although it by no means became softer, but rather the reverse. However, I did what I could to ripen the two fruit, raised the temperature, and gave plenty of air well warmed, and was rewarded at last by one falling off "dead ripe," as a friend informed me. On trying to open it we found it harder than we expected, but, as my friend said, "that was the shell!" so, as a knife was of no use, we procured a saw, and succeeded, after some

labour, in opening it; but, alas! where was the bread? The inside was certainly rather softer than the outside, but still dreadfully tough, and tasted as much like a mixture of cocoa-nut fibre and frosted Parsnips as anything could taste. Here was disappointment; but we were not to be done, and as I had read somewhere of its being needful to bake the fruit, I suggested the other one should be cooked. My friend liked the idea, and in order to insure success, recommended its being roasted "à l'Otahite"—viz., by digging a hole in the ground, and filling it with hot ashes, putting the fruit upon them, and covering the whole up with soil. No sooner said than done. The soil remaining "fruit" was picked, and, after we had dug a hole, and, with great difficulty, lighted a fire therein, the Bread Fruit was deposited in the hot ashes, and carefully covered with turves. In about an hour it was dug up looking more like a charred stump than a fruit, and having been opened with the aid of a trowel we proceeded to taste the bread; but enough! I will not describe our disappointment on finding that it had the consistency of a very hard dumpling, and the taste of a very bad Potato. Merely permit me to express a humble but most decided hope that it may never be my lot to feed on the Bread Fruit, for I should most assuredly starve ere I brought myself to eat it again; in fact, I never tasted anything worse, and although I have had many since then, they all had the same flavour.

I should add that the trees were grown in an ordinary stove temperature, with plenty of air and moisture when not at rest. There is not much difficulty in growing the tree; but I much fear that in England the fruit will never be fit to eat.

Another tree I was desirous of fruiting was the Cocoa-nut Palm (*Cocos nucifera*), and as it is easily raised from the nut, and, unlike many Palms, bears male and female flowers on the same tree, it is in these respects well adapted for culture. I found no difficulty in making ordinary Coco-nuts push in about seven or eight weeks in a strong bottom heat; at least, out of twenty, on an average six would grow; but the young plants invariably failed after attaining the height of a few feet. This, however, I afterwards remedied by sowing the nuts where they were to remain in a rich, but very rough, vegetable mould, mixed with a little sand, and by constantly syringing the trees with weak salt water. By these means, and by growing the plants in a high temperature, they soon formed magnificent objects with their great, yet elegant leaves, often more than 10 feet in length. I soon found, to my great mortification, that no house I had would be half tall enough to grow them in, and I was at last obliged, though much against my will, to destroy them, after they had seriously injured the roof by pushing against the glass.

This tree could, I should imagine, be easily fruited, provided it had sufficient head-room, and was never moved after beginning to grow; this last is an important point, for if transplanted, no matter how carefully, it never seems to thrive again. As the trees grow they should have plenty of light and heat, and be constantly syringed well both with weak salt water and with fresh; they should also

occasionally be watered as well as syringed with salt water, taking care not to use it too strong. I would, however, warn any one who means to attempt growing this gigantic plant that a height of at least 40 feet will be required, and each tree must have a tub fully 6 feet across and 4 feet deep.

Another tropical fruit I could never succeed with is the Anchovy Pear (*Grias cauliflora*), rather a common stove plant I believe, at least I have met with it several times, but one I never heard of as bearing anything more than flowers. My tree grew well enough, but could never be induced to open its blossoms, and they invariably fell off in bunches. I was the more vexed at this, as the tree itself is really ornamental, bearing fine leaves, somewhat like those of a Pear, often 2 feet long, and the flowers would, I am sure, be both handsome and fragrant if they would open. I believe I tried almost everything to cure the plant of this unfortunate propensity, but in vain; and if any of your numerous readers have been more successful with it I should feel grateful for a few hints.

Passing over the Mammee (*Mammea americana*), a noble tree, with a delightful fruit somewhat like an Apricot, but richer, and which I was fortunate enough to fruit twice, so I suppose I must not class it with my failures, I will come to the last I mean to mention at present, as I fear our good Editors will be getting rather impatient with me for filling up so much of their valuable space; this is the Sappodilla (*Achras sapota*), a tree with beautifully smooth leaves, and white bell-shaped flowers. It grows freely, and generally looks very healthy, which is more than can be said of most tropical trees, but it seldom flowers, and still more rarely bears fruit, which never ripens, but rots on the tree in a green state, and nothing seems to be able to prevent this. I some time ago gave away my trees in disgust, which now I am sorry for, as the tree is very ornamental, the leaves being so smooth and shining that they look as if they were waxed, and the flowers very sweet-scented, besides which the plant will grow anywhere in a stove, and is by no means particular as to soil or culture.—J. H.

## THE MODERN PEACH-PRUNER.—No. 19.

### ORCHARD-HOUSE PRUNING AND TRAINING.

Among the various beautiful forms suggested by cordon training none are superior to the spiral cordon. This style is excellent in every way, productive, manageable, and elegant in appearance. Visitors invariably prefer it, and during the blossoming period it shows to the best advantage in the whole house.

There are various ways of forming the spiral cordon. Two trees, equidistant, may be planted in the border, and curled round wires or rods as desired. The diameter of the spiral need not exceed 15 inches, and at this interval there is no fear of crowding the spurs and shoots. A Peach and a Nectarine tree look very well together thus placed. Round the pillars of an orchard-house is the most natural position for a spiral cordon. I have, however, thought of late to place three trees together, equidistant, in the border of the house, and to coil these, at regular intervals of 12 inches, round five upright wooden rods firmly fixed into the ground. These five posts are connected at the top by a stout iron hoop. In this case the diameter of the spiral should be greater, and be about 2 feet. This plan will be found very advantageous for utilising the central borders of the house. Light and air are freely admitted within the spiral, and every part bears well. Indeed, the form seems so natural to the trees that the spurs on them are unusually strong. The continuous ascending curve favours the development of the tree, while it encourages healthy shoots all round. Sometimes the ends of the spiral cordons are allowed to run along the rafters, or they might be slightly pendulous, to check any rank growth; but of this last there is little fear. Cordon trees in full bearing are never over-luxuriant, but rather the reverse: therefore we should encourage them to grow rather than dwarf them. Trees thus trained never require lifting nor root-pruning, which is a great saving of labour.

The shoots of spiral cordons may be treated as those of bush trees, and be stopped at three leaves, if the intervals between the twist be 12 inches. Second growths should be stopped as usual at two leaves.

There is no reason why Apricots and Plums should not form handsome spiral cordons. Cherries might produce too much wood.

For the back wall of any lean-to no method equals the diagonal

cordon. If the house is low, say about 9 feet high, then no very strong trees should be thus trained, and those of moderate growth would require the double or triple cordon. For houses with 10 feet of back wall single cordons of moderately vigorous kinds would suit. Twelve or thirteen feet of back wall is the best height for single cordons. They will not be long in reaching the top, and when there there is no trouble in keeping them close. Very strong sorts, such as the Stanwick, may be double cordons on such a wall; but there is no doubt that the single cordon is the easier to form.

The distance between the trees, counting from stem to stem, varies according to the style of treatment. If flat cordons, with the shoots rather closely kept, be decided on, then 12 inches from stem to stem will suffice, and there is no practical difficulty in keeping the spurs and shoots within these limits, as the amateurs, now rapidly increasing in number, who have adopted this style, will testify.

Trees grow naturally towards the sunlight, and thus produce, if allowed, numerous forerights. Out of doors we should soon lose the benefit of the wall radiation and shelter if these were not restrained; but in orchard-houses this is not the case. There, forerights are the rule rather than the exception. Flat diagonal cordons, then, are easy of formation, and can be trained without any more difficulty than fan-shaped cordons. Of late I have gradually been led to adopt a larger form of the diagonal. In the new house just planted the trees are placed as single cordons, being old trees transplanted, and the oldest in England of this form, against a 13-foot back wall, at intervals of 15 inches. All the roots were found to have been produced in a forward direction, towards the light, and thus no difficulty arose in planting or transplanting from lateral development, as we expected. These trees have straight stems about 2 inches thick, and the spurs on them are generally half an inch in thickness. On these spurs are from six to ten shoots, which project forward, and are sometimes spread out symmetrically by ties. These large spurs and shoots require but little winter pruning, as most of the shoots on them are of classes 5 and 7. They look exactly like a small bush tree grown in an eight-inch pot, and could bear nearly as well. In replanting these trees the lower portion of each alternate one is now made to project about 12 inches from the wall, the remainder lying close to it. The object of this is to acquire more space for the roots, while the shoots on the lower third of the tree thus advanced will be allowed to grow all round, as in pyramidal cordons. Thus the space gained by advancing the alternate trees will be utilised, and the tree be allowed to make more wood at that part which most requires it. At about 5 feet from the ground the stem is allowed to touch the wall, and is trained, like the others, close to it. The angle of inclination of all is only about 6°, as the trees are now full grown and established. To distinguish them from the usual flat diagonals I have named them "diagonals with pyramidal bases."

The advantages of diagonal training may be briefly summed up as follows: The trees come sooner into bearing, which is only to be expected, as each tree lies at the natural angle made by a branch with the parent stem; the wall is sooner covered than by any other mode; many varieties can be grown side by side, and those not found good replaced; a succession is obtained from the same wall, which is a great object in small houses or gardens; the produce is large; the training is not more difficult than in the case with other forms; and the trees are very readily untied to cleanse the wall, also a matter of importance.

There is little doubt that, when better known, this form for the back wall will be common. Mr. Richard Clay, of Hampton Court, has had the happy idea of largely adopting this method for his large span-roofed house, 160 feet long by 20 high, and of great width. In this house there are six rows of diagonal cordons, trained parallel to the length of the house on wires at an angle of 45°, with shoots on both sides. The produce of this new house is already very great.

For the open air it may be questioned if, in this climate, the diagonal is sufficiently large of form, and therefore suitable, although it succeeds in France. It is, however, strange that it is not more adopted for Pears, Apples, and Plums on the open wall, where a large variety and a succession of fruit is desired, and the walls are more than 11 feet high. Cherries are rather rebellious under this form. Plums do very well, requiring, however, the triple cordon; very strong-growing sorts might not suit. For choice Apples, however, and especially for Pears, there is no question of the advantages to be derived from this simple and natural mode of training. It is much

adopted on the Continent, and will gradually make its way here, not, however, that English gardeners need this teaching. I believe I may say that Mr. Pearson thinks highly of this form, and I know that Mr. Rivers does.

The easiest method of forming a diagonal cordon is as follows:—A well-drained trench, 2 or 3 feet wide, and about 1 foot deep, is made along the wall of the house. Healthy and vigorous young Peach and Nectarine trees are then laid against the back wall, at intervals of 12 inches if for the double and triple cordons, in case the wall be low, and at 15 inches if for the larger-developed form, described above as single cordons. The trees should have healthy buds and shoots all along their length, no vacant spaces from accident or otherwise. The first year they may be upright, or at the angle of 70°, according to their vigour. The second year, if prosperous, they may be lowered to 45°, there to remain. In the first winter of planting about one-quarter of the tree may be cut off, always to a front bud, as thereby the future growth presents less deformity at the point of junction. Wires or trellises placed at angle of 45° much facilitate the training, as the object is to have the stems as straight as possible. If placed otherwise, guiding-rods for the young wood will be necessary, with frequent ties—say at every 6 inches. The trees will largely benefit by no fruit being taken from them till they are three years old, and then only one or two specimens. There is no loss of time, as these trees can now be had 6 feet long at Mr. Rivers's, and by resting them one year they will bear every succeeding season, lasting the usual time of any such trees. After the first winter's heading-down, no further shortening of the trees is needed. Provided the shoots and roots are then well looked after, the leader or leaders may be left alone. Accidents may be remedied by grafting by herbaceous approach, an easy and a certain way.

The next form of cordon which I shall notice is the lateral cordon. This is best described by Mr. Rivers in speaking of the ground vinery, which is also admirably adapted for the close cordon training of Peaches. "There are no cross bars, but merely a frame; in the top bar is a groove half an inch deep; in the bottom bar a groove a quarter of an inch deep; in the bars at each end are grooves half an inch deep. The pieces of strong 21-oz. glass, which should be cut so as to fit, are pushed into the upper groove, and let fall into the lower one. The two end pieces of glass are then pushed inwards, so as to bring the pieces close together. A little putty at the lower bar keeps water out, and a little is also applied to the end pieces, so as to prevent lateral motion. The width of such a span-roofed frame should be 3 feet at base; 20 inches of height to the ridge; slope in all, 24 inches." In such a structure two Peach trees laid horizontally side by side, and raised on rods or wires sufficiently to keep them free, would produce the finest fruit. In lengths of 7 feet, only one at each end being closed, these structures are easy to manage, and would be very economical. It is easy to see how only close pruning, as described, could be practised in such cases.

An adaptation of these principles, wherever the front walls of an orchard-house were available, would be to take one-half of the span of this "ground peachery," which would give a light 7 feet long by 2 broad. Some bricks or perforated planks, placed 30 inches from the wall of the house, form a rest for the lower edge of the light, and afford low ventilation, which is also secured by an interval of 2 or 3 inches being left between the upper edge of the light and the wall of the house. Tiles or slates make the best floor for such miniature lean-to houses. It is easy to place hinges so as to open them, and they should be secured from high winds lifting them. Mr. Rivers wrote to me very recently, "It will be a hard fight between these low lateral cordons and diagonals as to produce." No doubt of it; and if the back wall of the house and the low front be thus utilised, it is difficult to conceive how they could be better employed. The roots should be placed on a well-drained spot, and the shoots of these lateral cordons stopped at three leaves as soon as five are produced, and second growths at two leaves as soon as three or four are developed.—T. C. BEECHER.

#### HOW TO USE PRUNING SCISSORS.

In your Number for the 11th of November, writing on the "Cultivation of the Vine," Mr. Willis says—"Avoid using scissors for pruning the Vine. These have a tendency to bruise the shoot for an inch or more below the cut, &c." This certainly differs from my own experience in the matter. For several years I have used only scissors for pruning Vines,

Peaches, &c.—scissors of the usual form, one arm being a curved square bar of metal, under which shuts the knife-blade of the other.

Now, the fact I wish to point out is this, if you are careful when pruning always to place the curved bar on the part of the shoot that is to come off, you may then close the scissors and cut without the least chance of a bruise on the part left, and with a less chance of splitting than when you use a knife.—J. S. S.

#### FLOWERS OF THE PAST SEASON.

PELARGONIUMS.

"Which do you consider the best Geraniums of last year?" By Geraniums the questioner meant greenhouse ones. Well, it really requires some time to reflect as to which were those of last year. One year we see them as seedlings exhibited; and when we are the second year examining them in our own houses another batch of candidates for public favour is presenting itself to our criticism. It is the same in Roses, Verbenas, and other florists' flowers, and, indeed, in Orchids, stove plants, Ferns, &c. There is a continuous progress going on; and although

"To paint the Lily,  
To throw a perfume on the Violet,"

may have been in the eyes of our great poet "a wasteful and ridiculous excess," yet it is what we are now continually doing. The man who tells me that he thinks the little wild *Viola tricolor* more beautiful than the lovely varieties that the skill and patience of the hybridiser have added to our gardens is, I have no doubt, sincere; but for all that I hold differently. And although there be an impatience on the part of some at making inroads into the domains of the botanist, so that even good Mr. Bateman said the other day that he was always glad when any of Mr. Dominy's Orchid marriages proved unhappy, yet we are all, I think, gainers by their success. Some persons have said that further advance in some sections (this amongst others), is impossible. This I hold to be a fallacy; and I would also again suggest what I have frequently stated before—that when we have made such advances as we have done further progress must necessarily be slow, and a little improvement each year all that we can reasonably hope for. I sometimes look back and see what has been done, and remember how I have thought nothing could go beyond flowers which are now passed away from remembrance; and so the other day, when talking with Mr. Hoyle of Reading, and expressing doubts as to his progress, he immediately referred me to one of his new flowers, Charles Turner, which, as having a white throat, is a decided advance on all scarlet flowers. I now proceed to notice the flowers of last season.

HOYLE.

1. *John Hoyle*.—This flower merits all the honours that were heaped upon it, and the favourable manner in which it has been spoken of. It is a large flower, of fine form, white throat; lower petals orange red, richly painted; upper petals very dark maroon, evenly bordered with a bright carmine margin.

2. *Mary Hoyle*.—A lovely and refined flower, large, and of excellent habit, orange rose with a white throat; blotch small, with bright orange surrounding it.

3. *Exhibitor*.—Lower petals rose, with white centre; upper petals maroon, shaded. Good habit.

4. *Mrs. Workman*.—Orange rose lower petals, white centre; maroon upper petals, shaded with red and orange.

5. *Pretty Mary*.—A beautifully coloured flower. Orange rose lower petals; rich orange upper petals, painted, with small maroon blotch.

6. *Publicola*.—Deep orange rose petals, rich maroon top. Stout, good flower.

7. *Sunny Memories*.—Orange rose lower petals, white throat, rich maroon blotch, with a margin of bright orange. A very pleasing and bright-looking flower.

8. *The High Admiral*.—Fine, large, and bold-looking flower. Mottled rose and lilac lower petals; rich maroon top, bright margin.

FOSTER.

9. *British Sailor*.—Lower petals deep rosy violet; dark top petals, shaded on the margin with lake.

10. *Constance*.—White centre; lake lower petals.

11. *Florist*.—A striking bold flower, scarlet rose, with white throat. Free-flowering.

12. *Cura*.—Deep rose lower petals, maroon spot on top petals orange margin, white throat.

13. *Amazon*.—A large light rose variety, not to be confounded with an older *Amazon*. A pretty flower.

## BECK.

14. *Astarte*.—A pretty blush flower, with pink spot; large. Much in upper petals.

15. *Alba Formosa*.—In the style of *Alba Regina*. Very pure white, purplish crimson spot. A well-shaped flower.

16. *Heartsease*.—White, purplish spot on all the petals.

17. *Rose Spot*.—Pretty colour. Bright rose, rose spot.

18. *Antonina*.—Purplish crimson, white throat; petals narrow.

19. *Pulcherrima*.—Something in the way of Beck's *Hector*, but no improvement.

20. *Excellent*.—Bright crimson, with very dark spot.

It is but fair to say that I received the plants of Mr. Beck's varieties very late, and consequently had no opportunity of seeing them at their best. I believe the flowers may be placed thus—*John Hoyle*, *Mary Hoyle*, *British Sailor*, *Sunny Memories*, *Pretty Mary*, *High Admiral*, *Astarte*, *Alba Formosa*. The others I consider inferior.—D., *Deal*.

## TROPICAL FRUITS.

THE papers on tropical fruits by "J. H." induce me to offer the following remarks, having spent some time in the tropics of both the New and Old World, and being well acquainted with their fruits from the grateful *Garcinia mangostana* of Java, to the stinking Durio zibethinus. The latter fruit can never become a favourite in this country. It is certainly very agreeable in flavour, but the powerful disagreeable odour when ripe, like that of Onions in the last state of decomposition, and which is also imparted to the breath of those who eat the fruit, makes them as disagreeable to come near as those who have eaten horseflesh. The Durion in India more frequently attains the height of 60 than 30 feet, as stated by "J. H.," and has a stem the size of that of an ordinary Oak. I was not aware that it had fruited in this country, and I would go a considerable distance to see it. Perhaps "J. H." would say where it is to be seen.

With respect to *Anona squamosa*, the Scaly Sweet-Sop of South America, it is certainly very good. The tree attains a height of from 15 to 20 feet in Brazil, while *A. muricata*, or the Sour-Sop, only attains a height of 10 feet. *A. cherimolia*, or as it is sometimes called, *A. tripetala*, is one of the best, but I am not aware of its having fruited in this country. There are five or six other species of *Anona* cultivated for their fruit.

The *Mangifera indica*, or Mango, is, perhaps, as much esteemed as any fruit in the tropics. It varies as much there as the Apple does with us; some kinds being much like a very fine Apricot, and others, the majority, like a mixture of turpentine and honey.

The *Garcinia mangostana* is certainly one of the most delicious fruits grown, but you must go to Java to eat it in perfection. Even at Calcutta it will not succeed; the supply coming from the Straits. This is easily accounted for: The temperature of Java, Sumatra, and other neighbouring islands, ranges from 82° to 85° by day, and falls to 70° by night; while that of Calcutta, in March and June, ranges from 75° to 110° in the day, and during the nights of December, ice is frequently formed. Much noise was made some time back, when the tree at Sion House produced three or four fruit. I may be wrong, but I always looked upon that fruitfulness as accidental, and not obtained by superior cultivation; or why has it not fruited since? Being well acquainted with its culture, I was only surprised that it ever fruited at all, as its treatment was very different to what it would have received in Java. I have seen the Mangosteen fruit freely in Brazil, but the fruit there will bear no comparison with that produced in Java.

I well remember some years ago meeting a party of Europeans at the table of the British Consul at St. Salvador, on which occasion twenty-seven varieties of tropical fruits were served as dessert, all of which were new to the party, except the Pine and Orange. Various opinions were expressed as to the various merits of the fruits. The Musas were pronounced soapy; the Mangos smacked too much of turpentine; Sour-Sop too acid; *Limnospis dissecta* and *Blengi*, good; *Chrysophyllum cainito*, better; the Navel Orange the best fruit on the table; and then the Pines, a variety called *Abochichis*, very fine. By-the-by this is the only Pine admitted to the royal table, and the best I ever ate. Beautiful as this dessert appeared on the table, there was a want created by the absence of Grapes, Peaches, and

Strawberries. *Psidium Raddii* was very good, and the stinking Durion was placed in the verandah for those who liked to try it.

While on the present subject, may I ask if *Lucuma deliciosa* has fruited in this country? I ate it in perfection in Chili, though it is not a native of that country. I may return to this subject at some future day.—RADDII, *Peterborough*.

(We enclosed the preceding letter to "J. H.," and the following are extracts from his reply:—

"I would give the address 'RADDII' requires in his private note, and also I should much like to know him, as his remarks are, many of them, much in accordance with my own. With regard, however, to the Durion, I think he rather exaggerates the odour, which, although very revolting, is, when the fruit is constantly kept wet during ripening not quite so bad. I have detected a slight oniony smell, but as I never had the pleasure of smelling anybody's breath directly after he had eaten 'horseflesh,' I am unable to say whether I think the odour similar to that. I have an uncle who for some years took much interest, while he was in Madras, in growing this fruit, and from whom I had originally sent some small trees of this sort, but he has often told me that if the fruit is kept moist whilst ripening, the scent is far less; and a friend of mine who grew the tree, and once fruited it in England, found the same. Again, varieties differ much, some being less offensive than others. I am not saying that the fruit does not stink, for it does; but this evil may, I am certain, be much lessened, and I believe if grown in our hothouses its smell is never so strong as it is abroad.

"I perfectly agree in what 'RADDII' says (by the way is 'RADDII' the name of a plant, for if so I should much like some cuttings?) about the Mangosteen, and he has hit the vital point I am certain about the temperature. I found that to my cost. I feel sure, also, that he is right about the Sion House plant. I firmly believe it fruited 'by accident,' or why, as he says, 'has it not fruited again?' I have a letter before me from Mr. Smith, some time gardener there, and who was an under gardener there when this tree fruited. He seems to think the trees very bad now, and they never fruited or flowered before or since, and never will, mark my words, as they are kept now.

"What Pine is it with the unpronounceable name, that is always used at the royal table in Brazil? Can we obtain it?"

"In conclusion, would your correspondent kindly give me a description of the *Lucuma deliciosa*, and any other unknown fruit? I should really esteem it an immense favour, as I take so much interest in the subject, and I am so thankful for information.—J. H."

There is no species known to botanists, we think, as *Lucuma deliciosa*. Our correspondent probably refers to *L. mammosa*, or Teated Mammee Sapota, a native of South America, and the West India Islands. It is sometimes called the "American Marmalade," the soft pulp of its fruit, of a russet colour, is delicious, and not unlike the marmalade of Quinces.]

## SOMETHING ABOUT ROSES.

OUR late lamented friend Donald Beaton (for though I never saw him in my life, yet his writings in your Journal must have made him so familiar to thousands of lovers of horticulture, that many who never saw him came to regard him as an old friend, now gone to his rest)—our late friend, then, was frequently saying that the queen of flowers, the Rose, never did so well as on its own roots: that, in fact, no kind of stock was so suitable for or so worthy of bearing this regal beauty amongst flowers. Now, I do not feel at all able to decide this knotty point. Where doctors differ I cannot undertake to pronounce a verdict that shall be decisive and satisfactory. I am growing some two hundred or more Roses in almost every form, on briars, on *Manetti*, on their own roots, double budded, and not budded at all, and after two or three years' more experience I hope I may be able to decide, at least in what form they are best adapted to my own soil and locality; but, for the present, I wish to take it for granted that in some soils certain Roses will do better on their own roots than in any other way.

I have also read lately an observation by an experienced rosarian that a Rose propagated from a bud (I mean to grow on its own roots) is far superior to one of the same kind propagated from a cutting. Now, I do not know how it may be with other amateurs, but I find the striking of Roses, or at least of the Hybrid Perpetuals, difficult and disappointing.

If I succeed in striking a lot and getting them to grow for three or four months, I find I lose a large per-centage in the re-putting or removing, and I find in the case of bought Roses that I lose more of those sent to me on their own roots than of those sent in any other form. There is, however, one way in which I find I can propagate Roses with entire success and satisfaction, and that is by budding on the Manetti, and I want to know if I cannot get them on their own roots off the Manetti with success and certainty. I do not know whether my theory for doing this will be new to your readers; I must confess it is but a theory, though I believe it to be based on sound principles; and my chief object in writing is to induce others to join me in trying the experiment, if it seem feasible, or, to prevent disappointment to myself and others, by inducing some one more learned than myself in horticultural matters to point out in what respect the experiment is likely or certain to fail. The late Mr. Beaton, if I remember aright, used to say that the Manetti was only of use as a medium of getting Roses on their own roots; but I cannot help thinking that this very remark shows that he could not have used it extensively, for I well remember the Rev. Mr. Radclyffe writing not very long since, that in the case of a lot of Roses on the Manetti which he was removing, scarcely any had thrown out roots from the junction of the bud with the Manetti, but were depending entirely upon the stock for support. As far as my own experience has gone, I can thoroughly endorse this opinion both as to what I have bought and what I have propagated myself. I have found some few throw out roots from the junction of the bud with the stock, and I believe this will take place in the case of the budded Rose being a particularly free grower, or of the stock being injured in some way or planted too deep. In either such case the stock cannot supply sufficient nourishment for the Rose budded upon it, and nature assists by causing roots to be emitted at the junction of the bud with the stock.

This, as you will see, just brings me to my plan for insuring this production of roots from the bud, or, in other words, from the Rose itself, so that after awhile it shall walk on its own legs, and do away with the crutch or wooden leg with which it has hitherto been supported. The first year after budding on the Manetti I would let the Rose grow away as freely as it would. Then in the following autumn, say in November, I would take up the plant, cut a strip of bark off the stock just below the bud, about a quarter of an inch in width, and about half round the stock, and then replant, of course taking care to bury this wounded portion of the stock at least 2 inches below the surface of the soil. I conclude that this would so far check the flow of sap as to cause the formation of roots from the part from which the bark had been removed, or rather from the bud itself, and that the portion of bark remaining uninjured would be ample to carry on the healthy growth of the plant until the formation of new roots from the bud itself; or, supposing the bud to have done particularly well, it might answer to remove this portion of bark in the June or July following the budding, and thus obtain a good plant on its own roots in one season. In this case I need scarcely say that the plant should not be taken up, but the soil should be taken away from round the stock until the portion of bark can be removed with facility, and the soil then at once replaced. I am not sure whether budding unusually high on the Manetti, as for instance 9 inches above the roots, and then planting very deep, might not effect the same object—viz., the emission of roots from the bud. The flow of sap in this case, from deficient root-action on account of deep planting, as well as from the length of stock through which it would have to pass before reaching the bud, would be so much checked that I am inclined to believe that roots would soon be emitted from the bud to supply the deficiency of sap arising from the above causes.

I am half afraid that the Editors will say I am spinning a very long yarn about a very little matter, a case of "*montes parturient, nascitur ridiculus mus*;" and yet if it be a fact that some Roses in all soils, and all in some circumstances, do best on their own roots, and if it be a fact that a Rose propagated from a bud is better than one from a cutting, I believe the theory I have propounded will, on the whole, be found the surest and quickest mode of attaining the object in view, such object being understood to be the attainment, not of a dwarfed weakly plant about as long as your finger, but of a vigorous well-established plant, able to go ahead without nursing and coddling. I do not know why other stocks might not be used for this purpose as well as the Manetti; why, for instance,

short stocks of the Dog Rose, from 6 to 9 inches long, budded, and then planted deep so as to cover the junction of the bud with the stock, might not succeed in the same way.

In case of any of your readers commenting upon this contribution, I would especially ask for information on two points—1st, whether November would probably be the best time of year to remove the patch of bark?—and, 2nd, whether a width of more than one-quarter of an inch of bark, and extending more than half round the stock, would not be desirable? Of course if too little bark is removed, new bark would be formed over the place from which it had been removed, and, instead of roots being emitted, the flow of sap would thus be continued as before. I need scarcely explain that when roots have been freely emitted from the bud, it is intended that the Manetti stock should be cut away altogether from below the bud, and the Rose then replanted on its own roots.—COUNTRY CURATE.

## KITCHEN GARDENING.

DECEMBER.

THE work to be done this month will depend on the state of the weather; for instance, if damp and wet weather occur keep off the ground by all means; but if frosty many kinds of work can and ought to be attended to. First, as to protection. The Savoys should be protected if thought necessary, using them as fast as possible, and some of the Turnips should be taken up and laid in soil in the root-shed or other convenient place, cutting the tops off those left in the ground, by which means they will be induced to grow again, when they will furnish many a nice dish of greens when other things become scarce. If the weather should be very severe the Cauliflower plants under hand-glasses will require a little more protection than the glasses will afford them; this may be given by shaking a little dry litter over and between them; and should it be intended to keep the plants on the open border they should be covered with hoops and mats, or some of the numerous contrivances that gardeners are obliged to resort to. The Celery, too, must not be forgotten, covering it so as to leave nothing but the top leaves visible; some short dry litter is the best for this purpose. Endive, if well blanched, should be taken up and laid in by the heels, under cover, and the successional beds should have some flat tiles or slates laid over the plants, thus blanching and protecting them at the same time. Lettuces should be treated in the same way, and if there be a spare hand-light or two lying about they should be placed on the seed-bed of the latter.

Sowings of Mustard and Cress under glass should be attended to where that description of salad is in requisition. These are all the sowings which I make this month. Perhaps it may seem strange to some of your readers that I have omitted to mention autumn sowings of Beans and Peas, but it must be remembered that every piece of ground is already cropped, and even if it were not so, I am not an advocate for autumn sowing; but as early in the year as I can have a piece of ground clear and in good working condition, the latter being a great consideration with me, I make a start with early Peas, Potatoes, &c.

Advantage should be taken of dry mornings to get all the wheeling done without injury to the walks, and at this time of year every attention should be paid to the latter, keeping them in good order, so as to give the garden, as far as is practicable, a clean and tidy appearance; and in dull, damp weather the time may be well taken up with making labels, sharpening sticks, &c., so as to have them ready for the ensuing year's campaign, not forgetting to look over the root-store occasionally; and the seed-order may be prepared, referring to the cropping table to see what varieties have succeeded best, and making alterations accordingly. I think it is a very good plan to obtain seeds grown at a distance from the neighbourhood in which they are to be sown.

From my own cropping table or diary I will venture to give the following remarks on the vegetables grown here in the past season, and I think it would be very interesting and instructive if others would do the same, as different localities would produce different results, and we should learn each other's plans of guarding against the weather, which is the essence of the gardener's art. During the early spring, or rather the end of winter, vegetables held out well, and with the assistance of forced Sea-kale, Kidney Beans, Rhubarb, &c., lasted until the Asparagus was in, which was the case earlier than usual this year, and here it was remarkably good, and lasted till the Peas

were well in, owing to the hot weather which we had in May and the assistance of some liberal doses of manure water applied to it at that time. Cauliflowers did not do much here, not so well as they usually do, and every plan that I adopted failed to prevent them from buttoning and running to seed. Peas were very good in the early part of the season, and some tolerable gatherings were made in the latter part of it; but in the middle of the summer, when they ought to have been first-rate, they were hardly worth gathering, with the exception of one or two sorts. Yorkshire Hero and a second growth of Dickson's Favourite were the only ones with me that in any way repaid the extra trouble of watering and mulching. On the whole the Pea crop this year has been indifferent. Spring and summer Cabbages were in early and hearty well, in short they could not have been better, though I heard that in some parts they were not so good as usual. Spring Spinach did well, but the summer crop ran to seed too quickly, in fact, I came to the conclusion that it was a waste of time to sow Spinach. Dwarf Kidney Beans and Scarlet Runners did exceedingly well, but required much more water than they would have received had not the winter stuff been planted between the rows, and as that required frequent waterings and surface-stirrings, the Beans came in for their share of the benefits. They were in bearing later in the year than usual, as they were picked here late in October. Broad Beans did not do much, as they ripened too quickly. Vegetable Marrows did very good service all through the season, but they were planted in a good position, and received regular attention in watering, stopping, &c., as much, indeed, as a pit of Cucumbers. It has been rather difficult to keep the supply of salading up, especially where space is limited and the ground all exposed. Celery had a hard struggle, and took up much time, but after all it is very passable, and the late Celery will be good, as the autumn has been favourable. Carrots, Parsnips, Beet, and Onions are not so large as usual; but still they are just the right useful size. In the latter part of the season the winter stuff did wonders, and it is now in first-class condition. Turnips here are a very good crop, and Brussels Sprouts unexceptionable. Taking the season altogether there is little to grumble at, and very much to be thankful for, and I hope from the difficulties of the past year we may have gained experience, and summoned resolution to meet similar difficulties with a good heart in the next.

The present is the concluding article on this subject, and, like its predecessors, it has been written in the hope of imparting some little information, and I trust that any little defects that may have been seen will be overlooked on that account. In conclusion, I hope that if these few remarks of mine have been read by a master, that he will treat his servant well, and if by a servant, that he will do his duty to his master, and remember that a gardener's work is never done.—BENTWOOD, P. D.

## ROYAL HORTICULTURAL SOCIETY.

DECEMBER 19TH.

**FLORAL COMMITTEE.**—The last meeting of the Committee was held this day. Three plants only were sent for examination—viz., three *Odontoglossums* from Mr. Robson, gardener to G. Cooper, Esq., Old Kent Road, and which were in many respects similar to the varieties sent home by Mr. Weir; they were not named, and it was requested that they might be seen again. Mr. Veitch kindly sent a large collection of plants, consisting of *Lycaste Skinneri* in great variety; *Rhododendrons* Princess Alexandra and Princess Helena; beautiful specimens of *Poinsettia*, *Barkeria Skinneri*, *Urecolina aurea*, *Aucuba japonica longifolia*, vera, and the common variety, in berry, and many other plants. The usual special certificate was awarded, and the Committee recommended this beautiful collection to the Council for a medal, which was granted. Plants of *Aucuba japonica* bearing bright red berries were exhibited from the garden, and also the fine specimen of *Musa cocinea* so much admired at the last meeting. Cut specimens of that exquisitely scented winter-flowering shrub, *Chimonanthus fragrans*, and the variety *C. fragrans grandiflorus*, were sent from the gardens at Chiswick, where it is grown under a south wall. These flowers proved very attractive, and were eagerly sought after by the ladies and Fellows present.

This terminated the last meeting of the Floral Committee for 1865. Of the success and popularity of these meetings there can be no doubt. They have been well attended, and the interesting plants exhibited have never been surpassed. Through the liberality and courtesy of the Fellows, both amateurs and nurserymen, plants have this year been brought before the public which were probably unknown to many. The number of certificates awarded has exceeded that of any previous year, and valuable new plants and florists' flowers of the highest merit have been added to the lists of those already known. We sincerely hope that these meetings will still continue to be as well sup-

ported during the next year; and that Fellows and others possessing plants, however insignificant in their own estimation, if they display any extraordinary feature or character, will kindly send them to these meetings; and most especially is it to be desired that when improvements have been made in any seedling florists' flower by hybridisation, the older or parent plants should be sent for comparison. It is not always an easy matter to carry in the mind's eye the flower on which an improvement is said to have been made. It is the earnest wish of the Committee that justice should always be done. That the awards should satisfy every one is not to be expected, and it is only fair to ask that credit be given for integrity of purpose in all the decisions. It was with the greatest satisfaction and pleasure that we heard from the Chairman at the meeting, W. W. Saunders, Esq., that the Council had that day determined on establishing another medal, to be used solely at these meetings, and to be awarded either to new plants of first-class excellence or collections of plants. The value of this medal will be in no slight degree enhanced by the name which it is to bear. It is to be called the Lindleyan medal—an appropriate compliment to the memory of one who held the interest of the Society so much at heart. Mr. Veitch will have the honour of receiving the first Lindleyan medal that is struck for his superb collection of plants exhibited this day. We cannot omit to notice the interest that is so frequently expressed in the pleasant and easily understood remarks made by the Rev. M. J. Berkeley on the new and curious plants and fruits exhibited. The objection too frequently made to botanical study is the difficulty of mastering the terms used by botanists. Science surely never loses any of its interest from simplicity of language. It is very obvious, that the more attractive the study of plants can be made by divesting it of difficult terms the more numerous will be its admirers and followers. On the other papers which have been read at these meetings we need not comment, they have already been noticed in this Journal. It remains, then, for us to express an earnest hope that every one interested in horticulture, whether a Fellow of the Society or not, should endeavour to promote the Society's object in making these meetings attractive and successful, and to keep alive and active that work which is going on, small and unimportant as it may seem to some, but which the Council most earnestly desire this Committee should be able to carry on with credit to the Royal Horticultural Society.

**FRUIT COMMITTEE.**—G. T. Wilson, Esq., F.R.S., in the chair. The only fruit placed on the table consisted of twenty-one dishes of Apples and nineteen of Pears, from M. Capeinick, of Ghent; Tangeline Oranges from Messrs. Rivers & Son; and from the Chairman some fine Chantrelle Pears, the produce of a pot tree grown in an orchard-house, and moved out of doors to ripen its fruit. All of the above subjects had previously appeared at the Fruit Show in the previous week. No certificates were awarded at this meeting.

**SCIENTIFIC MEETING.**—W. Wilson Saunders, Esq., F.R.S., in the chair. The Chairman having announced a donation of books to the library which the Society is endeavouring to form, the Rev. Joshua Dix stated that the Floral Committee had given a special certificate for Mr. Veitch's fine exhibition, and had further recommended it to the Council for a medal. To meet this and similar cases the Council had granted a new medal to bear Dr. Lindley's name. Mr. Dix concluded by thanking the exhibitors at the Tuesday meetings, and trusted that these, next year, would be equally well, if not better, supported.

Mr. Wilson Saunders said he had to state on the part of the Council that, with the view of bringing forward really valuable things, it had been agreed to have a new medal struck, which should bear the name of one who had done so much for the Society, and whose loss they had so lately to lament. It would, accordingly, be called the Lindley medal, and would be next in value to the gold Banksian. It was usual to be given as a medal, and for things shown at Tuesday meetings only. These were now over for the present year, but they would be resumed in January, when he trusted they would not be less appreciated by the Fellows than they had been. Mr. Saunders concluded by urging every one possessing subjects, whether remarkable for novelty, interest, or beauty, to send them to the Tuesday meetings, and so add to the interest and utility of these.

The Rev. M. J. Berkeley remarked that one of the *Odontoglossums* shown by Mr. Robson, gardener to G. Cooper, Esq., had some resemblance to *O. pescatorei*, a species belonging to the same category as *O. pulchellum*, and membranaceum, all three of which have a single lobe on each side of the column, but in Mr. Robson's *Odontoglossum* the column is fringed. With regard to *Poinsettia pulcherrima*, of which some plants were shown, Mr. Berkeley observed that it was not so much cultivated as so showy and effective a plant deserved to be. Mr. Berkeley then exhibited a specimen of *Libocedrus decurrens* (Torrey), bearing fruit, and which came from the garden of the Marquis of Huntly at Orton Longueville. This *Libocedrus* was originally discovered by Colonel Fremont, the great traveller and explorer, who had made considerable additions to the flora of North America. It there formed a magnificent tree 120 feet in height, with a stem 7 feet in diameter. It seems, added Mr. Berkeley, perfectly hardy in this country. The tree from which the specimen shown had been taken was covered with fruit, and he trusted it would ripen seeds next year.

Mr. Wilson Saunders (the Chairman), said that before separating, he wished to draw attention to *Chimonanthus fragrans*, of which numerous flowering shoots came from the Society's garden. The plant was difficult to propagate from cuttings, and never seeded in this

country. It would be interesting, therefore, to know how the variety grandiflorus had originated whether a sport or seedling. It was a great advance on the comparatively small greyish-flowered species, and that knowledge being obtained, a yet greater advance in the size of the flower might be obtained. Mr. Saunders concluded by intimating that the *Chimouanthus* flowers were at the service of the ladies.

### CYCLAMENS.

I AM agreeably surprised to find a communication from Mr. J. Atkins, in the Journal of November 28th, page 411. I wrote of him as "the late" purely from misadventure; it occurred to me at the time I wrote the paper on Cyclamens, that I had heard him spoken of as the "late," which I now understand was not intended to mean that he was not in the "land of the living," but not the same enthusiastic raiser and grower of Cyclamens as in former times. Viewed in that light, I think many who having a talent do not exercise it, or allow it to lie hid, might to advantage be set down as "late," if by so doing we could induce them to yield it up with interest, as Mr. Atkins has done. I am, indeed, glad to find Mr. Atkins still a grower of Cyclamens, and that he may long enjoy in health his favourites, is, I beg to assure him, the only sentiment I have towards him, and every other grower of Cyclamens, whether differing from, or agreeing with me, in opinion. Whilst thanking Mr. Atkins for his favouring us with the account of his experience of *C. repandum*, I cannot but express my regret at his leaving to "a more able hand," the penning a few remarks on my paper, differing very materially from me as Mr. Atkins does in some points. I really do not know who can be "a more able hand" than the raiser of *Cyclamen Atkinsi*, a hybridiser (and the only successful one), a raiser, and grower of Cyclamens for many years. I hope Mr. Atkins will reconsider his decision, and favour us with his experience, as also that to which he alludes.

I am glad to find that Mr. Atkins and I are agreed as to *Cyclamen odoratum*, which, as I have seen it, is nothing more nor less than *C. europæum album*, there being no good white form of *C. europæum*, but a very pale form passes under that name, and is identical with *C. odoratum*. There is a variety of *C. persicum*, called *C. persicum odoratum*, which has white petals dashed with pink; but no one could possibly confound one with the other, as they differ so very materially in foliage and time of flowering. As to *C. græcum*, what is it but a form of *C. europæum*, and what are all the round or orbicular-leaved Cyclamens but varieties of *C. coum*? *C. coum* may be, and I am pretty nearly certain will be, at no distant day, the only true species of the orbicular-leaved section; *C. coum vernum* being nothing more than the first natural remove from *C. coum*, indebted to some variegated-leaved kind for its marking on the leaves. After it would come *C. europæum* as *C. coum europæum*, and its white form as *C. coum europæum pyrenaicum odoratum*, or Sweet European Cyclamen from the Pyrenæes; *C. græcum* being neither more nor less than a deeper red form of *C. coum europæum*, which might be distinguished from the others as *C. coum europæum græcum*. I am certain when Cyclamens come to be botanically sifted, that the many differences of colour and time of flowering in the orbicular-leaved section of Cyclamens will not be regarded as real distinctions. Culturally the kinds differ widely, and that is enough for me, only it would be well if something like accuracy were attainable in Cyclamen nomenclature.

"W. X. W." lays me under a debt of gratitude to him. I have perused his article, and beg to thank him for it. I may tell him that from what we see of other bulbous plants, it was but natural that he should find the corms of Cyclamens buried under from 4 to 6 inches of light soil. No one would think of growing Cyclamens as hardy plants with the corms exposed, any more than of planting *Hyacinths*, *Talips*, &c., in the open garden, with the bulbs only half buried in the soil, but on the contrary they would be covered with 2 or 3 inches of soil, to protect the roots from the cold of winter, the heat of summer, and the atmospheric influences at all seasons. We all know, however, that we do plant many bulbs with the crown level with the rim of the pot, and the bulbs only half buried in the soil, and were we to bury them from 4 to 6 inches (I have found none of our hardy bulbous plants buried so deeply) below the rim of the pot, the roots would have very little soil indeed to grow in, whilst by only half burying the bulbs double the amount of feeding ground for the roots is obtained.

That it is necessary that the corms of Cyclamens should be covered with soil is evident from the leaves, and especially the

flower-stalks, hiding themselves in the soil for a while, even when the corms are only half buried, appearing again at some distance from the crown, and forming a circle round it first of foliage, and then of flowers. To argue that because some Cyclamens will bury their flower-stalks in the soil, all ought to be covered with soil, is going a little too far without proof or warranty for the practice. Imitating Nature sounds well. It is little carried out in practice. Growing a bulb in the open air is one thing, under protection another. It is necessary, if they are intended to live, to say nothing of thriving, that the corms of all hardy Cyclamens should be buried 3 or 4 inches in light, friable soil; and also in growing some of them in pots or pans for the corms to be covered with soil; for it is their nature not for the leaves and flowers to rise directly from the root, but to grow horizontally from the crown of the corms beneath the soil, and appear at some distance from the place whence they take their rise, or where the corm is situated. Leaves and flower-stalks have alike this tendency to run out horizontally from the corm under the soil, the latter giving themselves a twist, and sending up the flower-bud directly towards the zenith, remaining until the blooming is past, when the pod seeks its native earth, striving hard to bury itself, which it sometimes, but not always, does. It remains half hidden until the seed is ripe, when the pod opens, and the seeds are thrown out, not falling, for the pod opens at its highest part, appearing like a cup with the seed in it. All the Cyclamens taking after *C. coum* have this peculiarity, and this is one of the chief reasons why *coum* cannot but be accepted as the type of the Cyclamens with spiral, or corkscrew, leaf and flower-stems just as *C. persicum* is the type of those whose leaves and flowers rise directly from the root or corm. All the Cyclamens taking after *C. coum* require to be buried in the soil, and, if grown in pots or pans, it is sufficient to cover the corm half an inch, and not more than an inch, when they will do just as well as if buried 2 or 3 inches as Mr. D. Stewart says, 3 or 4 inches as Mr. Atkins says, or from 4 to 6 inches as "W. X. W." states he found them growing wild. I have grown them in this way successfully, more so than when the corms were placed deeper, or very little above the drainage. Planting so deeply as this in pots or pans is very injurious, and the leaves and flowers will be poor in consequence; for Cyclamens, even those that require to be buried in the soil, root from the lower part of the corm, sending their thick wiry roots far lower than the depth of the deepest of our bulb-pots, and never upwards, so that if not planted well up in a pot or pan, they might as well not be planted at all, as no amount of soil above the corms compensates for the lack of that below them. "W. X. W.'s" remarks were, I am sure, never intended to apply to plants in pots, but to those in the open ground, for he concludes by hints as to their culture in pans, with which I agree, only the mound of earth above the corms would be of no practical use, for instead of the leaves pushing through it they would come through the sides of the mound, unless those kinds whose leaves and flowers rise directly from the corm were planted, and for such I do not think this a suitable mode of culture. These (of which *Cyclamen neapolitanum* and *C. persicum* are the type) will do just as well with the soil level over them, and, if grown in pots or pans, it is enough if the corms are placed with their crowns level with the surface, or even but half buried, for, from the continual wetting of the surface, many of the flowers will suffer.

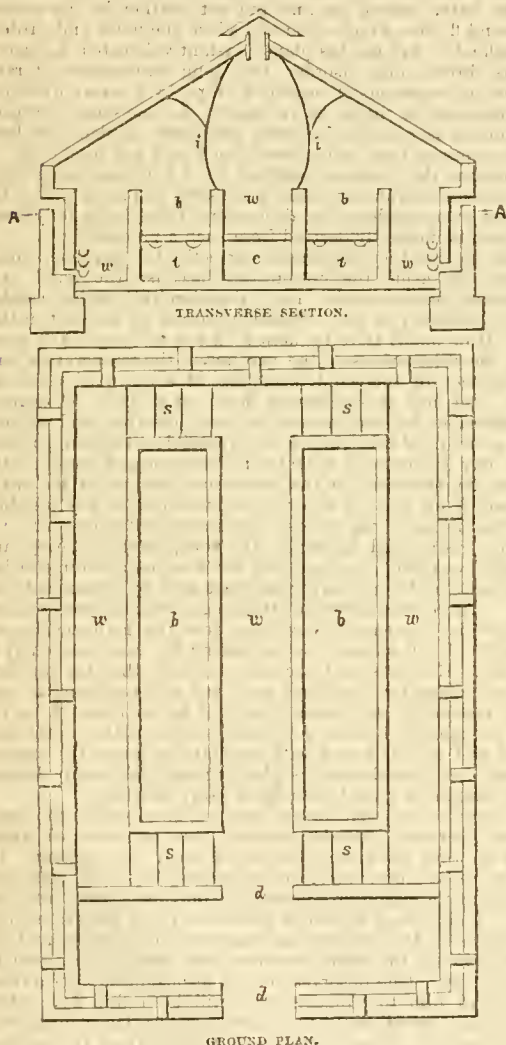

Though "W. X. W.'s" notes are very interesting and valuable, they do not afford information on one point, which I hope he will not think it troublesome in me to ask him to furnish. I allude to his making no mention of the kinds. *C. neapolitanum* would be over, I fancy, when he was in Sicily last spring. What could it be but *C. coum*? for *C. repandum* is nowhere found that I know of except in Greece. In Syria he would probably find *C. persicum*; *C. europæum* he would not, of course, see anything of, but "W. X. W." best knows. Would he kindly give the above information?

Mr. D. Stewart confirms "W. X. W.'s" observation, having lately visited Corsica, where he found Cyclamens covered 2 or 3 inches deep with soil composed of decayed leaves. That is the kind of soil to cover Cyclamens with—something rich and light through which they can run and push their leaves and flowers. Mr. Stewart does not name the kind. From the description of the root or corm it belongs to any of the *C. coum* family. Our correspondent is right—"Cyclamens would do well in similar situations on a south bank in any of our southern counties," to which I would add, avoiding *C. persicum*, and if the bank were partially shaded from the mid-day sun.

Thanking your correspondents for their interesting and valuable communications, I may, in conclusion, state that I am anxious to obtain as many of the Cyclamen family as possible in order to ascertain what constitute their real differences, any one, therefore, having any of the species to spare will confer a favour by sending them to me.—G. ABBEY.

### NO. A. A WINTER CUCUMBER-HOUSE.

It becomes every man to advance his own interest in a proper way, and also to lend a hand to his neighbours if necessary, and especially to such of them as are of his own calling. It sometimes happens that rendering assistance to one is injurious to another; but gardeners have a right to study their own interests, and to make known the disadvantages under which they labour in some places, and often through the miscalculations of others.

GROUND PLAN.

It frequently happens, and especially in small places, that when a gentleman has a glass house to put up, perhaps a greenhouse, or a forcing-house, he speaks to his gardener about it, or it may be that it is at the suggestion of the gardener that he wishes to build the house. However, a horticultural builder is sent for to see what can be done and to specify his terms. He speaks to the gentleman about the affair, and explains everything in his own way; the gentleman, perhaps, does not know what sort of a house is absolutely indispensable for his purpose, does not take the trouble to consult his gardener about it, but will take for granted everything the builder says about

the requirements of the house, and being perfectly satisfied as to the expense, he orders the builder to erect the house as soon as possible, perhaps at a specified time. Almost before the gardener knows what they are about the house is half built; he does not approve of it, it is deficient in many things that are necessary to insure success, but all there is left for him to do, is to try and make the best of a badly-adapted house, and one that the employer expects a speedy return from.

For instance: I will take it to be a winter Cucumber-house, a lean-to with the roof at about an angle of 35°, a walk 2 feet wide at the back, a bed 5 feet wide, no tank to produce vapour, not sufficient hot-water pipes to heat the house, a heavy, clumsy, wooden trellis to tie the plants to, and sufficient to prevent these from ever enjoying the full rays of the sun. With such a house a gardener can never please himself nor satisfy his master. I have seen more than one of the above description, or very nearly so. The annoyance arising from such a result could easily be avoided at the beginning; by consulting the gardener and allowing him a little of his own way to draw a plan of a house that would suit. He might then show the plan to his employer and explain it, and if approved of, or if there should be any alterations required they could be easily done, then submit it to the builder and make the best arrangement with him. It is possible that the house would cost a trifle more than that which the builder might propose; but that would be only a penny lost and eventually a pound gained, besides the pleasure that a gardener would derive from being successful with a house of his own choice.

As I am writing this it has occurred to me, that if the correspondents of this Journal would oblige by giving us more generally the dimensions of certain houses, where they describe the fruit as being good and of first-rate quality, it would give others more confidence to undertake the construction of, perhaps, a similar house, or houses. To suit the thought, I send a drawing of a winter Cucumber-house that was erected at Holkham, the seat of the Earl of Leicester, four years ago; it answered very well. I have endeavoured as well as I can recollect, to show how the walls are built. In the centre is a hollow chamber, as shown in the transverse section of the house; a little above the ground line, A A, are holes where the air passes in, and it goes down the chamber and comes in contact with the lower pipe, so as to become of the same temperature as the house before reaching the plants. The ground plan shows how the walls are tied. The space between the two outside lines and the two inside lines represents the hollow chamber, the cross lines represent the bricks that unite the two sides together. d, d Represent two doors, the inner d being a door and a glass partition, so that any one going in could close the outer door before opening the other, thereby excluding all cold draughts, which are very injurious. There are three four-inch pipes all round the house, two under each bed, and flow and return pipes in the chamber under the centre walk. The pipes are represented in their respective places by half-circles: b, beds; w, walks; t, tanks; s, steps, going down to the side walks; c, chamber for the flow and return pipes; i, i, are two iron stays to support the centre of the roof. At the top, air can be given, as shown, by the lids which rise up and down at pleasure by the aid of a lever; also, the air-holes in the sides can be closed by a slide-board.—M. O'DONNELL.

### A VINEYARD UNDER GLASS AND COIL PLANTING.

IN No. 235, a correspondent has described his method of growing Vines planted in the area of his house, leaving the roof clear. As I understood him, he does not train his Vines to upright rods or stakes, but cultivates them as bushes. The method of planting Vines in the border of a house and training them to stakes, as is done in the gardens of the south of France, is first given in the eighth edition of the "Orchard-House." I had then well ascertained its feasibility by planting a few Vines in one of my houses, and then the idea slumbered. Last spring, on learning from one of my friends the great delight his vineyard under glass had given him, I devoted a span-roofed house, 20 feet long and 14 feet wide, to this purpose, and from the progress the Vines have made, and the perfect way in which all kinds of Grapes, including the Frontignans, ripened their fruit, I prophesy that houses planted after this method will one day be very popular.

I divided my house thus—in the centre I made my path, 30 inches wide, leaving a border on each side 5 feet 9 inches

in width. These were both dressed with rotten manure and half-inch bones, and then trenched 2 feet in depth, mixing the dressing with the soil. Wishing for immediate effect, and having plenty of young Vines, I planted twenty on each side—forty in all. In a few years they will, probably, be too much crowded; I shall then remove some of them. For those not wishing to do this, fifteen Vines in each border would be enough. The great recommendation of this mode of planting Vines in a house is the pleasure derived from being able to walk among them to prune, pinch, and direct their shoots, and gather their fruit.

In the house of a friend, which was devoted to the culture of Muscat Grapes, and forced, I once saw some Vines trained to perpendicular iron rods which reached to the top of the house—about 12 feet. They were full of fine bunches from bottom to top. He mentioned the great pleasure he derived from their culture, and on my inquiring if the lower spurs broke kindly, he said that they never failed, but that he took the precaution of detaching the Vines from the rods and placing them in a horizontal position till their shoots were 2 inches long. With this system of growing Grapes it is necessary; it is also recommended by some authors to be practised with Vines trained to the roof.

I have been tempted to advert to this method of growing Grapes to introduce a new (?) method of planting Vines, recently communicated to me by a very old French cultivator and friend. It is based on such sound principles, that although it may be so old as to be almost ridiculous in me to publish it, still I will risk it.

Presuming that your Vine, as usual in this country, has a single rod of a length of from 6 to 7 feet, you must cut out all the buds from the bottom to 2½ feet up the stem; then, after planting your Vine in the usual way, make a circular furrow 2 inches deep to receive the coil, as in the annexed figure, fasten the coil to the bottom of the furrow with two hooked pegs, *a a*, cover it with soil well pressed down, fasten the upright shoot to the stake, and the work is done. The surface of the soil over the coil should be covered with some rotten manure, 10 inches in depth, to encourage the buried part of the stem to emit roots rapidly.

A coil 9 inches in diameter will take 2½ feet of stem to make it. A coil 10 inches, and one 12 inches in diameter, will take respectively 3 feet, and about 3½ feet of stem. So that in planting a fine cane from 6 to 7 feet in length you may coil and bury half its length instead of "cutting it down," and thus throwing away that part of it on which the buds are most highly developed. In the pot culture of Vines, a coil just inside the rim of the pot covered with a rich compost, would give much vigour to the plant and enable it to carry more bunches.

The rationale of this simple method of planting a Vine is, that by merely giving it a large rooting surface a vastly increased vigour of growth is promoted; the coiling, as is found in twisting a layer in nurseries, inducing rooting very rapidly, so that a Vine in a very early stage of its growth finds abundance of food. It is not only to Vines planted in pots, and *à la* "vineyard under glass," that this mode of planting may be applied, there is no doubt that it will give increased vigour to Vines planted in the usual way to be trained under the roof. My friend was very eloquent when telling me the effects of this

coil-planting in his garden in France, and I feel quite assured that no hazard will be incurred by our adopting it in England.

—THOS. RAYERS.

WEATHER WISDOM.

How many persons there are who would like to know the probable weather, perhaps only for one day, it may be for a few hours, is a statement which I think will be conceded by all to be true; but how few there are who try to attain that object by the means which have been placed within their reach by the steady advance of science. Many, many years elapsed before the sailor would place the slightest reliance on the fluctuations of the barometer; even now there are found many persons who cavil at that instrument, deny its utility, and totally disregard its movements, solely, I believe, because when rain has descended their barometer indicated "set fair" or *vice versa*. Now, not only to the mariner ought the barometer to become a familiar instrument, but also to the gardener. Does not the latter depend on fine and wet weather for the various crops and flowers which cover and adorn the fields and gardens of England? Are not his plans constantly defeated, his calculations thrown into disorder, by a long continuance of rain, and his anticipations of beautiful crops by a severe drought? Can this state of things be reversed? In one sense, certainly not; but it is possible for every intelligent gardener to have at his command an instrument which will tell him from its fluctuations the probable weather for a few succeeding days, and such an instrument would, I am sure, be placed within the reach of every gardener by all masters if the latter only knew the benefits indirectly derived from such a proceeding.

Now, to use the instrument correctly, the gardener must entirely lay aside the notion that because the hand in a barometer points towards "fair," therefore the coming weather must necessarily be fair. Weather cannot be forecast in that way. How ought it to be done? I will tell you. You must study the fluctuations of the barometer, the temperature, and the changes of the wind, every day at some fixed time, say 9 a.m., and note these changes down on a chart. A chart is indispensable, for the memory is very defective, and without such an artificial aid it would be impossible to remember from day to day the different heights of the column of mercury, the various temperatures, or the successive changes of the wind. A steady rising glass is as a rule an indication of fine weather, and a falling one of the reverse. Constant oscillations—i.e., the mercury rising and falling in the tube, foretell stormy and unsettled weather. Any one can see whether a barometer has been rising or falling during the past days by reference to his chart. There is no expense attending such observations, and the gain is immense. Now, how does the gardener benefit himself? I will suppose he is waiting for rain previously to planting. He looks at his chart; he finds that the mercury has been rising for some days past, and still continues to rise. In all probability he knows there will be no rain—(I use the word probability, because I am sure as long as this world lasts no one will be able to tell with absolute certainty the coming weather)—and he defers his planting until the steady descent of the barometer gives him hope of rainy weather.

It seems to me that, by the means placed within the reach of most persons, probable weather can be reckoned upon, and with that knowledge the world must rest content. By degrees, as the observer gains experience, he will note how the barometer has been affected by previous gales, frost, or snow. I admit that without a barometer many are exceedingly weatherwise. Persons who are constantly in the open air form an estimate of the future weather with rare ability, each in his own way. One observes certain atmospheric appearances which lead him to suppose there will be a fine day; while another lays great stress on a change of weather coming with the new moon. Some foretell cold weather from the appearance of particular birds before winter; and others, again, prophesy bad weather from rainbows, halos round the sun and moon, the "backing" of the wind, or the twinkling of stars. Some note the peculiar habits of different animals before rain; whilst meteors and comets are supposed by others to affect our climate for the time. Now these weather-predicting persons should not be despised, but I would say to them, "A barometer will make you all-powerful."

These few remarks would not be complete unless, in concluding, I made mention of the dry- and wet-bulb thermometer as a great and necessary aid to the barometer in estimating probable weather. By its help a knowledge of the moisture in

the atmosphere is obtained. Many and various are the instruments in use amongst scientific men by which a nearer approximation to probable weather can be gained; but for general out-door purposes an observer may rest content if he note down the daily readings of the dry-and-wet-bulb thermometer, the way of the wind, and the rise and fall of the barometer. Let him always remember these two old sayings, the one—

“ Long foretold, long last;  
Short notice, soon past.”

The other—

“ When the wind changes against the sun,  
Trust it not, for back it will run.”

—X., Surrey.

## WORK FOR THE WEEK.

### KITCHEN GARDEN.

In consequence of the mildness of the season little should now remain to be done in this department. As the ground is cleared of the vegetables now in season it should be dug, so as to be ready for sowing in spring. *Cauliflowers*, during the present very mild weather the glasses should be left off night and day to prevent drawing; divest the plants of dead leaves, and look frequently for slugs. *Celery*, as it still continues to grow vigorously it will be necessary to earth it up frequently, so that whenever frost may set in it will not be injured so much as it otherwise would. *Cucumbers*, continue to pay every attention to those in houses; above all, keep them free from insects, as on this depends in a great measure their well-doing at the present season; take care that they are not over-watered; if they have a good body of soil to grow in they will want but very little. *Herbs* may be taken up, and planted in boxes or pots, and introduced into the forcing-house as wanted for use. *Lettuce*, any young plants that may be in frames should have the glasses left off day and night during this mild weather; watch narrowly for slugs, as they are particularly fond of this plant. *Mushrooms*, horse-droppings should now be saved for spring beds; this is the best season for saving them, as horses usually have more dry food than during the summer. *Rhubarb*, keep up a succession of this most useful vegetable by potting old roots, and introducing them into a heat of about 60°.

### FRUIT GARDEN.

Prune Gooseberries, Currants, and Raspberries in open weather. When frost sets in lay a coat of manure, say 3 inches, round every bush. Where the Gooseberry and Currant bushes are old, and covered with moss, a good dredging of powdered quicklime put on when the bark is moist will entirely destroy it, rendering the stems clean and the bark healthy.

### FLOWER GARDEN.

Every advantage of the present favourable weather should be taken for transplanting trees, shrubs, &c. See that all the principal and choice plants in this department have sufficient scope to develop their true and natural characters. There are few parts of a garden more ornamental than a well-regulated and well-arranged shrubbery, where every plant, from the largest to the smallest, has sufficient room to form perfect specimens. Collections of shrubbery plants appear to receive much less attention than their merits entitle them to.

### GREENHOUSE AND CONSERVATORY.

The weather has been so highly favourable for hardwooded plants that many of them are growing as freely at the present time as if it were September. As this young growth will be found very tender, abundance of air must be given to the plants, and great precautions must be taken against the Ice King stealing a march, as a slight frost in the present state of the young wood would do irretrievable injury. While, however, you guard against frost, take care also to avoid overheating the houses, and give all the air possible at all times. Water cautiously and in the morning, but take equal care not to allow any plant to suffer from the want of that element. Look well to growing plants, such as *Leschenaultias*, *Pimeleas*, &c. At this season every effort should be exerted to keep up a good display of bloom in the conservatory, for this house will now be used much more than when the weather is favourable for out-door exercise; its inmates, if attractive, will, therefore, now be much more valued than they would at any other period, and on that account every possible care and forethought should be exercised, so as to secure a good supply of plants in bloom during winter and early spring. *Azaleas* which set their buds will soon come into flower, if placed in a warm moist temperature, and some of the early-blooming *Rhododendrons* require

very little forcing to bring them into blossom at any time after this season; therefore, where there is a good stock of these, and of Belgian and other hardy *Azaleas*, well set for bloom, a portion of the plants should be placed in heat at intervals of about three weeks, and as they are very showy and last long in bloom, they will be invaluable. These, together with *Camellias*, *Heaths*, *Epacrises*, *Acacias*, *Daphnes*, *Gesneras*, *Cyclamens*, *Cytisuses*, *Chinese Primroses*, *Cinerarias*, *Mignonette*, *tree Violets*, and other things which bloom naturally in winter will afford a good display.

### STOVE.

Here all is still and quiet. Keep a moderate heat of from 50° to 60°, and give plenty of air. The *Ixoras* should be elevated near the glass to set their bloom, and have plenty of air at all times. Keep them comparatively dry. *Stephanotis*, *Allamanda*, &c., may be potted and trained preparatory to starting after the new year, and the staking of all specimen plants must be proceeded with as fast as possible. Cut down *Clerodendrons* to the lowest eye so as to secure bushy specimens with the pots covered with foliage, and when they fairly start into growth the balls should be reduced sufficiently to allow of giving a good shift of fresh soil without increasing the size of the pots. A few of the *Allamandas* may also be pruned and placed in heat, provided the wood is well ripened. Where there is not the convenience of a house that can be kept at a rather high temperature for such plants as it is desirable to push into growth at this early season, they should be placed in a bottom heat of 80° or 85°, which will encourage the roots, and render a high atmospheric temperature, or over-driving the other inmates of the house, less necessary. It will be seen from what little we have said from time to time on the management of *Orchids*, that they are not so difficult to cultivate as is generally considered. A high temperature was supposed necessary for their growth. To prove how erroneous that idea is, we would suggest a friendly visit to some of our most successful neighbours. *Orchids* are a most curious, interesting, and beautiful tribe of plants. Where shall we find any other plants continuing, as they do, in bloom, in many instances for months together, giving out at the same time such a profusion of scent, filling the air of the house with the most delightful odours, again representing, as they do, in their forms, such a variety of insects, birds, fishes, reptiles, beasts, &c.? Then see how odd and fantastically they grow; and lastly, the exquisite colours of their flowers—tints the most delicate, soft, and lovely, blotches the most gorgeous, of many different colours in the same flower, and all blending together in a manner to excite our admiration.

### FORCING-PIT.

Introduce such plants as are generally used for forcing, especially those which are sweet-scented, as *Lily of the Valley*, *Sweet Briar*, *Lilacs*, *Roses*, and bulbous plants. All forcing plants should be under temporary covering of some kind, an open shed is as good a place as they can be put in, or under the stage of the greenhouse.

### PITS AND FRAMES.

The abundance of light with which the plants in these structures have been favoured (there having been scarcely any need to have recourse to protective measures in the shape of covering), combined with the mild weather, has excited a vigorous growth, and a disposition to grow long and straggling. To counteract this some attention will be required on the part of the cultivator, a stiff dwarf habit is easily obtained by a frequent use of finger and thumb. Avoid watering as much as possible, it is better to let the plants flag a little than to have them too much saturated at the root. *Geraniums* and *Calceolarias* are very liable to become damp and mouldy, remove all mouldy leaves as soon as they are discovered, or they will be certain to contaminate others, and thus spread over the whole pit or frame.—W. KEANE.

## DOINGS OF THE LAST WEEK.

THOUGH the weather has been dry, warm, and pleasant, there has been but little sun, and therefore it has been worse for early forcing than colder and brighter weather. The chief point to be thought of in such dull weather is to keep the temperature correspondingly low, but so as to be safe, and the atmosphere drier than usual to prevent damping. The careful wielding of the watering-pot is now of great importance. The slushing about of water now will be apt to require a week or two of care, to manage things and keep them right afterwards.

It is all very well to wash paths in houses at midsummer, but now as little water as possible should be spilled. If paths in houses must be washed, it should be done with a scrubbing-brush and cloth, and every bit cleaned and dried up as the work goes on; and the water should be as hot as the hands can bear, as the place will dry all the quicker in proportion to the heat of the water. In many cool houses it will be the best plan to brush the paths clean, and then sprinkle them over with dry sand.

#### KITCHEN GARDEN.

Our work was very much a continuation of that detailed last week, only as the dryness continued we took the opportunity to wheel from decayed hotbeds and rubbish heap on ground intended for trenching down for Carrots, and for a fresh piece of Asparagus.

Asparagus, we have not been able to top-dress as yet, but we must get the young part done before frost come, as we notice that the buds are close to the surface. This is partly owing to the mode we have of late years adopted with this crop—that is, growing it on single raised ridges some 20 inches apart, instead of in beds. The ground is well manured and trenched in the usual way, then thrown into little ridges, and the plants placed over them and covered 2 or 3 inches, and in winter, as we can get at them, a little rotten dung is thrown over the ridges. Little trouble is thus given, the produce is generally good, and the roots are more easily taken for forcing than when the plants are grown in beds. However, any plan does well that answers. We like to plant best when the plants are sprung an inch or two, but then care should be taken that the roots are never parched or dried when the planting is going on. We have never seen the necessity for covering Asparagus to any great depth, as the slight dressing of manure, rough, saves the roots; for, if quite exposed, we have seen the buds killed by frost. We are, perhaps, wrong in saying that we have never seen the necessity of deep covering, for three or four times we have had many buds of Asparagus, when in a dormant state, nibbled by mice, and such nibblers would have attacked them less easily if they had been more deeply covered.

Kidney Beans have done pretty well, but some that were planted rather far from the glass in a pit have not done half so well as those grown in pots, and the plants elevated so that the tops were within a few inches of the glass. If those in the pit had been favoured with glass on all sides they would have done better. If there had been a fair amount of sun they would also have succeeded better. They were nothing like a failure, but, merely to secure all the light possible, it is best to have Kidney Beans in pots grown in pits, or, if planted out, the soil should not be more than 18 inches from the glass. In houses where there is front glass, and no shade above, there is no necessity for such nicety. We are thus particular as we have several complaints from young beginners about Beans damping off. Give all the light possible, heat enough to permit of air, and yet keep up a temperature of from 55° at night, to 60° and 65° during the day, and there will be no damping. As we had a little shelf room at liberty, filled it with 48-sized pots, with five or six Beans in a pot. These when up, stopped, and breaking well, will either be planted out or transferred in a piece to larger pots.

All that was said of Cauliflower, salads, Rhubarb now coming in, and Sea-kale, last week, will apply equally well now, only we may mention, that at this season we generally grow our Sea-kale in pots, in the Mushroom-house, not for considering anything about light, as in the case of the Beans, but for regulating the heat and the supply. For instance, if we want the Sea-kale quickly, we plunge the pot in mild fermenting material in the house, and cover with another pot, to keep the heat about the buds. When we do not want it in a hurry, we allow the pots to stand on the path, and insure darkness; and if notwithstanding this little care, it comes quicker than we want it, we move the pots into a colder place, and keep them dark there. When this vegetable is used from November, it requires a great deal of roots to keep up a supply, more room, in fact, in summer, than can well be spared in a small garden, and when the roots are taken up and planted in a bed, there will be a likelihood of having too much at a time, which can be better regulated if the roots are packed nicely and firmly in pots. Of course, the bed-system is quite as good for market, but large quantities at a time of anything should be avoided in a gentleman's garden. Just imagine a large dish of Kidney Beans on the table every day in December, and the Beans would be no more thought of than a dish of Scotch Kale. The same would

be the associations of Sea-kale if it made its appearance every day. Even the best things should never be so presented as to produce satiety.

At page 508, second column, there occurs the expression, "Some of these little Turnips keep well in winter." It should have been, "Some of the smaller yellow Turnips keep, &c.," which will make all clear. We are anxious that some of our readers would try the old Yellow Maltese, the Orange Jelly, or Golden Ball, or even the Dutch Yellow, as these to our taste are as good if not richer flavoured than the favourite whites, as the American Red Top, so much run upon, and they would make a variety, and, perhaps, yellow Turnips might thus, from being reported on, come into fashion. We must confess that when we grew them they remained on our hands, or were sent for the animals to eat, and they knew what was good for them.

#### FRUIT GARDEN.

Lots of work to do in pruning, lifting roots, washing walls, and washing trees; but we have been able to do nothing but continue with all departments much the same as noticed last week. The only annoying thing we have met with is finding a shelf of Black Prince Strawberries, swelling freely, which we intended for Christmas or the New Year, pretty well destroyed by an inroad of mice. It was very annoying to find lots cut over, lying in the pots, others on the shelf, and from others where the stalk was not cut the seeds in many cases had been nibbled out, and in that case all chance of swelling was over. Some of the depredators were trapped, and we suspect others were poisoned, as lots of pieces of toast and butter liberally dressed with arsenic were taken quite away, and, we presume, partaken of by them. At this season of the year we would be inclined to look even upon our vermin enemies with something like kindness, and act on the principle of live and let live, if they kept at all within bounds; but such a set-on, and more to gratify their love of mischief than to satisfy any feeling of hunger, was rather too much even for the benevolence of a very patient philosopher. However, we dislike having anything to do with poison in any shape if it can be avoided, and when used every crumb should be carefully looked after in the early morning, so that no other animal may come in contact with any of it. Not a bad plan for putting down such poisoned material is to place the pieces in a garden saucer, with another saucer over it, but kept far enough apart to permit a mouse to enter freely, with a weight on the top one to prevent its being moved. Such a plan would be of no use in the case of the cunning rat, but the mouse will often like it all the better from even the appearance of keeping him from the bait, and cares but little for the taint left behind from the touch of the hand. For temperature of houses see last week. When a temperature of from 60° to 70° is maintained care should be taken, especially in bright weather, to see that the air is moist enough. Of late the air has been moist enough if the temperature ranged from 50° to 60°.

#### ORNAMENTAL DEPARTMENT.

For the management of plants in houses, pits, frames, &c., see last and preceding week's notices. As the weather is again threatening to be dull, and the barometer falling, betokening more wet, took the opportunity of rolling the lawn again to keep down worm heaps and make all smooth, and proceeded with alterations in groundwork, moving and transplanting evergreens, fresh turning discarded clumps, &c. Here we must notice an error in the last line of the first paragraph under the above heading last week; the word "Strawberries" should be "shrubberies." We notice the word, however, chiefly for two purposes: first, because, properly speaking, we never dig among our Strawberries, from the time they are planted until they are trenched down out of sight; and, secondly, for the reminder to say a few words on the digging of *shrubberies*. Now, we consider careful digging is a good plan for encouraging rapid growth among shrubs fresh planted. As the plants advance and the space becomes filled with roots, the fork will be better for this purpose than the spade, and should be used merely to break the surface where the roots are thick; a rich top-dressing will also greatly encourage growth, and keep out summer's heat and winter's frost. When shrubberies become established, this digging among them is worse than useless. Many of such shrubberies, however, have a border in front of them appropriated to flowers, and of course these borders must be dug, and in such cases the shrubberies, though beautiful in themselves, are less picturesque in outline, and are chiefly regarded as a varied background for showing off the more gay but ephemeral summer plants in front of them. A fine specimen of such shrubberies, but very rich in the variety and goodness of the plants, may be seen at En-

vile. They lend a rich charm to the ribbon-borders in front of them in summer. The only drawback of such a system is that the bare ground in front of such shrubberies in winter detracts from the effect at that season, and the necessity of having the border of a somewhat uniform width, whether bounded by straight or curved lines, just so far lessens the picturesque easy outline of the shrubbery. It is scarcely possible to obtain all advantages from any one system. The culminating point of the ribbon-borders at Enville is their splendid background; but then, to make a new word, you must be more concerned about the floweresque than the picturesque—with the splendour of colour rather than the graceful in outline. Now, on the other hand, when a shrubbery is managed so as to become and be made a prominent feature of itself, as soon as the main plants are established, all nurses should be removed, all straight lines abolished, all digging dispensed with, and grass and moss be allowed to fill up all the openings; the bold outline of a few fine plants in front, the deep and varied recesses, giving the whole an easy, graceful, picturesque effect. One of the finest specimens of this kind of shrubbery may be seen at Oulton Park, forming the boundary of the flower garden there. There is the thicket of fine forest trees, then Evergreen Oaks, &c., with fine specimens of evergreens in front, breaking all stiffness of outline, and charming with its rich picturesqueness. That shrubbery, the using of a spade in which would be an act of Vandalism, we considered to be alike a proof of the good taste of the proprietor, of our late coadjutor Mr. Errington, and of our present friend Mr. Wills. We have often intended to speak of that shrubbery, and of the place in general, before Mr. Wills left it, but a mass of work prevented our describing that and many other places, of which we have copious notes, and can yet bring before the eye of our memory. We have several times alluded to Mr. Wills's ribbon-borders, they only wanted the background to make them perfect. Considering the difficulties of the position, one of the most wonderful sights as respects flowers in summer is the Botanic Garden at Liverpool. The banks and fences come in there at times with good effect as backgrounds. Keeping to the matter of shrubberies, it will now be seen that when used as backgrounds to ribbon-borders, &c., the ground in front of them must be dug and enriched; and when intended to be the chief attraction in themselves, and to produce a pleasing picturesque effect, as soon as the plants are established no spade or fork should ever come near them; and provided a background is maintained, the more single and varied the plants stand the better. Even a few plants in prominent situations will do much to destroy monotony and uniformity, and the more varied the spaces of turf between them the more easy and picturesque will the whole be rendered. The finest taste and the highest art in such circumstances will be used to conceal art by giving free play to the easy and graceful in outline.

We find we must waive, by referring to previous Numbers, what we would have said of moving evergreens, fresh turfing, draining, &c., and would just say a word on *window gardening*. A few small Geraniums, Daplines, Cytisus, and Cyclamens will be the principal stationary plants, as the Chrysanthemums will now be about over, if they have not been confined to the outside of the window, or against a wall. In the last position they generally bloom splendidly, and with the title of the care that they must have in pots. Whatever plants are grown in the window must now be kept scrupulously clean, leaves and stems washed with a sponge or soft woollen cloth, pots scrubbed, window-sills kept extra clean, and a cloth thrown over all the plants when the room is dusted, or the plants moved out into another place until that needful work is performed. We would especially urge all such little attentions on our young sister friends. In addition to washing with water between 60° and 70°, the water used for the soil should never now be below 60°, and, as stated in previous weeks, should only be given when needed. No water should stand in the saucers now, but if you have any plants like Cinerarias that like a moist cool bottom, place some moss or a fold of woollen cloth in the saucer, and you may keep that damp. Plants in sitting-rooms will want more water than in a cooler place, and will like to have the leaves damped more frequently. The chief charm now will be the bulbs. Snowdrops, Crocus, Hyacinths, Narcissus, and Tulips will now be coming on, and giving fresh pleasure every day. They will all do best kept cool, moderately moist, and dark, until the pots are full of roots; but after that if you wish them to do well, to bloom well, and with bright colours, you cannot give them too much light. In all mild

weather and sunshine keep them as close to the glass, as possible, with nothing, at least, to obstruct the light from them. Never place them in the middle of a room, or near a fireplace, even at night, except in very severe weather. Hyacinths, Tulips, and Crocuses will bloom on a chimney-piece, or even on a sideboard, by exhausting all the stored-up energies of the bulb.—R. F.

### TRADE CATALOGUES RECEIVED.

Cartier & Co., 237, 238, and 261, High Holborn, London.—*Gardener's and Farmer's Vade Mecum. Part I., Flower Seeds and Plants. Part II., Vegetable and Agricultural Seeds.*  
Sutton & Sons, Reading.—*List of New Flower Seeds.*

### COVENT GARDEN MARKET.—DECEMBER 22.

As might be expected at this season, more especially as the weather has been so mild, supplies are heavy; but the demand is correspondingly brisk, and quotations, therefore, remain nearly the same as last week. Pines and Grapes are sufficient for the demand, but good dessert Apples are very scarce, and Pears far from abundant. The former chiefly consist of Cockle and Ribston Pippins, Nonpareils, and Court-Pendu-Plat; the latter are the same as enumerated in our last report. Asparagus is unusually good for the season; that from France is also good, but commands from 25s. to 35s. per bundle. In the Potato market consignments are very heavy.

### TO CORRESPONDENTS.

.. We request that no one will write privately to the departmental writers of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

APPLES (*A Subscriber*).—Several of the varieties of Apples you mention will be described in the new edition of the "Fruit Manual," now passing through the press. "The Ringer" we do not know.

ADVERTISEMENTS (*J. H. Lock*).—Our charges are published on the first page every week. Write to Mr. F. S. Angel at our office. We cannot refer you to any one whose bees are suffering from dysentery.

GUANO LIQUID MANURE (*F. L.*).—Do not apply it to any plant during winter. As soon as plants begin to grow, and during their growth, is the time for its application. For five postage stamps you can have free by post from our office "Manures, or Muck for the Many."

**GARDEN DESIGNER (J. Young).**—There is no book specially devoted to the subject, nor do we know of any one who supplies them on paper. "Flower Gardening for the Many," which you can have free by post from our office for five stamps, contains a few, and many are scattered throughout our volumes.

**HERBARIUM (A Young Gardener).**—Hogg's "Vegetable Kingdom" will inform you as to the classification. You can have it free by post from our office for 10s. 6d. Thick blotting paper, folio size, is to be preferred for displaying the plants. A drop of spirit of camphor upon each page will check the appearance of insects; renewing the application as the smell of the camphor declines. The book you mention we do not know.

**INSECTS (H. S. Wandswoorth).**—The small grub from your young Apple tree is a newly-hatched caterpillar of the Goat Moth, one of the greatest enemies of fruit trees, as it grows to the length of 3 inches, so get rid of them as soon as you can. Blow tobacco smoke into their burrows, by means of a fumigating bellows, to dislodge them, and try the effect of thrusting a stiff wire up the holes. By no means cut away the injured parts, but you may cover the openings with grafting clay. (C).—The white powdery objects on the bark of your Beech trees are not American blight, but a small species of *Coccus*, which, if not cleared off, will gradually entirely envelope the stem. Hot water and a soft brush is the best remedy.—W.

**VARIOUS (York).**—The rust in the water from the hot-water pipes will be lessened, and the water rendered softer, by putting an ounce of carbonate of ammonia frequently, say two or three times a week, in the water. Such heated water will rarely be injurious to borders, &c., but it will be dangerous to many tender plants in pots. We consider that heating water by pipes passing through a cistern is better every way than taking the hot water from pipes; though we are obliged to do it often. If you could heat your water without taking it out of the pipes it would be better in all cases for syringing. If you empty the pipes, or nearly so, often, of course all injury from iron in the water will be lessened. We do not think merely a trace of iron injurious. The hard water you will soften easily by adding carbonate of lime, and allowing the water to stand in the sun before using it for syringing. Our water is either so dirty or so hard, that we seldom syringe in consequence, unless when the water is unusually clear. You may add a little lime or chalk to your loam for the trees, but most likely you will find the trees would do well in the loam, especially if you top-dress with a sprinkling of super-phosphate of lime, and that we would like better than the chalk, say a quarter of a pound at a time in a yard of border, repeating the dose in a month or six weeks. We have met with no plants in the fruit way that a little of this does not suit. We admire your *ail desparandum* motto, and hope you will succeed. You must not let your pots be frosted, and the Strawberries when introduced should not be far from the glass. We shall be glad to hear from you on the mode you adopt for the wet and dry bulb, for showing temperature and atmospheric moisture, but our trade is most opposed to all professional secrets, and we generally say to our friends, Take your secrets elsewhere, they would not be safe with us. These measurers of humidity and temperature are, however, most useful for the inexperienced, as we know many old gardeners who can tell the heat and the humidity whenever they open the door of a house, and without looking at a thermometer or hygrometer at all. We leave you to decide as to making your plans known. You are quite right to hold and maintain your own views on the utility of sulphur; rightly used, we hold the reverse, but we shall be none the less glad to hear of your mixture that is such a preservative against mice, birds, &c., attacking the buds of fruit trees.

**CUCUMBERS DECAYING (Constant Reader).**—From what you say of the treatment of the Cucumbers, we can come to no conclusion as to the cause of the fruit showing strong, and then beginning to damp off and wither up when 2 or 3 inches from the stalk, unless it be from the roots being kept too hot, or the plants being allowed to show too many fruit. Try what thinning the fruit freely will do; also what keeping the roots cooler will do. We once had a somewhat similar case, and the roots seemed to be moist enough within 6 inches of the surface, but on digging down we found the bottom soil very dry and hot, and when we made holes and put in narrow two-inch-over drain-tiles and poured in plenty of chilled water they began to swell freely enough. There are things about Cucumbers which no one can understand, for after never having had the least trouble with them for a quarter of a century, they have troubled us a good deal lately, and especially towards autumn. The Vines will take no harm from the asphalt until they swell the buds, but a piece of calico or even straw would have been better.

**MELON AND PROPAGATING-PIT (A. Y. Z.).**—We would proceed thus—in the four-feet space for the bed place two four-inch pipes a couple of inches or so from the floor, and around these pipes and 4 inches over them place cinders, brickbats, &c., covering all with 1 inch of rough, clean-washed little stones or gravel. Have means of pouring water amongst the gravel as you like, without passing through the soil. Let the soil be about 18 inches thick, and let your wires be a foot from the glass in front, and 18 inches, or at least 15 inches from it at the back, and have two four-inch pipes for top heat. We heated such a place with two three-inch pipes for bottom heat, and two for top heat, but the heat was not enough. We have added one more three-inch pipe; the four-inch ones would have done. Success depends on not having the pipes too hot.

**PLANTING IVY TO COVER TREES (G.).**—The most suitable Ivy to plant is *Ledera helix*, or common tree Ivy. Dig a hole by each tree, at least a yard square and 18 inches deep: fill it up with good rich light loam, or if the soil is of good light quality, mix with it one-fourth of well-rotted manure, and a like quantity of leaf mould, thus forming a slight mound; level its top and plant, leaving a basin-like hollow to hold water. If the soil is wet and heavy, mix with it one-fourth of brick and lime-rubbish, and a like quantity of leaf mould. If the trees proposed to be clothed are large, make two holes, and plant two plants of Ivy near each tree next March. The best plants are those which have been grown in pots, such may be had with shoots from 4 to 6 feet long to begin with. Give a good watering after planting, and occasionally during the summer when the weather is dry. Nail up the shoots to the trunk of the trees, directing the young shoots, as they are produced, upwards. It is difficult to say how long the shoots will grow annually, for that depends on how far the trees shade the ground at their base, and keep it dry. We have known them grow 6 feet in a season, whilst in other cases the growth has not been more than half that, and sometimes not more than a foot in length.

**TWENTY ALPINEA FOR POTS (Alpine).**—Your pots will answer for alpinos, which we presume you propose to grow without the protection of a frame. Instead of selecting a shady, give preference to a sunny and exposed situation, for these plants do not like a close, soft, or still atmosphere; and as you have no rockwork, raise a mound of coal ashes, in which plunge the pots to the rim terraced-fashion. The pots must be drained to one-third their depth, and be filled to the rim with the compost suitable for each kind, making the surface slightly higher in the centre of the pots. *Aquilegia alpina*, loam of a turfy nature, enriched with one-fourth leaf mould, and kept moist. It has very large, purplish blue flowers with white centres, and grows about a foot high. *Dianthus alpinus*, deep rose spotted crimson; grit, turfy peat, and loam in equal parts, which should be kept wet. It grows but a few inches high. *Thalictrum anemonoides* plum; peat, loam, and grit kept moist. *Veronica saxatilis*, blue; plant proreubent. Loam and grit in equal parts kept moist. *Phlox Nelsoni*, white; requires peat, loam, and grit, or sand. *Oxalis spiræoides*, yellow; fine purplish brown leaves. Loam and gravel. *Papaver alpinum*, yellow; peat, loam, and grit kept moist. *Linaria cymbalaria variegata*, fine foliage; loam and grit. *Saxifraga atnisis* and *S. palmata*, loam and grit; *S. oppositifolia*, turfy loam and grit, with pieces of rock kept moist. *Silene acaulis*, turfy loam, peat, and grit; *S. alpestris*, and *S. Schaffii*, *Gentiana verna*, blue; loam and grit or gravel. *Draba boetica*, yellow; loam and grit. *Gnaphalium leontopodium*, two-thirds grit, and one-third sandy peat. *Linum alpinum*, blue; light loam. *Acaena novæ-zelandiæ*, crimson; sandy loam and peat. *Campylopus gurganicus*, bluish purple; sandy loam and grit. We by no means consider the above the most choice of alpinos, but such as would suit your purpose, though not, perhaps, your taste; for in this, as in nearly everything else, taste varies considerably. Twenty of the choicest plants for pot culture are *Primula farinosa*, *P. calycina*, *P. ciliata*, *P. minima*, *P. viscosa*, *P. nivalis*, and *P. marginata*; *Androsace ciliata*, *A. chama-jasica*, *A. carnea*, *A. helvetica*, and *A. villosa*; *Pyrola uniflora*, *P. media*, and *P. secunda*; *Eritrichum nazanum*; *Aretia vitaliana*; *Andromeda hypnoides*, *A. tetragona*; and *Eriophorum alpinum*. Spring would be the best time to obtain them; but they could be bought safely at any time, as they are all grown in pots for sale. The present is a good time to obtain them when the weather is mild, for, though hardy, they will not endure moving about during frosty weather. Any of the principal London and provincial nurserymen could supply you with all of them, or obtain them for you. We never recollect to see—

**RAISING VINES FROM EYES (A Bucks Tree-keeper).**—On the opposite side of the cane to the bud place the knife, and cut slantingly so as to bring it out three-quarters of an inch below the bud. From the point where the first cut was made, make another cut exactly like the first in the reverse direction, and coming out three-quarters of an inch from the other side of the bud. This being done the bud will measure  $\frac{1}{2}$  inch on the side where the eye or bud is situated, and have two sloping cuts at the back. Pot the eyes in January, in pots from  $\frac{1}{2}$  to 6 inches in diameter, placing one in each pot. In preparing the pots put a crock over the hole, and a few smaller upon it, and then an inch or so of the roughest parts of the compost. This may consist of rather light loam from rotted turves a year old, which is best, or light rich loam. Fill the pots with this compost to within an inch of the rim, and exactly in the centre of each place an eye, the eye upwards, and flat, pressing it down so that the eye may be level with the soil. Cover with half an inch of fine soil, and give a gentle watering, at once plunge the pots to the rim in a cucumber-frame if you have one, and let them remain there until May, keeping the soil just moist, then remove to the greenhouse. If you have not a hotbed so early, or have one later—say March, place the pots in the greenhouse without water until that time, then plunge them in the hotbed until the end of May or early in June. In this, or the former case, put the eyes after they have been in the greenhouse a few days into nine-inch pots in the same compost as before, and train the shoots up the roof of the greenhouse, keeping the soil in the pots well supplied with water, never, however, giving any until it is required, at the same time the leaves of the Vines should not be allowed to flag. When the Vines cease growing diminish the supply of water, and withhold it altogether when the leaves fall, and then stand them in a cool place for the winter. If you have no hotbed place the pots in the greenhouse, and keep the soil just moist, giving but little water until the shoots appear. Afterwards they are to be treated in the same way as those in the hotbed. In January cut the young Vines in two eyes, shift them into nine-inch pots, or the same size as that in which they were grown in the year before, removing the greater part of the soil, and place them in the greenhouse, from which it is not necessary to remove them in winter if the temperature from the two eyes, make exceed 45°. In due time two shoots will spring from the two eyes, make choice of the stronger, and rub off the other. Train that left to the roof, and about 1 foot from the glass, stopping the laterals, as they show, at the first leaf. In June pot the plants into 12 or 15-inch pots, draining well, and when the pots become full of roots, or say in three weeks, water at every alternate watering with liquid manure. Stop the shoot (take out its point), after it has grown 8 feet, and allow the laterals to grow, stopping them, however, at the first leaf, and if they shoot again let them make six or more leaves. Keep well watered up to the time the plants seem to have done growing, and the wood is the thickness of the little finger and turning brown, then less in the supply, and leave off watering when the leaves fall, cutting away the laterals by degrees as the leaves change colour. The Vines, if you manage them well, will fruit in pots in the following year, or you may plant them in a border in front of the greenhouse, train the canes to the roof, and have fruit the year after planting. You will find full particulars in the "Vine Manual," which you can have free by post from our office for 2s. 6d. in postage stamps.

**FUMES FROM HOT-WATER PIPES KILLING PLANTS (A Victim, Staplehurst).**—We think, from the way in which your plants are affected, that the pipes have been coated with gas tar, which may easily be detected by the smell of the fumes when the pipes are hot. The fumes from pipes thus coated will kill all the plants in time, unless the pipes are taken out and the tar burned off. We are not sure that this is the cause of the leaves falling and the young growth of the plants being injured, but it is a very likely one. If the pipes were coated with paint or black varnish the fumes would be injurious to vegetation for a time, but you may soon get rid of that by heating the water in them until it boils, and keeping this heat up until the smell disappears, which will be the case in twenty-four hours. Of course you must remove the plants, or give air in proportion to the heat.

**RABBITS BARKING TREES (H. F. E.).**—If you refer to our Number published December 12th, you will see a reply to the same question.

**CONSTRUCTING A COLD PIT (Inquirer).**—Your proposed plan of forming the pit is right, only it will be too low at the back for the roof to have sufficient slope. We should advise you to have it 4 feet high at the back, and in front 1 foot 6 inches above the ground level. This would give you 7 feet headroom over the pathway—not too great a height, as you there propose having a Vine, and that must be trained 1 foot from the glass at least—15 inches would be better. In addition to the Vine over the pathway, we would have two others trained lengthwise, one at the back and the other at the front, 1 foot from the back and front wall respectively, and another in the centre, they being planted in a border prepared for them at one or both ends. A ventilator at each end, and two others at the top, will answer; it will suffice if the end openings are a foot square, and the top ones 2 feet by 1 foot. Fruit trees in pots would do, only you must be content with one Vine at back, and have the portion of the front above ground of wood and glass instead of bricks and mortar, and then you might have a row of Peach trees in front, where you propose to keep plants in winter. You cannot have them and the plants, but you could have the Vines and plants. Your proposed heating of the pit by a hobbed at one end, and letting the heat into the pit through drain tiles, will not answer, for it would only warm one end, and the plants at the other would be frozen stiff. A small fireplace, and an equally small flue running along the front, would be the best and most economical mode of heating, and give the most satisfaction. It is worth while considering, before making the pit, whether it would not be better to have it double the width. It would cost little more at first, and no more in fuel annually, and it would certainly afford more than double the gratification.

**CUTTING BACK YOUNG CLIMBING PLANTS (W. F. Kent).**—If we understand your letter aright, your stove climbers are trained against upright wires or trellises, and are not intended to cover the roof, which would be much the best place for them. If they are trained a foot from the glass, they need not be cut back until they reach the top of the house, when, the points being taken out, side shoots will come freely, which may be allowed to hang loose or be trained up or down to fill vacant space. If trained against upright trellises, they should be cut back to within 2 feet from the bottom, or, if the trellis is sufficiently wide, train them horizontally, bending the shoots at the extremities of the trellis sideways in serpentine fashion. This will check the sap, and cause them to break all along the shoots, but they will still shoot strongest from the upper part. For ourselves, we should cut them all back in March to 18 inches, or to five or six good eyes, and when the new shoots came, if there was not a sufficient number to cover the trellis, we would take out the points of these shoots at 18 inches to make them branch, and this repeatedly, until the trellis was sufficiently clothed. Serve the *Mandevilla suaveolens* in the same manner, but far better train it to the roof; if cut back, do so in March. Syringe the plant frequently during summer to keep down red spider, directing the force of the water against the under side of the leaves.

**ASPECT FOR VINEY (J. D.).**—We would prefer the south-west aspect, and if the wall must not be more than 8 or 10 feet in height, we would prefer the three-quarter span, as then you could have the height at the ridge or apex 2 or 3 feet more, and more direct light besides. For a span-roof, we prefer north-west and south-east, but it is no great matter, only the western sun is always more powerful than the eastern.

**GARDEN PLAN (Countess of B.).**—We are reluctantly compelled not to plant plans of gardens, but merely to criticise the proposed planting. We have no doubt that the garden will look very nice on grass, but we cannot help thinking that the beds come too near the house, as there is much less grass there than in other open parts between the beds. Perhaps there are rather too many sharp angles in the beds, too; and sweeping circles out of the sides of hearts, &c., is chiefly useful for enabling one to get easily at the centre of beds, otherwise, when planted, these openings will be little seen. The same will hold true with the starry figure on the right-hand side; but, on the whole, the garden, we have no doubt, will look very well. Contrary to our rules, we will just say what we think would be a pretty arrangement, and we would edge all the beds, so that each bed would be complete in itself. As there are no numbers we will just allude to the centre, and begin with the octagon bed in front of the library. This we would plant with Tom Thumb Geraniums, edged with *Centaurea candidissima*. The prince's feather beyond we would plant with white Verbena, or some other white, and edge with Purple King, and the circle beyond with Bonle de Fen Geranium, and *Cineraria maritima* for an edging. These three will form the centre of the group. Then beginning next the library again, we find there are four beds on each side of these three centre beds—say two ovals, *Aurea foribunda Calceolaria*, edged with *Lobelia speciosa*, and a strip of *Cerastium* next the grass; two hearts, *Hellebore*, or dwarf *Ageratum*, edged with *Calceolaria* Prince of Orange, yellow; then a pair of three circles joined in one on each side of the prince's feather, Brilliant Geranium, bordered with *Pulchella Verbena*, and then two open-centred kidney-shaped ovals, dark purple Verbena, as *Aristo* Improved, edged with variegated *Alyssum*; and so we would go on with the rest, planting so that each bed would contrast softly with those nearest, and yet be distinct and complete in itself. The long narrow ribbon-border of 6 feet should look both ways, and should at least have five rows, as purple, yellow, scarlet, yellow, purple. With a foot wider, or 18 inches more, you could add white, as *Cerastium*, all round,

making seven rows across. The objection to that border is that it is too far from the walk, and has no background, except the chain border a long way off. That chain of thirteen circles being surrounded by gravel, may be planted with every circle different. If all were filled with variegated Geraniums, as yellow-leaved and white-leaved alternately, and banded with blue *Lobelia* and lilac Verbena, or purple, as the *Iresine*, or *Amaranthus*, they would look well—as well as they could do in an isolated position.

**HOBBED FOR CUTTINGS (F. T. C.).**—Your pit will require to have the interior taken out, and a bed of hot dung formed 4 feet deep, and if it be made of dung and leaves mixed, it will raise a milder and more lasting heat. The bed should be made high enough to touch the rafters, or level with the top of the frame after it has been well trodden. Put on the lights, and in a week or ten days the heat will have risen and the bed settled. Level the surface, and cover with the bottom of the wood stack, which, though not so good as cocoa-nut refuse, will nevertheless answer, as would sand, sawdust, or ashes. The lights should slope from the back to the front, 1 foot in every yard of width, so that the water may run off and not drip upon the cuttings. The cuttings cannot be too near the glass at first, for the bed will sink, and at no time should they be further from it than 15 or 18 inches. The nearer they are the less they will be drawn. The spaces for linings filled with hot dung will not raise sufficient heat for striking cuttings, but they would serve the purpose for which they were undoubtedly designed, that of maintaining the heat in the bed when it begins to decline. To do this the front lining should be given when the first decline in temperature is noticed, keeping the heating material filled up above the holes in the pit wall, through which the heat will pass into the bed. Take care that the bed is so high inside as to cover the holes, or the heat from the lining will rise in the atmosphere of the frame, and injure, if not kill the cuttings, especially if the steam be at all rank. In ten days or a fortnight the back lining should be made, and this, with the front lining, will keep the heat up for a sufficient length of time to strike three lots of cuttings, they, when struck, being removed to the greenhouse. If the heat of the bed sink too low before you have raised as many cuttings as you wish, take out the front lining before the back lining has become cold, and refill with hot dung, and when this becomes hot renew the back lining. Always keep the lining supplied with litter above the holes, or the heat will escape without heating the bed, and the lining should be piled up against the sides of the frame to give top as well as bottom heat.

**FRUIT GARDEN (G. Hunting).**—Your good grass land seems well suited, and situated for such a purpose as that which you propose, but its paying will depend more on the custom you can obtain than on the produce of the land, for some part of it will have to be made ornamental, and be furnished with arbours or tea-houses, trees, shrubs, and flowers. The frontage to the road should be planted with trees and be forced on the interior with shrubs and a border of flowers, and then should come a lawn, level enough and large enough for a croquet ground, which for one set of players the law of the game says should be 110 feet long by 65 feet in width. If it were sufficiently long and wide for two sets all the better, as it could easily be divided by an Arber-Vita hedge. Near this ground, which could be used not only for croquet but for bowls and other games, trees should be planted, weeping trees for shade, with seats under them, or if any such trees exist they should be carefully preserved. A belt of trees and shrubs to shut out the fruit garden from the part intended for visitors will be required, and a winding path should go round the pleasure ground, with some seats, bowers, and summer-houses, placed here and there. Remember the more respectably and neatly the place is kept, the more likely is it to be frequented by those who will pay best. An area of half an acre will be necessary, and besides what you may derive from parties playing on the ground, you may make something of the flowers from the borders. We recommend you to grow a quantity of Wallflowers, Stocks, Roses, Pinks, Glove Carnations, and other popular flowers, Sweet Brier, and Thorn. A narrow belt of trees and shrubs may be planted all round the other part of the ground, partly for pleasure and partly for profit, as you could plant them thickly and keep them thinning them out. In front of the belt of trees, none of which should grow larger than a Thorn or Laburnum (*Lilacs* would pay for cutting), plant a border with flowering shrubs, and edge it with plants that bloom abundantly and are sweet-scented, and do not forget evergreens which are sure to be called for. In front of the border have a walk, and at each corner a summer-house and seats, and on the other side of the walk have a corresponding border of flowers, and at the back of it a row of fruit trees, of which you must grow kinds that ripen in summer. The remainder of the ground we would divide into quarters by a walk through the middle, and another transversely, having a border 4 feet wide on both sides for Strawberries, and a row of fruit trees behind them, consisting of pyramids or bushes of Cherries, Plums, Pears, and Apples. Devote the quarters to Strawberries, Raspberries, Gooseberries, and Currants. Unless you could make sure of a renewal of the lease, it would be well to lay out no more than would repay the outlay. An agreement for either a renewal or a valuation at the expiration of the lease should be entered into before you incur any great expense. With land at 45 per acre, or 2£ with house, the ground would pay as a fruit and market garden, and better still as a tea or pleasure garden. The ground will require to be dug or trenched to a depth of 2 feet, digging in the turf, and then you may plant anything in it with every prospect of success.

METEOROLOGICAL OBSERVATIONS in the Suburbs of London for the four days ending December 20th.

## POULTRY, BEE, and HOUSEHOLD CHRONICLE.

## LABELS FOR EXHIBITION POULTRY.

I FEEL quite certain that the officials of poultry shows have no idea of the inconvenience caused to exhibitors by the delay in sending these labels. On one occasion I received them the morning of the show, and of course it was useless to send my birds, and I claimed the entries. Again: it often happens that our "Fridays" are, like mine, careful over the poultry, but quite ignorant of letters. The exhibitor may be leaving home, and if the labels have not arrived he leaves in some trepidation, fearing that Friday, however willing, may perpetrate some error that ruins all prospect of prize-taking. Even with the late Birmingham Show the labels did not arrive, I think I am correct, until after the original day fixed for the opening. A fortnight, except in the largest shows, appears to me ample time between the closing of entries and the opening of the show. I feel confident it would greatly add to the comfort of exhibitors if the Secretary, immediately on the closing of entries, settled the catalogue, and forwarded the labels. Am I asking too much if I say that in a show of five hundred entries this might be accomplished within four days? It is a duty which has to be performed, and which, when over, must be a relief to the official. Any later entries the Secretary well knows how to add to the list.

Perhaps I am wrong in believing that my brother and sister exhibitors would be glad of an alteration here, and the Committee may solace themselves with this belief. Possibly these few lines may ventilate the subject, but I can say for myself that it has often been an annoyance to—Y. B. A. Z.

## THE POULTRY CLUB AND THE BIRMINGHAM AWARDS.

THE suggestion of "P." in your Number of December 12th, that the Poultry Club should institute a poultry show in opposition to the Bingley Hall Exhibition, together with his liberal offer of support, demand the warmest thanks of all amateurs.

There can be no doubt that very general dissatisfaction as regards the Birmingham awards has long existed; and the manner in which the expressed wishes of numerous exhibitors on the appointment of Judges have invariably been ignored, I may say treated with contempt, is by no means calculated to allay the prevailing distrust. In No. 218 of your New Series, a correspondent writes of Mr. Hewitt, "Almost every show that takes place is judged by him," and urges most earnestly that his name should be added to the list of Birmingham Judges; and you, Messrs. Editors, in a foot note, seconded that proposal, stating emphatically, "We know that the Council of the Birmingham Show would gratify exhibitors generally, and remove much obloquy from themselves, if they added Mr. Hewitt to the Judges of that Show."

Another correspondent, in your columns of the 17th of October, suggests that exhibitors should address a letter to the Council praying them to add Mr. Hewitt's name to the list of Judges. I followed this advice, as, to my certain knowledge, did many others also; but our prayer was not granted, and no reason has been assigned for the refusal. Between January and October of the present year, Mr. Hewitt's name appears as Judge at twenty-one exhibitions of poultry and Pigeons! Assuredly, then, he must be at least as well qualified for the office of Judge as those gentlemen whose names appear on the list of Judges of the Birmingham Show!

But, I think, we have a just right to demand a much larger measure of reform than simply asking the addition of the name of our most popular Judge. What are the facts of the case as regards the judging? At the late Show there were 1675 pens of poultry. These, divided equally between the five Judges, would give 335 pens for each Judge; and supposing the labours of these gentlemen to commence at nine and end at three o'clock, as much of daylight as can be expected during a dark November day, there would remain fifty-five pens for each Judge per hour, or a little more than one minute to decide upon the merits of each pen! Will exhibitors, after paying high entry-fees, submit to be treated thus?

I do not think "P.'s" suggestion, that the members of the Poultry Club should pledge themselves individually not to exhibit at Bingley Hall again, could be carried out, for various

reasons, and, doubtless, there are some who would refuse to pledge themselves; but there can be little doubt that a show at Birmingham, conducted upon sound principles, with a liberal prize list, under the auspices of the Club, and to be held about the same time as, or a little earlier than, the present Bingley Hall Show, would prove a most successful rival. I say Birmingham, because, from its midland position, its railways, &c., it is better adapted for a poultry show, where north and south may meet in friendly competition, than almost any other town.

Allow me in conclusion to suggest to the Committee of the Club, that in carrying out any show upon a large scale:—

1st. A Judge, or Judges if the entries require more than one, be appointed for the several divisions of fowls, as for—1st, Game fowls and Game Bantams of all varieties; 2nd, Spanish; 3rd, Dorkings; 4th, Brahma Pootras and Cochins-Chinas of all varieties; 5th, Hamburgs of all varieties; 6th, for fowls and Bantams of any other variety than those named, &c.

2nd. Let the names of the Judges for each division be published on the schedule, so that an exhibitor may know, before entering his fowls, who will be their Judge.

3rd. Let it also be stated on the schedule as an invariable rule, in no case to be departed from, that the Judges shall not be allowed to see the address cards, nor in any way to ascertain the ownership of the birds.

If the Poultry Club will only act energetically, and take a decided lead in poultry matters, instead of following its hitherto do-nothing policy, it will, doubtless, become a large and flourishing Society, and will obtain the hearty support of all classes of exhibitors.—AN ESSEX CURATE.

## THE NEWPORT (MONMOUTHSHIRE) POULTRY EXHIBITION.

ALTHOUGH many persons expressed their apprehensions that the poultry exhibition held this year at Newport in connection with the agricultural meeting would be a comparative failure, from the fact that the portion of the show devoted exclusively to cattle would be unoccupied on account of the cattle plague, the result proved such forebodings were quite uncalled for. As to the poultry, the entries were as numerous as ever, the competition in most of the classes was really excellent, and the attendance of visitors waiting for the moment of opening to the public was, beyond question, without precedent. The whole Show was speedily crowded, and continued so during the remainder of the day. The general arrangements were exceedingly good, but differed very little from those carried out in former years.

The Game classes were well filled, and the quality of most of the birds was such as to leave a very trifling hope of improvement. Mr. J. H. Williams, of Spring Bank, Welshpool, however, pretty nearly monopolised all the principal Game premiums by exhibiting fowls not only of very first-class breeds, but also in so faultless a condition, that several of those amateurs who competed with him were perfectly astounded when permitted to test them by hand. Mr. Williams, with Game fowls alone, took not only the silver cup for Game, but also several first prizes, many of his opponents also sending most excellent birds. The single Brown Red Game cock, and the Duckwings exhibited by Mr. Williams, became quite popular favourites at the Newport Show. The Duckwings were the winners of the silver cup for the best pen of any variety of Game exhibited. In Spanish fowls, Lord Tredegar's Show, as it is called, was not by any means a meagre one, Mr. Alfred Heath, of Calne, taking the cup, closely pressed by the pen of Mr. George Lamb, of Compton, near Wolverhampton. Grey Dorkings were very well represented, and most numerous, a quite new name taking precedence, Mr. Peacey, of Chelworth, Tetbury, Gloucestershire. Singularly enough, although Grey Dorkings were so numerous, not even a single pen of White ones was shown. In Cochins there were some good Partridge-coloured ones. Some really first-rate White ones were also present; and as to the first-prize Buffs, it would, indeed, be a somewhat difficult task for any one to even imagine a better pen. For the silver cup offered for the best pen exhibited of these popular fowls, irrespective of colour, there was a good competition, though not an extensive entry. A magnificent pen of adult Buffs, the property of that so-long-experienced breeder, Mr. Henry Tomlinson, of Birmingham, proved the plate-winner, and was one of the most marked objects of admiration throughout the whole of the Newport Show. The owner still unhesitatingly declares them to be "by far the best pen he has ever exhibited throughout his whole career," an opinion so generally concurred in by breeders, as to be universally endorsed by those Cochins amateurs who examined them as exhibited for the first time at the late Birmingham Show; yet at Bingley Hall, this pen was passed by entirely unnoticed, although a very inferior lot, sent in by the same exhibitor, with no other idea but "for sale," appear in the prize list. At the Newport Show, the Brahmans proved far better than have ever been shown in this locality.

In Hamburgs there was a good entry, and every variety was well shown. Mr. John Holland, of Worcester, succeeded in taking the silver cup given to the Hamburgs generally, with a pen of Silver-

pencilled ones, a variety which, it will be recollected, was so successfully cultivated and improved in the same neighbourhood some few years back by Mr. Archer, and whose strain they strongly resemble. The Golden and also the Silver-spangled Hamburgs shown at Newport were most meritorious. The *Polands*, both Golden and Silver (the class being open to both kinds), were very good; but the Black ones with white crests, although having the like premiums offered exclusively to this breed, brought only a single entry, and as even this pen was not first-rate, a second prize only was awarded. The *Bantam* classes were good, Mr. Davies, of Newport, taking the Bantam silver cup with an excellent pen of Silver-laced Sebrights. This gentleman also took second in Black Bantams with a very good pen, and again exhibited his Birmingham first-prize pen of Blacks. This latter pen was at Newport simply passed over, as, though at Birmingham one of the hens exhibited such a multiplicity of white spots as to cause general remark, a favourable change is now in progress, for at Darlington last week obvious improvement had taken place, an opportune symptom that the last few days have also still further confirmed. Some really good White-footed Bantams were also successful, and the Game Bantams were well shown. The class for Any other distinct breed was unusually good, the first prize being secured by an excellent pen of Sultans, shown by Mr. Zurborst, of Dublin, in perfect plumage; the other prizes were awarded respectively to La Flèche fowls, Black Hamburgs, Malays, and Indian Game.

The Aylesbury Ducks proved a remarkably fine class, Mrs. Seamons taking her usual post, and Mrs. John Logan, of Newport, proving one of the closest rivals that lady has met with in Aylesburies for some years past. It is also a singular circumstance here worth mentioning, that in a class for Ducks, exhibited exclusively by cottagers, no other variety than Aylesburies was shown, whilst in the extra class for Ducks only the Buenos Ayrean breed put in an appearance.

The selling class was most successful, embracing forty pens, a good many changing hands, as the price was limited to 30s. the pen.

The *Turkeys* and *Geese* were exceedingly fine, and weighty also, the competition being most severe. The Hon. F. C. Morgan, of Ruperra Castle, Newport, exhibited one of the finest pens of purely White Turkeys we have seen for years past.

The show of *Pigeons*, though not so numerous as might be expected, was of great merit, a reference to the prize list showing that the competition rested with many of our most noted exhibitors; in fact, it is only very rarely, indeed, that so many pairs of first-rate Pigeons can be seen in so small a collection.

The greatest care was devoted by the Committee to the welfare and comfort of the valuable specimens entrusted to them, and we have great pleasure in stating that not a single case of indisposition occurred throughout the birds exhibited.

**GAME** (Black or Brown-breasted Reds).—First, J. H. Williams, Spring Bank, Welshpool. Second, J. Cocks, Severn Bank Tannery, Worcester. Highly Commended, W. Bradley, Worcester; R. W. King, Wellington, Salop. Commended, R. Sheil, Bassaleg, Newport.

**GAME** (Duckwings or other Greys and Blues).—First and Cup, J. H. Williams, Spring Bank, Welshpool. Second, W. Dunning, Wellington, Salop.

**GAME** (Any other variety).—First and Second, W. Nicholas, Caerphilly, Glamorganshire. Highly Commended, J. Rees, Langstone, Newport.

**SPANISH**.—First and Cup, A. Heath, Calne, Wilts. Second, G. Lamb, Compton, Wolverhampton. Highly Commended, R. H. Nicholas, Newport; J. Smith, Walsall.

**DORKING** (Coloured).—First and Cup, W. R. Peacey, Chelworth, Tetbury, Gloucestershire. Second, R. N. Hooper, Cowbridge. Highly Commended, R. H. Nicholas, Malpas, Newport.

**COCHIN-CHINA** (Coloured).—First and Cup, H. Tomlinson, Balsall Heath Road, Birmingham. Second, Miss J. Milward, Newton St. Loe, Somerset. Commended, Mrs. M. Seamons, Aylesbury.

**COCHIN-CHINA** (White).—First and Second, J. Gardiner, Bristol.

**BRAHMA POOTRA**.—First, J. Hinton, Hinton, near Bath. Second, Rt. Hon. Lord Tredegar, Tredegar Park, Newport.

**HAMBURGH** (Gold-pencilled).—First, E. Hutton, Pudsey, Leeds. Second, R. H. Nicholas, Malpas, Newport. Commended, J. Stretton, Worcester.

**HAMBURGH** (Silver-pencilled).—Cup, First and Second, J. Holland, Chestnut Walk, Worcester. Highly Commended, R. H. Nicholas, Malpas, Newport; J. Platt, Dean, Belton, Lancashire.

**HAMBURGH** (Gold-spangled).—First, A. K. Wood, Burnside, Kendal, Westmorland. Second, T. Fletcher, Commissioners' Office, Great Malvern. Commended, J. Hawkins, Newport.

**HAMBURGH** (Silver-spangled).—First, A. K. Wood. Second, T. Davies, Belmont Cottage, Stow Hill, Newport, Monmouthshire. Highly Commended, G. Whitcombe, Kingsholm, Gloucester.

**POLANDS** (Black with White Crests).—First, Withheld. Second, T. Fletcher.

**POLANDS** (Gold or Silver).—First, J. Hinton (Silver). Second, H. B. Sketch, Blaina Iron Works (Golden). Highly Commended, Mrs. Ely, The Poptars, Gregory's Bank, Worcester (Silver).

**BANTAMS** (Game).—First, Rev. A. K. Cornwall, Bencombe, Dursley. Second, E. Tate, Leeds. Highly Commended, T. Davies; E. Tate; W. Bradley, Severn Navigation, Worcester.

**BANTAMS** (Black or White, Clean Legged).—First, E. Cambridge, Stokes Croft Road, Bristol. Second, T. Davies.

**BANTAMS** (Any other variety) First and Cup, T. Davies. Second, Rev. P. W. Storey, Charwellton House, Daventry.

**ANY OTHER DISTINCT BREED**.—First, F. W. Zurborst, Belleville, Donnybrook, Dublin (Sultans). Second, E. Pigeon, Lymington, Exeter (La Flèche). Third, R. H. Nicholas, Malpas, Newport (Black Hamburgs). Fourth, J. Hinton (Malays). Fifth, P. P. Oother, Salisbury, Wilts (Indian Game). Highly Commended, E. Phillimore, Caerlenton (Malays); R. H. Nicholas (Silkies). Commended, Rev. P. W. Storey (Silky Niggers); G. Corps, Newport (Minoreas).

**DUCKS** (Aylesbury).—First, Mrs. M. Seamons. Second, J. Logan,

Maindee, Newport. Highly Commended, J. Pyc, Abergavenny; Mrs. M. Seamons; S. Lang, jun., The Shrubbery, Redland, Bristol. Commended, Right Hon. Lord Tredegar, Tredegar Park.

**DUCKS** (Rouen).—First and Second, J. Williams, Goytre, Usk. **GEESE**.—First and Second, Mrs. M. Seamons. Commended, R. Rees, Coldbrook Cottage, Abergavenny.

**TURKEYS**.—First, Miss J. Milward, Newton St. Loe, Somerset. Second, S. Lang, jun., The Shrubbery, Redland, Bristol. Highly Commended, Hon. F. C. Morgan, Ruperra Castle, Newport; M. A. Horlock, East Yaga, Chepstow.

**SELLING CLASS**.—First, J. Gardiner, Bristol (White Cochins); Second, J. Logan (Dorkings). Third, J. Hinton (Brahmas). Highly Commended, F. G. Phillips, Chippenham, Wilts (Golden-pencilled Hamburg); J. Williams, Goytre, Nantyderry (Dorkings). Commended, J. Hinton, Bath (Silver Polands); J. Logan, Maindee, Newport (Dorkings); J. Williams (Dorkings); R. H. Nicholas, Malpas, Newport (Brahmas); T. Davies, Newport (Silver-spangled Hamburg); J. Logan (Silver-spangled Hamburg).

#### SWEEPSTAKES FOR SINGLE COCKS.

**SPANISH**.—Prize, T. Aoe, Ystalyfera, Swansea Valley. Commended, T. Aoe.

**DORKINGS**.—First, Rev. A. K. Cornwall, Bencombe, Dursley. Commended, E. Shaw, Plas Wilnot, Oswestry.

**GAME COCKS**.—Prize, J. A. Williams, Spring Bank, Welshpool. Highly Commended, G. S. Sainsbury, Devizes. Commended, W. Nicholas, Caerphilly, Glamorganshire.

**COCHIN-CHINA**.—Prize, H. B. Sketch, Blaina Iron Works, Blaina. Commended, Mrs. M. Seamons.

**BANTAM** (Game).—Prize, Rev. A. K. Cornwall. Highly Commended, T. Davies. Commended, W. Bradley.

**ANY OTHER VARIETY**.—Prize, H. B. Sketch (Crève Cœur).

**COTTAGER'S PRIZES**.—First, C. Allen, Malpas, Newport (Spanish). Second, G. Boundy, Malpas, Newport (Silver-spangled Hamburgs). Third, Mrs. E. Ford, Newport (Golden-spangled Hamburgs). Fourth, W. Davies, Victoria Avenue, Maindee, Newport (Spanish). Highly Commended, C. Allen. Commended, W. Jenkins, Malpas, Newport (Game). C. Harris, Maindee Park, Newport (Silver-spangled Hamburg); W. Davies (Brahma).

**DUCKS**.—First, C. Harris. Second, W. Reed, Malpas, Newport. Third, C. Allen. Fourth, W. Reed.

#### PIGEONS.

**CARRIERS**.—First, E. E. M. Roysds, Green Hill, Rochdale. Second, H. Yardley, Market Hall, Birmingham.

**POWERS**.—First, E. E. M. Roysds, Green Hill, Rochdale. Second, H. Yardley, Market Hall, Birmingham. Commended, G. S. Sainsbury, Northgate Street, Devizes.

**TUMBLERS**.—First, J. Percival, Clent Villa, Harborne, Birmingham. Second, H. Yardley, Market Hall, Birmingham. Highly Commended, H. Yardley.

**PASTALS**.—Second, G. S. Sainsbury, Northgate Street, Devizes. Highly Commended, G. S. Sainsbury. Commended, T. Roe, Dock Parade, Pillwenny.

**ANY OTHER VARIETY**.—First and Second, H. Yardley, Market Hall, Birmingham (Spots and Priests). Third, E. E. M. Roysds, Green Hill, Rochdale (Yellow Balbs). Highly Commended, A. Middleton, Newport, Mon. (White Trumpeters); G. C. Murton, Bishopstrow, Warminster, (Red Jacks). Commended, T. Roe (Black Jacobins); G. C. Murton, (Silver Owls and Blue Turbans); J. B. M'Gregor, Great Malvern (Blue Owls); E. Lanfear, Newport (White Trumpeters).

The Arbitrator was Edward Hewitt, Esq., of Eden Cottage, Sparkbrook, near Birmingham.

#### STOKE-ON-TRENT EXHIBITION OF POULTRY AND PIGEONS.

The third annual Exhibition of Poultry and Pigeons took place in the Town Hall, Stoke-on-Trent, on the 13th and 14th instant. The number of entries was much larger on this than on the two former occasions, and some excellent pens in the various classes were shown.

The following is the prize list:—

**DORKINGS**.—First, Mrs. Bailey, Shooters' Hill, Longton. Second, Mrs. Arkwright, Etwell Hall, Derby.

**SPANISH**.—First, J. Mansell, Longton. Second, E. Fell, Burslem.

**COCHIN-CHINA**.—First, H. Yardley, Market Hall, Birmingham. Second, J. Stokes, Grinden Rectory, near Leek.

**HAMBURGH** (Golden-pencilled).—First, G. Williamson, Nantwich. Second, J. Gleave, Church Lawton.

**HAMBURGH** (Silver-pencilled).—First, G. Bagshaw, Uttoxeter. Second, J. Gleave.

**HAMBURGH** (Golden-spangled).—First, W. Tatton, Leek. Second, J. Birkin, Newcastle.

**HAMBURGH** (Silver-spangled).—First and Second, T. Leech, Knutton Cottage, Newcastle.

**POLANDS**.—First and Second, J. Heath, Nantwich.

**GAME** (Black-breasted Red).—First, J. Heath. Second, F. Bagshaw, Uttoxeter.

**GAME** (Other kinds).—First, G. Swift, Fulford, Stone. Second, W. Clark, Burland, Nantwich. Cocks (Single).—First, W. Wainwright, Stretton-under-Fosse, Rugby. Second, T. Stanyer, Nantwich.

**BANTAMS**.—First, W. Griffiths, Nantwich. Second, G. Williamson.

**TURKEYS**.—First, J. Bringson, Barlaston, Staffordshire. Second, G. Walker, Sandon. Single. —First, Rev. A. Clark, Longton. Second, F. E. Richardson, Bramshall, Uttoxeter.

**GEESE**.—First, C. S. Smith, Consall Hall, Leek. Second, J. Lyeett, Marston Villa, Stafford.

**DUCKS** (Aylesbury).—First, J. Platt, Swanlow, Winsford. Second, Mrs. M. Hornby, Swanlow, Winsford.

**DUCKS** (Rouen).—First, J. Withnashaw, jun., Elm Honso, Nantwich. Second, Rev. H. J. Stokes.

**GUINEA FOWL**.—Prize, Rev. H. J. Stokes.

**Prizeons: Carriers.**—First, H. Yardley, Birmingham. Second, G. C. Holt, Tunstall. **Tumblers.**—First, H. Yardley. Second, J. Smith, Longton. **Trumpeters.**—First, T. Robson, Penkridge. Second, J. Withinshaw, Junr., Nantwich. **Pouters.**—First and Second, G. Tunnicliffe, Hinckley. **Dragons.**—First, E. Butterworth, Nantwich. Second, H. Yardley. **Fantails.**—First, H. Yardley. Second, G. Edwards, Normacott. **Runts.**—Prize, H. Yardley. **Any variety.**—First, J. H. Nixon, Nantwich. Second, H. Yardley.

The Judges were: **Poultry:** Messrs. J. Machin, Trentham, Macclesfield. **Pigeons:** Messrs. Woodley & Dutton, of Banbury.

## ERRORS IN THE GOOSE AWARDS AT BIRMINGHAM.

As a rule I never complain of the decision of Judges, whether I exhibit at an Agricultural, Horticultural, or Poultry Show, but there have been on two occasions at Birmingham such singular violations of the rules of the Council that I feel I must for the second time call attention to them.

About two years ago I stated that in the first-prize pen of Geese, in the Grey class, there were a white gander, a Toulouse gander, and a pied goose—certainly two Ganders—all utterly different birds, and when I remarked that I might just as well have shown a Buff, a Partridge, and a White Cochon all in one pen, I was told that it was a heavier pen by 1 lb. than mine, the birds in which were true to a feather, and all perfect Toulouse in every characteristic, and which had won three or four years in succession at the same Show. Here weight had the pre-eminence, although the rules state that "high condition, beauty of plumage, and purity of race, must stand before mere weight." However, I put up with it, and did not show last year, nor did the celebrated lady who won the year before; and this year I sent again a pair of my old birds, weighing 56 lbs. the pair, and found my old opponents—one Toulouse gander and one pied goose—again beating my two pure-bred ones. If a pied goose be shown, it should have a white or pied gander to match it; at all events, purity of race demands its recognition.

I now come to the birds of 1865 in the same class, and I cannot understand this. The same rule applied as before, two odd birds were placed first, a pair of Toulouse of Mrs. Seamons' second, a pen of my Toulouse highly commended, and my beautiful pen, which actually weighed 9 lbs. the pair more than the highly commended pen, and 5 lbs. more than Mrs. Seamons', not noticed. Now, here mere weight was not allowed to tell, notwithstanding that it was allied to all the other qualifications; this pen weighed 47 lbs. when it left here, and when the birds came home they still weighed 9 lbs. more than my highly commended pen, and 4 lbs. more than the second prize one. Surely this system wants correcting.—JOHN K. FOWLER, *Prebendal Farm, Aylesbury.*

## RAILWAY CHARGES.

I HAVE perused with pleasure the remarks of "Y. B. A. Z." on the above subject, which appeared in your issue of the 5th inst., and my only surprise is, that the matter has not been taken up before, especially by those parties who are in the habit of sending a great number of hampers to a considerable distance. Those who do so, though they may be fortunate enough to win a prize or two, would, one may reasonably suppose, feel rather galled to find that the amount of their prize money, or even more, was swallowed up in railway carriage. This is a sore point, and I trust, now that the matter is started, every one interested will lend a helping hand and try to overcome the difficulty. I feel convinced that it can be done, and if the various railway companies would grant a reduced rate for the conveyance of exhibition poultry, I am persuaded a greater number of persons would exhibit their specimens than at present. There are some who possess first-rate birds and are anxious to exhibit them, and are prevented solely through their inability to pay entrance money as well as excessive railway charges. How to remedy the evil, then, is the first consideration. Of course we, the poultry exhibitors, are in the hands of railway officials as far as the point in question is concerned, let us then view the existing rates for the conveyance of poultry by railway. On some lines I find the charges are 50 per cent. more than the ordinary parcels rate. I do not say it is the case on all lines, but I dare say the charge is even higher than this on some. I would suggest, then, that instead of the above rate, the ordinary parcels rate should be charged to and from the places of exhibition. This rate would be amply remunera-

tive to the railway company, as well as within the means of the cottager who might wish to show his birds; or, if this is objectionable, although I cannot see how it can be, let the existing rates remain unaltered, and, as suggested by "Y. B. A. Z.," unsold specimens be returned free, or, as "returned empties," the rates for which would be quite nominal. To suggest, however, is easier than to carry into effect.

How to obtain a reduction of the present rates is the next consideration. As success cannot, in my opinion, be achieved through the representations of an individual, let it be done collectively. I would, therefore, recommend the formation of a committee, comprising poultry exhibitors or others who are interested in the matter, the subject to be well discussed, and their decisions or suggestions communicated by them (the committee), to the head of one of our great railways—say the Great Western or London and North-Western, or both, and I do not see any serious objections in the way of gaining the point to the benefit of railway companies, as well as of a large class of the public. I have no doubt that if the consent to a reduction of the rate could be obtained from one of the companies named, others would follow suit. No other way readily presents itself at present, and with all due respect to the press, if left to the press alone ultimate success, I imagine, is a long way off. Decisive measures should be taken, and that speedily.—J. K.

It seems evident to any impartial person that railway authorities do not act altogether fairly towards exhibitors of poultry. They grant the return of empties, however bulky, at a nominal charge; they often return stock free, pointedly excluding our pets, of which the weight is comparatively nothing. We not unfrequently notice in schedules of prizes that such a railway has consented to return all birds unsold free; sometimes we notice the same railway performing this kind act annually. Is it probable that they are large losers by their generosity? I think I have shown before that this cannot be the case; that it is a point which often decides exhibitors in showing not only their poultry but themselves.

A brother fancier has lately told me a marvellous piece of red-tapeism, which can only be useful to the revenue from Post-office. He says, "I always get back the railway charge for the return journey on such and such a line; but still they always persist in charging it, and then a correspondence ensues, which ends in their refunding the amount!" Well, this is better than paying; but how much more gracefully all this might be done beforehand—held out, in fact, as an inducement to exhibitors to patronise the Show.

Latterly I have experienced a little in the shape of "insult added to injury." Most exhibitors are well aware that a pen of poultry returning from a Show weighs considerably less than when it started from its owner. Recently I sent some pens to a neighbouring Show, one was sold, but, marvellous to relate, the remaining pens were charged for the return journey far more, although less in weight and numbers. Of course I requested a solution of the enigma. My own station-master replied that they had a bye-law by which poultry in crates were charged 50 per cent. extra. He further told me that, noticing the enormous charge, he had remonstrated with the other official, explaining to him his error. Either he could not or would not see it. He said he had charged it, and that was sufficient. I quite agreed with him that it was more than sufficient to pay, and I felt extremely obliged by his kind extra attention to my birds. I paid the money, wrote to headquarters, and explained that this official reply did not satisfy me, and in process of time the extra 50 per cent. was refunded, and I trust this very sharp (?) official was reprimanded. I presume I was not the only exhibitor so charged, and possibly many paid it in ignorance. It is a novel method of encouraging railway traffic that cannot, I fancy, pay in the long run!

I think I shall try the refunding plan of my friend, although it does seem unnecessary to pay, and then to receive it again. If several of us tried this persuasive plan we might by degrees teach railway authorities the lesson which they do not appear to understand. Perhaps even they may be sinning in ignorance. If I may further trespass on your space in this matter, I shall hope shortly to propose a remedy.—Y. B. A. Z.

## TUMBLING PIGEONS.

I SEND you an account of an extraordinary roll performed by one of my Pigeons last Saturday. He is a neat rolling cock, one of my best high-flyers, but rolls so much that he cannot

fly with the flight, but is what is called a top-flyer, flying above all the others, and every now and then rolling into the flight. They were at the time taking a nice fly; the cock in question was at the height of about 400 or 500 feet, as nearly as I could judge, when he made a sharp spin and rolled till he came to the ground. I was much afraid he would be hurt, but, fortunately, he does not appear to have received any injury. He quickly got up, flew to the roof and went in, leaving the others to continue their flight, which they did for an hour. I have several others that roll to the ground, but then they cannot get up so high, indeed, it is the longest roll I ever saw or heard of; how many times he went over in that roll it is impossible to say.

Air-tumblers often tumble twenty, thirty, or even forty times in a minute, and I once counted a white cock tumble forty-five times in a minute. I have still some of the breed, but the beauty of their tumbling is that each somersault is made clean and distinct, without rolling or falling; first-rate birds are very rare. Others of the House-tumbler variety tumble close to the ground, the best cannot fly up at all, they will tumble in the house or on the lawn, and are very curious and amusing.—B. P. BRENT.

### A CAUTION TO SELLERS.

A SHORT time since I received a memorandum bearing a printed name and address at a certain street in Manchester, requesting me to forward some birds which I had for sale. I was not satisfied with the bait, and I did not swallow the hook. I have since ascertained that the person in question is "a notorious swindler, and not worth a penny."

This communication may be acceptable to your readers, as it may prevent some of them from sending birds to Manchester without a sufficient guarantee for their safety, and it will save much trouble to the swindling fraternity to know that I am not easily taken in, and that I am prepared to "ventilate" them should they make the attempt.

If any of your readers should have been victimised by an application from Manchester, and will send me the name of the swindler, I will publish the name and address in full if it should be the same as that of the fellow who tried his tricks upon me.—GEORGE MANNING, *Springfield, Essex.*

### THE WOODBURY HIVE.

IN Mr. Woodbury's description of his justly celebrated hive, respecting fitting it with bar frames, he says, "A three-eighth rabbit is cut out of the top inner edge at the back and front, and below this are the notches, seven-eighths wide by three-eighths deep, in which rest the ends of the frames. This arrangement affords the bees a free passage above the frames as well as below and at the sides." Now, in the first Woodbury hive I had made these instructions were rigidly carried out, in fact, my Woodbury hive was exactly like the pattern given in "Bee-keeping for the Many," and made by a good workman.

My first swarm this year was on May 19th, it was hived in the usual way, and the bees were afterwards shaken out on a cloth and the Woodbury hive placed over them; they soon went up and all went right. July 1st I removed the crown-board and placed the super on, one exactly the right size and fitted close down to the hive. August 14th I removed the super quite full of splendid honeycomb, not a brood cell in it, and all sealed up, weighing about 30 lbs. nett, and leaving the stock-box with 25 lbs. in it; but unfortunately the bees had worked between the super bottom and the tops of the frames, though there was only three-eighths of an inch between them (the proper distance), and then again the bees had worked between the tops of the bars and crown-board in the super.

I have not had the frames out of the hive yet, but I do not think that the bees have worked between the sides of the hive and the frames, excepting a little down two frames which come against the window; the glass being let in too deep a rabbit, instead of being flush up, gave them a little more room. I suppose Mr. Woodbury's reason for having the frames let-in the three-eighth rabbit is that the bees may have free access to the super. I should not have troubled you with this, but I am having more boxes made, and I thought of having the frames put in level with the sides of the hive. Please say if you see any objection to this, and if you have known instances of bees working between the frames and super, as I have described.

In the spring I shall want to remove the bees and frames

from this hive into another of the same dimensions; but not being quite such a good hand at it as Mr. Woodbury, I think it would be best first to drive the bees into an empty hive. To accomplish this, should I remove the crown-board and drive them up in that way, or should I remove the floor-board and turn the hive upside down? Be good enough to say which is the right way.—J. A.

[Three-eighths space is left at the top of the frames in order to facilitate the removal and replacement of the crown-board without crushing the bees. It is true that during the height of the season they will fill even this small space with comb, but it can be readily scraped off when supering is over, and the crown-board will then remain free till next year. If the combs are not worked perfectly straight it may be the easiest plan to drive the bees, and we should be glad if you would try to drive them upwards through the bars, and report the result, as it is a little matter on which "doctors differ." During the autumn of 1863 Mr. Woodbury hazarded the opinion in our columns, that bees might be driven in this manner, which opinion was demurred to by "E. & W." As we doubt whether either of these gentlemen have submitted their ideas to the test of experiment, we should like to see it tried by a third party.]

### THE DISEASES OF BEES.

(Continued from page 476.)

DROPSY (?).—During the winter of 1861-2 I lost three stocks from what at the time I called, and believed to be, dysentery,\* but which I am now disposed to consider a malady heretofore undescribed by apianians, and which may, perhaps, be appropriately designated dropsy, to which disease it bears indeed no inconsiderable resemblance. Its symptoms are great enlargement of the abdomen, which becomes so distended with a watery fluid that the unfortunate bee is perfectly unable to fly, in which state it either betakes itself to the top of the hive or rests on the floor-board, where, if the weather be cold, it dies, or whence, if the weather be warm, it drops on the ground, and crawls about until it expires. The natural functions appear to be entirely suspended, and if the abdomen be forcibly compressed a rupture of the membrane takes place, attended by a flow of its watery contents, which emit a sour and disagreeable odour. Contrary to what Dzierzon remarks in the case of dysentery, the queen enjoys no immunity from this disease. When she is attacked she becomes incapable of oviposition, whilst her abdomen swells to a remarkable size: after some days have elapsed she loses her hold of the combs, and drops on the floor-board, where, surrounded by a number of her subjects, she may yet linger many hours before death relieves her from her sufferings. A friend of mine, who is an excellent naturalist, kindly undertook to preserve and set up a very handsome Ligurian queen that perished in this way, and he informed me that on opening her abdomen a good teaspoonful of fluid gushed out! I had also a young Italian queen which, about the time I expected her to commence egg-laying, increased so rapidly in size that I became not a little proud of her as the largest queen I ever saw. Alas, for the fertility of human hopes! My magnificent queen turned out to be not *enciente*, but diseased, and perished without ever having laid an egg.

I had two other instances of this malady about the same time in which the queens escaped, and I could almost fancy their breeding powers were actually stimulated by the presence of the disease, since their fecundity not only overtook the extraordinary mortality which constantly prevailed, but theirs became two of the strongest stocks in my apiary. It was, however, most pitiable to see, all through the spring and during the finest summer weather, the ground in front of the hives perpetually covered with hundreds of disabled and dying bees, which crawled about in all directions, setting up at intervals a feeble vibration of their wings, as if in faint imitation of the hovering cloud of joyous labourers overhead, in whose delightful toil they were never again to participate. It will readily be believed that I exhausted my ingenuity, and sought for information from all quarters, in the hope of effecting a cure. I even obtained the advice of the great Dzierzon, who was, however, unable to suggest a remedy, but opined that the disease I described was "a kind of dysentery." As a remedial measure I first tried shifting the combs and bees into clean hives, but no mitigation of the virulence of the disease was the result. I next took away all their combs and brood, which I gave to other

\* *vide* JOURNAL OF HORTICULTURE, Vol. V., page 503.

bees, and compelled those I had thus rendered destitute to commence the world afresh in an unfurnished habitation, but all to no purpose. New combs were built and profusely brood in, but still the mortality continued. One thing, however, became evident—viz., that the infection, whatever it might be, was certainly confined to the bees themselves, since neither their combs nor their brood communicated it to those healthy stocks to which they had been transferred. It therefore occurred to me, that if I could succeed in eliminating every diseased bee, retaining only those that were perfectly healthy, I might succeed in banishing the disease altogether; and as this really turned out to be a "perfect cure," I will fully describe the means by which it was effected. Selecting a fine day, and spreading a cloth on the ground, I looked over the combs until I discovered the queen, which I imprisoned in a queen cage, and then set the hive on the ground, putting an empty one in its place. I next took out the combs one by one, brushing off every bee on to the cloth, placing the combs in the previously empty hive, and completed the operation by putting on the crown-board and introducing the queen at the top. In this way I effected the end I had in view, which was that no adult bee should be permitted to enter the new hive, that was unable to rise from the ground and gain the entrance by means of its wings. A number of infant bees, as yet unable to fly, were unquestionably lost; but I spared no pains in rescuing as many of these as possible, and had the satisfaction of finding that I had at length effected a radical cure. I am, moreover, happy to say that this troublesome malady has not since appeared in the apiary of—A DEVONSHIRE BEE-KEEPER.

### HONEY HARVEST.

As my brother is sending you an account of the cure of foul brood, I just add a short notice of my experience during the past season.

Like my friend "T. W.," I began with three stocks. Two of these were in frame hives, whilst the third was housed in a flat-topped straw hive; all were fed regularly from the beginning of March to the end of April. The straw hive threw a swarm on May 20th, weighing 5 lbs., which I placed in a frame hive, taking from it on June 24th a small cke of honey, weighing 9 lbs. This swarm set off a "virgin" on July 3rd, weighing 6 lbs. 3 ozs., and twelve days subsequently a "virgin cast," whose weight I am unable to speak of. I took a second well-filled cke of 9 lbs. from the swarm, and in addition a "super" from the parent stock on July 22nd, weighing 14 lbs.; so that besides quadrupling my stock I obtained 32 lbs. of fine honey. The other two stocks in frame hives have not swarmed, but have yielded together a side box and two supers containing 52 lbs. of beautiful honey.—D. K. D.

### FOUL BROOD CURED.

In September, last year, I made the unpleasant discovery that foul brood existed in two of my hives, some account of which, and of my attempt at cure, will be found in the Numbers of "our Journal" for September 27th, and October 11th. I now write, as promised, to inform you of the result.

Premising that most of your readers will not be able readily to refer so far back, and hardly supposing that those who could, would be at the trouble of so doing, I will briefly mention the facts of the case.

In the summer of 1863 I purchased a stock of Ligurians in a Woodbury hive. In the autumn of that year, finding that it was queenless, and that the bees had almost dwindled away, a driven swarm was added. In the spring of 1864 I found four of the combs covered over with mould, and removed them. During the summer the hive dragged on a miserable existence. The bees increased in numbers, but seemed dispirited, and neither swarmed nor yielded me any surplus honey. So unsuspecting was I, however, of anything seriously wrong, that I placed a fine Ligurian swarm, in May, side by side in the same shed. Not till September did I overhaul the combs, and then found large masses of foul brood in nine out of the ten frames, and unfortunately the adjoining swarm had caught the infection, though it only existed in a few scattered cells. I afterwards found that a neighbour's hive, a swarm from a perfectly healthy stock, was also infected, doubtless from the bees robbing mine, which they had been seen to do.

Mr. Woodbury, to whom I sent a sample of the comb, pro-

nounced the disease to be of a very virulent type, and advised the destruction of both the infected colonies. For reasons then given, I resolved, however, to attempt a cure, and first securing the queens of each of the hives, drove and united the bees. After keeping them in quarantine for six days (giving them the best queen, a well-marked Ligurian, on the fifth day) they were put into a common straw hive full of comb, which was entirely free from brood, and had a sufficient supply of food. I then took them to a friend's garden two miles off for the winter.

During the cold weather many bees died. I twice cleared from the bottom board a thick covering of dead bees, so that when the hive was brought home in the spring, there was a mere handful left clustered in two end combs, and many of the other combs were a good deal mouldy. I at once began to stimulate them, by giving about an ounce of syrup every night regularly for several weeks, and they rapidly increased, swarmed on June 6th, and cast on the 13th. Shortly afterwards I drove the remaining bees and united them to the cast. I then cut out the combs from the hive, very minutely examined them all, and am glad to say that there was not the least trace of the disease. I have also examined the swarm and cast, which are, I believe, perfectly healthy, they are strong stocks, and have each yielded me surplus honey.

I think this experiment has proved that the cure of foul brood so late as October is possible. I am not sure that it is commercially profitable to attempt to do so. In the case of common bees, at least, I should think to destroy would be safer and cheaper. My neighbour whose hive was infected adopted this course. I trust we may both escape a return of this very unwelcome visitor to our apiaries.—C. D.

### BEE-KEEPING IN HAMPSHIRE.

A SITUATION only just on the outskirts of the City of Soot, as some persons, more jealously than respectfully, choose to designate the metropolis of cutlery, may be supposed to offer but small prospect of successful bee-keeping, and many would probably regard the attempt as a ridiculous and somewhat cruel hobby. So three apiarists, living within the sound of Sheffield parish church bells, send you a few results of the past season to show that under great disadvantages bee-keeping may be both pleasurable and profitable:—

#### SATISFACTORY HARVEST—EXTRAORDINARY VIRGIN SWARM.

Commenced the season with three stocks:

A, a plain box, intended for supering, very weak in numbers, and rather short of food. From March 1st to May 17th gave 1½ oz. of syrup every evening. Swarmed June 22nd—5 lbs. 12 ozs. weight, which I sold, and July 11th took from the stock three bell-glasses containing 11 lbs. of honey.

B, a set managed on the collateral system, moderately strong, and fairly supplied with food. From March 1st to May 8th gave 1 oz. of syrup each evening. Swarmed May 22nd—weight 5 lbs., and, July 28th, took away a side box containing 16 lbs. 5 ozs. of honey. This swarm was put into a frame-box, and, July 2nd, I took from them a well-filled super of 25 lbs. nett, and, July 22nd, a second super containing 11 lbs. 8 ozs. of honey.

C, a good stock, strong, and well stored in a collateral set of boxes, and not encouraged by spring feeding. This stock swarmed May 20th, weighing 5 lbs. 9 ozs., was put into a Woodbury frame-box, and gave a cast June 3rd—2 lbs. 1 oz., which was put into a flat-topped straw hive. The swarm yielded me July 3rd, three bars of honey from the super—11 lbs. 3 ozs., and, July 28th, 11 lbs. more; and, on the 7th July, it sent out a virgin swarm, weighing 8 lbs. 9½ ozs., a fact which I could not have believed if I had not, besides weighing the swarm myself, had two intelligent witnesses, and I am sure it was not a union of swarms, for I saw the whole process from the beginning, and did not leave them till I had shaken the swarm from the groaning branch of an apple tree into a large straw hive. The cast prospered well, and, besides filling their straw home, gave me 2 lbs. 2 ozs. of honey in a small topping.

I have thus had four swarms (two of which I sold immediately, the extraordinary virgin swarm being one of them) and one cast—that is, 26 lbs. 15 ozs. of bees, and have taken 91 lbs. 2 ozs. of pure super and side-box honey, in which there was not a particle of bee-bread, and only in the centre combs of the Woodbury super any trace of brood.

My six stocks are all well supplied with food of their own gathering, and appear in a prosperous state, except A, which

is wofully diminished in numbers, and I quite apprehend to be queenless, but, not being in a frame hive, I can only guess at the matter, and suppose that some accident happened to her July 15th, as I noticed a very great commotion among the bees in the evening of that day, which did not wholly subside till the 18th.—T. W.

#### TEMPERATURE OF BEE-HIVES.

HAVING felt a considerable curiosity as to the temperature of bee-hives, I last year commenced a register of the thermometer in one stock, continuing my observations on two stocks during the spring of the present year, having (as an extra inducement for so doing) succeeded in getting my friend "T. W." to keep me company with two of his hives. These observations were made three times a-day—viz., at 8 A.M., 1.30 P.M., and 6.30 P.M. I had two thermometers in each of my stocks A and B, one suspended in the centre, and the other placed at the back window. "T. W." had only one at the back window of his two stocks C and D, and as I fear it would be occupying too much of your space to send a copy of the daily readings, I have reduced them to monthly averages, and hand you a summary of the whole four stocks for the three months ending May. The figures in every instance show the average difference in temperature between the hive and the external air. The greatest difference recorded on any day was in B on May 5, when the thermometer in the centre of the hive showed 43°, and at the window 24° higher than the temperature of the outer air.

	A		B		C		D

#### DYSENTERY AMONG BEES.

THAT dysentery arises from the bees retaining their feces too long will, I think, be admitted by most people who have had much experience of the evil. Their powers of retaining them for a long time when circumstances are favourable are very great, but they may be overtaxed, and, when this is the case, excrements will be discharged within the hive. Long before the capability of retention, however, is overcome, the foundation of an almost incurable state may have been laid. With the avoidance of the feces the evil may be only temporarily at an end; for bees afflicted with dysentery do not, on obtaining relief to their distended abdomens, immediately return to a completely healthy condition. If, after this, they are compelled to continue within the hive for some length of time, it will be found that many of them are swollen as before, and loaded with a watery fluid, which will be opaque or transparent, according to its greater or less consistency. In order, therefore, to secure the safety and preservation of a stock suffering from dysentery, it is absolutely necessary that the bees be able to leave the hive at short intervals and evacuate. If, by reason of cold inclement weather, this is impossible, the hive, with abundance of food and thousands of bees in it, may perish in a night. I have seen one or two nights of severe frost exercise a fatal influence upon an unhealthy hive.

With the cure prescribed by Dzierzon, as given in Mr. Woodbury's last interesting article, I am perfectly familiar, and have several times put it in practice with results sometimes favourable and sometimes the reverse; but, when practicable, I would recommend the window against which the bees are intended to fly to be moveable, and placed immediately in front of the outer window of the room. The glass of the outer window, even with a winter sun shining upon it, is often very cold, so much so, as to torment the bees, and if they once fall down asphyxiated, the cure is little better than the disease. It is desirable, also, to have the room in which operations are conducted heated by a fire, and, to save the carpet from discharges, the space between the hive and the window, which should be 2 or 3 yards, may be covered with newspapers.

The causes of dysentery are very correctly stated to be any circumstances which occasion such a consumption of food as to overload the bees with feces, which they cannot get parted with. Long confinement will cause it, and so will impure air, which excites the bees to begin ventilation, and they are thereby thrown into unseasonable activity. Sudden changes of temperature are also deleterious, for the moment the thermometer

makes any considerable rise within the hive, the hitherto inactive inhabitants begin to consume food. Continued wet weather in October, November, and the early part of December, with either a high temperature or one that keeps only a few degrees above the freezing point, is very prejudicial, especially if high winds prevail. Bees in an active state, from whatever cause, necessarily consume food; and, if prevented by stress of weather from travelling beyond the limits of their habitation, the results witnessed in dysentery must inevitably follow.

As prevention is better than cure, I would recommend that winter stocks be neither fed nor disturbed in any way after the middle of October, and that as soon as possible thereafter they be equipped in warm winter coverings. A sheltered corner, played upon by the winter sun, is also a very good location in this cold, ungenial, northern clime. When the bees have gone to roost, and been continued frost sets in, they can retain their feces with impunity for two or three months, and in such weather the site of the apiary is of little consequence; but with frost and thaw frequently recurring, a nook screened from wind, and lying towards the sun, is truly valuable.—R. S.

As one who has suffered by dysentery in my apiary, I most willingly offer to the readers of THE JOURNAL OF HORTICULTURE, what I have found to be most useful in removing it, or at least staying its further progress.

At the end of last February I received a hive of bees from Germany, and when I gave them their liberty many could only reach the entrance of the hive, where they voided their feces. Every morning I examined the hive, and found numbers dead on the floor-board. I got ready a second floor-board, and every morning lifted the hive off its board, and gave it a clean one, taking the dirty one away and washing it in boiling water and soda made very strong. This I continued to do till the end of March, feeding the bees during the interval, as they were short of food, and cutting away the bottom of the combs they had soiled by their excrement. April set in fine, and the queen began laying very rapidly, but not till the inhabitants had dwindled so low that there were scarcely enough left to rear the brood; however, they recruited so rapidly that the hive yielded more honey than I could have expected.

I am of opinion that one of the causes of dysentery is the long confinement to which the inmates of many hives are subjected in protracted winters, and in the case of my hive there is not the least doubt, as it came from the continent; and, as Mr. Woodbury states, the winters are both long and severe in Germany. I have been conversing with an old and experienced German bee-keeper, who tells me that in Germany, when the hives are attacked, nothing that can be done will stop the disease, and nothing seems to do them so much good as a change to mild weather. From my own experience, I believe cleanliness to be essential to the bees, taking care to remove all deposit about the hives. If I have a second visitation of the disease, I will inform you of the result.—T. S.

LATE POLLEN-GATHERING.—The weather to-day (Dec. 20th), being very mild, although dull and sunless, the bees of all my twenty-five stocks are showing in greater or less activity, and into one in particular, which, for certain reasons, is watched with peculiar interest, pollen is being freely carried.—A DEVONSHIRE BEE-KEEPER.

#### OUR LETTER BOX.

WHITE COMB (R. W.).—The white scurfy appearance on the comb and face of your Hamburg hen, is known as white comb. Rub the place with a little sulphur ointment.

PIGS AND POULTRY (J. Cocker).—A volume on the pig was published in the "Library of Useful Knowledge." Our "Poultry-keeper's Manual" is now published, price 7s. 6d., and can be had free by post from our office for four additional postage stamps.

MACAWS (W. K. W.).—There are no Macaws found in Africa. All Macaws, numbering about ten different species, are natives of South America. The colours are scarlet and yellow, red and blue, blue and yellow, and dark blue and black. The most valuable is the large blue one, known as the Maximilian. The Australian Grass Paroquet breeds freely in this country if properly managed, but it is preposterous to suppose anything like the Canary. We know of no small foreign birds that can be depended upon for breeding in cages in this country, nor are we aware of any work published on the subject of breeding small foreign birds.

Old Christmas

THE  
JOURNAL OF HORTICULTURE'S  
Christmas Number  
AND  
Almanack  
FOR 1866.

H. WARREN

LONDON: JOURNAL OF HORTICULTURE OFFICE, 171, FLEET STREET.

## THE BEGINNING OF IT ALL.

IN the dreary month of November,—that was the stereotyped commencement of old tales,—as the two editors, like two spiders, were each in his appropriate nook—that's not a bad simile, for editors, like spiders, have to spread their webs to catch contributors and make them buzz, and to catch readers and bleed them; but that's all, by the by. There the two editors sat, and the one said to the other, "I wonder what that proposition from our friend at Waterloo will come to?"—not the Waterloo in Belgium, although both the editors have been there this year, and took care to let their readers know it, but Waterloo in England, and the proposition was in these words: "Do you ever publish at Christmas an extra special number for our Christmas hearth?"

Now, the proposer of that question knew as well as the editors did that they never had published such a special number; but he knew the nature of editors, and that if he had dared to say, "You had better publish a Christmas number," their superior knowledge would have felt smalled, so the advice was masked and cunningly disguised by its query form. So the two spiders did not withdraw as spiders do when they hear an unwelcome noise, but they extended their webs subtly, and hoped to entangle many contributors—and they had waited days but entangled no one—and this induced the suggestive sentence aforesaid, "I wonder what that proposition will come to?"

Now the other editor was not blithe that morning; it was, as has been said, in the dreary month of November, and it was a morning of fog—fog such as only the dwellers in London know—yellow, and thick, and full flavoured; so that editor put the extinguisher on the prefatorial suggestion by a *cu* ("I don't know.") Now his brother editor never suspected he did, for he knew he was not a medium; but there was no occasion for such a reply as that. Why did he not say, "I think very satisfactorily?" for he did think so; and his brother editor looked at him reprovingly, but like a wise editor, as he is, replied nothing—

Which is an unerring way  
When people nothing have to say.

Nor was there any occasion for a reply, for one of the desired contributors was announced—"a fellow of infinite jest"—a fellow who lives to joke, and who one would think dreams jokes, for he has some fresh every morning. He was loud in laudation of a Christmas number. "For," he added, "you can have some jokes in it. I've got one or two already. Here, now's,

## AUTUMN PAYMENTS.

Sounding through the hazy woodlands  
Fall the nuts about;  
Nature from her fair and good hands  
Now's a shelling out.  
Bees have ceased their drowsy humming;  
Blows the fitful gust;  
Breezes on the roads are coming  
Down with their dust.

"I've not got any further than that, but here's an ornithological article—capital, though I say it who shouldn't:—

## THE AVIARY.

Tastes differ with regard to birds. The infant delights in crows, but hates the thrush; some lunatics are raven mad; gluttons are fond of swallows; artillerists are fond of Parrots; misers cultivate the golden eagles; gamblers like pigeons and gulls; thieves go in for robin; and every good husband loves his duck of a wife."

And the editors said "Good; go home and finish those happy beginnings." So he went, but they heard of him no more, nor of his jokes either.

Soon letters began to arrive, and the first needing mention was one from that terrible Cornish woman, Miss Penelope Pomeroy, of Cackleton Hall: it was not to be mistaken, written on determined stiff paper with a broad-nibbed pen, every stroke a dig. The editor hesitated over the missile, but his co-sufferer said, "Oh, never mind!" though he well knew that the contents would partake of the nature of what the great boys at our school with grim irony called "giving case," as they rubbed the hairs of little boys up the wrong way, and the editors were not wrongly anticipatory, for it began without any prefatory address—"We have too many Christmas numbers already; a 'Michachmas Medley,' or a 'Spring Syringing,' might have had a semblance of novelty. You are like our rocking stone, everlastingly moving; you'll be upset some day." The editors rubbed their noses—that organ is the index of mental irritation—and he who read this inky snap said, "I'll tell her never to dare to write to us again, and that she is only excusable because she's an old woman." "Perhaps she may reply," said he of the other nook, "that she is glad that she is not an old man, for that's worse!" So the editors communed together, and were pacified, and their countenances radiated as they looked upon the next letter, for it was from that blessed man the "Wiltshire Rector"—a man strong in the Scriptures and in making things comfortable; and thus began his drops of balm from his rectorial downs, "Excellent! Capital! The plan may be carried out so as to be extremely beneficial." And then he proceeded to show that he would write about everything and one or two subjects besides. Then the two editors looked benignly on one another and nodded as if taking wine together; but that was only imaginary, unless they "made belief very much" more than the little "marchioness," for they had not even her orange peel and water.

The third letter was on satin paper—pink and musky—and the small, very pointed letters, written seemingly with a crow quill; in fact, it was not a full-grown letter, but a darling little note, and began "Dear Editor;" and the spiders looked each at the other, and said within his inmost thoughts, "She can't have thought *him* very attractive." Then the reader proceeded with the note, and it said, "Have some poetry in your Christmas number. I do love poetry, and you know that you once wrote this"—

## THE THORNLESS ROSE.

## I.

That night the fairy Queen was led  
By Oberon to the nuptial bed,  
The elves with magic sleight conveyed  
Flowers of all seasons to the glade,  
Where, as in some enchanted zone,  
The royal lovers supped alone.  
Imperial blossoms formed the dome  
Kaleidoscopic of their home—  
A small pavilioned area, bright  
With blossoms shedding living light.  
Of rose leaves was their couch—the ground  
With lilies carpeted, around  
Ambrosial odours shed, to tell  
How high their state who there did dwell.

## II.

While there in amorous folds they lay,  
Attendant fairies bore away  
The thorns that every rose-stem bears  
To symbolize a lover's cares!  
And piling them in one dark pyre,  
To ashes burned with mystic fire.  
Then offered up a lily, filled  
With honey-dew, by charms distilled,  
To Cupid, that his radiant wing  
Might ever wave around their King;—  
Since which that rose has never borne  
On stem, or spray, or leaf—a thorn.

And the Editor who had *not* written that shook his head; and the Editor who *had* written it said, "Ah! *your* days for poetry are gone." And then he took up another letter, and opened that, and it was all about what the Christmas number ought to be named, and urged that it should be "Holly Berries," because the northern soil cultivators hang up a bunch of these berries at Christmas, and keep them through-

out the year following, to insure prosperity to their gardens, and poultry yards.

Another letter suggested "The Christmas Lamp;" a third "The Wassail Bowl." That irritating woman, Miss Penelope Pomeroy, wrote at the end of her philippic—"P.S. If you will have a Christmas number, call it 'The Christmas Folly.'" Lastly, a sober "Old Subscriber" wrote—"Name it 'Our Diary,' it's an appendix to 'Our Journal.'" "We might as well call it an Almanack," said one of the spiders. "And why not?" rejoined the other. So they commended together, and were pleasant, and agreed that it should be entitled "The Journal of Horticulture's Christmas Number and Almanac for the coming year;" and that was—

THE BEGINNING OF IT ALL.

NOTES FROM THE LIFE OF A FERN.

"Everything in nature hath a voice."

**W**HAT I was, and where I came from, was the mystery of my childhood.

I awoke to life, it seems ages ago; poking my nose out of a corner in a huge rock.

"Halloa!" said I, "how did I get here? and who am I?"

I rubbed my head, to try and help out a limited understanding, and in doing so, I rubbed away a tiny nubbly roll of something green.

"You've spoilt your beauty for many a day," said a voice close by, which sounded like a little bell.

"Who are you?" said I, for I felt that I had an inquiring mind.

"I'm your grandmother," said the voice.

"Oh, indeed," said I; "and pray who may that be?"

"Little people should be seen and not heard," said wisdom.

Then I shook myself, and poking my head still further out of the rock, I saw all around me—jammed into all sorts of uncomfortable positions—numbers of graceful little creatures, with quantities of green bells, depending from black shining stems.

"Good gracious!" I cried, touching the mantle of the one I supposed was my grandmother, "how pretty you are."

"Don't touch," said granny, sharply; "you've no eyes in your fingers' ends."

I drew back much ashamed, but presently, seeing a little neighbour who looked good-natured and merry, I nodded,

and said in low tones, lest grandmother should hear and reprove me,—

"If you please can you tell me something about myself? I do so want to know what I am, and why I'm here."

"Ha! ha! ha!" said the merry-looking neighbour; "do as I do, open your mouth, and drink in this delicious spray; never mind if it does make your head feel a little queer; that will wear off as you grow older; it's very pleasant, so drink away; spread out your arms to embrace the sunshine—that's right, eat, drink, and be merry."

Just then up came a huge-looking creature, and without saying "with your leave, or by your leave,"—as is proper in polite circles—he began to scoop me out of the rock, and not only me, but my grandmother, and all my relations, for aught I know, putting us out of sight in a dirty creaky machine called a basket.

"Oh dear!" said I, "I shall be smothered."

"Hold your tongue," said the merry neighbour, sitting down upon me with a flop; "who do you think cares for you? every one for himself."

"Our race will be exterminated," sighed granny.

"What race, granny?" asked I, still bent on acquiring knowledge.

"You should not ask questions, child, it's vulgar," answered grandmother.

Presently I heard a tramp, and a gentle voice said:

"Can I find any maiden-hair fern about here?"

"Not a bit," said the creature who carried us, "it has all been taken long ago, but I have collected a few plants at my cottage if you like to come and see them."

"Oh, thank you; I should, indeed, like to examine them."

We were hurried to a cottage, and the gentleman requested to be seated. Then I found myself dragged out of the basket by the hairs of my head, violently stuck in some soft material, and patted down all nice and tidy.

Then the gentle voice spoke:

"These are very fine specimens, pray where did you get them?"

"Oh, far enough away from here," replied the creature, rudely.

"It is very strange," remarked the gentle voice, and I thought his eye fixed itself kindly on me, "very strange. I was distinctly told I should find specimens of *Capillus Veneris* in these rocks."

"I can't help what you were told, there ain't none hereabouts," said the creature, in the rude rough way I have since found out is peculiar to people who are doing wrong.

"Am I a maiden-hair or a *Capillus Veneris*?" thought I.

Then I shook out my tiny bells, and said as plainly as I could speak, "Oh let me go with you. I want to see the world. You are a friend to me and mine. Take me with you, that I may learn about myself."

I think I was understood, for the kindly voice said immediately:

"I will take six of your specimens, if I may, and I should like this one particularly."

Oh, how my heart beat; how pleased, how triumphant I felt. I looked round at granny, saying: "Now I shall see the world, now I shall know everything."

"When you are as old as I am," said granny, tartly, "you'll be tired enough of gadding; however, good-bye, child, I wish you well, and don't forget you owe everything to me."

"All right," said I.

"Thank you for nothing," sneered my late merry neighbour. "I hope you'll remember I stood your friend when no one else did."

"Ah, well!" broke in a melancholy voice, "I always knew you were born for great things, but no one would believe me."

"Bless me," I thought, "I'm rather sorry to go; I had no idea I had such good friends, nor that I was held in such high estimation."

However, I had no time for regrets. I was pulled out of my soft bed, one of my legs was crumpled up under my body, one of my arms broken, and in this pitiable condition I was rolled up, tied together, and it was dark.

What a long time ago that was, and what a great deal I have learned since then; I often wonder how my head holds it. I'll explain to you, though, how it all came about.

The gentle human voice that broke in upon my childhood so pleasantly was that of my dear friend,—“The Professor,” he is called. Dear heart, how much *he* knows! I've heard the gardener say, many a time, that the Professor made no more of the “ologies” than he did of cabbages, but turned them inside out, extracting their heart as quickly as a squirrel does a nut; and then he has made a rule of informing me about everything ever since the memorable day on which we became friends. He has the pleasantest way of imparting knowledge, too, making out as though half the information had been given by me.

The morning after I arrived at “Yatton Grove.” I had been put in a nice little home of my own; not large, but “genteel.” The Professor came to visit me. I heard him walk leisurely along; every now and then giving a welcome to a friend in the cheerful voice that had made me his from the moment I first heard it.

When he arrived before me, he stopped. “You like Yatton Grove, do you, my little maiden-hair?” he said. “It is a pretty place enough; and I'll tell you what, you'll hear no lies here. Bad word—lies—is it? Well, if we are so particular, I'll call 'em fibs. Will that suit you?”

I shook my little bells in assent.

“No, but really,” said the Professor, “you were astonished, weren't you? Why, little fern, I saw your graceful head peeping out of the basket the fellow had in his hand. Bad man; hate lies—fibs I mean; we'll have none here—none here,” said the Professor, evidently musing.

“So you're a real Cornish maiden-hair, are you?—a *bonâ fide* *Adiantum Capillus Veneris*,—true species, and no variety? Hem; no such thing—no such thing, little fern.” Then I heard a low chuckle, so full of amusement and so contagious that I began to laugh too.

“Ha, ha, ha!” laughed the Professor. “I am descended from a monkey, am I? That's Darwin's idea, little fern. Well, well; we're an *improving* race, it seems. We must not retrograde, or it might be a little awkward. You think so, do you? Well, we shall see—we shall see.”

Then the Professor moved on; and, recovering myself, I looked up to see what he really was like.

Not tall, nor yet short; well dressed, and not old. He had no whiskers or beard, but his face was so clear, so pleasant to look upon, I would not have had one inch covered for the world.

And so it was in this manner that I had my longings for knowledge satisfied, and that I came at last to think that the truest aim of any life was that of making others happy. I did my best to copy the dear Professor in this particular, and

I put on my brightest looks whenever he appeared, and as this was every morning, I grew at last, by habit, to be what I loved to hear my dear master call me, his “cheery little fern.”

I have said that the Professor came to see me every morning, and at every visit he imparted some knowledge, till at length I felt that really Darwin was right, and that doubtless, before long, I should develop myself into something exceedingly “new and strange.”

I am afraid I did not impart my ideas to the Professor as quickly as I wished. Sometimes I longed to tell him thoughts that crowded my mind, but I felt “my mission is to look bright, and listen to my master.” Then I longed to tell him things that went on in the garden during his absence, but I could not bear to destroy his kindly feelings towards everyone. So when the cook came to have a little quiet flirting, spending, perhaps, just a little too much time about it, I modestly turned my back. And when the gardener forgot to water me, as he sometimes did, I did my utmost not to look thirsty. But one memorable day my reticence was sorely put to the test.

The Professor was very gallant to ladies; and though a bachelor, many ladies came to visit him, and to wander over the far-famed grounds of Yatton Grove.

It was a bright, fine morning, and the Professor had just arrived on his daily tour of inspection, when the butler came into the greenhouse and informed his master that Lady Jones, with another young lady, had called upon him on particular business.

“I will come instantly,” said the Professor, in what appeared to me very cheerful tones. He was leaving the greenhouse, when he turned to me, and passing his hand caressingly over my hair, said,—

“Little maiden-hair, tell me, is her soul as fair as she herself is, think you? Yes! Ah, little friend, how shall I tell—how shall I tell?” Then putting his face very close to mine, he whispered,—“I love her—alas! little fern, I love.”

Here was a pretty kettle of fish! The Professor in love, indeed; whoever heard of such a thing! Who did he love? Lady Jones, or the other young lady? “Time will show—time will show,” said I to myself, imitating, in sincerest flattery, the self-forgetting habit of my friend.

After a while I heard a merry laugh ringing joyfully on the air. Oh, how pretty it was! not loud, yet so bright and clear, so guileless, that in a moment I said, “Yes, yes, she is fair and pure—fair and pure.” Then the party entered the greenhouse, and I thought, “How shall I know which laughed? ah, my master, how to know!”

“Mr. Professor,” said a voice that made me thrill with pleasure, for it came from the sweetest, prettiest lips in the world, and I knew the voice and the laugh were one. “Oh, Mr. Professor,” it said, “I do believe this is a real, true, Cornish maiden-hair; my very own little countrywoman.”

“Are you Cornish?” asked the Professor; and I heard the dear voice tremble.

“Really, Jessy,” said the stouter lady of the two, with a nasty short laugh which had a dash of derision and a false specious hilarity about it, “you must not engross the dear Professor's time, he is going to explain to us the internal structure—”

“Oh, not to-day, Lady Jones; please, not to-day,” said my master; then turning to Jessy, he said, “Wait here one moment. Excuse me, my lady,” and he vanished.

“What a horrid old bore!” said my Lady Jones; “who cares a fig for his stupid explanations or his rubbishy plants. If he does not give me a right-down good bouquet, I'll never come flattering him up again; see if I do. Ha, ha! it makes me long to laugh out loud to see how he swallows all I say. I declare, Jessy, I wish he'd make love to you instead of to me.” With that she whisked round, and, lo! my house was a ruin, and I a cripple beneath the wreck.

“Oh, Carry, Carry, see what you've done, and the good Professor does love his plants so much. Oh, I am so sorry!” and down Jessy knelt, and without staying to take off her delicate kid gloves she raised me up tenderly.

“I think it must have been a sudden gust of wind, dear Professor,” said my lady, as the Professor entered the greenhouse, bearing a magnificent bouquet and one single separate friend of—mayhap it was an aunt or a cousin. “I am so very,

very sorry; for I think I love flowers as much as you do. Ah, Jessy! thank you, darling;" and she held out her hand for me, as if she had suggested to Jessy the raising me up from my perilous position.

The Professor thanked Lady Jones with marked courtesy; but I noticed he intercepted her hand, so that he received my poor bruised remains from Jessy herself, and as he did so he gave her the one frond of fern, saying, "This is from Cornwall, I found it myself."

I saw a bright blush on Jessy's face, and I heard the Professor say in a voice audible only to me, "I wonder—oh, I wonder!" Then they passed out; and, oh! how I longed to tell my master all I had heard, for he soon returned and placed me in a home much better and prettier than my last; and as he doctored my broken limbs, I heard a soft murmur of—"She touched you, little fern, she touched you, and I love her; but, oh! I wonder—I wonder."

I knew what was passing in his mind, so I rang out my bells, and made them say as distinctly as ever they could, "Fair and pure—fair and pure." "Yes, yes, I think so," said the Professor; "but who can tell—who can tell?"

After this morning I found myself the special object of the Professor's care. I was shaded from the sun; put out of doors to inhale the sweet showers; and every day I learned more and more of my dear master's heart. Can no one amongst men answer the question, thought I.

"No, no," said the Professor, "I must wait; I must be patient, little fern; but I love her."

Well, not many days after this there came on a sudden soft shower, and the Professor came out so hurriedly to give me a taste of it, that I saw he had actually forgotten to change his slippers, he who was always so extremely neat.

Just as he had set me down by the side of a bed of choice pansies I heard the joyous laugh. My master hurried behind an arbour close by, for not even to see Jessy would he consent to be found in *déshabille*.

Lady Jones came up and caught sight of the pansies. "Oh, how beautiful!" said she, in real admiration. "Hold my parasol, Jessy; I must have some cuttings, and the old miser never offers me roots, only his trumpery flowers."

"Oh don't, Carry, don't," said Jessy's sweet voice. "Oh, it is really sinful; indeed, indeed it is."

"Preaching?" said my lady, in a sneering voice; "preach to your dear Professor if you like, you are always praising and quoting him, but I'll trouble you not to interfere with me. There!" she said triumphantly; "now I'll just pop 'em in my parasol, and who'll be the wiser? Ha! ha!"

"Carry, you are too wrong," said the low earnest voice; "I cannot bear it."  
"Stuff and rubbish," said my lady; "don't be a goose, but come on."

So they passed into the house, and after a time they returned, accompanied by the Professor. I noticed that he was very pale, and that he walked close to Jessy, but his step was firm and determined, and though pale there was a look in his face I had never seen before; a look of bright intense happiness. When they came near me I saw Lady Jones look aside, but the Professor would not let her escape.

"Oh, do look at my pansies," he said; "I am sure your ladyship must admire them."

Jessy turned deadly pale, but my lady only laughed, saying, "Yes, indeed they are pretty."

"You must allow me to give you some," said the Professor. "I will take you some slips in a moment, or would your ladyship do me the great favour of helping yourself."

He would take no denial, so my lady stooped to gather, and in so doing her parasol flew open.

"Bless me," said the Professor, "why I am only adding to a collection." I saw Jessy look pleadingly at the Professor; he turned aside to allow Lady Jones to recover herself, and I heard in the faintest whisper, "Jessy, Jessy give me heart-ease."

Did she understand him? I heard no more, but I missed my master all that day, and the next morning when he came to the greenhouse, all he said was, "I never doubted her, little fern; never, never."

"Fair and pure, fair and pure," said I, as fast as ever my bells could ring.

"Little fern," said the Professor, while a tear fell upon me, "she will be like God's blessed sunshine to us all. Yes, yes, like sunshine."

When these words fell from my dear master's lips, I felt that my mission was accomplished; that the love of the "cherry little fern" would be perfected in the pure true love of woman; and as my master turned to leave the greenhouse, some idea of the same kind must have crossed his mind, for he whispered tenderly, "Poor little fern; poor maiden-hair."

I looked up as brightly as I could; still brightly, though I had learned so much as to know that from the inevitable there is no escape. Nor did I wish it, for there was shining in my master's face a light too bright for my feeble life to have placed there. He touched my hair as caressingly as in olden days, but all he said was, "My very own, my Jessy."

From that day I saw but little of the Professor, and after a

while he disappeared altogether, and I heard rumours that he was gone abroad, but these rumours seemed to fall unheeded on my ear. I took no note of time, till one bright autumn evening, just as the sun was setting, and I was wishing that I too might sink—borne on the sunny rays—down, down, far away in my beloved west, when all at once I awoke to life, to hear, as in a dream, ringing, oh, so joyously on the evening air, the happy laugh I knew so well, and a voice—perhaps dearer to me now than ever, because I felt I was listening to its tones for the last time—say, “Oh Jessy, darling wife! look here, my little fern is dead.”

FELIX FÆMINA.

## CHRISTMAS IN THE FENS.

### CHAP. I.—OPEN WEATHER.

DO any of my readers know the fens of Cambridgeshire and Huntingdonshire; or, I should rather say, did they know them five-and-twenty years ago, before they were opened out to the rest of England by means of railways? for though drainage did much to alter the fens, yet the iron-horse has done more: the former changed their outward appearance, the latter changed their inhabitants.

The fens—“chilly subject” you will say, dear reader; “nothing to warm one this Christmas time.” Wait a wee, and let me see if, out of the recollections of the fens of my boyhood, I cannot jot down something which will, at any rate, amuse you this dull winter time.

By the way, I am right glad when the dream of a Christmas number disturbed—no, came like a pleasing vision across—their slumbers, that our editors kept to the idea of a *Christmas* number. Christmas I like, and the one fault laid to its charge—viz., having anything to do with bills—ought to be removed for ever, for it is all a mistake. Christmas bills, indeed! they are New Year’s bills for Christmas Day, and Christmas weeks come and go, but not a single bill appears; while no sooner has that chilly new thing, born on January 1st at fifty-nine minutes and a-half to one o’clock, A.M., made its appearance—that thin, thoughtful baby—but rat-rat goes the knocker, and those vulgar yellow letters appear. Why the colour of their envelopes is enough to turn any one bilious, to say nothing of previous Christmas feasting. So let us never hear again of one single Christmas bill; it is all a misnomer. Christmas has no dismal thoughts connected with it. Old Father Christmas is a jolly, rosy, strong, mirthful, mirth-inspiring rogue, given to

“Quips and cranks, and wanton wiles,  
Nods and becks, and wreathed smiles.”

The fen district of England I cannot think of without venerating the memory of the mighty men of olden time, who wrought noble deeds there; men who went out and did battle against the water in the then inclement aguish fens. These brave men fought against the water there hundreds of years ago; they banked it out, drained it out, cut mighty canals, built vast sluices, but in it came again; the dreaded flood appeared some winter’s morning: it came sweeping on, breaking barriers, but man fought away against the mighty antagonist. Among these brave men the greatest of all was Cornelius Vermuden. Charles I. reigned, and lost his head. Stern Cromwell fought and ruled, and grew timid and died. Charles number two, hid up in an oak, listened to long Puritan sermons, reigned, and lived most unpuritanically. What cared old Vermuden about these things; he had other employment than to mingle with politics; he fought against the water; and although he was not able to do all he wished, and I fear died very poor—perhaps, too, broken hearted—still he did much good in the fens, and has left his name there; for take up a map of Cambridgeshire, even the most recent, and you will find “Vermuden’s drove and drain” marked on it. Drove long, straight, wide, and in summer grassy roads; but, oh! in winter black, soft, unsafe ways, up to your horse’s belly if you did not know exactly where to

ride. When the fen farmer anticipated a speedy “dishun to the family,” and he had to turn out of his bed—of course on a moonless night—to fetch the doctor, he mounted his old cart mare, both sorely troubled at the disturbance, and had to go, say, six miles. When he arrived at the door of that most useful but ill-paid servant of the public, called the country surgeon, he rang the bell, with an accompaniment of small stones at the window, to wake up the doctor more speedily.

The doctor soon awoke; the stone shower was not needed, for he slept through any other noise, but the least touch of the “night-bell” awoke him; while, on the other hand—such is use or instinct, or what you please to call it—his wife never heard the bell, and her husband has been known to go out and return, she peacefully slumbering on; but the least movement of the babe in its cradle beside her, the child’s “coo” at the night-light, or its little hand picking at the pink lining over its head as the light of the early morning broke upon its young bright eyes, at these sounds she awoke at once. Well, the doctor is mounted, but how does he ride in safety along the treacherous black drove? In this way: the farmer in front carries the doctor’s lantern, but that was not all; from his old mare’s tail he attached a halter to the bridle of the doctor’s horse, and owing to this contrivance they jog on safely.

This reminds me of an old story. A relation of mine was, about fifty years ago, journeying from Cambridge to the fens, and when he got into the blaek country, especially to a bit of road which lay between two parishes, neither of which would repair it (it was a dispute of long standing), his courage began to fail him, as he found his horse sink deeper and deeper, so he must needs dismount, and try walking; but he began to sink deeper and deeper, to the imminent peril of a new pair of galligaskins. Talking of his perils the next day, with true townsman’s horror, to a company of femmen, one old webfoot (they do say fen children in those days were born webfooted) said, amid puffs of tobacco, “Oh, sir, that’s nothing to what happened to a poor gentleman once when coming through the blaek country. He was riding in the middle of the drove, and saw on one side a man’s hat, and as it seemed a good one, he got off his horse to pick it up. He seizes the hat, but lo! beneath it was a head, and a faint voice said, “Oh, pull me out; I’m nearly dead.” This he did, but his new friend said, “Don’t go, please; now help me to pull out my horse, for he was under me.” This was a fen story; you may do as you like about believing it.

In summer it was awfully hot in the fens, such scorching, with not the least shade to be had; a sort of black Sahara. But we boys liked it; there was plenty of birdnesting—i.e., of birds who built on the ground; and as to fishing, it was our Saturday afternoon’s amusement for months.

But winter was, I think, *the* time; true, we chiefly depended upon ourselves for our pleasures: there was no travelling, no excursion-making. Sometimes, indeed, amid a great flourish of trumpets and display of handbills, a coach to London was started; at first it was fairly loaded, then gradually it came down to be the coachman’s private carriage, and then it soon ceased to run. What did a fenman want to travel for; he would have echoed the rustic bard’s lines:—

“Let vouldes go sarching fur and night,  
We hides at whoam, my dog and I.”

Then, if fenmen did not go out—well, they were likewise not troubled with people coming into the fens from what was called “the high country.” The high country people thought of the fens as King George III. did, “Ah, ah, ah! fens, fens, fens; all fogs, bogs, and ague.” So the fen people kept to themselves, married among themselves, talked their own talk, and went their own ways; names were few, but many of one name, so nicknames abounded, such as “Long Tommy,” “Short Tommy,” “Fat Billy,” “Thin Billy.” If a clergyman from a distant county had a living given him in the fens he felt sorely out of place. As the livings were often good he became non-resident, or shut himself up in his study, and wrote letters to his friends, telling them he had nothing but earth and sky to look at. Poor man! but what a sky—what a study for clouds—Oh! ye painters. The population of the fens was very scattered. Some farmhouses very poor places, but on the Duke of Bedford’s vast estates, the houses were excellent; but as a rule, the gentlemen farmers lived in the towns, and mounted on fine, well-groomed horses—they

were excellent judges of horseflesh—might be seen at an early hour, one after another, "going farming," riding out of the different ways leading to the fens.

Fen society was peculiar; no large landholders resided there. "The Duke"—we knew of no other duke—lived at Woburn. Gentry, properly so called, there were none; hence, clergymen, as a rule, were the magistrates; a bad plan, but how could it be avoided? Gentlemen farmers, owners, or large renters, were the upper class, not over educated certainly, but hearty good fellows, some of them apt to sit a little too long at the market-table; while the lower farmers were, as a rule, lower in all respects. The fen labourers who were employed at drain or dyke work were called "bankers;" and by drain I do not mean little narrow ditches (you would need a leaping-pole to jump them with), but broad dykes full of dark brown water, not muddy, but dark from the black peaty sides and bottom. In these long, straight drains the pike darted, or slept in the sun. The drains ran along the wide drove, while fields to the right and left—little squares of a few acres extent—reached from the drove by bridges across the main drain, and each field surrounded by its ditches full of sluggish water. Windmills and watermills abounded; you might stand and count thirty or more within sight. There were no enclosures a quarter of a century ago; here and there a row of ancient willows, grey stemmed and pollarded each season, might be seen hanging their queer, cut-short heads over the drains. A farmhouse, too, was not unfrequently marked out to the eye by a row of poplars in front of its garden; but elsewhere nothing to catch the eye save the beautiful church spires which abounded, for the fens are rich in churches, or perhaps there rose before the eye the massive forms of Ely or Peterborough Cathedrals, which you appeared to see from the lowest tier of stone to the battlements, for there was nothing to hide them.

From the fen "bankers" came originally the now universal English navvies. These bankers had for generations been accustomed to cut out with their narrow spades, and cast up the blue clay, and so were ready and fit for railway making. They were a rough, drinking set, many were followed everywhere by their brindled bull-dogs, the courage of which dogs they were accustomed to test in puppyhood, by fastening them through the ear by a dinner fork to the edge of the ale-house table; the pup that squeaked, or showed anything but his close-shut teeth, was doomed to be hung. The bankers fifty years ago were great customers to the doctor at spring and fall in an odd way. They fancied that being bled, or, as they called it, being "blooded" periodically did them a world of good. So they came in

crowds to the surgery on a Sunday morning, their leisure time, and stood in rows, leaning against the wall, watching the operation, and waiting each his turn; or they were outside chatting in groups. The most were lengthy tall fellows; their dress peculiar—red cotton neckcloths, wondrous smart waistcoats, short slops, mere round jackets, corderoy breeches, and rough home-knitted blue or speckled stockings; but on a Sunday morning was one mark especially—their high water-tight laced boots were unlaced, and very slovenly they looked. Here and there a dandy among them would have Sunday boots of a thinner texture, but of similar make, and these brightly polished and neatly laced. Short pipes were unusual, they better liked the long pipe of the public-house kitchen. They loitered about the streets all Sunday morning, hands in pockets, or stood at the idle corner, watching the people going to and returning from church. In the afternoon the older and steadier men were wont to attend church, sitting in a deep gallery by themselves, "the poor man's gallery," it was called; and a fine sight it was to see them rise to sing the evening hymn. The women sat in an opposite gallery by themselves.

This strange population is now strangely altered. The bankers are navvies, and have emigrated—the fens are drained. That was a remarkable Sunday morning when, owing to Telford's genius in deepening the outfall, the sluggish waters in the drains began to run. The people and parson, too, it is said, ran out of Thorney Church—properly Thorney Abbey—to see the wonderful sight of the waters on the move though many miles from the sea. Trains now cross and recross the fens; fennmen travel as much as any men; the lands are in parts inclosed; the last-left great inland piece of water "Whittlesey Mere," that long defied the engineer's skill, is now dry, and like other fen land, its bottom sends to London market good corn, or grazes fine bullocks. No more decoys on the mere to entrap the wild duck, the flights of starlings are diminished, and reeds, once the universal roofing of the houses, cannot now be procured. Yet let me revive for a few moments the past, and speak of a winter's day on the ice.

#### CHAP. II.—FROZEN HARD.

"Have you heard, Harry," said the doctor to his son of twelve years old, "that there are to be races on the mere to-day? Lord Fitzwilliam (the doctor liked my Lord, and his Lordship's hounds, too) has given ten guineas to be run for, and the Milton ladies will be there on their sledges. The great Cowbit runner came to town last night, and there

will be the best skating these many years, for the ice is firm, and in rare order. You shall go, my boy. Neighbour Wigmore, who skates well, will let you go with his party; indeed he told me all about it. You shall go, my boy, for it's Christmas week, and I will ride round and see the fun after I have visited my patients. You shall go, lad."

"Thank you, father." (He hated to be Pa'd.)

The doctor had just got another horse. His wife declared (what will not wives declare!) that he had a new steed every month; that each was an angel the first week, a good nag the second, "hang it! rather shy" the third, and "a brute" the fourth. Well, a doctor is tied by the leg to his profession, and as *he* cannot get change, it seems but fair that he should have a change of steeds. Besides, the doctor had an account book, which showed that at the end of the year he was gainer rather than loser by horse dealing.

"Dat a good breakfast, my boy. Here's another rasher of bacon; it came on a dead horse," *i. e.* it was brought instead of money by some honest cottager to liquidate his debt to the doctor. However, there was one man, a blacksmith, who always got over the doctor. The man's wife was frequently ailing; besides, she presented her husband each year for a dozen years with that kind of "comic annual" called a baby, but the fellow never paid the doctor. It was always the same quiet gentlemanly manner and phrase, "You, doctor, do the best by Mrs. Stonely, and I will do the best by you." This coolness, and a certain likeness he bore to a cousin of the doctor's, always softened the good man's heart, and *he* did the best for Mrs. Stonely, but Mr. Stonely did not do the best by *him*, never paying him one shilling. But to our tale. The morning was bright and clear; there had been snow, but not deep; no need of much sweeping, much less for digging the paths. Harry was soon off; he

first flew his Tumblers, though. He found the whole town was alive with the thoughts of the races which were to be on the mere, some miles distant. The men who went about with turf carts every morning—the poor did not buy coal, but turves (dried peat), each about the size of two bricks—told their customers about the races while they stood beating their hands across their breasts. And the old women, handing their three pennies (good old cart-wheel pennies), told back of the races when they were young. "It was the year, bless you, poor young Spicherley was drowned, &c., &c., &c." Few were the farmers seen going farming that morning. Only a few old fogies crept to the reading-room—for there was one even in those days—but very dear, very poor in papers and books, and very exclusive. The male population, man and boy, were going off to the mere. Harry heard such remarks as these: "The frost 'ill last, for didn't you see the wild ducks fly over the town yesterday afternoon?" "Aye, bor, and I seed a sea-gull; he wor flying

right across the drove." The crowds were wending the way towards which the mere lay. Some riding, more in gigs—three in a gig, that uncomfortable arrangement; but the majority were going to skate there, for fennen could all skate. Many had first put on their "pattens"—local name for skates—by the fire, and learned to stand in them on their mother's wash-tub.

Skates in hand, with neighbour Wigmore's party, Harry started off, with comforter round his neck, and tneked into his buttoned-up jacket, but no great coat on; such wraps were for muffs who rode or walked, poor fellows!

Harry listened with eager ears to the remarks about the chance of winning which the champion runner of his town had, —one Bellmore, a rosy-checked and quiet labouring man, quite a nobody, except when there was frost, then he became a hero, or at least a notoriety. He was one of a large family, and had an uncle who bore a bad character for pilfering; he was the black sheep of the Bellmores. This fellow was entering an orchard through its hedge, with a design, doubtless, upon its apples. However, the farmer was on the watch, and as Bellmore got safe through the hedge, the farmer called out—"Where are you going, Bellmore?" The cool knave replied, "Back again, sir, now I see you." He was for ever after known as "Backagain Bellmore," to mark him from the thirty others of the name.

The mere could be reached on the ice by two ways,—one by the river (itself, indeed, a huge dyke), this was the longer way,—the other by the fen drains. The latter Harry's party chose. The skates are soon on, and off they go.

"Why, Mr. Wigmore, if there's not old Asthmatical Tom out bird-catching, as usual," said Harry.

On they go, along the straight drain, having, however, to walk across the bridge, which was a nuisance. There were six of the party, close following one another, stroked by stroke, and each stroke taken by each skater at the same time.

"Oh! how my feet ache, Mr. Wigmore." "Never mind, Harry, that will soon wear off." "Do stop, please." "No; we shall be late. Be a brave boy." They reach the end of the long drain, and have to walk across a wide road to get to the "Leam." "Leam! What's that?" says my good reader. Well, friend—for so I will deem you if you travel patiently with me to the end—you will not find the word in any dictionary; but in the fens are many words of peculiar sound and signification. "Leam" is a large dyke, the width of a canal, cut probably by the early Dutch drainers. This leam,—but Harry found it awkward work to walk across the road in skates to get to it, to ttering, foot-aebing work, and some distance, too. At length the "Leam" is reached, and on the smooth ice glide the party, while before them, beside them, behind them, are numerous other parties skating away as only fen men can skate. This "Leam" was a rare place in summer for catching bream,—"*Bellows Bream*," as they were called, from their shape somewhat resembling and size nearly equalling that of a pair of bellows. Another road to cross, another

dyke to reach, then crossing from dyke to dyke. (Oh, these horrid low bridges, straight and flat, which no one could get under.) Oh, that horrid walking in skates. "Come, Harry, the races will have begun." "What's that great wood, only they don't look like trees, Mr. Wigmore?" "Why, boy, that is the mere; and that thick wood, as you call it, is acres upon acres of reed that grow round it. Put on a spurt, Harry." And the boy did; and soon the reed forest is entered by a narrow ice path, some way which, being flooded and frozen, afforded an entrance to the skaters. The reed stood high above head, and, growing close and straight, looked like some monster field of corn in "*Brob-dignag*." As the wind whistled through it, and brought bits of frozen snow from the tops, and the reed swayed gently, now this way, now that, it sent forth a strange, shrill, piercing sound. This reed was a great source of profit to the owners. It supplied the best covering for houses,—neat-looking, warm in winter, cool in summer, so unlike the thin cold slates, but

which attract the sun, and make a house most hot when we want it most cool. One fault it had; in case of fire it was food, ready and prepared for the devourer. But in those days we slept secure; as were our neighbours, so were we,—equally exposed, but equally careless of what might happen.

The skaters at length pass the reed-belt and reach the open frozen mere, and no contemptible size was it,—I suppose nearly three miles by two, and with its deep fringe of reeds it covered a very large space. The crowd Harry saw were gathering to a centre, where tents and flags bespoke some business to be going on. Hundreds of people were already on the mere, and hundreds more were issuing from the different inlets. The frost had been continuously severe, so there was no danger. Sixteen runners had offered themselves, and they are to run in pairs. The long course is cleared, and the first pair start, each man cheered by his friends. The runners wore gay silk handkerchiefs on their heads, and stripped to their shirt sleeves; some of them wore a tight-fitting flannel dress. As to the first two, one was manifestly superior, so the interest speedily flagged. The eight races are over, the winner of each is to receive a share of the prize. Then came the four, then the two, and then at length the great race between the two best men. Here is our friend Bellmore, the other the noted Cowbit runner. Each man is determined to do his very best. Bellmore smiles and looks confident with his good-humoured face and merry hazel eye. 'Tis said he has been training hard, and living high: nothing less, they whisper, than slightly-cooked beef-steaks and other good things. The Cowbit man is of altogether a different build—a tall, sallow, dark-haired man, long in leg, neck, and nose—a very wiry fellow, with such a long stride, though critics notice he has not the leg and loin of his antagonist.

Off they start, amid a dead silence of attention. The Cowbit man shoots ahead, and soon is far ahead; he surely flies on skates. Bellmore goes at a terrible pace, as those find who try to keep up with him, but the pace is altogether inferior to that of his opponent. Bellmore had an odd fancy to have his skates tied with stout tar string instead of straps,—he said they stuck closer together; and he was no dandy, but a plain labourer, or rather miller's man, and what sacks of corn and beans he could carry! The Cowbit man has turned the corner, but surely they are not quite so far apart now. Bellmore is round too, and both meeting a strong wind. The smaller man bends low; his stature is in his favour now, and so is his terrible lasting strength. Surely he is gaining: the Cowbit man's pace is not what it was, and the wind mauls him terribly. Harry is awfully excited, stretching his little neck to see the race, while the shouting is fierce and loud.

What! the men are nearly abreast. The Cowbit man is cheered vociferously by his friends—fierce, determined shouts; while Bellmore's are afraid almost to cheer, lest a breath should hinder him or take off his attention. They are now neck and neck, side by side, stroke with stroke, but 'tis the Cowbit man's last effort, he is done up; he has not the stamina of the short Saxon, who glides on smiling now with all confidence, but at so rapid a rate that he is caught in the arms of his friends many yards beyond the winning-post. As to the Cowbit man, blood is seen trickling from his ears and nose. He is terribly exhausted; it is doubtful if he will ever race again. Harry is highly delighted, for does he not know the hero of the day; had not Bellmore nodded to him that very morning. He is charmed, too, with the sledges, and one or two ladies who skate—now-a-days, happily, there would be more.

But the brief bright winter day begins to decline, and friends had in the crowd got separated. Harry had lost his party, and as the multitude is thinning, he bends his way, as he thinks, to the part of the mere at which he entered. But, poor boy, he is wrong; he has not noticed, boy-like, the one guide to positions on the mere, viz., Yaxley Church, so he comes out at quite a different place. He feels somewhat alarmed; but evening will soon be upon him, and what if he did not get home that night? Still, even in his alarm he cannot but pause a moment or two and listen to the sound; he turns and looks back upon the mere. It will be the last time there will be races there; for that far-famed piece of water, in which was lost the great bell on its way to Ramsey Abbey, will be drained next spring. The plans are all ready; the engineer is quite confident that he can do away with the last remnant of the fens, their last lake. "Horrid man!" ejaculates Harry, "no more decoys, no more wild ducks in flocks, no more reeds, no more great flights of starlings, almost darkening the sky; and worst of all, no more races on the ice." Harry wishes that engineer—

"A cravat with a drestle tight twist in it."

He was a thoughtful boy, and he was tired, and the excitement over; both which things conduce to contemplation. So he paused and listened to the sound of the hundreds of skaters; the rumble and roar as of a sea, but broken in upon by the merry voices. Through the reeds and up a river, but where is Harry? Why, he has come out on the Farsett side of the mere; for him the wrong side. The boy is now tired, and cold, and hungry, utterly done up, and hangs on the coat-tails of a skater who pities his weary condition. But soon he is too tired to get any further. So coming to a farm-house, he takes off his skates, and as he gets near hears from within many voices, which cheer our somewhat down-

east hero. Having knocked timidly, he asked still more timidly for something to eat, a bit of bread will do; and will they tell him the way home. The servant-girl looks thunder and lightning at Harry; the former from her frown, the latter from her eyes; and goes straight to her mistress with—"Please, mum, here's a young gent—leastways he ought to be a young gent by his clothes—who wants some food and to be shown his way; but, mum, I think it's a boy them Lunnun thieves has brought (Jack was a-saying in the kitchen, he saw a lad who saw a lad what told him they was coming to the races) to put through the dairy windy, when they will break into the house; and he's come to find how the front door be fastened. Please, mum, may I set the dog on the young varmint?"

The mistress stared, the company stared, too; for it had been said before all assembled. The farmer muttered a "bother the girl!" and went to investigate matters himself; and being a better judge of character than the damsel, and being moreover in a very good humour, he soon saw how it was and brought the boy in. "Why, Harry, wherever are you come from?" said a gentlemanly-looking, flaxen-haired, middle-aged man, with florid complexion and bright kind eye—a surgeon all over. "Oh, Mr. Cust, I am so thankful to see you." This Mr. Cust was Harry's father's great surgical chum (for, by-the-way, doctors in the same town hate each other like vipers; 'tis terrible how they quarrel sometimes, and their wives oftener). A few words of explanation follow and Harry is welcomed at the table. "Now, my lad," said the farmer, "tuck into that goose, or shall it be turkey, or fowl, or pigeon-pie? None of your butcher's meat for me, young gentleman; none of your mutton from sheep that died of their own accord; I'm a poultry fancier, that I am—ha, ha, ha!" and the farmer laughed, and as he laughed one lost sight of his eyes; and his bald crown seemed to laugh, too, so bright did it look as his head shook. Harry ate and was thankful. "Well," said the farmer, "I was just going to tell you about that brood of duckwings; well, I was done again, only two cocks out of eleven eggs. But the old woman shall never pick her eggs again; it shall be guess work, it shall; she knows what eggs will hatch pullets well enough, and my bargain was, she to have the pullets, and bring up the young cocks for me; but she shall never pick her eggs again, not she," and then the farmer laughed one of his glorious laughs.

Mr. Cust had twice looked at his watch, and—thoughtful man—family man he was, too—he began to think of the anxiety which Harry's mother would feel as night came on and he not appearing. "Come, doctor, you must not go yet, I want to show you my new fowl-houses. Fowls are looked down upon now; but mark my word, if the cattle should ever run short and meat be dear, then the value of fowls will be learnt. Poultry are looked down upon as poor paying stock, but I can prove they do pay, and may be made to pay by anybody." "I can't stay longer, Mr. Summery; I can't see your new houses to-night; indeed, I have staid too long already; but I drove round to see my old patient, your good wife, for I heard she had been ill. Ah, Mr. Summery, you did me a good turn when I was in practice nearer you, and I hope I feel grateful. Why, dear me! here's my young friend fast asleep." Harry had been caught nodding. The doctor's gig (there were no dog-carts in those days, and four wheels would have speedily been two wheels on rough fen roads) was soon at the door, and Harry tucked in comfortably and invited to come again, "and the girl shan't set the dog on you, or take you for a young thief," said the farmer slyly.

On they drove, Harry blessing his stars that he had done with skating and walking for that day, and in an hour or so he was deposited at his father's door. Maternal anxiety is now over, and Mr. Cust thanked; and Harry is soon in bed and fast asleep, as his mother had seen before she left him. She had stood and listened to the steadily drawn breath, and looked on the closed eyes—"tired eyelids lying upon tired eyes"—and she had admired the boy's auburn curls as they lay crushed up on the white pillow; and she blessed him, her only boy left, and thanked the God who had brought him home safely.

Harry slept and dreamed—no, boys seldom dream—with them it is one long sleep from five minutes after getting into bed to five minutes before getting up.

WILTSHIRE RECTOR.

## THE GOOD OF OUR PETS.

WE like the term Natural History for the study of animal life. It is a natural study, and almost from the earliest periods of our lives we have recollections of some pets. We do not believe the child first catches the fly for the sake of pulling off its wings; it is for the sake of possessing something weaker than itself—something it can patronize and protect; then, having caught it, it plays with its subject just as the cat does with a mouse. Did you ever

notice this last operation narrowly without, in imagination, becoming the victim of some generous lion or cruel tiger? "I have seen," says an Eastern traveller, "the lion take a small ox, jump a high fence with him, throw him over his back, and go off with him without an effort." A man who was rescued from a tiger describes the animal as having taken him through the shoulder, and carried him easily into the jungle, stopping every now and then, and "purring" round him like a cat. Just look at the cat as he enters the room with a mouse in his mouth. See him with his tail erect; notice the dignity of his step; and, arrived at the spot he meant to reach, see him deposit the poor panting animal between his paws. He allows it to run away till close to a refuge, then all the spirit is aroused, and he bounds after it, returning triumphant. Then he pretends to have lost it; then he lies down on it. If it becomes faint he gives it a small bite in a non-vital part; and when all power ceases, then he eats it. Fancy two hours in a jungle, "far removed from noise and smoke," under similar circumstances.

The almost infant catches the fly, and loves the dog, cat, bird, or other domestic animal.

The eminent philanthropist, Charles Sturge, has an institution near Birmingham for the purpose of reclaiming convict boys. Many of these are very Pariahs, workhouse boys, English Bedouins. There are many such in London. Those who are in the habit of rising very early can tell of these white sons of Ishmael: how they sleep under the dry arches of the bridges, the porticos of churches, the covered doorways of large houses, and the clumps of evergreens in the Green Park. Many may have admired the beautiful engraving of the stag rising from his lair: the vigour and truthfulness of the uplifted head and open nostril, snuffing in the fresh morning breeze; the partially curved back, preparatory to the stretch that shall restore the cramped limbs to their freedom; and his *breakfast waiting for him*. Did they ever imagine these cockney Arabs, as they emerge from their lairs—growing, healthy, hungry boys. They stand erect and stretch; they shake the rags that serve for clothing, they go to the nearest pump and wash, and then they look around them. They are right hungry, but *they have no breakfast waiting*. It is a trying position to have a good hard-working, natural appetite, and nothing to satisfy it. It is difficult to understand one like this in a metropolis overflowing with wealth and food, all kept from him. We are afraid it is not hard to imagine that such an one, who has never had a kind word spoken to him in his life, should think little of a society that seems only to spurn him. He wakes, and is hungry, but has nothing to eat. It is not the figurative nothing of the systematic, who have their hot-water punctually at half-past seven, and breakfast on the table at eight—*only* toast and bread-and-butter, and cold beef; not an egg nor a broil; positively nothing for breakfast! Every day that our young Arab prowls about the streets in search of breakfast he becomes more and more hardened; he does not dread prison, as he is there clothed and fed. Prison is the result of stealing, but by stealing he can pacify his hunger, and he does so. He is not careful to escape; and in this class are found the youthful cynics, who quiz the judge while he passes sentence, and ask for increase of punishment. He goes to prison, only to become worse. It is no exaggeration to say many of these

never heard a word of kindness applied to themselves. Prisons, reformatories, and houses of correction are full of them. Their thefts are generally for food or clothing, and their sentences for short periods; but when they leave the prison they have no option but to steal again. Mr. Sturge has founded a reformatory for such boys. During some years progress was very slow, scarcely perceptible. The inmates appreciated warm clothing, and good regular food; but except to fear, they cared not for their master or benefactor. They did not believe in love or kindness. They had become animals, and remained so till it struck the good philanthropist one day he would try a new plan: he would find out whether there was not a latent spark of better feeling in them. A few animals were placed in the grounds, a few birds on the water. The boys soon noticed them, then gave them part of their meals, and then grew fond of them. They were then allowed to have pets of their own, and improvement began directly. As soon as they had something to look to them for food and protection, and something to love, they could understand their own position; their regeneration began, and many useful members of society may date their reform from the day that made them possessors of a lamb, rabbit, guinea pig, or dog. As soon as a living thing looked to them for food and protection, and loved them, a new feeling was evoked, and they could then feel drawn to their fellow-creatures. Their protégés supplied at once a bribe and a threat; by their means they could be encouraged or punished.

It is almost impossible to assign limits to this love of animated nature. Lately, when some of the most desperate and reckless of French galley-slaves were being removed in order to be transported to Cayenne, the most hardened of the chain, a triple murderer, walked with a rat upon his shoulder, caressing it so far as a man could who was chained. The captain of the vessel objected to receive the rat, but the guard who had charge, said it was impossible to govern that man if it was taken from him. He was the terror of the place till he had tamed it. As the rat tamed, he softened, and the threat of taking away his rat, would govern him at any time. He had had but one outbreak, and that was when a fellow-prisoner threw a stone at his rat. He fell on him, and but for being prevented, he would have committed a fourth murder.

This love of animals appears to be common to all. Every one in London is familiar with the four-wheeled van, that is seen loaded with shabby, such shabby-looking furniture the day before quarter-day. On the tail-board, there sits a woman, holding a Dutch clock and a baby in her lap. Three or four other children sit beside her: one holds a basket,

from which proceeds sounds that proclaim the inmate to be a cat; another holds a dog, and a third a canary. Look at the plagues of screaming, biting parrots; those terrible toy-dogs, that are better fed and tended than many children. Sometimes, however, the love is reciprocal. We know the beautiful traits of fidelity of dogs. Even cats have shown love for home. They have been known to travel many miles to get there; indeed, we believe their attachment is more to place than to person.

We were, a time since, talking to a sailor about the terrible wreck when so many coolies were lately lost near Calcutta.

"I know the spot," said he. "I have been wrecked there. The alligators chase you ashore, and the tigers wait for you on the beach."

Nevertheless, he assured us that no one is allowed to kill these latter without permission, which is not always easily granted. When a tiger has once tasted human flesh, it is said to prefer it to any other food, and seek it constantly. Such an one is called a man-eater. The same sailor we have quoted above, told us a tale of one of these. He said:

"There was a frigate lying off the coast of Asia. Among the crew was one man, so evidently cast down, that orders were given to his shipmates to watch him. He one day asked for the loan of a cutlass and brace of pistols, and for permission to go ashore. All shook their heads, till he came to the commander, who told him he was the last man in the ship to whom he would grant such permission, as he should never expect to see him return. He then told him he had had him watched for weeks.

"Your honour," said the sailor, "there is no occasion for that. I am no coward to put an end to my life—not that it's much pleasure. I have been in debt for years, everything is fore-stalled, and work as I will, I can't get on. It makes a fellow dull when he can't do as his shipmates do. There is a man-eater on shore, and heaps of money promised to whoever can kill him. I want to try, and if I do, you will see there is no necessity to watch me."

"All he asked was granted. He walked for some time before he met any one willing to show him the way to the jungle where the dreaded tiger lay. At last he met one.

"What do you want to know for?" asked the native.

"I want to kill him."

"So have many more, but he killed them."

"They were getting near the jungle, when the black climbed a long straight tree, and pointing to a thick patch, said, 'He is there.'

"The sailor stripped to his shirt, looked at his pistols, and loosened his entlass. He then entered the thicket, throwing

stones as he went. Soon were heard two shots, and then a continued hacking, and lots of those 'funny words' that Ingoldsby says sailors use. Then the sailor came out; his shirt was torn from him, his back was deeply furrowed with claw marks, and he had evidently been bitten through the shoulder. 'Come down, blackie, I have killed the tiger.' The blackie looked down, and, seeing the sailor streaming with blood, grinned, and said—'Don't look like it.' 'But I have, I tell you.' 'No one will believe it without you bring his head.' 'True,' said the sailor;—'something to learn from a nigger.' He went in and returned, bringing the head. 'Any drink to be had?' 'Lots, now you have killed the tiger.' And they went to a drink house. The sailor poured quantities down his back into the wounds, and still more down his throat; when, overcome with fatigue and rather faint, he leaned his head on a table and went to sleep. The black rolled the head in part of his turban, and went to the village, where the head man of the country sat daily to administer justice; or, as some of us know who have the privilege of serving on juries, 'on behalf of our Sovereign lady the Queen, to do and examine such things as shall then and there be brought before you.' Among other duties he was to pay the reward to any one who killed the man-cater. 'Well!' said he, as the black entered, carrying a large bloody bundle; 'well!' The black salaamed. 'I have killed the tiger.' The head man looked well at him; he did not look like one to undertake such a feat, much less to accomplish it. 'What proof?' said the Governor. 'I have his head.' The Governor sat on a small raised platform, approached by three or four steps. 'Come here,' said he to the claimant. 'Do you see my beard?' 'Yes.' 'Do you see that long white hair?' 'Yes.' 'Pull it out,' shouted the head man. The blackie approached timidly, and was about to touch it delicately with the tips of his fingers, when the Governor snapped at him with his mouth. 'Oh!' screamed the black, and jumped off the platform. 'Look that man up,' said the chief, 'he did not kill the tiger.'

"Some time afterwards the sailor came. 'Justice,' he said, 'I killed the man-cater, and a black fellow stole his head.' The chief put him to the same ordeal as the black. When the sailor was told to pull out the white hair, he laid hold of a handful, and when the head man snapped at him, he doubled his fist and knocked him down. As his attendant picked the great man up, he said, 'Pay that man, he killed the tiger.'"

A trifle will sometimes save a life, or throw a party into consternation, and these trifles may be the work of the smallest and most despised reptiles. During the most sanguinary period of the French Revolution a nobleman was flying from his pursuers. He was hard pressed; he entered a house, and crept into an oven. His pursuers entered almost with him. "He must have gone into the oven," said one. "Impossible," said another; "here is a cobweb across the mouth of it." In the instant a spider had spun his web at the mouth of the oven. A friend of our's, a great observer of natural history,

wished to solve a doubt. He had been told that when birds of prey have young only one parent feeds. He lived in the north of Scotland, and had an eagle's nest in some rocks on his estate. He waited, and shot the female bird. He watched narrowly; the male was constantly backwards and forwards with food. The young were constantly crying for two days. The parent still brought food, but there was no sound from the nest. He got up to it and found the young ones dead, surrounded by lambs, hares, rabbits, and everything eatable. The male brought the food, but did not feed. Men become so interested in the pursuit, that when they are astride their hobby they are apt to forget the "convenances" of society. An old enthusiast was the lion of a conversation, held at the house of a lady, the wife of a millionaire. The entertainers had little sympathy with talent or intellect. The master was proud of his wealth; the mistress, of the faultless condition of her house. The one could lend them a trifle; the other could invite them, and, as she said, "trot them out." Our enthusiast was a celebrity—and deservedly so. The

hostess brought him into the room, and he was soon the centre of a circle, where natural history, and the instinct of birds as compared with the reason of man, formed the subject. He enlarged on it, and spoke highly of the quality of their instinct. He looked round for an illustration. "Take, for instance," he said, "that cobweb in the corner of the ceiling. The spider knows it is easier to build from side to side—" Before he had got as far as this his circle was broken, the hostess being the first to disappear.

— Another, and perhaps a more genial phase of our subject, is that which comes home to most of us—to many to whom lions, tigers, and that class are known only from reading, or in menageries. We speak of the animals that are about our homes. Migratory birds return year after year to the same spot—to their home. Many Londoners, or transplanted countrymen, who look for the first swallow, will recollect those that used to come to the corner of Bennett and Arlington Streets, and built in the corners of some blank windows. We watched them for years, and we there saw that of which we had often read—their fashion of walling up or entombing alive any pertinacious intruder into the nest. It was very early in the morning, when no one was about. There was a great crying, and we saw a sparrow doing all in his power to enter the nest to which the swallows had just returned; he seemed the stronger and obtained admission. The beaten swallow clung to the edge of the entrance with his feet, spread his wings to prevent egress, called for assistance, which was speedily at hand, when all seeming to understand the case came ready for work, and in a few minutes the intruder was securely built into a living tomb. We have known a robin build year after year in a shed used as a knife house; a fly-catcher in the bend of a branch that was trained along the top of a low dining-room window.

Those who are fond of shooting, or of watching the habits of our field birds, can tell us of the strong home feeling of partridges; how they cling to the field in which they were bred; how it is their feeding ground; and how certainly they may be found there morning and evening, so long as even a headland remains unploughed. There is the marvellous instinct of the pigeon, which has puzzled all to account for. Taken in a close box from Hertfordshire to Antwerp, and released on its arrival, it returns in so short period of time, as not only to necessitate the greatest possible speed, but to preclude any possibility of doubt in the bird's mind as to the route to be followed. We ourselves, when boys, had two young white pigeons given to us. They could scarcely feed, and were reared in a rabbit-hutch. *They were never at liberty.* When some months old they were put in a bag, which was placed in a dog-cart, and they were taken thirty-one miles into the country; after dark they were placed in a pigeon-house. One of them was back in London before eleven the next morning, the other the following day.

Take the way of wild fowl steering through the air for thousands of miles. Air and water, trackless both, yet both

affording highways for our feathered friends. Many a time are they harbingers of joy. The weary mariner, long before he sees the land, is told of his approach to it by the bird that settles in the rigging of his vessel.

And what shall we say for the robin—the cheery autumn songster. There is no copse or wood so lonely, that you are not immediately accosted by a robin. We say accosted, because he is not content to warble his song unscen, but he challenges notice. He turns the leaves over at your feet; he eats his meal, and then flying to a handy sprig or bough, he lustily sings his merry carol. And the luscious song of the nightingale, the morning and evening hymn of praise, coming when the earth is grateful for her re-clothing with her beautiful mantle; and the bold thrush trolling forth his grand notes; the soft warbling of the hedge sparrow; and the familiar “Little bit of bread and no cheese” of the yellowhammer; the beautiful goldfinches and bullfinches; the saucy magpie; the screaming jay; the familiar jackdaw; the sapient and mischievous raven, with many others, all associated with some period or other of our lives.

Certain places are renowned not only for the number of the song birds that frequent them, but also for the quality of their song. When Peter Pindar tells his humorous tale of Sir Joseph Banks being taken by the police officers for one of the burglars they were in search of, because he was what they called hanging about a lonely lane; and of the same officer, who being told to apologise said, “I beg your pardon, Sir Joseph, and will never judge a man by his looks again,” he was only describing a common occurrence. Holland House Lane, at Kensington, was for many years the most renowned spot in the neighbourhood of the metropolis for hearing nightingales, and we have seen it full of people at night. They are mostly amiable and kind companions who, like Gilbert White, can mark the arrival of every bird; who make nature a book in which they read, and whose record of the periodical changes are their almanacks.

Still greater enthusiasts, and who pursue their hobby under difficulties that would deter many, are the working men of London. The weavers of Spitalfields have long been famous for their love of animated nature. Pigeons, rabbits, dogs, song-birds, are all kept by them. In the palmy days of their trade they were owners of all the best of these different breeds. Now the love remains, but few have the means of gratifying it to the extent they did formerly. Nevertheless, by the side of the loom or in the window there always hangs a bird. When it challenges to sing the man leaves off work, and listens motionless while the song lasts. Let his poverty

be ever so great, while the bird sings it disappears, and in the words of the French song, he forgets

“Les fatigues de la Veille  
Les soucis de lendemain.”

The ballad of the young knight and his Goshawk has been verified over and over again among these weavers.

These are, however, the delights and companions of the real country, not of the suburban residence of the professional man, whose over-worked brain requires relaxation; and who gets home after a seven hour's argument as to whether the man described as Clark without an e could by any means be Clark with an e, and who has been for the prosecution; the point involved being only the murder of a wife and two children, the judges give him the benefit of the doubt, and, being of course superior to the stupid jury who called it all a legal quibble and tom-foolery, and found the man “Guilty,” they order him to be discharged. How refreshing after the dusty court and stale arguments, to look at the common sense poultry and see them enjoy their lives. The surgeon, the physician, the merchant, the tradesman, the artisan owe much of their relaxation to the study of this phase of natural history. We have known a physician in large practice who has spent the night by the side of a hen hatching her eggs; and for the purpose of elucidating a knotty point by comparative anatomy, he has passed through the long hours, constantly using the stethoscope.

The love of these pursuits is the unbending of the bow: it is the natural relaxation, and affords not only an amusement, but an inducement to out-door pursuits. Another charm is, that it can be indulged in by parents and children together.

We have often thought the different breeds of fowls were types of the people of the country after which they are named. The Game Cock represents the manly carriage and the pluck of the independent Englishman, while the Dorking is a fair sample of the well-to-do middle class tradesman, the agriculturist, and the workman. The La Fleche is the old “preux chevalier” of France, the Crève-cœur is the middle class, the “Epicier,” while the Houdan is the representative of the “Robert Macaire” school. The Brahma represents our transatlantic consins, full of good quality, but of doubtful origin. The Spaniard is handsome, bold, and vain, becoming numerous, and taking temporary importance by fits and starts. The Coehins are good types of those from whom they have taken their names,—quiet, money-making, clever, satisfied birds. The Polands are handsome and useful, but not sufficiently numerous to become an important breed. The Malay looks

like those who are ready in the use of the steel, and careless of consequences.

All have their admirers. Poets use them constantly in the way of simile. They are, however, not only hobbies; they have their useful points. They provide delicate meals for invalids, luxuries for those in health. They eke out scanty

incomes. They afford a harmless and pleasing excitement in the way of competition.

Most of our readers keep them. When the cock wakes you on the blessed Christmas morn, may he call you to a merry and happy Christmas, and may he find you striving for peace upon earth, and showing good will towards men.

## THE IVY AND THE BELL.

A LEGEND OF CLONALLEN TOWER.

N days when Alfred ruled the land,  
As ancient legends tell,  
The Ivy was a gardener's lad,  
And loved a lady well;  
And the Bell that hangs in the turret high  
Was the lady pure as snow,  
The only daughter of an earl,  
A thousand years ago.

That lady fair, so bright and rare,  
Had suitors many a one,  
Both knights and earls, and knaves and churls;  
But she loved the gardener's son.  
They pledged their faith, in life or death,  
In happiness or woe,  
And seal'd the promise with a ring,  
A thousand years ago.

The grim earl read his magic book,  
And lo! before his sight,  
The deeds they did, the love they hid,  
Were clear as morning light.  
He swore an oath to slay them both,—  
The maid for looking low,  
The gardener's lad for looking high,—  
A thousand years ago.

By magic might he changed the lad  
Into an Ivy flower,  
And the lady bright to the booming Bell  
That swings in the donjon-tower.  
"Be this," quoth he, "the doom they dree,  
Who guiled a father so!"  
And the grim earl burned his magic books,  
A thousand years ago.

But every time the Bell was rung  
The Ivy spread and grew,  
"Climb to me! climb!" said every chime,  
"O, Ivy! ever true!"  
And the Ivy clomb an inch a day,  
As never did Ivy grow,  
And reached the Bell and cover'd it o'er,  
A thousand years ago.

A mortal hand ne'er rang the Bell,  
But up in its turret high  
It peal'd sweet tunes, like Norland runes,  
To the breeze that wander'd by;  
And every year at Christmas Eve,  
As winds begin to blow,  
Yon may hear it ring—as oft it rang  
A thousand years ago.

Sometimes merry, and sometimes sad,  
But always sweet and clear,  
And all who listen dream of Love,  
And the hearts they hold most dear.  
For Love's the same, and ever the same,  
Though ages ebb and flow;—  
O Love, be happier than thou wert  
A thousand years ago!

C. MACKAY.

**A GARDENER'S GOSSIPING REMINISCENCES OF CHRISTMAS.**

T is a sad heart that never rejoices. More than sad must the heart be that does not feel a joyous bettering influence amid the social charities and benevolences of Christmas.

If there has been anything in the way of a till, a standing aloof, a reserve, and a coldness among friends and neighbours, who are each keeping loftily apart, until they notice the first advances in kindly feeling, what better opportunity for burying in deserved oblivion everything connected with the unpleasantness of the past, and thinking only of the delightfulness of the present, than meeting together on the birthday of *Him*, whose advent, whilst *Time* shall endure, will ever be associated with all that is best calculated to promote "Peace on earth and good will to man."

Except amongst the most ascetic religionists, who look upon the mortifying of the body as one of the best means for securing spiritual merit, this great festival, amid all its solemn associations, has ever been attended with the symbols of outward rejoicing. Feasting and gladness, if kept in their right place, are some of the best ways for expressing our thankfulness. The speaking of kind words, the doing of kind deeds, the thankfully partaking of the good things provided, the assisting of others less favourably circumstanced than ourselves, have ever been considered some of the best practical proofs we could give of a heartfelt gratitude. Hence the great interest with which Christmas is regarded; hence the preparations for its festivities; hence the reciprocal invitations of friends and neighbours; and hence the zest with which members of the same family, though scattered far apart during the rest of the year, contemplate meeting again around the same table, and to express their mutual love and sympathy.

Amid these stirring times, when so many young men, and young women too, must go from the home of their fathers, to find and to keep for themselves a sphere of action and of

honourable labour, there are now fewer, and there will still be fewer, of these happy family reunions. In such circumstances, the recollection of past scenes will often do much to nerve to manly resolution and energetic efforts, amid the longings, the wants, and the felt loneliness of the present. But for such recollections and associations, my first Christmas from home would have been sad and dreary.

A short time before, I had gone as one of the under gardeners to a place, where some half a dozen of us lived in a bothy or barrack, formed out of the back sheds to a range of forcing houses. This bothy had little more in the way of fitting up, than so many beds against the south wall, a table along part of the north wall, between two windows, that admitted, and especially in winter, only a dim light from the width of a four-foot pathway, the other side of the pathway being bounded by a wall supporting a bank of evergreens, higher than the roof of the living rooms; and between the fireplace and the first bed was room for a small table for eatables, and some four-footed stools to place round it. Fortunately there was a doorway in each end of this room, opening up into other sheds, with stock holes and their general accompaniments, amongst which were some rough cupboards, in which we could keep any private stores in the way of eatables, the bulk of our meals being supplied from a stock common to all. I say the door at each end was a fortunate thing; not so much for any of those cunning devices which it might suit some of our young friends to practice, but simply because a good draught of air could thus pass through the room in summer without let or hindrance by us, for the windows did not look as if they had been opened for a generation. In fact, in those days, though vastly more particular than is general now in giving fresh air to plants, I and my comrades thought little—it would be truer to say nothing at all—of the importance of fresh air for ourselves. Between the foot of the beds and the table against the front wall was room enough for a passage, and a trunk or two at the end of each bed, and that was pretty well as much property room as any of us required.

The place altogether would have stood a good chance for being condemned by the easiest-going Board of Health of the present day, but it was a paradise for comfort when compared with other places appropriated to young gardeners in Scotland and England, some of which I had then seen, and others I afterwards became acquainted with; and some few of them, I have reason to believe, now remain in their original hideousness, soon, I hope, to be enrolled amongst the curiosities of the past. From that shed-room men of great activity and intelligence had been scattered over dif-

ferent parts of the home country, and some there were who have left the marks of their influence on other parts of the world. If inclined to be studious, the very companionship of so many acted as an incentive to industry and application, as the different bent of each individual mind, brought within that room much of the requisites for forming a mutual instruction society; requisites which in some cases were turned to profitable account.

Being mostly young and healthy, the roughness of our living, and such lodgings as I have described, did nothing SEEMINGLY to impair the buoyancy of our youthful vigour, or to prevent us, especially in winter, getting robust, fat, and ruddy; and, yet, now I am convinced of nothing more firmly than this, that many of the ailments, decrepitudes, and pains and penalties from rheumatics, and other evils, suffered by many gardeners as they get up in years, are owing to the seeds of these ailments and diseases having been sown broadcast in their constitutions, from living, and especially from sleeping in such and such, very much, worse lodging bothies. The existence of such unsuitable places now, I believe, is owing more to the ignorance than the apathy of employers. It is a noble characteristic of our times, that ladies and gentlemen generally consider such *little* matters worthy of their earnest attention. Young gardeners should make the most of their greater comforts. If some must yet contend with unsuitable lodgings, I would earnestly advise them to counteract, as far as possible, the injurious results for the present and the future, by extra attention to general and personal cleanliness, and to a free circulation of fresh air.

In this room I spent my first Christmas from home, and mostly alone. Some of my comrades were within visiting distances of their relatives, and others had received invitations to go to the Hall in the after parts of the day; and it was considerably arranged, that, as I knew no one particularly in the neighbourhood, it would be best every way if I attended the necessary duties of the place. This was all very well so long as there was plenty to do in covering up frames and pits, clearing out and setting furnaces a-going in several ranges of houses, keeping the mouth and nose protected all the time with a handkerchief from the dust and the sulphur fumes with which the coals were much loaded, &c.; but when I got into the room some time after it was dark, and sat down at the fireside waiting for the kettle to boil, the small tallow dip only sending a mere misty, ghostly light into the farther end of the great gannt gallery of a place, I did begin to feel an eeriness and a sort of all-overishness creeping over me; and more especially as the wind rising began to sough among the evergreens, whistle in at the doors, and moan in the dark sheds, whilst the Scottish nightingale (the owl) perched on or close to the chimney, kept up its dismal *hoot-hoots*; altogether conjuring up nearly-forgotten tales of the spectre-world.

An interesting field of inquiry would be, under what circumstances a belief in the ghostly and the supernatural is best promoted in, and best eradicated from the mind. The newspapers and serials of the day often show us how much there is of a lingering semi-belief in such spectre-visitants even now; and after all it must be confessed, that as our knowledge is yet very imperfect of our material bodies, we know little or nothing of our own spiritual existence, and, if possible, less of the great spirit-world. My own opinion, the result of experience and observation, is, that the most ignorant are the least timid and superstitious in such matters; that it requires a certain amount of intelligence to bring us under the dread of ghosts or other unearthly visitants; and a good deal more of intelligence and experience to enable us calmly to regard all such *unked* matters as merely the result of a deceived imagination, or the prickings of an uneasy conscience. I can recollect when, as a boy, I could go anywhere in the darkest night as cheerfully and as free from anything like fear as I could have done at mid-day. But I also recollect that, when years older, and having surreptitiously obtained and read in secret places, which I dared not have done before father and mother, tales of ghosts, and wizards, and witches, I actually dreaded to go out of doors in a dark night by myself; thus receiving a terrible punishment for the secret indulgence in curiosity. I had left such paralyzing dread far behind me before I sat thus *ery* in the bothy; and in addition to increased experience and intelli-

gence, perhaps one of the most effectual means of cure for the malady was the finding that a young rascal of an archer was trying to riddle my poor heart with his arrows, and giving me plainly to understand that, if I would get ease from my pain, it must be from the sympathy of another heart that could be reached only by much longer walks after dark than merely making a tryst at the garden-gate. But with all this increase of courage, there were still certain places, where dark deeds had been committed, that I used to pass on the run at night; and if that running roused up a recumbent sheep or cow, the sound thus made pretty well caused my bristling hair to lift off my bonnet. I mention all this clearly, first, to account for the feelings that came over me on that lonely Christmas; and, secondly, to solicit from those more advanced in life, and who have forgotten to be troubled with any such fantasies, not their badinage, however playful, but their sympathy and kindness for laddie youths placed beside them in similar circumstances.

This eeriness, increased, if possible, by the gnawings of mice and the rasping cutting of rats to get at the simple edibles, the quiet leading them to conclude they could do as they liked, was ere long associated with thoughts of home and friends at home; what each of these so dear to me would be doing and saying then; whether I was of importance enough to be missed; whether some one would think of me fondly, and some other one would be vexed I could not participate personally in his joy; until I began to feel a fullness at the heart, and a pearly messenger came tumbling down my cheek which I would not have let another see almost for a world. But this would never do; I determined to look matters fairly in the face; I dared unscrupulously to look at myself, to turn myself, as it were, inside out, wants, deficiencies, shortcomings, and all; and so absorbed was I in the work, that the kettle unnoticed sang, and hissed, and spurted itself dry. But from that long examination I rose, all eeriness gone, took our lantern, examined every hole and corner, went to every house, tried every gate, got too happy to think of boiling kettles, crunched a piece of bread, and washed down with Adam's wine mixed with something more cheering, and spent the evening in reading the best of books and pieces from our favourite authors, and writing to friends; and was engaged in this latter pleasant work, when one of my comrades returned in the short hours, gave me a good blowing-up for *wasting* the candle, and ordered me off to bed. From that night I have never known *eeriness*, because I have never met at night with worse than flesh and blood; and though living in lonely places I have never felt solitary and alone, because in books I could hold friendly converse with the greatest and best of our race. Pity the gardener who lives a good way from neighbours, if he has no taste for reading. There is just a pity and a beware on the other side. Our converse with books must not deaden our sympathies with those around us, or make our hearts old. Ah! there is a vast fund of happiness to be derived from keeping the heart young, even if our bodies grow aged.

The expression above—"writing to friends"—may need a little explanation. There was no penny postage in those olden times. At the period referred to, I was fond of letter writing, and it did me good, so far that it enabled me to write quickly, and often more clearly, on a subject than I could speak about it. But then my letters to friends were not sent singly through the post-office as now, but in parcels by coach or carrier. One person generally received and distributed. I knew I was acting against the law, but then I somewhat jesuitically argued I had no hand in making the law; and the law never thought of me or my interests as a letter writer, because it just rendered frequent communications an impossibility. It pressed hard enough upon me when I was forced to have letters by post. I recollect when in another place, with 12s. per week, and find everything, lodgings, &c., that in one week I had four letters, which cost respectively 10d., 12½d., 14½d., and 16½d. I was very glad to receive them, but the price, in my circumstances, did diminish the pleasure. The price of letters then was my excuse for cheating the post-office; now I give it my cheerful support. If there is a doubt about the weight, even, I would put on another stamp rather than give them the trouble to weigh or charge extra to the receiver. I consider that Rowland Hill was one of the greatest benefactors to the intelligent,

striving, working classes. I believe that the penny postage is most closely associated with all moral improvement. Use it freely, my young friends, when you leave home. Temptations to walk in the "downward road" will be found weak, just in proportion as the home influences of purity and love are strong, and preserved as evergreens in our memory. There will be little danger of going wrong so long as an unbroken, outspoken, confidential correspondence, is maintained between child and parent, and between brother and sister. The felt sympathy of those he loves, and its frequent expression, will make a young man

"Strong in all he dares to do  
For the right and for the true."

Favourite authors alluded to might have well led me to speak of the advantages young people possess now from a cheap instructive serial literature. Mawe's Calendar and London's Encyclopedia were the standard works on gardening. The Gardeners' Magazine was the only professional periodical; and that, so far as I recollect, was 2s. 6d. or 3s. per number. In a cheap form, there was little between the mostly worse than trash sold by hawkers, and the more substantial fare provided by the Religious Tract Society. Young people now can form little idea of the zest and relish with which I perused the first numbers of Chambers' Edinburgh Journal,—the grand pioneer of a cheap, pure, instructive, general literature for the people. A good deal was done in those days by lending and borrowing books, and we were so far saved from what is now a common danger—in a literary sense—the danger of actually starving in the midst of plenty; and because of the plenty, as from the plenty to read, there is less time for thought and consideration. I and my comrades also knew something of what was going on in the world, from joining in taking in a weekly newspaper. The paper which cost sixpence was neither half so large nor half so good as now can be had for a penny. I pass such matters, however, to mention a few other recollections of the old bothy.

In addition to those who slept there, more gardeners and labourers met there for breakfast and dinner; and though there was no lack of roughish animal spirits, I never heard an expression approaching indelicacy. I never saw cards, dice, or any sort of gambling on the premises. A racy old woman came every morning to *smooth* the beds, make breakfast, and, as to clearing up, gave the place a lick and a promise. As to the fire, that had never been out for thirty years, so the old chroniclers of the place stated, as coal was found in the neighbourhood. One of us took the cooking and general supervision week about; and it was the custom to get our supper as soon as possible after finishing the day's work. Before supper time no place could be more of a Babel: there

would be whistling, singing, shouting, and even dancing; and violins, flutes, clarionets, fifes,—all at work, and often each practising a different tune or piece of music. But this all dropped after supper, and no one then attempted to interfere with the necessary quiet so essential for reading, studying, &c. Those who wished to continue their musical performances just walked themselves off outside, and all this seemed to be done without any particular law or regulation on the subject. The time for going to bed was from ten to eleven, and if any one attempted to keep the candle burning after that time he got an unmistakable hint, by an old shoe coming in too close proximity to the candlestick, and leaving the place in darkness. Of course such beneficial regulations were departed from when we had gardening or other visitors, and more especially when a few friends or neighbours came on invitation. Then we all did our best to honour our guests in a humble way; and in comparing notes, harmless repartee, strokes of wit and humour, animated discussion, song, sentiment, and recitation, we did enjoy "the feast of reason and the flow of soul."

Ah! but these pleasant mementos of the days of Auld Lang Syne too truly—

"Remind me of departed joys—  
Departed never to return;"

for some of the choicest spirits that were there—first in frolic, first in efforts for self-improvement, and first in large-hearted generosity—I shall meet no more in the course of life's journey.

As far as I recollect I spent the next Christmas, especially in the evening, with the under-servants at the mansion. Much of the high order maintained in the establishment was greatly owing to keeping everybody, as well as everything, in its proper place. The proprietors I scarcely ever saw, but I felt that they wished their dependants and servants to rejoice with them. I have a vivid recollection of the feasting, the music, and dancing at harvest-home. I seem to hear the songs and sentiments—freely vented on New Year's Day, when all employed on the estate dined together; and again, on Christmas Eve, or Christmas evening, the gardeners were invited to the hall. But for the *mass* and the *priest*, I have often thought that such mindful kindness was well portrayed in the old poem:

"On Christmas Eve the bells were rung;  
On Christmas Eve the mass was sung.  
This only night in all the year  
Saw the stoled priest the chalice rear;  
The damsel donned her kirtle sheen—  
The hall was dressed with holly green.  
Forth to the woods did merry men go,  
To gather in the mistletoe.  
Then opened wide the baron's hall,  
To vassal, tenant, serf, and all."

If the damsels did bask themselves out fu' hraw, there was also extra scrubbing, and brushing, and decking among the garden lads, to appear to the best advantage. My reminiscences of the evening, with one exception, chiefly concentrate in the reply of the old coachman at the head of the table, when a very dandified footman proposed a game of cards. "Aye, aye," said he; "time enough, lad, when we get short of better matter." The passing all round the table of little wheeled waggonettes, filled with horns of ale and glasses of punch, that each might help himself or herself as was judged proper, there being no compulsion; and, amid the lulls between song, toast, and sentiment, a trial of strength in badinage between myself and my right-hand neighbour, a bright-eyed lass from the kitchen.

There was a sort of law that the garden men were to have nothing to say to the young women of the house; but, in a quiet way, there was a good deal of gossip sometimes out of doors in an evening; and such innocent badinage did good to us of the bothy monastery, by softening our manners, and sharpening our wits. I have no doubt the upper servants knew of this, and would not see it, and I think they had good reasons. They knew perfectly well that not one of us would go to the hall without being invited; I believe that was the only time I had been in the house. They knew also that for more than a quarter of a century such friendly intercourse had never resulted in anything unpleasant. I must, however, add, for the benefit of young girls who might *think earnestly* about a young gardener, that for the same twenty-five years or more, according to the old women at the garden, among the many men who had lived there, only one returned to marry his old sweetheart.

There was that night just one trifling exception to the full measure of enjoyment, and that I will mention. Among the garden men was one older than the rest, and then settled in the neighbourhood, who, in addition to a good knowledge of music, could sing most beautifully. As usual, he obliged us several times in the hall that evening; but also, as usual, after supper in the housekeeper's room, he was sent for to amuse and please the party there, and then returned to us. Some of the least intelligent envied him for the preference shown; others pitied him. He told me himself how much he felt degraded in his own self-respect by being asked to go into higher society *merely* to amuse and please; but then he added, "I am not in a position to refuse. I sang to them, 'A man's a man for a' that,' but the words seemed as they would hang in my throat." It would have been better every way if the good folks in the parlour had stepped into the hall to hear the music. Working men, as a rule, would neither be gratified nor elevated if desired to dine even with a lord, but a lord would do something to elevate them, and nothing to lower himself, by going among them on festival occasions; and even taking the head of the table. In little matters of this sort, when a mistake is made, it is generally the result not of want of kindness, but merely the want of consideration.

Since then I have passed a good many Christmases, and spent them in various ways, and mostly happily, because, without any stolid stoicism, I had learned to be so far independent of external circumstances. As an under-gardener, I have been soaked with sleet and rain in turning over sea-kale beds, to get a nice dish, when sea-kale was forced by fermenting material out of doors. I have been nearly blinded when shovelling and sweeping snow, to get a dish of spinach; and lightening snow, and uncovering frames, to get asparagus, lettuce and endive. I have ceased to feel my fingers in washing lots of celery with water close at freezing point. I have stood up to the ankles in slush in the gutters of a mansion, to prevent the melting snow getting into the ceilings. I have searched for mistletoe on apple and lime, as if I believed all the old tales connected with Druidical story. I have scratched and torn my hands in collecting the best pieces of holly, heaviest loaded with berries, with as much interest as if I really believed the poor starved-out spirits of the woods could shelter themselves in house and hall until better days should come. And then—well, and then I have thought I was treated something like the ivy, in the old ditty about the Ivy and Holly:

"Holly stood in the halle, fayre to behold;  
Ivy stood, without the dore: She ys fall sore a-cold."

and cold and wet I might have been for any, the smallest recollection of my existence from high or low at the hall.

Reasons there may be and are, why, even on such festivals, different departments should be kept separate and distinct as at other times. Reasons there may be and are, why young gardeners, who are to have little or no communication at other times, should not be tantalised with a somewhat free and easy intercourse with the house servants once a year. But there can be no reasons why, in such a season of general rejoicing, and which they help to promote, they should be entirely passed over. With every heart-felt anxiety that my younger brethren should have enough of independence of character to rise far superior even to the seen and felt want of such attentions, I do feel glad that many employers, who for the reasons I have hinted at, do not bring gardeners within the range of their domestic festivities; yet do what is perhaps more valued—give them a dinner or supper by themselves, or order a trifle in money to be given, that they may have something out of the common way for the great festival. Young men of independence of feeling, who would sooner live on bread and water, and potatoes *and point*, than accept anything in the way of a charitable boon, would yet receive gratefully, at this season, any such small mark of attentive kindness as I have alluded to, and feel, in consequence, more encouraged to a thorough prosecution of their duties.

Finally, as I believe that happiness, to be worthy of the name, must be bound up with the happiness of others: so do I believe, other things being equal, that the greatest possible happiness, is that which is identified with the happiness of the greatest possible number. In the obtaining and the diffusing of such happiness, all classes may successfully work as in a fertile field, from the noble peer in his palace, to the humble labourer in his cottage. Good words, kind actions, true sympathy, thankful hearts, are mostly within the reach of all, who, having the will, will find the way; and these will never lose their double power—power to bless the possessor and the imparter; power to benefit the receiver. If those exalted in rank and rich in wealth, with all their attendant anxieties and cares, are to be envied at all, it is chiefly on account of the greater ability possessed for carrying bright sunshine into many a gloomy home, and thus realising,

"A brother to relieve, how exquisite the bliss,"

and that

"The heart benevolent and kind  
The most resembles God"

when engaged in lessening human ills, and in not merely wishing, but *making*, for many, a *joyous Christmas and a happy New Year*.

R. F.

## CHARLIE'S CROWN.

### CHAP. I.

"The blackbird there, when showers are gone,  
Still pipes at eve his benison;  
And on the frosty vernal morn,  
The valley's cheerful sounds are borne.  
The ash puts on and drops its leaves,  
When the dishevel'd autumn grieves:  
But no rude change again shall come,  
To reach them in their peaceful home."—WILLIAMS.

**F**AR away from the manufacturing town near which I lived, in the quietest corner of a quiet country churchyard, where daisies and primroses spring up unsoiled from the green turf, and the grey old church stands a sober witness of the faith of our forefathers, we made "our graves."

The noise of the toil and traffic of the world cannot reach the spot; the sounds of sin and strife come in such faint echoes, that they do not mar the deep serenity; and the churchyard has about it an air of such calm repose, that the voice instinctively takes a softer tone, and the footfall a more gentle pressure, as you pass through the little wicket gate that divides "God's acre" from man's.

The boughs of a feathering larch spread themselves protectingly around, and wild flowers peep in between the little

railings that divide "our graves" from those surrounding us. A pathway runs through the churchyard, but it is not much frequented; the labourer may pass through to his daily toil, or the cottager's wife with her weekly marketings, and now and then the innocent gleeful voice of childhood, or the tender whispers of maidenhood may be heard, but there is no ruder sound, and of a summer's evening the nightingales sing their sweetest songs there.

I am writing far away from that dear spot, and the simple tale I am going to relate belongs to other days. It may be that my thoughts take a softer tone, from the knowledge that time daily brings me nearer and nearer to the loved ones who are sleeping in that far-off peaceful home.

It was at the close of a soft July day, "long ago," that I entered, as was my wont, the sacred precincts, with a basket of flowers to deck the graves for the approaching Sabbath. I had made a wreath of glorious white lilies, and I was laying it tenderly on the grassy mound, when I was startled by hearing a child's voice of peculiar sweetness at my side. I turned hastily round, and saw a little lad of about six or seven years gazing earnestly at my occupation. It seemed as if he had dropped from the clouds, for there was no one near him, and the large grey eyes that fixed themselves inquiringly on mine, had a searching far-away look that was hardly natural.

"What is it?" said the child softly.

"It is a wreath," I answered.

"Yes, I know it is a crown, but it is all one. What is it?"

"Oh," I said, guessing his meaning, "it is a lily."

The little lad shook his head, and then coming nearer he almost whispered, "It is not love, for that's a rose. Do you know granny is a rose, and you are like one. A rose is love, you know, but what is that?"

The little face was peering at me through the railings, and the dark silky hair fell from beneath a well worn cap, and I thought I had never before, even in beautiful childhood, seen so strangely beautiful a face.

"Do tell me," he pleaded, "what it is, for there must be one in my crown. It isn't truth, for that's a bluebell, and do you know I never tell a story, because I want lots of bluebells in my crown."

What was there in the sweet childish face that struck my heart with a pitiful feeling, and yet attracted me with such deep fascination? It seemed as if a spirit-voice spoke from those lips, parted in their anxious waiting for my answer; a child and not a child. I took a lily from the basket and gave it to the little fellow, saying, "It is purity."

"What is that?" asked the child, caressing the pure white flower. "You see I must know, because I must be like it."

"It means always speaking gently," I replied, "and never saying naughty words."

"Is it swearing?" he asked in a whisper; "oh, it frightens me." Then the large wistful eyes once more sought mine, and in a frightened tone the child said, "Will all the lilies drop from father's crown? Poor father."

I was getting sorely puzzled about my little companion, when I heard a well-known voice calling from the cottage corner close by, "Now, Charlie dear, Miss Mary will be tired of all your chatter."

"That's granny!" cried the child joyfully; "that's granny." Then he looked lovingly at the lily, and holding it to his face he said, "Come, and you shall see granny."

I did not need to ask who "granny" was: the voice told me the little lad's history so far.

In a sheltered nook of a wide common, a mile from the manufacturing town I have spoken of, there was a cluster of whitewashed cottages, built upon what I believe is called by the owners a "key holding;" a very small acknowledgment being paid to the lord of the manor for sufficient land on which to build a cottage, and to form a dear old-fashioned garden, where flowers, fruit, and vegetables contend with one another for precedence. In the prettiest of these cottages lived Charles and Mary Ingram, who from my earliest childhood I had reckoned as dear friends. Many a cup of tea have I drank by their peaceful fireside; many a simple song have I sung with the children of the cottage, whose joys and griefs had ever been shared with me.

And "Charlie" was Mrs. Ingram's grandchild, of whom I had often heard, though the parents had married and settled at some distance from their native place, and had only just returned to occupy a cottage, newly built on a part of the garden of my old friend.

They had not chosen a happy time for their return, for the trade of Milton had suffered a grievous check, and poverty of the direst kind lurked like a wolf round the doors of the inhabitants.

The new cottage had been begun before the disastrous strike took place, that, coming as it did when there was a glut of ribbon in the market, helped to bring about misery and starvation, such as I trust never to witness again.

But the house had been built, the "big loom" purchased with the accumulated savings of many years, and John Ingram had returned to take his part in the great battle of life.

And Charlie? I had often heard from Mrs. Ingram of

the exceeding oddness of this little child ; how he perplexed them, and yet bound all their hearts to his in the strongest chords of love by his winning endearing ways.

When I heard my old friend's voice, and saw Charlie's glad look, a mingled feeling of pity and joy came over me, for I knew that the parents and grandparents, though loving each other tenderly, were separated far apart, in that John Ingram and his wife were not Christians. They were not what is called great sinners ; they were honest, sober, and industrious, but for all that there was a something that made you, when in their company, feel that there was no hidden joy about their daily life ; no laying up of the beautiful treasure, over which moth, and rust, and thieves have no power. They toiled from week's end to week's end ; the children were kept clean and tidy ; they were caressed when good and beaten when naughty, and that was all their life ; and it was in this home that little Charlie had lived and thought.

I had heard some little word of a Sunday school, where the young teacher, to interest her class, had talked to them about flowers, and old Mrs. Ingram had told me how strangely her grandchild was "taken up" with them ; and amongst many other singular notions, how he used to fancy he was a flower himself, so that oftentimes she was led to believe that the little laddie was not right in his head.

All these things made me feel a deep interest in the child : so, closing the iron gate, I told him I would go with him to his grandmother.

Before he left he turned once more to the grave, and pointing to the lily wreath he asked, "Was she a lily?" My eyes filled with tears as I replied, "Yes, can you read the writing, Charlie ; it says, 'Blessed are the *pure in heart*, for they shall see God.'"

"I am glad," said the child ; "when my crown is big enough I am to see God too."

There was never any lack of talk between Mrs. Ingram and myself, and Charlie walked quietly by our side, holding his grandmother's hand, and every now and then looking deep into the lily bell, with which he appeared to be on terms of whispering intimacy.

I did not like to talk of himself before the child ; besides, there were graver matters to be discussed, not only the falling off of the ribbon trade, but also the consequent depression of all other trades, old Mr. Ingram finding no sale for his coal, he being what in Warwickshire phrase is called a coal biggler.

There was little work for the loom, and still less pay, and my heart felt faint when listening to the forebodings of the faithful gentle spirit that was opening out to me its inner workings.

"Of course you know, Miss Mary, we have savings—something put by in the old stoeking you tease me about—bless your dear heart ; but we have helped John a good deal with his house, and the children must be fed and clothed decently ; and Charlie he's a getting a big boy, and his clothes can't be made out of nothing now, and he has a good appetite ; for he grows well, and I would not grudge the child his victuals."

"Granny," said the same dreamlike voice that had at first so struck me, "when I am ready, I am to go and live with God."

Mrs. Ingram put her hand softly on the lad's head, and, looking at me, said, "There, I told you, miss, he ain't like other children ;" and added, in a whisper, "Poor boy ; he isn't right, I'm feared."

So we passed into the dear whitewashed cottage, and I began to laugh and play with Charlie, finding out very soon that in his love of fun he was like other children ; while every now and then there was a word showing me what strange thoughts were at work within the little brain.

Then the mother came out to welcome me, and I had to go all over the new house, upstairs and down, to admire all "John's capital contrivances," for he was a tidy man, and "uncommonly useful about a house ;" and then I had to admire the garden, which was parted off from that of the old people by some wooden rails. After duly looking at everything, Sarah gathered a few pinks, and offered them to me, when Charlie, who had kept close to my side, gave a little shudder, and said, "No, no ; don't touch them ; they swear." "Swear?" I asked, forgetting for a moment the child's peculiar notions. "What do you mean?" "Hush," he replied, in a whisper ; "they hear father."

I saw the mother colour, and John turn away shyly, but they did not look angry, only ashamed. "Poor little fellow," said the mother, colouring yet more deeply, "he is not right."

## CHAP. II.

"Oh, poverty is a weary thing,  
'Tis full of grief and pain ;  
It boweth down the heart of man,  
As with an iron chain :  
And maketh e'en the little child  
With heavy sighs complain."—ANON.

AND the summer days went speeding onwards, and with them passed away all hope of a revival taking place in the trade. Scheme after scheme was tried to force back the tide that had flowed down other channels. Ladies turned themselves into ribbon dealers, and the masters grumbled ; then they bought of the masters, and the shopkeepers grumbled ; then they took to wearing ribbons in all sorts of fantastic and impossible ways, using up hundreds of yards in making a dress, and the milliners grinned and the masters grinned, for they knew full well that the light graceful fabric was perfectly innocent of an English loom. And then the ladies all at once turned political economists, and found out that there were more things in buying and selling than their philosophy dreamed of ; so they took to collecting funds, and gathered together food, and clothes, and coals from every quarter, giving them away from a large empty house, called by the poor people "Joseph's barn."

At first only the idle or least modest came, but day by day the number increased, and many a well-remembered friend appeared, with shame-faced looks and voice broken by sobs, telling the same sad, pitiful tale of misery and want. And then came nearly the sorest trial of all : "Joseph's barn" was, as it were, helping to ruin the small traders ; all the shops were empty save, indeed, the pawnbrokers' ; one by one the old cherished bits of furniture were missed from their familiar places ; the family Bibles followed, the wedding-rings, and then—starvation.

Oh, reader ! have you ever seen a once-well-to-do, happy home reduced to the very verge of starvation ? have you ever seen a strong man, too proud to beg, so weak for want of food, that the unbidden tears *will* come, in spite of every effort to restrain them ? have you heard the low wail of children crying for bread when there is none to give ?—these sights and sounds were now of hourly recurrence in the once prosperous town of Milton, and we had to deal with them as best we could.

The little district school went on, and amongst its most regular attendants was little Charlie Ingram.

Three times a week the children had a poor dinner given them—all who really needed it : not very nice—alas ! even that pleasure was debarred those who strove to minister to this pressing need. The food, even for little children, could not be made enticing, lest those who were not really hungry should take it.

And little Charlie ? Poor child, he was not right, you know ; and often in a quiet corner, I found him sharing his poor dinner—sometimes only a bit of bread and treacle—with a child more hungry than himself. One day I found him sitting empty-handed, watching the child of parents, I knew to be nearly starving, devour his little store.

"My child," I said, "you have kept none for yourself?"

The large grey eyes fixed themselves on mine, he crept close to me, as was his wont, and taking my hand, whispered : "Hush ! I want to be like a rose. I am so tired of waiting for my crown, and I like roses best. Do you think the angels are weaving it now, Miss Mary?"

I answered him as I knew he best liked to be answered : and taking him on my knee, I told him, "surely yes, that the dear Lord of the angels had laid up a beautiful crown for every one—even the smallest child—who loved Him and tried to follow in His blessed footsteps."

"I do love Him," said the boy, earnestly ; "He is like a lily and a rose, and all the beautiful flowers put together ; and when I whisper to them, they tell me about Him, and all his love ; and granny loves Him, and you love Him, and—what will your crown be made of, Miss ?" And then he drew closer, and whispered even more softly : "And do you know, mother says that she will try and have a crown, too,

only the flowers won't grow in our garden ; but they grow, oh ! so big in granny's garden, so very big." And the child opened his eyes, and all at once I saw the little face turn white, and Charlie had fainted away.

I took the little lad home ; and after he had recovered, we left him in bed, and I sat down to talk to his mother.

It was a strange tale that Sarah told me—strange, and yet showing in brightest characters the wondrous Love that is ever at work around us, making even simple flowers His ministers, and the voice of a little child, powerful as a trumpeter's call.

Charlie seldom spoke, the mother said, of the poverty and distress he witnessed ; but she constantly saw him hiding away his own food to give to neighbours' children more in need than they were, and when she remonstrated, he only crept nearer to her, and in tender loving words, so simple, and yet so full of meaning, entreated her to let him help the angels weave his crown. That very day, after the children were gone to school, the mother had discovered that Charlie had scarcely touched his breakfast, so that it was no wonder he had been ill ; " and indeed, Miss," continued Sarah, " one cannot resist his pleading voice ; he speaks of the angels as if they were his friends, and he could not bear to vex them. It was only yesterday that his father made use of an oath,—it was but quite a little one, please, Miss," said Sarah, apologetically, " but Charlie ran to him all trembling and crying out : ' Oh ! please don't, father, don't: the angels will hear, and all the flowers will fade and die ;' and if you'll believe me, John wasn't a bit angry, but he stooped and kissed Charlie, and promised he would never swear again. And, indeed, I do believe the child is helping to save the father and me too ;" and the mother's voice fell. I asked Sarah if she could remember what first gave her boy the strange ideas he had ?

" It was when we were at Ansty, Miss," answered Sarah ; " the clergyman's daughter, seeing the child's love of flowers, used to give him one every Sunday, giving it some name, and telling him to try and grow like it during the week, and this took such hold of his mind, that it seemed as if he must be good. Father laughed at first, and I'm afraid I laughed, but somehow I know the child is right, and that we are wrong ;" and the mother's face tinged with shame as she added, " and I've promised Charlie I will never miss church again, but always be there that the angels may hear our voices together, and put honey-suckles in our crown. He calls prayer honey-suckles, and when I asked him why, he said he smelt them such a long way off, but he never seems to have any real reason, Miss ; but, poor little fellow, he's not quite right, I fear."

From the child we went on to talk of the husband and of their saddened prospects. John had no work, and there was no prospect of any. Grandfather had helped them continually ; but there was no trade now for higglers to speak of, since Joseph's barn supplied coals, and for what coals he sold there was no present payment. There had been some talk of emigration, and John had made up his mind to emigrate, if only it could be managed ; for he felt, if he stayed in England, he should only bring ruin on the dear old people as well as on himself ; they had a few bits of things still left they could sell to pay their debts, if only a free passage could be procured for them.

We turned the matter over in every way, but there seemed nothing else to be done, and so it came to pass that the life-long parting was looked upon as a settled thing ; and old Mrs. Ingram's face grew very pale, for John was her darling child, and little Charlie had become the light of her life ; but the steadfast, trusting faith that had been her characteristic through life, did not forsake her now. John felt it would be for his happiness—the privations they were enduring were very great—so she only said, " It is the Lord's will," and then she was content.

To little Charlie the coming parting seemed impossible—he could not realize it ; he only shook his head, saying, " I can't leave granny ;" and when asked if his mother should go without him, he shook his head again, and answered still, " I can't leave mother." He looked on all the preparations with an untroubled eye, and spoke little ; was more than ever occupied in his granny's garden ; and was, if possible, more gentle and loving in his ways.

CHAP. III.

" In all places, then, and in all seasons,  
Flowers expand their light and soul-like wings,  
Teaching us, by most persuasive reasons,  
How akin they are to human things.

" And with child-like, credulous affection,  
We behold their tender buds expand ;  
Emblems of our own great Resurrection,  
Emblems of the bright and better land"

LONGFELLOW.

A YEAR had passed away since the calm July evening on which I had first become acquainted with Charlie Ingram ; during that time he had often been my companion to the quiet churchyard. We had talked together of the dear ones resting there, and of the bright and beautiful world beyond the grave. It was Charlie's special privilege to bring one flower to add to the wreath. Sometimes it was in reality

only a daisy, or a spray of hawthorn, or a primrose; but to him it was the embodiment of some sweet thought connected with the particular flower.

I had made Charlie a promise that, on the anniversary of our first meeting, he should help me gather the white lilies for the wreaths, and should choose the fairest amongst them for his own flower. When the time came round; it was the second Saturday in July—I am not likely ever to forget the day—Charlie had been with me all the afternoon, his merry voice sounding cheerily as he ran in and out amongst the flower-beds, and was gone home to have his tea and to show his mother his beautiful lily; “it will not hurt it,” said the child tenderly, “for father does not swear now.”

I promised to call at the cottage between seven and eight, that we might have our little walk and talk together. I remember the evening as if it were but yesterday. I can recall every look of the dear old home, with its ivy-covered walls; its porch of roses and honeysuckles, with the little cross above, proclaiming to the passers-by that the house professed to be no common home. I remember the sunlight gleaming through the huge elm, that with many another goodly tree graced what, in courtesy, was called the park. I seem to feel about me the very scent of the lily wreath that was in my hand as I passed through the garden gate on my sacred mission. The air was filled with the soft music of the birds; the honeysuckles that, next to roses, Charlie loved the best, hung in waving wreaths from the ivy and the trees; and all around me and above me spoke of Peace!

I had scarcely reached the common gate when I saw a poor woman running quickly towards me, who called in a voice of horror, “Oh, Miss Mary, come fast; little Charlie is killed!”

I cannot dwell upon this hour. It was too true. There was a runaway horse, a little child, thinking only of guarding a lily which he held tightly in his hand; one blow, and it was over.

I found him where he lay with the pale lily, still unbroken, in his hand; the parents and neighbours standing round, stunned and utterly helpless.

We did what we could, but it seemed of no avail; and then we laid him on his little bed, and sat by watching till the doctor I had sent for came. I was not hopeless, for I fancied there was still life, though the face was white as chiselled marble.

As we watched, to my intense relief, I saw spreading over the child's face a sudden gleam as of sunshine; and with it a smile broke from the lips, of such unearthly beauty as fills me with joy even now to remember; the eyes opened, there was a searching look till they fell on his mother, and then, with a startled happy cry, I heard the little voice I had learned to love so well, say in its whispering tones, “Mother, mother, it is all of roses!”

And then—Peace.

Beneath the sheltering boughs of the larch, nestling close to the side of “our graves,” there is a small mound, and at its head a slab of grey stone, on which there is Charlie Ingram's name, and beneath it is written—

“Yea, speedily was he taken away lest wickedness should alter his understanding, or deceit beguile his soul.”

Yes; we laid the little laddie in his quiet resting-place close to the spot where I had first seen him standing, and on the mound we placed a crown of roses: there was scarce a cottage garden round that did not furnish one.

John Ingram came in as Sarah and I were weaving the crown. “John,” I said, “Charlie would like to have one flower of your gathering.”

With his rough, worn hand he hastily brushed off a tear, and turning away said, “I must be a better man to my other children before I'm fit to lay a rose on Charlie's grave.”

So Charlie's mission had done its heavenly work—not *done*, for all that is true, and good, and pure is of heaven—eternal.

And still gaunt poverty stalked through the place, and one happy home after another crumbled to ruins beneath its blasting influence; some of the poor drifted off to search for work in other places: some to the over-crowded workhouse, others to far-off lands beyond the sea, and amongst these latter were John Ingram, his wife, and children.

A marked change had fallen on John and Sarah; not shown in words, not easily perceived in deeds, and yet both in words and deeds it was most surely there. I noticed the quick stopping of the hasty word; the intense anxiety for the future passing away into a quiet trustfulness. Small changes they may appear to others, but to me almost as great as is the distance between earth and heaven.

It was the evening before the day on which the emigrants were to leave for Liverpool. Sarah had asked me to go with her to pay a last visit to Charlie's grave.

Just as we entered the churchyard gate I saw a man's figure disappearing in the distance: the step was hurried, whoever it

was, and I fancied the retreating figure bore some resemblance to John Ingram; the person was evidently avoiding us.

When we arrived at the grave, we found lying upon it one bright, fresh rose. I looked at Sarah; she understood it in a moment, and turning to me with a tearful, smiling face, she said, “We shall not leave him here, Miss Mary, his angel will follow us.” These were her very words. I remember them distinctly as when spoken. They seemed strange to me, and yet I felt I understood them. I understood them better by-and-bye.

And the sad parting was over, and another Ingram had taken to John's cottage, and the dear old granny had other grandchildren playing about her cottage door, and other great sorrows pressing on her faithful heart that seemed to grow more and yet more faithful, as outward stays were broken, and she was drawn close beneath the wings of sheltering love.

#### CHAP. IV.

“Obedience—it is love;  
And where love is, is harmony:  
And all we know of angels blest  
Is, that they love, and they obey,  
And sing away.

Ever singing, ever loving,  
In the mansions of their rest,  
Around the throne where God is manifest.”

WILLIAMS.

It was nearly six months since the good ship “Southern Cross” had sailed from Liverpool, and I was anxiously expecting tidings of the emigrants. One letter from Queens-town, written by John in high hope and spirits, was all that we had yet received. When I read it to Granny Ingram—for the dear old lady went by that endearing name far and near—she said, in her quaint way: “What a thing it is to be young, miss; why, it sets my heart all of a tremble only to think of the water, with neither top nor bottom to it, as one may say, a-rolling about all higgledy-piggledy, here, there, and everywhere. I went in a barge up the canal but once, and that was enough for me. Do you mind how little Charlie

clapped his hands as the water came in from the lock, and cried out, 'Higher and higher—oh, granny, we are going up to Heaven!' Bless the dear child, his heart was always a-going there." And so from the emigrants our talk went wandering, as was its way, much as the water does, here, there, and everywhere.

The Queenstown letter gave us a pleasant foretaste of the still better letter we were expecting; it served to make us on terms of acquaintance with the ship, and with the water. "Being on the water" was being on the water to the good folks of Milton; and whether it were the Channel, the broad Atlantic, or Moreton Bay, did not so much signify.

At last the long-expected letter came. I do not know why, but I held it in my hand many minutes before I opened it. I turned it round; I read the post-mark "Brisbane," and the words "Thank God!" escaped my lips, for I felt in some sort responsible for the safety of these my friends. When at last I opened the letter, there fell out two sheets of an account-book, much soiled and blotted. "That's from Sarah," I thought; for I had given her a little book, and she had promised to write down every now and then her impressions of the sea, for Sarah was a good scholar, a much better one than her husband. The letter was from John. I give it in its own sad, simple words—words that made my heart die within me, and yet in the midst of my anguish comforted me. The letter was as follows:—

"Honoured Miss—The rest will tell you of our voyage, and of the safe arrival of the 'Southern Cross' at Brisbane; I have no heart to write of anything. I have lost my wife. Oh, Miss Mary, what shall I do? my dear wife and the child are both taken from me. We did very well till baby caught the measles; and my wife nursed him night and day till he died, just as we were entering Moreton Bay, and I thought we were safe; and then my wife, who had been feeling sadly for many days, took worse, and in two days she was gone. The captain put us ashore at a little island, and the doctor came with me, and we made her a grave and buried her beneath the only tree on the island, just in sight of shore. All she said when she was going was, "Don't fret, John; I am going home, to Charlie's home;" and I think she is safe there, Miss Mary, for she was a changed woman since Charlie died, and set me such a good light as I'm not like to forget in this world—no, never; and all I hope is, that God will be good to me, and help me to follow her and little Charlie."

And that was all. Other letters there were from other emigrants, all full of life, and hope, and happiness; but in these few lines I read the utter destruction of that home, to build up which John Ingram had left his native land.

From John's letter I turned with streaming eyes to the poor soiled manuscript, written in the hand of her who laid in her lonely grave by that far-off sea. It was evidently the beginning of a journal such as I had begged her to keep. Why so little was written, or why it ended so abruptly, I never knew. Why it was written at all, and when written, why it found its way to my hands, seemed but as threads of the same woof of love that had sheltered me beneath its folds all my life, giving me in the midst of sharpest sorrow a glimpse of thankful joy. The manuscript ran thus:—

"On board the 'Southern Cross.'

"I am at sea. The latitude and longitude I cannot tell; but my heart counts the distance from 'home' by troubled days of hidden yearning and nights of watchfulness. It is not that I am, as many of my companions are, troubled by the water; but I am filled by an overwhelming sense of the presence of God; by a vague feeling that I cannot conquer or understand, that the swift passage of the vessel over the waters is hurrying me on to eternity. This feeling follows me day and night. Thank God, of his deep love, it does not frighten me; but it gives me a strange yearning over my little ones! it adds a deeper tenderness to my love for my husband.

"In the beautiful days when the sunshine is gleaming over the white-capped waves, and the fresh breeze bears the vessel merrily along, and I hear the glad voices of happy children playing around me on the deck, I feel 'He is coming.' When I lie awake in the night, and hear the storm rattling in canvas and mast, I clasp my baby to my heart and feel 'He is come.' I know not how I am so altered, but ever since my dear child went to Paradise, I have felt a quiet trust and confidence in my heart, that raving wind and roaring wave cannot touch or rob me of; and I can lie still, watching and listening for the Approach, that seems so near and yet so lingering."

On the evening of the day upon which I received John Ingram's letter—a day spent in tears of sympathy with my poor friends—I went to visit Charlie's grave. For the first time since he died, I took no flowers. This new sharp grief, added to the blighting influence of the misery and starvation around me, seemed to have thrown a shade of sadness over even the dear flowers. I wanted comfort deeper than they could give.

I sat down on the little mound, scarcely thinking, scarcely dreaming. I remember spelling over and over again the blessed promise that the pure in heart should see God. I remember a thankful sense of Charlie's freedom from temptation, and sin, and then—

I seemed to be in a flood of light and glory; there were no things of definite shape about me, only the echo of soft delicious sounds, with, as it were, the memory of the breath of flowers. My whole being seemed filled with the sense of satisfied joy and perfect peace.

Entering on this wondrous abode, I saw an angel shape, which, as I gazed, assumed the look that once or twice I had seen on the face of her I was mourning. Presently I heard a cry of such exceeding joy, as never reaches earth, and I saw—yes, I could not be mistaken in that sweet innocent look—Charlie clasped to his mother's breast, and through all the happy space I heard a joyous murmur of "Charlie's Crown! Charlie's Crown!"

FILIX FEMINA.

### DOMESTICATED DIP-CHICKENS.

SOMEWHAT remarkable circumstance it is, that birds or animals, which by nature are the most secluded and wild in their habits, become especially tame and even docile when long kept under constraint by man; this was especially illustrated by the circumstances I am about to detail. Many years back a person called upon me, and introduced himself by saying "he had heard I was very fond of birds, and that he wanted to sell me two dip-chickens that he and a companion of his had caught, during the preceding night, whilst fishing." A few inquiries put me in possession of the fact that they had been

caught in a trammel-net by these men whilst poaching for fish in enclosed grounds.

At the time I felt certain they would not live long, as they would not even attempt to eat anything that was offered to them, though I watched them narrowly for some time, and unseen. I mentioned, however, the name of a person I knew had a small pond in a walled garden, and the man called on him, demanding a sovereign for the two dip-chicks, as he had previously asked me, on the ground they were unusual and so great a curiosity. They were declined, and then, prior to leaving, the man who caught them pressed earnestly for a "bidding," and one of five shillings resulted, but was in a very ritche manner declined.

Two days afterwards I called to see if they had been purchased, and thus found out the facts detailed. Singularly enough, whilst we were walking in the garden, the man again called to say, "Please to tell the master he shall have them birds at his own price," for it seems he had expended most of the intermediate time in trying to sell them without getting a single bidding. Strange to say, these birds looked quite as hearty and well as when just caught, though absolutely fasted for forty-eight hours. They were bought. I pinioned them at once, and they were then put on the water, and dived immediately. The pool was very small, and a great portion very weedy; but as spring had barely set in, the weeds were scarcely grown, and offered no material obstacle to seeing what might be going on. Still, after waiting about, perhaps, an hour, without getting even a glimpse of either, the wife of my friend began to ridicule the investment as "a stick-in-the-mud affair."

For five or six days nothing was seen of them by any one of the family; but one day afterwards, at early dawn, both were observed busily engaged searching the floating duckweed, purposely placed for them. They dived as soon as they detected themselves seen, but they were now traced to a very small clump of rockwork, on which were a few bushes, that stood in the water to support a figure, and which place it was evident they frequently visited. To be brief, from this time they gradually became less and less timid, until eventually they were absolutely regardless of bystanders. They would even eat small pieces of worms and chopped egg that were thrown to the gold-fish, with which the pond absolutely swarmed, diving after each individual morsel with a dexterity that was beyond realization, save to those who witnessed it, and that often within a couple of feet of persons on the bank.

As time progressed, the bulrushes pretty well filled a considerable portion of their little watery domain, and in some place or other that the owner could never discover, they actually hatched five young ones. These youngsters were as beautiful in appearance as young partridges, which in colour and markings they closely at first resembled, and this brood were generally to be seen dipping and bobbing about more like the floats of fishermen, than anything else I can describe. They grew most rapidly, and soon assumed the splendid satin-like breasts; and I suggested, that unless these young ones were also pinioned, they would soon be missing, as they had become scarcely recognizable from the old ones, and the lot together, with their curious hopping gait if seen on land, was so quaint and extraordinary as to be absolutely ridiculously amusing, though they *always* instantly took the water on the approach of any one. For nearly two days, with a large fishing net, efforts were made to catch them for "pinioning," but only one (an old one already pinioned) was ever taken, though several hundreds of gold and silver fish were destroyed in the attempt. I was not myself present, but even now I think this affair was bunglingly managed, though as the pond was purposely staked to preserve the fish, it might disarrange the free use of the net. The five young ones, within a fortnight or so afterwards, took wing in a group, and never returned. The pair of old ones now proved fidgety and unsettled, and at the commencement of winter, both were one morning found dead by the side of the frozen water, to the absolute grief, I may truly say, of every one of the family who owned them. In fact, at first they seemed as though deploring the loss of one of the household. The birds were certainly one of the most interesting "hobbies" I can call to recollection. To myself, it was a matter of surprise they exhibited so hardy a constitution and tenacity of life, as was proved by the fasting powers of the old birds when first caught.

Their breeding on so small a water was quite as unforeseen, and the non-discovery of any nest, after the most scrupulous search, was another strange circumstance worthy of attention. That the old birds were caught on the eve of breeding was evident, and perhaps to this alone may be attributed the increase of this singularly amusing pair of birds. I am sure any individual, having suitable convenience for the attempt, would experience a great amount of pleasure, providing they were to be equally successful, with the Dip-Chick as a fanciful "pet;" its rarity, and the singularity of its habits and conformation, rendering it quite an exhibition; nor do I think it at all impossible, with proper care, to have preserved them alive throughout the winter.

EDWARD HEWITT.

Spark Brook, Birmingham.

[We knew a Moor-hen that was similarly domesticated; but, at length, one warm spring it departed, probably on a matrimonial excursion, and never returned.]

**A FEW DAYS' BOTANISING IN CORNWALL.**

"If we read Nature's book with a serious eye, Not a leaf but some precious thought on it will lie; And 'tis good to go forth among scenes such as these, Among music and sunshine, and flowers and trees, If 'twere only to waken the deep love that springs At the sight of all lovely and innocent things."

It is now several years ago that two flower-loving ladies set off from London, with little luggage and by no means heavy purses, to explore certain districts in Cornwall for their botanical treasures. As their adventures were manifold, and their deeds at times non-heroic, we will suppress their names, and call them by the colour of their gowns—Dove, and Mauve.

Their first entrance into Cornwall was to be soled by the sight of familiar faces, and after leaving the railway station at Plymouth, and proceeding in a hired vehicle twenty miles, or so, they reached a little town, lying snugly under its own cliffs at the mouth of a river, and facing a twin town on the other side of the embouchure; the two called East and West Looe. Our tourists felt some dissatisfaction with their driver, as he hurried the horses along a street so narrow, that there seemed no possibility of any other carriage passing, and even a donkey coming up from the coast laden with seaweed, had to go upon the footpath while the Plymouth cab dashed by. They concluded that he was taking them by some ingenious back way to their friend's house, and great was their astonishment when they learned that this was the principal street of East Looe.

A warm welcome awaited them. They found the table spread for a Cornish tea, a meal scarcely equalled by the most elaborate dinner served in any other county. Upon the table stood a good-sized fruit pie, and crystal bowl full of cream of the kind characterised as Devonshire cream, and procured of first-rate quality in Cornwall. Cold fowl and cold pork were there too, and cakes of every description. But not till the tea was poured out did the essentially Cornish dish appear; then, at the critical moment when the steaming tea was placed beside them, a tureen was brought in, and beneath the cover was the piping hot potato cake.

How shall I describe the excellence of that dish? If my

readers like Yorkshire pudding, they have advanced one step towards the power of appreciating potato cake. All kinds of good things are contained in it: eggs, and butter, and currants, and potatoes. It has all the lightness of a Sally Lunn, and all the tastiness of an Ash-Wednesday fritter. French cooks would be delighted with it for a third-course dish, only it is beyond their reach; it can only be made by a Cornish cook, and of Cornish potatoes. Moreover, not every Cornish cook can make it, for our friends, Dove and Mauve, soon learned to associate the appearance of a benevolent old lady with this dish. She was the widow of a sea captain, and a kind of general grandmother of East Looe, and when she came to spend the afternoon, she would lay aside her knitting at four o'clock and go to wash her hands, and then at five o'clock appeared a potato cake.

Dove laid an innocent little trap for Granny Pengarret, by which she found out the truth of this matter. "What a delicious cake this is, granny," she said; and granny replied modestly, "Well, my dear, when the eggs and butter are fresh, and the potatoes fine, and all are rightly mixed, and baked quickly, it isn't any credit to the cook that the cake is good." "Then you make these cakes, granny?" said Dove, proud of having divined the secret; and granny said, "It is a pleasure to me, my dear; I have few ways of being useful now."

"Granny" also lived in the main street of East Looe. She had a narrow strip of a house, three stories high, with a grand view of the river and harbour from the attics, while all the other windows looked into the narrow street. Mauve suggested, when visiting her, that the look-out was rather dull. "Not now, my dear," replied granny. "It used to be a little so, but now they have opened a butcher's shop opposite it is very cheerful. I can see everybody buy their meat for dinner while I sit and knit."

Ere granny finished speaking, a servant girl rushed tumultuously into the room. "It's the pilchards, missis!" she exclaimed; "the boats is in, and they are selling 'em on both quays. Shall 'un go and buy some?"

"Yes, Honor, go and buy sixpennyworth; they shall be marinated, and you shall have some for supper when you do come back from your trip, my dears."

"What is marinading, granny?" asked Dove.

"It is baking the pilchards all night, and then putting bay leaves, and vinegar, and spices. Strangers like them best marinated, but I prefer them as fair maids."

"Are fair maids pilchards too?"

"Yes, my dear, certainly; fair maids are plain salted, and when boiled they are very nice. I seldom take my breakfast

all the year round without a little bit of fair maid. They are very good fresh also, but that is fitter for dinner. Mr. Tregelly has set up a salting-house, and all the boats are his, so we shall have a great pilchard trade here this year."

But the tourists could not stay to feast on potato cakes, and fruit, and cream, and to study the science of preserving pilchards, so they fixed a day for proceeding on their journey, their host selecting Wednesday for the start, because of it being market day. What the Looe market could have to do with their tour was a puzzle to them, but granny solved their difficulty.

"This is how it is, my dears," she said; "Mr. Tregelly wants to save you expense, so he will drive one of you as far as Fowey in his land gig, and the lawyer from Fowey will come to the market, and he will take the other with him. You see land gigs are the lightest and most suitable carriages for these hilly roads, but it is tiresome that they only carry two."

Poor Dove looked so nervous at the thought of a drive with a stranger, that Mauve at once proposed her as Mr. Tregelly's companion, and herself awaited the convenience of the strange lawyer. The summer sun was already low, when Lawyer Black brought his "land gig" to the door. Dove and her host had started two hours before, and Mauve had begun to fear that the lawyer had forgotten her. But no, the gig came to the door, and Mauve took her place by the stranger. Up hill they went and down hill; it was not a monotonous drive, for though the lawyer was not very conversational, the horse made himself very entertaining, always jibbing up hill or dancing down hill. Then, though the darkness cut off all sight of the lovely prospect, the glow-worms lit their lamps in abundance, and made the hedge-rows into illuminated pleasure grounds. Suddenly the driver pulled up short, and Mauve only then noticed that they had reached the bank of a wide river. Mr. Black put his hand to his mouth and shouted, "Horse-boat, a-boy!" repeating the shout several times before handing his companion from the gig. Soon the splash of oars was heard, the horse, carriage, and passengers entered the boat, and the oarsmen began to pull across. As the boat turned they saw the lights of Fowey on the hill side opposite, and as the oars troubled the water phosphorescent light glanced from the spray.

At the house of Mr. Tregelly's brother the tourists were hospitably received, and Mauve was warmly congratulated upon her safe though tardy arrival. Mrs. Tregelly praised her courage in venturing to travel with such a dangerous horse, and promised her a safer excursion on the morrow. She had been kindly planning a row up the river to Lostwithiel, where a great variety of flowers were to be found; she only regretted that, her husband being otherwise engaged, she and her fourteen year old son must be the boatmen.

The chance of getting flowers and a free passage was a temptation not to be resisted, and Dove was charmed with the prospect. Mauve was less delighted, for her nerves, though strong enough regarding strangers and horses, were weak upon water, and she would have been happier with more skilled boatmen.

The morning dawned brightly, and after an early breakfast they wished their kind host good-bye, and proceeded down the garden steps to the boat which was moored there. It was a rising tide, and the harbour looked gay and picturesque in the extreme. Many foreign vessels were there, merchantmen principally from Norway, and the sing-song cry of the sailors, as they performed their regular morning's work, added to the general charm of the scene. Mrs. Tregelly and George rowed bravely, and with the tide in their favour soon left the harbour behind, and lost sight of the blue sea, but still the river was broad and deep. Up ran the tide, and up darted the bonny boat, between the banks so richly wooded, and by mansion and cottage, till the valley widened, and the river narrowed, and they reached Lostwithiel.

"It is not high tide, yet," said Mrs. Tregelly, "so you have plenty of time for botanising, and these salt marshes are good hunting grounds for you. I have business in the town, but I will return in two hours; the half-tide will serve for our return."

And now the search for flowers began in earnest, and the tin case filled rapidly. First, there was the Sea Milkwort, throwing up its small leafy spikes in scores at and beyond

high tide mark (*Glaux maritima*); then the Brookweed (*Samolus valerandi*), with its primrose-shaped white blossoms, egg-shaped leaves, and tall stems. The Thrift was there, of course (*Statice armeria*), and its rose-coloured tufts of blossom made the short turf quite gay. It was too early for the flowers of the Sea Lavender (*Statice limonium*), but its fleshy leaves were there in abundance, as also those of the Sea Aster (*Atripolium*), and the glaucous foliage of the Shrubby Orache (*Atriplex portulacoides*) puzzled them greatly, for there was as yet no indication of the flower spikes. The Sea Club rush (*Scirpus maritimus*), with its bracteated panicle, was nearly in perfection; the many-stalked Spike Rush (*Eleocharis multicaulis*), and the Reflexed Sweet-grass (*Glyceria distans*), with its partially decumbent stems and stiff panicles.

The time passed quickly to the botanists, as they wandered about gathering these plants, and stowing them away in their tin case; and when Mrs. Tregelly returned, she was astonished to find that they had been in no anxiety about her lengthened absence, nor had even eaten the luncheon they had brought with them.

"You must not eat it now," she said, "for the tide is running out fast, and if we wait much longer there will not be water enough for us to get along."

Accordingly they started with all speed, and had much ado to get the boat off, though George took to wading like an experienced boatman. Once fairly off, they got along pretty well for a mile or so, and the strangers hoped they were sure of a speedy return to Fowey, and applied themselves to the neglected sandwiches. But Mrs. Tregelly knew that the muddy bottom was dangerously near, and she was by no means surprised when the boat stuck fast. Their position was not an enviable one. At high tide the river was a quarter of a mile wide at that part, yet at half-tide there was barely water to float a pleasure-boat. The tide being more than half turned now, there was the cheerful prospect of waiting there for six hours, till the coming tide should bring a fresh supply of water. George sprang out of the boat, and succeeded in pushing it a little way, but it soon stuck faster than ever. "It is of no use," he said; "unless you can all get out and push, we must stay amongst this mud for the next tide."

Mrs. Tregelly was already engaged in divesting herself of boots and stockings, and the two strangers followed her example. In a few moments the four were fairly launched in the mud, two hauling the boat and two pushing. By their united efforts they made steady progress, and in half-an-hour they had passed the mud-banks, and the water was becoming inconveniently deep for ladies, albeit their skirts were well looped up. They were very willing to get into the boat again, and were doing so with alacrity, when a "halloo!" from the right bank revealed the unwelcome fact that their tactics had been observed. Mr. Tregelly had been electioneering far and wide, and having tired out one horse, he had hired another, and profited by its powers to make a detour to within three miles of Lostwithiel.

It was pleasant to regain the harbour, and know that their adventure could have no worse result than that of subjecting them to a little good-natured raillery from Mr. Tregelly, who did not fail to remind them, on every possible occasion, of the picturesque effect of bootless feet. But first they rowed to some romantic caves, where they had the pleasure of recognising the dark green leaves of the rare Cyclamen, though most of these had died away, and there was a show of coming blossoms.

The many anxieties connected with an impending contested election for the county absorbed all Mr. Tregelly's energies, and had already knocked up his own horses, and those that could be hired in Fowey: so on the morrow he started up the river in a boat, telling his wife he should be back during the day in some vehicle or other—whatever he might be able to hire at the hamlet to which he was bound. Dove and Mauve went out alone on to the cliffs, for Mrs. Tregelly was tired with yesterday's exertions. Upon the cliffs they found the Awl-leaved Spurrey (*Spergula subulata*), the Hairy Sea Pearlwort (*Sagina apetala* and *maritima*), the Sea Plantain (*Plantago maritima*), the Sea Beet (*Beta maritima*), the Sea Sandwort (*Arenaria maritima*), and the far-famed Sapphire (*Crithmum maritimum*). A little further

from the town the cliffs assumed a style of gorgeous ornamentation, masses of the Red Valerian (*Valeriana rubra*) hung from the crags, glowing in the broad sunlight—

“Like a banner bathed in slaughter.”

This deep colouring was relieved by great quantities of pale golden blossoms adorning the myriad spikes of the Sea Cabbage (*Brassica oleracea*), and the effect of these were heightened by the intense blue of the Borage (*Borago officinalis*), which grew in abundance upon those sea-girt cliffs. Wherever there was a crevice in the rocks, one or other of the Stonecrops had established a home; now it was the white star of the common English species (*Sedum Anglicum*) which, adorned by their rosy stamens, covered all the surface of the plot: and now it was the amber stars of the golden moss (*Sedum acre*); or the plot changed its mossy appearance, and showed whorled branches and tall flower-stalks, upon which were borne dense cymes of the orange blossoms of the rock Stonecrop (*S. rupestre*). The Thrift and Sea Sandwort contributed their quota of gay colouring, and the Fowey cliffs were dressed as for a feast of flowers, the drooping fronds of the Sea Spleenwort (*Asplenium Marinum*), completing the charm of nature's decoration.

On returning from their long ramble, our tourists found their hostess in some anxiety, owing to her husband not having returned. She stood at the window looking out for him. The dinner waited; and her solicitude increased. Presently the noise of wheels was heard along the narrow street, the neighbouring clock chimed eight, and rang out its quaint tune, just as the nodding plumes of a hearse were seen approaching. It drew near, and the anxious wife was too much fascinated by the horror of its association, to observe who sat on the driving box; and when the sombre vehicle drew up at the door, she fainted away. On recovering, she found her husband by her side, laughing at her fears. He had tried in vain to hire a “land gig,” and the tide being low, no other “gig” was available. He was at his wits' end for the means of returning home, when he found that the Fowey hearse had been in attendance at a neighbouring funeral, and was about to return: so he was glad to mount the driving box and secure a lift. He had wholly forgotten the state of his wife's nerves, or he would not have brought the ominous conveyance to his own door.

Canvassing business called him to St. Austell within a few days; and as he then succeeded in hiring a horse, and, being in advance of the age, was accustomed to drive in a four-wheel, Dove and Mauve got a further lift towards their next halting-place, Penzance. They reached St. Austell in time to take the coach for Truro, where they got upon the railroad, and reached Penzance early in the evening.

Their stay at Penzance proved prolific in floral treasures, but poor in adventures, for they had ceased to consider such *contretemps* as getting bogged in Marazion marsh, or overtaken by the tide on St. Michael's Mount, worthy of such a name. The shore was gay with the exquisite rose-coloured bells of the Sea Convolvulus (*C. soldanella*), the sand hills were covered with the fleshy stems and foliage of the Sea Sandwort, whose tiny white flowers made no show at all in comparison with the swollen seed-vessels and heavy foliage. The Sea Horned-Poppy was there, too, with its large golden petals of delicate texture and horn-like pod, the glaucous leaves contrasting charmingly with the amber flowers (*Glaucium luteum*). A low wall separated the coast from the marsh and the road leading to the ancient Jewish settlement, and here that treasure of the fern group, the Lanceolate Spleenwort (*Asplenium lanceolatum*) was growing.

The marsh was still richer in its store of plants, and our botanists had advanced but a short distance, when they were delighted at the sight of a sunny bank, perfectly covered with the rosy blossoms of the Bog Pimpernel (*Anagallis tenella*). The thread-like stems, beset with tiny leaves, were forming a net-work over the sward, and the blossoms were like expanded bells trembling in every breeze. In the wetter ground grew quantities of the viscid *Bartsia* (*B. viscosa*),

its broad, delicately tinted leaves sticky with balsamic glands, the odour of which nearly resembled the common garden Musk, and the yellow labiate blooms rising from their axils. A little further on and the ground was covered with water, out of which rose little mounds surmounted by low bushes, while at their side grew lordly masses of the Royal Fern (*Osmunda regalis*.) It was in procuring specimens of this King of Ferns, that Mauve found herself as deeply immersed in water as she had been in the Fowey river, but without the advantage of being prepared for the plunge.

Part of the marsh consisted in more or less shallow ponds, and here a large variety of water-plants were flourishing. The common Butter Wort (*Pinguicula vulgaris*) and Forget-me-not (*Myosotis palustris*) were blooming on the margin, and the Floating, Perfoliate, and Shining Pondweeds (*Potamogeton natans*, *perfoliatum*, and *lucens*) grew in abundance in the depths; there were also the Least Water Parsnip (*Sium inundatum*), with its tiny umbels of inconspicuous flowers and pinnate leaves, wedge-shaped above the water and thread-shaped underneath; and the Water Ranunculus (*R. aquatilis*), of similar habit, covering the surface of the pond with its delicate white roses. The Spiked Milfoil (*Myriophyllum spicatum*) was lifting its pink blooms above the water, keeping its feathery leaves carefully below; masses of the Vernal Starwort (*Callitriche verna*) grew in every pond, and the Common Hornwort (*Ceratophyllum demersum*) was found in one. Various kinds of mosses covered the damp earth, and in particular the Common Fontinalis grew in great luxuriance in the ditches, as did also the Narrow-leaved Bog Moss (*Sphagnum acutum*). It was fine calm weather, and the weeds thrown up on the shore were few, and those only of common species, mere branches of *Fucus* and *Laminaria*, with an occasional frond of *Chyrocladia* and *Delesseria alata*.

The day at the Land's End was one of great enjoyment; there was no tea saloon there then, and our tourists were the only persons on the wild granite rocks. A seagull was engaged in the maternal duty of incubation on a rock a little out to sea, but so near the coast cliff, that an unpractised hand might have hit her with a stone. She did not seem the least annoyed by the vicinity of Dove and Mauve, though her mate was evidently a little uneasy about it, for the whole time that they stayed there he stood beside her, as if to extend his protection over her. Of course the tourists explored the caverns, and brought away crystals from their glittering walls, and they gazed on the expanse of ocean, and invoked a blessing on the outward-bound vessels. But as far as the botanical collection went, it only increased that day by one plant—the Sea Heron's Bill—which was displaying its petalless blossoms on the arid rocks and roadsides (*Erodium maritimum*).

The drive back to Penzance was cheered by the light of glowworms in the hedge-banks, and by that of the twin Lizard lights to seaward; and the stars came out gloriously, and the clear sky and balmy air suggested a foreign climate rather than that of the British Isles.

A journey in a van on the morrow brought our travellers from Penzance to Helston. It was not the feast of flowers, and so Helston looked very much like any other small country town, and the Angel Inn was fully as comfortable as any other old-fashioned house in an old-fashioned place. By careful inquiry our tourists learned that one grand object of their western excursion—the Loe Pool—lay but three miles from Helston; so they stipulated for a very early breakfast, and with sandwiches in their tin case, they left the town by seven o'clock in the morning.

The ground, as you approach within the last half mile of the inland lake, known as the Loe Pool, bears the signs of frequent floods: very little verdure grows in the lower part of the valley; and the bushes are entangled with straw, dead weeds, and other wreck. Keeping the right side of the valley, the explorers soon came in sight of the lake, a handsome piece of water about three miles long, and one and a-half broad in its widest part. The path led along the banks through pretty meadows and park-like fields; it crossed a brook by means of a rustic bridge, passed before a mansion of some importance, and then traversed a low sandy shore shadowed by birch and other small trees. Here grew the Spring and Thyme-leaved Sandworts (*Arenaria verna* and *serpyllifolia*), the broad and narrow-leaved Mouse-ears (*Cerastium vulgatum* and *viscosum*), the Cathartic Flax (*Linum catharticum*), and that most minute of flowering plants, the Little Flax-seed (*Radiola millegrana*). This tiny plant is less than half an inch in height; its main stem and numerous branches are the thickness of a hair, and you may count thirty cruciform flowers and fifty leaves on one plant.

This sandy ground passed, they entered a hilly wood, and soon came out on high ground, close to the lake but commanding a prospect of the wide sea. The lake at its further end is only separated by a bar of white sand and glittering pebbles from the ocean. As our tourists observed, this lake is much subject to inundations; and when the waters rise to a great extent, they endanger the machinery of several copper and other mines in the neighbourhood. So when the floods have reached a certain height, a deputation waits on the mayor of Helston, and, accompanied either by his worship or a duly authorised lieutenant, proceeds to the bar of sand, where workmen have already arrived, and are only waiting the signal for action. In a short space of time a channel is cut through the bar, and the pent-up waters of the lake rush out into the ocean, creating such a turmoil there that the blue waves of the Atlantic are discoloured as far as the Scilly Islands.

These rocky woods were not only gay with sunshine, but with the glowing umbels of the Portland and Wood Spurge (*Euphorbia Portlandica* and *Amygdaloides*). The exceeding brightness of the sand and pebbles of the bar made it trying to walk upon; and Dove and Mauve wished for parasols, for their mushroom hats were no protection from the glare. The whole of the bar had the appearance of being wet; but this arose from the crystalline transparency of the material of which it was composed. Among the sand grew many plants of the Sea Holly (*Eryngium maritimum*), its spiny glaucous foliage attracting observation and admiration to a much greater extent than its globular umbels of pale blue flowers.

To sit under the shade of a cliff and watch the tide rolling in, while they eat the luncheon they had brought, was a pleasant change and refreshment; and then they pursued their way along the other side of the lake. In a tract of swampy ground they found the delicate blossoms of the Pale Butterwort (*Pinguicula lusitanica*), and near to these the frail stems of the Ivy-leaved Campanula (*C. hederifolia*) were supporting themselves against the culms of grasses, and hanging their delicate bells ready for a joy-peal. On rocky ground, bushes of the Burnet Rose (*Rosa spinosissima*) were clustering; a few cream-coloured blossoms remaining, though the greater part had given place to blackening fruit. The fragrant Sweet-briar, too, was there (*R. rubiginosa*), and the Trailing Dog-rose (*R. arvensis*), in abundance.

About half-way in the length of the lake the waters expand

into an elbow, and there the water was full of weeds—the Narrow-leaved, Grass-leaved, and Fennel-leaved Pond Weeds (*Potamogeton tenellum*, *graminum*, and *pectinatum*), the Tassel Grass (*Ruppia maritima*), and Floating Club Rush (*Scirpus fluitans*), were the most important.

They passed one cottage on that side the lake, and then entered charming woods; sometimes the path was dark with cloister-like branches, sometimes it allowed a view of the lake and its meadow lands. At length they emerged from the woods and found themselves in the valley again, the lake lost to sight, and their own faces turned Helston-wards.

The fatigue of the day at the Loe Pool necessitated a day's rest, so it was not till the third day of their stay at Helston that they proceeded in a hired carriage to the Lizard Point. The driver contrived that they should reach Kynance Cove at low tide, and they had thus the advantage of finding the sands well exposed.

The white windmill-like towers of the lighthouse were only interesting from their associations, and the village of Landewednack had few claims on notice beyond that of being the most westerly village in England, and having a most picturesque and unapproachable harbour. All the country was very bare, and, excepting for a few enclosures, was covered with budding Cornish heath (*Erica vagans*), whilst the few apologies for hedges were straggling bushes of the Tamarisk, attractive enough at that season from their numerous and elegant spikes of rose-tinted bloom. The Starry-headed Water Plantain (*Alisma damasonium*) was the only plant that tempted them to leave the carriage on their return.

As they re-entered Helston the church bells struck up a triumphant joy-peal. This roused their interest enough to induce them to question the handsome and efficient chambermaid as to the cause of the rejoicing. The woman smiled, passed her arm round one of the bed-posts, and leaning at her ease upon it, replied—"Well, you see, it is because the election is over."

"Then who has won the day?" exclaimed the two friends in one breath, for their experiences at Fowey had roused their interest on the subject. The chambermaid smiled again, and replied loftily—"It can't be known, for some hours yet in Helston who has won—but the ringers know that whichever it is he will pay them, and they are ringing for the victor."

And the bells rang at East Looe, whither Dove and Mauve repaired on the morrow: travelling by coach in the early morning, by rail at midday, and by a hired vehicle, half van half waggon, in the evening. They came in upon their old friend Mrs. Charles Tregely at a critical moment, and their interruption was by her accounted most opportune.

During their absence, at Fowey, Penzance, and Helston, the pilchard trade had gone on merrily—in no degree interrupted by the excitement of the election. The fish were caught in thousands, packed "heads and tails" in the salting-house, pressed by heavy weights till the oil ran in a stream down the gutter in the centre, and then duly salted and packed in casks for exportation. The thick of this being over, and the election being decided in favour of the popular candidate, the two leading fishwives waited upon Mrs. Tregely with an humble request, which was no less than that they might have a dance and a supper, and that Mr. and Mrs. Tregely would preside. While preferring this request, the two fishwives were much troubled by *mauvaise honte*. Under this direful influence they advanced hand-in-hand, and while pleading their cause encircled each other's ample waists with proportionably ample arms, and otherwise acquitted themselves very like children in a village school asking for a holiday. When they departed it was hard to say whether they were more rejoiced at the prospect of the *fête*, or at the termination of the interview. They described their feelings to their waiting friends thus: "We felt as dazed as wheelbarrows."

The fishwives' dance was a rare occasion for lovers of the unique. The supper was of a character that might be called heavy, consisting as it did of huge pieces of boiled beef, and piled dishes of vegetables. Mr. Tregely hewed away as a carpenter might do in cleaving wood, and was thankful when at last the appetites of the fisherfolk were satisfied. Then the arms had rest, but exertion became the duty of the other limbs; and he had to lead off the country-dance with the most portly matron present. Mrs. Tregely honoured an old fisherman with her hand, and Dove and Mauve could not be less

"free" than their hostess. They retired after the first dance; and if the company felt the loss of glory in their departure, they got more than a proportionate enjoyment in the increase of freedom.

M. P.

### THE PET MAGPIE.

SOME thirty to thirty-five years back, when assiduously engaged in obtaining specimens for my small private museum, I became acquainted with a gamekeeper, who, up to that time, had actually nailed everything he shot (game excepted) against the end of a large barn, or some similar building, as a proof of his prowess in killing almost everything that came in his way, on the general assumption they were all game destroyers. Among many other equally erroneous impressions was one he firmly entertained and stoutly insisted on, to this effect, that the night-jar, or fern owl, was the worst of all enemies to the partridges, for they eat all their eggs, and he knew they carried them to their young to feed on. He actually adduced, in confirmation of his assertion, that as they had such a large mouth, the fern owls carried the eggs one at a time away, thus clearing a whole partridge's nest in a single night. He also professed to believe that these harmless birds "sucked the goats in some countries;" and I almost think he was really as superstitious as he appeared, for he would not accredit that the "goat-sucker," as he called it, fed on cockehafers, and consequently was of benefit to mankind. His aversion to the hedgehog was extreme, for there, before us, were numbers of them nailed up and shrivelled, for crimes of which they certainly were as entirely guiltless as was even the individual who had destroyed them: a bittern, three or four of the short-horned owls, many magpies, a variety of hawks, polecats, weasels, stoats, and rats being ranked on the wall in strange incongruity. The house eats, he stated, he always buried, that they might tell no tales. His cottage was very small, carelessly kept, and stood far away from other habitations. It was here that one of the most amusing incidents occurred. Some one applied to him to get a young magpie for rearing, and though rendered comparatively scarce by the continuous slaughter carried on against them, a nest was procured, and the youngest of his own children having cried heartily to be allowed to keep one, his mother's intercessions with the father, "that the child would soon be tired of it, and then it could be done away with," induced, at length, a reluctant compliance from the father, who "couldn't think what they wanted with such varmint." The young bird, however, grew rapidly and prospered, and quickly became quite a "pet" among the younger children, though the eldest son seemed to have imbibed all the strange prejudices of his father against keeping anything that did not "get money." It had full liberty to come into the cottage whenever it pleased so to do, and if not there, could always be found either in the lane or on the housetop. It was exceedingly familiar, and talked, though but little.

I myself always believed it to be a female bird, but as the family who kept it were of a directly opposite opinion, in deference to those who were with it daily, I will speak of it as a cock bird. Its vocabulary consisted of "Polly—Come—Marg'ret—Don't you bite—Jacob—" and "Where are you?" He washed himself almost daily in the brook, was in splendid feather, and generally made the most intimate acquaintance with everything connected with the place. Even it and the pointers were capital friends, though he furiously flew round any strange dog so long as it remained, ever after the time a spaniel, in trying to catch him, once pulled his tail out; for henceforward no care could reconcile him to such new comers.

He passed a good deal of his time with the younger children in the cottage, or in fine weather would mount the roof,

chattering wildly, or at times reiterating the few words he had now acquired. At dusk, for a long time, he always roosted in his allotted corner. He fed precisely as did the children, for they gave him portions of all their meals, and up to the commencement of the following year was always closely within call. At length, he was absent at short intervals, particularly in the early part of the day, and it was discovered he had formed an acquaintance in a small plantation about two fields distance, and even began to stay out at night also. This circumstance seemed to raise the ire of the gamekeeper, who threatened "to shoot him if he saw him there again." Having now become the "pet" of both the children and their mother, they strove all they could to prevent these tendencies; and from being constantly driven back, at length both he and a wild hen magpie constructed a nest on a high tree at the bottom of the garden. These birds sat and produced several young ones, and this strange and unnatural union of wild with tame birds proved in the result most whimsical. The cock magpie, so far as he had learned, absolutely "talked" to his mate in an evidently unknown tongue. When the young brood wanted food, his daring and impudence increased intensely. This bird took all the food he supplied to them from the gifts of the household, whilst the hen as invariably sought sustenance for the nestlings in the fields. This plan of getting food continued throughout. "Mag's" talkativeness, that now seemed at its height when connected with his present occupation, was to strangers almost supernatural, particularly when they were perfectly unacquainted with the circumstances just described. If thrown a piece of meat (for he would not now feed from the hand), he would fly up with it to his little family, screaming wild notes interspersed, however, with words as quickly uttered as though calling over a muster-roll. He would repeat, "Come, Jack, Jacob, Polly, Marg'ret," and occasionally, "Don't you bite," but seemed to have entirely forgotten his old saying of "Where are you?"

His rapacity (caused, no doubt, by the daily increasing wants of his young ones) led to his destruction, from the reckless determination he evinced to obtain every edible within reach. The eldest son, a lad of about fifteen years, had either been engaged in net-fishing, or was about to go out for that purpose, and unluckily his dinner had been put on a plate (uncovered) on the table. The boy had left the room for a short time, and on entering again at the back-door was unfortunately just in time to see poor "Jack" fly out at the front with a selected morsel, the greater bulk of his meal being pulled about the table in sad disorder. Maddened by the sight of his dinner-plate, he reached a loaded gun from the house-wall, and before his mother could prevent him he shot the poor bird in his nest, bringing all in one confused heap to the ground. I am told that the lad, with blubbering tears, immediately repented, could eat no dinner, and that he would have given anything he possessed to undo what his passion had suggested. This boy's two little relatives, after many bitter tears, made quite a funeral of their "pet," and buried him at the foot of the tree from which he fell. Even the father himself, on returning, professed great grief at "his being killed in that way;" a doubt of sincerity, however, arose from the circumstance that only the next day he shot the old hen magpie, and secreted it from the prying eyes of those by whom this interesting family had been so closely observed.

Spark Brook, Birmingham.

### A CORNER FOR THE CHILDREN.

#### INTRODUCTION.

Y the side of how many a Christmas fire is a corner left for the children? Why, the fire-side at Christmas-time would be sadly incomplete without the dear children. Old Father Christmas—kindly, jolly old fellow as he is—gives (there can't be a doubt about it) a nod and a smile to the little ones. Nay, I have heard say that he takes them on his knee and trots them up and down, till their young blood laughs with warmth, even in their very little toes.

We all learned to love Christmas when we were children. It was then the love grew up in our hearts, and our after-love of the season when we have grown portly or thin, or bald or grey, is chiefly from the recollection of our childhood's Christmas-days—the days when we first assisted in hanging up the mistletoe branch, or eyed with wonder our bigger brothers and sisters decorating with evergreens the dining-room, or that snug *parlour*; yes, that was the word,—the suggest room we ever knew,—and there we always lived when there was no company. The room in which we played dominoes, learned to play draughts, or wondered at the intricacies of back-gammon, for we always had some games before that dreadful nursemaid appeared and summoned us to bed, just when we were “so happy.”

I went, a few years since, to a large children's Christmas party. The host had about a dozen of his own (“pretty party at all times for a man to be bothered with,” methinks I hear exclaim Jonathan Musty, Esq., old bachelor, residing at Mouldy Hall); but he (my host) loved to have once a-year at any rate—that once being Christmas time—some forty other children added to his own. And when, after the frolics were over, I bade them good night, he said, “Ah! there is nothing like making children happy; it is the greatest happiness on earth to see children enjoy themselves.”

Greatly do I reverence;—no, that is not the word,—greatly do I love another friend of mine, an old boy of about fifty, who, when a young boy of only forty, was one evening in company with a number of school lads, and was so thoroughly one with them, that at the end of the evening they had all grown so wonderfully confidential that one boy said to him, oblivious of his whiskers, “Oh! you are at Eton, are you not? What form are you in?” How I envy that man, his being able to keep “his young lamb's heart amid the full-grown flocks” as to be himself taken for a young one.

But to the point. I crave “a corner for the children” in this our Christmas number. Will not room be made close to the fire for many a Gertrude, or Lucy, or Netty, or Harry, or Tom. I see, in thought, the elders squaring round, and the ladies contracting their crinolines; and I see the children coming, shouldering their little chairs and squeezing into the corners made for them. There, now, you are all seated, and, better still,—quiet. Cyril by his mother's side, of course. We all know to whom he runs always; there he has put his cheek on her warm silk dress, and is gazing at the fire, while a velvet hand (how light, and smooth, and warm it is) is passing over his face and forehead, and then the fingers of the said hand play for change among the tangles of his hair. But no jealousy, you whiskered individual in the big chair opposite, for in your corner little Lucy has got. We all know her way. Well, you are seated, and the Christmas dinner is eaten, and you in the large chair are whirling the nutcrackers about, using them like a little flail thrashing imaginary corn on your knee, for you have had enough of the walnuts and the wine. Our Christmas number is on the table; the “light of the dwelling” having spied “a corner for the children,” has laid the number open and ready for reading to *her* children at this very vacant, musing, fire-light hour. She clears her voice. Why does she do that? It is clear as silver at all times. And then she begins to read:

#### THE BANTAM HEN THAT LAID GOLDEN EGGS.

ONE cold morning in spring when the cook opened the back-door—it was the door from the back-kitchen, and led out into the stable-yard. The lock always went hard, grated rustily: “That hoy,” meaning Buttons, “never would oil the lock,” said cook; and the door grated very rustily this morning, for there had been a great deal of rain lately. At length the door opened, and cook forgot her anger in her surprise at seeing a little, *little* bantam hen picking up some crumbs that had been thrown out from the cloth after supper the evening before, for the birds were always remembered in that family. The girl was a kind girl; and when she saw how thin, and cold, and miserable the little bantam looked, and how its feathers were ruffled and broken, she went into the larder to the bread-pan and got some more crumbs, and enticed the little hen to come in; and she came in right to the kitchen

fire (it had just been lighted), and she fed in front of the fire, and, at length, roosted on the back of an old Windsor arm-chair, the one cook did her sewing in. And the girl went about her work; and as the housemaid looked in, she begged her not to disturb Miss Ada's pet, for she meant Miss Ada to have it; and when “that boy” (he was down late, of course) threatened “to wring that banty's head off,” she threatened him with the broom-stick; which threat quieted that “boy,” for his shoulders had ached on a former occasion, and cook always kept her word.

Miss Ada at last came down: a little miss of seven years of age, with a fair face and short nose; her big brother, when home from school, used to add, “and a shorter temper;” but this was only his fun. One thing Ada had, and that was real golden hair, not hair washed yellow with—but I must not tell ladies' secrets. And Ada was called into the kitchen, and cook presented the bantam to her, and she, Ada, was pleased beyond all bounds of staid pleasure, skipping, laughing, jumping, kissing the giver, though she was not at that time of day over-tidy, and calling her “dear old cooky.” And then mamma hearing the noise came in, and she was pleased because Ada was pleased. And then papa was fetched in, who seeing the course events were taking, and fearing the result of expectations raised only to fall, said gravely,—“My dear Ada, this is a very good game bantam; I have seen them at shows; and it belongs, no doubt, to some one who values it highly, and we must, therefore, seek for the owner.” Talk of the effect of a wet blanket on a fire, this speech was a pile of wet blankets to poor Ada, for she was grievously disappointed. As to cook, she grumbled something about “a too bad of master to go disappointing missie like that; but she should have it, for findings was keepings; and she found it, and she gave it to Miss Ada, and master had nothing at all to do with it.” But right and justice prevailed. Everybody in the neighbourhood who kept fowls was sent to: old Mrs. Smith on the Green, Mr. Little, John Tomkins at the Farm, Squire Harcourt, who took all the silver prizes at the great shows; but no owner was to be found.

“They sought him that night, they sought him next day,  
They sought him in vain till a week passed away.”

The real secret never came out as to how the hen came, or where she came from. It was supposed by “Buttons,” who would not, however, give his authority, that it had been stolen by Jem Stiggins, who had lately run away from his work at Birmingham, and had come back to his father's, and that he had kept it in his old rabbit-hutch some days; but being a good flyer, and not liking its quarters, it had on the first opportunity flown away like a sensible little bird as it was. One thing was certain, Jem knew better than to claim it. So justice being satisfied in the matter of the ownership, nobody claiming the hen, it was declared, even by her papa, to be Ada's, or, as she said, “her very own.” The cook declared it would lay *Golden Eggs*; she knew it would. In a few days the little hen, after sundry searchings, and lookings, and “pratnings” about—having, by the way, soon got her plumage in good order, by dusting herself on the sand-bank near the nut-walk—fixed upon a corner of the manger in the stall not used, and having made a nest, or, rather, found a bit of hay all ready, laid an egg, and then set up such a cackling as if there never before had been done such a wonderful thing in all the world. Cook ran to see, and her cap flew off, or, at least, only hung by a single hair-pin; but she ran on in spite of it. She then fetched Miss Ada, and said, “Look, miss, at the beautiful golden egg; didn't I say it would lay *Golden Eggs*.”

The first egg was eaten at tea by Ada; then more eggs were laid, and then the little hen sat; and Ada took corn into the stable every morning, and fresh water and green food—*i.e.*, grass or cabbage or lettuce leaves—slyly peeping at the eggs while the hen was eating. There were nine yellow eggs. “Ah!” said she, “cook was right; they are *Golden Eggs*.”

Time passed on, and when the twenty-first morning came, Ada heard, when she took the corn in, a faint noise or rather noises—several faint “cheep-cheeps” coming from under the hen; and cook took up the bantam gently, who resented the interference greatly, kicking and pecking furiously. There were nine yellow, downy chicks.

"There, Miss Ada look! *Golden Chickens* from *Golden Eggs*; why, their little beaks are as yellow as sovereigns." The hen was soon put into a coop, and the coop into the kitchen, for the weather was cold, and the mother and chickens fed first with chopped egg, then bread crumbs and whole grits. Ada loved to watch the little golden noses peeping from out the hen's breast and wings. The chickens grew and prospered famously; but the little cockerels, alas!—for truth must be told—when they grew hobbledchoys, fought each other, and got bloody noses; but except for these occasional battles all went on well. Ada was very proud of her chickens, and showed them to everybody that called. One day, by chance, a gentleman learned in poultry happened to call, and he was taken to see the chickens; and he declared them to be very good, indeed, and picked out the three best—a cock and two pullets—and advised Ada to send them to the poultry show which would be in the town in a few months. The time came, and after due inquiry, the birds being now grown to their full size, though that was a very small size, it was determined by papa that they should be sent to the show. Cook washed them gently; then put them in some clean straw in a basket, and set them before the fire to dry; and then put them into a small lamper—a round one it was, so as not to spoil the cock's tail. And cook almost blessed them—at least she blessed herself—and declared them to be "beauties." The next day the pony carriage was at the door at one o'clock, and papa mamma, and Ada soon got in and drove—it was rather a long drive, to where the show was held. They found the church bells ringing, and everybody in their best clothes, while crowds were entering a gate leading into a field; at the gate stood two solemn-looking policemen. Ada entered with the rest, and inside the field it was like a fair. A military band was playing, led by a fearfully-excited man, who seemed to threaten all near with his black stick. Ada passed the fat pigs, and declared them to be "ugly things." She passed fat cattle, and said they were "too fat." She came to the flower tent and was pleased enough, but kept pulling her papa's hand towards a tent from which came the sound of crowing—crowing. There must be some cocks there. Most of them said, as all proper cocks since Adam's time, "Cock-a-doodle-do," while some great Cochins and Brahmas seemed to have started a new fashion ("Just like upstarts," said old Mr. Dorking) and said "Cock-a-doodle-don't."

There were such a number of pens in the tent, such queer-looking fowls in some of them, thought Ada; but her eyes all the while wandered about to see her pets, and whether they had plenty of food and water, but she could not see into the uppermost row of pens. She felt a strong pair of arms raise her from the ground—they were her papa's,—and looking straight before her, there were her own dear bantams.

"Well, they have plenty to eat and drink, papa—how nice! but what means that card nailed on the top of the pen?"

Her papa put up his eye-glass—he was rather short-sighted—and exclaimed: "Well, I declare, Ada, you have got first prize; there must be a mistake." But on referring to the catalogue, there was no mistake, for it was printed—"Game Bantams, black-breasted reds.—1st prize, Miss Ada Seymour." And as to the card, why it was as big as one of Ada's school-books. There was no mistake, for the secretary—a grave-looking man who seldom made a mistake—handed Ada a bright *gold sovereign*. "Why, papa, cook's right," cried the delighted Ada; "my hen does lay *Golden Eggs*!" But that was not all: next day came a large letter, very business-like looking, directed "Miss Ada Seymour," in a bold hand. "That's about Ada's bantams," said her papa. "I dare say it was all a mistake; the child's could not be so very good." But papa was wrong; it was indeed about the bantams, but it was to offer three sovereigns for the hen exhibited at the show; and a few days after the clerk at the post-office handed Ada three sovereigns on her signing the order. "Well, cook was right," said the child, looking at the three yellow coins in her hand; "my bantam does indeed lay *Golden Eggs*. But may I give her one for her poor mother, who is ill?" "Certainly, child," said her mamma. And that made Ada all the happier. And so ends my tale of "The Bantam that laid Golden Eggs."

jolly! but how I should have liked to have thrashed that Buttons." Little Lucy said, "How nice; and what do you think of it, papa?" But papa had kept playing slower and slower with the nut-crackers till they lay extended, very helpless-looking, on his knee, and he was very quiet. "Why, papa, you are asleep," they both cried. "No, no; I heard it all," said he, starting. "I was thinking about Lord Russell's last letter to Mr. Adams." "Papa," said Lucy, "I'll prove it. Now tell me all that the tale was about." But papa declined to be examined, so I fear he was a little asleep.

Now, Lucys and Gertrudes, and Cyrils and Harrys, and all of you, if you have a fancy to keep bantams that will lay golden eggs, and want to know how to manage them, and you do not know how to contrive it, write to the office where this is printed—if you write in large hand between lines, never mind—and the Editors will answer you in print, in next week's Journal—or perhaps I should. And now believe me to remain (I wish I could kiss Lucy) your affectionate old friend,

WILTSHIRE RECTOR.

### THE CHAPLAIN'S CHRISTMAS HOMILY.

GENTLEMAN, among other bequests, left his son a ring, and desired that he would have engraved upon it the word "THINK." He laid also upon him a further command—viz., that he would always wear the ring. The father showed much wisdom in this matter; he wished to do good, to have a salutary influence over his child when he himself was dead and gone, and we can scarcely doubt but that he succeeded in his wish. Thus, was the son in after years tempted to speak rashly, his eyes would fall upon the ring on his finger, he would read the word "Think," and he would remember by whose wish the ring and its motto were placed on his hand; and, perhaps, instead of speaking rashly, "unadvisedly with his lips," he would be silent. Again, was his hand about to be clenched in anger to strike another, the inscription on the ring would, most probably, check the blow. But doubtless the ring had other uses; thus, was the wearer about to commit himself, without due consideration, to a certain line of conduct, the ring would bid him "think" first, or "think" more.

Now, let me give you the word "think" as a motto at this time—this Christmas time—and with Christmas almost the end of another year. Let me endeavour to bind the word "think" upon your memories.

A sober word at the conclusion of this, our "Christmas number," can scarcely be deemed out of place by any one. Christmas brings with it various feelings: to the child, simply joy; to the grown man, thankfulness, and, I hope, cheerfulness too; he is cheerful because he is thankful. But in a certain higher sense—I mean not now in a religious sense—it makes us thoughtful. Not only thoughtful while remembering other Christmas times, perhaps happier, or in calling up before the mind's eye faces not now to be seen around the Christmas hearth, faces

"Which we have loved long since, and lost awhile."

But Christmas also makes us thoughtful without the dash of melancholy which is thrown across such recollections; here is a musing which is not sad, a musing which becomes a man, and which is neither romantic nor foolish.

We grown folks shall have to ourselves some quiet, lonely hour this Christmastide when, good reader, there will come over you

"A feeling of sadness and longing,  
That is not akin to pain,  
And resembles sorrow only,  
As the mist resembles the rain."

As the lady's voice ceased, Cyril cried out, "Capital!

Let me try to supply food for thought at such an hour. But I am thinking of those into whose hands this Christmas number will fall—a number which will, perhaps, be more generally and thoroughly read than any other issue of “the Journal” during the whole past year. Masters in their business rooms, clergymen in their studies, will (is it too fond flattery?) read it quite through, and then carry it, with a pleasant smile of gratification on their faces, to their wives and daughters for them to read. I fancy I see elder sisters reading parts of it to “the children.” Happy elder ones, who are thoughtful and good, and who are sharing with their parents the care of bringing up in the way they should go their younger brothers and sisters. Oh! blessed large families; and, by-the-way, how much I dislike to see the word “incumbrance” applied to a wife and children. Did our Creator give Eve to Adam, telling him she was to be an incumbrance? No, He said, “I will make a help meet for thee.” Then, in thinking of those who will read this number, I remember our oldest friends and our firmest friends—the gardeners—for does not “our Journal” bear upon its title-page “for gardening and gardeners?” True, we have outgrown our original proportions; we are no longer the thin Cottage Gardener, but more bulky Journal of Horticulture. I hear, too, of broad-acre squires looking forward to Wednesday’s post, and, after their field sports, loving to read our pages; and I hear of ladies studying “the Journal” week after week; and as to the parsons, why hundreds upon hundreds are among our readers. Still, we look first to our gardening supporters, gentlemen who love their gardens and those who live by old Adam’s trade.

Now a little word both to masters and gardeners—to both of you, if you please. Metaphorically I uncover my head from respect while I address you. There is, first of all, the labour question—man’s skill given for the mutual benefit of employer and employed. Is this question on a satisfactory basis? I fear not always. I would say, let the position of each gardener and his duties be clearly defined upon his entering a new situation; this would ease much after sorrow and many a little annoyance. Then there should be a true and loyal feeling on the side of both *man* and *master*, each to the other. “He is my master, I will stand by him faithfully;” and “He is my gardener, I will support him.” There is a nasty disrespectful feeling now-a-days in many men, young men especially, towards their superiors; a feeling quite opposed to the teachings of that old Book in their bedrooms; a feeling which has come out this last year in all its vileness in many an election riot, and which reduces one indulging it to a mere hireling, taking the bread, but with no feeling of kindness or respect to the one who supplies the bread. This is wholly wrong; this is ruinous to right principle, and, I may add, to happiness also. A man that feels no respect for others is far on the road to losing his own self-respect, while right self-respect (I do not mean self-conceit) will lead to respecting those above you. Duty to self done, duty to others will be done. As saith that great master of all human feelings, Shakespeare:—

“This above all,—to thine own self be true;  
And it must follow, as the night the day,  
Thou canst not then be false to any man.”

I grieve to read even one question about the necessity of “Gardeners’ Unions.” The gardener should be the friend of the gentleman, the gentleman the friend of the gardener; both are in the same boat. Perhaps there is in some masters a want of genuine sympathy with their gardeners’ trials (they are many), and their feelings, which are very keen. This should not be: the interest of the two orders do not clash, rather they are identical; there should, therefore, be a kind feeling on both sides.

Next I would say a word about gardeners’ cottages. I venture to think—pardon me, masters—there needs in many gardens some improvement in this respect. The gardener is a man of education, and with education come higher tastes and more refined feelings; these tastes and feelings should be considered. It is of course well, in the first place, that a gardener’s cottage should be near the garden; this is a good thing for both employers and employed. But such cottages should not be cold thin buildings, run up in a north aspect, under some high wall or higher trees. They should not be cheerless and cold with few comforts. Indeed, gentlemen of

fortune might always make at least their head gardener’s house, as many do, a pretty feature of the place. Let it be well situated; let it be a substantial dwelling, comfortable and convenient, so that it may be felt to be what we all long for, or enjoy—a home. A porch put on this house, a back kitchen added to that, &c., &c., might make many a cottage doubly comfortable, and the good wife proud of her home. Make people comfortable and they will work the better; the light heart and the quick hand go together.

Then if young and unmarried men be also employed, as most probably they will be, let them, if possible, lodge with some tidy couple. The Scotch “bothies,” in which not unfrequently well educated young gardeners live together, shifting for themselves, cannot be defended. The “bothie” system is a bad system. What an inducement there is for young men living in them to go where there is a cheerful fire ready lighted, and where the drop of whiskey-punch will cheer, one drop at first, many drops after a time. I have been in gardeners’ bothies in Scotland, where the contents of the bookshelves and the general aspect of the room were painful contrasts. Let us try to make men comfortable, not let them feel ashamed—as young men well clad and well read do feel ashamed—to be found living in such “pair places.” Comfortable homes or lodgings go far towards making comfortable and contented minds. Now I am well aware that there are hundreds of employers who know and do all this, yet there are others who do not think about it, and so those under them have little comfort because of their forgetfulness.

“But evil is wrought, by want of thought,  
As well as by want of heart.”

Bear, then, a reminding word from one who is becoming almost an old friend (so he is told) to many a reader of the *Journal of Horticulture*.

Next a word to gardeners on a higher subject:

Neglect not public worship. Keeping the Sunday is the key to a man’s character. All is, in most cases, going on well if he be present at church regularly; but if he begins to fail in this duty, if he be but an occasional worshipper, then if he goes at all, goes, or says he goes, to some other church—ah! he has done what is wrong, and does not like to meet the eyes of those who know him, he feels uncomfortable among his neighbours, conscience is at work. Satan, bent on leading him further astray, makes it whisper, “The church is no place for you.” His sin may not be known as yet, but presently it will be. As a clergyman of experience, I would say that among those in the humbler classes so acting, I have never known one but concerning whom at length the sad truth has come out,—immorality, or pilfering, or sly drinking, or some other sin.

A gardener’s cottage, inside and out, what ought it to be like? Let me endeavour to sketch it as it should be and often is. Outside the sun shining on a substantial dwelling, with an air about it that few passing would fail to stop and ask, “Who lives there?” Inside tidy and clean, and by woman’s hand made thoroughly a home. Books—scientific, botanical, horticultural books—bought by the husband in his single days, with money that others spend upon drink or tobacco; the better room this Christmas time decorated with the bright holly berry, and the brighter holly leaf; children with a look of intelligence, and I like people to keep themselves quite up to their station; there is no wrong pride in all this, it is only rightly feeling the place Providence has placed you in. Oh! how I wish every gardener’s cottage could be bright without and bright within. No pinching poverty, but the thrift which half doubles the wages; no discontent against any one, least of all against the employer; but that “peace and good will,” preached on the first Christmas day, felt towards all men. Finally, a merry Christmas to all of you, writers and readers. You, good editors, in Johnsonian Fleet Street, and you brother scribblers, wherever ye dwell, and you readers, young and old, dwelling in mansion or cottage, in rectory or vicarage, or curates’ lodgings, a merry Christmas to you, each and all, and remember the motto on the ring—the word “Think.”
