With a view to carrying on a similar business to that hitherto conducted by the waste firm of Meyer Cohn, Hanover, a new concern has been formed, under the style of the Verwertungs Gesellschaft für Rohmaterialen m. b. H. (Company for Utilization of Crude Materials, Limited). A number of the members of the management of the old firm have entered the employment of the new company, of which Herr Erich Bonwit has been appointed temporary sole manager.

A GAME PLAYED IN GERMANY.

Here is a photograph of a group of German girls playing push-ball. This evidently is a game somewhat like basket-ball, except that the ball is vastly magnified in size, and the game played on skates, on ice, rather than on a gymnasium floor as is the

Playing Push-ball on Ice Skates.

case with basket-ball. Evidently, this big ball is not as heavy as it looks; being composed of rubber and air, its weight is probably not commensurate with its size. These players must be hardy young persons, as their costume would seem to indicate a sultry day at Atlantic City, rather than an ice-skating rink and the wintry conditions that usually obtain at such a place.

Analysis and Tests of Rubberized Fabrics.

DEALING with this point in a paper read at the recent Congress of Applied Chemistry, M. B. Setlik and M. J. Zopka, of Prague, indicate the steps to be taken (particularly in the case of fabrics for hospital or domestic use, or for clothing purposes) to determine their chemical and physical properties, by the application of simple and expeditious tests. The object of such determination is to ascertain whether the fabrics are suited for the purposes intended.

In analyzing rubberized fabrics, the general object is to define the composition and quantity of the mass used for the purpose of impregnation, so as to determine the quality and quantity of the coating and to define whether it contains rubber, rubber substitute or some other imitation. Another object of such analysis is to be able to imitate a given sample.

Within three years the authors of the paper have examined 500 samples of different qualities from different factories, and have arrived at the conclusion that this class of fabrics can be classified according to qualities, combinations and physical or chemical properties, into several groups of similar quality and value. The fabrics to be tested are subjected to physical, practical and technical tests, and then to chemical tests. Finally, to define the tensile or breaking strength, they are subjected to mechanical tests.

EXAMINATION OF A RUBBERIZED FABRIC.

The fabric is first tested in an empirical way, its strength and resistance being found by scratching it with the fingernail, by creasing it and by crumpling it between the hands. It is then spread out smooth and the condition of the broken places is noticed, also whether the rubberized layer is detached or is in holes. Then a large piece of the fabric is fixed upon a filtering frame, so that it forms a bag which is filled with water. The same course is pursued with the piece crumpled between the hands, both pieces being left two or three days to find their respective waterproof qualities. A good quality of fabric ought to absolutely resist water.

Another comparative test is effected by submitting one piece of the fabric to the action of a 5 per cent. acetic acid solution, and another piece to that of a 5 per cent. ammonia solution; observing at the end of two days what changes have taken place. These tests are meant to represent the action of urine, blood and perspiration. A square decimeter (15.50 square inches) is cut off the rubberized fabric and is weighed by a tangential scale by which means the weight per meter is ascertained. The thickness of the fabric is taken by the average of three different points.

After heating a piece of the fabric for three hours with about 100 cubic centimeters (6.10 cubic inches) of chloroform it is rinsed with chloroform and then with pure alcohol. The fabric is then stretched on polished glass and the coating is scratched with the back of a knife or a spatula. The appearance of the fabric treated with chloroform allows of determining the character of the rubber coating and to what depth it has penetrated the fabric, as well as its adhesion and combination. If the coating forms a solid and compact layer which comes off easily and in large pieces it contains at least 50 per cent. of rubber. If there is little rubber, but if the fabric is well impregnated, it can still render good service.

There are consequently four alternative stages for the coating.

1. To swell up and easily come entirely off.
2. To swell up, but only come off in small pieces.
3. Not to swell up, but come off in small pieces.
4. Neither to swell up nor come off

The composition of the coating is then analyzed in the usual manner, as explained by Dr. C. O. Weber in the "Chemistry of India Rubber," page 256. In the removal of the coating from the fabric the following process is used:

(a) By the use of acetone, the resins, the resinous and mineral oils, the wax and similar combinations are extracted.

(b) The residue is treated by an alcoholic solution of potash which saponines the saponifiable oils, by which means the rubber substitute is extracted.

The balance is rubber, mineral substance, colors, etc., which can be quantitatively and qualitatively determined by the ashes of the fabric.

SWELLING UP OF A RUBBERIZED FABRIC.

The swelling up of a rubberized fabric is more or less rapid, according to whether it is subjected to the action of chloroform, carbon, or sulphide of carbon. The fabric containing resin swells up the quickest under the action of sulphide of carbon. The more mineral substance or rubber substitute there is in a rubberized fabric, the slower and of less extent is the swelling. The layer of coating is not of the same thickness on both sides of the fabric and is not uniform in composition or adhesion. After the coating has been removed the fabric is heated for a moment in alcohol and then washed in alcohol. It is then boiled with water and weighed and is then tested for breaking strength and elasticity with a dynamometer.

As to ashes, it is evident that the less they are in quantity the better the product, while their quality is likewise a matter of importance.

Certain substances, like zinc oxide, magnesium oxide and calcium carbonate, in a certain proportion, are not only not injurious but are beneficial.

A GERMAN APPRECIATION OF THE RUBBER CONFERENCE.

Dr. Dannerth, the Honorary Secretary of the Third International Rubber Conference held in New York last September, recently received a communication from the Royal Testing Station in Berlin, Germany, signed by A. Martens, director of the station, in which the following very pleasant paragraph occurs:

"According to the reports of the members of this Station, you rendered them, on the occasion of their study-trip to America, such kind and valuable assistance that the director wishes to assure you of his personal appreciation of this courtesy."

The Station was represented at the Conference by Dr. Hinrichsen and Ingenieur Memmler. This is one among many demonstrations of the fact that the International Conference was conducive to much friendly feeling on the part of rubber men who attended it from abroad.

USE OF FILLERS VOIDING TIRE GUARANTEES.

The conditions of guarantee adopted at the recent meeting of tire manufacturers included provisions for the manner in which claims under guarantees would be admitted. One of the clauses is to the following effect:

"Any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights in excess of those for which the various tires are recommended; or who does not keep tires inflated to the pressure recommended by us."

On January 8 the National Association of Automobile Manufacturers passed the following resolution:

"That members of this association will withdraw from their warranty all cars in whose pneumatic tires there has been any substitution for the usual air cushion."

Rubber at the Paris Automobile Salon.

By a Special Correspondent.

THE thirteenth Automobile Salon, recently held in Paris, again brought to the front, the noted French manufacturers of tires; including Michelin & Co., the Etablissements Bergougnan, the Etablissements Hutchinson, the French Dunlop Co., the French B. F. Goodrich Co., the Torrilhon, Continental and Falconnet-Perodeaud concerns, as well as other regular exhibitors on these occasions.

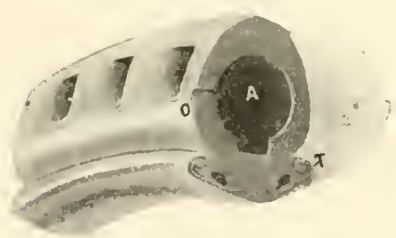
Among the most prominent features of the Salon was the relative absence of the "anti-skid" armored protective covers, which were at one time represented by some 50 exhibitors. These covers, in chrome leather or other materials, seem to have lost favor; their disappearance having been accelerated by the introduction of the Michelin tread. This type of anti-skid was introduced in 1905 and has since gained in favor.

It is composed of a tread of chrome leather about one-sixth of an inch thick, tapered off at the edges, cemented to an undertread of rubber and fabric from one-tenth to one-eighth of an inch in thickness, and wider than the leather tread, likewise having tapered edges. Rivets pass through the two treads, the whole being cemented on the cover by a solution allowing of hot vulcanization. The chrome leather is a special quality, which will resist a temperature of 140 to 150 degs. C. (284 to 302 degs. F.). Tires furnished with this form of anti-skid are very light. Under the rivets there is placed a layer of very soft rubber, which prevents the heads of the rivets from injuring the fabric of the body and likewise increases the elasticity of the tire.

Tire repair establishments have now given up cold vulcanization and have taken up hot vulcanization; using in many cases the R. Bobet hot vulcanizer, which gives results of very regular character. These vulcanizers are all made of the same diameter and are of various lengths, according to the number of tires to be vulcanized at a time; the most usual types being those for holding 6, 9 and 12 tires.

In elastic tires and wheels there are but few new exhibits. The pneumatic and the solid tire have, however, met with a rival of daily growing importance in the "Ducasble Automatic Tire." Until its appearance there was nothing between the pneumatic and the solid tire; the so-called elastic and hollow tires far from realizing all the indispensable conditions of security, suppleness and resistance.

The Ducasble automatic tire is a species of cushioned tire containing a series of cells, communicating with the exterior air by a little channel in the lateral portion of the tire. In addition to the great suppleness thus obtained, heating is prevented by the automatic introduction of fresh air; competition in speed with the pneumatic tire being thus possible. This arrangement of interior cells is the only one by which a tire can be designed, absolutely suited for the vehicle on which it is to be used; insuring the maximum of suppleness, together with the minimum of weight compatible with the intended load. Tires can be made by this system of the qualities of rubber best suited to the contemplated load; being, moreover, adapted for all classes of motor and other vehicles, autobusses, trucks, etc., as well as bicycles.



Overturning and skidding are prevented by a series of hollow grooves in the treads for the back wheels, arranged rectangularly. This system of anti-skid is very durable, on account of the slow wear of the rubber employed. Moreover, the depressions can be remade by hand when they have disappeared through wear.

One of the latest improvements consists of certain modifications introduced in tires for city use and touring, with more rounded lines; perfectly resembling pneumatic tires in their appearance, without being subject to the numerous disadvantages of the latter; such as blow-outs, repairs, rapid wear, higher cost, etc. The numerous advantages of the demountable rim in conjunction with the Ducasble automatic tire render the use of the two together advisable.

POSTAL DELIVERY WAGONS.

The qualities of all descriptions of the Ducasble automatic tire have earned for it a universal reputation; it being used by many corporations and traffic companies. In Paris it has been applied to 3,000 cabs, as well as to the vehicles employed for the delivery of telegrams. The large stores of Paris and the principal cities of France, use it on their automobile delivery wagons; the Ducasble automatic tire being the only one which they have found to combine speed with economy.

THE "DUCASBLE AUTOMATIC" ON JINRIKISHA IN THE EAST.

AN EXHIBIT OF MUD-GUARDS.

Among the new applications of rubber to purposes connected with the automobile, there is to be noted the mud-guard; for which, in my opinion, there is a certain prospect of development.

On November 2 and 3 last, a mud-guard competition took place at Versailles, on which occasion the indisputable efficiency of circular rubber mud-guards was recognized.

With the extraordinary development in the large cities of automobiles and heavy autobusses, pedestrians to a distance of 15 or 18 feet and more are liberally sprinkled with mud. It is, moreover, nothing rare in narrow streets, to see it reach the first floor of stores. Under these circumstances, it is to be anticipated that police regulations will render compulsory the use of mud-guards by all automobilists in large cities.

Rubber manufacturers should not fail to give attention to this movement. Mud-guards cannot be of metal; and rubber must be used in order to obtain a combination of flexibility with efficiency. The researches of inventors have led to the introduction of circular rubber mud-guards, which form exhibits of interest; two models, the "Menu" and the "L'Eclair" calling for special notice.

The "Menu" mud-guard is composed of a hoop of rubber or of rubberized fabric, of a diameter corresponding with the wheel and placed parallel to it, at a distance of an inch or two. The mud-guard is fixed to the rim by means of catches; the rubber hoop being kept in position by a sectioned false rim, which insures the mud-guard preserving its rigidity in the event of its striking against the pavement. This style of mud-guard forms a screen in front of the wheel throughout its whole extent, by which means the splashing of mud is prevented.

The "L'Eclair" mud-guard is formed by a kind of rubberized fabric, fixed on the outside of the tire; this shield being kept in place by four elastic stretchers made of rubber, which pass behind the spokes, and by reason of their elasticity, allow of the displacement of the mud-guard in all directions. The stretchers are covered with a figured fabric in shades which harmonize with the color of the wheels. The metal hoop which holds the rubber hoop, is round in the portion resting on the tire, in order to prevent the rubber from wearing at the point of friction, while it is flat on the exterior side, so as to protect the rubber hoop against collisions with the edge of the pavement. It is placed against the side of the pneumatic tire; the shield being fixed in its groove by means of a rod. Owing to the rubber attachments, this mud-guard is very flexible. It prevents lateral splashing, and is easily fitted and unfitted; while the automobiles to which it is applied retain their ordinary aesthetic appearance, without being made too heavy.

As mud-guards appear on this occasion for the first time at an automobile exposition, I have thought it advisable to deal with them in detail. They will doubtless be used in the large cities in a number of instances, and it is possible that their employment may become compulsory with certain classes of vehicles. Rubber manufacturers are interested in the question, for all the tests hitherto made lead to the conclusion that circular rubber mud-guards solve the problem of preventing lateral splashing.

NEW FRANCO-AMERICAN AUTOMOBILE FACTORY.

Benjamin Briscoe, former president of the United States Motor Co., is reported to have established an automobile factory at Billancourt, France, with a staff of French and American engineers and designers. Interest attaches to the fact that this is the first American automobile plant to be established in France.

In addition to manufacturing in France, the new company will, it is understood, assemble in England parts made in Detroit. Operations at the latter point will probably be under the management of Mr. Briscoe, who is about to return to that city, to supervise the erection of a factory, with a special view to the American trade.

THE JAPANESE RUBBER INDUSTRY DURING 1912.

EARLY in 1912, the Sugii Rubber Works of Tokio, the Tiger Rubber Works of Osaka and the Osaka Rubber Works, were established.

Other works established in 1912 included: Kobe Rubber Works, Kobe; by English experts, for making tires and tubings. Kumano Rubber Works, Osaka; all lines of rubber manufactures. Kusumoto Rubber Works, Honjo, Tokio; fibrous rubber and waterproof silk fabrics. Setton Rubber Co., Ltd., Hyogo; capital, $50,000; for manufacturing tires. Saskane Leather Belt & Rubber Co., Ltd., Osaka; capital, $500,000, one-fourth paid in; the available funds to be used for purchasing the rights and plant of the Sakane Belt Factory, and for establishing the manufacture of rubber tires and hose. Kanto Rubber Waterproof Co., capital, $100,000; to manufacture waterproof goods. Kume Rubber Manufactory, Tokio; to produce all lines of rubber goods.

Various small concerns were established at Tokio, principally for the manufacture of "Tabi" soles.

The Yokohama Electric Wire Works, Ltd., have rebuilt the shops burnt in February, 1912, but the inside mechanical installation is not yet completed. The Osaka branch works have been moved to Hyogo.

A change was made during the year in the management of the Asia Rubber Co., Ltd., Tokio. Mr. Masakuni Yamada becoming general director in place of Mr. Masao Watanabe. The Tiger Rubber Works, Osaka, changed its name to the Hosono Rubber Works, Mr. G. Hosono having become proprietor. It manufactures all descriptions of tires, as well as heels and other rubber goods.

One-half of the plant of the Fujikura Electric Wire & Rubber Co., Ltd., burnt in May, 1911, has been rebuilt; while the Nippon Rubber Co., Ltd., which likewise suffered from fire at the same time, has replaced all its buildings, removing its headquarters to larger premises in Tokio. The plant of the Osaka Rubber Works, established in January, 1912, was subsequently acquired by the Kansai Rubber Works of Osaka..

Sumitomo Electric Wire Works, of Osaka, purchased an extensive site for the erection of their new additional factory buildings.

FIBROUS RUBBER.

This material, for the manufacture of which the Kusumoto Rubber Works, of Tokio, was established, is composed of crude rubber, powdered cork (for decreasing weight) and wool or some fibrous compound. Fibrous rubber resembles any other rubber in appearance, but on being handled its lightness becomes apparent. It is specially advantageous for tires, being light, durable and sustaining friction without heating.

FIRST OFFICIAL VISIT TO A RUBBER FACTORY.

On May 15, 1912, Baron Makimo, Minister of Agriculture and Commerce, paid an official visit to the Meiji Rubber Works, Tokio, accompanied by several experts. This is the first recorded instance of such a visit.

JAPANESE CRUDE RUBBER IMPORTS.

Although it is known that Japanese imports of crude rubber increased during 1912, the exact figures are not yet available. Meanwhile, the following summary will give an idea of the principal sources:

Imported from	Descriptions
Singapore	Borneo; India; Plantation Pará sheet, biscuit and crêpe; Jelutong.
Ceylon	Plantation Pará sheet, biscuit and crêpe.
America	Upriver fine Pará; Islands fine Pará; Bolivian fine; Guayule; Balata sheet.
Africa	Gold Coast lump; Mozambique.
London	Upriver fine Pará; Rubber paste.

IMPORTANCE OF VARIOUS GRADES.

First in the order of importance comes Plantation Pará sheet and biscuit (from Singapore and Ceylon); second, Upriver Fine Pará (from New York and London); third, Borneo (from Singapore); fourth, India (from Singapore); fifth, Islands Fine Pará (from New York).

Few Japanese rubber manufacturers know how many grades there are of crude rubber, the Japanese industry being still in the early stages of its development. Only about four or five grades are familiar to them. Hence their requirements are relatively simple. Electric wire companies mostly use Pará; toy balloon manufacturers only Borneo and Pará biscuit. Other manufacturers use all of the grades named.

THREE INTERESTING CHARTS.

Three interesting charts have been prepared by Mr. Y. Matsuo, director of the Tokio office of De Wette & Co., representing the local movements during 1912 of prices for three standard grades, which may be summarized as follows:

	Lowest	Equaling per lb.	Highest	Equaling per lb.
Upriver Hard Fine Pará	Nov. 7	$1.09½	March 27	$1.30½
Pará sheet (Fair av'ge quality)	Nov. 4	$1.00½	April 15	$1.26½
Borneo No. 1	Nov. 4	$0.52½	March 14	$0.66

THE BALATA INDUSTRY OF SURINAM, DUTCH GUIANA.

By a Resident Correspondent.

DURING the year just ended the balata industry of Surinam, Dutch Guiana, suffered terribly owing to the unprecedented drought that passed over the colony. This long spell of dry weather began in November, 1911, and lasted until the middle of May, 1912. The condition was then serious. There were large numbers of contracted men (bleeders) who were compelled to remain in Paramaribo (the capital) owing to the low state of the rivers and the scarcity of water for drinking and other purposes in the bush. These men had to be fed by their employers, according to the terms of contract, for as long as they were detained in town. This paying out of money weekly by the companies and others engaged in the industry, was the cause of much dissatisfaction and the result was that many laborers were released from their contract (*pro tem*) to enable them to obtain employment on the plantations and other places.

This arrangement was on the part of the employers a wise one, for it released them temporarily from further disbursements to the men. About the end of May the weather began to be favorable for bleeding operations and the bulk of expeditions left Paramaribo for the hinterland. Soon after tapping operations began another difficulty presented itself, the trees began to blossom, and operations were stopped. Experienced balata men resorted to prospecting their grants rather than incur the expense of bringing their workers into town. This was wise, for in September, when the trees were again fit for bleeding, the collectors knew exactly the extent and number of trees they had to handle, and bleeding operations were rushed ahead with a determination to make up for the time lost. The results were that the production for 1912 was not so alarmingly low as was expected. After taking into consideration the many drawbacks and unforeseen circumstances which attended the industry in 1912 the returns can fairly be said to be satisfactory. In reality the bleeders have only been at work for three months out of the nine which makes up the season in a year.

The balata produced in the colony during 1912, according to Government reports, amounted to 1,651,000 pounds; of which 65,116 pounds were produced from private lands; the balance from concessions.

NOTES FROM BRITISH GUIANA.

From Our Regular Correspondent.

BALATA IN 1912—THE PROSPECTS FOR THIS YEAR.

THE year closes better for the balata industry than could have been expected. The exports are very much reduced, of course, as compared with the total for 1911, but they are not so discouraging as was feared would be the case and large shipments are still coming down from various parts of the colony, chiefly from the Siparoni district, for the Consolidated Rubber and Balata Estate, Ltd. The completed returns for 1912 place the balata export at 705,214 lbs., against 1,149,924 lbs. for 1911. Consideration is now being given to the work of 1913. The drought and all its consequences are being forgotten as rapidly as possible. Prospections for the year have been good, provided the reports are reliable, and if management is prudent there ought to be less difficulty with labor. One thing is assured, and it is that the advances—a pernicious feature of the industry—will be on a far less generous scale. Companies have been too seriously hit by the drought to throw money away in advances. Most of the employers have accordingly agreed to a set of fourteen different conditions for 1913, drawn up by the council of the Institute of Mines and Forests, and covering the whole question of advances in its various ramifications—the granting of store orders, the payment of hotel bills and transportation, the giving of bonuses and the treatment of absconders.

It is believed that adherence to these conditions will probably mitigate the labor troubles which have been such a burden on the industry in the past.

THE POSITION OF RUBBER—EXTENSIVE PLANTING.

Although the export of rubber during 1912 was very small, chiefly owing to the drought, the foundations of an industry have been laid. A good deal of work was done in a quiet way during the year, and it is estimated that there are at the present time 3,000 acres under cultivation. At Calabash Creek, Canje, and Davson's, the sugar estate owners have established cultivation on a fairly large area. On the east coast of Demerara experiments on sugar estates have shown that rubber does not thrive on wind-swept areas or on the heavier types of land on the front of the estates, but that better results are obtained when the plantings take place in well-sheltered positions. On the Demerara river plantations—the Diamond and Noitgedacht—tappings have already taken place on 12-year-old trees, and it has been demonstrated that on loamy land, with a regular rainfall and beyond the reach of the wind, satisfactory growth may be expected with certainty. Large areas of land in the Polder district, on the west bank of the Demerara, are exceptionally well adapted, both in respect to soil and the prevailing meteorological conditions for the cultivation of Pará rubber. On the Demerara river, at Plantation Christianburg, the Government has established an experimental station. The experiments have proved that light sands are not favorable to the rapid growth of rubber.

Cultivation proceeds on the west shore of Demerara. Aliki, situated in the rain belt of the Essequibo, and on the right bank of the river, is admirably adapted to the cultivation of rubber. The young trees have made good progress. Satisfactory growth has been made at Liberty Island, at the Onderneeming School Farm, Essequibo. The Golden Fleece, sugar estates on the same coast, have put in a large number of plants which have made fair progress. Near Bartica there are the Hills Estates where good work is being done. In the Pomeroon district suitable land has been found, and the farmers there are keen over the cultivation of rubber. The Northwest District of the colony has the largest cultivation of rubber, the soil there being well adapted to it.

VICISSITUDES OF THE AMSTERDAM BALATA COMPANY—DIFFICULTIES WITH LABOR AND PROSPECTORS.

A semi official defence of the Amsterdam Balata Company, which recently went into liquidation, has been published in the local press, which throws an interesting light upon the manner in which the balata industry in the colony has been exploited. In the course of the statement it is asserted: "The company was formed in Holland in a few days through the energy of the late Col. Link. The Colonel passed as an expert in balata matters and gave assurances to his friends there that the licenses he had to sell were most valuable. He was backed by good credentials, and also had the statement of Mr. Melville that the licenses were most probably valuable. The sale to the company was accompanied by a guarantee that the licenses sold would yield 450,000 lbs. of balata in the first two years, and the vendor companies bound themselves to pay any deficit. No cash was paid for the licenses; the vendors accepting shares for the purchase money. Under such conditions several business men in Holland were persuaded to, and did form a company and easily raised a substantial sum of money as a working capital. The capital was ample to work for two years, even with the worst of bad luck.

"The company, at great expense, sent a prospecting expedition to the Roiwa Grants last year and received a written report from one who was considered trustworthy, that balata existed on the grants and that at least 100 men could be sent in 1912 to work a part of the grants which cover a very large area. These Roiwa Grants are practically on the Brazilian frontier. The journey to them occupies the greater part of three months. The other licenses, nearer Georgetown, purchased by the company, were all thoroughly prospected at great expense and proved to be valueless. The Roiwa Grants were, therefore, the only hope left. Under the contract with the vendors the company was bound to work the grants. The directors were, therefore, left in this position. They knew that they had been deceived about the grants near Georgetown; they had every reason to believe that the Roiwa Grants were valuable; they were bound to work the grants purchased. At the beginning of the year the company had in hand what appeared to be abundant means to equip and pay all expenses of expeditions to the Roiwa Grants to bleed and thoroughly prospect them, and arranged through their representative in the colony, Mr. de Flines, to do so.

"The unfortunate drought which prevailed early in the year compelled not only this company, but all others engaged in the balata industry, to make very large advances so as to enable the men engaged to live until they could leave for the Bush. This unexpected call was very heavy and cost the company at least £2,000. The company, in order to meet the men, made what may be termed generous contracts with them, so as to compensate them for the hardships they had to endure. The great body of men have proved most unsatisfactory. Their unwillingness to work, and the consequent delay have caused considerable loss to the company, a loss that is not under-estimated at another £2,000. The expedition has returned without any balata. The report that there was wood for 100 men has been proved to be false. The company has spent over £30,000 in the colony and has received nothing for it. The vendor companies are without any means to pay the deficit. Owing to this and to the drought, and the unwillingness of the men to work, the capital has been exhausted and there is a deficit at present of about £3,000 to meet which there are many valuable assets to be realized."

GERMINATION OF RUBBER SEEDS.

At a meeting of the Board of Agriculture held recently, Professor Harrison, reporting on the germination result of rubber seeds for 1912-13, said the percentage was not very high. They had about 119,000 young plants, and would have probably a few more, and taking the whole shipment the percentage had been about 70 per cent. It was lowered by the shipment from Ceylon, which was guaranteed to give 75 per cent., but only yielded 55 per cent. The Singapore shipment varied from 65 or 66 per cent. to about 80 per cent. in germination.

COMMISSIONER OF LANDS AND MINES' REPORT—RUBBER AND BALATA STATISTICS.

The annual report of the Commissioner of Lands and Mines (Mr. Fowler), which has just been issued, states that the balata industry suffered from unreliability of the laborers, but that the decrease in production is chiefly attributable to the severe drought. One hundred and sixty-three balata-collecting licenses were issued, of which 47 were in lieu of licenses which had expired and were being extended. The estimated area held under balata-collecting licenses was 83,000 square miles. The registration of balata laborers was conducted by the Institute of Mines and Forests, 7,012 laborers being registered. The commissioner reports that the interest evinced in rubber planting was not as strong as during the previous year. Planting operations were, however, actively pursued by the Bartica Agricultural Estates, Ltd. (an American company), which had 489½ acres under *Hevea Brasiliensis*, on 221½ acres of which sisal was interplanted. With the exception of Plantation Noitgedacht, Canal No. 1 Demerara, none of the cultivated rubber trees had reached a tappable age. On this estate the age of the trees ranges from one year to 15 years, the average girth of the trees tapped being 39 inches (the smallest 20 inches and the largest 43 inches), the average yield of rubber per tree being 2¾ lbs.

THE NEXT RUBBER EXHIBITION—COLONY TO BE REPRESENTED.

At a meeting of the Permanent Exhibitions Committee, just held, it has been decided that the colony shall be represented at the Rubber Exhibition to be held in London in June, 1914.

GOVERNMENT REPORT ON BRITISH GUIANA RUBBER.

Official estimates place the area under Pará rubber in British Guiana at 1,800 acres. There was a keen demand in 1912 for Pará rubber plants, some 45,000 of which were sold by the Department of Science and Agriculture. Private importations of stumps (which are inspected by the Board of Agriculture at port of entry), amounted to over 170,000, while there were also large importations of seeds from the East. On some estates, according to the Colonial Office report, trees planted in 1907-08 and 1908-09 are now being tapped.

A CASTILLOA PLANTATION IN COLOMBIA.

A recent Consular report from Barranquilla contains this information regarding *Castilloa* planting: "About thirty-six miles west of the town of Rio Hocha a company is developing a large plantation of rubber (*Castilloa elastica*), having now 60,000 trees, which were planted twelve years ago. This is the principal plantation of this character in northeast Colombia. The company is experimenting now with the *Hevea brasiliensis* and also with Ceara rubber, and it is intended to further extend this plantation. The rubber trees are doing well."

BAHIA AS A CONSUL VIEWS IT.

Recent Consular reports from Bahia are not particularly optimistic regarding the immediate success of rubber production in that district. The Consul writes: "Although many species of rubber-producing trees thrive well in this district, the difficulties presented by the lack of means of transportation in those sections where the most rubber trees are found, and by the scarcity of competent labor and efficient supervision are almost insurmountable beyond a certain extent; so that no material increase in the production of rubber here is to be looked for in the very near future."

WATERPROOF CLOAKS FOR SOUTH AMERICA.

It is reported that several leading English houses have been shipping waterproof cloaks in considerable quantities to South America. The principal article is the so-called "capote" or "poncho" of waterproof material; large enough to cover both rider and horse.

Some Rubber Planting Notes.

CEYLON RUBBER EXPORTS DOUBLED IN 1912.

ACCORDING to the official reports for last year, the exports of rubber from Colombo amounted to 15,001,075 pounds, as compared with 7,154,658 pounds for 1911; the increase being thus nearly 110 per cent. It is of interest to note (as shown by details in another column) that the exports to the United States represented 4,833,085, as compared with 2,045,499 pounds the previous year; the augmentation being at the rate of 140 per cent.

During the year 1912, the exports from Ceylon to the United Kingdom amounted to 8,176,523 pounds, as against 3,956,812 pounds in 1911. When, however, allowance is made for the quantity of Ceylon rubber which finds its way to this country through the English market, this seemingly increased English consumption would prove to be more apparent than real.

TEN YEARS OF CEYLON RUBBER EXPORTS.

A valuable supplement to the "Weekly Times of Ceylon" recently gave the following interesting data as to the exports of Ceylon rubber for each of the last ten years:

	Pounds.		Pounds.
1903.....	41,798	1908.....	912,125
1904	77,212	1909.....	1,492,580
1905.....	168,547	1910.....	3,586,854
1906.....	327,661	1911.....	7,154,658
1907.....	556,080	1912.....	15,001,075

AFRICAN CEARA RUBBER.

Interesting experiments have lately been carried out by the Imperial Institute, London, upon samples of Ceara rubber from the Sudan, Northern Rhodesia and Portuguese East Africa.

The Sudan type, of light brown sheet of good elasticity and tenacity, was found to contain 82.7 per cent. caoutchouc; 6.4 per cent. resin; 7.8 per cent. protein and 1.4 per cent. ash; being valued at 4*s.* 9*d.* per pound, with fine hard Pará at 4*s.* 8*d.*

A sample from Northern Rhodesia, from three and a half year old trees, showed proportions of 71.7 per cent. caoutchouc, 4.3 per cent. moisture, 6.7 per cent. resin, 14.0 per cent. protein, and 2.7 per cent. ash. The valuation was 4*s.* to 4*s.* 3*d.*, with fine hard Pará at 5*s.* 3*d.* Notwithstanding the high proportion of protein and resin, the rubber was considered of promising quality.

RUBBER CULTIVATION IN KELANTAN.

According to a recent official report the area planted with rubber in the Malay State of Kelantan, was increased during the year 1911 from 5,402 to 11,010 acres. In addition a considerable acreage had been during the year cleared for planting. The previous improvement in the condition of the estates had been well maintained; the opinions of planters who had visited Kelantan being to the effect, that trees three to four years old in that State, when they have had proper care and treatment, are six months in advance of those of the same age in the Federated Malay States. Tapping had already commenced on some estates.

DOMINICA RUBBER.

From the analysis recently made by the Imperial Institute, London, of a sample of Pará rubber prepared from *Hevea Brasiliensis* trees growing in the Botanic Gardens, Dominica, the composition shows the high proportion of 93.9 per cent. caoutchouc, the result being somewhat better than was obtained by an analysis of similar samples in 1908. The opinion is expressed by the Institute that the Pará trees in Dominica will furnish rubber of excellent quality, which will realize good prices in the market.

SENOR ARANA TO GO TO LONDON.

Despatches received about the middle of February from Iquitos, Peru, state that the Upper Court revoked the order of arrest issued by a judge of the Lower Court against Señor Julio Arana, the chief director of the Amazon Co. which owns the rubber concessions of Peru. After an investigation into the atrocities committed in the Putumayo district, Señor Arana announced his intention of proceeding to London.

A NEW MEXICAN RUBBER TREE.

The discovery of a new rubber tree in Mexico has been reported by the West India Committee Circular. It is said to be known by the natives under the name of *Cacaloschili*, and to be one of the many species of the *Plumeria*, from which a high class rubber can be obtained. The rubber from the young branches is superior in quality to that from the stem of the tree, hence tapping is not practised. It is stated that the coagulated sap contains 21.9 per cent. resinous matter, 15 per cent. water and 25.5 per cent. caoutchouc.

Mr. Stuart R. Cope, of London, has called attention to the fact that the late Dr. Olsson Seffer some years ago placed in his hands a memorandum on the subject of a plant called by the Indians *Cacaloxuchitl*, which he recognized as a variety of *Plumeria*. Dr. Seffer, it is added, was the first to study the *Plumerias* and *Jatrophas* of Mexico from a scientific point of view.

GUAYULE PLANTS OPERATING AGAIN.

While the disturbances in the city of Mexico have during the last two or three weeks been of such a nature as to attract the attention of the whole world, 3,000 people being killed, according to the estimates, in the conflict between the different factions, the situation in some other parts of Mexico has materially improved. According to reports received from Torreon about the middle of February, the Guayule industry is assuming a normal condition in that district. Prospects are now favorable for a much larger production of crude rubber during the present year than the factories were able to turn out last year.

The Intercontinental Rubber Co., which operates the largest guayule rubber factory in Mexico, situated at Torreon, has again placed its plant in operation after several weeks of idleness, due to the lack of a sufficient supply of raw material. This shortage has been filled by large shipments of the shrub. The factory is now running with a full force of men, and there promises to be no further interruption to its steady operation. The Cedros ranch embracing 2,000,000 acres, which is owned by the Intercontinental company and which is the chief source of supply of guayule shrub for its factories, is now free from rebels.

MEXICAN PLANTATIONS RATHER QUIET.

It is hardly to be expected that rubber developments in Mexico would, under the present exceedingly disturbed conditions, show very rapid progress. The following paragraph taken from a consular report from Frontera, Mexico, is, therefore, not surprising: "Owing to local conditions little development work has been done on the rubber plantations. As most of the American plantations in this State are operated on the installment plan, they are at present experiencing difficulties in carrying on their operations. During 1911 the exports of rubber through this port to the United States amounted to 357,543 pounds, valued at $369,530. Of the above total 35 to 40 per cent. was wild rubber.

INCREASED PRODUCTION OF MEXICAN RUBBER.

That large proportionate increases are not confined to the East, is shown by the figures of the U. S. receipts of Mexican Rubber for the last two fiscal years:

	Pounds.	Value.
1910-11.....	853,805	$ 822,651
1911-12.....	2,226,541	1,602,046

Mexican rubber has only since 1910-11 been reported separately from guayule.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED JANUARY 7, 1913.

NO. 1,049,335. Vehicle wheel. J. Brittell, Port Henry, N. Y.

1,049,346. Artificial breathing apparatus. J. H. Drager, Lübeck, assignor to Dragerwerk; Heinr. & Bernh. Drager, Lübeck, Germany.

1,049,369. Reinforcement for cushions of pool and billiard tables. F. W. Kelley, Sioux City, Iowa.

1,049,392. Weather strip. J. D. Pierce, assignor to Monarch Metal Weather Strip Co.—both of St. Louis, Mo.

1,049,418. Vehicle wheel. H. E. Stratton, Empire, Ohio.

1,049,442. Quickly detachable tire holding ring. W. N. Booth, Cleveland, Ohio.

1,049,448. Swimming glove. H. P. Case, Stockton, Cal.

1,049,497. Cushion wheel. J. L. La Driere, Albuquerque, New Mexico.

1,049,579. Vehicle wheel. A. H. Harris, Youngstown, Ohio.

1,049,584. Suspenders. J. Holtzmann, Baltimore, Md.

1,049,617. Antiskidding device. W. H. Snyder, Ashbourne, Pa.

1,049,635. Springwheel. S. F. Zenger, Covington, Pa.

1,049,677/8. Cooling device for pneumatic tires. A. B. Craig, Tarkio, Mo.

1,049,727. Splash preventer. L. J. Jones, London, England.

1,049,751. Antiskidding device. H. W. Maurer, Cleveland, Ohio.

1,049,813. Truss. F. Dassori, New York.

1,049,864. Hose supporter. M. B. Jennings, Pawhuska, Okla.

1,049,892. Overshoe retainer. H. J. McGee, Punxsutawney, Pa.

1,049,893. Antiskidding device for tires. I. D. Meals, Harrisburg, Pa.

1,049,899. Metal tire protector. J. Morasky, Forbes, Colo.

1,049,937. Vehicle tire. Alfred Steinhauser, Philadelphia, Pa.

1,049,968. Hose clamp. H. O. Allen, Ellwood City, Pa.

1,050,061. Coupling link for antiskid chains. E. S. Holmes, Jr., Washington, D. C.

Designs.

43,438. Resilient tire. C. H. Semple, Trenton, N. J.

43,439. Resilient tire. C. H. Semple, Trenton, N. J.

Trade Marks.

15,691. The Koy-Lo Co., New York. The word *Koy-Lo*. Hairpins made of rubber, composition, etc.

62,155. Airease Tire Filler Co., Washington, D. C. The word *Airease*. Tire filler compound.

66,447. I. W. Hoyer, Philadelphia, Pa. The word *Flexillion*. A synthetic rubber compound for waterproofing, etc.

ISSUED JANUARY 14, 1913.

1,050,128. Vehicle wheel. A. Haller, Sioux City, Iowa.

1,050,197. Resilient wheel for vehicles. A. Zimprich, Oberndorf-Purgstall, Austria-Hungary.

1,050,297. Wheel tire. D. Ronconi, Eveleth, Minn.

1,050,326. Abdominal and hip supporter and stocking attachment. H. Abramson, Philadelphia, Pa.

1,050,383. Pedal for bicycles, etc. O. Overton, Mobile, Ala.

1,050,384. Pedal for motorcycles, etc. O. Overton, Mobile, Ala.

1,050,442. Elastic cord. F. H. Frissell, assignor to the Russell Mfg. Co.—both of Middletown, Conn.

1,050,481. Resilient wheel. B. Marley, W. P. Thacker and R. P. Barnard, Nokomis, Ill.

1,050,491. Tire valve. M. C. Schweinert, West Hoboken, N. J., and H. P. Kraft, New York, assignors to A. Schrader's Son, Inc., New York.

1,050,492. Water bag fixture. M. C. Schweinert, West Hoboken, N. J., and H. P. Kraft, New York.

1,050,498. Vacuum carpet cleaner. M. Teehan, Philadelphia, Pa.

1,050,506. Vehicle wheel. O. Zarth, Aurora, Ill.

1,050,526. Horseshoe. J. E. Downs and G. D. McNames, Battle Creek, Mich.

1,050,581. Tire. B. Walter, Livermore, Pa.

1,050,603. Conveyor belt. T. A. Bennett, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.

1,050,615. Hose coupling. Leo Coates, Pittsburgh, Pa.

1,050,636. Tire protector. S. W. Funk, Charter Oak, Cal.

1,050,688. Rotary air pump. J. Petermoller, Holm Foundry, assignor to G. & J. Weir, Ltd.—both of Cathcart, Scotland.

1,050,727. Antiskidding tire armor. D. Fasold, Keswick, Iowa.

1,050,767. Air pump. H. A. Fleuss, Thatcham, England, assignor to The Pulsometer Engineering Co., Ltd., Reading, England.

ISSUED JANUARY 21, 1913.

1,050,790. Tire tread. F. M. Rawden, Toronto, Ontario, Canada.

1,050,798. Detachable tread for tires. J. A. Bowden, Los Angeles, Cal.

1,050,803. Syringe. W. T. Buckner, Shelbyville, Ky.

1,050,813. Hose supporter. A. P. S. Deem, Belpre, Ohio.

1,050,853. Spring wheel. J. Sanders, Washington, D. C.

1,050,858. Wheel. H. O. Shockley, Darlington, Wis.

1,050,859. Resilient wheel. H. O. Shockley, Darlington, Wis.

1,050,861. Cushion tire. A. M. Smith, Petersburg, Va.

1,050,886. Vehicle tire. A. B. Wetherell, Pittsburgh, Pa.

1,050,942. Check valve for pneumatic tires. C. A. Haas, St. Louis, Mo.

1,050,950. Resilient wheel. E. E. Julien, Watseka, Ill.

1,050,989. Adjustable nozzle. G. F. Niuffer, Springfield, Ohio.

1,051,004. Toy balloon. W. Pfeiffer, Walla Walla, Wash.

1,051,038. Tread for auto tires. W. H. Weddington, Lankershim, Cal.

1,051,046. Brake pipe for railway cars. E. Witzenmann, Pforzheim, Germany.

1,051,053. Vehicle wheel. C. Altman, Wilber, Neb.

1,051,057. Valve cap. C. R. Bailey, Los Angeles, Cal.

1,051,058. Valve cap. C. R. Bailey, Los Angeles, Cal.

1,051,079. Demountable rim and tire fastener for wheels. C. F. Burkhart, New York, assignor to W. J. Reiman, Buffalo, N. Y.

1,051,083. Holder for garden hose. G. J. Chambers, Denver, Col.

1,051,103. Machine for internally coating tubes. J. R. Harbeck, assignor to Detroit Can Co.—both of Detroit, Mich.

1,051,117. Resilient tire. F. W. Karches, assignor to Fidel Ganahl Lumber Co.—both of St. Louis, Mo.

1,051,132. Elastic wheel. J. Leonard, Parc-St.-Maur, France.

1,051,135. Nozzle. G. Linderborg, Erie, Kan.

1,051,167. Garment supporter. M. A. Simmons, Pittock, Pa.

1,051,174. Hose coupling. D. H. Taylor, Tercio, Col.

1,051,178. Elastic wheel. T. Whitehead, Blackpool, England.

1,051,187. Tire tightener. W. R. Badwell, Tuscaloosa, Ala.

1,051,236. Automobile wheel. A. Johnston, Great Falls, Mont.

Designs.

43,453. Ornamental design for tire. F. B. Carlisle, Malden, Mass.

43,454. Ornamental design for tire. F. B. Carlisle, Malden, Mass.

43,455. Antiskid device for dual tired motor trucks. M. H. Cleaver and W. R. Corbin, Kingston, N. Y., assignors to Never Skid Mfg. Co., Inc., New York.

ISSUED JANUARY 28, 1913.

1,051,396. Hose connector. J. Fentress, Hubbard Woods, Ill.

1,051,457. Vehicle wheel. B. H. Seevers, Akron, Ohio.

1,051,465. Cushion tire. D. J. Thayer, Pittsburgh, Pa.

1,051,472. Antiskidding grip tread. H. D. Weed, Syracuse, N. Y.

1,051,482. Cow milking apparatus. G. A. Brodie, Portland, Ore.

1,051,490. Tool for repairing pneumatic tires, etc. T. C. Dobbins, Los Angeles, Cal.

1,051,500. Corn husking machine. E. S. Jones, Mobile, Ala.

1,051,517. Vehicle wheel. L. L. Rogers, Boston, Mass., assignor to Standard Auto Spring Wheel Co., Phoenix, Ariz.

1,051,573. Life saving suit. J. Gera, Baltimore, Md.

1,051,621. Hose connector. L. R. Nelson, Peoria, Ill.

1,051,628. Spring hub for vehicle wheels. J. C. Pearson, Natchitoches, La.

1,051,694. Demountable rim. E. R. Cox, Ladonia, Tex.

1,051,715. Case for combs. D. L. Edwards, New York.

1,051,716. Collapsible bag. M. H. Eiseman, Chicago, Ill.

1,051,738. Pneumatic tire. G. Kavanagh, St. John's, Newfoundland.

1,051,745. Spring wheel. O. C. Merrick and Frank Jefferson, Seaford, Del.

1,051,767. Cushion heel. F. Rossbach, Frankfort, Germany.

1,051,798. Vehicle tire. W. F. Beasley, Plymouth, N. C.

1,051,805. Hose coupling. J. J. Danverg, Beach, N. D.

1,051,813. Tire protector for automobile and other wheels. F. Kilcher, Birsfelden, Switzerland.

1,051,850. Surgical appliance. T. T. Sandmark, Port Townsend, Wash.

1,051,851. Horseshoe pad. G. Knapp and D. Cruice, assignors to J. M. Ehrlich—both of New York.

Reissues.

13,521. Stamp. W. J. Pannier, Jr., assignor to Pannier Bros. Stamp Co.—both of Pittsburgh, Pa.

Trade Marks.

57,040. Boston Rubber Shoe Co., Malden and Boston, Mass. Picture in a circle of a seal on a cake of ice with word "SEALON." Rubber boots and shoes.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JANUARY 8, 1913.]

20,548 (1911). Mud guards. C. J. and G. Wilson, Preston street, Brighton.

*20,594 (1911). Pressure gauges for tires. W. P. Hammond, 96 Warren street, New York, U. S. A.

20,640 (1911). Inflatable garments, etc. W. D. Williamson, Canbelego, New South Wales.

20,658 (1911). Bicycle tire inflators. L. Briggs, Kenmore Cottages, Quorn, Leicestershire.

20,702 (1911). Impregnated leather tire covers. A. Hardcastle, Highfield, Hawkhurst, Kent.

*20,711 (1911). Feeding bottles. G. R. Shepherd, Winthrop, Mass., U. S. A.

20,730 (1911). Tire covers. J. Bartlett, 67 Grove Hill Road, Denmark Park, London, and A. E. Collett, 4 Thornby avenue, Osterley Park, Middlesex.

20,743 (1911). Syringes. R. Edwards, The Gardens, Beechy Lees, Sevenoaks, Kent.

20,748 (1911). Spring wheel. T. Brown, 139 Wingrove Gardens, and J. Fogan, 223 Wingrove Road—both in Newcastle-on-Tyne.

20,778 (1911). Depressions of golf ball surfaces. A. Johnston and North British Rubber Co., Castle Mills, Edinburgh.

20,855 (1911). Spring wheels. R. Blakoe, 96 Maida Vale, London.

*20,888 (1911). Spring wheel with cushions. T. H. Grigg, 3838 Baring street, Philadelphia, Pa., U. S. A.

20,993 (1911). Elastic substitute for inflated tubes. M. D. Rucker, "Heimath," Foxley Lane, Purley, Surrey.

20,994 (1911). Composite rubber tire. M. D. Rucker, "Heimath," Foxley Lane, Purley, Surrey.

21,044 (1911). Auxiliary rims. A. Turnbull, St. Mungo Works, Bishopbriggs, Glasgow.

*21,060 (1911). Spring wheels. N. Cornfield, 2 W. 14th street, New York, U. S. A.

[Abstracted in The Illustrated Official Journal, January 15, 1913.]

21,118 (1911). Tapping rubber trees. T. McKenna, 31 Basinghall street, London.

21,120 (1911). Spring wheels. C. P. Rundle, 149 Grove Lane, Denmark Hill, London.

21,148 (1911). Mud guards. J. Menu, 41 Rue Saint Ferdinand, Paris.

*21,304 (1911). India rubber compositions. E. von Vargyas, 5527 Second avenue, Pittsburgh, Pa., U. S. A.

21,424 (1911). Cow milkers. E. Schultz, Stanley street, West Melbourne, Victoria, Australia.

21,440 (1911). Tire attachments to rims. G. Webb, Priory street, Monmouth.

21,519 (1911). Isoprene and its homologues. J. Y. Johnson, 47 Lincoln's Inn Fields, London.

21,566 (1911). Rubber reclaiming. F. W. Golby, 36 Chancery Lane, London.

21,567 (1911). Rubber reclaiming. F. W. Golby, 36 Chancery Lane, London.

21,583 (1911). Sectional spring wheels. J. E. Graham, 14 Albert Palace Mansions, Battersea Park, and G. Wallace, 48 Old Compton street W. —both in London.

21,607 (1911). Block tires. L. Gaucherand, 76 Rue Molière, Lyons, France.

21,627 (1911). Bottle fastenings. H. Williams, 35 Lark Hill, Farnworth, Bolton.

[Abstracted in The Illustrated Official Journal, January 22, 1913.]

21,691 (1911). Detachable rim attachments. A. C. Palmer, St. Margarets, Park avenue, and J. Craig, 82 Amptbill Road—both in Bedford.

21,748 (1911). Detachable rim attachments. W. T. Smith, Harlington Road, Bolton.

21,749 (1911). Improvements in golf balls. W. T. Smith, Harlington Road, Bolton, Lancashire.

21,779 (1911). Siphon bottles. J. Dittrich, 15 Ampton street, London.

*21,787 (1911). Cushions for tires. H. B. Montgomery, 902 North 2d street, Harrisburg, Pa., U. S. A.

21,874 (1911). Tire valves. J. S. Clarke and G. Spencer, Moulton & Co., 77 Cannon street, London.

21,909 (1911). Improvements in tread bands. C. Kioque, 24 Rue Duret, Paris.

21,916 (1911). Improvements in stamp-inking pads. E. Steiger, 3 Meierweg, Zurich, Switzerland.

21,917 (1911). Improvements in tire covers. W. W. Wiggins, "Wbareiti," Albert avenue, Chatswood, near Sydney, Australia.

[Abstracted in The Illustrated Official Journal, January 29, 1913.]

*22,027 (1911). Spring wheels. J. S. Gammon, 209 Park street, Detroit, Mich., U. S. A.

22,074 (1911). Protective band for tires. G. A. V. Longuemare, 34 Rue de la Hene, Sainte-Adresse, Havre, France.

22,177 (1911). Block tires. J. H. Betteley, 24 Old Square, Lincoln's Inn, London.

22,301 (1911). Removing and replacing tires. E. Bebn, 37 Schutzenstrasse, Karlsruhe, Germany.

22,319 (1911). Washing hose pipes. M. Kummer, 2 Faschinggasse, Volkermarkt (Karnten), Germany.

*22,339 (1911). Improvements in tread bands. A. W. Savage, Duarte and Savage Tire Co., Monrovia—both in California, U. S. A.

22,247 (1911). Disk wheels. S. Geezynski, 57 Schönhauser Allee, Berlin.

22,396 (1911). Apparatus for closing punctures. F. T. Porter, 18 Larkhall Rise, Clapham, London.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

444,963 (April 10, 1912). T. D. Kelly. Flexible composition for replacing rubber.

445,230 (June 20). A. D. Laurent. Improvements in automobile and other tires.

445,260 (June 21). H. K. Heide. Air chamber composed of separate cells for automobile and other tires.

445,265 (June 21). J. & J. Schoenfeld Freres. Rubber dancing toy, working by compressed air.

445,371 (June 25). W. D. McNaull. Pneumatic automobile tires.

445,395 (June 25). J. Lend. Improvements in pneumatic tires.

445,477 (May 14). Van Driessche & Mahen. Improvements in elastic tires.

445,485 (June 5). H. T. Mawley. Tire filling substance and its manufacture.

445,664 (July 2). D. Maggiosa. Improvements in solid tires.

445,704 (July 2). Michelin & Co. Appliance for fitting pneumatic tires.

445,722 (July 3). E. Fullner. Rubber covered rollers for paper machines.

445,727 (July 3). J. Guerrero. Improvements in elastic tires.

445,917 (July 9). A. O. Remy. Rods for pneumatic tires.

445,929 (July 10). Gordon & Barchete. Pneumatic tires.

445,951 (July 10). Gesellschaft für Teerverwertung. Manufacture of substance similar to rubber.

446,014 (July 12). A. Toudet. Unperforable tire protector.

446,043 (July 13). L. J. Tetlow. Protective tire cover.

446,075 (July 16). H. M. Ambler. Improvements in tires.

446,244 (September 26, 1911). G. Reynaud. Process of rubber manufacture.

446,291 (July 26, 1912). J. F. P. Peignet. Antiskid rivet.

446,354 (July 23). McAuslin. Insertion of vertical elastic pieces in footwear, to facilitate putting on and taking off.

446,433 (June 22). A. Abts. Mud guards for automobiles and other vehicles.

446,469 (July 24). A. Libert & Dewarzegurs. Pneumatic tires.

446,501 (October 3, 1911). B. Abeil & fils. Antiskid for tires.

446,506 (July 22, 1912). V. A. Roux. Protective anti-puncture armor for tires of automobiles, bicycles, etc.

[Note.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

256,174 (April 20, 1912). Process for cleaning rubber. H. P. C. G. Debauge, Paris.

256,173 (May 1, 1912). Durable combination of leather with vulcanized rubber. Alfred E. Petersen, Carlsruhe, Germany.

256,216 (February 3, 1912). Coagulation of latex. Wilhelm Pabl, Dortmund.

256,413 (November 1, 1911). Rubber substitute of technical value. Farbenfabriken, vorm. Fried. Bayer & Co., Leverkusen and Elberfeld.

256,369 (May 1, 1912). Cooling of pneumatic tires. A. B. Craig, Tarkio, Missouri, U. S. A.

256,370 (February 9, 1912). Covers with removable treads, for pneumatic tires. Walter Woblert, Fährstrasse 15, Hamburg.

256,684 (December 30, 1911). Tapping tool resembling an axe. Jacob da Costa Gadelha, Nova Vista, Brazil.

256,487 (August 30, 1911). Process for production of tires with a filling of froth. Fritz Pfleumer, Marienstrasse 48, Dresden.

256,753 (February 14, 1911). Production of certain objects through the coagulation of viscose in open molds. Dr. Otto Eberhard, Heidenau, near Pirna, Germany.

256,904 (November 28, 1911). Process for the preservation and improvement of rubber latex. Dr. Georg Eichelbaum, Augsburgerstrasse 82, Berlin.

256,696 (April 21, 1912). Motor truck wheel with solid rubber tire. H. Büssing, Brunswick, Germany.

SEVEN INCH PNEUMATICS.

Just what the limit in size of pneumatic tires is going to be it might be difficult at present accurately to prophesy, but that the tendency is towards larger tires for heavy vehicles there is no doubt. Some recent tests have been made with 7-inch tires on cars weighing, with load, 2½ tons, and the tests have proved very satisfactory. The larger tires have several advantages. In the first place, there is a bigger expanse of rubber to grip the roadway, which reduces the tendency to skid; in the second place there is, of course, more resiliency in a 7-inch tire than in one half that size, as a 7-inch tire means a 7-inch air cushion around the rim. With a larger tire it is possible to have a lower air pressure which decreases the liability of blow-outs. As against these advantages is the greater initial cost of the larger tire, which calls for a greater quantity of rubber and other materials —but the advantages seem to outweigh the disadvantages.

Report of the Crude Rubber Market.

SINCE from date covered by last report (January 25) at 4*s.* 5 *d.* the London market for fine Pará has gradually dropped during February, reaching on February 25, at time of writing, 4*s.* 0 1/2*d.* The various stages of the decline were reached as follows: 4*s.* 4*d.* January 30, 4*s.* 2 1/4*d.* February 5; 4*s.* 2*d.* February 17; 4*s.* 1 1/4*d.* February 18. From 4*s.* 4 1/4*d.*, or 1*d.* below Para fine, plantation pale crepe, first latex, followed practically the same course during the month; reaching on February 25, at time of writing, 4*s.* 0 1/2*d.*

The two principal standards are therefore now quoted on the same level. While hovering for about a week just above the four-shilling mark, the price has been kept from going beneath that line, notwithstanding the large quantities offered at the two February auctions. The falling off during the month has been in fine Para, 4 *d.* per pound, and in plantation, 3 3/4*d.*, the two grades both standing on February 25 at 4*s.* 0 1/2*d.*

The London auction of January 28 included 970 tons, of which practically the whole was sold at a reduction of 2*d.* to 3*d* per pound below the previous fortnightly sale. Satisfaction was expressed at the ready manner in which the trade operated on the lower basis thus established. At the sale of February 11 there were about 1,000 tons offered, which realized prices about 1*d.* to 1 1/2*d.* per pound below the rates of January 28. Cable advices regarding the sale of February 25 report the quantity offered as 900 to 1,000 tons; prices averaging about 2*d.* per pound below those of a fortnight earlier.

New York prices followed the movement of those reported from London, local demand being restricted to the meeting of actual requirements. From about the middle of the month, the tone of the market was affected by the labor troubles at Akron and Trenton, reported in other columns. Large tire manufacturers have been holding off, and a similar policy has affected consumption in all markets. Liberal arrivals have, moreover, tended to depress prices. Still, according to latest reports, the rubber market has suffered less than might have been anticipated from the strikes.

The Antwerp sales of January 23 included 545 tons, of which 344 were Congo and 205 Plantation. Of the former, 274 tons were sold at an advance of about 5/8 of a penny. For the latter, which was all sold, the prices obtained showed a falling off to the extent of 3/4 of a penny.

At the Hâvre sale of January 21, only 18 tons were sold out of the 70 tons offered. Prices were relatively satisfactory to holders; an average advance of 1.65 per cent. being established. For the sale of February 26, about 115 tons were declared.

The Amsterdam sale of February 14 included 62 tons *Hevea*, 15 tons *Ficus* and 6 tons of various descriptions. It resulted to the satisfaction of holders, the whole offering being practically sold at unchanged prices. For February 21 there was scheduled a sale at Rotterdam of 35 tons, mostly Congo.

NEW YORK QUOTATIONS.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "The money market has continued easy during February with a good demand for paper, and during the early part of the month rates ruled at 4½@4¾ per cent. for the best rubber names, and 5@5½ per cent for those not so well known, but after the middle of the month rates ruled rather firmer at 5@5¾ per cent for the various grades, and some as high as 6 per cent."

Amsterdam.

Joosten & Janssen report [February 14]:

Good demand prevailed at today's sale; the whole offering being sold except some lots held above market value. Next sale will be held March 12.

Rotterdam.

Havelaar & De Vries report [February 8]:

The next sale will take place on February 21 and will include 27 tons Congo, 6 tons *Hevea*, and 6 tons of miscellaneous descriptions.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.

No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. APRIL 1, 1913. No. 1

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

THE WASHING OF BRAZILIAN RUBBER.

THE standardizing of Brazilian crude rubber sorts is something that has often been discussed. No special progress has been made, however, and the trade designations have remained loosely descriptive or wholly arbitrary. There has never even been formulated a clear descriptive paragraph that would adequately describe Up River Fine.

That it is a pity to pay freight on water, bark, chips, sand and other worthless contents of crude rubber pelles, slabs and balls, no one doubts, *but*—and this is a very large but—how is the washing of all of the 42,000 tons of Brazilian rubber going to be viewed by the parties most interested—the rubber manufacturers? They are equipped with washing and drying plants that cost hundreds of thousands of dollars. They are accustomed to judge the rubber by certain physical characteristics. They know its value for various lines of goods by these characteristics. If the rubber all comes to them in crepe form it means not only the scrapping of much valuable machinery, but involves the testing of every grade in the laboratory, in compounding, vulcanization, and in actual use. It is by no means certain that Fine Pará rubber, for example, washed in Manáos, will arrive in New York possessed of the same degree of nerve that it shows when it comes in biscuit form. The generally accepted explanation of the superior nerve of Pará biscuits is that the constant pressure of the stretched and superimposed films, together with the water held in the mass, are responsible for this superiority. With some of the softer sorts like Mangabeira, washing, particularly clean washing, tends to soften the rubber so that it deteriorates.

All of these points were put before the Minister of Agriculture at Rio de Janeiro recently by the editor of THE INDIA RUBBER WORLD, who was given an audience for that special purpose. His Excellency, however, gave his assurance that nothing would be done hastily and that sample lots of all kinds would be shipped for examination before any grade was definitely changed.

A point in favor of the bid for the plant in Manáos is the comparative cheapness of the price charged—about six cents a pound. This is for washing, sheeting and packing in boxes. The present price for cutting and boxing is over 20 cents a pound. In this connection it might be well to cite the various grades of crude rubber that now come from Brazil. Of the Amazon sorts nearly all of the grades named are still further sub-divided into Fine, Medium and Coarse.

The various grades are as follows: Bolivian, Peru, Acre, Matto Grosso, Amazonas sorts (Javary, Purus, Jurua, Madeira, etc.); Tapajos, Xingu, Islands, Cameta, Weak fine *Hevea* (Rio Negro, Peruvian, Bolivian, Purus, Pará).

Bolivian, Peruvian, Matto Grosso, Acre, Amazonas and Pará caucho.

Ceara sheet and crepe, Jequié sheet, Jequié washed, Jequié scrap, Piauhy rubber, Mangabeira slabs, Mangabeira crepe.

A TROPICAL AGRICULTURAL UNIVERSITY IN THE WEST INDIES.

IN that exceedingly interesting paper on "The Present and Future of the Native *Hevea* Rubber Industry," by Dr. Jacques Huber, which appeared in the March number of THE INDIA RUBBER WORLD, he made this statement: "It would seem strange that in the Amazon region, the very home of the *Hevea Brasiliensis*, its cultivation has not made more progress, in spite of the many efforts in that direction. The cause is not only in the general conditions of the country and in the scarcity of labor, but perhaps principally in a factor which unfortunately has too often been overlooked—that of management. In Amazonia there

are practically no plantations on a large scale, and trained plantation managers are seldom to be found there."

The lack of trained experts which Dr. Huber mentions as the chief obstacle in the way of successful rubber plantations in South America is also noticeable everywhere in the rubber field where plantations have been started. To be sure, in the Far East, now that plantation enterprises have been under way for a number of years, there is quite a body of men who have secured a practical training through their experience on the plantations, and there are in various parts of the tropical world experimental stations where a few men, under government auspices, are trying to solve some of the many problems to which tropical agriculture has given rise; but nowhere in the world is there a tropical agricultural college where men may be trained quickly, and without waste of time and effort, in the science of tropical agriculture—whether relating to the production of rubber, sugar, cacao, or tropical fruits; and the pressing need of such an institution has long been felt by intelligent observers. It has been dwelt upon in the agricultural and tropical papers; it has come up for discussion in the conferences of those who are interested in tropical products, and it was particularly emphasized in the West Indian Agricultural Conference held in Trinidad last year.

A new impetus has been given to the subject by an article which appeared in a recent issue of "The London Times," calling attention in an emphatic manner to the need of a tropical agricultural university if the British colonial possessions in the tropics are to reach their proper development. It called attention to the extreme wastefulness of the haphazard methods that at present obtain in agriculture in these colonies, being in fact practically the same methods in vogue half a century ago. The fact was dwelt upon that nature had been looked to to do practically all the work, on the hypothesis that nature produced enough and to spare, and required little assistance from man. But the conditions have changed materially in fifty years, and in order to meet competition from the other parts of the tropical world, and in order to enable the British colonies to attain to anything like their proper development, the time has come for supplying those colonies with a body of men specially trained to meet their requirements.

This editorial in "The Times" has encouraged the advocates of a tropical agricultural college to new efforts, and it certainly is to be hoped that these efforts may soon materialize. Such a college should, as a matter of fact, not only train men for the pursuit of agriculture in the tropical belt, and train them so broadly that after leaving its doors they would be at home in any tropical country—whether the West Indies, South America, Africa, or the Far East—but it should go beyond such training and engage in research work of a character that would be of benefit to the tropics generally. It should not only train men in a thorough understanding of tropical climates and soils and in the sciences of entomology, mycology, botany and chemistry, but it should take up the great number of problems coming under these various classifications that have not yet been solved, but must be solved, if tropical agriculture is to reach its best estate. Such an institution, giving both practical training and engaging in advanced research work would in reality be a university rather than a college.

In regard to the best location for such an institution, "The Times" expresses the belief that the West Indies are best adapted for this purpose, as they are within the tropical belt and yet readily accessible to students from England, and admirably situated as a starting point from which the graduates could go out —either to South America, to Africa, or to the East.

"The Times" does not designate any particular island, but to anyone who has traveled extensively through the West Indies, Trinidad will immediately suggest itself as an ideal location for such an institution. It certainly presents true tropical conditions, being only ten degrees from the equator, and while it is one of the West Indies, it is so close to the South American shore as to be to all intents and purposes a part of that continent. The great Orinoco River draining thousands of miles of tropical country, including forests of rubber, empties almost at its door. Those who gathered there for instruction would pursue their studies under ideal tropical conditions. The foundation for such a university has already been laid in the Imperial Department of Agriculture for the West Indies, which under the executive management of Commissioner Watts has done so much to train men in tropical agricultural knowledge, and has been of such assistance in supplying experts to both government and private enterprises.

Moreover, it is readily accessible, not only to the English, but to Canadians and to the United States;

and it would naturally draw its student supply, not only from the mother country, but from the surrounding islands, from South America and from North America. And herein lies an important feature—the establishment of an institute conveniently at hand, where young men from the United States could be thoroughly equipped for successful agricultural operations, either in foreign lands, or in the American tropical possessions—Porto Rico, the Philippines and the Hawaiian Islands. It is this feature of it that makes this discussion of special interest to Americans. In the Philippines and the Hawaiian Islands we have extremely valuable possessions, but the young man who goes to either one of these islands to seek his fortune goes absolutely unequipped, and has to acquire the knowledge necessary for success through the slow processes of observation and experience. If he could take a three or four years' course in a well equipped tropical agricultural college it would be a wonderful saving of time and energy.

English colonists have been talking about this agricultural institute for many years, but now they are talking about it with greatly increased earnestness. It is to be hoped that it will soon materialize and that its materialization will take place at some spot like Trinidad where it will naturally attract American patronage and support.

While such an institution—a thoroughly equipped tropical agricultural university—would greatly help all the industries of the tropics—the production of sugar, cacao, fruits and the other products of the equatorial belt, it would, undoubtedly, be of the greatest benefit to the industry of rubber planting, which has such tremendous possibilities in a vast territory—some of it belonging to the United States—where as yet hardly a start has been made.

THE ANNUAL LEGISLATIVE RAID ON THE AUTO.

IT is hardly to be expected that any State legislature would close its session without "taking a fall" out of the auto. But the New York legislature during the month of March certainly established the record. Its members introduced twenty different bills placing various prohibitions and penalties on the use of the auto. The very volume of this proposed legislation was its undoing, because it provoked such a storm of protest from the automobile owners of the State—and there are 100,000 of them—and brought so many hundred representatives of various organizations to Albany to voice their objections by personal presence, that the greater part of these laws were buried—temporarily at least—in committee.

But one of the most pernicious of them, affecting the manufacturer and dealer and ultimately the consumer, was rushed through both houses, and that is a law providing for the dating of automobile tires, and reading as follows: "No person or corporation shall manufacture, sell, offer or expose for sale in this State a tire for use on a motor vehicle unless the date when such tire was manufactured shall be impressed or branded upon the material of which such tire is constructed, or otherwise indicated by label securely attached thereto."

This act was introduced a year ago, and after some discussion and amendment disappeared from view. But the Hon. Christy Sullivan, a statesman representing the lower East Side of New York City, penetrated into the legislative mausoleum and brought forth this presumably defunct issue. It was galvanized into life—by what vivifying influences it cannot be stated—and as said above, it was rushed through the Assembly and the Senate, and at present writing lies on the Governor's desk for his action.

The effect of this act would be to reward dishonesty and penalize honesty; for the dealer who had not yet entered upon the ethical life would simply put new tags on old tires and pocket the profits, while the honest dealer would, naturally, want to avoid any tires dated more than two or three months back; and in consequence the manufacturer would be exceedingly careful not to get much of a supply of tires ahead. During the dull months, when he naturally would be making up a stock for the brisker months to come, he would close down and wait till the market revived. The result of this would be, of course, to make the manufacture of tires materially more expensive, and to advance the price proportionately to the consumer.

It is a totally unnecessary piece of legislation, because the guarantee given by practically all important tire makers, covering their best-grade tires, is adequate protection to the consumer that he will get the tire service he is paying for. In addition to this guarantee, it is, of course, a truism to state that every reputable tire maker is quite as anxious to have his product prove satisfactory as the purchaser of that product is. If a maker's tires go wrong the consumer suffers simply to the extent of the one or possibly four tires that he has purchased, but the maker suffers to the extent that his reputation, on which his continued prosperity is based, is seriously damaged. No tire maker of any standing wants his name on tires of an unsatisfactory character.

If this act is signed and becomes a law, the next step logically for our wise legislators to take is to convene in special session, and to pass an act making it compulsory to date the air that is pumped into the tire.

DYNAMITE IN RUBBER PLANTING.

TEN years ago the discussion of the use of dynamite in the development of rubber plantations would have interested only an extremely small number of people in the United States. The consideration of any subject pertaining to rubber planting would have made but a limited appeal to Americans, for the simple and logical reason that aside from a few holders of shares in Mexican ventures, there was no one in this country who felt anything more than an academic interest in the subject of rubber plantations, or anything that pertained thereto.

But all that has now changed. When one American company is developing the largest rubber plantation in the world—investing millions in the enterprise—and when other large manufacturing concerns are sending their agents through the whole rubber belt to make a thorough study of the planting problem, it can no longer be said that Americans have no personal interest in rubber plantations, and the conditions affecting them.

There are, undoubtedly, many readers of this journal, therefore, within our own home borders, who will read with more than a merely general interest, the paper on the use of dynamite on rubber plantations, which Mr. Hamel Smith, editor of "Tropical Life," contributed to the International Rubber Conference, recently held in New York, and which is reproduced in this number.

Our Western farmers who are as alert agriculturists as can be found anywhere, have long used dynamite and other explosives to conquer the soil. Its swift and thorough efficiency strongly commends it to their distinctly modern temperament; and now the Eastern planters are awakening to the fact that a pound of dynamite is worth a dozen men with the hoe. As Mr. Smith points out, it lays hold of the sub-soil, which neither hoe nor plow can touch, and opens it up to the beneficent influences of air and light, letting the water beneath it up and the roots above it down. It is particularly effective in preparing the holes for the actual planting of the trees, as it not only digs the holes but softens and mellows the surrounding earth, so that the new roots can push out into hospitable soil; and its utility as a destroyer of pests—both animal and vegetable—is obvious. It is a safe conjecture that explosives will grow in popularity with the evolution of the rubber plantation.

AMERICAN MANUFACTURERS INVADE BRAZIL.

THIS issue of The India Rubber World contains some exceedingly important news regarding the industrial development in the great continent to the south. It is news, moreover, of special interest to American manufacturers, as it relates to the invasion by one of them of the great South American domain. Last year the Government of Brazil enacted certain legislation to induce capital at home and abroad to embark upon manufacturing operations in that country. Among those who responded to this appeal, and responded successfully, was the Goodyear Tire & Rubber Co. This company contemplates the immediate erection of large rubber refining and washing plants at Pará and Manaos and, even more important, of an extensive and completely equipped factory for the manufacture of rubber goods in Rio de Janeiro. These interesting enterprises are described in detail in two articles appearing in this issue, one devoted to the manufacturing plant, the other to the refining and washing plants.

RUBBERS AS LEGAL TENDER.

ENTHUSIASTS as to the ultimate destiny of rubber are prepared to believe that it can be and will be utilized in multitudinous ways not yet dreamed of, but probably very few of the enthusiasts ever expected that it would take its place with the precious metals as a medium of exchange. This, however, has come to pass, as will be noted by the following paragraph, taken from a paper published in a highly respectable community in New Jersey:

"The young people of the Epworth League of the Methodist Church of this place are going to hold a 'rubber social' in the church Thursday evening, March 27. Admission will be a parcel of old rubbers."

Here is a fine illustration of the doctrine of efficiency, now so loudly heralded, which is as applicable to matter as to energy. To make the useless put on usefulness appeals to the well-balanced, economic mind, and this special instance also shows exceptional financial perspicacity on the part of the leaders of this particular Epworth league; for undoubtedly this New Jersey village, like all other reputable villages, is full of homes where actual cash is scarce, but where old rubbers—too good to throw away and too bad to wear—have been accumulating for years. What more delightful than to tie up an assortment of these old rubbers—some of them having been stored in the garret since the Civil War—and present them at the box office, in exchange for an evening of elevating entertainment? At last rubber has come into its own, and takes its place side by side with gold and silver as a standard of value and a recognized instrument of exchange.

RUBBER MANUFACTURING IN THE "NEW YORK ZONE."

By G. Wilfred Pearce, C.E.

THE year 1912 chronicles the highest volume of trade ever attained in the zone of New York as to sales of manufactures of rubber to the marine, mechanical and electrical engineering interests, and to the building trades. The zone of Greater New York is a radius of twenty miles from the City Hall. The area is 2,345 square miles and the population is almost seven and one-half millions. This zone is growing faster than the nation; New York City alone yearly adds to its population the equivalent of the population of Paterson, New Jersey. Since the opening of the year 1910, the increase in the population of the zone of Greater New York has been as many persons as are accounted for in the last census of Boston. To provide for the wants of the vast population of the zone of Greater New York the manufactures of rubber, calls for the employment of as many rubber trade workers as were employed in the whole domestic rubber industry in 1850.

Accurate statistics of the volume of rubber goods consumption in this zone are not procurable. There is no good reason why manufacturers or jobbers should make known the volume of their sales, and there are cogent reasons why they should not set forth the volume of sales in a community, in which hundreds of promoters are looking for arguments for the flotation of schemes based upon the manufacturing interest. But fairly good estimates of the annual consumption of mechanical trades requirements in manufactures of rubber, are obtainable from the principal designing and constructional engineers. Judging from what the principal local scientific engineers set forth as estimates as to the consumption of all kinds of rubber manufactures bought by final consumers for use within 25 miles of the City Hall, and under specifications which cover the twelve months of 1912, the sum is not under $3,000,000. This sum does not include an estimate of the purchases by thousands of janitors and tens of thousands of householders, concerning which statistics are not collectable.

Thirty-four millions of our population reside at places that are reached by watercraft documented at New York and adjacent ports. These vessels consume largely both staple and special manufactures of rubber, and in addition to this trade, the local marine engineering outfitters are doing a yearly increasing trade with many of the almost 12,000 foreign steamships that come to this port in a year.

So much is printed by the daily press as to the alleged decay of our mercantile marine, and the necessity for Federal aid to nurse our ocean carrying trade, that the general public takes it for truth, whereas our coastwise, river and lake shipping interest is enormous in tonnage, and, for the most part is paying good profits to the owners. In the past twelve-month, our water transportation lines carried two and one-half times as much freight as was carried within the same period by all our steam railroads. Many of our great lines of coastwise, river and lake steam vessels are owned by railroads, and in all that relates to the use of the best grades of mechanical and other rubber wares, these steamship lines are as well circumstanced as the railroad interest is at such plants as the Pennsylvania system's shops at Altoona, Pa., and the plant of the Vanderbilt lines at West Albany. It would be difficult to find anywhere among the storerooms of the greater steamship lines of Europe, a stock comparable in variety and quantity with those maintained at the Great Lakes ports for the one hundred big steamships operated by the United States Steel Corporation. What is shipped from New York City and vicinity in rubber goods to the Great Lakes ship yards, marine engineering works and vessels, aggregates about $750,000 a year, as is estimated by an officer of a local corporation engaged in the manufacture and jobbing of marine engineering supplies. But this amount is not included in the estimate herein given for the annual sales of such wares within the zone of Greater New York.

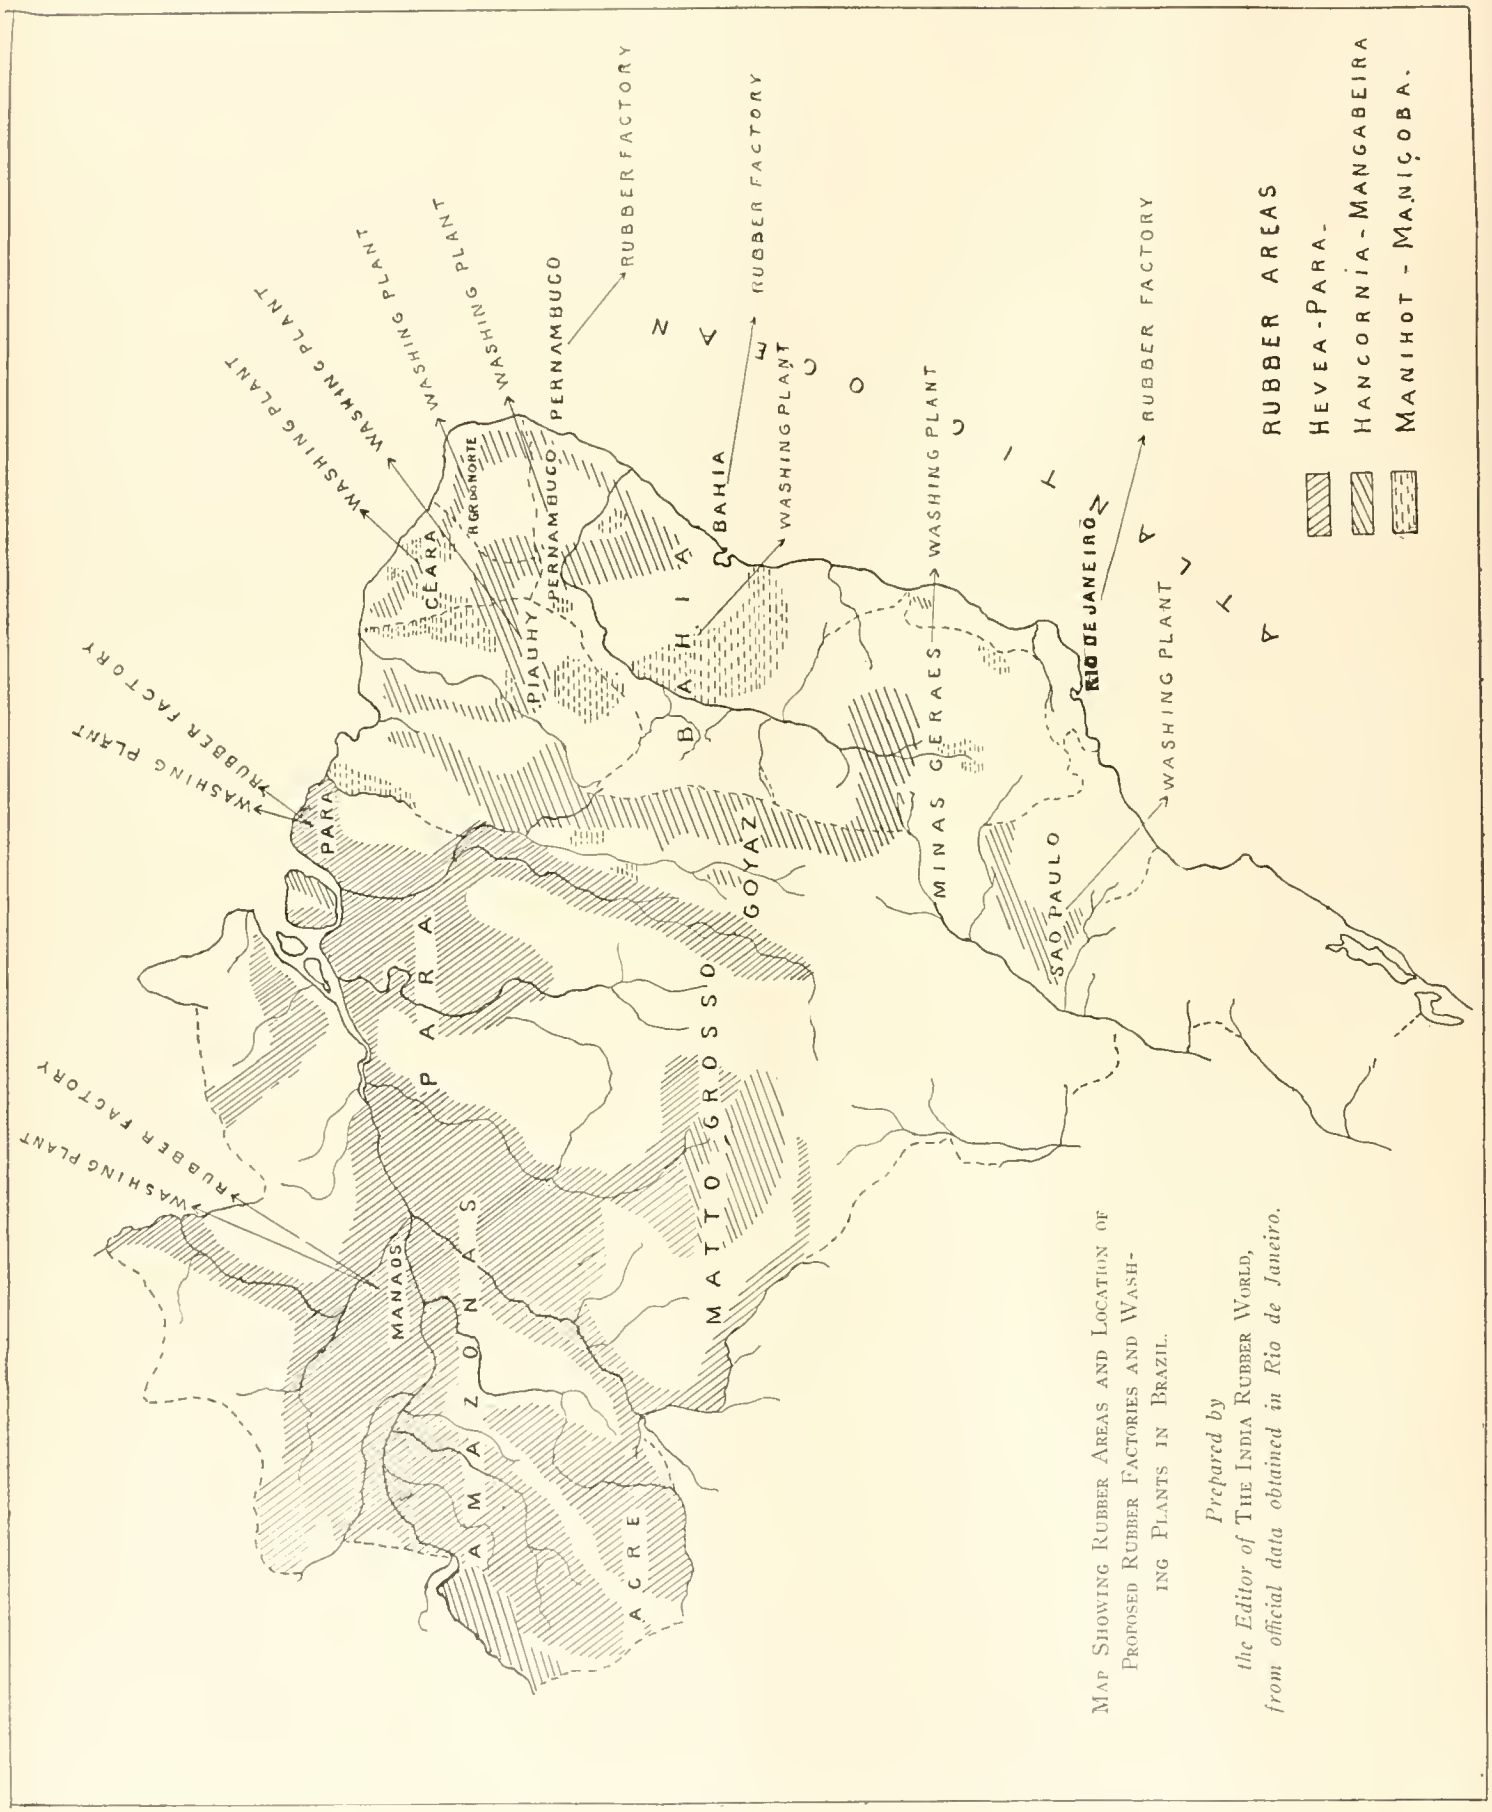
A factor of importance in 1912's local rubber goods trade is the large number of mercantile buildings and apartment houses that were completed, and most of which are so high that the fire engines cannot force water to the upper stories. That fact has developed in Manhattan and parts of Brooklyn, and in parts of adjacent cities, the installment of fire pumps, hose and other fittings for fighting fire by employees of the owners and tenants of the tall structures. So well provided are scores of the new tall mercantile structures, completed on Manhattan Island, with fire-fighting apparatus, and with driven wells beneath the buildings, that upward of 2,500 concerns in the textile industries moved during last year from the downtown wholesale drygoods district to new quarters above Union Square.

For fire hose and hose for vacuum cleansing apparatus, the expenditures by owners of new buildings completed within the zone of Greater New York during 1912, aggregated almost a third more than the sum estimated for the previous twelvemonth by conservative mechanical engineers. In the twelvemonth, ending with last December there were completed within New York, and in cities within a few miles thereof, 2,687 high-class apartment houses. Few of these cost less than $500,000; many cost upward of $750,000 each. None of these houses is without private fire-fighting equipments. In the larger and most costly of these houses, steam, electric, hydraulic and compressed air power are used, and the resident engineer has under him from six to twenty assistants to care for water, steam heating, refrigerating, power and lighting apparatus. A year's requirements of engineering rubber products for these apartment houses comes to a big sum. Just how much it comes to the sellers do not care to tell. But it is certainly a factor of importance to the trade.

Cheap and good coal from Southern mines, laid down at the port of New York and vicinity at extraordinary low water freight rates, has enormously stimulated manufacturing within this zone, so that it now ranks first in the world in number of employees and value of production. Cheap coal has brought about a number of very large power-producing and selling corporations that sell power much cheaper than any but a very large manufacturing plant can produce it for. One such power-producing plant in this city employs 187 mechanical draughtsmen in designing electrical apparatus and planning electric power installations for users of power.

To take advantage of this low-priced and steady power, many buildings have been especially built hereabouts within a few years, in which manufacturers can rent room and power at low rates. All this results in making this zone a continuously increasing market for a very large sale of rubber wares used in constructural engineering work, and in many lines of manufacture in which rubber goods play a considerable part.

A short time ago it seemed as if the local jobber in rubber goods was being pushed to the wall by manufacturers who employed all arts to reach the consuming interest. Today, the jobbing trade is in good case, and a number of manufacturers have abandoned the solicitation of consumers, and are selling through the engineering trades supply concerns. The jobbers are serving the retailers and final consumers with promptness, and are doing sound educative work in introducing new and improved rubber wares in many lines. By means of the telephone and fast motor wagons these jobbers are filling orders, local and within 20 miles out of town, on very short notice, so that it is no longer necessary for the retail and consuming trades to carry large stocks. Several jobbers within the zone of New York, having accounts with power plants that work day and night, now provide for filling emergency orders at night, by having employes at warehouses all night, who fill orders and rush them off at once by their emergency motor wagons.



Map Showing Rubber Areas and Location of Proposed Rubber Factories and Washing Plants in Brazil.

Prepared by the Editor of The India Rubber World, *from official data obtained in Rio de Janeiro.*

Brazil's New Rubber Activity.

AN AMERICAN COMPANY MAKES TENDERS FOR TWO LARGE REFINING PLANTS.

THE Brazilian legal enactments now in force affecting rubber, consist of the Act of January 5, 1912, in conjunction with the decree of April 17, 1912, explaining and defining the provisions of the former measure. While the fundamental act only acquired legal validity through its being passed by the Brazilian legislature towards the end of December, 1911, its provisions had already been submitted to, and approved by the Rubber Congress held at Rio de Janeiro the previous summer, Being a government proposal, it had been drafted by the Minister of Agriculture, Dr. Pedro de Toledo, who presided over the Rubber Congress and was assured beforehand of a cordial reception on the part of the rubber industry, both wild and cultivated.

During its passage through the Brazilian Legislature it had been subjected to trifling detailed changes, but its terms are

DR. PEDRO DE TOLEDO.

more or less familiar to the readers of THE INDIA RUBBER WORLD by the extracts in the numbers of October 1, 1911 (page 7); March 1, 1912 (page 266), and June 1, 1912 (page 427).

A thoroughly representative character marked the Rio Congress of 1911, on which occasion a commission of five delegates spent a week in discussing the government proposals, which it subsequently endorsed in the main, and which formed the basis of the two measures of 1912.

That the Brazilian rubber industry was in an unsatisfactory condition was patent to all connected with it. It was costing too much to produce rubber in Brazil, while prices were going down under the influence of the actual and prospective Asiatic yields. Moreover, the latter in their heavy profits had a margin to fall back upon, not existing in the case of Brazilian rubber.

In submitting these proposals to the Rubber Congress Dr. de Toledo urged that they were brought forward in the interests of Northern Brazil generally. In line with the general policy of lowering the cost of producing rubber, was the reduction of the two principal items of expense:—food and transport. These objects have been prospectively attained by the provisions for leasing national lands and for the construction of new railroads.

CONDITIONS OF THE INDUSTRY.

In his presidential address, Dr. de Toledo urged the importance of the rubber industry as a means of support to a considerable section of the population of all the northern states of Brazil. This fact, he added, called for the intervention of the national government, with a view to preventing the occurrence within a few years of a lamentable crisis.

The chief part of the Brazilian rubber production is composed, he explained, of the "Seringueira" (*Hevea* and *Caucho*); growing spontaneously in the valley of the Amazon. In addition to these are the *Maniçoba*, chiefly found on the right bank of the river Parnahyba, and the *Mangabeira*, met with in the states of Goyaz, Minas Geraes and Matto Grasso. The production of the valley of the Amazon would, he said, be sufficient to meet the world's consumption, if that region were worked in an economical and practical manner. This would only be possible with a relatively dense population and with the needed transport facilities.

Most of the *Hevea* rubber is now produced on the banks of more or less navigable rivers, and seldom comes from farther than six miles, on either side of the streams. In the northeastern states of Brazil, there is a considerable quantity of *Maniçoba*, though for some reasons its working has not been satisfactory. At the same time, he added, there is no reason why the *Maniçobas* of the northeast should not be rationally exploited and their product as far as possible increased.

PRODUCTION OF BRAZILIAN RUBBER.

The following figures show the production of Brazilian rubber during the five years, 1906-1910, in spite of the existing disadvantageous conditions:

	Tons	Value equalled
1906	34,960	$70,946,000
1907	36,490	72,501,429
1908	38,206	62,785,631
1909	39,027	100,646,651
1910	40,000	125,657,286

DECREES OF JANUARY 5 AND APRIL 17, 1912.

Closely following upon the passing of the government measure by the Brazilian parliament, before the end of the season of 1911, it received the presidential approval by a decree of January 5, 1912. A subsequent decree of April 17, 1912, elaborated its provisions; both statutes now forming part of the Brazilian Federal Code.

The original measure contained 15 articles, while the supplementary decree, which omitted certain formal sections and transposed others, only contained 13.

The former, however, only occupies 6 pages of printed text, while the latter covers about 30 pages, being much more detailed in its provisions. It will therefore be necessary to consider the two measures together.

Of the fifteen articles in the first decree, four were merely formal, while five were indirectly for the advantage of the rubber industry, leaving six articles intended to directly benefit that branch of national commerce.

Those of indirect advantage were the regulations providing for the erection of three hospitals, the construction of new railroads, free admission of products intended to promote river navigation, establishment of coal depots, and measures tending to reduce the cost of provisions. These measures were dealt with in detail by THE INDIA RUBBER WORLD June 1, 1912, page 427.

Six articles were intended to directly benefit the rubber industry. They were:

Exemption from import duties of appliances for rubber production.

Premiums for new plantations.

Establishment of experimental stations.

Prizes for the establishment of rubber refining plants and rubber goods factories.

Holding of triennial expositions.

Reduction in export duties on rubber.

EXEMPTIONS FROM IMPORT DUTIES OF MATERIALS AND APPLIANCES FOR RUBBER CULTIVATION AND MANUFACTURE.

By the earlier decree free admission was granted to all utensils and materials for the culture of *Hevea, Caucho, Maniçoba* and *Mangabeira* trees, as well as for the collection and preparation of rubber extracted from them. The later decree restricts this free admission to a long list of articles, and includes regulations as to the certificates required of the status of the applicants for such free entry.

In the April decree the provisions of free entry are amplified as follows: "Materials and machinery which shall be discovered or invented during the time this regulation is in force, which have special application to the rubber industry, shall enjoy the same exemption from import duties."

The materials specified for free entry are classified into 4 groups; the fourth one being subdivided into 8 sections. The entire list includes about 400 articles. Its divisions are:

Group 1—Implements and Utensils for the Rubber Gatherer.

Group 2—Implements and materials for Cultivation.

Group 3—Materials and Utensils intended for the culture of trees and treatment of rubber, including building materials.

Group 4—Chemical substances: 1, Coagulants; 2, Dissolvents; 3, Deodorizers and Disinfectants; 4, Coloring materials; 5, Hydrocarburets, heavy bodies and oils; 6, Resin, resinous gums and lacs; 7, Vulcanizing agents; 8, Fibers and Cloth; 9, Insulating materials, and 10, divers materials.

PREMIUMS FOR PLANTING AND REPLANTING.

The scale of premiums to be granted for the planting or replanting of (1) *Hevea*, (2) *Caucho* or *Maniçoba*, and (3) *Mangabeira*, was given in detail in The India Rubber World of June 1, 1912, page 427. For the three broad divisions as indicated, new plantations in groups of 12 hectares (about 30 acres) were to receive awards respectively of: (1) 2,500 milreis ($833); (2) 1,500 milreis ($500) and (3) 900 milreis ($300). Replanting for groups of 25 hectares (about 62½ acres), would entitle the planters respectively to 2,000, 1,000 and 720 milreis ($667, $333 and $240). Under certain circumstances the premiums for *Hevea* rubber may be increased five per cent.

Planters have to submit to the Minister of Agriculture plans of the property it is proposed to cultivate; with details of the nature of the soil and the production for the previous three years, where the property is already under development. The smallest number of trees for new cultures will be 250 per hectare (100 per acre) for *Hevea* and *Caucho*, and 400 per hectare (160 per acre) for *Maniçoba* and *Mangabeira*. In replanting, the distance between the trees should, when possible, be for the former group 20 to 21 feet and for the latter 16½ feet. The premiums will be paid during the year preceding the first crop of rubber, but none will be paid where the trees have been inefficiently treated.

ESTABLISHMENT OF EXPERIMENTAL STATIONS.

The government will establish experimental stations for the study of all the factors in the culture of the rubber produced in the respective regions. For *Hevea* these stations will be at convenient points in the Territory of Acre and the States of Matto Grosso, Amazonas Pará, Maranhão, Piauhy and Bahia; while those for *Maniçoba* jointly with *Mangabeira* will be in the States of Piauhy, Ceara, Pernambuco, Bahia, Minas Geraes, São Paulo, Goyaz, Parana and Matto Grosso. Planters will be furnished with precise data as to methods and processes for rubber production. The total area of each station will be from 80 to 100 hectares (200 to 250 acres); while each each one will include laboratories and museums. Annual bulletins will be issued of the work accomplished.

The position of director is to be held by a specialist in any one of the technical sections, while the technical positions may be filled by native or foreign professors of recognized ability.

WASHING AND REFINING OF RUBBER.

While it is hoped by means of the various facilities accorded in respect to rubber cultivation to place Brazilian rubber in a better position to compete in the world's markets, the proposals likewise include provisions for encouraging the washing and refining of crude rubber and for the manufacture of rubber goods. Although both subjects are treated in article 4 of the Act of January 5, 1912, and in article 23 of the decree of April 17, 1912, it will probably be simpler to consider them separately.

The premiums offered in respect to rubber refining are:

(1) 400,000 milreis ($133,000) to the first plant established in each of the cities of Belem (Pará) and Manaos, for refining *Hevea* rubber, which reduces the different qualities to a uniform and superior export type.

(2) 100,000 milreis ($33,000) to the first refining plant for *Maniçoba* and *Mangabeira* rubber in each of the States of Piauhy, Ceará, Rio Grande do Norte, Pernambuco, Bahia, Minas Geraes and São Paulo.

In order to have a right to the benefits of this article, the factory must have capital actually employed equal to four times the value of the premium.

Under article 23 of the later decree, there is an exemption from import duties and fees for all materials, machines, utensils and tools necessary for the construction and complete installation of the factory, as well as for all chemical substances, fabrics and various materials, combustibles and lubricants necessary for the operation and maintenance of the factory during a term of 25 years.

Article 24 provides for the formalities of application to the Minister of Agriculture by any one intending to claim these premiums.

The details asked for as to the proposed manufacture illustrate its prospective scope: "A descriptive memorandum in which the capacity of production of the factory is declared, the principal articles intended to be manufactured, the lowest price for which it is proposed to wash and refine rubber, which should be reduced, for each quality, to one superior type for exportation; in general giving the government all the information that will help it to form a correct opinion as to the nature and importance of the projected establishment."

PREMIUMS FOR MANUFACTURE OF RUBBER GOODS.

While the general provisions of the two decrees regarding the washing and refining of rubber equally apply to the manufacture of rubber goods (included in the same article), there are various points specially referring to the latter.

A premium up to 500,000 milreis ($166,000) is given to the first factory of rubber articles which shall be established in Manãos, Belem (Pará), Recife (Pernambuco), Bahia and Rio de Janeiro.

The provision for exemption from import duties on materials and supplies, as shown in the section applying to rubber washing, is evidently also intended to apply to the manufacture of rubber goods. Among provisions apparently referring specially to the latter is the right of appropriating lands required for the development of the factory, and the following clause defining the preference to be received from the government in its purchases: "A preference shown by the government in the purchase of the products used in the service of the army and navy, and the federal public departments, which shall be manufactured by the factories, when they can compete in quality with similar foreign articles—the contract for furnishing of same, arranging every three years with each factory, for those of their products which

were classified in the first place in the triennial expositions at Rio."

Any organization contemplating the erection of one or more of these factories will have to submit to the Minister of Agriculture an application with a general and detailed plan of the factories, an estimate of expenses of first establishment and a descriptive memorandum of the nature and importance of the projected establishment. The company would have to agree in the contract made with the Minister of Agriculture to the clause of reversion at the end of the combined term.

The provision that the capital invested must equal four times the value of the premium evidently applies to both rubber washing and manufacturing factories.

REDUCTION OF EXPORT DUTY ON RUBBER.

Article 12 of the January Act contains the following authority for the Federal Government to make arrangements with certain States and the Territory of Acre for the reduction of export duty upon wild rubber and the exemption of cultivated rubber from that burden:

"The executive power is authorized to enter into an agreement with the States of Pará, Amazonas and Matto Grosso, for the purpose of obtaining an annual reduction of 10 per cent. until the maximum limit of 50 per cent. of the actual value of the export duties placed by the States upon the *seringa* rubber produced in their territories, and the exemption from any export duty, for the space of 25 years, to begin from the date of this law, upon rubber of the same quality and derivation which may be gathered from cultivated plantations.

"At the time the agreement is effected, the executive power shall issue a decree making such reduction which the States may make in the export duty collected on the rubber of the Federal Territory of Acre and conceding an equal exemption upon cultivated rubber."

Export duties being a State prerogative, it was necessary to authorize special negotiations between the Federal Government and the authorities of the several States interested, with a view to the proposed reduction and abolition of export duties.

HOW TO ATTRACT RUBBER GATHERERS.

In discussing the rubber question in the "Boletim" of the Rio Ministry of Agriculture, Dr. Affonso Costa, of that department, has commended the remedial measures lately adopted. He added that the large numbers of rubber gatherers in the immense valleys of the Amazon are nomads and adventurers, who never settle down nor become attached to the soil. To attach them to their work it should be remunerative. The government of the republic will, he remarks, help by establishing centers for the production of alimentary substances throughout the Amazon valley.

PROPOSALS FOR ERECTION OF RUBBER WASHING PLANTS.

Following up the decrees of January 5 and April 17, 1912, which promulgated and explained the measure passed by the Brazilian legislature in the previous December, an announcement was issued by the Federal Government on August 29 last that tenders would be received on December 30 from all persons who may propose to establish any of the factories for the manufacture of rubber goods and for refining rubber, which were referred to in the act already quoted.

The act, it will be recalled, provided for three premiums: $133,000 for the first refining plant for *Hevea* rubber to be established in Pará and Manaos and $33,300 for the first refining plant for *Maniçoba* and *Mangabeira* rubber in certain other States, while a premium equaling $166,000 was allotted to the first factory for the manufacture of rubber goods at certain points.

In the "Diario Official" of February 9 the four following proposals (which had been opened January 31), were reproduced:

1. Goodyear Tire and Rubber Co. of South America; refining plants at Manáos and Pará.

2. G. Chauffour (representing French interests); refining plant at Pará.

3. Luiz Cantanhede de Carvalho Almeida and Arthur Haas; washing and refining plant for *Maniçoba* and *Mangabeira* rubber, on the bank of the river S. Francisco, near the city of Pirapóra, in the State of Minas Geraes.

4. J. D. Leite de Castro; refining plant for *Maniçoba* and *Mangabeira* rubbers in the State of Minas Geraes.

Special interest attaches to the first of these proposals, it being the only American one, and having been submitted by Mr. J. C. McFadgean, a director of the company who visited Rio for that purpose. He had brought with him credentials, establishing his technical and financial capacity, and had further deposited in the National Treasury government bonds to the value of more than $3,000.

MANAOS AND PARA PLANTS.

The Goodyear proposal closely followed the lines of the government instructions as to details of the proposed works and their prospects of success. It included the erection of two plants at Manáos and Pará, to cost, respectively, $584,503 and $834,937, with an estimated production of 40 and 100 tons per day. The prospective economy of the larger plant is thus demonstrated, and is shown in detail by the subjoined tables A and B, while table C illustrates the proposed mechanical equipment of the two plants.

MANAOS.

Building No. 1 (two floors), 237 x 119 feet, with two wings:
First floor to contain scales, cutting machines, tanks, washing and purifying machines.
Second floor to contain cutting and weighing rooms and five compressors, packing room and analytical laboratory.

Building No. 2 (one floor), 100 x 60 feet, to contain two tubular boilers furnishing steam to building No. 1, as well as small repair shop.

A workmen's village to be provided.

PARA.

Building No. 1 (two floors), 237 x 237 feet, with 4 wings:
First floor to contain scales, cutting machines, tanks, washing and purifying machines.
Second floor to contain cutting and weighing rooms and ten compressors, packing room and analytical laboratory.

Building No. 2 (one floor), 100 x 60 feet, to contain two tubular boilers furnishing steam to building No. 1, as well as small repair shop.

A workmen's village to be provided.

GENERAL FEATURES OF CONSTRUCTION.

The application of the Goodyear company states that the buildings will be constructed of iron combined with cement or brick and cement masonry. Windows and doors are to be of iron. The first floor is to be cemented and the second floor executed in cement with a covering of tiles. Electric light would be used internally and externally. Drains would be provided, as well as a supply of water for drinking purposes and industrial uses.

GENERAL NATURE OF OPERATIONS.

According to the terms of the application, the operations of the company would include the receipt of rubber to be weighed on arrival and after treatment. Each customer's rubber would be treated separately, official inspection being allowed of the refined product, which would be packed in cases of the standard capacity of 220 pounds. The charges would be 3 cents per pound of crude rubber entering the works, with a further charge of three-quarters of a cent per pound of dry rubber after treatment.

PROSPECTS OF THE REFINING INDUSTRY.

In the explanatory portion of the application, the need of full and continuous occupation is urged, as necessary for the profitable operation of the works. To attain this result the whole or a great part of the rubber produced in Brazil would have to pass through the refining works.

The principal value of the plants would be in the establishment of standards, in accordance with which the products would be stamped and classified. Such arrangements, it is urged, would constitute a guarantee, alike for producer and dealer, and would go far to meet the complaints of irregularity brought against Brazilian rubber in foreign markets. The *crux* of the situation is met by the suggestion that the prosperity of the refining plants would be secured by the rubber-producing States imposing higher export duties on rubber lacking in purity than on rubber washed and cleaned. Without such regulations, it is added, refining plants could not make their way, especially in view of the taxes they would have to pay.

Such are the principal features of the proposal of the Goodyear company, which has undertaken, in the event of same being accepted, to begin construction of the plants within six months from the date of contract and to have them in operation within eighteen months.

(A)—ESTIMATE FOR MANAOS PLANT.

The cost of all the buildings and installations (daily production 40 tons) will be as follows:

	Brazilian.	American.
Building No. 1, with 2,610 square meters (about 28,083 square feet) in two floors.	696,000$000	$232,000
Building No. 2, with 554 square meters (about 5,961 square feet) in one floor..	83,100$000	27,700
Worker's village	180,000$000	60,000
Machines and installation of power and steam plant	80,000$000	26,666
Refining machinery and installation properly so called	520,000$000	173,333
Repair shop and case factory	35,000$000	11,666
Contingencies 10 per cent	159,410$000	53,138
Total	1,753,510$000	$584,503

(B)—ESTIMATE FOR BELEM (PARA) PLANT.

The cost of all the buildings and installations (daily production 100 tons) will be as follows:

	Brazilian.	American.
Building No. 1, with 5,220 square meters (about 56,160 square feet) in two floors.	1,044,000$000	$348,000
Building No. 2, with 554 square meters (about 5,961 square feet) in one floor..	83,100$000	27,700
Workmen's village	250,000$000	83,333
Machines and installation of power and steam plant	90,000$000	30,000
Refining machinery and installation properly so called	775,000$000	258,333
Repair shop and case factory	35,000$000	11,666
Contingencies 10 per cent	227,710$000	75,905
Total	2,504,810$000	$834,937

(C)—PROPOSED INSTALLATIONS OF MACHINERY.

	Manáos. (Production 40 tons daily)	Pará. (Production 100 tons daily)
Building No. 1 (first floor).		
Scales	2	2
Machines for cutting bails of rubber	4	10
Tanks for softening rubber	4	10
Washing machines	4	10
Purifying machines	12	30
Second floor.		
Compressors	5	10

BRAZILIAN COMMENTS ON THE GOODYEAR COMPANY'S PROPOSAL.

It is natural, of course, that more or less local opposition should be expected against the entrance of a big American company into the rubber industry of Brazil. Obviously some such opposition is felt, as can be seen from sundry comments in Brazilian papers. Commenting on the proposal of the Goodyear company, for the establishment of rubber refining plants, a correspondent of the "Jornal do Commercio of Rio" specially opposes the suggestion for the rubber producing States to place higher export duties on rubber which had not been cleaned. Such an arrangement, it is urged, would give the Goodyear company a monopoly. Objection is also made to the words "of South America" being used in the title.

In dealing editorially with the subject, the journal questions the assertion that the Manáos plant with the equipment shown could treat 40 tons a day, or the Pará plant 100 tons, placing the output at a much smaller quantity.

A comparison is drawn between the figures of the French proposal and that of the Goodyear company, by which it is shown that the latter claims to be able to turn out 100 tons a day with two boilers, while the former only indicates 27 tons as the prospective daily output with six boilers. It is also questioned at what point a complete washing of the rubber may be considered as having been effected.

By the repeated mention of the three other competing proposals it would seem that these utterances of the journal in question are not unprejudiced, and that they represent the anti-reform sentiments which exist in various forms in Brazil.

AWARDS MADE FOR WASHING PLANTS.

Late advices, received just as this publication goes to press, state that the government awards for washing and refining plants had been made as follows:

For the Manáos plant, to the Goodyear Tire and Rubber Co. of South America.

For the Pará plant, to Gabriel Chouffour, of Paris.

For the Minas Geraes plant, to L. Cantanhede and Arthur Haas.

MR. HAZLETT BACK FROM SOUTH AMERICA.

Those who attended the International Rubber Exposition, held in the Grand Central Palace last fall, will remember the fine South American views and interesting lectures given by Mr. Dillwynn M. Hazlett, who has made a study of the South American situation—particularly in reference to its rubber industry. He sailed again for that country in December to acquaint himself with the scope of the exposition to be held later in Rio de Janeiro, and has recently returned. He delivered some illustrated travel lectures on the returning steamer, which were so much appreciated by his fellow passengers that they presented him with a silver desk clock combined with a perpetual calendar.

Mr. Hazlett is most optimistic in regard to the opening in South American markets for goods made in the United States. He expects to return to that country in June, and will represent a number of important American manufacturers at the International Exposition to be held in Rio next September. Where manufacturers do not feel like going to the expense of shipping heavy exhibits they can tell their story very effectively to those who attend that exposition through Mr. Hazlett's system of moving pictures, accompanied by explanatory remarks. Everybody enjoys a moving-picture show, and it really affords an effective and inexpensive way of telling one's story to an audience in a foreign country.

A Big American Rubber Factory for Rio de Janeiro.

THE BRAZILIAN GOVERNMENT ACCEPTS THE TENDER OF THE GOODYEAR TIRE AND RUBBER CO.

THE great awakening that has taken place in the rubber interests of Brazil during the last two years has been exceedingly significant in itself, but it has of late become more interesting because of the important part that an American manufacturing company promises to play in it.

The leading men of Brazil began two years ago to discuss seriously the steps that it would be necessary to take if Brazil was to keep its old commanding position in the rubber producing world. This discussion finally resulted in the act of the Brazilian Congress of January 5, 1912, which was further elaborated by the decree of April 17, 1912. This act and this decree have been described in considerable detail in the pages of THE INDIA RUBBER WORLD—especially in the issues of March and June of last year. It was the purpose of this legislation to encourage—by the offer of generous inducements—domestic and foreign capital to embark in the various forms of the rubber industry already established in Brazil, and also to enter upon new phases not hitherto attempted in that country, but which in the opinion of the legislators could be inaugurated with great benefit to the state.

Among the inducements for the entrance of new capital into the rubber field were certain large prizes offered for the first important washing and refining plants opened at sundry Brazilian points. Among those who have entered this competition and tendered bids to erect such refining plants is the Goodyear Tire & Rubber Co. of South America, a child of the Goodyear Tire & Rubber Co., of Akron, Ohio. The inducements offered by the Brazilian Government for the building of refining plants and the tender made by the Goodyear company, to erect two such plants—one at Pará and one at Manaos—are given in detail in another article which will be found on page 345 of this issue. But the Goodyear company was not content to enter the Brazilian field with a plant for washing and refining, but also made a tender under that paragraph of the decree of April 17, which offered a premium amounting to about $166,000 to the company that should first erect a plant in Brazil, in one of several points mentioned, for the manufacture of rubber goods, under the detailed specifications cited in that decree.

The bid of the Goodyear Tire and Rubber Co., which will be found quite fully described a little farther on, covered the erection of a factory at Rio de Janeiro, and a cable recently received from the American Consul at Pará states that this offer has been accepted by the committee appointed by the government to pass upon the bids submitted; and unless some untoward event arises to change the present plans, it is highly probable that within a year's time, a large rubber manufacturing plant—the first one on the South American Continent—will be in operation in the chief city of Brazil, owned and operated by an American manufacturer.

This entrance into the foreign field by the Goodyear Tire and Rubber Co. was not the result of any sudden impulse; its directors evidently have had such an ambition for some time. Two years ago or more they had practically completed arrangements with President Diaz of Mexico for the erection of a rubber goods factory in that Republic, under conditions that would have been exceedingly favorable to the company. But the revolutionary disturbances that came soon after, accompanied by the flight of Diaz and the ascendency of the unfortunate Madero, brought all these plans to naught. The company then sent Mr. J. C. MacFadgean to South America to look over the situation there. He made a careful investigation, first of Buenos Aires and then of Rio de Janeiro, the latter place appearing to him to offer the best advantages as a site for such a factory. He returned to Akron and made his report and then went back to Rio with Mr. Litchfield, the factory superintendent, and together they went still more thoroughly over the ground. They were satisfied that it was an exceedingly promising field, and they located a site where there was abundance of water. Then in order properly to prosecute the enterprise the Goodyear Tire and Rubber Co. of South America was incorporated under the laws of the State of Maine, in Augusta, Maine, on October 14, 1912. The certificate of incorporation states that "The purposes of said incorporation are to engage in, carry on and license others to carry on the business of manufacturing articles from rubber and other materials; to lease, purchase, or otherwise acquire, and to hold lands for the cultivation, collection and refining of crude rubber; and to do all things incidental thereto." Further amplification of the purposes of the company, as given in the certificate, permits it to engage in practically any sort of undertaking (except banking and insurance) anywhere in the world where not contrary to the laws of the community in which the enterprise is to be undertaken. Specifically it is the intention of the company to manufacture tires, mechanical rubber goods, insulated wire and druggists' sundries. With this charter and armed with credentials not only from the State of Ohio, but from the authorities of Washington, Mr. MacFadgean returned to Rio de Janeiro and got into communication with the government. Hearing what was under way a number of Rio de Janeiro people went to England and interested capitalists there in the same enterprise. However, either they were not sufficiently familiar with the conditions or did not put their proposals in proper shape, for they were not successful. The bids were submitted to the Defesa da Borracha, a commission of which Raymundo P. da Silva is the head, and after several adjournments the bids were opened and read at a public hearing and published in the "Diario Official." Then a committee of five, consisting of four prominent professional men in Rio, and J. Simeo de Costa, whose knowledge of rubber is recognized, was appointed to pass upon them, and the bid made by the Goodyear company was the one accepted.

The Goodyear people plan to have their factory in operation inside of a year. They intend to take the foremen of the departments from Akron, and they purpose also to send a number of young Brazilians to the great Ohio rubber centre to learn the rubber business. One interesting feature of the enterprise will be the erection of several hundred cottages for the employees. In addition to giving them suitable shelter, the company proposes to furnish them with a substantial and wholesome mid-day meal. The specifications of the tender made by the Goodyear company and accepted by the Brazilian Government are as follows.

THE PROPOSED GOODYEAR MANUFACTURING PLANT AT RIO.

The Rio "Diario Official" of February 13, following up the proposals of the Goodyear Tire & Rubber Co., published February 9 (reproduced on page 346 of this number) for washing and refining plants at Manáos and Pará, published the text of that company's estimate for a manufacturing plant at Rio. While in various points it is based on the same fundamental principles as the washing plants, it is of a much more extensive character, as may be seen by a comparison of the various estimates, that for the manufacturing plant being subjoined.

Briefly summarizing its main features, it will cover a space exceeding 150,000 square feet and will have 10 buildings, each with three floors, in which will be conducted the operations connected with practically all branches of the rubber manufacturing

industry. As the company owns lands of the area of about 800,000 square feet, it will have ample room for further extension.

It is contemplated to distribute the prospective large product of the company, not only in Brazil but throughout South America and the East. The last named form of distribution is evidently based on using the Panama Canal. In view of expected requirements the Goodyear Tire & Rubber Co. of South America, proposes to employ a capital of $3,000,000 in the enterprise, which capital would be increased as necessary. The supply of water for drinking purposes, as well as for industrial uses, is said to be abundant.

Importance is attached to the contemplated attraction to Rio de Janeiro of an influential group of experts in all branches of rubber manufacture. Among the articles it is proposed to manufacture besides those named in the estimate are: Combinations of rubber and asbestos; waterproof fabrics, and industrial preparations of rubber.

In the application, stress is laid upon the necessity of maintaining the principles of fiscal protection, without which no premiums and no amount of government support would be efficacious. Such are in brief the main features of the proposal of the Goodyear company for the erection of a rubber goods factory at Rio, with which it is hoped to gain the premium equal to about $166,000 as provided by the law.

ESTIMATE OF THE COST OF A RUBBER MANUFACTURING PLANT AT RIO, AS SHOWN IN THE PROPOSAL OF THE GOODYEAR TIRE AND RUBBER CO. OF SOUTH AMERICA.

	Brazilian.	American.
Acquisition of ground	400:000$000	$133,300
Construction of ten buildings covering an area of 14,253 square meters (152,507 sq. ft.) in three floors	2,069:020$000	689,673
Workingmen's village	550:000$000	183,300
Electric plant for 750 h. p.	180:000$000	60,000
Machinery and installation for washing and refining	60:000$000	20,000
Section of maceration and calenders: Machinery and installation	180:000$000	60,000
Section of pneumatic tires, etc.: Machinery and installation	90:000$000	30,000
Vulcanizing section: Machinery and installation	155:000$000	51,666
Section of electric wires and cables: Machinery and installation	360:000$000	120,000
Section of hose and rubber tubing: Machinery and installation	90:000$000	30,000
Section of shoes and accessories: Machinery and installation	80:000$000	26,666
Section for belting, etc.: Machinery and installation	70:000$000	23,333
Section for toys and stationery articles: Machinery and installation	40:000$000	13,333
Sections for air goods, etc	20:000$000	6,666
Section for surgical and pharmaceutical goods: Machinery and installation	25:000$000	8,333
Small sections: Machinery and installation	35:000$000	11,666
Repair shops	60:000$000	20,000
Electric lighting, water and fire service	250:000$000	83,333
Tramways, railways and switches	80:000$000	26,666
	4,794:020$000	$1,597,935
Contingencies 10 per cent.	479:402$000	159,869
Totals	5,273:422$000	$1,757,804

One interesting phase of the particular paragraph of the Brazilian act which has to do with the encouragement of the building of a rubber factory is the list of manufacturing ingredients that are to be admitted free. This list was made up from "Crude Rubber and Compounding Ingredients" written by the editor of The India Rubber World; but unfortunately the list was compiled by some one evidently not familiar with rubber compounding, and consequently contains some irrelevant items and omits some of material importance. For instance, whiting and litharge are omitted—the two most important compounding ingredients, while certain other articles are mentioned which are not to be found in any market. Kamptulicon appears on the list, which in reality is nothing more or less than linoleum. Okonite is also on the list, which would appear to enable the Okonite Co. to send in their insulated wire free.

The advantage of a rubber goods factory in Brazil, over all competitors outside, in securing the South American trade, is very obvious, as, in the first place, crude rubber exported from Brazil pays a duty of 20 per cent., and in the second place, manufactured rubber goods imported into Brazil, and the neighboring countries, pay exceptionally heavy duties, and it is reported that a law will be passed by the Brazilian Legislature to advance the import duties where necessary so as to give the Goodyear company a practical monopoly. And it is said to be the intention of the Goodyear company to seek not only Brazilian trade, but the entire trade of South America, including Argentine, Paraguay, Uruguay, Chile, Peru and the other republics.

The present consumption of rubber goods in South America is not so very large, although it affords a very substantial market on which to begin operations; but the possible South American market which can be secured by an enterprising manufacturer making just the goods that the market demands, is an extensive one. The total imports of manufactured rubber goods into South America for the year 1912 from the United States amounted to $600,000, divided about as follows: Packing and belting, $188,000; footwear, $81,000; auto tires, $46,000; other tires, $50,000; all other rubber goods, $235,000.

The last complete statistics of the imports of manufactured rubber goods into South American republics from all sources cover the year 1909, when the imports from America amounted to only one-tenth of the entire rubber goods imports. Presumably about the same relation exists today, which would indicate that the entire consumption in South America of imported rubber goods is something like $16,000,000 a year. It would appear on the surface as if the new factory at Rio de Janeiro ought to get a very large part of this trade, and under the advantages of crude rubber and other ingredients free from duty as against competitors, all of whom have to pay Brazil's export duty on the crude rubber, and high import duties on the manufactured article, it ought to be able to market its products at a price that would greatly and rapidly increase the demand for its goods.

The proposal of the Goodyear company includes an agreement to commence manufacturing within the term of 12 months from the signing of contract, as well as a clause for reversion to the government in 90 years.

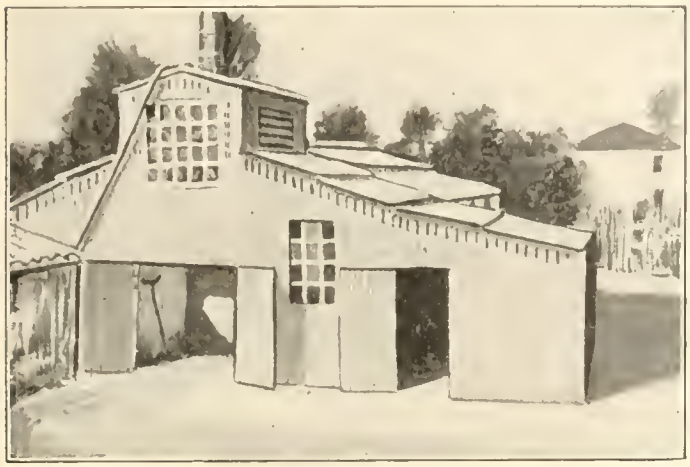
Late advices, received just as this publication is going to press, state that the Brazilian Government, in addition to granting the Goodyear Tire and Rubber Co. of South America an award for a rubber factory at Rio, has given an award for a rubber factory at Pernambuco to the Companhia Norte Brazil; which would seem to indicate that while the Rio factory will enjoy advantages as against outside competitors that will be practically prohibitive, it is not to have an absolute monopoly of rubber manufacture in South America. Possibly there is to be a division of the field, each factory confining itself to certain lines of manufacture. Advices received up to the present time give no information regarding this point.

INVESTIGATION INTO TAPPING METHODS.

The Agricultural Department of the Federated Malay States is carrying out some interesting experiments in regard to tapping methods, with a view to ascertaining the effect upon yield of the number of cuts per tree. Figures will be shortly available.

Rubber Washing in Bahia.

IN September, of the year 1910, the Jequié Rubber Syndicate, Limited, erected a custom washing plant at 59 Avenida Luis Tarquinho, Bahia. This was the first plant designed for general rubber washing to be established in Brazil. The buildings were erected and the machinery set by Mr. George A. MacNab, a



First Rubber Washing Plant in Brazil—Jequie Rubber Syndicate, Limited, Bahia.

competent rubber machinery expert, for some time in the employ of David Bridge & Co., of Manchester, England. The washing machinery consisted of 2 Dessau washers producing irregularly shaped chunks weighing from ¼ to ½ pound each—the product being called "Rock" rubber—and 3 roller washing and creping machines, built by David Bridge & Co. The capacity of the plant was 1½ tons per day. The charge per cleaning the rubber was from 300 to 400 reis per kilo (from 4½ to 6 cents per pound), according to the dirtiness of the rubber.

According to the law passed in April, 1912, a premium of 100:000$. (about $30,000) was to be paid for the first factory

Washing Plant of the Lafayette Rubber Estates, Limited, Machado Portella, Bahia.

established in Bahia for the washing of Manicoba and Mangabeira rubber. The Jequié Rubber Syndicate, Ltd., applied for this premium, but it was claimed that they had not complied with certain provisions of the act, and they were never able to collect it.

There is still another washing factory in Bahia, a small one owned by S. Hess & Co., which is now in operation. Still a third one is now being erected by the Villa Nova Estates and Trading Co., of London and Bahia, and associated with the Companhia Nacional de Artefactos da Borracha. Local directors are Sr. José Gama da Costa Santos and Theodore Oedekoven, Esq. The plant consists of a 70 h. p. engine and a Cochran Vertical Tubular boiler; one Werner & Pfleiderer Universal Roller Washer for producing "Rock" rubber; four David Bridge & Co.'s Roller Washers for sheet and crepe rubber; pumps, tanks and water heating apparatus; and also a separate cement-lined well set in the floor to collect the impurities, in order to obtain accurate data as to the quantity and character from each washing.

The plant is to have the capacity of 2,000 kilos (4,400 pounds) per day, and like the Jequié Rubber Syndicate's plant, is being erected by Mr. Geo. A. MacNab.

There are also several washing plants connected with the larger plantations; for instance, that of the Lafayette Rubber Estates, Limited, located at Machado Portella. Illustrations of the exterior and interior of this plant are here shown.

Interior View of the Washing Plant—Lafayette Rubber Estates, Limited, Machado Portella, Bahia.

It is interesting to note that the washing of the rubber in such tropical places as Bahia has developed difficulties that do not appear in the temperate zone, and many batches have been injured rather than helped by the washing. Some of the "Rock," for example, softens and breaks down before it reaches Europe or America. The Manihot is the easiest to wash, and the Mangabeira the most difficult. The latter, if badly coagulated, seems to decompose more easily after washing than before. Some of the Maniçoba also is so dirty that it costs 600 reis per kilo, or about 9 cents per pound, to wash. Air drying is accomplished in all the plants in Bahia by hanging the rubber on poles, in dark, well-ventilated lofts. Ten to twelve days are required to complete the drying process; when the rubber is ready to be boxed and shipped.

RUBBER IN THE HAWAIIAN ISLANDS.

The report of the manager, W. A. Anderson, at the annual meeting of the Nahiku Rubber Co. and the Hawaiian-American Rubber Co., gives assurance that the rubber industry will become established on a profitable footing in Hawaii. A total yield of 10,000 pounds is expected this year.

Farming By Dynamite.

By Harold Hamel Smith, Editor of "Tropical Life."

[A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.]

WHILE I have long suspected the possibilities of explosives in connection with agriculture, especially in the tropics, it has been only during the last twelve months that I have been able to satisfactorily demonstrate how very useful dynamite, and the other "ites" can prove, when used with discretion and by trained natives or Europeans. By their use both time and money can be saved, and better work done, both as regards the soil and the crops.

As regards the handling of these high explosives by natives, I would consider that any race or tribe which is intelligent enough to be trained to tap rubber trees, or extract pulqué from the maguey plant, as is done under the direction of white supervisors,

HAROLD HAMEL SMITH.

could be trained to handle these explosives, drill the holes, and pack in the cartridges under the same class of white directors, as with the rubber tapping.

I did intend to devote my paper to "Rubber Seed Oil," a subject to which I have given a considerable amount of attention of late, but have chosen the question of "Farming by Dynamite" instead, as it is more widespread and international in character, and is of special interest to an Anglo-American Tropical Congress. On account of the now widespread use of explosives on cultivations, I would first state that if I do not include the names of the leading centers which have lately been using or experimenting with them for breaking up soils (some of the farmers in the western states of America have, I understand, regularly blasted their ground for twenty or thirty years past, and obtained bumper crops thereby), nor mention the names of all the leading journals that have been good enough to open their columns to discuss the matter, it is not for want of appreciation on my part, of the important share that they have taken in helping us to become "at home" with the use and handling of explosives, but for lack of space and time at my disposal and yours. I must, on the contrary, be far more brief than pleases me, for this is a subject which, the more it is discussed, the more one can realize what can be done with dynamite, and hence the more one would like to say on its use.

Dynamite or other explosives—and for the sake of brevity let me say "right here," that every time I use the word dynamite, I mean to infer "or other explosive if more suitable"—can be used with advantage in agricultural industries for the following reasons:

1. To break up hard or virgin soil to facilitate ploughing; and especially to break up the under-crust, when present, which no plough could penetrate, at any rate no plough used by the average farmer or planter.

2. To blast out for removal, boulders, or rocks, and especially tree stumps, whereby not only is the risk of root disease removed, but, what is of great importance, the ground is left in a state to be easily and properly ploughed; which otherwise would be impossible in a satisfactory manner, if the stumps or rocks are left *in situ*.

3. For clearing the soil of pests, destroying ants' nests, or rabbit warrens, etc., etc., as well as for regenerating and aerating hard or worn-out soils generally—as the sugar-lands on some of the West Indian estates which are not ploughed, but only hoed; i. e., the surface only scratched over, but the hard pan sub-soil is left year after year, and so becomes water-logged and airless; hence dangerous.

4. For throwing up the soil for drains, especially deep gullies, and facilitating its removal by ploughs or hand.

5. For making holes for tree planting, and at the same time loosening the soil, which is a great advantage; also for fence-post holes, or for setting uprights for buildings, etc., in position.

6. For well-boring, or well-torpedoing—i. e., for increasing the flow from an artesian well by exploding a charge at the bottom of a well, to widen the aperture, and break up the ground, to let further supplies of water (or oil, if an oil-well) come through.

As time goes on, many other uses on the estates will no doubt be found, but as I do not pretend to have an exhaustive knowledge on the subject, I think I have said enough. Of course, I do not pretend to touch on the use of explosives for mining, since I speak only from the agriculturist's point of view; nor even of their utility for removing large masses of rock or soil for making estate roads, as the latter, although not uncommon, is too big and dangerous a task for the average planter, and should not be carried out without consulting an expert, one of whom nowadays is to be found at all large centers, especially in the neighborhood of mines.

"It must not be thought that dynamite obviates the necessity of top ploughing," very truly points out the "Queensland Agricultural Journal." "Far from it. The plough must be used just as much as ever. The only difference is, that the dynamite expends its disintegrating force in the sub-soil, which is never touched by the plough, so that one is not merely planting the crops in the same soil year after year," but can, by its use, enable the crops to draw up their nutriment from below. Where clay sub-soils form a water seal, the use of explosives, if correctly applied, breaks up the clay strata and so allows the accumulated and stagnant water to pass through (at the same time the explosion kills myriads of harmful lives), and dissolving the plant foods in the lower, and hitherto inaccessible strata, liberates it in such form that it can be drawn up by capillary attraction, and pass through with the now non-stagnant water to be assimilated by the crops. May I remind you here—as I reminded the readers of my book on "Coco-nuts"—of the need of regular, adequate supplies of water at all times, if you want good crops. Water is necessary, and therefore should constantly be at the disposal of the crops (provided, of course, if not in over supply), to convey

the plant's food in soluble form up to the crown. The quantity of such food assimilated or digested by the plant is roughly proportional to the amount of water which it absorbs—provided, of course, that the food is there to be absorbed; but the food alone is no use; without the water it cannot pass up the trees or plants and nourish them.

"Farming by dynamite," wrote the (London) "World's Work" last April, has gripped the United States and is spreading through Canada and Mexico like a prairie fire. "The farmers who have tried it, swear by it, and are upheld by the leading authorities in agricultural science." I can confirm this from the tropics. Since I first drew attention to the use of high explosives in tropical and sub-tropical agriculture, by reviewing a book (The Book of High Explosives, published by the Nobel Explosives Co., Ltd., of Glasgow), I have received innumerable applications for copies of the book and further information on the subject, right up to the time of writing these notes, which I stopped doing to order a copy to be sent to a cacao planter in Una, State of Bahia, Brazil. The "Queensland Agricultural Journal," already quoted, evidently found the same thing, for the editor writes: "Since the publication of our articles on the value of dynamite as an aid in clearing land, and to subsequent agricultural operations, judging by the numerous letters we have received from farmers and fruit growers seeking further information on the subject, much interest—we might almost say enthusiasm—has been aroused in many parts of the state in connection with the use of dynamite on the land;" while the "Times of Ceylon" quotes the following instance of its use for rubber planting by a Kelani Valley (Ceylon) rubber planter, using only ordinary dynamite cartridges: "First of all he used a quarter of a cartridge, then a half, and then a full one, and kept data of the area of ground disturbed when the quantities of dynamite had been fired. The plough only breaks up the top surface, so that the water mingles and dissolves the plant nutriment to a depth only of a few inches. The sub-soil, however, remains intact, and the roots of the crops have to feed upon what they can obtain from the land broken up by the plough. But breaking the land up by dynamite disturbs it to a depth of several feet, letting in the water which dissolves the essential nutriment, while the roots are able to descend to a greater depth and thus secure their fill of food. Again, the roots are allowed to grow downwards and not laterally; thus they do not encroach on the feeding areas of the adjacent trees, which is the case when there is only a top shallow layer of porous soil.

"The planter in question, we understand, has applied the new method to five acres of land and planted rubber trees therein. It is, of course, too early yet to judge the results in the growth of the plants. If the results are as good as anticipated it is very likely that the method will be widely adopted in Ceylon. The Red Cross dynamite was mentioned in the article which we quoted, but these not being procurable, ordinary dynamite cartridges were used in this case.

"Now that a local planter has started the method here," continued the paper, in its comments on the experiment, "it will not be out of place to quote one section of a recent article on the subject, which is of especial interest to planters: 'Possibly what at first sight appears to be the strangest application of dynamite is for the purpose of planting trees, yet its success in this connection is peculiarly remarkable. When a hole is made with a spade the surrounding soil is left in its hard condition. The result is that the roots find it difficult to start. They are cramped in the tight quarters of the hole and cannot pierce the surrounding hard wall of earth. Under these circumstances growth is appreciably retarded for a considerable time. With dynamite a large clean hole is blasted out and, in addition, the soil on all sides is loosened for five or six feet. When the tree is planted the young and tender roots force their way without effort through the crevices, sucking up nourishment, and commence to grow from the moment they are set, without any retardation whatever.' Those qualified to speak upon the subject are of opinion that this will bring trees forward at least a year sooner than those planted under the old conditions."

"A new profession has arisen of expert dynamite farmers," says "The Wealth of India," when commenting on the article in "The World's Work"; "dynamite is used for planting trees. The spade-made hole leaves the surrounding soil in a hard condition, and the roots find it hard to start. With dynamite a large, clean hole is blasted out, and the soil on all sides is loosened for five or six feet, thus enabling the trees so planted to grow twice as quickly as those set in the usual spade holes."

"We heartily commend the subject of 'Farming by Dynamite' to our readers"—writes the editor of "Grenier's Rubber News," at Kuala Lumpur, right at the heart of the plantation rubber industry in the Far East. "The consensus of opinion, at least among planters of the Federated Malay States, is that clean-clearing, which means the removal of all stumps and timber, is of paramount importance, and we feel sure that a perusal of the methods discussed" (in an article they published) "will convince planters that at last there is material available to accomplish the work expeditiously and economically."

"In South Africa," reports the "Home and Colonial Mail"—well known throughout India and the East—"experiments in ploughing by dynamite are becoming quite popular. It is claimed that operations can be carried out without injuring crops, and demonstrations are now taking place all over the Union with the object of fostering agriculture. The cost per acre is said to work out at between £2 10s. and £5 according to the nature of the soil and trees. Dynamite can be used for ditching, for constructing irrigation furrows, and other farming purposes."

All the leading papers in the rubber producing world, as well as those devoted to planting interests elsewhere, recommend attention to the use of dynamite for estate work. Its use especially appeals to me for out-of-the-way sections, and especially in Latin America, where the transport, even of the lightest make of ploughs, is difficult and costly, often impossible. In centers where the *tsetse* or other pest discourages the use of draught animals, the use of explosives should rapidly increase. Possibly the shocks, if not the actual explosions, might diminish the pests, especially if steps were taken to attract them to the spot by bait, in the shape of food to which they are partial. In locust infested soils, the numbers of these pests, at all stages, even when in flight, could be greatly reduced by organized explosions to greet them with a *feu de joie* whether in the soil as grubs or flying over it. But there is no need to extend the list. You whom I am addressing are far more able than myself to think them out. I would, however, say in conclusion, that planters of cocoanuts, fibres, Ceará rubber, and other crops which can be grown to advantage, when scientifically cultivated, in almost semi-arid districts, will find the use of explosives a great aid as the following letter, written from Kalkudah, in the Eastern Province of Ceylon, to the editor of the "Times of Ceylon" (see their issue of June 20, 1912) tends to prove:

"I read with great interest the articles *re* 'Farming with Dynamite' in the 'Times of Ceylon.' I believe this method will gain popularity in the Eastern Province, as there is a slab of coral from the coast here to one-and-a-half miles inland, or further, and this runs from 2 to 9 ft. below the surface, in some places measuring 18 to 24 in. in thickness. It is not porous, but in some parts is soft and limy. There is water immediately below this slab, but the coco-nut roots cannot get to the water, and the trees are therefore greatly affected by the drought, and large sums of money have to be expended in watering plants. One notices patches of coco-nuts, old enough to give large crops, looking sickly, with not even a blossom on them. This is mainly due to the existence of this slab, which had not been broken through before planting out. Dynamite blasting will do more for these than tons of manure. A hole drilled in between every four plants through this slab and blasted with dynamite

will crack up this slab, and enable the roots to find their way to the water, which is just underneath it.

"Again one finds that, after rain, the water remains in some places for weeks on the surface, affecting all the trees or plants in that area. This, too, would not occur if the slab were broken up, as the water would find its way through the cracks. In some places here, where this slab was broken through before planting out, the plants require very little watering, and the bearing trees are healthy and full of crop even during the severest drought. The method used in these places is to cut down to the slab and break it with pick-axes at a prohibitive cost. If holes could be drilled and dynamite used, the breaking up of the slab will be much greater and the cost less than half. Perhaps the cost of holing with dynamite and planting will be slightly higher, but there will be a great saving in watering, and the chances given to plants to strike root and bring them earlier into bearing will amply repay this. Even in bearing fields where this slab occurs it would be well to have it broken up a little and allow the roots to find their own water.

"It would be interesting to hear of results of a few experiments and also have the views of some of the veteran planters of the Eastern Province on the subject."

In conclusion, I hope to see further reports on the matter, not only over coco-nuts, but in connection with rubber-planting and tropical agriculture generally. Meanwhile there is no doubt that explosives have not only come to stay as a necessary auxiliary to modern agricultural science, but their use will extend on all sides until they occupy a prominent position therein.

A Brief History of Fire Hose Specifications in the United States.

By E. A. Barrier, Factory Mutuals Laboratory.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

THIS paper is not presented as a brief in defence of the present Underwriter Hose Specifications, but is intended to relate the more important events which have led to their development.

The statement, still occasionally heard, that fire hose is installed principally for fire insurance inspectors to look at, was evidently the standard used by a large number of manufacturers previous to 1890. The quality of hose, especially that for private equipments in those days was truly remarkable. It was a matter of common occurrence for length after length to burst at pressures well under 100 pounds and if the rubber lining stayed soft and pliable for two years, the purchaser could consider himself lucky. Frequently the backing would fail, allowing the lining to separate from the fabric and occasionally the lining would be ripped out by the water and be washed along with the stream, plugging the nozzle. It is true that in many cases the price of the hose was so low that a good grade could not have been expected, but this does not alter the fact that the situation was a serious one and badly in need of improvement.

Steps in this direction were first undertaken by Mr. John R. Freeman, then connected with the Inspection Department of the Factory Mutual Fire Insurance Companies, and now one of the foremost hydraulic engineers in the country, although still connected with the Mutual Companies in the capacity of president of several of the individual companies. Mr. Freeman had previously, in 1888, conducted a series of experiments on the hydraulics of fire streams, in which he found that the character of the waterway in the hose had a marked effect upon the friction loss or drop in pressure. Thus, with a badly corrugated mill hose, the drop in pressure per 100 feet with 240 gallons flowing per minute in 2½-inch hose, was found to be 25½ pounds, while with the smooth hose, the drop in pressure was only 14 pounds. In other words, if 200 feet of hose were being used in a line, it would require a pressure of about 73 pounds at the hydrant to give a good fire stream with good hose, while with poor hose it would require a pressure of 95 pounds.

In view of the importance of this matter, the question was taken up with a number of the largest hose manufacturers. In the numerous conferences which followed, the discussion spread from friction loss to include cotton fabric, rubber lining, bursting strength, elongation, etc. Practically all agreed that the fire hose situation, especially with respect to private equipment hose, needed improvement, and most of the manufacturers were in favor of specifications. Finally, after a large number of tests had been made and many lots of hose examined in the field, the first set of Underwriter Hose Specifications were agreed upon and published in July, 1896.

It should be mentioned that in these first specifications, it was originally suggested that all reference to the kind of rubber in the lining be omitted, but many of the manufacturers objected, stating that if the kind of rubber was not specified, some unscrupulous manufacturers would take advantage of those who were honest by using an inferior rubber. Accordingly a clause specifying the kind of rubber was inserted, and it was the concensus of opinion that 40 per cent. of pure Pará should be required. This unfortunate wording, which later gave rise to the question as to what was meant by pure Pará, has been the cause of more discussion than any other clause in these specifications. There is ample written evidence, however, to show that at the time the original specifications were written, and for several years after, everyone interested in hose specifications understood that pure Pará meant fine Pará.

The whole idea in this matter of specifications was to obtain a list of manufacturers whose product could be depended upon, and which could be recommended to mills insured in the Factory Mutual Companies. This idea had been and was being developed in many other lines of fire protection appliances at the same time. The plan of procedure used then, and which has not been changed in any important particular, was as follows: Any manufacturer desiring to have his hose placed upon the approved list, had only to make known his desire and send in samples of commercial hose for test. If the samples were found to conform with the specifications, his name was placed upon the approved list without charge for the tests.

In these early days, the words "Factory Inspection" were not used, but it was understood that representatives of the Mutual Companies would be welcome to visit the factories of the hose manufacturers at all times. Although no systematic plan of inspection was carried out, many such visits were made to the factories, and without objection on the part of the manufacturers.

From the time the first specifications were published in 1896, no change was made until 1900, and at that time the changes were of no great importance. In the meantime, the National Fire Protection Association had been formed and the Underwriters' Laboratories established. At this point it may be stated that although the National Fire Protection Association is a national association of those interested in the prevention of fire, in reality, through a large preponderance of members affiliated with stock insurance companies, it is controlled largely by the stock companies.

In 1889 the National Fire Protection Association adopted a set of specifications for hose which were very similar to the Factory Mutual Specifications of 1896, but enough different to cause some confusion among the manufacturers. It became evident at once that where these two organizations covered the

greater part of the field, it was desirable that their specifications should be uniform. With this idea in view, a number of conferences were arranged, and finally a "National Standard" satisfactory to both parties was adopted in May, 1902. Only two important changes from the original specifications were made. One item regarding stretch of the rubber lining to five times its original length, which had appeared in the N. F. P. A. Specifications, was omitted, and another item requiring a test of 200 pounds on each 50-foot length, not originally in the Mutual Specifications, was added. From that time to the present the specifications for underwriter hose for both organizations have been essentially the same, although their ideas regarding the method of enforcement have differed widely.

The intervening years up to 1911 were occupied with the continual testing of samples from the field and from the factories and the gradual accumulation, especially in the later years, of evidence that most of the manufacturers of hose were not turning out a product made in accordance with the specifications. During this time the methods of rubber analysis and testing developed considerably, and the Insurance Laboratories made an effort to keep pace with the progress. In this way the number and character of the analyses and tests made in connection with the examination of hose gradually changed. It should be noted, however, that the chemical and physical tests which were used, were employed merely as laboratory standards with the idea of determining whether or not the specifications had been complied with. Owing to the fact that many points in connection with rubber testing had not been established with the same degree of certainty as in other lines of chemical work, some of the manufacturers did not neglect the opportunity to deny the findings of the laboratories, although in many instances the cases were so clear cut as to leave no question.

A typical example of this kind taken from many others, is one where a certain lot of hose which failed after four years' service was sent by the assured to the Factory Mutual Laboratories for test. An acetone extract of over 20 per cent. was found after deducting the free sulphur, and a small percentage of wax, and this, in connection with other chemical tests, showed beyond question that the requirements regarding rubber in the specifications had been seriously violated. Notwithstanding this evidence, the manufacturer steadfastly maintained that the lining contained only a mixture of fine and coarse Parás. He even went so far as to claim that he could show samples of Pará which would give an extract of 20 per cent. He also obtained a sample of the lining which he submitted to an independent chemist for analysis. Needless to say his proposal to submit a sample of Pará containing 20 per cent. resin extract never materialized, but a representative of the manufacturer called up on the telephone some time later, and stated that he had a report from his chemist showing that the lining in question had consisted only of Pará, as he had claimed. He was requested to bring in the report, but although that was four years ago, it has not put in an appearance as yet, and the manufacturer finally agreed to replace the hose with another lot fully in accordance with the specifications and without charge to the assured. The hose was replaced in time and to make a long story short, suffice it to say that the second lot was no better than the first. The manufacturer was surprised to learn that we had tested the second lot, but after an extended controversy agreed to replace the hose again.

This case, although in some of its features a little more extreme than most of the others, is simply a sample of similar incidents that took place, and which made it very difficult for us to appreciate the position of some of the manufacturers whose integrity had previously never been questioned. These controversies also made it evident that before the hose situation could be definitely cleared up, it would be necessary to include as part of the specifications the laboratory standards which had been used in testing hose.

In the meantime, in 1906, the Underwriters' Laboratories of Chicago developed their system of "Label Service." In brief, this system required that an inspector should be stationed at the factory and inspect every length of hose sent out; also that each length should bear a label stating that the hose had been manufactured under the supervision of the Underwriters' Laboratories of Chicago. Samples of hose could be taken at any time and shipped to the Underwriters' Laboratories for more detailed tests than could be conducted at the factory. The labels were to be purchased by the manufacturers from the Underwriters' Laboratories at the price of 25 cents each. Owing to several objectionable features which it was found impossible to have removed in spite of a number of conferences, the label service has never been adopted by the Mutual Companies.

The proposition, although at first opposed by some of the manufacturers, was adopted by a few of them. Owing to various differences of opinion and controversies, however, these few manufacturers later dropped the labels and during 1909 and 1910, all of the manufacturers on the Approved List of the Chicago Laboratories were dropped. The opposition to the label service on the part of the manufacturers was very bitter and for over a year their ranks were kept unbroken. In the early part of 1911, however, two of them submitted samples of hose to the Underwriters' Laboratories, which were approved, and adopted the label service. Later in the year another manufacturer followed. At the present time these three are the only ones using the labels.

The system has been developed, it is understood, until now the inspector at the factory supervises the washing of the crude rubber, the weighing and compounding of same and the calendering and making up of the tubes. In short, the rubber from the beginning of the manufacturing operations until the hose is completed is either in the inspector's presence or under lock and key kept in his possession. The tests which the specification require are made on every length, and are conducted in the presence of the inspector.

In 1908, the National Board of Fire Underwriters undertook the preparation of specifications for public fire department hose, both cotton, rubber-lined and rubber-covered. Regarding the history of the development of these specifications the writer has no detailed knowledge since the Mutual Companies have, as an organization, never taken a sufficiently active interest in this matter to warrant drawing up specifications for this class of hose.

In brief, however, it may be stated that after a long series of conferences between the National Fire Protection Association and the manufacturers, a set of specifications were drawn up which, at the time, were satisfactory to both parties, and which allowed a much lower grade of rubber than the present specifications. The manufacturers insisted, however, that these specifications should be used merely as a laboratory standard, and not furnished freely to purchasers. In other words, hose would be approved by the Underwriters' Laboratories without its becoming generally known that it was all made in accordance with a definite set of specifications. Whatever may have been the understanding, or misunderstanding, the specifications were used freely throughout the country by the Underwriters' Laboratories. The manufacturers accordingly cancelled their agreement and dropped all negotiations. The N. F. P. A. later worked out a much more stringent set of specifications which were proposed at the annual meeting in May, 1911, and formally adopted in May, 1912. The requirements regarding rubber lining in these fire department hose specifications are very similar to those contained in the underwriter hose specifications. The three manufacturers who have adopted the label for underwriter hose are also manufacturing label hose under the fire

department hose specifications, which we already referred to.

As previously stated, the accumulated experience of the Factory Mutual Laboratories during the last five years showed that much more specific and definite requirements regarding rubber lining would have to be included in the specifications before the situation could be improved. A considerable amount of experience backed up with experimental work showed pretty clearly what was necessary to produce good hose, and a new set of specifications were accordingly drawn up in the latter part of 1910. At the same time the Underwriters' Laboratories prepared more definite specifications and presented them at the annual meeting of the National Fire Protection Association in May, 1911. The two specifications differed somewhat, however, and the matter was referred back to the Hose Committee in order that the two organizations might have an opportunity of agreeing upon a uniform standard. A number of conferences followed and a specification was finally drawn up satisfactory to both organizations. It was formally adopted by the Factory Mutual Companies in December, 1911, and by the National Fire Protection Association in May, 1912. Owing to the various delays, the Mutual Companies have not yet put these new specifications into effect, but in the near future the manufacturers of underwriter hose will be notified that after a certain date, approval will be withdrawn in cases where the hose is not made in accordance with the new specifications. The specifications have already been sent to the manufacturers and in a few cases they have voluntarily expressed their satisfaction with them and stated that they were heartily in favor of the change.

The most important points where the new specifications differ from the old are with respect to the rubber lining. The change consists simply of a more definite statement of what was required in the old specifications. The new specifications call for 40 per cent. of fine Pará instead of pure Pará, and specify tests which the compound must meet, including acetone extract, free and total sulphurs, alcoholic potash extract, tensile strength, elongation and the so-called permanent set.

In closing, it may be stated that the only object of the Mutual Companies in this matter of hose specifications is to make it possible for their members to obtain good hose. The work of testing and inspection is done without charge to the manufacturers, and it has always been the intention to treat them fairly and co-operate with them as far as they would allow.

Referring to the situation in 1908 between the manufacturers and the National Fire Protection Association the author says:

"It may be stated that after a long series of conferences between the National Fire Protection Association and the manufacturers, a set of specifications were drawn up which, at the time, were satisfactory to both parties, and which allowed a much lower grade of rubber than the present specifications. The manufacturers insisted, however, that these specifications should be used merely as a laboratory standard, and not furnished freely to purchasers. In other words, hose would be approved by the Underwriters Laboratories without its becoming generally known that it was all made in accordance with a definite set of specifications. Whatever may have been the understanding, or misunderstanding, the specifications were used freely throughout the country by the Underwriters' Laboratories. The manufacturers accordingly cancelled their agreement and dropped all negotiations."

OVER 100,000 AUTO-CARS IN NEW YORK.

The automobile is exceedingly popular in the State of New York. This State owns over one-tenth of all the motor cars of the United States. In 1912 the number of automobile owners registered with the Secretary of State was 107,262, an increase of 21,961 over the number recorded in 1911. In the same period 45,347 chauffeurs were licensed, an increase of 9,457 over the previous year. The registrations were divided as follows: Pleasure vehicles, 95,484; commercial cars, 9,767; dealers, 1,716; exempt vehicles, 295.

REPORT OF THE RUBBER SECTION OF THE AMERICAN CHEMICAL SOCIETY.

By D. A. Cutler, Chairman of the Section.

[Presented at the Third International Rubber Conference.]

In regard to what the Rubber Section of the American Chemical Society is endeavoring to accomplish, I would say that in the first place it aims to select or to elaborate standard methods for the analysis of vulcanized rubber products, and to define these methods with sufficient precision so that they will yield accurate results.

Having agreed upon such a series of analytical methods, the Section will endeavor to secure for them the endorsement of the American Chemical Society. If successful in this, the methods will then be published as the official methods of the Society. The great advantage of such official methods would lie in the fact that analyses made according to them would possess, in very high degree, impersonal validity. This would be an indispensable factor in cases of dispute, whether forensic or not, and in all cases in which the public might be concerned.

On the other hand, with reference to individual practice, our Section would have no desire to urge unduly the adoption of the official methods, but we do permit ourselves to hope that these methods will so commend themselves by their evident and inherent practicability, definiteness and accuracy, that chemists will be glad to adopt them in their practice.

In the second place, our committee is endeavoring to bring about uniformity in the manner of stating the specifications to which consumers wish the manufacturers of rubber goods to conform.

As to this matter we do not wish to be misunderstood. Our aim is not at all to formulate specifications of any sort, much less to impose them upon anyone. For if it is the province of the consumer to specify the goods which he will accept, and if it is equally the province of the manufacturer, after studying his market, to decide what goods he will make, we have no desire to interfere.

What the Section hopes to do in this field is to provide official terms and phrases and to define them so carefully and precisely that the consumer may state his specifications by means of them, if he will, without any ambiguity.

At present the Rubber Section of the American Chemical Society has over 100 members. These include nearly all the manufacturers of rubber products, as well as a great many consumers. The committee believes itself, therefore, to be in possession of exceptional facilities to serve both these interests.

There is no desire on our part to gain any information, or to pry into any processes or policies which the interested representatives may wish to guard, but it is our sincere desire to do what we may along the lines indicated, to minimize the chances of ambiguity, confusion, and misunderstanding between the manufacturers and consumers of rubber goods.

THE CHEMISTS TO GIVE A COMPLIMENTARY DINNER.

The presiding officers of six of the important chemical societies of the country, including The Chemists' Club, The American Institute of Chemical Engineers and The American Chemical Society, intend to give a dinner on April 19, at the Chemists' Club in New York—and at the same time to present testimonials—to Dr. W. H. Nichols, president of the Eighth International Congress of Applied Chemistry, "in appreciation of his unswerving fidelity to the welfare of chemistry of the United States, and more particularly for his self-sacrificing services in behalf of the recent congress." On the same occasion there will be a presentation to Dr. Bernhard C. Hesse, the secretary, "whose devotion to his duties gave constant evidence of high efficiency." Professor Edward W. Morley, the honorary president, has been asked to preside.

REPORT OF THE RUBBER COMMITTEE OF THE AMERICAN SOCIETY FOR TESTING MATERIALS: STANDARD SPECIFICATIONS FOR RUBBER PRODUCTS.

By E. B. Tilt, Chairman of the Committee.

PRESENTED AT THE THIRD INTERNATIONAL RUBBER CONFERENCE.

THE Executive Committee of the American Society for Testing Materials, appointed in December of 1911, a committee known as "Committee D-11 on Standard Specifications for Rubber Products." The first meeting for organization and the appointment of sub-committees was held in New York in February, 1912, and another meeting was held in New York in March, 1912, for a continuation of the organization and the distribution of work. Since then the sub-committees have been completing their organizations and gathering information relative to their work and data upon which to base specifications. Another meeting was held in September, 1912, in New York, and the present situation with reference to specifications on rubber products and the work of the different sub-committees was discussed. It is expected that a report of material progress, with perhaps one or more specifications covering rubber products, will be presented at the Annual Convention of the American Society for Testing Materials to be held in 1913.

The organization of a committee on Standard Specifications for Rubber Products by the American Society for Testing Materials is due to requests from a number of sources that a committee be organized to draw up specifications covering the following: Rubber Tubing, Air Hose, Steam Hose, Hot-water Hose, Cold-water Hose, Rubber Belting, Gaskets and Rubber Insulation, as well as Rubber Inner Tubes and Casings for Automobile Tires. Sub-committees have been appointed for all of these, excepting Rubber Tubing, Inner Tubes and Casings for Automobile Tires. In addition, sub-committees have been organized to gather data for specifications for rubber valves and for rubber tiling, and it is probable that committees will be appointed to cover cement, rubber rolls and other important rubber goods just as soon as the work at present in hand will permit.

It is expected that the specifications which are to be forthcoming will cover each product with tests, physical or chemical, or both, with instructions for making these tests, as well as description in detail of the construction desired, together with such physical dimensions as will permit of the manufacture of a standard product. It is not intended that other than commercial materials or articles shall be described by these specifications, and where necessary different grades will be included in the same specification, with such difference in the tests as may fix the limits. The intent is not to hamper the manufacturer, but to assist him to establish standards which will be the basis for the making of a reasonable price and which we hope will also be the guarantee of reasonable service.

It is unnecessary to debate upon the advantage from the consumer's point of view, of securing standard material in rubber products. Many of us are familiar with the difference in service given by similar materials, sold by different manufacturers. It is for this reason that standard materials are at this time most necessary.

The question as to what extent chemical analyses will be a part of these specifications, it is impossible now to answer, but each material will be covered by a chemical analysis in so far as our present information warrants such analysis; but the dominating feature of these specifications will be physical tests of as simple a character as is consistent with the characteristics it is intended to expose and the service demanded of the material.

The American Society for Testing Materials is fortunate in being able to select from its members a committee which represents the producer and the consumer, and the regulations governing technical committees are very clear on this point as they read: "On committees dealing with subjects having a commercial bearing, either an equal numeric balance shall be maintained between the representatives of consuming and producing interests; or the former may be allowed to predominate with the acquiescence of the latter. Unattached experts shall be classed with the representatives of consuming interests." This means that a committee will include men having the data relating to the service given by material as well as men having knowledge of the theory and technique of manufacture. It seems to us that the only other essential to make a specification which may be pronounced a success is the use of judgment in its application. It is intended of course to co-operate with all other societies having similar interests in so far as that is desirable, as well as to do such additional research or investigation as may be required.

If I may be permitted to say a word about specifications generally, I should like to add here that the manufacturers who fear a specification have been unfortunate in their experiences with the use of specifications, and I can truthfully say that after a number of years' experience on various materials, bought with and without specifications, that the greatest satisfaction has been on those materials covered by a specification. Referring to rubber particularly I may say that the most satisfaction is gotten with the material at present bought on specification. I am not prepared to say that the unspecified materials are not made as good as they would be if covered by a reasonable specification. It is, however, a fact that a great deal of dissatisfaction exists in the use of these materials. A guarantee of service by a reputable maker is, in the abstract, the sweetest thought that ever consoled a purchasing agent worried with the fear that he was not getting value for the purchase price. It may be possible in a closely consolidated plant to take advantage of a guarantee, but on a large railway, a guarantee on small rubber mechanical goods is probably not worth the time of consideration.

Our policy in drawing up these specifications will be to do justice to manufacturers and consumers alike, and we shall be open always to suggestions or ideas from those interested in our work. We may go further and say that we invite criticism, though we realize that we cannot hope to satisfy all. It is believed that progress is made when the majority are satisfied. We would welcome to membership on our committees any of those here now or any others who are interested, and again we can assure the manufacturer and consumer that our attitude is that of friendliness and a desire for progressive co-operation.

Regarding the use of specifications that we may offer, we believe that the governments of the United States and Canada, and large corporations such as railways, will welcome them, and as a recompense for our work we shall have the satisfaction of knowing that their use will be immediate and general, if not *in toto*, at least in their main essentials.

ASSESSING THE DUTY ON TIRES.

The Board of United States General Appraisers in a case that recently came before it decided that tires should be assessed separately from automobiles. The Collector of New York had held that tires and wheels were assembled articles and they should, therefore, properly be assessed at 45 per cent. ad valorem as "parts of automobiles." But the Board decided when the case was appealed to them that tires should be assessed at 35 per cent. ad valorem as coming under the head of "manufactures of rubber," and that they were not dutiable under the classification of finished parts of automobiles.

EDITOR'S BOOK TABLE.

THE FINANCIER RUBBER SHARE HANDBOOK. TENTH EDITION. London, 1913. The Financier & Bullionist, Ltd. [Cloth, 8vo., 988 pages. Price, 2s. 6d. net.]

THE 1913 issue of the Rubber Share Handbook shows further increase in the number of companies domiciled in England or in English possessions, and controlling rubber plantations in various parts of the world. The general tendency of rubber cultivation during the last few years is exemplified by comparing the number of companies at present operated with those of a year ago. The grand total has during the time increased from 729 to 749, as follows:

	1912.	1913.
Malay States	263	277
Ceylon	201	209
Java	43	44
Sumatra	39	40
Borneo	28	27
India	34	37
Oceania	4	4
Africa	52	49
South and Central America and Mexico	37	33
Rubber Trust Companies	28	29
	729	749

The numerical increase is therefore practically confined to the Malay States and Ceylon. The above figures are not directly shown by the Handbook, but are the result of a careful examination of its contents. Thus in actual numbers the Malay States and Ceylon have together 486 companies, or nearly two-thirds of the grand total of 749. Of this total of 486, about 140 are operated with local capital in the form of "Dollar and Rupee" companies, the others being financed in sterling by British interests.

Of course mere alterations in numbers of companies do not represent their actual development. That information is contained by the "Handbook" as to each company in separate alphabetical order.

The grand total of 749 companies includes 67 new companies and is arrived at by the deduction of 47, which for one reason or another are absent from the new book. There is thus an increase of 20 companies within the year.

This handy volume contains this time 988 pages as compared with 884 last year. It has many well executed illustrations of rubber planting operations, and the uniform manner in which its information is presented, adds much to its value.

ECONOMIC PLANTS IN THE WEST INDIES. AGRICULTURAL Bureau, German Kali Works, Havana, Cuba. [Paper. 88 pages; illustrated.]

In this comprehensive booklet this large German potash concern has grouped a quantity of information upon West Indian economic plants generally, giving prominence to rubber. Experiments at Porto Rico have shown that *Castilloa* will not thrive on hard clay soil, without cultivation or fertilization; the latter course being specially recommended when the trees do not make the desired growth.

OVER THE ALPS BY AUTO.

Hitherto it has been something of an undertaking to cross the Alps, but now it can be done very comfortably in less than two hours in an auto omnibus. An electric automobile service has recently been established at a very considerable cost. The line is about 25 miles in length, running from a point in Switzerland to a point on the Italian side of the Alps. These autos hold about 22 passengers each and make three trips a day in each direction—when the snow will permit.

NEW TRADE PUBLICATIONS.

METAL fittings constitute an indispensable accessory in the application of rubber to industrial or domestic uses; particularly in the case of sprinklers, hose nozzles and hose couplings. In few branches of the metal industry has greater exactness of standard dimensions been attained. This fact is demonstrated by catalog No. 32 recently issued by the W. D. Allen Manufacturing Co., of Chicago, which in its 96 pages forms a complete guide to the buyer of such goods; while its copious illustrations bring each article of importance clearly before him.

Starting with the various makes of spray nozzles, the important article of Lawn Sprinklers is reached, of which there are no less than 71 varieties in the Allen line. Hose fittings next claim attention in the form of holders, couplings, nozzles, clamps, play pipes and other articles, including Allen's "Bull Dog" hose clamp. Fire hose fittings naturally form an interesting section of this booklet, in addition to a large variety of hose racks. The completeness of the catalog is typical of that which marks the productions of this enterprising firm; the established character of which is emphasized by the fact that this catalog is the thirty-second issued by the house.

HOW RUBBER IS GATHERED AND MANUFACTURED.

So much has been written in the papers of late regarding the whole rubber industry and especially about the manufacture of tires, that there is a very general interest on this subject, and many inquiries are received at this office from people who want some general information regarding rubber, its characteristics, the methods of gathering and cultivating it, and the various manufacturing processes. Several manufacturers have issued little booklets that give just this information. Among them might be mentioned a booklet of twenty-two pages, entitled, "From Latex To Tire" issued by the Goodyear Tire & Rubber Co., of Akron.

This little booklet devotes four pages to the consideration of the geography of rubber, gathering it in the native forests, and cultivating it in plantations. The remaining pages are devoted to a description of the many processes through which the crude rubber has to pass before it comes out as a finished tire.

A HANDBOOK OF THE GOODRICH FACTORY.

The B. F. Goodrich Co. has just sent out a handsomely printed little booklet of about forty pages describing what one would see in making a tour through the company's big factory in Akron. One valuable feature of this book is the large number of half-tone illustrations—there are fifty of them—which give an excellent idea of the different departments of the factory and the various processes through which rubber passes before it becomes a finished tire. The first few pages of the book are devoted to a description of the rubber forests and plantations.

THE INTERNATIONAL RUBBER REVIEW.

A new monthly rubber publication has come into the field; namely, *The International Rubber Review*, a technical and scientific publication devoted to the rubber industry, and particularly to the plantation field. It is edited by Gustave Van den Kerckhove, a well-known rubber planting expert, and its place of publication is Brussels, Belgium. This review is printed in three languages—English, French and German. The initial number is highly creditable. It contains an interesting article on "Artificial Rubber," by Mr. Van den Kerckhove. Another valuable contribution is "*Hevea* Rubber, the Future of Plantations on the Coast of West Africa," by Alfred Chandler, and in addition there are in a department entitled, "Sales of Rubber Plantations," a good many items of interest to people engaged in that industry.

Conrad Poppenhusen, Manufacturer and Philanthropist.

THE rubber industry of this country during its seventy-five years of existence has produced a number of men who have not only been conspicuous for their commercial success, but who have been equally marked for their broad philanthropy — men who not only acquired wealth, but used it generously and wisely for the good of those about them. One of the earliest of the rubber manufacturers to attain marked financial success, and to turn that success to the lasting benefit of the community was Conrad Poppenhusen.

Standing on a plot of ground, given to the former village of College Point, L. I., as a park by Conrad Poppenhusen, and directly opposite the grounds on which his residence was built,

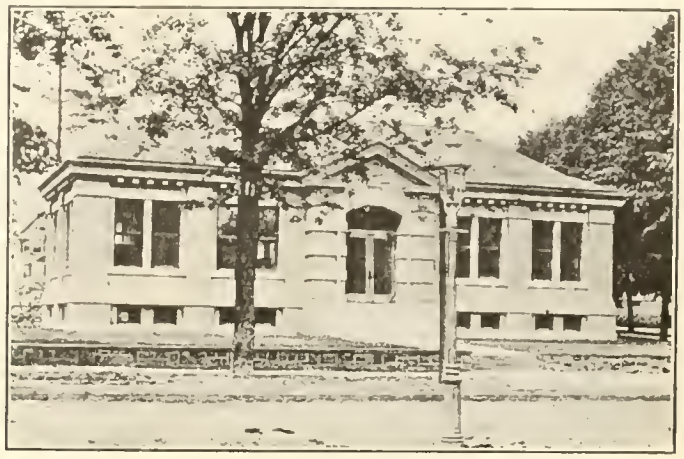
The Monument Erected to Conrad Poppenhusen, at College Point.

is a granite shaft with a bronze bust in heroic size, bearing the inscription: "To the Memory of the Benefactor of College Point. Erected November 1, 1884."

In the year following Conrad Poppenhusen's death, citizens of College Point, many of whom had been associated with him in his various interests, bore testimony to their affection and respect for the man by uniting in erecting this permanent monument to his memory.

Mr. Poppenhusen was born at Hamburg, Germany, April 1, 1818, and came to America about 1843. He became a member of the firm of Meyer & Poppenhusen, manufacturers of whalebone at Williamsburg, Long Island. In 1852 this firm secured the license for the manufacture of artificial whalebone, using the newly discovered compound, hard rubber.

In the following year the license to manufacture hard rubber combs was obtained, and in 1854 a plant called "Enterprise



The Poppenhusen Branch of Queens Borough Public Library.

Works," was built at College Point for the manufacture of artificial whalebone, combs and other articles of hard rubber. The firm name became Poppenhusen & Koenig, which was used until 1867, when the India Rubber Comb Co. was formed. This name was continued until 1898 when the American Hard Rubber Co. was incorporated to include the College Point plant with other hard rubber factories.

In his connection with industrial matters Mr. Poppenhusen showed great foresight, as evidenced by the adoption of the Corliss engines shortly after the invention of the Corliss valve and other devices whereby economy of manufacture was obtained, and in his securing ample land and valuable water grants about his plant, also in providing homes for his employes, and in organ-

Church and Chapel Donated by Mr. Poppenhusen.

izing a mutual benefit association in his works, through which employes were assured aid during absence from work when ill, together with provision for burial in the event of death.

His desire to help those among whom he lived is shown by his gift to the people of College Point in 1868 of $100,000 for the erection and maintenance of the Poppenhusen Institute, in cele-

bration of his fiftieth birthday. This Institute under the management of the Conrad Poppenhusen Association provides free instruction in arts and crafts, industrial and commercial subjects.

In 1872 Mr. Poppenhusen gave $30,000 for the erection of the First Reformed Church of College Point in memory of two daughters who died in infancy.

When the Queens Borough Library established a branch at College Point, the books of the circulating library at the Poppenhusen Institute were transferred to the city, and they are now a part of the equipment of the Public Library in the building erected under the Carnegie fund of New York City, and known as the Poppenhusen branch of the Queens Borough Public Library.

Conrad Poppenhusen was married when about twenty-two years of age to Miss Bertha Kaerker, who died in 1858. Three sons, Adolph, Herman and Alfred were associated with their father in his industrial works.

He was married a second time to Miss Caroline Huetterott, who died in 1903, twenty years after the death of Mr. Poppenhusen. One son of this marriage, Mr. F. A. Poppenhusen, of Hamburg, Germany, is the only surviving member of the second generation.

A grandson, Mr. H. C. Poppenhusen, is now secretary and treasurer of the Conrad Poppenhusen Association, and three grandsons are prominent in business circles of Chicago. Two granddaughters have their homes abroad, and one granddaughter lives in New York.

The illustrations given above show the monument erected in honor of Mr. Poppenhusen by the people of College Point; the Public Library known as the Poppenhusen Branch; and the Church, Chapel and Parsonage of the Reformed Church which were among his benefactions to the community.

RAILROADS RUBBER COMMITTEE.

(Communication from the Secretary.)

IN response to numerous inquiries which this committee has received regarding its activity, the following communication is submitted:

The committee consists of nine members, of whom three represent manufacturers, three consumers, and three public laboratories. The object of the committee has been to formulate standard specifications for high-grade rubber insulation (30% Hevea rubber). In connection with this work it was found necessary to devise a standard procedure for the chemical analysis of such products. The following determinations are being studied:

Total acetone extract—saponifiable, unsaponifiable, hydrocarbons, and free sulphur.

Chloroform extract—alcoholic potash extract, mineral fillers, (free from sulphur) total sulphur, and rubber.

In the course of its studies the committee has considered or tested most of the methods which have been published and several which were privately communicated. The most important types of extraction apparatus have been tried in order to determine the variation in results obtained from the several forms.

The main idea has been to determine the sources of error so that these could be definitely enumerated or eliminated. It is hoped that this will result in closer harmony among results obtained by different chemists, whether they represent buyer or seller.

Considerable progress has been made along these lines, and the committee is doing its utmost to presents its results at the earliest possible date. This will not be done until it has reasonable assurance that the proposed methods of analysis are adequate.

WM. A. DEL MAR.

NEW YORK, February 26, 1913.

AMERICAN RUBBER FOR THE ARGENTINE NAVY.

AN officer of the Argentine Navy, met by a reporter for THE INDIA RUBBER WORLD, at the F. H. Lovell Co.'s naval machinery works at Arlington, New Jersey, spoke of the increasing use of manufactures of rubber in all navies. This officer is here for inspection service on the two large battleships that are being built in domestic yards for the Argentine Republic—at the cost of $23,000,000 for both ships. The specifications under which the contract was awarded did not call for any rubber products. But it is now semi-officially declared that all the rubber products for both ships will be of American manufacture. Provisional estimates put the rubber goods requirements for both dreadnoughts at $78,000. This does not include estimates for some sort of rubber flooring in cabins, hallways and certain parts of several decks. Such flooring will be used. But just what kind has not been officially determined.

So far as is possible steam-actuated auxiliary engines and other kinds of steam power apparatus will not be used on these ships, as compressed air power will be used instead. This ensures the liberal use of rubber packing. Steam-actuated auxiliary engines and long runs of steam pipes, in which defective unions together with inferior metal, spun-yarn and leather packing were used by the contending fleets in the great battle of the Japanese-Russian War, brought about almost as many deaths and severe wounds through steam pipes fractured by projectiles, as the medical corps reported as due to cannon fire. This explains the elimination of steam-actuated auxiliary machinery, so far as is practicable, by all navies since the medical reports of the navies of Japan and Russia in the late war became accessible to naval engineers and constructors. It is a remarkable fact, that during the Civil War all our naval commanders reported strongly against the inferior oakum, spun-yarn and leather packing then in use, and as to defective unions and long runs of steam pipes, the use of which as Admiral Goldsborough reported, "caused greater loss of life, and more wounds to officers and men throughout the war than occurred from engagements between ships."

The historic "Monitor" narrowly escaped going to the bottom in a violent gale on her first voyage, because an old-school naval officer insisted upon removing the rubber ring set within a bronze frame at the base of the turret, and which John Eriesson had designed to prevent water from getting into the turret and thence into the engine room. The fossilized officer took out the rubber and bronze rings and substituted strands of oakum soaked in grease, and he caused the removal of the rubber belting from the air and water pumps. The result was, that off Hatteras, the great waves washed out the oakum, and left a space of sixty-four feet in circumference and two inches high as an open water-way down which the water rushed, and soaked the leather belting so that it slipped, and thus the choking coal gas drove out the engine-room crew, and left the vessel at the mercy of the gale until it subsided. After that, Ericsson brought about a return to rubber packing and belting on the "Monitor." But once more, when the vessel was being outfitted to go on a sea voyage, an old-school naval officer had the rubber packing and belting removed and rope-yarn packing and leather belting restored. In a gale off Cape Hatteras, the turret packing was washed out, the engine room was flooded, and all who were unable to reach the naval towboat that stood by were lost, and the "Monitor" went to the bottom. So far as the writer hereof knows, this incident that places the blame for the loss of the "Monitor" on defective packing and belting has not been in print. THE INDIA RUBBER WORLD's representative noted it down a few days ago from the lips of the last surviving officer of the "Monitor," when she was lost. He lost an arm by being caught in the loop of a hawser that bound the "Monitor" to the towboat that rescued all who escaped from the vessel which revolutionized naval warfare.

Protection of Intellectual Property in Relation to Chemical Industry.

[EXCERPTS FROM A PAPER READ BEFORE THE AMERICAN INSTITUTE OF CHEMICAL ENGINEERS, AT THE DETROIT MEETING, DECEMBER 4, 1912, BY DR. L. H. BAEKELAND, PRESIDENT.]

THE mass of unthinking people, as well as those whose views are predominantly guided by precedent, have little or no conception of the natural rights of intellectual property. It is difficult to teach such people that adequate protection of intellectual property is abundantly more beneficial to the community at large than to the temporary individual possessors of these rights.

Yet these same people consider as sacred and inviolable, any other property rights as soon as the latter relate to chattels or real estate, whether such rights were obtained by purchase, by inheritance, by gift, by privilege, by labor, or by any other way.

When, however, it comes to recognize the claims of ownership to intellectual property, the result of the truly creative effort of the citizen, we butt right away against some stubborn conceptions, which have petrified into the code of our long established laws.

If Tom steals Dick's two-dollar scarf pin, Dick will have little trouble in putting Tom in jail, even if Dick himself has obtained his pin by questionable methods. But when it comes to protect even for the short period of 17 years, the most logical, the most legitimate personal property, intellectual property, as embodied in patent rights, with all that it involves, with enterprise depending thereon, based often on the work of a life-time, then our law courts are woefully deficient, on account of uncertainties, delays and enormous expenses connected with the adjudication of patent rights. All this works overwhelmingly in favor of the litigant with the well-filled purse, the large corporation.

Yet, no country in the world has expressed in a fairer and broader spirit, the rights of intellectual property, than the United States, in Article 1, Section 8, of the Constitution: "Congress shall have power to promote the progress of science and the useful arts by securing for limited times to authors and inventors, the *exclusive* right to their respective writings and discoveries."

This proclamation lifted the right of a patentee at once, far beyond the mere privilege conferred by most countries, which grant patents not only to the real inventor or originator, but also to those who are first to introduce unpublished inventions into their respective countries. With some legitimate pride, we can say that in this respect, at least, American patent law stands head and shoulders above the laws of Germany, France and England.

The wisdom of these provisions has been abundantly proved by subsequent events. Only a man stubbornly blind to evident facts, will deny that just those countries which have the most liberal laws for patent protection are also those which have taken the lead in the industrial and scientific development of the world.

Up to about thirty years ago, our patent system covered tolerably well the purpose for which it was intended. It stimulated individual inventions and promoted numerous private enterprises. Since then, with the extraordinary growth of our nation, with the tremendous increase of agglomerations of capital for industrial enterprises, and more especially with the astonishing increase in the ramifications of applied science, our patent system has become totally inadequate to the needs of the country; it suits our new conditions in about the same way as baby clothes fit an overgrown boy.

Our patent system, although based on an excellent fundamental law, has now degenerated in a set of exceedingly complicated technicalities of law practice, a system of legal acrobatics, whereby any contestation before the courts can be turned into "perpetual motion" to the advantage of wealthy litigants, and whereby the individual patentees of slender means and the small industrial concerns find themselves under smothering disadvantages when opposing rich antagonists. In this way our patent system, instead of accomplishing its intended purposes of stimulating individuality, simply reinforces the rich and big industrial enterprises, and discourages the individual inventor unprovided with a liberal bank account.

It is true that on November 4, 1912, the Supreme Court of the United States, has promulgated revised Rules of Practice for the Courts of Equity, which intend to simplify our methods of litigation. Unfortunately, this is only a half-way measure, leaving still abundant opportunity for the tactics of delay, chicane, and expense which have too much disgraced American patent litigation.

These new rules might gain in efficiency, if they were supplemented by the creation of a final court of patent appeals. They might be made incomparably more efficient, if they could be strengthened by a system whereby the adjudication of the validity of patents does no longer devolve upon judges who do not possess the technical or scientific preparation, required nowadays for discerning the merits of complicated patent questions. Some of the far reaching details of scientific technology absolutely baffle the comprehension of those who have no preliminary technical or scientific training. Certain problems of chemistry and physics involved in many patent suits can no longer be understood by an intelligent judge, if he has not had long and systematic preliminary training in that branch of knowledge. I do not deny that an intelligent judge can be coached and instructed by long, tedious, time-robbing methods, even in intricate scientific problems; but his education has to be made over again for each special case. After you have made a chemist of him for one case, the next adjudication will require the knowledge of a physicist, an electrician, an engineer, and so forth.

Even under the new rules, it will not be difficult to drag on a case by presenting an unrestricted amount of testimony taken before an incompetent examiner, and by calculating every step so as to tire out your opponent, and so as to lead the judge into doubt and error, by swamping him with endless contradictory expert testimony calculated to befog the issue instead of making it clear. Such tactics are relatively easy for the litigant, who, for that purpose, can afford to pay accommodating experts and skilful lawyers. Even if at the end, the judge, after laborious and conscientious efforts, masters the technicalities of the case and reaches a good decision, much needless time has been wasted. All this might easily be avoided, and judges might be saved the trouble and responsibility of going in every single case through a different scientific or technical training, if their intervention could be limited to what they are more competent for, namely, to determine what claims have been infringed and in how far this infringement entitles the patentee to damages.

That such a method of settling patent suits is quite practical, is shown by the example of Germany. In that country, patents are allowed after preliminary examination, just like here; but, after the patent is granted it can be attacked for annulment or revocation before a competent court in the Patent Office. So that any party who is sued for infringement of a patent which he thinks is invalid can avoid temporarily the adjudication of the infringement issue by starting an annulment or revocation suit. In the meantime, the courts in which infringement cases are examined have to take the patent as it stands, and it is only left to them to interpret the scope of the claims, and to what extent these claims have been infringed.

This relieves the equity court of all the complicated questions

of validity or non-validity of a patent, and puts this whole matter in the hands of a properly constituted court of experts, who can handle this subject with incomparably less hesitation, or delay. Besides this, the whole system of practice in the German Patent Office tends towards systematic elimination of invalid patents. After an examiner has decided upon preliminary allowance of a patent, the claims and specifications are open for public inspection, and for a period of two months, anybody whomsoever can file arguments against the final grant of the patent. In this way, the nation does not too lightly confer patent privileges and has furthermore, the benefit of the free advice of any experts in the art, who may advance good reasons for non-allowance of the claims, of which the examiner was not aware, when he rendered his first decision. These opposition proceedings give added thoroughness to the work of the examiners. They are relatively inexpensive and do not necessitate the intervention of law counsel. Sometimes they delay the issue of a patent, if there is any good reason for doing so. On the other hand, a patent that has successfully withstood vigorous opposition proceedings is very much strengthened thereby; this, in itself, is a very valuable compensation for any delays to which the patentee may have been subjected. In other words, by that system, a good patent becomes stronger, while a defective patent application is easily weeded out. A similar system of public opposition exists here in the United States in relation to the granting of trade-mark rights, and seems practical enough that it could be extended to our methods of allowing patents.

All officers of our patent office, high or low, should be made independent of any political favoritism; they should be better paid, with more opportunity for promotion, according to merit; their work should be made simpler by an improved office equipment and increased facilities for a thorough search; furthermore, our unnecessarily complicated and expensive methods of interference proceedings should be simplified.

With these reforms, there is no doubt that we can organize right in the patent office, a competent court, supplemented by the Court of Appeals of the District of Columbia, for deciding, in a very expedient way, all questions of validity of patents.

This Court of Appeals, because it is situated right in Washington, would have easy and immediate access to all the records of the Patent Office; by this fact alone, it would have superior opportunities for prompt and efficient work.

At least some of these facts seem to have been very well recognized in the masterly report of Hon. William A. Oldfield, chairman of the House Committee on Patents. (See report No. 1161, on H. R. 23417, August 8, 1912.)

Unfortunately, his proposed Oldfield Bill (H. R. No. 23417), with a regrettable lack of consistency, neglects utterly the paramount issues, and busies itself with secondary regulations which, if carried out, will practically put a penalty on patented articles.

The new provisions of the Oldfield Bill aim at curtailing the power of patents in the hands of trusts or large corporations; but, in doing so, new provisions are introduced which will create endless new opportunities for protracted litigation.

The Oldfield Bill overlooks the axiom that whatever increases the expense or delays of litigation, is a very potent weapon in the hands of large corporations, which they can hurl against the poor litigant who stands in their way.

The saddest thing of all is that the new Oldfield Bill tries to abrogate the hitherto accepted principle established by our Constitution, that a patentee has the right to license or sell his patent on whatever terms he pleases. It has been feared that this principle, if carried too far, might become a dodge for avoiding the Anti-trust Laws. Since the decision of the famous, but harmless Dick case, the most hysterical exaggerations have been published on this subject. Fortunately, since then, the recent and unanimous decision of the United States Supreme Court in the "bath-tub trust" case, November 18, 1912, does away with all these redundant arguments and settles, beyond doubt, the principle that, patent or no patent, unlawful combinations in restraint of trade can be stopped by the Sherman Law.

The Oldfield Bill, in its eagerness to avoid any hesitation on the subject, goes one step further, and unfortunately, one step too far. It puts so many restrictions on the sale of a patent article, or on a patent license, that it may become a positive disadvantage to transact business by means of patents.

Examined in the last analysis, it threatens a business based on patented processes or patented articles, with penalties which unpatented articles thus far are not subjected to. It takes the proposed patent law as a pretext for saddling a patented article with restrictions which have not heretofore been formulated for non-patented goods.

This unexpected paradox, promoted by the Oldfield Bill, is distinctly in opposition to the rights of intellectual property conveyed by the words and the spirit of the Constitution, and if the Oldfield Bill becomes an effective law, it will be the saddest blow ever given to our patent system. It will do comparatively little harm to large business interests, because for them, there are many ways of circumventing its provisions; on the other hand, it will cause great discouragement to smaller enterprises which, until now, have held the hope of matching inventive genius and initiative against the money power of big organizations.

Another unfortunate miscarriage of purpose in the Oldfield Bill is its provision against so-called wilful "supression" or "non-use" of patents. It does not take into consideration that in numerous instances, a patentee or an assignee possesses a series of so-called alternative patents, which can be used to bring about identical or similar technical results by modified means. Among such alternative patents, the best or the most suitable are used, absolutely irrespective of any other reason or intention to suppress their use. Yet without the exclusive possession of every one of these patents, the invention would not sufficiently protect against competitors, and the field would be so much reduced as not to make it worth while to put one's best energies to the development of the invention. In most cases, it would become a material impossibility for a small concern to maintain the exclusive ownership of its patents, if it had to go to the enormous expense of working simultaneously all its "alternate" patents; by omitting this expensive technicality, it would be exposed to the risk of being compelled by its competitors to grant a compulsory license; this would practically annihilate the advantage of exclusive ownership as expressed by the constitution. There again large concerns would be at an overwhelming advantage, because they can at an expense relatively small for them, equip the necessary appliances for remaining within the technical provisions of the law. In the meantime, they could easily harass their financially weaker competitors in exacting from them compulsory licenses which would break up the only prospects of successful competition which the smaller concern might have possessed, until then, in its patents.

I have no doubt that this bill has been framed with the best intentions for the interests of the country. Unfortunately, the framers of this bill do not foresee the far-reaching and dangerous effects of its provisions.

ENGLISHMEN WANT AMERICAN SOLID TIRES.

The representative of an English firm of motor truck manufacturers opening up a sales business in Canada informs an American consul that he would like to receive catalogs and price lists from American manufacturers of detachable solid rubber tires suitable for motor trucks carrying a load of one to four tons. The number of the consular report is 10546.

THEY WANT AMERICAN RUBBER SHEETING.

An American consul in a European country states (Report No. 10,395) that a local firm desires to be placed in communication with American manufacturers of rubber sheeting for hospital use, with a view to making direct purchases or of representing such firms on the local market.

TESTING OF GERMAN EAST AFRICAN RUBBER SOILS AND PRODUCTS.

DURING his visit in 1911 to German East Africa, Dr. Eduard Marckwald, of Berlin, in addition to investigating actual conditions on many points (as reported in THE INDIA RUBBER WORLD, March, 1912, p. 269) laid the foundation of researches, which have since been more or less completely carried out, particularly as to fertilizing agents.

These tests, made in East Africa, are fully described in the latest quarterly report of the Colonial Rubber Section of the Henriques Laboratory, Berlin. In making them three samples of chemical compounds, weighing 145, 185 and 145 pounds, were prepared, with various proportions of sulphate of potash, superphosphate, bone meal and sulphate of ammonia. In a fourth sample the first of the agents named was omitted; the sample weighing 100 pounds. These samples were incorporated with the soil by a thorough mixing, one field being left unfertilized, for comparison with the three others. For convenience of handling, these samples were each divided into three.

According to the report of the Henriques Laboratory, the results obtained are by no means uniform or conclusive as to the effects of artificial fertilization. This fact, it is added, should cause no surprise, as experience with salts and other fertilizers has often shown them in virgin soil, to be directly prejudicial, or to have no effect. The above-named tests were unofficial, but official tests have led to similar conclusions.

Apart from the question of the effects produced by artificial fertilization, the report urges that results obtained show German East African plantations to be in a position to deliver first class rubber, adapted for all technical requirements. The German Potash Syndicate contributed financially to the carrying out of the above-named experiments.

SOILS FOR RUBBER.

The experiments made in Germany by Dr. Wohltmann, of Halle, and Dr. Marshall, dealing with the properties of South American soils, indicate that the demands of rubber plantations for nutriment from the soil are not very exacting; the samples of South American soils showing only an extremely small proportion of nutritive substance. The results of experiments have been reprinted from the "Tropenpflanzer."

Other experiments indicate the importance of fineness and deepness in soils intended for rubber cultivation. Heavy soils, of the nature originally preferred, have given relatively unfavorable results. Soils in West Africa, Ceylon and Sumatra, which had at first been condemned on account of their low proportion of nutriment, have now been approved for rubber.

SAMPLES EXAMINED.

Samples of rubber received from East Africa included two of *Manihot* rubber, which, after being treated, proved to be a first-class product.

An interesting group of five samples was received from Mr. R. Fyffe, director of the Botanic Gardens, Uganda. One sample was of *Clitandra Orientalis* and showed good working qualities, while a sample of *Hevea* rubber was very pure and proved in working equal to wild Pará soft cure. A third sample of *Kickxia*, coagulated with tannic acid, was very clean; producing a good rubber after normal working. Another sample of *Manihot*, tapped according to Mr. Fyffe's process and coagulated with water, proved well vulcanized even after an hour's heating. It would not dissolve (a fault common to *Manihot* rubber); the quality only proving a better class of second grade. The fifth sample was of *Landolphia Davei*, which likewise was perfectly clean, and was coagulated with acetic acid, but could only be designated as second grade. Its working qualities corresponded with what might be expected from its origin. A sample from Togo was good and fully equal in value to the best East African grades. From Kamerun a large number of samples was received, produced by various methods of coagulation. In addition a sample of *Kickxia* came to hand from the Gold Coast Botanic Station.

In all, 63 crude rubber samples were examined. The work of the Laboratory was, however, not confined to rubber; castor seeds from New Guinea, and other tropical products having also been dealt with.

Other subjects handled included the determination of albumen in rubber, on which the work of the laboratory is complete, and the results of which will soon be published.

RUBBER CULTURE IN SOUTHERN ASIA.

IN a recent discussion of the above question in the "Tropenpflanzer," Herr Emil Helfferich, of Hamburg, supplemented his former investigations in that direction. Continuing its earlier review of Herr Helfferich's work, the "Annales de l'Institut Colonial" of Bordeaux remarks that plantation rubber has now taken possession of the market; everything pointing to its soon occupying the leading place. The first yields had aroused considerable enthusiasm, the most fantastic calculations having been made as to the future of the plantations. The results achieved and the analysis of the reports published by some companies, today allow of a more just appreciation of the value of these enterprises, and of formulating some rules as to the organization of rubber plantations. It is no longer a question of the varieties to cultivate, *Hevea* more and more replacing all others; vines and *Maniçoba* being almost abandoned on the African continent, in the same way as *Castilloa* and *Ficus* are in Southern Asia.

Hevea plantations, it is remarked, should only be established in well drained soil, freed from the roots of old trees, or ligneous debris, which might afford a home to that dreaded parasite, the *fomes semistotus*, which attacks the roots. Some of the best known estates, such as Batu Caves, Glenshiel, Highlands and Lowlands, Federated Malay and Vallambrosa, have had to make considerable sacrifices in combating this pest.

GENERAL PLANTATION REQUIREMENTS.

In the choice of seeds, it is necessary to select those from healthy trees, in regions free from disease, at an altitude and under a climate as near as possible to those of the plantation contemplated.

As to distance, opinions are divided as to whether it is best to give the trees enough space for them to attain their full development, or to place them close together, in order to better utilize the soil, and thus facilitate the work of the plantation. An average distance of 26 feet is recommended by Herr Helfferich, making about 150 trees to the acre. This number of trees would be subject to reduction where there is risk of disease being propagated or of yield diminished.

As to interplanting, Java and Sumatra, it is added, have advantages over Malaya in "Robusta" coffee, but this does not grow uniformly well. It needs a deep soil rich in *humus*, and ought to be planted at same time as the *Hevea*.

English planters, it is remarked, favor clean weeding as a preventive of parasitical diseases, but it is calculated to do harm to the soil in plantations on sloping ground. Dutch planters, on the other hand, seek to avoid this result by covering the soil with vegetation, which impedes the growth of weeds and increases the quantity of azote which would be utilized by the *Hevea*. This system, however, renders it more difficult to combat diseases attacking the roots; the managers of the Kuala Lumpur and Glenshiel estates having pulled up the *Passiflora* and other plants which covered the soil of their plantations.

Excessive pruning favors the growth of the trunk and the widening of the top of the tree, but it exposes the tree to the action of the wind, and cutting should therefore be practised with caution. It should, however, be recalled that the yield in

general depends on the size of the trunk, which it is naturally endeavored to enlarge as rapidly as possible. Attempts have been, however, wrongly made to tap trees from three to five years old, without considering the medium quality of the rubber they might furnish.

Definite rules for tapping, it is remarked, can only be fixed after long years of experience, but in most cases the half herring-bone on one quarter of the circumference has been adopted. In this way the bark is spared as much as possible. Each zone tapped rests for three years; time being thus given for its wounds to heal before fresh incisions are made.

No positive indications are available with respect to the time needed for the regeneration of the bark of old trees; nor as to the age when they cease to be tappable. This, it is added, is all a matter of experience and observation.

COST OF UP-KEEP.

Cost of up-keep varies according to the ages of the trees on the plantations. As the shade becomes more dense, spontaneous vegetation becomes more rare, and the cost of up-keep diminishes. The following costs, given by leading companies, are quoted:

	Up-keep per acre, 1910.
Kapar Rubber Estate (50 per cent. in bearing)	$7.12
Harpenden (51 per cent. in bearing)	4.32
Highlands & Lowlands (85 per cent. in bearing)	7.61
Pataling (60 per cent. in bearing)	7.80
Kuala Lumpur (productive surface)	3.23
Kuala Lumpur (unproductive surface)	7.75

The figures of Kapar, Highlands & Lowlands, and Pataling include not only the regular expenses of up-keep, but also those caused by the removal of trunks and roots. Eliminating these expenses, which really belong to the initial cost, it is estimated that the yearly average per acre equals $5 for a plantation in full yield. This figure, it is added, is inferior to the cost of up-keep of tea and coffee plantations, which for the same surface and period represent $15 to $20.

YIELDS PER TREE AND ACRE.

The reports of different companies show various yields, being based on an average of 150 trees to the acre, while accidental destruction or loss through disease reduces the average after the fourteenth year to 125.

	Age of trees.	Yields per year per acre.	per tree.
		lbs.	lbs.
Batu Tiga Estate	4	90	0.60
Damansara	4	92	0.61
Bikam	5	250	1.66
Seafield	6	450	3.00
Seremban	6	572	3.80
Klanang	10	741	3.93
Seremban	11	870	6.96
Federated Malay	12	1,030	8.24
Federated Malay	13	1,147	9.18
Kuala Lumpur	14	1,302	10.42

Experience has shown that the yield of trees regularly tapped increases from the fourth year up; these results in various cases surpassing all expectations. At the same time, it is added, it is better only to count on a regular production of 500 pounds to the acre. One English rubber expert will not endorse a higher estimate than a maximum production of 300 pounds per acre.

The quality of rubber depends not only on the nature of the soil and the climate, but also on the age of the trees producing it. Young *Heveas* give a resinous product, inferior in value to that of older trees.

FIRST LATEX.

It is further added that as long as no uniform method of coagulation has been found, based on the principle of smoking, it will not be possible for the different plantations to deliver a uniform product. However, a system of classification has been elaborated in London, Antwerp and Hamburg, where the term "First Latex" has been adopted as signifying a plantation rubber made from the latex of *Hevea Brasiliensis*, collected immediately after tapping, and not containing any traces of scrap or foreign latices. To be classed as belonging to this type, the rubber ought to be nervy, without any admixture of earth, and must not be mouldy or sticky.

"Prime Plantation" rubber formerly commanded in the London market 4*d*. to 8*d*. more per pound than "Fine Pará"; the reason of this difference being the smaller loss which plantation rubbers suffer in washing. In Hamburg, in contracts for later delivery, "First Latex" is valued at the equivalent of about 3 pence per pound above "Fine Pará."

These facts show the strong position which plantation rubber has attained on the market, and which is expected to become more marked as the quality is improved.

PRICE OF RUBBER LANDS.

When planting companies first started in Southern Asia, land was very dear, as much as £5 sterling ($25) per acre having been paid. Today, however, matters are different. Not only can good lands for rubber plantations be obtained, it is stated, at 10*s*. ($2.50) per acre, in Malaya and the Dutch Indies, but certain companies which had acquired too extensive holdings are trying to resell part of them at low prices.

LABOR.

The extension of Asiatic rubber cultivation depends to a great extent upon the question of labor; the scarcity of which has been exaggerated. The cost of hiring coolies has, it is true, considerably increased, but the immigration of Chinese and Tamils has furnished the Dutch possessions with an abundance of workers. The number of laborers arriving there amounted in 1909 to 24,568; in 1910 to 58,616; while for the first eight months of 1911 70,000 arrived, compared with 45,000 for the corresponding period of the preceding year. India and China furnish the greater proportion of the immigrants to the Malay States.

Great efforts have been made by the Government of the Dutch Indies to improve the condition of the coolies, particularly on the east coast of Sumatra. Before granting permission for estates to receive workers, the administration is thoroughly posted as to their situation and their sanitary conditions, the mode of living and the medical service available. The establishment of workers' settlements under the most favorable hygienic conditions forms an important step. The scarcity of coolies on certain estates is attributed to the insufficient measures there adopted regarding their food and lodging. Complaints have been heard from Java as to Chinese workers, who are more expensive than Tamils, while their work is defective. On the Malay Peninsula and in Sumatra tapping is effected by contract workers, who remain a long time on the same plantation, regular and satisfactory work being thus ensured; while in Java, where the work is done by free workers, good results are not easily obtained.

Such are a few of the points brought forward by Herr Helfferich in his review of the subject covered.

EAST INDIAN POTENTATES ADOPTING AMERICAN AUTOS.

According to the "Manila Daily Bulletin," East Indian sovereign princes are fast abandoning their gorgeous formal equipages of state for motor cars made in the United States. Five Maharajahs have lately become owners of American automobiles. The upper classes in India generally are developing a similar tendency, owing to the saving of time thus effected.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

A GENERAL SURVEY OF THE SIX WEEKS' STRIKE.

THE strike in the Akron rubber trade, mention of which was made in the March number, which arose in the Firestone Tire & Rubber Co. through a dispute over wages, due to a new schedule for tire finishers, spread rapidly through the Firestone company, and later through the other rubber companies in Akron until almost two-thirds of the rubber employes in Akron had quit work. These quit work for various reasons, a small minority on account of some alleged grievance in regard to wages, a large number in sympathy with the few who claimed a grievance, and probably a still greater number either through fear or because of their work being dependent upon that of some other person who was on a strike, and consequently the material could not be supplied to them.

To secure recruits from other companies, the strikers had large parades, part of the time headed by a small band and a number of women, which continually marched around the rubber factories, using every form of argument and invective to try to get recruits. At first, this action was peaceable and practically no opposition was offered by the city police or county sheriff's office, or by the rubber manufacturers, but when this matter of marching in a body failed to secure recruits, the strikers became unruly and tried to force the employes who were still working, either by threats or actual bodily harm, to leave their employment. The various rubber companies had prepared for this by erecting board fences around each of their plants and had guards on duty inside the fences.

Then the citizens of Akron formed a "Citizens' Welfare Association" and tried to get the strikers to go back to work, subject to a reconsideration of whatever grievances they might have by the rubber companies at a later time, but this the strikers refused to do.

A rubber worker who left the factory with the intention of striking was hustled down town and, without any explanation whatever, was generally induced to sign an application to the I. W. W., whereupon he paid the initial fee and was given a red ribbon, and to all practical intents and purposes was a regular member of the I. W. W. As soon as many of the workmen understood the real purpose of this organization and their former methods of conducting strikes, they ceased to wear the red ribbons and took no part in their matters whatever.

The I. W. W. then commenced their chain picketing, which consisted of a long single file of men marching very close together at some opportune place, generally the entrance to one of the rubber factories, up one side of the street and down the other, so that the chain remained unbroken, persuading any person who happened to pass to join them, and if they could not be reached by persuasion, they hurled the worst form of invective, and if they could not be reached in this manner, would grab their dinner baskets, and scatter the contents upon the streets. At other times, the men themselves would be grabbed and hustled along rudely, and sometimes beaten This form of picketing became a menace because some of the leaders of the I. W. W. not only encouraged open violence and disrespect of law and order, but took any means whatever necessary to make their strike effective, not excepting personal violence, injury to property and sabotage. At this point, many of the rubber workers who had not gone on the strike became fearful lest they would receive bodily harm.

The Citizens' Association, which up to this time had been formed wholly for persuasive methods of securing an end to the strike, now took the form of a Citizens' Police Association, and approximately 1,000 able-bodied men were sworn in and furnished with a policeman's badge and a club, and the use of about fifty automobiles was given to the city for rapid reconnoitering. The city was placed under martial law by the sheriff, and the citizens' police, together with the city police and deputy sheriffs, were placed wherever needed, many going on duty at five o'clock in the morning. Parading and general picketing was prohibited and, after several clashes with the citizens' police and the city police, it was effectively stopped. Then guerilla warfare was started throughout the city, where lone workmen were held up and beaten by strikers. This was broken up by means of a large number of automobiles, manned by four or five policemen rapidly reconnoitering from one point to another where strikers or rubber workers were apt to be, especially at the time the workers were going to work or when they were coming from work. A large number of slater's tacks were thrown upon the streets and a number of these automobiles had punctured tires, but instead of frightening the owners of the automobiles it only made them more determined and more vigilant. Forty or fifty undesirable persons who had come to Akron during the strike, and who had no known means of support, were ordered out of town and they left immediately. This seemed to have the effect of completely stopping the guerilla warfare.

During the first week or ten days of the strike, the rubber factories fully supplied all their branch offices with tires and all kinds of rubber goods to fully protect their trade against any bad results which might come from the strike. They provisioned their plants, and offered any man who did not desire to go home necessary sleeping quarters and meals. A great many meals were served to the employes, but not many took advantage of the sleeping provisions offered, as they felt safe to go to their homes from work and to return to work in the morning.

Before the Citizens' Police Association was formed, the mayor of Akron, believing the militia necessary, asked the governor of the state to provide militia, which was refused. This compelled the citizens to give aid to the police of the city of Akron and the sheriff of Summit county, each of om had been very vigilant and effective, cautious and careful, yet firm; and the fact that there was practically no blood shed in the whole strike where thousands of men were out of employment, is due largely to the foresight of the mayor in closing the saloons for over two weeks, and to the efficiency of the Akron police and the sheriff of Summit county and his deputies, backed by the Citizens' Association and the good common sense and high intelligence of the Akron rubber employes.

There were several elements in this strike which stood out prominently. The first is that whatever dissatisfaction existed arose chiefly from a cut in wages. With few exceptions, the Akron rubber worker is contented with the working condition of the various factories, the one complaint being that a system of payment is used whereby a man is paid for his work and that he must "hustle" to earn what he feels is his day's wage. Secondly, the strike had a very depressing effect upon the stock of the various rubber companies and on business in general, which, however, is gradually recovering. Third, practically all the buildings of the rubber factories have been built within the last six years, and light, fire protection, space for working, toilets, hospital service and everything necessary for the convenience of an employe have been provided better probably than in nine-tenths of the factories in the United States in any line.

Another fact which stands out pre-eminently is that these immense organizations for the production of rubber goods have been built up chiefly within the last six years. Six years ago, the majority of the superintendents knew every

man in their employ. On account of the rapid growth of the work, the immense amount of new machinery that has been invented and placed in the factories, the great diversity of labor, where six years ago one man completed a whole article himself, this same article at present may be made by at least a dozen persons. This has caused a constant change of work and, consequently, a change of wages and many times a shifting of labor and many new laborers, so that this is now impossible for the employer; and no matter how determined and careful he may be to bring about a maximum of efficiency, and at the same time the greatest comfort for his employes, many causes for grievance have arisen, which are generally of minor importance and would be readily overcome and provided for by the manufacturer, if they were specifically and clearly called to his attention. The officials of the various rubber factories have stated time and again that they would be glad to discuss with any of their employes any differences they may have and, if possible, settle these grievances amicably and satisfactorily to both the employer and employes. This sometimes has been impossible on account of some sub-foreman or inspector who was arbitrary and overbearing, and, to make a good showing for himself, would not report these small differences to his superiors, and if he did report them, would do so in an untruthful manner. This strike no doubt has called the attention of the rubber manufacturers to many of these small grievances which they will remedy, and would have remedied even if no strike had occurred, if they had been properly placed before them.

The American Federation of Labor in no way sympathizes with the I. W. W. and gave them no support in this strike, the principles of the two organizations being diametrically opposite.

The strikers, through the I. W. W., after almost two weeks of meetings and argument, sent a scale of wages which they desired, which called for from 25 per cent. to 100 per cent. increase, which demand was absolutely refused.

The Senate of the state of Ohio appointed an investigating committee, which has been taking testimony in Akron for several weeks, both sides being represented by attorneys. As a result of this investigation it was brought out that the average wage of the Akron rubber worker is something like $2.60 per day; that the average wage paid in the United States is about $1.40 per day; that a few of the girls working in the rubber factories receive small wages, but that this is the exception rather than the rule; that the wage of the day-worker in the Akron rubber factories is practically the same as that of the average day-worker throughout eastern Ohio and, if anything, the work more steady; that there are some lines of rubber work that are not the most healthful, but that the factories have done their utmost to remove, as far as possible, these unhealthful conditions; and that the factories have tried to provide safe and suitable places to work and surroundings for their employes.

On March 24, at least three-fourths of the rubber workers were back in their places working and many more going back each day, and a number of new men have been hired who will necessarily need to be trained, so that the maximum efficiency of the rubber plants cannot be expected for several weeks and perhaps a couple of months.

The consensus of opinion among the I. W. W. leaders is that the strike will be declared off by them about April first. The rubber companies so far have refused to re-hire the active participants of the I. W. W., believing that they may follow the teachings of their leaders and put in effect sabotage, which is the revenge of a lost cause inflicted upon the material and machinery of the employer.

The basis of the I. W. W. movement is that all wealth is created by labor, that capital has no rights whatsoever, that the control and ownership of all factories should be given to labor and that this should be brought about, if possible, by peaceable means; if it cannot be brought about by peaceable means, then by any means whatsoever. This doctrine is revolutionary and anarchistic and is wholly opposed to the principles upon which our government is based. The writer believes that strong laws should be passed that where violent acts are the result, or probably will be the result, of speeches setting forth such doctrines, that the instigator should be punished at least as severely as the perpetrator.

The writer suggests that, as it is to the advantage of the rubber manufacturer and the public, as well as the employe, labor should secure a fair and reasonable wage; that wage reductions generally are caused by the fierce competition in the rubber trade, which competition is becoming more severe from year to year; and that the rubber manufacturers should, among themselves, adopt a minimum wage both for men and women, under which they will not go, and thus avoid future wage reduction—the natural result of increased competition—and the strikes that such reductions are always liable to provoke.

* * *

Akron was visited by an unprecedented rain of over three days' duration, which made every brook a running river. This created an immense increase in the Little Cuyahoga River, and at least forty homes and business places were washed away and destroyed as if of so much kindling. On account of the vigilance of the city fire and water departments, only two persons lost their lives.

The rising of the waters caused The Goodyear Tire and Rubber Co. and the Buckeye Rubber Co., the Akron branch of The Kelly-Springfield Rubber Co., to suspend operations for a few days, the water having reached their engine rooms. The water stopped the fires in the power house of the N. O. T. & L. Co., so that the city was without car service and in darkness for two days and a night.

Over half the bridges and culverts in the county have been washed away, and for a short time railroad and street car service to all outside towns was suspended.

The large reservoirs which supply the rubber plants, with the exception of the Big Reservoir, remain intact, and the Big Reservoir, on account of an overflow at one of its feeders, was lowered about nine feet.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

THE past month has been an exceedingly active one with the Labor Union advocates, and strikes have occurred in more than a dozen plants and trades. The rubber industry has not been hit as hard in this respect as was first anticipated. Notwithstanding the strikes and the strike talk, many plants are working day and night shifts.

* * *

Former Mayor Frank A. Magowan, who in former years was a power in the rubber world in this section of the country, is back in town planning to launch a half-million-dollar tire-making company. He states that he has subscriptions to stock to the amount of $150,000. Judge Richard Peck, of New York City and Atlanta, is interested in the proposed venture. Mr. Magowan states that he has been granted a patent on a stitch tire which he proposes to manufacture. Some time ago he organized the Braender Rubber and Tire Co., of Rutherford, New Jersey, a $90,000 concern, and placed an order with the John E. Thropp & Sons' Co. for tire equipment. The order was filled by the Thropps.

Mr. Magowan and the heads of the Thropp concern were to have had a conference March 25, but a fire in the Thropp plant on that day interfered. The fire destroyed the pattern shop. The exact amount of the damage has not been ascertained, an inventory now being taken; but many devices for making tire moulds, vulcanizers and other tire equipment were either destroyed or damaged.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

BUSINESS has hardly started out into springtime activity. Not much change is noted since last report. The boot and shoe trade—in rubber goods—has received a severe blow, when, after an almost snowless and nearly iceless winter, a warm and early spring has discouraged the jobbers and the retailers, all of whom are likely to carry over considerable stocks of rubber footwear. Thousands, probably millions, of New England and New York people have gone through the entire season without wearing rubbers for a single day, and, of course, they haven't bought any.

The druggists' sundry business, it is claimed, is likely to be a misnomer if things continue to develop, as at present, for the department stores now prove to be the largest buyers of these goods. To be sure, the two syndicated drug store concerns compete with each other in seeing which can cut prices the deeper, and this discourages retail druggists from stocking up. The result is large sales to the syndicated druggists and to the department stores, but as they are very close buyers, the result isn't so extremely satisfactory.

The mechanical lines still feel the effect of conservatism and the tendency of mill men to allow the manufacturers and jobbers to carry the lion's share of the stocks. Many purchasing agents are so reducing supplies of belting, etc., in their stock rooms that they have to shut down some of their machinery while waiting the filling of rush orders, this in some cases proving costly economy.

But whatever may be the report in other lines, the automobile tire business continues lively. Some of the factories are working overtime to increase their capacity to supply the urgent demand. A man well posted in the tire business estimates that there are 700,000 cars now in use, which will require 3,000,000 tires to run them through this season, and judging from last year and the year before, about 300,000 new machines will be sold this year which will require 1,200,000 tires to equip, and at least 400,000 more to renew those worn out or seriously damaged. Thus the whole country will need 4,500,000 tires during 1913, and to make these will require more rubber than in all the other rubber industries combined.

The reclaimers are feeling the effects of the lack of rubber-wearing weather mentioned above. As few people have worn rubbers, not many cast-off rubbers are found by the junk men, and prices of scrap rubber shoes are soaring. There is a sympathetic rise in the prices of scrap tires, etc., with the result that reclaimers are paying out large sums for desirable lots of second-hand material.

* * *

The automobile show last month was a gigantic success in many ways. The show itself made good, clearing a handsome profit above all expenses. The attendance was larger than ever, and at times the great building proved too small for the careful inspection of the exhibits, owing to the crowded condition of the aisles and enclosures. As a means of inducing business this has far surpassed any previous show, and with the aftermath of orders which will come later as a direct result of the exhibition, will certainly prove that Massachusetts stands near the top in the proportion of automobiles to the number of inhabitants. The tire men were unusually well represented, and seem perfectly satisfied with the results of their exhibits.

* * *

Among the exhibits at the Truck Show was a fine Packard motor-truck, specially designed for the Monatiquot Rubber Works, of South Braintree. This truck has since been added to the service department of that company for use between the factory and the Boston store on Atlantic avenue, and is intended for emergency shipments where rush delivery is required.

The new building of the United States Tire Co. briefly mentioned in this department in the March India Rubber World, is now fully completed and is occupied. Manager E. H. Kidder is very proud of the new headquarters which in location, thoroughness of detail, adaptability to the requirements of the business, and elegance of fittings are in perfect accord with the enterprise of the company. The building is neatly triangular in ground-plan, at the junction of Beacon street and Commonwealth

United States Tire Co.'s New Boston Building.

avenue, at the very gateway of Boston's Automobile district. It is of reinforced concrete, four stories and basement, with large windows giving a flood of light on all sides. A large clock occupies a prominent position, which will be consulted daily by the thousands who pass along these two prominent streets every day in the year, while in the evening strikingly conspicuous electric signs flash out the name of the company.

The first floor is utilized as salesrooms, suitably and handsomely fitted. The second floor contains the business offices. Both these floors are carpeted with artistic rubber tiling, a product of the United States Rubber Co. The third and fourth floors are for stock, and here are carried, ready for immediate sale or shipment, a full assortment of all the different styles and sizes of tires, including pneumatic, motor-truck, motorcycle and bicycle tires made by the company. In the basement, which is reached by an inclined run-way, a complete motor truck department is installed, with everything in the way of machinery and tools to repair and equip trucks with the tires of this manufacture.

* * *

Hon. L. D. Apsley, president of the Apsley Rubber Co., invariably plays a game of checkers on March 13 of each year, unless that day falls on Sunday. March 13 is the birthday of his venerable father, who was born ninety-five years ago. Mr. George Apsley, of Lock Haven, Pennsylvania, is a wonderful man, straight, active and vigorous. He opens his store in the morning, waits on customers, and closes up at night. When his son, of whom he is very proud, visits him on his birthday there is always a game of checkers on the program, and the older man is fully as often the winner as the younger. It is because L. Dewart Apsley has seen so many games played in little shoemakers' shops and country grocery stores that he decorates every case of Apsley rubbers with a checker board on one end, and distributes boxes of checkers to dealers.

* * *

George H. Hood, who is well known to our readers as a former rubber footwear manufacturer, but who sold out his business to the United States Rubber Co. some years ago, has not been in rugged health for the past year or two, while Mrs. Hood was also an invalid. Last January, they left their hand-

some residence in Hamilton, this state, to spend the winter in Florida. They went to Palm Beach in their own private car, accompanied by a physician and several trained nurses. On the 13th of last month news came from Palm Beach of the death of Mrs. Hood. The body was brought North, interment being in Chelsea on Sunday the 17th. Mrs. Hood was the mother of Frederick C. Hood, president of the Rubber Club of America, and general manager of the Hood Rubber Co., and also of Arthur N. Hood, treasurer of that company, and of Richard Hood, of Paris, European agent for the company.

* * *

The B. F. Goodrich Co. stores have good window displays. Their Boston store on Boylston street contains a very attractive exhibit. It is a model of the plant at Akron, Ohio. It is of wood, but so finished as to imitate the original, some buildings being of brick and others of concrete. The model shows in a ground space about six feet square ten or twelve of the factory buildings, each built to scale, and all electrically lighted, thus representing a night view of the plant. This model, which is an exact copy in miniature, is a center of attraction. A bird's-eye view alongside shows all these buildings, and also a large part of the plant not included in the model. Manager Limric is receiving many compliments on the attractiveness of the exhibit.

* * *

The Walpole Rubber Co.'s tire salesroom, at 757 Boylston street, has in its window another unique display of the tires made by the company. In the center, however, is a model which brings passers-by to a stop. It is a miniature automobile, perfect in its appointments, exact in its proportions, although only two feet long. It has left-hand drive, thoroughly upholstered seats, fore doors, full canopy top, clock, speedometer, etc. Instead of a six-cylinder engine, however, is a clock-work which enables the machine to propel itself "like life." The miniature tires, naturally, are labeled "Walpole." The remarkable thing about it is that the model was made by a prisoner in Charlestown State Prison, who has never seen an automobile except through the bars of his cell, but who has fashioned this model from pictures in advertisements.

* * *

Carpenters, painters and floor layers are busy at 863 Boylston street, where preparations are being made for its occupancy by the Republic Rubber Co., which expects to move into these larger and more convenient quarters about April 1.

* * *

The Patterson Rubber Co.'s plant at Lowell is well along toward completion. It was expected that it would be making tires by April 1, but there is a possibility of some slight delay beyond that date. The foundations for the heavy machinery are ready and the machines arriving, but it may be some days before they will be properly set and so adjusted that real production can begin. However, it is safe to say that before another issue of The India Rubber World is printed, the factory will be turning out goods.

* * *

W. F. Stevens, who was Charles A. Coe's right-hand man, when the latter was managing the American Rubber Co.'s agency in Pearl street, this city, is now a prosperous fruit farmer and automobile merchant in San Juan, Porto Rico. "Billy," as all his friends know him, is at present in this country. He and his brother started a fruit ranch in Porto Rico a few years ago, and while waiting for the trees to come into bearing worked up a fine pineapple business, and at the same time took the agency for two lines of automobiles and a line of trucks, so that he has enough to keep him busy, prosperous and happy.

* * *

The garment workers' strike in this section has interfered materially with some of the raincoat makers. Some of the concerns have accepted the terms of the strikers, while others in their attempts to run their factories with non-union help have found more or less difficulty in doing so. In Milford, Massachusetts, a near-riot occurred on March 3 in front of the Archer Rubber Company's factory, in which several non-union men were badly bruised, and two policemen were roughly handled. The trouble appears now to be settled satisfactorily.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

BUSINESS in the various lines of the rubber industry in Chicago continues fair, with reports from scrap rubber dealers that conditions are much better in their line than they were one month ago. It was the general belief that the Akron strike would play havoc with the scrap rubber interests, but Chicago dealers assert that the worst has passed and that they are now anticipating a fairly active spring. Business in scrap rubber had been good until the Akron strike began, and then there was a setback for about three weeks. However, this period of inactivity simply served to move slowly what little overstock there has been on hand.

Belting and packing lines are moderately active, though manufacturers note a tendency on the part of consumers to let the mill-supply houses and manufacturers carry the bulk of the stock, by buying in smaller quantities and only as needed.

The unusual weather that prevailed during March gave quite an impetus to the clothing market and many dealers who had a small stock on hand in anticipation of a late spring lost no time in sending in their orders. The result has been that jobbers have had their hands full getting orders out on time.

The demand for footwear throughout the month of March has been up to expectations, and this is due in a large degree to the favorable weather conditions. The prosperity that is being enjoyed at the present time is sadly needed, as business in footwear during the winter has been unusually poor. Some houses report that their sales of footwear during the winter were smaller in volume than in any winter for years, and this is ascribed to the comparatively mild weather. The blizzard that prevailed recently and the consequent slush had a tendency to assist the foot-wear market, and the appalling storm of a week ago created a wide demand for rubber shoes and especially for boots.

Mechanical rubber goods are reported stronger at the present time than they have been at any time since the beginning of the year. Throughout the winter the mechanical rubber interests have at all times expressed themselves as pleased with market conditions, but since the beginning of March their feeling of satisfaction has been more pronounced than heretofore. A feature of the trade has been the remarkable demand for belting, and this activity is attributed to the unexampled prosperity of Chicago's manufacturing concerns at present. Orders for belting have been coming in regularly, and for large lots, mechanical rubber goods houses report, and most of the demands are for immediate delivery.

The Cowell Rubber Co., which has recently put on the market the Keystone bath spray line, has made application for a state charter for incorporation. The capital of the concern will be $10,000.

"The market has been much easier in scrap boots and shoes during the last few weeks than it had been at any time since the Akron strike began," said H. Muehlstein. "A feature of the market is that prices have been steady and the trouble at Akron has little bearing on the Chicago market at the present time. Collections are much better than they have been in some time and offerings are being made more freely in boots and shoes. There is a good demand for all items of hose, excepting air brake, which shows little activity. The Chicago trade is pleased to note that the prospects are good for an early adjustment of difficulties at Akron, and is also glad to announce that the strike has not been affecting the local market near so much as most of us believed it would."

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

JAMES W. FRANKLIN, superintendent of the boot and shoe departments of the National India Rubber Co., at Bristol, has had a long term in the service of rubber concerns in his home town. While he is a young man in appearance, he has served in various capacities in the National India Rubber Co.'s factory and the Byfield Rubber Co.'s factory—now the plant of the Consumers' Rubber Co.—for 32 years.

Not only is Mr. Franklin well known in the rubber business, but he also has a wide acquaintance in political circles, having been at one time a member of the Rhode Island General Assembly. He has also held many offices in Bristol, including that of Town Councilman, and he feels a proper pride in the fact that he was never defeated in a political contest.

In former days when the National India Rubber Co.—now employing 1,300 hands—was known as the National Rubber Co. Mr. Franklin, as a boy, procured employment in the packing department at the modest wage of 75 cents a day. Since then he has worked upward step by step until he is now the directing superintendent over nearly 1,000 hands. Serving his apprenticeship in the rubber industry, sweeping the floors and putting things in order in the department in which he worked, he soon showed an aptitude for a more responsible position and before he attained his majority he was in charge of the packing department at night, continuing in this position for several years. When a vacancy existed he was appointed day foreman of the packing department, eventually being promoted to the position of assistant superintendent.

When the Byfield Rubber Co.—later merged with the Consumers' Rubber Co. of Bristol—was organized, Mr. Franklin became its superintendent, remaining there for about three years, or until 1898, when he was recalled to the factory of the National India Rubber Co. A native of Bristol, Mr. Franklin has had a wide experience in the rubber business and his knowledge of the vulcanizing of rubber is considered to be the best in Bristol. During his employment in the National India Rubber Co.'s factory he has seen the shipments of footwear increased from 14,000 pairs of shoes to 30,000 pairs of shoes a day.

* * *

John T. Fales, for years connected with rubber factories in Newport, died of pneumonia at the Rhode Island Hospital, Providence, March 3. He was born in Pelham, Massachusetts, in 1842 and entered a mill at East Amherst at an early age. In 1893 he went to Newport as overseer of the Goodrich Manufacturing Co., and in 1896 was made superintendent of the Narragansett Web Co., remaining in that capacity until the company was moved to Providence in 1902. Of late years he was engaged in the insurance business in Providence.

* * *

The annual shut-down of the Alice Mills and the Millville mills of the Woonsocket Rubber Co. for the taking of an inventory of stock and also for the making of needed repairs took place the latter part of March. The shut-down was for a shorter period than in the rubber mills in other places. At the Alice mill 1,400 hands were affected while at the Millville mill 600 were idle.

* * *

Manager LeBaron C. Colt, of the National India Rubber Co. of Bristol, who has been in the West for a month, returned March 5. Mr. Colt went to Denver for a rest. He returned much improved in health.

* * *

William D. Newbold, aged 56, died March 2 at his home in Bristol, after an illness of three days of bronchial pneumonia. He had lived in Bristol the greater part of his life. Mr. Newbold was formerly a rubber bootmaker in the factory of the National Rubber Co. and in the factory of the Boston Rubber Shoe Co., at Malden, Massachusetts. He retired from active work several years ago.

A new engine, boilers and other fittings are being installed at the International Rubber Co.'s plant at West Barrington. The company has many orders ahead and in order to keep up with the rush of business the plant is running night and day. The engine is larger than the one that it is replacing and, it is expected, will take care of the needs of the plant for some time to come.

* * *

Albert C. Luther, a veteran of the Civil War and for years an an employee of the National India Rubber Co. of Bristol died March 13 at his home on Cottage street, Bristol, as a result of a fall on the street. He was 82 years old and was a native of Warren.

* * *

The factory of the National India Rubber Co. of Bristol closed down March 29 for two weeks for the annual stocktaking. The mill will resume work April 15. It employs about 1,000 hands.

* * *

Walter R. Reeves, foreman at the Washburn Wire Works, Phillipsdale, makers of rubber insulation, was painfully injured at the plant recently when his right hand was drawn between the rolls of a machine. Mr. Reeves was able to free himself from the machine just in time to prevent a more serious accident. As it was, the thumb and forefinger of the right hand were injured.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

BUSINESS activity is steadily maintained and little or no complaint is made by local rubber interests on trade conditions. Weather conditions in this section, however, are responsible for some decrease in activity in rubber footwear trade, but on the whole retail distribution has been measuring up to the average. Rubber clothing dealers report a good trade, as there seems to be a growing demand for rubber clothing.

* * *

Rubber shoe manufacturers and jobbers are at sea over a bill introduced in the Ohio Legislature now in session, known as the "Pure Shoe Bill." While its provisions are particularly directed to leather footwear, yet local jobbers see a "sleeper" in the proposed law which would bring rubber footwear under its operation, and consequently jobbers have joined the local manufacturers in their campaign to defeat the measure. The bill has been introduced by Senator Potting of Akron, who comes from one of the principal rubber footwear manufacturing centers of the country. The bill, if it passes, will compel all manufacturers of footwear in the State to stamp the products turned out by them if substitute products have been used. It is claimed by Ohio manufacturers that if the proposed law is enacted it would practically eliminate the Ohio concerns from competing with outside manufacturers, as the former's cost of production would increase to a point where they could not compete with manufacturers in other states.

* * *

The Ohio State Pharmaceutical Association has joined forces with manufacturers of druggists' sundries in an endeavor to bring about a revision of the postal laws, so that it is made clear what articles may and may not be sent through the mails by druggists. Resolutions have been drafted by a committee of the association and will be forwarded to the postmaster general.

* * *

The shock shifter hub, invented by John Muir, of London, England, will shortly be given a try-out in this city. Mr. Muir has been in this city for several days, and has arranged with the Taxicab company to fit the device on one of its cars. An axle company has also decided to give it a test. Instead of pneumatic tires, solid rubber tires are used. The road shock, according to the inventor, is reduced to a minimum. Mr. Muir is here primarily to interest manufacturers of solid rubber tires in organ-

izing a company to make the hub in this city. The Kelly-Springfield and several other large manufacturers of solid tires have become interested. In this invention, steel balls being placed around the axles of motor vehicles so as to give them an all but liquid bearing, and by their centrifugal movement divert road shock therefrom and convert it into propulsive effort. As 45 per cent. of the present cost of maintenance is due to vibration, the importance of the Muir system is obvious. Its practical success is vouched for by some of the largest users of motor traction in Europe.

* * *

While many of the big rubber factories throughout the country were facing strike troubles, the Cincinnati Rubber Co. was operating its plant in a peaceable manner, not the slightest signs of disturbance being observable at this plant among its employes, notwithstanding the fact that the local newspapers were publishing daily columns of strike news from Akron.

* * *

The Revere Rubber Co., of Chelsea, Massachusetts, has inaugurated a local advertising compaign for the purpose of promoting the demand for "Red Plug Rubber Heels," one of the products of that concern. Local dealers report that there is a growing demand for rubber heels, especially since the public is becoming educated to their merits.

* * *

To the regret of his many friends in Cincinnati and vicinity, Robert Motte, manager of the local branch of the United States Tire Co. has been transferred to New Orleans, where he is to put in action his valuable services in establishing a new agency in the Louisiana metropolis. He is succeeded here by E. W. Bailey.

* * *

The Ira J. Cooper Rubber Co., representing the Kelly-Racine Rubber Co. and the Motz Cushion Tire Co., and operating branch houses in Dayton, Springfield and Columbus, has installed a battery of service motor wagons that will be at the instant disposal of auto owners meeting unexpectedly with troubles while touring within ten miles of the different cities where branches are operated. Expert mechanics supplied with every requisite for immediate repair are in charge of these service wagons, and their services are available without charge.

Ira J. Cooper, head of the company, treated his friends in the rubber trade to a surprise March 12, by taking to himself as his wife, Miss Florence Johnson of this city, who had been secretary of the company since its organization several years ago. Immediately following the ceremony the bridal couple left for a honeymoon trip through the south.

The F. M. Ross Springwheel Co. of this city has filed articles of incorporation with a capital stock of $100,000. The company will manufacture a patented solid rubber tire for automobiles which has been invented by F. M. Ross, who will head the new company.

The Pennsylvania Rubber Co. has entered the local field with its "Oilproof Vacuum Cup Tires." This company is represented here by G. M. Toe Water & Co., dealers in auto supplies, who have recently moved to 917 Race street, where spacious quarters have been opened.

The Lee Tire and Rubber Co., of Pennsylvania, is about to become a competitor in the local field for the tire and rubber auto accessories business. The company will open a branch house at the corner of Seventh and Main streets as soon as extensive repairs have been made.

Messrs. Hanke and Rothe, who are the local representatives of the Ajax-Grieb Rubber Co., of Trenton, N. J., have moved into new and more commodious quarters. The new home of the Ajax tires in this city is now located at Ninth and Race streets.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

ONE of the representatives of a local rubber establishment, dealing in rubber tires extensively, advances the opinion that the Government should step in and abolish the guaranteeing of rubber tires, hose, etc.—but particularly on automobile tires. This should be done, he suggests, not on account of the relief which it would give the rubber dealers, but because it would prevent much fraud and imposition, and would benefit the morals of the whole community. People buy guaranteed tires—say guaranteed for 1,000 miles. After they have run 4,000 miles the tire is in a bad shape. Then they remember the guarantee, are tempted and fall. The best men of the town, lawyers, doctors, prosperous business men all fall before the temptation. They bring their tires back in the hope of getting a new one, and having started they must carry the thing through, and under the shrewd cross-examination of the adjustor they tell many more and blacker lies than they started out to tell. No one but the tire man knows to what extremes the automobile owner will go. The automobile owner is buying his machine on time, and has put every cent he can borrow into his first payment. From then on he commences to beat the oil man, the gasoline man and the tire man, but he falls most desperately upon the tire man because the tire man is foolish enough to give him a guarantee. Competition compels the tire men to make the guarantee, and there seems no present chance of their abolishing it.

* * *

The new factory of the Goodyear Rubber Co., of San Francisco, has been fully completed and is now in full swing. This is one of the finest rubber factories in the west.

* * *

Mr. E. W. Balding, general sales agent for the New York Belting & Packing Co., is now visiting on this coast.

* * *

A. L. Comstock, the superintendent of the American Rubber Co., of Boston, has been in San Francisco for a few weeks, and from here he will go to Honolulu for a pleasure trip.

* * *

W. J. Gorham, president of the Gorham-Revere Rubber Co., sailed recently on the steamer "Korea" for the Orient, where he will visit the principal market cities in the interests of the company. He will be gone three or four months and will go all through the Orient. This is the first time Mr. Gorham has been across the water for years, although formerly he used to visit China and Japan, and knows the countries well.

Mr. Valberry, who formerly had the agency for the Faultless Rubber Co.'s line on the coast, has given up that agency and has gone in with the B. F. Goodrich Co.'s local branch.

B. H. Pratt, Pacific Coast manager of the Fisk Rubber Co., is in the southern part of the state, where he is visiting the branch stores at Los Angeles and the San Diego agency.

H. W. DuPuy, president of the Pennsylvania Rubber Co., who is now in Seattle, Washington, has been visiting all of the Pacific Coast distributing agencies accompanied by his coast representative, Mr. J. E. French, of San Francisco. They have already visited all of the principal cities of California, including Los Angeles and San Francisco, and Mr. DuPuy is more than pleased with conditions on this coast. He was surprised at the growth of San Francisco, this being his first visit here since immediately following the 1906 fire.

The Chanselor & Lyon Co., agents for the Lee tires, called a conference of the heads of departments which met recently to plan for a state wide campaign now that the touring season is about to open. There were present F. H. Lyon, of the Los Angeles branch; W. A. Avery, of Seattle, Washington; W. H. Whipple, of Fresno; Geo. E. Johnson, of Portland, Oregon; Henry D. McCoy and William Reed, of San Francisco.

New Rubber Goods in the Market.

THE BRAIDOID GAS TUBING.

THE Thermoid Rubber Co. has been very successful with its Braidoid Gas Tubing, which is a tube designed especially for automobiles, and is made with great care in all its details. The tube is made of selected stock so that it will stand the action of all gases, and the covering is closely braided — not wrapped — and is constructed of a particularly strong and light thread. The outside rubber cover is of the same composition as the inside tube. It is believed that this is an ideal tube for gas lamp and gas tank connections. No nipples or rolled ends are necessary in attaching it for service. [Thermoid Rubber Co., Trenton, New Jersey.]

RUBBER SHOES FOR DIVERS.

If anybody has the impression that the diver is not an important person, he will immediately change his opinion on looking over the 72 large pages of the catalogue entitled, "Diving Apparatus," issued by Andrew J. Morse & Son, of Boston, for these entire 72 pages are devoted to the diver and his divers wants. There are, moreover, fully a hundred illustrations showing the many different articles that are necessary for his work — or at least for his safety and comfort. Among articles of the latter class may be included the divers' shoes. The catalogue shows quite a variety; two kinds are illustrated here. One illustration shows a pair of very heavy rubber shoes to which are strapped iron soles running well up over the toe. These iron soles add weight to the diver's feet and operate to keep him in the desirable perpendicular position. The rest of the shoe is made of rubber, not so much, probably, with the expectation of excluding every drop of water, but because of the fact that rubber will stand innumerable immersions without deteriorating or stiffening. These shoes go over the foot of the water-proofed suit that encloses the diver's whole body.

There is no reason to expect that these shoes will become generally popular on the dry promenades of the upper world, but their utility in the subaqueous walks of life is obvious.

The smaller illustration shows a pair of lighter shoes made simply of canvas and rubber. These are called "Chaffing" shoes and serve to protect the feet of the diving shoes.—Andrew J. Morse & Son, Boston, Massachusetts.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

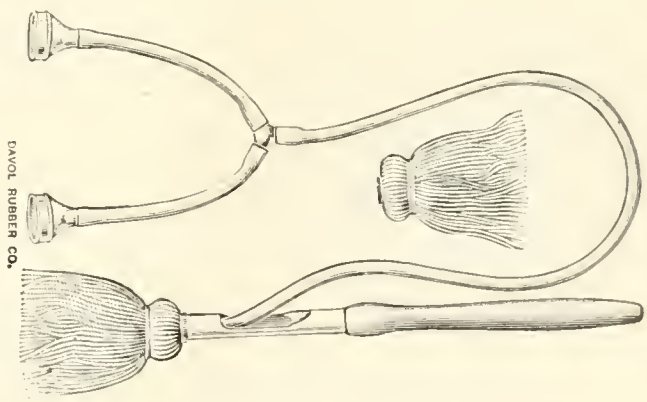
A THICK TREAD INNER TUBE.

Of new inner tubes there is no end, but here is one that is certainly interesting. It is made on the principle of the most wear where the most wear comes. In other words, instead of being of the same thickness in all parts, it is very much thicker on the tread than it is on the sides or at the base. The tread is nearly an inch in thickness, while at the base it is about a quarter of an inch in thickness. The cut shows the exact proportions of the tube. It is molded in just the shape shown. The advantages of this tube as claimed by its manufacturers — which claims would logically seem to be substantiated by the shape of the tube—are that it eliminates pinching, greatly lessens the liability to punctures and blow-outs, and requires less air pressure.

While this tube has but recently come on the market, the manufacturers have given it a very thorough testing during the last two years. [The Kokomo Rubber Co., Kokomo, Indiana.]

WASHING DISHES WITH DRY HANDS.

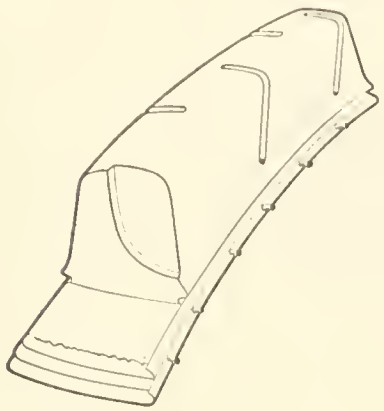
The great perpetual desideratum of the housekeeper is to know how to do kitchen work and keep parlor hands. Plenty of women are perfectly willing to do housework, but they do not want to have hands that show it. Here is a little invention that will help women in this predicament, as it will enable them to wash all the dishes without even wetting their hands. It consists, as the cut shows, of a rubber tube with a forked end, the two ends of the fork having suction cups that go over the hot water and cold water faucets of the kitchen sink. At the other end of the rubber pipe there is a dish mop. The dishes are put in the sink or in a wire tray, the water is turned on at just the temperature desired, and in whatever volume is needed. Then the housekeeper takes hold of the dry handle and mops her dishes. It is obviously a clean and sanitary process, as the dishes are washed with running water. It is simple to operate, as all that is necessary is to detach the mop after each washing, and hang it up to dry, while the pipe can be left over the faucets or taken off—as the housekeeper may prefer. [The Davol Rubber Co., Providence, Rhode Island.]



"Yankee Girl Dish Washer."

THE ST. LOUIS CO.'S NOTCH ELECTRIC TIRE.

About three years ago Mr. J. A. Swinehart, who had been for some time connected with a tire manufacturing concern, retired from the business. But once a tire man, evidently always a tire man; and Mr. Swinehart was not able to keep his mind from the great tire problem. As a result he has evolved a tire which he has called the Notch Electric Tire, and which is being manufactured by the St. Louis Tire & Rubber Co., of St. Louis, of which Mr. Swinehart is vice-president and manager. The accompanying cut gives something of an idea of this "Notch" tire. These notches are inserted alternately at regular intervals on a slant of about 20 degrees. They serve to give the solid tire more spring and resiliency, and according to Mr. Swinehart, they serve another very important purpose. Where the car is running on a smooth but muddy road-bed, these notches serve to push the mud or moisture to one side so that the smooth tire has a clean smooth surface to operate on, and thus avoid skidding. Moreover, these notches serve an excellent turn in city streets, as they make it easy for a car to get out of a street car track when it is wet.



Mr. Swinehart's new company not only makes this notch cushion tire, but is manufacturing truck tires of the flange type, and also a pneumatic tire on a new principle, which provides for the expanding of the carcass within the mold by hydraulic power, so as to insure against buckling or pinching of the fabric.

RUBBER SEAL FOR BOTTLED LIQUIDS.

Bottled liquids have come into such general use for domestic as well as outdoor purposes, that to keep them secure, and at the same time free from exposure to air, has become a matter of daily necessity. These ends have been accomplished by the "Brownie Cap," an absolutely sanitary rubber seal for bottles, which is quickly cleansed and sterilized in hot water. The rubber is always pliable and effectually protects the liquids from germs, dust, vapors and foul air or odors.

While this cap thus affords full protection for liquids, it can be easily slipped on or off, and is thus specially adaptable for use on picnics, excursions and camping trips. It is also most valuable for the purpose of sterilizing milk intended for babies and, owing to its airtight clinching under the collar, permits the bottle to be placed in any position on the ice, without risk of leaking or spilling.

A REMEDY FOR CHAFING.

Insulated wire and rubber gas tubing are liable to become chafed by passing through holes in sheet metal. This can be prevented by short pieces of heavy rubber and fabric tubing slipped over the former, and held in place by a little rubber cement.

A LITTLE RUBBER TUB FOR BABY.

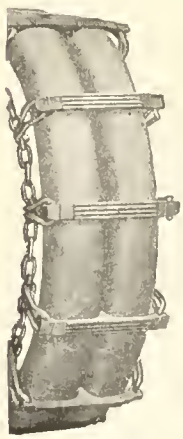
How to bathe that member of the family usually flippantly referred to as the "kid," has always been something of a conundrum. Obviously it would not do to fill a bath-tub full

The Baby's Bath Tub.

of water as the child might go under, and to bathe him in a few inches of water in the bottom of the tub is a back-breaking process for the mother or nurse. But here is a bath-tub designed especially to meet the situation. It is a flexible rubber tub, just the baby's size, on a rigid steel frame that fits on the side of any bath tub. This tub within a tub can be filled from the faucet and emptied into the tub, which obviates all carrying of water. The child gets all the depth of water necessary, and can tumble around in the tub without being injured in any way, while the nurse can stand or sit during the bathing operation in a comfortable position. [The Heaton Manufacturing Co., First National Bldg., Chicago, Illinois.]

PERFECTION NON-SKID CLIMBER.

The adaptation of motor vehicles to commercial uses has resulted in the presentation of various difficulties, prominent among which is that of skidding. While this problem is a troublesome one under all circumstances, it becomes doubly so in the case of motor-trucks where the weight of the load is naturally heavy.



With a view to remedying these troubles the "Perfection Non-Skid Climber" has been introduced, in which the shoes or treads are made from fine drop-forged steel, treated with heat, connected to Swedish iron side chains by steel side-links. The shape of the shoes prevents them from injuring the tire. Tires can be worn down to the rim without altering the shape. The cross-shoes having two flexible joints, there cannot be any permanent distortion of any of the parts, the tread freely adopting itself to the surface of the road. There are no chains over the tire to collect sand and gravel to cut into or wear it. The device is marked by simplicity of construction. Ease of adjustment and infallible action are also claimed for it. It has but three working parts, can be easily and quickly put on and taken off; operating on a simple mechanical principle which automatically checks all sliding, skipping and skidding. [Perfection Non-Skid Climber Co., Edon, Ohio.]

News of the American Rubber Trade.

THE ACUSHNET PROCESS.

THE Acushnet Process Co. report many inquiries in regard to their "New Tabasco" and "Hidalgo" brand rubbers. The good appearance of these rubbers has been generally commented upon. They also report a good demand for uncured friction scrap, and state that this part of the plant is now working on a day and night basis. A new reclaiming process is being developed by them, from which they claim that they are getting excellent results. The reclaimed products will probably be put on the market during the summer.

RUBBER GOODS MANUFACTURING CO.

The annual meeting of stockholders of the Rubber Goods Manufacturing Co. for the election of directors and for the transaction of any other business which may properly be brought before the meeting, will be held at the principal office of the company, No. 15 Exchange place, Jersey City, New Jersey, on Thursday, April 10, 1913, at 12 o'clock noon.

The transfer books will be closed, but the New Jersey Corporation law will not allow to be voted at said meeting any share of stock which shall have been transferred after March 21, 1913.

STATEMENT OF THE APSLEY RUBBER CO.

The Apsley Rubber Co., Hudson, Mass., has filed with the Massachusetts secretary of state a statement of its financial condition, dated January 20, 1913, which shows an increase of $30,000 in surplus over a year ago. Its latest statement in comparison with that made a year ago is given below:

Assets:	1913	1912
Real estate	$252,359	$252,133
Machinery, fixtures, tools	239,932	233,866
Material stock in process	511,365	508,334
Cash and debts receivable	444,797	414,173
Patent rights trade marks	8,851	8,882
Investments	120,000	120,000
Total	$1,577,304	$1,537,388
Liabilities:		
Capital stock	$750,000	$750,000
Accounts payable	197,203	117,095
Floating debt	265,000	335,000
Surplus	365,101	335,292
Total	$1,577,304	$1,537,388

A BOSTON VIEW OF U. S. COMMON STOCK.

There are few topics as interesting to financial writers as the potentialities in the way of dividends of the common stock of the United States Rubber Co. Here is a paragraph taken from a recent issue of a Boston financial paper, which shows how at least one New England observer views the situation:

"There continues to be a strong impression in quarters close to the controlling interests of the United States Rubber Co. that at their approaching meeting the Rubber directors will place their common stock on a 6 per cent. basis. Anthony N. Brady and Samuel P. Colt, I am told, retain their very large holdings, estimated by well-informed people a few weeks ago at 75,000 shares of this issue. They are the dominant interests in the company and are credited with the belief that the earnings of the Rubber company, present and prospective, amply justify the talked-of change in dividend. The open winter was against the rubber shoe business. On the other hand, the automobile industry is extremely active. The auto truck is gaining in usage by leaps and bounds. Hence a big field for the rubber tire business."

THE DUNLOP RUBBER CO. TO MAKE FABRICORD TIRES.

The "Fabricord" tire, owned by the Century Rubber Co., of Plainfield, N. J., has spread over new territory. A tire deal of considerable importance was recently completed, when the Dunlop Tire and Rubber Co. concluded an agreement with the Century Rubber Co. for the exclusive use and manufacture of the Fabricord tires in Canada. The agreement gives the Dunlop company the exclusive right to the Dominion and the goods produced in Canada will be known as the Dunlop-Century Fabricord Tire.

CAPITAL INCREASE AND OPERATIVES BACK AT WORK.

The Plymouth Rubber Co., of Canton, Ohio, has been incorporated under the laws of Massachusetts, with a capitalization of $1,500,000, consisting of 5,000 shares of 7 per cent. cumulative preferred and 10,000 shares of common at $100. The incorporators are A. Sydeman, J. Meade, D. Harris, S. Lewnberg and W. H. Howard.

Incidentally, the employees of the company who went on strike late in February returned to work on March 10, on the terms offered them by the company.

A BOSTON BRANCH FOR THE D. FEINBURG CO.

The D. Feinburg Co., 243 Water street, New York, opened on March 15, a branch store and warehouse, with full facilities for handling scrap rubber, at 168 A street, Boston. It will be in charge of M. G. Hopkins and Fred. Feinburg.

PORTAGE RUBBER CO.'S DIVIDENDS.

The board of directors of the Portage Rubber Co. at a regular meeting held on Wednesday, March 12, declared the regular quarterly dividend of one and three-quarters per cent. payable April 1 on all stock of record March 1. This company has been paying a dividend of 7 per cent. on its preferred stock since 1910. It is reported that they have already booked orders for practically all the tires they can make during the coming season, and it is believed by people familiar with the company's affairs that it can soon pay a dividend on the common stock also.

TRADE NOTES.

The Century Rubber Co., of Chicago, has acquired a five years' right to manufacture Goodall packings. This is a relatively young concern, which has made rapid strides. It makes a general line of mechanical goods, as well as an excellent quality of reclaimed rubber.

Robert Badenhop, importer of crude rubber, balata and gutta-percha, has recently moved into his new offices at 69 Wall street, New York. The change from the old quarters was occasioned by the increase of business. The firm has recently opened a branch office in the Second National Bank building, of Akron, with Mr. Harold W. Holcombe in charge. Prior to Mr. Holcombe's present affiliation, he was connected with the Trenton Rubber Co.

The Dryden Rubber Co., of Chicago, is now operating its new plant, which is as well-equipped and as busy a factory, for its size, as there is in the West. The Dryden Co., in addition to a general product, is making a line of highly successful specialties, including a rubber belt boot for horses, and a special type of plumbers' force-cup, both of which are in active request. George Dryden, the president of the company, whose methods have brought the Dryden business to its present successful condition, is one of the most aggressive and effective members of the Western rubber manufacturing trade.

The McIlroy Hose & Belting Co., of Hammond, Indiana, has put a new rubberized fibre hose on the market, said by Mr. McIlroy to be the only hose of its type now being offered.

OBITUARY RECORD.

DANIEL S. PRATT.

DANIEL S. PRATT, president of the Foster Rubber Co., of Boston, died at his residence in Brookline on March 15 after a short illness. He was well known in the rubber trade, having been connected with the Elastic Tip Co., a business founded by his father. He was the organizer of the Foster Rubber Co. He was a member of the Rubber Club of America, and had many friends in the trade. He is survived by his father and his brother-in-law, Mr. Stetson, both of whom are interested in the Foster Rubber Co.

FRANK E. HALL.

Frank E. Hall, widely known among tire men as the inventor of a sectional automobile tire, died at his home in Wollaston, Mass., March 14, after a lingering illness. He was sixty years of age, and had spent the greater part of his business life in rubber manufacturing. He devoted a great deal of time to experimenting, and six years ago was granted a patent for a sectional automobile tire. He is survived by two sons, both in the rubber business—Harry, connected with a rubber house in Portland, Oregon, and Stanley, connected with the Kelly-Springfield Co.

RHODEY P. WHALEN.

To be connected with a manufacturing company continuously for forty-five years is as creditable as it is unusual in these days. But Rhodey Patrick Whalen, who died March 19, in Tuckahoe, New York, had been in the employ of the Hodgman Rubber Co. —whose factory is located in that town—for forty-five years.

He was born in Ireland in 1852—his father coming to this country a year later and settling in Tuckahoe. The boy attended the public school, and at the age of sixteen, entered the service of the Hodgman company as a driver of one of its factory wagons. A little later he was transferred to the calender room, where his efficiency soon placed him in the position of foreman. Later he was made foreman of the compounding room, a position which he filled faithfully and satisfactorily for many years. Mr. Whalen did not confine his energies altogether to his factory work, but was active in the affairs of the village, serving at one time as a member of the Board of Education, in his district and later as receiver of taxes for the village. He was also one of the organizers of the "Holy Name" and temperance societies of the Church of the Immaculate Conception, of which he was a member.

C. E. W. WOODWARD, PH.D.

Dr. C. E. W. Woodward, of the Fisk Rubber Co., died suddenly of heart disease on March 24, in Chicopee Falls, Massachusetts. Dr. Woodward was one of the organizers of the Fisk Rubber Co., which he formed in conjunction with H. G. Fisk and H. T. Dunn in 1898, acting for the first few years as the company's superintendent. Prior to that time he had been connected with the Overman Wheel Co., Dr. Woodward was sixty-one years of age. The funeral occurred in Chicopee Falls on March 26, and the burial took place the following day in Cambridge, Massachusetts.

THE AKRON STRIKE.

An article in this issue which will prove of special interest to many of our readers is the letter from our resident Akron correspondent, giving a general survey of the strike that began among the rubber workers of that city on February 12, and was finally abandoned by its organizers on March 31—a strike without any adequate excuse, as foolish as it has proved futile, the chief result of which has been to inflict great damage upon the city of Akron, and especially upon the rubber workers of that centre, and lasting injury upon the cause of organized labor.

ENGLISHMEN WANT COTTON DUCKS.

A business man in England informs an American consular officer that there is an increasing demand for cotton ducks and sailcloth, which are used extensively in the rubber trade for sheeting, belting, hose, automobile tires, etc. The number of the Consular Report is 10,528.

PERSONAL MENTION.

H. W. DuPuy, president of the Pennsylvania Rubber Co., is making a tour of the Pacific Coast and incidentally visiting the branches and jobbing connections which have been established by his company.

Mr. R. P. Dowse has been appointed general sales representative in the Central district, with headquarters in Detroit, for the Goodyear Tire & Rubber Co.

Mr. B. W. McCabe, who was formerly with the Swinehart Tire & Rubber Co., of Akron, now covers the New York district for the Lee Tire & Rubber Co.

Mr. Max Loewenthal, of the United States Rubber Reclaiming Co., has recently returned from an eighteen months' tour of Europe. Mr. and Mrs. R. A. Loewenthal left on the *Caronia*, during the latter part of March for a Mediterranean trip.

MR. GEORGE J. BATES GOES TO THE FIRESTONE CO.

Mr. George J. Bates, who was formerly a department manager with the Diamond Rubber Co., has recently connected himself with the Firestone Tire and Rubber Co., Akron, Ohio, and will have charge of the sales department for pneumatic tires.

COMMODORE BENEDICT TO BE THE FIRST.

The society columns of a recent issue of the New York "American" contained the following interesting paragraph about Commodore Benedict, who is not only one of the directors of the United States Rubber Co., but who has made several trips up the Amazon in his private yacht, in connection with rubber planting and other enterprises in that country: "E. C. Benedict, mariner of many voyages upon the Spanish Main, is to be the first private yacht owner to steer a vessel through the turgid waters of the Panama Canal. Nothing delays Mr. Benedict's achievement except the fact that there isn't any water in the canal. But the yacht guests are all invited and the trip is a sure thing. Benedict bought John Hays Hammond's yacht, the *Atreus*, not long ago, and it's the *Atreus* that is going to show society the easiest way from coast to coast."

MR. STONE GOES TO THE PLYMOUTH COMPANY.

J. Everett Stone, assistant treasurer of the Hood Rubber Co., who has been with that company for the past fourteen years, severs his connection on April 1, to become treasurer and a director of the Plymouth Rubber Co.

THE UNITED STATES RUBBER CO. ELECTS A NEW DIRECTOR.

Raymond B. Price, president of the Rubber Regenerating Co., which was recently acquired by the United States Rubber Co., has been elected a director of the latter corporation.

THE STEIN RUBBER PLANT SOLD TO THE MOHAWK CO.

The Mohawk Rubber Co., recently organized in Akron, with a capital of $350,000—$100,000 in 7 per cent. cumulative preferred stock, and $250,000 in common stock, has bought the plant of the Stein Double Cushion Tire Co. The plant with its present facilities has a capacity of about 100 tires a day.

THE FIRE HORSE SOON ONLY A MEMORY.

One of the most spectacular sights imaginable, and one which never fails to arouse even the jaded sensibilities of the city dweller, is the engine on its way to a fire, drawn by two superb horses going at a mad gallop. But the spectacular has to give way to the efficient, and one large city after another is abandoning the horse-drawn fire engine in favor of the motor vehicle. The Fire Commissioner of New York announced early in March that no more horses would be added to the fire department, but that they gradually would be superseded. The New York department now has 100 motor vehicles and by the end of the year will have 200.

The apparatus now in the department numbers 850 vehicles, and it will take about five years and cost $2,500,000 to convert them all from horse-drawn to motor vehicles. New York fire horses die at about the rate of sixty a year, and as many more are laid off for old age or inefficiency.

A PAD MEMORANDUM CALENDAR.

J. W. Coulston & Co., 80 Maiden Lane, New York, importers of zinc oxide, lithophone, barytes and other ingredients used in the rubber trade, have supplied their customers with a small desk memorandum pad about 4 by 8 inches in size, in which each page has space for memoranda for a week. This pad is interleaved with pages printed in red, describing the various articles made and imported by this firm.

THE RUBBER STRIKE AFFECTS THE COTTON MILLS.

The interdependence of various industries has been strikingly demonstrated during the last few weeks by the serious effect that the Akron rubber strike has had on some of the New England cotton mills that supply the tire manufacturers with their fabrics. As the tire mills have been compelled to run on partial time, the fabric mills have been compelled to do the same; and the papers published in the localities where the cotton mills are situated have published the Akron strike news in detail.

AMERICAN TIRES ON THE SAHARA.

A set of 5-inch tires made by the Lee Tire & Rubber Co., of Conshohocken, Pa., is in service on the Sahara Desert. It would seem as if the wide pneumatic tire would go quite a distance towards solving desert transportation—like the wide feet of the camel.

ALLEGED INFRINGEMENT OF BATAVIA RUBBER CO. PATENTS.

The Batavia Rubber Co. of Batavia, N. Y., has served the following notification upon five tire manufacturing companies:

"You are hereby notified that you are infringing upon the rights of the Batavia Rubber Co. in the making of a non-skid tire, which is so close an imitation of the 'Security' non-skid tire, which has been made by the Batavia Rubber Co. for many years, as to deceive purchasers seeking Batavia tires, and you will be held responsible by suits at law for any damages.

"We will wait a reasonable time for your notification that you will cease further infringement."

THE H. W. JOHNS-MANVILLE CO. BUYS THE PULLMAN FARM.

The H. W. Johns-Manville Co., large manufacturers of a great variety of asbestos articles, have recently purchased the old Pullman property at Riverdale, Indiana, situated not far from Chicago. The purchase consists of 125 acres of land. The company is not yet ready to announce its plans for the improvement of this property, but it is rumored that it will build a factory, costing several million dollars, and giving employment to five or six thousand people.

AUTOMOBILES AT THE PANAMA-PACIFIC EXPOSITION.

Automobiles, motorcycles and accessories will be housed at the 1915 Panama-Pacific Exposition in a one-story structure, 600 feet long and 350 feet wide. This will be the first occasion on which a separate building of that magnitude has been devoted to the representation of the industries named, at an international exposition.

THE EASTERN RUBBER CO., LTD., OF TORONTO.

A new company has just been formed in Toronto, Canada, called The Eastern Rubber Co., Limited, with an authorized capital of $1,000,000, consisting of $400,000 cumulative preferred stock of a par value of $100, and $600,000 common stock with a par value of $50 a share. The company has been organized to manufacture all kinds of rubber goods, including auto, bicycle, truck and carriage tires, belting, hose, packing, and rubber heels. It took out its charter first under the name of the Dominion Rubber Co., Ltd. Subsequently it discovered that there was a company by this name in the Province of Quebec. Consequently it changed its name to the Eastern Rubber Co., Ltd. Its principal officers are: Roger Miller, president; W. L. Horton, vice-president, and A. G. Gamble, director and secretary-treasurer.

THE ALLIANCE RUBBER CO.

INCORPORATION papers were submitted early in March to the Secretary of State, in Ohio, of the Alliance Rubber Co., which is to manufacture rubber goods in the town of Alliance in that state. The company intended originally to take the name National Rubber Co., but as that name is already in use by more than one concern, the name Alliance was adopted in place of National. The company intends to manufacture a general line of rubber goods, including inner tubes, druggists' sundries, surgical goods, gloves and toys.

The incorporators are: George C. Russell, Milton Bejach, W. H. Purcell, M. S. Melbourne, F. E. Dussel, Robert Auld and H. F. Bohecker.

The company is capitalized at $100,000. A site containing three acres along the Pittsburgh Railroad has been acquired, which affords good facilities for manufacturing purposes.

A factory building 50 feet by 150 feet, two stories high, will be built on the location. According to those interested, the plant will be in operation by June, if nothing unforeseen occurs.

TO MARKET COUPLINGS FOR HIGH PRESSURE WORK.

The Star Supply Co., Inc., has recently been organized by a number of the salesmen of the Republic Rubber Co., with a view to marketing a special coupling for high pressure work in connection with steam and air drills. The company has its quarters at 229 West Fifty-eighth street, New York, and expects to have this special coupling on the market some time during the present month.

A NEW RUBBER COMPANY IN EAST LIVERPOOL, OHIO.

The Morgan & Marshall Co-Operative Tire and Rubber Co., with $500,000 capitalization, with R. J. Marshall, I. M. P. Marshall and Morgan Howell as incorporators, expects soon to begin the construction of a factory at East Liverpool, for the manufacture of rubber tires, tubes and sundries.

The Department of the Interior, Bureau of Mines, has recently issued a twelve-page pamphlet on the preparation of specifications for petroleum products, by I. C. Allen. It is known as "Technical Paper 36." Copies will be sent free to anyone sending in a request, but not more than one copy will be given to one person. Address, Director of Bureau of Mines, Washington, D. C.

A NEW CRUDE RUBBER FIRM.

James T. Johnstone, formerly agent in New York City for the crude rubber house of L. Sutro & Co., of London, has formed a partnership with Frank Whitworth, under the name of Johnstone, Whitworth & Co., at 130 Pearl street, New York, to act as agents in the crude rubber business for L. Sutro & Co., London, and also to act as agents for H. Diedrichsen & Co., of China, for the sale of products from the Far East.

THE AKRON TIRE AND RUBBER CO., OF BOSTON.

The Akron Tire and Rubber Co., of Boston, has been incorporated under the laws of Massachusetts with a paid-in capital of $15,000 for the purpose of handling automobile tires and rubber goods of all kinds, making a specialty of manufacturers' "second" tires. The treasurer of the company is Mr. M. Laserson, who has been connected with the rubber trade for a number of years.

AN ITALIAN FIRM WANTS AMERICAN RUBBER HEELS.

A firm of general representatives in Italy of English exporters and dealers informs an American consulate that it desires to represent American exporters of patent-leather and fancy shoes for men and women, shoes for workingmen, hunting boots, and rubber heels. This firm sends its traveling salesmen over the entire country. Correspondence may be conducted in English. The number of the Consular Report is 10,628.

THE ELECTRIC RUBBER RECLAIMING CO.'S NEW PROCESS.

In the attractive and interesting booklet lately issued by the recently incorporated Electric Rubber Reclaiming Co., of Akron and Barberton, Ohio, detailed reasons are given for the claim of that corporation, that its electrically reclaimed rubber is superior to the best grade of the article hitherto offered.

While the moisture, specific gravity, ash, tensile strength, stretch and recovery, vary with the stock from which reclaimed rubber is made, such variations can, by the company's process, be controlled within the limits of any given specification adapted for the article. Such limitation is only possible where the reclaiming is in the hands of experts and experienced reclaimers, and where the production is under laboratory control. These conditions existing with the Electric Rubber Reclaiming Co., they claim uniformity of product. The most important quality claimed for the latter is, however, its long life, due to its freedom from undecomposed fabric, sulphur and pieces of metal. By the use of the electric current on which the process depends, these objectionable features are completely removed.

Sample shipments of scrap rubber are invited by the company for treatment by their electric process, and subsequent analysis. The officers of the company are: Emil Gammeter, president; Francis A. Prodbeck, Jr., vice-president; H. A. Backderf, secretary, and Fred W. Albrecht, treasurer. The directors are the above, with William A. Byrider, Joseph Dangel, Shreve Clark, Frank R. Moore, Chas. Fosnight, E. E. Crooks and George W. Blackburn.

It is anticipated that this new company will add to the great reputation Akron already holds in the rubber world.

Plant of the Electric Rubber Reclaiming Co., Barberton, Ohio.

PAYING CLUB DUES WITH OLD TIRES.

The Massachusetts Auto Club, of Boston, has discovered a way of making it easy for its members to pay their dues. The house committee has sent out the following announcement to the members of the club: "Members wishing to dispose of worn-out tires and inner tubes may send them to the club, express prepaid and plainly marked with the owner's name. The tires will be shipped to a rubber manufacturer, and members will receive a credit on their bills for the number of pounds of waste rubber at the net price received from the manufacturer."

TO MAKE TIRES ON THE PACIFIC COAST.

Some of the business men living on the Pacific Coast have been asking themselves why tires could not be made there as well as anywhere. They have satisfied themselves in their own minds that they can, and they have formed the Panama Rubber Co., incorporated under the laws of California. The capital stock of the company is $500,000 preferred and $500,000 common. The officers are: W. D. Newerf, president; W. E. McCune, vice-president; J. S. Benner, secretary, and John F. Roe, treasurer. They have not yet decided where the factory is to be located, but are waiting for the best bid. It is likely, however, to be either in the suburbs of San Francisco or of Los Angeles. The company has prepared and issued a very pretty little book by way of a prospectus. It offers its 7 per cent cumulative preferred stock, in $10 shares, at par, giving a bonus of one share of common stock with every four shares of preferred stock purchased.

THE PERUVIAN-CHAMAYRO RUBBER CORPORATION.

A company has recently been formed, under the name of the Peruvian-Chamayro Corporation, with offices at 60 Wall street, New York, to engage in the exploiting of rubber lands in Peru. The company's prospectus states that: "The Peruvian-Chamayro Rubber Corporation absolutely controls 62,500 acres of the choicest rubber lands in the Province of Huanuco, Peru, which is in the heart of the great Montana rubber producing region. These lands lie between the Mayro and Palcazu Rivers and sworn statements by practical rubber men make the assertion that there are at least 250,000 full grown rubber trees on the property." The officers of the corporation are: President, O. P. Sperber; vice-president, Tonko L. Milic; secretary, George R. Allison; treasurer, A. C. Jenkins, of F. W. Mead & Co., New York. The board of directors is composed of the following: O. P. Sperber, Tonko L. Milic, George R. Allison, A. C. Jenkins, Dushan Trbuhovich, and F. D. Buck, of the Delaware Charter, Guarantee and Trust Company, of Wilmington. The company is incorporated under the laws of Delaware for $700,000, par value of the shares being $5. $200,000 is in 7 per cent. preferred stock, $500,000 in common stock.

TRADE NEWS NOTES.

Dr. S. W. Stratton, Director of the Bureau of Standards, Washington, has been elected to membership in the Council of Underwriters' Laboratories. The body is composed of twenty-two of the leading experts of the United States and Canada, who serve without recompense and supervise the technical work of the institution.

The Hampton Manufacturing Co., of Indianapolis, has been organized with a capitalization of $35,000, to manufacture a tire reliner. The organizers are Samuel Rubens, Simon B. Nussbaum and M. Moskin.

The Derrickson Manufacturing Co., of Muncie, Indiana, has been formed with a capitalization of $125,000, to manufacture a puncture-proof compound for tires. The principal stockholders are H. S. Osborn, R. C. White and H. L. Kitselman.

The factories of the Boston Rubber Shoe Co., at Edgeworth and Essex Fells, Massachusetts, shut down March 15, to remain closed until April 7 for the annual stock taking and repairs.

The $100,000 preferred stock of the B. & R. Rubber Co., recently offered to stockholders pro rata, has all been subscribed for. Shipments of the company for January and February are said to have increased about 25 per cent. over last year.

Receivers have been appointed for the Ferromatic Tire and Manufacturing Co., of Cleveland, which manufactured a spring tire.

The Bibb Manufacturing Company at Macon, Georgia, which owns seven or eight cotton factories in Macon and other points in Georgia, has had a large and increasing business during the last four years in the manufacture of tire fabrics. This is an old company and prior to its entrance on the tire fabric field, had been manufacturing other fabrics for over a quarter of a century.

Van Clief Bros., of 7111 Woodlawn avenue, Chicago, manufacturers of rubber cement and water-proofing substances, have recently doubled the size and capacity of their plant.

Charles E. Wood, previously with the New York Commercial Co., is now operating independently as a crude rubber dealer, with offices at 290 Broadway. Mr. Wood is handling all grades of Parás, eastern plantation, central and African rubbers. He was identified with the New York Commercial Co. for a long period.

L. Blitz, importer of crude rubber, will remove on May 1, from 5 Hanover street, New York, to the Maritime building, 8 and 10 Bridge street. Mr. Blitz was identified with the house of Livesey & Co. for a number of years, and handles a general line of crude rubber.

THE DREADNAUGHT TIRE AND RUBBER CO.

The Dreadnaught Tire and Rubber Co. has just been incorporated in Baltimore, Maryland, with an authorized capital of $1,000,000, for the purpose of making automobile casings. The company will have a site of about four acres, and expects to begin building operations within the next three or four weeks. The initial plant will consist of a main building 65 x 180 feet, three stories in height, made of brick and concrete, with a power house 35 x 50 feet. The main building will be laid out with reference to the addition, later, of wings, which may carry it completely around the power plant. The president is A. F. Gilbert; the treasurer, C. P. Triplett; the secretary, Walter E. Hill—all of Baltimore, and prominent in financial and social circles of that city. Mr. Wilmer Dunbar, very well known to the rubber trade, will be general manager and vice-president of the company, and will have full charge of the manufacturing operations.

DIVIDENDS OF RUBBER COMPANIES.

The board of directors of the Rubber Goods Manufacturing Co., on February 28, declared from the net earnings of the company the fifty-sixth regular quarterly dividend of 1¾ per cent. on the preferred stock, and a dividend of 6 per cent. on the common stock, both payable March 15, 1913, to stockholders of record of March 10.

Early in March the Intercontinental Rubber Co. declared a regular quarterly dividend of 1¾ per cent. on its preferred stock, payable March 31 to stock of record March 21.

The Walpole Tire and Rubber Co. has declared a regular quarterly dividend of 1¾ per cent. on preferred and 1 per cent. dividend on common stock, payable April 15 to stock of record April 1.

Canadian Rubber Co. has declared the regular quarterly dividend of 1¾ per cent. on preferred and 1 per cent. on common, payable April 1.

The Boston Belting Co. has declared a quarterly dividend of $2 a share, payable April 1, to stockholders of March 15.

The B. F. Goodrich Co. has declared a quarterly dividend on its preferred stock of 1¾ per cent., payable April 1, to stockholders of March 24.

UNITED STATES RUBBER CO.'S ISSUES.

Transactions on the New York Stock Exchange for four weeks, ending March 22.

Last year—High, 105; Low, 102½.

A TIRE COMPANY IN FLORIDA.

A report comes from Florida that a rubber company, to be known as the Seminole Rubber Co., will erect a plant in Jacksonville, that state, to manufacture automobile tires and other auto accessories in which rubber is used. The company is capitalized at $1,000,000, and expects to employ 500 hands and turn out 300 tires per day. It hopes to be in operation within three months' time.

THE FAMOUS YACHT OF THE MONATIQUOT CREW.

The sight of boys playing marbles back of the school house is not the only harbinger of spring; another sure sign that summer is not far away is the restlessness of the chronic yachtsman who begins in March to anticipate the delightful cruises of August.

The officers of the Monatiquot Rubber Co., of South Braintree, Massachusetts, own a little craft which they have named "Hypatia," and which they use during the summer for their own recreation and for the entertainment of their friends. One of the "Hypatia" crew who is already in anticipation skimming over the blue waters of Boston Harbor on one of those rare June days that Lowell used to write about, affectionately describes his boat as follows:

"She is about 45 feet of gracefulness and sturdiness, and there's a year for every foot of her. Her timber is as sound as the day she slid from the ways. An engine or something or other furnishes the power, and an awning, or whatever is the nautical term, keeps the rain from her deck-house. She was known once to have made nine knots per hour between Hangman's Island and Hull Gut, and she is said once to have cruised seventy consecutive miles off Boston Light. But it is her cabin, which can accommodate ten or twelve rubber men and her crew of Indians, known as the "Four Good Indians," that command the most attention.

"The pilot-captain of the ship is naturally one "Squantum," who has gained some considerable fame in rubber circles; while the technical member of the crew is "Monatiquot," nominally in charge of the power plant. In the commodious cabin, where there is every delight for the passenger, "Massasoit" and "Samoset" act as steward and chief mixer."

It would appear that a trip on the "Hypatia" is equivalent to a back-to-nature cure, or better still, a "Naturizing" treatment.

THE UNDERWRITERS' NEW LABORATORIES.

The Underwriters' Laboratories, Inc., have secured ten thousand square feet of additional land adjoining their holdings on East Ohio street, Chicago, and plan to extend their present buildings to provide additional space for hydraulic and chemical laboratories and offices. This follows the recent completion of a special building for tests of structural methods and materials, and will give the institution a total ground area of 26,600 square feet, a total floor area in buildings of 45,000 square feet and a yard space of 9,000 square feet. When the present extension is completed, the plant will represent an expenditure of $175,000, this amount having been contributed by the stock fire insurance companies.

THE RUTHERFORD RED INNER TUBE.

The Rutherford Rubber Co., Rutherford, N. J., is making a red inner tube which it calls the "Sterling," and it has adopted a method of bringing this to the consumers' attention, which, while expensive, is certainly convincing. It mails a cross-section of the tube about one inch wide attached to a card describing it and giving the price, and also suggesting a good way to test the qualities of the tube, namely, to make a cut or puncture in the sample and then tear it apart. This red tube is made of floating stock, and will not crack after long usage, as it is not heavily compounded. It has a cross grain to prevent splitting or "running."

100,000 GROSS OF JAR RINGS.

The B. & R. Rubber Co., North Brookfield, Massachusetts, recently shipped off to the South a single order of 100,000 gross of jar rings. This is not the company's record order, but it is the largest yet received this season.

A STRIKING TIRE ADVERTISEMENT.

The Fisk Rubber Co., of New York, recently had a full page advertisement in the humorous weekly "Life" that was certainly different. It was printed in colors and in the upper left-hand corner there was a small panel showing a robust native tapping a rubber tree, from which prodigious drops of latex exuded As these drops fell down the page they gradually assumed circular form until finally they appeared as full fledged Fisk tires on a red touring car going at a spanking pace. This advertisement leaves the impression that Fisk tires are made of genuine rubber—you can see it coming out of the tree—and that it is pure rubber and of very recent origin. It is a striking advertisement.

A RUBBER FACTORY TO BUILD A CLUB-HOUSE.

The Republic Rubber Co., of Youngstown, Ohio, have just embarked upon a project that ought to be very effective in making the 1,500 employees of that plant pleased with their lot. The company has decided to build a large and commodious club house for the use of its operatives. The house will be just across the street from the company's main offices. It will be an attractive three-story brick building 60 x 130 feet in size.

The first floor will be given over to bowling alleys, pool tables, shower baths, reading and lounging rooms; the second to a lunch room in which all employees can secure hot coffee and eat their lunch, and the third floor will be devoted to dining rooms for office employees. The second floor also will be used for meetings in which employees are interested.

Building of the Underwriters' Laboratories.

SIX-BY-FORTY TIRES.

The Fisk Tire Co. is said to have the distinction of making the largest pneumatic truck tires manufactured. They make a tire 6 x 40, used exclusively for fire apparatus, protective wagons and similar vehicles, where tires of great durability and strength are necessary.

"THE PRICKING OF THE BUBBLE."

Mr. Frank A. Seiberling, president of the Goodyear Tire & Rubber Co., gave some very interesting testimony before the Senate Committee appointed to investigate the Akron strike. But nothing that he said impressed his hearers more than this reference to the effect of the strike upon the market prices of the stock of some of the tire companies. He observed: "Perhaps one feature of value has come out of it all; namely, the pricking of the bubble of fictitious values on the stocks of the various corporations. Speculators had carried the value of Goodyear common stock to a basis of $465 per share ten days ago; it is now around $350; while its intrinsic value is approximately $125. Let this good work go on, and we will not have as much false reasoning when this fictitious basis of values has been properly exploded."

DIVINE TIRES.

The Divine Tire Co., of Utica, New York, filed incorporation papers early in March. The capitalization is $225,000, $100,000 preferred and $125,000 common. The directors are Bradford H. Divine, Charles W. Wicks and A. James Eckert, of Utica; William Dalton, of Schenectady, and Edward F. Torrey, of Clinton.

NEW INCORPORATIONS.

The Akron Tire & Rubber Co., of Boston, February 28, 1913; under the laws of Massachusetts; authorized capital, $15,000. Incorporators: Abraham Palder, 6 Milford street, Boston; Max Laserson, 99 Brunswick street, Roxbury, and Charles Braunstein, 205 Chelsea street, East Boston—all of Massachusetts. To manufacture, buy, sell and deal in tires, rubber goods, etc.

The Alliance Rubber Co., March 7, 1913; under the laws of Ohio; authorized capital, $100,000. Incorporators: George C. Russell, Milton Bejach and W. H. Purcell. Location of principal office, Alliance, Ohio. To manufacture any and all kinds of rubber goods, etc.

American-West African Corporation, March 7, 1913; under the laws of Maine; authorized capital, $250,000. Incorporators; James J. Wardrop, 160 Fifth avenue, New York; George Walker, 12 Martha place, Passaic, New Jersey, and George Douglass Wardrop, 293 Welling street, Richmond Hill, New York. To carry on a general rubber business in all its branches, including importing and exporting, etc.

Continental Rubber Works Selling Agent Incorporated, March 8, 1913; under the laws of New York; authorized capital, $3,000. Incorporators: Clarence E. Thornall, 50 Church street, New York; William A. Darling and Walter S. Tullis—both of 35 Murray street, New York. Location of principal office, New York. To deal in rubber goods, tires, etc.

Dreadnaught Tire & Rubber Co., February 24, 1913; under the laws of Delaware; authorized capital, $1,000,000. Incorporators: F. D. Buck, George W. Dillman and B. M. Grawl—all of Wilmington, Delaware. To manufacture and deal in tires, etc.

Du Fay Tire Filler Co., February 28, 1913; under the laws of Illinois; authorized capital, $10,000. Incorporators: Joseph C. Fuhs, Will T. Lostetter and Lebel M. Wheeler. Location of principal office, 714 South Clark street, Chicago, Illinois. To manufacture and sell a compound for filling tires for automobiles.

F. C. D. Inner Tube Protector Co., January 30, 1913; under the laws of New Jersey; authorized capital, $150,000. Incorporators: Gilbert S. Field, 379 Trumbull avenue; James H. Christensen, 1653 Second avenue, and Thomas Dick, 26 Cadillac square—all of Detroit, Michigan. To manufacture, purchase, etc., land and wares of every description, and to carry on any business, etc., so acquired.

Franco-American Safety Tire Co., February 17, 1913; under the laws of Delaware; authorized capital, $100,000. Incorporators: Emile Le Fevre, Eugenie Wolff and Armand Gaillard—all of Philadelphia, Pennsylvania. To manufacture and deal in automobile tires, etc.

John A. Gallagher Co., Inc., March 13, 1913; under the laws of New York; authorized capital, $2,000. Incorporators: Edward G. Weiser, 632 Grant street, Buffalo, New York; John A. and Ida B. Gallagher—both of 215 Crescent avenue, Buffalo, New York. Location of principal office, Buffalo, New York. To manufacture and deal in press blankets of rubber and felt, printers' supplies, etc.

Henschel Tire and Rubber Co., March 24, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Rudolph and Anna Henschel—both of 147 East 90th street, New York, and William A. Wollman, 1402 Lexington avenue, New York. Location of principal office, New York.

Hesco Tire Co., February 15, 1913; under the laws of Illinois; authorized capital, $300,000. Incorporators: C. S. Hayden, John Schwarz and Joseph Ellis—all of Chicago, Illinois. Location of principal office, No. 3204 South Michigan avenue, Chicago, Illinois. To manufacture and sell tires and automobile supplies, etc.

Mercer Rubber Co., March 19, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: William A. and James G. Dale—both of 340 East Fifty-second street, New York, and William H. Saijen, Jr., 294 Nassau street, Princeton, New Jersey. Location of principal office, New York. To deal in rubber goods.

Merritt-Elliott & Co., March 8, 1913; under the laws of New York; authorized capital, $350,000. Incorporators: Daniel T. Merritt and Charles E. Elliott—both of 130 Duane street, New York, and L. D. Apsley, Hudson, Massachusetts. Location of principal office, New York. To deal in boots, shoes, rubber goods, etc.

Mohawk Rubber Co., of New York, Inc., March 24, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Morris E. Mason and Charles W. McLaughlin—both of Akron, Ohio, and Milton Dammann, 141 Broadway, New York. Location of principal office, New York. To deal in tires and rubber goods.

Star Supply Co., Inc., March 14, 1913; under the laws of New York; authorized capital, $800. Incorporators: Charles W. Hardin, 315 West Ninety-ninth street, and Gustave A. Lepkem, 558 West 164th street, and Frederick C. Iringer, 507 Manhattan avenue—all of New York. Location of principal office, New York. To manufacture rubber hose and hose couplings, etc.

United States Graphite Co., February 21, 1913; under the laws of Illinois; authorized capital, $500,000. Incorporators: Eugene McSweeney and A. D. Eddy—both of Saginaw, Michigan. Location of principal office, 18 North Clark street, Chicago, Illinois. To sell graphite and graphite products.

Divine Tire Co., Inc., March 12, 1913, under the laws of New York, authorized capital, $225,000. Incorporators: Charles W. Wicks, 770 Genesee street; A. James Eckert, 108 Genesee street, and Bradford H. Divine, 202 Whitesboro street—all of Utica, New York. Location of principal office, Utica, New York.

Morgan & Marshall Co-operative Rubber & Tire Co., March 3, 1913; under the laws of Delaware; authorized capital, $500,000. Incorporators: R. J. Marshall, East Liverpool, Ohio; Morgan Howelk, Pittsburgh, Pennsylvania, and Ila M. P. Marshall, East Liverpool, Ohio. To deal in rubber tires and tubes, sundries and other rubber supplies.

THE SEAMLESS COMPANY ISSUES STOCK.

The Seamless Rubber Company, of New Haven, Conn., which makes the Bragg stitched tire, has certified to an issue of 5,000 shares of its treasury stock. The issue makes the total outstanding stock $1,000,000, of which one-half is common.

PRESIDENT WORK'S ANNUAL REPORT.

At the annual meeting of the B. F. Goodrich Co., held March 12, President B. G. Work read the following report:

"Since the purchase of the Diamond Rubber Co., on April 1st, 1912, excellent progress has been made in the unification of the Goodrich and Diamond organizations and their plants, providing thereby for great improvement in economy and a large increase in capacity.

"The report of the treasurer as certified by public accountants shows the company to be in a strong financial condition.

"As I pointed out in the published report, the bringing together of two large organizations entails a great many readjustments, the benefits of which do not appear immediately. It has been the policy of your directors to place the company upon a sound economical basis of operation as quickly as possible, and, while this may have interfered with the showing of earnings for the period, they feel that the best interests of the stockholders have been conserved for the future.

"The volume of business transacted during the nine months was practically the same as that of our company combined with that of the Diamond company for the corresponding period the previous year.

"It is unnecessary for me to comment on the disturbed labor conditions which have existed among the rubber industries in Akron during the past month, as you are all undoubtedly familiar with them.

"In reference to the future, I believe that it should be the policy of this company to husband its resources and accumulate a substantial surplus, and I shall not recommend to the directors the payment of a dividend on the common stock for the current period, nor until such substantial surplus over and above the preferred dividend and amortization requirements shall have been accumulated from the earnings."

GOODRICH STATEMENT FOR NINE MONTHS.

The statement of The B. F. Goodrich Co., Akron, Ohio, for the nine months ending December 31, 1912, shows net sales amounting to over $37,000,000; with net earnings of over $3,500,000 and undivided profits for that period of a little over $800,000. The detailed statement is given below:

Income Account.

Net sales nine months	$37,533,861.00
Expense	33,814,526.87
Net profit	3,719,334.13
Other income	571,844.51
Total income	4,291,178.64
Depreciation	440,851.73
Interest on bills payable	327,837.92
Net profit nine months	3,522,488.99

Assets.

Plants, good will, etc.	$70,685,721.89
Investments other companies	1,635,957.93
Twenty thousand five hundred and eighty-seven shares preferred at cost.	2,227,117.03
Inventory	16,226,639.63
Trade accounts receivable	5,147,703.47
Other accounts receivable	1,223,186.26
Bills receivable	606,944.44
Cash	803,224.60
Prepaid accounts	229,618.98
Total	$98,786,114.26

Liabilities.

Common stock		$60,000,000.00
Preferred stock		30,000,000.00
Bills payable		6,479,410.54

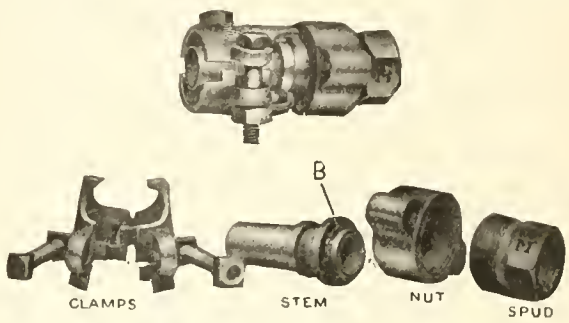
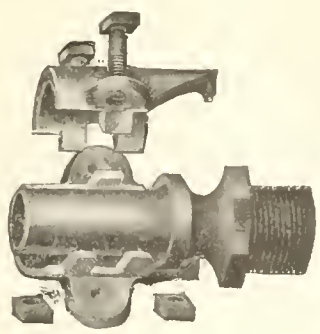
THE MULCONROY COUPLING AND NIPPLE.

TWO mechanical devices extensively used by rubber manufacturers are the Mulconroy Coupling and Nipple, said to be original types. They are specially designed for high pressure steam, air and water and are described as very durable.



The new features of the coupling are represented in the smooth stem, rounded and tapered, permitting easy access into the hose without injury to the tube, and a grooved lip at the spud-end of the stem, which prevents loss of the washer, a frequent cause of annoyance and lost time. The improved clamps cover the exterior of the hose so completely that when they are tightened they do not injure the hose cover itself. They are sufficiently long to cause such pressure at the end of the hose or stem, so as to occasion no injury. The projections over the collar render it impossible for the coupling to blow off, irrespective of pressure.



The new Mulconroy nipples are made with a thread of such size as to render the use of reducers unnecessary. For instance, ½-inch nipples are made with either ¼-inch, ⅜-inch or ½-inch thread, and the ¾-inch nipples with either ⅜-inch, ½-inch or ¾-inch thread. Both couplings and nipples are made from maileable iron and threads are standard iron pipe.

RUBBER WORKERS GET AN INCREASE.

The A. & A. Rubber Co., South Framingham, Massachusetts, early in March posted a notice announcing a 5 per cent. increase in the wages of all its employees, to take effect immediately. Voluntary increases in the wage rate are great lubricators of factory operations.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THIS North of England Show, organized by the Society of Motor Manufacturers and Traders, was held at Manchester February 14 to 22. There were really two exhibitions, the pleasure cars being located at the Rusholme exhibition buildings in the suburbs and the commercial vehicles at the city exhibition hall in the center of the town near to Deansgate, where the offices and show rooms of so many motor and tire companies are to be found. With the idea of expediting business and relieving the congestion of former years no free admission tickets were given to exhibitors to distribute among their friends, the result being that at no time were the premises overcrowded. The lessened attendance, however, must not be taken as reflecting in any way upon the importance of the show, which was the largest and most complete ever held in the provinces. Prospective purchasers attended in satisfactory numbers and the bulk of exhibitors seem to have been well satisfied with the business done. This applies more particularly to the motor vehicle show which, though sparsely attended by the public, was officially visited by deputations from corporations and other public bodies interested in traction engines and motor fire engines.

MANCHESTER MOTOR SHOW.

The question of motor lorry transport (the lorry is a long low platform wagon) is one of great interest to the industrial centers of Lancashire. It is recognized that for going to and fro in towns the horse lorry has the advantage, but in conveying goods such as machinery and cotton for distances of five to twenty-five miles the motor vehicle is being increasingly used. With regard to the port of Manchester it is estimated that 7 per cent. of the traffic is now dealt with in motor lorries, and, though this figure is not an imposing one, it is higher than pertains to any other British port. Though motors of several types and capacities are employed, there is a consensus of opinion that the best paying vehicle is the 5-ton wagon with rubber tires and with steering lock so arranged as to enable the wagon to turn in a small space. It has not been customary in these notes to go beyond tires when referring to motor shows, and with regard to these important accessories there was very little of novelty. Practically all the prominent British makers, as well as half a dozen leading European manufacturers, had stands, the show in this respect being far more complete than any of its predecessors. Shrewsbury, Challiner and Dunlop tires were shown at both Rusholme and City Hall, the other makers contenting themselves with one exhibit. Various bodies of the plastic nitrocellulose class have now for some time been used as leather substitutes in the upholstering of cars, and a quite modern use of plastics is the case of the wind-screen.

STANDARD specification and tests for rubber draw-bar springs used on private owners' wagons have recently been issued from the London Railway Clearing House. Embodied with the letterpress is a drawing showing the construction and dimensions of the spring, it being also laid down that the manufacturer is to guarantee a life of three years. After this it is not surprising to read that only vulcanized rubber of good quality is to be used, and that this must be thoroughly compressed, of a homogeneous character throughout, and free from defects. With regard to tests five per cent. of the springs are to be submitted for testing purposes. Rigid adherence to the detailed specification is not a *sine qua non*, as it is stated that springs of approved design may be used, provided they comply strictly with the test enunciated. This specification, I may say, is a new departure, buffers in the past having always been supplied according to the particular manufacturer's ideas of what is wanted. If it has the effect of doing away with the cheap buffer it will serve a useful purpose.

RAILWAY BUFFERS.

IN February occurred the death at the age of 72 of Mr. Benjamin Blundstone, manager of David Moseley Son's India Rubber Works, Manchester. He had been in the employ of the firm for 52 years, having commenced work with Mr. David Moseley, founder of the firm and grandfather of the present partners. The deceased was of a retiring disposition and was very little known in the trade, though Mr. J. B. Dunlop consulted him in 1888, soon after he invented the pneumatic tire, and for some years they worked together at this matter. As late as January 28 of this year he took out a patent for improvement in pneumatic tire air tubes.

OBITUARY NOTICE.

IN the "India Rubber Journal" of December 7, 1912, Frederick Kaye and R. S. Sharp describe a method for the estimation of sulphur in vulcanized rubber and other organic compounds. Of late years several new or modified processes have been evolved by different chemists, but it is generally recognized that all of these have some drawbacks more especially in point of accuracy or in the length of time required for the determination. An important point which seems to be frequently lost sight of is the extremely heterogeneous character of what is sold as vulcanized rubber, and it may easily happen that a method which will work well for a certain range of compounds will prove unsatisfactory in the case of other vulcanized rubbers. This is testified in the variations in the sulphur figures which usually characterize rubber analyses when carried out by different chemists; though the other figures may agree closely, yet it is generally found that those for sulphur differ considerably. A matter which has perhaps not always been allowed for is the migration of sulphur from the interior to the exterior of the rubber goods, thus leading to segregation. Unless therefore each analyst takes his sample in exactly the same way discrepancies in the results may easily occur.

NEW METHOD FOR SULPHUR ESTIMATION.

Not to linger further, however, on generalities, I proceed to the new method which resembles a good many previous ones in being a fusion method, while it differs from them in that zinc oxide is the base of the fusion mixture. The process in a few words is as follows: .25 to .5 of a gram of the finely divided sample is weighed out into a porcelain crucible and mixed intimately with eight times its weight of pure zinc oxide and four times its weight of potassium nitrate. Ignition with the lid on is effected by cautious heating after a layer of pure zinc oxide has been put in the crucible. After the reaction the crucible is heated strongly and after cooling the contents are dissolved in hydrochloric acid and the sulphur weighed as barium sulphate in the usual way. This method is certainly a simple and rapid one, and is admirably adapted for a great many cases. In all fusion methods, as distinct from wet methods, a good deal depends upon the state of subdivision of the rubber; i. e., the finer the particles the better the result. Unfortunately there are many rubbers which either from their purity or their oil content cannot be finely divided, and it would be interesting to know how far the accuracy of this method is affected in cases where the rubber cannot be finely divided.

One other point which is not without importance may be mentioned. This has reference to the presence of sulphates such as barytes and sublimed lead in the mixing. These are decomposed to a variable extent by the fusion mixture and will add considerably to the amount of sulphur found, thus necessitating a correction if the sulphur of vulcanization is the object of the

determination. Such a source of error applies also to other fusion methods, and further, as sulphates are by no means widely employed in rubber compounding, it need not be taken as destructive criticism of what promises to be a decidedly useful process both in point of accuracy and saving of time.

TRAVELERS' AGREEMENTS.

On February 21, in the King's Bench Division, London, Mr. J. A. Heath, late traveler for the firm, was sued by the Continental Tire and Rubber Co. (Great Britain), Limited, in respect to an agreement not to enter the service of a competing firm for one year after leaving the plaintiffs' employ. After a year's service with the plaintiffs Mr. Heath was discharged with a month's salary in lieu of notice, and subsequently was engaged by the Bavarian Rubber Co. Mr. Heath had had considerable experience in solid tires, the manufacture of which is a comparatively new departure for the Continental Co., and it appears that he brought in business amounting to about £1,000 a year with Messrs. Pickford, the well-known carriers. This business had recently, the plaintiffs stated, been transferred to the Bavarian Rubber Co., which sold Metzger tires. Evidence was given by Mr. Wolff, manager of the Michelin Tire Co., that his company's travelers all entered into similar agreements, five years being a common period of time. The main defense was that such agreements were harsh and against the public interest, especially in the present case, which applied to all rubber goods, whereas the defendant's business at the Continental Co. had to do with solid tires alone. The judge found for the Continental Co., holding that it was incumbent on the defendant to keep to his agreement. Recent decisions of the courts, he said, were against such contracts being held to be in restraint of trade, freedom to make agreements as to terms of service being considered as of importance in these days of trade competition. The judge also thought that the application of the agreement to rubber goods generally was fair, in view of the facilities a tire traveler would have of getting information on other goods from a company doing a general business. The result of this case is doubtless considered satisfactory by those tire companies which make it a rule to bind their travelers down. This procedure, though common, is not universal, as I know of at least four large manufacturers who do not insist on any such agreements being entered into. In the bulk of cases where such agreements are signed it is more or less on compulsion, the travelers as a whole being naturally averse to them because of the prospect of being out of work for one or more years, if their engagements are suddenly terminated. That this feeling is general is seen in the action which is being initiated by a certain travelers' association to have the matter discussed, with the view of getting all travelers to agree not to sign any such documents. It is recognized that it is only by concerted action that any effective steps can be taken to deal with the matter. There is, of course, plenty to be said on the other side, but space prevents the matter being discussed now at greater length.

ENGLISH WOMEN WEARING SUSPENDERS.

The differences between men and women grow less with the revolving years. One of the vital distinctions for some time has been the fact that men wore suspenders and women did not; but that distinction is soon to be obliterated—possibly. The London department stores have recently displayed, among their other attractions for women, feminine suspenders. Just how generally they will be adopted remains to be seen. Some women hardly appear to need them, but for perpendicular spinsters, for instance, who are straight up and down, suspenders would certainly appear to be a convenience. According to the best information at hand, this article has not yet appeared in the American stores.

A WELL-KNOWN MAKER OF GLASS MOLDS.

One of the best known makers of glass molds for rubber goods is Arnold Prox, of Leyland, near Preston, England. He has been blowing glass molds for rubber manufacturers for a great many years. He began making glass teat molds for the trade about 20 years ago, and has supplied a great many of the leading English firms; such for instance as Imgram & Son, of London; Macintosh & Co., of Manchester, and John Dowell & Son, of London. He has recently applied for a patent for a dipping-board, which is very simple and inexpensive, and said to be a great time saver.

THE LONDON COTTON AND FIBRE EXHIBITION, 1914.

Rubber, however important, is only one of the tropical products which have been taken up by the industrial nations of the world. Hence much attention is being paid in the East to the First International Exhibition of Cotton, Fibres, Tropical Products and Allied Industries, to be held in London June, 1914, concurrently with the Fourth International Rubber Exhibition.

Efforts are being made by the exhibition authorities to secure the co-operation of local experts in tropical countries. Reports from Manila state that Mr. M. M. Saleeby, chief of the fiber division of the Bureau of Agriculture, has been invited to join the advisory committee of the exhibition. Director F. W. Taylor and Mr. Otis W. Barrett, chief of the horticultural division, have also been asked to participate.

There are so many points of connection between rubber and fibres in their distribution, if not in their cultivation, that the two exhibitions will be complementary to each other.

PURCHASE OF MANUFACTURED RUBBER GOODS.

In commenting upon the recently published work of Pierre Pellier on the above subject, the "Revue Internationale" of Paris remarks that buyers of rubber manufactures, in addition to the necessary information as to the nature and properties of rubber need guidance as to the choice of qualities specially applicable to their contemplated employment.

Rubber, it is remarked, has many new and growing applications, being required in most branches of industry. From pumps to pneumatic tires and balloon coverings it is used for the most varied purposes. It would, however, be a mistake to think that for all uses it is indispensable to insist on a large proportion of rubber or upon the best qualities. In many cases it is necessary to incorporate with the rubber other substances in greater or less quantity, imparting to the compound special qualities in view of the uses contemplated.

To make a judicious choice it is necessary to be well acquainted with the properties of all the substances entering into the composition of manufactured rubbers, and in particular the influence of each of them upon the qualities of the compound.

In further illustration of this point, it is added that vulcanized rubber placed in contact with liquids not exercising any chemical action on it, such as water, only absorbs a small quantity of these liquids.

CORK-LINED BALLOONS.

One of the theories, and one quite widely accepted, advanced to explain the disastrous termination of Vaniman's balloon experiments, accounted for the explosion of the ill-fated "Akron" by the fact that the heat of the early sun breaking suddenly from the morning mists inflated the gas of the balloon so rapidly that the fabric was not able to stand the strain, and burst. A German manufacturer believes that he has found a way of counteracting the effect of external heat on the gas enclosed within a balloon. He is making a balloon fabric with a layer of pulverized cork on its inner side, on the theory that cork being a very poor conductor of heat, will render the enclosed gas less liable to rapid expansion. The cork is not a separate layer, but is incorporated and vulcanized into the fabric itself.

GROSS LICHTERFELDE MATERIAL TESTING BUREAU.

By Our Regular Correspondent.

THE annual report of the Gross-Lichterfelde Material Testing Bureau, dealing with the year ending March 31, 1912, records the work of the establishment in various branches of testing, including rubber, both crude and manufactured.

Among the samples tested was one of crude rubber, respecting which it was desired to ascertain whether it was really *Hevea*, so far as this point could be ascertained by the known process. The test made showed 2.1 per cent. of components soluble in acetone, which were almost completely saponifiable, but did not display optical activity. On the basis of these facts it could be stated that the sample was probably of *Hevea*.

Another sample of rubber was to be tested for loss in washing, which exceeded 20 per cent. As, however, the sample had been shipped during the hottest season and in a bag which admitted water, the report called attention to the fact that a considerable portion of the water must have been taken up on the way and in storage.

Numerous tests were made of technical rubber goods, such as hose, etc., with the object of ascertaining their chemical composition. Samples of balloon material in the unused as well as used state were subjected to comparative chemical investigation. From the results of the analyses it was to be determined whether the destruction of the used material was produced by the gas used in filling the balloon or not. The analyses only displayed slight differences in the chemical composition of the two samples. The changes noticed corresponded with those which might in practice be expected from the influence of air, light and mechanical causes (apart from that of the gas).

VULCANIZATION.

The large number of vulcanization tests had showed that physical absorption was combined with a chemical reaction of the sulphur with the rubber. The former occurs in a moment, while the latter often takes a considerable time. Vulcanization can take place at any temperature, even at a normal degree, but its speed varies with the temperature.

CRUDE AND VULCANIZED RUBBER.

The analyses of vulcanized and crude rubber included in the first place different forms of the bromide process. In this way a number of sources of error were discovered. Consequently, for determining the rubber content of crude rubber or rubber compounds it is necessary to resort to indirect analysis. That is, the other components are defined and the difference between their total and 100 per cent. is assumed to be rubber.

DEVELOPMENT OF GERMAN COLONIES.

In a retrospect of the past six years in the German colonies, Dr. Wohltmann, editor of the "Tropenpflanzer," advocates the importance of training young German agriculturists, both theoretically and practically, with a view of utilizing their knowledge and experience for the benefit of the German colonies. The number of such students is annually increasing. Such has been the policy of the German government since 1907.

Respecting the prospective rubber supplies from the German colonies, the author remarks:

"Only the next few years will afford us a reliable idea of how much good rubber is to be obtained from our colonies. On the one hand, the best methods of cultivation, tapping and collecting, are the subject of much discussion; while on the other hand, the trees planted in East Africa and Kamerun are in part so young, or have been in bearing so short a time, that an indisputable prognosis cannot be made. * * * It is today certain that the results of our plantations will not be unfavorable. What yields and profits they will show in the future, we must wait to see."

THE JAPANESE WASTE RUBBER AND RECLAIMED RUBBER TRADES.

By Our Regular Correspondent.

WASTE rubber is supplied to Japanese consumers from two sources, domestic collection and imports. In the former shape it is gathered by ragpickers, who go from door to door in search of various kinds of waste, including waste paper and rags. Each broad class of waste is then handled by houses in the particular branch. Thus waste rubber passes through the hands of waste rubber dealers. Waste rubber is also obtained in more or less important quantities through tenders made to the naval and military administrations and large industrial corporations.

Another source of waste rubber is the purchase of old cycle and motor car tires from dealers in those articles.

Imports of waste rubber are from Shanghai and other points, representing an average of $1,500 a month. Such imports take place when Japanese waste is scarce or dear. The latter is, however, in most cases, preferred by the Japanese rubber manufacturers. Waste is sorted into black, red and white; in each class there being superior, medium and inferior grades.

The quantity of waste rubber produced in Japan is estimated at about 2 million pounds, and the value at about $200,000. Black waste is in the largest quantity and varies in price from 5 to 15 cents per pound. The production and consumption of Japanese waste rubber are alike increasing at the rate of 20 per cent. annually. Most of the waste rubber produced was originally of Japanese manufacture. Tokyo is the principal center of the Japanese waste rubber trade, the waste being shipped thither from Osaka and other points, for eventual distribution among the principal cities of Japan.

RECLAIMED RUBBER—JAPANESE AND IMPORTED.

At one time Japanese rubber manufacturers used to mix waste rubber with crude rubber, in order to cheapen their product. The waste, after being mixed with certain ingredients, was brought into an unsulphurized state by mixing it on a roll with certain ingredients. This compound was designated as "reclaimed rubber" by Japanese manufacturers and used for the production of molded goods, such as "tabi" soles, tubes, tires, etc., either alone or in conjunction with crude rubber.

Reclaimed rubber, properly so called, is not produced in Japan, but is imported to the extent of about 15 tons a month. It is principally consumed by several insulated wire makers, who must have the genuine imported reclaimed rubber, as they cannot use the Japanese article; although the latter can be used for the manufacture of other goods, such as molded articles. The efforts made to get copper wire wrapped or tubed in thin sheets of the Japanese so-called "reclaimed rubber" have been unsuccessful. The imported reclaimed rubber principally comes from England and the United States.

DUTY ON IMPORTED RECLAIMED RUBBER.

The Japanese duty on reclaimed rubber is 20 per cent., while the article is free of duty in England, the United States, Anstria, Italy, Denmark, Norway and China. Several years ago there was no duty in Japan, but a duty of 10 per cent. was imposed to meet the case of the Dunlop Rubber Co. (Far East), importing free of duty as "reclaimed rubber," a compound, the ingredients of which in some cases paid 5 to 20 per cent. Under the new Japanese tariff it was made dutiable at 20 per cent. Waste rubber was still retained on the free list as being of benefit to Japanese manufacturers, but reclaimed rubber was treated as a manufacture of waste, at the lowest rate applicable to manufactured rubber.

Efforts are being made to get the duty reduced to 10 per cent., in which the correspondent of THE INDIA RUBBER WORLD is taking an active part. This rate has met with the approval

of the principal manufacturers. It will be submitted to the legislature through the Custom House Bureau of Finance. Mr. Ernest E. Buckleton, who has been visiting Japan in the interests of his company, the Northwestern Rubber Co., Litherland, Liverpool, England, as well as various Japanese manufacturers, advocate the freedom from duty of reclaimed rubber, but they in some cases fear a repetition of the attempt to import as reclaimed rubber an unvulcanized compound, the separate ingredients of which would pay from 5 per cent. to 20 per cent.

JAPANESE CRUDE RUBBER IMPORT STATISTICS.

Official Japanese statistics show the following comparative results for the last three years:

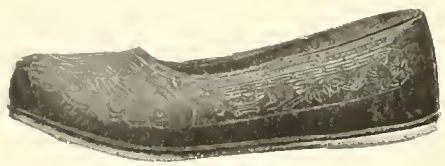
	Pounds.	Value.
1910	1,580,918	$1,515,093
1911	2,054,864	1,530,008
1912	2,004,010	1,514,560

The quantities for 1911 and 1912, it will be remarked, are about equal, and in each case represent an increase of about 25 per cent. on the figures of 1910. Owing to the depreciation of the article in the two later years, the value still remained about the same.

THE CHINESE MARKET FOR RUBBER GOODS.

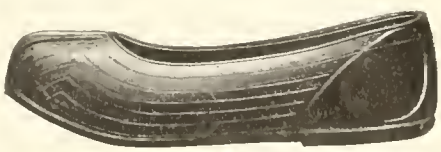
A WRITER in a recent issue of the "Gummi-Zeitung," discourses at some length upon the fact that the German rubber trade—and particularly the rubber footwear trade—has not been able to make any conspicuous progress in the Chinese market. In this particular the German rubber trade does not stand alone. The American rubber trade has enjoyed no very glittering success in this direction.

For instance, in the line of rubber footwear, American exports of boots and shoes to China are noticeably smaller now than they were some years ago. Nine or ten years ago



Chinese Sandal.

some of the American manufacturers of rubber footwear made a special Chinese rubber shoe, similar in shape to the ordinary sandal that the Chinaman wears, with a pointed rising toe, thick sole without heel, and without any arch. The accompanying cuts show some of the styles manufactured for Mongolian consumption. At one time this trade reached the



Chinese Sandal with Low Heel.

fair proportions of 200,000 or 250,000 pairs a year, with a net value to the American manufacturer of from $65,000 to $85,000. These shoes were made at a very low price, so that the Chinaman could get a pair at retail at a price in the neighborhood of 50 cents. But that was when crude rubber was considerably lower than it is now, and with the rise in the price of rubber, and the consequent increase in the price of manufactured goods, the Chinaman went back to his native shoes and dropped the American-made Chinese "golosh"; so that now the value of American-made rubbers going to China is very small.

The voluminous book on statistics, called "Commerce and Navigation of the United States," issued by the Department of Commerce and Labor, gives the following valuation of American rubbers sold to China for the last five years:

1907	3,850 pairs	$4,414
1908	2,055 pairs	2,360
1909	386 pairs	416
1910	385 pairs	447
1911	318 pairs	620

This certainly is nothing to boast about.

The entire rubber exports (including all articles) for the last three years as given by the same authority are as follows:

	1909.	1910.	1911.
Belting, hose and packing	$10,172	$12,265	$12,372
Boots and shoes	461	447	620
Tires for automobiles	Not specified	Not specified	590
Other tires	Not specified	Not specified	38
All other goods	6,455	7,125	4,883

The automobile is seen daily in Chinese cities, more and more of them being constantly purchased by rich Chinese merchants. Solid tires are being used in an increasing scale,

Chinese Gaiter.

particularly in connection with the improvement in the character of the rickshaws used.

Rubber goods are likewise profiting by the extension of demand for railway and electrical purposes.

There is also a demand for rubber rings in Shanghai, for use in preserving fruit for the European market.

BALATA INDUSTRY AND RUBBER PLANTING IN BRITISH GUIANA.

At the opening of the Combined Court of the Colony of British Guiana, the Governor referred to the promotion of Mr. F. A. Stockdale, the Assistant Director of Science and Agriculture, to the post of Director of Agriculture of the Island of Mauritius, and to the appointment in his place of Mr. Keith Bancroft, of the Federated Malay States Agricultural Department; upon which he congratulated Professor Harrison. He added:

"I trust that Mr. Bancroft may be able to take up the important question of investigating the best method of extracting the latex of the balata tree and also that the weight of his opinion may be used to induce planters in this colony to more seriously consider the planting of Pará rubber. I have inspected several estates and small plantations of this product but nowhere have I found the necessary care and attention being given to the planted area. This is a great disappointment to me, for the few trees I have seen properly attended to prove, as might be expected, that this tree grows here as freely and satisfactorily as in the Eastern Hemisphere."

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

WHILE to the outsider matters in balata circles are quiet, the present is by no means a period of waiting. The short rainy season is drawing to a close and in a couple of months—possibly less—we shall have the long rainy season upon us. Most companies, therefore, which intend serious business this year, are getting ready to dispatch their expeditions, especially those whose grants are in the far interior. There is no reason at present to anticipate other than a successful season. Up to January 30 the exports have been 90,932 lbs. as against 11,839 lbs. exported to the same date last year.

THE ASSISTANT DIRECTOR OF AGRICULTURE—A GOOD APPOINTMENT.

An appointment has now been made to the Assistant Directorship of Agriculture, rendered vacant by the promotion of Mr. F. A. Stockdale to the Directorship of Agriculture of Mauritius. The appointment has been given to Mr. Keith Bancroft, B.A., who is at present in the Colonial Service in the Federated Malay States. The appointment is an exceedingly good one, because Mr. Bancroft will not only be able to do much to assist rubber cultivation, but, being a Barbadian, he will by no means be a stranger to the West Indies. Coming from the Malay States, where he has had an opportunity to study the *Hevea* from the scientific as well as the practical standpoint, he should prove of immense value to the owners of young *Hevea* plantations.

THE FELLING OF BALATA TREES.

A good deal of discussion has been created in the neighboring colony of Dutch Guiana on account of the Government having given A. F. C. Curiel permission to experiment in the felling method of bleeding balata, over an area of 8,640 hectares (21,600 acres). The Government's action is described as unconstitutional, and complaint is to be made to The Hague. An echo of the Surinam dispute has been heard in this colony. The "Daily Chronicle," dealing with the Surinam dispute, and with an article on the subject in the January number of The India Rubber World, says: "Into the merits of the system we do not propose to enter. The subject is largely in the domain of theory. We have heard it stated by equally competent authorities that the tree yields more latex when it is felled than when standing, and also that it yields less. This is a thing that perhaps our authorities will be able to tell us in the future—the not too distant future, we hope. Nor do we propose now to enter into the very alluring figures that have been placed before us regarding the value of the felling method. Mr. Henry Daley, who was a prime mover in the business, said that the cost of collection would be one-third of what it is now, and the output would be three times as great; that the balata licensees would be willing to pay a royalty of six cents per pound of balata, and that 5,000 men would be provided with work for 25 years, from which the Government would draw in royalties $100,000 per annum, which would pay the guarantee of interest. A very attractive prospect, but just why we should sacrifice our balata trees for the purpose of providing company promoters with a guarantee of interest on their capital, we do not know. It is a somewhat curious thing that this proposal should have come—not from the old established companies, but from those that came into the colony on the crest of the rubber boom. Looking back at the proposal at this period of time, we can see that it is fortunate that the project came to nothing. It was suggested that provision can be made that for every balata tree felled, a rubber tree should be planted in its place. This is a suggestion with merits, but supposing that such arrangements had been made with the several companies which have since failed, of what value to the colony would have been the rubber trees they planted? Granted that Mr. Daley's figures were correct, the question that calls for consideration is whether it would have been worth while to sacrifice our balata resources for a railway—the necessity of which would to that extent have diminished—and a very prospective rubber industry? On these terms this act of vandalism would, we think, have been wholly unjustified. We agree with The India Rubber World that the only way to arrive at truth in this matter is by experiment. It is urged that under existing conditions the trees die before they give that amount of balata that they would if they were at once felled. But to what extent that is the result—if it exists—of improper bleeding we have no means of knowing. It is certainly worth experimenting in the matter over a small area, but these experiments should be conducted by the Government, and should not be handed over to a private company, as apparently is being done in Surinam, to operate over 8,640 hectares. We shall watch the progress of events in Surinam with much interest."

Mr. Henry Daley, who was the prime mover in the former discussion, has replied to the *Chronicle* in the following terms: "Of course, if the colony wishes to refuse to support 'this act of vandalism,' the colony is the chief loser. It is certainly a very nice and patriotic feeling but likely to be expensive. I find generally though, that in the end business will override patriotism and also vandalism. It will be the same here. The Government will have to modify their balata regulations—within a short time—if they wish to derive revenues from the industry. My arguments in favor of allowing balata licensees to bleed trees as they think fit—with certain restrictions—are as follows: 1.—A considerably increased revenue could be secured, as licensees could well afford to pay higher royalties. 2.—Grants could be worked that are today impossible to work at a profit. 3.—Bleeders would earn more money; naturally, also the licensees. 4.—If the Surinam Government has followed its Venezuelan method of bleeding, they surely have fully considered the position. From my knowledge of the Dutch they seldom act on impulse. 5.—There is nothing to show today that trees will stand re-bleeding with advantage and it certainly seems improbable that a tree will survive a long number of years, if bled every five. 6.—There is little doubt that the equivalent amount of balata can be secured from a tree at one bleeding—as from the same tree in 30 years—under the existing regulations. 7.—The price of balata today is good and likely to remain so for the time being. What will be its value in 10 or 30 years? 8.—The demand for balata, unless the price goes down, is not likely to increase. Cables are not being laid nowadays, and low-grade rubbers treated can and do replace balata. 9.—That if the Government allowed the destroying of certain trees, it will take more men than there are today available, 30 years to bleed them, assuming there is only one balata tree to every 10 acres of the colony's area. 10.—Trees destroyed could be replaced—on plantations on the coast—by cocoanut or other trees, under some scheme of Government control, paid for by the increased royalty, which would yield in 20 or 30 years a very much finer revenue than balata is ever likely to give."

CATTLE RAISING PROPOSED IN BRITISH GUIANA.

Mr. C. L. Foot, an Englishman, with long experience in the cattle raising business in the Argentine, has applied to the British Guiana authorities for concessions of land, on which to establish ranches. Owing to the scarcity of cattle in Argentina he had determined on making a trial of British Guiana, which he considered excellently adapted for that purpose.

TWO MONTHS' BALATA EXPORTS.

British Guiana statistics from January 1 to February 27, 1913, show exports of 102,125 pounds, as compared with 23,483 pounds in the corresponding period of 1912.

Some Rubber Planting Notes.

THE AKERS RUBBER COMMISSION.

ONE of the most interesting events in the recent history of the rubber industry was the appointment of the Akers Commission, which has now published its reports upon the rubber situation in the Orient and in the Amazon territory. The commission was divided into two sections as follows:

Orient Commission.—Mr. C. E. Akers, Dr. Jacques Huber, Mr. A. Ufenast and Mr. F. Lugones.

Amazon Commission.—Mr. C. E. Akers, Mr. H. C. Rendle and Mr. F. Lugones.

The objects of the Commission included the reporting upon the Amazon rubber industry, and the endeavor to find improved methods of administration, collection and preparation, with a view to enabling the Brazilian product to compete with that of the Orient. Another subject treated was the formulation of practical ideas for the colonization of waste lands. While the investigations of the Commission have thus been of an extended character, it had been appointed by a group of financiers closely connected with the port of Pará, in conjunction with the Booth Steamship Co., and other interests closely allied with the trade of the Amazon Valley. Its inquiries were first carried out in the East and then continued on the Amazon.

Among the subjects treated in the reports are the working of wild rubber properties, as well as tapping and preparation, and other points tending to facilitate comparison between Brazilian and Eastern methods.

The questions of labor supply and relative cost of production are likewise treated. The reports will be dealt with later in detail.

MABIRA FOREST (UGANDA) RUBBER COMPANY, LTD.

At the recent extraordinary general meeting of the above company, a resolution was carried for the creation of 30,000 new Participating Preference shares of £1 each. It was stated that a surplus of revenue over expenditure might be expected in 1915, and a satisfactory profit in 1916. By latest census published the company had about 700 acres planted in rubber, chiefly in *Hevea*.

SUNGEI MATANG RUBBER COMPANY, LTD.

In his report on his recent visit to the company's estate of 1,000 acres, in the State of Perak, Federated Malay States, Mr. F. O. Streeten, a member of the board of the company, commented on the fact that the older rubber was doing very well, while the younger was excellent for its age. About 700 acres are planted. Mr. Streetem adds that the treatment of Tamils is thoroughly understood, they being well and happy. In proof of the assertion, he mentions that it is no uncommon thing for those who have worked on the estate and then returned home, to come back again subsequently, bringing friends and relations with them. The hospital accommodation he found to be excellent, but, fortunately, in limited demand.

SMALL COMPANIES PAYING BEST.

Dealing with the successful record made by some of the smaller rubber companies, "Truth," of London, remarks that it is the small companies which have done the big things. The Cicely Company (established 1904) with £16,000 capital, brought 829 acres into bearing and paid for 1910 a dividend of 200 per cent. Pataling (established 1903) with a capital of only £22,000 has brought 1,467 acres to the tapping stage, paying for 1910 as much as 325 per cent.; while Selangor (established 1899) with 1,836 acres under cultivation, has a capital of only £30,000, and paid 375 per cent. in 1910.

While profits are lower than in the bonanza year 1910, the latest dividends of respectively 75, 175 and 187½ per cent. are still highly remunerative for the original investors in the three companies named.

Comparing past conditions with future prospects, the journal adds: "Companies formed in the early days, however, had the advantage of cheaper land, cheaper labor, and lower salaries; and estates were brought into bearing at a figure which would now be impracticable. No one expects to see the young producers reach the magnificent premiums attained by the older companies. The days of prosperity, however, have not yet departed from the rubber market, and if profits are to be smaller in the future, there is still a margin large enough to bear a gradual diminution without seriously cutting into the profits of progressive companies."

MANURING RUBBER.

Commenting upon the general question of manuring rubber, Mr. J. F. Naughton in a letter from Colombo, in the columns of the "Malay Mail," remarks that the subject is still more or less in a stage of discussion in the Federated Malay States, as compared with Ceylon, where manuring is almost universally recognized as a *sine qua non*.

With reference to comparisons which have been drawn between the manuring of wheat and rubber, he calls attention to the fact that wheat is a field crop and a direct product, whereas latex is only an indirect product obtained by the unnatural method of removing bark. The largest and healthiest trees naturally produce the most latex: the object of manuring rubber trees being the indirect increase of latex by the direct nourishment of the tree.

OFFICIAL REPORT ON BRITISH MALAYAN EXHIBIT AT NEW YORK RUBBER EXPOSITION.

In his official report on the above exhibit, Mr. Leonard Wray, I. S. O. (the commissioner to the recent New York Rubber Exposition for the Federated Malay States and the Straits Settlements) has described the preparations which led to the satisfactory result achieved on that occasion.

This section occupied about 3,500 square feet, being second in extent only to Brazil. Seventy-four plantation companies were represented, as against 34 at the London Exhibition of 1911; the total number of samples being 141, with an aggregate gross weight of 18,474 pounds. In quality, it is recorded that the rubber showed as great an advance over that sent to the 1911 exhibition as the latter did over that of the 1908 exhibition. This statement is confirmed by the fact that out of the ten awards in the prize competition of the Rubber Growers' Association, London, eight were taken by the Federated Malay States.

TO EXPLORE THE UPPER AMAZON.

The expedition organized under the auspices of the University of Pennsylvania, for the purpose of exploring the upper tributaries of the Amazon—an enterprise regarding which quite a little has appeared in the press during the last year—set sail from Philadelphia on the 19th of March in the "Pennsylvania," a yacht of 184 tons burden. The expedition will be gone about three years and is expected to penetrate to regions never before visited by white men.

The yacht is in command of Captain J. C. Rowen, U. S. N., retired, and the expedition is headed by Dr. William C. Larrabee, curator of the American section of the museum. His chief associates are Dr. Franklin B. Church, an authority on tropical medicine, and H. Sandy McNab, a traveler and scientist. The "Pennsylvania" carries a crew of eleven men.

THE BATAVIA EXHIBITION OF 1914.

POSTPONED from April, 1914, to the following September, the Batavia Rubber Exhibition will form the next link in the chain after the London display of June, 1914. By this arrangement of dates the visitors to the earlier exhibition can still take in the later one.

In the official program of the Batavia (Java) International Rubber Congress and Exhibition, attention is called to the fact that there are in the Netherlands East Indies 260,000 acres planted with rubber; the exports having amounted in 1911 to 2,249 tons. In addition to Dutch capital, the equivalent of about 92 millions of dollars has been invested by other nations in the Netherlands East Indies, this amount including about 75 millions British, 12 millions Belgian and four millions American. Germany is only represented by about three-quarters of a million.

As in the case of previous rubber exhibitions in other parts of the world, a Congress will be held, when it is expected that the views of well-known authorities on vital questions will throw light on many matters of consequence. One of the special features of the exhibition is—that being held in a rubber-producing country, rubber-yielding species will be planted in the exhibition grounds; while an opportunity will be afforded for visiting rubber estates in the vicinity of Batavia and in other parts of the East.

The Congress will be divided into eight sections, as follows: 1, Botany and Zoology; 2, Climate and Soil; 3, Culture and Crops; 4, Preparation, etc.; 5, Working Policy, etc.; 6, Synthetic Rubber; 7, Commerce; 8, Publications.

Prizes and diplomas will be offered by official and commercial organizations, the jury dealing with them being international in character. According to the latest announcement, the exhibition will be open from September 8 to October 10, 1914; the congress being scheduled to close on September 12, 1914.

A definite program of the congress will shortly be issued. Meanwhile, information can be obtained from the secretary of the committee, Dr. C. J. J. Van Hall, Buitzenborg, Java.

The Congress and Exhibition will be held under the patronage of the Prince Consort of the Netherlands and with the support of the Dutch Government. Applications for space should reach the secretary-general of the exhibition before November 1, 1913, mentioning floor or wall area required.

Among the principal objects of the exhibition will be to show how the culture and preparation of rubber are conducted in the principal rubber producing countries of the world. The necessary attention will also be given to wild rubber species.

Major General J. G. H. de Voogt is president of the executive council, the vice-president being Dr. W. B. Tromp de Haas, the well-known rubber expert.

SINGAPORE AS A DISTRIBUTING POINT FOR PLANTATION RUBBER.

The East Asiatic Co., Limited, of Singapore, has issued a circular to plantation companies, pointing out that the charges incurred by selling rubber in London represent 4⅜ per cent., of which 2¾ per cent. would be saved by selling in Singapore. The expenses of shipping and landing rubber from Singapore for the American market are estimated at 2⅛ per cent.

MANCHESTER (NORTH BORNEO) RUBBER, LIMITED.

According to the report of Mr. T. A. Ball, one of the directors of the above company, who recently visited the property, the rubber trees are everywhere looking healthy and strong. The best individual trees measured at three feet from the ground, 15½ to 16¾ inches, all tappable now at 2½ years' growth, which Mr. Ball considers very good indeed. By the last accounts about 1,700 acres were planted in rubber on the company's estates.

BRITISH MALAYA RUBBER PRODUCTION, 1906-1911.

OWING to the crop reports being furnished by various departments, the aggregate of the items of British Malayan rubber production is not always clear.

This point is, however, distinctly shown by the report of the Director of Agriculture of the Federated Malay States, which gives the returns of the four divisions comprised in the term "British Malaya":

ACREAGE UNDER RUBBER.

	1906.	1907.	1908.	1909.	1910.	1911.
Federated Malay States	85,579	126,235	168,048	196,953	245,774	352,974
Straits Settlements	11,341	42,866	50,121	57,587	60,568	80,629
Johore	2,310	10,126	20,944	33,344	43,516	74,975
Kelantan & Kedah	.....	.....	2,025	4,151	12,995	34,299
Total British Malaya	99,230	179,227	241,438	292,035	362,853	542,877

The preponderance of the Federated Malay States in the rubber production of British Malaya is shown by the official tables; those States representing about two-thirds of the total acreage under rubber and seven-eighths of the total yield.

Another feature of this return is the comparative table of acreage under rubber and yield of the four States which constitute the Federated Malay States. For 1911 the figures stand as follows:

	1911. Acreage Under Rubber.	1911. Yield. Pounds.
Selangor	145,222	11,438,966
Perak	124,681	6,041,762
Negri Sembilan	75,356	4,297,745
Pahang	7,715	31,144
Total of Federated Malay States	352,974	21,809,617

Thus, the State of Selangor produces the largest actual quantity of rubber, while the average per acre was approximately: Selangor, 79 pounds; Perak, 48 pounds; Negri Sembilan, 56 pounds; Pahang, 4 pounds. Selangor therefore leads under both heads. In connection with this total for 1911 of 21,809,617 pounds as yield of British Malaya it is of interest to note that the aggregate estimate of Malayan exports for 1912 is 44,588,807 pounds; thus showing an increase for last year exceeding 100 per cent. Official details on same basis as shown for 1911 will follow at a later date.

YIELDS OF RUBBER (POUNDS).

	1906.	1907.	1908.	1909.	1910.	1911.
Federated Malay States	861,772	1,990,754	3,192,710	6,083,493	12,617,383	21,809,617
Straits Settlements	25,560	105,621	145,580	330,381	1,045,577	2,137,644
Johore	47,724	182,495	201,632	327,635	664,352	905,218
Kelantan & Kedah	.....	.....	.....	.....	41,551	51,564
Total British Malaya	935,056	2,278,870	3,539,922	6,741,509	14,368,863	24,904,043

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED FEBRUARY 4, 1913.

No. 1,051,939. Resilient tire. P. F. Wobst, Milwaukee, Wis.
1,051,975. Tire fastener. E. G. Watrous, Chicago, Ill.
1,051,987. Process of treating rubber and product of the same.
1,052,009. Cushioned automobile wheel. W. F. Nelson, Exira, Iowa.
1,052,064. Vehicle wheel. E. F. Krell, Detroit, Mich.
1,052,088. Combined hose coupling and faucet. L. C. Prettyman, Los Angeles, Cal.
1,052,103. Hose clamp. W. J. Tuttle, Albany, Wyo.
1,052,106. Hose. F. D. Voorhees, Montclair, N. J.
1,052,129. Tire fastener. F. M. Carhart, Sea Cliff, and A. Van de Water, Glen Cove, N. Y.
1,052,143. Rubber stamp. E. L. Hamilton, Lumberton, N. C.
1,052,270. Wheel. L. H. Perlman, New York.
1,052,289. Milk bottle stopper. T. B. Sluby, Canonsburg, Pa.
1,052,290. Wheel. B. Smartt, Indianapolis, Ind.
1,052,350. Spring wheel. V. E. Lane, Brooklyn, N. Y.
1,052,358. Cushion spring wheel. H. J. Marks, Toowoomba, Queensland, Australia.
1,052,391. Sediment tester. T. L. Valerius and O. Larsen, Fort Atkinson, Wis., assignors to Creamery Package Mfg. Co., of Illinois.
1,052,422. Inclosed core for tires. J. M. Miller, Washington, D. C.
1,052,430. Vulcanizing distinct parts or surfaces of rubber. O. Walter, Hanover, Germany.

Designs.

43,495. Wheel tire. J. Christy, Akron, Ohio.
43,499. Rubber cushion. W. A. Force, New York.

Trade Marks.

55,728. New York Belting and Packing Co., Ltd., assignor to New York Belting and Packing Co., N. Y. The trade mark *Great Seal*, with company's name and dates of foundation and incorporation in circle.
67,188. Chicago Belting Co., Chicago, Ill. The word *Reliance*. For leather belting.

ISSUED FEBRUARY 11, 1913.

1,052,508. Rotable heel lift. W. J. Newland, Omaha, Neb.
1,052,560. Tread band for tires of motor vehicles. J. C. Berry, Harrow, England
1,052,565. Spring wheel. R. M. Burgess, Columbia, Mo.
1,052,570. Spring spoke. W. H. Clark, West Burlington, N. Y.
1,052,572. Rim brace and tire clamp. J. P. Corbett, Fayette, Ala.
1,052,576. Spring cushion and weather strip. J. F. Fauner, Newark, N. J.
1,052,757. Vehicle tire. J. T. Shea, Glen Cove, N. Y.
1,052,765. Man's garment. J. C. Strauss, St. Louis, Mo.
1,052,801. Emergency tire for automobiles. S. Davidson, Detroit, Mich.
1,052,861. Steam hose. C. A. Swanson and A. B. Brooke, Hancock, Md.
1,052,873. Protector for pneumatic tires. C. B. Woodworth, Niagara Falls, N. Y.
1,052,936. Belt fastener. J. Mathews, Plymouth, Pa.
1,053,101. Vehicle tire. F. A. Magowan, N. Y.
1,053,141. Rim and tire for vehicle wheels. J. A. Cooper, Chattanooga, Tenn.

Designs.

43,556. Rubber bathing cap. R. Parker, New York, assignor to Parker, Stearns & Co., Brooklyn, N. Y.

Trade Marks.

59,107. The Republic Rubber Co., Youngstown, Ohio. Illustration of portion of inner tube.

ISSUED FEBRUARY 18, 1913.

1,053,142. Tire tightener. J. Alcorn, Mecca, Ind.
1,053,155. Vacuum creating apparatus. C. G. Campbell and M. Benbrook, Milwaukee, Wis., assignors to Creamery Package Mfg. Co., Chicago, Ill.
1,053,186. Typewriter roller. A. G. Hug, Chicago, Ill.
1,053,238. Tire. G. A. Stewart and H. E. Goodell, Ridley Park, Pa.
1,053,299. Brake liner fabric and process of making same. E. B. Knowles, Bridgeport, Conn., assignor to C. L. Hill, Lancaster, Pa.
1,053,304. Pneumatic tool. H. E. Le Gendre, Creskill, N. J., assignor to E. W. Bliss Co., Brooklyn, N. Y.
1,053,332. Vehicle wheel. A. R. Weaver, Batesville, Ark.
1,053,346. Wheel rim for pneumatic tires. E. K. Baker, assignor to Universal Rim Co., both of Chicago, Ill.
1,053,347. Wheel rim for pneumatic tires. E. K. Baker, assignor to Universal Rim Co., both of Chicago, Ill.
1,053,402. Spring wheel. E. B. Keemer, Washington, D. C.
1,053,404. Machine for preparing cores for re-use in manufacturing pneumatic tire shoes. F. L. Killian, assignor to F. R. Ormsby, both of Akron, Ohio.
1,053,408. Machine for covering circular objects. C. J. Landin, Boston, assignor to Boston Woven Hose & Rubber Co., Cambridge, Mass.
1,053,427. Acetylene gas apparatus. A. Moser, Hickman, Neb.
1,053,439. Process for treating worn or waste rubber or the like for the utilization thereof. W. E. W. Richards, assignor to The Bourn Rubber Co., Ltd., both of London.
1,053,504. Anti-skidding device for tires. M. C. Harris, Philadelphia, Pa.
1,053,535. Pump. J. Meklensek, San Diego, Cal.
1,053,636. Vehicle wheel. C. J. Ohlsson, New York.
1,053,707. Spring tire for vehicle wheels. S. J. Casey, Keeseville, N. Y.
1,053,723. Resilient wheel. C. D. Galvin, Merchantville, N. J.
1,053,778. Wheel. G. L. Bourquin, Sellersville, Pa.
1,053,821. Resilient tire. R. L. Jenkins, Richmond, Va.
1,053,847. Tread band for pneumatic tire wheels. J. McLeod, St. Kilda, Victoria, Australia.
1,053,852. Cushion wheel. A. Moon, Fallon, Nev.
1,053,879. Self-filling fountain pen. J. L. Schnell, Arlington, N. J.
1,053,889. Vehicle wheel. J. F. Starbuck, Philadelphia, Pa.
1,053,910. Locking device for train pipe couplings. W. A. Greenlaw, Melrose, Mass., assignor to The Greenlaw Mfg. Co., Boston.
1,053,933. Rubber-lined fabric hose. B. L. Stowe, Jersey City, N. J.
1,053,953. Detachable tire tread. A. Ascheri, Puteaux, France.

ISSUED FEBRUARY 25, 1913.

1,054,060. Soldering apparatus. W. Ulbrich, Leipzig, Germany.
1,054,171. Tire holder. Henry Buermann, Newark, N. J.
1,054,245. Detachable rubber heel. J. E. Shell, Lenoir, N. C.
1,054,312. Sectional pneumatic tire. M. P. Prince, Cambridge, and C. M. Reinheimer, Newburyport, Mass.
1,054,444. Resilient tire for wheels. E. L. A. Olivier, Paris, France.
1,054,501. Spring wheel. S. D. Brooks, Oneonta, N. Y.
1,054,504. Means for tire inflation. L. Burgraff, Jr., Mason City, Iowa.
1,054,516. Resilient tire for the wheels of vehicles. M. G. C. Dodwell, Wellington, New Zealand.
1,054,519. Wearing apparel. M. M. Dryfoos, New York.

Trade Marks.

61,738. The J. F. & W. H. Warren Co., Worcester, Mass. The trade mark *B and F*. Leather belting.
59,847. Voorhees Rubber Mfg. Co., Jersey City, N. J. The word *"Ideal."* Rubber boots, etc.
63,769. The Philip Carey Mfg. Co., Lockland, Ohio. The words *Est. 1873 Carey* in black and white diamond. Packings, etc.
64,403. F. Goetze, New Brunswick, N. J. The words *Goetze Devo Gaskets* over illustration of gasket. Gaskets.
66,556. Morley Bros., Saginaw, Mich. The word *Wedgeway*. Automobile tires and rubber hose.
66,645. Mishawaka Woolen Mfg. Co., Mishawaka, Ind. The word *Vac*. Rubber boots and shoes.
66,858. Fort Wayne Oil and Supply Co., Fort Wayne, Ind. The word *Paratex*. Canvas stitched belting.
67,354. Hood Rubber Co., Watertown, Mass. Illustration of a rubber shoe, boots, shoes, etc.

[Note.—Printed copies of specifications of United States patents may be obtained from The India Rubber World office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[Abstracted in the Illustrated Official Journal, February 12, 1913.]

23,109 (1911). Spring wheels with rubber cushions. G. S. Ogilvie, Sizewell Hall, near Leiston, Suffolk.
23,116 (1911). Rubber couplings for vehicle wheels. E. Schneider, Le Creusot, Saone-et-Loire, France.
23,133 (1911). Improvements in solid and pneumatic tires. F. Baptiste, 36 Cannon street, Birmingham.
23,210 (1911). India-rubber substitutes containing soya-oil. J. W. Butler, 29 Glenshiel Road, Eltham, Kent.
23,349 (1911). Protecting rim during painting of tires. J. W. Harrison, Cranford, Layters Way, Gerrards Cross, Buckinghamshire.
23,419 (1911). Tire attachments to rims. C. S. Challiner, 18 Park Range, and J. A. Challiner, The Glen, Anson Road—both in Victoria Park, Manchester.
23,475 (1911). Pneumatic tire with solid rubber tread band. D. Strang, Esk street, Invercargill, New Zealand.
23,593 (1911). Round links in tread bands. C. Mercanton, Clarens, Vaud, Switzerland.
23,611 (1911). Spare wheel cover. Dunlop Pneumatic Tyre Co., and H. J. Dunn, Alma street, Coventry.
23,630 (1911). Rubber substitutes containing gelatinous solvents. J. Stockhausen, 105 Fischelnerstrasse, Crefeld, Germany.

[Abstracted in the Illustrated Official Journal, February 19, 1913.]

23,700 (1911). Leather tread bands for tires. H. Roths, and G. Schwyzer, Mannedorf, Zurich, Switzerland.
23,722 (1911). Improvements in pneumatic tires. H. A. Fleuss, Dunston Lodge, Thatcham, Berkshire, and R. H. Davis, 187 Westminster Bridge Road, London.
23,723 (1911). Improvements in coagulation of latex. J. Y. Johnson, 47 Lincoln's Inn Fields, London.
23,738 (1911). Tire repair outfits. M. J. Schulte, Hillcrest, Kenilworth, Warwickshire.
*23,741 (1911). Detachable rim attachments. J. H. Wagenhorst, Akron, Ohio, U. S. A.
*23,838 (1911). Improvements in solid tires. G. T. Doty, 3625 21st street, and J. D. Show, 1609 Race street—both in Philadelphia, Pa., U. S. A.

24,074 (1911). Stair treads. D. Baxter, Inveresk, Compton avenue, Cathcart, and R. L. Baxter, 150 Bothwell street, Glasgow.

24,117 (1911). Packing for gas pipe joints. L. Schomburg, 53 Kaiserstrasse, Gelsenkirchen, Germany.

24,124 (1911). Plastic composition including rubber or gutta-percha. J. W. Aylsworth, 223 Midland avenue, East Orange, N. J.

24,156 (1911). Stocking suspenders. C. Nicholson, The Leylands, Hatfield, near Doncaster.

24,196 (1911). Spring wheels with pneumatic cushions. E. Allen, 78 Salop street, Penarth, South Wales.

[Abstracted in the Illustrated Official Journal, February 26, 1912.]

24,313 (1911). Mud-guards for vehicles. C. H. Nichols, 40 Stratford Road, Wolverton, Buckinghamshire.

24,412 (1911). Rubber tubes for lubricators. K. Rotherham, 27 Spon street, and W. Johnson, 39 Park Road—both in Coventry.

24,429 (1911). Use of rubber buffers in hanging pictures. A. Hailey, 4 The Mall, and H. A. Green, 2 The Mall—both in Church End, Finchley, London.

24,437 (1911). Vulcanized fabric composed of leather and rubber. S. F. Connolly, 101 Chalton street, Euston Road, London.

24,484 (1911). Safety stair-treads. Safety Tread Syndicate, Ltd., 15 Barbican, and E. S. Higgins, 21 Cornfield Grove, Balham, both in London.

24,496 (1911). Rubber in fabric-stretching rolls. S. Hough, Ash street, South Shore, Blackpool.

24,549 (1911). Decomposition of terpene in production of isoprene. P. A. Newton, 6 Breams Buildings, Chancery Lane, London.

24,615 (1911). Rubber shock absorbers for flying machines. A. V. Roe, 47 Rusholme Road, Putney, London.

*24,752 (1911). Inflation and deflation of motor tires. L. Burgraff, 1437 Third avenue, Mason City, Iowa, U. S. A.

24,758 (1911). Closing punctures in tires. F. H. Michelsen, E. W. and H. P. Hudd, Burnet street, Hatfield, Pretoria, Transvaal.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

446,541 (July 26, 1912), MacQueen. Elastic vehicle tires.

446,557 (July 26). C. Michot. Improvements in apparatus for vulcanizing repaired tires.

446,598 (July 27). Farbenfabriken, vorm. F. Bayer & Co., Manufacture of a product resembling vulcanized rubber.

446,600 (July 27). Badische Anilin und Soda Fabrik. Manufacture of products resembling rubber.

446,602 (July 27). G. Roumier. Pneumatic tire.

446,659 (July 30). U. Sarrat and E. Sarrat. Separation of air chambers of pneumatic vehicle wheels.

446,670 (July 30). L. Steurs. Leather cut and incrusted with rubber, for use in footwear, soles, heels, etc.

446,702 (July 31). Harvey, Frost & Co., Ltd. Improvements in electric heating appliances and particularly in vulcanizers.

446,724 (July 31). L. Tervièire. Elastic tires for automobile and other vehicles.

446,749 (August 1). J. E. Johnson and F. G. Mason. Protective cover for pneumatic tires and its process of manufacture.

446,758 (August 1). R. Trautwein. System of combined solid and pneumatic tires for automobiles and other vehicles.

446,828 (August 2). R. Muller. Protective cover for solid and pneumatic tires.

446,851 (August 2). C. Schragin. "Ventilating" tire, with protective cover for automobiles.

446,742 (August 1). M. Kochnitzsky and A. Field. Process for extracting resin from crude rubber.

446,942 (August 6). G. E. Starr. Pneumatic tire for automobiles and other vehicles.

447,024 (October 16, 1911). G. Kantor. Pneumatic vehicle wheel.

447,025 (October 16, 1911). G. Kantor. Automatic pneumatic vehicle wheel.

447,093 (August 9, 1912). R. Angelle. Mud guards for vehicle wheels.

447,142 (August 12). E. Junghaus. Automobile tire.

447,166 (August 13). E. H. Koken. Improvements in elastic vehicle tires.

447,245 (August 16). L. J. G. Collet. Central pneumatic wheel.

447,247 (August 16). F. Mabraux. Mud guards for automobiles, autobuses and similar vehicles.

447,344 (August 17). P. Lagasse. Protection for pneumatic tires.

447,421 (August 20). Gummiwerk Solle, Munich. Pneumatic tire with mica protection.

447,428 (August 21). W. Langmuir. Continuous tire for rubbered wheels.

447,411 (October 26, 1911). L. Velasquez. Process for making artificial rubber.

[Note.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

257,548 (January 3, 1912). Pneumatic truck tires removable while inflated. Gustav Fischer, Stormstrasse 4, Berlin-Westend.

257,875 (September 17, 1911). Manufacture of leather cloths, waterproof fabrics, etc. Albert Reimann, Andernach A. R.

257,813 (March 24, 1911). Process for preventing artificial rubber from becoming viscous or resinous. Farbenfabriken, vorm, F. Bayer & Co., Leverkusen.

258,151 (April 7, 1910). Products resembling vulcanized rubber. Farbenfabriken, vorm, F. Bayer & Co., Leverkusen.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

250,713 (1913). Amalgamation and agglomeration with rubber of granulated or powdered carborundum. C. Leclercq and M. Bertholomé, Liege.

250,569 (1913). Process for preserving the elasticity of rubber objects. C. Bayer, Alteburgerstrasse 57, Cologne.

250,385 (1913). Coagulation of gelatine and like substances by cold. M. Find, head of 5th st., Camden, N. J., U. S. A.

252,244 (1913). Utilization of rubber waste. O. A. Wheeler, E. D. Loewenthal and B. Loewenthal, 17 North La Salle st., Chicago.

249,979 (1913). Manufacture from animal substances of an elastic product analogous to rubber. Naamlooze Vennootschap Chemische Industrie, Amsterdam.

252,274 (1913). Manufacture of waterproof products. J. H. W. Daw and the Azulay Syndicate, Limited, 8 Laurence Pountney Hill, London.

251,190 (1913). Production of elastic composition. H. Haulot, avenue Louise 49, Brussels.

251,275 (1913). Manufacture of plastic elastic and non-hygroscopic masses. W. Plinatus, Zuffenhausen, near Stuttgart.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of the values of exports of manufactures of india-rubber and gutta-percha for the month of December, 1912, and for the first eleven months of five calendar years:

Months.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	Total.
December, 1912...	$187,105	$113,067	$578,552	$878,724
January-November.	2,342,738	1,245,155	7,305,234	10,893,127
Total, 1912.....	$2,529,843	$1,358,222	$7,883,786	$11,771,851
Total, 1911.....	2,276,511	1,686,092	7,140,140	11,102,743
Total, 1910.....	2,056,944	2,266,137	5,681,486	10,004,567
Total, 1909.....	1,800,300	1,653,466	4,413,626	7,867,392
Total, 1908.....	1,256,490	1,329,170	3,580,685	6,166,345

The above heading, "All Other Rubber," for the month of December, 1912, and for the first eleven months of two calendar years, include the following details relating to tires:

Months.	For Automobile.	All Other.	Total.
December, 1912.....*values*	$187,434	$64,053	$251,484
January-November	3,034,699	544,477	3,579,176
Total, 1912.....	3,222,133	608,530	3,830,663
Total, 1911.....	2,458,177	561,330	3,019,507

AN ASBESTOS MERGER.

The Northwestern Asbestos Mills and the International Asbestos Mills and Power Companies are said to have instructed their directors to proceed with plans for the merging of the two companies into one corporation, with a capital stock of $8,000,000.

1,500,000 BALES OF COTTON FOR TIRES.

Few people have any conception of the tremendous consumption of cotton in the great tire industry in this country. The Government Report shows that last year automobile tires required one and a half million bales of cotton—and, of course, cotton of the very highest grade. It is not surprising, therefore, that the price of cotton remains at a high level.

Report of the Crude Rubber Market.

THE most prominent feature of the London market for fine Pará during the month has been the relatively small extent of fluctuation. In the closing days of February, the price recorded on the 25th of 4*s*. 0½*d*. had slightly dropped, the month of March starting at 4*s*. and touching 3*s*. 11*d*. on March 3, which has practically been about the basis since then, with some fractional changes, and closing on the 26th at 3*s*. 10¾*d*. Plantation rubber pale crepe has been at almost identical prices with fine Pará during the month, the figure on the 26th being 3*s*. 10¼*d*., as compared with 3*s*. 10¾*d*. for fine Pará. Prices have been to some extent supported by the absence of pressure to sell.

On March 11 there were 900 tons plantation offered by auction in London, prices realized showing a decline of ½*d*. to ¾*d*. as compared with those of the previous auction, a fortnight earlier.

Owing to the approaching Easter holidays, there was a small sale of 350 tons on March 18. Notwithstanding the absence of American purchases (owing to the strike), the buying power of the market proved fully equal to the quantity offered, which sold at prices slightly easier than those of the previous week.

In New York the continuance of the Akron strike has continued to depress the market, which is, however, expected to recover with the settlement reported to have been made for March 31. Manufacturers have, as a rule, abstained from purchases, preferring to make further inroads upon their stocks before replenishing them.

Leading plants in the above-named city claim that they have had but little difficulty in working their plants at full capacity during the strike. This estimate is, however, not regarded as general, the proportion of operation to capacity being considered to have averaged 50 per cent. Large tire interests at Akron are reported to have enough stock of crude rubber to last through the summer months.

At the Rotterdam sale of the 14th, the Congos were withdrawn, while the plantation rubber fetched market rates.

The monthly Antwerp auction on the 19th of March, resulted in the sale of the 225 tons of Congos and the 75 tons Plantations, at an average of 3 per cent. below valuations.

In the Amsterdam sale of March 12, were included 33 tons *Hevea* and 15 tons *Ficus*, which sold respectively at 2½ per cent. and 3½ per cent. below valuations.

Hamburg has shown a somewhat better feeling during March. Quotations of March 14 equaled: South Cameroon, 63¼c.; Mollendo Pará, 92½c.; Prima Red Rio Nunez Niggers, 89; Conaky Niggers, 85c.; Maniçoba Crepe, 85c.

With reference to the question of the visible supply of rubber, it is noted with interest that the stock at the end of February has been stated to be 6,960 tons Parás and 2,010 tons Caucho, against 7,930 and 1,700 tons respectively at the end of February, 1912.

New York Quotations.

Following are the quotations at New York for Pará grades, one year ago, one month ago, March 29—the current dates:

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During March the money market has continued quite stringent, with very little demand for paper, the best rubber names ruling at 5½ per cent. @ 6 per cent., principally the latter, and those not so well known 6¼ per cent. @ 6½ per cent., with some as high as 7 per cent."

Liverpool.

William Wright & Co. report [March 3]:

Fine Pará.—Prices remained fairly steady during the first half of the month, but the financial difficulties of an important American house caused a further decline in values, and we close fully 4*d.* per pound lower on the month, with a dull demand and an easy tendency. Closing value: Upriver, spot, 4*s.* [97 cents]; Islands, 3*s.* 11*d.* [95 cents]. Receipts continue ample, but the increase this month is in caucho, rubber being 130 tons less. Total receipts 4,980 tons, including 1,190 tons caucho, against 5,130 tons last month, and 4,840 tons last year, bringing the crop up to date to 29,170 tons, against 25,710 tons last year, showing an increase of 1,610 tons in rubber and 1,850 tons in caucho.

Amsterdam.

Joosten & Janssen report [March 12]:

The result of today's sale, though very irregular, was above expectations, considering the unfavorable position of the market.

Rotterdam.

Havelaar & De Vries report [March 17]:

The sale of 14th included 77 tons Congo, which were mostly bought in, while the 10 tons *Hevea* were sold at market prices.

IMPORTS FROM PARA AT NEW YORK.

To Italy	.....	8,108
To Canada	10,482	.....
To Norway and Sweden.....	39	.....
Total	2,031,062	3,066,133

The export Figures of Rubber for 1913 given in the above table include the imports re-exported. (These amount to 382,419 lbs.—263,778 lbs. from the Straits and 118,641 lbs. from India.) To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date deduct the quantity of imports from the total exports. In previous years the exports of Ceylon rubber only were given.

TOTAL EXPORTS FROM MALAYA.

(From January 1 to December 31, 1912, corrected. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

INDIA RUBBER WORLD

FOUNDED 1889

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol XLVIII. No. 2. MAY 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.
No. 15 West 38th Street, New York.
CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. MAY 1, 1913. No. 2

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

OFFICIAL REPORT ON AKRON RUBBER STRIKE.

THE rubber strike at Akron, after an acute case of what the doctors call progressive anemia, finally dwindled down to nothing and expired of exhaustion, the last of March. Two weeks later the "Probe" Committee, appointed by the senate of the Ohio legislature, to investigate the cause of the strike, brought in its report. The essential features of this report are reproduced in the letter from our Akron correspondent, to be found on another page in this issue. The committee found that there were no conditions existing in the rubber plants of Akron that could of themselves have occasioned the labor demonstration that began in February, and for a short time assumed rather threatening proportions. They report that the strike was almost entirely the work of professional agitators, connected with the I. W. W., who went to Akron solely for the purpose of making trouble. The conditions in the rubber factories are reported to have been in the main most excellent. The operatives are abundantly supplied with light and ventilation, and surrounded by the best conditions that modern sanitation has been able to devise. Nor did they have any ground for complaint in regard to the rate of wages, which in some departments, particularly the tire making departments, are reported as exceptionally high. The wages of the men employed in these factories range from 17 cents an hour for unskilled labor to 60 cents an hour for skilled labor. The wages paid the women range from 10 cents an hour for beginners to 30 cents an hour for experienced operatives.

There are practically but two paragraphs in the report which savor of criticism of the employers. One refers to the incident which was seized upon as an excuse to start the strike, where a new wage scale was put into force in a certain department of one of the factories. The committee reports that a greater length of time should have been allowed to intervene, for purposes of discussion, between the date of the announcement and the date when the new scale was to go into effect. The other point of criticism refers to the "speeding up" system, which the committee deprecates.

The majority of the committee could not refrain from an attempt to make a little political capital out of their investigation, by bringing in a supplementary report containing certain tariff suggestions—which were quite out of place, as being entirely foreign to the purpose for which the committee was appointed; but the main report on the whole seems to be the result of painstaking and intelligent work. To the employer, it will emphasize the necessity of always keeping an open ear to any properly expressed request the employes may make; while to the workers in the Akron factories, the lesson of the report must certainly be a salutary one, as it shows them that compared with factory operatives generally they are exceptionally favored. This report ought certainly to serve as a strong deterrent to any further labor demonstrations in that city, as long as the present conditions continue.

THE DROP IN TIRE PRICES AND WHY.

ON the 31st of March The B. F. Goodrich Co. announced the reduction of price to the consumer of five per cent. in its general line of automobile tires, to take place on the first of April. Practically all the other important tire manufacturing companies followed with a similar reduction, although in some cases it did not apply to the entire line; some specialties being excepted. It is hardly necessary to state that this reduction in the price of automobile tires was extremely welcome to the car owners, particularly in view of the ascending tendency noticeable of late in the price of gasoline.

But that this reduction should have been decided upon so soon after the six weeks' strike in Akron, and when, because of that strike, there would naturally be a much smaller stock of tires on hand than would be the case under normal conditions, came as a surprise to the trade.

Two reasons are assigned by those who inaugurated this reduction, both sound and substantial; first, the marked drop in the cost of crude rubber during the last few months; and, second, the constant improvement in the manufacturing facilities.

It requires only a glance at crude rubber prices during recent years to see how steadily they have gone down.

The price of Upriver Pará on the first day of April, 1910, was $2.70; in 1911, $1.39; 1912, $1.22, and 1913, 87 cents. In other words, the best crude rubber costs today less than one-third of its cost three years ago.

In addition to the two causes assigned for the reduction, there is a third not officially referred to, but probably quite as potent as either of the others; namely, the increasing competition among tire makers. It is estimated that for the present year the consumption of automobile tires will reach 5,000,000. To supply that demand will require an average daily output of about 17,000 tires. There are two companies which have a combined daily capacity equal to this number; and besides these two leading companies there are between forty and fifty other tire manufacturers, some of them of no mean importance. So it is obvious that the present capacity has outstripped the present demand, and is likely to exceed it for some time to come. This inevitably means that tire prices cannot be kept very much above the figure at which the best equipped companies can afford to market them.

AN UN-AMERICAN WORD WITH A SINISTER MEANING.

THERE is nothing particularly repugnant to the American mind in a fight *per se*. The average American (whether creditable or otherwise) has rather a soft spot in his heart for a good fight; but it must be a fair fight, in the open and altogether square.

In the fight that labor has been waging against capital for a number of years—where the means employed have been manly, open and decent—the laboring man has received sympathetic consideration, not only from the disinterested public (as far as the public can be disinterested in such a dispute) but from the employer himself. It has been generally recognized that where the workman had a grievance he was entitled to state it, and to be heard, and to take any proper means for redressing that grievance.

But with the advent into our American labor situation of this new alien organization, the Industrial Workers of the World, methods have been introduced that do not appeal to the American public, and there has come into quite general use a new word, with a significance that is altogether abhorrent to everybody who has any appreciation of fair play and decent dealings in every contest. This word is "sabotage." In the recent strike among the rubber workers of Akron, this word appeared quite frequently. It is so new to our American vocabulary that it does not appear in even the most recent editions of the dictionaries. It comes from the French word "sabot," a wooden shoe with the secondary meaning of an iron drag placed under the carriage wheel to prevent it from turning. Thus "sabotage" is the stopping of the wheels. As used in labor discussions, "sabotage" is the doctrine of premeditated inefficiency or maliciously doing the wrong thing, or let us say, of doing your best to do your worst. It appears to be taught quite consistently by the leaders of the I. W. W., and it means that their members, where they cannot effect their ends by open opposition, are to retain their positions in the factory; apparently doing the work for which they are paid, but in reality doing it as badly as they can—wasting their time, damaging the machinery, injuring fabrics, or any other material that may be used, and in every way open to them making it impossible for their employer—whose money they are living on—to produce satisfactory and marketable goods. It is, in short, a process of poisoning the whole industrial system.

Such a method as this is so contemptible, that no organization that employs it can expect to have any standing before the bar of American public opinion. Unfortunately, it does not operate simply to the injury of the organization that practises it, but must inevitably operate to the injury of other organizations, which may be seeking by perfectly proper and legitimate means to better the working man's condition.

From the manufacturers' standpoint, this new doctrine is one that must be guarded against most vigilantly; but it is hardly probable that any important employer is not fully alive to the seriousness of this new phase of the labor problem, and is not taking all necessary steps to nullify its malignant possibilities.

CLEAN RUBBER IN BRAZIL.

RUBBER washing in such centers as Manáos and Pará, in spite of the laws passed for the *Defesa da Borracha*, is not yet an accomplished fact. As the matter stands, the successful bidders may at once erect their factories and may wash such rubber as they can get. There has as yet, however, been no law passed making the washing of all rubber compulsory. Nor has there been any arrangement looking toward a government supervision and stamping of various lots. In other words, the government is feeling its way, with a view of doing only what will make the Brazilian product both better and cheaper.

It has always seemed to us that the place to clean the rubber is at the *seringal*. These seems to be no good reason why clean latex, smoked in a clean manner, should not produce clean *pelles*. Caucho, even if it were brought into camp in wet, dirty masses, can be cut into strips, then washed and stretched in any nearby rivulet, and allowed to dry out to a degree. This was successfully practiced on Panama rubber, which sold for 15 cents a pound more than in its usual form.

If the government would lower its export tax on clean rubber and raise it on dirty rubber, the gatherers would do the cleaning and reap the benefit.

THE COST OF AUTO. SHOWS.

THE Automobile Show held in Boston appears to have been exceptionally successful, viewed both from the standpoint of the exhibitor and of the visiting public. This exhibition, being the last of the large auto-

mobile shows for the present season, was the object of a good deal of attention, because of the question which has recently been discussed among manufacturers of automobiles, tires and other accessories, whether or not these big auto shows really pay. Their cost to the exhibitor is undoubtedly large, and the contention that they interrupt the regular and orderly work of the manufacturer, and demoralize his staff generally, is unquestionably well founded. But, on the other hand, there are many obvious advantages in this annual exploitation of the automobile and allied industries, and, while probably the greater part of those who are personally interested in them acknowledge that their cost is excessive, so far the number of those who advocate the discontinuance of these shows is far smaller than the number of those who are disposed to go on with them.

Without going into the subject as a whole, one phase might be pointed out where undoubtedly there has been a large element of waste, and where economy could be practised without the slightest detriment to the industry, or to the success of the exhibits. The element of waste referred to lies in the lavish and indiscriminate distribution of expensive advertising literature. Many companies have been accustomed in the past to printing a large number of different catalogs and booklets—sometimes as many as fifteen or twenty—many of them generous in size and expensive in character. These literary offerings have often been piled up on stands at the front of the booth, where whosoever would could help himself, the only limit being how many he was willing to carry away.

If all visitors represented paid admissions, and came to the exhibition with a serious desire for automobile and tire information, it would be a different matter; but, in view of the fact that many thousands—and in some cases the large majority—of the visitors enter through complimentary channels, and attend the show simply because it costs them nothing, it is quite obvious that in the throngs that crowd the aisles there is a large percentage of people—boys, girls and those in indifferent financial circumstances—who could by no stretch of imagination be classed among possible automobile buyers; and yet these are the people often who carry away the greatest weight of expensive literature.

Assume, for instance—and it is a conservative assumption—that during a week's exhibit 5,000 finely-printed and attractive booklets, costing ten cents each to produce, are carried away from a single booth by the visitors to the show, and that only 20 per cent. of the literature so distributed falls into the hands of those seriously interested in the books they take. That leaves a waste of 80 per cent., or $400, on the week's distribution.

Of course, it is not possible in distributing advertising to eliminate all waste, but it is possible to reduce this waste to a minimum. Elaborate catalogs and other expensive booklets can be kept where they are easily available for distribution to visitors who by their manner and inquiries, appear to belong to the class of possible purchasers, while inexpensive offerings will often serve just as well—and sometimes very much better—to appease the general crowd that surges up and down the aisle.

As an illustration of matter suited for the general visitor, a map, issued by one of the tire companies at the New York Automobile Show, might be cited. It was a leaflet showing an excellent map of the center of New York—sometimes referred to as "The Tenderloin"—and giving the location of all the principal hotels and theatres. This was something that not only interested the visitor from out-of-town, but also appealed to the seasoned New Yorker, as even the city man who has spent his life in the metropolis often finds himself ignorant as to the exact location of some new hotel or recently erected theatre.

To distribute advertising with nice discrimination is very much of an art, but it is one worth cultivating, as it often means the difference between the success or failure of an expensive exhibit.

That the drastic Underwood Tariff bill, as far as it relates to rubber manufacture, will hurt, is patent. Any appeal seems a waste of effort, however, and the trade is grimly taking its medicine and looking to the future—perhaps two, certainly four years hence.

That the firm of George A. Alden & Co. may emerge from its troubles and again occupy its former position of influence and helpfulness, is the sincere wish of the rubber trade of the world. It is within the memory of many now in active business, when every rubber manufacturer in the United States was dependent upon both banks and rubber importers for credit. Geo. A. Alden & Co. did their part to the extent of millions of dollars. Their history embraces the "carrying" of scores of companies until conditions became better. The assistance that they unostentatiously gave to others should in full measure be given in turn to them.

The election of George B. Hodgman to the presidency of the Rubber Club of America is an event upon which the association is to be congratulated. Mr. Hodgman, a former president of the Rubber Sundries Manufacturers' Association, an active member of the New York Chamber of Commerce and director in the Rubber Manufacturers' Mutual Insurance Co., has had valuable experience in commercial bodies. He is a dignified and competent presiding officer, and represents in his capacity as president of the Hodgman Co. the best traditions of the trade. Under his leadership the growth and usefulness of the club are sure to be enhanced.

A further showing of Brazil's purpose to be up to date in methods of rubber production is now evident in Rio. It consists in lessons in rubber tapping, the teacher being Dr. J. C. Willis, the director of the Botanic Gardens, who illustrates the methods followed in Ceylon and the Malay States on *Hevea* trees, in the Botanic Gardens. A series of cinematograph views have also been taken of this work, which will be shown up the Amazon.

Rubber in Southern Brazil—I.

By the Editor of The India Rubber World.

FIRST LETTER.

Southern Brazil the Center of Rubber Interest—Three Weeks to Rio—Rubber News En Route—Cape Frio—Summer in January—A Marvellous Climate—The Most Picturesque City in the World—The Minister of Agriculture—The Defesa da Borracha—Rubber Washing Laws—Old and New Friends—Corcovado—The Sugar Loaf—The Botanic Gardens.

MANY rubber men have visited Northern Brazil, are familiar with Pará and Manáos, and perhaps with Ceara and Pernambuco, but do not know Rio de Janeiro. Yet an acquaintance with the greatest and most progressive of South American cities is necessary, if one is to adequately understand Brazil, particularly in its attitude to the rubber industry.

In the valley of the Amazon nearly all of the commercial activity centers in its rubber. But in the great southern country coffee, cattle, hides, sugar and cotton, together with the beginnings of many lines of manufacture, all have their effect in determining the governmental attitude toward rubber production, protection and taxation.

The Ancient Aqueduct, Rio.

The early part of 1913 promised to be a period of exceptional activity in rubber legislation in Brazil, with the center of interest at Rio. The distinguished Brazilians who were present at the New York Rubber Exposition, made no secret of the fact that they felt that the situation in Brazil was nearing a crisis, and that the Federal and State Governments were preparing to do everything possible to preserve their great industry, and to put it in a position to compete with Eastern plantation rubber.

Rio de Janeiro is three weeks distant from New York by steamer, and correspondence is slow and inadequate. These and other considerations led me, therefore, to journey down to the Brazilian capital to see for myself, at least in part, what was doing or about to be done.

There are three ways commonly employed by those who take this journey,—by the cargo boats that ply regularly between New York and the River Plate; by the excursion steamers that intermittently visit the islands of the Caribbean and the eastern coast of South America; and by the fine passenger boats that ply between Europe and Rio. The cargo boats have been uniformly bad, as far as bed and board go, although the constant and emphatic protests of traveling Americans are taking effect in an attempt at better service and more courteous treatment. By taking a Dutch boat to Barbados, and a big excursion boat from there, I got to Rio speedily and comfortably.

It is a curious fact, but the smoking room of any steamer bound for a rubber port yields an amount of information credible and otherwise, relating to gum elastic that one could not get easily anywhere else in the world. On the two boats named, for example, I was informed of a new balata concession in Venezuela; of a great chicle concession in the same country; of a

Entrance to Harbor, Rio.

One of the Magnificent Boulevards, Rio.

great annual crop experiment in rubber in another South American country; of rubber planting in Trinidad, in the Guianas and the Colombias, etc., etc. One who knew the Amazon country well told at length of Commodore Benedict's enterprise for connecting Pará and Manáos by wireless; of the money and effort expended; and then when success was attained, of the decision of the Federal government that the states of Pará and Amazonas had no right to give telegraph concessions, such being the property of the Federal government. Another told of the rubber concession of the Commodore's twenty miles from Pará at Mojú, with a wealth of detail that proved that he had never visited it. That Brazil should treat the enterprising American generously, and appreciate the value of his undertaking all were agreed.

The monotony of the voyage was also broken by deck sports, fancy dress balls, the Captain's Dinner and a visit from Neptune as we crossed the Equator. The "King of the Sea" was a big German-American drummer who secured the position chiefly because of his size. It transpired at the last moment that he never had crossed the line, and as a finish to the ceremonies he was ducked in the same tank to which he had condemned his victims, and this in spite of his wrathful protests.

Dr. Lauro Muller,
Minister of Foreign Affairs.

Finally we sighted Cape Frio,—picturesque, forest clad, with its lighthouse perched far up on a shelf of rock. Then followed a rocky shore, beautiful in its array of mountain tops, steep ravines and wooded slopes, and a little later we sighted the "Sugar Loaf," "Corcovado," and other peaks that mark the entrance to the greatest harbor on the South American coast. We steamed into port just as night fell and dropped anchor far out from shore. At once two swift police boats, showing no lights, and moving without sound were circling our boat, keeping a score of noisy launches at a distance, until the doctor and the customs had taken possession. After a long wait the launches that had come for passengers were allowed alongside, and one of them proved to have been secured by a friend, who bade us welcome to Rio. He, in the first place, advised that we have our luggage examined on board, thus avoiding two or three days' delay at the customs. A few milreis properly placed quickly accomplished this, and we were off. Personally I should have enjoyed staying where I was a bit longer and taken my fill of the beautiful shore view. For night though it was, the great semi-circle of lights that marked the long boulevards that follow the sweep of the shore was fascinatingly beautiful. So also were the mountain peaks, shadowy, to be sure, but rising in, around, and back of the city, some with lights far up on their wooded sides, some dark, cloud-capped and forbidding.

Did I mention that although it was the month of February, it was midsummer and quite like a July night at home? Not oppressively hot, not nearly as hot as New York or Boston can be, but comfortably warm.

We went first to the Estrangeiros, an excellent downtown hotel, but as the Carnival season was near at hand, there was no choice of rooms, so we changed to the International, situated 2,000 feet above the city in the forest reserve that is within the city limits, and were most comfortably housed. The first thought of the Anglo-Saxon visitor to Rio is the supposed danger from yellow fever. This is due to the time, now happily long past, when the city was more or less a pest hole. The scourge has, however, been stamped out forever, in all probability, and there has not been a single case, so it is said, for the last ten years. Americans and English do not seem to appreciate this fact, and those who for business or professional reasons are slated to live in Rio for a period of months or years, are likely to have forebodings. For example, one scholarly gentleman told me that before accepting his billet he had carefully specified that he should be required to be in the city only during the day, that his nights should be spent at Petropolis, a mountain resort a few miles distant. On his arrival in Rio, however, upon learning of the true

J. Simao da Costa.

Dr. Pedro de Toledo,
Minister of Agriculture.

Dr. J. C. Willis,
Director of the Botanic Gardens.

state of affairs, he promptly took a house there, and has been perfectly healthy and contented ever since.

Speaking of climate, Rio possesses one of the most equable in the world. The hot season of January and February is not oppressive, and as for the rest of the year it is enchantingly spring-like. The rainfall is evenly distributed and torrential tropical downpours are unknown. The nights are characterized by heavy dews, so that from one year's end to the other flowers bloom, and grasses and leaves are always green. Almost anything tropical or sub-tropical thrives there, and the result is an exceedingly varied flora.

No city in the world possesses so picturesque a setting. The original site was a tiny plain bordering on the bay, backed by a maze of mountains big and little, most picturesquely disposed, and covered to their tops with jungle. As the city grew it climbed the slopes, went up the valleys, skirted the shores and covered other little plains until today it extends some fifteen miles, with suburbs so unevenly and remotely disposed, that were it not for the excellent electric car service, the fine boulevards and the automobile, it would be a metropolis of magnificent distances but of residential isolations.

The "bonds," this is, the street cars, are controlled by a company that also does the electric lighting. It is a foreign corporation, partly European and partly American, the moving spirit in which is Percy Farquhar, an American, who has financed many other great undertakings, such as railroads, the Port Works at Pará and Rio; and according to the Brazilian papers he and his are a cruel monopoly. However that may be, they give wonderful service, and have added much wealth to the country.

The man to whom Brazilians have naturally looked to assist them to maintain their supremacy in rubber is Senhor Pedro de Toledo, Minister of Agriculture. He is an able head of his department, but it must be remembered that all of the agricultural interests must be considered by him, and that perforce he has been obliged to move slowly. No doubt the recommendations put forward by the Rubber Congress in Manáos in 1910 had their effect; for shortly after that an investigation of the present and the future of rubber planting in the Middle East was fully made by Dr. Jacques Huber of Pará. Unfortunately at the same time an investigation by certain corporate interests was also made, the report of which tended to minimize the danger of the plantation rubber in competition to wild. It therefore came about that the great governmental planting of *Hevea* that was projected came to nought. The Minister of Agriculture, however, was able to put through his "Defesa da Borracha" plan. This consists in a central bureau situated at Rio, the head of it being Senhor Pereira Da Silva. Under him are sub-heads located at various centers throughout the rubber areas. At once commissions were sent out in all directions to collect and prepare facts about gathering, costs, notes on transportation, etc., all of which will be passed upon at the head office in Rio. It is also said that the government has charge of the Cerqueira Pinto process for coagulating the latex of the *Hevea* and *Castilloa Ulei*. This process, it will be recalled was exhibited at the International Rubber Exposition in New York. For the Manihots the Hess process is also government property. The most interesting project for the reduction of the first cost of rubber, however, was the plan to wash it all before it left the country. As already chronicled (see India Rubber World, April, 1913) this was to be done by laws that gave bonuses for washing plants in the various centers such as Manáos, Pará, etc. This would mean that instead of some 40,000 tons of rubber wet and dirty, Brazil would ship say 30,000 tons clean and approximately dry. It was further planned to have lots kept separately, and to fix a government stamp upon each lot—a guarantee of quality.

The Monroe Building, Rio.

The Guaranteira-Amazonia Bldg., Rio.

The washing of rubber is to the man in the rubber mill a very simple operation. But to one in Brazil, familiar only with crude rubber and with at best only a book knowledge of its handling in the factory, it is very much of an unknown art. One alert Brazilian, J. Simão da Costa, however, went to Europe and spent some months in England, France and Italy in the great rubber mills, learning to wash rubber. On his return to Rio he placed his knowledge at the disposal of the government. In the meantime a law had been passed designed to encourage the manufacture of rubber goods in Brazil, and the Goodyear Tire and Rubber Co. of South America had been formed to put up a factory, draw the bonus and manufacture goods. It was right in the midst of this interesting state of affairs that I arrived at Rio.

The head of the Botanical Gardens at Rio, Dr. J. C. Willis,

was formerly head of the Royal Department of Agriculture in Ceylon. He gave me much assistance in securing facts and figures on *Hevea* planting in the Middle East when in 1904 I visited that part of the world, and so I naturally sought him first. If I may digress a bit, Dr. Willis was the discoverer of "Wound Response" in *Hevea*, and his experiments, observations and notes were a determining factor in the uniform success that

Avenue of Mangoes.

Avenue of Palms, Botanic Gardens.

The Heights Above Rio, Sylvestre.

attended rubber planting in Ceylon and the Malay States. This is no reflection upon the many able men attached to that Agricultural department, but it happened that he was in the right place at the right time to be useful.

I found Dr. Willis deeply engrossed in the work of making of the somewhat neglected Rio gardens "the most complete and beautiful tropical botanic gardens in the world." And that is undoubtedly what he will accomplish within the next ten years. Thus it was that his immediate interest was not in rubber or rubber washing. He did, however, put me in touch with the men who were vitally interested. The first thing was a visiting membership to the "Club Central," where all the English and Americans to the number of seven hundred belong. Then came a dinner at which I met George Morgan, the American Ambassador; Mr. Ellis, of the Geological Survey, and Sr. Rodrigues, owner of the "Jornal do Commercio," the "London Times of Brazil." He took me to call upon the Minister of Agriculture, Sr. Toledo, and the head of the *Defesa da Borracha*, Sr. Da Silva, and arranged visits to the many points of interest round and about the city.

Then J. H. MacFadyean, the head of the Goodyear Tire and Rubber Co. of South America, looked me up. His story of the decision to start a factory in Rio, of the opposition of local rival concerns and of his persistent diplomatic work was interesting and enlightening. At the time I saw him his bid for a manufacturing plant had not been accepted. He had also put in a bid for a washing plant at Manáos, not to make money, as he explained, but to do the work at a fair price, and to keep other bids down to a reasonable figure.

Directly after my chat with MacFadyean I met J. Simão Da Costa on the Avenida. I had thought of him as being at his home in Pará, and was delighted to find him in Rio. He took me to the Guarantea Amazonia building, where his offices are situated, and gave me the full story of the *Defesa da Borracha* from the Brazilian point of view. He also secured for me documents, books, maps and photos; all of which helped to throw light on the Brazilian situation.

Sr. Da Costa delivered two scholarly lectures last winter before the Club De Engenharia at Rio, on rubber in Brazil from the plantation standpoint, and again from a commercial and industrial standpoint. At both of these gatherings the most distinguished men in the city were present, and the lectures did much to give them a clear view of the world's rubber situation.

Boat Landing, Rio.

Water View, Botanic Gardens.

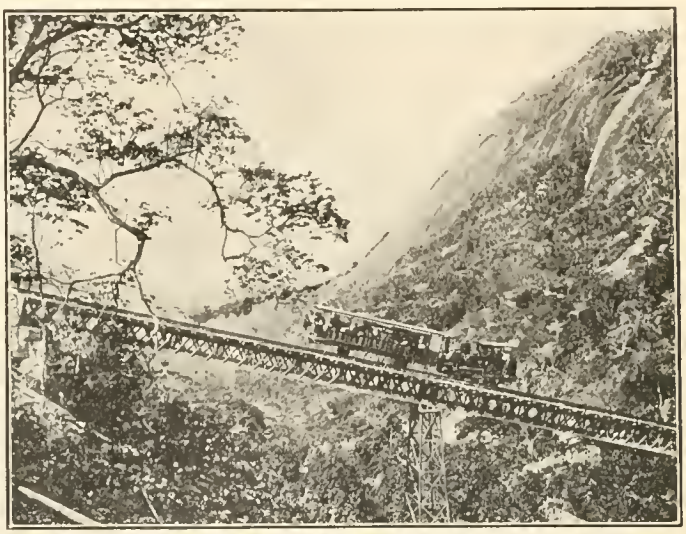
Through the courtesy of Sr. Roderigues I also breakfasted with the Minister of Foreign Affairs, Sr. Müller, who is shortly to visit the United States to return the visits of Secretaries Root and Knox. He is very much the type of man that Root is, and is one of Brazil's leading statesmen.

To make the story complete, I should describe in detail the Carnival season with its joyous and orderly crowds, its magnificent procession of "floats" and its three days of confetti throwing and perfume spraying—for the Carnival came when I was there. Or perhaps I should tell of the trip to the mountaintop, "Corcovada," first, by trolley that circles and climbs half way up, then by cog-railway to the summit, where one has an incomparable view; or of the basket cage, slung on a cable, that takes one to the top of "Sugar Loaf," the lone granite peak that stands sentinel at the harbor's mouth. I certainly should be derelict if I did not chronicle a delightful visit to the Botanic Gardens, or the afternoon tea with the Director and his charming wife, and then the visit to the gardens themselves. One

J. H. MacFadyean.

feature is particularly striking in these gardens—the palms. Of the many other beautiful palms there, none are so striking as a group of travelers palms, the like of which I certainly have never seen elsewhere. There is some rubber, for the *Hevea* will grow here, but its growth is slow, and it could not be profitably cultivated.

To go back to my visit to the Minister of Agriculture, I found him exceedingly interested in the problem of rubber washing and quite ready to listen to any suggestions. I made it clear to him that I represented neither rubber manufacturers nor importers, and that moreover I was wholly in favor of the complete standardization of crude rubber sorts. At the same time I pointed out that the rubber manufacturers of the world had hundreds of thousands of dollars' worth of machinery already installed for rubber washing and could probably do it cheaper than it could be done in Brazil. They were also familiar with the various grades of Brazilian rubber as they now exist, and that washing in Brazil would result in an entirely new series of grades which it would take time to learn. In addition I pointed out that the biscuits of Fine Pará that were acknowledged to have the most nerve of any sort of Pará rubber probably got their extra quality because they were kept in that shape, each film stretched and wet, for months before sheeting. That sheeting soon after coagulation would probably result in a product of less strength. My suggestion was that the rubber manufacturers be sent small washed lots at first, and be asked to report upon them before the attempt to wash all of Brazil's rubber.



Inclined Railway to Corcovado.

My arguments were received with the most cordial expressions of interest, and after my departure Sr. Toledo wrote me upon the subject as follows: "I express my cordial thanks for your courtesy. Your remarks on the question of rubber washing were much appreciated—being founded on long experience and study, and being for that reason especially valuable. I shall consider these observations, and shall endeavor in the solution of this highly important problem to proceed step by step and with the greatest caution."

Rest House at Summit of Corcovado.

(To be continued.)

The Proposed New Tariff.

In two important points the rubber industry has reason to be satisfied with the proposed new tariff. The idea which had been put forward of a duty on crude rubber did not find favor with the authors of the new measure, as according to its provisions, rubber continues on the free list, where it remains in spite of efforts made since the introduction of the bill to impose a 10 per cent. duty. The waste trade has succeeded in getting the objectionable clause withdrawn, which has in the past limited free entry to waste rubber worn out by use.

A much more serious point, in which the industry is deeply interested, is that of the sweeping reduction made by the new tariff upon the rates hitherto in force on rubber manufactures.

From the 35 per cent. to which manufactures of rubber are subject under the Payne bill, a reduction has been proposed to 10 per cent. on manufactures of rubber not specially provided for; the rate of hard rubber being, however, placed at 25 per cent.

On goods not strictly manufactures of rubber, but into the composition of which rubber enters, radical changes are proposed. Thus cables would, under the proposed tariff, pay 20 per cent., as against about 52 per cent. at present under a composite rate. Belting of cotton and rubber is reduced from 30 per cent. to 15 per cent.

With the view of offsetting these reductions in duties on manufactures of rubber, cuts have been made in various semi-manufactured and other articles used by rubber manufacturers, with the object of lowering the cost of production. The "basket" clause under which machinery has paid 45 per cent. has been replaced by one on a 25 per cent. basis. In the chemical schedule important reductions have been proposed in ground chalk, fuller's earth, calcined magnesia, castor oil, barytes, litharge, oxide of zinc, lithopone and other articles. Sulphuric acid, which now pays a duty of ¼ cent per pound (equalling 8.63 per cent.) would be on the free list. The changes affecting rubber chemicals are dealt with in another column.

Owing to the extent to which cotton goods are used by rubber manufacturers, their requirements are represented under various paragraphs, but the general character of the changes proposed may be inferred from the duty on cotton goods not specially provided for (now standing at 45 per cent.) being placed in the new measure at 30 per cent. Waterproof cotton cloth, which has paid a compound duty equalling a fraction over 50 per cent., is prospectively reduced to 25 per cent., while tire fabrics would be reduced from 45 per cent. to 25 per cent.

While finished automobiles are retained at 45 per cent., finished parts (not including tires) are reduced from 45 per cent. to 20 per cent. There being no special provision for tires, they would apparently come under the "basket" clause at 10 per cent.

The new tariff has still to be subjected to much discussion, and rubber goods, coming under section N, are near to the close of the dutiable portion.

Two tables are subjoined. One gives the principal changes proposed affecting the rubber trade, and another deals with the rates on rubber chemicals. The first includes extracts from the latest statistics of imports and exports, of which an advance copy was published in the March issue of the India Rubber World (page 316), showing the distribution of imports and exports among the various countries of origin and consumption. From the table it will be seen that in the fiscal year, 1912, the imports of unmanufactured rubber represented $105,034,556, against which there were exports to the value of $6,646,950; the net consumption having thus represented slightly under $100,000,000.

The imports of manufactures, strictly classified as being "chief value rubber," amounted to $998,722, while the exports under the same category represented $11,167,289. The imports as recorded do not include such goods as cables and cotton belting, which are shown separately; nor waterproof cloth and tire fabrics; while any exports under the last three heads are included in the "all other" classification.

It is thus difficult to indicate the proportion of manufactures containing more or less rubber, which are included in the statistical returns of imports and exports.

No finality is to be expected until the new tariff is signed, but the details on the subject published in this issue may facilitate its provisions being understood by those whom it affects.

ASBESTOS IN THE NEW TARIFF.

From the table published in another column, it will be seen that it is proposed to reduce the duties on both woven asbestos fabrics and other manufactures of the article. Under the present tariff woven fabrics, wholly or in chief value, of asbestos, pay 40 per cent.; that rate being prospectively reduced to 20 per cent. Other manufactures of asbestos now paying 25 per cent., it is proposed to reduce to 10 per cent.

At the hearings before the Committee on Ways and Means arguments were adduced by Mr. R. G. Rhett, of the General Asbestos and Rubber Co., Charleston, S. C., in favor of making the duty on asbestos manufactures generally 40 per cent., thus covering both yarns and cloths. Testimony was also given by other representatives of asbestos manufacturing interests. From the measure as introduced it would seem that reductions are proposed in both cases dealt with at the hearings.

THE WASTE TRADE WINS AT WASHINGTON.

Since the new tariff has been in preparation the waste rubber trade has been active in efforts to get the final clause of par. 591 in the tariff of 1909 struck out. This clause limits the free importation of rubber scrap to such as has been worn out by use.

The official report of the hearings before the Committee on Ways and Means with respect to this clause, contains on page 5863 the testimony of Mr. Herman Muehlstein, of New York, as representing the American dealers in waste rubber. He presented the brief of the scrap rubber dealers asking the withdrawal from clause 591 of the words "which has been worn out by use." Useless ends and clippings of factory waste have been paying a duty of 10 per cent., although not available for any purpose other than scrap. In his testimony, Mr. Muehlstein emphasized the arguments of the brief.

Letters on the subject were addressed to the Committee by the Philadelphia Rubber Works Co., Trenton Scrap Supply Co. and United States Rubber Co., of Naugatuck, Conn., which are embodied in the official records of the hearings.

The clause appears in the proposed new tariff with the omission of the objectionable words.

NO DUTY ON CRUDE RUBBER.

Since the rubber industry has every reason to be congratulated at the failure of the attempt to impose a duty on crude rubber, it may be appropriate to recall the efforts made with a view to that result. One of the principal features of this opposition was the brief of the Rubber Club of America, addressed to the Committee on Ways and Means, on March 28, 1912, and supported by telegrams from many men prominent in the trade.

These efforts were reinforced by renewed representations during the past winter on the part of various rubber companies and their officials, made not only to the members of the Ways and Means Committee, but to the representatives in Congress of the rubber manufacturing centers.

TABLE SHOWING COMPARATIVE TARIFF ON CRUDE AND MANUFACTURED RUBBER AND ASBESTOS.

	Tariff 1909. Paragraph	Rate	Proposed Tariff. Paragraph	Rate

DUTIES ON MATERIALS USED IN RUBBER MANUFACTURE.

In July, 1911 (page 380), the India Rubber World published a table showing the duties on the principal rubber chemicals under the Dingley and Payne tariffs. Following up this table the subjoined comparison of the Payne duties with those proposed under the new tariff, will be found of interest at the present juncture. By using the two tables the incidence of duty on any article of importance can be traced over 16 years.

The *ad valorem* equivalents under the Payne tariff are those recorded in the official statistics, while those under the proposed new rates are estimates, based on the assumption that present prices will be maintained.

The Rubber Sundries Manufacturers Dine.

OF the many successful annual dinners enjoyed by the Rubber Sundries Manufacturers' Association, none have been better than that held April 10 at the Waldorf-Astoria. On the afternoon of that day the usual business meeting was held. The officers elected were: Alexander M. Paul, president; Frederick H. Jones, vice-president; and E. E. Huber, secretary and treasurer.

ALEXANDER M. PAUL, PRESIDENT.

The dinner served at seven had the accompaniments of fine music, a wealth of flowers, and a menu that would tempt the most fastidious epicure. The souvenir was what at first glance looked like a cork tipped cigarette, but which turned out to be in reality a very ingenious self-contained cigar lighter.

As the newly-elected president was unavoidedly absent, Mr. George B. Hodgman, the retiring president, acted as master of ceremonies. With the coffee and cigars he first introduced the editor of THE INDIA RUBBER WORLD. In a five minute speech the speaker sketched the beginnings of the rubber sundries trade, with which he had been as a boy personally identified, described its present wonderful expansion, and semi-humorously pictured its future "forty years hence."

Mr. Howard E. Raymond, vice-president of the B. F. Goodrich Co., was the next speaker. After touching on a variety of topics of interest, he described the great floods in Akron, and the shifts to which the great rubber companies were put to continue running. The story was most graphic, and gave one a new view of the resource and alertness of the industrial chieftains of the rubber city.

Then followed an excellent vaudeville entertainment, the most startling feature of which was an Oriental mind reader who bewildered all by his accurate reading of unspoken questions, to which he returned answers often witty, always appropriate.

It was unanimously conceded that Messrs. Hodgman and Huber, the Committee of Arrangements, had again scored an unqualified success in the 1913 dinner.

BANQUET OF THE RUBBER SUNDRIES MANUFACTURERS' ASSOCIATION.

The Thirteenth Annual Meeting of the Rubber Club of America.

THE thirteenth annual meeting of The Rubber Club of America was held at the American House, Boston, on the evening of April 21. It opened with the usual business meeting and election of officers for 1913, which was followed by a meeting of the Board of Directors. After the meeting a very enjoyable supper was served, which as usual brought forth the undeniable musical talent for which the Club has always been noted, and which naturally added to the joy of the occasion.

GEORGE B. HODGMAN, PRESIDENT.

FREDERICK H. JONES, VICE-PRESIDENT.

The feature of the evening was an illustrated talk by Mr. Henry C. Pearson, the editor of THE INDIA RUBBER WORLD, which dealt with the experiences of his recent South American trip. Mr. Pearson's description of various places and conditions in South America were effectively illustrated by colored pictures, and certainly justified his opinion that "Rio Janeiro is the most beautiful city in the world."

Mr. Pearson showed some seventy beautifully colored views of Rio de Janeiro, sketch maps of the wild rubber areas showing the distribution of *Hevea, Hancornia* and *Manihot*, and views of *Manihot* plantations in the vicinity of the Rio San Francisco. The speaker described in detail Brazil's laws for the "Protection of Rubber," the projected washing plants and the great factory at Rio to be erected by the Goodyear Tire and Rubber Co. of South America.

PRESIDENT HOOD'S ADDRESS.

President Hood's address at the annual meeting was as follows:

"We have come to another milestone in the history of this Club. Tonight we elect a new president, a new vice-president, and new members of our Board of Directors. The Board of Directors will appoint a new Executive Committee. It is hoped that the board will see fit to re-appoint most of the members of the present Executive Committee.

"My first privilege is to express my personal thanks and the thanks of every member of this Club to the members of the Executive Committee.

"You will doubtless remember that prior to the 1912 annual meeting, the Executive Committee was larger than the Board of Directors, and the by-laws were changed a year ago to create a small Executive Committee. The wisdom of that change has been very apparent. The Executive Committee has regular quarterly meetings, elects the members, spends the money, and generally manages the business of the club.

HAROLD P. FULLER, SECRETARY.

J. FRANK DUNBAR, TREASURER.

HENRY C. PEARSON.

It has had several other meetings during the year.

"While a small Executive Committee is wise for the execution of business, we all feel that it would be advisable to have more frequent meetings of the Board of Directors, so that they would also feel the responsibilities of the club and more fully understand its problems.

"Two years ago the club was a social organization. There has been added to the sociability a large number of business duties, and these two years have been practically a period of transition from a purely social into a live club, for the purpose of profitably solving our common problems.

"The paper read by your president at the annual dinner last January mentioned several topics that should be properly discussed here—the tariff, the nomenclature of rubber, the clarifying of crude rubber dealings, the stopping of stealings of crude rubber (which really should be included in the last subject, as the way to stop stealings of crude rubber is to stop the market for it and to catch the purchaser of it.) What other agency is there to undertake the solving of any of these problems except this Rubber Club?

"Within two months we expect to have a firm membership of eighty. We are already assured of sixty firm members, which, with the dues from the active and associate memberships, will give the club an income of over three thousand dollars. What this money will be used for is a question several members have asked. There is the cost of the meetings of the Executive Committee, without railroad fares; there is the postage and stationery, and printing; the clerical work; and there is an attorney's bill for tariff and other briefs. But to my mind the most important expenditure that can be made is the expenditure for a paid secretary.

"The old adage, 'If you want a thing done, get a man who has all he can do,' applies to an executive in the sense of making decisions, but the lesson that has been learned this last year is that no president can find the time to give to the detail work of the club. And the pioneer work requires a man of ability and discretion.

"At this time I desire to formally thank the members of the Executive Committee and the members of this club for the many considerations and kindnesses shown me during my term as president."

THE TREASURER'S REPORT.

Statement—Rubber Club of America, as of April 1, 1913:

Receipts.

Bank balance as of April 1, 1912	$405.44	
Received for dues to April 1, 1913, from members	1,396.25	
Received for initiations—new members	165.00	
Received from members for banquets, outings, etc.	2,351.61	
		$4,318.30

Payments.

Expenses for banquets, outings, etc.	$3,012.43	
Sundry printing	142.05	
Sundry postage	33.98	
Bank collections	2.10	
Death resolutions and flowers—H. C. Morse, F. D. Balderston	36.00	
Clerical work	100.00	
Expenses a/c. meeting Executive Committee.	76.17	
Telephone calls	16.75	
Legal expenses, S. S. Meyers, "Tariff Brief"	300.00	
Expenses a/c. Messrs. G. B. Hodgman and F. C. Hood's trip to Washington in connection with tariff matter	67.85	
Bank balance, April 1, 1913	530.97	
		$4,318.30

THE SECRETARY'S REPORT.

Boston, Mass., April 1, 1913.

On the above date we completed our thirteenth year, and I believe that the work inaugurated during the period just closed, if properly followed up, will accomplish much good to the rubber trade as a whole.

Under the new classification, our membership today stands as follows: 59 Firm, 216 Active, 63 Associate, and 5 Honorary, a total of 343, or a net gain of 43 during the year. This membership will insure us an approximate income of $2,700, with which your Executive Committee can start systematic work.

This committee has deemed the club business of sufficient importance to hold regular quarterly meetings in New York, and these meetings have been well attended.

During the year we have lost four members by death—Messrs. F. D. Balderston, S. Lewis Gillette, E. R. Rice, and D. S. Pratt; 12 have resigned, and 7 have been dropped for non-payment of dues.

Your committee thought it wise on September 24 last to resign from the Massachusetts State Board of Trade, as they could see no benefit to be derived from membership in a purely local organization.

The summer outing was attended by 148 enthusiastic members and guests, who were united in their praise of the Rhode Island clambake and other attractions. The annual dinner in New York was of the usual high standard, and seemed to be thoroughly enjoyed by those fortunate enough to attend.

The following is a list of the officers, honorary vice-presidents, board of directors, and committees of the club for the year 1913:

OFFICERS.

George B. Hodgman, president, 806 Broadway, New York City.
Frederick H. Jones, vice-president, Andover, Massachusetts.
J. Frank Dunbar, treasurer, Geo. A. Alden & Co., Boston.
Harold P. Fuller, secretary, 49 Federal street, Boston.
John P. Lyons, assistant secretary, 15 West 38th street, New York.

HONORARY VICE-PRESIDENTS.

L. Dewart Apsley, Augustus O. Bourn, John M. Flint, Alexander M. Paul, Henry C. Pearson, Arthur W. Stedman, Frederic C. Hood.

BOARD OF DIRECTORS.

Henry Spadone, Gutta Percha & Rubber Co., New York.
George B. Hodgman, Hodgman Rubber Co., New York.
J. Frank Dunbar, Geo. A. Alden & Co., Boston.
Harold P. Fuller, E. H. Clapp Rubber Co., Boston.
L. Dewart Apsley, Apsley Rubber Co., Hudson, Massachusetts.
Augustus O. Bourn, Bourn Rubber Co., Providence.
John H. Flint, Tyer Rubber Co., Andover, Massachusetts.
Frederic C. Hood, Hood Rubber Co., Watertown.
Alexander M. Paul, Davidson Rubber Co., Charlestown.
Henry C. Pearson, India Rubber World, New York.
Arthur W. Stedman, New York Commercial Co., New York.
Homer E. Sawyer, United States Rubber Co., New York.
Elisha S. Williams, Rubber Goods Mfg. Co., New York.
H. E. Raymond, B. F. Goodrich Co., Akron.
Francis H. Appleton, F. H. Appleton & Son, Boston.
Frederick H. Jones, Tyer Rubber Co., Andover.
George E. Hall, Boston Woven Hose & Rubber Co., Cambridgeport.
Allen L. Comstock, American Rubber Co., Cambridgeport.
Albert Zeiss, Arnold & Zeiss, New York.
H. S. Firestone, Firestone Tire & Rubber Co., Akron.

EXECUTIVE COMMITTEE.

Frederick H. Jones, Tyer Rubber Co., Andover (chairman).
Henry C. Pearson, India Rubber World, New York.
Homer E. Sawyer, United States Rubber Co., New York.
Frederic C. Hood, Hood Rubber Co., Watertown.
Albert Zeiss, Arnold & Zeiss, New York.

NOMINATING COMMITTEE.

Alexander M. Paul, Davidson Rubber Co., Charlestown (chairman).
L. Dewart Apsley, Apsley Rubber Co., Hudson.
Homer E. Sawyer, United States Rubber Co., New York.
Robert L. Rice, Hood Rubber Co., Watertown.
Charles T. Wilson, Chas. T. Wilson, New York.

AUDITING COMMITTEE.

J. Everett Stone, Plymouth Rubber Co., Canton (chairman).
E. F. Dewing, Boston Rubber Shoe Co., Malden.

ENTERTAINMENT COMMITTEE.

William L. Proctor, Enterprise Rubber Co., Boston (chairman).
James H. Learned, Revere Rubber Co., Chelsea.
A. T. Baldwin, Walpole Tire & Rubber Co., Walpole.
Ira F. Burnham, Stoughton Rubber Co., Boston.
E. H. Kidder, United States Rubber Co., Boston.

SPORTS COMMITTEE.

Frank R. McKenna, Bourn Rubber Co., Providence (chairman).
Edwin L. Phipps, United States Rubber Co., Boston.
William L. Pitcher, Easthampton Rubber Thread Co., Easthampton.
Francis H. Appleton, Jr., F. H. Appleton & Son, Franklin.
William J. Kelley, Arnold & Zeiss, New York.

DINNER COMMITTEE.

Charles A. Coe, United States Rubber Co., Boston (chairman).
William E. Barker, United States Rubber Co., New York.
Robert L. Rice, Hood Rubber Co., Watertown.
Robert B. Baird, Rubber Trading Co., New York.
Theodore W. Bassett, United States Rubber Reclaiming Co., New York.

VALORIZATION IN JOLIET.

According to a Joliet paper, there is now being stored in that city, waiting for a rise in the rubber market, a total of 2,500 pounds of rubber—the first commercial product from the Mexican plantation of the Joliet Tropical Plantation Co., which has been operating for a few years, and has among its chief stockholders some of the substantial citizens of Joliet. The statement is made that had it not been for the revolutionary activities in Mexico during the last year or two, the plantation's output this year would have been 20,000 pounds, valued at about 80 cents a pound.

BRAZIL WITHDRAWING PREFERENTIAL DUTIES ON AMERICAN GOODS.

ACCORDING to a cable from Ambassador Edwin V. Morgan, received by the Department of State on April 10, 1913, the Brazilian Cabinet, at a meeting on April 9, decided upon the immediate withdrawal of the preferential duties hitherto applied to certain American goods. A preference of 30 per cent. has been enjoyed by American wheat-flour, and a rebate of 20 per cent. by some fifteen other articles, including manufactures of India rubber.

The whole value of the American exports to Brazil affected by this change is less than $5,000,000, of which rubber manufactures represent about $150,000. The withdrawal of this preference does not affect more than about one seventh of the total United States exports to Brazil.

As shown in table A, American imports from Brazil for the fiscal year 1912 represented about $124,000,000, while United States exports to that market were only about $35,000,000.

In table B is shown the movement of exports of American rubber manufactures to Brazil since 1907.

With the erection of the new factories in Brazil and with the loss of the preference, it would seem likely that a portion of this trade would be lost to United States manufacturers. They have been supplying about 75 per cent. of the total Brazilian imports of rubber goods.

The abolition of the preference in favor of the United States seems to have given satisfaction to the German rubber industry. The measure is said to be retroactive, and applying to the whole of 1913; so that the Brazilian importers of the goods affected, will have to pay the difference of duty on their imports of this year.

(A)—United States Trade With Brazil.

	Imports from Brazil. Free of Duty.	Dutiable.	Total of Imports.	Exports to Brazil.
1907.....	$96,601,490	$1,279,668	$97,881,158	$18,594,838
1908.....	74,462,813	115,051	74,577,864	19,364,238
1909.....	97,261,855	791,374	98,053,229	17,444,759
1910.....	107,599,155	555,336	108,154,491	22,764,183
1911.....	100,457,075	410,109	100,867,184	27,240,146
1912.....	.....	.....	123,881,644	34,678,081

(B)—Exports of Rubber Manufactures to Brazil.

Fiscal Years	1907.	1908.	1909.	1910.	1911.	1912.
Belting, hose and packing	$15,221	$11,861	$25,310	$17,470	$34,442	$40,777
Boots and shoes	12,983	18,962	23,746	20,785	35,548	41,036
Automobile tires	.....	.....	.....	.....	10,112	24,952
Other tires	.....	.....	.....	.....	7,767	11,273
Other goods	27,808	29,044	35,406	66,890	62,596	81,201
Totals	$56,012	$59,867	$84,462	$105,145	$150,465	$199,239

(Tires were included with other goods until 1911.)

When the preferential was first applied, this country made no special concession to Brazil, beyond that embodied in the general tariff treatment of Brazilian products; under which more than 99 per cent. of these products come into the United States free of duty. This liberal tariff treatment of Brazilian articles was the consideration for the preference given by Brazil to a limited number of articles from the United States.

INDIA RUBBER LIFEBOAT.

A collapsible lifeboat has recently been patented by an English inventor. It is composed of thin sheets of india-rubber, reinforced with a thin layer of canvas, which does not perish or get hardened with repeated coats of paint. The resiliency of the boat diminishes the risk of injury from collision.

THE FUTURE OF RUBBER IN BRAZIL.

AMONG the features of the present movement for the development of rubber cultivation in Brazil, are the two interesting lectures delivered at Rio de Janeiro on December 26, 1912, and January 16, 1913, by Senhor J. Simão da Costa, industrial engineer. The lectures dealt respectively with the agricultural and commercial or industrial aspects of the question.

With relation to the cultivation of rubber, the lecturer referred with approval to the efforts in that direction of Drs. Lauro Sodré, Paes de Carvalho and Firmo Braga, natives of the State of Pará. They recognized the enormous advance in store for the rubber industry if the Federal government took the least interest in its development. Had their efforts been duly seconded, Brazil would have been in a position to control the world's market for rubber.

FORESTS OF NORTHERN BRAZIL.

No one who has not traversed the forests which mark the extended course of the River Amazon, can form an idea of the virgin forests in that region. It would be a mistake to judge from the forests of Southern Brazil; there being no comparison between the two. An opinion exists that a *seringal* is a forest almost exclusively composed of rubber trees. Nothing would be more erroneous, said the lecturer. Out of an average of 40 to 80 different species of trees per acre, only an average of 6 would be rubber trees under the more favorable circumstances.

TROUBLES OF THE SERINGUEIRO.

Doomed to live isolated from civilization in the virgin forest, the *seringueiro* is forced during seven months of the year to rise before daybreak, while the most expert of them cannot tap more than 120 trees a day. Were it possible to provide the *seringueiros* with moderately comfortable dwellings, and sufficient food, two of the greatest difficulties in the exploitation of the native *seringaes* would be overcome.

YIELD OF *HEVEA* TREES.

That the cultivation of rubber trees is profitable has been demonstrated in the East, as *Hevea* trees there commence to bear at the end of the fourth year; while the combination of *Hevea* with bananas would cover the whole expense of cultivation in the basin of the Amazon. M. Paul Le Cointe, the French agronomic expert, has demonstrated the correctness of this last assertion, in the course of his lectures.

REASONS AGAINST CULTIVATION OF RUBBER TREES.

Two reasons might apparently exercise a deterrent effect upon the development of rubber cultivation—the discovery of a laboratory substitute and the possibility of over production. With regard to the first, the lecturer expressed the conviction that synthetic rubber would never emerge from an academic stage. As to the second, he considered that even were the production of rubber quadrupled, it would still be absorbed in various industries.

CONSUMPTION OF RUBBER.

The constantly increasing demand for rubber in connection with telegraphy, telephony, lighting, power transmission, etc., insures the consumption of rubber in enormous quantities. On the basis of an estimated American yearly production of 300,000 automobiles, 18,000 tons of rubber would be wanted for the tires. Almost all mechanical industries require rubber. It is, moreover, an indispensable requisite of many popular games and sports, while it is used in footwear throughout the world.

THREE OBJECTS TO BE KEPT IN VIEW.

The three objects to be kept in view in any measures of reform, were thus summarized by the lecturer:

1. To supply fine *Hevea* rubber in sufficient quantity to prevent manufacturers from having to use substitutes and inferior products.

2. To keep in view an increase of production in order to satisfy the continued increased consumption.

3. To endeavor to reduce the cost of production, so as to permit the creation of new industries and to stimulate the development of those already existing. In this way raw material will be available in the sufficiently increased quantities needed, at reasonable prices.

PROPORTION OF RUBBER IN GOODS.

In support of his recommendation to produce enough fine rubber to meet the legitimate requirements of consumption, the lecturer stated that with 75,000 tons of rubber manufacturers produced 400,000 tons of rubber goods.

HOME MANUFACTURES FOR BRAZIL.

The lecturer expressed the opinion that any programme for the "Protection of Rubber" would be incomplete, which did not include measures for preventing Brazil being still inundated with foreign goods under the designation of rubber manufactures, which do not contain the smallest particle of that raw material. It would be possible by legislation to insist upon incontestable proofs that Brazilian rubber had been used in goods passing through the custom houses of the Republic. Such an arrangement would, however, only be possible when Brazil is able to supply the home market for rubber goods.

BRAZILIAN RUBBER MANUFACTURING PLANTS.

IN the April number of The India Rubber World the fact is reported of the awards for the proposed Brazilian manufacturing plants having been made. The Goodyear Tire & Rubber Co., of South America, obtained the award for the Rio de Janeiro plant; a summary of its proposal having appeared in the last issue of this journal.

The award for Pernambuco (Recife) was made to the Companhia Norte Brazil. According to that company's proposal, reproduced in the "Diario Official" of February 13, it offers to erect a large factory at the side of the Great Western Railway of Brazil, besides acquiring an extensive site in the vicinity. Among the principal articles manufactured will be machine belting, cables, waterproof goods of all descriptions, cotton fabrics for use in automobile tires and for other purposes. Rubber pneumatic and solid vehicle tires of all kinds, rubber carpets and mats, rubber hose, rubber heels and other rubber goods will likewise be made. The company expects to work up annually 700 tons of crude rubber.

Special attention will be paid to the manufacture of electric wire, for which purpose bar copper will be imported direct from Chile. It is expected to secure the orders of the various Brazilian States and municipalities for the above-named wire. The Companhia Norte Brazil was established in March, 1911, and claims to have a paid up capital equalling $400,000.

Subjoined are the equivalents of the items shown in general estimate of cost:

RECIFE MANUFACTURING PLANT.

	Brazilian Currency.	American Currency.
Buildings	2,350:000$000	$783,330
Machinery (including spinning and weaving plants)	2,700:000$000	900,000
Site, water supply	200:000$000	66,670
Total	5,250:000$000	$1,750,000

As the estimate of the Goodyear company for the Rio plant equals $1,757,804, or practically the same as that of Companhia Norte Brazil for Recife, the two companies are evidently in a position for close competition.

THE NEW BRAZILIAN WASHING PLANTS.

As recorded in the April issue of The India Rubber World (page 348) the awards for the Brazilian washing plants were made for Manaos to the Goodyear Tire and Rubber Co., of South America; for Pará to Gabriel Chouffour of Paris, and for Minas Geraes to Luiz Cantanhede de Carvalho Almeida and Arthur Haas. The estimates and proposed installation of machinery of the Manaos plant were reported last month.

THE PARA PLANT.

The proposal of Gabriel Chouffour for Pará, as published in the "Diario Official," states that he is acting in combination with the Banque Credit Française of Paris, and with the Compagnie de Caoutchouc Etablissements Hutchinson of the same city. It is proposed to establish a plant capable of washing and purifying 4,000 tons of scrappy Manaos in six months. The total annual production of scrappy Manaos is stated to be about 8,000 tons, of which 4,000 tons come into Manaos and 4,000 tons into Pará. It is the latter quantity to which the proposal applies, and which would have to be treated at the rate of about 27 tons a day for 150 days. The installation of machinery would be in groups composed as follows:

(a) One grinder (three cylinders); (b) Two washing machines, Werner & Pfleiderer type; (c) Three washing and compressing machines (two cylinders).

As each group could wash about 3,500 pounds in a day of ten hours, there would be 17 groups needed. Adding two groups for use in case of necessity, 19 groups would be required. It is estimated that these machines would cost and weigh for each group:

	Cost Equalling.	Weight (tons).
(a) (one machine)	$2,000	10
(b) (two machines)	4,000	12
(c) (three machines)	3,600	18
Transmissions	600	3
Foundations	1,000	—
		—
Total	$11,200	43

(Total cost of 19 groups, $212,800.)

On this basis the total estimate would amount to $587,500, composed as follows: (The original figures are in francs, but have been converted into American currency).

(1)—Machinery	$212,800	
Drying equipment	14,000	
Installation, etc.	28,000	
Pumps, water service	19,000	
Washing appliances	6,000	$279,800
(2)—Motive force		126,200
(3)—Buildings		109,500
		$515,500
Surveys and superintendence		20,000
Contingencies, 10 per cent		52,000
Estimate francs, 2,937,500 =		$587,500

To this amount will have to be added freight on material, estimated at $40,000. A site will also have to be provided for, with an area of about 110,000 square feet.

The total estimates, it is stated, after making allowance for variations in cost of labor and freight, would represent in Brazilian currency 1,932:500$000; thus equalling in American money, $644,166.

The charge of washing or purifying rubber would be 200 reis per kilo (equalling about 3 cents per pound).

THE MINAS GERAES PLANT.

The proposal which has been accepted from Luiz Cantanhedo de Carvalho Almeida, civil engineer, and Arthur Haas, industrial proprietor, covers the construction on the bank of the river San Francisco, near the city of Pirapóra, in the State of Minas Geraes, of a plant for washing and purifying Maniçoba and Mangabeira rubber. The capacity of the plant is estimated at about 1,500 pounds a day.

WERNER & PFLEIDERER'S WASHING MACHINES FOR BRAZIL.

It is of interest to note that the proposal accepted by the Brazilian government for the Pará washing plant specifies the washing machines of Werner & Pfleiderer. As the installation would include 38 of such machines, the order will be of importance.

DAVID BRIDGES' RUBBER MACHINERY FOR BRAZIL.

The proposal of the Companhia Norte Brazil for two rubber manufacturing plants, one of which was awarded that company, states:

"The plans for both factories of rubber goods were drawn up by David Bridge & Co., Limited, of Manchester, one of the most noted English engineering firms."

BRAZILIAN IMMIGRATION.

One of the difficulties in the way of Brazilian development is being removed. The Federal Government recently signed a contract with the Companhia Rural de Commercio e Industria to introduce and settle 10,000 families of European immigrants.

DYNAMITE IN BRAZILIAN AGRICULTURE.

The Secretary of Agriculture of the State of Sao Paulo has asked the Minister of Finances to reduce the duties on dynamite in order to facilitate its employment in agriculture. As there is a dynamite factory in Brazil, the State Treasury has expressed disapproval of the proposed reduction.

PUERTO CABELLO RUBBER EXPORTS.

A consular report from Puerto Cabello shows the value of rubber shipped from the port in 1912 as $5,593 as compared with $10,683 in 1911.

MALAYAN PLANTERS FOR BRAZIL.

The need of capable superintendents is one of the admitted difficulties of the present Brazilian situation. The "Malay Mail" reports that large fees had been offered to Malayan planters, to induce them to take up work in Brazil. A case is likewise referred to in which a planter from Malaya, spending a holiday in England, had been offered and had accepted, a two years' agreement to go out to Brazil to supervise tapping methods. The salary attached to the post is $4,250 the first year and $5,000 the second, with all expenses paid—an important item, since the work involves a great deal of traveling from one property to another.

THE PERUVIAN AMAZON CO.

The Peruvian Amazon Co., which has owned the rubber concession in the Putumayo District in Peru where the atrocities have been committed on the Indian rubber gatherers—the disclosure of which has shocked the civilized world—was ordered into compulsory liquidation on March 19, by the Chancery Court of London. By the action of the Court, J. C. Arana was removed from the position of liquidator of the company.

Notes on Tension Tests of Rubber.

By P. L. Wormeley, United States Bureau of Standards.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

THE wonderful development in the rubber industry and the enormous demand for rubber products with their constantly multiplying and broadening fields of application, make it evident that the time is now ripe for the heartiest co-operation between manufacturers and consumers, with a view to establishing uniform methods of testing and, as far as possible, uniform specifications for goods intended for the same purpose. Uniformity of methods is absolutely essential to an intelligent comparison of the work of different laboratories, and a more general interest in the standardization of specifications and

P. L. Wormeley.

methods of testing would result in a substantial benefit not only to the reputable manufacturer and large consumer, but also to the public at large.

In testing materials in general, the refinement of the methods used should be determined in each case by the nature of the material tested, and in the speaker's opinion there is no reason why rubber should be an exception to the rule.

Now as regards testing machines and apparatus used in determining the physical properties of rubber, a most interesting field is presented, in which there is room for many improvements. However, when one considers the rather large and apparently unavoidable inherent variation in the physical properties of rubber, it seems that in the present state of our knowledge, uniformity of methods is more to be desired in testing than extreme accuracy and refinement in the matter of taking measurements. This of course is particularly true in the case of commercial or routine testing where the goods have been manufactured to meet the requirements of specifications. Unfortunately specifications are not always as definite as might be desired, nevertheless, the adoption by both parties concerned of uniform methods of testing, would remove the cause of numerous misunderstandings between manufacturer and consumer.

To discuss in a comprehensive way the various methods that have been proposed for testing the physical properties of rubber would require a more thorough knowledge of the subject than I possess, and far more time than is at my disposal today. There are, however, certain points in connection with methods and machines used in testing the tensile properties to which I should like to ask your attention, with the hope that sufficient interest may be aroused to bring out a discussion and an exchange of ideas and opinions on the subject.

In regard to the most desirable form of test piece, the ring and the straight specimen, each has its particular advantages, and considerable difference of opinion is being expressed as to the relative merits of the two. The method which is usually followed in preparing rings involves several distinct operations which, if carefully carried out, consume quite a good deal of time. On the other hand the straight specimen may be cut out by a single stroke of the die, the operation requiring only an instant. Rings, when accurately cut, undoubtedly show uniform results, but on account of the varying stress over the cross-section, this method does not give the true value for tensile strength. An analysis of the distribution of stress in a ring shows that near the breaking point the tension decreases at an approximately uniform rate from the inside to the outside surface. If this variation in stress were the same for all rubbers, the ring method might be accepted as giving a true relative measure of strength, but tension curves plotted for different rubber compounds show that this is not the case.

The ring lends itself very rapidly to the automatic measurement of elongation, and in this respect its advantage over the straight specimen is apparent. It may be noted, however, that since the strength of rubber is not the same in all directions, being greatest in the direction in which the sheet has been rolled, the ring gives a smaller ultimate elongation than is shown by a straight specimen. This difference in strength and elongation by the two methods is not always found, but the results of tests which I have made on twenty different compounds show a general tendency toward higher values for straight specimens, particularly in the case of high-grade compounds.

Objection to the straight test piece is often raised on the ground that specimens fail by tearing at or near the grips. This difficulty may be overcome by gradually increasing the width of the test piece at the ends, and by using a grip that will not bruise or injure the rubber by excessive pressure. A form of grip which the writer has found to be exceedingly convenient and perfectly satisfactory consists of a series of circular discs mounted eccentrically, and in such a way that each disc acts independently in pressing against the test piece. By this means the gripping pressure holding the specimen is automatically increased in proportion to the applied tension, and furthermore, the pressure is uniform over the entire width of the grip even in cases where the thickness of the rubber varies.

For measuring the applied load it would appear that preference is usually given to some form of dead weight or pendulum machine, the spring balance or dynamometer being often looked upon with disfavor.

It is the policy of the Bureau of Standards to encourage as much as possible the testing of rubber goods and for this reason our testing machines have been constructed with a view to the greatest simplicity consistent with a reasonable degree of accuracy. For determining tensile strength and elongation we use an ordinary twin spring dynamometer attached to the upper end of a metal column. This column is slotted to receive a rack which carries the movable grip and which may be operated either by hand or by motor, with stepped pulleys for different speeds to meet the requirements of experimental work.

It is necessary, of course, to provide means for cushioning or preventing the recoil of the springs when a specimen breaks.

For this purpose we at first employed a dash pot, but later it was found more satisfactory to use a device which prevents recoil by holding the springs under the maximum tension. We realize that this method of measuring the load is in a way open to criticism, but at the same time we are gratified to find that after more than two years of continuous service the corrections for the dynamometers are so small as to be negligible, being well within the limits of variation of the materials tested. We have provided a set of weights with which the machines are calibrated from time to time, and should the dynamometers become inaccurate it will be a simple and very inexpensive matter to have the old springs replaced by new ones.

As already mentioned the measurement of elongation at rupture is a less simple matter in the case of a straight test piece than with a ring, the reason being that the rubber has a tendency to creep to a greater or less extent through the gripping surfaces, thus making it inaccurate to take measurements between fixed points on the grips. A little practice however enables one to observe the extension between gauge marks on the test piece with a fair degree of precision by pressing the end of a measuring scale gently against one of the marks and taking the scale reading just opposite the other mark as the specimen breaks. The dynamometer automatically registers the breaking load.

In my own experience the large amount of time consumed in testing the elasticity or what is commonly termed "set" or "recovery" after extension, has prompted me to devise means for expediting the work, with the result that a piece of apparatus has been constructed in which six specimens may be tested at once.

Of the tensile machines that I have had an opportunity to see in operation, or to study from illustrations, some appear to be rather better adapted to experimental or research work than to the requirements of routine testing. This is due partly to delicate or expensive construction, and also to the fact that more time is required in their operation than is desirable in ordinary routine work, for which, simplicity of construction, ease and rapidity of operation, would seem to be very desirable to say the least. For reasons already stated it would be difficult to obtain by autographic means, tension or hysteresis curves for straight test pieces. A rather slow but otherwise satisfactory method of securing curves may be carried out in the following way:

A narrow flexible scale either of paper or tracing cloth is attached to the test piece at the upper gauge mark by means of a small spring wire clip. From this scale one operator reads and announces the elongation at convenient intervals of 25 to 50 per cent., to a second operator who observes and records the corresponding tension. With a little practice this process becomes exceedingly simple and the points when plotted are found to give very smooth curves which clearly show the characteristics of different rubbers. Such curves offer a convenient means of studying the tensile properties of rubber when cut in different directions; and when compared with similar curves obtained with ring specimens the influence of the form of test piece is clearly apparent. In testing twenty or more different compounds I have found that specimens cut longitudinally or in the direction in which the sheet has been rolled through the calender give curves that lie well above the corresponding curves for specimens cut in the opposite or transverse direction. Ring test pieces produce curves which lie below those for longitudinal specimens and which sometimes coincide very nearly with the curves for transverse specimens.

The tension test is generally considered to be the most satisfactory and most widely applicable test for soft rubber products. In its various modified forms it is used to determine the more important physical properties such as strength, ultimate elongation and elasticity of recovery after a definite extension or a definite load. The methods followed in making these determinations vary according to the judgment of different persons, and since the results obtained are thereby influenced to a marked extent, the importance of uniformity of methods is not open to question. Of the influences that appreciably affect the results of tests may be mentioned the following, which being familiar to those interested in rubber testing would make an interesting subject for open discussion:

1. Shape and size test pieces.
2. Method of preparing and measuring test pieces.
3. Design of grip.
4. Direction in which test pieces are cut (when straight specimens are used).
5. Temperature.
6. Previous stretching.
7. Time allowed after extension and release, before measuring set.
8. Speed at which rubber is stretched.

Reference has already been made to the influence of the form of test piece, and as regards the area of cross-section it appears that in the case of rubber, as in the case of other materials, there is a tendency for small test pieces to develop higher unit values for strength and ultimate elongation, than larger ones.

2. The preparation of test pieces and the measurement of cross-section is generally conceded to be of the greatest importance, and unless this part of the work is carefully and accurately performed, it is useless to expect uniform results to follow. When one considers that the width of ring as commonly used is only 4 mm it is seen that a very slight eccentricity of say ½ mm introduces an error of 12½ per cent. in strength. In the case of straight specimens this particular difficulty does not present itself, but here also it is necessary to make sure that the cutting edges of the die are parallel and sharp. The usual method of cutting straight specimens I believe, is to strike the die a sharp blow with a mallet, but when used in this way, unless the blow is well directed, there is a tendency for the die to drift to one side, thus producing a specimen whose cross-section is not rectangular. It would therefore seem worth while to employ mechanical means to insure that all specimens are cut alike. In our work we have found that an arbor press is perfectly satisfactory, and we use a piece of leather under the rubber to prevent injury to the cutting edges of the die.

For measuring the thickness, a spring micrometer is probably the most convenient and accurate instrument available.

3. The design of grip is of importance in that excessive local pressure often causes failure at that point. For this reason it would seem desirable to use a form of grip which closes automatically as the tension is increased, and produces a uniform pressure across the end of the test piece.

4. As is generally known the tensile properties of a straight test piece are influenced by the direction in which it is cut and it is unfortunate that specifications sometimes fail to take this fact into consideration. For example, a common specification for water hose in this country limits the set after 300 per cent. extension, to 25 per cent. and a rubber compound used for such hose might show a set measured in the longitudinal and transverse directions of, say, 28 and 22 per cent., respectively. Unless this point were definitely covered therefore the hose might be accepted or rejected according to direction in which the test pieces were cut. The same is also true though to a less extent, in the case of tensile strength and ultimate elongation. This of course does not apply to ring specimens in which tension is exerted equally in all directions.

5. The influence of temperature on set, strength and ultimate elongation, though often disregarded, is undoubtedly great enough at times to justify consideration. When one considers that the temperature in a testing laboratory may easily vary twenty degrees or more between summer and winter it is not difficult to account for variations in results which might otherwise be overlooked.

6. The influence of previous stretching on strength and elongation is often so marked that it should be taken into consideration.

In testing for set and strength it is convenient to use the same test pieces for both determinations, but by so doing, the stretching which a specimen receives in connection with the measurement for set, has a tendency to increase not only its ultimate elongation but also its strength. This increase in strength appears to be more pronounced in high grade rubbers than in compounds of low quality. It is rather surprising that specifications do not always state the methods to be followed in this case.

7. There appears to be a marked difference in the methods followed in determining "set." Although it is well known that the recovery of rubber immediately after release is very rapid, it is not unusual to see specifications that require the set to be measured "at once" and the specimen remarked in preparation for a second stretch and measurement for set. Now since the straight specimen does not lend itself readily to the usual methods of taking autographic records and since it is very difficult to measure the set immediately after the release except by autographic means, much more uniform results could be secured by measuring the first set after a definite number of seconds, say fifteen or twenty, have been allowed to elapse.

A further objection to the practice of attempting to measure and remark the specimens immediately after release, is that a variation of only a few seconds in the time of remarking is sufficient to influence the second set very materially. So great is this influence in fact, that if the specified limits for set were insisted upon, material would often be accepted or rejected according to the quickness with which the operator was able to remark the test pieces after the first set.

8. A variation within reasonable limits of the speed at which rubber is stretched does not affect the strength and ultimate elongation to a very great extent, still its influence is generally considered to be sufficient to justify uniformity in the rate of stretching. Whether it is more desirable to maintain a uniform speed, or to increase the load at a uniform rate, is a point on which there are differences of opinion. I believe that stretching at uniform speed is the method usually adopted in this country.

In conclusion I would state that my aim has been to deal principally with those points which are most essential to the development of uniform methods of testing, no attempt having been made to treat the general subject of physical testing in anything like an exhaustive manner.

Lithopone and Oxide of Zinc in the Rubber Industry.

By G. C. Stone and Gilbert Rigg, of the New Jersey Zinc Company.

A PAPER PREPARED FOR THE THIRD INTERNATIONAL RUBBER CONFERENCE, BUT NOT READ.

THE zinc oxide of commerce is a white amorphous powder, the purity of which depends entirely on the character of the ore from which it is produced. Zinc ores, with the exception of those from Franklin Furnace, New Jersey, contain considerable lead and usually cadmium. For the production of a white oxide, suitable for rubber compounds, the presence of these constituents except in very small quantities is inadmissible, especially when the object is to make as white a product as possible. The necessity of avoiding the presence of lead and cadmium, which are the only volatile constituents of the ores other than zinc, insures unusual regularity in the composition of oxide of good color. For example, the oxide made by the New Jersey Zinc Co. contains upward of 99 per cent. of zinc oxide. The principal impurities are small quantities of carbon-dioxide and sulphur trioxide.

Zinc oxide is made by two processes, known respectively as the direct, or American, and the indirect, or French. In the direct process the zinc is driven off from the ore by the reducing action of carbon at a high temperature, and the zinc vapor burned direct to oxide. In the indirect process the ore is first smelted to produce metallic zinc, or spelter, and this metal is then burned to oxide. The latter process is naturally more costly than the former, and the products made by the two differ in certain material points.

Direct Process Oxide: The grades used in rubber compounding are "XX" (red brand) and "Special" (red brand). The difference between the two is mainly one of color, the Special being more desirable when the whiteness of the compound is important.

Indirect Process Oxide: These are graded as "Red Seal," "Green Seal" and "White Seal." They are of a purer and brighter white than direct process oxides. The Green Seal oxide is smoother and of a more perfect white than the Red Seal. The white Seal is a comparatively new product, and is characterized by its remarkable lightness and bulkiness. While Green Seal and Red Seal oxides are packed 300 pounds to the barrel, White Seal can only be packed 150 pounds to the barrel. The exact meaning of this difference will be discussed later in this paper.

Chemical and Physical Properties of Oxide of Zinc: In general, the first essential of a zinc oxide for rubber purposes is, as indicated above, purity. The presence of serious amounts of metals that yield colored sulphides is entirely inadmissible, as during the process of vulcanization these sulphides are formed and discolor the product. Further, in rubber compounds it is in the first degree desirable that the compounder should know exactly what he is using if he is to get good results. Uniformity of composition, therefore, is very desirable.

The determination of zinc is a rather difficult matter, and the analytical error involved is frequently of such magnitude in comparison with the amount of impurity present as to make the determination valueless. Even in experienced hands the error is rarely less than 0.25 per cent., which, taken in connection with a zinc oxide content of over 99 per cent., obviously vitiates any attempt to determine the amount of impurity present by difference.

We believe that users of oxide will be well advised to confine their analytical work to simply testing for adulteration and to ascertaining the suitability of an oxide for a particular purpose by a practical compounding test in the laboratory, rather than to spend much time and effort in attempting to determine the zinc contents of the oxide. This mode of procedure we understand is in vogue in the majority of rubber laboratories.

Zinc oxide should dissolve in dilute hydrochloric acid without effervescence and without smell, and should leave no appreciable residue. On the addition of ammonium chloride to the solution and then an excess of ammonium hydrate and ammonium carbonate, the liquid should remain perfectly clear, or show at most a slight cloudiness. Care is needed in carrying out this test, as a considerable excess of ammonia and ammonium carbonate is necessary to dissolve the carbonate of zinc first formed. If the solution in hydrochloric acid has been performed in a test tube, it is desirable to transfer the liquid to a beaker before proceeding with the addition of ammonium chloride, etc.

Having regard to the nature of the process by which zinc oxide is made, positive results, as for example, a residue insoluble in hydrochloric acid, indicate either a leaded oxide, which is unsuitable for rubber purposes, or wilful adulteration.

Commercial zinc oxide consists of extremely small particles, so small in fact, that it is doubtful if they can be seen under the ordinary microscope. These small particles always form more or less coherent aggregates, which are apparently somewhat of the nature of a slightly elastic sponge entangling considerable air. These aggregates are what we see and speak of as the particles of zinc oxide. The tendency of an oxide to cohere in this way can be to a considerable extent regulated during the manufacture. In White Seal oxide, for example, the coherence is much slighter than in any of the other brands, which makes it necessary to pack only 150 pounds to the barrel. By forcing in a larger quantity this property can be partially destroyed.

It is necessary to distinguish clearly between the degree of coherence of an oxide and the true specific gravity, because the two properties are not infrequently confounded under the term "density." Broadly speaking, all amorphous oxides have the same specific gravity, the variation being fractional and the mean figure in the neighborhood of 5.6. This means that the zinc oxide itself, disregarding altogether its state of aggregation, is 5.6 times heavier than an equal volume of water. If, however, we take a box having a capacity of 1 cubic foot and weigh it full of White Seal oxide, and afterwards full of Red Seal Oxide, being careful not to compress the oxide in the box, we shall obtain a greater weight in the latter case than in the former. This means merely that there is more air entangled in the White Seal than in the Red Seal. It must be borne in mind that this property of entangling and holding a larger quantity of air is associated with the character of aggregation and compactness of the oxide groups, and that this latter condition has a decided bearing in the application of the oxide for some purposes.

It is possible to make a series of zinc oxides varying from solid crystals large enough for the form to be clearly visible to the naked eye, and which sink in water like stones, to the very light form known as "philosophers' wool," which floats in the air like thistle-down. All, so far as tested, have the same specific gravity, but the great variations in the amount of entangled air causes an enormous variation in the apparent densities.

The determination of the actual specific gravity is not an easy matter, and considerable care is necessary. The oxide tends to retain its entangled air very obstinately, and the use of a good vacuum pump is necessary to insure that the air has been completely expelled.

Owing to its extreme fineness it is useless to attempt to size oxide of zinc by any system of screens. Screening is, however, often useful to break up the aggregates formed. This can best be done in a bolting-machine of the type known as a centrifugal reel, in which a set of beaters revolve at a high speed inside a cylindrical screen which revolves more slowly. The beaters throw the oxide against the screen and force it through the meshes, which do not need to be finer than 20 to the inch. Shaking screens are unsuitable, as they tend to make the oxide cohere in small balls. Revolving screens without beaters tend to form balls, and also to coat themselves with an impervious layer of oxide, and if brushes are used to clean the screen they only make this coating harder. At intervals the coating drops off the screens and, with the balls, is discharged as rejections. This makes the operation of such screens very slow and wasteful.

Oxide of zinc is one of the most important ingredients of manufactured rubber, and its use is increasing very rapidly. Fortunately for the user it is remarkably constant in chemical composition and physical properties. The latter vary in the different grades, but the makers use every endeavor to keep them as nearly uniform as possible in each. Luckily, also for the user, it is rarely adulterated, and the adulterations are easily detected. The price, too, is stable, and any one who is misled by false ideas of economy into buying material as oxide of zinc at much less than the market price can hardly blame any one but himself if it proves unsatisfactory. If purchased from a reputable manufacturer and properly applied, it is certain to give satisfaction.

Lithopone: Lithopone is an amorphous white pigment made by mixing solutions of barium sulphide and zinc sulphate, which causes a transfer of the acids and produces an intimate mixture of zinc sulphide and barium sulphate. The properties of the mixture so formed are quite different from those of a mixture of the two dry salts. Barium sulphate has very little opacity, or hiding power, while zinc sulphide has a great deal. A mixture of the two dry has a hiding power intermediate between the two, and it varies almost directly with the proportion of zinc sulphide present. In properly made lithopone every particle of the barium sulphate appears to be coated with zinc sulphide and the opacity is much higher than that of a mixture of the dry salts in the same proportion.

The process of manufacture is complicated. The carefully purified solutions of the two salts are mixed; the crude lithopone filtered out, dried, heated to redness and plunged in water. The mixture of lithopone and water is then ground, filtered, dried and re-ground; it is then ready for packing. Every step of the process requires great care and careful regulation of conditions. If properly carried out it gives an excellent white pigment of great "strength," or hiding power. It is largely used in the manufacture of rubber goods, but the general opinion is that it does not give as strong, or resilient, a product as oxide of zinc. Care must be taken that no lead is present in the compound or it will darken seriously.

A good sample of lithopone should contain not less than 28 per cent. of zinc sulphide. It should be a good white, be smooth and free from coarse particles and have good hiding power. For use in rubber manufacture, however, probably the most useful test is to make up a small quantity of the compound.

NEW YORK FIRE RECORD FOR 1912.

The report of Fire Commissioner Joseph Johnson for 1912, recently issued, is an unusually interesting one, as it shows a marked increase in the efficiency of the New York Fire Department; the particularly interesting feature being that this increase of efficiency occurs simultaneously with the increased use of motor vehicles in the place of horse-drawn vehicles in the department.

The number of fires during 1912 was over 1,000 greater than during the preceding year, being 15,633 against 14,547 for 1911; but the fire loss was not only less per fire, but was over $3,000,000 less for the total number of fires. The total fire loss for 1911 was $12,470,806, or an average loss of $855, while the aggregate loss for 1912 was $9,069,580, or an average loss of $580, the loss of each fire being nearly one-third less than during the preceding year. The commissioner has contracted for 75 more motor vehicles for the department, as follows:

2	hose wagons	$8,326
16	combination chemical and hose wagons	105,170
3	high-pressure hose wagons	13,875
28	second-size steam fire engines	248,920
1	ladder wagon with 85-foot ladder	8,210
8	ladder wagons with 75-foot ladders	63,152
17	ladder wagons with 65-foot ladders	125,716
	Total	$573,369

The high winds that prevailed during the early part of April had the effect of taking the roof off the plant of the New York Rubber Co., at Matteawan, New York, but no very serious harm was done.

Railroad Air Brake Hose.

By J. S. Sheafe, Engineer of Tests, Illinois Central Railroad.

A PAPER PREPARED FOR THE THIRD INTERNATIONAL RUBBER CONFERENCE, BUT NOT READ.

THE requirements of air brake hose are prescribed by the Master Car Builders' Association so that hose applied to all railroad equipment shall be uniform and up to a certain standard. But air brake hose, as now being manufactured, does not comply with the M. C. B. requirements in other than the physical tests.

For instance, M. C. B. specifications prohibit the use of rubber substitutes. Pure rubber certainly cannot be used at the price paid. Neither can a fair grade of rubber. In calling for a "hand made tube composed of three calenders of rubber," the requirement is not met as hand made tubes and those consisting of three calenders of rubber are only made on special order and at an advance in price. The great bulk of air hose tubes today are single calender and machine made, or "squirted."

In calling for swelled ends more difficulty is met with in the manufacture and a less perfect hose results. The inside and outside diameters should be the same throughout the entire length of the hose.

Air brake hose today is poorer than formerly and both the railroads and manufacturers may be blamed; the former for continually hammering down the price asked for an honest article, and the latter for consenting to attempt the manufacture of an article at a price below that which they know can be fairly met. The quality of air hose of necessity must be improved and both the manufacturer and consumer must work together, making concessions where necessary, for the ultimate mutual good.

Air hose today is sold as low as 30 cents and as high as 50 cents per foot, a difference of 66 per cent. How much can be expected of air hose costing the minimum?

This is a splendid illustration of false economy as the extra number of poor hose lengths necessarily purchased overbalances the increased cost of better hose; this too, when only the relative service is considered. In addition, and directly attributable to cost, should be considered the labor of collecting, shipping, dismounting and fitting up, each of which would not be necessary so frequently to be done with better hose.

The M. C. B. Association, allow a cap from 1/16 inch to ⅛ inch in thickness. A cap of 1/16 inch is better than one of ⅛ inch thickness. Even less than 1/16 inch would be preferable. If the cap is made only thick enough to protect the exposed end of the fabric during the process of vulcanization the clamp used will not overlap the fabric, thus increasing the possibility of hose pulling off of nipple.

Some claim has been made that air hose is quite generally porous. The percentage of porous hose, i. e., those pieces which have leaked and which, on examination, have no evident defect, may be fairly placed at not over 5 per cent. This appears to be a reasonable maximum.

The cause of the largest number of failures appears to be the result of outside injury. Such failures are entirely apart from any inherent weakness of the hose. The "Railway Age Gazette" of April 19, 1912, places the number of such failures at from 65 to 70 per cent. There is good evidence at hand in hose shops to corroborate this statement.

The use of power machines for inserting nipples and couplings into air hose should be discouraged. The inner tube will be cut if there is any roughness to the shank of the nipple or coupling, or if they are out of line in entering. Mounting can be almost as rapidly done by hand and with the certainty that no damage to the inner tube results.

One of the M. C. B. requirements is that the friction between layers of duck shall be such that a 20-pound weight attached to the free end shall, in ten minutes, unwind less than 8 inches, the section being 1 inch in width. Just how far a "high friction" hose is advantageous is a question. Tests made by a large railroad, wherein a machine was used for kinking the hose while under pressure, resulted in a better showing for hose made with little friction than that made to meet the M. C. B. requirement. While this may not prove anything it at least opens up a very interesting point in the subject of air hose. In the same tests, hose with poor friction, gave better results in the bruise test. This bruise test was made by fastening the hose, under air pressure, to an anvil, and causing a 20-pound weight to fall upon it at the nipple end.

There can be no doubt of the deterioration of the average air hose within six months of manufacture. The making of hose to wear well is quite the important part of the manufacturer's problem. No matter how good the hose is at the start if it becomes useless after a few months, the loss to the consumer is immense.

Some rubber manufacturers say that a good stretch test of the tube and cover, combined with a tensile strength requirement, will do more than any other one thing to increase the life of the hose. Tensile strength proposed by these manufacturers varies from 650 to 1,200 lbs. per square inch. As hose in service does not stretch the 200 or 300 per cent., is the stretch test practical? A rubber band will stretch many hundred per cent. and yet its deterioration is rapid.

It would appear that the rubber manufacturers could make a more lasting hose by compounding a tube and cover with just as much or as little flexibility as would be necessary for long life. The minimum amount of flexibility would have to be sufficient to allow bending, without kinking, in coupling up.

It would also appear that the amount of damage caused by pulling hose apart, without uncoupling, is exaggerated. It is probably the universal practice in yards for switchmen and trainmen to thus neglect uncoupling. If an observation will be made in a yard, it will be found, on examining hose so treated, that failure is evident in none of them, provided the coupling has not been jammed and that a wedge has not been made use of to take up leakage in the gasket. As proof of this we have the strength of our air hose, versus the resiliency of the gaskets; the former is much greater.

In considering defective hose, and from which follows a leaky train line blamed on the hose, leaky angle cocks, nipples and couplings must not be lost sight of. They contribute their fair share of the extra burden on the air pump. A more careful inspection of air hose by car inspectors may save damage, as a hose ready to fail may be sometimes removed in time to avoid failures.

Some attention has been given to the question of making air hose with one or more ply woven. This appears likely to be the best hose of the future.

If the manufacturers will produce a hose with an inner tube hard enough to protect itself from the nipple, and a cover hard enough to protect itself from the clamp, both of ability to withstand the action of time and weather for approximately 36 months, and will demand a price commensurate with the ingredients entering into the manufacture, the whole situation will be greatly improved.

WANT AMERICAN LAMPBLACK.

An American consul states that a firm in his district desires to hear from American manufacturers of lampblack, with the object of representing them in Europe. The consular report is No. 10,771.

The Akers Rubber Commission.

WHILE the rubber growing industries of various countries have been the subject of separate investigations, there was felt to be the need of such an inquiry as would contrast the situation in the East and the West, as they appeared to the same observers.

Hence the Akers Commission was appointed by a group of financiers, identified with the Port of Pará and with the Amazon Valley. Prominent among these was the Booth Steamship Co., so intimately connected with the distribution of Amazon rubber.

As briefly stated in the April issue of this journal, the objects of this commission included the detailed investigation of conditions in both the Orient and the Amazon Valley. During about 10 months the commissioners pursued their researches, first in Asia and afterwards in Brazil. The members of the commission were as follows:

ORIENT COMMISSION: Mr. C. E. Akers, Dr. Jacques Huber, Mr. A. Ufenast and Mr. F. Lugones.

AMAZON COMMISSION: Mr. C. E. Akers, Mr. H. C. Rendle and Mr. F. Lugones.

The Orient Commission reached Colombo on December 29, 1911, and arrived back in Europe about the end of May, 1912. Leaving Europe again early in July they reached Pará August 8, and completed their work on October 25.

In two volumes, of respectively 90 and 164 pages, they have reported on their labors in the two principal centers of the world's rubber supply, the Orient and the Amazon valley.

As summarized by the commissioners the objects of their labors were as follows:

1. To give a clear and exact description of the characteristic features of the Lower and Upper Amazon and its tributary rivers as far as the ground could be covered.

2. To investigate the general condition of agricultural industry, and suggest practical means for its development in the immediate future.

3. To report upon the Amazon rubber industry, and to endeavor to find improved methods of administration, collection and preparation, to enable the Brazilian product to compete with that from the Orient.

4. To make a comparison between methods in Brazil and the Orient.

5. To consider the question of labor in the Amazon Valley, and suggest practical means to place it on a cheaper and more effective basis.

6. To formulate practical ideas for the colonization of waste lands.

7. To investigate the cost of establishing one or more experimental plantations or farms.

8. To bear in mind that all work undertaken for development purposes has for its object the creation of additional traffic for the steamship company, docks and other enterprises in which capital is interested.

THE WORLD'S PRODUCTION AND CONSUMPTION OF RUBBER.

Before dealing with the present report under its separate heads of the Orient and the Amazon Valley, it may be of interest to glance at the figures of the world's actual production and consumption of rubber, as estimated by the commission:

The chief interest of these estimates lies in the fact that the predominance of the United States in the consumption of rubber is clearly shown as being nearly 50 per cent. of the total.

According to the following estimate, the western hemisphere at present contributes about one-half of the world's production of crude rubber, and the eastern hemisphere the other half. This position of equality will, however, be gradually altered, through the largely increased yields anticipated from the East within the next few years.

ESTIMATE OF WORLD'S PRODUCTION OF CRUDE RUBBER, 1912.

Country of Origin.	Quantity in tons.	
1. Amazon Valley	42,000	
2. Bahia, Ceara, &c.	4,000	
3. Matto-Grosso, via routes other than the Amazon	600	
4. Peru, Colombia, Ecuador and Venezuela	2,000	
5. Mexico and Central America	3,000	51,600
6. Oriental Plantations in Malaya, Ceylon, India, Burmah, Java, Sumatra, Borneo and Sargon		31,000
7. Africa, West	15,500	
8. Africa, East	6,000	
9. All other sources	900	22,400
Total tons		105,000

(The above figures include all qualities of rubber and caucho, but not gutta percha from India, the Malay Peninsula, Java or Sumatra.)

ESTIMATE OF WORLD'S CONSUMPTION FOR 1912.

	Tons.
1. Europe	48,670
2. United States	47,300
3. All other countries, including Japan and China	2,080
Total	98,000

THE ORIENT.

Based on this general statement, the two separate volumes handle successively the rubber industries of the Orient and the Amazon Valley.

Taking up the Orient, which formed the object of the commission's first attention, it is shown that these 31,000 tons represented the product of 1,530,000 acres; divided as follows:

	Acreage 1912.	Yield tons 1912.
(a) Malay Peninsula	650,000	21,000
(b) Ceylon	225,000	6,000
(c) Southern India	60,000	600
(d) Burmah	40,000	400
(e) British North Borneo and Sarawak	60,000	500
(f) Java and the Javanese Archipelago	230,000	500
(g) Sumatra	220,000	1,700
(h) Dutch Borneo and the Celebes	10,000	.....
(i) Saigon	25,000	300
(j) New Guinea, Philippine and other islands	10,000	.....
Total	acres 1,530,000	tons 31,000

LOCALITY.

From the annexed table it will be seen that nearly 90 per cent. of the acreage under rubber in the Orient is in the Malay Peninsula, Ceylon, Java and Sumatra (1,325,000 acres out of 1,530,000).

In the first two cases, the yield is about 65 and 53 pounds per acre, while in Java it represents on the average 4½ pounds and in Sumatra 15 pounds per acre. From both the last named sources a large increase is looked for in 1914.

ESTIMATE OF PROSPECTIVE YIELDS OF PLANTATION RUBBER.

	Malaya Tons.	Ceylon Tons.	India Tons.	Burmah Tons.	Sarawak Tons.	Java Tons.	Sumatra Tons.	Saigon Tons.	Total Tons.
1912.....	21,000	6,000	600	400	500	500	1,700	300	31,000
1913.....	36,000	10,000	1,000	700	900	1,750	3,500	700	54,550
1914.....	43,000	15,000	2,600	2,000	1,800	10,650	8,000	1,200	84,250
1915.....	63,000	25,000	5,000	3,500	2,500	18,300	12,000	2,000	131,300
1916.....	80,000	30,000	7,000	5,500	5,500	26,550	16,000	3,000	173,550
1917.....	97,500	35,000	8,000	7,000	8,000	32,300	22,000	4,000	213,800

1919.....	130,000	45,000	13,000	8,000	13,300	43,650	44,000	5,500	302,450
	584,250	206,000	47,200	34,600	42,500	171,950	140,200	21,450	1,248,150

FUTURE YIELDS.

Since Sir John Anderson, late Governor of the Straits Settlements, made the startling estimate of 75,000 tons as the Malayan yield for 1915, the possibilities of future rubber supplies from the East have commanded the attention of the rubber industry. In this connection the annexed estimate is of particular interest; showing, as it does, a prospective ten-fold growth of plantation rubber supplies within 8 years—from 31,000 tons in 1912 to 302,450 tons in 1919.

COST OF RUBBER PRODUCTION.

The cost of producing a pound of rubber in the Orient is not uniform, but varies with the price of labor, and the facilities for transport. Owing to the fact that many plantations are in a transition stage, it is anticipated that in two years' time, when yields have increased, costs will be materially lower than at present.

Owing to the detailed subdivision of the report, it is possible to compare the estimated cost of producing rubber f. o. b. in four principal quarters in the East:

	English pence.	American cents.
Ceylon	8	16
Malay Peninsula	14½	29
Sumatra	11½	23
Java	14	28

In comparison with these figures is that shown in the other section for Brazilian rubber, of 32½ pence (65 cents American) f. o. b. per pound.

The following general summary deals with the salient features already reported in detail:

"At present Ceylon is the cheapest producer, and in many cases the cost f. o. b. is 6½*d.* (13 cents American) per pound. In view of all existing circumstances, a fair average price f. o. b. for Oriental rubber may be taken at 1*s.* (24 cents American), from the year 1914 to 1919. During the same period the costs from port of shipment to date of sale may be calculated at 3*d.* (6 cents) per pound, making the average aggregate cost on the market 1*s.* 3*d.* (30 cents American) per pound.

VARIETIES OF RUBBER TREES.

The investigations of the commissioners have been confined practically to the cultivation and growth of *Hevea Brasiliensisi*, the production of other varieties, such as *Castilloa*, Ceará *Ficus Elastica*, jelutong and other rubber-bearing trees and vines, being described as insignificant in quantity and value as far as the present or future supply of the European and American markets is concerned.

CLIMATE.

Pará rubber demands a hot moist temperature, with an even distribution of rainfall and an equable climate both night and day throughout the year. These conditions, it is remarked, prevail to a marked extent in the Malay Peninsula, Sumatra, Java, and to a somewhat lesser extent in Ceylon, Borneo, Saigon and various great islands of Oceania. In Southern India and Burmah, marked divisions of the seasons take place, and the distinctive periods of dry and wet weather are less favorable than the more equable distribution of rainfall in the former countries.

PROSPECTS OF CONSUMPTION.

In commenting on the statistics already quoted, showing the world's present annual consumption as 98,000 tons, the report states that the commission understands a fall of 40 per cent. in present values will bring into the market purchasers for an additional 100,000 tons of raw material distributed over the ensuing quinquennial period; this amount being required for street paving and other purposes impracticable while the price exceeds 2*s.* 6*d.* (60 cents) per pound for spot and forward contracts. Therefore, the rapid increase of production which must inevitably come in the five years, 1913 to 1918, will be to a certain extent offset by a great expansion in demand, which, it is added, should prove an important factor in reference to market values in the near future.

SYNTHETIC RUBBER.

In its calculations the commission has only dealt with the natural product, and will not venture to make any prediction whatever as to the part synthetic rubber will take in the development of the situation. However, it is added, the most effective method of fighting this danger is the reduction in the cost of producing natural rubber to the lowest possible figure.

RECLAIMED RUBBER.

With reference to statements made to a member of the commission that the loss of weight in process of recovery should not exceed 5 per cent., and that practically all the sulphur can be extracted at trifling expense—it is remarked that if these statements are correct, the effect on the crude rubber market must be felt severely within a very few years. The anticipation is expressed that the accumulation of old material will be extremely rapid, now that the production from the plantation industry has reached its present stage of development. It is added that if this recovered rubber can be utilized equally well for the manufacture of low grade articles, it will be a decided check to expansion in the consumption of crude rubber, as however cheap the latter may become, the cost of the discarded material will be substantially lower, so long as the price leaves a margin of profit over the manufacturing charges.

THE AMAZON VALLEY.

In the report on the Orient, the Commission has had to deal with facts of a statistical nature already recorded in various forms but not hitherto presented in such a comprehensive way. Within the space of four months this little band of investigators carried on its researches in the various rubber-growing countries of the Orient; the uniform way in which the results have been presented materially adding to their clearness and intelligibility. After a short breathing time in Europe, the Commission took up the work in the Amazon Valley, as recorded in the second volume of the report. In doing so they had the advantage of their previous researches in the East, so as to be in a position to draw comparisons. This second division of the Commission's investigations will be dealt with in the next issue of this journal.

THE COMMERCIAL NOMENCLATURE OF CRUDE RUBBER VARIETIES.

SUGGESTIONS MADE BY THE COMMITTEES APPOINTED BY THE RUBBER CLUB OF AMERICA AND THE RUBBER CONFERENCE.

ONE of the most important topics discussed during the Rubber Conference held in New York last fall was the simplification of crude rubber nomenclature. A committee was appointed, consisting of three members named by the Rubber Club of America and eight members named by the Rubber Conference, to consider this matter and make suggestions. The members of this committee were as follows:

From the Rubber Club of America.—Albert Zeiss of Arnold & Zeiss, crude rubber brokers, of New York City; Arthur W. Stedman, of New York Commercial Co., New York City, and William F. Bass, of the General Rubber Co., Sumatra and New York.

From the Third International Rubber Conference.—Leonard Wray, commissioner for the Governments of British Malaya and Straits Settlements; F. Crosbie-Roles, Ceylon; Cyril E. S. Baxendale, Federated Malay States; Dr. Jacques Huber, of Museu Goeldi, Pará, Brazil; Wilbur A. Anderson, official commissioner from Hawaii; Henry C. Pearson, editor of THE INDIA RUBBER WORLD, New York; Dr. J. C. Argollo, State of Bahia, and Noel Trotter, of the Rubber Growers' Association, Federated Malay States..

Several meetings of the committee were held during the conference week, and tentative lists covering both Plantation and Amazon sorts were submitted. Those lists were not published in these columns at the time, as it was hoped that further action would soon be taken upon them, but as the lists, owing to the fact that the members of the committee are at present so widely scattered, have not yet been revised, it may be of interest to many in the trade to see them, though still in tentative form. They are as follows:

MIDDLE EAST PLANTATION SORTS.

Scientific Names.	Trade Names.
Malay Hevea Sheet (or biscuit)	Rambong—Sheet
" Smoked Sheet	" Crepe
" Block	" Ball
" 1st grade Crepe or blanket	" Lumps
" 2nd grade Crepe (Mottled)	" Scrap
" 3rd grade Crepe (Brown)	Manihot—Sheet
" 4th grade Crepe (Black)	" Crepe
" Scrap (untreated)	" Scrap

(Or Ceylon, Java, Sumatra, Burma, India, etc.)

The following list of names for Amazonian rubbers was submitted:

AMAZONIAN RUBBERS.

Scientific Names.	Trade Names.
(A.) AMAZONIAN HEVEA RUBBER.	
1. Amazonian Hevea Brasiliensis rubber.	
Amazonian smoked Hevea Brasiliensis rubber	Amazonian fine Hevea
Upriver Sorts:	Upriver
Bolivian smoked Hevea Brasiliensis rubber	Bolivian fine
Peruvian " " " "	Peruvian fine
Acre " " " "	Acre fine
Matto Grosso " " "	Matto Grosso fine
Amazonas { Javary " " "	Amazonas fine
Amazonas { Jurua " " "	(Javary, Purus, Jurua,
Amazonas { Madeira, etc. " "	Madeira, etc.)
Middle River Sorts:	
Tapajos { upper / lower smoked Hevea Brasiliensis rubber	Tapajos fine
Xingu { upper / lower " " " "	Xingu fine
Islands Sorts:	
Pará Islands smoked Hevea Brasiliensis rubber	Islands fine (extra dry common)
Badly smoked Amazonian Hevea " "	Medium or extra fine
Coagulated Sorts:	
Matto Grosso alum coagulated H. Bras. rubber	Matto Grosso Virgin
Pará spontaneously coagulated " " "	Cameta
H. Bras. rubber, prepared by the process of Cerqueira Pinto	Cerqueira Pinto's extra fine Hevea
Air Dried Sorts:	
Upriver air dried Hevea Brasiliensis rubber	Upriver coarse
Pará " " "	Islands coarse (Scrap and Negrohead)
AMAZONIAN HEVEA RUBBER FROM OTHER SPECIES THAN HEVEA BRASILIENSIS.	
Smoked Sorts:	Weak fine Hevea
Rio Negro smoked weak Hevea rubber (different species)	Rio Negro weak fine (different grades)
Peruvian smoked weak Hevea rubber	Peruvian weak fine (Mollendo Peruvian dibil)
Bolivian (Sorata) (H. Peruvian 1st grade)	Bolivian weak fine
Purus smoked weak Hevea rubber	Purus weak fine
Pará " " " " (from H. Guayanensis)	Pará weak fine

SCIENTIFIC NAMES.	TRADE NAMES.
Coagulated Sorts: None.	
Air Dried Sorts:	
Rio Negro air dried Weak Hevea rubber	Rio Negro weak coarse
Pará " " " " "	Pará " "
Putumayo " " " " " (from Hevea Foxii)	Peruvian tails
(B.) AMAZONIAN CASTILLOA RUBBER—CAUCHO.	
Air Dried Sorts:	
Bolivian air dried Castilloa rubber	Bolivian caucho
Peruvian " " " "	Peruvian caucho
Matto Grosso air dried Castilloa rubber	Matto Grosso caucho
Acre " " " "	Acre caucho
Amazonas (Javary, Jurua, Purus, Madeira, etc.)	Amazonas crude
Pará (Xingu, Tapajos, Araguaya)	Pará caucho
Coagulated Sorts: caucho slabs.	
Caucho prepared with Cerqueira Pinto's process	Cerqueira Pinto's caucho
(C.)—BRAZILIAN MANIHOT RUBBER	Manisoba rubber (sheet crepe scrap)

Produced in the States of Ceará, Piauhy, Pernambuco, Bahia, Minas Geraes. If desired, the name of the producing state can precede the name of the grade instead of the name of the country.

1. Brazilian Manihot Glaziovii rubber	Ceará rubber
Brazilian {alum coagulated / acid coagulated} Manihot Glaziovii sheet	Ceará sheet
Brazilian {alum coagulated / acid coagulated} Manihot Glaziovii crepe	Ceará crepe
The alum or acid coagulated varieties would of course be specified in the contract.	
Brazilian crude or naturally coagulated Manihot Glaziovii	Ceará scrap
Brazilian naturally coagulated Manihot Glaziovii, washed	Washed Ceará scrap
2. Brazilian Manihot dichotoma rubber	Jequié rubber
Brazilian Manihot dichotoma sheet	Jequié sheet
" " " crepe	Jequié crepe
" crude or naturally coagulated Manihot dichotoma	Jequié scrap
" naturally coagulated and washed " "	Washed Jequié scrap
3. Brazilian Manihot Piauhyensis (and heptaphylla) rubber	Piauhy rubber
(D.) HANCORNIA RUBBER. (MANGEBEIRA.)	
This is the usual variety	
Alum coagulated Hancornia rubber	Mangabeira slabs
" " " " crepe	Mangabeira crepe

The lists given above were offered simply as suggestions and as basis for discussion. It is quite possible that these names may be materially changed before they are finally accepted by the people most interested in this subject, but this action taken by these members of the committee constitutes at least a substantial beginning in an undertaking of prime importance. A commercial nomenclature for crude rubber varieties that shall be generally accepted and used will certainly prove of vast convenience to the rubber industry.

At one of the committee meetings it was also suggested that it was the sense of the committee that all plantation sorts should be branded with the name of the estate on every piece and delivered to the manufacturers in the original cases. The claim that chips were often found in plantation rubber was thoroughly discussed, the suggestion being made that the cases be lined with cloth or paper treated with something analogous to paraffine. No decision was reached, as it was the thought of practical planters present that such lining would exclude air and cause stickiness. It seemed to be the sense of the planting interest present that the chips came not from the original cases in which plantation rubber was shipped, but from the sorting and shipping in larger and rougher cases in which the rubber is delivered to the American rubber market.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, circulation, etc., of THE INDIA RUBBER WORLD, published monthly at New York, required by the Act of August 24, 1912.

Editor, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Managing editor, John P. Lyons, 150 West Ninety-first street, New York City.

Business manager, Edward F. Pfaff, 94 Hawthorne street, Brooklyn, New York.

Publisher, The India Rubber Publishing Co., 15 West Thirty-eighth street, New York.

Owner, Henry C. Pearson, Tompkins Corners, Putnam Co., New York.

Known bondholders, mortgagees, and other security holders, holding 1 per cent. or more of total amount of bonds, mortgages, or other securities: None.

(Signed) EDWARD F. PFAFF, Business Manager

Sworn to and subscribed before me this 28th day of March, 1913. (Signed) HELEN HEROLD, Notary Public,

(Seal) Kings County No. 162.

Certificate filed in New York County. Term expires March 30, 1913.

Kings County Registers Certificate No. 882, New York County Registers Certificate No. 3082. (Commission continuous.)

The Obituary Record.

FRANK E. HALL.

IN the April issue of THE INDIA RUBBER WORLD there appeared a brief notice of the death of Frank E. Hall, which occurred in March. It is possible now to give a more adequate account of his active and interesting life.

Frank E. Hall, for many years prominently identified with the rubber industry, was born in Boston, May 20, 1852, the eldest son of Henry A. and Amelia W. Hall. His father was one of the pioneer retail rubber merchants, and from his business grew the Hall Rubber Co., for many years among the leaders in the trade.

The son, Frank, early in life showed marked mechanical and inventive genius, and during his sixty years of life was responsible for many improvements and inventions of more or less value. Entering the business world at the age of 19, he almost immediately established a retail store at Portland, Maine, which he continued to run until his father's death in 1879, which compelled him to take charge of his father's affairs, and his own store soon became a branch of the larger firm, and the name of the latter was changed to the Hall Rubber Co.

About two years later he established a factory at Bemis, Mass., and for the next ten years devoted much of his time to the manufacture of the highest grade of clothing. He retired from the rubber business in 1890, selling out to the Stoughton Rubber Co. From then until 1898 his interests varied until again he entered the rubber field with the Newton Rubber Works Co., in the tire business.

His ingenuity was responsible, among other things, for the first hose nozzle capable of various streams from one pipe, the first dull finished rubber boots, the rubber lined rubber boots, the first mackintosh goods of American manufacture, the block, or sectional tire so prominent on motor trucks and several improvements on ball and socket buttons to make them practical on heavy clothing.

He was married in 1874 to Lucy A. Sprague, of Bridgewater, Mass., and they are survived by three children, Stanley F., associated with the Kelly-Springfield Tire Co.; Harry B., with the Boston Belting Co., at Portland, Oregon, and Amelia F. Pillsbury, of Prince Rupert, British Columbia.

The last few years of his life were spent in Wollaston, where he purchased the old Quincy homestead, and where he died, March 14, 1913, just two years after the death of his wife.

ISAAC B. KLEINERT.

Isaac B. Kleinert, president of the I. B. Kleinert Rubber Co., died at his home, 31 West 87th street, New York City, on April 18th in his 84th year. Mr. Kleinert was born in Borek, Prussia. He came to this country in 1850 and soon became interested in manufacturing enterprises. About thirty-three years ago he took up the manufacture of dress shields. At that time the articles of this description most used in this country came from France, and there was at first considerable prejudice against any other kind; but Mr. Kleinert rapidly overcame this prejudice and built up a large business in this particular article. About twenty years ago, the I. B. Kleinert Rubber Co. was incorporated, with its principal factory at College Point, Long Island. The company soon established branches and selling agencies, not only in Europe, but in various other parts of the world.

Mr. Kleinert was not only a successful manufacturer, but he was a philanthropist, and took a deep interest in the welfare of all his employees. Their regard for him was shown on his 75th birthday, which occurred on August 19, 1905, when he was presented with a massive silver loving cup, to which 1,200 of his employees had contributed.

FRANK E. HALL.

ISAAC B. KLEINERT.

ADOLF PRINZHORN.

ADOLF PRINZHORN.

On March 28 Adolf Prinzhorn died at Stuttgart, Germany. Having been for thirty years a member of the board of the Hanover corporation, the "Continental-Caoutchouc und Gutta-Percha-Compagnie" he was one of the leaders of the industry. His death constitutes an irreparable loss for the company towards the development of which his remarkable technical and commercial capacity had largely contributed.

After retiring from the board, his experience continued at the service of the company as a member of the committee of inspection. He was beloved alike by his colleagues and by the working staff of the concern.

Adolf Prinzhorn will long be honored, as intimately connected,

not only with the growth of his company, but with that of the entire rubber industry.

WILLIAM J. CABLE.

The death in announced of William J. Cable, who passed away in Seattle, Washington. He was the son of Wheeler Cable, who founded the Cable Rubber Co. and who died in 1899, William J. succeeding to the presidency of the Cable Rubber Co. This company failed in 1905, since when Mr. Cable had various rubber connections, chiefly in the West. He is survived by a widow and two daughters.

JOHN BROWN.

John Brown, who was associated with the Boston Rubber Shoe Co. for 32 years, during the last few years being connected with its New York warehouse, on Thomas street, died in New York about the 15th of April.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE directors of the B. F. Goodrich Co. met on April 23, for their regular quarterly session. According to their earlier plans, as announced at the annual meeting, the dividend on the common stock was passed. Mr. Work, president of the company, says that the general condition, so far as the Goodrich company is concerned, is much improved, and that the Akron plant is running closer to capacity than six months ago, and that the outlook is excellent.

In connection with the cut in prices of tires, Mr. Work says: "All the larger manufacturers have followed our lead, although I understand that one of the smaller companies has announced that it will not order any cut. It should be borne in mind in the talk of slashing tire prices that the price of crude rubber to-day is much lower than it was a year ago. High grade Pará is now selling close to eighty cents a pound, and a year ago it was one dollar a pound." Mr. Work expressed the opinion that as a result of the lower price of crude rubber, a 5 per cent. tire price cut ordered the first of the month will leave practically the same margin of profit to the manufacturer as obtained a year ago. The actual consolidation of the Diamond and Goodrich plants did not become operative until April 1, 1912. Mr. Work did not wish to commit himself as to the length of time he thought the common dividend would be suspended, although he is inclined to be optimistic. He made it very plain among the Board of Directors as to the advisability of passing the common dividend, it being the common desire of the Board that a good-sized surplus be built up before resuming payments on the common stock.

At a meeting of the directors of The Miller Rubber Co., held in Akron, April 17, the $200,000 treasury stock was placed on the market, present stockholders of Miller stock being allowed to subscribe for 25 per cent. of their present holdings at par. It was also decided to submit at an early meeting of the stockholders the question of doubling the capital of the company, thus increasing the present one million capital to two million; said increase of stock to consist of 5,000 shares of common stock at the par value of $100 each, and 5,000 shares of preferred stock at the par value of $100 each.

The company is just completing buildings which will practically double the floor space of the factory, and with the machinery already delivered or ordered, the company will be in a position to manufacture approximately 1,000 automobile tires per day, and also to increase the output of other departments.

The following is a summary of the report made by the Probe Committee selected by the Ohio State Senate about April 15:

That the Industrial Workers of the World teach among other things the following doctrines:

All employes shall belong to one general union.

No contract providing for wages or conditions of employment shall be entered into for a definite length of time between employer and employe.

That the doctrine of sabotage is a matter of grave public concern, not only to the state of Ohio but to the nation at large, and that the line of distinction between this doctrine and anarchy is so indistinct as to be almost imperceptible.

That the leaders of the I. W. W. instead of helping the striking employes of the rubber factories of Akron, did them much injury, and are largely responsible for their failure to secure a redress for any wrongs which may have existed and the adjustment of any grievances.

That the testimony of the employers and employes shows that the wages paid by the rubber companies generally compare favorably with those paid in other industries, and that the wages paid in the tire building and tire finishing departments are higher than the amount paid in other industries where like skill and effort are required.

That the strike which originated in the tire department of the Firestone Tire & Rubber Co. and spread to other companies, could have been averted had there been a reasonable amount of time between the date on which the notice for readjustment of prices was posted and that fixed when it would take effect, so as to insure due deliberation and conference.

That analysis of the conflicting testimony concerning the so-called "speeding-up" system would seem to justify the conclusion that it could be wisely dispensed with, because it is fraught with danger both to employers and employes.

That few violations of the state law regulating the hours for women employes were developed in testimony taken; but that in view of the general tendency toward shorter hours of employment in all industries, the complaints regarding the long hours of employment at night are justifiable.

That as the most striking feature of the evidence was the fact that the employes refrained from submitting grievances for adjustment, because of fear of discharge, the committee suggests that notices be posted in the factories advising employes that they may submit any complaint with the assurance that they will not be discriminated against.

That no evidence was adduced showing that a list was kept by the factories for "blacklist" purposes.

That the evidence taken showed that the earnings of the rubber manufacturers have been and are such as to justify the payment of high wages to employes and the maintenance of good conditions in their factories.

That the buildings of the rubber companies are practically fireproof, well lighted and so constructed as to provide for good ventilation. In closing, the committee reports that the investigation has proven of great value to the rubber manufacturers, the employes and the general public.

"The publicity," observes the report, "attending the investigation and the facts collected are of great value to the general public. In addition, the data collected will prove to be of incalculable value to the industrial committee and also the Legislature and succeeding ones which may give consideration to questions affecting the relations of capital and labor."

The committee acknowledges the co-operation and courteous treatment accorded it by the rubber manufacturers, the representatives of the companies and the people of Akron as a whole.

* * *

Dr. C. M. Knight, who has spent much time in rubber research and in building up the rubber chemical department of Buchtel College, has resigned as Professor of Chemistry in that institution. Professor Knight has been actively engaged in chemical research for the last thirty-eight years. He will continue with the college in an advisory position, but will retire from active labor. Prof. H. E. Simmons has been elected by the trustees to fill the vacancy.

Dr. Knight was born in Dummerston, Vermont, in 1848. He graduated from Tufts College with the degree of A. B. in 1873, and received his master's degree in '78. He also took graduate work at Harvard and the Massachusetts Institute of Technology.

In 1875 he came to Buchtel and was the instructor in natural science until 1883, when he was transferred to the work of the physical science department, which position he held until his recent resignation.

For a number of years Dr. Knight has been dean of Buchtel, and for one year, '96-'97, he was acting president of the college. About two months ago, the trustees conferred upon him the degree of Professor Emeritus of chemistry and dean emeritus of the faculty.

Professor Simmons, who will take Dr. Knight's place as the head of physical science department, was graduated from Buchtel in 1908, with B. S. degree, and for four years was a student under Dr. Knight.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

GENERALLY speaking, business is hardly up to normal for this season. Various causes are suggested, but the principal one seems to be that the rubber business is in few respects different from others, and that all lines are marked by conservatism in buying. To be sure, the tire business is the exception. With thousands of new automobiles going into commission, and tens of thousands being put in order for summer service there is necessarily a pressing demand for tires, and the factories are working overtime in their endeavors to catch up with their orders.

But even in the tire business there are some signs of a letting-up in the demand, and this is not unwelcome to the over-taxed factories. The marked decline in crude rubber prices has been quite thoroughly published, and one effect has been that many users of cars are delaying the purchase of extra tires, hoping that the less cost will reduce the selling prices still further. The views of manufacturers' agents here, however, are to the effect that as the rubber now being put into tires was bought at higher prices, it is not at all probable that any saving will be available to the retail purchaser for some months to come.

There is a little better business doing in mechanicals, and druggists' goods are going well. Garment manufacturers are busy, but there is not quite the usual activity of the spring season. In footwear the tennis demand is good, but rubber boots and shoes are dull. Retail stocks were carried over, and therefore these will be available for next season's trade, while those who have had only moderate stocks, and have cleaned them well up, seem to realize the risk of ordering early, and fewer than usual are expected to take the advantage of the extra five per cent. by placing heavy orders previous to the time limit for securing this discount.

* * *

The trade extension trip of the Boston Chamber of Commerce has not met the wide and hearty enthusiasm which was hoped. Originally it was expected that there would be at least eighty who would participate. Instead, less than half that number were listed for the tour, which started on the "Metapan" on Thursday, the 24th ultimo. Among the reasons given for this falling off from the expected number were mainly the expense of the trip, the long-required absence from business and the uncertainty of commercial conditions, owing to changes in the tariff, trust prosecutions, etc. Several prominent business men who had at first signified their intention of making the trip, later decided it inadvisable to do so. The rubber business is represented by Edward T. Smith, of the Iroquois Rubber Co. of Buffalo, who goes as the accredited representative of the United States Rubber Co.

* * *

Ira F. Burnham, president and treasurer of the Stoughton Rubber Co., with Mrs. Burnham, started April 9 on a trip to the Pacific Coast. While this is essentially a pleasure trip for Mr. Burnham, he will probably call on several of the principal jobbers of rubber goods with whom the company does business.

Back of Mr. Burnham's desk at the office is a framed motto, or axiom, or proverb, or maxim—call it what you will—which is so self-evident and suggestive that your correspondent copied it for reprinting here, simply as missionary work. It says: "No one ever got a dividend out of a quarrel."

* * *

The Marlboro Rubber Store at Marlboro, has been purchased from Mrs. Barnard by William G. Riecke of Southboro, who will hereafter run the business. M. W. Weeks, who has been managing the store for some time, will, for the present, continue at the store. He is showing his friends a handsome gold watch, a present from Mrs. Barnard in appreciation of his faithful conduct of the business.

* * *

The case of Geo. A. Alden & Co., which would seemingly be in the jurisdiction of James Munroe Olmstead, referee in bankruptcy for Suffolk County, because the firm's business headquarters were in Boston, has been transferred elsewhere, because of the residences of the members of that firm. The proceedings will be heard in Norfolk County, because George E. Alden lives in Wellesley, in that county. Arthur W. Stedman lives in West Roxbury, Adelbert H. Alden in New York, Fred W. Dunbar in Montclair, N. J., and J. Frank Dunbar in Wakefield, Mass.

* * *

Mrs. Robert Dawson Evans, widow of the well-known rubber man, who gave $500,000 in 1911 to pay for a memorial building for her husband, the same to be an extension of the Boston Museum of Fine Arts, has increased her generous gift to $825,000, in order that the memorial may be handsomer and more complete in its appointments, and enlarged by an additional building, 53 feet wide and 109 feet long. This will be a lasting and imposing memorial to the late Mr. Evans.

* * *

The Springfield (Mass.) Rubber Co. had a fine exhibit at the Industrial Exposition in that city early last month, its booth being a center of attraction from the opening to the closing hours. Rubber in all states, from the Pará biscuit to the finished products, was exhibited, and a working demonstration of making rubber boots and shoes kept people interested. The demonstration was in charge of John J. Hawkins, of the United States Rubber Co., who was busy showing, explaining and answering questions, as the boots and shoes were being made up from the various parts which were cut out at the mill of the Boston Rubber Co. of Malden.

* * *

The Monatiquot Rubber Works Co., of South Braintree, Mass., celebrated their third anniversary on April 19, and invited the town people to be present in order that the progress of the concern might be noted. The large number of guests who attended and the intelligent interest shown was very gratifying to the company officials. The mills were kept in operation and the visitors had an opportunity to see a batch of "Squantum" going through process. Those who had attended were shown the additions of the year, namely, three new brick buildings and a reinforced cement dam, besides alterations in the older buildings which have brought them up to modern efficiency. In addition there is under construction a brick storehouse. At the conclusion of the inspection, souvenirs were presented to the ladies and their escorts. In the evening the company gave a dinner and a theater party to the various officers and department heads.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

THE tariff is not seriously disturbing the rubber trade in Chicago. Rubber men here, as a rule, are too busy to think about what effect the tariff will have.

Rubber hose is about the only line that is not flourishing; but this is not worrying the dealers any. The sun is becoming hot and almost every day commuters may be seen loaded up with seed catalogues, or gardening implements and packages of seeds, and this means that the garden is in the making, and that the garden will have to have water, and the owner of that garden will have to have hose. A feature which should have a bearing on this trade was a story published in one of the Chicago dailies. This was to the effect that Hull House, a social settlement, had arranged with owners of vacant real estate to have the free use of this space for the use of the working people of this city. This vacant property is to be tilled and cultivated, and there is no doubt that rubber hose will be wanted for the irrigation of those lots. Of course this is a minor matter, but it will help the hose trade in local circles.

The weather has been decidedly favorable for makers of rubber garments and rubber shoes. For almost a week it has rained and there has been a great demand for rubber coats and rubber shoes. The demand for rubber garments has been much increased this spring. The public at large is taking to the new rubberized coats, and a good many economical young men—and young women, too—who cannot afford a spring coat are buying these coats and making them do double duty.

The demand for automobile tires has fallen off considerably of late, strange to say. One would think with the spring of the year approaching, and with the autos all on the road, the demand for these goods would increase. Jobbers, however, say they find a noticeable let-up in the buying. This is attributed a good deal to the recent cut made in prices. Buyers noting that prices had been cut are rather nervous about laying in supplies for future needs, fearing a further cut in values, and this has made the demand of a "hand-to-mouth" character, so to speak.

Your correspondent in his tour among the dealers found them almost uniformly taking a cheerful view of the situation. The Chicago Rubber Co. said: "Trade has been good in all lines. The wet weather has been a boon to our trade of late. Rubber coats met with a surprisingly good demand. The demand for automobile tires has slowed up somewhat. The recent cut in prices has made buyers cautious and they have been limiting their purchases to immediate requirements. They probably anticipate a further cut, and for this reason they do not care to be caught with a lot of high priced goods on their hands."

R. D. Evans, of the Picher Lead Co., was enthusiastic in his reports on business conditions. He said: "As far as we are concerned business is booming. The only trouble I can find is that our trade is bothering the life out of us for shipments. The situation in Akron, Ohio, is clearing up and factories there are running normal." The representative of the Chicago Rubber Works said that the demand for all lines was good and trade conditions were greatly improved. Mr. Simons, of the W. D. Allen Co., said: "Trade is good. We have had and are still having a good call for all brass hose accessories."

E. F. Lindley, representative of the Raven Mining Co., with offices in the Marquette building, is now in Utah visiting the mines of his company. He is expected back in a week or two.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

WHILE the flood which prevailed in this section tied up business in all commercial lines, the rubber footwear and rubber clothing jobbers and manufacturers experienced the busiest season of the year. The extensive stocks carried by local concerns have been depleted, and rush orders have been placed for complete inventories. With the flood situation about over and business returning to a normal condition, the local tire houses are facing a demand for goods in excess of the supply. All orders are "rush," and in consequence there are busy scenes around the local tire houses, as the extra demand for goods to replace those which were destroyed or lost by reason of the flood, coupled with the opening of spring weather and active buying of automobiles, has increased business beyond expectations.

* * *

Though long rumored and looked for, the formal announcement of a reduction in price of automobile tires came unexpectedly at this critical time from the Diamond Rubber Co. and the Goodrich Rubber Co., on April 1. Automobile tire users could not believe the big announcements, appearing in the local newspapers, that the price had been cut, and throughout the day it was treated locally as an "April Fool" joke. For the greater part of the first day after the announcement appeared, Manager C. W. Simpson of the Diamond and B. M. Lovell, manager of the Goodrich, were kept busy assuring customers that the announcement was *bona fide*. As a result of the unexpected cut the telegraph wires were kept hot by managers of other tire factories, wiring headquarters of the announcement, and inquiring if they intended to follow. As a result of the cut, competition in the tire business in this section has been very keen, and local tire men are closely watching the result, and many make the statement that the announcement of the two big tire factories of a cut in price is the forerunner of a price-cutting war.

While the Firestone Tire and Rubber Co. did not advertise a cut in the price of their tires, managers and agents of the company were instructed that the price had been cut to meet that of the Diamond and Goodrich.

* * *

Rubber footwear manufacturers have joined hands with the leather shoe manufacturers to assist dealers in the flood zone in rebuilding their business by extending credit for practically an indefinite period. An agreement has been secured from the manufacturers by the Ohio Retail Dealers' Association which has a committee working with the manufacturers. The flood has wiped out shoe stores from the upper end of the Ohio to the Mississippi. It means that the customer for years must have credit and long time credit at that.

Perhaps one of the heaviest losses caused by the Dayton flood will be the Barney & Smith Car Works. The mammoth plant of this concern was completely inundated, and while the exact loss has not been fixed, it is estimated that it will reach half a million. Thousands of dollars' worth of air brake hose, packing, rubber springs, rubber treads, and tiling which are used in the manufacture of railroad coaches was destroyed, and on account of the terrific current during the flood period most of the supplies on hand were carried off by the water.

The Atlas Rubber and Belting Co., at 212 Walnut street, while located in the flood zone, enjoyed a rushing business during the high water. With water swirling around the front door of the building where the company is located, it was supplying the needs of flood-visited business houses with washout hose and other rubber goods that are most essential in high water times.

With but one or two exceptions the recent flood through Ohio cost the various rubber companies vast sums, as most of the companies operating branch houses in this city operated supply stations in Hamilton, Dayton and other smaller cities that were located in the flood zone. Notwithstanding the heavy losses suffered by the rubber companies, these same companies were the first to respond to the call for help that came from the stricken cities. Among the first company to come to the aid of the flood sufferers in Dayton was The B. F. Goodrich Co., which promptly sent a full car load of rubber boots and tires.

One of the "hard hit" concerns in the Dayton flood was the I. J. Cooper Rubber Co., whose headquarters are located here. A large stock of the company's Racine and Motz tires floated away and were given up as permanently lost. Now, however, these tires are "floating" back in a unique way. One of the tires had taken a swim clear to Miamisburg, 12 miles from Dayton, and had been lodged there for days in the top of a tree. It was returned later with the compliments of the owner of the tree. Two other tires were restored by a young woman who found them in her sitting room in the second story of the Knecht House, at Dayton.

The Ohio Rubber Co., of Cleveland, having a large retail house here and a sub-office at Dayton, suffered a heavy loss as the entire office of the company was submerged and for a time it was feared that the employees of the office had lost their lives in an effort to save the stock. Later, however, it was found that the employees escaped, but not until they were compelled to use boats to get to dry land.

Captain J. F. Ellison, formerly of this city, and now operating head of the Amazon Navigation Co. (Companhia Navegacao do Amazonas), with headquarters at Pará, has written a letter to President Draper of the Cincinnati Chamber of Commerce, stating that business conditions are not so good on account of the declining price of rubber. Captain Ellison's letter in part is as follows: "I note that you have established a foreign trade department and now don't consider that which follows as a kick, but only as a suggestion, inspired by personal knowledge of conditions, and the usual practice carried out by the merchants and manufacturers in the States. Almost invariably letters and circulars reach this country with only the ordinary domestic postage thereon, and while in my particular case I am always delighted to pay anything within reason to get a letter from home, you can appreciate that to a merchant whose business is being solicited, it is not pleasant, nor does it give him a good idea of the ability of a particular firm that sends him communications without proper postage being placed thereon. The practical amalgamation of the Amazon Steam Navigation Co., and the Amazon Navigation Co., has now been consumated, the former company being the operating company and the Ca. Navegacao do Amazonas the holding company. General business conditions in North Brazil are none too good. The steadily declining price of rubber, which is practically the sole output of the Amazonas, is having an effect. This effect is not temporary, but due to the amount of cultivated rubber coming into the markets of the world from the Far East, and is a permanent condition which North Brazil has made no preparation to meet. It is the opinion of men who should and do have vastly more weight than the writer, that Amazonas is facing a rather serious crisis. Cost of living is excessive here, which naturally means high wages for every one; and living expenses cannot be reduced until this particular part of Brazil puts itself in position to produce its own food supply. The climate here from my viewpoint is wonderful. In over a year I have never seen the temperature above 92 degrees in the shade, or lower than 75 degrees, the usual range being from 80 to 85 degrees."

* * *

The suggestions contained in an editorial published in THE INDIA RUBBER WORLD several months ago on the question of a revision of the United States patent laws, and the better protection of inventors with reference to their inventions being bought up only to be put in the "discard," have local illustration in the incorporation in this city of the "National Society For the Promotion of Invention and the Useful Arts." The incorporators are Drs. William P. Murray, C. N. Bradford and Arthur Ewald. The purpose of the company is the protection and advancement of the interests of inventors, through the organization of a society of inventors. The company is incorporated for the nominal capitalization of $1,000 and will not attempt at the outset to finance inventions, but will attempt to prevent valuable ideas being taken from their originators or being purchased but never manufactured.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

OLIVER H. BLAISDELL, master mechanic at the factory of the National India Rubber Co., in Bristol, is one of the few men who have served upwards of a quarter of a century with the corporation. Mr. Blaisdell has been with the National India Rubber Co. for almost 28 years, going there in 1885 as chief engineer. Ten years ago he was promoted to master mechanic.

Mr. Blaisdell was born in Alton Bay, New Hampshire, in 1843, but a few years later his parents moved to Portsmouth. Finishing his schooling when he was 13 years old, he went to work in a shovel factory, remaining there until the war broke out in 1861. At the age of 18 he enlisted in the Fourth Massachusetts Infantry, serving three months. He returned home and at once enlisted in the United States Navy. He was assigned to the United States gunboat "Sunflower" and served nearly two years on board that vessel. Mr. Blaisdell was a first-class fireman in the navy, which is equivalent to assistant engineer ashore.

After the war he was employed as engineer in several different manufacturing plants. He moved to Bristol in 1885 and since then has had charge of all the steam engines, machinery shops and pumping outfits for the National company. His son, Fred G. Blaisdell, is one of the engineers at the company's factory.

* * *

Another employee who has been long in the service of the National India Rubber Co. is Capt. Patrick H. McGovern, who is rounding out his 40th year with that corporation. He worked his way from an assistant in the store-house of the company—when it was known as the National Rubber Co.—to yardmaster, a position which he has held for the last 20 years.

Capt. McGovern is an expert in moving large pieces of machinery and buildings and has an original way of rigging purchases which for many years has proved successful. He has a diversity of duties in his position as yardmaster. The livestock, moving gear, tools and the care of the fire-fighting apparatus come under the yardmaster's care. When any machinery needs to be shifted from one part of the big factory to another Capt. McGovern takes it in charge. Last year when a portion of the appurtenances of the Bristol factory were moved to Cleveland and other places, the yardmaster moved the great vulcanizers and other machinery to the railroad yards, and directed the loading of them in freight cars. Capt. McGovern acquired his title by reason of his having served as commanding officer of former Company C of the Second Regiment of Infantry of Bristol.

* * *

James Taylor, formerly employed in the National India Rubber Co., died of pneumonia, March 28, at the home of his daughter in East Providence. Mr. Taylor was 58 years old and had been employed by the company 35 years, retiring a few years ago.

* * *

Operations were resumed at the factory of the National India Rubber Co., April 14, after a shut-down of two weeks, for the purpose of taking the annual inventory. More than 1,200 hands went to work. While the factory was closed many improvements were made in the buildings, including painting, carpentering and masonry. An addition is being built to the wire-drawing room. The company is shipping large quantities of insulated wire to Dallas, Texas, and other parts of the South.

* * *

Work was resumed in the Alice and Millville mills of the Woonsocket Rubber Co., April 8, after a week's shut-down.

* * *

The Goodyear Tire Co. has acquired control of the Killingly Manufacturing Co., at Killingly, Conn., and they plan to manufacture 1,000,000 yards of tire duck at the plant each year. The company is reported as using 8,000,000 yards annually. They are to equip the mill with new machinery.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

CONSIDERING the time of the year business with the rubber establishments is fairly good. Everyone is hoping for rain; there have been four comparatively dry years, and a series of big rains would do wonders for the State.

R. H. Pease and wife are now in New York, where they will remain for a month. R. H. Pease, Jr., sailed on April 19 on the liner *George Washington* for Europe, and contemplates making a two months' stay visiting European cities.

The Ralphs-Pugh Co., of 502 Mission street, has taken on the

Beacon Falls Rubber Shoe Co.'s line and will carry a complete stock. They have also made arrangements to act as Pacific coast agents for the Hodgman Rubber Co., of New York, and will carry a complete line of their druggists' sundries in San Francisco.

The Pennsylvania Rubber Co. is now making provisions for handling the Pennsylvania V. C. truck tires on this coast from its branch here, and George Muther, who has been chief clerk for the past three years is to be manager of the new truck department. This truck tire with its patent demountable construction makes it possible to change tires as easily as the ordinary tire, and is an innovation in truck tires, so that Mr. French, the manager, believes that the new department will be a big success from the start. Mr. Muther is a reliable and efficient rubber man with long business experience.

The Asbestos Rubber & Supply Co. has consolidated with the Plant Rubber & Supply Co., and the business will be conducted under the name of the Plant Rubber & Supply Co.

Mr. Nat Dodge, the new vice-president and general manager of the American Rubber Manufacturing Co., whose offices are in San Francisco, reports that an additional brick building will be constructed adjacent to the two big brick buildings which now constitute the factory at Emeryville. New machinery is being installed, including a new calender, new mills, a 25-foot belt press, and belt making machinery, so that the capacity of the plant will be nearly doubled. The excellent increase in business warrants him in believing that there will have to be still further increase in the matter of facilities. This establishment is going especially after the belt business.

Bissell & Roch is the name of the new vulcanizing firm at Marysville, Mr. Roch having bought a half interest with B. L. Bissell.

The Miller Rubber Co., of California, has been incorporated with a capital stock of $10,000, with its principal place of business in San Francisco.

William Perkins is no longer connected with The Goodrich Rubber Company, having made plans to start in for himself with a new rubber heel which he has invented.

Charles Gilbert, Pacific coast manager for the United States Tire Co., was married in Hanford last week, to one of the most attractive young ladies of that city. Mr. Brady, of the Gorham-Revere Rubber Co., acted as best man.

Mr. Sawyer, of the Sawyer Belting Co., of East Cambridge, is now visiting the principal points of interest on the Pacific coast.

Considerable talk has been heard recently among the men in the rubber business of forming a club for social purposes only. The regular trade association has fallen into disuse, and as its real benefits were chiefly from the social end it has been deemed advisable to have for the chief object of the new club, monthly luncheons at which the members may all meet together.

The Oregon Packing & Rubber Co. has been incorporated at Portland, Ore., with a capital stock of $15,000.

The Firestone Tire & Rubber Co. is now installed in its fine new building on upper Van Ness avenue. This company had built a special building not long ago, and had not occupied it long when the property was taken over by the city, as part of the new civic center site. This was not so unfortunate for the Firestone people as might appear, because they had found that they hardly had enough room for their increased business. Their new building is much larger. W. H. Bell, the coast manager, says that business has nearly doubled during the past year.

B. H. Pratt, Pacific coast manager of the Fisk Tire & Rubber Co., has returned from his recent visit to the factory.

J. Elwood Lee, president of the Lee Tire & Rubber Co., is making a tour of the west, and visiting the company's branches. He is now in San Francisco, having come up from a visit to Los Angeles, where he made his headquarters with the Chanslor-Lyon Company, distributors for the Lee tires.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

THE rubber manufacturers of this city and nearby towns intend to fight against the proposed cut in the tariff on rubber of from 35 to 10 per cent. The rubber manufacturers of this city and Lambertville decided at a meeting this month to make a formal protest against any reduction in the present rate.

The manufacturers who have combined to protest to Congress include John S. Broughton and J. Watson Linburg, of the United and Globe Rubber Manufacturing Co.; John A. Lambert, of the Acme Rubber Manufacturing Co.; George W. Pratt and B. H. Taylor, of the Lambertville Rubber Co.; J. Russell Kelso, of the Woven Steel Hose and Rubber Co.; Charles E. Stokes, Home Rubber Co.; William G. Grieb and L. P. Destribats, of Ajax-Grieb Rubber Co.; Clarence D. Wilson, Joseph Bartine and Bruce N. Bedford, of the Luzerne Rubber Co.; Alfred Whitehead, of the Whitehead Brothers Rubber Co.; Oscar F. Beck and Samuel H. Dodd, of the Vulcanite Rubber Co., of Morrisville; A. E. Sawyer, of Vulcan Tire Co.; C. H. Oakley, Essex Rubber Co., Inc.; C. Edward Murray and J. Boyd Cornell, Empire Rubber and Tire Co., and Crescent Belting and Packing Co.; W. J. B. Stokes, of the Thermoid Rubber Co.; William L. Blodgett and William H. Servis, of the Hamilton Rubber Co., and the Mercer Rubber Co., and the Joseph Stokes Rubber Co.

The manufacturers declare that the proposed reduction if put into effect, will virtually put out of business many branches of the manufacture of soft rubber. It is the opinion of the local manufacturers that the proposed cut is decidedly inimical to the interests of the manufacturers and employes. The duty on hard rubber is left considerably higher than that on soft rubber. John S. Broughton, of the United and Globe company, and C. H. Oakley, of the Essex company, will head a delegation which will visit the tariff makers at Washington.

* * *

The makers of automobile tires say the proposed cut will bring havoc to the trade. It is claimed that English, French and German tire makers will have no difficulty in underselling the American manufacturers, as the tire makers here are paid from $22 to $28 per week, while in the foreign countries it is said the average wage of tire makers is not more than $10 per week at the outside, with other labor in proportion.

* * *

Cornell G. Murray, son of General C. Edward Murray, treasurer of the Empire Rubber and Tire Co., and Crescent Belting and Packing Co., is to be married to Miss Anna G. Apgar, daughter of Counsellor W. Holt Apgar at an early date. Young Murray is manager of the sales department of the Empire Co.

* * *

With a view of further increasing the present prosperous business abroad of the Home Rubber Co., Arthur R. Foley, of this city, has been promoted to the superintendency of the London branch. W. J. B. Stokes, head of the Home company, said the business of the company was increasing so steadily that it was decided to have Mr. Foley assume direct control. Mr. Foley sailed on the *Mauretania*, April 23, from New York. He has been identified with the rubber industry from boyhood.

* * *

The Joseph Stokes Rubber Co. has contracted with builder, George E. Benson, for the erection of a one-story brick addition to the plant on Taylor street to cost $3,500. The new building is an addition to the power house.

New Rubber Goods in the Market.

A PUNCTURE PLUG AND A SELF-VULCANIZING PATCH.

WHEN the motorist skims by in his red touring car, going 30 miles an hour, he is naturally an object of envy. But when a few minutes later he is discovered with the machine pulled up at one side of the road, while he sits down in the dirt with various tools strewn around him making emergency repairs, envy turns to commiseration. If all the work, and bother, and fussing, and fretting of wayside accidents could be eliminated, how delightful automobiling would become.

But many active minds are busily engaged trying to make wayside repairing as easy as possible. Here for instance are a couple of articles, that many a motorist will recognize instantly as undisguised blessings. One is the Self-Vulcanizing Patch, a cut of which is herewith shown. It consists of a combination of raw gum inner surface with a "cured" outer covering. To use it merely moisten the face with gasoline and apply to the cleaned surface of the tube. Rub down firmly and the repair is finished. The heat of the moving tire is sufficient to make a properly vulcanized job of it, inside of a few minutes.

GOODRICH SELF-VULCANIZING PATCH.

Another boon to the motorist whose tire has taken a puncture—as tires inevitably will, as long as nails and other small, sharp-pointed objects are permitted to lie in the roadway—is a puncture plug that consists of a flat disc with a pointed stem coming from the center. Where the puncture is small, this stem can be pushed through the hole, when the little metal ball inside the stem automatically seals the puncture. No cement—no mess—no muss. Simple and quick, and said to be absolutely air tight. (The B. F. Goodrich Co., Akron, Ohio.)

WHAT A WOMAN DREADS MOST.

The newspaper humorists, who do so much to contribute to the gayety of life, invariably contend that what a woman most fears and dreads is a mouse. This, however, is not true. What a woman most fears, dreads and abhors is a wrinkle; and anything that will protect her from this arch enemy of her sex is bound perforce to receive an enthusiastic welcome.

Here is a contrivance, small, simple, neat and not expensive, that is designed to ward off as long as possible, the evil day of wrinkles. It is called the Daisy Massage Tapper. It requires no electricity or other extraneous power for its manipulation, as the patient is her own operator. It has a hard rubber handle, while the tapping feature consists of about 20 soft rubber vacuum cups, mounted on a metal back. Vacuum or suction massage is said to be recognized by the experts as an unrivalled beautifier, and the principle of this tapper is suction massage. The action of these vacuum cups is to stimulate the circulation, the theory being that stimulation brings the blood to the surface, feeds the tissues, builds up the flesh and renews the skin. This tapper can be applied wheresoever it is desired, but its chief field of operation naturally consists of face, neck and arms.

The manufacturers probably hardly contend that it would make a woman of 69 look like 19, but if it makes a woman of 50 look like 30, it will have adequately served its mission. [Imperial Brass Manufacturing Co., Chicago, Illinois.]

RUBBER EARS AND NOSES.

To be sure, one's own ears and nose are preferable to even the finest works of manufactured art. But if one has been caught in the rush of the Brooklyn Bridge, or has taken part in some peaceful political primary and has lost an ear or parted with a section of his nose, it is consoling to know that art can adequately supply the deficiency. Artificial ears and noses are made to take the place of the natural members which have been lost in part or *in toto*. They are made of rubber, which does so much in a thousand different ways to add to man's comfort and well-being. These artificial members are made of a vulcanized rubber, pliable in form and so natural in coloring that the difference cannot be detected. They are not, however, turned out in wholesale lots like shoes and tires; for if a man has lost an ear and wants a new one of rubber, naturally it must match the other. This means in every case an individual mold prepared with great care. The two cuts shown herewith are made from photographs of a rubber ear and a rubber nose made by Dr. W. B. De Garmo, 27 West 42nd street, New York.

A RUBBER NOSE.

AN EAR MADE OF RUBBER.

News of the American Rubber Trade.

A RUBBER COMPANY BECOMES A WATER COMPANY.

IT is not very often that a rubber manufacturing company goes into the business of municipal water supply, but that is what occurred during the recent Western Flood, when the Republic Rubber Co., of Youngstown, Ohio furnished the city with its entire water supply for a number of days. The city's own water supply was temporarily vitiated by the flood, while the water supply of the Republic Rubber Co., amounting to 6,000,000 gallons a day, was not affected. The company volunteered to give the city its supply of water, gratis, as long as it was necessary.

THE UNITED STATES RUBBER CO.'S ANNUAL MEETING.

The twenty-first annual meeting of the stockholders of the United States Rubber Co., will be held at the office of the company, in New Brunswick, New Jersey, on Tuesday, May 20, 1913, at 12 o'clock noon, for the election of directors, and for the transaction of any business that may come before the meeting, including the approval and ratification of all purchases, contracts, acts, proceedings, elections and appointments by the Board of Directors or the Executive Committee since the twentieth annual meeting of the stockholders on May 21, 1912, and of all matters referred to in the Twenty-first Annual Report to stockholders, which will be sent to stockholders before the meeting.

The transfer books will not be closed, but the New Jersey Corporation Law will not allow to be voted any share of stock which shall have been transferred after April 30, 1913.

A FIERCE BLAZE.

A fire that was sudden, fierce and dramatic, though not attended, fortunately, by any loss of life, or by any great loss of property, occurred in Needham, Massachusetts, early in the morning of April 11, when Stowe & Woodward's Rubber Works plant was practically destroyed. The building, constructed of cement and wood, was about 150 feet long, and a story and a half high. Within five minutes of the breaking out of the fire the entire building was a mass of flames. The company manufactured a rubberized lining used for buggy and automobile covers. In its preparation considerable gasolene is used, and it is supposed that a vat of gasolene situated on the first floor exploded. What occasioned this explosion is not known. The first intimation that the workmen had of the trouble was a sudden burst of flame, which gave them barely time to rush through the doors and leap out of the windows. The workmen on the second floor saved their lives only by leaping from the windows. There were about one hundred employes in the building at the time. The financial loss did not exceed $20,000, covered by insurance.

The firm is running its Campello factory to full time, however, and filling orders as fast as possible under this serious handicap.

Regarding this fire, a curious coincidence is noted. At a large establishment, devoted to the manufacture of rubberized cloth, not over fifty miles from the one just mentioned, three incipient fires were started on the same day that the Stowe & Woodward factory was burned. These fires were also in the machine room, and were immediately under the rolls or calenders. An official of this larger concern states that in his opinion, there was something peculiar in the meteorological conditions of the atmosphere that day, and that the electricity in the air was sufficient to ignite the material passing between the rolls of the calenders.

THE UNITED STATES RUBBER RECLAIMING CO.'S NEW OFFICES.

The United States Rubber Reclaiming Co., Inc., has joined in the uptown movement and moved its offices to the handsome new Forty-Second Street building, 18 East Forty-second street, New York.

THE SEAMLESS TIRE.

An automobile tire which is creating quite a little comment in automobile circles is that known as the "Seamless," so named from its makers—The Seamless Rubber Co., of New Haven, Connecticut. This company has been identified with the rubber manufacturing industry since 1877. It has been well known in the manufacture of druggists' sundries, and for two years and a half, now, has been marketing the "Seamless" tire. We reproduce their trademark, which is printed in red and black and is distinctive and striking. The tire is made of all Sea Island fabric, and Pará rubber, and is built and vulcanized in a single unit by the "Seamless" one-cure, wrapped-tread process. The company has adopted the slogan, "Built up to a Standard, not down to a Price," which is strong as a motto and excellent as a declaration of policy.

THE J. P. DEVINE CO.'S NEW LOCATION.

The J. P. Devine Co., manufacturers of vacuum drying apparatus, Buffalo, New York, have moved their offices and also their factory to 1372 Clinton street in that city.

NEW ADDRESS OF THE R. J. CALDWELL CO.

The R. J. Caldwell Co., commission merchants, have recently moved their offices from 488 Broadway, New York, to 15 Park Row, on the corner of Broadway.

THE REVERE CO.'S GENEROUS GIFT.

Mention has been made before in these columns of the donation of a spacious playground by the Revere Rubber Co., to the city of Chelsea, Massachusetts, where the company has a large plant. The deeds to the playground were finally passed on March 28. Mr. W. M. H. Gleason, the company's treasurer, acted as the company's representative, while the mayor and treasurer of Chelsea accepted the gift in the name of the city.

THE FIRESTONE'S NEW SYRACUSE BRANCH.

E. A. Hoffman, formerly manager of the supply house of Wyckoff, Church & Partridge Co., has just been selected by the Firestone Tire and & Rubber Co., of New York, to open and operate its new Syracuse branch and service station at No. 502-504 East Genessee street. This is another advance on the part of the Firestone Co. in its general policy of establishing branches and service stations over the country. Mr. Hoffman has lived most of his life in Syracuse, where he has a host of friends. His experience dates back to the early bicycle days, having been at one time in business for himself in Syracuse operating as Hoffman & Weaver.

MR. BABCOX IS PROMOTED.

Once in a while a man does so well in some other field of advertising that he is promoted into the rubber field. Mr. Edward S. Babcox has just achieved this distinction. He was formerly advertising manager of the Yawman and Erbe Manufacturing Co., of Rochester, New York, and has now been made advertising manager of the Firestone Tire and Rubber Co., of Akron, Ohio. Mr. Babcox is not only an advertising writer and planner of acknowledged ability, but he can talk very entertainingly on this most abstruse science.

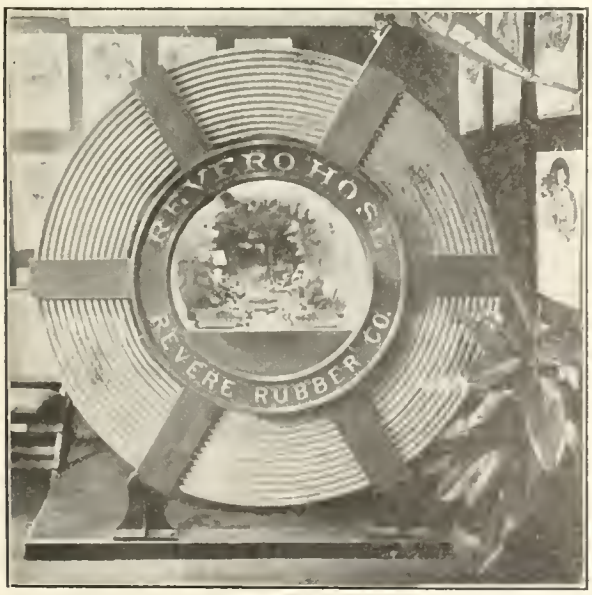
A RUBBER DISPLAY AT THE FLOWER SHOW.

The flower show held from April 5th to the 13th, at the Grand Central Palace, in New York City, was an unqualified success, and it deserved to be. There was one feature of particular in-

A Pergola Made of "Revero" Hose.

terest to rubber men, and that was the exhibit of the Revere Rubber Co., which showed how a commercial display could be made to appear in perfect harmony with an exceptionally artistic environment. Generally speaking, the show was a vast bower of bloom and blossom; while the Revere Rubber Co.'s exhibit was an exploitation of garden hose, but so exploited that there was no sense of incongruity. On the contrary, the hose exhibit seemed a very natural feature of the flower show.

The exhibit consisted of a pergola about 12 feet wide and 10 or 12 feet deep, the posts and cross-pieces being wrapped in "Revero" hose, while between the posts stood rubber plants and around the cross-pieces twined southern smilax. Eight thousand feet of hose were used in the construction of this artistic booth. An additional feature standing just outside of the pergola was



A Six Foot Reel of Hose, Containing a Miniature Garden.

a large reel of hose, of polished oak, 6 feet in diameter, and large enough to accommodate 6,000 feet of hose. In the center of the reel, covered by glass, was a miniature garden scene, showing flower beds and shrubbery and a garage in the background, while in the foreground stood a miniature gardener spraying the flower beds with real water from a diminutive hose. This exhibit attracted a great deal of attention—notwithstanding the riot of floral beauty, including priceless roses and $25,000 orchids, that surrounded it.

NEW INCORPORATIONS.

Behrmann Shoe Co., Inc., April 21, 1913; under the laws of New York. Authorized capital, $10,000 Incorporators: Henry F. Behrmann, Caroline Menauch and Alme Behrmann—all of 31 New Chambers street, New York. Location of principal office, New York City. To deal in shoes, rubber and cloth goods, etc.

Boston Rubber Supply Co., April 5, 1913; under the laws of Massachusetts. Authorized capital, $5,000. Incorporators: Jacob Gordon, 11 Westminster road; Isaac Kabler, 28 Creston street, and Louis Goldstein, 47 Linden Park street—all of Roxbury, Massachusetts. To manufacture and deal in rubber specialties, etc.

Cottica Rubber & Coffee Corporation, March 27, 1913; under the laws of New York. Authorized capital, $250,000. Incorporators: George J. Ord, 851 West One Hundred and Eighty-first street, New York; Vincent G. Butler, 122 Market street, Newark, New Jersey, and Daniel L. O'Connor, Huguenot Park, Richmond, New York. Location of principal office, Buffalo, New York.

The Harper Tire & Rubber Co., March 3, 1913; under the laws of Ohio. Authorized capital, $100,000. Incorporators: Warren D. Harper, James Thomas and Albert H. Vayo. Location of principal office, Canton, Stark County, Ohio. To manufacture and deal in automobile tires and the doing of all things necessary or incident thereto.

The Ireland Rubber Co., Inc., March 26, 1913; under the laws of New York. Authorized capital, $25,000. Incorporators: Frederick William Humphreys, 142 West Eighty-third street, New York; Charles Summa, 189 Academy street, Newark, New Jersey, and Walter Ulrich, 1572 Broadway, New York. Location of principal office, New York City.

Newark Rubber Co., March 26, 1913; under the laws of Maine. Authorized capital, $100,000. Incorporators: John H. Stone, 31 State street, Boston, Massachusetts, William R. and Edward S. Antoine—both of 57 Exchange street, Portland, Maine. To manufacture and deal in all kinds of rubber goods.

Peerless Tire Co., Inc., March 25, 1913; under the laws of New York. Authorized capital, $15,000. Incorporators: Michael Schiavone, 1424 Sixty-eighth street; Antonio Caropreso, 1452 Seventy-first street, and Louis Schiavone, 1450 Seventy-first street—all of Brooklyn, New York. Location of principal office, New York. To deal in rubber tires.

Severin Tire & Rubber Co., February 27, 1913; under the laws of Oklahoma. Authorized capital, $10,000. Incorporators: A. L. and L. H. Severin, and J. R. Eagan—all of Oklahoma City, Oklahoma. Location of principal office, Oklahoma City, Oklahoma. To manufacture, buy and sell automobiles and automobile supplies and sundries, etc.

The Stetson Mfg. Co., Inc., April 2, 1913; under the laws of New York. Authorized capital, $25,000. Incorporators: Cora S. Butler, 2112 Euclid avenue, Cleveland, Ohio, Florence M. Hall, 128 Ascension street, Passaic, New Jersey, and William A. Shepard, 5 Beekman street, New York. Location of principal office, New York City. To manufacture devices made of rubber, etc.

Zip Co., Inc., April 12, 1913; under the laws of New York. Authorized capital, $5,000. Incorporators: A. Calvin Ross, 38 Adelaide street, E. Toronto, Ontario: Augustus G. Porter, 127 Buffalo avenue, and Frederick Chormann, 315 Jefferson avenue, both of Niagara Falls, New York. Location of principal office, Niagara Falls, New York. To manufacture compounds used in treating rubber, and to manufacture rubber goods.

TRADE NEWS NOTES.

The W. C. Hendrie Rubber Co., of Denver, which recently gave out a contract for a tire factory in Torrence, California, is at the same time doubling the size of its Denver plant.

The Buckeye Rubber Co., of Akron, Ohio, is making a $20,000 addition to its present buildings, and is also remodeling one of its old buildings in order to use it as a curing room.

The American Tire and Rubber Co., of Akron, Ohio, has recently opened a branch office in Milwaukee, Wis., with Albert Weisskopf as general sales manager.

The Fort Dearborn Rubber Goods Co., of Chicago, dealing in reliners, blow-out patches and outer boots, has recently increased its capital from $5,000 to $10,000.

The Squires & Byrne Rubber Co., of Los Angeles and San Francisco, was recently awarded the contract to furnish the California and Oregon Grain & Elevator Co., of Portland, Oregon, 2,250 feet of Quaker City Rubber Co.'s Grain Elevator Belt.

The B. F. Goodrich Co., Akron, Ohio, recently opened new quarters in the Glenwood-Inglewood Building, Minneapolis, Minnesota.

The National Rubber Co., of St. Louis, is marketing a tire-cut filling material called "Narco." It is said to be self-vulcanizing and becomes an integral part of the tire upon standing over night.

Announcement has been made of the opening in New York of a branch selling agency for the Etablissements Bergougnan of Clermont-Ferrand, France, makers of the Gaulois tires, and an initial shipment of 5,000 tires is said to have been already received at the Gaulois headquarters, Sixty-fourth street and Broadway.

The Alling Rubber Co., which has a chain, or more properly a group of rubber stores in various towns in New England and New York State, expects soon to open another at 92 Genesee street, Utica, New York, of which Mr. William Walls will be the manager.

The stockholders of the Patterson Rubber Co., of Lowell, incorporated last October, have voted to increase the capitalization of the company from $500,000 to $1,000,000 by the issue of 2,500 shares of preferred and 2,500 shares of common stock at $100 a share.

UNITED STATES COMMON PAYS SIX PER CENT.

The directors of the United States Rubber Co. on April 3 declared the usual quarterly dividend of 2 per cent. upon the first preferred stock of the company, and a quarterly dividend of 1½ per cent. upon the common stock. Over nine-tenths of the second preferred stock has been extinguished under the recent offer made by the company; on the small amount as yet outstanding 1½ per cent. will be paid. It was stated that, although all of the April 1 inventories had not been completed, sufficient was ascertained to show that the net earnings of the company for the year would be from $1,500,000 to $2,000,000 in excess of all dividends declared, including the increased dividend on the common stock.

WANT AMERICAN RUBBER COATS.

A report from an American consular officer in a Mediterranean country states that a firm of large dealers in rubber goods in his district desires to represent an American exporter of rubber coats for men and women (mackintoshes) of the less expensive and of the better qualities. Correspondence may be in English. The report is No. 10,627.

LABOR ORGANIZATION AT AKRON.

While there are now practically no reminders in Akron of the recent strike that lasted a number of weeks in that city, it is reported that the American Federation of Labor is striving to bring about a permanent local organization in that city and to make it the headquarters of the rubber workers of America, who are connected with that labor organization.

PERSONAL MENTIONS.

Charles M. White, Jr., of The Firestone Tire and Rubber Co. has recently located in Detroit as pneumatic tire representative to the Automobile Manufacturers of Michigan. Mr. White formerly represented that company in Syracuse and his new position comes as a well deserved promotion.

M. A. Magee, who for several years has been connected with the Motz Tire and Rubber Co., of Akron, Ohio, has succeeded P. M. Pontius as sales manager. Mr. Pontius is specializing in the work of the Electric Pleasure Car Tire and is now in the position of manager of that department.

George W. Taite, who was vice-president and manager of the Sawyer Belting Co. for about ten years, and who resigned some few months ago and became the moving spirit of the transfer of The National Belting Co.'s plant from Lawrence, Mass., to Elyria, Ohio, has resigned his office as president of The National Belting Co. and sold his holdings.

MR. KENDALL GOES TO AKRON.

Mr. J. A. Kendall, the Western representative of Tyson Bros., Inc., of Carteret, N. J., who has been representing the company in Cleveland, has taken an office at 524 Second National Bldg., Akron, in order to be able to take better care of the Akron trade.

A RUBBER MAN IN SOUTH AMERICA.

A delegation of American business men, principally New Englanders, sailed from Boston on April 24th, under the auspices of the Boston Chamber of Commerce, for a three months' tour of South America. They will go across the Isthmus of Panama, take a look at the Canal, and then coast down the west shore of South America, visiting Lima and other points in Peru, besides the principal cities of Bolivia and Chile, going as far South as Valparaiso; from there cross the continent to Buenos Aires, and go up the east coast, stopping at Montevideo, Rio and other points, and landing in New York, July 23. There were about sixty-five members in the party.

Edward T. Smith.

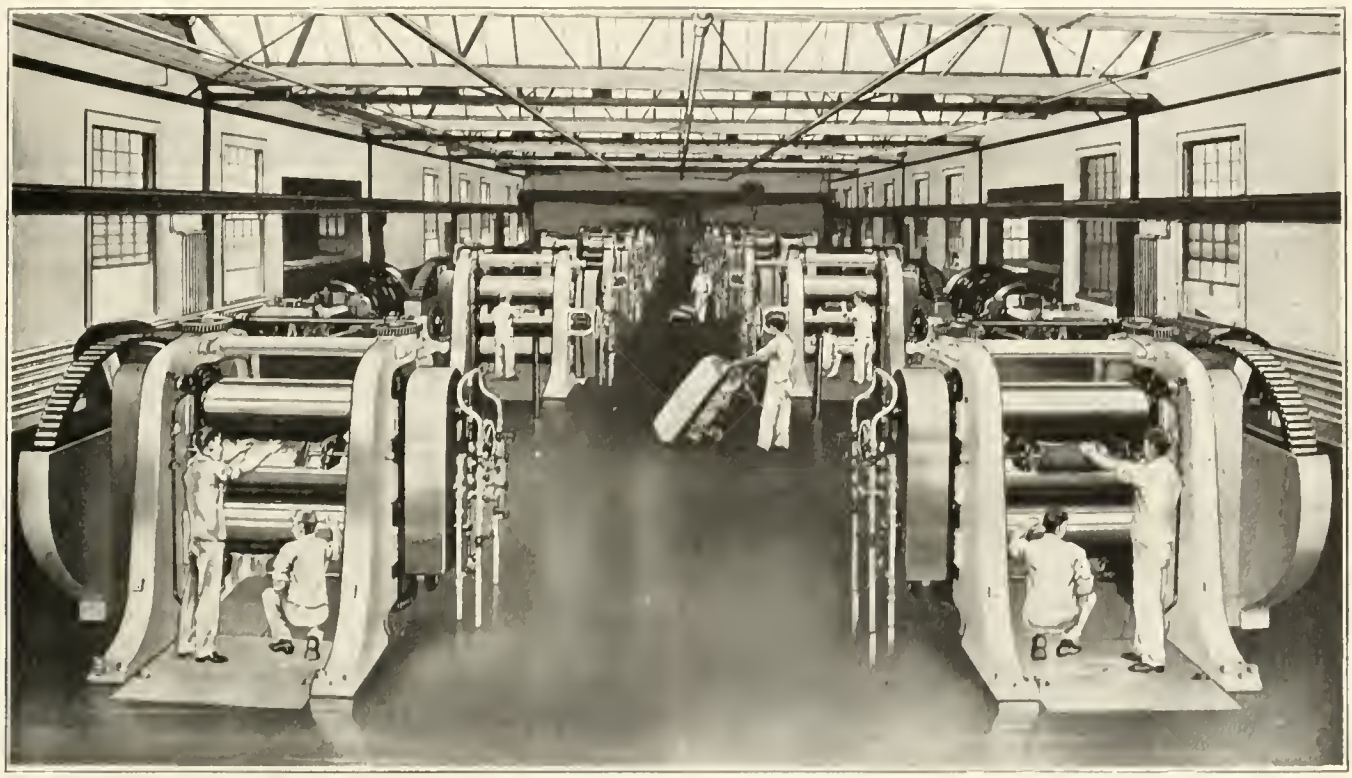
The only rubber man in the delegation is Edward T. Smith, of the Iroquois Rubber Co., of Buffalo, N. Y., who goes in the interest of the United States Rubber Co., to see what rubber goods are used on the Southern continent, what they look like, where they come from, and what prices are paid for them. In the present spirit of enterprise so evident all over South America, these tourists from the States will undoubtedly receive a warm welcome. Mr. Smith will doubtless learn a great deal of value to the company he represents.

A GREAT CALL FOR TIRES.

The statistician of the United States Tire Co., estimates that during the present year 5,000,000 pneumatic tires will be necessary for automobiles, and that in addition there are 50,000 motor trucks that will require tiring, and 250,000 motorcycles. Assuming that the motor trucks will require six tires each, that will make a total of 300,000 truck tires; and allowing only a pair of tires for the motorcycle, they would require a half million tires, bringing the total number of tires for the year in the vicinity of 6,000,000.

THE CALENDER ROOM OF THE REPUBLIC RUBBER CO.

The cut above shows the calender room of the Republic Rubber Co., of Youngstown, Ohio, as it appears in the new rolling mill of this plant. The company refers to this as "the biggest calender room in the world." The reproduction below shows that it is certainly a very large and well equipped calender department. It is here that the famous "Staggard" tread tires are made.



REPUBLIC RUBBER CO.'S NEW CALENDER ROOM.

OCCUPATIONAL DISEASES IN CHEMICAL TRADES.

A committee on occupational diseases in the chemical trades was recently appointed by the New York Section of the American Chemical Society. The objects of the committee may be specifically stated as follows:

1. To hold itself ready to advise the legislatures of the states of New York and New Jersey in reference to matters pertaining to occupational diseases in the chemical trades.

2. To study various bills presented in the legislatures in an effort to avoid unwise legislation; especially that which might be inoperative or ineffective from one or many reasons resulting from lack of technical knowledge at the time of writing the laws.

3. To inaugurate and superintend such investigations as might be decided upon which look toward improvement of conditions of labor in the chemical trades.

Dr. Charles Baskerville, Professor of Chemistry and Director of the Laboratory, College City of New York, is chairman of the committee.

TRUCK TIRE PRICES TO COME DOWN.

C. W. Martin, manager of the motor truck tire department of The Goodyear Tire & Rubber Co., Akron, Ohio, is authority for the statement that there will be another 10 per cent. reduction in truck tire prices. "This cut will take place immediately," he remarks, "and is the second cut which has occurred since the first of the year. This reduction is made possible not only by reason of our increased manufacturing facilities, but also by the recent drop in the price of crude rubber.

"Now that the truck has proved itself a prime factor in economic transportation, it seems safe to say that within four years the truck tire business of the country will exceed the automobile tire industry by far, for the truck represents the actual utilitarian reason for the existence of the motor driven vehicle."

TIRE MAKING IN THE SOUTH.

The citizens of Jacksonville, Florida, or at least some of them, are very enthusiastic on the subject of tire manufacture in that city. The Seminole Rubber Co has recently been formed and has purchased the site of a former tannery on the banks of the St. John's River. One of the Florida papers takes the following very optimistic view of the outlook:

"As 72 per cent. of a finished tire consists of long staple Sea Island cotton, this will be the only industry enjoying the many advantages of having the chief raw material right at its doors.

"Owing to the saving in freight rates on raw material and other advantages, a standard tire, with one extra layer of fabric and a real 5,000 mile guarantee, will be retailed at 10 per cent. below the present price. It is believed this will result in keeping a large part of the $20,000,000, that annually leaves the South for buying auto tires, for home circulation."

The consumption of tires in the South is of course very considerable and ought to increase rapidly, as motoring can be carried on in many parts of that section during the entire winter. There seems to be no reason why at least a certain percentage of the tires consumed in that section should not be constructed there.

THE FAULTLESS RUBBER CO. WINS ITS SUIT.

The United States Circuit Court of Appeals, for the Northern District of Ohio, recently rendered a decision favorable to the Faultless Rubber Co., in an interesting suit brought against the Star Rubber Co., of Akron, for infringement of its "Kantchoke Nipple," patent No. 926,011. The Faultless Rubber Co. owns patent No. 926,011, issued to it June 22, 1909, as the assignee of Thomas W. Miller. The subject matter of the suit was a nipple for nursing bottles. The specification stated as one of the objects "to prevent any contraction of the opening from the body portion into the mouthpiece of the nipple under compression of the same." The claim said to be infringed was claim 1, reading as follows:

"1. A nursing nipple, embodying a mouthpiece, a neck, and an intermediate body portion flaring from said neck to receive the bead of the bottle neck, the upper wall of said body portion projecting inwardly at an acute angle from its point of greatest width to form a substantially flat wall, the diameter of the opening from said body portion into the mouthpiece being relatively small in comparison with the diameter of said body portion."

In rendering its decision the court stated: "We agree with the Board (of Examiners) that the specification and drawings disclosed a novel combination giving a useful, new result, and entitled to protection by patent. One practical difficulty which Miller sought to avoid was the collapsing of nipples while in use. Evidently, a mere tube, when bent sharply to one side or when pushed inwardly so as to make a bend, would collapse and close. It is the patentee's theory that in the Ingram nipple (taken as the best type of previous nipples) the enlarged body portion is still so characteristically a tube that if the mouthpiece is pushed inwardly or bent to one side, either the opening into the mouthpiece or the two together will collapse; while, in the Miller device, this upper part of the enlarged body portion is so predominantly a diaphragm that it cannot break over, and instead, it yields longitudinally to a push or pull, and when the mouthpiece is turned sidewise, the diaphragm also turns. The arch of Ingram would resist against a sidewise bend of the mouthpiece, and the opening into the mouthpiece would collapse, but the diaphragm yields and the mouthpiece remains open. This result, as a new and useful result, seems probable enough on inspection of the patent and the earlier patents, and observation of samples, as far as they were submitted to us, confirms this idea. In any event, the utility of the new combination is probable enough, evidenced, as it is, by extensive public adoption,, so that the defendant who has copies cannot be heard to deny such utility."

Accordingly, the court grants the usual interlocutory degree for injunction and accounting against the defendant company.

INFRINGEMENT SUIT DECIDED IN FAVOR OF THE FISK RUBBER CO.

In a recent important decision—which it would take two and one-half pages of this publication to reproduce—the United States Circuit Court of Appeals, for the First Circuit, affirms the decree of the District Court which held that the claims of United States Patent 822561 to P. D. Thropp were invalid by reason of anticipation.

Suit was brought against The Fisk Rubber Co. for infringement of this patent which, it was alleged, covered the form of mold used in the manufacture of Fisk tire casings by the one-cure wrapped-tread process.

This case has been before the courts for nearly four years, and the two decisions in favor of The Fisk Rubber Co. are of great interest to the tire makers of this country by whom the one-cure wrapped-tread process, and the apparatus involved in this suit, have been very extensively used.

TRADE NOTES.

William H. Scheel has announced that he has recently added to his already extensive line of compounding ingredients for the rubber trade, new dry colors of exceptional excellence and has already developed an active request for yellows, reds and greens noted for being impervious to heat. Mr. Scheel is also offering a zinc chromate chemically pure, both yellow and green, as well as a line of English brilliant vermilion, and English Vermilion substitute. These new colors will compare favorably with the general line which Mr. Scheel has been successfully offering to the American rubber trade for the past twenty years.

Ernest Jacoby & Co., whose headquarters are at 79 Milk street, Boston, were incorporated March 1, 1913, for $25,000 under Massachusetts laws. This concern is putting out a superior English substitute made by Englishmen in its South Boston factory. This house has an extensive connection throughout the rubber trade. Its New York representative is Mr. W. F. Schling, 150 Nassau street.

THE CRAWFORD SECTIONAL OVEN.

It is claimed by many that temperatures can be more accurately gauged in cases where steam is employed than where other mediums are used. Recent experiences made in the generation of heat from gases have tended somewhat to negative this view. The Crawford Sectional Oven, heated by an enclosed gas burner, is said to be a very high type of oven construction and an economical consumer of fuel. It is especially designed for close temperature control.

It is claimed to have been successfully used in the treating of certain composition products, and to have successfully vulcanized certain types of rubber goods. It is in extensive use among manufacturers of electrical goods for drawing the moisture out of fabrics prior to impregnation and heat, treating them in the finishing process. In the latter case it is perhaps needless to call attention to the fact that cotton carbonizes at a slightly higher point than that at which water boils (212 degs. Fahr.). Therefore successful impregnating compounds must be capable of heat treatment at no higher temperature.

The insulation of all these ovens is high and permanent. Their sectional arrangements permit of rapid erection in cramped quarters by unskilled labor and they are easily portable.

The Crawford Sectional Oven is made by the Oven Equipment & Manufacturing Co., of New Haven, Connecticut.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india-rubber and gutta-percha for the month of January, 1913, and for the first seven months of five fiscal years, beginning July 1:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
January, 1913	209,772	$128,082	$662,623	$1,000,477
July-December, 1912	1,373,297	845,341	4,033,073	6,251,711
Total, 1912-13..	$1,583,069	$973,423	$4,695,696	$7,252,188
Total, 1911-12..	1,297,422	1,076,492	3,987,743	6,361,657
Total, 1910-11..	1,215,134	1,600,041	3,397,718	6,212,893
Total, 1909-10..	1,096,459	1,371,199	2,739,953	5,207,611
Total, 1908-09..	803,067	958,671	2,088,523	3,850,262

The above heading "All Other Rubber," for the month of January, 1913, and for the first seven months of three fiscal years, beginning July 1, includes the following details relating to tires:

MONTHS.	For Automobiles.	All Other.	TOTAL.
January, 1913 .....*values*	$273,519	$389,105	$662,624
July-December, 1912	1,777,324	2,255,748	4,033,072
Total, 1912-13	$2,050,843	$2,644,853	$4,695,696
Total, 1911-12	1,374,337	291,460	1,665,797
Total, 1910-11	1,015,673	319,022	1,334,695

RUBBER IN THE RECENT FLOOD.

A FLOOD always means a loud call for rubber goods—obviously; rubber footwear and rubber clothing are in great demand. Some day when people are more provident than they are now, those who live in a territory where floods occur with any frequency, will have stored away in an odd corner, a folding raft with collapsible rubber floaters which they can get out on short notice and, by inflating the rubber floaters, put to good use, in saving life and valuables. But perhaps people have not yet quite reached that desirable degree of foresight.

One of The India Rubber World's occasional correspondents lives in Ohio, close to the region where the recent flood did its worst, and he has sent in a few paragraphs, together with snapshots, showing the use that rubber boots, rubber coats and rubber tires were put to, during the ten days' inundation.

THE FLOOD AND THE TIRE TRADE.

"It's an ill-wind that blows nobody good," and the recent huge flood disaster in the mid-west has been the direct cause for the purchase of a vast number of tires.

To begin with, curiosity impelled almost every automobile owner in the vicinity of the flood belt within "motoring distance," that is—to speed away to see the flood. The roads were so bad, the streams so swollen, the concealed rocks so numerous, that many a tire was burst. Then, if one approached too near the flooded area, his automobile would be seized by the soldiers and impressed into relief work. Relief work is death to tires. It means speeding through streets where the asphalt has buckled beneath the waters, or it means going through water so high that your carburetor is all but flooded. It means riding over stock and stone and keeping on, on the flat tire when the inner tube has burst; for when lives are to be saved tires don't count.

An Auto in the Hamilton Flood.

In addition, many an auto was caught in its garage by the tide, and knocked helter-skelter, out into the street; thence to be pummelled and driven about by the swift current till finally resurrected, much in the shape of the one in this snapshot taken at Hamilton.

RUBBER BOOTS IN THE FLOOD.

Many a man has been saved from catching a deadly cold through the use of rubber shoes or boots; but it is seldom that rubber footwear has assisted in the actual saving of so many lives as during the recent flood in Ohio. When the first horrors of that flood-night were over, the few who managed to escape from the torrent went out to the rescue of others. The work was done largely in boats, but often submerged out-houses, fallen walls, picket-fences and the like, kept these boats from making further progress. Then it became a matter of wading, and in ordinary foot-wear, with the waters freezing the feet, this would have been next to impossible, after two or three excursions into their depths. When relief work was finally organized, rubber boots were provided, and fitted in these the rescuers went about, carrying the sick and the exhausted to safety.

This photograph shows a rescue near the county court house at Dayton.

If there was any one item of dress more valued than any other by the soldiers of the Ohio National Guard detailed for

A Flood Worker in His Rubber Boots.

RUBBER COATS IN THE FLOOD ZONE.

patrol duty in the flood districts along the Great Miami, it was the rubber coat.

Almost without ceasing, the rain poured, day after day, succeeding the actual torrents that caused the flood, and refugees, some of whom were on the house tops, beyond reach of rescuers, for full forty-eight hours, looked with no little envy on the more

A National Guardsman in His Rubber Coat.

fortunate national guardsmen, notably the men from Toledo, who walked about—even in the lightest drizzle—well protected in rubber coats. The floods had, of course, gutted the stores of the rubber dealers, and, where not, left everything beneath a coating of mud a foot deep, so that until relief came in from without, little could be obtained from local purveyors.

The photograph shows a major of the guard halting the autos and sightseers at the borders of Hamilton, until they secured the needful passes.

THE INCREASING DEMAND FOR RUBBER TOYS.

A PHASE of the kindergarten system which is making demands upon dealers in rubber toys, is the use of such object teachers to convey to infantile minds the forms of characters in fairy tales, as portrayed by book illustrators at home and abroad. As a teacher reads a fairy tale she places on the desk, one by one, a rubber doll designed to portray this or that fairy, gnome or elf, as for instance, the "Mad Hatter," the dormouse, and the Queen, and other characters in "Alice in Wonderland." When the tale is told, the teacher passes the rubber toys about the room for the children to play with while the impression of the story is active in their minds.

At first thought, it would seem as if this development of the idea of teaching by means of toys would not be of consequence in sales of rubber products, but the contrary is the case as THE INDIA RUBBER WORLD has learned in interviews with makers, distributors and retailers of toys. The reason is not far to seek: it is that there are at least three million children in domestic kindergarten schools, and that the parents of many of these children, buy at the urging of the children, such rubber dolls and other rubber toys as are used in the school for conveying certain ideas set forth in fairy and other tales.

A very large order was recently placed for rubber toys of these kinds by a large corporation of cut-rate druggists. The designs to which the manufacturers will conform in filling this order provide for following the drawings of famous child-life illustrators of England, France, Germany and our country. Many of the patterns will be in colors, but the most of the order calls for terra cotta finish.

All buyers for department stores, and for the larger retail druggists give it as their opinion, that the market for rubber toys is enlarging. In almost all instances, rubber toys as sold by these branches of trade are advertised in the press and bulletined by placards in the stores as unbreakable toys. This is a catchy term that goes far with those who buy gifts for children, and who know that for a number of years the guile of many makers of toys has been to make the products extremely fragile, for the purpose of giving the shortest possible life to the object, in order that the whimpering of the child over a soon broken toy may quickly lead to the purchase of a duplicate. It is becoming the practice both in drug stores and department stores to place a good assortment of rubber toys in the show cases that display rubber bath tubs, basins, spraying bottles, hot water bottles, and many other articles in rubber of especial design for use by mothers and nurses in the care of young children. In many hospitals where children are treated, and where a long time is occupied in giving special forms of baths, the nurses keep the children from fretting by placing rubber ducks, geese, swans and dogs in the tubs. This is a sound method of preventing the fretting in children which in adults is termed worrying.

NAVY DEPARTMENT WANTS RUBBER SUPPLIES.

The Bureau of Supplies and Accounts of the Navy Department, Washington, invites bids until May 6 for rubber boots, air hose, garden hose, rubber hose for flexible voice tubing, rubber pipe hose, suction rubber hose, upper-deck fire hose, wash deck hose, and rubber steam hose.

NEW TRADE PUBLICATIONS.

ELBERT HUBBARD DISCOURSES ON THE DEVINE VACUUM DRYER.

THAT seer, sage and most hilarious metaphysician, Elbert Hubbard, has penned a treatise entitled "The Age of Rubber —Being an Appreciation of the Vacuum Drying Apparatus Manufactured by J. P. Devine Co." The vacuum drying apparatus manufactured by the J. P. Devine Co., is interesting enough in itself, but when touched up by Elbert Hubbard, and set off by the spangles of wit, humor, history, logic and philosophy that characterize the literary style of the prophet of East Aurora, it becomes more than doubly interesting. This is the way he starts: "Three-fifths of the surface of the earth is covered with water. The world seems very much better adapted to raising fish than men, although man in his existence passes through an aqueous stage, and to a degree he never gets out of it." And then he goes on to describe, in his own way, the vacuum drying process as done by the Devine apparatus. If you are not familiar with this vacuum drying machinery, you should get one of these books and find out about it, and if you are familiar with the machinery but would like to know more about Mr. Hubbard's peculiar gift of writing, get the book on that account.

"THE STAGGARD."

The Republic Rubber Co., of Youngstown, Ohio, issued on April 1, Number 1, Volume I, of "The Staggard," a four-page illustrated publication, devoted primarily to the exploitation of the Staggard tire. It appears to be intended chiefly for circulation among the employes of the company, and of its branches and agencies, but it contains quite a little news of interest to the tire industry generally. This first number contains some interesting illustrations, among them a typical scene in the recent Ohio flood, which shows some Youngstown factory (not the Republic) so deep under water that the freight cars alongside are buried to their roofs.

IF YOU ARE GOING TO MOTOR IN EUROPE.

If you have any expectation of touring Europe this summer in your motor car, you should get a "Goodrich Auto Map and Guide to Continental Europe," just published by The B. F. Goodrich Co. The map when opened out is 20 x 24 inches, and covers England, France, Germany, Switzerland, and a very considerable part of Spain, Italy and Austria. It shows the principal thoroughfares in all that vast section. On the reverse side of the map there is a good deal of information of importance to the Continental tourist. It gives the various customs and other laws of each country, with the requirements for local registration, and much other information necessary for the motorist's welfare and comfort. It also reproduces the road signs generally in use in England and the Continent, so that the motorist can familiarize himself with them in advance.

In addition to the Continental Guide, the Goodrich Co. has just issued a number of other leaflets—one being a route book showing how to get from St. Louis to Kansas City without having to ask a question of anybody. Three other smaller leaflets are entitled "Goodrich Service," which is devoted to tennis balls; "Police," which treats of the Goodrich clincher tires, and "The Newest Chocolate Lines in Rubber," describing various syringes and pumps made of chocolate colored rubber.

A FOLDING RUBBER WASH BOWL.

One of the convenient little travelers' kits, provided for the comfort and physical well-being of the motorist, contains among other helps for cleanliness, a folding rubber wash bowl, which takes practically no room when not in use, and can be filled with a plentiful supply of water when it is needed.

The Editor's Book Table.

THE RUBBER TREE BOOK. BY W. F. DE BOIS MACLAREN. London, 1912. Maclaren & Sons, Limited. [Cloth, 308 pages, with 83 illustrations; price, 11*s.* 6*d.* post free.]

WHILE it may be considered by some that everything possible has been said about rubber, the rapid and continuous growth of the industry involves so many new considerations, that there is always room for a well considered and comprehensive work, such as that recently produced by Mr. Maclaren. His intimate connection with rubber, as director of various successful planting and financial companies, gives him special facilities for treating his subject. Having had a period of large and constantly increasing yields, with the result of big dividends, rubber companies have not up to now experienced the need of special efficiency in estate working. It is, however, being more and more recognized, that efficiency is no less essential to success in the rubber-growing industry, than in any other.

It has been the author's purpose to arouse the interest of the planter in the soil he cultivates and the trees he grows there, by showing how varied and wonderful are the phenomena connected therewith. In the words of the introduction, the object with which the book has been written has been to assist in obtaining better results than in the past, on more economical lines, and with a view to the future welfare of the rubber-growing industry.

Starting with the general consideration of "What a Tree Is," Mr. Maclaren takes up the question of the soil and its fertility, manuring, weeding and other subjects; leading up to the seed and its reproduction through roots, stem and foilage. At this point he quits the botanical division of the subject for that of cultivation, dealing successively with "Land Grants"; "Elevation"; "Roads, Bridges and Dams," "Felling and Burning," as well as various other points.

Next in order come the questions more directly affecting planting; including nurseries, planting-out and pruning.

Of special interest to estate owners, is the chapter on "Planting Distances." Mr. Maclaren arrives at the conclusion that a distance of 30 x 30 feet, or 48 trees to the acre, is not too wide. While it would involve at first a little sacrifice, later results would more than pay for waiting. An instance is recorded from Sumatra, in which three isolated trees eleven years old yielded in 1912 over 100 pounds each of rubber. Mr. Maclaren remarks that 48 such trees per acre would, on this basis, produce annually 4,800 pounds, while 400 pounds per acre is considered a very good yield from closely planted trees.

Proceeding to the subject of extraction, the questions of tapping and coagulation are next dealt with, both in principle and practice. Under the former head the various methods of incision are treated on the basis of trials made at experimental points, while the merits of different tapping knives and utensils are likewise discussed. In the treatment of the question, "The Latex and How It Is Coagulated," latex is considered as a reserve of plant food, representing only about 2 per cent. of the total volume of nutriment, and being intermingled with other elements of no service as food reserves. Mr. Maclaren disputes the correctness of Dr. Stevens' suggestion that the resins in trees must be stores of plant food also if latex is. The functions of latex are considered under various aspects, it being added that the co-operation of nature has a wider scope than many dream of.

When the coagulation of the latex has brought it out of the hands of nature into an industrial form, it becomes available for mechanical treatment. Under this head washing mills are considered from various points; including the width and speed of rollers and loss in weight. The process of creping is finally dealt with. This naturally leads up to the subject of the grading of rubber; the opinion being expressed that (instead of five as had been suggested) three grades should be quite sufficient for all purposes, namely, first latex rubber; second grade earth rubber. Drying, smoking and packing occupy the following chapters.

Most direct interest attaches to Mr. Maclaren's estimate of the cost of production, for arriving at which he thinks there should be a standard way. When any estate is producing 100,000 pounds of dry rubber a year, he considers the cost f. o. b. should not exceed 1*s.* 6*d.* (36 cents) per pound. He adds that such a figure ought to be looked upon as having to be reduced each successive year, till it is well under 1*s.* (24 cents) per pound.

Every page of this work contains some statement of interest; the whole volume reflecting high credit upon its author.

KALENDER FUR DIE GUMMI-INDUSTRIE. EDITED BY DR. KURT Gottlob. Berlin, 1912. Union Deutsche Verlagsgesellschaft. [8vo, 514 pages, cloth.]

The last annual issue of the Gummi-Kalender (to call it by its abbreviated title) is fully up to the mark of its predecessors. Its main divisions include a diary with blanks for memoranda of prices and names of manufacturers of supplies; details of the various organizations connected with the German and Austrian rubber industries; rubber washing and manufacturing tables. In its miscellaneous section there is a discussion of the risks of poisoning in the rubber industry.

In the supplement, the "Annual for the Rubber Industry," is a chronological calendar of the history of rubber from 1536 to the present time; followed by an article on the "Chemistry of Rubber," from the pen of the editor. Next in order come articles on "The Technology of Rubber," "Analysis of Rubber and Rubber Goods," "Practical Testing of the Qualities of Rubber Goods," "The Coloring of Rubber Goods," and "Viscosity of Rubber Solutions." The value of this work is materially enhanced by various groups of statistical tables.

Any one in a position to follow the intelligent arrangement of the Calendar and its supplement will find them of material value as a guide in technical operations and as a compendium of facts affecting the rubber industry.

GUMMI-ADRESSBUCH, 1913. (RUBBER DIRECTORY, 1913.) UNION Deutsche Verlagsgesselschaft. Berlin. [8vo, cloth, 578 pages.]

The 11th edition of this directory of the German rubber industry has lately appeared in its accustomed form, displaying a steady increase in the number of names. As it will be recalled by those familiar with the work, the cities of Germany are classified in alphabetical order; in each case the separate sections of the trade showing the names of the local houses in the different branches. The names in each city are thus concentrated, the handy little volume being therefore specially adapted for use by those personally visiting the centers of the German rubber industry.

A separate section is devoted to Austria-Hungary, filling 16 pages, arranged in the geographical order of the cities and towns referred to. A number of advertisements are interleaved or appear in the body of the text. Any one wishing to arrive at the details of the German manufacture and distribution of rubber and asbestos goods will appreciate this directory for its completeness.

RUBBER STOPPERS IN CHAIR LEGS.

A man out in California with an inventive turn of mind writes to "Popular Mechanics" that he has discovered a very inexpensive way of preventing chairs from marring the floors. He gets four rubber stoppers and then bores a hole the size of the stopper in the lower end of each chair leg, and inserts the stopper so that it projects slightly below the wood. This is something that anybody with an auger the proper size can do for himself.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE reports of the Akers Committee, though of primary interest to Brazilian politicians and people, have been followed with considerable interest by manufacturers in Europe. Popular though Eastern plantation Pará has become for very many purposes, there still remain many purposes for which the Brazilian product is considered indispensable, and it would seem inevitable that it must command a considerably higher premium in the market in the near future than is at present the case. A prominent manufacturer in conversation with me recently, confidently predicted the price of 2s. per lb. for plantation Pará in the not distant future, and expressed the opinion that in order to compete, the Brazilian merchants will have to pay their gatherers at a higher rate and considerably reduce the present remuneration of officials, capitalists and other go-betweens. Of course one must take into account the prospective advantages to be derived from the Madeira-Mamoré railway, a railway which is now familiar to British investors—or perhaps I ought to say underwriters—owing to recent financial developments on this side.

THE FUTURE OF BRAZILIAN PARA.

A point in the report which I have seen criticized in various papers is the proposal to start rubber works in Brazil with Government assistance. Quite apart from any considerations as to the suitability of the climate, there is no doubt that European rubber manufacturers look with apprehension upon the probable loss of some profitable export business. It is probably correct to say that as regards value mechanical rubber goods, largely for railway use, are the most important of our rubber exports to South America, these being followed by waterproof garments and tires. How the position stands with Continental countries or the United States I have no information, but our manufacturers are certainly not enamored of the idea of rubber manufacturing in the South American countries, though they extract a few crumbs of comfort from the assertion that the competition will take several years to make itself seriously felt. The first factory, I understand, is being put up at Bahia; machinery being already despatched from England.

In the Russian supplement to the "Times," published on March 28, appeared an interesting contribution by V. P. Krymoff on the manufacture of rubber goods in Russia Owing to the system of protection, coupled with the possession of two very large factories, the imports of rubber goods into Russia are described as insignificant, while the exports have shown a large increase. The daily output of goloshes at the "Prowodnik" works now amounts to the huge total of 42,000 pairs. Solid cab tires are made and used in Russia in numbers far exceeding all other countries. On the other hand the automobile tire trade has not yet achieved any great proportions, though rapid progress is being made at the present time. It appears that compared with some of the American states, the proportion of motor vehicles in Russia is only 1 to 100 other vehicles. Rubber sponges are stated by the writer to be virtually a monopoly, which, whatever may have been the case twenty years ago, seems rather surprising, now that the manufacture is carried on in several other countries.

THE INDUSTRY IN RUSSIA.

The writer does not refer to Russian reclaimed rubber, the export of which in large quantities to England is a very sore point indeed with English reclaimers. It is, of course, generally known that there is an export duty on Russian goloshes going to England and America. This is sufficiently high to bar their use in England as raw material for reclaiming, and as there is no export duty on Russian reclaimed rubber to England this is proving a serious competitor to reclaimed stock of similar quality made in England. Indeed the situation is such that I hear rumors of an important English reclaiming works proposing to erect a branch factory in Russia. Outside reclaimed rubber I don't know that the imports of Russian rubbers into England occasion home manufacturers any disquietude. As far as footwear is concerned the competition seems to be practically limited to America. Perhaps the Russian goods cannot compete with the American in price; certainly, as far as old goloshes for reclaiming are concerned, the quality of the rubber is superior to that of the American. With regard to Russian goods in England I ought to add that quite recently motor tires have been coming over in quantity and of a quality to make their competition felt by home manufacturers.

Early in the morning of March 12, the works of the Mersey Rubber Reclaiming Co., Ltd., of Stockport were entirely gutted by fire, and the business of the company has for the present been brought to an abrupt stop. The works in the main consisted of a four-story mill, formerly used in the textile industry. The fire appears to have started on the top floor, where the drying screens were situated, though the actual cause remains a mystery, nothing wrong having been noticed by the night watchman who had quite recently visited the rooms. The loss to plant and rubber, of which there was a large stock, may be put at about £12,000; electrical driving gear having only quite recently been installed. This loss is fully covered, I understand, by insurance, and so also is the mill. The Mersey company was established about two and one-half years ago, and as they were well booked up with orders for several months ahead, the fire is a most unfortunate occurrence. At the moment I cannot say definitely what will be done in the future, but I understand that recommencing the business on another site is a matter now under the consideration of the directors.

DISASTROUS FIRE.

Like the matter of the new King who is to preside over the destinies of Albania, there is considerable discussion and uncertainty about the personality of the new chairman of the above association. Colonel Birley has now held office for nearly two years, the ordinary term of one year having been extended by general request. If what I hear is correct, some difficulty is being found in deciding upon his successor, not from any rush of applicants, but because those approached have begged to be excused. Compared with what is known—at any rate in this country—as the American Rubber Trust, our manufacturers' association has always suffered from the fact that important works like the Silvertown, North British, Dunlop and Warner, have remained outside its membership though without in any way acting antagonistically towards it. The salesmen in America, I understand, have a definite price and stick to it, while here, despite the issue of notices as to this or that advance in price by the association, individual members have confessed to an uneasy feeling that their competitors do not always quite play the game. This is a delicate matter to which I only refer in a spirit of detachment, as being quite outside my personal ken. It is, of course, well known that the proceedings of the association are not communicated to the press, a matter which has in the past been adversely commented on by our London contemporary. With regard to the conduct of affairs I may say that general meetings of the members are only called at irregular intervals, the main business being attended to by a standing committee of half a dozen and a secretary.

THE INDIA RUBBER MANUFACTURERS' ASSOCIATION.

The 1913 revised druggist sundries list has just been issued

(end of March) from the London premises, 117 to 123 Golden Lane, London, E. C., and the type and illustrations are of their usual excellence. The general trend of the alterations in price is downward, an important reduction being in the case of the De Vilbies range of atomizers.

THE B. F. GOODRICH CO., LIMITED.

A new pencil-mark eraser, to take the place of the well-known rubber brand, is now on sale at our stationers' shops, coming, I understand, from Germany. Whether this has anything to do with the recent fall in price of rubber, I do not know, but at any rate, I have met people who say they prefer the new substance to rubber. A block of the following approximate dimensions sells for one penny: 2 in. x ¾ in. x ½ in. thick. It is evidently made of some solidified oil with mineral matter of a soft texture, which does not remove the gloss on the paper.

NEW ERASER.

This company whose works are at Ordsall Lane, Manchester, have recently completed the extensions to their balata belting plant, and are now busily engaged in extensions to their mechanical rubber department. Owing to contiguity to house property, and the difficulty of getting more ground space, some of his passages, where a knowledge of rubber machinery on the American girder and concrete principle. This work when completed will afford room which is very necessary for the expansion in the mechanical rubber business to which branch the company largely confines itself.

THE IRWELL AND EASTERN RUBBER CO., LIMITED.

"Celluloid, Its Manufacture, Application and Substitutes," is the title of a new and important work by Masselon Roberts and Cillard. It has been translated from the French by H. H. Hodgson, and published by Griffin & Co., London, at 25s. net. As the first book, I believe, published in English on the celluloid industry, and at any rate, the most modern and comprehensive, I may perhaps be allowed a few lines in this correspondence to congratulate the authors on having achieved a somewhat difficult task, and it would not surprise me if he met with criticism in of course, familiar to many rubber men by reason of its connection with our Parisian contemporary "Le Caoutchouc et la Gutta Percha," in which paper considerable attention has all along been paid to the celluloid industry. In drawing attention to the paucity of literature on the subject the authors make no reference to the important work of E. C. Worden, of Milburn, New Jersey, published in 1911; which, dealing with the nitro-cellulose industry, devotes 205 pages to celluloid alone.

CELLULOID.

Celluloid is an intimate mixture of nitro-cellulose and camphor, and in the earlier chapters of the book nitro-cellulose, the rationale of its nitration and the various commercial nitration processes, are fully treated, with a wealth of mathematics, which will probably prove disconcerting to many readers. Those, however, who are in a position to understand the mathematics will recognize their importance, and will not enroll themselves among those who may be inclined to think them out of place in a volume of this sort. The celluloid industry has attained considerably more prominence in France and Germany than is the case with England and America, for which, and for other reasons, the book is almost entirely concerned with continental practice. The British Xylonite Co., for instance, finds no mention, though there are some references to American procedure.

Rubber men who are unfamiliar with the celluloid industry will be interested to notice so much similarity in plant, the rolling mill for instance in which the cellulose nitrate, steeped in the alcoholic solution of camphor, and mixed with various mineral or organic colors, is worked into uniform sheets, seems to differ in no essential from the rubber mixing mill. The block press again is very similar to that used in the fine cut sheet industry. The waste celluloid, i. e., cuttings from goods, corresponds to unvulcanized rubber waste and can be used again in large proportions. There is nothing corresponding to vulcanized scrap in the industry. The analysis of celluloid is stated to be very difficult, another point of similarity with rubber. Not unnaturally, under the circumstances of the authorship, reference is made to the advantages offered by the Dynamometer P. B. and the elasto-durometer, for making mechanical tests on celluloid. I must confess that I have never worn a celluloid collar, but goods of their class, made from what is commonly called American linen, seem to be largely manufactured in France and Germany in the celluloid works. The inflammability of celluloid naturally comes up for mention in the book, but as I do not feel inclined to discuss this important matter in a line or two, I leave it alone.

The book concludes with a limited notice of the proposed substitutes for celluloid, few of which the authors say have any real industrial value. The best future, they say, appears reserved for the acetates—which, by the way, are now being used in the "non-flam" film manufacture. Altogether the authors must be congratulated, in my opinion, in having produced a much needed and well written work. The translator has had by no means an easy task with a very great measure of success. The name Cillard is, some one-story buildings are being converted into three-story would have come to his aid in making rough places smooth.

BIG PROFITS IN WATERPROOF GOODS.

At the twenty-fourth annual meeting of J. Mandleberg & Co., recently held at Manchester, a dividend of 15 per cent. was declared. During the last fourteen years there had been an average distribution of 20 per cent. per annum; their investments having thus been returned almost three times to the original shareholders.

STATISTICS OF RUBBER CONSUMPTION.

The fluctuations of rubber consumption during recent years as quoted by Messrs. Hecht, Levis & Kahn are as follows:

	Quantity.	Increase.	Decrease.
	Tons.	*Tons.*	*Tons.*
1905/6	62,574	.....	.....
1906/7	68,173	5,599	.....
1907/8	62,376	.....	5,797
1908/9	71,089	8,713	.....
1909/10	76,026	4,937	.....
1910/11	74,082	.....	1,944
1911/12	99,564	25,482	.....

The remarkable increase of consumption in the last year reported upon, is the most interesting feature of this table.

REGISTRATION OF THE HANOVER RUBBER COMPANY.

The Hanover Rubber Manufacturing Co. has been registered in that city. Its object is the manufacture and sale of rubber goods. The capital equals $5,000.

THE BERLIN-FRANKFURT RUBBER WORKS.

The Berlin-Frankfurt Rubber Works report a satisfactory year for 1912. Advantageous purchases of crude rubber led to this result, which allows the payment of a 9 per cent. dividend.

NEW AUSTRIAN RUBBER FACTORY.

The "Fama" Rubber Manufacturing Co. has been registered at Vienna with a capital equalling $12,600. Its address is Rennweg 64.

EASTER EGGS OF RUBBER.

Easter eggs of rubber are reported to have been again in favor during the recent Easter season. They consist of an oval ball of rubber, containing a number of rubber toys. This new adaptation of rubber is being watched with interest by manufacturers of rubber toys in Germany.

RUBBER FLUCTUATIONS.

The Credit Colonial and Commercial, of Antwerp, the company which is continuing the business of the old firm of L. & W. Van de Velde, has issued a valuable chart, showing the fluctuations in rubber prices since 1893. Several comprehensive statistical tables deal, moreover, with the world's production and consumption during that period.

Gustav F. Hübener, of Hamburg, has published a large chart showing in graphic form the fluctuations in rubber prices since 1902, with a table going back to 1883; thus indicating thirty years' results.

PROPOSED GERMAN COLONIAL UNIVERSITY.

Since 1908 Germany has had a "Colonial Institute" at Hamburg in which a certain number of young officials in the Colonial Administration have received instruction in the languages, ethnology, zoology and botany of the varous colonies for which they are destined. It is now proposed to establish a regular colonial university at Hamburg, which will regard all outlying nations and civilizations as separate entities of the human race. This university will have chairs in colonial history, languages and sciences, and will work in harmony with the Colonial Institute.

CAPITAL IN STOCKS OF RUBBER.

German rubber manufacturers are said to have a large amount of capital invested in stocks of crude rubber. In the case of one leading concern, their stock of rubber in the crude state and in process is said to represent upwards of $400,000. Few other branches have to carry such large amounts of valuable raw material. This fact is quoted as illustrating the financial importance of the rubber industry.

STATISTICS OF JAPANESE TRADE.

NOW that the effects of the new Japanese tariff are being fully experienced, the statistics of Japanese imports for January, 1913, are of special interest, as compared with the returns for the three months ending January, 1912:

	Month of January, 1913.	Three months to January 31, 1912.
Dental rubber	$2,770	$432
Soft rubber—Rods and buds	4,779	6,978
do Plates and sheets	2,110	3,905
do Tubes	4,182	4,223
do Belts and belting (machinery)	2,800	904
do Thread	790	4,074
do Erasers	1,270	1,734
do Supplies	917	51
do Other goods	5,212	3,822
Other—Lumps, bars, rods, plates and sheets	4,882	1,174
Other forms	8,856	3,266
Cycle tires	28,669	26,647
Insulated wire (other than submarine, telegraph and telephone)	178,120	60,288
Cords (other than flexible)	8,393	34,310
Rubber boots	1,964	72
Overshoes	902	1,310
Waterproof tissues	1,522	2,394
Elastic webbings, etc.	2,968	2,193
Insulating tape	3,275	3,341
Totals	$264,381	$161,118

Bearing in mind that the figures referring to 1912 are for the three months ending January 31, which those of 1913 are for the month of January alone, it will be seen that a marked advance is taking place in Japanese importations. In soft rubber tubes the imports for the month of January are alone about equal to those for the three months ending January, 1912. The total for January, 1913, in the 19 divisions quoted is $264,381 as compared with $161,118 for the three months ending January, 1912.

Taking one-third of the last-named amount as representing the amount for the month of January, 1912, the result is about $54,000 or one-fifth of the amount shown for January, 1913. The purchases made in anticipation of the tariff of 1911 have evidently been used up, and the Japanese import trade is returning to a position of normal activity.

Japan is making progress in the export of insulated electric wires. The figures of January, 1913, equalled $5,060, against $3,166 for the three months ending January, 1912.

NOTES FROM BRITISH GUIANA.

(By Our Regular Correspondent.)

WEATHER conditions are still conducive to the successful prosecution of the balata industry. Scarcely a day passes but that there is a fairly heavy rainfall, and there are abundant indications that the long rainy season is upon us. The result is reflected in the exports, which for the first three months of the year are 198,888 lbs., against 23,810 lbs., for the same period last year, when industry generally was in a paralyzed condition owing to the parching of the earth by the drought.

The annual session of the legislature has now closed. The financial chamber has sat in Committee of Ways and Means and fixed the taxes for 1913-14. It will be some relief to those interested in the balata industry to learn that there has not been a whisper as to the revival of the export tax on balata. It will be recollected that when last year this export tax was taken off in response to a fairly whole-hearted protest, some members of the combined court held out the threat that the abolition of the tax must only be regarded as a temporary measure, that sooner or later the industry must be compelled to contribute more largely to the revenue. Since then the report of the Balata Committee has been issued, in which it was clearly demonstrated that the government is in reality heavily in debt to the balata industry. That probably has in itself been sufficient to scotch any proposal as to reviving the tax. In addition, the industry is certainly not in such a position that it can afford to pay any further imposts. On the contrary, it requires the most careful attention of the government, which it has not received at this session. The promised bill is still apparently in course of preparation. In the meantime the fact that the combined court has cheerfully consented to meet the deficit that is expected to accrue at the end of the financial year by drawing on the surplus fund, would appear to indicate that the balata industry need not fear any new raid from the tax-gatherer for some time to come.

The annual report of the Director of Science and Agriculture for 1911-12 has just been issued. Professor J. B. Harrison says, in the course of a comprehensive review of the condition of agricultural industry in the colony, that the rubber industry continues to expand. A total of 2,259 acres is now under rubber, of which 1,800 acres are estimated to be under Pará rubber. Prof. Harrison says, "Tapping has been continued on two estates and has been started during the year on another. The quality of the rubber has been good, and the yields are reported to be satisfactory. The growth of Pará rubber trees continues to be satisfactory when they are planted in suitable situations. It has been free from any serious pests or diseases during the year, and Pará rubber does not appear to have been very adversely affected by severe drought. The rate of growth was considerably reduced during the drought, but the plants remained in a vigorous condition, except in wind-swept situations in the coastal regions."

The speech of the new governor at the session of the legisla-

ture, recently closed, was listened to with interest, but it contained little of importance to the balata industry. Referring to this subject he spoke as follows:

"I have inspected several estates and small plantations of this product, but nowhere have I found the necessary care and attention being given to the planted area. This is a great disappointment to me for the few trees I have seen properly attended to prove, as might be expected, that this tree grows here as freely and satisfactorily as in the Eastern Hemisphere."

INTERESTING CORRESPONDENCE ON THE SUBJECT OF THE IMPORTATION OF PARA SEEDS.

Professor J. B. Harrison, Director of Science and Agriculture, sent the following letter to the Government Secretary on January 28: "Sir: With reference to my letter of the 3rd April, 1912, covering an indent on the government of the Straits Settlements for the supply of 150,000 Pará rubber seeds and your reply thereto, of the 10th April, 1912, I now have the honor to report that the germination results have not been quite as satisfactory as in former years. The records are as follows:

Dates of receipt, 1912.	No. of seeds received.	No. of seeds germinated.	Percentage of germination.
October 24	7,844	4,276	54.5
November 7	20,676	12,960	62.7
November 21	63,659	48,170	75.7
December 2	7,935	5,799	74.6
December 5	51,813	24,451	47.2
Total	151,927	95,656	62.9

"The seeds received on December 2 were part of the shipment, the bulk of which came to hand on November 21. These seeds were left by the postal authorities at Trinidad, and thence were eleven days longer than necessary in transit. In every case the packing was all that could be desired, hence the lower average rate of germination appears to have been due to defects latent in the seeds when packed. These defects may have been caused by the prolonged droughts which affected many parts of the tropics in 1911 and 1912."

The Assistant Government Secretary sent the following letter to the Colonial Secretary of the Straits Settlements: "I am directed by the Governor to transmit herewith, copy of a letter from the Director of Science and Agriculture with regard to the Pará rubber seeds imported from the Royal Botanic Gardens, Singapore, and to say that this government is fully satisfied with the results, which show that these seeds can, by the method adopted by the Straits Settlements Botanic Department, be cheaply sent to the most distant places and yet give excellent germination results."

The annual report of the Institute of Mines and Forests, which has just been published, raises many points of the greatest interest to those engaged in the balata industry. One matter that occasioned some difficulty was a point raised by the Secretary, as to whether it is the duty of the institute to take out warrants and arrest laborers, without using any discretion and merely at the request of any employer; if so, in case of failing to prove the charge, and an action for damages is brought, is the institute liable in any way? Mr. Payne held on this point, of so much importance to employers, that as the institute acts as the agent of the employer and engages employes out of monies placed at its disposal by employers, it is its duty to proceed against the breaker of the contract in the absence of some exceptionally complete and satisfactory explanation. When the services have been embarked upon, however, the employe is also entitled to claim the assistance and protection of the institute, and the institute is entitled to and should use discretion, and liability to an action subsequently would depend upon the circumstances of each case.

The Secretary of the Institute wrote to the Government Secretary with regard to an ordinance under which nothing excused a laborer for leaving his employment, not even sickness or the absence of work, objecting to its injustice. Large gangs of men had been sent to work on places improperly prospected, where there was not sufficient work for half the number of men sent. Laborers coming to town under these circumstances before the expiration of the contract were liable to imprisonment, although in some cases they had been at the grant six months without earning sufficient to repay advances.

A letter was also sent to the government regarding better means of communication with the upper reaches of the Essequibo, a vital matter for the balata industry, suggesting an overhead ropeway from a point below Waraputa Falls, to which launches run in all seasons, to a point above King William Falls. The power to work this, it was suggested, could be obtained from the various falls met with *en route*. It was estimated that the journey would then occupy 12 hours instead of 12 days as at present. The government replied asking to be "furnished with some information as regards the probable amount of traffic to be dealt with at present and in future" and also with respect to "the number of persons who would be benefited by such a scheme." Nothing appears to have been done in the matter, since no concrete proposal has been put forward.

With regard to the labor question, the report states "It is regretfully to be put on record that the labor troubles, which were acute during the period on which we last reported, have not by any means subsided to normal conditions. When a system of advances to laborers is practised, there will always be found absconding, and other irritating and annoying circumstances. The mutual confidence that existed between capital and labor in the past has not been fully restored. There is every reason to believe however, that labor difficulties will be gradually overcome, and that we shall soon see a change for the better in the relation existing between employers and employes." The institute statistics show that the percentage of absconders contracted through the institute, as indicated by the warrants issued, was 3.66 per cent. of the number employed in the balata industry, as against 1.94 per cent. in the mining industry, and 1.37 per cent. in other industries.

THE BATAVIA RUBBER EXHIBITION OF 1914.

The program just received of the 1914 International Rubber Exhibition and Congress, at Batavia, show the latest arrangements prospectively made. Opening September 8 and closing October 10, the exhibition in this term of nearly five weeks will give ample time for the study of the display, while its technical interest will be largely concentrated in the Congress, lasting from September 7 to September 12; particulars of which appeared in the April issue of this journal.

The exhibition will be divided into thirteen sections, where the various exhibits will be properly grouped so as to show the botany, cultivation, preparation and packing of rubber, in fact, all its phases from the time it leaves the tree until it is ready for market. The subsequent stages of washing, vulcanizing and manufacturing are dealt with in a special section, confined to manufactures; with a view of both the crude rubber and the finished product being shown.

Other special sections include wild rubber and substitutes, gutta-percha and balata. The literature of rubber, its commerce and statistics are likewise under their respective heads. Applications for space should reach the General Secretary, Koningsplein, Batavia, Java, by November 1, 1913.

While the exhibition will undoubtedly do much by its international features, to attract those specially interested in crude rubber, it will at the same time afford the American manufacturer an opportunity of reaching with his products the teeming populations of the Far East. Java has a population of nearly 30 millions and Sumatra three millions. Numerous visitors may be looked for from other parts of the East, who would be possible, if not actual, buyers of rubber goods.

Some Rubber Planting Notes.

THE GROWTH OF MALAYAN RUBBER SHIPMENTS.

STATISTICS for the first three months of the present year as compared with 1912 and 1911, show a steady increase in the rubber exports of the Federated Malay States. The figures are:

	1911.	1912.	1913.
January	1,329,170	2,730,576	4,787,280
February	1,490,849	2,715,767	3,936,529
March	1,916,219	3,089,583	3,890,880
Total pounds	4,736,238	8,535,926	12,614,689

It will be remarked, however, that the returns for February and March, 1913, show a retrogression from that of January.

A supplementary return from the Colonial Secretary, Singapore, shows exports from the Straits settlements ports during March, 1913, as 2,008,533 lbs., as compared with 1,584,267 lbs. in February. These figures, in addition to rubber from the colony, include trans-shipments, but do not include rubber exported from the Federated Malay States.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY (FEDERATED MALAY STATES).

According to the report for 1912, the crop was 706,945 pounds, as compared with 352,688 pounds in 1911. The gross price obtained was 4s. 3.17d. per pound, against a cost of 1s. 10.52d. Estimate for this year's crop is 947,000 pounds. Total area planted is 6,749 acres. A dividend of 50 per cent. has been declared.

RUBBER ESTATES OF JOHORE.

The report for 1912 presented to the seventh annual meeting of this company shows a crop of 106,261 pounds, against an estimate of 90,000 pounds. For the current year the estimate is 230,000 pounds. Cost, including selling charges, was 2s. 9.84d. per pound, and price realized was 4s. 3.18 d. per pound. The total area planted is 14,942 acres; the dividend paid being 5 per cent.

ANGLO-MALAY RUBBER CO.

According to the report for the year 1912, the total crop for the year was 943,491 pounds, against 780,972 pounds in 1911. Cost of production f. o. b. was 1s. 8.78d. per pound, against 1s. 8.52d. in 1911. The gross price realized was 4s. 3.36d. per pound; and the total cultivated area is 4,318 acres. A dividend of 60 per cent. was declared for the year 1912. For the current year the crop estimate is 1,150,000 pounds.

THE VISIBLE SUPPLY OF RUBBER.

At the annual meeting of the Golden Hope Rubber Estates, Mr. James Lloyd Anstruther, chairman of the company, quoted the total visible supply of rubber on April 1 as having been: 1911, 12,738 tons; 1912, 10,698 tons, and 1913, 12,978 tons. London deliveries of plantation rubber for the month of March had been in excess of the receipts; the respective quantities being 2,614 and 2,443 tons.

SELABA RUBBER ESTATES (FEDERATED MALAY STATES).

The crop for 1912 was 319,595 pounds, which realized 4s. 4.64d. per pound, against a cost of 1s. 10.53d. per pound. A saving of 5d. per pound had been effected as compared with last year in the cost of production. A dividend of 28 per cent. has been announced.

BIKAM RUBBER ESTATE (FEDERATED MALAY STATES).

The crop for 1912 amounted to 153,295 pounds, which realized 4s. 5.89d., as compared with a cost of 2s. 7.36d. per pound; the planted area being 993 acres. A dividend of 18 per cent. has been declared for the year.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES.

The report for the year 1912 shows a crop of 14,301 pounds, costing 1s. 0.82d. per pound, which realized 4s. 0.07d. per pound.

SOUTH AFRICAN CRUDE ASBESTOS.

According to an official statistical return, the South African exports of crude asbestos for four years are as follows:

	Total.	Proportion shipped to Germany.
1908	$111,140	$50,550
1909	138,755	67,525
1910	140,650	65,655
1911	139,890	65,370

United States importations for the four years represented:

1908	$1,115,800	1910	$1,122,085
1909	1,021,390	1911	1,318,539

The American importations were almost entirely from Canada, while Germany and Russia furnished in 1911 manufactured asbestos to the amounts, respectively, of $12,616 and $10,928.

GOLD COAST AGRICULTURAL DEPARTMENT.

In amplification of the annual report for 1911 reviewed in the February number of the INDIA RUBBER WORLD, the Agricultural Department of the Gold Coast Colony has issued a short history of its institution and development. Since 1890 the number of its agricultural stations has grown from one to nine; while the distribution of Pará seeds has increased since 1904 from 55,000 to 300,000 in 1910, and that of plants from 12,000 in 1906 to 29,000 in 1910. The total staff has risen in number from 2 in 1890 to 27 in 1911.

ENGLISH ENTERPRISE IN GERMAN EAST AFRICA.

"Manihot Rubber Plantations" is the style of an English company, registered nearly three years ago with a capital equaling $250,000, for the acquisition of two estates aggregating 1950 acres, about 18 miles from Tanga, German East Africa. According to the report issued December, 1911, it was expected to complete by the following March the planting of 350,000 *Manihot* trees; a sufficient acreage remaining unplanted for a further 150,000 trees.

While some 300,000 trees on the younger plantations are expected to begin coming into bearing towards the end of the present year, the results obtained from trees already matured have been sufficiently favorable, to encourage the company to arrange for dealing with the larger yield anticipated for 1914 and succeeding years. The resident manager reports that he is now engaged in removing the rubber cleansing factory from Tanga to the plantations, which will permit of the cleansing taking place immediately after tapping; with an anticipated improvement in the condition and color of the "Manihot crepe" produced.

RUBBER GROWING IN COCHIN.

A Cochin planter writes the "South of India Observer," that there are about a dozen rubber estates opened in the Cochin States, under a contract of 50 years, with certain conditions. He adds that in view of the exorbitant expenses of rubber cultivation, while the price of rubber is going down every now and then, and with artificial rubber over our heads like a sword of Damocles—the Cochin government should be a little more farsighted. The writer of the letter suggests that it should consent to receive at present only about one-half of the contract amount, which would be a great boon to rubber planters in Cochin, and would furnish a good incentive for more openings.

According to the latest accounts, there are now 37 rubber planting companies in South India, against 34 a year ago.

PROPOSED TROPICAL COLLEGE FOR CEYLON.

AT one time the mere gathering of tropical produce brought wealth to the discoverers, but now-a-days systematic and scientific cultivation is imperatively needed. Special training is moreover required, as the most efficient agriculturist of the West, when called to reside in the East, has to start his agricultural education afresh, building up his knowledge by experience.

The prominence given to the subject of a Tropical Agricultural College through the article in the London "Times," referred to editorially in the April issue of this journal, has attracted attention in the East. The Ceylon "Observer," in commenting on the proposition of such a college in the West Indies, remarks:

"The idea of such a university is one worthy of every support, for its success would mean profitable employment for those in the tropical zone and those at home. The scheme is full of possibilities, and it is to be hoped, will materialize. . . . Rubber is a case in point."

Meanwhile it is of interest to note, that an effort is being made in Ceylon to secure the Tropical College for that island. A strong and representative committee has been formed, which has held several meetings with that object in view. A memorandum had been drawn up urging that Ceylon is the most centrally situated tropical possession of the British Crown and therefore the most convenient center in the East for the college, with, moreover, its tropical planting industries at hand.

Peradeniya, it is remarked, is already a center of study, research and instruction, and would be the most suitable location for the college, which would subsequently become one of the colleges of the University of Ceylon, when the latter was established in the course of time. A site of 40 acres had been reserved for college buildings on this experimental station, which covers 500 acres. Rubber, tea, cocoa and cocoanuts are now grown on plantations, while experiments are conducted with a variety of other product. With this view, the raising of a fund to go towards the endowment of such a college was proposed in the memorandum.

On the suggestion of Mr. E. Rosling, a cable was drafted to the London "Times," drawing attention to the meetings and to Ceylon's reasons for asking for the college. The memorandum referred to was drawn up by Mr. R. N. Lyne, the Director of Agriculture.

OFFICIAL REPORT ON CEYLON EXHIBIT AT NEW YORK.

IN the April number of The India Rubber World reference was made to the report of Mr. Leonard Wray, the Malayan Commissioner, upon his section at the New York exposition. Since then the report of Mr. F. Crosbie-Roles, the Ceylon commissioner, dealing with the exhibit under his charge, has come to hand in the "Times of Ceylon," of which he is editor.

In his opinion, the New York International Rubber Exposition was a decided success from the plantation-producers' point of view. He adds, that as all plantation rubber is called Ceylon rubber by the trade in America, it would have been lamentable had the island not participated in the first exposition in the country of largest consumption. He refers to the rubber-testing machines of the Bureau of Standards, Washington; suggesting that it would be desirable to offer that department samples of first grade Ceylon rubber, with a view to best plantation being mentioned in future specifications, for which hard fine Pará continues to be the sole standard.

Reference is made to the commissioner's efforts to promote the establishment of a fast line of steamers from Ceylon to the Atlantic ports of America, in view of the largely increased shipments of rubber and other produce. The British Consulate General at New York had promised to do all in its power to facilitate trade between Ceylon and America.

With reference to the question of direct trading as compared with purchases for America through London, Mr. Crosbie-Roles remarks that the increased consumption of plantation rubber is what all planters desire, and that it will soon be demonstrated whether London can maintain its position as the chief medium between the East and West.

With regard to the American consumption of rubber, the commissioner expresses the opinion that America will want all Ceylon can supply; adding that there would be a great improvement in evenness of quality as the trees matured, and as the output of the individual plants became larger manufacturers would also better understand plantation rubber.

Many other features of the exposition and conference are likewise dealt with in this interesting report.

PLANTERS' ASSOCIATION OF CEYLON.

RUBBER occupied a leading position among the subjects dealt with at the recent annual meeting of the Planters' Association of Ceylon, when the fifty-ninth yearly report was presented.

During the past season new clearings had not been extensive; operations of this character having been chiefly limited to clearing and planting by the small native land owners. Owing to the S. W. monsoon having been abnormally heavy, tapping was carried on with difficulty in certain districts, with a consequent loss of crop.

While pricking is still in vogue in some cases, tapping is principally restricted to paring. The importance is emphasized of only cutting bark, which is completely renewed. Differences of opinion have prevailed as to thinning out; there being some advocates of a maximum number of a hundred trees per acre, while others claim that 150 or even 200 trees to the acre can be grown if kept in a high state of cultivation.

With regard to preparation, a tendency is recorded towards the smoke cure; the benefits of which consist in the action of the constituents of the smoke, directly upon the proteid matter contained in the rubber latex. It is considered necessary to retain as much proteid matter as possible in the prepared rubber. The report continues:

"This question is an important one, if plantation rubber is to compete, quality for quality, with the product of the Amazon which is at present the acknowledged standard. There is undoubtedly room for a large amount of research work in this connection, together with the invention of machinery and appliances to carry it out economically and on practical lines."

Total shipments of Ceylon rubber had been: 1909—1,372,416 pounds; 1910—3,298,652 pounds; 1911—7,154,658 pounds; 1912—15,001,075 pounds.

Reference was made in the report to the benefits Ceylon might anticipate from participation in the recent New York exposition.

In addressing the meeting, Mr. G. G. Bliss, the retiring chairman, moved the adoption of the report and referred to the services rendered planting interests by Sir Henry McCallum, the retiring governor, particularly through the creation of an Agricultural Department. He likewise alluded to the benefits the planting community would receive from the appointment of Mr. R. N. Lyne, as head of that department.

Among other subjects, the question of motor transport was discussed; a committee being appointed to deal with the matter, in its relation to Ceylon planting interests.

INCREASED YIELD OF LUMUT ESTATES.

At the recent annual general meeting of this company, it was stated that the original estimate of 60,000 pounds of rubber for the year 1912 had been more than doubled in the actual yield, which amounted to 139,000 pounds. The estimate for the current year is about 250,000 pounds.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED MARCH 4, 1913.

NO. 1,054,679. Demountable rim for resilient wheels. S. A. Currin, Bristol, England.
1,054,692. Automobile wheel. G. A. Imhoff, Carrington, N. D.
1,054,696. Fountain-mop. I. L. Lewis, Syracuse, N. Y.
1,054,762. Automobile pump. R. A. Goeth, R. B. Rodgers and J. A. Dittmar, San Antonio, Tex.
1,054,802. Instrument used for diagnostic purposes in obstetrical practice. Harry Spiro, San Francisco, Cal.
1,054,820. Tire with detachable tread. J. A. Bowden, Los Angeles, Cal.
1,054,842. Hose-coupling. A. Heimerman, Syracuse, N. Y.
1,054,863. Gasket. C. S. Parker, London, Ontario, Canada.
1,054,935. Governing mechanism for elastic-fluid turbines. M. M. Pearson, assignor to General Electric Co.—both of Schenectady, N. Y.
1,054,980. Tire attachment. R. L. Morgan, Worcester, Mass.
1,055,029. Vehicle-wheel. G. L. and H. C. Garrett, Richmond, Indiana.
1,055,111. Crutch tip. W. R. Wilcox, Ypsilanti, Mich.
1,055,118. Elastic supporter. A. V. Ziegler, Los Angeles, Cal.
1,055,283. Spring-hub wheel. E. Kreh, Mare Island, Cal.

Design.

43,673. Golf-ball. A. Johnston, Edinburgh, Scotland.

ISSUED MARCH 11, 1913.

1,055,326. Drilling-cable. T. Gore, New York.
1,055,333. Resilient wheel. E. J. Kreis, Mendota, Ill.
1,055,372. Tire-armor. A. Turnbull, Glasgow, Scotland.
1,055,404. Saturating machine. F. W. Kremer, Rutherford, N. J.
1,055,430. Machine for treating coated fabrics. A. Thoma, Cambridge, Mass., assignor to Clifton Mfg. Co., Jersey City, N. J.
1,055,444. Pneumatic slack-adjuster. C. P. Cass, Maplewood, Mo., assignor to The Westinghouse Air Brake Co., Pittsburgh, Pa.
1,055,472. Tire. M. L. Keagy, Canton, Ohio.
1,055,477. Hose-coupling. E. J. Lombard and O. L. Krogstad, Hudson, Wis.
1,055,496. Vehicle wheel-rim. E. C. Shaw, assignor to The United Rim Co.—both of Akron, Ohio.
1,055,507. Pen. C. F. Backmyer, Chicago, Ill.
1,055,573. Tire. H. C. Tripp, Auburn, N. Y.
1,055,696. Wheel-rim. F. R. Barker, assignor to J. C. Lewis.—both of Boston, Mass.
1,055,709. Automobile-wheel. W. W. Cheeseman, Cincinnati, Ohio.
1,055,750. Resilient wheel. R. J. Hughes, Houston, Tex.
1,055,774. Pneumatic tire casing. N. W. McCleod, assignor to American Tire Co.—both of St. Louis, Mo.
1,055,895. Resilient wheel. W. J. Faber, Oneida, N. Y.
1,055,946. Attachment for fire nozzles. C. Scheer, Silverton, Col.

Design.

42,701. Vehicle-tire. H. J. Richards, assignor to The L. & M. Rubber Co.—both of Carrollton, Ohio.

Trade Marks.

56,372. Condensite Co. of America, Glen Ridge, N. J. The word *Condensite.* For solid plastic compounds, etc.
58,948. Weissfeld Bros., New York. Illustration of a globe map. Rubber aprons, etc.

ISSUED MARCH 18, 1913.

1,056,010. Plastic packing. F. A. Dailey, St. Paul, Minn.
1,056,013. Tire-vulcanizer. C. I. Dodson, Pittsburgh, Pa.
1,056,033. Pneumatic cleaner. J. Kubosch, Milwaukee, Wis.
1,056,082. Anti-skid device for wheels. F. Young, Newark, N. J.
1,056,109. Vehicle-wheel. W. B. McFadden, Syracuse, N. Y.
1,056,113. Feeding-bottle. E. Watkin, Morgan, Wyomissing, Pa.
1,056,136. Demountable rim. A. Denis, Springfield, Mass.
1,056,167. Cushion-tired wheel. N. Gratz, Boise, Idaho.
1,056,184. Hose-coupling lock. F. T. Kitchen, West New Brighton, N. Y., assignor to Gold Car Heating & Lighting Co., New York.
1,056,188. Hose clamp. Sidney J. Linton, Groveland, N. Y.
1,056,208. Hose rack. C. Nuhring, Cincinnati, Ohio.
1,056,278. Vehicle wheel. T. B., K. E., C. T. and H. W. Jeffery, Kenosha, Wis.
1,056,390. Aeroplane. P. Anderson, Freeport, and Aage Nielsen, New York, assignors to Anderson-Nielsen Airship Co., New York.
1,056,506. Air hose coupling and uncoupling tool. C. L. Courson, Pitcairn, Pa.
1,056,521. Spring vehicle wheel. W. H. Fahrney, Chicago, Ill.
1,056,539. Fountain pen. G. W. Heath, Newark, N. J.
1,056,554. Resilient wheel. J. Kohler, Chicago, Ill.
1,056,591. Vehicle wheel. W. E. Schilling, Kansas City, Mo.
1,056,597. Cushion wheel. W. D. Simpson, Columbia, S. C.
1,056,617. Bicycle pump. E. B. Wright, St. Helena, Cal.
1,056,642. Anti-slipping device for vehicle wheels. W. P. Deonier, Harrah, Okla.
1,054,664. Automobile wheel. G. L. Griffith, Blockton, Iowa.
1,056,726. Tube for automobiles, bicycles and the like. E. J. Andrieu, Roubaix, France.

Trade Marks.

62,087. Gold Medal Water-Proofing Co., Oakland, Cal. The word *Walrus.* For water proof coats.
63,876. Frank Duttenhofer, Cincinnati, Ohio. The words *Cincinnati Gasket & Packing Co.* in circle. Metallic, gum and other gaskets, etc.

ISSUED MARCH 25, 1913.

1,056,828. Ventilating cushion for boots and the like. W. B. Price, New York, assignor to Sponge Rubber Inner Heel Co., New York.
1,056,844. Aeroplane. J. T. Simpson, Newark, N. J.
1,056,976. Vehicle tire. B. H. Devine, Utica, N. Y.
1,056,977. Tire. B. H. Devine, Utica, N. Y.
1,056,988. Respirator. S. W. Greene, East Greenwich, R. I.
1,056,994. Vehicle wheel. V. J. Hultquist, Bellevue, Pa.
1,057,002. Elastic fluid turbine. T. J. Loftus, Castella, Cal.
1,057,083. Vehicle tire. M. C. Overman, New York.
1,057,108. Overshoe holder. E. J. Akins, Moundsville, W. Va.
1,057,164. Tire. J. H. Messenger, London, England.
1,057,232. Tire. J. R. Gammeter, assignor to The B. F. Goodrich Co.—both of Akron, Ohio.
1,057,333. Method of attaching rubber to metals. L. Daft, Rutherford, N. J., assignor to Electro-Chemical Rubber & Mfg. Co., New Jersey.
1,057,388. Emergency automobile tire. F. L. Bigsby, Kirksville, Mo.
1,057,396. Hose supporter stud. R. Gorton, Newton, Mass.

Design.

43,738. Hoof pad. J. H. Curley, Brockton, Mass.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MARCH 5, 1913.]

24,899 (1911). Rubber steps for vehicles. A. Upton, 21 Albert Road, Peckham, London.
24,915 (1911). Treating bunions. F. J. Scholl, 5 Manchester avenue, Aldersgate street, London.
25,020 (1911). Inflation of motor vehicle tires. R. A. Rogers, St. Cleer, Wilton Park Road, Shanklin, Isle of Wight.
25,066 (1911). Veil fastenings. G. Barnett, 36 Dunsmure Road, Stamford Hill, London.
25,102 (1911). Tread bands. W. Long, 48 The Avenue, Southampton.
25,129 (1911). Detachable linings for mackintoshes. A. E. Tarbuck, Ness Holt, Ainsdale, and G. B. Carr, 537 Land street, Southport—both in Lancashire.
25,134 (1911). Medical compresses. R. D. Johnson, Bagshot House, and E. S. and H. B. Hudson, Pengelly—both in Bush Hill Park, Enfield, Middlesex.
25,201 (1911). Jointing rubber articles. H. Gare, 230 Bristol Road, Edgbaston, Birmingham.
25,213 (1911). Wheel for dealing cards. H. Hurm, 14 Rue Jean Jacques Rousseau, Paris.
25,248 (1911). Spring wheels with pneumatic cushions. A. Roe, 5 Waterloo Square, Anna Valley, Andover, Hampshire.
25,256 (1911). Coagulation of rubber latex. A. C. Davidson, Sirocco Engineering Works, Belfast, Ireland.
25,286 (1911). Plastic compositions. R. H. Pybus, 74 Kedleston Road, and E. M. Pybus, The Old Lodge, Markeaton street—both in Derby.
25,329 (1911). Jackets and covers for wheel tires. E. Dankmann, 10 Catharinen Canal, St. Petersburg.
25,333 (1911). Anti-skid device on twin tires. A. Bosshard, Arbon, Switzerland.
25,360 (1911). Tire attachments to rims. L. Scaglia, 4 Rue Neuve, Nyon, Switzerland.
25,449 (1911). Plastic compositions. W. Plinatus, 8 Xantenerstrasse, Berlin.

*25,453 (1911). Pneumatic cushions for wheels. A. J. Wolff, Hartford, Conn., U. S. A.

[Abstracted in The Illustrated Official Journal, March 12, 1913.]

25,541 (1911). Repairing patches for boots. Deutsche Gummiwaren-Industrie, O. Schlappig & Co., and O. Schlappig, 10 Lorettostrasse, Dusseldorf, Germany.

25,637 (1911). Making pneumatic tires, etc. F. H. Rushton, 158 Grimsby Road, New Cleethorpes, Lincolnshire.

25,747 (1911). Detachable rims. E. F. and G. W. Goodyear Reliance Works, Dudley, Worcestershire.

25,782 (1911). Pneumatic cushions in wheels. J. Algie, 6 Algonquin avenue, Toronto, Canada.

25,805 (1911). India-rubber substitutes. W. Plinatus, 39a Kornbergstrasse, Stuttgart, Germany.

25,845 (1911). Mud guards for wheels. C. Stride, Summersdale, Chichester.

25,872 (1911). Pneumatic cushions in wheels. C. Stride, Summersdale, Chichester.

25,882 (1911). Rubber and canvas tubes. W. E. Carmont, 55 Queen's Road, Richmond, Surrey.

25,883 (1911). Rubber insertions for tires. W. E. Carmont, 55 Queen's Road, Richmond, Surrey.

25,931 (1911). Detection of punctures. G. H. E. Cooke, 17 St. Edmunds Terrace, Regents Park, London.

25,942 (1911). Making cycle rims. G. W. Dawes, Monastery Bldgs., Upper Priory, Birmingham.

25,993 (1911). Fabric foundations for tire covers. H. Theis, 13½ Viktoriastrasse, Cassel, Germany.

26,016 (1911). Making pneumatic tires. P. A. Newton, 6 Breams Bldgs., Chancery Lane, London.

26,049 (1911). Air tubes and chambers. St. Helens Cable and Rubber Co., Arpley, and G. W. Price, 182 Wilderspool Causeway—both in Warrington, Lancashire.

26,121 (1911). Vehicle wheels. G. Hookham, and J. A. Harrison, 7 New Bartholomew street, Birmingham.

[Abstracted in The Illustrated Official Journal, March 19, 1913.]

26,285 (1911). Pneumatic treads. D. Marshall, 30 Winchcombe street, Cheltenham.

26,424 (1911). Boot protectors. R. Stelling, 17 North street, Scarborough.

26,479 (1911). Horseshoes. R. G. W. Pockett, Daisybank, Leckhampton, Gloucestershire.

*26,591 (1911). Detachable rims. B. C. Ball, 482 Harrison street, and L. E. Younie, 71 Seventh street—both in Portland, Oregon, U. S. A.

*26,612 (1911). Compound fabric for pneumatic tires. L. A. Subers, 1722 E. 85th street, Cleveland, Ohio, U. S. A.

26,622 (1911). Waterproof fabrics. G. M. Anderson, and Anderson, Anderson and Anderson, St. Paul's Churchyard, London.

26,623 (1911). Compound waterproof fabrics. G. N. Anderson, and Anderson, Anderson and Anderson, St. Paul's Churchyard, London.

26,631 (1911). Syringes. J. R. Bullen, Parnell, Auckland, New Zealand.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

447,619 (August 24, 1912). F. W. Smith. Improvements in vehicle tires.

447,730 (August 29). C. R. Terrell. Repair stopper for tire punctures.

447,834 (August 31). M. G. C. Dodwell. Elastic tire for vehicles.

447,917 (September 3). E. Bessonnet. Mud guards for wheels of automobiles and other vehicles.

447,962 (September 5). J. Theroulde and E. de Huertas. Process for replacing treads of pneumatic tires.

447,904 (September 27). Société Thomas, Bazin, Casanova & Co. Process for manufacture of artificial rubber.

448,005 (September 5). A. Bloch and F. Arena. Elastic tires.

448,108 (November 17, 1911). G. Reynaud. Process of rubber manufacture.

448,035 (November 16). E. Vincent. Solid rubber tires for vehicles.

448,068 (September 7, 1912). A. Fraissier Fils. Mud guard for automobiles.

448,139 (September 18). M. M. Weiss. Elastic tire.

448,169 (September 11). M. Baudon & R. Baudon. Elastic vehicle wheel.

448,170 (September 11). J. Florin. Mud guards for vehicle wheels.

448,273 (September 13). J. Savoie. Tire cover for wheels.

448,419 (November 25, 1911). Desmettre. Improvement in pneumatic tires.

448,433 (September 18, 1912). L. Chapirot. Circular revolving mud guard for vehicle wheels.

448,438 (September 18). S. Laville. Cover for pneumatic tires.

448,456 (September 19). J. J. Butler. Pneumatic tire.

448,520 (September 19). Diamond Rubber Co. Process for preparation of substance analogous to rubber.

448,573 (November 29, 1911). R. Legrand. Elastic tire and method of manufacture.

448,627 (September 24, 1912). Ilanovija and Milkorie. Armed anti-skid cover.

448,644 (September 24). E. Licot. Articulated elastic mud guard, easily mounted and dismounted.

448,663 (December 2, 1911). G. Reynaud. Process of rubber manufacture.

448,711 (August 5, 1912). H. Dreyfus. Process for the manufacture of synthetic rubbers and of their intermediate products.

448,744 (September 18). V. Gandon. Machine for manufacture of pneumatic tires.

448,796 (September 27). G. Dezavis. Mud guard for vehicles with rubber wheels.

448,860 (September 30). L. Demuth. Mud guards for autobusses and other vehicles.

448,968 (July 6). H. P. Plicht. Tire for automobiles.

448,980 (September 18). C. Friederich. Elastic tire for vehicles of all kinds.

[Note.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

258,450 (May 12, 1912). Appliance for tapping the latex of rubber or other trees. George M. von Hassel, Königgrätzerstrasse 87, Berlin.

258,460 (March 3, 1912). Process for manufacture of rubber tires and covers with radial screw springs. A. E. Wale, Coleshill, England.

258,532 (November 28, 1911). Tire fastenings. Otto Eisele, Möhringen, near Stuttgart.

258,899 (April 7, 1911). Coagulation and disinfection of rubber latex. Martin Hohl, Colombo, Ceylon.

258,872 (June 25, 1912). Manufacture of soles from rubber and leather. Max Singenwald, Elisenstrasse 57, Leipzig, and August Schreiber, Leipzig, Sellerhausen.

259,124 (March 10, 1911). Rubber washing machine. Max Frankel & Runge, Spandau.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

252,849 (1913). Molding core for the manufacture of hollow rubber objects; more specially of air chambers for pneumatic tires. H. Zeimer, Kaiserstrasse 125, Carlsruhe, Germany.

252,531 (1913). Process of manufacture of rubber substitutes for industrial uses. O. Rohm, Weisterstadterstrasse, Darmstadt, Germany.

252,749 (1913). Process for manufacture of elastic substances possessing the properties of rubber and products resulting therefrom. W. E. Reeser, Amsteldyk 46, Amsterdam, Holland.

252,906 (1913). Manufacture by means of ethers and cellulose, of rubbers and other ingredients. L. Collardon, Glen Lyn, Greenfort avenue, Hanwell, England.

252,623 (1913). Process of preparation of a substance resembling rubber, and product resulting therefrom. Farbenfabriken vorm. F. Bayer & Co., Leverkusen, Germany.

252,907 (1913). Compositions with a foundation of rubber and their manufacture. L. Collardon, Glen Lyn, Greenfort avenue, Hanwell, England.

Report of the Crude Rubber Market.

THE most prominent feature of the London market during April has been the steady fall in the price of fine Pará from 3*s.* 10¾*d.*, at which it stood on March 26, to 3*s.* 3¾*d.* on April 15; the lowest point reached during the month. An improvement then set in which brought the price on the 21st to 3*s.* 6*d.*; since which time it has receded to 3*s.* 4½*d.*, on the 26th at time of writing; the net reduction for the month being 6¼*d.*

Manufacturers seem to be still holding aloof from operations exceeding actual requirements. In many cases the opinion is entertained that supplies can be replenished on a lower basis of values, caution in purchasing being thus the order of the day.

In harmony with the movement of fine Pará, plantation rubber dropped almost continuously during the month; the prices for first latex giving way from 3*s.* 10¼*d.* on March 26, to 3*s.* 2½*d.* on April 26. The two standards were quoted:

	Pará.	*Plantation.*
March 26	3*s.* 10¾*d.*	3*s.* 10¼*d.*
April 26	3*s.* 4½*d.*	3*s.* 2½*d.*

Following the Easter holidays came the plantation auction of April 1, when 890 tons were offered. As compared with the previous sale of March 18, a reduction of 6*d.* per pound was established by the close of the third day's sale. The opinion was expressed that the fall has come very inopportunely and will affect all branches of the trade.

Statistics of the London auctions up to and including the first April sale showed up to that point total offerings in 1913 of 6,129 tons, as compared with 3,891 tons for the corresponding period of 1912. Average prices realized at the seven series covered by the statistics for 1913 showed a decline during the three months from 4*s.* 5½*d.* to 3*s.* 5½*d.*

Notwithstanding the increase of 2,238 tons in quantity offered, London stocks of plantation rubber on March 31 represented in 1913 2,790 tons, as compared with 1,849 tons a year earlier; the augmentation in quantity being thus only 941 tons. Another healthy sign is the fact that the London deliveries from January 1 to March 31 were this year 6,980 tons, against 4,027 last year during the same period.

The second April sale on the 15th included 1,013 tons, which sold at an average of 6*d.* to 7*d.* below the rates of the previous sale. As to the future course of the market, it was considered that in view of the large quantities still coming forward, the prospect of any rise in values depends upon a more active demand from the United States.

The Hamburg market has been very quiet during the month, but prices have not been much influenced by the London plantation auctions.

At the Amsterdam sale of April 11, 82 tons were offered, of which 69 tons sold. The quantity placed on sale included 56 tons *Hevea*, 21 tons *Ficus* and 5 tons of other descriptions. *Hevea* realized 17 per cent, and *Ficus* 20 per cent. below valuations.

A sale was announced for April 23 at Antwerp of 453 tons Congo and other sorts and 77 tons plantation.

New York Quotations.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During April the condition of the money market as regards commercial paper has improved somewhat, there being a better demand, especially the last half of the month, but rates have held high, the best rubber names ruling at 5½@6 per cent., and those not so well known 6@6½ per cent."

Liverpool.

William Wright & Co. report [April 1, 1913]:

Fine Para.—The market has been dull and an easy tendency has prevailed; during the past few days a sharp decline has been experienced, this doubtless owing to strikes and a consequent absence of demand in America, coupled with dear money and ample supplies in Brazil. Closing value of Up River, 3*s.* 8*d.* [89 cents] (a decline of 4*d.* per pound during the month), with indications of still lower prices, though a reaction may come at any time. Receipts this month are 4,265 tons, including 1,365 tons Caucho, against 4,980 tons last month, and 4,400 tons last year, bringing the crop up to date to 33,435 tons, against 30,110 tons last season, showing an increase of 1,430 tons Rubber and 1,895 tons Caucho.

Amsterdam.

Joosten & Janssen report [April 11]:

The result of today's sale must be considered satisfactory in view of the dullness pervading the market generally.

Plantation Rubber From the Far East.

EXPORTS OF CEYLON-GROWN RUBBER.

[From January 1 to March 17, 1913. Compiled by the Ceylon Chamber of Commerce.]

	1912.	1913.
To Great Britain .....*pounds*	1,470,427	2,436,562
To United States.....	928,028	1,840,795
To Belgium	355,810	457,506
To Australia	26,754	74,871
To Japan	2,181	50,978
To Germany	14,307	23,479
To Italy	.....	22,460
To Austria	2,717	20,419
To Holland	.....	500
To Canada	12,121	.....
To Norway and Sweden.....	39	.....
Total	2,812,384	4,927,570

The export figures of rubber for 1913 given in the above table include the imports re-exported. (These amount to 505,361 pounds—376,392 pounds from the Straits and 128,969 pounds from India). To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date deduct the quantity of imports from the total exports. In previous years the exports of Ceylon rubber only were given.

TOTAL EXPORTS FROM MALAYA.

(From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

INDIA RUBBER WORLD

CAOUTCHOUC HEVEA BRASILIENSIS FOUNDED 1889 GUTTA-PERCHA PALAQUIUM GUTTA

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVIII. No. 3. JUNE 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.
No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. JUNE 1, 1913. No. 3

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

FOREIGN FACTORIES IN THE UNITED STATES.

THE tariff demolishers, in their statistical endeavors, do not seem to figure out the number of foreign industries that have been brought over to the United States solely because those interested could not sell in this market and make the goods at home. In the rubber trade alone are scores of examples. The greatest hard rubber business in America was founded by the German Poppenhusen, who brought with him such men as A. D. Schlesinger, and about whose factories gathered scores of skilled German artisans, today patriotic and thrifty American citizens. Later the great hard rubber company, Heinrich Traun & Söhne of Hamburg, found it wise to build and operate their own factory in the United States.

The real beginning of the druggists' sundries business lay with the Tyer Rubber Co., started by Henry G. Tyer, an Englishman, who brought more than half a million of dollars of English money to this side of the water.

The Michelins, first in the field of automobile tires in Europe, found the tariff not to their mind, and erected a factory in New Jersey to manufacture for the Americans.

Card clothing made on a large scale in Europe was taxed at our custom house, and the English Moseleys helped to establish the Mechanical Fabric Co.

Mandelberg, a great English manufacturer of mackintoshes, quite recently equipped a factory near New York, simply because of the protection given to American manufacturers.

Nearly all of the original American elastic fabric companies, and these are many, came here because of our protective duties.

In a word, capital, skilled labor and great industries have come here to stay—to the advantage of the country—under, say, a 35 per cent. duty. Had the duty been 10 per cent. they would have stayed at home, and with their cheaper labor shut up many an American factory.

REDUCING RUBBER PRICES TO ENCOURAGE NEW USES.

A VERY interesting proposal, referred to on another page of this issue, has recently appeared in the English financial press, to the effect that the rubber planters agree to set aside one-tenth of their product to be sold to certain English and American manufacturers at 60 cents a pound, under an agreement that this shall be used in the manufacture of articles not now on the market—the purpose being to encourage new uses for rubber.

It undoubtedly would be easy to find manufacturers who would religiously live up to this arrangement, and employ any 60-cent rubber they might acquire, solely in exploiting new methods of using rubber; but would any substantial end be accomplished by this project? Obviously it would be a matter of expense to the planters, for when the market price of their rubber was 90 cents, if they sold 10 per cent. of their product for 60 cents, they would be losing 33⅓ per cent. of their legitimate price for the one-tenth sold at this figure, which would be a loss of 3⅓ per cent. on their whole product. And would this artificial lowering of price in reality greatly encourage new uses of rubber? If under this encouragement a use were found for some new rubber article, as soon as it secured recognition it would have to be manufactured from rubber at the full market price—this 10 per cent. cheap rubber being reserved exclusively for untried articles.

Rubber manufacturers, if not quite as deeply interested as the planters in the increased consumption of rubber, are, nevertheless, alert to the possibilities of the unbeaten path, and are always ready to test the

public demand for something new. It is quite probable that this natural ambition to manufacture something in which, for a time at least, they would have a monopoly, is a sufficient incentive to keep the manufacturing mind constantly at work on the possibilities of new and original lines of production.

But the one thing that will best serve as an encouragement to the extension of rubber manufacture into entirely new fields will be for the producers of crude rubber to bring their costs down, and keep them down, so that they can offer low prices not to a few manufacturers under special arrangement for a specified use, but to all manufacturers alike, for whatever use may seem to them to promise success and profit.

THE ADVANTAGE OF COMBINING TIRES WITH FOOTWEAR.

THE venerable adage about the undesirability of having one's eggs all in one basket, is as sound now as on the day when it was predicated. The United States Rubber Co. recognized the sanity of this saw, when some seven years ago it purchased the control of the Rubber Goods Manufacturing Co. Up to that time its product had consisted almost entirely of rubber footwear. It perceived the desirability of having something else to fall back upon, when the demand for footwear was slack, so it acquired a number of capable tire mills.

A number of the other large rubber manufacturing companies have taken a similar step—for instance, the Hood Rubber Co., which has added a well-equipped tire department to its footwear plant, and the Goodrich and Diamond companies, which some time ago increased the variety and volume of their product by the installation of efficient footwear departments.

There couldn't be a finer combination than the manufacture of tires with the manufacture of boots and shoes. One insures the other. The consumer is kept consuming, no matter what the meteorological conditions are. When it is prime weather for motoring, it is poor weather for rubber boots and arctics, and when everybody is clamoring for hip boots and high-top gaiters, nobody wants a tire. But the demand for one or the other goes continuously on.

Last winter, for instance, was an unfavorable one for the makers of footwear. In the greater part of the country there was but a light fall of snow. In the big cities, at any rate, one might have gone through the entire winter quite comfortably with only a pair of footholds. But the same open winter that made many people oblivious to the rubber boot and arctic, kept the call for automobile shoes and inner tubes continuous, for the car that in normal winters has been jacked up for a four months' rest was out daily on the roadway, wearing out its tires.

Where a manufacturer has both a footwear and a tire department he need not concern himself about the prognostications of the weather bureau. Every kind of weather brings grist to his mill.

RUBBER IN COLLEGE THESES.

AN interesting side light on the rubber industry, illustrating the general interest that the public takes in this subject, is shown by its popularity as a theme for college theses and school compositions. There is lying at this moment on the editorial desk a finely bound typewritten volume of 35,000 words, with sundry appendices of charts, maps and tables, on the history of the American rubber industry. It has been prepared by a candidate for an advanced degree in one of the largest of our American colleges, as a partial fulfilment of the requirements for securing that degree. The editor has been asked to look it over. It is a worthy and painstaking effort, and shows a wide reading in the literature of india-rubber.

Two days ago an application was received from a senior of another large university for suggestions as to where the best information could be obtained on the manufacture of rubber in the United States, with a view to preparing a graduation thesis on the subject. Immediately following that came a young woman, about to graduate from a high school, accompanied by her instructor, also in search of information on this interesting topic, as a preparation for the writing of a high school composition.

The editor seized a few fleeting moments from his busy life to give what assistance he could to these applicants for rubber knowledge. These are not isolated cases, for during the last year many similar requests have been received—sometimes from students—sometimes from teachers—for light on the great industry of rubber production, gathering and manufacture.

Possibly the popularity of this subject as a theme for school and college work is due to the fact that it is newer than most of the subjects that have been used for this purpose since schools were. But probably it is owing to the amount of space devoted to the various phases of rubber manufacture, and particularly to tire making, in the

daily and periodical press. At any rate it shows a very general interest in rubber in its relation to modern life.

Quite a number of the large manufacturers—with specially wise advertising departments—have recognized this general desire for rubber information, and have published little pamphlets giving a swift survey of the history, botany and general development of rubber production and manufacture; concluding naturally with a more or less extended reference to the particular product—boot or belting, tire or hose—which that company may be interested in. Where the advertising is permitted to permeate the entire story, the value of the pamphlet is materially weakened, but where the advertising is not allowed to be too glaring, the pamphlet is bound to appeal to the inquiring mind, is insured a serious reading, and consequently is effective from an advertising standpoint.

The distribution of these booklets, which takes place in response to requests from seekers after rubber light, and particularly from students engaged in literary research, is obviously a very valuable sort of distribution, for this literature not only makes a lasting impression upon the mind of the student who is deep in the preparation of his thesis, but is bound to be duly impressed upon all those who come in contact with him during this season of literary production; for nobody feels his work more profoundly than the undergraduate who is enjoying the first thrills of authorship.

THE BEST RUBBER SCHOOL.

OVER in London they have inaugurated a rubber school, or rather they have opened certain distinctively rubber courses in one of their polytechnic institutes, on "The Chemistry and Analysis of Rubber," "The Manufacture and Analysis of Rubber Goods," and kindred themes.

It is not the desire of this publication to belittle any enterprise that makes for the development of the industry. This London rubber school will probably accomplish creditable results, and certainly can do no harm, but in our own country at least, the best rubber schools are still to be found within the four walls of the factory.

This does not mean that the best way to study rubber is to enter the factory at an early age and grow up exclusively in its atmosphere; for in order to achieve the best results, the factory school should not be entered until a sound and broad foundation has been laid in the technical school. But having availed himself of the instruction given by the best technical schools, the graduate can then enter the rubber mill and acquire this particular instruction rapidly and effectively. For instance, having devoted several years to the general study of chemistry, the best place to acquire a knowledge of the special chemistry of rubber is in the laboratory of the rubber mill. Possibly some day our leading rubber experts will be found giving courses of instruction in the schools, but at present they are confining their attention to the practical running of rubber factories; and to learn what they know, one must resort thither and put himself in contact with them.

THE CALL OF CHEAP LABOR.

BRAZIL'S crude rubber industry is threatened by Eastern plantation rubber. Labor in the Brazilian rubber sections was, and is, scarce and high priced. At the call of the cheap and abundant labor in Ceylon, the Malay States, Java and contiguous territory, the Brazilian industry of Pará rubber production was moved half across the world in less than ten years. So much for tropical industries.

Now as to those of the temperate zone. There are in Central and Northern China millions of capable, thrifty, industrious workmen who would joyfully hustle fifteen hours a day for fifteen cents. They would make excellent workers in any line of rubber manufacture where labor is a chief consideration. Their call to American manufacturers has heretofore been unheeded. But, if competition with European cheap help is forced upon the American manufacturer, and further if to meet such competition he is not to be allowed to adjust his wage scale to suit new conditions, will he not be forced to listen to this call?

In the light of rubber history will not the present tariff program end in the establishment of great American shoe, tire and sundries factories in Chinese centers of cheap labor?

NOT ALONE IN THE GREAT COMPANY THAT HE NOTABLY helped to create, but all over the world is the passing of Adolph Prinzhorn heard with sincere sorrow. His unruffled friendliness, his broad charity toward human frailties, and his genuine interest in all that was for the good of the trade made him a most lovable character. His friends were not only the best and most distinguished men in the Fatherland, but in the United States, in England, and in the Middle East. Such men, citizens of the world, friends of humanity, are potent apostles of industrial integrity and progress. We voice the thought of the world's rubber trade in tendering sincere sympathy to the Continental Caoutchouc & Gutta Percha Company for their great loss.

A. STAINES MANDERS HAS, ABOVE ANY OTHER MAN that we know, the rare faculty of organizing great exhibitions of international interest. What he has done in the past in rubber exhibitions has been of the greatest educational value. Rubber planting was new, and thousands who were interested wanted to have the graphic presentment of the exhibition, to supplement and explain what they had read in the printed page. Hence governments, planters and those who supplied planters, were eager to exhibit. Like all other industries, however, rubber planting is fast getting upon a stable basis and its novelty is disappearing. In the future the new tools, machines, processes and products will steadily lessen in number. Under these conditions it will be only the novel that will be willingly shown, and the result will be a steadily diminishing volume of exhibits—that is, if rubber exhibitions were planned every two or three years *ad infinitum*. We hold no brief for Mr. Manders, but it would seem that he appreciated this situation. The fact that he planned a fibre exhibition to be held in an adjoining building, and at the same time as the 1914 Rubber Exhibition, would point to such conclusion. In his announcements Mr. Manders says: "A similar exhibition will not be held until 1918 or perhaps latter."

If all that is new in rubber, in fibres, in coffee, cacao, cane, and all of the varied tropical products could be shown once in two or three years in London, the joint exhibitions would be very great, and valuable beyond description.

The Tropics are just beginning to be generally exploited. A comprehensive Tropical Products Exhibition, including of course all that is new in rubber, is what is needed.

IN VIEW OF THE PRESENT TARIFF SITUATION ONE OR TWO statements which appear in the letter from our Japanese correspondent, in this issue, are interesting. He is describing the industry of making rubber toy balloons in Japan. He says that the imports of toy balloons into Japan ceased some years ago. He then goes on to remark that the lowest grade of the imported toy balloons of former days cost the Japanese dealer 25 cents a gross, while the same thing is now being produced in Japan at the price of 7½ cents a gross. Later in his letter he makes a statement that renders it very clear how the home product can sell at one-third the price of the imported article. He says: "The average daily wage of the women balloon makers is 20 sen (10 cents) for ten hours. The average daily rate for rubber manufacturing workers, male and female, is 50 sen (25 cents) for ten hours." There you have the contrast;—rubber workmen in Japan receiving 25 cents a day and rubber workmen in America receiving from ten to twenty times that amount. Men who work for 25 cents per day have to live on a 25 cents a day scale. Is that, or any approximation thereto, desirable in this country? That is the crux of the tariff question.

AN ENGLISH PAPER SPEAKS OF THE FACT that the question is being agitated of organizing a rubber club in London. It certainly would seem as if London could support such a club. There has been a rubber club in this country for fourteen years, and it is a highly successful organization. It has a membership of nearly 350, and the midwinter dinner, midsummer outing and other gatherings of the club are largely attended. It also has an inner membership, called a "firm membership," in which between 50 and 60 of the leading rubber concerns of the country are represented, which is devoting itself to the solution of the important problems pressing upon the American rubber trade today. To be sure, the English rubber manufacturing industry is less than one-half that of the United States, but it is a large and important field, in addition to which are the great rubber plantation interests centering in that city. A rubber club in London ought certainly to prove a successful and valuable organization.

IF ANYONE HAS BEEN UNDER THE IMPRESSION that the use of the automobile had about reached flood tide and was unlikely to remain stationary or possibly to recede, his impression was erroneous. The Secretary of State for New York announces that the number of automobile owners who have registered during the past three months has exceeded the 100,000 mark, which is more than 20,000 over the number registered during the same period last year. The registration fees collected during the same period came within $8,000 of reaching a million—which is nearly $325,000 in excess of the fees for the same time last year.

The same situation has developed in Ohio, where the registrar of automobiles announces that in point of registrations the entire number for 1912 was exceeded on May 10, the registrations at that time for this year being 63,720, as compared with 63,117 for the entire twelve months of 1912.

Obviously, the stationary period of automobile consumption has not only not been reached, but is nowhere in sight.

Rubber in Southern Brazil—II.

By the Editor of The India Rubber World.

The Rubber Port of Bahia—Chats with Exporters—Courtesies from Brazilian Officials—Local Washing Plants—Wide Distribution of the Manihot—The Four Principal Kinds—Methods of Gathering—Yield According to Dr. Quinn—Dr. Zehntner's Figures.

MORE than eighty per cent. of the *Maniçoba* rubber produced by Brazil's southern states comes out at the port of Bahia. It is therefore an interesting place to the rubber man, and one that I was more than anxious to see.

BOAT LANDING, BAHIA.

A PLANTED AREA ON THE UPLANDS.

Somewhere I had formed the idea that the landing was difficult and dangerous, so when we left the steamer in a comfortable launch and disembarked at a very respectable pier, the surprise was an agreeable one.

The water front buildings were a bit ragged in outline and the piers crowded with merchandise and debris, but that was due in part to the Port Work preparations of the French concessionaires. This concession is to be a monopoly, the company charging for every pound of cargo entering the port. The quays are to have 36 feet of water at low tide, the fill being made by pumping from the harbor. Modern warehouses, cranes, etc., will be installed, and as All Saints Bay is better adapted in its surroundings for expansion than is the bay at Rio, the city of Bahia has great future possibilities.

The city is built first on a narrow terrace but a trifle above tide water, then on a steep incline, and then on a plateau high above the first tier of buildings. To get to the upper city there is a steep inclined plane, and for foot passengers a big double elevator.

Like Brooklyn it is a city of churches, the total being 260; and others, so it is said, are projected. There are many fine buildings, a fair second-class hotel, some excellent *pensions*, and the finest oranges that the thirsty traveler could desire. As befits an ancient city, the streets are grotesquely narrow, although the modern spirit is evident in the broadening of some of the main thoroughfares, which means cutting long blocks of high buildings clear to their centers. There is to be a central avenue 250 feet wide. There are excellent trams, the usual tropical carriages and some 100 automobiles and motor trucks. Speaking of the latter, tires suffer severely, and motor owners are constantly complaining. This is due to the uneven stone pavements, the car-tracks and the reckless driving—that is, in part. Another reason is that seconds

MAP SHOWING *Manihot* AREA IN EASTERN BRAZIL.

and thirds in tires have been sent to this market, and when they gave out were bought in for a few cents, shipped abroad, mended and came back as new ones.

There are five firms in rubber exporting in Bahia, and two of them have cleaning plants of their own. Several are also interested in *Manihot* plantations in the interior. We visited all of them and found them more than willing to give information, and deeply interested in the future of Ceará rubber. Incidentally none seemed to believe that any general plan for washing all of Brazil's rubber would be of value, either to producer or manufacturer. One said very plainly that the existence of dirty rubber was due to the cupidity of the rubber manufacturer. He purchased dirty lots in the hope of getting a cheaper rubber content. If he bought only clean rubber, such would in time be the only product.

We learned that last year caterpillars destroyed many of the rubber trees, and that this year the rains were delayed so that another setback was feared. Indeed some of the local rubber men were very gloomy about the future of *Manihot* planting because of insect pests — such as caterpillars and white ants—and droughts. At the same time they acknowledged that wild *Manihots* were not killed off, and that it cost 50 per cent. less to gather plantation rubber than wild.

PLANTATION *Manihot Glaziovii*—7½ YEARS OLD—35 INCHES IN GIRTH—IN COURSE OF TAPPING.

Then, too, there are the taxes and costs of transportation. They were all of the opinion that the whole export tax on Ceará rubber should be taken off, for a time at least. They also cited the freight rates on the railroads as being far too high. For example, from Joazeiro to Bahia—about 577 kilometers—the rate is 670 reis for 10 kilos, or about what it costs from Bahia to Europe. Labor is also scarce and food and all other supplies are very high.

The courteous head of the *Defesa da Borracha*, in Rio had cabled ahead to the department in Bahia, and the result was courteous attention on the part of Sr. Alvaro Ramos and the heads of the local *Defesa*, who arranged audiences with the Governor, the Secretary of State and other high officials. They were all exceedingly polite, and opened every avenue to us in our endeavors to gather information concerning rubber.

The rubber fields — that is where the *Manihots* grow, either wild or planted—are not of easy access from Bahia. The nearest is a day's journey, and the best up the San Francisco River are five days away, the journey involving railway travel, water travel and mule riding.

But first a bit on the various *Manihots* about which there has been considerable confusion. Only a short time ago but one was known, the *Glaziovii*. Today four distinct types are recognized, and only last winter I met a student of the tree who said he was sure that there were at least seven. Right here it may be well to describe the four, not botanically, but in such terms that the non-scientific may be able easily to identify them.

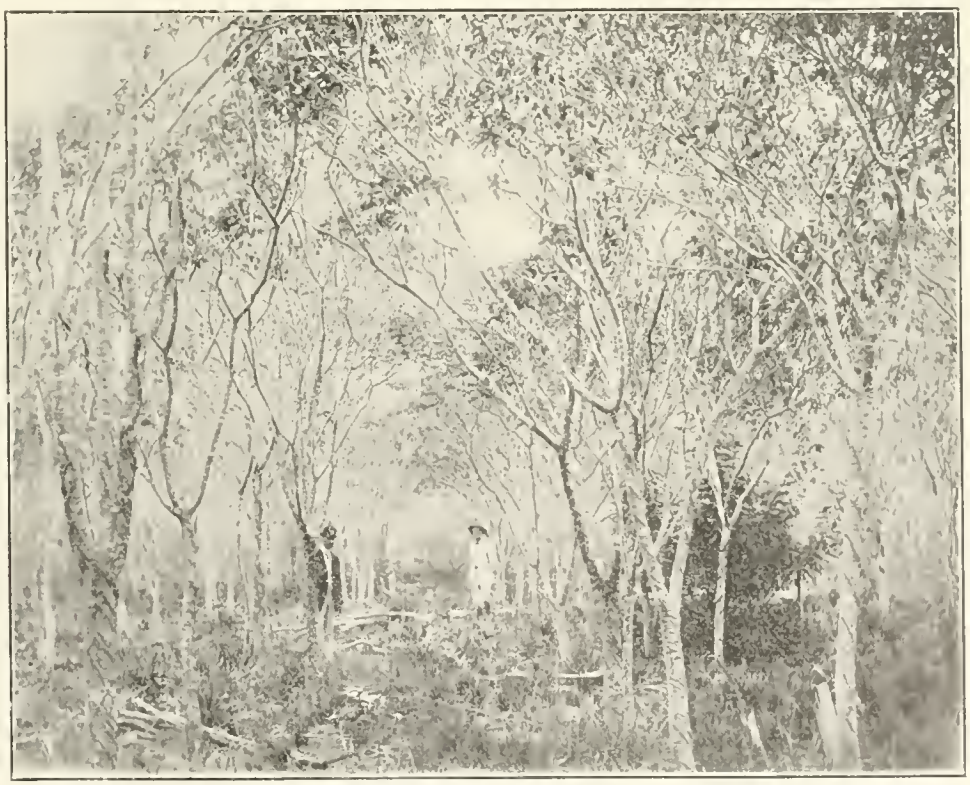
The *Manihot* was formerly called the *Jatropha Elastica*, and it is a blood cousin of the *Manihot Utilissima*, which produces sweet cassava, and the *Manihot Palmata*, or bitter cassava. The product of the various *Manihots* is called Ceará, *Maniçoba*, Jequie or *Manihot* rubber.

American manufacturers for a long time ignored Ceará rubber. The Europeans, however, used it freely, and have always claimed that under most conditions it was the equal of Fine Pará.

The *machadino,* which has so irreparably damaged the Pará forests of the Amazon, is very generally used for tapping the *Manihot Glaziovii,* to which it does just as much harm. In Bahia, however, the other sorts are tapped by a kind of home-made farrier's knife that answers the purpose very well.

Manihot Pianhyensis—FOUR YEARS OLD—AVERAGE YIELD PER ACRE 232 POUNDS OF DRY RUBBER.

In tapping the *Glaziovii* and *Dichotoma* the outer bark is first removed and the tree trunks tapped in zigzags. The roots are pared half-herring-bone fashion but roughly. On the tree trunk the latex is caught in cups, but the general procedure is to tap the trunk low down between the roots and dig a shallow hole at the base of the tree. Into this the rubber milk trickles, its watery content being absorbed by the soil. The sand with which the hole is dusted sticks to the rubber and makes it easier to handle, and also decreases its value very considerably. In the past the Ceará milk was allowed to coagulate on the tree, and the result was a good dry rubber containing some bark. Some of the planters are now preparing *Manihot* rubber in sheets that are clean, dry and in every way excellent. This can only be done in plantations or where it is possible to superintend the tapping of wild trees. Most of the rubber at present comes from trees scattered over a vast wild area, impenetrable except by native tappers, who are paid by weight. The result is, as a rule, very dirty, wet rubber, badly coagulated and containing stones, bark and dirt. Wherever it is possible to gather the latex in receptacles, clean rubber of fine quality is the result.



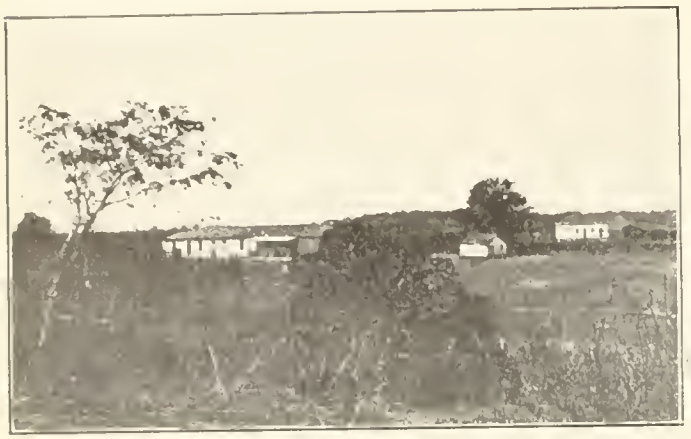
Manihot Dichotoma—ONE TO SEVEN YEARS OLD.

The *Manihot Glaziovii,* or Ceará rubber tree, grows to a height of forty feet with a diameter of twelve inches. It has many branches, the lowest of which is about six feet from the ground. The bark is dark purple with transparent film-like epidermis, which curls off as bark is removed. This exfoliation is usually removed before tapping. The leaves are large, and are divided in five, and sometimes there are seven parts. The leaf stalk and veins are whitish. The planters were deceived at first by the favorable appearance of this tree, and planted it extensively, but it did not produce well. It is found wild in Ceará, Parahiba and Rio Grande do Norte, is deciduous and thrives in dry lands and mountain regions—in fact, will grow anywhere.

The *Manihot Dichotoma,* or Maniçoba of Jequie, derived its last name from a town in the state of Bahia, which is the center of commercial trade in this rubber. It is a small tree, with a trunk scarcely exceeding 10 inches in diameter. The bark is smooth and purplish in color with parchment-like epidermis, similar to the *Glaziovii.* The leaves when new are of peculiar shield-like shape, and later become digitate. It is found in the southeastern districts of the state of Bahia, and along the Paraguasu and Contas rivers. It thrives best in red clay soil, and is rarely found in sandy soil, or if so, gives much less rubber.

The *Manihot Heptaphylla* (Ule) is a small tree, growing to the height of seven to sixteen feet, with a diameter of four to six inches. The trunk is comparatively short and stocky, dividing into two or three branches which form a full-leaved top of a lively green color. The bark is dark gray in color, and the leaves are usually divided in seven lobes. The seeds are light colored, without the sharp edges, thereby differing from the Ceará, and are larger. This tree is found exclusively

on the right margin of the San Francisco river, growing in the mountains and rocky places.



HOUSES AND STORE ON *Manihot* PLANTATION EIGHT DAYS FROM BAHIA.

Manihot Heptaphylla—NINE MONTHS OLD.

The *Manihot Piauhycnsis* originated in the state of Piauhy, and although small in size is most important as a producer of rubber. It resembles the *Heptaphylla*, with a height of seven to sixteen feet and a diameter of four to six inches. The trunk, smooth and light gray in color, divides into two or three branches forming a full spreading top. The leaves are usually divided in five and sometimes seven parts. They are digitate in form with the points rounded, a peculiarity of the *Piauhycnsis*. The seeds are similar to the *Heptaphylla*. This tree, found in the state of Piauhy along the dividing line of the state of Bahia, and between 8° and 10° south latitude, and as far to the north as Itamaraty or San Pedro. It grows principally on the small mountain slopes and ridges.

Like the *Hevea* the *Manihot* shows one type which Dr. Quinn calls the *Manihot Brava* which gives no rubber at all, but which is easily confused with the good *Manihots*—that is, those that do produce rubber.

Manihots have more than once been suggested as adapted to cultivation in the United States, particularly in parts of Florida and Texas. Indeed, at one time one of the Southern experiment stations started their cultivation. The matter was not carried far, however, and no conclusions reached. That they could be grown in the Philippines and Porto Rico, as they are in the Hawaiian Islands, there is no doubt.

So many different figures were given as to the yields of *Manihots* that I was at a loss to wholly reconcile the great differences that were but too apparent. Of course in some cases my informants had taken the product of certain trees that were abundant producers, and based their estimates upon them. In others they were frankly optimistic

TAPPING *Manihot Piauhycnsis*, RESACCA ESTATE, MINAS.

promoters. I have therefore turned to the statements of Dr. Santiago Cardwell Quinn, who is in the center of the *Manihot* district, and an unbiased observer. He says:

"The tapper works approximately six months in the year, covering January to June. He takes one set of 650 trees, on the average tapping on Mondays and Tuesdays 250 trees per day and on Wednesdays 150. On Thursdays and Fridays he re-taps Monday's and Tuesday's lots and on Saturdays those he tapped the previous Wednesday. The same trees are tapped twice a week. With *Manihot*, as with *Hevea*, the so-called wound response is very marked.

"In the season his output may be taken on the average at 360 kilos of damp rubber, equivalent to about 475 pounds market rubber, or, say, equivalent to about 285 pounds actual dry rubber. He is paid by the kilo, depending more or less on the state of the market. Nowadays the average price may be taken at 1$200 Brazilian—or say 29 cents—per pound for market rubber, or about 48 cents per pound for dry rubber. These costs, however, do not represent the real ones. The tapper is paid really by a barter method as on the Amazon, and the profits on the barter transaction must be deducted in order to arrive at the true cost. We may deduct, therefore, at least 12 cents per pound on this head, making the original net cost about 17 cents per pound.

"The carriage of this rubber to the railway is not so great as one might imagine. Thus every year some 200 to 300 tons of *Manihot* rubber is despatched from Gruna, an important rubber center in Bahia at some distance from the right bank of the River San Francisco, for shipment on rail at Bomfim. The distance is about 150 miles, and the pack-mules, carrying 250 pounds each, take five days on the journey, at the regular rate of 12 milreis—$3.80—per mule, which works out at about 1½ cents per pound. The rubber is packed in sacks which represent a small item. There are town dues amounting to 16 cents per 30 pounds, and a rail freight to the port of Bahia of about 38 cents per 30 pounds, whilst the sea freight is rather under $19 per ton weight to New York or Liverpool."

BADLY TAPPED *Manihot Dichotoma.*

SHOWING THE TWO DISTINCTIVE GROWTHS. x1—*Heptaphylla*, x2—*Piauhyensis.*

As in Pará the export tax on rubber at Bahia (11¼ per cent. ad valorem) is assessed through the "Pauta" or valuation taken every two weeks, and based upon the market price at the time of the last valuation. It amounts to about 5 cents per pound. In Minas, at 3½ per cent., it amounts to 1 to 2 cents a pound.

In this connection it will be interesting to note the figures given by Dr. L. Zehntner on the production of the Maniçobas of Bahia. These observations were made at the Villa Nova Plantations, Bomfim, Bahia, and are as follows:

Age.	Dry rubber on tree, one day.	Dry rubber on tree, 60 days.	Dry rubber 700 trees, 60 days.
2 yrs.	2 Grs.	120 Grs.	185 lbs.
3 "	3 "	180 "	277 "
4 "	4 "	240 "	370 "
5 "	5 "	300 "	463 "

The *Manihots* cover an immense area of the healthy uplands of Southern Brazil, a territory running 1,000 miles north and south and as much east and west.

There are, of course, sections where it does not appear at all, and others where it is inaccessible. In eleven of the great Brazilian states it is found wild, but its gathering is chiefly in the states of Bahia, Ceará, Piauhy and Maranhao. So far the planting of *Manihots* in Brazil has been in the states of Bahia, Minas and Piauhy. There are also several in Rio, and even as far south as Sao Paulo. It is estimated that there are at least three million trees in the Brazilian plantations at the present time.

Of the Ceará plantations so far installed a few are owned by Americans, Germans and French. The Michelins, for example, are said to be back of one that is distinctly French.

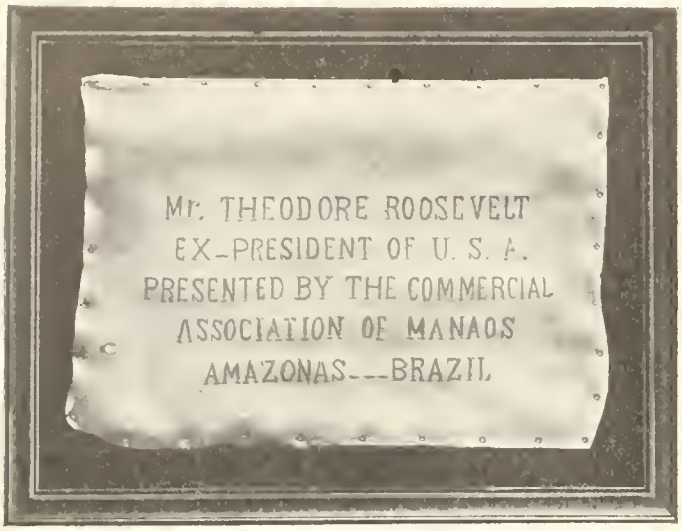
It is an interesting fact, however, that most of the plantations are owned by Brazilians, particularly as the salvation of the rubber industry, as far as Brazil is concerned, seems to lie in rubber planting.

(*To be Continued.*)

The accepted authority on South American rubber—"The Rubber Country of the Amazon," by Henry C. Pearson.

INTERESTING RUBBER SOUVENIRS.

THREE very interesting souvenirs, showing progress in rubber preparation up the Amazon, were given to the Editor of THE INDIA RUBBER WORLD after the close of the New York



SHEET OF AMAZONAS RUBBER PRESENTED TO MR. ROOSEVELT.

Rubber Exposition. They represented fine sheets of unsmoked *Hevea* rubber, prepared in Amazonas, and were intended for President Taft, Ex-President Roosevelt and the Editor of THE

SHEET OF AMAZONAS RUBBER PRESENTED TO MR. PEARSON.

INDIA RUBBER WORLD. The illustrations show two of them mounted and framed; and as the first of their kind they are certainly historic.

THE CLYDE RUBBER WORKS CO.'S NEW PLANT.

The Clyde Rubber Works Co., Ltd., of Glasgow, Scotland, has just removed to its new plant at Renfrew, a short distance from Glasgow. This new plant has been specially erected to meet the company's requirements and is equipped with the most modern machinery, electrically driven. These greatly increased facilities will enable the company to meet the demand for its goods with the utmost promptness.

FRENCH VIEW OF BRAZILIAN SITUATION.

M. O. LABROY, a French engineer (who, in conjunction with M. V. Cayla, recently made a journey of investigation through Amazonia, on behalf of the Brazilian government), lately returned to France to purchase the plant necessary for the contemplated experimental stations. He has contributed to the "Bulletin" of the Paris Brazilian Information Bureau an article embodying his views on the situation and the measures proposed for remedying it.

In the first place he recalls the fact that the Amazon Valley (which exported last season 40,000 tons of rubber) derived this valuable product almost exclusively from two varieties of trees, which are still to be found in abundance in the vast forests in the territory drained by the various rivers. This rubber-extracting industry occupies annually more than 150,000 workers, or *seringueros,* whose task is to collect the milk flowing from incisions in the lower part of the trees, transforming this milk, by the heated smoke of a fire of palm nuts and certain indigenous woods, into a gum of industrial and commercial value far exceeding that of any other description.

In view of the spontaneous growth of new trees and the reserves of virgin forest, the writer expresses the opinion that the Brazilian rubber-extracting industry is not in any immediate danger from the exhaustion of supply; while even a marked reduction in present values would not materially affect the Amazonan production. Still, the northern States of Brazil, which derive their principal revenues from the rubber export tax, have, in conjunction with the Federal government, decided to put into force a series of economic measures tending to reduce the cost price of rubber and at the same time to develop agriculture in the different productive centers.

The service of the "Protection of Rubber" was organized last year in accordance with the new law, due to the intelligent initiative of Dr. Pedro de Toledo, minister of agriculture. After deciding upon the creation of a rubber manufacturing industry at Rio de Janeiro, the commission settled the important question of coal depots on the Amazon and navigable rivers. A commission of hydrographic engineers has been making surveys for the improvement of the navigation of the Rio Branco and a similar work will soon be undertaken on the Rio Negro.

A trial of agricultural colonization is now being made on the national *fazenda* of São Marcos, and will furnish indications of value in future enterprises of this kind.

While giving attention to the improvement of river transport, the question of sanitation has not been lost sight of, commissions of doctors under Dr. Oswaldo Cruz being engaged in studying the various diseases prevalent among the Amazonian population.

Finally, agronomic stations are being established in the states of Pará, Amazonas, Matto Grosso, Bahia, Piauhy and Minas Geraes. These stations will be specially devoted to the study of various technical and scientific problems connected with the rational production of rubber. Such establishments in the natural centers of production, with perfectly equipped laboratories and installations, will prove an important feature in the plans of colonization, in regions where agriculture is but little advanced. The development of agricultural production is regarded as a matter of primary importance, without which there is no lasting prosperity to be anticipated. The Valley of the Amazon presents very favorable conditions for such development.

It is pointed out that the cultivation of *Hevea* would be easily supplemented by that of Cacao, young and old trees having proved equally fruitful, notwithstanding the absolute lack of rational treatment. Other products which could also, in M. Labroy's opinion, probably be successfully raised are tobacco, sugar cane, cocoanuts, rice and bananas.

Such are a few of the features of the present movement which, according to M. Labroy, are now being carried out for the direct or indirect benefit of Brazilian rubber cultivation.

The Plantation Rubber Industry.

By Cyril E. S. Baxendale.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

EARLY HISTORY.

IT is remarkable that—as civilization has become dependent on cultivated produce—the profitable cultivation of rubber should have been, for years, open to doubt.

It was in 1876 (not less than 36 years ago) that *Hevea* seeds were brought from Brazil to Europe by that prince of smugglers, Mr. H. A. Wickham. There was an earlier attempt, but as the few seedlings raised all died, we need not waste time over that. From the 70,000 seeds collected in Brazil by Mr. Wickham, 2,800

CYRIL E. S. BAXENDALE.

plants were raised at Kew Gardens (London) and, in the same year, shipped to the Perideniya Gardens of Ceylon (Ridley tells us) as a depot for the plants from which the cultivation might be spread all over those British Colonies wherein the plant could thrive.

In 1877 a case of 22 plants reached Singapore and were successfully planted by Mr. Murton, the then curator of the newly founded Botanic Gardens there. The same year the first *Hevea* trees arrived in the Malay States. Two cases were sent from Ceylon to the late Sir Hugh Low (British resident of Perak) who planted them at Kwala Kangsar, and, I am glad to say, he lived long enough to see something of the great success of the industry that he helped to found.

It may seem strange that these trees reached maturity many years before it was realized that they were capable of yielding a sufficient quantity of rubber to make their regular tapping profitable. The only explanation I can offer for this is that the duty of tapping them was relegated to Sakeis (Malayan Aboriginals), who adopted the same methods they applied to the collection of wild rubber; that is to say, they hacked them with choppers, while the results they achieved were insufficient to tempt any capitalist to put ten cents into the business.

It is to our scientist friends that we owe the primary knowledge of how these trees might be made profitable. On what we now consider to have been a red-letter day in the year 1888, Mr. H. N. Ridley was appointed director of the Botanic Gardens in Singapore and very soon afterwards commenced experimental tapping; but it was not until 1891 that the first sample of plantation Pará was sent to London from Malaya, and was favorably reported upon by experts. During the nineties, several gentlemen in Ceylon, and Mr. Derry and my learned colleague, Mr. Leonard Wray, in Malaya, continued the experiments.

The first actual sale recorded from Malaya was in 1899, from the trees planted by Sir Hugh Low, and realized 3s. 10d. a pound. The trees were then 22 years old. To the brothers Kindersley belongs the honor of first planting rubber on a commercial scale in our country. That was in 1895, and within three years the late Mr. W. W. Bailey and several other planters, including the humble individual now addressing you, had summoned up sufficient courage to plant a few hundred acres amongst them. To attribute this slow development to lack of enterprise would be unjust. If any explanation is required it must be attributed to lack of money. At the time of which I am speaking, we were all coffee or sugar planters, struggling for a bare, very bare, existence. Some of us may have had the privilege of being on terms of a nodding acquaintance with men of means, but not many of these could recollect that rubber was useful for any practical purpose, except for the erasure of pencil marks.

A favored few had seen or heard of a Mr. Charles Rolls, traveling in a horseless carriage preceded by an ancient man on foot, carrying a red flag as a danger signal; but, probably, none of these realized that this object of merriment was the forerunner of the greatest mechanical industry of the age, or if they did, would not, at any rate, have found it a reason for supporting the schemes of would-be rubber planters.

Rumors of remarkable results from the first planted *Hevea* trees of Ceylon and Malaya reached Europe, and as the years rolled on a few speculative—or may I call them, far-sighted—persons staked a portion of their savings on the new venture.

The extension of the area under *Hevea* in Malaya, which in 1905 amounted to about 38,000 acres, increased at an average rate from that year of about 70,000 acres per annum. The total area at the end of last year (1911) was 542,877 acres.

THE BOOM.

During 1909 the income from the older companies attracted the attention of the investing and speculating public of Europe in general—and Britain in particular—as being unusually large for an agricultural industry. At the same time the value of crude rubber went up by leaps and bounds, bewildering even to those acquainted with the elastic nature of the subject; and indiscriminate speculation was indulged in, of which the promoter of many a wild-cat proposition took full advantage.

It is said that the boom far exceeded that which heralded railway development 70 years ago and can only be compared with another that occurred in the reign of our late Queen Anne in connection with a venture known as the South Sea Bubble.

Well, *our* Bubble, has since deflated somewhat, I am glad to say, but it has not burst; and I think it may be said that the planters who had borne the burden and heat of the day generally kept their heads in spite of the somewhat embarrassing attention paid to their humble efforts, and this had much to do with steadying the market when the bubble was soaring, and also in stopping total deflation when investors rushed to the other extreme.

CLIMATIC CONDITIONS.

The reason the Malay Peninsula attracted most attention for this purpose was, primarily, its regular rainfall. It is commonly said that there are two seasons in that country. One is the wet, and the other is the d——d wet season.

This peculiarity is due to its unique situation as the meeting place of the N-E Monsoon of the China Sea and the S-W Monsoon of the Indian Ocean. After the subsiding of the rains of the

S-W Monsoon, the N-E commences and as the width of the Malay Peninsula does not exceed 170 miles in any part, the land on both coasts is affected by either monsoon.

I have kept the rainfall records at Jugra for 14 years and have never experienced a month without rain, and rarely a month below the average rainfall of Britain. It must be admitted that some of us, in cabling particulars of our monthly outputs, explain a shortage against the estimate by adding "owing to the drought"; but the truth is we have yet to experience the true meaning of the word "drought." There are very few days in the year when it is too wet to work, and this, of course, gives us a great advantage over the collector of wild rubber on the Amazon, where I understand there can be no tapping for several months of the year.

HEALTH.

A very considerable change has come over the conditions of life in Malaya. I regret to say that many of the plantations can hardly yet be described as health resorts; but there has been an immense improvement, and in view of the more or less recent discoveries of our medical men there is good reason to hope that the improvement will continue. To Sir Patrick Manson and Professor Ross we owe the original discovery that the *Anopheles* mosquito is the principal, if not the only, carrier of malarial infection, and the doctors of Malaya have amongst them done excellent work as a result of this discovery. I would single out Dr. Malcolm Watson for special mention, as his work as medical adviser to plantations has come, particularly, under my notice.

He has discovered that the variety of *Anopheles* which favors the coast districts, rarely, if ever, travels more than one-half a mile from the jungle, and there is practical immunity in dwelling places at this distance.

The valleys, in some of the inland districts, harbor another variety of the *Anopheles*, the spawn of which can exist in running water, and can only be got rid of by carrying the water away in enclosed drains. Interesting experiments in this direction are now being carried out by several rubber companies in Selangor.

Thanks to the natural richness of the soil, a considerable amount of capital was attracted to British Malaya from Ceylon, where there was comparatively little suitable land available, and our community owes something of its success to the cash and experience introduced from that colony.

GOVERNMENT AND PLANTER.

Although the new applications for land are still sufficient to tax severely the resources of our over-worked (and not over-paid) Survey Department, the increased rent and export duty has driven a certain amount of British capital to the Dutch Colonies of Java and Sumatra, and considerable development has recently been made in those islands, as well as in Borneo.

When stating these facts, I do not wish it to be understood that I am advocating the avoidance of British Malaya as a country for investment, or that I would belittle the fine work accomplished by my fellow countrymen who have been officially responsible for the development of that region.

On this occasion, I have the honor to represent the Planters' Association of Malaya, who amongst them manage a total of upwards of 600 plantations, with an invested capital of about fifty million pounds sterling, a value, which through their efforts, has appreciated to several times that amount. I am quite certain that I should not be correctly voicing that community if I conveyed the impression that we would prefer any form of government than that approved by our Sovereign Lord, King George.

The success of our industry is largely due to the confidence inspired by the existence of an absolutely honest and conscientious public service. Mistakes have been made, but these have been due, entirely, to the excessive zeal of those in authority, who desire that the whole country should participate in the prosperity of our industry; and judging by past experience in times of adversity, we may reasonably expect that if our burdens become too grievous to be borne, we shall obtain the relief necessary to meet the stress of competition.

CULTIVATION.

With your permission I will now direct your attention to a few details connected with our plantation work.

At first, the cultivation was almost entirely confined to interplanting *Hevea* trees through the old fields of coffee, but a few bold spirits ventured to clear the jungle for this product only. But it is regrettable to mention that some tempered their rashness by planting rubber and cocoanuts in alternate lines, and had to pay rather heavily for their caution, by being forced to cut out either one or the other when both required more room for expansion. I need hardly mention that it was usually the cocoanuts that were condemned. As one who does not believe in keeping two good things in a parcel not large enough to hold both, I have planted the two products in adjoining fields; and, perhaps, for that reason, my feelings have always been harrowed by the woeful spectacle afforded by the destruction of thousands of these valuable palms.

The interplanting of *Ficus Elastica*—the red rubber of commerce (this has no connection with the rubber shipped from the Congo)—was at one time popular, particularly on the estates of the coast districts; but although this variety yielded a fair quantity at the first tapping, it did not compare at all favorably with *Hevea* in continuous yield, and the tapping seemed to check its growth. A considerable area remains under this variety in Sumatra, but it has become a negligible quantity in the Peninsula and has never been in favor in Ceylon.

At the outset we obtained our *Hevea* seeds from the original stock, and this was an expensive item, which has gradually declined in cost, now that we have trees of all ages and have no certain knowledge of any difference in the quality of the plants, whether raised from seeds of old or young trees.

In the hilly districts ordinary surface drainage is required but near the coast great care has to be taken to select land which can be drained efficiently, and this work frequently involves considerable expense. Fortunately for us, Malaya is not subject to tidal waves, as large areas of our finest plantations are only a few feet above sea level. The drains are laid out with the compass, and cut through the living jungle before felling. The jungle is then cut down and the branches lopped to a level of about 4 feet from the ground. A few weeks later, the burning is carried out by a line of men walking at ten to twenty yards apart, with their backs to the wind; and in favorable weather, the undergrowth and smaller branches are consumed. Afterwards the unburnt branches and small trees are piled and burnt, and generally speaking, when this is done the field is described as cleared, although the stumps and trunks of the big jungle trees still remain on the land. Recently on some estates, heavy expense has been incurred in getting rid of these, before planting, as a precaution against the spread of root disease and white ants. It is a debated point as to whether the risk of loss by disease justifies such expensive precautionary measures, and whether it is not better to wait for three or four years when the few rotten logs that remain can easily be got rid of.

Planting is done either from stumps or seed at stake. In the former case, the plants are taken from the nursery, being then from 6 months to 2 years or even older, cut to a length of 3 to 4 feet, the roots hacked back and then planted in the holes previously prepared for them. It says much for the vitality of the *Hevea* that it usually survives this drastic treatment and starts to sprout afresh, within a month, if the weather is propitious. From this time on ensues a battle between the planter and the original jungle, which endeavors to regain possession of the land. Numerous kinds of obnoxious weeds—coming from Heaven knows where—also make their appearance.

From time to time there crops up something almost as bad as weeds. I refer to the wearisome controversy as to whether it is

not desirable to allow grass to grow or to cultivate some cover plant which will extinguish the weeds. There are one or two cover plants which do not cause any permanent damage and have even proved beneficial on some plantations, when they have lacked sufficient cash to maintain a proper upkeep and when the only alternative was abandonment. I have experimented with small areas under grass, but the results have not shaken my belief in clean weeding, to be followed by digging or ploughing whenever there is a sufficiency of funds and labor. With a sufficient supply of these sinews of war, the planter can hold his own, and after three or four years, aided by the shade then afforded by his trees, he becomes master of the situation.

THE HARVEST.

The longed-for harvest then occupies his attention; and nowadays his thoughts turn, naturally enough, to the curing factory. When I started tapping, the word factory had not been invented, or, at any rate, used in this connection. I began by settling the latex in my washing basin, rolling the rubber with a beer bottle (an empty one) and drying it on the veranda. Then acting under strong domestic pressure, I moved the scene of operations to the stables, and carried it on there until there was no room for the horse. Next I built a little shed and bought a hand mangle. The next move was to the factory of today.

COST OF PRODUCTION.

You will, I think, be interested to hear something about the cost of production. We planters are frequently twitted about our old promises of cheap production and these are compared with actual costs, which in some cases exceed 60 cents (U. S. A. currency) a pound. The twitting, curiously enough, was most severe when rubber was worth from two to three dollars, at which time we had to pay an ad valorem export duty and charges, based on these extremely high prices. Then, as there were not quite enough experienced planters to go round, assistants, as well as managers, thought they would like to participate in the general prosperity and expected either larger salaries or else commissions. Our coolies also felt that what was good for master must be good for man, and demanded either more pay or less work—generally both. Even the government suffered from the prevailing spirit and on new applications increased the rent and charged a premium on the land. Shareholders often seem to forget to study the other side of the profit and loss account and to compare the price actually obtained against the price we figured on when estimating the cost of production Moreover, we did not contemplate tapping our trees at four years old, at which age the rubber is naturally more expensive to collect.

I admit that I speak with prejudice, but it seems to me only right and proper that those responsible for supervision should enjoy some of the fruits of the industry, when the industry can well afford it. There are many other items of expenditure which will automatically decline when the value falls.

CLOSE VS. WIDE PLANTING.

I do not desire to encourage the expectation that the yields from our closely planted trees will approach that obtained from those first planted. The latter were usually planted at wide distances, and enjoy as much light and air as the heart of a tree can desire. Ten years ago, I collected 18 lbs. of rubber in 35 days from one of the trees planted by Sir Hugh Low; while from avenue trees of my own planting, 14 years old and 7 feet in girth, results have been obtained far in excess of those planted in the fields. It is for this reason that I am inclined to deplore references in published reports to yields *per tree*. All calculations should be based upon the yield per acre. Probably the average number of trees planted to the acre in Malaya is nearer 200 than 100, and thinning out is inevitable as the trees expand. Thus, your trees are an uncertain quantity, whereas the acre is always the same.

A well known botanist who studied the *Hevea* in its native land used to urge us strongly to plant at 40 x 40 feet, i. e., 27 trees to the acre.

The *Hevea*, like most quick growing trees, is extremely brittle; and, at this distance, would suffer severely from the wind, but if I allowed, for the sake of argument, that every tree reached maturity, I found by comparing the results from avenue trees against the results from closely planted fields that up to 8 years old I should have harvested less than half the quantity of rubber from the same area, had I adopted our botanical friend's advice.

It is true that I should have economised to a certain extent on the actual cost of collection but not sufficiently to compensate for the loss of rubber.

Thinning out as the trees get older and require more space, has been opposed on the ground that the dead roots encourage the spread of disease. I have pursued this policy for several years past and cannot find that the fear is justified. Indeed, as the years roll on, I become less anxious about plant diseases and pests of all kinds. *Fomes Semitostus* (our worst fungus disease) and white ants (the most destructive of our insect pests) have lost their terrors for me now that I know how to keep them in check; and as the loss from all causes on the plantations I am connected with does not average two per cent. after attaining maturity, I cannot, justly, be charged with "turning the blind eye" in that direction.

LABOR PROSPECTS.

The most plausible argument against the future output of plantations is that of shortage of labor. It is true that most plantations are at times short of labor, but I think this must generally be attributed to the manager's desire to keep down expenses. Out of a total of 227,985 coolies employed on Malayan plantations 126,665, or rather more than half, were imported from India. The average period of service on the plantation does not exceed two years—although many of these return after a holiday in their native land; and the difficulty is to engage during the recruiting season the exact number that are required to make good the probable departures during the rest of the year, without becoming burdened at the beginning with labor for which there is no profitable employment.

Within two years the plantation labor force has more than doubled. I do not believe that by increasing the rate of wages any great stimulus would be given to Indian emigration. Tamil coolies are more easily recruited for some plantations at half the wages paid on others which are unpopular, owing to unhealthiness or to some other cause; and this fact is becoming more clearly marked, since those employed at the lowest rates have found themselves able to remit more than half their earnings to India, and their savings in three or four years are sufficient to establish them as capitalists when they return to their native villages.

The future success of estates which are unpopular with Indians will depend on the attractions they can offer to Chinese or Japanese. To these, the rate of wages is of more importance than any other consideration; and there is practically no limit to the number that can be recruited—at a price.

It must be remembered that by doubling the cost of labor we do not double the cost of production. Generally speaking, the average cost of tapping is less than one-half the total cost of production, if we include home charges; and as the majority of the trees now being tapped have barely reached half their full yielding capacity, labor rates can, if necessary, be materially increased without raising the cost of production, when the trees attain maturity.

MANURING.

Recently, some consideration has been given to the question of manures. From Ceylon some interesting results have been reported, but in Malaya little has been done in this direction, except on some estates where the soil is excessively rich in humus, and lime has been applied to correct the acidity, with good results.

My own opinion is that for some years to come, at any rate, systematic cultivation of the soil will be of more value than any manure, but the experiments in Ceylon are deserving of atten-

tion; and the Agricultural Department of Malaya, if they have not already done so, might study the question with advantage.

FUTURE SUPPLIES.

It has been suggested to me that you will be interested in an estimate of the supplies that are to be obtained from plantation sources, and it is obvious that a paper of this kind would be incomplete without it. It is not easy to obtain reliable statistics of the cultivation in all the tropical countries in which rubber is grown. Naturally, the yields vary considerably and the high price has undoubtedly encouraged more vigorous tapping on many plantations than would have been considered advisable if the price had been less tempting. I know fields where from 800 to 900 pounds an acre have been collected for two or three successive years, but I question if such high yields can be maintained. A first-class, well-managed plantation may be expected to yield an average of 500 to 600 pounds an acre for as many years as our experience guides us, but we must assume a considerably lower average from all plantations. The area under rubber in the Malay Peninsula at the end of 1911 amounted to 542,877 acres, and as far as I can ascertain the total area under this cultivation in the world amounts to about 1,000,000 acres. We know that during the half year ending June 30, 1912, the exports from Malaya amounted to 9,038 tons, and from Ceylon to 2,252 tons. Allowing for the output from India, Sumatra, Java, etc., I estimate the total output of plantation rubber will be from 25,000 to 30,000 tons for the whole year. The annual increase will be fairly steady, and at about six years from date the production is likely to amount to 100,000 tons per annum or, in other words, equal the total consumption of rubber during the year ending June 30 last.

During the year ending June 30 (1912), with rubber averaging 5/2 (say a dollar and a quarter) a pound, consumption—according to the figures recently published by Messrs. Hecht—increased by 25,482 tons. I am aware that this statement has been challenged by other authorities. We are told that they are *eminent* authorities, but as they unfortunately published their views anonymously, we are obliged to take their word for it.

The most pessimistic of these that I have read, calculates the increase at about 14,000 tons, and if we accept this figure in preference to Messrs. Hechts' (I don't know why we should), and assume that this increase will be maintained, the requirements six years hence will amount to 184,000 tons, so that the struggle between plantation and wild rubber does not appear to be very imminent.

I have now told you as well as I can what I believe to be the immediate course of events. To you gentlemen, who are manufacturers, I would say this, whether our achievements will lead to prosperity for *our* industry will depend entirely on the growth of *your* industry. Speaking personally of my first few years' experience in tropical agriculture, I was engaged in planting coffee. At the outset of my career in this line, the price in local currency and weights was $40 a picul and I saw it fall to $16. This experience is put in the shade by that of my brother planters who were interested in pepper and cinchona. Our misfortunes were due to the fact that an increased supply did not lead to any considerable increase in the demand for these products. We have yet to hear of anyone who shakes the pepper castor more vigorously over his potatoes owing to a slump in the price of pepper, or increases his dose of quinine because the quantity of cinchona offered at the auction sale is in excess of anticipations.

The future of the rubber industry depends on whether the planter can confidently anticipate manufacturers digesting the increased supplies.

A well-managed, favorably situated, mature plantation can produce with a handsome profit at 2/6 (60 cents) a pound. It must be remembered that the increased demand depends on the new uses to which it may be put, the increased demand for uses to which it has hitherto been put, and the supply demanded by making good the losses by wear.

As an illustration of what I mean, I will take the case of solid and cushion tires which if not now, will perhaps shortly absorb more rubber than is used for any other purpose. If we assume that 1,000,000 of these tires are used through the world this year, and only the same number next year, the amount of rubber required on this account will, other things being equal, be only that amount necessary to replace the loss involved by wear and tear.

The irregularity of the cost has undoubtedly militated against its use in some directions. For instance, I am informed that whereas electric light mains and leads were in the past invariably insulated with rubber, paper insulation has been substituted in many cases. Experts tell me that rubber is preferable for this purpose, and no doubt a number of instances will occur to you gentlemen, where it would be preferable, if the price admitted of this use.

This brings me to the crucial question from the planter's point of view, and a question which my present audience is in a better position to make an authoritative reply to than any audience previously addressed by a planter.

We can guarantee an enormously increased supply of rubber and will in future years be content with a much lower price than now prevails. What we want to know is whether there is to be a glut in the market, and a scramble to sell, with every successive increase in the supply. Perhaps, gentlemen, you can allay the misgivings of those planters with the weaker faith in the future of the industry, and can send them, through me, assurances which will encourage them to hope for a continuance, even if in a modified degree, of the prosperity we have recently enjoyed—a prosperity which, I believe, has never been rivalled by any agricultural industry in all the history of the world.

MANURING RUBBER TREES.

EUROPEAN manufacturers and Asiatic importers of fertilizers have been zealously pushing their commodities with the planting public. The difficulty seems to lie in knowing which forms of manures are best suited to particular localities, and whether the outlay will be repaid by increased rapidity of growth or larger yield of latex. Experiments on the government plantations at Kuala Lumpur (Federal Malay States) established the fact that any kind of manure stimulated growth, and that lime was well suited for trees on the soil selected.

It is understood that further experiments are being conducted at Kuala Lumpur, and that a more extended series of trials will take place at Teluk Anson. While such experiments are of value from a general standpoint, the need has been pointed out of a certain amount of experimental manuring to ascertain the qualities best suited to individual estates. The opinion has been expressed that if fertilizers have anything like the effect on yield that they have been shown to have on growth, it may be anticipated that manuring will be largely adopted in Malaya.

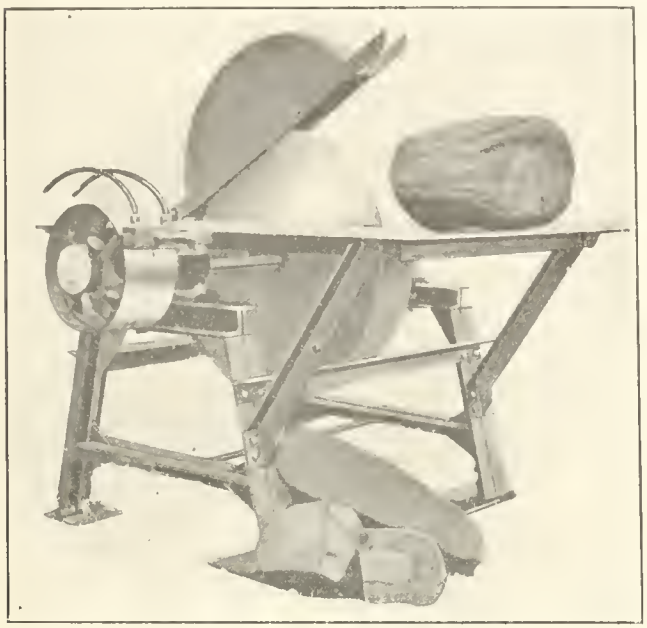
PARA RUBBER TREE IN CEYLON.

In the course of an interview with the Kandy representative of the "Times of Ceylon," Mr. H. A. Wickham, the father of the rubber planting industry, lately expressed himself as follows:

"The Pará rubber trees in Ceylon plantations are better than the trees in the Amazons, and I am not surprised at it. If you bring a product from one country to another possessing suitable conditions and cultivate it, the exotic will flourish in a remarkable manner. Take, for instance, coffee, an Eastern product which was introduced into South America. You will not get anything like the South American coffee in the East, and the yield is abundant. The coffee grows in Brazil better than in its native home. In the same way the Pará rubber tree introduced into the East from Western Equatoria, and finding favorable conditions, has developed in a remarkable manner. The trees here are much hardier than in their own country.

The Washing of Crude Rubber.

CRUDE RUBBER as it comes to the market appears in a great variety of forms—hams or pelles, balls, strips, sausages, lumps, flakes and all conditions of scrap. In all of these forms there is more or less foreign matter—matter that must be removed before the rubber can be used in manufactured goods. The foreign substances are bits of bark, leaves, splinters



KNIFE FOR CUTTING RUBBER BISCUITS.

of wood, sand, fibre, earthy matters, etc., etc. The only exceptions to this very general rule are deresinated and plantation rubbers. Many manufacturers find it worth their while to wash even these sorts, as the process seems to result in a better and tougher product. The primary process, whatever the line of rubber manufacture, therefore, is that of washing.

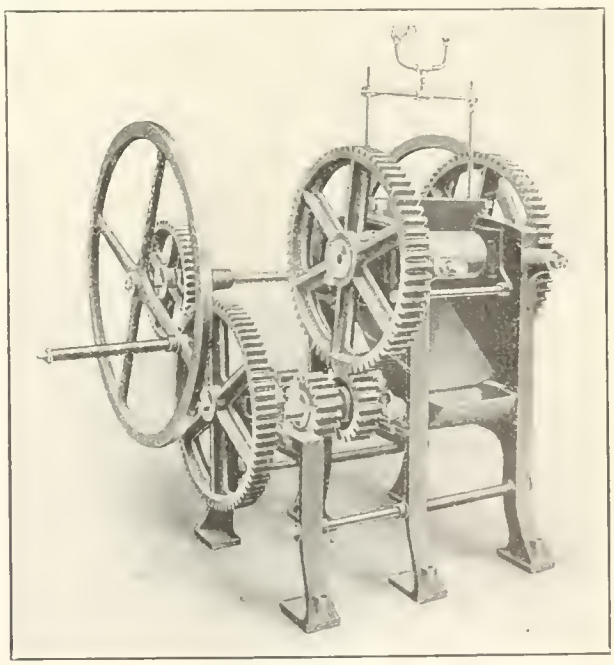
The gum is usually put into a pickling tank containing warm water, where it is allowed to soak. This removes foreign matter on the surface, softens the rubber and makes it more easily worked. This tank is usually sunk to the level of the floor near the washers to facilitate the handling of the rubber. For some grades, such as pelles of fine Pará, a power-driven circular knife is used for cutting the rubber into smaller pieces, that they may be more easily sheeted. The rubber thus prepared is fed into the first washing machine or cracker. The action of this machine is to tear or mangle the rubber, releasing the dirt and bark, which are washed away during the operation by a stream of cold water, which plays upon the mass. The cracker is a heavy, powerful, two or three-roll type of machine, the size and number of rolls depending on the quantity of material to be handled.

After a thorough washing in the cracker the partially cleaned rubber passes to the two-roll washer. The province of this machine is to complete the washing process and to sheet the torn rubber. Warm water is used on the tough mass to produce a degree of stickiness, that the action of the rolls may form it into sheets. Cold water is then turned on and the sheets passed through the rolls repeatedly until completely cleansed by the kneading action of the rolls and the running water.

There is a great variety of washers in use in the world's rubber mills, but a majority of them are of practically the same design; that is, they are usually two roll machines, the rolls geared in different speeds and running toward each other. In rubber plantations practically the same type of a machine is used, run either by hand or by power, and in some of the larger plantations batteries of machines are employed. As plantation rubber is washed very soon after coagulation, the machine may be quite light and does not take nearly the amount of power to run that the same types in rubber factories call for. When it is remembered that crude rubber shrinks anywhere from 12 to 50 per cent., that while a considerable percentage of the shrinkage is due to the water extracted from the rubber, a great deal is foreign matter, more or less injurious to the gum, it will be wondered at that manufacturers have not insisted upon rubber being washed at the source of supply and delivered clean and dry, thus saving much in the way of freights. The explanation is that as soon as rubber is massed and its physical aspect changed, it is so easy to amalgamate the inferior and superior qualities that manufacturers decline to take the risk of being cheated, and have consistently frowned upon all such suggestions. There have been, however, and still are, crude rubber washing companies in various parts of the world that have done a fair business, but none of them have been conspicuously successful as yet.

There are some forty companies in the world making roll washers, and their patterns are more or less similar. It will, therefore, be sufficient, in describing these machines, to take examples from the output of any of the higher class of machine manufacturers and describe them as practically typical of the whole.

Roll washers consist of heavy iron rolls running toward one another, set in substantial iron frames, fitted with piping so that hot or cold water may be sprayed over the rubber as it passes between the moving rolls. These rolls, be it remarked, are



PLANTATION HAND WASHER.

fluted or corrugated so as to bite the often intractable and slippery gum.

Regarding the kind of roll—corrugation, many experiments have been made to determine the best possible form. There is for example the saw-tooth corrugation, in some cases both

rolls being cut to this shape, while in others one roll is smooth and the other cut. Probably more rolls are made with the V-shaped corrugation than any other. Experiments have shown that this form will do quite as good work at least, as it holds its shape longer and is easier to recut than the other forms. It seems to be quite a question whether two cut rolls or one (one being a smooth roll) will give the better results. There are cases where two cut rolls with ordinary corrugations make good sheets, but in small mills where one machine is required to do all the work from breaking down the biscuit to sheeting out, the machine with one smooth and one cut roll with a friction of about 1¼ to 1 in the rolls, is the better.

Taking a two-roll washer of the standard type, it has about the following description. The frames are heavy in construction, accurately lined and firmly held in place by stay rods. The frames are side-capped. The caps are bolted in place with heavy bolts in order to resist the strain at this point.

The journal boxes are solid cast, designed to keep out water and dirt. The bearing surfaces are channeled to insure perfect lubrication and bronze-lined in the sections exposed to greatest wear. Oiling devices easy and safe of access are provided.

The rolls are hard gray cast iron. The grooves or corrugations of both rolls are planed in spirally about 4 to the inch. The front or driving roll revolves in stationary boxes. The follower roll is brought into adjustment by means of steel adjusting screws, working in bronze nuts set into the back of the frames.

The power is taken from the main shaft by means of a jaw clutch and pinion. The latter engages a spur gear, keyed to the driving roll. A gear is keyed to the other end of this roll and meshes with a larger gear keyed to the end of the follower roll, causing the two rolls to travel at different speeds. The following are standard sizes of two-roll washers and their ten-hour product:

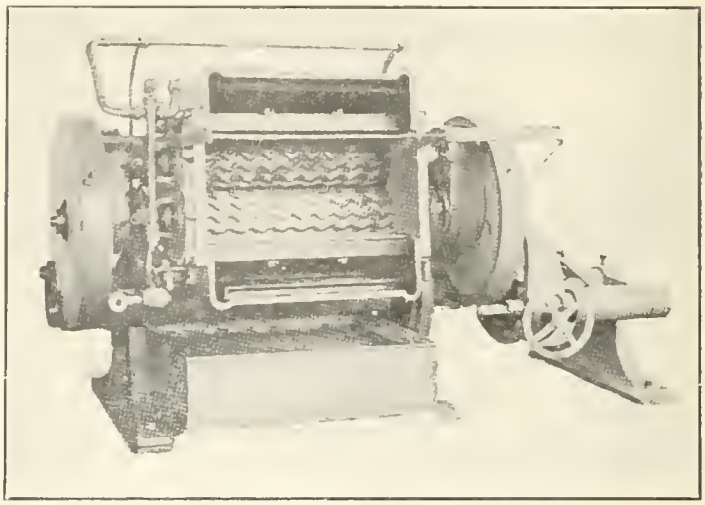
8 x 16"	2 roll	500	pounds	in	10	hours	7½ H. P.
10 x 20"	" "	750	"	"	10	"	10 H. P.
12 x 24"	" "	1,200	"	"	10	"	15 H. P.
14 x 28"	" "	1,500	"	"	10	"	20 H. P.
15 x 30"	" "	2,000	"	"	10	"	25 H. P.
16 x 36"	" "	2,500	"	"	10	"	30 H. P.

The cracker when used in washing is practically the same machine as the two-roll washer. It is, however, usual to have the rolls more coarsely corrugated, and of chilled iron. The rolls of the cracker run at the ratio of about 1 to 1½. A cracker-washer with rolls 15 x 24 should deliver 1,500 lbs. of stock in ten hours, and take about 25 H. P. to do it. One 16 x 30 should produce 2,000 lbs., and require 30 H. P. One 18 x 36 should deliver 2,500 lbs. and use 35 H. P.

The three-roll washer is designed to handle large quantities of rubber after it has been passed through the "cracker." It has a capacity nearly double that of a two-roll machine of corresponding size, while only one operative is required. The frames are heavy, strong, should be accurately squared as to each other and securely held in place by strong stay rods or bolts. The caps are located on the front of the frames to facilitate removal of the rolls. They are of heavy construction and provided with strong bolts in order to resist the powerful thrust directed against this part of the machine.

The journal boxes are solid cast, provided with oiling devices, easy and safe of access, and the inner or bearing surfaces are oil-channeled to insure perfect lubrication; so designed as to keep out water and grit. The bearing sections exposed to greatest wear are bronze-lined.

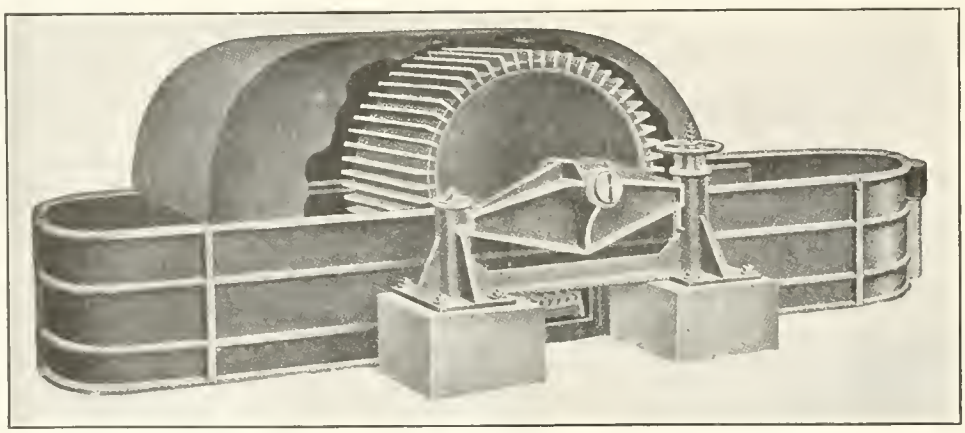
The rolls are usually solid cast of hard gray iron. The grooves or corrugations of all three rolls are V-shaped, planed in spirally about four to the inch. The front or middle roll is



MASTICATOR WASHER.

the driver and revolves in stationary boxes. The two follower rolls are brought into adjustment with the middle roll by means of steel adjusting screws, working in bronze nuts set into the back of the frames. Power is applied from the main shaft by means of a jaw clutch and pinion which engages a spur gear keyed to the middle or driving roll. A gear is keyed to the other end of this roll and meshes with gears of similar pitch and face, keyed to the ends of the two follower rolls; thereby all rolls are driven at the same speed.

Three-roll washers come in three sizes, weighing 15,000, 18,000 and 25,000 lbs. They have a capacity for ten hours' work in Pará rubber of 25,000, 35,000 and 45,000 lbs., using all the way from 50 to 100 H. P.



TUB WASHER.

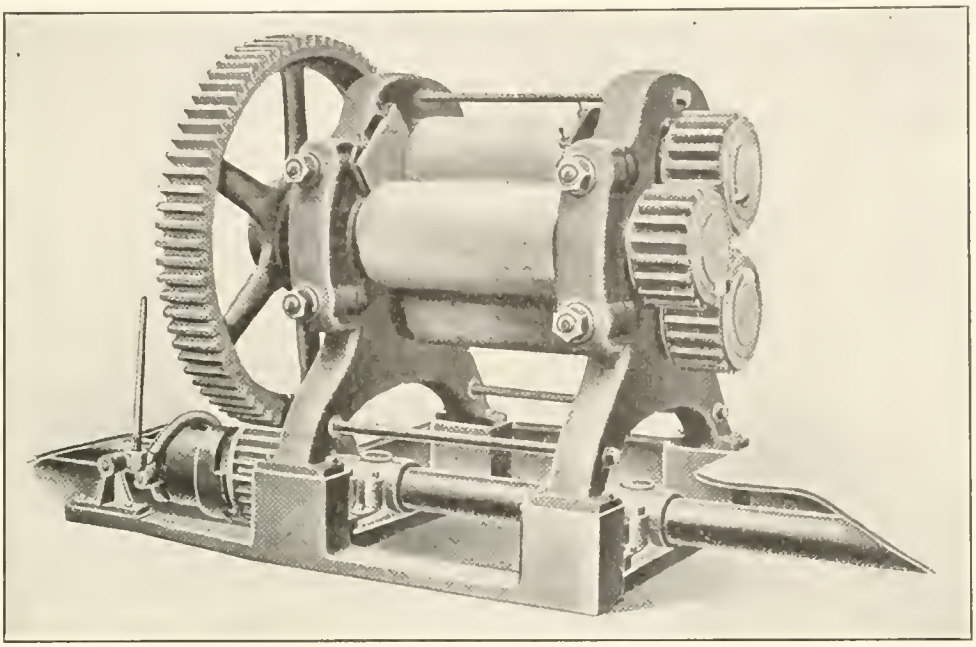
The three-roll cracker can be used as a cracker or a cracker-washer. For a cracker, the rolls are usually chilled and provided with coarse corrugations, such as the undercut or saw-tooth spiral shape with the face backed off, and the driving roll is geared to run 1 to 1½ or 1 to 2 as compared to the follower. A steel neck is also recommended for the driving roll.

The three-roll cracker-washer does the entire work from the biscuit or crude material to the clean sheet. The corrugations are usually the V-shape spiral on all rolls, but in some instances

the driving roll is corrugated and the follower rolls are smooth. The differential speed of the rolls is 1 to 1½.

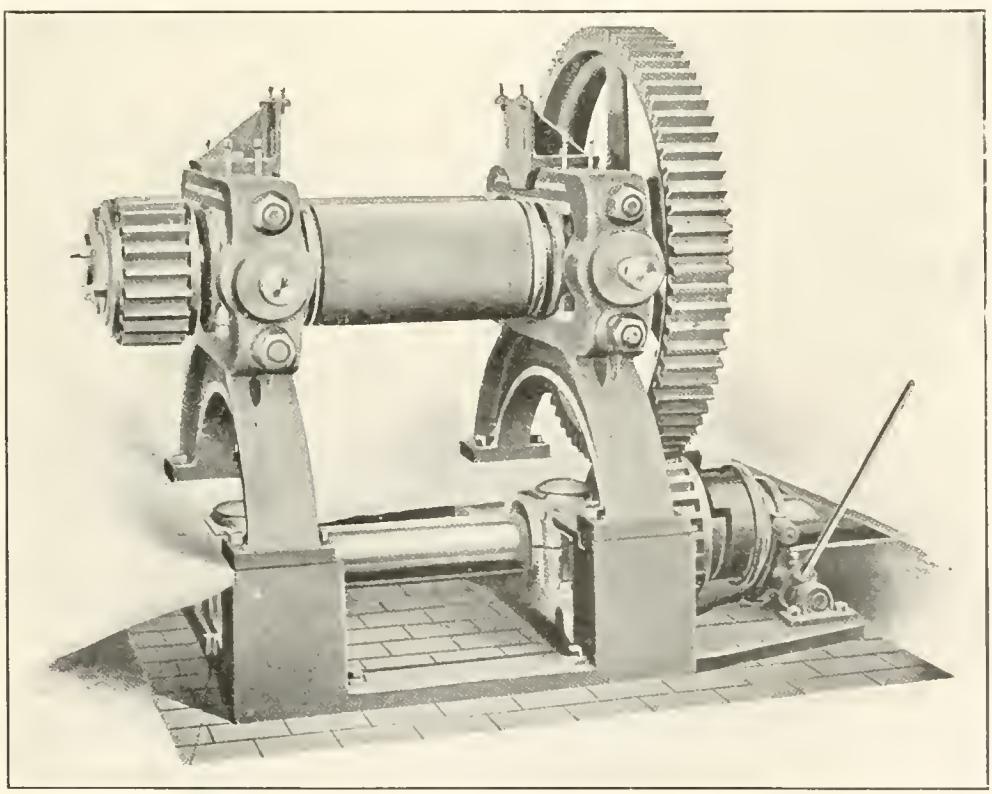
A distinct type of washer has grown up by the side of the roll machine, and is very generally used, particularly in cleaning the softer gums. It is known as the "Tub" washer and is very much like the so-called "paper engine."

It is in brief a tank anywhere from 2 to 16 feet long, with a beater wheel running in it. When filled with water and shredded material it runs the contents round and round the tank, beating and cleansing, and yet never crushing. In use the rubber is first run through a cracker of some sort and shredded. It is then put in the tub, which has been previously filled with water. When the machine is started the rubber is carried under the washing roll and over the bed plate at the bottom, which spreads and stretches the rubber and releases particles of sand or bark or other foreign matter. The bark, being lighter than the rubber, floats on top and is skimmed off, while the sand and gravel settle to the bottom out of the way and are removed after the batch is finished.



THREE ROLL WASHER.

For certain grades of rubber, where fine sand is present, this type of machine is indispensable. The type shown in the illustration is made of cast iron sections bolted together, and calked with lead. The bottom is built of cement or concrete, after the machine is placed in position. The bearings are set on piers outside of the tub with an adjusting screw on one side. The surface of the beating roll is fitted with steel-faced knives, set into cast-iron heads. The bed-knife is made of cast-iron and easily removed. The weight of a full-sized machine of this kind is about 12,000 lbs., and the beating roll 58" in diameter with 36" face. A tub of this sort will hold from five to six hundred gallons of water, carry from 300 to 500 lbs. of rubber per charge and take some 40 H. P. to run it.



TWO ROLL WASHER.

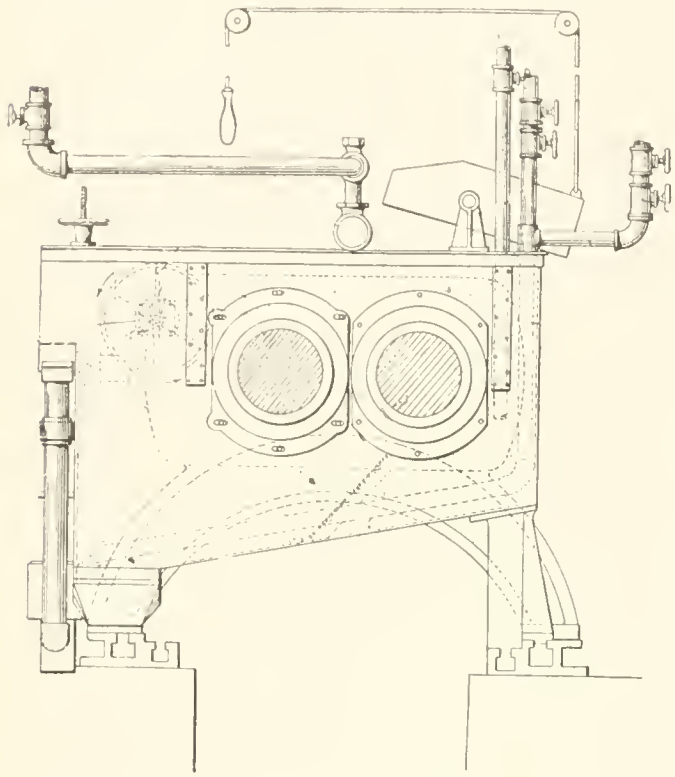
A type of washer which is essentially European, is an adaptation of a Masticator. The argument of the inventors of this type is that in ordinary washing with the two or three-roll machine, impurities are all crushed or splintered and held in the rubber, causing a much longer duration of washing than should be necessary, and that this impairs the "nerve" of the rubber. In the machine under consideration every particle of rubber is brought in contact with the water, and the water escaping carries the impurities away with it, at once.

The machine consists of a pair of deeply corrugated rolls, carried in a trough shaped at the bottom to follow the periphery of the rolls. The trough carries ledges at the back and front, which turn the rubber over and guide it between the rolls. The machine is furnished with gratings in the back and front of the trough, through which the lighter impurities escape.

This machine comes in three sizes, which take charges of rubber of twenty, forty and eighty pounds. The horse-power required is approximately 9, 15 and 25, and the time required per batch from ten to twenty minutes. The above relate to Pará sorts. For low grade gums

the charge may be as high as one hundred and fifty pounds.

What is known as the Hood washer is a two-roll machine set in a closed tank, so that the level of the water during washing



HOOD ENCLOSED WASHER.

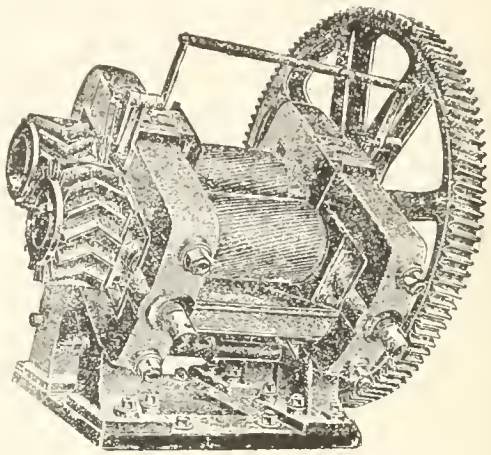
comes above the nip of the rolls. When at work the rubber sheet floats up to the surface automatically, and feeds through the rolls. Floating impurities are washed away, while the heavier ones sink to the bottom out of the way, and are removed periodically through a gate.

Another enclosed roll machine is the Dessau. It consists of a pair of rolls, corrugated and studded, revolving in a tank. The sides of the tank support a central screened box that immediately encloses the rolls. This gives a liquid space at the bottom and sides. There is arranged also at the bottom of the liquid space an agitating device which keeps the water in motion and is designed to prevent any particles of foreign matter from settling upon the rubber while it is being washed.

Still another enclosed washer is the Kempter, of German origin. This, like the Masticator washer, has bladed rolls, the bottom of the trough containing them being in the form of intersecting cylinders with a ledge in the middle. Water is forced in from the bottom. The rubber passes down between the rolls, is opened up by the ledge, and then up between the rolls and the sides of the trough. Foreign materials pass through perforations in the trough and over lips on either wall.

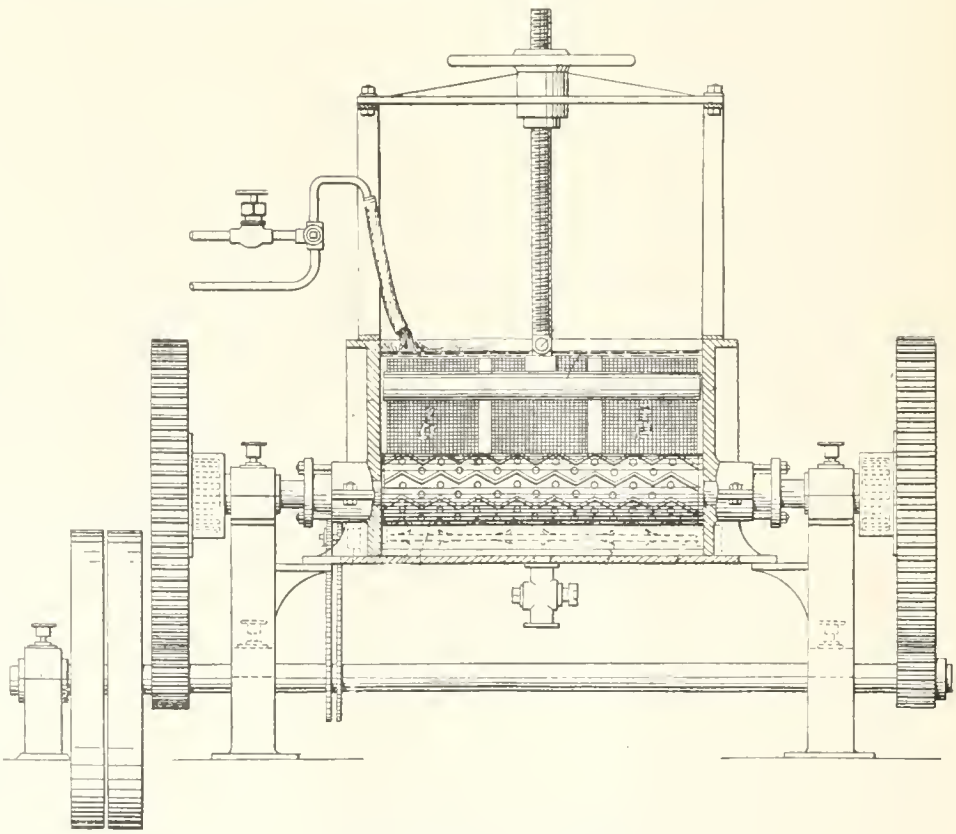
In addition to the foregoing there are sundry individual machines and processes in use in various factories for the further cleansing and treatment of crude rubber.

For example: In the production of a certain grade of rubber great difficulty was found in getting rid of the great amount of woody fibre that was present. After the rubber had been shredded, both rubber and wood floated on the surface of the water, and if put through ordinary roll washers much fibre was imbedded in the rubber. One solution of the problem was a method of dissolving the wood fibre by treating the mass with a strong alkaline solution. After many experiments a simple process for removing most of it mechanically was invented. It was this: to float the shredded rubber and fibre into a tank that could be hermetically sealed. Air was then forced in and the pressure freed the minute globules of air that clustered about each shred of fibre, and the shred, water-logged, sank to the bottom out of the way.



ANGLE TYPE TWO ROLL WASHER.

The above covers pretty fully rubber washing where water alone is used. Where rubber is washed free from resins, for example, and solvents are used, a radically different apparatus is necessary. That, however, is another story.



THE DESSAU "ROCK" WASHER.

Possible Rubber Producers in the Temperate Zone.

By Charles P. Fox.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912

THIS paper has been prepared at the suggestion of Mr. H. C. Pearson, originating from comments made upon an editorial in a recent issue of the INDIA RUBBER WORLD.

The idea of producing rubber in commercial quantities within the boundaries of the Temperate Zone is not a new one. The increasing use of this commodity and the increase in cost are responsible for the occasional stimulation of interest in the matter. Thirty years ago the farmers of Canada were forming companies for utilizing the common milkweed for this purpose. The high price of rubber in 1910, caused some Summit County (Ohio) farmers to seriously think of the same thing.

While the proposition is quite possible, its probabilities are remote, and dependent upon many conditions, some of which are: demand, cost of production, grade of product, influence of supplies of natural and plantation-grown rubber and the ever-appearing spectre "synthetic."

We have several rubber-producing plants suitable for the various sections of the temperate zone. During the past fifteen years the author has examined a number of plants, the examination including almost every plant likely to contain rubber, from Carolina Palmetto to California Cactus. For convenience I have grouped these plants according to their nativity and climatic requirements.

Of the foreign plants we have *Atractylis* and *Eucommia*.

Atractylis gummifera is a thistle-like Composita of Southern Europe with enormous beet-like roots and thorny leaves. A few years ago European writers advocated this plant as a source of crude rubber. Our examination did not confirm this view.

Eucommia ulmoides, known as the "Chinese Rubber Tree," is a native of Northern China, a country very similar in soil and climate to Eastern Washington. According to the Arnold Arboretum, Harvard College, it is perfectly hardy in New England. Just what it will do in this section in the production of rubber either in quality or quantity, is not given out by the authority quoted. Under natural conditions, it produces a good rubber, the rubber appearing as long silky threads in the broken bark. This source of rubber has been known since 1882. It has been recommended for planting by the Indian Forestry Commission. According to Vilmorin, Paris, who propagated it for sale, there was never much demand for it. It is a fine appearing tree and well deserves a place in ornamental forestry.

Of our native plants those of possible value as rubber producers in the North are members of the *Asclepiadaceae*, *Apocynaceae*, and *Compositae* families.

Of the true milkweeds there is only one of any importance, *Asclepias cornuti*. This species is very abundant throughout the United States, growing upon almost any kind of soil and showing great drought-resisting qualities. This plant contains an abundance of milky juice containing 3% per cent. of fair grade rubber. The cost to collect this latex is, however, prohibitory. The amount of product given up by extraction of either the fresh or dried weed is too small, and its character too inferior to command much attention.

If by selection or transportation from one section to another, the quantity and quality could be increased and improved to a degree sufficient to make the production by extraction profitable, this plant would be the favorite, as perennial plantations yielding annually 2 to 3 cuttings of at least 10 tons each per acre of green weed, could be easily and economically established.

The common Indian hemp, *Apocynum cannabinum*, occupies about the same territory as the milkweed but is less abundant. It produces less latex than the milkweed, but the quality of rubber is better. The root of this plant contains rubber, and is very similar to that of the African *Landolphia*.

The native *Compositae* of this region give us several rubber producers. *Souchus* (Sow thistle), an introduced species now naturalized, is credited by Jumelle as the producer of an excellent grade of rubber. *Souchus* rubber is the subject of a German patent of 1885. This plant thrives on a dry, barren soil and is regarded as a troublesome weed.

We have two species of wild lettuce, *Lactuca Canadensis* and *L. virosa;* both very abundant, especially the latter, which is a terrible pest. Both produce thick rubber-containing latex and medicinal agents. *L. virosa* gives a water extract similar to chicory as a coffee substitute.

The arid section of the Temperate Zone is amply provided for with guayule, pingue, greaseweed and candelillia.

The value of the guayule (*Parthenium argentatum*) as a rubber producer is too well known to need a description. Prof. Lloyd is certain that guayule can be successfully grown in Mexico. Mexican conditions can certainly be duplicated in the Southwest.

Pingue (*Actinella Richardsonii*) is a related plant found in New Mexico and southern Colorado. While containing less rubber than guayule, it possesses some superior advantages in other ways. The root of the pingue is the producing portion. The top furnishes numerous shoots for propagating. The pingue requires a deep, sandy soil for the maximum development of its long tap root. Under these conditions the yield of rubber may reach 7 per cent. of good grade rubber equal to, if not better than, the guayule product.

While investigating the pingue, this peculiar condition was observed: As before stated, the pingue, under natural conditions, i. e. mountain slopes and dry sandy banks, develops a fusiform type of root, comparatively rich in rubber. On clay soil, in meadows along irrigating canals, the pingue root becomes fibrous and contains little or no rubber. This phase may have an important bearing upon the utilization by cultivation of the guayule and pingue for the production of rubber.

The neglected mariola, another *Parthenium*, occupying a wider range and much more abundant than guayule, may sometime be of value on account of its resin. Nevada greasewood contains rubber as shown by the Ellis & Werner patents of 1902. Mr. Sam P. Davis, Nevada Industrial Commissioner, advises that there is a large amount of this plant.

Another promising plant of the arid region is "Strockles Rubber Bush," a robust *Composita* growing abundantly throughout the Great Basin. While the rubber of this plant is inferior to that of the other two *Compositae* mentioned, it can be utilized. This plant also contains a large amount of valuable resin.

In North Mexico and the "Big Bend" country of Texas, there is an immense growth of Candelillia, an *Euphorbia* which contains rubber and wax. This wax is now a commercial product much used in Germany as a constituent of hard rubber. On account of its drought-resisting qualities and the facility by which it can be propagated by its bulbous root, it should be a valuable plant for the extremely arid, non-irrigated section of the Southwest.

The South has its special rubber producing plants. Some 15 years ago the growing of *Ficus elastica* for rubber was attempted in Florida. The point selected, unfortunately, was on Key West, a small island near the mainland, with shallow soil and dry meteorological conditions.

The venture was not successful. The ruins of the plantation with its dwarfed, straggling trees still remain. The trees are now 15 to 20 feet high and 6 inches in diameter. Some of these trees were tapped in April, 1910. Very little latex was secured and this was of poor quality. When grown on the mainland, in the deep, fertile and moist soil near Miami, it becomes a large tree.

There is a native fig (*Ficus aurea*) found growing abundantly throughout southern Florida. Large trees, 60 feet high and 2 feet in diameter, of this species, are to be seen on the grounds of Fort Dallas, once the prison home of the defiant Seminole chieftain, Osceola.

Mr. Flagler, the founder of Palm Beach, planted this species along the shores of Lake Worth for ornamental purposes. The tree gives an abundance of latex containing rubber, of quality

CHARLES P. FOX.

probably as good as the Amate rubber of Mexico. The tree will flourish in almost any situation found in South Florida.

That portion of Florida south of Homestead is a vast stretch of saw grass, with swampy clay of doubtful value for agricultural purposes, even after the "Everglade Reclamation" has been completed. The Florida fig will grow there. Considering the large area suitable, the rapid growth of the tree, and the possibilities of the yield of rubber, the proposition is not the worst one.

In the sandy and drier portions of the South, we have several species of *Bumelia*. Tropical relatives of the *Bumelias* are producers of gutta percha. Texas "stretchberry" (*Bumelia lanuginosa*) contains rubber. The "stretchberry" is a shrub of wide distribution suitable for much of the waste land along the Pecos.

In the arid portions of the South, especially on the Florida Keys, the hedge spurge (*Euphorbia triangufolia*) does entirely too well. Planted out originally for fencing, it has, in many localities, spread into the fields. This plant produces a small amount of rubber. Recently, it has been strongly advertised as "Cuban Rubber." Value of the plant as a rubber producer has been over-estimated.

Of the several plants mentioned for the possible production of rubber in the Temperate Zone, only two of them, guayule and pingue, have been found to contain enough rubber to insure a profitable working. The balance must be improved by careful "Burbanking." This work of selection and improvement lies within the scope of our experiment stations. Already the universities of New Mexico and Arizona have work in progress along these lines.

In the possible production of rubber in the Temperate Zone, the arid West has the better chance, with the South a close second. While the Temperate Zone may never do much in the way of producing first class rubber, the firm believer may find consolation in the prophecy that, if necessity demands, it can produce enough masticatory to keep busy a hundred million maxillae.

CHARLES P. FOX.

ONE of the most fascinating studies connected with the botany of the United States is the possibility of cultivating, on a commercial scale, some rubber-producing plant. Probably nobody has given more attention to this matter than Mr. Charles P. Fox, whose interesting paper, "Possible Rubber Producers in the Temperate Zone," appears above. Mr. Fox has studied the question of rubber producing plants in the United States for the last fourteen years, and studied it in a thoroughly scientific way. He is an Ohioan by birth, graduated from the Ohio State University in 1900, and very soon thereafter became Professor of Agriculture in the University of Idaho. From 1899 to 1912 he was chemist with the Diamond Rubber Co., and since the merger of that company with the Goodrich company has acted as chemist for the larger corporation.

He has devoted a great deal of time to investigating the source and preparation of Guayule, Jelutong, Colorado rubber weed, Castilloa, the Cuban cactus and Florida fig rubbers.

He is a member of a number of scientific societies, including the American Chemical Society, Society of Chemical Industry and the National Geographical Society; and he has published many pamphlets and articles relating to agricultural and rubber industries.

RUBBER SEED OIL.

UNTIL recently the demand for seeds for planting purposes has absorbed a considerable portion of the supply, but as the "Malay Mail" remarks, this is no longer the case, and every year will see a larger quantity produced. In order to make the industry remunerative, it would probably be necessary to extract the oil from the seeds in Malaya, which would involve the putting in of costly and delicate machinery. As the quantity of seeds on even a large estate would be relatively small, and as it would possibly not pay individual companies to buy and work the necessary plant, it is suggested that groups of estates, or a syndicate, might carry out the idea profitably.

CONGO CONDITIONS VASTLY IMPROVED.

The Congo Reform Association of London has recently presented a memorandum to the effect that the conditions in the Congo, barring one district, are greatly improved over those which prevailed under the administration of the late Leopold. The memorandum states that there is still one district where many barbarities are practised, and suggests that the present Belgian administration should send an official of experience and character to work in conjunction with the British Consul, to ameliorate the conditions in that district. The following paragraph taken from the report will be pleasant reading to all those whose sensibilities in the past have been so keenly aroused by the reports from the Congo:

"Systematized, officially directed and inspired enslavement of the people, accompanied by brutalities, violence and torture as a fixed, definite policy for purposes alike of public revenue and private profit, has disappeared from five-sixths of the Congo.

"That these results are due to the leading part played by his majesty's government and by the people of this country, in a wholly unselfish effort to restore to the unrepresented races of the Congo the liberties and rights of which they had been deprived, history will bear witness."

The Purchasing Agent.

*By Frederic Dannerth.**

IN this twentieth century, with our schools of scientific salesmanship and correspondence courses galore, for those who purpose selling commodities, may we not hope soon to have an institute for the training of buyers—the men who purchase the raw materials for our manufacturing establishments—the men who have so frequently been accused of receiving gratuities and similar forms of "rake-off." And if you examine closely you will probably find that the accusers are receiving more spoils and "graft" than the most prosperous buyer has ever dreamed of.

At a time when strikes are the order of the day, when the supply of coal, of textiles and iron products may be cut off without further notice within twenty-four hours, it becomes most necessary for this official to scent from afar-off the delays incident to labor troubles. He must take care to lay in a goodly store of those materials which his factory needs most, in order to keep its various shops in operation. Then again when his requirements are less than the monthly allotment called for in his annual contract, the buyer must be able so to conjure the situation that the vendors—his supply houses—do not hurry him or "saddle" him with excessively large shipments. Another point which must be constantly kept in mind is the large amount of storage space required for goods which are ordered in carloads and used by the pound.

One phase of purchasing which comes into play more frequently among importers and jobbers, is due to the quadrennial prospect of tariff changes. This possible revision makes it necessary to keep in touch with the new administration and the desire on the part of the party in power to raise or lower the import duties on certain commodities. The arrival of importations ten hours after the tariff act goes into effect is a familiar spectacle at custom ports, and one which brings forth sadness or cheer in the heart of the importer, depending upon whether the duty has been advanced or lowered. One other point which the buyer usually keeps before him when placing orders is: the possibility of delay in shipments due to spring floods and excessive snowfall on railroad lines, or fires and strikes at the shipping point.

A well organized purchasing department is characterized by the specialization of duties—an arrangement by which the shifting of responsibility is eliminated, or at least reduced to the minimum. Thus the chief buyer with his assistant counts among his duties:

Interviewing the representatives of vendors;

Visiting the trade markets and manufacturing plants;

Watching trade tendencies and prices of raw material,

Checking his monthly consumption of each raw product, and noting the daily consumption of the principal materials. The time spent on these "incidental" duties and the accuracy with which they are performed will determine to a large extent the efficiency of the purchasing agent's office. To purchase profitably, comprehensively and safely, the buyer must be not only a judge of values but he must likewise be familiar with every line in the market, for it is obvious that the farther his knowledge in this direction extends the greater will be the choice open to him. The buyer must be a man of judgment and convictions, for he is frequently consulted by the head of the firm and must be able to back up his opinions with good reasons. Thus he is constantly being put on the defensive, for no corporation head will be so irrational as to O. K. every expenditure, however large, without inquiring into its advisability. A buyer's duty is not to do the small things himself, but to see that they are done; and to that end he should hold the reins on all branches of his department. He can take nothing for granted; if he would know his materials he must see them, and even this is but a test of the shape, smell, color and taste of the article. In other words, he can determine off-hand only those properties which cannot be expressed by numerical values, properties which are ascertained by the senses of sight, smell, taste and touch. Hence we find that those materials which are used in chemico-engineering industries—materials which are valuable entirely or partly because of their chemical and physical properties, must be tested by one who is familiar with laboratory methods for making exact determinations.

Thus the amount of actual "tannin" in a tanning extract; the amount of free caustic alkali in a silk-dyeing soap; the amount of "active chlorine" in the paper-makers' bleaching powder; or the amount of adulteration in antimony for rubber goods manufactures—determinations such as these must of course be made in the testing laboratory, which is attached to all properly organized purchasing departments. These chemical tests are supplemented and sometimes preceded by the physical tests for specific gravity, viscosity, tensile strength, elasticity, hardness and dimensions.

In addition to the testing laboratory, the buyer has under his supervision the clerical room and the receiving room. In the first of these all requisitions for the purchase of machinery, chemicals, or departmental supplies are filed and passed upon. Bills of lading, invoices and statements are likewise inspected and passed upon in this branch of the department. Here also is kept an accurate card record of discounts, terms and the responsibility which each vendor guarantees or assumes. The original copy of "Specifications for Materials Purchased," which have been drawn up by the head of the testing laboratory, is likewise kept on file in this office.

In the receiving room we find the warehouse foreman and the receiving clerk, who receive shipments and make a physical inspection of each article with reference to dimensions, weight, number and size.

In the testing room or laboratory, samples of all shipments are received and subjected to such tests as will determine whether or not the delivery complies with the standard of quality set forth in the contract or specification. All these duties, as a rule, fall to the lot of the buyer's chemist, who in turn acts and cooperates with the factory chemist, the engineering chemist and the sales chemist.

After having thus briefly reviewed the duties of the buyer and the functions of his several assistants, it will be of interest to consider a few phases of his work, which at times bring him in closer contact with the laws of business and the courts of commerce.

A casual inspection of the court decisions in the various States of the Union shows at a glance the confusion which has arisen from the fact that buyer and seller did not understand each other, and it is for this reason chiefly that so much time and energy have been spent in recent years on the preparation of rational specifications for the purchase of materials. (See also THE INDIA RUBBER WORLD, January and February, 1911.) Among the topics which are of interest in this connection are: "What is the legal meaning of the word 'agreement'?" "What constitutes the acceptance of a proposition?" "What constitutes a sale?" "How should contracts be constructed and how are they

*Dr. Dannerth has for a number of years been acting as advisory chemist to various rubber goods manufacturers.

interpreted by the courts?" These points will be taken up in detail in the paragraphs which follow.

AGREEMENT.

In order to make an agreement which shall be valid in the eyes of the law, it is essential that all the parties to it agree upon the same thing in the same sense. For example, a promise to deliver "good quality Pará rubber" cannot be construed to mean "fine Pará rubber," as fine Pará implies a grade of rubber superior to those grades which might ordinarily be accepted as "good quality." Again, if a buyer orders ten barrels of antimony sulphide on 60 days' credit and the vendor or merchant sends two barrels on 30 days' credit, the goods if lost on the way need not be paid for by the person sending the order. In construing a contract, the court takes into consideration the honest and actual intention of the parties as expressed in the contract. The common law, or that which prevails on the authority of usage and the decisions of courts, plays a very important role in the adjudicating of disputes on contracts.

ACCEPTANCE.

The surest and most binding form in which to accept an offer is to use a simple affirmative, without stating any new conditions or terms. Thus, goods which were sent as directed by the buyer, and which were lost on the way, had to be paid for by the purchaser. In the matter of offers which are not accepted at once, Parsons notes that it is not necessary that the acceptance should follow the offer instantaneously. If "A" makes an offer to "B," the latter may take time to consider this offer, and, though "A" may expressly withdraw his offer at any time before acceptance, yet, if he does not do so, "B" may accept within a reasonable time. And if "B" accepts, "A" cannot say, "I have changed my mind." "A" may, if he so desires, stipulate a certain time for which his offer holds good; in fact, this is a safeguard very frequently adopted by merchants when offering materials for sale. A factor may offer goods for sale at a certain price, the offer to hold good for 30 days. This offer may be withdrawn at any time before the expiration of the 30 days, but if it is not withdrawn, the factor is bound to sell the goods at the price originally mentioned by him.

TRADE CUSTOMS.

A very large part of the mercantile law of the present day is the product of old established trade customs which have been recognized as valid by the various trades and professions, and which have been confirmed as reasonable by the courts. The Supreme Courts of several States have repeatedly refused to recognize as "trade custom" any practice which is opposed to the statute laws of the land, or which is oppressive and unreasonable. In the same manner, a custom which violates the principles of common honesty and the public welfare, will not be recognized by the courts. This, it will be seen, is of interest in cases involving such questions as: What is meant by a "barrel," or a "cask," or a "case"? Thus a contract for the delivery of "cotton" without any qualifying phrase made it possible for a mill to deliver a fabric made from "sick cotton" (abnormal cotton), as there did not appear to be any well-defined trade custom covering the point.

WHAT IS AN ACTUAL SALE?

An actual sale is always understood to be a contract which has been executed, although payment for the chattels or the delivery of the same may not yet have been made. A sale is the exchange of goods for money. An exchange is the transfer of chattels for other chattels. Thus, if the ownership in a thing be transferred to another person for money (or a price) a sale has taken place. Thus, if Smith agrees with Blank that the ownership in a certain property will be transferred to Blank for a fixed price, an agreement and a sale have been consummated and Blank owns the property wherever it may be.

"CAVEAT EMPTOR."

"Let the buyer beware": that is the warning which the law gives to all who trade and it is one which is only too often unknown, forgotten or neglected. If an article is offered and a sample of that article is submitted, the vendor thereby warrants that the goods will conform to the sample. If then the delivered goods do not correspond in quality with the sample, the buyer may sue for the breach of warranty. When the buyer orders an article and specifies the purpose for which it is to be used, the supply house which fills the order implies a warranty when it supplies the goods to the buyer. Thus if the buyer receives a sample of 98 per cent. magnesium oxid and places an order based on the sample, and then receives a shipment consisting of 25 per cent. magnesium carbonate and 75 per cent. magnesium oxid, the supply house is liable to damages for losses which may arise from the use of the impure magnesium oxid. In this case it is important that the buyer convince himself through a chemical test that the sample is actually 98 per cent. pure magnesium oxid. Again, if the buyer can show that the seller contemplated fraud when closing the contract, that contract will be held to be null and void. On the other hand, a thing which cannot be proved is equivalent to a thing which does not exist.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india-rubber and gutta percha for the month of February, 1913, and for the first eight months of five fiscal years, beginning July 1:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
February, 1913.....	$182,997	$103,906	$644,077	$930,980
July-January	1,583,069	973,423	4,695,696	7,252,188
Total, 1912-13....	$1,766,066	$1,077,329	$5,339,773	$8,183,168
Total, 1911-12....	1,491,121	1,139,181	4,640,177	7,270,479
Total, 1910-11....	1,354,060	1,699,371	3,899,406	6,952,837
Total, 1909-10....	1,233,910	1,437,252	3,053,753	5,724,915
Total, 1908-09....	896,362	1,013,544	2,454,707	4,364,613

The above heading, "All Other Rubber," for the month of February, 1913, and for the first eight months of three fiscal years, beginning July 1, includes the following details relating to tires:

MONTHS.	For Automobiles.	All Other.	TOTAL.
February, 1913.....*values*	$276,253	$367,824	$644,077
July-January	2,050,843	2,644,853	4,695,696
Total, 1912-13.....	$2,327,096	$3,012,677	$5,339,773
Total, 1911-12.....	1,641,373	349,372	1,990,745
Total, 1910-11.....	1,194,720	368,029	1,562,749

BAKELITE PATENT RECOGNITION.

As a result of negotiations between the General Bakelite Co. and the Condensite Co. of America, the suits brought by the former against the latter and its customers for alleged infringement of the Bakelite patents, have been withdrawn, and the Condensite Co., recognizing the pioneer character of Dr. L. H. Baekeland's work, has acknowledged the validity of the Bakelite patents in suit and some others, and will pay substantial royalties thereunder.

The General Bakelite Co. will continue the manufacture of Bakelite under its numerous patents, and the Condensite Co. will manufacture Condensite under the Aylsworth patents, as well as the license just granted for such of the Baekeland patents as are broad enough to cover Condensite.

The Akers Rubber Commission in the Amazon Valley.

THE second volume of the English Akers Commission report, dealing with the Amazon Valley, forms a suitable continuation of the first volume (reviewed in the May issue of the INDIA RUBBER WORLD, page 417), which dealt with the work of the commission in the Orient. Many points treated in the earlier report were of a general character, requiring to be kept in view in the consideration of the later record; the two volumes forming an unusual instance of comparative investigation, at the chief points of rubber production of the eastern and western hemispheres.

From the commission's estimate of the world's rubber production for 1912, it will be recalled that the grand total of 105,000 tons included: Brazil, 46,600; other South American countries, 2,000; Mexico and Central America, 3,000; the total for the western hemisphere thus being 51,600 tons. The eastern hemisphere contributed about an equal quantity: Oriental plantations, 31,000; Africa, etc., 22,400; making an aggregate of 53,400 tons. These two amounts together constitute the grand total of 105,000 tons for 1912. An estimate for the ensuing seven years, presented at the same time, showed a prospective increase of the yield of Oriental plantations, from 31,000 tons in 1912 to 302,450 tons in 1919. Hence the question arises whether, and in what proportion, the Brazilian supply is likely to be increased during the same period. To define actual and prospective conditions, was the object of the visit to Brazil of the Akers Commission; in which that body must be considered as having achieved a relative success, seeing that its labors in the Amazon Valley only extended to a period of less than three months, from the beginning of last August to the end of October last. That its work was fruitful in results is shown by the fact that while the report of the four months spent in the Orient fills only 89 pages, that of the three months in the Amazon Valley takes up 164 pages, and is supplemented by 26 pages of illustrations, representing various features of Brazilian rubber cultivation and kindred subjects.

OBJECTS OF THE INVESTIGATION.

As stated in the May issue, the objects of the commission included the investigation of the general condition and prospects of agricultural industry, and the endeavor to find improved methods of administration, collection and preparation, in order to enable Brazilian rubber to compete with that from the Orient; as well as the placing of labor in the Amazon Valley on a cheaper and more effective basis. In connection with the last named question, were those of the colonization of waste lands, and the establishment of experimental plantations or farms.

The party left Pará on August 20 for their journey up the Amazon to the rivers Madeira and Purús, to carry out their investigations. They made the voyage in the new stern-wheel steamer "Curityba," of the Mosquito fleet, which had been specially fitted out for their use. Mr. C. E. Akers had already visited the rivers Mojú and Guamá, pending the arrival from Europe of his colleagues, Mr. H. C. Rendle and Señhor F. Lugones.

The voyage up the Amazon and many of its tributaries (practically as far as steam navigation was possible), was both interesting and instructive, the commission having covered about 7,000 miles of river, inspected close upon 50 estates, and seen rubber and cacao of all ages and sizes, growing under every conceivable condition.

THE LOWER AMAZON VALLEY.

The lower Amazon section of the Amazon Valley includes the district served by the Bragança Railway, all the islands of the delta, and the rivers Mojú, Guamá, Xingú, Tapajós, Maicuru, Canumá, Jary, Paru, Curua, Trombetas and many smaller streams; as well as the land on both banks of the Amazon as far as Manáos. This vast area can be divided into three distinctive zones: (1) The islands, where rubber is largely collected by residents or squatters on their own account, to enable them to purchase the necessaries of life; (2) the various rivers, where the rubber is collected on the system of half shares between the collector and owner of the lands; and (3) the country on the banks of the Amazon as far inland as Manáos, where the principal industry is cacao, rubber taking a place of secondary importance.

Dealing with the separate rivers, it is remarked that on the Tapajos all enterprises is practically confined to rubber production, the cry of agents and owners in Pará being always for "rubber and more rubber," and any form of cultivation of the land being discouraged from headquarters. One reason of this opposition is said to be the fear of the owners of large estates that their profits from the stores would be diminished if the laborers were allowed to cultivate mandioca, maize and beans on their own account.

Nowhere in the course of their investigations did the commission find a greater wealth of rubber trees than on the islands and shores of the Xingú, the proportion of untapped trees being very large. Fine old trees of big girth were to be found at no great distance from the banks of the river. An important factor in the trade of the Xingú, is the through traffic in rubber and caucho from Matto Grosso, which would be materially aided by improved means of transport, existing methods by canoes and on muleback being costly and slow.

Rubber is practically the sole industry of the Tocantins river, the facilities thus afforded for gaining a livelihood having driven out other forms of agriculture. Large quantities of rubber trees are to be found on the river banks and islands; a large proportion of which have been worked many years, and damaged by the use of the *machadinho* or rubber collector's axe. This damage has, however, been confined to a great extent to the lower part of the trunk, and it is anticipated that much latex can still be extracted by overhead tapping. As, moreover, a large number of young trees are approaching maturity, there is small likelihood of the supply of rubber being exhausted for many years to come.

THE UPPER AMAZON VALLEY.

The most important rivers of the Upper Amazon Valley are the Madeira and the Purús, and it is to these that the commission has devoted special attention in its report.

The river Madeira, which flows into the Amazon about 100 miles below Manáos, is formed by the junction of the rivers Mamoré and Beni, which flow through Bolivian territory. After the confluence of these two rivers into the Madeira, it forms the boundary line for about 100 miles between Bolivia and Brazil, and then takes its course in a northeasterly direction for 850 miles, until it merges into the Amazon.

At flood time it is navigable for ocean steamers of 22 feet draught as far as Porto Velho (a distance of 635 miles), and for those of lighter draught at all seasons. Above Porto Velho are a series of rapids, which only allow the passage of flat-bottomed boats or canoes. It was to facilitate communication with Bolivia around these rapids, that the Madeira-Mamoré railway was constructed.

Virtually the only industry on the river Madeira is rubber production, agriculture being discouraged by the proprietors of rubber properties, in order to force the rubber collectors to purchase all they require from the general stores, which yield enormous profits. Rubber plantations, in the proper sense of the term, can be hardly said to exist. The Madeira is the most

prominent factor in the prosperity of the Amazon Valley. Its territory contains great numbers of the best variety (black) of rubber trees, while the quantity and quality of the rubber exported from that district are most noticeable features in the markets of Manáos and Pará. It provides the outlet for rich districts of Bolivia, and the excellent soil on its banks is capable of development in many branches of agricultural industry in the future. The climate, moreover, is such that it presents no obstacle to European colonization.

The river Purús flows into the river Solimões, 200 miles west of Manáos; the distance from that point to the confluence of the river Acre and the Upper Purús being 1,065 miles. For the first 600 miles, it is navigable the year around for vessels drawing 15 feet.

Rubber forms practically the only industry of the Purús river. It is entirely collected from forest grown trees, the few attempts at planting having proved failures, or not having yet come to maturity. It is remarked that many of these rubber properties are of very great value, or would be so if developed on intelligent and reasonable lines. On one estate containing over 200,000 fully grown trees, only 25 per cent. are worked, and these are being hacked to pieces by the use of the *machadinho*. Such a property, it is added, in competent hands, could produce 2,000,000 pounds of rubber annually, while the present output barely reaches 150,000 pounds. There is not a property today on the Purús which could not be worked to at least twice its present capacity, under skilful direction and management.

CLEARING AND WEEDING.

Special attention was paid in the course of the recent investigation to the question of clearing. According to the opinion of the commission, there is not much to choose between the forest growth in Brazil and that of the rubber-growing districts of the Orient. The average tree may be slightly larger in the Amazon Valley, but not to an extent to make any appreciable difference in the amount of labor required for felling and clearing up afterwards. Any differences in cost would be solely dependent on the wage rate and not on variations in natural physical conditions.

It has been asserted that with expensive labor, the cost of weeding on cultivated land in the Amazon Valley makes plantation work on Oriental lines a practical impossibility. The results of the investigation show that less labor is required for this purpose in the Amazon Valley than in the East. This fact is attributed to the absence of pernicious grasses, such as lallang; nor are the rapidly-seeding weeds common on eastern plantations nearly so numerous in Brazil.

METHODS OF TAPPING.

A separate chapter deals with the general question of the rubber industry of the Amazon Valley. Among many other points treated in this chapter is the subject of tapping. The view is expressed that under the present system of using the *machadinho* (or small axe), there is not only the risk of serious damage to the trees in the present, but the total extinction of the industry in the future is likewise inevitable. In order to demonstrate the advantages of the herring-bone system of tapping rubber trees by the use of the gouge, the members of the commission gave between 45 and 50 such lessons in the districts of the rivers Madeira, Purús, Tapájos and Xingú, and in the vicinity of Maués and Obidos. In this way they claim to have created an innovation in tapping methods, and firmly established the principles which have been carried to such successful issue in the Orient.

THE LABOR QUESTION IN THE AMAZON VALLEY.

The problem of the labor supply in the Amazon Valley is not easy of solution, but on it depends the future development and prosperity of this section of Brazil. In an interesting table it is shown that the annual exports of the Amazon Valley are estimated for 1913 at:

	Approximate quantity, tons.	Approximate value f. o. b. Manáos or Pará.
Rubber and caucho	48,000	$72,000,000
Brazil and Sapucaya nuts	12,000	750,000
Cacao	3,000	900,000
Hides and skins	1,500	175,000
Miscellaneous	6,500	475,000
Tons	71,000	$74,300,000

It is asserted that with a sufficiency of labor there is no reason why this production of some 70,000 tons annually should not be increased twenty-fold. The forests are extraordinarily rich in natural wealth, but generations must elapse before any expansion of the present bare nucleus of population can be sufficiently extensive to develop the vast resources left dormant so long. Immigration alone, it is added, can remedy the difficult conditions now dominating the situation.

It is pointed out by the report that two widely distinct classes of immigrants are required to make rapid development possible, and at the same time establish a permanent peasant population, hereafter to become an integral part of the Brazilian nation. These classes are on the one hand colonists or settlers, and on the other paid laborers. Both have spheres of action to fill, and both are urgently needed to people and open to civilization, those great tracts of land that Nature has endowed with such generous munificence.

Certain qualities are necessary in regard to the immigrants. They should be selected on account of a knowledge of agricultural work in their own homes, such as that possessed by the peasants in many districts of Italy, Spain and Portugal. These go in thousands to North America, Argentina and Southern Brazil; and they would come to the Amazon Valley, once its fertility and resources were made known to them, and good land became available for their occupation.

The other description of immigrant required is the paid laborer, to meet the needs of the owners of landed estates, from whose properties come the rubber, which forms quite fifteen-sixteenths of the total value of the exports from the Amazon Valley and is the source of the bulk of the revenues of the States of Pará and Amazonas. At present these rubber estates employ about 100,000 men, recruited from the more southern states of Brazil at an expense of about $100 each, to bring them to the districts of the Madeira, the Purús, the Juruá and other centers of rubber production. These men have not been paid direct wages, having worked on the sharing system, but a crisis in the situation has now been brought about by the competition of the Orient, and a complete change in the method of production has become an imperative necessity. To meet altered conditions, another 50,000 daily wage laborers are required within the next twelve months.

Hence the question arises as to where they are to be sought, it being useless to look for this number in Brazil, and there being a doubt of a ready response in Europe, the alternative is to bring the men from the East. The recruiting of Indian coolies not being permissible, the question is reduced to the advisability of introducing Chinamen.

From every point of view, the report urges, the employment of Chinese laborers indicates satisfactory prospective results in the Amazon Valley. They can earn high wages at a lower cost to the employer than is the case at the present time, the work being light and leaving ample leisure for the cultivation of a garden or a patch of food stuffs. Finally, they would not supplant the existing labor force, but would add to its efficiency in many directions. The carrying out of this plan would be a matter for the Federal Government, which could subsequently recover the

cost from the employers. It is estimated that the initial expenditure for bringing 50,000 Chinamen from Canton or Shanghai to the upper Amazon would not be less than the equivalent of $5,000,000, but this sum would not be an abnormal obligation, in view of the vastly important interests at stake.

COST OF PRODUCTION.

As shown in the May issue, the report of the Commission on the Orient makes the present free on board cost of producing rubber in the Malay Peninsula to be 14½d. (29 cents) per pound, while the estimate for 1914-1919 is 12d. (24 cents.) In comparison with these figures may be quoted the following estimate of Brazilian cost f. o. b.

	Pence.	Cents.
Freight to Manáos or Pará	½	1
Commission charges	½	1
Administration	3	6
Cost (per lb.) of maintenance of collector	....	..
Delivering 1,000 lbs. of rubber	16	32
Duties	12½	25
Total	32½	65

The present f. o. b. cost in the Orient is thus estimated at 29 cents with a prospective reduction to 24 cents, while the commission expresses the opinion that a similar position can be attained in the Amazon Valley within five years; by improved methods of tapping, largely increasing production without additional labor; by more systematic administration; by opening up the reserves of untouched trees; by cheapening the price of living; by diminution or abolition of the export duties, and by the introduction of Chinese or European immigration. By such means only is it possible for Brazil to meet successfully the competition of the Orient in the world's markets. In conclusion the report states that there is no doubt such reduced costs can be brought about, if the measures recommended are adopted.

GENERAL RECOMMENDATIONS.

The general recommendations of the commission are summarized in twelve brief paragraphs under the caption "Some Suggestions for the Improvement of the General Conditions of the Brazilian Rubber Industry." These suggestions are as follows:

In order to meet successfully the growing competition of the Orient in the rubber markets of the world, certain innovations and reforms are necessary. The objects in view are a reduction in the cost of production, an increase in the annual output, the preservation of the trees from unnecessary injury, the gradual development of a plantation industry, and the general prosperity of the owners of rubber properties and the laborers employed thereon.

I advance the following suggestions after careful considerations as the most practical means of dealing with the existing situation:

1. The distribution of illustrated literature printed in Portuguese throughout the rubber districts, explaining the system of tapping with the gouge and the injurious effects of the use of the machadinho.

2. The establishment of an Agricultural School at some central point, hereafter to be selected, where practical instruction will be given in methods of tapping, care of trees, system of cultivation, mode of treating latex, and preparation of rubber for shipment.

3. The erection of adequate machinery at Pará and Manáos for washing and preparing scrap rubber previous to shipment.

4. The appointment of expert rubber planters to make constant tours of inspection through the rubber districts in order to advise owners of properties in all matters connected with the cultivation, tapping and preparation of rubber.

5. To advise the Federal Government and the governments of Amazonas and Pará to grant a reduction of export duty to the extent of 75 per cent. on all shipments of rubber when the work of the extraction of latex has been carried out with approved implements and in the manner generally prevailing in the Orient. This concession to remain in force for not less than seven years.

6. To advise the governments concerned to enact a law prohibiting the use of the machadinho under penalty of fine or other punishment.

7. To urge the Federal Government to carry out the establishment of central hospitals throughout the rubber districts as provided for in the terms of Law No. 2543 of January, 1912, and the regulations decreed April 17, 1912, and for which funds have been voted.

8. To take the necessary steps to establish centers of supplies where the employers of labor can purchase at reasonable rates all articles required for the maintenance of workmen in the rubber districts, and in this manner bring about a substantial reduction in the cost of living.

9. To establish one or more experimental plantations in order to demonstrate economical methods for the production of rubber, cocoa and foodstuffs.

10. To take measures to encourage immigration from southern Europe and to consider carefully the question of the introduction of Chinese laborers.

11. To make arrangements to facilitate at low cost a supply of tapping tools, machinery for preparing rubber and agricultural implements.

12. To introduce the system of planting food crops in the alluvial deposits on the river banks after the annual floods.

I consider the last suggestion most important. The custom prevalent in Egypt for thousands of years of growing crops at low Nile could be imitated with extraordinary advantage in the Amazon Valley, especially on the upper rivers. The waters fall at the end of April and rise again in October, thus giving five months for the harvesting of maize, beans, rice, millet (dhura) and other foodstuffs.

Moreover, on the river banks between flood level and low water, no clearing of timber is required. The land practically needs no cultivation beyond dibbling the seed into the rich alluvial mud, and then nothing remains to be done except a little weeding until the harvest is garnered.

ENCOURAGEMENT OF NEW USES FOR RUBBER.

A PROPOSAL recently broached in the English financial press suggested that the rubber plantation companies, acting in unison, should set aside 10 per cent. of their crops to be held at the disposal of certain English and American manufacturers, at the fixed price of 2s. 6d. (60 cents) per pound, to be used solely for purposes not hitherto exploited. In commenting upon the subject, Mr. E. L. Killick, the rubber expert of the "Financier," expresses the opinion that the proposal makes a stronger appeal to reason the more deeply it is considered, no single argument of any weight having been brought forward in opposition to it.

He adds that any method of rendering more certain an adequate future demand should be welcomed and put into practice. Consequently the proposal named is regarded as worthy of close attention, coming, as it does, from one who has a large stake in the plantation industry and is thus evidently acting in perfect good faith.

The instability of raw rubber prices has been a most serious handicap to manufacturers, while it is more than probable that if there were any assurance of rubber remaining stationary in price, the large manufacturers would not hesitate to enlarge their works and plants. Mr. Killick expresses the conviction that if a basis of 60 cents were established, American manufacturers alone could take the whole of the world's supply.

If adopted, this proposal would, it is added, place at the disposal of manufacturers this year about 4,000 tons of plantation rubber at 60 cents. As it would be used solely for new purposes, there would be no question of unfair competition on the part of the selected manufacturers employing the "bounty rubber"; at the same time a step would be made in the direction of keeping consumption in line with supply.

The Obituary Record.

EDWARD BEECHER KELLEY.

EDWARD BEECHER KELLEY, treasurer of the Mechanical Fabric Co., Providence, Rhode Island, died at his residence in Brookline, Massachusetts, May 13, 1913, of pneumonia. He was sick only five days.

Mr. Kelley was born in Canton, New York, July 22, 1859, the son of Joseph H. and Samantha L. Westcott Kelley. He was educated at the public schools of Canton and later attended the Hungerford Collegiate Institute, Adams, New York, and the Peekskill Military Academy, Peekskill-on-the-Hudson. Immediately upon finishing school he began work in the office of the Stedman & Fuller Manufacturing Co., Lawrence, Massachusetts, and removed with that company to Providence in 1885. When the Mechanical Fabric Co. was organized in 1890 he went with his brother as one of the managers, and in 1899, upon the death of the late George A. Fuller, was elected treasurer and served in that capacity and also as director to the time of his death.

EDWARD BEECHER KELLEY.

He came from a long line of New England ancestry. His father's ancestor, John Kelley, settled in Newbury, Massachusetts, in 1636, and Stukeley Westcott, his mother's ancestor, came to Rhode Island with Roger Williams and received the first deed of land granted in that colony.

He had a wide acquaintance with the customers of the Mechanical Fabric Co. both here and abroad, the necessities of the business taking him frequently across the water. He was a man of a kindly, sociable nature, making friends quickly and holding them through life. He will be greatly missed not only by his immediate associates in business, but by a very wide circle of customers and friends. He was a member of the Rubber Club and rarely missed attending its gatherings.

He is survived by his wife, Maud A. Kelley, and his only brother, Arthur L. Kelley, president of the Mechanical Fabric Co.

GEORGE PELLINGER.

George Pellinger, president of the Vulcanized Rubber Co., 251 Fourth avenue, New York, with factory at Morrisville, Pennsylvania, died suddenly Saturday night, May 24. The funeral took place Tuesday, May 27, at his home in Weehawken, New Jersey. A sketch of his career, together with his photograph, will appear in our July issue.

ALANSON D. BROWN.

Alanson D. Brown, for many years the head of the Hamilton-Brown Shoe Co., St. Louis, Missouri, one of the largest distributors of rubber footwear in America, died on May 10, at San Antonio, Texas, where he went some time ago owing to a nervous breakdown. Mr. Brown was one of the best known men in the entire footwear trade. He was a man of the most extraordinary personal energy and powers of application. Undoubtedly it was this intense devotion to business that finally undermined his health.

He was born near Albany, New York, on March 21, 1847. He went West to seek his fortune before he had attained his majority. In 1872 he formed a partnership with James Hamilton under the firm name of Hamilton & Brown—which was later changed to the Hamilton-Brown Shoe Co.—for the purpose of establishing a wholesale footwear business in St. Louis. About ten years later the firm began the manufacture of footwear, and in a short time had secured an enormous business in this line.

Mr. Brown was married in 1877 to Miss Ella Bills, of Waltham, Massachusetts. His brother, George W. Brown, is the head of the Brown Shoe Co., of St. Louis—another large distributor of rubber footwear.

Mr. Brown devoted himself, almost without respite or relaxation, to his business—and to his church. He was a profoundly religious man—as much so on Mondays and the following five days as on Sundays. Business and religion with him were constantly interwoven. He was a man of the highest integrity and the finest sense of business honor.

JAMES WALKER.

News has been received of the death on May 8 of Mr. James Walker, the founder and chairman of James Walker & Co., Limited, of London. Mr. Walker was in his seventy-fourth year. He was well known in the rubber trade because of the variety of machinery and appliances used in that trade made in the "Lion Works," Garford street, London, which he founded many years ago. He was a man of sterling character and universally respected.

The organization of the house will not be changed by his death. The management of the company will be continued under the direction of Mr. George H. Cook.

MR. KLEINERT'S WILL.

The will of Isaac B. Kleinert, the founder of the I. B. Kleinert Rubber Co., who died April 18, has been probated. The value of the estate is given as more than $100,000 realty, and more than $100,000 personalty. Bequests are left to the United Hebrew Charities, and the Home for Aged Hebrews. His widow is left a cash legacy of $75,000, together with an annuity of $6,000, and a life interest in his realty holdings. The greater part of the remainder of the estate is divided between his two daughters and the children of a third daughter, now deceased.

One exceedingly interesting paragraph in the will, characteristic of the man, and of the interest he took in those in any way associated with him, is found in the following provision for his needy relatives: "I give and bequeath in trust to my daughters, Mrs. Leonie B. Guinzburg, of No. 115 West Eighty-sixth street, and Hermone E. Kleinert, of No. 31 West Eighty-seventh street, the sum of $10,000, the interest of which shall be distributed among poor and needy relatives of mine, this to continue for fifty years."

THE INCREASING POPULARITY OF RUBBER-SOLED SUMMER SHOES.

WHAT is deemed a rather remarkable feature in the shoe trade is the sudden increase in popularity of rubber-soled footwear. The so-called cemented tennis shoe, which has been a regular summer seller for years, has evidently made many friends, and the coming summer season will undoubtedly show more people shod in these canvas-upper, rubber-soled shoes, than any previous season. Every rubber shoe factory which makes

FOSTER RUBBER SOLES AND HEEL.

these shoes is today running to full ticket on these lines, and in some overtime work is necessary to insure deliveries when required.

But with the increased call for cemented tennis shoes comes the report that the old-time, cheap McKay-sewed canvas-upper tennis shoe has declined in popularity, and many shoe factories where these were turned out in large quantities, years ago, have discontinued their manufacture.

This decline in popularity is mainly ascribed to the lack of style, and the poor quality of the rubber used in the soles. So many shoes thus soled were returned to the manufacturers, on account of poor service, that they abandoned the production of these "sneakers," and very few are now being made.

However, in place of these, an entirely new phase of the shoe business is noted, namely the manufacture of fine shoes with rubber soles and heels. To be sure, such footwear has been made for years in sporting shoes, for the tennis court and the golf links, but the present development is the demand for summer footwear of finer qualities with rubber soles. Nearly every manufacturer of fine shoes, both men's and women's, is making

REGAL SHOE CO.'S "COMMODORE."

low-cuts with rubber soles and heels, and the shoe stores catering to the fine trade are all carrying one or several lines of such shoes.

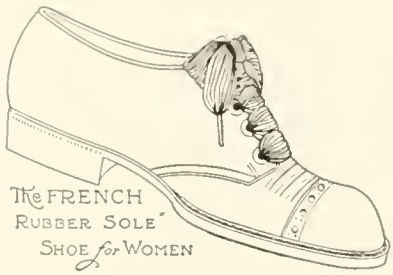
A former superintendent of a shoe factory in a western state is said to be responsible for the present popularity of rubber-soled shoes. Realizing that quality and service would result in bringing about a demand, he resigned his position in the shoe factory, and re-opened a rubber plant which had been forced to close because of the unsatisfactory quality of the rubber soles it turned out. It took him six years to restore the confidence of shoe manufacturers, but this was finally accomplished, and each succeeding year has shown a steady and large increase in the volume of business done. Other manufacturers have also succeeded in working up a large trade in rubber soles for shoes, and while

ONE OF THE ESSEX SHOES.

some are short-sighted, and make only low priced grades, of poor quality, by far the larger part of the sole now made are of excellent durability, well worthy the finer shoemaking of which they form a part.

Most of these shoes sold today are low cuts or Oxfords, and are in white or colored leather of dull or ooze finish. One of the principal uses for such shoes is for seaside resort wear, because of the obvious impermeability of the soles; and white or tan shades are most appropriate for wear with seaside costumes.

The fad—if such it may be called—came from England, where



MADE BY THE ESSEX RUBBER CO., TRENTON, N. J.

such shoes have been popular for several seasons, and many of the shoe stores selling to the finest trade have imported English shoes with rubber soles, though these are in no wise superior to American-made shoes of the same kind.

Manufacturers have found some difficulty in properly attaching the soles so as to insure against a separation of the rubber outer-sole from the leather welt, the inner-sole and the filler. A too fine stitch tends to split the rubber along the line of stitching, while silk and linen threads have been found to be less serviceable than long-staple cotton, treated with a special "wax" or

MADE BY THE ESSEX RUBBER CO., TRENTON, N. J.

cement, which so "fills" the interstices of the thread, and the holes made by the needle, that even when the threads wear off, the stitching still holds. This, with proper cementing, usually prevents peeling of the sole, which was one of the chief difficulties at first encountered. Some manufacturers double-stitch around the toe, and others insert metal clinch staples to prevent the start of such peeling.

Another form of overcoming the difficulty is the skiving off of the rubber sole at a point just in front of the ball of the foot, and piecing out the sole, from this line forward, with

leather. This has been done for several seasons in shoes intended for golf players, and having been found to work well, has been adopted in walking shoes, thus insuring the soft easy tread, yet protecting the most vulnerable point from undue wear or accident. In golf shoes this leather forepart is studded with hob nails to secure footing while making the stroke, but of course these are omitted in walking shoes.

Some English shoes have the soles cemented on, and present to the eye a plain unbroken surface, but American manufacturers all prefer to supplement the cementing with stitching, and on the finer shoes the Goodyear machine stitch is used, though, as is mentioned above, the number of stitches to the inch is far fewer than in leather shoes.

These soles are of white, grey or red rubber, and various finishes—smooth, corrugated, checkered, or with deep holes, which tend to form vacuums when the wearer walks over a smooth wet surface, like the deck of a yacht. One rubber company manufactures a widely diversified line of these soles, varying in price from thirty cents to three dollars per pair. Some have the sole and a solid rubber heel of the same shape as common leather heels. Others have the heels separate, and some place two "lifts" of leather above the thinner rubber heel. Most of the shoes now made in these lines, however, have the "wedge" heels such as are shown in the illustrations.

Great care is taken in the choice of the inner-soles and linings of these shoes, to mitigate or overcome the tendency of rubber to "draw" the feet. Where these are properly chosen, the shoes can be worn with the same comfort and ease as leather shoes, with the added advantage of silent tread and freedom from slipping.

A tan Russia calf blucher Oxford for all-around summer wear has a sole of red rubber, stitched to a leather welt. This is a specially stylish and serviceable shoe.

The outing Oxford of white buck with russet trimmings, made on a narrow toe last, is a striking style, to be worn with outing costume or morning dress.

The shoes shown here are made by the fine shoe manufacturers in New England and retail at from $4.50 to $6.00. English made shoes, quite similar in style and quality, are shown in some of the finer retail shoe stores in New York, Philadelphia, Boston and Chicago at $6.00 to $10.00 a pair.

Many manufacturers number among their samples canvas shoes in white and brown, some reinforced with leather, while among women's shoes there are combinations and colors as varied as are customary with leather-soled outing shoes.

This development of the use of rubber soles is not an ephemeral fad. The style is likely to standardize itself, and the use is likely to grow with each recurring season, and thus more and more demand will be noted in the consumption of rubber, which is already very large, in the shoe industry.

RUBBER GOODS MANUFACTURING CO.'S FOURTEENTH ANNUAL REPORT.

ON May 21, 1913, the Rubber Goods Manufacturing Co. held its fourteenth annual meeting at the registered offices of the company in Jersey City. The president presented the following report:

REPORT OF PRESIDENT WILLIAMS.

TO THE STOCKHOLDERS OF THE RUBBER GOODS MANUFACTURING CO.:

The report of the treasurer, appended hereto, gives the Consolidated General Balance Sheet and the Consolidated Income Statement of the Rubber Goods Manufacturing Co. and of its subsidiary companies, for the fiscal year ending December 31, 1912.

The net sales of the year are approximately the same as those of the previous year. The net profits, however, are less, owing principally to the sharp competition in tires, which has prevailed during the year.

The plants of the company have been maintained in good repair and in certain instances enlarged—the Morgan & Wright plant at Detroit being in process of enlargement to more than double its former capacity.

The selling organization of tires, conducted by the United States Tire Co., has been further developed until now it has reached great efficiency.

Respectfully submitted,
ELISHA S. WILLIAMS, *President.*

TREASURER'S REPORT.

RUBBER GOODS MANUFACTURING CO. AND SUBSIDIARY COMPANIES.
Consolidated General Balance Sheet, December 31, 1912.

ASSETS.

Property, Plants and Investments		$29,541,886.27
Inventories, Mf'd. Goods and Materials	$8,636,293.89	
Cash	2,407,332.36	
Bills and Accounts Receivable	12,634,719.90	23,678,346.15
Stock owned in General Rubber Co.	1,666,700.00	
Securities Owned	384,030.55	2,050,730.55
Sinking Fund Cash in hands of Trustee		382,759.61
Miscellaneous Assets		444,396.21
Total Assets		$56,098,118.79

LIABILITIES.

Capital Stock, Preferred	$10,351,400.00	
Capital Stock, Common	16,941,700.00	$27,293,100.00
Bonds of Mechanical Rubber Co. and N. Y. Belting & Packing Co.		1,005,500.00
Reserve for Redemption of Bonds		423,348.87
Bills and Accounts Payable		8,354,395.10
Accounts Payable to General Rubber Co.		7,752,724.70
Reserve for accidents to employees		40,940.47
Fixed Surplus (Subsidiary Companies)		2,499,218.65
Surplus		8,728,891.00
Total Liabilities		$56,098,118.79

Respectfully submitted,
EDWARD J. HATHORNE, *Treasurer.*

Of the above "Assets" and "Surplus" $197,126.13 represents the ratable interest therein of minority stockholders in a Subsidiary Company, of the Rubber Goods Manufacturing Co.

Contingent liabilities for certain guarantees, which are offset by corresponding contingent assets, are not included.

CONSOLIDATED SUMMARY OF INCOME AND PROFIT AND LOSS FOR YEAR ENDED DECEMBER 31, 1912.

Net Sales		$36,147,332.34
Earnings		2,885,883.27
Income from Investments		100,002.00
		$2,985,885.27
Less:		
Expenses of Home Office		221,396.78
Net Profits		$2,764,488.49
*Dividends	$2,280,601.00	
Reserve for Redemption of Bonds	15,873.75	2,296,474.75
Surplus for the Period		$468,013.74
Surplus and Working Capital, January 1, 1912		8,260,877.26
Surplus and Working Capital, December 31, 1912		$8,728,891.00

Respectfully submitted,
EDWARD J. HATHORNE, *Treasurer.*

*Includes $31,250.00 paid minority interests in one Subsidiary Company.

ANNUAL ELECTION.

At the annual meeting, on May 21, the following directors were reelected:

WALTER S. BALLOU	ERNEST HOPKINSON
ANTHONY N. BRADY	CHARLES A. HUNTER
SAMUEL P. COLT	LESTER LELAND
FRANK W. EDDY	RAYMOND B. PRICE
JAMES B. FORD	HOMER E. SAWYER

ELISHA S. WILLIAMS

The United States Rubber Co.'s Annual Report.

THE twenty-first annual report of the United States Rubber Co. was dated and distributed on May 1, three weeks ahead of the annual meeting, which occurred on May 20, at New Brunswick, New Jersey. The reports of the president and treasurer are given below.

REPORT OF PRESIDENT COLT.

TO THE STOCKHOLDERS OF THE UNITED STATES RUBBER CO.:

The past year has been somewhat eventful in the history of our company. Progress has been made along lines of efficiency in management with a proper expansion in operations, all having been kept within the sphere of sound and conservative business principles.

The report of the treasurer, appended hereto, gives the Consolidated General Balance Sheet and the Consolidated Income Statement of the United States Rubber Co. and subsidiary companies for the fiscal year ending March 31, 1913.

In view of the fact that the United States Rubber Co. now owns all but a fraction of one per cent. of the common stock and the great bulk of the preferred stock of the Rubber Goods Manufacturing Co., it has been thought that it would give our stockholders a more comprehensive understanding of our business to include this year in these consolidated statements the operations of the latter company. For the purpose of comparison, the statements of both companies as made last year should be considered. As now shown, the surplus includes the surplus of each company—that of the United States Rubber Co. of last year having been reduced by the common stock dividend, amounting to $5,000,000, and having been augmented by $2,254,700, gain by the conversion during the same period of second preferred stock into first preferred stock on the basis of four shares of second for three shares of first. In the Consolidated Statement the surplus is increased by $6,909,275, being the difference between the par value of the common stock of the Rubber Goods Manufacturing Co. purchased by the United States Rubber Co., and the price paid therefor; resulting, with the year's operations, in a present surplus of $23,545,629.32. From this surplus your directors have deemed it advisable to set up as a reserve $7,000,000.

The fixed surplus formerly appearing in the several statements of the two companies, which represented the surplus of each of their several subsidiary companies at the time of their acquisition, and which amounts to $14,504,714.54, not being subject to division, may be applied whenever deemed advisable in reduction of the valuation of property and plants.

The operations of the Canadian Consolidated Rubber Co., Ltd., the General Rubber Co., the United States Tire Co., and the Rubber Regenerating Co. (the latter recently acquired) are not included in the consolidated statements. The dividends, however, derived from the same go to make up the profits of the year.

CHANGE OF FISCAL YEAR AND OF DATE OF ANNUAL MEETING.

In view of the consolidation of accounts of the Rubber Goods Manufacturing Co. and its subsidiary companies with those of the United States Rubber Co. and its original subsidiaries, it became desirable that the fiscal year of both companies should be identical, and it has, therefore, been decided by the directors to have the fiscal year of the United States Rubber Co. end December 31, instead of March 31, to correspond with that of the Rubber Goods Manufacturing Co. and the Canadian Consolidated Rubber Co., Ltd., this being also the date when the reports have to be made up for the Federal Government. With this change in date of the fiscal year, it became desirable that the annual meeting should be held at an earlier date and an amendment to the by-laws has, therefore, been submitted to you, providing that the date of such meeting shall be the third Tuesday in March instead of the third Tuesday in May.

VOLUME OF BUSINESS.

As appears by the consolidated statement for the year, the net sales were $91,782,861.87; and in addition the net sales of the Canadian company for the year were $7,199,336.28. In most cases the selling prices were lower than the previous year. The sales of the General Rubber Co., United States Tire Co., and Rubber Regenerating Co. are not included, their product not adding to the aggregate product of manufactured goods.

PROFITS.

As shown by the consolidated statement, the net profits for the year were $7,544,217.67 after bringing down to market price the inventories of crude rubber and other materials. Of this profit, however, $219,131.31 pertains to the minority stock interest in the Rubber Goods Manufacturing Co. and a subsidiary. As heretofore all interest paid by the company upon both its funded and its floating debt is deducted as an expense before the net profit is shown. The net profits of the year exceed the dividend payments of the year by the sum of $1,730,755.36.

Both the net earnings and volume of business are the largest in the history of the company—the percentage of net profit on net sales being, however, but about 8 per cent.

DIVIDENDS.

The regular dividends of 8 per cent. upon the first preferred stock and 6 per cent. on the second preferred stock have been paid. There have also been paid to the holders of the common stock cash dividends at the rate of 4 per cent. for the first three-quarters and at the rate of 6 per cent. for the last quarter of the year, and also in July last a dividend of 20 per cent. in common stock.

CAPITALIZATION.

In June, 1912, by amendment to the charter, the authorized first preferred capital stock of the company was increased from $40,000,000 to $70,000,000, and the authorized common stock from $25,000,000 to $40,000,000, and the right was given to convert the second preferred stock into first preferred stock. Under the plan authorized $5,000,000 of common stock was declared from the surplus as a dividend to the common stockholders; $10,000,000 of first preferred stock was offered pro rata to the stockholders at par, of which $9,699,400 has been subscribed and paid for; and up to this time, $9,018,800 out of $10,000,000 of second preferred stock has been converted into first preferred stock. The company also renewed a former offer to exchange Rubber Goods preferred stock into first preferred stock of the United States Rubber Co., under which offer $817,800 has been exchanged during the year.

TIRE OPERATIONS.

At the last annual meeting your president called the attention of the stockholders to the desirability of enlarging our facilities for the making of tires, and suggested the building of an additional mill. In furtherance of this suggestion, the Morgan & Wright tire plant at Detroit, Michigan, which is a modern mill, is being enlarged to more than double its former capacity; and a new tire mill at Berlin, Canada, is about completed.

Our sales of tires for the first three months of this calendar year show an increase of about 40 per cent. over those of the corresponding months of last year.

ACQUISITION OF THE RUBBER REGENERATING COMPANY.

Next perhaps in importance to obtaining advantageously supplies of crude rubber is the obtaining of the regenerated product of the proper quality in order to derive the best results in manufacture. Though laboratory work in the proper compounding of rubber in this country is practically in its infancy, Mr. Raymond B. Price, president of the Rubber Regenerating Co., and his staff of chemists have demonstrated their marked ability in this line. Your board has no doubt that not only will the direct earnings of the Rubber Regenerating Co. fully demonstrate the wisdom of its purchase by our company at the price of $6,000,000 in our common stock, but that the indirect advantages to the United States Rubber Co. will far surpass even the direct returns.

CRUDE RUBBER—FAR EASTERN PLANTATIONS.

During the past fiscal year crude rubber has had a downward tendency, the extreme prices for fine Pará being $1.23 on August 22, 1912, and $0.90 on March 31, 1913.

The development of our plantations in Sumatra has continued during the year. We now have planted with *Hevea* rubber trees (fine Pará) 32,500 acres, or an area more than double that of Manhattan Island, comprising 3,900,000 trees. The growth of the trees has been more rapid than anticipated, so that we look for the first rubber from our own estates next autumn, a year earlier than expected. It would seem inevitable that our company must realize great benefit when the time arrives that we will obtain at least a large portion of our requirements of crude at its cost of production in Sumatra.

PROFIT SHARING.

The profit sharing plan, as adopted last year, met with much favor among our employes. It was taken advantage of very generally, and an earnest desire is shown to anticipate payments for the stock subscribed for. Your directors have de-

cided to make a similar offering this year, the price fixed for the stock, however, being $65, instead of $45, at which price with increased dividend the yield will be as great.

OUR OFFICE BUILDING.

Our new twenty story office building, corner of Broadway and Fifty-eighth street, New York city, was completed last summer. In point of location, beauty of architecture, utility of layout and thoroughness of construction, it is a most gratifying success. Our company itself occupies at present ten floors, as well as the basement and sub-basement, and all of this space is fully and economically utilized. Nearly all of the remaining space has been rented to good tenants and we expect that the unoccupied residue will also be let before the end of the present renting season. It is further believed that as the years roll around higher rents will prevail in our locality, thus making our investment increasingly profitable.

MAINTENANCE OF PROPERTIES AND RESERVE.

It has not been the custom of our company to make specific charges for general depreciation of properties, but on the other hand our many plants, here and in Canada, are maintained in the highest degree of efficiency, all repairs and replacements being charged to expense account. The setting up out of surplus of a reserve available for depreciation of $7,000,000, will, it is believed, commend itself to our stockholders, especially when taken in connection with the fact that the fixed surplus of $14,504,714.54 may be similarly applied when deemed advisable.

CONCLUSION.

Your president desires to express his appreciation of the ability and fidelity shown during the past year by the officers, heads of departments and employes of the company. The importance of this spirit cannot be overestimated, as it is only by the loyal co-operation of all connected with the company that the best results can be obtained.

It is with deep regret that we record the death of Mr. Edward R. Rice, who was an able and faithful officer of the company for many years and who was a member of the board of directors, and also held the responsible position of manager of sales at the time of his death.

The present condition of the business of the company is very satisfactory and the outlook for the future is most promising. Our sales of merchandise have substantially increased the past year over any previous year. The lower prices prevailing for crude rubber and the certainty of an ample supply of the crude product of the best quality from the cultivated plantations of the far east would indicate a future expansion of the rubber manufacturing industry to a far greater extent than would have been possible if the source of supply of the crude article had continued limited, as in past years, to the wild growth of the rubber tree in the forests of Brazil and elsewhere.

Confidence in the unselfish patriotism of our government creates the conviction that whatever shall be finally done by it with respect to the tariff or otherwise will be done for the welfare and prosperity of the whole people. Towards this prosperity your company must contribute a helpful part and of its benefits will have the full share that it will deserve. Respectfully submitted.

SAMUEL P. COLT, President.

TREASURER'S REPORT.

UNITED STATES RUBBER COMPANY AND SUBSIDIARY COMPANIES.

(Not including assets or liabilities of General Rubber Company, Canadian Consolidated Rubber Company, Limited, United States Tire Company and Rubber Regenerating Company.)

ASSETS.

Property and plant (including shares of Canadian Consolidated Rubber Co., Ltd., and Rubber Regenerating Co.)		$105,687,667.88
Inventories, manufactured goods and material	$30,384,520.03	
Cash	7,456,804.28	
Bills and loans receivable	1,281,808.97	
Accounts receivable	28,292,273.11	
Stock owned in General Rubber Co.	5,000,000.00	
Securities, including stock and bonds of U. S. Rubber Co. held by subsidiary companies	6,439,680.55	
Sinking fund cash in hands of trustees	382,759.61	
Miscellaneous assets	845,313.09	80,083,159.64
Total assets		$185,770,827.52

LIABILITIES.

Capital stock, first preferred	$57,281,300.00	
Capital stock, second preferred	981,200.00	
Capital stock, common	36,000,000.00	94,262,500.00
Minority Rubber Goods Mfg. Co., preferred stock	1,596,100.00	
Minority Rubber Goods Mfg. Co., common stock	60,000.00	
Minority stock subsidiary of Rubber Goods Mfg. Co.	37,500.00	1,693,600.00
Ten-year 6 per cent. collateral trust sinking fund gold bonds		18,000,000.00
Bonds of subsidiary companies		1,975,500.00
Loans and notes payable	17,750,696.03	
Merchandise Accounts Payable	2,840,191.02	
Accrued interest, taxes, etc.	759,054.50	21,349,941.55
Due General Rubber Co.		8,125,141.76
Reserve for dividends		1,700,344.00
Reserve for redemption of bonds		423,348.87
Reserve for depreciation		7,000,000.00
Fixed surpluses (subsidiary companies)		14,504,714.54
Surplus		*16,735,736.80
Total liabilities		$185,770,827.52

The contingent liabilities for certain guarantees, which are offset by corresponding contingent assets, are not included.

$2,000,000 of the original issue of $20,000,000 bonds have been canceled under Sinking Fund provision.

Those Companies whose fiscal year ends on December 21 are for the year so ended.

*Of this surplus $190,107.48 pertains to minority stock interests.

CONSOLIDATED INCOME STATEMENT FOR YEAR ENDING MARCH 31, 1913.

Net sales, footwear, tires, mechanical, misc.		$91,782,861.87
DEDUCT:		
Cost of manufacture, selling, general expenses and taxes		81,307,154.90
Operating profits		$10,475,706.97
Other income (net)		84,123.49
Total income		$10,559,830.46
LESS:		
Interest on funded and floating debt	$2,170,598.63	
Interest allowed customers for prepayment	736,459.35	2,907,057.98
Net income		$7,652,772.48
Deductions for bad debts		108,554.81
NET PROFITS		$7,544,217.67
Dividends—U. S. R. Co.	$5,594,332.00	
Dividends to minority R. G. M. Co. and Susidiary Co.	205,623.00	5,799,955.00
Surplus for period		*$1,744,262.67
Additions to surplus—adjustment R. G. Mfg. common stock from cost to par value	$6,909,275.00	
Capital gain in conversion of second preferred into first preferred stock	2,254,700.00	
Transferred from reserves to surplus	390,891.98	9,554,866.98
		$11,299,129.65
Surplus U. S. R. Co., April 1, 1912, and R. G. Mfg. Co., January 1, 1912		17,436,607.15
		$28,735,736.80
Common stock dividend		5,000,000.00
		$23,735,736.80
Deductions from surplus—reserve for depreciation		7,000,000.00
Surplus March 31, 1913		$16,735,736.80

Respectfully submited,

JAMES B. FORD, *Treasurer.*

*Of this surplus $13,507.31 pertains to minority stock interests.

BUSINESS OF THE COMPANY.

The following table showing the amount of net profits of the United States Rubber Co. and the amounts disbursed in dividends since the organization of the company, has been compiled from the printed reports of the successive treasurers of the corporation:

Year Ending—	Net Profits.	Dividends.
March 31, 1893	[Not Published.]	
March 31, 1894		
March 31, 1895	$2,716,370.00	$2,056,190.00
March 31, 1896	2,339,790.60	2,056,190.00
March 31, 1897	1,999,611.34	1,552,040.00
March 31, 1898	2,070,750.41	1,164,030.00
March 31, 1899	3,226,513.46	1,882,040.00
March 31, 1900	3,007,887.54	2,828,680.00
March 31, 1901	62,605.57	705,765.00
March 31, 1902	deficit	none
March 31, 1903	1,594,908.16	none
March 31, 1904	1,575,641.29	none
March 31, 1905	3,761,922.63	1,882,040.00
March 31, 1906	3,881,270.23	2,846,092.00
March 31, 1907	4,590,382.72	3,485,956.00
March 31, 1908	3,553,556.14	3,495,448.00
March 31, 1909	4,507,655.39	3,498,940.00
March 31, 1910	5,535,163.15	3,574,205.00
March 31, 1911	4,349,825.73	3,800,000.00
March 31, 1912	5,376,306.86	4,550,000.00
March 31, 1913	7,544,217.67	5,799,955.00 *5,000,000.00

*Common stock dividend.

THE ANNUAL ELECTION.

At the annual meeting, on May 20, the entire board of directors was reëlected. All of these directors have served for some time with the exception of Mr. Price, who was elected in February last, in place of Mr. E. R. Rice, deceased. They are as follows:

1. Walter S. Ballou, Providence, Rhode Island.
2. E. C. Benedict, Greenwich, Connecticut.
3. Anthony N. Brady, Albany, New York.
4. Samuel P. Colt, Providence, Rhode Island.
5. Harry E. Converse, Boston, Massachusetts.
6. James Deshler, New Brunswick, New Jersey.
7. James B. Ford, New York City.
8. J. Howard Ford, New York City.
9. Frank S. Hastings, New York City.
10. Francis L. Hine, New York City.
11. Henry L. Hotchkiss, New Haven, Connecticut.
12. Arthur L. Kelley, Providence, Rhode Island.
13. Lester Leland, Boston, Massachusetts.
14. D. Lorne McGibbon, Montreal, Canada.
15. Raymond B. Price, New York City.
16. Homer E. Sawyer, New York City.
17. Frederick M. Shepard, East Orange, New Jersey.
18. William H. Truesdale, Greenwich, Connecticut.
19. Theodore N. Vail, Boston, Massachusetts.
20. John D. Vermeule, New York City.
21. Elisha S. Williams, Nahant, Massachusetts.

OFFICERS OF THE UNITED STATES RUBBER CO.

At a meeting of the Board of Directors of the United States Rubber Co. for organization, held at the office of the company, 1790 Broadway, New York, May 23, 1913, the following officers were duly elected for the ensuing year: Samuel P. Colt, president; James B. Ford, vice-president; Lester Leland, second vice-president; W. G. Parsons, treasurer; E. J. Hathorne, assistant treasurer; Samuel Norris, secretary; John D. Carberry, assistant secretary; Homer E. Sawyer, general manager footwear business both manufacturing and selling; Elisha S. Williams, general manager tire, mechanical and miscellaneous business, both manufacturing and selling; and Raymond B. Price, general manager development department.

EXECUTIVE COMMITTEE.

Samuel P. Colt, James B. Ford, Lester Leland, Walter S. Ballou, Anthony N. Brady, Elisha S. Williams, Homer E. Sawyer.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

REPORTS differ as to business conditions, and manufacturers making similar lines are not entirely agreed regarding the state of trade. A review of the leaders here in the rubber industry, however, seems to show that while there is a moderately active business the orders appear to be conservatively small, seeming to indicate the policy on the part of customers to be safe rather than sorry. In clothing there is a good business doing in the finer qualities, while in the cheaper grades trade is far less active. In druggists' goods a rather lively demand is noted, many of the chain drug stores as well as the department stores doing extensive advertising and reaping the benefit of their publicity. The boot and shoe business is very far from satisfactory. The natural disposition has been to hang back and to delay ordering as long as possible without losing the benefit of the extra five per cent. for early orders. The rubber companies offered this extra discount on all orders coming into their hands prior to July 1, and on May 15 they notified their customers that this time limit would be extended—with the result that many customers are likely to procrastinate still further. The one really satisfactory branch of the rubber manufacturing business is tires, the demand for which is sufficient to keep every factory working over-time.

* * *

Speaking of the tire business reminds your correspondent that in front of the main office of the Tyer Rubber Co., at Andover, is a sign "Tires pumped here free." As this factory is on a main, traveled road, where thousands of automobiles pass, the sign brings many machines to a stand-still, and right there, outside the doorway, is a case containing a handsome, snow-white Tyrian Tire, conspicuously labeled. This case is strongly illuminated at night, and not only becomes a standing advertisement for these tires, but is also a prominent land-mark from which to compute distances and identify location.

* * *

Jenkins Brothers, manufacturers of the "Jenarco" sheet jointing and packing, are finding that their newly fitted up store and warehouse at 524 Atlantic avenue is none too large for the added business which has come to them since their removal to that address a few months ago. Manager Stiles wears a smiling face these days and presents to his customers a series of illustrated blotters, bearing the Jenarco trade-mark, and pictures of youthful base-ballists which bring back memories of boyhood days.

* * *

The Walpole Tire and Rubber Co. are removing their offices, which have for some years been in the Brown Building, corner of Sumner street and Atlantic avenue, where they occupied the entire fifth floor. The business headquarters will be located at the store opened a few months ago at 757 Boylston street, right in the heart of the automobile supply trade, and therefore especially beneficial to their tire business. The shoe supply department, however, will still be located in the shoe district, in the vicinity of Sumner and Lincoln streets.

* * *

J. W. Fenner, formerly with the W. Brigham Co., Cleveland, spent a portion of his pleasure trip east in this city last month, and while here called on many of his friends in the trade.

* * *

Hon. L. D. Apsley, president of the Apsley Rubber Co., with Mrs. Apsley, sailed on the *Canopic* from this port April 26, for a tour of Europe. Reports of their safe arrival and thorough enjoyment of their vacation have been received.

* * *

Charles A. Coe, eastern selling agent of the United States Rubber Co., has moved his family to Annisquam, where he has

a summer residence and a motor boat, both of which he thoroughly enjoys throughout the summer and early fall months.

* * *

Captain Francis H. Appleton (every rubber man in the country knows him) completes his year as commander of the Ancient and Honorable Artillery Company this month. On the first Monday in June he will march, at the head of this distinguished military company, to the Old South Church, thence to the world-renowned Boston Common, where, after a drum-head election, he will surrender his insignia of office to the Governor of Massachusetts, who will confer it upon his successor. But his duties will not yet be done, for there will be a monster banquet at Boston's newest hotel, where he will preside, in the evening. This will be an unusually brilliant function, for this year rounds out two and three-quarters centuries in the history of the company, and due cognizance will be taken of this event. Captain Appleton's year in command has been a notable one, and he retires with honors heaped upon him by his fellow officers and the rank and file of the organization.

* * *

George E. B. Putnam, editor of the rubber department of the "Boot and Shoe Recorder" of this city, sailed from New York on a vacation voyage to Panama and neighboring Central American and South American ports, and will be gone several weeks. During a service of nearly a quarter of a century this is the first time he has absented himself from duty for a longer period than two weeks. Mrs. Putnam accompanies him.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

ONE is reminded of the recent strike that lasted for a number of weeks in Akron by the letter which has recently been sent by Mr. E. C. Shaw, second vice-president of the B. F. Goodrich Co., to Mayor Rockwell of Akron, in which he encloses a check of $2,000 to be applied to the Police Pension Fund. In his letter Mr. Shaw writes as follows:

"Generally speaking, to no class of workers is less appreciation shown for fidelity and integrity in the performance of duty than to our public officers and servants. It is, therefore, with great pleasure that we, along with all other law-abiding and order-loving citizens, hereby express our approval of the manner in which the police department of our city, under the guidance and direction of yourself and the chief of police, and the sheriff of our county and his assistants, so ably protected life and property, preserved order and enforced obedience to law during the recent attempt on the part of certain irresponsible individuals to demoralize the usual good behavior of some of our citizens.

"We are enclosing a check, payable to the trustees of the police fund, as a slight token of our appreciation for the services rendered, not so much to ourselves as to the city generally. In so doing, we have no apology to offer to the breeders of discontent or to the preachers of anarchy, all of whom we are sure will have no hesitancy in criticising the police department for its conduct and our action in commending it."

The Mayor in his reply wrote: "I heartily agree with you that our police force deserves the hearty commendation of every law-abiding and order-loving citizen for the courageous and impartial manner in which the situation was managed, and thank you for the substantial manner in which you manifest your appreciation of their conduct."

* * *

The Akron rubber factories are running full force and are working day and night and need more help than they can secure. It is claimed that there is need of 5,000 workingmen in Akron at the present time.

* * *

Mr. E. C. Shaw, second vice-president of The B. F. Goodrich Co., is making a trip to Paris to inspect the Goodrich plant at that place. This plant is having marvelous success and although established in a foreign country and in the seat of the foreign tire business, has made great progress. It is manufacturing a full line of auto and truck tires and is pushing work in the line of mechanical goods manufactured by the factory in Akron. It is the first and only complete American plant in a European country. The foreign sales organization of the Goodrich company is now complete and radiates chiefly from London. A large number of the tires for this foreign trade are supplied by the Paris plant.

The B. F. Goodrich Co. has combined the old Diamond sales office and the service station with the Goodrich sales office and service station in Pittsburgh, and is moving into a large new building at 414 Craig street, erected for the Pittsburgh trade.

The Goodrich company's combined newspaper, magazine and outdoor advertising for a period of six months, if carried on one bulletin board, more than a mile high, would reach over ten miles, or from one end of Manhattan Island to the other. The lamps of their electric signs would illuminate the streets of a large city, while their road markers would cover over 30,000 miles of road.

* * *

Mr. Anthon Berg, a noted expert on balata belting and packing, has just completed the installation of the balata belting and asbestos sheet packing plant of The Goodyear Tire & Rubber Co., of Akron. Mr. Berg has installed several large balata belting plants in Europe and has spent more than a score of years in the balata belting business. He expects soon to return to Sweden, his native country, where he will spend the summer, returning in the fall to the United States.

* * *

On account of their increased trade, the Firestone Tire & Rubber Co. has been compelled to build a new service station for solid tires at West End avenue and Sixty-second street, New York City, which will be opened about July 1. It is of concrete fireproof construction, four stories and basement, and is built so that additional stories can be added as needed. The building will cover between 30,000 and 40,000 square feet. It is aimed to make this station complete in every respect, with facilities for the repair of 50 trucks at a time. It has a complete steel and woodworking shop, so that all parts of the wheel can be furnished immediately. In addition, this building will be used as a distributing point for New York and vicinity for all rim and solid tire equipment. The plant will be open 24 hours a day and seven days a week. No expense has been spared to make this a time saving service station. It is the plan of the Firestone company to connect a similar service station directly with its tire branches in all the larger cities. A year ago similar, though smaller service stations were built in Boston and Philadelphia.

The Firestone factory is running day and night, on account of the immense growth of business.

The rim plant of the Firestone company has shown a wonderful growth and is running day and night. During the past eighteen months the business has increased 600 per cent. It is claimed that more than half the new cars put out this year are equipped with Firestone rims.

The Firestone Tire & Rubber Co. has opened a new branch in Syracuse, N. Y., under the management of E. A. Huffman, at 502-504 East Genesee street.

A RUBBER COMPANY HELPING CIVIC WORK.

ON May 13 an entertainment, with an accompanying exhibition, was held in the assembly hall of the Hood Rubber Co. plant at Watertown, Massachusetts, under the auspices of the North America Civic League of that town. The exhibition showed the character of the work done at the League settlement house, and the entertainment consisted of music, dramatic selections and a stereopticon lecture.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

THERE has been no lack of demand for all lines in the rubber trade locally. In fact the activity has been such that the local houses are scarcely able to cope with the situation. This is particularly true of the tire business. This branch of the trade has just recovered from the demand for tires resulting from losses in the recent flood in the Ohio Valley, and the local branch houses have about completed the re-stocking process to meet the demands occasioned by favorable spring weather, when they are confronted with the present street car strike. The automobile and motor truck have come to the rescue. Every kind of vehicle has been pressed into service to help out the situation. Vehicles that have been tireless all winter, and some that have been stored away for several seasons, are being used to transport a portion of Cincinnati's 400,000 inhabitants from their homes to their work and business places. In consequence the rubber tire people are at this time the busiest persons in the city, supplying the demands. There is also a good demand for rubber footwear for immediate shipment, most of the orders coming from the recent flood district and representing complete stocks.

* * *

It was cheerful news to automobile tire manufacturers that was sent out from Columbus by the Register of Automobiles when it was announced that Ohio's automobile record for 1912 had already been passed. With license tags issued to May 10 the total reached 63,720, compared with 63,117 for the entire year of 1912. It is predicted that the year's business will reach 85,000.

* * *

The Lee Tire and Rubber Co. has opened a branch house at Eighth and Main streets. The new branch is in charge of E. M. Henderson as manager. The company carries a large stock of tires and other rubber automobile accessories.

* * *

If the present street car strike continues for any length of time Cincinnati will be the silent city. Since walking has become the habit in this city there has been a great demand for rubber heels, and cobblers together with shoe dealers have been obliged to employ extra forces to tack on rubber heels and rubber soles. It is estimated that the first two days the strike was in progress over 5,000 pairs of rubber heels were sold; and the rubber heel business has come to stay locally, as the strike has been a pronounced educator as to the value of rubber heels and soles. It goes without saying that dealers are making every day of the strike count.

* * *

H. Bumiller and M. E. Remelin, of the firm of Bumiller & Remelin, local agents for the Seamless tire and dealers in rubber automobile and motorcycle accessories, were the hosts of about 100 motorcycle owners at a recent chicken dinner in the country. This firm has done much to bring the motorcycle into general use in this city and it constantly entertains riders in one fashion or another.

* * *

The Ohio Rubber Co., operating houses in Cleveland and Cincinnati, and dealing in rubber clothing, footwear, belting and rubber sundries is about to branch out in the wholesale line on an extensive scale. This company now occupies a seven-story building at 612-614 Race street, where it has been located for about 20 years, conducting a retail business principally. The company has just entered into a lease for a new seven-story concrete building which is nearing completion at 228-230 West Seventh street. The company announces that the tremendous growth of its wholesale business prompts it to devote its entire attention to this department. It is the intention of the company, as soon as the new quarters are completed, to close out its retail department which is one of the largest and most complete in the state of Ohio. The company's business in this city is in charge of Howard J. Howard, who is general manager of the firm.

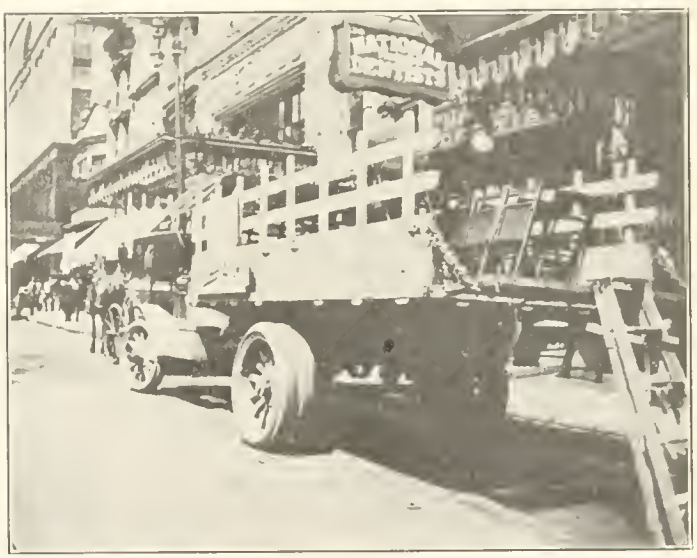
* * *

A meeting of the Executive Council of the Ohio State Pharmaceutical Association has been called for the purpose of outlining plans to have the postal laws applying to the trade more clearly defined. Because of the reading of the law druggists are afraid to send certain of their wares through the mails. It is the purpose of the meeting to prepare a list and present it to Congress.

THE RUBBER TRADE AND THE CAR STRIKES.

WHILE in Cincinnati and adjacent territory recently the population, as a whole, has been groaning beneath the imposition of a street car strike because of which for over a week not a car ran in this "City of Distances," the dealers in automobile supplies, and particularly in tires, found much to their liking.

To begin with, everyone who had a car used it to the utmost. Cars were employed to get the household help and to take them home; cars were sent to the grocery, where the grocer had none of his own or found his wagon service insufficient. The family automobile was used by the head of the household for business purposes to round up his own employes and to help in delivering goods; all of which used up tires and sent the owners of the cars to purchase more, materially assisting the work of tire consumption. Obstructions placed in dark nooks of the streets by



TEMPORIZED PASSENGER SERVICE DURING CAR STRIKE.

street car sympathizers, slivers from boards, sharp bits of rock, nails and tacks placed where they would be effective, helped the tire business greatly. Of course the auto tire and repair concerns got a share of the extra profits, receiving from a quarter to seventy-five cents a puncture per tube, and from three to seven dollars for fixing a casing; but generally tires would be so badly damaged as to require a new supply.

Again, while forty-six hundred automobiles are registered in and about Cincinnati, the strike caused many a non-motorist to invest in a second-hand car. From this he will get the habit, later buy a new car, and so increase the demand for tires.

It is not to be wondered at, therefore, if the automobile dealers and the sellers and repairers of rubber tires are able to view a car strike with a very moderate amount of distress.

The accompanying photograph shows how passenger service in Cincinnati was taken care of during the car strike. It shows a four-ton truck in which chairs have been arranged along the sides, reached by a step ladder from the back.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

THE most noteworthy feature in the rubber trade is the activity noted in the mechanical line. Almost every dealer in the Chicago market reports business in this particular branch of the trade as active. Many of them say they are working their factories night and day in the effort to keep up with their orders. Another line that has been fairly active is rubber clothing, but it has been a poor season for rubber shoes. Garden hose has had a good season, far better than last year, which was a wet year; and many people put off buying garden hose until it got so late that they concluded to do without. The tire business has also been good, and all houses report an increase in sales.

* * *

The Salisbury Co. held its annual meeting recently. All of the old officers were re-elected. The annual report showed one of the best years that concern has had. Its wholesale business showed an increase of more than 56 per cent. over that of a year ago. This remarkable increase was attributed to a large contract received from the Rumely Co. for a special patented belt.

* * *

E. F. Lindley, of the Raven Mining Co., is spending a good deal of time on the road. After returning from a trip of inspection of the company's mines he left for an eastern trip, from which he has just returned.

* * *

William E. Barker, manager of sales of the United States Rubber Co., visited the local offices of the company about the middle of May. R. F. Spencer, comptroller of that corporation, visited the local offices during the first part of May.

* * *

Dealers in local rubber circles are greatly incensed by the increasing number of "fly-by-night" rubber coat concerns which are springing up over the "loop" district and which have done a great deal of injury to the legitimate rubber coat business.

These unsavory companies generally use old-established and well-known rubber names, in order to mislead the people, who, naturally, seeing a familiar name on the store front and in the advertising, assume that the store is connected with the well-known company bearing that name—or, bearing one so similar that the ordinary purchaser would not notice the difference. It is stated that both the Goodrich and the Goodyear companies have brought court proceedings against these people, but have so far been unable to get any redress.

Another feature of the situation that makes it possible for these illegitimate concerns to thrive is the fact that the papers of large circulation seem to be willing to accept their advertisements.

The way these concerns operate is what hurts the legitimate trade. They rent a store in close proximity to a legitimate house, usually on a short-time lease—say, a month or two, or sometimes longer. They then load up their show windows with good-looking coats and advertise ridiculously low prices for their goods. Of course the nature of the show attracts attention, and once a prospective buyer is in the place the salesmen almost lock the store rather than that he should get away. Indeed, a very small percentage of them ever get away without making a purchase. Of course after the coat is worn through one good rain the purchaser discovers that it leaks like a sieve, and some of the cheaper kinds all but fall apart. By the time redress is sought the firm has moved away, and frequently the buyer goes into the legitimate concern close by and raises trouble, and it is with difficulty that he is convinced that he did not buy the coat in the latter place.

An incident which recently occurred serves to illustrate their operations. A man who was a close personal friend of an official in one of the large local rubber concerns received a present of a coat bought in one of these will-o'-the-wisp stores. His wife was going to treat him to a mild surprise and purchased the coat as a birthday present. The gentleman in question went to his friend and asked him what he thought of the coat. After closely examining it the rubber dealer stated that his house sold the same coat for $5. The owner then stated that his wife had paid $12 for it. He found where the coat was purchased, went to the store and tried to recover his money, but naturally did not succeed.

How to get rid of these pests and save the legitimate dealer from injury is a problem which remains to be solved. Local dealers would welcome any plan which would curtail, or better still, eliminate, these objectionable concerns.

A law similar to that put in operation in Minnesota recently would be one way in which some relief could be obtained. This law prohibits any firm from misrepresenting its goods in any advertisement. If the local rubber dealers would get together and petition their legislators to secure legislation of this sort it would tend to minimize this evil.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

A LARGE new addition to the administration building is being constructed at the plant of the Revere Rubber Co. on Valley street, Providence, that will be up-to-date in every particular. A refrigerator system is being installed which will complete the cooling system for the warehouses where the product of the plant is stored. A large force of workmen is engaged in completing the battery of new boilers which are being installed. The entire establishment is being operated day and night, ten hours to each shift, and the management reports that it is finding great difficulty in caring for its constantly increasing orders.

The demand for solid tires for motor trucks continues to increase with great rapidity, so much so that the capacity of the plant is unable to keep pace with the demands made upon it. The orders on the company's books for solid tires are reported as being very much ahead of the number for pneumatics, due to the sudden big demond for motor trucks for delivery and heavy work.

* * *

The wire drawing department at the factory of the National India Rubber Co. at Bristol is to be enlarged, because of the increased business. A room 40 by 60 feet, east of the present wire drawing room, is to be equipped with several of the finer wire drawing machines. A new roof has been put on the building and concrete floors are being laid, so that when completed it will present a very modern appearance. A new smoke-stack is also being installed.

* * *

Would-be thieves entered the plant of the Air Lock Rubber Co., 42 Thurston street, Pawtucket, a few days ago, but were evidently frightened away before they could steal anything, as nothing was missed from the premises. A pedestrian passing the plant heard noises inside that attracted his attention and he notified the police. It was found that a side window had been entered, but no one was found in the building.

* * *

The Atlantic National Bank, of which A. T. Baldwin, of the Walpole Rubber Co., is a director, and which was recently closed by order of the Comptroller of the Currency, is declared, in the report of Bank Examiner Schofield, to be insolvent, and Receiver Curtis has been instructed to liquidate as soon as possible.

Percy W. Gardiner, who was one of the committee of investigation into the affairs of the Consumers' Rubber Co. in January, 1912, is president of the Atlantic National.

An excellent photographic picture of the Banigan Rubber Co.'s factory at Woonsocket appears in the back of that concern's new catalogue, recently issued.

* * *

LeBaron C. Colt, manager of the National India Rubber Co., at Bristol, has been elected captain of the new honorary veteran military organization in that town.

* * *

Just at this time, when innumerable schools and colleges throughout the country are preparing to send forth their annual quota of young men into the business and professional world to carve out a future, it is very interesting and instructive to hear from men who are at the head of large business enterprises or commercial establishments some of their personal experiences in attaining these high standings.

Not many young men fitting themselves for teaching would think of giving up that vocation and taking to another calling, much less in the humbler position of errand boy. Isaac Crocker, of the Hope Rubber Co., did this when he was 21 years of age. He is now president and treasurer of a system embracing ten rubber companies.

"Leaving my school work," said Mr. Crocker recently, "I went to Lowell, Mass., where I let myself out at $4 a week as an errand boy. It was just such a position, nothing more. I was employed by the Lowell Rubber Co., a retail concern. The first thing I had to learn was how to sweep a floor properly. I delivered packages all over the city, helped move big cases of goods, made myself generally useful, and, being the 'office boy,' was at general beck and call.

"There were no parcel deliveries in Lowell at that time, and not all the retail stores owned delivery wagons. That was thirty-three years ago. I had to work from 7 o'clock in the morning until 7 o'clock every night, with 11 o'clock as the closing hour on Saturday nights.

"I must have made good, as the expression is now, for in a short time I was entrusted with the making of sales, and when I had become familiar with the business and the trade I was sent out on the road. In 1889 I had advanced to the point where I was made manager of the Lawrence, Mass., branch, and in 1898 I came to Providence to take charge of the shop in this city. I purchased the business in 1903, thereby controlling a chain of eight stores."

* * *

The American Electrical Works at Phillipsdale, East Providence, report an increasing demand for their products, and are adding to the number of their employes. Recently they have been calling for men in their wire drawing department, offering 20 cents an hour while learning, with an average of $14 to $16 weekly thereafter.

* * *

The State Board of Control and Supply, of which Gilbert R. Parker of Providence is secretary, is making up the forms for bids for supplies for the various institutions throughout the State for six months, commencing July 1. The list includes all the rubber goods of every description used in the institutions.

* * *

John J. Kelley, paymaster of the National India Rubber Co., who has been confined to his home in Warren for the past six weeks with a severe attack of inflammatory rheumatism, has resumed his duties at the Bristol offices. He was warmly congratulated by his friends on his recovery. Frederick Wilson, of the paymaster's department, was acting paymaster during the time Mr. Kelley was absent.

* * *

A new one-story brick building, about 260 feet in length and 160 feet wide, is to be erected within the next few months at the plant of the National India Rubber Co. at Bristol, and three buildings are now being demolished to make room for the new structure, which will be located east of the wire-drawing plant. The new building will be used for the wire-stranding machines. The buildings which are being razed are the old one-story press room, part of the old druggists' sundries room, the one-story building which contains the curing heats, and part of the old two-story calender and gum rooms.

Ground has also been broken for a new one-story shipping shed to extend 146 feet west of the present shipping shed northwest of the wire department. The building will be 70 feet wide and built of wood. A new naphtha storage reservoir, made of cement below the surface of the ground, is being constructed. This will be divided into four compartments or tanks, each of which will have a capacity of 5,000 gallons, so constructed as to be entirely independent of each other.

* * *

The Bourn Rubber Co. of 58 Warren street, this city, has been granted permission by the inspector of buildings to erect a one-story brick workshop in the rear of Westfield street, adjoining the present plant.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

TRADE has quieted down somewhat during the past month, owing to a variety of causes. In the first place there is the tariff. Then the State Legislature has passed measures which big corporations feel to be restrictions on their enterprises, and one measure the liability of employers for injuries occurring to employes—has also tended to make some big industrial companies feel uneasy. The law as it now stands gives compensation (in all mechanical industries) in cases of those who are injured or killed, even though the injury be the result of the negligence of a fellow employe. This law will affect many employers who are allied with the rubber business, and they are naturally interested in the outcome. The theory of the law is to shift the burden of the financial loss, in the case of accidents, to the employer instead of to the employe, upon the theory that the employer will for this reason be much more concerned for the protection of those in his service.

* * *

Mr. R. H. Pease, president of the Goodyear Rubber Co., of this city, has returned from his eastern trip. He has renewed his contract as Pacific Coast selling agent of the United States Rubber Co. He reports that he found conditions in the East about as they are here. R. H. Pease, Jr., treasurer of the company, is now in Paris, and will return early in June. Upon his return from Europe it is likely that he will take charge of the company's branch in Portland.

* * *

Mr. Brady, general sales manager of the Gorham-Revere Rubber Co., has returned from his trip to the northwest, where he found business very good, especially in Seattle. Mr. W. H. Given, the former manager of the company's branch at Spokane, has resigned, and Henry Thompson has been placed in charge of that store. Mr. Thompson was formerly manager of the Portland branch store. The new manager of the Portland branch will be W. G. Roope.

* * *

M. E. Morris, recently appointed Pacific Coast district manager of the Goodyear Tire and Rubber Co., of Akron, succeeding W. T. Powell, has arrived in this city, accompanied by his wife and daughter. This being district headquarters, Mr. Morris has been getting acquainted with the big establishment on Van Ness avenue. He is accompanied by C. W. Martin, manager of the truck tire department of the company, and also by L. C. Rockhill, manager of the pneumatic tire department. The latter two will make semi-annual trips to this territory. They have been busy conferring with Manager Frank Carroll of the local branch, and are about to start for a trip through the cities of the northwest.

Mr. H. T. Dunn, president of the Fisk Rubber Co., has been visiting in San Francisco, and while here is making his headquarters with Mr. Pratt, manager of the local branch. Mr. Dunn is very well pleased with the progress which the tire industry is making on this coast. In his belief, the automobile industry must thank the tire manufacturers to a large extent for the increasing popularity of the automobile, which is largely due to the increased efficiency and better service of automobile tires.

* * *

W. H. Bell, Pacific Coast manager of the Firestone Tire and Rubber Co., reports that the tire business is keeping up to its high standard of activity on this coast. Mr. Bell keeps well posted not only on the commercial demand for tires, but also on all improvements in tire construction, and is a strong believer in the idea that the longer a manufacturer can make a tire last the greater will be the ultimate demand for its general use. Improvements on the rims, to keep the dust and rocks out, are important, he says, and also improvement may be looked for in the matter of fibres of which the fabric is composed. The best that are now to be obtained are the fibres of natural grown plants, and it is really the toughness and efficiency of the fabric which goes to make up the life and efficiency of the tire.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

C. H. OAKLEY, president of the Essex Rubber Co. and William G. Grieb, of the Ajax-Grieb Rubber Co., local concerns, were two of the committee of four representing the rubber manufacturers of this country which presented to Congress a joint memorandum on the Underwood tariff bill, as to the necessity of granting a measure of protection in the matter of tariff considerably in excess of that contemplated by the Democratic administration.

Other Trenton rubber manufacturers who assisted in the preparation of the appeal to Congress were: W. H. Sawyer, of the Mercer Rubber Co.; R. J. Stokes, Thermoid Rubber Co., and J. K. Pellinger, Morrisville Vulcanite Rubber Co.

The Finance Committee of the Senate received the committee at the hearing, which lasted about two hours. Mr. Oakley and Mr. Grieb both spoke against the contemplated action of the administration. The memorandum presented represented factories producing an annual output of $75,000,000 worth of rubber goods, a great portion of which is manufactured in this city.

* * *

Tibor Miklos, administrator of the estate of John Mikulas, has instituted suit in Mercer Supreme Court to recover $10,000 damages for the loss of the life of the deceased. Mikulas was killed in one of the rubber mills some months ago, as the result of the explosion of a vulcanizer. It is charged that the machine was defective, and that it was improperly and unskillfully operated.

The reputation of Trenton as the home of expert tire makers is again borne out by the effort to induce local men to accept positions in other sections of the country. The Akron Rubber Co., Akron, Ohio, has run large advertisements in the local newspapers calling the attention of workmen to the advantages of locating in the Ohio town. A rubber company at Rutherford, New Jersey, another in New York State and a New England concern have advertised in the local newspapers for tire makers, offering all kinds of inducements.

THE SENATE HEARING ON THE TARIFF.

About the middle of May there was a meeting of rubber manufacturers held in New York City, and a committee of four was appointed to present a memorandum on the Underwood Tariff Bill before the senate committee, which was holding Tariff hearings at that time. The committee consisted of F. A. Seiberling, president of the Goodyear Tire and Rubber Co., Akron, Ohio; Geo. B. Hodgman, president of the Hodgman Rubber Co., New York; William G. Grieb, of the Ajax-Grieb Rubber Co., and C. H. Oakley, president of the Essex Rubber Co., of Trenton.

These representatives of the rubber trade were cordially received by members of the senate committee, and were given an opportunity to state their reasons for opposing the reduction in duty on manufactured rubber goods from 35 to 10 per cent. Besides these four members of the committee, a number of other manufacturers, including several of the leading Trenton manufacturers, were present and took part in the discussion.

PROPOSED REDUCTIONS IN DUTIES ON MANUFACTURES OF RUBBER.

BY the annexed table the differences between the present and proposed duties on rubber manufactures are shown in more complete form than in the table published in the May issue of THE INDIA RUBBER WORLD (page 404). There is a sweeping reduction to the extent of about 70 per cent. of present duty on rubber manufactures in general, a reduction of 60 per cent. on cables, of 50 per cent. on belting of cotton and rubber and on waterproof cotton cloths, and of 45 per cent. on tire fabrics.

Webbings containing india rubber would pay duties as now according to the other materials of which they are composed. Wool webbings have hitherto paid a compound rate equalling a figure (according to cost per pound) from 68.94 per cent. to 148.40 per cent., nine-tenths of the quantity paying 84.13 per cent. The proposed reduction to 35 per cent. will be a serious one for makers of this class of web, who, however, would benefit by the free wool clause of the new tariff.

India rubber enters into the composition of so many articles that it is difficult to define just how far the effects of the new tariff would reach. But the annexed figures show its incidence as affecting the principal branches of manufacture.

COMPARISON OF PRESENT AND PROPOSED DUTIES ON MANUFACTURES OF RUBBER.

Present (Payne) Rates.		*Proposed (Underwood) Rates.*	
		Paragraph.	
Manufactures of india-rubber	35 per cent.	378—Manufactures of india-rubber or gutta-percha	10 per cent.
Rubber sponges	40 per cent.	379—Manufactures of vulcanized india-rubber known as "hard rubber"	25 per cent.
Manufactures of gutta-percha	35 per cent.		
Cables, etc. (1c. per lb. + 40 per cent.)	51.86 per cent.	116—Telegraph, telephone and other wires and cables composed of metal and rubber, or of metal, rubber and other materials	20 per cent.
Cotton and rubber belting for machinery	30 per cent.	267—Belting for machinery made of cotton or other vegetable fiber and india-rubber	15 per cent.
Waterproof cotton cloth (10c. per sq. yd. and 20 per cent.)	50.56 per cent.	259—Waterproof cloths composed of cotton or other vegetable fiber, whether composed in part of india-rubber or otherwise	25 per cent.
Suspender webbing—*Cotton*	45 per cent.	267—Fabric, suitable for use in suspenders and braces, of cotton or other vegetable fiber and india-rubber; not embroidered	25 per cent.
Fibres other than cotton	45 per cent.		
Composed of wool, etc, chiefly	84 per cent.	287—Webbings of flax, hemp, or same and india-rubber	30 per cent.
Of silk	50 per cent.	301—Webbings of wool, etc	35 per cent.
		324—Webbings of silk, etc	40 per cent.
Tire fabrics	45 per cent.	267—Tire fabrics, etc	25 per cent.
Cotton ducks (minimum)	45 per cent.	271—Cotton cloths (minimum)	30 per cent.
Clothing of silk and india-rubber	60 per cent.	325—Clothing of silk and india-rubber	50 per cent.

New Rubber Goods in the Market.

THE TYER "HOLD-TITE" TIRE.

THE Tyer Rubber Co., of Andover, Masachusetts, makers of the Tyrian rubber goods, have incorporated the letter T in the tread of their "Hold-Tite" anti-skid automobile tire. There are two rows of these T-shaped depressions. The heads abut a strip of uncut rubber which extends around the tire at its greatest circumference. As the greatest amount of wear comes on this point it should have excellent wearing qualities.

SHAVING WITHOUT SOAP OR CUP.

Simplification is the great law of civilized conveniences.

Here is a shaving brush called the "Selfeedo" that combines in itself the work of a brush and the offices of a shaving cup. The handle, which is made of hard rubber, is hollow and is in two parts, the outer part working on a screw over the lower. In the hollow handle enough shaving cream

THE SELFEEDO SHAVING BRUSH WITH HARD RUBBER CASE.

can be stored for 100 days' use. When the shaver is ready for operations he simply dips the bristles into water, give the top of the handle a quarter turn, and that forces a sufficient amount of cream down into the bristles for the morning's shave.

The brush is put up in a hard rubber case, so that a man can carry his shaving outfit in his waistcoat pocket. (Baird-North Co., Providence, Rhode Island.)

"SOLID AIR."

A new tire filling compound is mentioned in the French technical press, which can be injected in a liquid state into tires at different degrees of tension, to correspond with the weight and normal load of the vehicle, as well as the size of the tire casing. After a few hours the injected liquid becomes plastic, generating gas in millions of cells. It is said to be compressible and inextensible, differing from rubber, which is incompressible and extensible.

Replete with Information for Rubber Manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

NEW STYLES OF WATERPROOF GOODS FOR WOMEN.

THE latest catalogs issued by the most progressive New York manufacturers and dealers in women's waterproof goods contain some very attractive designs, three of which are here reproduced:

No. 1 shows a raincoat of rubberized silk mohair and is very light in weight. It has a high standing turnover collar and a slot pocket on each side. Accompanying this raincoat there is a convenient auto hood, as shown in the picture.

No. 1. No. 2. No. 3.

SOME NEW PATTERNS OF WATERPROOF GARMENTS.

No. 2 shows a more mannish design. This is made of English worsted cashmere with fancy plaid rubber back, and comes in castor, tan, navy or black. It has patch pockets, inlaid velvet collar and loose-belted back.

No. 3 is a raincoat of light weight spun silk Ottoman cloth with rubber back. This is made in castor, taupe, navy or black. It has a soft, convertible collar, patch pockets and a detachable half belt at the back.

A NEW PREPARATION FOR AUTO TOPS.

Rubber has contributed not only in a thousand ways to the comfort of living, but it is continually contributing to the wealth of our vocabulary. Every day some new word born of rubber appears in print. Here's one of the latest—"RUB-R-TITE." It is the name of a preparation for use on worn-out and leaky automobile and carriage tops. It is alleged to renew and render waterproof any sort of fabric, whether mohair, pantasote, leather or cravenette, re-filling and re-surfacing the fabric. The manufacturers do not tell what it consists of, but they say that it is neither a paint nor a varnish, and that it puts an elastic, durable coating on the auto top. Its name seems to warrant the assumption that it contains at least some suggestion of rubber. (Rub-On Manufacturing Co., Buffalo, New York.)

News of the American Rubber Trade.

McGRAW CAPITAL STOCK $1,000,000.

THE McGraw Tire and Rubber Co., of East Palestine, Ohio, has been incorporated, with a capital stock of $1,000,000, to manufacture rubber tires and various other rubber goods and automobile accessories. The incorporators are: E. C. McGraw, Lenore H. McGraw, Robert W. McGraw, James C. Chaplin, C. H. Bolton, John S. Wilson, George Flaccus, John Morgan, R. F. Taggart, R. B. Taggart, J. C. Chamberlin, H. C. Fraser and C. L. Merwin.

18 NEW MOTORS FOR BOSTON WOVEN HOSE COMPANY.

THE Boston Woven Hose and Rubber Co., Cambridge, Massachusetts, will put into operation in its plant eighteen new motors ranging from 15 to 400 horsepower, oil switches with transformers and controller panels. All this equipment will be furnished and installed by the General Electric Co. The General Electric Co. will also install very soon in the plant of the Empire Gypsum Co., Garhutt, New York, a new electrical drive apparatus consisting of one 10 kv-a. and three 150 kv-a. transformers, fourteen motors ranging from 5 to 100 horsepower, switchboard apparatus and accessories.

RUBBER AND GUAYULE AGENCY, INC.

A COMPANY has been incorporated under the laws of the State of New York with an authorized capital of $60,000, under the name of "Rubber and Guayule Agency, Inc.," for the purpose of doing business as brokers, agents and importers of crude rubber, guayule, balata and kindred products. Edward Weber will act as the general manager of the concern, and the board of directors will consist of Edward Weber, president and treasurer, Cornelius Schroeter, and Albert F. Hill, secretary.

The Rubber and Guayule Agency is acting as sole agent for a number of leading firms in Hamburg, Antwerp, London and other European markets, as well as for Colombo and Singapore firms. It is also sole agent for Madero's Sol & Gallo brand guayule, and for the Toro brand of the Cia. Mexicana Explotadora de Hule.

THE GORDON RUBBER CO. ADDS TO THEIR PLANT.

The Gordon Rubber Co., Canton, Ohio, manufacturers of seamless and hand-made rubber sundries, is adding two large buildings to its plant—one being 200 x 40 feet, the other 165 x 40 feet. These will be used in the manufacture of druggists' sundries, auto tires, tubes and other specialties.

WHY THE PRICE OF FEDERAL TIRES WAS REDUCED.

ON the 4th of May the Federal Rubber Manufacturing Co., of Milwaukee, advertised a reduction averaging rather over 10 per cent. on the "Rugged Tread" Federal tire in sizes running from 32 x 3½ inches to 38 x 5½ inches. Because of their quality, these "Rugged Tread" tires had previously been sold at a somewhat higher price than other tires, but owing to increased manufacturing facilities and the larger demand for these tires it was found possible to lower the price somewhat while still maintaining the quality; consequently the company decided on this reduction.

$5,000 IN PRIZES TO TIRE USERS.

THE Ajax-Grieb Rubber Co. has offered 208 prizes, amounting all told to $5,000, to the chauffeurs who will make the best record with their tires during the year ending March 31, 1914. The first prize amounts to $500, the second $300, and the third $200. Then there are five prizes of $100 each, and numerous smaller prizes. Those who want to enter the competition should secure the proper blanks from the company, which will show them just what it is necessary to do in order to compete successfully.

THE RUBBER CLUB OUTING.

The midsummer outing of the Rubber Club of America is set for the 15th of July. It will be held as usual in or near Boston, and the committees are preparing a program that bids fair to be by far "the best yet."

ONE WAY TO AVOID LABOR TROUBLES.

On Saturday morning, May 10, Mr. J. K. Williams, president of Williams Foundry and Machine Co., Akron, Ohio, assembled all the employes of his factory and presented each one of them with an envelope containing a sum of money, and a card with the following matter:

"The Williams Foundry and Machine Co. has completed another successful year, and its directors, knowing that its prosperity is largely due to the efforts of its faithful workmen, have decided to recognize their services in a substantial manner."

After explaining the method of distribution the card continued: "We trust that we may have your help in making the year 1913 even more successful, and that future disbursements of this kind will be possible."

While this distribution was a surprise to the employes, still they had had some previous preparation for it, because last year a similar though smaller distribution was made. It might be added that labor troubles are practically unknown in this shop.

THE MONATIQUOT BIRTHDAY MAT.

The Monatiquot Rubber Works Co., which manufactures in its factory at South Braintree, Mass., various brands of "Naturized Rubber" with good old historic Indian names, celebrated its third birthday-anniversary, which occurred on April 19, by presenting its customers and friends with a fine specimen of "Naturized" rubber in the form of a useful and convenient rubber mat. It is eight inches in diameter, artistic and attractive in design, and of a copper-red color, which goes appropriately with the celebrated Indian names used by the company. It can be used as a pitcher mat, coin mat, or in a hundred other ways.

THE CANADIAN CONNECTICUT COTTON MILLS, LIMITED.

THE Canadian Connecticut Cotton Mills, Limited, recently incorporated, will start soon on the work of erecting a plant at Sherbrooke, Quebec. It is expected that the plant will be completed and in operation by the first of next January. This company has authorized capital stock of $1,750,000. The president is H. L. Burrage, the vice-president R. J. Caldwell, and the treasurer and buyer Tracy S. Lewis. Mr. Lewis is president and Mr. Caldwell vice-president of the Connecticut Mills Co., of Danielson, Connecticut, which manufactures automobile tire fabrics. The new Canadian company will manufacture special cotton fabrics, presumably for automobile tires.

ALLIANCE RUBBER CO. ALREADY MANUFACTURING.

THE April issue of THE INDIA RUBBER WORLD contained a statement regarding the incorporation of the Alliance Rubber Co., of Alliance, Ohio, giving the names of the incorporators, the amount of capital and a brief description of the building plan. This building has not yet been completed, but the company hopes to have it in condition to occupy by July 15. It will be used for the manufacture of inner tubes, druggists' sundries, hand-made, molded and dipped; gloves for the surgical, household and electric trade; toy balloons and mechanical goods. The company is already doing some manufacturing in the line of dipped goods, in a temporary factory which will be used until its new plant is completed.

MR. R. L. CHIPMAN BECOMES A BROKER.

Mr. R. L. Chipman has opened an office as a crude rubber broker at 290 Broadway, New York. Mr. Chipman was for 14 years connected with Geo. A. Alden & Co. and the New York Commercial Co. and has a very wide acquaintance in the rubber trade. He graduated from Harvard in 1898 and for the next two years was in the Boston office of Geo. A. Alden & Co. Then he represented that concern for two years at their Akron office,

R. L. CHIPMAN.

where he became acquainted with the Western and Canadian trade. He then returned to the Boston office and remained there until January of the present year, when he joined the forces of the New York Commercial Co. Since this company went into the hands of a receiver Mr. Chipman has been assisting Mr. De Long in untangling and adjusting its affairs—until the opening of his own office about the 20th of May.

Owing to his experience and the large number of friends he has made in the trade it is quite safe to say that Mr. Chipman will enter at once upon a successful career.

MR. SYMINGTON'S VISIT TO AMERICA.

Mr. William Symington, head of the firm of William Symington & Co., Ltd., London, sailed for home from New York, May 10, on the *Caronia*, after a visit of two or three weeks in this country and in Canada. The firm of Wm. Symington & Co., Ltd., handles the crude rubber business of the United States Rubber Co. in London, and Mr. Symington came over, primarily, to confer with the officers of that company and also of the General Rubber Co., through which the United States Rubber Co. purchases its crude rubber supply. The "Boston Financial News" contained a very interesting interview with Mr. Symington a few days before he sailed, in which he gave his views relative to the rubber outlook in the Middle East and in the trade generally. He is quoted as follows:

"In the Middle East all told there were about 1,500,000 acres planted at the close of 1912, which will be in full bearing in 1919. So far as we can estimate, the total annual output of that planted acreage will be 300,000 tons of crude rubber. The world's consumption now is approximately 120,000 tons. Of course, between these two sets of figures there is still a rather wide margin, but it must be remembered that the output is increasing at a very rapid rate.

"The exports of plantation rubber from the Federated Malay States and Straits Settlements for the first quarter of this crop year showed an increase over the corresponding three months of last year of 70 per cent. On this basis this year's crop will be 50,000 tons, which will represent a very substantial increase over last year's. This estimated output of plantation rubber for the current year will be in excess of the Amazon crop, which was 43,000 tons for the calendar year 1912."

Mr. Symington, speaking of the tremendous increase of plantation rubber, says that unless new uses are found for it, production will soon greatly exceed consumption; and he states that in Europe representatives of some of the large producing companies are offering manufacturers a certain amount of crude rubber free of charge, to be used for experimental purposes with a view to finding new uses for the product. But he is not at all a pessimist on the situation, for he calls attention to the fact that the crude rubber supply of the world ten years ago was only 50,000 tons, while now it is 120,000 tons. That is, in ten years' time the production of crude rubber has increased nearly two and a half times and yet the consumption has fully kept pace with this increase, so that rubber is selling no lower now than it was ten years ago.

MR. GILBERT LEAVES TIRES FOR AUTOS.

The resignation of Mr. J. M. Gilbert from the general managership of the United States Tire Co.—which occurred the last of April—came as a surprise to most people in the trade. This step however, was fully explained when immediately after his resignation he was elected president and general manager of the Lozier Motor Co., of Detroit.

Mr. Gilbert has been a prominent figure in the tire industry for a number of years. He has been associated with rubber manufacture for the last twelve years. Two years ago he was general manager of the Continental Caoutchouc Co., one of the constituent companies of the Rubber Goods Manufacturing Co. At that time—in March, 1911—the United States Tire Co. was formed, embracing the Continental Caoutchouc Co., Morgan & Wright, the G. & J. Tire Co., and the Hartford Rubber Works Co., all belonging to the Rubber Goods Manufacturing Co. It was currently reported that Mr. Gilbert was largely instrumental in bringing about this consolidation of interests and in gradually supplanting these four individual brands of tires by the United States Tire Co. brand.

The annual reports of the Rubber Goods Manufacturing Co. show that the business of its tire department during the last two years has been most successful, and it is stated that the first months of the present year indicate an increase of over 40 per cent. in volume of sales over the corresponding months of last year.

After the announcement of Mr. Gilbert's resignation there was much speculation as to who would succeed him as general manager of the tire company, but this speculation has been quieted by the action of the directors of the United States Rubber Co., who, at their annual meeting for the election of officers—held May 23—elected Elisha S. Williams—president of the Rubber Goods Manufacturing Co.—to be "general manager of the tire, mechanical and miscellaneous business of the company, both manufacturing and selling."

A testimonial dinner was tendered Mr. Gilbert early in May, at the New York Athletic Club, by his former associates in the tire company, and he was presented with a handsome combination cellarette and humidor.

RUBBER REGENERATING CO. TO HAVE A NEW YORK LABORATORY.

The Rubber Regenerating Co., recently purchased by the United States Rubber Co., is to have a well-equipped laboratory in New York City, and the four-story-and-basement building, located on the northeast corner of Eleventh avenue and Fifty-eighth street, has been leased for a term of years for this purpose.

TRADE NEWS NOTES.

A branch of the St. Louis Tire and Rubber Co., of St. Louis, has recently been opened in Chicago. It is located at 2027 Michigan avenue and is in charge of Mr. Alexander Hendel.

Walpole tires will be distributed in the southern part of New York State and the State of New Jersey by Meyers & Grayson, 1008 Broadway, New York.

The Goodyear India Rubber Glove Manufacturing Co., one of the constituent plants of the United States Rubber Co., is making arrangements to increase its office space by a two-story addition.

The F. S. Carr Co., of South Framingham, Massachusetts, has just started on a four-story brick and cement building 150 x 75 feet, and a one story frame building 200 x 60 feet. These additions will practically double the capacity of the plant.

One of the most successful lines of fire hose now on the market is the wax and Pará gum-treated cotton rubber-lined fire hose made by the Fabric Fire Hose Co., with factories at Sandy Hook, Connecticut, and offices at 127 Duane street, New York. The manager of this company, Mr. William T. Cole, is one of the best known rubber men in the trade, and his administration of this company is responsible for one of the most complete and effective organizations of its kind in this country.

Theodore Hofeller & Co., of Buffalo, large dealers in old rubber, have distributed some color barometers in the form of little cards to be hung upon the wall, which, by the changing color in the piece of sensitized cloth, indicate whether we may expect fair weather, rainy weather or a change of any kind. It is perhaps not quite as accurate as the government barometers, but it serves its purpose.

W. F. Gammeter, of Cadiz, Ohio, who manufactures Universal Steel Calender Stock Shells, had a very wide distribution for his product in the last week in May. He not only made shipments to Boston, Lowell, Woonsocket and various other New England points, and to Buffalo, Wilkes-Barre, Trenton, Akron, Cleveland and other middle state and middle west localities, but he sent shipments to various places in Ontario, some to California and some as far away as St. Petersburg, Russia.

The Mexican Mutual Planters Co. has moved its offices from 167 West Washington street to 123 West Madison street, Chicago, Illinois.

COSHOCTON TO HAVE A RUBBER PLANT.

THE town of Coshocton, Ohio, is to have a rubber factory. The S. & M. Tire and Rubber Co., capitalized at $400,000, has signed a contract with the representatives of the Coshocton Board of Trade to locate a factory in that town. The town contributes two acres of land with a factory building formerly used for another purpose, and it is expected that the citizens of the town will subscribe to $100,000 worth of stock. The company expects to remodel the factory building at once, and hopes to be manufacturing tires within three months. It intends at the start to employ 200 men, and expects within the next two years, at any rate, to increase this number to 500.

THE COLUMBIA RUBBER CO.

THE Columbia Rubber Co. has been incorporated, the promoters being the owners of the L. & M. Rubber Co., of Carrollton, Ohio, to manufacture rubber tires in a factory now being built at Columbiana, Ohio. It is expected that the factory will be completed by July 1, with a capacity of 300 tires per day. The capital stock is $1,000,000, and the officers are: E. L. Henderson, president; A. E. Albright, secretary, and J. H. Richards, treasurer.

The directors of the Boston Woven Hose and Rubber Co. have declared a semi-annual dividend of three dollars per share on the preferred stock, and a quarterly dividend of three dollars per share on the common stock, both payable June 16, 1913, to stockholders of record June 5, 1913.

THE RUTHERFORD CO.'S NEW BRANCH.

THE Rutherford Rubber Co., Rutherford, New Jersey, has just opened a new branch in Boston, at 53 Church street, near Park square. In addition to this Boston store it has branch stores at 438 West Forty-second street, New York City; 240 North Sixteenth street, Philadelphia, and in Bridgeport, Newark and Reading.

An item has recently appeared in some of the papers to the effect that the Rutherford company is increasing its capital stock. This, however, refers to an increase which took place last December, when $200,000 additional preferred stock was issued, making the present capitalization consist of $500,000 preferred 7 per cent. cumulative stock and $300,000 common stock. This increased stock was issued to take care of certain extensions in the business and for the purpose of opening further sales branches.

A VERY CONVENIENT SHIPPING BOX.

"The Behrendt Knock-Down Shipping Box" ought to be a great convenience to almost every shipper. It is constructed entirely of galvanized sheet iron (24 or 26 gg.), and while it weighs only half as much as the ordinary wooden box, it is strong enough for the heaviest merchandise or machinery. In its collapsed state it stands only 4 inches high and can be put together by a boy in a few minutes. It can be locked up in a minute and opened just as quickly. It has no visible nails, screws or bolts. It can be skidded around like any ordinary box, and can be used over and over again, as it is practically indestructible. It is made by the Metal Package Corporation, of Newark, New Jersey.

REPORT OF THE CONSOLIDATED RUBBER TIRE CO.

The annual report of the Consolidated Rubber Tire Co. of New York for the year ending December 31 last, recently published, shows that during the year $4,276,993 worth of goods were sold, an increase of $893,461 over the previous year. The total income of the company from all sources during 1912 was $4,513,358, while the expenses amounted to $4,399,338, leaving a net profit of $114,020.

THE ECONOMY OF THE AUTO ENGINE.

In an address given by Ex-Chief Loller of Youngstown, Ohio, at the recent semi-annual meeting of the New Jersey Fire Chiefs' Association, he made this statement, showing the comparison between the horse drawn steamer and the auto engine:

"The first motor engine placed in service in Ohio was of the Webb type. During the recent flood it worked from 7 o'clock on Sunday morning until the following Monday night, taking suction from the river, which was covered with oil and other waste. The same engine was used to pump out cellars, and I do not think a steam engine could have done any better. In fact, I think the automobile engine proved to be a little better than the steamer. From the point of economy it is far ahead. Three men are required to operate a steamer and take care of horses, besides the expense of fuel, while only one man was needed for the automobile engine, and half the time he was strolling around with his hands in his pockets. From the point of operation, the auto engine costs about one-sixth of the amount needed to run a steamer. The tire question is the largest item in the automobile expense list, although I had a machine equipped with one set of tires which lasted three years, and they were pneumatic tires at that. Several solid and cushion tires are now being manufactured which nearly approach the pneumatic in resiliency."

THOSE RUBBER EARS AND NOSES.

THE "New Goods" department of this publication described and illustrated in the May issue the rubber ears and noses manufactured by a surgical appliance house of New York City. These artificial members were ascribed, in that article, to the well-known New York surgeon, Dr. William B. DeGarmo. That was an error. They should have been attributed to the G. J. DeGarmo Co., 33 West Forty-second street.

WILLIAM E. BARKER MANAGER OF SALES.

Those students of human affairs who champion the theory that only homely men ever get very far, thought that their case was proved for all time when Mr. Wilson went to the White House and Mr. Sulzer was sent up to Albany; but they have since received a tremendous set back, for on the 8th of May their theory was utterly exploded by the appointment of Mr. William E. Barker to the position of Manager of Sales of the United States Rubber Co.

Mr. Barker is not so very venerable—some little time has still to elapse before he reaches the half century mark—but notwithstanding that fact he is one of the veterans of the rubber industry, for his rubber career runs back to the early 80's, when he became

WILLIAM E. BARKER.

connected with Charles M. Clapp & Co., who had a large and successful store on Devonshire street, Boston, and who were, in addition, proprietors of the Aetna Rubber Mills of Roxbury, Massachusetts.

Mr. Barker stayed with this company for seven years and when he left had reached the position of general manager. It would have been impossible to select at that time, or in fact at any time since, any place in the rubber trade where seven years could be more profitably spent. Mr. Clapp was not only a very successful manufacturer and merchant, but he was a man of large vision and held an important position in commercial and civic affairs. Anyone who spent seven years with him without having all that was good in him made still better would be a psychic phenomenon.

After leaving this company Mr. Barker was for a year with the selling agents of the Pará Rubber Co., and then, in 1891, he started the Enterprise Rubber Co. of Boston, being made its president, a position which he still holds after 22 years of office. In 1909 the branch store system of the United States Rubber Co. had grown so large and was such an important channel of distribution, that the management decided that it was desirable to have some capable person take full charge of all the merchandise distributed through these stores—and Mr. Barker was put in that position, with the title of Merchandise Manager of Branch Stores. This practically made him a sort of first lieutenant to Mr. E. R. Rice, the manager of sales. It was natural, therefore, that the directors, on Mr. Rice's death, should look upon Mr. Barker as his logical successor.

The position of Manager of Sales of the big corporation is a highly important one. It has been filled in the past by such notable figures in the trade as Charles L. Johnson and Eben H. Paine.

MR. MAYO APPOINTED TO AN IMPORTANT POSITION.

Mr. Geo. H. Mayo has been made "Merchandise Manager of Branch Stores" of the United States Rubber Co., in place of Mr. Barker, who has recently been promoted to the position of manager of sales.

Mr. Mayo was born in Chelsea, Massachusetts, in 1875, which, it will be noticed, places him on the safe side of the line at which Dr. Osler says men should normally be chloroformed. Though born in Chelsea, Mr. Mayo evidently never came under those devitalizing influences which—around Boston, at any rate—are so generally attributed to the city of Chelsea, for he was only 19 years old when, having graduated from the famous Boston English High School, he was hard at work in the large and important wholesale distributing house of Wm. H. Mayo & Co., of which his father was the head. At that time they distributed leather footwear and rubbers, but in 1900 they devoted themselves exclusively to rubber footwear, and from that time on handled all the damaged goods of the United States Rubber Co., which had previously been sold at auction. It is currently reported that the Mayo company has done not so badly in this exclusive field.

GEORGE H. MAYO.

Five years after entering the rubber business, and at the age of 24, Mr. Mayo had become a partner in the firm, and his work there made such an impression upon the selling department of the United States Rubber Co. that when it was found desirable to add three new branch stores to the company's list, to sell the new "Hub-Mark" brands in Boston, New York and Detroit, these stores were put in Mr. Mayo's charge. This was a year ago. Evidently he has given a good account of himself in the management of these three branch stores, for he is now promoted to the general management—as far as control of the merchandise is concerned—of all the company's branch stores, which fairly comfortably cover the map of the United States—at least that part of it where rubbers are chiefly sold and worn.

If the charge should be brought against Mr. Mayo that he has climbed rather rapidly, the defence could be made for him that he was compelled to, being constructed exclusively on climbing lines.

The United States Tire Co. is making rapid progress in the transformation of its big Detroit plant, and expects to make it the largest tire factory in the world.

NEW INCORPORATIONS.

Couch-Georger Tire Agency, Inc., May 3, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: C. A. Couch, E. F. Howell and Frank P. Georger—all of Buffalo, New York. Location of principal office, Buffalo, New York.

Gaulois Tire Corporation, April 24, 1913; under the laws of New York; authorized capital, $20,000. Incorporators: Jean Grenier, 49 West 64th street, Victor W. Cutting and Maurice Leon—both of 60 Wall street, New York. Location of principal office, New York.

Globe Rubber Tire Manufacturing Co., May 6, 1913; under the laws of Delaware; authorized capital, $1,500,000. Incorporators: Harry B. James, Sherman Square Hotel, 72nd street and Broadway, New York; Joseph P. Hall, 60 Hawthorne avenue, East Orange, and Spencer Weart, 273 Washington street, Jersey City—both of New Jersey. To manufacture rubber tires and inner tubes for automobiles and other vehicles.

The H-H-H Tire and Manufacturing Co., Inc., May 3, 1913; under the laws of New York; authorized capital, $50,000. Incorporators: John Dravis, William C. Burroughs and John J. Coyle—all of 1777 Broadway, New York. Location of principal office, New York. To manufacture and deal in rubber tires, etc.

The Harper Tire and Rubber Co., March 3, 1913; under the laws of Ohio; authorized capital, $100,000. Incorporators: Warren D. Harper, James Thomas, and Albert H. Vayo. Location of principal office, Canton, Ohio. To manufacture and deal in automobile tires.

Interchangeable Rubber Heel Co. Inc., May 10, 1913; under the laws of New York; authorized capital, $50,000. Incorporators: H. W. Crane, Hotel Windsor, Philadelphia, Pennsylvania; George A. Mathesius, 108 West 90th street, New York, and John F. Krolm, 834 Hudson street, Hoboken, New Jersey. Location of principal office, New York.

The McGraw Tire and Rubber Co., April 8, 1913; under the laws of Ohio; authorized capital, $1,000,000. Incorporators: E. C. McGraw, Joseph C. Chaplin, and C. H. Bolton. Location of principal office, East Palestine, Ohio. To manufacture and deal in rubber tires, rubber goods, etc.

Northwestern Tire Co., April 19, 1913; under the laws of Illinois; authorized capital, $2,000. Incorporators: George A. Chritton, N. B. Dearborn and L. Holzhalb. To make and deal in automobile tires and accessories, and to do a general vulcanizing business.

Para Rubber Manufacturing Co., Inc., May 2, 1913; under the laws of New York; authorized capital, $2,000. Incorporators: Victor Lowenberg, 1980 Seventh avenue; Simon Lifshitz, 1557 Second avenue, and Nathaniel Loewenberg, 980 Simpson street, New York. Location of principal office, New York.

The Quality Tire and Rubber Co., May 9, 1913; under the laws of Ohio; authorized capital, $10,000 Incorporators: E. E. Smith, J. D. Guthrie, and E. D. Smith. To manufacture and deal in tires, tubes, casings, etc.

Rubber and Guayule Agency, Inc., May 14, 1913; under the laws of New York; authorized capital, $60,000. Incorporators: Albert F. Hill, 44 Cottage Place, Englewood; Cornelius Schroeter, 123 Shippen street, Weehawken Heights—both of New Jersey, and Edward Weber, 3495 Broadway, New York. Location of principal office, New York.

Specialty Insulation Manufacturing Co., Inc., May 6, 1913; under the laws of New York; authorized capital, $30,000. Incorporators: Michael Casey, 164 Bartlett avenue, William P. Wood, 48 Onota street—both of Pittsfield, Massachusetts, and Clinton Bateholtz, Hoosick Falls, New York.

The Swinehart Tire and Rubber Co., of New Jersey; March 11, 1913; authorized capital, $10,000 Incorporators: Irving D. Stone, Yale Club, New York; Charles S. Kingsbury, 260 16th street, Brooklyn, New York, and Francisco L. Godinez, 123 Duncan avenue, Jersey City, New Jersey. Location of principal office, 211-213 Halsey street, Newark, New Jersey. To acquire, take, and hold the absolute wholesale and retail agency of the Swinehart tire for the State of New Jersey.

United Rubber Tire Co., March 20, 1913; under the laws of Illinois; authorized capital, $1,000. Location of principal office, 1427 South Michigan avenue, Chicago, Illinois. To manufacture and deal in automobile tires, tubes and other accessories.

BRISTOL'S RECORDING DIFFERENTIAL PRESSURE GAUGES.

A NEW and comprehensive line of Recording Differential Pressure Gauges has been developed by the Bristol Co., of Waterbury, Connecticut. Some of these recorders have been in successful service continuously since the preliminary models were first sent out in 1908, and the design and construction of the line of these instruments now being placed on the market is based on results obtained in actual service during the last four years. These recording differential pressure gauges are adapted for use in connection with venturi meters, pitot tubes, orifices, combinations of orifices and pitot tubes; to record velocities and volumes of air, gas, steam, water and other liquids flowing through mains and pipes. These recorders may also be used to advantage for recording differences and variations of liquid level in steam boilers, pressure tanks, filter beds and process kettles.

BRISTOL'S PATENT RECORDING DIFFERENTIAL PRESSURE GAUGE.

Important patents dated September 12, 1911, and September 17, 1912, have been issued to Prof. Wm. H. Bristol, president and founder of The Bristol Co., covering novel features resulting from his pioneer work in developing differential recorders in addition to the other numerous lines of well known Bristol recorders which he has originated during the twenty-four years which have elapsed since his first patent was allowed on a recording pressure gauge.

The fundamental principle employed in the construction of this differential pressure gauge is that one pressure is applied to the inside of the operating tube, while the other is applied to the outside of the same pressure tube, within a closed casing. In order to record the movement of the pressure tube it becomes necessary to transmit its motion to the outside of the pressure tube casing. As the differential pressure to be recorded is usually small as compared with the static pressure, the operative force is correspondingly small, and it is quite evident that it would be impracticable to use a stuffing box around a shaft passing through a pressure casing, because of the friction which would be produced. To obviate the use of a stuffing box a unique frictionless selling device is employed. The illustration shows the exterior of one type of these recorders.

PERSONAL MENTION.

Mr. W. J. B. Stokes, of the Thermoid, Home and Joseph Stokes rubber companies, arrived from Europe, June 1—having visited the European agencies of the companies named.

Mr. E. E. Wadbrook is back at his place in Arnold & Zeiss' office, fully recovered from his recent indisposition.

Mr. Charles E. Stokes, general manager of the Home Rubber Co., Trenton, New Jersey, has been elected a director in the Trenton Life Deposit and Trust Co.

Mr. I. W. Penniman, formerly with the Goodyear Tire & Rubber Co., has become New England sales manager, with offices at 757 Boyleston street, Boston, for the Walpole Tire & Rubber Co.

Mr. Herbert P. Choate, formerly connected with the Empire Rubber & Tire Co., of Trenton, New Jersey, has recently become sales manager of the Star Motor Car Co., of Ann Arbor, Michigan.

Mr. George Campbell, representing the McIlroy Belting & Hose Co., of Hammond, Indiana, manufacturers of Rubber-lte Fibre fire hose, left recently for a business trip to European cities, with a view of establishing agencies for the sale of their new style of fire hose.

Mr. Arthur L. Kelley, who, in addition to being a director in the United States Rubber Co., has also for some time been a director in the Rubber Goods Manufacturing Co., resigned from that position at the last annual meeting of the company, owing to considerations of health.

MR. PEARSON LECTURES AT YALE.

Mr. Henry C. Pearson, Editor of THE INDIA RUBBER WORLD, delivered a lecture on May 27 before a body of students of the Sheffield Scientific School—the scientific department of Yale University—on his travels up the Amazon. He delivered this lecture by special request of Professor Hiram Bingham, who has a class which is making a study of South America, its products, development and commercial possibilities.

This lecture was arranged for through Mr. H. Stuart Hotchkiss, vice-president of L. Candee & Co., and himself a Sheffield graduate. Mr. Hotchkiss is deeply interested in this particular class and has favored it with several talks on his travels through rubber countries.

MR. BROADWELL BACK WITH THE FISK CO.

Mr. E. H. Broadwell, who was formerly connected for quite a long time with the selling department of the Fisk Rubber Co. of Chicopee Falls, Massachusetts, and who later went with the Hudson Motor Car Co., of Detroit, has returned to the Fisk Co. and has been elected to the position of vice-president. He will have full charge of the sales of the company.

ALFRED SLACK, GLOBE-TROTTER.

Mr. Alfred Slack, who has been connected with the foreign department of the Tyer Rubber Co. for the last 20 years, with headquarters at San Francisco—but devoting the greater part of his time to traveling over the world at large—arrived in New York May 21 on his way to Andover, after a 13 months' absence, during which he visited practically all the trade centers of the Orient. While Mr. Slack is a selling man and visited the Middle East and the Far West to place orders for tires and the other products of the Tyer Co., he managed to acquire a vast fund of most interesting information regarding the plantations in that part of the world. Incidentally it might be mentioned that Mr. Slack speaks German, French, Spanish, and Portuguese—not to mention several minor languages—as fluently as he does English; and his English is exceptionally fluent.

ALGOT LANGE TO REMAIN IN BRAZIL.

Mr. Algot Lange, author of the book "In the Amazon Jungle," which came out about a year ago and attracted a vast amount of attention, and who also will be remembered for the entertaining lectures which he delivered last fall at the Rubber Exposition, on his travels up the tributaries of the Amazon, has been appointed to a position in the civil service of Brazil, by Dr. Pedro de Toledo, the Brazilian Minister of Agriculture. Mr. Lange was at one time associated with the expedition sent out by the University of Pennsylvania to explore the Upper Amazon, but he resigned from that enterprise some months ago and expects to devote his energies particularly to the "Defesa da Borracha," the important work recently undertaken by the Brazilian government.

MR. JOHN C. COLE IN EUROPE.

Mr. John C. Cole, one of the vice presidents of the Fisk Rubber Co. of Chicopee Falls, Massachusetts, and one of the most popular of the New England rubber men, sailed, with his wife on the "Cedric," May 1, for a two or three months' visit to England and the continent. He will divide his time between advancing the business interests of his company and sight-seeing.

A WELL-KNOWN RUBBER MAN.

The subject of this sketch, W. G. Brown, of W. G. Brown & Co., Cincinnati, Ohio, brokers and dealers in rubber manufacturers' supplies, is one of the best known men in his line, west of Pittsburgh. Mr. Brown has had extensive and successful experience, having started in 1880, with Bart & Hickox, Cincinnati agents of the Boston Belting Co., with whom he remained until 1885, in which year he became connected with the Globe Rubber Works, of Trenton, New Jersey. Subsequent to this Mr. Brown was identified with the Cleveland Rubber Co., as Cincinnati sales agent. In 1893 he became affiliated with the Mechanical Rubber Co., of Cleveland, Ohio, where he opened and managed a branch store covering Ohio, Indiana, West Virginia, and Southern States. In 1902 Mr. Brown discontinued this connection to take charge of the rubber department of Whitman & Barnes Manufacturing Co., Akron, Ohio, and during the last two years of his stay with this house became its general sales manager. In 1905 Mr. Brown organized the Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio, and became its vice-president and general manager, which position he occupied until 1908, when he started the present successful house of W. G. Brown & Co. Mr. Brown is considered an expert judge of crude rubber, and is frequently called upon as an appraiser in the adjustment of crude rubber difficulties. He is also a recognized expert in rubber compounding. Personally, W. G. Brown is of a genial and helpful disposition, and has a host of friends, not only in the trade but in his home city, where he is a prominent member of the Business Men's Club, and until recently was the chairman of the well-known Cincinnati Santa Claus Committee.

W. G. BROWN.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE BYRNE PROCESS OF CURING RAW RUBBER.

THE Byrnes—there are four brothers—have in the past played an important part in the rubber trade of Birmingham, their interests as manufacturers having been now for some years merged in the Dunlop Rubber Co., one of the family being now prominently connected with the Leyland-Birmingham Co., which absorbed their merchant business so long carried on in Birmingham. I mention these facts by way of indicating that an acquaintance with rubber is no modern acquisition by Messrs. E. J. Byrne and F. A. Byrne, whose names may not be so familiar to many young planters as they are to older manufacturers. Mr. E. J. Byrne has patented a process for curing plantation rubber on the lines so long employed by the rubber gatherers of the Amazon, the process briefly described being the treatment of the coagulated latex with certain wood vapors prepared in a concentrated liquid form, thus being easy to handle and use. This liquid is volatilized in a special portable apparatus, the resultant vapor being passed into the curing chamber where the rubber is subjected to its influence.

The patent is now the property of the Rubber Curing Patents Syndicate, Limited, of Norwich Union Buildings, St. James' street, London; the Messrs. Byrne continuing actively concerned in the management thereof. Following a previous visit of Mr. E. J. Byrne to the Far East, Mr. F. A. Byrne is at present in the Federated Malay States, superintending the installation of the process on many plantations where it has been decided to adopt it. I understand that laboratory tests have proved the superiority of rubber cured by this process over that which has been cured by the other methods in common use, and further, that prominent rubber manufacturers in England have expressed the same opinion as a result of practical tests. While the patentees apparently hold the opinion that the superiority of wild over cultivated Pará rubber is entirely due to the process of curing adopted, I do not understand that they assert that all the plantation rubber cured by their process is equal to fine hard Pará, though they claim in no doubting language that it is superior to all other plantation rubber.

This process does not call for the abolition of the ordinary acetic acid coagulation of the latex, but it is recommended that the amount of acid ordinarily used should be reduced, the coagulation to be effected only in part by the acid and finished by the antiseptic smoking process. The method thus is a combination of the Brazilian and Eastern methods in order to obtain a product with the properties of the former minus its usual large content of moisture. A further object of the patentees is to ensure the production of plantation rubber of uniform quality, which it is apparent can only be done by the general adoption of a standard method. It is stated that after the smoke cure is finished the rubber may contain 8 to 10 per cent. of moisture, and no attempt is made to remove this, it being found in general practice that the moisture evaporates during the time of transit from the plantation to the European mill. In addition to the specific properties conferred on the rubber by the adoption of this process, claim is also made for a reduction of working costs on the estates, as the entire operation from tapping to despatching is reduced to a period of four days.

RUBBER TANNED LEATHER

Many of the flotations connected with rubber brought out three years ago have had a checkered existence, to put it mildly, while others have come to an untimely end. With regard to rubber tanned leather, however, although from the actual dividend paying view the company has not proved satisfactory to the shareholders, it would be quite erroneous to think that its claims were entirely fallacious. It has taken time and more money than at first anticipated to get the rubber recognized on the market, but this may now be said to have been accomplished, and the present position is that the factory at Ross, Herefordshire, is unable to meet the demand for belting, now that repeat orders from various countries are coming in. At a recent meeting of the company the chairman, Mr. J. M. Craig, outlined a scheme for the formation of a subsidiary company, whereby the further working capital now absolutely necessary could be obtained. No resolution, however, on the point was passed. At the meeting the important statement was made that the company now has 500 customers on its books.

NEW RUBBER GOODS IN THE MARKET.

As some of the novelties referred to under this head in the April issue of the INDIA RUBBER WORLD had a strong domestic touch, I referred the pages to a lady who has favored me with her views on matters with which I cannot claim any special acquaintance. Her fancy was particularly taken by the "Yankee Girl Dish Washer" made by the Davol Rubber Co., Providence. I was informed that most improved kitchen appliances come to England from America, where servants are more scarce and independent than they are here. Here perhaps I ought to use the past tense, because the servant question is becoming increasingly acute in England, with the result that ladies who have not hitherto been accustomed to work in the kitchen are now often driven to do so. The main objection to this seems to lie in getting grease on the hands in the humble task of "washing up"; hence the interest in any development which tends to obviate this.

Apropos of this topic I may say that our iron-mongers' shops are now selling rubber gloves to ladies for the purpose of washing drawingroom china, etc. These gloves are made either of pure vulcanized rubber or of white compounded rubber. Each pair is put up in a red card-board box containing instructions to avoid getting grease on them. Each glove is stamped "Made in U. S. A.," the label on the box reading, "Peerless gloves seamless." I hear that these gloves are having a good sale, though they would be more popular still if it were not for the grease embargo. Proceeding now to another matter of novelty, the baby's bath tub arrangement of the Heaton Manufacturing Co., Chicago, is reported to me as being an excellent idea, and as likely to fill a want that has long been felt.

THE RAW RUBBER SITUATION.

The fall in the price of rubber and its maintenance at a comparatively low level is not unnaturally a source of disquietude to plantation shareholders, whose fears the chairmen at various annual meetings of Eastern companies have sought to assuage by explaining the why and wherefore of the fall in price. The various statements made on this head are by no means in strict agreement, and it would be more desirable to have an authoritative pronouncement from some manufacturer of standing. There is no doubt that too much stress has been laid upon the strikes at Akron, and too little upon the large increase in supplies of plantation rubber. One manufacturer here says the simple explanation is that there is so much rubber about, and it is no question of buyers holding aloof as this is now the busy season in the motor tire trade and rubber must be had.

According to a leading article in a prominent financial paper the manufacturers are not doing well, and this accounts for a decreased demand. This statement was described by one of our leading manufacturers to whom I submitted it as all nonsense. The manufacturers, he said, are doing very well, a statement which he qualified by adding—"at least all those who know their

business are." One certainly hears that certain firms are not as busy as they have been; but taking things all around, in the light of the continuance of the trade boom, it cannot be said that any falling off in the demand for rubber is to be expected. No one expects the price to fall below 3*s*. per pound during the present year, though 2/6 is freely mentioned for next year. Of course we are told that with a fall in price to that level new uses for rubber will arise; well, they may, but this cannot be expected all at once, and it must not be overlooked that among the various other components of the goods destined for new uses there may be rises in price sufficient to discount the advantage of cheap rubber. As far as the investing public is concerned the rubber boom is quite dead, and its immediate successor—oil—is in much the same state.

The next boom is likely to be coconuts, now that the demand for coconut oil as a basis of margarine has outgrown the supply. I know something of what is going on and expect to see the public scrambling for coconut company shares in the near future. Those rubber companies, therefore, whose properties contain coconut trees, can look upon the future with more complacency than those which depend entirely upon rubber to come to fruition during the next two years.

NEW FLOTATIONS.

Under the title of Stelastic Tyres, Limited, a company was formed in April with a capital of £200,000 in £1 shares, to take over the interests of the Torkington tire. The prospectus was issued to the public, with what rejoinder I have not yet heard. Among the various agreements ratified in accordance with the Companies Acts is one between Torkington Tyres, Limited, the vendor syndicate, and Chas. Macintosh & Co., Limited. This tire has been on show at the principal motor exhibitions of late, and its tests on the road appear to have quite fulfilled expectations. The issue has been favorably received by the press, one of the leading papers, which has a reputation for criticism, describing it as fair industrial investment. In contradistinction to the Wood-Milne tire which has its tread compounded with finely powdered steel the Torkington employs a network of steel fibres.

On May 1 was issued the prospectus of the Associated Rubber Manufacturers, Limited, a company formed with a capital of £100,000 to take over the business of Almagam, Limited, which concern was formed three years ago to work the Harpenden mills associated with the new Motor & General Rubber Co., and the Warwick tire. The new company is to manufacture general rubber goods, as well as to carry on the retreading of tires with Almagam (whatever that may be). This part of the business seems to have made great strides and to be now of considerable importance; a fact which those interested in taking advertisements can point to as an object lesson for hesitating advertisers. Four out of the five directors of the new company were directors of the old one and the flotation generally seems to be practically an appeal for further capital under change of name.

COMMERCIAL MOTOR VEHICLE EXHIBITION IN LONDON.

Interest in the United Kingdom as to commercial motor vehicles has been developed to such an extent that a special exhibition devoted to that branch will be held at Olympia, London, from July 15 to 30. Its title will be "The Heavy Motor Vehicle Show."

RUBBER CLUB PROPOSED FOR LONDON.

THE idea of a rubber club for London has been ventilated. It has been suggested that those interested in rubber, coffee or copra should be eligible, while planters at home for a holiday would enjoy the privileges of the institution.

VISITS OF COMMERCIAL EXPERTS TO GERMAN INDUSTRIAL CENTERS.

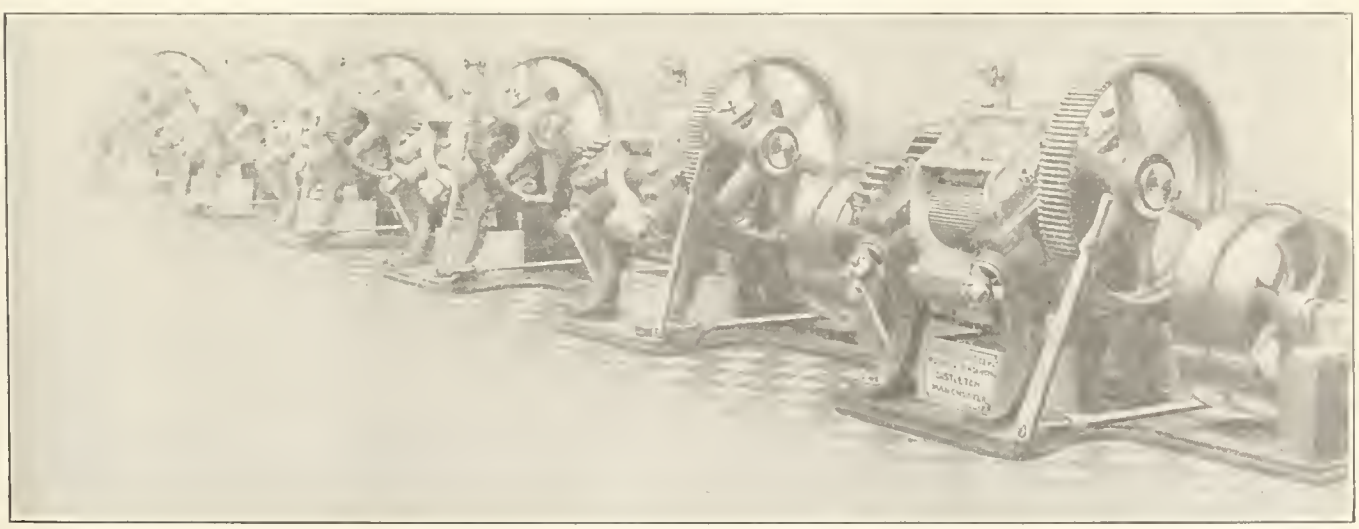
AN important feature of German export development consists of the periodical visits to German industrial centers of the commercial experts belonging to the Imperial Consulates in foreign countries.

Herr de Haas, who is attached to the Consulate General, Sydney, is now visiting the principal centers of the national industries, commencing at Breslau, May 2, and terminating at Magdeburg, June 30. During his tour he will visit thirty important cities, where he will be accessible to manufacturers at the local Chambers of Commerce.

ENGLISH OPINION OF THE PROPOSED NEW TARIFF.

In discussing the proposed new American tariff, the "India Rubber Journal" remarks that on the face of it, British manufacturers stand to gain a good deal from this reduction if carried out. But, it is added, whether the material reduction in the tariff now proposed will really enable British manufacturers to re-enter the American market is uncertain.

Scottish manufacturers are considered likely to make special efforts to profit by such reduction as may eventually be made in the duties on rubber goods.



BATTERY OF "ANGLE" BELT-DRIVEN WASHING MACHINES.
Made by David Bridge & Co., Limited, Castleton, Manchester, England.

NOTES FROM BRITISH GUIANA.

(By our Regular Correspondent.)

ALTHOUGH the actual production of rubber is still conducted only on a small scale in British Guiana, the planting of Pará rubber trees is going on steadily. The latest report by the Colonial Office shows that over eighteen hundred acres are now under cultivation in the colony. Trees planted as recently as 1907-8 and 1908-9 are now being tapped, and the results are said to be satisfactory as regards yield and quality. Good progress is being made on the Hills Estate at Bartica in the Massaruni district. Felling of trees, underbushing, planting of rubber and sisal hemp are being continued. The growth of the rubber trees is vigorous, and tapping will commence in a week or two.

The balata industry in the colony is in a much more healthy state than it has been for some time past. Whereas in the first four months of last year only 25,557 pounds of balata were exported, in the corresponding period of this year 221,652 pounds have been shipped, and week by week the exports continue to show increased growth. Last year's small figures were accounted for by the serious drought through which the colony was then passing. This year the rains have been plentiful in most districts, and bleeding is a success. From one or two of the outlying localities, however, come reports of dry weather, numbers of laborers having returned from grants in the Corentyne district, stating that owing to a shortage of rainfall it had been found impossible to bleed the bullet trees.

At the present time it is illegal to recruit laborers in British Guiana for work in a neighboring colony, and those engaged in the collection of balata in Surinam (Dutch Guiana) have been agitating for some time past to bring about a change in the conditions. It is a well recognized fact that without the laborers from British Guiana it will be impossible to work balata concessions in Surinam, and in the past it has been a somewhat difficult task to successfully secure the men from British Guiana without in a measure infringing the laws of the colony. Now, however, there is a ray of hope for those engaged in the industry in Surinam, by the fact that in a recent minute to the British Guiana legislature, the Governor, Sir Walter Egerton, advocated the passing of a law which will make it legal to contract laborers in this colony for work in the neighboring Dutch territory, after the contractor has satisfied the government of his *bona fide* intentions, and ability to comply with certain conditions which are to be embodied in the law.

It is understood that the Dutch balata companies would be willing to accept any reasonable conditions. In the course of an article on this subject, the "Paramaribo Times" says: "Sir Walter Egerton evidently holds a different opinion from his predecessor, who would not listen to such a proposition, and is unquestionably a very keen observer, and no doubt has been prompted in his action by the enormous amount of money orders and other money sent over yearly from Dutch Guiama by the laborers to their families on the British side. It is a well known and accepted fact that the majority of the houses built on the Corentyne coast were built with the money that the men worked for in Nickerie, and now that they propose to build a railway from New Amsterdam to Springlands it will mean a great deal more trade and closer connection between the British shore and the thriving and prosperous town of Nickerie.

"If this law is passed, as we have no doubt it will be, a great change will take place, which cannot but prove a boon to the balata companies, as the curse of the whole balata business is the absconding of the laborers, who as soon as they receive their advances simply cross over to the British shore where they are safe, while with this prospective law, the contracts entered into in British Guiana to work in Dutch Guiana will be binding on both colonies, and they could be held in either colony. Hence the absconding disease would be completely eradicated. British Guiana has always got one hundred times more out of her relations with us than we with her. For instance, Nickerie is not only populated with people from the British shore who get the majority of their supplies from Demerara, but is an English-speaking community, and it is therefore gratifying to see that at last they are willing to do something to give us a little protection. We know that in the past that powerful body known in British Guiana as "the Water Street Merchant" have objected to such a law, but we think that if they will investigate conditions carefully they will find that it will be materially to their advantage. The laborers only come over to Nickerie during the season and take their money over to spend it on their families on the British side."

The same paper finds fault with the government of the Dutch Colony, which it is felt ought to devise some economical plan to increase the labor population by means of land grants, etc.

There is a feeling among a number of those in British Guiana interested in the balata industry, in favor of the abolition of the existing law which prohibits the felling of the bullet trees. In Venezuela the felling method of collecting the milk is invariably practised. This method, though at first used in British Guiana, is now against the law here, as it also is in Dutch Guiana, and the method of allowing the trees to stand is now adopted in both these colonies, certain restrictions being placed upon bleeders with the object of safeguarding the life of the tree. In the opinion of the majority of balata experts here the felling method is a very wasteful one, as the forests are thereby denuded of valuable trees. As a contributor to the journal of the Royal Society says, "there are no reliable data available as to the yields obtained on the successive tappings made after the tree has first been bled, the class of men employed as bleeders and the condition under which the work is carried on being such as to render it difficult, if not impossible, to obtain such data. Yet the indisputable fact remains that tracts of Crown lands on which the balata trees were first tapped a quarter of a century ago are still being worked and continue to yield supplies of balata.

"Beside the balata trees there are other trees in the forests of British Guiana which produce latex in appreciable quantities. The most important of these is the 'Swamp Mabua' or 'Mabwa' of the Arawaks, also known to the Cari Indians as the 'Touchpong.' This species yields a rubber of good quality which has been exported for many years. It is usually classed on the market as 'Orinoco Scrap' and frequently brings good prices. Specimen biscuits of it prepared for the rubber exhibition held in London in 1908 were exhibited there."

The balata industry of the colony has lost one of its most prominent members by the recent death of the Hon. George Garnett, C. M. G., head of the firm of Garnett & Company, Limited, a firm which for many years has carried on a variety of business. Mr. Garnett was one of the pioneers of the balata industry here. He joined the firm in the early eighties, and shortly after his advent he and his partners launched into the balata industry, with which the firm has been connected for many years. A start was made in the collection of balata some thirty odd years ago in Nickerie, Dutch Guiana. Subsequently grants were obtained in Berbice, after which the firm's activities in this direction were pursued in the Cuyuni, Essequibo, Demerara river, and other districts. In Nickerie a very flourishing business was done at first, two sloops being regularly engaged in running there from Georgetown with provisions and other supplies for those engaged in the work. Ultimately, however, the Dutch government imposed enormous obligations, which greatly hampered the business, and eventually rendered it unprofitable. In this colony, however, the firm's activities in the balata industry have continued successfully.

Some Rubber Planting Notes.

HINTS TO RUBBER PLANTERS.

ONE of the features of the new "International Rubber Review," edited by M. G. van den Kerckhove, of Brussels, is the personal manner in which he addresses his readers, condensing into a few sentences the pith of the information he wishes to communicate. In regard to the relative merits of chemical coagulation and smoking he addresses his "Friends *Hevea* Planters," reminding them of his previous recommendation of coagulation by smoking, even if this should involve discarding an existing installation intended for the use of chemicals. He further urges that this step is necessary to insure plantation rubber maintaining its price with its prospective increased production in 1916-17.

In addressing his "Friends, the Castilloa Planters," he comments on the fact that the special composition of the Castilloa bark does not permit of working with an ordinary knife. For this tree the first requirement is for the tool to be as sharp as a razor, so as to properly cut the bark without crushing it.

Finally, in speaking to his "African Friends," M. van den Kerckhove dissuades them against the methodical growing of *Funtumia*, that tree not withstanding regular tappings, and not being capable of giving continuous yields.

GOVERNMENT PLANTATIONS IN THE FEDERATED MALAY STATES.

In addition to the experimental gardens at Kuala Lumpur, the government of the Federated Malay States now has the Castleton estate at Teluk Anson. It recently acquired possession of the Tanjong Pondok plantation, at Bagan Serai, in the north of Perak, containing 200 acres planted with 12 year old *Hevea* trees. Other experimental gardens belonging to the government include that of Kuala Tembeling, in Pahang, as well as Batu Tiga and Gunong Angsi. According to some opinions the results obtained by these experimental plantations are not regarded as sufficiently important.

COLLEGE OF TROPICAL AGRICULTURE FOR MALAYA.

ALTHOUGH the question of the systematic study of tropical agriculture has for some time been under consideration in Malaya, the proposal now under discussion is of far wider scope than anything before suggested. It is no less than the question of establishing a College of Tropical Agriculture, with an efficient staff and equipped with the necessary apparatus. In dealing with this subject, the "Malay Mail" refers to the advantages Japan has derived from institutions of this character. The cooperation of the District Planting Associations is suggested as one of the means likely to strengthen the hands of the government of the Federated Malay States in its efforts to promote agricultural education.

RUBBER PROSPECTS IN MALACCA.

DURING his recent visit to Ceylon the Hon. F. W. Collins, estate manager of the Malacca Rubber Plantations, Ltd., gave some interesting particulars as to Malacca in the course of an interview with a representative of the "Times of Ceylon." He stated that his company owns 24,000 acres and has about 80 Europeans employed on the property. The other laborers are Chinese and Javanese, the former proving careful and economical tappers and capable of doing a harder day's work than the Tamils.

The rubber, he reported, is doing excellently, disease being practically non-existent. Malacca, he added, is rapidly coming to the front as a rubber producing country. While the trees take longer to come into bearing than those of the Federated Malay States, the yield, once tapping has started, is well up to the general average. The whole of the Malacca properties are in a high state of cultivation, being thoroughly clean weeded. The limit of planting in Malacca is 20 x 20, diagonally, or 100 trees to the acre, which is proving exceedingly satisfactory.

It is of interest to note the favorable report of Mr. Collins on Chinese labor, in connection with the recommendations of the Akers Commission as to its adoption in Brazil.

NINE MONTHS' STATISTICS OF PLANTATION RUBBER.

DURING the nine months ending March 31 last, the London receipts of plantation rubber amounted to 19,700 tons, and the deliveries to 18,300 tons, compared with receipts of 10,600 tons and deliveries 9,500 tons for the corresponding period a year earlier. Stock of plantation rubber on March 31, this year, was about 2,800 tons, as against 1,850 tons in 1912, and 770 tons in 1911. From the above figures it will be noticed that the receipts and deliveries have both nearly doubled in the period ending March, 1913, as compared with the figures of a year earlier.

SOME RUBBER NOTES FROM PARA.

By a Special Correspondent.

MR. AKERS has arrived in Pará, and the Booths, accompanied by practical instructors in tapping, have also come from Europe to join him on his trip up the Madeira. He gave a practical demonstration of tapping at the Botanic Gardens at Rio, in the presence of the President of the Republic, assisted by Dr. Willis. But Dr. Willis seems cautious about saying that this system should be adopted in the case of old trees, whilst Mr. Akers' report suggests that the old system should be prohibited and the herring bone alone permitted. Another demonstration took place in Pará, the public invitation being given by M. J. Guerin, of the Port of Pará Port Works.

Dr. Huber has been working for several years on an instrument for tapping, which he claims will be "fool proof" and absolutely true to 1/128 of an inch in its setting. This is a handy tool, and any workman might be induced to use it; but the use of the gouge which Mr. Akers means to put into the hands of the *Seringueiro* is resented off-hand—and unless one can get such ignorant men to use a new implement with pleasure and good will there will never be a change in the methods of tapping.

Attempts are also being made to get the government to introduce 50,000 Chinese immigrants and take off all duties on both exports and imports of first necessaries of life, implements, etc. I believe popular sentiment is being aroused to the pitch that the government must yield to this elimination of duties, but I doubt whether it will concur in the introduction of Chinese. I also believe that the Chinese will come of their own accord as soon as the Panama Canal is opened and communications between the east of Asia and north of Brazil become established.

It is now seen that it was suicidal not to have begun to plant six or seven years ago, to meet the East Indian competition on equal grounds. But, nevertheless, not a single practical step has yet been taken to carry this out. A mass meeting was held at the Chamber of Commerce, to telegraph to the Federal government to adopt measures of relief for the industries in the Amazons, but nothing will be done beyond what has been projected through the "Defesa de Borracha," and this is doing its best to show its utility—but things cannot be done as hastily as people wish.

The fall of rubber to 3*s*. 4*d*. and the keeping of this price for some time longer will be fatal to the industry in the Amazons, unless the duties are removed. Whether these can be removed without violating the Constitution is a question open to debate. But if the interests of the nation exact this violation it should be done in the most open and frank manner.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED APRIL 1, 1913.

NO. 1,057,398. Vehicle tire. G. C. Allison, Louisville, Ohio.
1,057,439. Tire patching device. G. J. Martel, Chicago, Ill.
1,057,440. Tire patching device. G. J. Martel, Chicago, Ill.
1,057,451. Tire filling machine. E. Oliver, Daytona, Fla.
1,057,467. Vehicle tire. C. S. Turner, assignor to The Firestone Tire & Rubber Co.—both of Akron, Ohio.
1,057,486. Milking device. T. Kupper, Madison, Wis.
1,057,562. Pneumatic cushion for stump legs. J. G. La Point, New Albany, Ind.
1,057,580. Tire. E. C. Rhodes, Chicago, Ill.
1,057,672. Automobile tire. J. Ruppert, Jr., and Ernest Siegel, New York.
1,057,676. Pneumatic tire. George A. Shaw, Barberton, Ohio.
1,057,680. Production of isoprene. K. Stephan, Charlottenburg, assignor to Chemische Fabrik auf Actien (vorm. E. Schering), Berlin, Germany.
1,057,746. Emergency tire. F. W. Kremer, Carlstadt, N. J.
1,057,846. Automatic pneumatic vehicle wheel. G. Kanter, Murton, Victoria, Australia.
1,057,848. Boxing glove. D. J. Kennedy, Yonkers, N. Y.
1,057,911. Portable vulcanizing device for tires. C. F. Adamson, Akron, Ohio.
1,057,946. Puncture proof tire. C. De Hibbs, Fort Worth, Tex.
1,057,959. Vacuum pump. W. A. Hearn, Baltimore, Md.
1,058,005. Wheel for motor and other vehicles. R. W. Sewell, assignor to Sewell Cushion Wheel Co., Brooklyn, N. Y.
1,058,006. Vehicle wheel. O. K. Sletto and W. J. Shannon, Bend, Ore.

Trade Marks.

44,456. The Beacon Falls Rubber Shoe Co., Beacon Falls, Conn. Maltese cross emblem. Boots, shoes, arctics, etc.
65,402. "Flexitallic" Gasket Co., Camden, N. J. The word *"Flexitallic."* Gaskets and packings.
66,593. Continental-Caoutchouc-und Gutta-Percha-Compagnie, Hanover, Germany. Picture of man's arm holding tire in air.
68,722. Hood Rubber Co., Boston, Mass. The word *Holiday.* For boots, shoes, etc.

ISSUED APRIL 8, 1913.

1,058,029. Tire protector. M. D. Besse, Dayton, Ohio.
1,058,030. Resilient tire for vehicle wheels. W. S. Brooks, Akron, Ohio.
1,058,151. Resilient tire. John H. Cebolt, Indianapolis, Ind.
1,058,173. Massage instrument. H. A. Grass, Chicago, Ill.
1,058,186. Art of refining rubber. W. A. Lawrence, New York, assignor to Intercontinental Rubber Co., Jersey City, N. J.
1,058,189. Attachment for hose nozzles. J. McBoyle, Oakland, Cal.
1,058,273. Massage device. C. E. Thompson, assignor to Luxury Sales Co.—both of Troy, N. Y.
1,058,316. Portable vulcanizer. C. E. Marshall, Indianapolis, Ind.
1,058,358. Side wire tire. H. S. Firestone, assignor to The Firestone Tire & Rubber Co.—both of Akron, Ohio.
1,058,399. Demountable rim. R. W. Ashley and F. Oberkirch, assignors to General Rim Co.—both of New York.
1,058,400. Demountable rim. R. W. Ashley and F. Oberkirch, assignors to General Rim Co.—both of New York.
1,058,433. Pneumatic tire. F. B. Huckstep, Des Moines, Iowa.
1,058,517. Spring wheel. F. H. Allen, McNabb, Ill.

1,059,587. Vulcanizer. B. M. Allen, Des Moines, assignor to Diamond Mfg. Co., Polk County, Iowa.
1,059,603. Trousers supporter. A. R. Fritz, Waverly, Iowa.
1,059,612. Weather strip. J. Kammerer, New York.
1,059,616. Spring wheel. F. Klitchko, Cleveland, Ohio.
1,059,627. Surgical blanket. A. R. McClimans, Burwell, Neb.
1,059,736. Gun for killing flies and other insects. T. H. Kilduff, Brookline, Mass.
1,059,753. Hose nozzle. W. O'Brien and F. W. Waddell, Pittsburgh, Pa.
1,059,765. Demountable rim for vehicle wheels. J. Rosenbaum, Mount Vernon, Ind.
1,059,773. Filter. J. Sgambati, New York.
1,059,811. Dress shield pocket. M. Barrow, New York.
1,059,843. Tire. M. Dawson, Vancouver, B. C., Canada.
1,059,869. Elastic for children's socks. E. M. Hatfield, New York.
1,059,870. Tire clamping device. C. Helreigel, Pittston, Pa.
1,059,882. Spring wheel. H. W. Lang, Litchfield, Neb.
1,059,903. Insulator with fuse. K. Pettersen, Sarpsborg, Norway.
1,059,911. Blouse retainer and skirt supporter. S. E. Rutter, Camberwell, assignor to W. G. Harris—both of London, England.
1,059,961. Garter fastener. W. Frieder, Cincinnati, Ohio.

Designs.

43,892. Vacuum massage device. F. O. Parker, Washington, D. C.
43,894. Shower head. A. C. Recker, Oakville, assignor to Waterbury Mfg. Co., Waterbury—both of Connecticut.
43,895. Hot water bottle. A. C. Recker, Oakville, Conn., assignor to Waterbury Mfg. Co., Waterbury, Conn.

Trade Marks.

54,977. Century Rubber Trading Co., Plainfield, N. J. Illustration of eagle in circle. Tires.
59,278. Elchemco Mfg. Co., Jersey City, N. J. The word *Elchemco.* Metallic rubber covered floorings and stair treads.
64,155. The Diamond Rubber Co., assignor to The B. F. Goodrich Co.—both of Akron, Ohio. The word *Oriole.* Bicycle tires, rubber tubes, etc.
64,156. The Diamond Rubber Co., assignor to The B. F. Goodrich Co.—both of Akron, Ohio. The word *Highland.* Bicycle tubes, tires, etc.
68,442. National Wood Reproducing Co., Augusta, Me. The word *Natwood.* Waterproof floor covering.
68,807. Transportation Utilities Co., New York. The word *Tuco.* Fabric belting.

ISSUED APRIL 29, 1913.

1,060,080. Vehicle tire. T. L. Gunning, Chicago, Ill.
1,060,195. Tire. A. W. Livingston, assignor to Standard Steel Wheel & Tire Armor Co.—both of Oakland, Cal.
1,060,237. Bottle stopper. J. Duan, Waltersburg, Pa.
1,060,262. Core for building pneumatic tires. N. D. Kuhlke, Akron, Ohio.
1,060,301. Vehicle tire. E. Williamson, Chicago, Ill.
1,060,339. Tire shrinking machine. S. N. House, St. Louis, Mo.
1,060,480. Resilient wheel. G. D. Minnick, Riverton, Neb.

Trade Marks.

68,849. R. F. MacClemmy, New Haven, Conn. A diagonal strip. Body braces.
68,901. R. F. MacClemmy, New Haven, Conn. Illustration of a crown. Body braces.
68,998. The B. F. Goodrich Co., New York, and Akron, Ohio. The word *Pinnacle.* Flush valves of rubber.

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911 and 1912.
**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 2, 1913.]

27,617 (1911). Receptacles for mucilage, etc. J. Nitzgen, 17 Martinstrasse, Cologne, Germany.

27,659 (1911). Coverings for ships. R. McIvor & Sons, and W. T. McIvor, 309 Cleveland street, Birkenhead.

27,664 (1911). Preparation of india-rubber. F. A. Byrne, Ludgate Hill, Birmingham.

27,665 (1911). Preparation of india-rubber. F. A. Byrne, Ludgate Hill, Birmingham.

27,666 (1911). Preparation of india-rubber. F. A. Byrne, Ludgate Hill, Birmingham.

27,680 (1911). Band of balata for portable track wheels. F. Kilcher, 309 Hampstrasse, Birsfelden, Baselland, Switzerland.

27,683 (1911). Cores for paper rolls. H. Roscher, 107 Oberbilker Alee, Dusseldorf, Germany.

27,695 (1911). Jackets and covers for wheel tires. R. Latour, 157 Chaussee d'Ypres, Menin, Belgium.

27,759 (1911). Electric insulator. W. McLoughlin, 154 Anglesey street, Lozells, Birmingham.

27,802 (1911). Preparation of artificial rubber. G. Reynaud, 5 Rue Salneuve, Paris.

27,827 (1911). Tire attachments to rims. E. W. Harriott, High street, Droxford, Hampshire.

27,835 (1911). Cellulose solutions. E. de Haen, Chemische Fabrik "List," Seelze, near Hanover, Germany.

27,839 (1911). Ear protectors. A. Mallock, 3 Victoria street, Westminster.

27,870 (1911). Tool for removal and replacement of tires. C. S. Challiner, 18 Park Range, and J. A. Challiner, "The Glen," Anson Road—both in Victoria Park, Manchester.

27,903 (1911). Tire attachments to rims. L. A. L'Huillier, 52 The Grove, Hammersmith, London.

27,907 (1911). Construction of aerial planes. E. C. R. Marks, 57 Lincoln's Inn Fields, London.

27,933 (1911). Shield for filling hot water bottle. T. Rowe, 52 Harold Road, Leytonstone, London.

27,957 (1911). Detachable rim attachments to wheels. B. B. Roberts, Park House, Cimla, Neath, Glamorgan.

28,029 (1911). Massage appliance. H. Dreuw, 110 Koniggratzerstrasse, Berlin.

28,031 (1911). Rubber lining for deadening railway sounds. C. J. Evans, 108 Castelnau, Barnes, London.

28,035 (1911). Non-return valve for feeding bottle. A. T. Maw and R. J. Shannon, 7 Aldersgate street, London.

28,059 (1911). Tread bands, projections, etc. J. F. F. W. Ure, 12 Sloane Court, Chelsea, London.

28,109 (1911). Jackets and covers for tires. G. A. Mortier, Elsinore, Garstang Road, and C. Macbeth, 142 Watling street Road—both in Fullwood, Preston, Lancashire.

28,149 (1911). Tread bands. B. E. D. Kilburn, Chancery Lane Station Chambers, London.

28,163 (1911). Rubber soles for shoes. G. F. Forwood, West Chart, Limpsfield, Surrey.

*28,182 (1911). Tool for removing and replacing tires. J. H. Blake, 368 Front street South, Portland, Oregon, U. S. A.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 9, 1913.

28,256 (1911). Pocket atomizer. G. Blochet, 3 Rue des Grands, Augustins, Paris.

28,208 (1911). Outer ring for spring wheels. J. I. Duchateau, 29 Rue Gambetta, St. Omer, Pas-de-Calais, France.

*28,256 (1911). Outer ring for spring wheels. T. H. Grigg, 3838 Baring street, Philadelphia, Pa., U. S. A.

28,268 (1911). Key for removing crown stoppers. A. F. Sargeaunt, Chenies street, Tottenham, Court Road, London.

28,308 (1911). Pump for inflating tires. C. W. Tanner, High street, Laycock, near Chippenham, Wiltshire.

28,325 (1911). Waist belt. A. P. Jones, Hilbre avenue, Tue Brook, Liverpool, and A. Rae, 4 Sunbury Road, Seacombe, Cheshire.

*28,376 (1911). Outer ring for spring wheels. A. C. Backus, 717 E. 182nd street, Bronx, N. Y., U. S. A.

28,378 (1911). Tire vulcanizers. E. C. R. Marks, 57 Lincoln's Inn Fields, London.

*28,380 (1911). Fire extinguishing apparatus. D. W. Adams, Glendale Springs, North Carolina, U. S. A.

28,466 (1911). Suspenders for hats. W. Bereths, Hardt, near Munich-Gladbach, Germany.

28,536 (1911). Rubber as compounding ingredient of cement. G. A. A. Ceulaers, 186 Rue du Moulin, Brussels.

28,554 (1911). Skirt and blouse adjusters. J. A. Roth, "Knollys," Toxteth Road, Glebe Point, near Sydney, Australia.

28,761 (1911). Door mats, stair treads, etc. G. Cummings, Bleak House, Gosforth, Northumberland.

28,781 (1911). Treating india-rubber. R. Bridge, Castleton, near Rochdale, Lancashire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 16, 1913.]

17,648 (1911). Preparation of zinc oxide. F. C. Beauchamp, 9 Park Hall Parade, East Finchley, London.

28,871 (1911). Impregnated cords for packing. J. A. Dick, 51 Fenchurch street, London.

28,885 (1911). Tire attachments to rims. J. Ashton, Kilnahue Rectory, Gorey, Ireland.

28,905 (1911). Detachable rim attachments to wheels. A. Turnbull, St. Mungo Works, Bishopbriggs, Glasgow.

28,915 (1911). Tire attachments to rims. A. E. Lucas, C. H. May and W. Armstrong, 39 William street, Birmingham.

28,931 (1911). Non-metallic tire. J. Guerrero, 7 Rue Georges-Ville, Paris.

28,951 (1911). Rubber ball for anesthetic mask. K. A. E. Fries, 16 Scheelegatan, Stockholm.

29,001 (1911). Non-metallic tire. J. Guerrero, 7 Rue Georges-Ville, Paris.

29,008 (1911). Rubber masticating machine. J. E. Pointon, Westwood Works, Peterborough.

29,010 (1911). Detachable rim attachments to wheels. P. B. Bosworth, 48 Great Russell street, Holborn, London, and A. C. Tyre Co., Union street, Sunderland.

29,048 (1911). Rubber washer for siphon bottles. J. F. Marshall, 50 Wigmore street, London, and T. F. Garrett, 64 Kimberley avenue, Seven Kings, Essex.

29,057 (1911). Sheeting india-rubber. W. Coulter, 284 Hyde Road, West Gordon, Manchester, and R. Bridge, Castleton, Lancashire.

29,142 (1911). Jackets and covers for wheel tires. E. Clark, 4 Colloseum Terrace, Albany street, Regents Park, and C. N. I. Irving, Winter-13, Bruton street, Mayfair—both in London.

29,154 (1911). J. G. A. Kitchen, 7 Rose Bank, Scotforth, Lancaster, and I. H. Storey, Loughrigg Brow, Ambleside, Westmoreland.

29,213 (1911). Preparation of india-rubber. Farbenfabriken Vorm. F. Bayer & Co., 217 Koenigstrasse, Elberfeld, Germany.

29,215 (1911). Rubber for connecting pipe joints. C. Rudolph, 66 Rue du Theatre, Paris.

29,246 (1911). Jackets and covers for wheel tires. A. Margetts, 64 Cow Cross street, London.

29,265 (1911). Vulcanizer for repairing tires. C. F. Adamson, Hamilton Bldg., Akron, Ohio.

*29,274 (1911). Detachable rim attachments to wheels. W. F. Copithorn, 49 North Main street, and H. M. Ferguson, 25 Waban street—both in Natick, Massachusetts, U. S. A.

29,278 (1911). Compounds of rubber. L. C. T. Turcat, and G. E. Nuth, 44 Rue Crillon, Marseilles, France.

29,294 (1911). Motor car horns. W. P. Thompson, 6 Lord street, Liverpool.

29,296 (1911). Implement for tapping rubber trees. J. da C. Gadelha, Nova Vista, Labrea, Amazonas, Brazil.

29,360 (1911). Implement for tapping rubber trees. J. da C. Gadelha, Nova Vista, Labrea, Amazonas, Brazil.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 23, 1913.]

3 (1912). Bottle stoppers, etc. A. Nixon, 34 Deramore street, Rusholme, Manchester.

14 (1912). Non-metallic elastic tires. J. Cairns, 621 Alexander Parade, Glasgow.

27 (1912). Rubber in cycle springs. J. R. Hannam, 137 Bramall Lane, Sheffield.

47 (1912). Air tubes and chambers in pneumatic tires. S. Ramsbotham, 10 Keymer Road, Streatham Hill, London.

*75 (1912). Block tires. F. M. Henry, 222 Macdougal street, Brooklyn, N. Y.

76 (1912). Cores in vehicle wheels. G. Madden, 53 Devonshire street, Islington, London.

80 (1912). Outer ring for spring wheels. C. Beaven, 26 Bridge avenue, Hammersmith, London.

102 (1912). Silent chains. A. S. Hill, and Coventry Chain Co., Spon End, Coventry.

105 (1912). Rubber resins in chewing gum. P. M. Justice, 55 Chancery Lane, London.

139 (1912). Tread bands. M. H. Cleaver, 128 Gloucester Terrace, Hyde Park, London.

164 (1912). Mud guards for motor vehicles. C. H. Richardson, 73 Lorne Road, Forest Gate, London.

173 (1912). Method of making articles from caoutchouc. H. Dogny, 13 Avenue d'Eylau, and V. Henry, 82 Rue Claude Bernard—both in Paris.

185 (1912). Exercise appliances. H. T. and S. W. Tubbs, and F. H. Hopson, 29 Noble street, London.

207 (1912). Jackets and covers for wheel tires. T. H. Buckley, 34 Stoke Park, Coventry.

234 (1912). Air tubes and chambers of tires. L. W. Holmes, 48 Great Russell street, Holborn, London.

235 (1912). Vulcanizing tires. L. Corane, 23 Rue Jenner, Paris.

269 (1912). Closing device for boot. V. R. von Heidelberg, Meran, Tyrol, Austria.

*276 (1912). Apparatus for generating oxygen. D. E. Parker, 456 27th street, Niagara Falls, N. Y., U. S. A.

277 (1912). Method of obtaining dichlorhydrocarbons. W. H. Perkin and C. Weizmann, University, and H. Davies, 5 West Grove—both in Manchester.

293 (1912). Disk wheels. I. Sarkey & Sons and W. Burton, Albert street Works, Bilston, Staffordshire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, APRIL 30, 1913.]

339 (1912). Rubber in mats. C. E. Player, Birkenhead, Auckland, New Zealand.

408 (1912). Outer ring for spring wheels. M. Frani and P. Piano, 3 Corso Buenos Aires, Genoa, Italy.

*424 (1912). Rubber plug in crutches. H. H. Flynn, Bellevue, Washington, U. S. A.

457 (1912). Mud guards for wheels. A. J. H. Ladd, 10 Hainthorpe Road, West Norwood, London.

478 (1912). Rubber pads in jugs. H. Jewett and W. Kraft, Hans Crescent Hotel, Hans Crescent, London.

619 (1912). Non-metallic elastic tire. A. von Bruning, 17 Place des Etats Unis, Paris.

629 (1912). Non-metallic elastic tire. C. R. S. J. Halle, 17 Warwick Gardens, Kensington, London.

636 (1912). Plastic compositions. K. Scherrer, 33 Schwantbalerstrasse, Frankfort-on-Main, Germany.

654 (1912). Rubber tape for golf balls. W. T. Hill, Greenhill, Rathen Road, Withington, Manchester, and R. Milne, Arnold Avenue, Bishopbriggs, Lanarkshire.

660 (1912). Rubber in photography. G. Crane, Murdieston Farm, Greenock.

693 (1912). Tire attachments to rims. S. H. Cope and Warland Dual Rim Co., Alma street, Aston, Birmingham.

694 (1912). Process of making waterproof fabrics. J. W. H. Dew and Azulay Syndicate, 8 Laurence Poutney Hill, Cannon street, London.

695 (1912). Tread bands. J. W. H. Dew and Azulay Syndicate, 8 Laurence street, London.

715 (1912). Tread bands. J. Knight, 9a Caldy Road, Anfield, Liverpool.

737 (1912). Jackets and covers for tires. F. Rose, 1 Brunswick street, Liverpool, and A. Rae, 17 Northbrooke Road, Seacombe, Cheshire.

Report of the Crude Rubber Market.

THE course of the London market for fine Pará during the month of April was, it will be recalled, almost constantly downward, while the tendency during May has been nearly uninterruptedly in the opposite direction. From *3s.* 10¾*d.* on March 26, it had dropped to *3s.* 4½*d.* on April 26, having recovered on May 24, at time of writing, to *3s.* 9*d.* The price has risen slowly but steadily, the low figure of *3s.* 3¼*d.* reached on April 15 not having since been recorded. In the earlier days of May, buyers were following their former policy of only covering immediate requirements. At the close of the first week, speculative buying, both for European and American account, gave additional strength to the market. According to some reports this development of the market was due to the existence of a large short interest in Upriver Fine. The improved prices then established have since been maintained.

Plantation rubber, while sharing in the upward movement, has not done so to the same extent as was the case with fine Pará. On April 26 it stood at *3s.* 2½*d.*, while Pará fine was at *3s.* 4½*d.* By May 24 the respective quotations were *3s.* 3*d.* and *3s.* 9*d.*

In connection with the fact of Pará rubber being now quoted at 6*d.* per pound above plantation rubber, an opinion has been expressed in London that the Pará position is entirely artificial, the supplies having been concentrated in one quarter, and prices having been unreasonably advanced. The anticipation of the sale of 113 tons (principally Congos) announced for May 27 at Havre rendered buyers cautious during the month in their operations. It was, however, hoped that the improvement in London would affect the result of the approaching auction. At the Antwerp sale of April 22, Congo grades were neglected, only 105 tons being sold out of 506 tons offered. The prices realized showed a decline since the previous month's auction equalling 4¾*d.* per pound. Of the 178 tons plantation rubber offered, 165 tons were sold, at an average decline, equalling 7⅜*d.* per pound.

Antwerp stock at the end of April amounted to 990 tons as compared with 438 tons on April 30, 1912. The sale of May 21 at Antwerp included 200 tons of plantation rubber which sold at advanced prices, and 130 tons Congo which were disposed of at a decline. The Rotterdam sale of April 23 included about 20 tons *Hevea*, which realized 2 per cent. below valuations and 14 tons *Ficus*, which fetched 5 per cent. below rates of last sales. *Hevea* formed the largest portion of the Amsterdam sale of May 16, representing 81 tons out of 94 tons the balance consisting of *Ficus* and *Castilloa*. From Hamburg a much firmer market has been reported, important sales of South Cameroon balls having been effected.

The London auction of April 29 included 900 tons, the quantity being less than had been anticipated. Prices closed on an average 1*d.* below those of the previous fortnightly sales. Owing to the Whitsuntide holidays on May 12 and 13, an auction was held on May 6, which included 500 tons, which met with a fair demand at about the prices of the sale a week earlier. The next auction took place on May 19, including about 800 tons which realized an advance of 1*d.* to 2*d.* as compared with the sale of 6th.

Statistics, including the first series of sales in May, show a total of 8,536 tons as having been auctioned this year in London, as compared with 5,991 during the corresponding period of 1912. The London "Economist" states that the total supply now coming on the Mincing Lane market fortnight by fortnight, is, roughly speaking, what had been looked for by the end of 1914.

Statistics to the end of April show the following estimate of the visible supply of Pará and Caucho rubber:

		1912.		1913.	
Pará	*Tons*	6,260		5,230	
Caucho		1,670	7,930	2,830	8,060

The visible supply of the above grades had decreased by 500 tons within a month, this year's total being about that of the corresponding period last year.

Business in New York has followed the course of the London market. Many of the large consumers are said to be very busy, particularly in tires, while their supplies of crude rubber are said to be moderate, yet large enough to meet their wants for the early summer.

New York Quotations.

Following are the quotations at New York for Pará grades, one year ago, one month ago, May 29—the current dates:

New York

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During May there has been only a moderate demand for commercial paper in the rubber line, principally from out-of-town banks, and rates have ruled quite firm at 5½ @5¾ per cent. for the best names, and 6@6½ per cent. for those not so well known."

Increase in Stock, England, April 30th, 1913, against April 30th, 1912	163

WM. WRIGHT & CO., Brokers.

Liverpool, 2nd May, 1913.

During the month 40 tons Pará have been shipped from Europe to America.

Liverpool:

WILLIAM WRIGHT & CO. report [May 1, 1913].

Fine Pará.—There has been more speculative demand; prices declined from 3*s.* 8*d.* [89 cents] to 3*s.* 3*d.* [79 cents], then reacted somewhat, finally closing at 3*s.* 5¼*d.* [84 cents] for near position and 3*s.* 5¾*d.* [85 cents] for distant. The undertone is steady in spite of the absence of American demand and large first-hand stocks in Brazil; considering the demand for this grade, supplies are not too ample, the bulk of the crop increase being in caucho. Receipts this month are 3,540 tons, including 1,430 tons caucho, against 4,265 tons last month and 3,270 tons last year, bringing the crop up to date to 36,975 tons against 33,380 tons last year, showing an increase of 1,190 tons rubber and 2,405 tons caucho.

Rotterdam

HAVELAAR & DE VRIES report [May 13]:

At the sale of May 9 about 40 tons were offered, including 20 tons *Hevea* and 14 tons *Ficus*. The former went at 2 per cent. and the latter at 5 per cent. below valuations. Inquiry being good, nearly the whole quantity was sold.

Amsterdam

JOOSTEN & JANSEN report [April 30]:

The quantities declared for the sale of May 16 include about 93 tons, the bulk of which is *Hevea*. There are also included about 11 tons *Ficus*, of which 5 tons are plantation and 6 tons wild.

Rubber Scrap Prices.

LATE NEW YORK QUOTATIONS.—Prices paid by consumers for carload lots, per pound—are practically unchanged.

To Japan	5,687	75,502
To Austria	5,320	25,515
To Italy	4,692	22,460
To Holland	.....	992
To Canada	12,121	.....
To Norway and Sweden	39	.....
Total	3,737,826	6,960,047

[Same period 1911—1,509,408; same 1910—740,937.]

The export figures of rubber for 1913 given in the above table include the imports re-exported. (These amount to 647,683 lb.—507,452 lb. from the Straits and 140,231 lb. from India.—Ed. C. O.) To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date, deduct the quantity of imports from the total exports. In previous years the exports of Ceylon rubber only were given.

TOTAL EXPORTS FROM MALAYA.

(From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVIII. No. 4. JULY 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.
No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. JULY 1, 1913. No. 4

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

WELCOMING THE BRAZILIANS.

DR. Lauro Severiano Müller and the other members of the special embassy sent to this country by Brazil to return the visits made during recent years, first by Secretary of State Root, and later by Secretary of State Knox, will probably never complain that the reception accorded them was not sufficiently warm and complete. Probably if they were to express their real sentiments they would say, "How fine this would all be if there were only half as much of it." But this is a very large country, and there are a great many people here and many organizations and institutions that cannot forbear showing the good-will which they sincerely feel toward the great Republic of the South—and this is the first chance they have had in some time to give any sort of expression to this feeling. The amiable Ambassador, therefore, and the other members of his special suite, will have to endure as well as they can the superabundance of our American welcome.

On the day of the envoy's arrival at New York he was lunched at noon and dined at night—as described in some detail elsewhere in this number—and besides did much sight-seeing and receiving and returning of visits. The next day was equally busy, terminating in a great banquet by the Chamber of Commerce, at the conclusion of which he started for Boston. There he was similarly feted, and taken out to Cambridge, where the degree of Doctor of Laws was conferred upon him by Harvard University. These two days are samples of the Ambassador's entire American visit.

The sincerity of this reception cannot be questioned; the great Northern Republic has the friendliest regard for the great Southern Republic. But in one respect our relations with Brazil are certainly susceptible of much improvement, and that is in the matter of trade, which has not yet struck the proper balance. We took from Brazil last year $142,000,000 worth of her products. We sent her in return only $40,000,000 worth of American wares. We took one half of the coffee and rubber that came from Brazil, and yet the bulk of Brazilian purchases was not made in the American market, but in England and Germany. This is not Brazil's fault, it is our own, and it is one that calls for early correction.

THE HOUSE OF COMMONS ON THE PUTUMAYO HORRORS.

THE committee appointed some months ago by the House of Commons of the British Parliament to investigate the Putumayo atrocities has brought in its report. As the English directors of the Peruvian Amazon Co. were men of standing and reputation, there naturally would be a temptation on the part of this committee to attribute all the blame to the Peruvian partners and as far as possible to whitewash the Englishmen connected with the company; but the committee has not yielded to this temptation. While it held the Peruvian manager, J. C. Arana, directly responsible for the atrocities and absolves the English directors from any personal acts for which they could be punished under the Slave Trade law of England, yet it finds them "deserving of severe censure," and adds: "Directors who simply attend board meetings and sign checks cannot escape from their share of moral responsibility when gross abuses are revealed." The committee further expresses its belief "that the Putumayo incidents are but a shocking instance of the conditions that are to be found over a wide area in South America."

This is certainly a very serious imputation to be brought against the rubber country. If it is true, and if the Putumayo revelations are simply one glimpse

of conditions widely prevalent, there certainly is a vast amount of work for humanitarians yet to accomplish; and if these imputations are not true, those interested in rubber gathering along the Amazon should take the promptest means of absolutely disproving them; for the rubber industry has now assumed such a large place in the general progress of civilization that it cannot afford to rest under any suspicion of being associated, at any stage, with barbarities such as the Putumayo investigation has brought to light.

WHY THIS DISCRIMINATION?

NATIONS don't get the opportunity every day to celebrate the twenty-fifth anniversary of an emperor's coronation; so undoubtedly some allowance must be made at such a time for an excursion or two from the paths of sound thinking. On that ground, and only on that ground, can an explanation be found for a queer bill under discussion in the German Reichstag making it a misdemeanor to feed babies from a bottle with a rubber mouthpiece, on the theory that it is an unsanitary practice. This is humorous enough to make even the Kaiser, oppressed by the glories of his twenty-five years' reign, give a good, honest guffaw; for if the rubber mouthpiece on the baby's bottle, which can be sterilized outside and inside, and put to soak in boiling water, if need be, is unsanitary, what can be said for the substitute for the rubber mouthpiece provided by nature, where none of these drastic processes of disinfection can be employed? If the rubber mouthpiece is to be made a misdemeanor, mothers should be made a crime.

HOW WILL MR. REDFIELD DO IT?

MR. REDFIELD, the Secretary of Commerce and Labor, has attempted at divers times to express himself as to the dire consequences that will come upon the American manufacturer who, in case the Underwood tariff becomes law, tries to readjust himself to the new conditions by reducing the wages of his employees. But just what can Mr. Redfield do? Where is the law that compels an American manufacturer to pay a higher wage than he feels he can afford to pay, or in fact to pay any wages at all, if he prefers to cease manufacturing? If, in the opinion of the present administration, certain tariff duties are too high, it is the privilege of the administration, if it can secure sufficient votes, to reduce these duties; but if, under such a reduction of duty, the manufacturer feels compelled to reduce his scale of costs, including cost of labor, so as to meet the new situation, how can he be prevented from so doing? Mr. Redfield has made it plain that in such a case the manufacturer will be visited by the strong disapproval of the administration; but would not the average manufacturer prefer to incur even this distressing consequence rather than to run his mills at a continuous loss?

COLLEGE MEN IN RUBBER FACTORIES.

COLLEGE men appear to be coming into their own, at least in rubber manufacture. There is an item in our news columns in this issue regarding the action of one of the large Akron rubber companies—already employing a number of college men—in sending out invitations through these college employes to the institutions from which they graduated, for promising candidates for employment in the company. The manager, referring to college men, remarks: "We like their spirit and enthusiasm. The broad viewpoint and training these men receive has helped wonderfully in fostering friendly relations with our customers." The young university graduate, with his fresh sheepskin under his arm, ought to be full of spirit and enthusiasm and have a broader outlook than the less educated man, but for a long time he was not at all in favor with manufacturers generally. They thought him altogether too theoretical and impractical. Evidently this view has changed.

TO DO THE ATLANTIC BY DIRIGIBLE.

INTERESTING advices have been received from Berlin to the effect that Count Zeppelin will probably try to cross the Atlantic this summer in one of his big dirigible balloons. This appears like a dare-devil thing to do, in view of the fate of the lamented "Akron" and Vaniman's ill-starred crew. Some day of course some intrepid navigator of the air will cross the Atlantic, but to the layman it would seem the better part of discretion to manoeuvre airships over land until they show less liability to explosions and to other disturbing tendencies before essaying the long leap from Europe to America.

It is quite intelligible, to be sure, that flyers should look on the Atlantic passage with longing eyes. The man who first accomplishes this flight will go down in history as a

second Columbus. It is undoubtedly a tremendous temptation to aviators. But where there is one chance of going down into history, there are fifty chances of going down into the Atlantic.

It is stated that the German Government will detail a number of warships to be stationed at regular intervals along the route which the Count will be expected to take, in order to lend a hand in case of need. It would be a good idea if the German Government would employ its entire navy in this capacity, for, in the first place, the aviators would undoubtedly need as many available sources of succor as possible, and in the second place, it would be a pleasant spectacle to see a navy put to such practical use.

PLENTY OF POTATOES FOR THE SYNTHESISTS.

THE centre of the rubber stage has been so fully occupied of late by the Brazilians with their vast schemes for competing against the shilling rubber of the Far East that the synthesists have almost been lost sight of; but a dispatch received a few days ago from Minneapolis, saying that there were 100,000 bushels of potatoes spoiling on the railroad tracks, for which no market could be found, brings synthetic rubber once more to mind. For the theory of the laboratory workers, both of England and of Germany—which in fact they have very thoroughly substantiated—is that rubber can be made from starch, with a few intermediate steps such as converting the starch into fusel oil and that into alcohol and that into isoprene, which in turn is changed into rubber. But the basic necessity, according to the leading champions of synthetic rubber, is starch, to be derived either from corn or potatoes—the chief obstacle in the way of deriving rubber from starch in commercial quantities being the cost of the starch. In the present situation, however, with the country full of last year's potatoes for which there is no demand owing to the arrival of this year's potatoes from the south, it would seem to be the synthesists' golden opportunity.

THE RUBBERIZING OF CITY NOISE.

THE staid citizens of the conservative East always associate noise with the exuberant West, but here is Chicago giving serious consideration to a municipal ordinance for doing away with noise, and especially looking to the greatly extended use of rubber for the tiring of vehicles.

Doctors disagree regarding most things (except the size of the fee they ought to have), but the neurologists all agree on this, that the reason city nerves are so unstrung is chiefly because of city noises; and of city noise traffic noises constitute seven-eighths. The tremendous nerve-wrack of so much din is everywhere recognized. There is hardly a city of any size in the country that does not have its anti-noise society, seeking to prod the local authorities into lessening the noise nuisance, and particularly the roar of traffic on the streets.

Here is an unlimited field for the use of rubber. Nobody need be pessimistic as to what we will do with our rubber if we have, as the experts promise us, 170,000 tons of it in 1915 and 340,000 tons in 1919. All of this rubber and a great deal more can be used if every vehicle that travels the streets is rubber-tired, and if the streets where quiet is particularly desired are rubber-paved, as around hospitals, schools, churches, and in residential districts. From such a beginning rubber pavements could spread indefinitely. The practicability of general rubber-paving being once proved, there is no limit to the amount of rubber that could be usefully employed.

If anyone has imagined that the chemists who have been at work so long on the problem of synthetic rubber have relaxed their energies, he will discover his mistake by simply referring to the recent issue of patents as given in the present number of THE INDIA RUBBER WORLD. He will find under the American Patents five that have recently been issued for a "Caoutchouc-like substance and process of making same" to Herr Hofman and his collaborators in the great laboratory in Elberfeld, Germany. It is not to be wondered at, however, that the synthesists keep persistently at work, for the prize they are striving for is a magnificent one, and the success which they have already attained is most encouraging. They have fully proved that synthetic rubber can be made. The only part of the problem yet remaining to be solved is how it may be made cheaply enough for commercial use.

An exceedingly interesting event occurred on June 28. The Hodgman Rubber Co. on that date celebrated its seventy-fifth anniversary, the company having been founded in 1838 by the grandfather of its present president. There were rubber companies in existence earlier than 1838, but they were short lived, for the early days in rubber manufacture were troublous and precarious. Some of the plants of those early companies were later acquired by new concerns, but it is doubtful if there is another company besides the Hodgman which was in operation in 1838 and which has had an uninterrupted career up to the present time. If there is, THE INDIA RUBBER WORLD would be glad to be informed; and if there is not, the distinction of being the oldest American rubber company must be accorded to the house of Hodgman. There will be found on another page a brief historical review of the fortunes and progress of this company during its 75 years.

Dr. Muller, Special Ambassador from Brazil.

DR. LAURO SEVERIANO MULLER, Minister of Foreign Affairs of Brazil and Special Ambassador of that country to the United States, reached New York on June 17 and, together with the other members of the special embassy, was received with marked civic honors and with great cordiality by various commercial bodies.

Undoubtedly the Ambassador has led a busy life, but it is safe to say that he never has had a busier day than his first in New York. In the morning he was taken, with the other members of the embassy, on a special sightseeing tour that carried him from the observation tower on the Woolworth building up to Grant's Tomb, eight miles away. Incidentally, he received a formal call from the Mayor, at his hotel, and shortly after returned the compliment at City Hall.

At 1 o'clock he was tendered a luncheon at the Plaza by the American Manufacturers' Export Association. This was attended by about 150 members and guests. Speeches were made by Assistant Secretary of State Dudley F. Malone, who had been appointed by the State Department to attend Ambassador Muller during his American trip, and who spoke briefly for the Federal Government; and also by Assistant Secretary of the Department of Commerce Edward F. Sweet, Collector John P. Mitchel, of the Port of New York, and James A. Farrell, president of the United States Steel Corporation. Dr. M. de Moreira, president of the association, presided and made an excellent address.

DR. LAURO MULLER.

In some respects the most informing speech of the occasion was made by Assistant Secretary Sweet, of the Department of Commerce, as he gave a great many facts relative to trade between Brazil and the United States, stating that our exports to that country had quadrupled in ten years—being only $10,000,000 in 1902 and $40,000,000 in 1912—while our imports from Brazil have doubled during the same decade, now amounting to $142,000,000.

Mr. Farrell at the conclusion of his address presented the guest of honor with a loving cup of gold standing some 20 inches high. Dr. Muller made a brief but felicitous reply, and proposed a toast to the health of the President of the United States.

Following this lunch, and more sightseeing in the afternoon, the Ambassador was given a reception and dinner in the evening, at the Knickerbocker, by the Pan American Society of the United States. The function was in charge of a dinner committee including Lloyd C. Griscom as chairman, Robert Bacon, August Belmont, President Nicholas Murray Butler, Jacob Schiff, James Speyer, and others. It was an elaborate affair, admirably "staged," to borrow a dramatic expression. Mr. Griscom acted as toastmaster.

The speaking was considerably curtailed, as the dinner did not begin until quarter of seven and it was to be followed by a theater party. The toastmaster—who was very popular among the Brazilians present, having been formerly Minister to Brazil and being

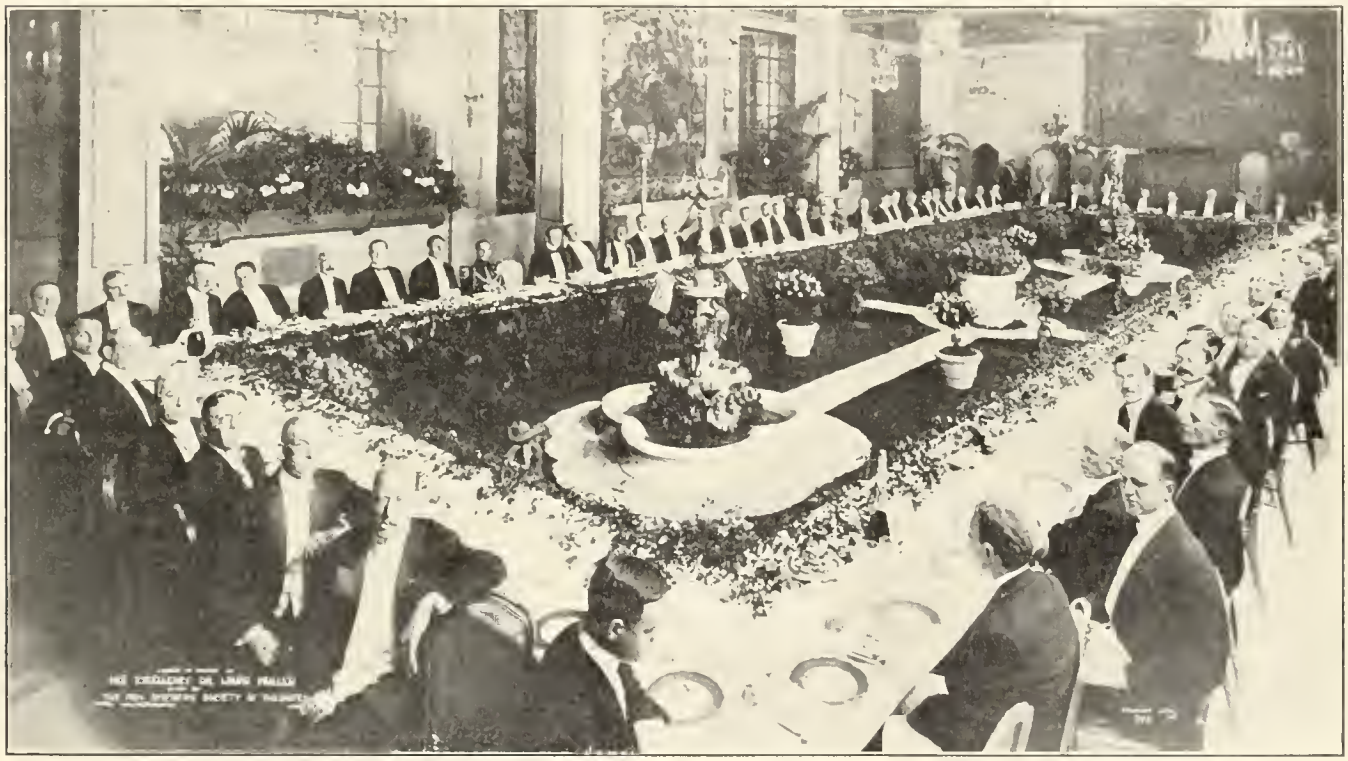
LUNCHEON GIVEN TO DR. MULLER BY THE AMERICAN MANUFACTURERS' EXPORT ASSOCIATION.

well known in that country introduced Third Assistant Secretary of State Malone to speak for the United States Government. Mr. Malone touched a responsive chord when he said that he would not be a party to any conspiracy to keep the diners away from the theater, which he knew they would enjoy more than his speaking. He was followed, briefly, by Ambassador Domicio da Gama, and then the chairman presented to the guest of honor a beautiful traveling clock, inscribed with an appropriate sentiment, from the Pan American Society. Dr. Müller responded in a few words, and at 9 o'clock the guests repaired to the New Amsterdam, a few doors away, on the same street, to witness "Follies," a light and sparkling performance, eminently adapted to the condition of the mercury on that particular evening. While quite a little of the humor of the performance consists of what is known as "local hits," the distinguished Brazilians, for whom the four lower boxes had been reserved, appeared to enjoy it heartily.

The editor of THE INDIA RUBBER WORLD had the pleasure of breakfasting with Dr. Müller last winter at his home in Rio de Janeiro and looks back upon the hour spent with this eminent Brazilian statesman as one of the pleasantest and most profitable during his entire visit to that interesting country.

Dr. Müller is rather a slender man—"wiry," as we say in America—and capable of an amount of physical and mental exertion to which many a heavy-weight would succumb. He is of much the same mould as Senator Root, whose visit to Brazil while Secretary of State is now being returned. While born in Brazil, he is of German ancestry and is a fine representative of the sterling German element that has become so prominent in Southern Brazil, both in government and commercial affairs.

The members of the special embassy attending Dr. Müller include Dr. Helio Lobo, secretary of the embassy; Capt. Antonio Sampayo, Lieut. Euclides Hermes da Fonseca, military aid and son of the President of the Brazilian Republic; Capt. Antonio da Fonseca, military attaché of the Brazilian Embassy at Washington; Dr. de Acquino, Leopoldo Moreira, Alberto do Ipanema Moreira, naval aide, and Capt. Thein Costa, commander of the Brazilian dreadnought Minas Geraes.



DINNER GIVEN TO DR. MÜLLER BY THE PAN-AMERICAN SOCIETY OF THE UNITED STATES.

COMPARATIVE PRICES OF BRAZILIAN AND PLANTATION RUBBER.

IN discussing the fact of hard Pará rubber being quoted at a premium over that of plantation rubber, the "Malay Mail" quotes a suggestion of Mr. E. L. Killick, to the effect that the former article should, in all newspaper quotations, be shown on the basis of its content in actual rubber. The Brazilian product is known to contain on an average 15 per cent. of moisture and impurities, there being thus only 85 per cent. of rubber in comparison with 100 per cent. in the pure product of the plantation. Thus if both qualities were quoted at 4s. the real proportionate cost of fine Pará would be about 4s 8½d, as compared with plantation rubber at 4s.

Mr. Killick (the rubber expert of the London "Financier") further holds that the vaunted superiority of hard fine Pará to plantation rubber is mainly traditional, that opinion gaining adherents every day, even among the most conservative of manufacturers. He adds that one or more of the new curing processes now on trial in the East may turn the scale of the market sentiment in favor of the plantation product. Mr. Wickham is actively engaged in Ceylon with his new curing system, which is said to turn out plantation rubber identical with fine Pará, less the impurities of the latter.

The new Byrne process is being taken up in Malaya with results of a highly encouraging nature, a trial consignment made to London some months ago, cured by this process, having been found in perfect condition, containing only ½ per cent. of moisture, and fully equal to any quality of first latex crêpe. It is reported that arrangements have been made to install the process and apparatus on about 30 rubber estates in Malaya and Ceylon.

In conclusion, the fact is urged that the chief handicap to the cultivated product has been the lack of proper standardization. The opinion is expressed that if the Byrne process is instrumental in bringing about this very desirable end it will do much to establish plantation rubber as the recognized market standard.

Problems in Vacuum Drying.

By J. P. Devine.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

IN the selection of a topic for discussion I rather reluctantly, and yet from necessity, selected one that is intimately identified with the business in which I am engaged, and my remarks may at times seem somewhat personal. Among so many who have devoted their time, ability and energy to solving the many intricate problems in the cultivation and production of crude rubber, as well as to improving and refining methods and processes of manufacture of the ever increasing number of articles of the product of rubber, I can assure you that my limitations are not an unknown quantity.

My introduction to and connection with the rubber industry was made about ten years ago when I sought to interest manufacturers in this country in a new method of drying rubber. I found, however, that the manufacturer was disposed to be quite satisfied with the then existing method and did not hesitate to forcibly express his views and opinions as to any improvement in the drying process by shortening the time or otherwise, except by sacrificing the quality of the rubber and thereby jeopardizing the standards that years had taken to establish.

I had been convinced that the Passburg Vacuum Drying Apparatus, originated and designed by Emil Passburg and William Strohn, of Berlin, Germany, possessed unusual merit for economically and thoroughly removing moisture from materials and particularly where it is desired that the final traces should be removed; as is necessary in rubber and rubber compounding materials, I was ready to and did back my judgment by my reputation and resources for its introduction in this country. Many installations had at that time been made in Germany for drying rubber as well as other materials, and the results from its use, as well as its advantages, were highly satisfactory. Notwithstanding the discouragements of my early efforts, I made investigation as to methods of drying rubber and learned that little, if any, advancement or improvement had been made up to that time, and this confirmed my opinion of the value of the vacuum process, and I have maintained ever since its introduction that the vacuum drying process and apparatus introduced in Europe by Messrs. Passburg and Strohn, and in this country by myself, would be and has since proven of inestimable benefit to the rubber industry.

For years rubber was dried by any means convenient at hand that would not represent an expenditure of capital, the boiler room or a room adjacent thereto serving the purpose, until the effects of the elements upon the rubber began to receive attention and study. And then, the improvements consisted largely in the construction of drying lofts, the racks on which the sheeted rubber was hung and the distribution of heat by coils, or by circulation of hot air by means of fans and blowers; little regard, however, being given to temperature or length of time of the drying process. Until the introduction of the vacuum drying apparatus this primitive method was still in use, and occasionally an advocate is still found, who asserts that the hot air method is necessary for the proper curing of some particular grade of rubber. The fallacy of such assertions is proved by the use of the vacuum apparatus drying every grade of crude rubber, and I shall endeavor to make clear to you the claims I make for the superior quality of rubber dried by a properly designed and constructed vacuum apparatus.

While it is true, considerable thought was given to improving processes for drying rubber, there were no striking departures from the antiquated method of using hot air as the heating medium. The dust and dirt that would settle upon the rubber were the least of the evils; the construction of special drying rooms from which direct sunlight was excluded, and provisions to eliminate dust and dirt, and the regulation of temperatures for various grades of rubber, as well as the attempt to dry the air before being admitted into the drying room, all contributed to avoid the deterioration of the rubber by such means; but the value of these improvements was doubtful as they only tended to reduce the effect of high temperatures with a consequent prolongation of the drying period. The fact is that the two insidious enemies of rubber are heat and oxygen and these elements are, and always will be present, and necessarily so, in any system of hot air drying. They are deteriorating agents and their elimination is most essential for the proper drying of rubber. Their elimination by the vacuum apparatus has proven the superiority of the vacuum-dried rubber in the processes of its manufacture.

Another and serious objection to the hot air system of drying rubber is, that rubber as it comes from the washing machine, contains a very large proportion of mechanically bound moisture; while this is readily given off in the hot air drying room, its expulsion causes a contraction of the rubber, which, with the oxidation constantly taking place, causes a hardening of the surface that prevents the elimination of the last moisture within the rubber, except by a very prolonged drying period, during which time the rubber is further subjected to oxidation and not unlikely to excessive heat. Unless the last traces of moisture are eliminated, "blowing" is sure to result during the following stages of its manufacture.

We still hear occasionally about "curing" rubber; but in reality this is simply the removal of the final traces of moisture; as stated, under atmospheric conditions, this can only be accomplished by a prolonged drying period, while under vacuum the rubber is thoroughly dried in a very short time, and in practice rubber is immediately worked up after removal from the vacuum dryer.

The deteriorating agents—oxygen and excessive heat—can be eliminated only by the vacuum process and apparatus. This process and apparatus alone afford the proper conditions to dry rubber rapidly, uniformly and thoroughly at a low temperature and without oxidation, independent of climatic conditions.

It must be borne in mind that under atmospheric conditions a rapid boiling can only take place at 100 degs. C. or 212 degs. F. and that as the temperature decreases, the drying time is extended; while under vacuum the boiling point is greatly decreased and increasingly so as the barometric reading is approached. To illustrate, under a vacuum of 29 in. water boils at 25 degs. C. or 77 degs. F. Rubber dried in the vacuum chamber, while the first free water is being removed, will not need to be heated, practically, above the boiling point of water at that particular vacuum. As the moisture is evaporated from the rubber, naturally the temperature of the rubber being dried tends to increase; to prevent any overheating the supply of the heating medium—steam or hot water—is regulated accordingly and entirely shut off before the final drying; the last traces of moisture are therefore drawn off by the latent heat in the dryer accelerated by the high vacuum. Because seemingly high temperatures are used at the beginning of the drying process to expedite evaporation, the erroneous impression is sometimes formed that the rubber is overheated in the vacuum chamber; but in a properly constructed vacuum chamber with its auxiliaries—condenser and pump—properly balanced, the application of well-known physical laws absolutely prevents any overheating, if only reasonable care is taken in its operation.

Then too, the drying process taking place under a high vacuum in the absence of oxygen, oxidation cannot take place. The rubber not being overheated nor impaired by oxidation has greater elasticity and tensile strength, and accomplishes that which is the aim of every manufacturer—to obtain the greatest yield when being made into final product.

As different grades of rubber must be subjected to varying temperatures, the temperature of the heating medium is easily regulated without over-heating or materially affecting the drying time; so that the vacuum process offers many advantages over the old method of drying rubber, whether it be fine Pará or Pontianak.

Another very great advantage of the vacuum process lies in the fact that as the drying period is only a few hours, varying according to grade of rubber, the crude rubber can be washed, dried and processed in a fraction of a day; consequently there can be no deterioration after drying and before using—as it is well known that washed rubber oxidizes very rapidly—and there is no danger of the final manufactured product being porous or spongy, due to the presence of moisture.

The rubber industry has expanded tremendously in recent years, owing to an ever increasing variety of products in which rubber is used. To meet the daily factory demands for large quantities of crude rubber of different grades, the use of the old method of drying is disadvantageous and unsuitable, as well as excessively expensive.

In an average establishment of to-day, making a general line of rubber goods, two tons of crude rubber is a conservative estimate of its consumption. If the old hot-air method is used, in order to properly and thoroughly dry the washed and sheeted rubber, six weeks are consumed in the drying process. Seventy-two tons of rubber would be hanging in the drying lofts, which at $1 per pound, would represent an idle investment of $144,000 on raw material, the carrying charge at 5 per cent. amounting to upward of $20 per day; and should the carrying charges for instance, factory space, etc., be included, the above sum would be greatly increased.

The same quantity of rubber could be more thoroughly and permanently dried by one or two vacuum chambers in a day of ten hours, so as to "work up" whatever grade may be required for each day's output, and the initial cost of such an installation would be less than the cost of the old-fashioned drying rooms for the same quantity. So that the vacuum chamber pays for itself in the savings on investment, carrying, insurance and other fixed charges on raw material, as well as gives a flexibility to the factory for its daily production that cannot be obtained by any hot-air method.

To illustrate the great saving in factory space, a vacuum drying chamber having a capacity of approximately two tons of dry sheeted rubber per 10 hours, occupies a space of 8½ feet high, 15 feet wide by 9 feet long; and its auxiliaries, the condenser and the pump, can be conveniently located at any place in the factory in proximity to the dryer.

In addition, the vacuum drying process offers further advantages over the hot-air system because of the other factory economies derived by its use. The drying expenses for a hot-air system for steam consumption and attendance are enormous. It is an established fact that by any hot-air system not more than one-third of the heat units supplied are utilized in the evaporation of moisture; whereas by the vacuum process practically every heat unit is transmitted to and comes in direct contact with the material being dried. The saving of fuel is consequently most considerable not only on account of the very much shorter drying time—reduced from weeks to hours—but because of the much higher efficiency of the heating medium used in the vacuum drying process.

The vacuum drying apparatus is constructed of cast iron and is practically indestructible; there are no appreciable maintenance charges and fire hazards are eliminated.

As to attendance, only one operator is required to operate the vacuum dryer, who, while one charge is being dried, is engaged in filling the second set of trays with rubber for the next charge, and in recharging the apparatus replaces each tray of dried rubber with one of wet.

A vacuum drying apparatus consists of a vacuum drying chamber, which should be constructed of a special grade of close-grain homogeneous cast iron, equipped with heating shelves made of hydraulically straightened sheet steel plates. I emphasize that the plates should be hydraulically straightened, as by this means only can a uniform even and flat surface be secured on which the trays are placed and which will withstand the strain of the varying steam pressures used during the drying process. It is important that the heating shelves are so constructed as to insure an even surface, as any distortion of the heating shelves will cause the trays to rest uneven and thereby permit an unequal transmission of the heat to the material being dried.

Connected with the vacuum chamber is a condenser, and it is most important that this auxiliary be of proper condensing capacity for the vapors given out during the drying process. In the determination of the size of the condenser, somewhat complex problems arise, for not only must the volume and speed of such vapors be determined, but the proportion to be condensed during the early stages of the drying process must be determined, when the free or mechanical moisture is driven off; and in this connection, there must also be considered the temperature of the cooling water available for condensing purposes. These elements cannot be determined by any "Rule of Thumb Method," but must be carefully calculated. The size and capacity of the dry vacuum pump is of equal importance to the well balancing of a vacuum apparatus; for in order to secure the highest efficiency it is necessary to create the highest obtainable vacuum as quickly as possible, and when obtained to maintain a uniform vacuum throughout the drying period.

Complaints have occasionally been made by some people who have attempted to dry rubber under vacuum that such vacuum-dried rubber was not satisfactory, and the blame was promptly put on the vacuum drying apparatus and process. I may state that though these complaints were, of course, *bona fide*, the cause for such complaints was misplaced. The vacuum apparatus and process have the advantage of working almost automatically and require scarcely any attendance; but these advantages have in the above mentioned cases been abused, and of course not without detrimental effects to the vacuum-dried rubber.

To illustrate what I mean, a certain size of a vacuum apparatus is intended to receive a certain quantity of rubber per charge, and naturally the heating surface of the dryer, which is equivalent to its drying capacity, has, as I have stated, to be most carefully calculated for this purpose, and if the instructions for operating such apparatus, which are most simple, are only followed, it is a physical certainty, I might say, that the vacuum-dried rubber will be satisfactory and far superior to air-dried rubber, because with a vacuum apparatus and process nothing is left to chance or climatic conditions.

In cases, however, where complaints have arisen, the well-meaning people who were using such a dryer, being surprised at the capacity of the apparatus far exceeding their expectations, thought it right to go a little further by further increasing the charge of rubber and ultimately loading the apparatus with a much larger quantity than their apparatus was intended for. Of course, it was soon found that the increased charge could not be dried in the stated time, nor with the stated temperature of heating steam. As it is only human not to decrease one's desires, the natural human remedy was resorted to, that is, an increased temperature of heating steam and also a prolonged drying time. If you consider that the heating surface at a certain temperature within the dryer is intended for a layer of rubber of a uniform and certain thickness, its capacity, or rather

the beneficial results obtained therefrom, will be destroyed, or at least impaired, by an increased quantity of rubber per charge and an increased temperature of heating steam, because the heating surface itself remains the same; and it is this factor which remains constant—that upsets the results sought to be obtained by the violation of well known, but not considered, natural laws.

Experience has taught us to balance the necessary heating surface, to transmit a certain temperature to a certain layer of material to be dried; and it is quite erroneous to argue—though a common mistake—that the same beneficial results may be obtained from a larger quantity of material, by simply increasing the thickness of the drying material and increasing temperature, in the belief that the above mentioned factor would increase proportionately. This, however, is not the case, as I will more fully point out.

If one takes the conductivity of rubber alone into consideration, and the gradual but decreasing evaporation of the water contained therein, it can very easily be understood that by altering some of the factors the physical laws, on which our calculations are based, will be violated without any such intention, and the penalty will be an unsatisfactorily dried rubber; —the cause of which is naturally placed at the wrong door. The fault is not in the apparatus, but in the method of its operation. The same remarks refer to the auxiliaries of an apparatus for drying rubber. These auxiliaries consist of a condenser and vacuum pump which are both calculated to correspond with the capacity of the vacuum apparatus they are intended to serve.

To illustrate what I mean: A vacuum dryer of a certain drying capacity and calculated for a certain purpose is intended to evaporate a certain quantity of water in a given time, and of course, which is essential, at as high a vacuum as is possible under practical working conditions. All this is, to a great extent, based on practical experience with the very material our apparatus is used for. If, however, the condenser, instead of handling the quantity of vapor for which its cooling capacity is calculated, is burdened with ever so much larger a quantity, the result must be detrimental in two ways; it not only re-acts on the dryer and the product it is supposed to turn out regardless of the time, but also re-acts on the working of the pump.

As regards the vacuum dryer, it is essential to have its inner space continuously freed from the vapor arising from the drying material in order that no inner pressure may be created in such apparatus to lower the vacuum. This can only be done by having the arising vapors taken care of in their entirety during their passage through the condenser, the capacity of which cannot be changed at will.

If more vapors are created than the condenser is intended for, such vapors will partly remain in the dryer, and create inner pressure. The inner pressure thus created consequently reduces the vacuum in the dryer and as a consequence the boiling point of the water contained in the rubber is increased, and the rubber will be heated up to a temperature never intended, with detrimental effects to its quality. The overcharging, as I said before, affects the efficiency of the pump and prevents it from creating the desired high vacuum. The reason for this is that a dry vacuum pump—the only type we have in mind in this discussion—is intended, dimensioned and constructed for pumping air and not vapor, particularly as the latter expands so enormously under vacuum. If the pump were intended to exhaust rarified or expanded vapor in addition to rarified or expanded air, its dimensions would be so enormous as to make its use practically impossible.

If, therefore, the dry vacuum pump has to exhaust vapors which have passed uncondensed through the over-taxed condenser, a burden is placed on the pump for which it was never intended; its work becomes inefficient and most naturally impairs the vacuum and efficiency of the whole installation for drying purposes.

I have but briefly outlined some of the factors which have to be taken into most serious consideration in designing and constructing a proper vacuum dryer and its auxiliaries. I submit that it is wrong and unfair to subject apparatus to work for which it is not intended, and to charge the inefficient or insufficient results of such an abused vacuum drying installation at the door of the principles of drying under vacuum,—viz.: rapid and thorough drying at a low temperature.

Owing to the remoteness of plantations and the difficulties surrounding the transportation of machinery and appliances for removing impurities, only primitive and unscientific methods of preparation could be adopted. The use of the vacuum drying process was, in consequence, first introduced and adopted by the manufacturers to dry washed rubber. In recent years, however, much greater thought and study have been given to the preparation of the crude rubber on the plantation. Especially is this noticeable in the quality of the rubber reaching the market from the Malaysian Straits Settlements, and Congo Plantations, where vacuum drying apparatus has been installed and is found to be of great value. This is somewhat reflected in the moisture content of plantation rubber that reaches the market with a low percentage of moisture, as compared with 15 per cent. or more, in Upriver Pará. There can be little doubt that in the future the planter will understand that the price is based upon actual rubber and he will serve his purpose best by adopting the very latest method for the treatment of the raw material so as to free it from impurities and to reduce its moisture to a minimum percentage. Pure and dry rubber does not suffer in transit through fermentation caused by vegetable impurities and moisture. This improved quality of the raw material will not cause the discontinuance of the drying process in the factory. It will, however, tend to restrict the operation for the treatment of such rubber to remove the final percentage of moisture only, and thus simplify factory operation.

The highly satisfactory results to the manufacturer and planter from the scientific and research work in the laboratory have contributed materially to the advancement of the industry, and its further progress can and will be accomplished by a closer and more intimate relationship between the manufacturer or producer and the appliance manufacturer. We are, after all, in our several activities dependent one upon the other, and why not recognize our mutual obligations to co-operate, that a maximum productiveness by newer and better methods may be secured?

NORTH BRAZILIAN SYNDICATE.

Advices have been received from Pará, of the establishment in that city of the North Brazilian Syndicate, Ltd., for the purpose of representing firms, companies or syndicates of capitalists, both Brazilian and domiciled in other countries. Its object will be the development of the resources of Brazil while it will have agents in the principal countries of Europe and America.

STATISTICAL POSITION OF PARA RUBBER.

Statistics quoted by the "Financier" of London show that the visible supply of Pará and Peruvian rubber was reduced from 6,550 tons on May 1 to 6,350 tons on June 1. At the same time last year the visible supply was 6,880 tons. There is consequently a falling off of 530 tons, although the South American output for the season to date has increased by 3,000 tons. From these figures it is deduced that consumption has increased 3,530 tons within the year.

A new Canadian company known as the Sterling Rubber Co., Ltd., is now manufacturing a line of drug sundries at Guelph, Canada. F. S. Friedman is the secretary and treasurer of the company.

A Brazilian's Commentaries on the Akers Report.

THE May number of THE INDIA RUBBER WORLD contained a general review of the report of the Akers Commission, particularly with reference to that part of the report which dealt with the findings of the commission in the Middle East. The June issue contained a review of the Second Volume of the Report, which is devoted to the Amazon Valley. Below are some commentaries on the report, by a Brazilian, who for many years has been prominent in the rubber trade and is very familiar with the rubber industry of the Amazon.

A haphazard reader of the Akers report would be puzzled to trace its origin and might never obtain a proper explanation of its reason for existence unless he learns all the facts that have led to its publication. In this respect, it may be said to be a unique publication.

Such a report would need no explanation were it officially hall-marked or recognized as an investigation conscientiously made under Government direction. On the contrary, however, it seems to be a sort of high-handed censure, set up by a private individual for the special purpose of showing up the past negligence of the government or driving it into further action, at greater speed than it has been accustomed to move at in matters of this sort.

Had this report been published before the promulgation of the Federal Laws for the Economic Defense of Rubber, the object of the publication might have, and perhaps would have, been accepted as a kindly indication of what might be done by the Government to improve the native rubber industries of the Amazon. But after the promulgation of those laws, *all of which it recapitulates at the end*, this publication has a tinge of inopportune obtrusion that rather spoils its otherwise good features. But the report may have been published to assist the safe launching of a special company to undertake a colonization scheme in the lower Amazon. It looks as though it were specially worded to suit the needs of an attractive prospectus, meant to enlist the support of foreign capitalists in a certain direction.

About 1907 there appeared the first symptoms of the competition which rubber grown in Asia threatened to put up against Brazil at no distant date.

About that time Mr. J. J. G. Vianna published a series of articles in the Pará press, calling attention to the necessity which existed for all interested in the native rubber industry to prepare to meet the competition of the East.

A volume entitled "A Crise Amazonica" was written by Mr. J. A. Mendes, showing the defective methods under which native rubber was exploited, and inciting the Government to take steps to escape the dangers which were ahead by favoring the fiscal and commercial reforms that were necessary.

Mr. J. Simão da Costa was also a champion of the cause of the said reform, and under the heading of "Rational Valorisation of Rubber," proved that in planting rubber abundantly, as near as possible to the Atlantic ocean, in the state of Pará, and by cheapening the cost of living and of transportation in the whole region, lay the only hope of the Amazon's being able to hold its own against the middle East plantation rubber. This, of course, on condition that the government lent its credit and prestige to the undertaking. All these writers were unanimous in denouncing the excessive hardships of the export taxes on rubber producers and the exorbitant rates of freights prevailing. The Chamber of Commerce of Pará also presented a memorial to the Chamber of Deputies of the Federal Union pointing out the excessive customs duties which were levied on all imported necessaries of life.

If we now turn to the Report itself and its intrinsic value, it must be acknowledged that Mr. Akers did all that he was asked to do, to the best of his ability.

As regards the tapping modifications he has tried to introduce in fifty different *seringaes*, within a distance of seven thousand miles, it takes more optimism than we are accustomed to meet, even in the Amazon country, to feel confident that any considerable increase of the production will result therefrom. The chances are that nothing but the pleasant recollection of Mr. Akers' passage now remains at the spots he visited. We doubt whether Mr. Akers had time enough to study the philosophic temperament of the average Amazonian rubber gatherer and how prone he is to follow the lines of least resistance.

The tapping of rubber trees in the East is still an open question, and of course while there are hopes that some inventive genius will some day devise the proper mechanical means by which the extraction of the most latex with the least possible danger to the tree will be accomplished, no one can assert at present that the method Mr. Akers tried to introduce in the Amazons is the very best, nor the last word on the subject. His suggestion for the planting of vegetables along the margins of the Amazon is now followed up to the utmost ability of those who have *Estradas* right by the river banks. But Mr. Akers could not expect men to tap rubber ten and fifteen kilometers (six to ten miles) off the borders of the rivers and at the same time cultivate lands on these borders.

As regards Theobroma Cacao, Mr. Akers would be surprised to learn that the Government of Pará issued a booklet, written by Mr. J. Simão da Costa and Dr. J. Huber, teaching how best to plant cocoa and prepare same for export. No appreciable improvement has taken place up to the present, as the result of this propaganda, because labor for carrying out planting operations cannot be obtained economically.

The Amazon's evils have been correctly and conscientiously exposed in a lecture delivered at the Engineers' Club at Rio de Janeiro by Mr. J. Simão da Costa and may be summed up as follows:

1. Lack of sufficient capital to undertake all the necessary reforms to place the native rubber gathering industry on a sounder footing, industrially and commercially.

2. Lack of technical knowledge on the part of the management of the above industries.

3. Natural drawbacks brought about by the extent of territory which must be traveled over before reaching seringaes, the unhealthy nature of these, and the great distances between trees that are tapped.

And the only remedies for such evils were also suggested, and are as follows:

1. The undertaking of intensive planting of the *Hevea* tree, side by side with every other branch of tropical agriculture, at the most suitable places near the Atlantic Ocean and under government assistance and supervision, and for the benefit of the whole community.

The series of measures the government has promised to undertake, and is carrying out to the best of its ability, are all indirect methods of cheapening cost of living and transportation, but the benefits to be derived can only be felt after a lapse of many years. It is evident, therefore, that the greatest benefit that could be created for the whole region would be the planting of enough trees to produce, under modern methods and by carefully taught laborers, as much rubber from Pará plantations as the wild rubber which the Amazon is now shipping, leaving the upriver seringaes to be exploited, as long as it would pay those whose primitive habits could never be changed by law, or by the spreading of printed instructions, which they cannot read and would never be willing to follow.

The constant procrastination in the undertaking of the intensive culture of the *Hevea* tree, *and this alone,* is responsible for the crisis which now envelops the whole Amazonian region in a common cloud of insolvency and ruin, and Mr. Akers has failed to point out the real salvation. Nor would the Amazon Land and Colonisation Company, with all the favors which Mr. Farquhar may be powerful and influential enough to obtain from the government, be able to solve the problem: first, because many years must go by before the lands it means to exploit can become inhabitable by Europeans; and second, because the obstacles in the way and cost of transportation to and from the Amazon River, up to the settled portions, must always remain a large item of expenditure in this exploitation.

Mr. Akers tells us that he went up to the experimental farm at Igarape Assú, on the Braganza Railway, having made the visit in a single day, ten hours of which were consumed on the voyage. Yet he had enough time to see everything and report upon everything representing an outlay of £70,000. In a word: he saw enough to justify the unrestricted condemnation of the whole thing, because the soil is composed of either sand or hard clay.

Mr. Akers will be surprised to hear that geological investigations have led to the conclusion that the whole tract lying between Igarapé Assú, was, to a great extent, submerged for ages. There is not as much humus, then, in this region, as is commonly found in other portions of the State of Pará. As a matter of fact, the really good agricultural section nearest the city of Pará begins just beyond the River Peixe Boi, which is the limit of the Igarapé Assú experimental farm. The lands from this spot up to and beyond Braganza, up to the Gurupy River, are among the best tropical agricultural lands on earth.

The tobacco produced in this zone is famous, and tropical agricultural farms organized under modern methods and tilled by machinery would yield wonderful returns. But what makes this region the most valuable of all the lauded assets of the State of Pará is the excellence and healthiness of the climate of the whole region.

Of course the lands on this side of Pará do not all belong to the government, and no concession of free lands to the extent of 60,000 square kilometres could ever be granted for the asking. But if the lands were needed for any enterprise for the public weal and good, their acquisition by the government would be quite an easy matter.

It is a great pity, therefore, that this proposition was lost sight of by Mr. Akers and his associates, as it would be quite possible to establish European laborers in this region, and the advantages of such possibilities cannot be exaggerated.

As regards the introduction of Chinese immigrants, suggested by Mr. Akers, there is yet to be proven one single instance in which this class of immigrants, even under indenture, ever proved satisfactory in any country.

The history of this class of immigration in the United States of America, in Australia, and in South Africa is of common knowledge, even in the Amazon. Dr. Huber, who visited the East with all the open-minded fairness and generous disposition peculiar to men of science, would hardly endorse Mr. Akers' opinions in this respect. There is no doubt that the Chinese laborer is intelligent, hardy, thrifty and industrious. But at heart he is a merchant, a speculator, a gambler, and a vicious reprobate, just as soon as he feels free enough to act unhindered by military supervision. If there is one place more than another where Chinese immigrants would feel at liberty to found a colony of their own to the absolute exclusion of every one else, that place is the Amazon. In a word—Chinese are not given to intermixing with any other nationality, for the very lowest classes of Chinese have been reared to believe themselves the "sons of Heaven" and all other human beings devils.

Now if we understand Brazil's proclivities, as a nation, one of its best traits is the happy way in which all comers are assimilated. Even the Indians and the Africans are being assimilated by degrees, and the time will come when few traces of these will be left in certain States. If for no other than ethnological reasons, therefore, Chinese should not be imported into the Amazon country.

As a whole, Mr. Akers has rendered the special interests so powerful in Brazil yeoman service in placing before them in a bright, succinct and lucid form, an excellent analysis of the rubber industry of the Amazon valley and its other resources. But much which he now says had been constantly repeated before by others, if in a more unassuming way in terms just as clear and intelligent; and the Federal government of Brazil seems to have awakened to the true situation before Mr. Akers undertook his task. The appendices to his report are proof of this. These comprise all the measures the said government has resolved to carry out, and it would seem that the best and most practical thing to do now is for Mr. Akers and his associates to exert all their influence in seeing that all that has been decreed will be duly put into practice.

It would never do to seek any alteration of the present government program, at this stage. And if the government begins to falter and show signs of indifference in the realization of the measures already provided for legally, then, and only then, would it behoove those interested in the Amazon to force the government's hand.

But the worst feature of Mr. Akers' report is the fact that it was issued at the end of the year 1912, and embodies suggestions that were adequately provided for by the laws promulgated by the Federal government on the 5th of January, 1912.

Mr. Akers seems to have condensed in twelve concise paragraphs the sum total of his findings on the investigation he made in the Amazon, and therein embodies all the suggestions he puts forward as the proper program to be observed by the Brazilian government.

First. He suggests the new method of tapping.

Second. He suggests the establishment of an agricultural school for training tappers and teaching modern methods of preparing latex, and preparation of rubber for shipment.

If we now turn to pages 144, 145, *et seq.*, we find in Chapters II and III of the Law for Economic Defense of Rubber, promulgated on the 5th of January, 1912, the most elaborate provisions for all that Mr. Akers suggests, and very considerably more than he mentions.

Third. He suggests the erection of adequate machinery at Pará and Manáos for washing and preparing scrap rubber previous to shipment. By referring to page 146 of the said report, we find that the Federal government offered prizes for the erection of rubber refineries, not only in Pará and Manáos, but also in Ceará, Bahia, Recife and São Paulo.

Fourth. He suggests the appointment of expert rubber planters to superintend tapping operations and the preparation of rubber for shipment. The creation of the Superintendency of the Economic Defense of Rubber covers all these items in the most elaborate form.

Fifth. He advises the Federal government to enter into agreement with the northern governments for the reduction of duties. This is fully provided for in the said law, and we have already stated why it cannot be done from one day to another.

Sixth. He suggests the urging of the Federal government to carry out the establishment of central hospitals, etc., and goes on to mention the very law we are citing and which he should know is being carried out, no less a personage than the world-famed Dr. Oswaldo Cruz having been entrusted with the task.

Seventh. He suggests the establishment of centres of supply, where the employers of labor can purchase at reasonable rates all articles necessary for the workmen in the rubber dis-

tricts, and in this manner bring about a substantial reduction in the cost of living. If we turn to the said law we find that the government has provided for the creation of several agricultural farms precisely for the said purpose.

Eighth. He urges the establishment of one or more experimental stations in order to demonstrate economical methods of producing rubber and foodstuffs. If we turn to page 153, we find a complete law, making every provision conducing towards the point he suggests.

Tenth. He suggests arrangements to facilitate the acquisition of tapping tools and agricultural machinery at low costs. By virtue of the said law, all such machinery and tools are allowed to come into the country duty free; and it would be impossible for any government to do more than this, within reason.

And last, but not least, the introduction of the system of planting food crops in the alluvial deposits on the river banks after the annual floods. Mr. Akers will be astonished to hear that this system does not require to be introduced, for it has long been prevalent along the Amazon. The only reason why it is not carried on to greater extent is because there is not enough labor. To remedy this Mr. Akers suggests the introduction of coolies from China. The law already referred to provides for the introduction of native and European labor, for which suitable accommodations are to be built in the principal points along the Amazon.

So far, then, one wonders whether the Federal government was inspired by Mr. Akers or his associates, in the drafting of the good laws, or whether Mr. Akers chose to follow the government's trodden path, only emphasizing here and there the points of great importance to the interests he represents.

But on this score, we, at least, have not the slightest doubt. For almost every item provided for in the said laws was fully commented on by Dr. Passos de Miranda Fitho at the Rubber Congress held in Manáos in 1910 and the one which followed it in Rio in 1911. We have not the slightest doubt that Brazilians are quite capable of solving their own problems and have disposed of the whole matter, satisfactorily, so far as making legal provision and voting the appropriations were concerned.

Mr. Akers' report then could have been made for no other purpose than to infuse enthusiasm in European financial circles, and we are pleased to see this done so cleverly and effectually. The question is whether the same purpose could not have been attained by a simpler method. For, as we have said, the world wonders who is it that has authorized Mr. Akers to issue a report of such pretensions on the Amazon valley, when it seems that no one in authority ever asked him to do so. We are quite certain that Brazil is ever ready to accord the bond holders of any enterprise within its limits every reasonable opportunity to improve their position and satisfy themselves of the solidity of the guarantees they hold, and it looks a bit out of the ordinary to adopt the indirect methods that are constituted by what is now known as the "Akers' Mission."

BRAZILIAN CREDIT IN THE FIRST RANK.

In writing the "Folha do Norte," Mr. Franklin Morse remarks: "The future of South America is the subject of serious discussion among the principal European bankers. According to the classification made by Lombard Street of the South American countries, there figure in the first rank Brazil, Argentina and Chile; in the second rank—Peru and Uruguay; and in the third rank Bolivia and Colombia. The remaining South American countries are considered as outside the limit of financial operations of a serious character."

BRAZILIAN GEOGRAPHICAL CONGRESS.

The Brazilian Geographical Congress, which has met in recent years at Rio de Janeiro, São Paulo and Curuyuba, is to be held this year at Recifé, on September 7. A geographical exhibition will remain open until September 16.

A HANDSOME RUBBER MEDAL.

An interesting souvenir, prepared by the thoughtful Brazilians at the New York Rubber Exposition, was a disc of Fine Pará Rubber, to which was attached a rosette of satin ribbon in colors that artistically blended those of Brazil and the United States. This was put up in a sumptuous satin-lined box. It was planned as a decoration for the presiding officer at the Rubber Banquet that closed the Exposition. An error prevented its being worn, but it adorns the editorial sanctum and is one of the very pleasant souvenirs of a memorable occasion. Aside from its value as a remembrance it has a very distinctive prophetic value. The fact that a Brazilian is able to produce easily and cheaply a product in every way the equal of the finest plantation biscuit, points to what may be done with the latex of the wild *Hevea* once it has been found to be necessary.

NEW AKERS EXPEDITIONS.

As reported in the June issue of THE INDIA RUBBER WORLD, Mr. Akers had arrived in Pará, where a demonstration took place of the Oriental method of tapping.

The "Folha do Norte" states that he would leave Pará for Europe and the East in June, with the view of organizing two supplementary expeditions. These expeditions, it is added, are intended to develop the service of instruction on the Upper Purus and the Upper Juruá rivers, as well as in the region of the Lower Amazon.

BRAZILIAN PREFERENCE AGAIN IN FORCE.

As explained in the May issue of the INDIA RUBBER WORLD, page 409, certain American goods have hitherto enjoyed a preference in Brazil. This preference has amounted to 30 per cent. on wheat flour and 20 per cent. on some 15 other articles, including manufactures of rubber. These preferences were withdrawn by the Brazilian government on April 9, but have since been restored under the decree of May 6.

BRAZILIAN GOVERNMENT INCREASES GRANT TO RIO EXHIBITION.

At the request of the Minister of Agriculture, the Brazilian Minister of Finance has given instructions for the credits allotted the fiscal delegations of the various states for defraying the expenses connected with the Rio Exhibition to be increased by Rs. 208:480$000 ($69,493). The amount will be divided *pro rata* between the delegations of Amazonas, Pará, Maranhão, Ceará, Rio Grande do Norte, Parahyba, Pernambuco, Alagoas, Sergipe, Bahia, Parana and Goyaz.

THE EAST PASSES BRAZIL.

For the first time in the history of rubber, the production of rubber from the Far East for the year ending June 30, 1913, will exceed the output of rubber from Brazil. According to the closest estimates, the Brazilian production for the year will be 42,000 tons, an increase of about 2,000 tons over last year—while the output from the East will be somewhere from 50,000 to 54,000 tons, or 20 per cent. more than the Brazilian product. Incidentally, it might be mentioned that the price of fine Pará on June 1st was 90c a pound as against $1.10 a pound one year ago.

Important Meetings at Pará.

ON May 1, a largely attended meeting responded to the invitation of the Pará Commercial Association, for the purpose of discussing the crisis now existing in Amazonia and the measures necessary for improving present conditions. The meeting had more than local significance, being held under the presidency of Admiral José Carlos de Carvalho, a prominent member of the group of noted Brazilians at the recent New York Rubber Exposition, and federal deputy from the State of Rio Grande do Sul. In his opening remarks the admiral referred to his visit to New York in company with Dr. Jacques Huber, whom he termed a "friend of Amazonia," expressing his appreciation of the information he had acquired on that occasion. He promised to do all in his power to further the objects of the meeting.

Speaking of the high cost of freights, he stated that it was due to the excessive size of the crews which the river steamers were obliged to carry under existing regulations. A measure introduced dealing with river navigation had been defeated in the Federal Senate for political motives. Other measures of that character are now engaging legislative attention.

Dr. Ferreira Teixeira then addressed the meeting, expressing the opinion that instead of taking up the many complex divisions of the subject it would be advisable to try to solve two fundamental questions:—The reduction of the cost of producing rubber, and the attainment of a higher scale of value through the careful preparation of a fixed type of the article.

In connection with the first question, he advocated the diminution of municipal taxes and the lowering of the freights of the "Lloyd Brazileiro" for articles of food, as well as the revision of customs tariffs on food, clothing and fuel. He likewise urged the abolition of inter-state and other taxes on imported provisions, as well as a lowering of freights by Amazon steamers.

With regard to the preparation of rubber, the speaker considered the initiative rested with the *Seringueiro*. He likewise expressed the opinion that the latex should be strained before coagulation and that the rubber should be extremely dry; that is, should not contain any water. "Sernamby," however, should be washed, thus completely eliminating foreign substances.

The general conclusions urged by the speaker included the formation of a large association, composed of those who are interested in the agricultural, industrial and commercial prosperity of Pará. He likewise urged the nomination of a large committee for the purpose of convening a congress at Pará at the earliest date possible, representing the three last-named interests, in which the State of Amazonas and the Territory of Acre would have the right of taking part.

Dr. Jacques Huber then spoke and submitted various samples of plantation rubber.

An opportunity was then afforded those present of examining samples treated by the processes of Dr. Cerqueira Pinto and Señhor José Amando Mendes. For both of these processes superiority is claimed over the eastern product. Deputy Vianna Coutinho referred to his process for rubber smoking with an apparatus of his own design, as well as to a *machadinho*, also of his invention. Specimens of both the above appliances, with samples of rubber prepared by the first-named method, were on exhibition.

Telegrams were sent to the president of the Republic and the president of the Senate, expressing the hope that measures would be taken to reduce the cost of living.

Various tapping appliances were shown by their respective inventors and referred to a committee under the presidency of Dr Jacques Huber.

RUBBER CONGRESS BEING ORGANIZED.

A committee was appointed to organize a congress at an early date. The committee was under the presidency of Admiral de Carvalho; the members being: Dr. José Ferreira Teixeira, Dr. J. Huber, Dr. J. Barbosa Rodrigues, Jr., Dr. Manoel José Rebello, Jr., Dr. Banto José de Miranda, Claudino Romariz, Dr. Luciano Castro, Dr. Antonino Emiliano de Sousa Castro, J. A. Fonseca, Manoel Barreiros Lima, Francisco Coutinho, Jr., Dr. Manoel Lobato, Col. Avelino de Medeiros Chaves, and Manoel Vianna Coutinho.

The purpose of the congress will be to deal with the present rubber crisis and to develop rubber preparation.

Following out this resolution, the principal members of the committee and others interested in the subject assembled next day at the headquarters of the Pará Commercial Association under the chairmanship of Dr. Ferreira Teixeira.

The officials chosen to organize the congress were: President, Admiral Carvalho; vice-president, Dr. José Ferreira Teixeira; secretary, José Amando Mendes; treasurer, Manoel J. Rebello, Jr.; assistant secretary, Dr. Casimiro Gomez da Silva. Various other committees were likewise appointed which will deal with the reduction of export taxes and the abolition of inter-municipal imposts on flour, fish (fresh, dried and salted), meat, fruit, etc.

Among the resolutions adopted was one providing for sending circulars to all inventors of appliances for the extraction of rubber, asking them to forward these articles to the congress, accompanied by photographs and brief descriptions. The object of another resolution was to ask from the principal Amazonian navigation companies and shipowners the exemption from freight of exhibits intended for the congress.

The preparation of a program has been entrusted to a special committee, which is composed of Señhores Dr. Sousa Castro, Dr. J. Huber, and Amando Mendes. It was decided to invite a number of prominent men connected with the rubber industry to join the committee of organization.

The congress is scheduled to open on August 15th next, under the presidency of Dr. Enéas Martins, governor of the State of Pará. Several meetings of the committee have taken place, at which various details were elaborated.

MEETING OF PARA AVIADORS.

Following the two meetings already mentioned, the Pará aviadors and exporters (in conjunction with members of the "Defesa da Borracha"), held a meeting on May 9, to consider the proposal of Admiral Carvalho. This proposal, as reproduced by the "Folha do Norte," was based on the alleged want of care in the preparation of rubber, particularly of "Sernamby." It urged that it is for the dealers to insist on the adoption of a system of curing, and on the establishment of the types best fitted to compete with plantation rubbers, thus improving the quality while reducing the expenses. For "Sernamby" there should be a perfectly clean quality, free from all impurities. For the quality known as "fine," a type should be established prepared on the system of J. A. Mendes, Vianna Coutinho, Cerqueira Pinto, or on any other system with like advantages.

Señhor Rebello urged the gradual adoption of improvements without giving up the present system. Dr. Ferreira Teixeira expressed his approval of the principal features of Admiral Carvalho's proposal, advocating the elimination of the "Entrefine" and "Cameta Sernamby" grades. Dr. Huber remarked that a transformation of system could not be general, as the type made in the form of balls was preferred by foreign consumers. The smoking ought to be continued as at present, if no prejudicial elements were present. The speaker coincided

with those who had advocated restricting the grades to Sernamby and "Fine," eliminating the "Entrefine" type.

Señhor Vianna Coutinho opposed the elimination of "Entrefine" rubber, as there are regions which cannot produce the latex required for the "Fine" grade.

The resolutions finally adopted were:

1. The elimination as far as possible, of the "Entrefine" grade, by the diffusion of the processes of smoking in sheets (Amando Mendes and Vianna Coutinho), and of the chemical processes of Cerqueira Pinto and others, when approved by the governor of the state.

2. The elimination of the type of "Cameta Sernamby."

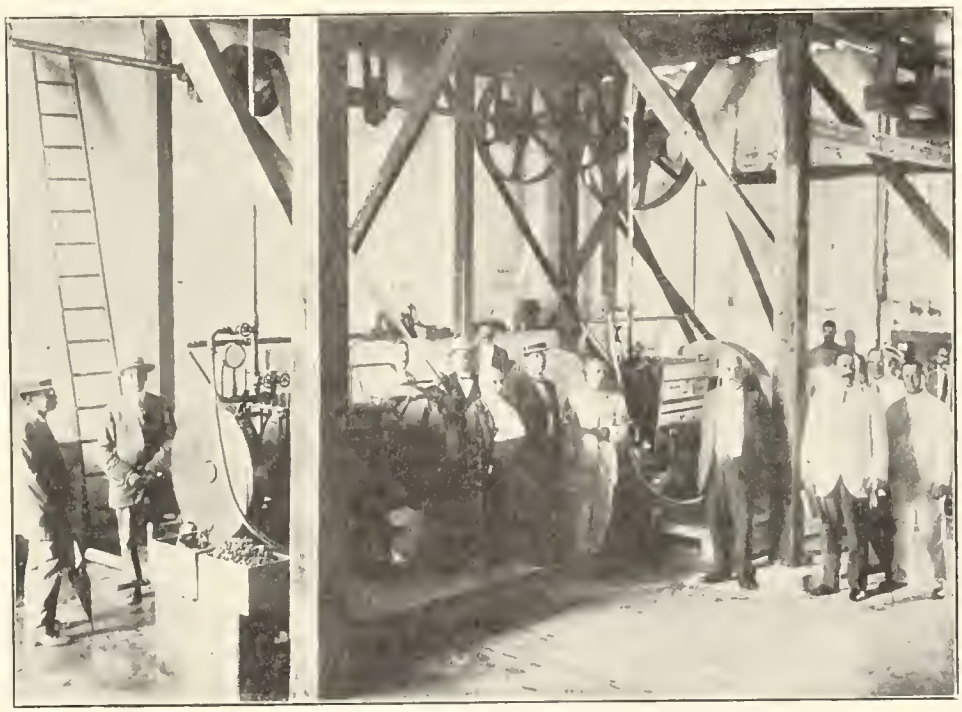
3. The improvement of Island "Sernamby."

4. The manufacture of Caucho by the Cerqueira Pinto process or other equivalent process.

Considerable interest attaches to the above meetings. The proposed establishment of a large association is doubtless expected to facilitate the carrying out of the various suggestions which have lately been made for the development of the Brazilian rubber industry.

WASHING RUBBER IN MANAOS.

A LETTER has just been received from Manáos—which is reproduced below—which is interesting not only because of its reference to the subject of washing machines, treated at length in the May issue of THE INDIA RUBBER WORLD, but particularly as giving a concrete illustration of the new activity in the Amazon rubber country in the campaign for producing cleaner and cheaper rubber, so as to be able to compete with the greatly increased product of the East. The samples referred to in the letter look like good, hard, dry rubber, and if the washing cost is not too great the work of these machines ought to prove entirely satisfactory.



RUBBER WASHING MACHINES INSTALLED AT MANAOS.

H.C.PEARSON,ESQ.,

EDITOR OF THE INDIA RUBBER WORLD, NEW YORK:

Dear Sir—In the issue of the INDIA RUBBER WORLD dated May 1, 1913, I noted with interest what you say about rubber washing and washing machines on pages 396 and 411.

As an interested party in the matter, I beg leave to state that rubber washing is indeed an accomplished fact in Manáos. At about the time when the famous law about the "Defesa da Borracha" was passed, I decided to try whether it would be possible to find a suitable machine for washing such rubber as comes to our market full of impurities, and which suffers in consequence a heavy reduction in price. For this purpose I took with me to Europe a certain quantity of dirty coarse, and after having seen various other systems of machines I visited Messrs. Werner & Pfleiderer in Cannstadt, who showed me their new rubber washing machines and washed in my presence the samples I gave them. As the result was a satisfactory one I bought two of their machines. They offered me the agency for their machines in Northern Brazil, which I accepted.

The above-mentioned two machines have been installed in the stores of the well-known firm of J. G. Araujo, of Manáos, and were operated recently in the presence of his Excellency the Governor of the State of Amazon and the local superintendent of the "Defesa da Borracha," as well as of other authorities and merchants.

My object is not to wash fine rubber, but only such qualities as would not find ready buyers in the consuming markets, i. e., dirty coarse, dirty caucho balls, etc. which would have to be sold at very low prices and would only impair confidence in good qualities. By sending a clean and uniform quality to the consuming markets I hope to establish a standard quality.

Enclosed I beg to hand you some photos showing the installation of the two machines, and by same mail I am sending you a sample of washed coarse.

I do not claim that the system is a perfect one as yet, and I shall be thankful for any hint which may be useful for its improvement.

I am, dear sir, yours very truly. PH. SCHLEE.

Manáos, May 26, 1913.

AMAZON EXPLORERS QUIT THEIR SHIP.

In the April issue of THE INDIA RUBBER WORLD mention was made of the expedition sent out under the auspices of the University of Pennsylvania for the purpose of exploring the upper tributaries of the Amazon. The expedition set sail on the 19th of March, in the "Pennsylvania," a yacht of 184 tons burden. Unfortunately, the "Pennsylvania" has not lived up to expectations. It sprang a leak soon after leaving Philadelphia and had to put in at Newport News. It was also found necessary to make further repairs on arrival at Charleston; and this experience was repeated off the Florida coast, so that they put into Jacksonville, where they abandoned the yacht. The expedition, however, will proceed to the Amazon, where a new boat suitable for exploration purposes will be secured.

DR. HUBER AND THE TURIN EXHIBITION OF 1911.

A banquet was lately offered at the Café da Paz, Pará to Dr. Jacques Huber and Señhor Jayme Abreu, two of the three representatives of Pará at the Turin Exhibition of 1911. Appropriate reference was made to the memory of the late Commander João Rodriguez Martins, the third delegate, deceased since the exhibition.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE City of Akron, which was the first city in the United States to use an automobile fire patrol, has just let contracts which will more adequately protect its various industries, among which are those manufacturing rubber goods. These contracts provide for the installation of motor apparatus and will do away entirely with all that now drawn by horses. The city has installed in its water plant heavier pumping engines, so that the present pressure is much stronger.

Contracts for the new reservoir which will dam the waters of the Big Cuyahoga River for almost two miles, with a maximum depth of 33 feet, have been let, and the water mains connecting the large reservoir with the power reservoir are rapidly being placed in position; so that within two years' time Akron will have a supply of pure water sufficient for a population several times the present one, including the needs of the rubber plants, several of the larger of which use as much water as many of the smaller cities of this country, ranging in size from 20,000 to 50,000 people. The new supply taken from the Cuyahoga River, together with that from the Tuscarawas River and the Portage Lakes, will give the City of Akron and vicinity enough water to adequately take care of the anticipated growth in its industries and population for many years to come.

* * *

Saturday afternoon, June 7, a fire broke out in the general offices of The Goodyear Tire and Rubber Co. among the office supplies which filled the basement. The fire before discovered affected the gas pipes, so that gas began to escape. There being no exit for the smoke, it became very dense, and on account of this and the gas the fire was very hard to locate. Six lines of hose were laid and it took three hours to subdue the blaze. When finally conquered the water lay several feet deep upon the basement floor, and although the total damage caused by the fire was not great, much damage was done by smoke and water.

The volunteer fire department of the company aided the city department. Mr. Shiller, from the master mechanic's office, one of the volunteers, stuck with the best of the veterans and finally had to be carried out, with several of the city force, overcome by smoke and gas. Both city and volunteer departments gave excellent service.

* * *

W. B. Miller, former secretary and sales manager of the Diamond Rubber Co., leaves in a week for his new home at Beverly Farm, Massachusetts. Miller's West Hill home was sold to Henry Manton, vice-president of the First-Second National Bank.

"No, I am not going into business again," said Miller. "I'm just going to loaf."

* * *

The Swinehart Tire and Rubber Co. is rapidly completing its large new addition, which will give space to almost double its present tire output.

* * *

As a tribute to Mr. Mason of The B. F. Goodrich Co., who has done so much for his home city, the school board has named the new school building which is being erected in East Akron the Mason School.

* * *

Many employes of the various rubber factories have, during the last few years, built homes on the west side, so that Akron is compelled to erect a new high school building, not far from the Perkins homestead.

* * *

The chemical section of the Goodyear Technical Society has the promise of the noted industrial chemist, Dr. John A. Shaeffer, chief chemist of The Picher Lead Co., Joplin, Missouri, to give them a lecture on "The Smelting and Casting of Lead and the Preparation of Lead Compound." He has many lantern slides illustrating the lead mines in Missouri, and will give the main facts concerning the manufacture of litharge and sublimed white lead, largely used in the compounding of rubber.

* * *

The Goodyear Tire and Rubber Co., through its vice-president, C. W. Seiberling, made the following statement:

"Sales of The Goodyear Tire and Rubber Co. over the last six months show the following gains, as compared with the previous year: April, 1913, 8 per cent.; March, 1913, 2 per cent.; February, 1913, 24 per cent.; January, 1913, 45 per cent.; December, 1912, 52 per cent.; November, 1912, 31 per cent. Although figures for May are not yet in, officials expect the gain in that month to be about 15 per cent.

"When we started this year everything indicated that we would do a $40,000,000 gross business. Now, however, indications are for figures considerably below that amount and we shall be satisfied with a 25 per cent. increase in sales as compared with a year ago, which would bring our gross business in 1913 up to about $32,000,000 or $33,000,000. There appears to be a general slowing up in business all around and the rubber goods trade has suffered as well as the rest.

"We have now about 6,100 employes, but could use at least 1,500 more. We are manufacturing about 5,500 automobile tires per day, as compared with 6,500 before the strike. In addition to the automobile tires, we are also putting out about 1,000 each of bicycle and motorcycle tires daily.

"So far as the reduction in tariff on rubber goods is concerned, I do not think that the proposed schedule will hurt us. We are well prepared to meet any foreign competition that may be offered.

"The Goodyear company is now going into the manufacture of mechanical rubber goods on a far greater scale than has ever before been attempted. Within two or three years we expect to be able to manufacture from $2,000,000 to $3,000,000 of mechanical rubber goods a year. We are not doing over $500,000 in this department at the present time.

"It has never been, with but one exception, the policy of the Goodyear management to sell any new stock that it might be deemed advisable to put out. This stock has always been distributed in the form of stock dividends. The Goodyear company has a little over $10,000,000 stock outstanding of an authorized issue of $15,000,000. The company is now paying 12 per cent. in dividends annually on its common stock. This dividend is paid in a single disbursement at the close of the fiscal year. It is the present intention of the management to make a distribution at the close of 1913 at least as large as that of a year ago."

* * *

The Goodyear Tire and Rubber Co. recently shipped to the Far East a large consignment of specially built rubber tires for use on jinrikishas.

* * *

C. A. Swinehart, for several years sales manager of the Swinehart Tire and Rubber Co., of Akron, Ohio, has become general manager of the Vulcan Rubber Co., of Erie, Pennsylvania. This company has been manufacturing mechanical rubber goods and inner tubes and now, under the management of Mr. Swinehart, will take up the manufacture of commercial truck tires. The company, in which Mr. Swinehart and Mr. H. F. Burger, formerly with the Swinehart company, have acquired an interest, is incorporated for $200,000. Mr. Swinehart has designed a solid tire for which he claims special merit and which this company will place upon the market.

* * *

Emil Gammeter, sales manager of the Universal Stock Calender Shells Co., Cadiz, Ohio, and also of "Aluminum

Flake," has gone to Europe, where he expects to organize sales agencies for his products.

* * *

On Saturday, June 14, Akron and Columbiana, Ohio, and all the towns and cities between, were the scene of one of the most "exclusive affairs" of the season in automobile circles. It was the occasion of "the Firestone Foremen's Home-

Firestone Foremen's Homestead Dinner.

stead Dinner," Mr. Firestone's invitation list being strictly limited to factory superintendents and foremen, with officials and directors of the Firestone Tire and Rubber Co. Even so, a fleet of about 30 cars was needed, the guests numbering 145. Charles S. Whitman, District Attorney of New York and candidate for Mayor, was the only guest drawn from outside the "Firestone Family." In addressing the diners—"down on the farm"—Mr. Whitman told of his life-long friendship with Mr. Firestone and of his years of boyhood spent in Columbiana County, Ohio, during which time he was a frequent visitor at the Firestone Farm.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

GENERAL conditions of the local rubber trade have not changed materially the past month. The retail trade is moderately active for footwear, clothing and sundries, while the wholesale business has been fair in all lines. The constantly increasing use of automobiles this season has benefited local tire houses, who report activity in that line. While almost every known make of tire has local representation, there is no complaint to be heard from dealers, jobbers and branch houses of lack of trade.

* * *

The day of leather sole and heel Oxfords for summer wear is past. This is the verdict of local shoe manufacturers who this year were obliged to put on the market, in competition with the big shoe factories of the country, Oxfords and pumps with rubber soles and heels. It is the unanimous opinion of the shoe manufacturers locally that the use of rubber soles and heels will ultimately result in the adoption of rubber bottoms for all kinds of shoes, as the demand will be for this class of footwear after the public becomes accustomed to the use of rubber soles and heels. What effect the adoption of rubber soles will have upon the shoe market with reference to price remains to be developed.

* * *

An interesting part of the exhibit which was held in connection with the annual convention of the Building Owners and Managers held in this city June 12-14, was the display of rubber accessories used in the modern office buildings and skyscrapers throughout the country. This part of the display was interesting to the delegates to the convention, as well as to the casual visitor to the exhibition, as it gave visitors an insight into the large number of uses to which rubber is applied in the manufacture of necessities for the modern office buildings of today. One of the largest exhibitors was the Dryden Rubber Co., of Chicago. The Atlas Rubber & Belting Co. of this city also had a unique display.

* * *

"Not guilty of stealing rubber, goodbye." This was the note found by the coroner beside the body of John Thompson, receiving clerk at the C. H. & D. railroad yards, who committed suicide by cutting his throat. Several weeks ago it was reported to the police that a number of tires, consigned to local dealers, were taken from the depot. According to testimony brought out at the inquest, it developed that Thompson was driven insane by companions who jokingly accused him of stealing the rubber tires.

* * *

The B. F. Goodrich Co. opened temporary employment offices in this city enlisting men to go to Akron to learn the rubber trade. It was announced at the employment office, which was established at the Grand Hotel, that on account of the increased business the company needs about 2,000 additional workmen, and to this end efforts are being made to recruit this small army of men from the various large cities within a reasonable distance from Akron.

* * *

James Albert Green, one of the directors of the Cincinnati Rubber Manufacturing Co., was appointed by the Common Pleas Judges of the County as a member of the Public Library Board of Trustees.

* * *

Judging from reports by proprietors of the various automobile supply houses, it would seem that this part of the country has taken on an exaggerated case of automobile craze. For example, A. C. Davis, of Coughlin & Davis, says: "Not in the seven years of my activity in the auto supply trade has there been so enormous a demand for accessories and so annoying an inability on part of the manufacturers to furnish them with any degree of promptness. Daily we are telegraphing and using long distance telephone, but without avail, in hurrying the shipment of goods that are in any wise staple. Similar complaints are heard in salesrooms of nearly every other supply house in the city.

* * *

The death on June 5 of Mrs. Cora Hayward Crawford, wife of Dr. J. M. Crawford, one of the founders of the Cincinnati Rubber Manufacturing Co. and for several years president of that company and now one of its directors, awakened sincere and widespread regret in the circles of the city in which for years she had been a gracious and winning personality. During the six years that Dr. Crawford was United States Consul General at St. Petersburg she was a resident of that city. Some six years ago she made an extensive tour of Mexico, and her observations and impressions have been given in a delightful volume, "The Land of the Montezumas."

* * *

The American Manufacturing and Distributing Co., of Louisville, has placed on the market a tire puncture cure known as "Prest-O-Ceal." The company has launched a big advertising campaign to introduce the product, and headquarters have been opened at 123 East Seventh street. It is claimed for the new product that it will seal up punctures of any size. The product is a paste-like amalgam of mineral and fibrous material.

The Ohio Rubber Co., which is retiring from the retail trade in this city and will operate a big wholesale house here—announcement of which was made in this column last month—started a "retail discontinuation sale" June 10 to continue until the big retail stock carried by the company is disposed of. The Ohio company, through the efficient management of Edward G. Howard, enjoys an excellent wholesale trade in this city and vicinity. It was because of this large trade locally that the company decided to discontinue the retail business, as it was in a way competing with its own customers. The company will act as jobbers or selling agents for the leading rubber companies of the country.

* * *

The annual "Orphans' Parade and Outing," as sponsored yearly by the Cincinnati Automobile Club, eclipsed this year all previous efforts. Approximately 300 machines were used in the parade, while 1,700 "kiddies" were made happy by reason of a delightful "joy ride." To encourage participation in the outing by auto owners, the committee this year having charge of the parade arranged for prizes to be awarded owners taking part. The local tire houses were the most liberal contributors of prizes, there being no less than ten different makes of inner tubes offered as prizes. The prizes consisted of every conceivable accessory used about an automobile, and they were hotly competed for.

* * *

Fred A. Geier, vice-president of the Cincinnati Rubber Manufacturing Co., has come prominently to the front in the past month in connection with Cincinnati's philanthropic work. He has been elected president of the Council for Social Agencies, which was incorporated last month, and at a recent meeting of "the better housing movement," which has in prospect the erection of modern homes for workmen, the rents of which are to be suited to the income of the occupants, Mr. Geier subscribed $10,000 to the fund being raised to carry on the work.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

THE trade in rubber tires is brisk, as of course it ought to be at this season of the year, for this is practically the rush season on tires. Old tires carried over on machines through the winter have by this time begun to show more or less wear and require replacing. There is considerable activity in mechanical rubber goods, particularly of the kind used on the large Western farms—rubber belting, for instance, for outdoor machinery. And in the footwear line it can be safely predicated that the popularity of the rubber soled shoe has reached Chicago. There is a very large sale for this exceedingly comfortable summer shoe.

* * *

The convention of the National Building Managers' Association, held at Cincinnati last month, was attended by many representatives of the local rubber houses, several of whom had exhibits at the convention and who report the returns therefrom as entirely satisfactory. The event is an annual one. It is a gathering of the managers of buildings throughout the country, for the purpose of getting new ideas on building equipment. Local dealers exhibited their various lines of fire hose equipment for modern office buildings, and the other necessary requirements of such buildings, as rubber matting, etc.

* * *

W. H. Salisbury & Co. are featuring a new garden hose mending device which is proving popular with the user of garden hose. It is a metal contrivance with clincher ends. A brass tube inserted in the hose couples the place to be mended, and the ends are clinched into the hose; which insures a firm grip. The price is moderate, which further commends its use to the consumer.

* * *

How ridiculous the rubber trade of Chicago is being made by the "shoddy" stores—of which an exposé was printed in this column last month—is indicated by the following paragraph clipped from the widely read humorous column of one of the Chicago morning papers: "As all raincoat and trunk dealers are constantly in a state of being overstocked or going out of business and selling below cost, I would suggest that all of the raincoats be packed in all of the trunks and shipped to some far off country where both commodities will find a profit producing market."

Despite individual fuming and complaining among the dealers in regard to the situation, no concerted action has been taken to offset the effect of these thoroughly unreliable houses. All agree that something must be done, but no plausible plan has as yet been presented. In the case of similar unscrupulous dealers in the furniture trade one house took it upon itself to expose their business methods in all of the daily papers; which plan proved effective, keeping customers away from those places.

* * *

A bill for receiver was filed against the $1,000,000 Dutch Guiana Culture company, a rubber planting concern with an Arizona charter, and with offices in the City Hall Square building. The petitioner, Roy C. Holbrook, secretary of the company, alleges waste of stockholders' funds by other officers. L. C. Parker is president and treasurer; James A. Crawford and Louis T. Orr are directors.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

THE annual sales conference of the representatives of the National India Rubber Co., of Bristol, with delegates from various States in the Union, was held at Bristol early in the month. There was a two days' gathering, during which business and pleasure were so combined as to detract from neither. Conferences were held with Vice-President LeBaron C. Colt at the offices of the company; and the wire department of the corporation was specially discussed in regard to the betterment of the business in insulated wire, which is one of the chief products of the Bristol plant.

The sales people arrived on Thursday morning, June 12, and a business meeting was at once held. The ground covered during the past year was considered at length, and reports and suggestions were offered by the delegates from the different sections. On Thursday evening Vice-President Colt entertained the visitors at his home on Smith street, when brief addresses were made by all present and Fay's orchestra rendered musical selections. Another business session was held the following forenoon at the company's offices, after which the party was entertained at a Rhode Island clambake at the farm of Col. Samuel P. Colt at Poppasquash Neck. Later a baseball game was played, the married and the single men forming opposing teams. The group was then photographed, and after general sightseeing the conference was ended. At the clambake were: Vice-President Le Baron C. Colt, Treasurer A. H. Emerson, F. L. Dunbar, W. R. Davis, J. W. Franklin, W. J. McCaw and J. T. Ashton, all of Bristol; A. P. Eckhert, M. F. King, George E. Shaw, R. M. Campbell and Rudolph R. Rosa, of New York; P. F. Lyons and M. E. Flaherty, of Chicago; William A. Wardwell, of Boston; E. E. Curry, of Atlanta, Ga., and H. B. Squires, of San Francisco.

* * *

The Revere Rubber Co. has commenced the erection of a considerable addition to its one-story frame building on Eagle street, this city, to be used for office purposes.

A system of pensions is being established in the factory of the National Rubber Co. at Bristol, and for several months past half a dozen of the former employes of the concern have been receiving weekly pensions. Two of the beneficiaries under the pension system, John Newbold and William H. Young, had served in the factory for upward of forty years each.

* * *

A new shipping shed, of wood with a concrete foundation, has been erected at the factory of the National India Rubber Co. at Bristol, for the shipment of insulated wire. It is 160 feet in length and 70 feet in width.

* * *

The Woonsocket Rubber Co. of Woonsocket, recently called for fifty girls to learn rubber shoemaking. The company is running to capacity to keep up to the demands on these goods.

* * *

The Woonsocket Rubber Co., the Joseph Banigan Rubber Co. and the Marvel Rubber Co., all subsidiaries of the United States Rubber Co., held annual meetings of stockholders on May 27. The meeting of the Woonsocket Rubber Co. was held at the company's office at Woonsocket, and Walter S. Ballou, Samuel P. Colt, Walter A. Read, John W. Ellis, James Harris, George Schlosser and Clarence H. Guild were elected directors. All of the seven, with the exception of Messrs. Schlosser and Guild, were re-elected, these two filling the vacancies caused by the death of Edward R. Rice and the resignation of Homer E. Sawyer. Walter S. Ballou was re-elected president and Clarence H. Guild, of Providence, secretary and treasurer. Homer E. Sawyer was chosen general manager in place of Walter S. Ballou, who previously held the latter position in addition to being the corporation's president. George Schlosser, of Woonsocket was again chosen general superintendent and Henry C. Wagner, of Woonsocket, superintendent.

At the meeting of the Joseph Banigan Rubber Co. Walter S. Ballou, Samuel P. Colt, Walter A. Read, John W. Ellis and Clarence H. Guild were elected directors. Messrs. Read and Ellis are new men on this board, taking the places of Homer E. Sawyer, resigned, and Edward R. Rice, deceased. The directors again chose Walter S. Ballou president and Clarence H. Guild secretary-treasurer. Mr. Sawyer was appointed general manager in place of Mr. Ballou, who had previously held that position.

The meeting of the Marvel Rubber Co. resulted in the election of Samuel P. Colt, Walter S. Ballou, Walter A. Read John W. Ellis and James Harris as directors. Samuel P. Colt was re-elected president and Clarence H. Guild secretary-treasurer. Homer E. Sawyer was appointed general manager in place of Col. Colt.

* * *

Among the corporations doing business in Rhode Island that have a corporate excess of $50,000 or more, according to the latest assessment made by the Rhode Island Tax Commission, whose report was filed a few days ago with the General Treasurer for collection, are the following: American Emery Wheel Works, excess $51,450.58, tax $205.80; American Multiple Fabric Co., excess $99,897.70, tax $399.59; American Wringer Co., excess $1,252,579.21, tax $5,010.31; Joseph Banigan Rubber Co., excess $1,338,900, tax $5,355.60; Bourn Rubber Co., excess $101,407.11, tax $405.62; Collyer Insulated Wire Co., excess $62,580, tax $250.32; Davol Rubber Co., excess $109,079.62, tax $436.31; Glendale Elastic Fabric Co., excess $229,733.76, tax $918.93; International Rubber Co., excess $78,506.99, tax $314.02; Mechanical Fabric Co., excess $636,676.93, tax $2,546.70; National India Rubber Co., excess $1,845,566.95, tax $7,382.26; Phillips Insulated Wire Co., excess $1,543,680, tax $6,174.72; Revere Rubber Co., excess $851,627.42, tax $3,406.50; Washburn Wire Co., excess $691,922.68, tax $2,767.69; Woonsocket Rubber Co., excess $955,512.28, tax $3,822.04.

* * *

C. L. Stockbridge, of Boston, sales manager for the Hood Rubber Co., was a member of the party which accompanied the delegation of the Institute of Automobile Engineers of England on their visit to a number of the manufacturing plants in this city and other sections of New England early this month.

* * *

William J. Golden, formerly of Bristol, who went to Muskegon, Michigan, a year ago last April to take the foremanship of the mechanical department in the factory of the Vulcanized Products Co. of that city, was recently appointed superintendent of the plant. He was for a number of years foreman of the mechanical department at the factory of the National India Rubber Co. at Bristol.

* * *

Col. Samuel P. Colt, president of the United States Rubber Co., gave a dinner at "Linden Place," his summer home at Bristol, on Friday, May 30, at which he entertained friends from New York, Washington, Boston, Providence and Bristol. On June 1 the party left this city for Boston en route for the Colonel's hunting camp—as described in the general news columns of this issue.

* * *

"Two years ago today we started in business here in Providence," said A. N. Bannister, local agent for the Goodyear Tire and Rubber Co., of Akron, Ohio, speaking reminiscently on June 13. "At that time we had five employes. In the two years this number has grown to 13 and the business has grown correspondingly."

* * *

A cablegram received at Woonsocket early in the month stated that Hugo Hammann died in Paris, France, May 28, where he was stricken several weeks ago. Mr. Hammann was for more than twenty years an overseer in the Millville rubber mill of the Woonsocket Rubber Co. and later he was superintendent of the Joseph Banigan rubber mill at Olneyville. From the latter place he went, four years ago, to the Kaufmann Rubber Co. at Berlin, Ontario, as superintendent. He remained there for three years, returning to East Blackstone last year. On April 12 he sailed for Paris on a business trip and while there suffered a shock, which resulted in his death. He was well known throughout rubber circles of New England.

* * *

Mr. and Mrs. Walter S. Ballou will sail on the Steamship "Baltic" of the White Star Line on July 10 for a motor trip through England and Scotland. They expect to be absent for several weeks.

* * *

The contract for the big refrigerating plant to be erected by the Revere Rubber Co. at its Valley street plant, this city, was awarded a few days ago to a Providence contractor. The building is to be one of the largest of its kind used by rubber manufacturers in this part of the country. It will be used in cooling the rooms where the rubber goods are stored. The dining hall for the use of officials of the concern is nearly completed. This will be a great accommodation to the heads of the several departments. A number of other improvements are under contemplation, but very few will be attempted for the present, as the concern is very busy, operating two full shifts—night and day.

* * *

"The latest step in the growth of the Goodyear Tire and Rubber Co.," said A. M. Bannister, manager of the Provi-

dence branch, a few days ago, "is the purchase of a large tract of ground at Killingly, situated in the extreme northeast corner of the State of Connecticut. On the property is a large cotton mill, four stories high and 400 feet in length, where will be made a large part of the tire fabrics, hose and belting ducks so extensively used by the company. There are also on the property houses for 350 employes, a store, a large boarding house and an assembly hall. The cotton factory will be equipped with the most modern machinery and will run steadily at a uniform output on fabric for the exclusive use of the Goodyear Tire and Rubber Co."

* * *

The steel bridge across the tracks of the New York, New Haven & Hartford Railroad Co., on Asylum road, which Col. Samuel P. Colt has built to connect his country estate at Bristol with his ocean drive on the west shore of Poppasquash, has just been completed. The work of preparing the pedestals for the bronze bulls which are to be placed on each side of the entrance to Asylum road is now going on. The foundations underground are of concrete. Each figure will rest on a massive Georgian marble slab, four feet wide, nine feet long and about eight feet high. The bronze bulls will be of life size. A white marble balustrade with a total length of 162 feet will extend on either side, and the figures will be about 35 feet from the main street.

* * *

Robert Gregg, who was for many years employed in the packing department of the National India Rubber Co. at Bristol, died at his home in that town recently, in his 88th year. He was a native of Ireland but had lived in this country about forty years.

* * *

The Consumers' Rubber Co.'s plant at Bristol, employing about 300 hands and manufacturing rubber covered insulated wire and rubber footwear, was closed the first of July. The plant is operated by the Walpole Rubber Co., of Walpole, Massachusetts. A. P. Baldwin, of the Walpole company, stated on June 24 that the Consumers' Rubber Co.'s plant would be closed for the purpose of making an inventory of its stock, and that before it is reopened a meeting of the stockholders will be called to define the business policy of the concern. "It may be two or three weeks after closing before the plant will reopen," said Mr. Baldwin. "It is not to be closed permanently, however. The recent failure of the Atlantic Bank of Providence had nothing at all to do with the closing of the plant," he said. "The company had some money on deposit in that bank, but it was by no means as much as the company owed the bank, but the bank is not worrying about that. We have not had any notes called on us."

The Walpole company took over the Consumers' a year ago last month, after the Consumers' company—then owned and operated by Terrence McCarthy—had gone into the hands of a receiver. After the Walpole company took over the plant Mr. McCarthy was engaged as manager, a position which he still retains. Mr. Baldwin could not say when the meeting of the stockholders would be called.

* * *

The Continental Rubber Works, of Erie, Pennsylvania, expect to make an addition 200 feet in length and 70 feet in width to their plant, increasing the factory space nearly 6,000 square feet.

THE RUBBER TRADE IN SAN FRANCISCO.

By Our Resident Correspondent.

CONDITIONS on the coast are rather quiet, not so much owing to anything peculiar to local affairs as to the general tightening of the money markets of the world and the tendency of all enterprises to hold up as much as possible at the present time.

The Ralphs Pugh Co., a comparatively new concern in the local rubber field, reports that business is moving along in a fairly busy fashion and that they feel well satisfied with the progress they have been making. This firm has decided to move into larger quarters, where they can carry a complete stock of boots and shoes of the Beacon Falls Rubber Shoe Co., whose lines they represent. They carry also a general line of rubber goods. The new store has practically been selected and will be in the vicinity of First and Mission streets.

* * *

The Crandley Rubber Co. has secured the Manhattan Rubber Co.'s account for this coast. William Crandley reports that business with his firm is satisfactory and is showing steady growth.

* * *

W. H. Gorham, of the Gorham-Revere Rubber Co., has just returned from a trip to the Orient, where he visited the principal cities and not only enjoyed a very pleasant vacation, but booked some highly satisfactory orders.

C. C. Case, vice-president and general manager of the Revere Rubber Co., is now in San Francisco on business, making his headquarters with the Gorham-Revere Rubber Co.

* * *

Mr. Anderson, manager of the local branch of the Electric Hose & Rubber Co., with a store on Howard street, is contemplating a transfer to the Chicago branch of the company, to take charge of the electrical supply department there.

* * *

Mr. Rigdon, of the Gorham-Revere Rubber Co., has left for a trip to the factory in the East in the interest of the company.

* * *

E. F. White has sold his vulcanizing plant in Los Angeles to W. F. Simpson. Mr. Simpson has also recently purchased the Ninth street Vulcanizing Works at Los Angeles, formerly owned by F. C. Wells.

* * *

The Ernest Rubber Co. has been organized at Chico, California, and has opened up for business in an attractive store.

* * *

C. A. Muller, of Oakland, California, has recently bought out the business of the Bay Cities Tire Co. of that city.

* * *

Elmer E. Woods, as proprietor of the Auto Tire & Vulcanizing Co. of Santa Barbara, California, has filed an involuntary petition in bankruptcy.

* * *

The Always Air Sales Co. has opened a branch store in San Francisco at upper Van Ness avenue. This company manufactures a fluid compound to be inserted in tires for the purpose of automatically filling punctures and preventing blowouts. Barney Oldfield is at the head of the local sales company, as vice-president and general manager, while Walter Hempel is in active charge, with Mr. Griffin as sales manager.

* * *

L. C. Rockhill, sales manager of the Goodyear Tire & Rubber Co., has returned to San Francisco after a tour through the Northwest, during which he visited Seattle and Spokane. After a short conference here he will return to the home office at Akron, passing through Los Angeles on the way. He is not only enthusiastic over the possibilities of the tire business in the Northwest, but he is impressed with the almost incredible work which is being done toward good roads in country districts, smooth traveling boulevards being made through country so rough and mountainous as to appear inaccessible.

* * *

Peart & Elkington, of Oakland, have taken the agency in that city for Ajax tires, arrangements having been made through Hughson & Merton of San Francisco, Pacific coast distributors.

* * *

The French-American Rubber Co. has drawn up incorporation

articles, and organized as a corporation at Long Beach, California, with a capital stock of $25,000. The original incorporators are W. Harbart, F. I. Lee, P. R. Rader, of Long Beach, and one or two others, from Colorado. The plan is to erect an automobile tire factory at Long Beach, at which 200 men will be employed.

Long Beach has also been selected as the factory site of the new Panama Rubber Co. This concern has purchased property at Long Beach and will manufacture automobile tires. They promise to erect a plant at a cost of $500,000 and to employ at least 500 men.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

MUCH to the satisfaction of manufacturers and the more skilled of the rubber workers, labor differences here have been settled and strike talk ended. The various plants in this city are operating day and night shifts, despite tariff uncertainty.

* * *

Clarence Arnold Hutchinson, one of the energetic young men of the Essex Rubber Co. staff, was married June 10 to Miss Mabel McCullough, youngest daughter of Mrs. Eliza McCullough of this city. The employes of the plant and officers of the company presented the bridegroom with a handsomely designed silver service.

* * *

The Thermoid, Empire, Home, Whitehead and Ajax-Grieb tire making concerns report big business the past month, the force of operatives being worked to the limit to keep up with the rush of orders. The $5,000 prize contest for chauffeurs who make the best records in the use of Ajax tires has boosted Ajax sales considerably.

* * *

From the post of office boy to that of general manager of the New York State and Canadian branch of the Empire Tire Manufacturing Co., of this city, represents the business progress made by Raymond Paddock, Trenton boy, within ten years. Last year he sold $191,000 worth of tires and other rubber goods manufactured by the local concern. Mr. Paddock is a son of Mr. and Mrs. Frank Paddock of this city. He attended the local schools and Rider Business College. At the age of seventeen he decided he had sufficient education to enable him to enter the race for riches and fame, but was undecided whether to become an editor, lawyer or business man. His decision in favor of the business world was sagacious, if not unique, and later events have justified the wisdom of his choice. Riding along on his bicycle he noticed a sign hanging on the office door of the Empire Rubber Co. on Clinton avenue. He stacked his wheel against the building, took down the sign, carrying it into the office of the president.

"Boy, why did you take down that sign?" the president asked somewhat brusquely.

"You don't need it up there now, I'm the boy," replied young Paddock.

The president was amused by the audacity of the lad and he was immediately engaged. He was so invariably prompt and diligent in the performance of his duties as office boy that when one day an invoice clerk left the company's employ, he was in line for and received promotion to the position thus vacated. But he didn't remain long at the invoice desk—he was jumped to a clerical position, and then he began to sit up nights studying the intricacies of the rubber business. From invoice clerk he went into the factory, in a minor position, where in less than a year he was given charge of the tire department. His next opportunity was to demonstrate his ability as a salesman on the road, and from the start he was successful. Three years ago when the company decided to open a branch house at Buffalo to supply the trade in upper New York State, Michigan and Canada, Paddock was the unanimous choice of the officers of the company; and he is today recognized as one of the keenest young men in the rubber industry.

* * *

The Eureka Tire Co. filed at the County Clerk's office on June 18 articles of incorporation, with an authorized capital

Raymond Paddock.

of $100,000, the incorporators being John E., Peter D. and Frank W. Thropp.

* * *

On June 20 Commissioner LaBarre recommended to the City Commission that the Hamilton Rubber Co. be given the contract for furnishing 5,000 feet of rubber hose for the fire department, at a cost of 85 cents a foot.

THE BROOKVILLE RUBBER CO.

The Brookville Rubber Co. has been incorporated in Trenton, New Jersey, for the purpose of manufacturing, purchasing and selling all kinds of mechanical rubber goods. The capital stock is $100,000, and the incorporators are Edward A. Fischer, Ezra Evans, Charles A. Joslin and William Groff, Jr.

THE SPECIALTY INSULATING MANUFACTURING CO.

The Specialty Insulating Manufacturing Co. has recently located its factory at Hoosick Falls, New York, where it is now running with about 70 employes. This company, which is capitalized at $30,000, was formerly located at Pittsfield, Massachusetts, under the name of The Specialty Manufacturing Co., and was incorporated under the laws of Massachusetts.

A NEW RUBBER COMPANY IN MILFORD.

The Askam Rubber Co., of Milford, Connecticut, has filed its certificate of incorporation with the secretary of state of that State. The capital stock is $150,000, and the incorporators are Isaac W. S. Hawes, William F. Askam and LeRoy Askam.

MACHINE SHOPS CLOSED FOR TWO WEEKS.

The machine shops of the New England Butt Co. at Providence are closed for two weeks' vacation, beginning June 28. They will open again on July 14. The office and the foundry will continue to run as usual.

News of the American Rubber Trade.

ADVERTISING MEN STUDY GOODRICH IDEAS.

THE Associated Advertising Clubs of America, including a membership of some 10,000 advertising men, held their annual convention in Baltimore from June 9 to 15. Among other features, the advertising campaigns of three different companies—large national advertisers—were presented in full to the members of the convention, as a study of this interesting science. One of the three companies selected was The B. F. Goodrich Co. It gave a complete exposition of its advertising methods, including newspaper and magazine work, bill-board display and road signs—which, by the way, now cover 30,000 miles of American highways. It also presented a full description of the Goodrich service system—which, though perhaps in the mind of the public would not be associated with advertising, still is the very best advertising that a tire company can engage in.

DUTIES ON HARD RUBBER PARTS OF FOUNTAIN PENS.

Notwithstanding the fact that our present tariff schedule may all be changed in a short time, it is none the less interesting to note the rulings in various lines of rubber manufacture under the rates now in force.

Some time ago the firm of Schrader & Ehlers imported the barrels, necks and caps that go to make up fountain pens, minus the pens. The collector of the port of New York assessed them at 35 per cent. ad valorem, as being manufactures of hard rubber, under paragraph 464. The importers protested that the goods were fountain pens and dutiable as such at 30 per cent., under paragraph 187; but the Board of General Appraisers overruled them and now the United States Court of Customs Appeals has also sustained the collector, deciding that assembled parts do not constitute the complete fountain pen, under the tariff act of 1909.

COLLEGE BOYS IN THE GOODYEAR FACTORY.

Many college men from all over the country are planning to work during the summer vacation in the factory of The Goodyear Tire & Rubber Co., Akron, Ohio. The company recently requested the college men in its employ to write to their colleges asking them to suggest promising candidates for factory positions; and the responses have been numerous.

"We like to have college men with us," says C. W. Seiberling, vice-president of the company. "We like their spirit and enthusiasm, and I firmly believe that the spirit of loyalty, which is a distinctive feature of the Goodyear concern, emanates largely from having so many clean-cut young fellows around. The broad viewpoint and training these men receive has helped wonderfully in fostering friendly relations with our customers."

TEHUANTEPEC RUBBER CULTURE CO. REPORT.

The report of the president of the Tehuantepec Rubber Culture Co., dated May 13, 1913, makes interesting reading, although it does not paint the immediate rubber prospects of the company in very bright colors. Owing to the exceedingly unsettled condition of affairs in Mexico, very little work has been done on the plantations during the last year. In the opinion of the president, the best course for the company to take is to devote its energies—for the immediate future at least—to some annual crops, particularly sugar. He remarks: "In recommending the planting of sugar cane for your consideration I can say from many years' intimate association with the sugar industry that it is a profitable crop, and if the present favorable indications with experimental planting are confirmed sugar cane will be a safe crop to plant at Rubio"—which is the name of the company's plantation.

THE REPUBLIC CO.'S NEW CLUB HOUSE.

The April issue of THE INDIA RUBBER WORLD contained a brief description of the new club house being built by the Republic Rubber Co. of Youngstown, Ohio, for the company's 1,500 employes. Here is a picture of the building, which shows its attractive appearance. It is 60x130 feet in size, is located

THE CLUB HOUSE.

just across the street from the company's main offices, and contains bowling alleys, pool tables, reading rooms, lunch rooms, shower baths, and all the other accessories and conveniences which could add to the comfort and happiness of the Republic's working force.

FACTORIES HELPING THE COLLEGES.

It has been the aim of all American colleges during the last fifteen years to make their instruction as practical as possible. They are no longer satisfied to send out their students furnished simply with book knowledge; they try now to equip their graduates as far as possible with such practical knowledge, particularly in the sciences, that they can put on the harness of actual work without too great a feeling of strangeness. The University of Minnesota arranged to have the graduating class in chemistry visit, during the last few weeks of the term, a number of industries where chemistry comes into play. As part of this tour they visited, early in June, the Federal Rubber Mfg. Co. works at Cudahy, a suburb of Milwaukee. The students first made a careful study of the laboratory connected with the plant and then went into the factory, where the work of the chemist was shown in the actual production of tires. Incidentally, the company entertained the students at a lunch, which undoubtedly still further impressed on their minds the practical value of factory inspection.

THE WALPOLE CO. OFFERS SOME 6 PER CENT. NOTES.

The Walpole Tire and Rubber Co., Walpole, Massachusetts, is offering directly to the public $350,000 of three-year 6 per cent. convertible notes, being a part of an authorized issue of $750,000. The notes are dated April 1, 1913, due April 1, 1916, and are convertible at any time before maturity into the 7 per cent. cumulative stock of the company.

The offering price on the present issue is par, but in addition the notes carry several inducements. The company guarantees the notes to purchasers free from all taxes. Furthermore, the note holders are offered preferential terms on all goods manufactured by the company. Both gross and net earnings of the company for the first four months of this year have shown nearly a seventy-five per cent. gain over the corresponding period of 1912. The notes constitute a first lien on all the assets of the company, amounting to $3,000,000, and after the issue has been sold no further obligations will be issued until retirement of the notes.

BOSTON WOVEN HOSE & RUBBER CO. SALESMEN MEET.

During the week of June 9 to 14 the annual salesmen's convention of the Boston Woven Hose & Rubber Co. was held at the executive offices at Cambridge, Massachusetts. Representatives from New York, Buffalo, Philadelphia, Pittsburgh, Chicago, St. Louis and Seattle, as well as traveling salesmen from other cities, were present. Business conditions were discussed and policies outlined for the coming year.

On Wednesday evening, June 11, Mr. George E. Hall, general manager, entertained the visiting salesmen and department heads at the Engineers' Club in Boston. Dinner was followed by the reading of papers bearing on subjects of interest. Here are some of the subjects discussed: The Sale of Manufactured Products, The Successful Salesman, Keeping Up with Production, Co-operation, The Evils of Over-Confidence in Our Own Ability, Factory Problems, To What Extent Should We Protect the Jobber, "Quality Is Remembered Long After Price Is Forgotten," Closer Relations Between Salesmen and Correspondents, Standard of B. W. H. Quality, and Team Work vs. Individual Play.

On Friday the salesmen and heads of departments were entertained by Mr. H. B. Sprague, treasurer, at luncheon at the Tedesco Club, Swampscott. Some of the party spent the afternoon on the golf links, while others enjoyed an automobile ride along the North Shore. In addition to the general manager and treasurer, the outing was attended by the president of the company, Mr. B. F. Spinney, and by directors Mr. J. Newton Smith and Mr. Albert M. Creighton.

NEW BUILDINGS FOR THE DETROIT PLANT OF THE UNITED STATES TIRE CO.

Some idea of the magnitude of the proposed additions to the old Morgan & Wright plant, now the Detroit factories of the United States Tire Co., may be gained from the fact that the addition will afford approximately 1,000,000 more feet of floor space. Among the buildings proposed are a laboratory 82 x 35, three stories high; a warehouse 93 x 235, six stories high; manufacturing buildings 60 x 315, six stories high, and 230 x 60, six stories high; machinery shops 80 x 170, one story high; 50 x 165, four stories high; 50 x 120, three stories high; 50 x 120, three stories high, and three storehouses each 93 x 170 and six stories high; two manufacturing buildings each 47 x 35, four stories high. As already stated, this will make an approximate increase in floor space of 1,000,000 square feet, and will render necessary an increase from 2,500 to 6,000 employes. All of these plants are to be equipped with the most improved machinery.

UNITED STATES TIRE CO., DETROIT.

CHANGING ITS NAME AND INCREASING ITS CAPITAL.

Notice has been filed at Columbus, Ohio, by the Bayne-Subers Tire & Rubber Co., of Cleveland, of a change in its name to the Subers Fabric & Rubber Co., and an increase in its capital from $250,000 to $1,500,000.

CLARENCE H. LOEWENTHAL.

Clarence H. Loewenthal was born in New York, June 10, 1885. He is a Columbia man, and before entering the U. S. Rubber Reclaiming Co., of which he is now the secretary, he spent three years in the banking house of Ladenburg, Thalmann & Co. He began his rubber career in the Buffalo factory of the United States Rubber Reclaiming Co. in 1906, where he spent two years. He is particularly interested in tennis and he is an amateur athlete of recognized ability. He is a conspicuous member of the younger set in the rubber trade. He sailed for Europe on the Imperator on the 25th of June and expects to return to this country early in August.

CLARENCE H. LOEWENTHAL.

RUBBER STAMP MAKERS HOLD A CONVENTION.

Manufacturers and dealers interested in rubber stamps, stencils and other marking devices—comprising the membership of the International Stamp Manufacturers' Association—held their second annual convention in Minneapolis from June 24 to 27. There were several hundred present—from all parts of the world. While there were many social features, the greater part of the convention's energy was devoted to the discussion of various matters of commercial importance to rubber stamp manufacturers.

FROM SAN FRANCISCO TO BALTIMORE BY MOTOR.

E. B. Hanson, vice-president and general manager of the San Francisco Exposition Tour Sales Co., and J. A. Clairmonte, recently finished a notable run from San Francisco to Baltimore, covering the distance in 18 days. The last lap, from Omaha to Baltimore, 1,430 miles, was made in 71 hours actual running time. Mr. Hanson attributed this remarkable record to absence of all mechanical troubles, and particularly to the fact that not a tire had to be changed. His car was equipped with the Firestone "Non-Skids."

GOODYEAR MOTORCYCLE TIRE PRICES REDUCED 10 PER CENT.

S. A. Falor, manager of the motorcycle tire department of the Goodyear Tire and Rubber Co., of Akron, announces a reduction of 10 per cent. in the price of motorcycle tires to dealers, consumers and jobbers, the reduction taking effect June 14. He says that these lower prices are not attributable so much to the lower price of crude rubber as to the company's increased business in this particular line of tires. They are now making 1,000 motorcycle tires a day and expect soon to be making 1,500.

TRADE NEWS NOTES.

The Mercer Rubber Co., of New York, Inc., 95 Broad street, New York, has been organized with a capital of $10,000 to take the New York agency of the Mercer Rubber Co., of Hamilton Square, New Jersey, which manufactures mechanical rubber goods and specialties. The president of the New York company is W. A. Dale, who has been connected with the New York rubber jobbing trade for twenty-five years.

The Swinehart Tire Agency has recently been opened at 726 Main street, Buffalo, for the distribution of the Swinehart solid and pneumatic tires in Western New York and Pennsylvania. The president of this new agency is C. A. Couch, and the secretary and treasurer F. P. Georger.

By a vote of the stockholders at a meeting held at Pittsburgh early in May, the business of the McGraw Tire and Rubber Co. of Pennsylvania was transferred to the McGraw Tire and Rubber Co. of Ohio, a corporation with a capital stock of $1,000,000 and with a factory at East Palestine, Ohio.

William H. Scheel, of 159 Maiden Lane, New York, who specializes in earths, clays, calcined magnesia and fillers of all kinds —domestic and imported—has the exclusive agency in New York of Ohio aluminum flake, and plans to carry a very large stock of this on hand, in order to be able to fill immediately all urgent requirements of the trade. He occupies a five-story building and has ample room for abundant storage.

The Rosenthal Co., manufacturers of rubber erasers and rubber balls, moved their offices, about the last of May, from 346 Broadway to 45 East 17th street, corner of Fourth avenue, New York, where they have taken considerably larger space.

The Keaton Patents Co., New York City, has been incorporated, with a capital stock of $100,000, for the purpose of manufacturing rubber tires and pnuematic cushions.

The United States Rubber Reclaiming Co., with factories at Buffalo and executive offices in the Forty-Second Street Building, New York, have recently erected a new factory building equipped with every late mechanical appliance, which will be exclusively devoted to the production of tire stocks, increasing the capacity approximately 100 per cent. in this class of work. The factory is in operation day and night.

The Firestone Tire & Rubber Co., Akron, Ohio, has given out plans for the construction of a four-story brick, steel and reinforced concrete manufacturing plant addition.

A firm of commission agents in a Mediterranean country informs an American consulate that it would like to secure agencies for the sale of American shoes, rubber goods, and hardware. This firm is said to be well rated and would like to import direct. The consular report is No. 11152.

The Ancient and Honorable Artillery Company of Massachusetts—of which Captain Francis H. Appleton has been the commanding officer during the past year—celebrated its 275th anniversary on June 2. The exercises consisted of church services in the morning in the Old South Church, Boston, with a sermon by Rev. A. Horton, D.D., while later in the day a banquet was served at the Copley Plaza Hotel.

MR. CUTLER OPENS HIS OWN OFFICE.

Mr. D. A. Cutler, formerly associated with The Continental Rubber Co., and more recently in the development work of the United States Rubber Co., has opened an office at 277 Broadway, where he will operate as an expert in crude rubber research. Mr. Cutler has had an extensive and successful experience in practical work of this sort, and there is every likelihood that his services will be in active request among rubber manufacturers.

A RADICAL DEPARTURE IN ADVERTISING U. S. TIRES.

The tire trade was very much surprised when it became known on June 10 that the United States Tire Co. had abolished its advertising department and that hereafter all the various kinds of advertising put out by this company would be handled through an agency, which is expected to move its offices into the United States Rubber Co. building, Broadway and Fifty-eighth street, New York, where the offices of the tire company are located. The only reason given for this radical change is that it is hoped to effect substantial economies. Mr. Hubbs, who has been in charge of the company's tire advertising department, has no plans for the immediate future.

MR. J. M. GILBERT.

The June issue of THE INDIA RUBBER WORLD contained an announcement of the resignation of Mr. J. M. Gilbert from the position of general manager of the United States Tire Co. and his assumption of the duties of president and general manager of the Lozier Motor Co., Detroit; and some details regarding his career in the tire manufacturing field were given at that

J. M. GILBERT.

time. The accompanying photograph shows that Mr. Gilbert is still a young man; and this fact, together with the possession of unusual energy, and a marked degree of executive ability, promise exceptional success in his management of the Lozier company. He has been acquainted with the automobile trade ever since the time, a dozen years ago, when he was sales manager of the Firestone Tire Co., so that, while he goes from tire manufacture to automobile manufacture, he is very far from being a stranger in his new field.

DIVIDENDS DECLARED.

The B. & R. Rubber Co. has declared a regular quarterly dividend of 1¾ per cent. on its preferred stock, and a dividend of 2 per cent. on its common stock—payable July 1 to stockholders of record on June 21.

The Canadian Consolidated Rubber Co., Limited, declared its usual quarterly dividend of 1¾ per cent. on its preferred and 1 per cent. on its common stock, payable July 2 to stock of record June 21.

RUBBER GOODS COMPANY PAYS DIVIDENDS.

On June 4 the Rubber Goods Manufacturing Co. declared its 57th regular quarterly dividend of 1¾ per cent. on the company's preferred stock, and a dividend of 1 per cent. on the common stock—both payable June 16.

PERSONAL MENTION.

Mr. James B. Dunlop, who invented the first pneumatic tire, about 25 years ago, recently arrived in America with a number of British engineers who came as guests of the Society of Automobile Engineers.

Mr. Fred J. Wagner, long identified with the automobile business, has been elected vice-president of the Ajax-Grieb Rubber Co., Trenton, New Jersey, manufacturers of Ajax tires.

Mr. Arthur E. Friswell, formerly connected with the Mechanical Fabric Co. and later with the Goodyear Tire and Rubber Co., after a year's vacation in Bermuda is back in the States with the thought in mind of again entering the tire field. Mr. Friswell's experience and capabilities are such that it goes without saying that he will not long remain idle.

Mr. Fred Moses, formerly with George A. Alden & Co., of Boston, is now operating on his own account as a broker in crude rubber at 220 Devonshire street, Boston.

COLONEL COLT'S CAMPING PARTY.

The summer camp of Colonel Colt, president of the United States Rubber Co., called "Camp Colt," and located at Kidney Pond, Maine, is one of the most attractive spots in that state. It has been the Colonel's custom for a number of years to take quite a party of guests to his camp during June. Continuing this custom, he started from Providence on June 1st with a party of about fifteen guests, including his brother, Senator LeBaron B. Colt, Mr. Walter S. Ballou and Mr. Nathaniel Myers, of the United States Rubber Co. The other members of the party were: Dr. Calvin S. May, Colonel and Mrs. Harold J. Gross, Mr. and Mrs. E. A. Barrows, Rev. G. L. Locke, Miss Beatrice Colt, Hon. Mrs. William Beresford, Miss Gertrude Barrows, Miss Ruth Anthony.

The party broke camp and returned home on June 14th.

COMMODORE BENEDICT BACK FROM HIS CRUISE.

Commodore E. C. Benedict arrived at his home in Greenwich, Connecticut, on June 5th, after a six weeks' cruise, including a long trip up the Amazon river. This is the Commodore's fifth sail up the Amazon, in which he has a double interest, for, being a director of the United States Rubber Co., he is interested in the supply of crude rubber from the Amazon, and, in addition, he installed on that river a few years ago a system of wireless telegraphy. The trip was made on the Commodore's yacht "The Oneida," which has an over-all length of 199 ft. and carries a crew of 36 men. The Commodore was accompanied by a party of friends, including Mr. and Mrs. Colgate Hoyt.

MR. COE AND MISS PIKE MARRIED IN JAPAN.

The consummation of a little romance which will interest many of the rubber footwear trade, was a marriage at the American Consulate in Yokohama, Japan, the latter part of June, when Mr. Kersey Fell Coe and Miss Louise G. Pike became husband and wife.

Charles A. Coe, the Eastern selling agent of the United States Rubber Co., is a resident of Medford, a suburb of Boston. Chester J. Pike, for many years with that company, and now managing the advertising campaign for the Hub-Mark rubbers, also resides in Medford. Here their children received their pre-collegiate education, and Kersey Coe and Louise Pike were schoolmates. Mr. Coe graduated from Williams College, and later entered the employ of the Standard Oil Co., and three years ago was sent to Japan.

But before starting on his long journey the young folks became engaged, and it was finally decided that as Mr. Coe could not come to America for his bride, she should go to him. Miss Pike started from Boston on Wednesday, May 28, for San Francisco. She was met by friends in Chicago, and in San Francisco embarked on the "Shimyo Naru" on June 4.

Mr. Coe met her on the arrival of the steamer at Yokohama, where the wedding took place, after which the couple proceeded to Otaru on the Island of Hokkaido, the northernmost of the large islands which compose the Japanese Empire, where Mr. Coe will be in charge of the local office of the Standard Oil Co., a position to which he has just been promoted. Many handsome gifts went forward on the same steamer, for both the young people have hosts of friends in Medford and Boston.

THE NEW TREASURER OF THE UNITED STATES RUBBER CO.

Some men seem to get through life without ever being visited by the consequences of their own acts, but not all men escape. Some men get caught with the goods, and have stern justice meted out to them. To the latter class belongs Mr. W. Guy Parsons, who has just got what he richly deserves. He has just been made treasurer of the United States Rubber Co. after an even twenty years of service in the financial department of that big corporation.

Mr. Parsons was born approximately forty-five years ago, in a little town in Kansas, but when he reached the reflective age

W. G. PARSONS.

of five he became convinced that while Kansas was a fine place for raising corn and cyclones, it was no place for future treasurers of $120,000,000 corporations—so he left for Chicago. That town did well enough until he was 19 years of age, when he concluded that though Chicago was the literary center of the Western Hempishere, large affairs of finance were arranged in New York; consequently he removed to the metropolis. That was in 1885. Eight years later, when the United States Rubber Co. was formed, he took charge of the bookkeeping department. Evidently his work was not so badly done, for very soon he was promoted to the cashiership; thence to the assistant auditorship; another promotion and he was made auditor; still another boost and he became assistant treasurer. And now, having climbed every round on the ladder—at least all the upper rounds—he has reached the top rung in the financial department, and has been made treasurer—a job of no small dimensions when you consider the size of the corporation, its various ramifications and its multitudinous interests. Here is a clear case where efficiency has come into its own.

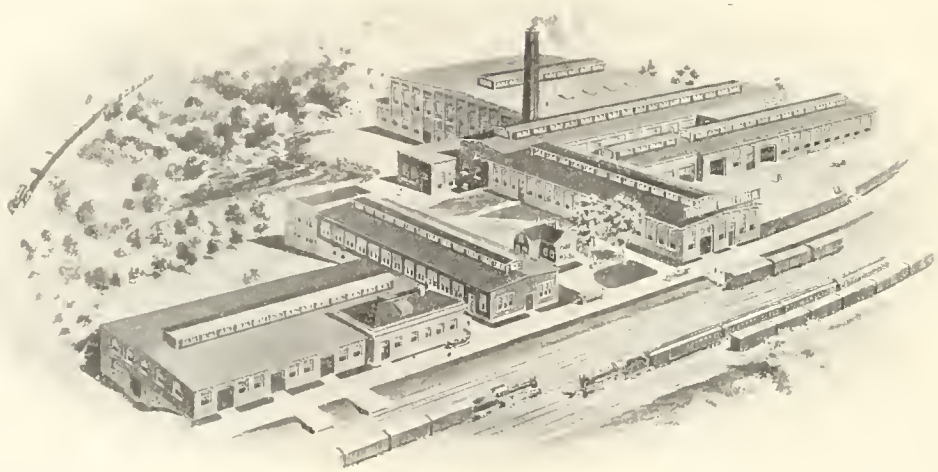
Incidentally it might be mentioned that personally he is a thoroughly likable man, perfectly genial even though living in Brooklyn; and a few years ago, when he weighed somewhat less than now and used to play on the Rubber Company's nine, he could be relied upon to hammer out a five-base hit almost every time he came to bat.

THE MONATIQUOT RUBBER CO.

Probably no branch of the rubber trade has shown greater advance during the last five years than the reclaiming industry. Several new enterprises have been launched during this period and remarkable growths have been attained. Prominent among these is the Monatiquot Rubber Works Co., of South Braintree, Massachusetts, which calls its product "Naturized Rubber."

This company first began to manufacture in April, 1910, and from the first, its brands (known as "The Four Good Indians") were popular with the manufacturers. The demand has shown continuous increase, rendering necessary substantial additions to its plant during the past three years, especially during the last twelve months. The company has found it necessary to erect three new buildings to take care of the healthy growth of its trade; so that the plant, as it stands today, is of entire brick construction and embodies three separate and distinct power plants. During this time a reinforced concrete dam on the Monatiquot River was built, a third engine installed and extensive mechanical equipments were added.

The company has a 1,000-foot siding on the Brockton Division of the N. Y., N. H. & H. R. R., besides being located on the Plymouth Division; and convenient and prompt shipment of manufactured product is further facilitated by means of a new power truck, which is used in the handling of rush orders to the Boston freight terminals.



MONATIQUOT RUBBER WORKS CO., SOUTH BRAINTREE, MASSACHUSETTS.

The company's original method of making few rather than many brands is still maintained and the wisdom of this policy is reflected in the demand for the "Four Good Indians"—Squantum, Monatiquot, Samoset, and Massasoit—who have recently been joined by Wampatuck, now known as the "Fifth Good Indian." Each stock occupies a distinct field of its own, and the processing of all is rigorously guarded so that there is no possibility of confusion.

An effective organization, of which Robert C. Harlow is president and James H. Stedman treasurer, has brought to the Monatiquot Rubber Works a degree of success more than commensurate with its three years of existence.

AMERICAN AND EUROPEAN TIRES.

One of the leading manufacturers of tires in America stoutly champions the American tire against those of European manufacture and believes that they will make their way abroad against European brands even at the higher prices which it is necessary to charge for them. His theory is that as American roads are not nearly as smooth as European roads, and as the conditions here to which tires are subjected are very much harder than those in Europe, the American manufacturers make a stronger and tougher tire to meet these severer conditions, and that the Europeans are gradually finding out the better qualities of our tires.

DR. DANNERTH AND A CO-OPERATIVE LABORATORY.

Dr. Frederick Dannerth, the rubber consulting chemist who acted as honorary secretary at the Rubber Conference held in connection with the International Rubber Exposition last fall, is interesting a number of rubber manufacturers in a co-operative laboratory. He has prepared a list of twenty-three arguments in favor of such an institution. He calls attention to the fact that the larger corporations have finely appointed laboratories and employ a large number of chemists who are at work constantly on the solution of various rubber questions, in the interest of these particular corporations. But the smaller manufacturers are not able to compete with the large ones in this research work, and, in his opinion, the only way in which they can engage successfully in this laboratory competition is by co-operation. He believes that a co-operative laboratory could be equipped at a cost not exceeding $5,000 and maintained at an annual cost of about the same amount. Such a laboratory would, he believes, serve a vast number of useful purposes, not only to those companies that banded together for this co-operative work, but to the trade at large. It could be used as a central bureau where disputes regarding crude rubber and reclaimed rubber and manufactured articles could be referred.

Anyone in the trade who would like to get the details of this project can do so by writing to Dr. Dannerth at Passaic, New Jersey.

A FINE COMPLIMENT FOR MANHASSET FABRICS.

The following letter has been received by the Manhasset Manufacturing Co., producers of tire fabrics and yarns, with mills at Putnam, Connecticut, and offices at 317 Howard Building, Providence. It is self-explanatory.

Rutherford, N. J., June 3, 1913.

Manhasset Mfg. Co., Providence, R. I. Attention of Mr. Ballou.

Dear Sir: Allow us to congratulate you on the clean construction of your duck. In the 3rd Annual Indianapolis Speed Race we used your fabric which you constructed for us, being style No. 1101 48" C. S. I. fabric and marked special racing tire.

These tires constructed with your duck by us went through the hottest race on the hottest course and made the world's record for endurance on any track, going the 500 miles without a change of tires, and 11 laps, or 27½ miles, on the day previous, and still good for more mileage. These tires were the only four tires to go through this great race without a change.

We would like you to give us the construction of fabric used in this roll of duck for our files and in ordering further material of this sort so we may know exactly the way we wish it, in the event of your firm not knowing the exact construction.

Mr. Mulford will use our tires in the 600-mile race at Tacoma, Wash., and as soon as things are settled we will be in line for another roll of this same duck. Wishing you success with your fabric and hoping to have the pleasure of hearing from you, we remain Yours truly,

BRAENDER RUBBER & TIRE CO.
FRED L. BRAENDER, MGR.

THE RUBBER CLUB OUTING.

THE annual Midsummer Outing of the Rubber Club of America will be held on Monday, July 14, at the Belmont Springs Country Club, in one of the beautiful suburbs of Boston.

BELMONT SPRINGS COUNTRY CLUBHOUSE, BELMONT, MASS.

There will be all the attractive features to which the club members have been accustomed in the past, and more. The outing

ANOTHER VIEW OF THE BELMONT SPRINGS COUNTRY CLUBHOUSE.

VIEW ON THE GROUNDS OF THE BELMONT SPRINGS COUNTRY CLUB.

is in charge of the Sports Committee, consisting of Frank R. McKenna, of the Bourn Rubber Co., chairman; E. L. Phipps, of the United States Rubber Co., W. L. Pitcher, of the Easthampton Rubber Co., Frank H. Appleton, Jr., of F. H. Appleton & Son, and W. J. Kelley, of Arnold & Zeiss; and they are hard at work on the most interesting program they can devise. There will be golf, baseball and tennis, of course, and other sports.

The Belmont Springs Country Club has exceedingly attractive grounds. Here are three convincing proofs of the fact, viz.: Two photographs showing different views of the club house and another photograph showing a wonderfully fine avenue of trees leading out from the club house.

The details of the day's outing will be sent to club members within a few days.

NEW INCORPORATIONS.

ALLING-LOCKWOOD CO., INC., May 23, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Clarence E. Alling, Stamford, Connecticut; Arthur E. Alling, New Haven, Connecticut, and Frederick F. Lockwood, Binghamton, New York. Location of principal office, Binghamton, New York. To manufacture and deal in rubber, etc.

Benton Raincoat Co., May 23, 1913; under the laws of Illinois; authorized capital, $5,000. Incorporators: Carl Cohn, Leo S. Kosichek and Jacob Schwartz. Location of principal office, Chicago, Illinois. To deal in men's clothing and wearing apparel, etc.

Costello Seat Co., May 13, 1913; under the laws of Illinois; authorized capital, $10,000. Incorporators: George W. Costello, Edward J. Hennessy and William R. Swissler. Location of principal office, Chicago, Illinois. To manufacture, buy and sell and generally deal in all kinds of automobile seats and sundries.

East India and African Rubber Co., May 12, 1913; under the laws of New Jersey; authorized capital, $20,000. Incorporators: Edward Walham, 158 North La Salle avenue; James Butler and Ernest Wilfried, 915 North La Salle avenue—all of Chicago, Illinois. To import, export, buy and sell raw products, as rubber, etc.

Federal Sales Co., Inc., June 2, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Henry S. Bliss, 726 West avenue; Charles A. Hahl and John J. Henry, 176 Woodward avenue—all of Buffalo, New York. Location of principal office, Buffalo, New York. To deal in rubber goods.

Live-Leather Belt Co., Inc., June 13, 1913; under the laws of New York; authorized capital, $1,000. Incorporators: Isal Weinman, 1800 Seventh avenue; Leon Heinmann, 1018 East 163d street, and Joseph Jacobs, 1348 Boone avenue—all of New York. Location of principal office, New York. To manufacture leather and elastic belts.

New Idea Tire Co., April 30, 1913; under the laws of Delaware; authorized capital, $500,000. Incorporators: F. R. Hansell, Philadelphia, Pennsylvania; George H. B. Martin and S. C. Seymour, both of Camden, New Jersey. To manufacture and deal in tires, etc.

Phillips Tire Co., April 14, 1913; under the laws of North Carolina; authorized capital, $10,000. Incorporators: W. L. Phillips, J. E. Craddock and C. D. Cooper—all of Asheville, North Carolina.

Pneumatic Rim and Tire Co., May 12, 1913; under the laws of Delaware; authorized capital, $200,000. Incorporators: R. Boyd Cooling, Clarence J. Jacobs and Harry W. Davis—all of Wilmington, Delaware. To manufacture and deal in pneumatic tires for engines, etc.

Positive Vulcanizing Co., May 26, 1913; under the laws of Iowa; authorized capital, $10,000. Incorporators: W. G. Sandford, Charles Huber and J. Reed Lane—all of Davenport, Iowa. To manufacture tire vulcanizers, etc.

THE TYER RUBBER CO.'S NEW FACTORY.

THE new tire factory of the Tyer Rubber Co., Andover, Massachusetts, completed early this year, is in full operation, turning out an average of seven hundred tires per week, which practically equals the steady demand. This new establishment is so modern and up-to-date that a recent visit by the representative of THE INDIA RUBBER WORLD is well worth recording.

The new factory is entirely separate and distinct from the old established factory of this company, which is still used and still fully occupied in the manufacture of its druggists' specialties, which enjoy so enviable a reputation.

The new establishment is at some distance from the other, on the line of the Boston and Maine Railroad. It consists of two

TYER RUBBER CO.'S PLANT.

distinct buildings, each 310 feet long, and parallel with each other, one being 50 feet and the other 60 feet wide. They are solidly built of brick, with most liberal window space. Each is three stories high, while two ornamental and two plainer towers and a tall and graceful chimney cut into the sky-line. The interior is of "factory construction," solid and substantial, as is needed for a building containing rubber working machinery; and every appointment shows thoughtful planning both for present and for future requirements.

The engine room and boiler house are models of modern industrial power plants. The building, of very liberal height, assures space for comfort and convenience and allows for growth by additional engines and boilers. The engines are Rice & Sargent's, of 1,000 horse-power, with direct rope drive. Besides these there are smaller engines for running the 500 kilowatt generators for electric light and power. The boiler room contains four Robb Engineering Co.'s boilers, each 19½ feet long and 72 inches in diameter. There is room for eight more boilers of similar size, when needed. Contiguous to the boiler-house is an immense coal pocket of solid concrete, where coal can be dumped direct from a spur track of the railroad. The pump-room has a fire pump capable of throwing 5,000 gallons of water a minute, the water coming from a private reservoir. Here also are the accumulators for running the hydraulic presses. The Bowser oiling system is used on all the engines.

Inspection commenced with the rear building. First comes the mill and calender room, with ten mills, a drying machine, two 72-inch calenders, and plenty of extra room for further machinery, when the demand requires. Each of these machines, as, in fact, most others throughout the factory, is run by an individual electric motor, thus bringing about a substantial saving of power. In the next room are three washers and all the appurtenances to an up-to-date washing room. The compounding room is large, light and roomy, and is especially convenient in its arrangement.

On the second floor is the machine shop, very thorough and complete; and here are made most of the molds used by the company. This shop is fully equipped for making all the repairs needed in the two factories. The remainder of this floor is used as a drying room. All the rubber used by this concern is air dried. A complete box factory occupies the entire third story, 310 x 50 feet, and here are made all the thousands of plain and fancy boxes in which the many specialties of the company are marketed.

Between this and the similar building fronting on the street is a receiving and shipping department, with large store rooms on the first floor and basement. A fine macadamized drive-way is now building to reach this department.

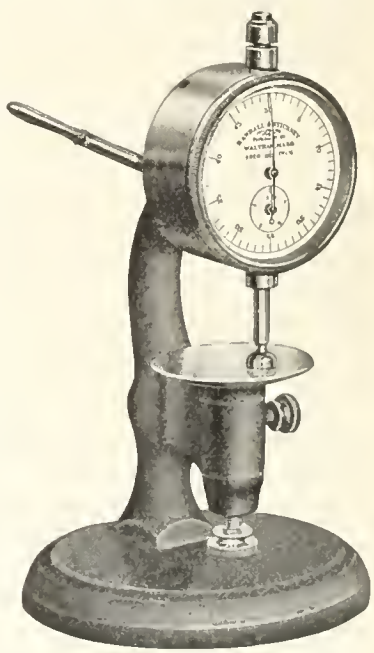
In the front building, the first room we enter is the press room, where 21 presses are in constant use for the druggist goods and sundries made by this company. Most of the remainder of this big building is devoted to the manufacture of the "Tyrian Anti-Skid" automobile tires. Nearly two entire floors are needed for this purpose, while the upper floor is used for stock room, packing and shipping.

The second floor is so arranged that the stock and the work go steadily forward, from the time of entering until leaving, with no lost motion and no backward step. There are in use three of the latest improved tire making machines, made by the J. J. Thropp's Sons Co., and more are to be added. These partly made tires then go to the ground floor, where a 12-foot press is molding a tread bearing the anti-skid device for surrounding the rim with the letters "T. T.," for Tyrian Tires. This press gives the threads a pressure of 3,000 pounds to the square inch. In this room are numerous other presses for various purposes, including 4 four-foot presses. Here also is an automatic wrapping machine, and three pit vulcanizers for curing. The tires, which are of white rubber, on coming out of the vulcanizers are thoroughly inspected, after which they are sent to the stockroom in the upper story.

This is in brief a description of the factory pictured herewith, a thoroughly modern establishment, now making nearly 120 tires per day, and with room for a large increase over and above this ticket. The factory is in charge of Superintendent C. M. Riddeck, ably assisted by Mr. F. W. Hodges.

RANDALL AND STICKNEY THICKNESS GAUGE.

Most rubber manufacturers have felt the need of an accurate method for determining the thickness of rubber. Such an object has been attained in the Randall and Stickney thickness gauge, illustrated by the accompanying cut.



In the use of the gauge, the plunger is first raised by pressing down the lever on the left, and the article to be tested is placed on the table under the plunger. The lever is then gently released, when the hands on the dial register the thickness. The long hand registers the thousandths of an inch, and the small hand the tenths. By means of an adjusting screw under the table, the long hand can be brought to the proper position, when it is not on the starting point.

The most important rubber goods manufacturers have taken up this thickness gauge on account of its known accuracy. Another proof of its merit consists in its adoption by the Bureau of Standards, Washington, which has expressed approval of its being exceedingly convenient and very easily read. It is manufactured by Frank E. Randall, 248 Ash street, Waltham, Mass.

The Hodgman Rubber Co. Seventy-five Years Old.

IT is an entirely legitimate sentiment—the pride of priority. To have been a long time on the earth proves the possession of the virtues that make for stability and permanence. Survival is the best proof of fitness. St. Augustine boasts because she is the oldest town in the United States, and Harvard plumes herself upon the fact that she is the oldest college in America. So why should not the Hodgman Rubber Co. take a proper pride in being the oldest rubber company in the United States—for this distinction undoubtedly belongs to this company. It was founded in 1838 and has been continuously and actively in existence ever since; and what is even more interesting, it has remained continuously in the hands of the Hodgmans—three generations up to the present time, with a fourth getting ready for active participation.

There were rubber companies before 1838, a number of them; but none survived those early, troublous days. One of them, the Roxbury Rubber Co., famous in its day, founded in 1828, may properly be called the ancestor of the Boston Belting Co., for this company later acquired the old Roxbury plant. But

DANIEL HODGMAN.

taking into consideration only continuous and uninterrupted existence, there appears to be no other rubber company that can compete with the Hodgman company's three-quarters of a century. If there is, now is the time to speak up; for until it does and proves its case the Hodgman company must be conceded the palm of priority, the record of its 75 years being unimpeachable.

It was founded by Daniel Hodgman. He was a typical Yankee boy, born in Mason, New Hampshire, in 1808, of good old sterling native New England stock—the only kind of stock there was in New England in those days. A copybook, full of arithmetical rules and problems which he composed as a part of his school work is still in existence. It is a most painstaking, accurate piece of work, with not a comma slurred or a dot slighted. Anybody looking at that copybook could tell that when the boy grew to be a man he would keep every engagement promptly and pay every bill when it was due—or a little before.

When he was 21 and had served his apprenticeship to a neighboring farmer, he struck out for Boston, the goal of all ambitious New England boys in those days. After remaining there a year he concluded that New York was even a larger field, and to New York he went. He found a position in the grinding room of a factory—probably the Atkinson rubber factory—and there he remained for eight years. It is no joke to say that working eight years in a grinding room is a good deal of a grind, but it showed the quality of the man—he didn't object to hard work—and during those eight years he learned many things and saved up some money. But, what was more to the point, he kept his eyes open; and among the important things that he saw was the fact that there was a great future for india rubber. Those were the days of rubber's beginnings. A good many alert people had conceived the notion that if rubber could only be properly treated it could be made to serve a vast variety of useful purposes. Goodyear was cudgeling his brain over the problem. A greater vogue was given to the possibilities of this new substance by the spectacular ride of President Jackson through the streets of Boston on a rainy day clad cap-a-pie in a rubber suit which was provided him for that occasion. So, after eight years in the grinding room, young Hodgman—then 30—pulled out, and, taking a partner by the name of Robinson, opened a rubber store on Beaver street, New York. But Mr. Robinson does not seem to have been adapted to the rubber business, for he soon dropped out and Mr. Hodgman decided to go it alone and on a larger scale, and accordingly took a new and bigger store a little further uptown, on Maiden Lane. He made several changes of location as the increase of business necessitated it, but for 41 years he remained in the neighborhood of Broadway and Maiden Lane, 35 of these years, from 1844 to 1879, being passed in Maiden Lane.

GEORGE F. HODGMAN.

He was not content to remain a storekeeper, however, but put his Yankee wits to work and started to invent useful articles of rubber. His first invention seems to have been a life preserver, for which he was given a medal and diploma at the Fair of the American Institute held in New York in October, 1840. In the meantime he had started a rubber factory at 26th street and East River, close to the factory where he had gained his experience. An exceedingly interesting document hangs on the

wall of the Hodgman company's New York office, being an enlargement of the letter of patent granted Mr. Hodgman in 1842 for "a new and useful improvement on overshoes," the document being signed by no less a person than Daniel Webster, then Secretary of State. These Hodgman overshoes were evidently made of pretty good material, for the company has a pair now,

OLD STONE BUILDING CONSTITUTING HODGMAN FACTORY IN 1851.

made in 1848, that time has not withered nor made brittle—they are as pliable as if made last year.

An extremely interesting advertisement is still in existence, clipped from the *Evening Post* of 1846, in which Mr. Hodgman advertised a great variety of rubber wares, among them "Rubber Pantaloons," considerably affected in those days but not now worn, except as they form a part of the body boots used by oystermen. Speaking of interesting advertisements, here is a reproduction of an old picture of a "Forty-niner," dressed all in Hodgman rubber. When gold was discovered every able-bodied easterner wanted to start for California; and Mr. Hodgman saw to it that as many of them as possible started well equipped against the elements, in his rubber coats and boots and hats, with rubber knapsacks on their backs, advertising his store across the continent.

In 1851 a certain H. B. Ames assigned to Mr. Hodgman—for a consideration of $2,000—a license which he had obtained from Charles Goodyear to manufacture rubber door springs. Mr. Hodgman seems to have put a great deal of energy into this particular branch. He built it up into a large business, as is shown by a little pocket account book still extant in which he recorded his monthly payments to Goodyear on his door spring sales; and seven years later, in 1858, a new indenture was made directly between Goodyear and Hodgman—an interesting document in Goodyear's own writing.

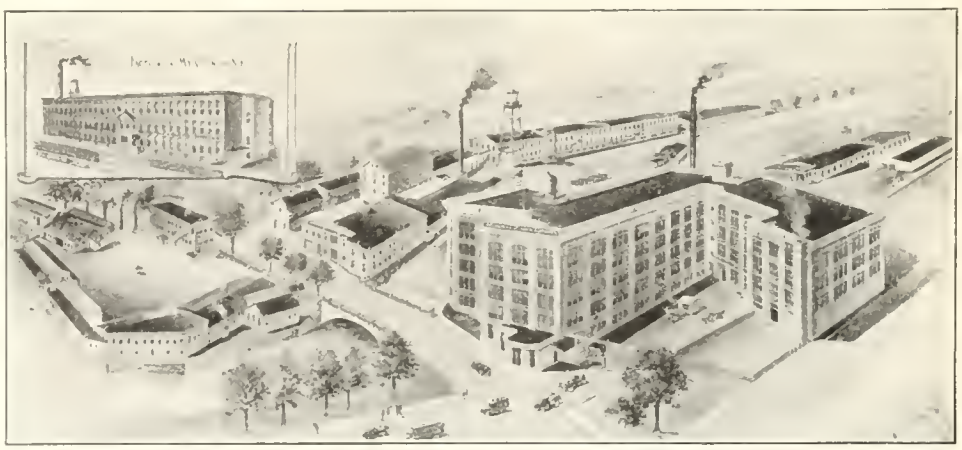
After a few years the factory on 26th street proved to be much too small, and in order to get more room for future developments Mr. Hodgman moved his manufacturing business in 1851 to Tuckahoe, a suburb north of New York City, where he bought a stone building, shown in one of the accompanying pictures, that had been used as a cotton mill. This was the beginning of the big Hodgman plant at Tuckahoe. This old stone structure still stands in good condition, tho it was built just 100 years ago this year, and gives every evidence of being able to weather another century.

Daniel Hodgman died in 1874, but his two sons, George F. and Charles A., had been well trained, so that they were able to step immediately into the management of the large and successful business their father had left them. Eleven years later the company was incorporated, under the name of the Hodgman Rubber Co., George F. Hodgman becoming president and Charles A. secretary and a little later vice-president. In the mean time, in 1879, the store followed the up-town march and located at 425 Broadway; and in 1882, in addition to the large plant at Tuckahoe a new factory was built in the adjoining town of Mt. Vernon, which is devoted exclusively to the manufacture of mackintoshes and other rain coats.

George F. Hodgman had all the sterling qualities of his father. He had the same unswerving sense of honor and indefatigible industry; and in addition he possessed many social graces which the elder man, like most men of his generation, had not—because of the harder struggle of those early days—had time to develop. Under the presidency of George F. Hodgman the business of the company grew steadily from year to year. While he was a very broad man, active in church, civic and social interests—a member of the Union League, the Chamber of Commerce and other leading organizations—his chief concern was the big industry which he had inherited; and on his death, in 1906, it was passed on to other hands, much increased in size and importance.

For three years the company's president was Charles A Hodgman, the second son of Daniel, who then retired because of ill health; and George B. Hodgman, son of George F., took the presidency, his brother, S. Theodore, being made secretary and treasurer—while a cousin, F. A. Hodgman, a son of the retiring president, was elected vice-president.

A few years before this, in 1903, the New York store had been moved to 806-808 Broadway, at 11th street, where it remains to this time, the most commodious rubber merchandising house in New York City. In the meantime the plant at Tuckahoe that began in 1851 with one small stone building has grown by one addition after another until it has assumed large proportions, many subsidiary departments being added, as, for instance, a box making shop, a machine shop, a printing department, an electrical department and an extremely modern laboratory, where a corps of chemists is constantly at work in experimental and research investigation connected with rubber manufacture.



THE HODGMAN RUBBER CO. PLANT OF TODAY.

It can be safely said of the Hodgman company that, while it is probably the oldest rubber company in America, there is none that is more modern in its equipment or its methods. As in the early days of Daniel Hodgman, its products cover a wide variety

of goods, a few of which may be mentioned: rubber clothing, mackintoshes, rain coats, air goods, articles for the bath and for the hospital; sporting goods, water bottles, syringes and other druggists' sundries; auto-top material, many kinds of tubing, and moulded goods.

A. W. WARREN,
Secretary and General Manager.

GEORGE B. HODGMAN,
President.

S. THEODORE HODGMAN,
Treasurer.

The present chief executive of the company, Mr. George B. Hodgman, is maintaining the high traditions of his ancestors. How he is generally regarded in the trade may be shown from the fact that he is president of the Rubber Club of America, the first man outside of New England to receive that honor. And the big company over which he presides never displayed more vitality or more promise for uninterrupted progress than it does today.

A FORTY-NINER IN HIS RUBBER OUTFIT.

The finances of the company are in the capable hands of Mr. S. T. Hodgman, who has been active in its affairs for twenty years. The secretary and general manager, Mr. A. W. Warren, has been with the company for nearly fifteen years and has done much to bring it to its present important and enviable position.

Incidentally, mention should certainly be made of Mr. Frank De Frate, great uncle of the president and of the treasurer, who has been connected with this company since 1846, 67 years ago. He is now, at the age of 89, daily at the factory. As the Hodgman company is undoubtedly the oldest rubber company in the country, it is equally safe to say that Mr. De Frate is the oldest man, both in years and in service, connected with any American rubber manufacturing plant.

On Saturday, the 28th of June, the Hodgman company held a great celebration in commemoration of its seventy-fifth anniversary and had a famous outing, where 1,500 of its employes and their friends were present. But that is a story all by itself.

INDIA-RUBBER GOODS IN COMMERCE

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india-rubber and gutta percha for the month of March, 1913, and for the first nine months of five fiscal years, beginning July 1:

MONTHS.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	TOTAL.
March, 1913.....	$200,573	$100,939	$854,230	$1,155,742
July-February.....	1,766,066	1,077,329	5,339,773	8,183,168
Total, 1912-13.....	$1,966,639	$1,178,268	$6,194,003	$9,338,910
Total, 1911-12.....	1,710,395	1,232,428	5,330,999	8,273,822
Total, 1910-11.....	1,511,975	1,801,977	4,485,644	7,799,596
Total, 1909-10.....	1,416,655	1,499,770	3,510,618	6,427,043
Total, 1908-09.....	1,053,758	1,071,489	2,805,914	4,931,161

The above heading, "All Other Rubber," for the month of March, 1913, and for the first nine months of three fiscal years, beginning July 1, includes the following details relating to tires:

MONTHS.	For Automobiles.	All Other.	TOTAL.
January, 1913.....*values*	$273,519	$50,409	$323,928
February, 1913	276,253	44,130	320,383
March, 1913	482,821	34,935	517,756
July-December	1,777,324	316,352	2,093,676
Total, 1912-13.....	$2,809,917	$445,826	$3,255,743
Total, 1911-12.....	1,869,471	393,920	2,263,391
Total, 1910-11.....	1,325,903	411,801	1,737,704

OLD ANDREW JACKSON AS A RUBBER ADV.

The United States Rubber Co. makes a brand of particularly tough rubber boots called the "Hickory" brand—a very proper name. To advertise this brand the company has recently issued a striking cut-out, a foot wide, standing about 20 inches high. It shows the figure, or at least the upper half thereof, of that sterling old American warrior, Andrew Jackson, known at his time and ever since as "Old Hickory." He is holding one of these "Hickory" boots in his hands while beneath a placard calls attention to the brand. This cut-out is printed in seven or eight colors and gives an excellent representation of the hero of New Orleans, as well as making an attractive advertisement.

OBITUARY RECORD.

GEORGE PELLINGER.

A BRIEF announcement was made in the June issue of THE INDIA RUBBER WORLD of the death of Mr. George Pellinger, president of the Vulcanized Rubber Co., which occurred at his home, Weehawken, New Jersey, on the night of Saturday, May 24.

Mr. Pellinger had been identified with the hard rubber industry since 1872, his start in the business being in a minor factory position with the India Rubber Comb Co. at College Point, New York. He remained with this company until 1878, when he resigned to accept a place in the Rubber Comb and Jewelry Co. of Bloomingdale, New Jersey. He left this company after several years of service, and helped organize the Keystone Hard Rubber Co. of Morrisville, Pennsylvania, with the assistance of Frank Nichols and Wm. A. Sheldon. He remained with this company until 1887, when, at the earnest request of Dr. B. F. Goodrich, he took charge of the Goodrich hard rubber department at Akron, Ohio, remaining there until 1895, when he accepted the position of manager of the electrical department of the Goodyear Vulcanite Co., since changed to the Vulcanized Rubber Co.

GEORGE PELLINGER.

His well known ability and good business qualifications helped him to rise rapidly from this position to the presidency of the company, which office he filled up to the time of his death.

He is survived by his widow and four children.

HENRY KIVER.

Henry Kiver, head of the well-known crude rubber house of Henry Kiver & Co., operating at 5 Fen Court, Fenchurch street, London, E. C., died on the 2nd ult. Arrangement has been made for the continued operation of the business on the same basis and at the same address as hitherto.

PROSPECTIVE EFFECTS OF PROPOSED TARIFF REDUCTIONS ON RUBBER GOODS.

ANY reduction in tariff rates would naturally in the first place operate in favor of those foreign makers who have been doing business with this country in spite of the 35 per cent duty, and are thus in a better position to profit by the situation than those who have been kept out of the market by the tariff and would now have to make new connections. The next efforts to profit by the change would naturally be on the part of countries which have lost ground and wish to regain it.

The annual American imports of india rubber manufactures have been as follows: 1907, $2,262,783; 1908, $1,956,590; 1909, $1,391,770; 1910, $1,154,347; 1911, $875,125; 1912, $998,722.

The average reduction of 60 per cent, between 1907 and 1911 was distributed as follows among the three principal sources of supply:

	1907.	1911.
Great Britain	$193,468	$288,668
Germany	1,028,746	438,302
France	825,399	68,322
Total	$2,047,613	$795,292
Other countries	215,170	79,833
Total	$2,262,783	$875,125

For the six years Germany shows a falling off to the extent of about 47 per cent., while France only retained about 8 per cent. of its former trade. Great Britain, on the other hand, shows a gain of about 50 per cent.

Whether or not the result of the new tariff would be to encourage those countries which have lost ground to make efforts to regain it under the more favorable conditions now in prospect, the advance in imports from England would seem to indicate a still keener competition from that quarter in the future.

Canada has of late partially regained lost ground. In 1907 the imports from Canada nearly reached $28,000. After a drop from $27,970 in 1907 to $1,894 in 1908, and $1,899 in 1909, imports from Canada recovered to $2,684 in 1910 and $51,864 in 1911.

COMPARISON OF PAYNE TARIFF AND NEW SENATE TARIFF BILL.

New Rubber Goods in the Market.

LIVING IN THE OPEN.

"BACK to the open" has been the cry of city dwellers for a number of years. People are pretty generally waking up to the fact that if they had less medication and fewer serums and more fresh air and sunlight they would be much better off. Here is an open-air bungalow. It is made of canvas sides, with plenty of screened windows, and has a canvas

waterproof roof. In addition to the open windows it has open gables—which enables the occupant, while being duly housed, to live practically perpetually in the open air. The cut shows one of these bungalows with a floor space 10 x 14 feet, and with screened windows aggregating 81 square feet. Canvas curtains are provided for covering these screened windows when inclement weather necessitates. It is an admirable little house for camping purposes, for out of doors sleeping, as a summer house on the lawn, a playhouse for the children, or to supplement sleeping accommodations at the summer cottage or camp. It is light and portable, easy to put up and readily taken down. [The Camping Bungalow Co., Hartford, Connecticut.]

A NEW FIRESTONE CLINCHER TIRE FOR ELECTRICS.

Extremely sensitive mechanisms—these electric cars. They cannot be bounced around with impunity—every jolt and jar by that much diminishes the mileage power of the batteries. For that reason pneumatic tires have been used extensively on the electric delivery wagons employed by city stores, to relieve, as far as practicable, not only the mechanism of the car itself, but the batteries from jarring.

But a pneumatic tire on a delivery wagon has its drawbacks, because it may be necessary to arrive at a given point at a certain time, and a puncture or a blow-out may interfere seriously with such a programme. Consequently various manufacturers have devoted much time to the designing of a cushion tire that shall be sufficiently resilient to be used on electric delivery wagons without subjecting the batteries to excessive jolting. The Firestone people have recently put on the market a new tire which they call the "Firestone Clincher Cushion Tire for Electric Cars." The accompanying cut gives a very good idea of it. The manufacturers say that this tire has all the cushion value of the pneumatics hitherto used. It is interchangeable with pneumatics on standard clincher or quick detachable clincher rims. [The Firestone Tire & Rubber Co., Akron, Ohio.]

A BELT TO KEEP SHIRTWAISTS IN PLACE.

Slovenliness is the greatest crime of which a woman can be guilty. Other delinquencies are readily forgiven her, but to go around with everything flying at loose ends is unpardonable—that is a mortal sin. Here is a device to assist women in their effort always to appear trim and orderly. It is a shirt waist belt, consisting of a specially woven corrugated elastic cord with small nickel fastener. It is worn as a belt around the shirtwaist, beneath the skirt, and keeps the waist in place. Its length can be regulated without in any way decreasing its snug fit and tenacious hold. It cannot tear the waist and it is quite inexpensive. [M. W. Schloss, 291 Seventh avenue, New York.]

THE "TREO" SHIRTWAIST BELT.

A RUBBER STAMP FOR EGGS.

In these days when there are so many different qualities for almost every sort of article, the consumer likes to know where his particular purchase comes from, as the brand indicates to him the quality. He always looks for the name when he purchases a tire or a pair of shoes. In fact this principle has been carried even into the world of edibles, so that many

THE "PAT" EGG MARKING STAMP.

people always buy oranges from a particular grove and eggs from a particular poultry farm. Here is a simple rubber stamp for marking eggs. It consists of a little metal tube, one end being open and the other end furnished with a molded rubber diaphragm. In inking the pad the finger is inserted in the cylinder so as to push the diaphragm against the inking pad, but in stamping the egg the finger is removed so that the rubber diaphragm conforms to the shape of the egg. It is a simple and inexpensive device. [The R. H. Smith Mfg. Co., Springfield, Massachusetts.

VOLUME OF RUBBER TRADE.

It has been estimated that out of a rubber production of 108,000 tons anticipated for 1913, nearly 45,000 tons will be consumed in factories identified with the automobile industry. That industry is said to now consume as much rubber as constituted the total supply of the world fifteen years ago.

NEW TRADE PUBLICATIONS.

THE LATEST GOODRICH LITERATURE.

THE B. F. Goodrich Co., Akron, Ohio, is a firm believer in advertising literature. The output from its printing presses is not only of an attractive and artistic character, but it is more or less continuous. During the past month it distributed to the trade a number of interesting pamphlets, among which the following are included:

"The Automobile Tire, Its Care and Repair," which is a catalog in convenient pocket size, of automobile accessories, and contains suggestions as to the proper way of using them. It describes and illustrates the "Goodrich Rubber Cement," the "Goodrich Plastic," the "Self-Vulcanizing Patch," the "Permanent-Puncture Plug," the Goodrich emergency band, the inside protector, and various other articles.

Another pamphlet describes the Goodrich elevator belts, including the special white-covered canning belt. Another little leaflet describes and illustrates the "Crest" fountain syringe. There is also another Goodrich route pamphlet, this time showing how to go from Philadelphia to Baltimore and Washington, and giving small but clear maps of these three cities.

AN EXCEEDINGLY ATTRACTIVE PURITAN.

THERE has been some criticism, these latter days, regarding the Puritan, some contending that while he was a very worthy person, he was too stern and austere to be altogether attractive. But regarding the Puritan maiden there never has been any ground for argument. She is altogether attractive. The E. H. Clapp Rubber Co., which makes certain "Puritan" brands of reclaimed rubber and uses the word "Puritan" as a trade mark, has favored its friends with a handsome colored panel, about 10 inches wide and 16 inches high, showing a "Puritan Girl" standing on the rock-bound coast, looking off at the "Mayflower"—or a craft of a similar type, anchored in the distance. As befits the type, she is a trim figure, plainly attired and extremely proper, but withal, very winsome in her youthfulness and unworldliness. The panel is in a narrow gilt frame and is pretty enough to hang anywhere.

A CONSPICUOUS TENNIS HANGER.

THE United States Rubber Co. has always issued attractive advertising in connection with its "Tennis" brand. Incidentally, its Tennis brand is one of its most popular lines. Possibly the popularity of the goods is attributable to the excellence of the advertising; or possibly the excellence of the advertising simply proves an effort on the part of the printing department of the company to keep pace with the work done by the factory. The latest Tennis product of the company's advertising department is a circular cut-out card, about 12 inches in diameter, printed in red and black, showing around the margin, in letters that appear to be deeply embossed, the words "Champion Tennis Shoes," while running across the card is a cut-out Tennis shoe, of the black variety. It is a conspicuous sign for wall or window.

A FOLDER FOR A RUBBER BOOT.

THE United States Rubber Co. is also distributing a small folder calling attention to its "Hickory" brand of rubber boots. It is printed in buff, green and black, and the front half of the folder shows a half-tone of the boot. On the inner pages will be found some excellent advice regarding the treatment and preservation of rubber footwear. A small wash-sketch shows a farmer coming from the barn, balancing two heavy pails of milk, and wearing a pair of these boots. Incidentally, there is a driving rain, and the pails are not covered, so that the honest farmer will have more milk when he reaches the house than when he left the barn—but he can't help that.

CANADIAN CONSOLIDATED RUBBER COMPANY, LIMITED.

In an attractive group of five catalogues, the Canadian Consolidated Rubber Company, Limited, tells the story of its products, under the divisions of Mechanical Rubber Goods, (A); Druggists' Sundries, (B); Molded, Miscellaneous and Plumbers' Rubber Goods, (C); Fire Hose and Supplies, (D), and Textile Goods, (F). The five catalogues have in the aggregate about 400 pages, in most of which are illustrations of the company's products. Each catalogue having a separate index, reference is thereby facilitated.

Rubber belting, for various reasons, claims superiority to that of other materials, retaining uniform width, thickness and tensile strength in spite of dampness and changes in temperature. These advantages are explained in catalogue A, which further gives prominence to the fact that the company's belting is thoroughly stretched in manufacture, the amount of stretch caused by work being thus minimized. Rubber hose likewise comes under this section, in which are illustrated the varied products of the company for conducting water, air, steam, oil, beer, wine, tannery fluids and acids. The eleven grades of garden hose are effectively illustrated in color printing. With regard to packing, the need of efficiency is duly urged, and emphasized by illustrations of the various grades made by the company.

In Catalogue B, the subject of Druggists' Sundries is fully dealt with, every feature being illustrated. Catalogue C takes up Molded Goods and Plumbers' Rubber Goods, including matting, stair-treads and tiling. Catalogue D is specially devoted to Fire Hose and Supplies.

Catalogue F directs attention to the company's complete line of rubber textile goods, including aprons, carriage cloth, auto top cloth, rubber coats, auto accessories, sportsmen's rainproof materials, horse covers, etc.

Each catalogue is complete in itself, containing views of the company's premises at St. John, Halifax, Montreal, Ottawa, Quebec, Toronto, London (Ont.), Hamilton, Brantford, Winnipeg, Regina, Calgary, Saskatoon, Edmonton, Vancouver and Victoria.

A NEW CATALOG FOR DAVID BRIDGE & CO.

David Bridge & Co., of Castleton, Manchester, England, have been issuing catalogs these 20 years, and as a rule the catalogs have constantly been getting larger, better and more complete. The latest catalog issued by this company—which it calls C 12—covers the friction clutches and driving installation under the Heywood & Bridge patents made by this company. It is a catalog of 190 pages, though, being only 5 inches in width, it can conveniently be inserted in a desk pigeon-hole, or in a coat pocket if desirable. The striking feature of this catalog is its wealth of illustrations. By actual count, there are 305 cuts in the book, some of them pen and ink drawings of machinery, but a great many of them half-tones made direct from photographs. The first cut in the book is an interesting birdseye view of the company's works, giving a very good idea of their magnitude.

In addition to a vast deal of information about the clutches and driving installations of every kind which the company makes, there are at the back of the book a good many tables which will be found of value to factory superintendents and others interested in any way in machinery—for instance, a table giving the belt velocity or circumferential speed of pulleys; a table of horse powers that a good cotton rope of different diameters will transmit at various speeds; a table showing the equivalent of millimeters in inches, and a conversion table which gives the equivalent of the metric system of weights and measures in the system generally in use in England and in the United States.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

The Editor's Book Table.

ANNUAL REPORT OF THE DIRECTOR OF FORESTRY OF THE Philippine Islands. Manila, 1912. [Paper, 60 pp.]

THE annual report of the Director of Forestry of the Philippine Island, for the fiscal year ending June 30, 1912, has come to hand. In the absence of the director, Major Ahearn, it has been submitted by the acting director, Mr. W. F. Sherfesse, and bears evidence of careful compilation.

It is stated that a marked decrease took place during the year 1912 in the exploitation of gutta-percha, owing to the extremely low market price during that period. Timber naturally occupies a prominent place in the report, which is embellished by some effective illustrations of Philippine forest scenes.

ACROSS THE ANDES; A TALE OF WANDERING DAYS AMONG the Mountains of Bolivia and the Jungles of the Upper Amazon. By Charles Johnson Post. New York, 1913. Outing Publishing Company. [Cloth, 362 pp., with 54 illustrations.]

In this bright description of one of the less known highways of travel, Mr. Post has accomplished the main object of the returned voyager. He has, by means of his vivid descriptions of ocean, mountain, jungle and river, carried the reader with him from Panama to Manáos. He reached Callao by steamer, and thence proceeded by a short railway journey of a quarter of an hour to Lima, described as a "Delightful City of Contrasts," in which highly civilized pleasures are found alongside of aimless poverty. Resuming his steamer voyage at Callao, Mr. Post reached Quilca, where he struck the trail leading to San José, continuing his journey by train to Arequipa and Lake Titicaca, finally arriving at Guaqui, where there is a connection with the railway for La Paz.

From the capital of Bolivia, his journey was continued by pack train and saddle, raft and canoe. The third and last of the Andean series was to be crossed, being also the highest and most difficult of the range.

Mr. Post's narrative of how he reached the confluence of the Madeira and the Amazon, thence breasting the current to Manaos, is graphic and picturesque, dealing with every notable incident which marked his journey, lasting over three and a half months from La Paz to its termination.

Rubber forms the subject of frequent reference, particularly the discomforts and disadvantages to which the rubber-pickers are subjected. The facts quoted illustrate and confirm the various statements which have been officially made as to the absolute dependence of rubber pickers upon the estate owners for even the barest necessaries of life.

PROTECTION OF INTELLECTUAL PROPERTY. DR. L. H. BAEKEland. 1913. [Paper, 16 pages.]

Readers of THE INDIA RUBBER WORLD will recall the excerpts published in the April, 1912, issue (page 361) from Dr. Baekeland's paper on the above subject, read at the Detroit meeting of the American Institute of Chemical Engineers. The recent issue of the paper in pamphlet form affords an opportunity of reading Dr. Baekeland's work in its entirety.

The excerpts in question included those portions dealing with "Intellectual Property Rights," "Fundamental American Patent Law," "Incompleteness of New Rules of Supreme Court," "German Practice of Settling Patent Suits," "Deficiencies of Proposed Oldfield Bill," and other points of importance.

In the more complete form as now issued, the paper refers to the fact that the average man has a one-sided conception of patents or inventions, and of the trouble and expense incidental to the protection of even apparently simple devices. The far-reaching effects of chemical inventions is a point which even the better prepared legislators find it difficult to understand; though such inventions have brought about the most far-reaching development. An instance is afforded by the perfecting of the automobile and all that it implies, from Goodyear's process of vulcanizing rubber. Another example is the diffusion of knowledge rendered possible by printing on cellulose paper.

With reference to the cost of living, Dr. Baekeland points out that the industries where invention and patents play the smallest rôle are also those where the increase of prices is most burdensome; while those commodities where patented inventions have had the fullest influence have, on the contrary, decreased in price, sometimes to an astonishing degree. The latter inventions include those of a chemical nature, where cheap soda means cheap soap, paper and glass, while cheap sulphuric acid leads to cheap fertilizers and cheap bread-stuffs. The present price of clothing is high, but would be still higher only for the patented machinery used in textile manufacture.

An interesting section of the pamphlet deals with the organization of the large German chemical companies, which employ hundreds of chemists and engineers exclusively upon research work. Other sections of interest treat of "The Gap Between Invention and Commercial Success," and "The Educational Effect of Inventions."

In the final section, "What should be done," Dr. Baekeland points out two ways open to our legislators; one of them "hitting the trusts" by mutilating the best there is in our patent system, while the other is not to put dangerous restrictions on the patent rights defined by the constitution. There is, however, he adds, an urgent need of reform by simplifying procedure at the Patent Office, as well as in the courts.

Dr. Baekeland, moreover, remarks that the history of almost every invention is an epic in itself, the details of which are known only by the few pioneers, who gave their brains, money, talent and even lives, to its development.

UEBER KAUTSCHUK UND GUTTA PERCHA HARZE (RUBBER and Gutta Percha Resins). By Dr. Gustav Hillen. Berne, 1912. M. Drechsel. [Paper, 96 pages.]

Of the various branches of rubber science, none has been more largely the subject of technical disquisition than that of the resinous components of the substance. In Dr. Hillen's work are condensed extracts of what the principal authorities on the subject have written, his references embracing the works of Terry, Weber, Henriques, Harries, Tschirch and others.

In his treatment of the matter Dr. Hillen has dealt with it in two sections—Rubber Resins and Gutta Percha Resins—regarding both of which branches he has supplemented his references to other authors by original chemical and scientific observations. His general conclusion shows, that, of the two, gutta percha resins are more uniform in their nature, while rubber resins, which have been in the past less the subject of investigation, show quite a different composition, largely consisting of greasy masses, difficult of separation, from which in many cases only substances hard to crystallize are to be obtained. Dr. Hillen adds that the resins of the so-called "pseudo-rubbers" such as Pontianak, Almeidine and others, form an intermediate group between gutta percha and rubber resins.

A number of tables illustrate the analytical results obtained by Dr. Hillen in the course of his researches.

His work, though only of 96 pages, has the advantage of concentrating much that has been written on the matter, thus forming a key to the results obtained by previous scientists. He prepared this dissertation in connection with his examination for the Doctor's degree at the University of Berne, where he had the benefit of the guidance of Professor Tschirch, a specialist on the subject. Dr. Hillen's work will be appreciated by rubber chemists generally, as a distinct addition to existing literature concerning rubber resins.

The India Rubber Trade in Great Britain.

By Our Regular Correspondent.

AN important action in reference to the use of proofing formulae came on for trial at the Manchester Chancery Court on May 29, and lasted for three and a half days. The plaintiff was F. A. Shiers, trading as Ferguson, Shiers & Co. at Failsworth, Manchester; the defendants being A. O. Ferguson and L. C. Fuller, both directors of a new proofing company at Hollinwood, Manchester. Mr. A. O. Ferguson is a son of the late Mr. Ferguson, who was senior partner of the plaintiff's firm. After his father's death two years ago Mr. A. O. Ferguson became manager of Ferguson, Shiers & Co., and a few months ago, after a disagreement with Mr. Shiers, left the firm, with Mr. Fuller, his assistant, to start a rival business. The present action was brought to restrain the defendants, by injunction, from using the formulae for the "mixings" in their new business, or any colorable imitation thereof; and also to restrain them from circularizing the trade to the effect that they were in a position to supply similar goods to those so long supplied by Ferguson, Shiers & Co. The case was complicated by the fact that the defendant, Ferguson, had been apprenticed to the older firm to learn the business and all the secrets thereof, with the idea of succeeding his father; thus being in a different position from that of an ordinary employe. The main point of the defence, however, was that the "mixings" of the late Manager Robinson having become obsolete, these had been replaced in recent years by new ones of A. O. Ferguson's own, and that therefore they were his property. The plaintiff and his witness contested the novelty of the new formulae, saying they hardly differed from Robinson's formulae, despite the inclusion of crêpe rubber and guayule, which, of course, testify to comparative modernity. Since the proceedings were started, the defendants for the first time had supplied the plaintiff with a copy of their formulae books, Ferguson's containing 99 recipes and Fuller's 163; and after the commencement of the trial, Fuller gave back his book. The issue was then reduced to whether Ferguson was to be allowed by the court to use his M. S. copy of the Ferguson-Shiers' "mixing" book. Chemical evidence as to the composition of the "mixings" was given by Mr. Hutchinson, F. I. C., for the plaintiff, and by H. L. Terry, F. I. C., for the defendants. The latter said that he had read through the book of formulae and had not noticed anything that could be called a secret process. All the constituents given in the formulae were well known in the trade, and were sold to the trade generally and not to individuals alone. The difference was in the proportions of the constituents and this was largely controlled by price and fashion. He could not say that "mixings" identical with those were common to the trade, with the exception of a certain government "mixing." Proofing managers who were worth anything knew well the general lines on which mixings at different prices were made, and though the same constituents might probably be used by different men, he would expect the quantities to vary, as every proofer was a law unto himself. Asked as to the probable effect of an injunction on the defendant, the witness said that he could no doubt carry on business without using their actual formulae, but it would be impossible to go on without using what would no doubt be held to be a colorable imitation. Further evidence for the defence was given by Mr. E. L. Curbishley, who supported Mr. Terry's statements and spoke to the common practice among proofers of having note books as aids to memory. After evidence had been given at length by the two defendants, discussion took place between counsel and judge, the result being that the colorable imitation clause was abandoned in the claim for injunction. Addressing the court for the defence at considerable length, counsel submitted that all a workman undertook to do when he entered his employment was to use his information and skill to the best of his ability on behalf of his employers. There was nothing restricting him, on originating anything, from making a record of it and from making sure of it for his own benefit after leaving that employment. Counsel then cited decisions to show that so far no court had granted injunctions respecting knowledge, unless it had been acquired surreptitiously, or respecting documents, unless they had been copied in breach of confidence. After counsel for the plaintiff had spoken, the vice-chancellor said he would reserve judgment.

ACTION BETWEEN PROOFING FIRMS.

On June 16 the vice-chancellor in his judgment said that an order must go against each of the defendants, restraining them by injunction from making use of any private or secret recipes used by the plaintiff or his firm, and obtained by the defendants while in the employ of the firm; and from communicating or disclosing to any person, company or firm, any of such secret recipes or any information relating to them, or making use of any confidential information relating to the plaintiff's business, obtained by the defendants while in the plaintiff's employ. The defendants were also ordered to deliver up books or memoranda containing recipes or information. The case, he thought, fell under the general rule that an employe, to whom confidential communications are entrusted to enable him to carry out the business of his employer, might not utilize that information for his own purpose after the employment was determined.

JUDGMENT IN PROOFING ACTION OF SHIERS V. FERGUSON & FULLER.

The extremely cool weather of the summer of 1912 gave a great impetus to new developments in the oilskin trade, and this year the business shows a large increase, though the weather has not been so persistently bad. The developments I refer to are the production of light articles, overalls and coats of oilskin to be worn by the man and woman in the street, the business in the past having been mostly confined to mariners, whose requirements were for something useful rather than ornamental. The oilskin business in Great Britain has not been carried on as a branch of a rubber manufacturer's business, except at the old established works of Messrs. Abbott, Anderson and Abbott at Dod street, Limehouse, London. This firm has long carried on the manufacture jointly with that of ordinary rubber waterproofs, and it is not surprising that they are in the van of the new business. I don't know whether the new goods are being made in America, but at any rate the subject is of some interest, as the oilskin comes into direct competition with the macintosh. In order to get some information on the subject I obtained an interview with Mr. William Abbott, who informed me that his firm had largely extended their oilskin business; new works having been acquired at Harpenden, some miles from London. The Dod street works are now devoted entirely to the making up of rubber-proofed cloth into garments. Mr. Abbott reports the new oilskin trade as exceedingly brisk; they being booked up with orders for months to come. Though the goods are made in different qualities to retail at from 4s. 6d. to 30s. ($1.08 to $7.20) each, the principal demand is for the 30s. oil-silk, known as

OILSKIN WATERPROOFS.

Abbott's "Auto-Soie." These are made in eight colors, and are very light and transparent. What their lasting power is, compared with a macintosh of the same price, I do not know. But I gather that their life is by no means co-extensive; more particularly because they require careful handling. The main point about the business is that they have become popular with ladies who are not too particular as to the price, as long as the thing is fashionable. One of the advantages of the oil-skin over the macintosh, I am told, is that it permits an expensive dress underneath it to be seen by others, and that largely accounts for their appearance this year at fashionable out-of-door gatherings in dubious weather. Although Abbotts may be considered the pioneers in this business, they are by no means without competitors, and in all probability, unless the demand should prove evanescent, we shall see further competition arise.

DANGEROUS GOLF BALLS.

A somewhat sensational paragraph has been going round the English papers with reference to a case in America where a boy lost the sight of an eye by opening a liquid core golf ball. As there is no reason to doubt the authenticity of the case, it would certainly seem advisable that balls containing corrosives such as caustic soda and chloride of zinc should be sold with some notification of their hidden danger. One of the results of the paragraph has been the bombarding of British dealers in golf balls as to the dangers that may lurk therein; the general answer being that such balls are not sold here.

RE-FORMED RUBBER.

Compared with what was the case two or three years ago, one hears singularly little about re-formed rubber nowadays. With regard to the Premier Re-forming Co., of Walthamstow, a new board of directors has been elected, and at a recent meeting it is understood that the financial position was under special consideration. Mr. Rawson, who was the promoter of the company, and who was to act as consulting engineer for a term of years at comfortable remuneration, has now severed his connection with the concern.

TEACHING RUBBER MANUFACTURE.

I have read the editorial headed "The Best Rubber School" in the June issue of THE INDIA RUBBER WORLD with interest, and have little doubt that it will be endorsed by our manufacturers generally. Here, as in America, the best rubber schools are still to be found within the four walls of the factory. Your reference to one of the Polytechnic institutes in London is not quite accurate; the Polytechnic in Regent street being the only institution bearing that title, and ranking among the numerous technical colleges now to be found scattered over the metropolis. Already the initiative of the Polytechnic in founding a rubber department has been copied in provincial technical schools and doubtless the movement will spread under the aegis of education enthusiasts, and the glut of those who wish to turn their knowledge to account as leaders. Some manufactures can no doubt be successfully taught at colleges, but I don't think that rubber can be included in their number, for reasons which it would occupy too much space to elaborate. Mention may, however, be made of the varying procedures in important matters of detail, which occur in the several works and which, if they do not in truth merit the term of secret processes, come near the category of such, and at any rate are kept as quiet as possible by those working them. It seems to me that the teacher of the rubber manufacture who goes beyond general principles will make himself unpopular with, at any rate, some of the manufacturers, and others will be in a constant state of suspense as to whether their particular methods will come out in the lime-light of the classroom. Leaving this point, however, for another, it is certain that the supply of chemists wishing for posts in rubber works will shortly (if such is not already the case) largely exceed the demand.

THE USE OF LIME IN RUBBER.

Compared with what was the case twenty years ago, the use of lime in compounding rubber shows a decided increase. Not only is it more generally used in rubber goods, but, what is more noticeable, the very small proportions of the past are now being exceeded. The main reason for this lies in the fact that whereas in the past rubber used to be kept for weeks—in some cases months—after washing, before being used, a more hand-to-mouth policy now prevails and the rubber is used up at once. Without necessarily being damp, it is apt to be so. Hence the increased use of lime as a preventative of prospective trouble.

THE RUBBER TRADE ASSOCIATION OF LONDON.

WITH the growing importance of London as a rubber market, the necessity had become evident of an organization in which the various sections of the trade would be appropriately represented and which would at the same time serve as an authority on the various questions arising in the conduct of the increasing business of the port.

The foundation in April last of "The Rubber Trade Association of London" has met these requirements. Its establishment under the auspices and with the co-operation of the "Rubber Growers' Association" ensures a continuity of previous efforts. The last named body has four representatives on the committee, which likewise includes six brokers and six dealers.

As defined in the general regulations, the objects of the association are: To promote the best interests of the Rubber Trade as a whole, for the mutual benefit of all concerned, producers, importers, brokers, dealers and consumers in general; to facilitate the settlement of disputes in the trade by arbitration; and for these purposes to make rules for the proper supervision and efficient conduct of the trade, including the regulation of mutual transactions between members of the association.

The entrance fee is £5 5s. ($26.25), the annual subscription being of like amount.

A prominent feature of the association is the "Standard Qualities Committee," whose duty it will be to examine all samples of plantation rubber sold under any of the standard descriptions, for the purpose of certifying before tendering whether such samples conform to the recognized market standards.

The officers and committee for 1913 are: Chairman, Samuel Figgis; vice-chairman, Harry Symington, and treasurer, J. D. Johnston.

The committee consists of the following brokers: A. Bussweiler, Andrew Devitt, Samuel Figgis, Patrick Gow, W. J. C. Hendrey, and Geoffrey Hoare; of the following dealers: E. Berg, J. D. Johnston, Arthur Meyer, E. Stevenson, L. Sutro, and Harry Symington; and of the following representatives of the Rubber Growers' Association: A. Gordon Dickson, E. L. Hamilton, Arthur Lampard, and John McEwan.

The Standard Qualities Committee for 1913 consists of Spencer Brett, Andrew Devitt, W. J. C. Hendrey, L. Jacob, Arthur Jones, F. Loeflund, A. H. Punnett, Roger E. Thompson, and W. S. Worthington.

The secretary is William G. Briggs, and the offices are at 6 Mincing Lane, E. C.

NEW LONDON RULES FOR PLANTATION RUBBER BUSINESS.

One of the first acts of the association has been the promulgation of a set of 30 rules, applicable under arrangement to private contracts, but to which all sales of rubber at public auction are considered as subject. These rules are to govern all contracts made on or before May 1, 1913, but rule 4, abolishing the allowances for draft and discount (referred to later on), will only apply to contracts made on and after January 1, 1914.

In rules 2 and 3 the usual formalities of auction sales are

provided for. Rule 4 fixes the "prompt" (or date of settlement) as the Saturday fortnight from date of sale or tender; sales or tenders dated on Saturday to be "prompt" that day fortnight. Draft ½ per cent., discount 2½ per cent., but on contracts made on and after January 1, 1914, no allowance for draft or discount will be made.

TENDERS.

Under rule 5 tenders are to be made on official forms, which are circulated through the hands of the parties interested. For a tender to be good, the first seller must be in a position to deliver on day of tender. By rule 6 buyers have the option of rejecting any tender of less than 2,000 pounds, except in completion of a contract.

Rule 8 provides that rubber sold under standard descriptions, before being tendered, must be certified by the Standard Qualities Committee of the association.

WEIGHTS.

According to rule 12, rubber is to be taken at reweights. Rule 13 provides for the final deliveries on contracts to be within 100 pounds of the weight contracted for, but in any case the nearest admitted by the average weight of the cases of the final tender

ARBITRATION.

The following rules apply:

DEFAULT. RULE 14.—Whenever it may be admitted by the seller or decided by arbitration that the seller has failed to fulfill the terms of the contract, the buyer shall "close" by invoicing back the rubber to the seller at once, at a price and weight to be fixed by arbitration, which price shall not be less than 2 per cent., and not more than 10 per cent. over the estimated market value of the shipment contracted for on the day upon which the default occurs, the difference to be due in cash in seven days.

SHIPMENT CONTRACTS. RULE 16.—When a parcel of rubber is sold under one of the standard descriptions for a specified shipment or for shipment by a specified steamer, and found inferior, or if any portion tendered be found inferior, buyers shall have the option of rejection; and the quantity so rejected, whether the whole or any portion, shall not constitute a delivery on the contract, but should the time for delivery have expired the seller shall be allowed three clear working days to replace the quantity rejected (provided that such quantity was in the opinion of the arbitrators a *bona fide* tender), otherwise Clause 14 of these rules to apply.

IF RUBBER IS INFERIOR TO GUARANTEE BY OVER 2*d*. PER POUND. RULE 17.—When a parcel of rubber is sold with a guarantee of quality other than as specified in Rule 15 for a specified shipment or delivery or for shipment by a specified steamer, and found inferior, or if any portion tendered be found inferior, the buyer must accept the same with an allowance, provided such allowance in the opinion of the arbitrators be not more than 2d. (two pence) per pound or otherwise as may be specified in the contract; but should the parcel or any portion tendered be rejected, the seller to have the option (provided that it was in the opinion of the arbitrators a *bona fide* tender) of substituting guaranteed quality on the spot, to fulfill his contract within three clear working days or the expiration of time for delivery as the case may be; otherwise Clause 14 of these rules to apply.

APPLICATION.

APPLICATION.—The final clause provides that these rules shall govern all contracts made on or after May 1, 1913.

RUBBER MANUFACTURING MACHINERY.

Under No. 10915, the Bureau of Foreign and Domestic Commerce reports that a European engineer, at present engaged as consulting and visiting engineer for tea and rubber estates, informs an American consulate that he is confident American manufacturers of rubber-making machinery could find a large market locally if they were willing to undertake the manufacture of machinery slightly different from that now in use on rubber estates. He states that he is willing to submit plans and specifications for machinery such as he believes would find a considerable market among estates, to any American manufacturers who will communicate with him.

RECOVERY OF RUBBER SOLVENTS.

In the application of rubber to fabrics on the spreading machine, the benzine is lost through being converted into gas by evaporation, unless there is a suitable apparatus for the recovery of the solvent. According to the "Gummi-Zeitung," such an apparatus might be constructed as follows: A longitudinal wood frame with a suction appliance is built in the spreading machine, while on the wood frame a funnel-shaped appliance of thin galvanized iron is constructed, in the center of which is a pipe for the suction of the benzine vapors. It leads to the cooling apparatus, which is situated outside the building. The suction pipe lies somewhat higher than the waste pipe, both being connected by a T-shaped piece. The pipes are cooled by cold water, the benzine vapors being thereby again converted into benzine and caught up in a glass carboy or other suitable receptacle.

A RUBBER INSTITUTE!

WRITING to the "Financial Times" of London, under the name of "Robusta," a correspondent suggests that the Eastern plantations should establish in London an institute for dealing with anything and everything which may promote their welfare.

Its activities might be under two headings: (1) commercial, (2) educational. Under the first heading it might be made the chief Rubber Exchange of the world, where the dealers might have their offices and meet their clients at daily markets. It could also be made a rubber technical institute, dealing with all problems in connection with the manufacture of the raw material and the discovery of new uses for rubber. Under the second heading it might become a training schoool, where young men proposing to become planters might receive the necessary scientific training for reaching the highest standard of efficiency.

It should have at its disposal funds for the encouragement of research, by offering substantial prizes for essays, observations, experiments, or technical improvements which might add to the prosperity of the industry.

A PROSPEROUS GERMAN COMPANY.

The Rhenish Rubber and Celluloid Co. reports for 1912 a surplus equalling $658,903, as compared with $617,263 for 1911. A dividend of 30 per cent. has again been paid.

UNITED BERLIN-FRANKFURT RUBBER FACTORIES.

At the recent general meeting of the above company a dividend of 9 per cent was declared for 1912. Prospects for the current year were said to be affected by the political situation, which had restricted purchasing operations.

HYGIENIC EXPOSITION AT LIMA.

An international hygienic exposition will be held at Lima, Peru, from September 2 until December 31, 1913. All exhibits will be admitted free of duty.

INCREASING FRENCH TRADE IN AMERICAN RUBBER SHOES.

United States Consul Carl Bailey Hurst, of Lyons, France, reports that trade in American footwear is increasing in his district, American rubbers, storm slippers and sandals being more widely used.

RUBBER TRADE BETWEEN LONDON AND UNITED STATES.

According to the recent report of Consul General John L. Griffiths, of London, the imports from the United States at that point for 1912 included 441 tons of rubber, valued at the equivalent of $135,488.

The crude rubber exports to the United States represented for 1911, $13,733,753; and for 1912, $28,676,300; while the exports of rubber clothing and manufactures represented for the two years respectively $483,178 and $487,379.

MR. YORKE'S OFFICE IN PARIS.

Mr. H. William Yorke announces to the trade that he has opened offices at 26 Rue de Turin in Paris, for the purpose of dealing in Colonial produce in general, but particularly in crude rubber. He has had twenty years' experience in the gathering, cultivation and manufacture of rubber.

GERMAN EXPORTS OF CRUDE AND WASTE RUBBER.

GERMAN statistics of rubber exports for 1911 and 1912 show the following results: Crude and washed rubber in 1911 represented 4,592 tons; in 1912, 4,943 tons. The amounts were made up as follows:

GERMAN EXPORTS OF CRUDE AND WASHED RUBBER.

To—	1911. tons.	1912. tons.
United States	2,394	2,671
Russia	428	660
Austria-Hungary	648	532
Great Britain	336	392
France	204	188
Belgium	206	164
Sweden	107	99
Italy	64	88
Denmark	42	38
Switzerland	43	25
Netherlands	62	20
Other countries	58	66
Total	4,592	4,943

GUTTA PERCHA.

Total exports were in 1911, 184 tons; and in 1912, 291 tons.

BALATA.

In 1911 Germany exported 220 tons; in 1912, 222 tons. Among the items of export were:

GERMAN EXPORTS OF BALATA.

To—	1911. tons.	1912. tons.
Norway	28	45
Great Britain	77	41
British Malaya	...	35
Other countries	115	101
Total	220	222

RUBBER SUBSTITUTES.

Germany exported in 1911, 198 tons; in 1912, 219 tons.

WASTE RUBBER, GUTTA PERCHA AND BALATA.

These represented in 1911 a total of 2,314 tons, and in 1912, 6,034 tons. The separate quantities taken by the chief outlets were:

GERMAN EXPORTS OF WASTE RUBBER, GUTTA PERCHA AND BALATA.

To—	1911. tons.	1912. tons.
Great Britain	968	2,840
United States	518	1,917
Netherlands	176	379
France	127	249
Austria-Hungary	180	222
Other countries	345	427
Total waste	2,314	6,034

GERMAN RUBBER INDUSTRY OF 1912.

The report of Consul General A. M. Thackara, of Berlin, on industrial conditions in Germany, states that the year 1912 witnessed a brisk trade in rubber goods, prices being, however, depressed. This was specially the case with the manufacture of tires, in which there was marked competition.

DRUGGISTS' EXPOSITION IN GERMANY.

The first South German Druggists' Exposition will be held at Münich from August 14 to 31, 1913.

CENTRAL ASSOCIATION OF GERMAN RUBBER MANUFACTURERS.

AT the general meeting of the Central Association of German Rubber Manufacturers, held in Berlin on May 3, the opinion was unanimous that makers have no reason at present to quote reduced prices. It was pointed out that the quotations for crude rubber differed but slightly from what they were when the last prices of goods were fixed. Furthermore, manufacturers have in many cases stocks of dear rubber, while the other elements of cost are constantly advancing. Even if the prices of crude rubber present certain advantages under special circumstances, these are needed, it was urged, for healing old wounds, and for recouping former losses, instead of spoiling the market by low quotations.

With regard to crude rubber, it was, moreover, represented that it is only a question of time when the price will again be generally higher, while Pará may advance any day. It would be difficult to restore the selling prices which would be affected by reductions at this time.

It would be specially unsafe to reduce prices of goods in which rubber, although a component, does not represent the predominant factor of value. A resolution was adopted expressing the opposition of the assembled manufacturers to any reduction of prices.

The meeting was under the presidency of Herr Kommerzienrat Hoff, who, in his opening address, reported that while in the business year—April to April—most factories had been well occupied, results could not be generally described as favorable. He attributed the reason in a great measure to the labor question. It was for manufacturers to prevent outside organizations from exercising any influence in their factories, at the same time promoting measures for the benefit of the workers.

Herr Hoff likewise drew attention to the need of combined action on the part of manufacturers with respect to the conditions of tender and guarantee in furnishing supplies to railways, expressing the opinion that the conditions of guarantee for brake and heating hose included some which could not be fulfilled. The association would again take up the matter with the railway administrations with a view to the needed reforms being carried out.

With regard to next year's London Rubber Exhibition, it was unanimously resolved that the participation of the German industry is desirable. Kommerzienrat Seligmann, who will be at the head of the German section, urged the necessity of such participation in order to claim the merited attention for German goods.

The annual report dealt, among other subjects, with the difficulties arising from certain legislative enactments prohibiting the employment of rubber containing lead or zinc for nipples, etc. Such articles are bought in foreign countries and the inability to furnish them forms an obstacle to German export trade.

For the purpose of allowing the needful representations to be made to the proper authorities with respect to the Putumayo atrocities, a resolution was adopted promising the moral and financial support of the association in such a course.

INCREASED PROFITS OF BELGIAN RUBBER COMPANY.

The report of the Société Anonyme pour le Commerce et l'Industrie du Caoutchouc, Brussels, shows the profits for the last three years as equalling: 1910, $48,632; 1911, $65,416; 1912, $84,092. These figures show a healthy development of the company's profits.

AMERICAN TIRES IN ITALY.

United States Consul Piero Gianolio, of Turin, reports the fact that although the French Michelin Co. has a large factory at Turin, and tires are also furnished to that market by Pirelli & Co., Milan, foreign makes are still imported in great quantities. Among them are the Continental, Dunlop, Goodrich and Palmer tires.

RUBBER TRADE IN JAPAN.

By Our Regular Correspondent.

TOY RUBBER BALLOONS.

THE Japanese factories specially devoted to the manufacture of rubber toy balloons number about 30 in Tokio and 12 in Osake. Several hundred factories, however, make this article as a supplement to their regular production. Crude rubber is used to the aggregate extent of about 250,000 pounds a year, the principal descriptions employed being Pará sheet and biscuit, in addition to Borneo rubber.

Imports of toy balloons ceased some years ago, the domestic production having been so placed as to exclude foreign competition. The makers of toy balloons have been working under the Japanese patent No. 8785, issued in May 1905 to Mr. A. Fukumori, the inventor of the process thus patented.

Briefly described, the process consists in the rolling of Pará, Indian, Borneo, or other grades of rubber, after mixing, through rollers at a high temperature. After being dissolved with volatile oil, the needed coloring substances are added. These rubber solutions are each kept in a metal or glass box, closing tightly, to prevent volatilization.

Various kinds of molds have been tried in succession, metal, china, and glass molds having been made. From being at first round, their shape has now changed to oval, like the top of a small spoon. The mold has a long handle, by which it is dipped into a solution of chloride of sulphur to facilitate vulcanization.

Dipping the mold into the rubber solution produces a membrane of rubber on the surface of the glass, this membrane attaining a suitable thickness after having been several times immersed. When the mold has been kept for three hours in a clean room to dry, the membrane is vulcanized by dipping it into a solution of chloride of sulphur for one second, this solution being on the basis of one ounce of chloride to half an American gallon of volatile oil. When the vulcanization is concluded, the rubber membrane is peeled from the glass mold and a seamless rubber toy balloon is thus turned out.

Such are the principal features of Mr. Fukumori's patent, of which he claimed that the process of Mr. K. Ogata and the late Mr. R. Kotake was an infringement.

In 1905 the lowest grade of foreign toy balloon was sold at 50 yen (25 cents) a gross; the same thing being now produced in Japan at 15 sen (about 7½ cents) a gross. The Japanese manufacturers who then went into the production of toy balloons made large profits and became wealthy in a few years.

Owing to its simplicity, the patent of Mr. Fukumori of 1905 was infringed by a number of manufacturers. He attached the factories of 20 in Tokio and 7 in Osaka, and 7 succeeded in arranging for a royalty in every case except one, in which a compromise was effected. In many instances, however, the manufacturers did not pay the stipulated royalty, and Mr. Fukumori was forced to take further steps. In 1907, being tired of thirteen years' litigation, he gave up his patent rights, since which time they have been open, with the result that the industry has freely developed. The method has been applied to nipples, finger cots, water pillows, etc.

Toy balloon factories employ many female hands. Among their manufacturing economies is the dipping of 100 molds at one time into the chloride of sulphur solution, each containing a membrane of rubber.

The average daily wage of the women balloon makers is 20 sen (10 cents) for ten hours. Other female hands get the same or a little more. The average daily rate of rubber manufacturing hands (male and female) is 50 sen (25 cents) for ten hours. This low rate of hand labor is calculated to encourage foreign manufacturers contemplating the establishment of factories in Japan, in the same way as has been done by the Dunlop Rubber Co. Far-East, and the Ingram Rubber Co. of Japan.

Toy rubber balloons are principally manufactured from September to February, and to a lesser extent between March and August, vulcanization during the latter period being more difficult. The same manufacturers produce a rubber toy operated by blowing, in which, however, only Pará rubber is used.

Out of the forty toy balloon manufacturers in Japan, three are of importance and finance the smaller makers. They buy the product of the latter for distribution in the cities, towns, and villages of Japan, Corea and China. These three are: C. Kamijo, Sekiya Rubber Branch, and T. Nishimura; all of Tokio.

It is reported that in order to profit by the cheap labor in Japan, a company will be established to export this article. The project is said to have the financial support of a foreign oil company.

JAPANESE RUBBER IMPORTS.

Comparative statistics published of the Japanese crude rubber imports for 1911 and 1912 show some interesting facts. The figures are as follows:

JAPANESE CRUDE RUBBER IMPORTS.

From	1911. *Pounds.*	1912. *Pounds.*
British Straits Settlements	1,223,071	1,214,485
Great Britain	426,013	242,620
British India	121,160	167,063
Dutch India	132,173	124,904
French India	not specified	3,805
United States	112,170	158,176
Germany	4,588	25,600
Mexico	not specified	113
Other countries	35,689	66,977
China	not specified	267
Total pounds	2,054,864	2,004,010

While the net average reduction equals about 2½ per cent., the difference varies in the cases of different countries. While there is a diminution of about 40 per cent. in the imports from Great Britain, there is a sixfold increase in the quantity from Germany, and that from "other countries" is nearly doubled.

In one respect the two years show a like result. The British Straits Settlements in each case supplied about 60 per cent. of the total Japanese crude rubber imports.

That, notwithstanding the development year by year of the Japanese rubber industry, the imports of crude rubber should show a decrease, is a fact which has been attributed to several causes. Japanese manufacturers used in 1912 an increased quantity of reclaimed rubber, of their own reclaiming or purchased in that condition. Another cause was the reduced consumption of "tabi" soles, used by the Jinrikisha men. The development of automobile and electric railway traffic was felt in the reduced demands of these men for the soles named. Still another reason was the general mourning for the late Emperor of Japan, which checked jinrikisha riding. While reclaimed rubber is the principal compound of "tabi" soles, a certain proportion is crude rubber, so that the imports of the latter were to a certain degree affected by the above-named cause. Some of the "tabi" manufacturers, however, turned to making rubber soles for Chinese sandals, and thus to a certain extent offset the falling off in the demand for their products.

RUBBER JINRIKISHA TIRES FOR MANCHURIA.

Solid rubber tires are said to have good prospects in Manchuria. Last spring forty pairs were imported from France, at Hoten, the capital of Hoten-Sho, where all the jinrikishas in the city have changed from iron to solid rubber tires. For this purpose, 2,000 pairs were imported from Japan.

DEATHS OF NOTED RUBBER MEN.

Mr. E. Sugii, proprietor of the Sugii Rubber Works, Tokio, recently died from heart failure. He went to the United States in 1905, where he entered Yale University. After his return to Japan, he established the East Marine Insurance Co., the Commerce Bank, and the Sugii Rubber Works

Mr. J. Iwaya, Japanese vice-consul at Singapore, has died of brain fever. He frequently reported to his government on Malayan and Dutch Indian plantations, and contributed to the development of rubber planting with Japanese capital

Mr. Isamburo Yamada, the first aviator and airship constructor in Japan, lately died, from a carbuncle. His experiments had lasted from 1897 to 1904. His airships, which are oval in style, as shown by the illustrations in THE INDIA RUBBER WORLD, December, 1911, were the only kind used in the Russo-Japanese war. There is no metal used in their construction, and their weight is consequently light. His funeral was attended by many prominent officials and other personages.

NEW JAPANESE COMPANIES.

The Kinshu Electric Wire Co. has been established at Osato, Fukuoka-Ken, with an area of 1¼ acres, of which about one-third is built on. The machinery has been installed by Birmingham makers and by the Japanese Iron Works of Tokio, the total capacity being 100 h. p.

In the equipment are included: 1 calender, 1 mixing roll and 1 washing roll. The product includes weatherproof wire, rubber wire, silk or cotton cord, lead tubes, etc. The officials are: President, S. Fujinami; director, S. Higase; manager, T. Seida, and expert S. Uemura.

The Taisho Rubber (Watanabe's Works) was established through the purchase by N. Watanabe, of the Tokai or Kwanto Rubber Works of Tokio, which were in financial difficulties. Its equipment consists of a 40 h. p. boiler and 15 h. p. engine, 2 mixing rolls and three vulcanizers. The product consists of "tabi" and "zori" soles.

NOMOTO RUBBER WORKS BURNED.

The rebuilding of the Nomoto Works, of Tokio, burnt in March last, is being actively proceeded with. In compliance with the wishes of the owners of adjoining premises, a three-foot wall is being erected, encompassing the factory, to diminish the risk of fire spreading.

WHEELS WANTED FOR RICKSHAWS.

According to the report of an American consular officer in the Far East (published under No. 11015, by the Bureau of Foreign and Domestic Commerce, Washington, D. C.), there is a considerable market at that point for wheels for rickshaws. A local company would be glad to hear from manufacturers of these wheels, with a view to taking an agency. The specifications furnished by this company are as follows: Wheels, 32 inches in diameter from rim to rim, not counting pneumatic tire or cover; hubs, extra strong, 4 inches between flanges, having ⅞-inch spindles, or screwed right and left to suit tubular axle; rims, 32½ by 2 inches, to take tires 36 by 2 inches, made of steel 17½ gauge; axle, tubular, either plain or screwed right and left to suit hub spindles; spokes, best quality, strong gauge, tangent spokes, and nipples to suit.

Vice-Consul Raymond S. Curtice, of Dalny (Darien), also reports that pneumatic-tired jinrikishas have recently been imported at Dalny from Shanghai, the wheels being of smaller diameter than the rubber-tired jinrikishas of Japanese make. The suggestion is made that American rubber manufacturers should note this possible opportunity for extending trade.

PROGRESS OF THE RUBBER INDUSTRY IN DUTCH GUIANA.

By a Resident Correspondent.

IT has long been known that the rubber tree grows in Dutch Guiana, but it has been cultivated commercially on an extensive scale for only a few years, the plantations being situated along the banks of some of the great rivers of the colony.

It is unnecessary to discuss the adaptability of the soil for growing rubber here, for no less an authority than the Editor of THE INDIA RUBBER WORLD, who visited the colony some years back, has declared that the common soil was equal to the best he had seen in the Malay country.

The colony is undergoing a great change in regard to its rubber raising industry, which will undoubtedly prove a source of wealth to those who have already invested, and to others who may put money into rubber growing in the colony. It will be interesting, however, to learn that in all the plantations on which Pará rubber—*Hevea Brasiliensis*—has been planted, the rapid growth of the trees and the large returns in latex have astonished visitors from other rubber producing lands. These facts certainly go to prove that the soil in Dutch Guiana is admirably adapted to the successful cultivation of this product. On plantation "Voorburg," for instance, during the month of March of the present year, tapping operations with 51 laborers at a cost of fl. 31.60 ($12.64) per day, yielded on an average 15 kilograms (33 lbs.) rubber per day. The total expenses, including preparation, etc., came to fl. 3 ($1.20) per kilogram (2.2 lbs.). Two hundred tapping days are calculated upon in the year, which would bring the production up to 3,000 kilograms at a total expense of fl. 6,320 ($2,528), as against a market price of fl. 5 ($2) per kilogram; which shows a profit balance of fl. 8,780 ($3,512). These returns and costs of production from only one plantation with about 7,000 trees, now nearing maturity, will be sufficient evidence that the rubber industry in the Dutch colony will prove highly remunerative, even when the market price of rubber stands at a lower figure than that used in the calculations above. It must also be remembered that the returns in rubber will be increased yearly as the trees grow older.

A little word of advice to those anticipating rubber ventures in the colony may be timely, and may help to remove any prejudicial feelings caused through misleading statements emanating from the late pessimistic Director of Science and Agriculture. This official, for reasons of his own, tried to impress the idea upon the public that the rubber industry in Dutch Guiana would never be remunerative; at least that it would not be nearly as productive as, for instance, in the Far East, where he claims that the soil conditions are superior. It is not our intention to comment too strongly on the unjust statements of this gentleman, as he has since been removed from the colony, for the colony's good, and sent to another part of the globe where he is likely to do less harm. Dutch Guiana is passing through a period of misfortune, and her good name must always be safeguarded against such unwarranted attacks, especially when she is endeavoring to make good what she has lost through repeated "black eyes" from some of her own sons. Incorrect statements from high officials, if left unchecked and unchallenged, tend to convey wrong impressions to those who may be inclined to consider the colony seriously at some time or another. It is pleasant, however, to know that in the face of all the false statements that have gone out from here—and which have been allowed so far to remain uncontradicted by those who by virtue of their prominent official positions, should be the first to make every possible effort to spread the truth about the colony—plantation "New Clarenbeck" was sold at public auction to an American combination.

We repeat, and with the strongest emphasis possible, that the future of Dutch Guiana as a rubber producing country is assured; and we are prepared at any time to contradict any incorrect statements that may be damaging to its reputation.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

THE BALATA INDUSTRY.

SOME interesting figures respecting the local balata industry have recently been furnished by the Comptroller of Customs in his annual report for 1912. The statistics given in that report show that last year the output of balata declined by the large total of 446,196 pounds, the value of this reduction being $219,860.22. The Comptroller points out that this reduction is a direct result of the drought, saying: "The upper reaches of the river were so dry that the despatch of expeditions to many of the tracts was considerably delayed; and so the bleeding season was much shorter than usual. The collectors found when they did commence work, furthermore, that the long spell of dry weather had so affected the balata trees that in the process of tapping the yield of latex was much below the normal." Doubtless the drought was the dominant factor, but it is possible that the failure of one or two companies exercised some small influence on the output. The year was an exceedingly bad one, as the figures for the past five years show: 1908-9, 1,090,405 pounds, value $471,076.19; 1909-10, 1,034,076 pounds, value $486,-034.81; 1910-11, 1,162,588 pounds, value $670,192.32; 1911, 1,152,-410 pounds, value $707,284.28; 1912, 705,214 pounds, value $481,-423.96. This year has witnessed a large increase in the exports of balata, and hopes have been entertained that the industry had excellent prospects. The rumors, however, of shortage of rain in the interior, of which I wrote last month, have proved true, and according to information direct from the bush, the bullet trees are budding and it is impossible to bleed them. There is at present in the colony Mr. R. Morrisson, a director of what we formerly called the Demerara Rubber Co., now known as the Demerara and Coverden Produce Co. Mr. Morrisson came out here towards the end of last year, and in January he accompanied the company's balata expedition to the Rupununi District. He has recently returned to town, and has expressed the opinion that the prospects in connection with the balata industry are very poor.

NEED OF RAILWAY BUILDING.

One of the most serious obstacles with which those engaged in the collection of balata in this colony have to contend is the difficulty of traveling in the interior, with the consequent loss of time. The building of a railway, which is still being talked of but about which nothing definite done, would revolutionize the balata industry here. One of the latest proposals in this connection is the construction of a line of railway along the coast of the County of Essequibo, to connect the colony with the Yurawai River District of Venezuela, in the province of Upata. An expedition recently went out to that district from this colony and found the whole region along the route which it has been suggested should be taken by the railway, extremely rich in balata and other products. It is generally believed that if satisfactory arrangements could be entered into with the government of Venezuela for the building of such a railway, along the route I have mentioned, the balata industry of both this colony and the neighboring Latin-American Republic would be greatly benefitted. Now that the prohibition of the importation of Venezuelan balata into this colony has been removed and it is allowed to come over the border on the same footing as the local product, viz., by paying a royalty to the British Guiana Government of two cents per pound, collectors of the latex in the Republic are glad to take advantage of the close proximity of the town of Morawhanna, in the northwest district of this colony, from which point there is a regular weekly service of steamers to the port of Georgetown for the shipment of their balata. In forwarding it by this route, collectors in Venezuela effect a considerable saving, for the expense of transporting the product of the expeditions to the nearest Venezuelan port is much heavier, the distance being so much greater. With the proposed railway in operation, transport would be still easier, and the balata industry in both countries would no doubt receive a great impetus. Unfortunately the lack of railway communication is not the only disability from which the Northwest District of the colony suffers. Dry weather is at present being experienced there, and during the past few weeks if it had not been for the fact that there is a good spring at the rubber station at Ossororo the members of expeditions would have suffered acutely. There are no water pumps in the district, and these are urgently required. The town of Morawhanna, which is the point from which the actual journey to the interior commences, is less than two hundred miles from the capital, but a weekly steamer service has to suffice. Recently His Excellency the Governor (Sir Walter Egerton) made a tour of the district, and the fact that in the course of his journeys he experienced considerable difficulty in traveling has aroused in the breasts of collectors of balata some hope that he will now realize the difficulty attending the prosecution of bush enterprises in this colony, and will extend a meed of sympathy to them.

DIFFICULTIES OF NAVIGATION.

The difficulties that attend the collection of balata would be infinitely less serious if good and experienced bushmen were more plentiful. Even with the most experienced man in charge of an expedition, the difficulties are very serious, as the following account, written to the "Chronicle" by a boat hand, will show: "It may, I think, interest a few of your readers (especially those concerned in the balata industry) to hear of a couple of experiences gained by one who has recently made his first trip to the Rupununi and back. The boats leaving Rockstone have failed pointedly to make the journey under a month, and this too (to use a common phrase), with severe blows, all owing more or less to the heavy dry weather prevalent in the district for the last six weeks or thereabout. Hence, Captain James McDonell, of the firm of Garnett & Company, and his four associates, deserved to be complimented on the manner in which they conveyed to Rockstone on the return trip, from the station known as Inkapati, for Messrs. Sprostons, Limited., one steam launch, one boat and seven steam barges, completing the task in the short space of eleven and a half days without an injury happening to any of the crafts. But for the coolness, the courage and quick presence of mind of this worthy captain, only half of the journey might have been made within that space of time, and who knows if some of these crafts might not have been badly injured, for I many times thought they would be dashed to pieces between the rocks, when such falls as Itonomi, Twashing, Abaquia and Waraputa had to be crossed. Thanks to the humane disposition of Captain McDonell and a few others of his skill and daring, or we should hear of many more accidents than those reported year by year from the Essequibo River when the balata season comes round. Indeed, our children and grandchildren will certainly bless that day when there shall be a railway running between Georgetown and Brazil, whereby much time and comfort will be gained, and whereby we shall feel less anxious about the safety of our lives than hitherto, in traveling through the interior of this colony."

GOVERNMENT BALATA SALES.

Considerable dissatisfaction exists here at present with the system in vogue as to the government balata sales. It appears that the Commissioner of Lands and Mines insists on only sending out circulars inviting tenders for the purchase of balata to those who are holders of balata tracts, instead of putting up the lots to public auction. It is argued that there may be others besides those mentioned above who would be prepared to make bids, but who, under existing circumstances, are ignorant of the sales. I understand that it is not necessary to take out a license in such a case, if one intends to ship the balata away forthwith, but only if it is intended to re-sell in the colony. It is thought that better prices would be realized by public auction than by tender, and that it would be more satisfactory all around.

Some Rubber Planting Notes.

RUBBER STANDARDIZATION IN THE FEDERATED MALAY STATES.

MR. LEWTON-BRAIN, the Director of Agriculture of the Federated Malay States, has been prominent in advocating the standardization of rubber. He has recommended the appointment of two additional chemists to supplement the present staff, with a special view to the efficient treatment of the question.

In supporting the proposal of Mr. Lewton-Brain, the "Malay Mail" enumerates various points in which the fact that the average planter is not deeply versed in chemistry would render invaluable the advice and suggestions of thoroughly professional men. Among such points is the question of premature tapping in order to provide dividends for expectant shareholders, as well as whether age does or does not increase the rubber content in the latex.

The opinion is finally expressed that some very useful results may be anticipated from the proposed addition to the chemical staff of the Department of Agriculture, in conjunction with the new experimental vulcanizing plant acquired by the government of the Federated Malay States. The information thus obtained should, it is added, do much toward bringing about the general standardization of Malayan rubber, which the plantation industry now so greatly desires.

DR. RIDLEY ON PROSPECTS OF RUBBER CULTIVATION.

Dr. H. N. Ridley, late Director of the Royal Botanic Gardens, Singapore, recently expressed the opinion, in a newspaper interview, that there is a great future before Malaya, the rubber plantations of which are enormous as compared with Ceylon.

As to manuring, he thought the time was coming when planters would go in for it scientifically and regularly. In the same way as in the cultivation of agricultural crops, he thought fertilizers would play an important part in rubber production in the future.

Referring to his recent visit to India, he stated that the whole of the plains, from Rajputana to Travancore, was in a backward way as regards agriculture and should be developed.

With reference to processes of curing, he had seen Mr. Wickham's system work and thought it extremely useful.

VARIATION IN QUALITY OF PLANTATION RUBBER.

The report of the Rubber Growers' Association for 1912 speaks of the New York Exposition having been a great success, especially with regard to trade. It is added that the chief American criticism was on the great variation in quality of the plantation product.

At the annual meeting the chairman, Mr. Noel Trotter, urged that if lower grades were better prepared more could be sold on reputation instead of on sample. He urged the standardization of the lower qualities, attention to washing and preparing scrap, and the uniform packing of various grades.

With regard to the near future of prices, Mr. Trotter was optimistic, urging, however, the necessity of economy in cost of production, freights and dock charges.

Mr. Noel Trotter was elected president of the Association and Mr. John McEwan vice-president.

CENTRAL FACTORIES FOR SMALL RUBBER ESTATES.

THE plan of central factories for small rubber estates has been advocated by the Malayan press, and the idea has met with approval in the English financial papers. Such an arrangement, it is urged, is likely to make for economy in working and for uniformity in the type of rubber produced.

MR. LAMPARD ON THE RUBBER OUTLOOK.

Presiding recently over the annual meeting of the London Asiatic Rubber and Produce Co., Ltd., Mr. Arthur Lampard expressed his conviction that there was nothing in the statistical position to cause the slightest uneasiness to shareholders. Stocks in Liverpool and London at the end of December were lower than in either 1911 or 1910. At the end of March, 1913, stocks were 5,968 tons, or 1,530 tons more than in 1912, but considerably less than at the same date in 1911, when the pure was 6s 1½d, ($1.47) compared with 3s 8d. (88 cents) on March 31, 1913. Practically the whole increase had been in plantation rubber. He believed that the drop in price would not be permanent, and that it would not be injurious to the cultivated rubber industry, though it might chasten it a little.

EXPERIMENTAL STATION ON THE MADRE DE DIOS.

Don Emilio Castre, a rubber expert who represented Peru at the International Rubber Exposition in London in 1910, is on his way, with a staff of assistants, from Callao, Peru, by way of Cuzco, to the Madre de Dios river, where they are going to establish an agricultural experimental station in some place to be selected by them which combines the best prospect of producing not only rubber, but food supplies. Don Castre has spent some time in Ceylon, studying rubber cultivation in that part of the world.

EASTERN CROP RETURNS TO END OF MAY.

According to cabled returns to the end of May, the largest plantation companies still show a progressive increase of output. Thus the Anglo Malay Rubber Co. reports for five months 516,080 pounds, against 307,498 pounds for the corresponding period a year earlier. For a similar time the London Asiatic Rubber and Produce Co. shows 362,589 pounds, as compared with 218,705 pounds; while the Selaba Rubber Estates produced 161,528 pounds in comparison with 111,288 pounds. The Sungkai Chumor Estates record for the 11 months ending May 31 a crop of 253,214 pounds, against 98,249 pounds for a similar period in 1911-1912.

The United Serdang (Sumatra) Rubber Plantations (Ltd.) produced in the 9 months ending May, 1913, 800,976 pounds, the product for a similar period terminating May, 1912, having been 347,658 pounds.

POUNDS OR TONS.

IT has been suggested that the returns of the monthly output by plantation companies should be published in tons instead of pounds, the present form becoming increasingly unwieldy and being likely to become still more bewildering to the reader as production further increases. Forward contracts are already made, as a rule, in tons, but at prices per pound. The long ton of 2,240 pounds being about equal to the metric ton of 1,000 kilos or about 2,204 pounds, comparison of statistics would be facilitated by the proposed new form of return.

A RUBBER RING IN LONDON?

The annual report of the Selangor (Malaya) Chamber of Commerce for 1912 states:

"For the producer, a serious development has lately taken place in London, where the dealers and brokers have come to an understanding, and formed a ring, making it impossible for the manufacturer in the future to deal direct with the producer."

SANITATION IN CEYLON.

Sir Patrick Manson, the well-known expert on tropical diseases, recently paid a visit to Ceylon. In an interview before starting for home he said:

"There is no proper sanitation at all in the planting districts. Whatever sanitation there exists is of a very elementary kind. The Government is doing its best now to improve matters by starting a research institute and laying down the lines of a sanitary system. But much cannot be done without the co-operation of the planters themselves, and such co-operation is very badly needed."

It is of interest to note that active measures are being taken for the establishment of a Sanitary Department for Ceylon. A committee has been investigating the question.

MR. WICHERLEY AGAIN IN CEYLON.

Mr. William Wicherley lately revisited Ceylon to look after his business interests in the island. Another object of his visit was to demonstrate a new rubber curing machine, which he described as a cheap portable machine, furnishing not only a ready but economical method of making rubber.

The speaker gave some interesting facts about rubber seed oil. His own plant at Grand Pass is already shipping prepared kernels yielding oil of very fine quality. The average yield of oil was 50 per cent., while the residue has sold very readily at a price equal to that of the best linseed cake. He was to return to England in June and to again visit Ceylon in October.

CEYLON PLANTERS EVERYWHERE.

Mr. Jesse Davis, the ubiquitous ex-Ceylon planter, who lately revisited the island, has stated that he had found the Ceylon planter in all parts of the world where he had been, particularly on the East Coast of Africa, where they were planting rubber, coffee and cocoa nuts.

COST OF CEYLON RUBBER PRODUCTION.

In a recent newspaper interview the Hon. F. W. Collins, general manager of the Malacca Rubber Plantations, Ltd., summarized the results of a month's stay in Ceylon, during which time he had visited a number of the leading rubber plantations. What struck him most favorably was the low cost of production. On some of the estates he had visited the cost is very much lower than it is in the Straits. This, he understood, was largely due to Tamil labor only being employed. Some estates are said to be putting their rubber in Colombo at as low a cost as 8½d. (17 cents).

With regard to yield, Mr. Collins had found the best Ceylon estates producing under 300 pounds of rubber per acre at seven years' old. At that age, some of the best estates in the Straits run to 450, and even 500 pounds per acre. The greater productivity in the Straits he attributed to climate and soil.

As to labor, Javanese coolies had been found the most economical in the Straits, but they had to work mainly with Chinese labor, which was plentiful but costly. In conclusion, Mr. Collins said: "We hope either to bring down the pay of the Chinamen, or to get a larger amount of work from them than we do at present."

These statements from the general manager of one of the largest Malayan companies, are of interest in connection with the proposed introduction of Chinese labor into Brazil.

THE NEW CEYLON DEPARTMENT OF AGRICULTURE.

Official notice has been received from Mr. R. N. Lyne, Director of Agriculture, Peradeniya, Ceylon, that the Royal Botanic Gardens Department has been replaced by a Department of Agriculture. The hope is expressed by the director that the cordial relations hitherto existing between THE INDIA RUBBER WORLD and Peradeniya, will be maintained under the new arrangements.

THE TROPICAL AGRICULTURE COLLEGE.

In a letter to the London "Times," Professor Wyndham Dunstan, president of the International Association of Tropical Agriculture, has advocated the selection of Ceylon as the site of the proposed Tropical Agricultural College. He proceeds to say that Ceylon is best suited for an agricultural college, as it possesses a variety of climates, and opportunities for studying rubber, tea, coconuts, and other tropical crops. It has a large, influential and enterprising planting community, both European and native, and also has the advantage of an agricultural department. Training in Ceylon, following a home course, should, in his opinion, qualify agriculturists for any part of the tropical world.

Commenting on the above and other proposals for a tropical agricultural college, "Tropical Life," of London, remarks: "We feel, therefore, now that East and West have both had their cause fully and carefully laid before the government and the public, it is for them to see which center should have the first college, until, we hope, in the near future, each will have its college of agriculture."

The fact is also referred to that there is a budget of £195,000,000, but not a cent for tropical medicine and education.

WHY RUBBER FELL.

IN discussing the causes of the recent fall in rubber, at an interview reported in the "Financial Times," Mr. T. E. Williams, of Messrs. Marling, Evans & Co., London, stock brokers, attributed the decline, in the first place, to the tightness and dearness of money, both in England and abroad, due to the world-wide prosperity having led to overtrading. Further contributory factors have been the war in the East, the war scares in England, and the trade difficulties in America.

Mr. Williams further pointed out that of the $450,000,000 invested in the plantation industry by English companies, probably three-fourths of the total is under the direct and indirect influence of people who are closely associated with the rubber industry and thoroughly understand the position. Yet there has been no selling of any importance traceable to such sources, those who are most thoroughly conversant with the conditions of the industry evidently showing the greatest confidence in its stability and continued prosperity.

The opinion was likewise expressed by Mr. Williams that owing to their increasing output, forward sales and lower production costs, a large number of companies will be able to maintain a return of 10 to 14 per cent. on the present price of their shares, with rubber where it then stood (about 3*s.* 4½*d.*). This, he added, would be subsequently possible, even with rubber on a declining scale of 3*s.*, 2*s.* 9*d.*, and 2*s.* 6*d.* in 1914, 1915 and 1916, respectively.

Regarding the growth of consumption, he added, in every civilized country the horse is being replaced by the motor. The use of commercial cars, requiring solid tires, is growing at a phenomenal rate, while the demands of the electrical and other industries are constantly increasing.

Finally, Mr. Williams expressed the conviction that the present low price of rubber is largely due to exceptional circumstances, which are now well known and will soon pass away. The low prices have permitted the "rubber barons" who had sold forward at 4*s.* and over, to cover their contracts, and to secure cheap rubber, with the expectation of higher prices when the ordinary trade demand gets into its stride again.

PENSIONS FOR ASSISTANT PLANTERS.

THE Amsterdam Langkat Co. is said to have formulated a scheme for pensioning assistant planters who have been in its employ for fifteen years, the pension obtainable being 1,000 guilders ($400) per year. Monthly premiums are to be paid, on a graduated scale. Pension schemes have also been drawn up by other Dutch companies.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED MAY 6, 1913.

NO. 1,060,624. Means for tripping the inking rollers of printing presses. H. Pearce, R. G. Parker and F. W. Wright, Broadheath, assignors to Linotype and Machinery, Ltd.—both of England.

1,060,777. Nipple for nursing bottles. H. J. Maynard, Newton Highlands, Mass., assignor to Thermolac Mfg. Co., Boston, Mass.

1,060,852. Vacuum massage device. F. O. Parker, Washington, D. C.

1,060,854. Pneumatic wheel. N. Peterson, Teton, Idaho.

1,060,886. Insulator. J. E. Bicknell, assignor to the Findlay Electric Porcelain Co.—both of Findlay, Ohio.

1,060,889. Life preserver. K. Brauer, Lyndhurst, N. J.

1,060,964. Vacuum cleaner. J. T. Atwood, Rockford, Ill.

1,061,015. Tire tool. G. Schaefer, New York.

1,061,017. Hose supporter. M. W. Schloss, New York.

1,061,069. Inner tube valve. J. S. Harber, Youngstown, Ohio.

1,061,184. Alarm for tires. H. E. Knies, White Haven, Pa.

1,061,200. Tire alarm. J. B. Polo, Clear Lake, S. D.

1,061,204. W. T. Smith and C. C. Royer. C. C. Royer assignor to M. Smith all of Bellefontaine, Ohio.

1,061,207. Rubber compound. E. Von Vargyas, Pittsburgh, Pa.

Trade Marks.

68,088. The H. O. Canfield Co., Bridgeport, Conn. The word *Canfield.* Rubber goods for plumbers' use.

68,356. The Manhattan Rubber Mfg. Co., Passaic, N. J. The word *Master.* Rubber gland packing for steam engines, etc.

69,390. Hanover Vulcanite Co., New York. The words *The Golf Club.* Combs made of hard rubber.

69,453. Converse Rubber Shoe Co., Malden, Mass. The words *Rabbit's Foot,* over an illustration of a rabbit.

ISSUED MAY 13, 1913.

1,061,275. Life preserver and pillow. S. P. Edmonds, Catonsville, Md.

1,061,344. Vehicle wheel. M. S. Weist, Sedalia, Mo.

1,061,369. Safety device to keep wheels from sliding. J. A. Gruber, Cincinnati, Ohio.

1,061,391. Tire patching device. G. J. Martel, Chicago, Ill.

1,061,472. Pressure gage. G. T. Hackley, Los Angeles, Cal.

1,061,523. Tire armor. J. J. Bukolt, Stevens Point, Wis.

1,061,524. Tire armor. J. J. Bukolt, Stevens Point, Wis.

1,061,539. Apparatus for administering narcotics. G. Haertel, Berlin, Germany.

1,061,566. Bathing brush. J. H. Pride, Kidder, S. D.

1,061,664. Combined corset and abdominal supporter. E. Drenshtein, New York.

1,061,686. Wrist and sleeve protector. P. J. Nichols, Ames, Colo.

1,061,693. Fountain pen. D. W. Schnebbe, New York.

1,061,722. Device for shaping the outer casings of pneumatic tires. G. W. Bell, Stockport, England.

1,061,748. Filler for ink wells, etc. J. W. Jacobus, Great Neck, N. Y.

1,061,807. Tire. W. A. Binion, Newark, N. J.

1,061,816. Demountable rim. J. H. Champ, assignor to The Standard Welding Co.—both of Cleveland, Ohio.

1,061,872. Nozzle for fire extinguishing apparatus. F. von Schidlowsky, St. Petersburg, Russia.

1,061,905. Tire fastener. L. G. Fleming, Tarrytown, N. Y.

1,061,927. Tire. S. Scognamillo, New York.

Design.

44,042. Waterproof cap covering. P. G. Tilton, Melrose, Mass.

Trade Marks.

62,081. Main Belting Co., Philadelphia, Pa. The word *Anaconda.* Machine belting.

68,791. Traun Rubber Co., Hoboken, N. J. The word *Golddust.* Dental rubber.

68,910. American Gum Products Co., Boston, Mass. The word *Goulag.* Manufactured gum.

69,076. Samuel C. Beck, Chicago, Ill. The name *S. C. Beck's* written through square of rubber.

69,431. The Mindease Co., Louisville, Ky. The word *Mindease.* A preparation for filling automobile tires.

ISSUED MAY 20, 1913.

1,062,024. Pneumatic tire. A. H. Morton, Cleveland, Ohio.

1,062,070. Tire armor. S. F. Wilcox, Garden City, N. Y.

1,062,072. Apparatus for vulcanizing rubber articles and the like. J. S. Wilson, Chelsea, Mass.

1,062,155. Flexible hose protector. J. D. Harris, assignor to The Westinghouse Air Brake Co.—both of Pittsburgh, Pa.

1,062,158. Truss. A. M. Hurel, New York.

1,062,160. Elastic pocket for garments. R. E. Kelly, Cocoanut Grove, Fla.

1,062,200. Wheel for vehicles. C. C. Sill, Seattle, Wash.

1,062,338. Detachable heel or shoe heel. P. Kane, North Brookfield, Mass.

1,062,401. Pneumatic tire cover. J. T. Johnson and F. G. Mason, Caulfield, Victoria, Australia.

1,062,426. Puncture closing compound. W. J. Watkins, Fort Worth, Texas.

1,062,435. Life preserver suit. J. W. Buchanan, Asheville, N. C.

1,062,462. Tire support. A. Harnishfeger, Evansville, Ind.

1,062,519. Vehicle wheel. W. T. Thorp, Litchfield, Ill.

1,062,535. Composition of matter to be introduced into the inner tubes of pneumatic tires for rendering the tires puncture proof. T. S. Causey, Arlington, Texas.

1,062,567. Tire deflation indicator. H. Jacoby, Eberstadt, near Darmstadt, Germany.

Design.

44,062. Resilient tire. H. H. Hewitt, Buffalo, N. Y.

Trade Marks.

60,511½. The Mechanical Rubber Co., New York and Cleveland, Ohio. The word *Meruco.* Rubber mats.

60,512½. The Mechanical Rubber Co., New York and Cleveland, Ohio. The word *Meruco.* Rubber water bottles and syringes.

60,513½. The Mechanical Rubber Co., New York and Cleveland, Ohio. The word *Meruco.* Rubber tubing.

68,002. The Seamless Rubber Co., New Haven, Conn. Fleur de lis in circle with the above company's name and address around same.

69,821. The Beacon Falls Rubber Shoe Co., Beacon Falls, Conn. The words *Rock Ribbed.*

ISSUED MAY 27, 1913.

1,062,618. Attachment to wheels. T. Townsend, Winnipeg, Manitoba, Canada.

1,062,631. Tire protector. G. Bellemare, Winnipeg, Manitoba, Canada.

1,062,730. Coupling for uniting hose pipes with faucets. J. G. Poppert, Portland, Ore.

1,062,786. Sanitary drinking device. A. S. Miller, Monroe, La.

1,062,826. Boot and shoe. S. J. Harris, Randolph, Mass.

1,062,828. Caoutchouc-like substance and process of making same. F. Hofmann, C. Coutelle, K. Delbruck and K. Meisenburg, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.—all of Elberfeld, Germany.

1,062,912. Caoutchouc-like substance and process of making same. C. Hofmann, C. Coutelle, K. Delbruck and K. Meisenburg, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.—all of Elberfeld, Germany.

1,062,913. Caoutchouc substance and process of making same. F. Hofmann, C. Coutelle, K. Delbruck and K. Meisenburg, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.—all of Elberfeld, Germany.

1,062,914. Caoutchouc substance and process of making same. F. Hofmann, C. Coutelle, K. Delbruck and K. Meisenburg, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.—all of Elberfeld, Germany.

1,062,915. Caoutchouc substance and process of making same. F. Hofmann, C. Coutelle, K. Delbruck and K. Meisenburg, assignors to Farbenfabriken vorm. Friedr. Bayer & Co.—all of Elberfeld, Germany.

1,062,958. Filler for caoutchouc and process of manufacturing same. L. Elfrink, Modjokerto, Java.

1,062,973. Producing rubber-like compounds. H. S. A. Holt, assignor to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany.

1,063,008. Vehicle tire. W. E. Budd, Elizabeth, N. J.

1,063,117. Tire of wheels of vehicles or the like. J. Cairns, Walsall, England.

1,063,161. Spring wheel. O. H. Hinds, Le Mars, Iowa.

Designs.

44,082. Cap for tire valves. W. B. Burke, Cleveland, Ohio.

44,087. Automobile tire. C. A. Daniel, Philadelphia, Pa.

Trade Marks.

62,730. Birdsey-Somers Co., New York. The word *Onist.* Dress shields.

67,899. The Manhattan Rubber Mfg. Co., Passaic, N. J. The word *Paranite* written over line with arrow points at either end.

68,530. F. Barth, Barmen, Germany. The word *Ajax.* Rubber cord, suspenders, etc.

68,535. The Pragma Tyre Filling Co., Ltd., Derby, England. The word "Pragma." Resilient filling for tires.

68,790. The Reality Rubber Co., Massillon, Ohio. The word *Reality.* Rubber gloves.

69,202. The Fisk Rubber Co., Chicopee Falls, Mass. The words *Gold Bond.* Rubber tires.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911 and 1912.

*Denotes Patents for American Inventions.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 7, 1913.]

806 (1912). Dress shields. J. Braunstein, 12 Hillbury Road, Upper Tooting, London.

850 (1912). Inflating tires. A. and E. Kloppenburg, Strackholt, Hanover, Germany.

1,049 (1912). Vulcanizing presses. H. Webb, 38 Glasgow Road, Plaistow, London.

1,087 (1912). Pneumatic tire cover. A. J. Callinan, 281 Collins street, Melbourne, and V. J. Heinecke, Murrumbeena, Victoria—both in Australia.

1,259 (1912). Treads for pneumatic tires. J. F. Cooper, Lyncote, Green Lane, Dulwich, London.

*1,284 (1912). Dress shields. V. Guinzburg, 721 Broadway, New York, U. S. A.

1,289 (1912). Rubber washers for milking appliances. M. Meaney, Codford St. Mary, Wiltshire.

1,321 (1912). Continuous tire. R. T. Smith, 111 Lovely Lane, Warrington, Lancashire.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 15, 1913.]

1,505 (1912). Elastic tires. G. A. Golding, Station Hotel, Haywards Heath, Sussex.

1,509 (1912). Rubber tips for canes, etc. J. H. Bent, 28 Johnson street, Cheetham, Manchester.

1,630 (1912). Massage appliances. M. Laughton, 90 Dickenson Road, Rusholme, and F. A. Coleman, 2 Beech Range, Levenshulme—both in Manchester.

1,649 (1912). Rubber coating for rugs, etc. C. E. Player, Auckland, New Zealand.

1,717 (1912). Mud guards for wheels. D. Jones, 26 Queen's Head street, Islington, London.

1,757 (1912). Inflating pumps. H. J. W. Dunn, 47 Kingsbury Road, Erdington, and R. T. Shelley, Aston Brook street—both in Birmingham.

1,784 (1912). Buttons of vulcanized flexible rubber. H. Jelley, "Westover," Selly Park Road, Selly Park, Birmingham.

1,843 (1912). India rubber compositions. C. Marter, 131 Tottenham Road, Southgate Road, Hackney, London.

1,909 (1912). Air tubes and chambers. A. Whiteway and C. McIntosh & Co., Cambridge street, Manchester.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, MAY 21, 1913.]

2,029 (1912). Silk and rubber tire fabrics. W. E. Muntz, 89 Pall Mall, London.

2,075 (1912). Reclaimed rubber. W. E. W. Richards, 50 Great Tower street, London.

2,199 (1912). Continuous elastic tires. N. Thonard, 2 Place du Theatre, Liege, Belgium.

2,246 (1912). Block tires. J. Berry, Kenrick Road, Mapperley, Nottingham.

2,306 (1912). Attaching rubber to metals. E. R. Boyston, Tower Building, Water street, Liverpool.

2,312 (1912). Vulcanized india rubber. Farbenfabriken vorm. F. Bayer & Co., 217 Koenigstrasse, Elberfeld, Germany.

2,313 (1912). Caoutchouc. Farbenfabriken vorm. F. Bayer & Co., 217 Koenigstrasse, Elberfeld, Germany.

*2,332 (1912). Boots, etc. E. Fuller, 352 Weybasset street, and J. Rosenblatt, 80 Clifford street—both in Providence, R. I., U. S. A.

*2,342 (1912). Inflatable suit for aeronauts. A. W. de Meir, Providence, R. I., U. S. A.

2,424 (1912). Rubber tread bands. P. Bold, Darrmietzel, Post Quartschen, Neumark, and P. Richter, Ostbahn—both in Berlin.

2,599 (1912). Dress shields. F. H. Mottershaw and C. Mackintosh & Co., Cambridge street, Manchester.

2,825 (1912). Rubber heels. F. Rossbach, 60 Kettenhofweg, Frankfurt, Germany.

3,042 (1912). Viscose. O. Eberhard, 5 Bergstrasse, Heidenau, near Dresden, Saxony.

3,043 (1912). Viscose; purifying gases. E. Knoevenagel, 28 Zahringerstrasse, and J. Reis, 11 Klosestrasse, and F. Kuckuk, 12 Muhlstrasse—all in Heidelberg, Germany.

3,095 (1912). Rubber heel pads. F. J. Scholl, 5 Manchester avenue, Aldersgate street, London.

3,130 (1912). Hollow rubber tires. A. Cleret, 6 Avenue Gambetta, Paris.

3,145 (1912). Tire puncture closing apparatus. R. Haddan, 31 Bedford street, Strand, London.

3,191 (1912). Washing india rubber, etc. J. E. Pointon, Westwood Works, Peterborough.

*3,226 (1912). Vulcanizers. C. M. Metsch 198 Pennsylvania avenue, East Liverpool, Ohio, U. S. A.

THE KINGDOM OF BELGIUM.

PATENTS PUBLISHED.

253,816 (1913). Portable vulcanizing apparatus. C. F. Adamson, East Palestine, U. S. A.

254,747 (1913). L. Schuller, Passau, Germany. Vulcanizing apparatus.

254,891 (1913). F. Estère Arglada, Vergara 10, Barcelona, Spain. Composition for repairing or gluing rubber objects.

254,943 (1913). Ostker A. Alton, Ohenson, Germany. Elastic substance applicable for repairs.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

448,974 (August 12, 1912). Diamond Rubber Co. Process for improving the lower grades of rubber.

449,176 (October 9). T. G. Tye. Process and apparatus for purifying gums or resins.

449,190 (December 16, 1911). H. Carroll. Process for the removal of substances from vulcanized rubber objects.

449,197 (October 9, 1912). L. Hardaker. Improvements in vehicle wheels with double tires.

449,220 (October 10). A. Mantelet fils. Elastic belt with combined horizontal and oblique bands.

449,224 (October 10). C. Terrier. Appliance for vulcanizing repairs to pneumatic tires.

449,250 (August 23). A. Fortini. Tires composed of pieces of leather or other substances.

449,291 (September 27). P. Bellot. Protectors for pneumatic tires.

449,306 (October 9). W. Köhler. Cover and tread for pneumatic tires.

449,425 (October 15). P. Reynier. Improvements in manufacture of pneumatic tires.

449,458 (December 23, 1911). Van Steinbrugghe & Breton. Shaped surgical glove of vulcanized rubber and its manufacture.

449,599 (December 27). Delahaye & Co. Anti-skid hood on rubber tire.

449,601 (December 27). Etablissements Hutchinson. Fabric for aerostat covers.

449,613 (October 17, 1912). J. Bertrand. New mud guard for vehicles adjustable in every direction.

449,714 (December 30, 1911). C. Morel. Elastic vehicle tires.

449,735 (October 23, 1912). N. G. Nevin. Dress shields.

449,767 (September 17). Degrully. Automobile wheel with interior pneumatic tire.

449,793 (October 18). P. Magnus. Covers for automobile or other wheels.

449,818 (October 25). C. H. Nichols. Mud guards for wheels of automobiles and other vehicles.

449,930 (October 29). Godek & Benjamin. Improvements in elastic tires in rubber or other like substances.

449,811 (October 24). F. E. Barrows. Plastic composition and objects containing rubber and their process of manufacture.

450,036 (October 26). H. Ruhnen. Solid automobile tires.

450,157 (October 31). W. Kops. Elastic fabrics.

450,040 (October 30). J. B. Alana. Process of repairing covers of pneumatic tires.

450,147 (November 4). T. Kanticki. Mud guard for automobiles.

450,176 (January 11). H. Brionne. Anti-skid protector for solid or pneumatic tires.

450,206 (November 6). J. Françon. Mixed elastic tire.

450,216 (January 13). J. S. Mariani & F. Husson fils ainé & Vaillant. Seamless dress shields.

450,257 (October 16, 1912). R. L. Fidide. Circular mudguards.

450,309 (November 7). L. Goodman and J. E. Goodman. Pneumatic tire cover.

450,389 (November 6). G. Cros. Pneumatic tire for vehicles, intended to circulate on moving surfaces.

450,395 (November 11). P. C. Fox. Vehicle tire.

450,452 (November 12). F. A. Byrne. Process and apparatus for the coagulation and treatment of rubber.

450,561 (November 12). F. A. Byrne. Process and appliance for the coagulation and treatment of rubber.

450,567 (November 13). Farbenfabriken vorm. Friedr. Bayer & Co. Process of dyeing rubber.

450,527 (October 23). C. E. Moser. Anti-skid tire for motor vehicles.

450,575 (November 13). A. Clément-Bayard. Movable wheel.

450,626 (November 15). M. Schwertführer. Economical tire.

450,650 (November 16). H. Stephens. Piece for repairing pneumatic tires, air chambers, etc.

450,651 (November 16). L. J. Perry. Improvements in tires.

450,667 (November 16). N. J. Spriggs. Improvements in repairing rubber articles.

450,686 (November 18). N. E. Carmont. Improvements in tires and tire covers.

450,739 (November 19). G. H. E. Cooke. Improvements in pneumatic tires.

450,729 (November 19). Motoculture Company. Anti-skid device for wheels of automobiles, traveling on fields and meadows.

450,777 (November 20). D. O. Nation. Improvement in vehicle tires.

450,887 (November 16). E. Windel. Pneumatic tire.

450,914 (November 21). A. Paris & L. Paris. Mudguards for wheels.

450,952 (November 22). T. D. Kelly. Improved vehicle tire.

451,042 (November 26). Julius Rompler Co. Elastic fabric and its process of manufacture.

451,072 (November 27). P. Fequant. Metal wheel with elastic tire.

451,091 (October 3). A. J. Ouvet. Mudguards for all descriptions of vehicles.

451,113 (November 12). U. Sarrat & E. Sarrat. Product and process for repair of air chambers and pneumatic tires.

451,239 (December 2). F. Pavlick. Protective cover for pneumatic tires.

451,258 (December 2). Mlle. Lloyd. Improved tire.

451,266 (February 8). E. Robergel Co. Elastic tires.

451,279 (December 3). A. A. Legrand, G. Depoilly and M. Durvien. Pneumatic mudguard for vehicles.

451,300 (December 3). A. Ducos. Sole of felt and rubber and its process of manufacture.

[NOTE.—Printed Copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

259,253 (September 19, 1912). Process of separation of rubber or balata from latex. Dr. Heinrich Colosseus, Regensburger Strasse 27, Berlin.

259,324 (April 12, 1912). Pneumatic tires with laced tread for motor trucks and similar vehicles. Eugen Fritz, Saarbrucken.

259,421 (December 15, 1911). Improvements in rubber heels. Atleta Rubber Works, Elberfeld-Vohwinkel.

259,721 (June 28, 1911). Process for separation of rubber from latex. Wilhelm Pahl, Dortmund.

259,722 (May 26, 1912). Rubber substitute. Farbenfabriken vorm. Friedr. Bayer & Co., Leverkusen.

260,196 (September 3, 1911). Improvements in vulcanizing presses. A. Olier & Co., Clermont-Ferrand, France.

260,714 (May 21, 1912). Seamless football covers of vulcanized rubber with fabric lining. Moritz Richard Fecht, Leipziger Strasse 8, Dresden.

260,956 (January 31, 1911). Process for production of cellular rubber objects. H. Dogny and V. Henri, Paris.

260,916 (September 21, 1912). Process for vulcanization of rubber, of unsaturated fatty oils and their derivatives. Dr. Hans Klopstock, Berlin-Wilmersdorf.

261,241 (January 20, 1912). Production of elastic substances, having the properties of rubber. Willi Ernst Reeser, Amsterdam.

261,438 (January 16, 1912). Process for making covers for pneumatic tires. Ernest Clark, London.

SANITARY DRINKING CUPS.

Ever since everybody became so much exercised—rightly or wrongly—over the germ theory, there has been a perpetual effort to design the most convenient sort of sanitary drinking cup. The accompanying illustration shows one used in Washington.

Harris & Ewing, Washington, D. C.
SANITARY DRINKING CUP ATTACHED TO RUBBER TUBE.

It will be noted that rubber tubes are connected with the fountain, about long enough for convenient use by a man of ordinary height. At the end of the tube there is a cup; but it is not necessary for the lips to come in contact with the cup, as the force of water carries it about an inch above the cup, so that you can drink water out of the air. Only the most perverse person can imbibe any germs when using this style of cup.

PNEUMATIC TREADS FOR HUMAN FEET.

A NEWSPAPER writer with a well-developed imagination that ought to make him successful in his high calling, recently contributed to "The Lynn Item" a disquisition on "The Possibilities of Rubber Soles," in which he sets forth the theory that because hides have gone up to 20 cents a pound and rubber gone down to $1 a pound, we may soon discard leather soles for our shoes and take entirely to rubber soles, with pneumatic inner cushions. As rubber has still further dropped in price since this was written, and is likely as time goes on to seek lower and lower levels (within certain limitations), and as hides in the meantime are likely to become still more expensive, the writer's dream of universal rubber soling for civilized footwear may quite possibly come true. Here is what he has to say:

"With hides up to 20 cents a pound, and prospects of going higher, and rubber down below $1 a pound and prospects of going lower, and a fashion of rubber soled shoes setting in, the time is at hand for speculation as to whether or not rubber bottomed shoes will take the place of leather bottomed shoes in the same fashion that rubber tired vehicles have taken the place of iron tired vehicles.

"It is not utterly impossible to conceive a pneumatic soled shoe. People wearing such shoes would certainly tread on air, and find life's walk easy, as far as physical exertion is concerned. To make a pneumatic sole, with an inner tube to hold air, would be a simple task in the mechanics of the rubber industry.

"To fill the inner tube with air would not be a difficult task in these days of common air compressors and pumps. The vacuum cleaner of the home might have a reverse gear, which would cause the bellows to pump air into the sole of the shoe, instead of to pump air out of the room and take with it dust and dirt. And if a person did not have any sort of an air compressor at home, he might go to the nearest garage, and use the common air pumps, or, in a final emergency, he might blow up his soles with a little hand pump, the same as is used by bicyclists.

"If people should wear pneumatic soled shoes they would naturally carry with them a repair kit, consisting chiefly of a few patches and plugs to use on those parts of the soles which might be punctured by tacks or bits of glass in the streets, or by rough pavings. Everybody who wore pneumatic soled shoes would be glad to join with autoists in voting 30 days in jail to the careless person who threw nails or glass into the street, and also, in voting to exile the street commissioner who failed to keep the sidewalks and the streets clean and smooth for the passage of the air tread shoes.

"Another possibility is that some cautious persons who might dread a punctured sole and a consequent limp home, might have the inner tubes of their soles filled with one of those substitutes for air that is as thick as molasses, and that is sometimes pumped into auto tires to make them wear forever. And on winter days, when sidewalks were slippery, a person afraid of a fall would naturally put some chains on his shoes and save himself from skidding on the ice.

"But the rubber soled shoes are a reality, not a possibility. Thousands of pairs of rubber soled shoes will be worn this summer by young men and young women, and some rubber soled boots will be made in the fall. The manufacturers of rubber goods are making a great deal of progress in the production of rubber footwear. They are able to buy rubber at about $1 a pound, and to make rubber soles that weigh three-quarters of a pound a pair, and sell them for 50 cents a pair. As time goes on they are apt to get their crude rubber cheaper, and to make their soles lighter, and to sell them for less. It isn't beyond the probabilities of the shoe industry that people will find rubber soles so serviceable and economical for shoes for street wear that they will commonly wear them. A new and unlimited outlet for rubber is thus opened."

Report of the Crude Rubber Market.

THE most prominent feature of the London market for fine Pará during May has been the practical maintenance of the improved values which succeeded the low record of 3*s.* 3¾*d.* on April 15. By April 26, the price had recovered to 3*s.* 4½*d.*, standing on May 24 at 3*s.* 9*d.* This price, with slight fluctuations, has ruled throughout June, the figure on June 25 being 3*s.* 8¾*d.*

While buyers have been cautious in their operations, sellers have not been trying to force business; with the result that there has hardly been any change in values during the month.

In plantation rubber, the course of the market has, on the other hand, presented a different aspect, as may be seen from the subjoined London quotations.

	Pará.	Plantation.
April 26	3*s.* 4½*d.*	3*s.* 2½*d.*
May 24	3*s.* 9 *d.*	3*s.* 3 *d.*
May 31	3*s.* 8½*d.*	3*s.* 2¼*d.*
June 6	3*s.* 9¼*d.*	3*s.* 1½*d.*
June 13	3*s.* 9 *d.*	3*s.*
June 20	3*s.* 8¾*d.*	2*s.* 11¾*d.*
June 25	3*s.* 8¾*d.*	2*s.* 11 *d.*

Thus, while Pará has held its own, plantation rubber has lost about 3 pence per pound within the last month.

During the six months ending with June, about 11,000 tons of plantation rubber passed through the London auctions, as compared with about 7,000 tons for the first six months of 1912. The average price realized at the January auctions this year was about 4*s.* 4*d.*, as compared with about 2*s.* 11*d.* at the June sales; the effect of the larger offerings being thus demonstrated.

The auction of June 3 contained about 1,000 tons, and was marked by a fair degree of activity on the part of buyers. Prices, however, gave way from 1½*d.* to 2½*d.* At the sale of June 17, 900 tons were offered, quotations varying but slightly from those of previous sale.

Attention has been drawn to the prospective effect on the rubber market of the growing demand for solid truck tires.

The attitude of buyers has to a great extent been one of expectancy, there having been a marked disinclination to exceed actual requirements in their operations.

Particulars by mail of the Antwerp sale, held on May 21, show the following results:

	Offered.	Sold.
Congo descriptions ..... *Tons*	573	133
Various descriptions	30	2
Plantation descriptions	212	201

Congo descriptions sold at an average decline of about 6 per cent.; plantation rubber having about realized the valuations. A sale was announced for June 25 of 461 tons Congo and 125 tons of plantation.

The Amsterdam sale of June 11 included 58 tons *Hevea*, which realized 7 per cent. below valuations; and 20 tons *Ficus*, which sold at 9 per cent. below estimates.

At Rotterdam on June 6, 18½ tons *Hevea* and 3 tons *Ficus* were sold at the equivalent of ruling London prices.

New York

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During June the demand for commercial paper has been very light, and principally from out-of-town banks, city ones doing but little; rates have ruled strong at 5¾@6 per cent. for the best rubber names, and 6¼@6½ per cent. for those not so well known."

WM. WRIGHT & CO., Brokers.

Liverpool, 3rd June, 1913.

During the month 200 tons, including 10 tons Caucho, have been shipped from Europe to America.

Rotterdam.

HAVELAAR & DE VRIES report (June 10):

The result of sale held 6th inst., was relatively satisfactory, particularly in view of the lower prices which had ruled since the catalogue was issued. Most of the lots were sold at the parity of London rates.

Amsterdam.

JOOSTEN & JANSSEN report (June 11):

Out of 81 tons offered at today's sale, 66 tons were sold. The offerings chiefly consisted of *Hevea* and *Ficus*, which realized 7 per cent. and 9 per cent. below valuations.

Plantation Rubber From the Far East.

EXPORTS OF CEYLON-GROWN RUBBER.

(From January 1 to May 19, 1913. Compiled by the Ceylon Chamber of Commerce.)

	1912.	1913.
To Great Britain..... ....*pounds*	2,205,112	3,980,582
To United States	1,268,902	2,599,367
To Belgium	489,501	1,055,089
To Germany	41,978	97,306
To Australia	37,655	220,151
To Canada	12,121	.....
To Austria	11,920	26,075
To Japan	5,708	81,461
To Italy	4,692	22,460
To Norway and Sweden.....	39	.....
To Holland	.....	992
To India	.....	209
Total	4,077,628	8,083,692

(Same period 1911—1,796,522; same 1910—838,280.)

The export figures of rubber for 1913 given in the above table include the imports re-exported. (These amount to 754,967 lb.—613,780 lb. from the Straits and 141,187 lb. from India.—Ed. C. O.) To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date, deduct the quantity of imports from the total exports. In previous years the exports of Ceylon rubber only were given.

TOTAL EXPORTS FROM MALAYA.

[From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.]

	Singapore. May 7.	Penang. March 31.	Port Swettenham. May 14.	Total.

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.
No. 15 West 38th Street, New York.

CABLE ADDRESS: IRIWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. AUGUST 1, 1913. No. 5

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

THE PRACTICABILITY OF RUBBER PAVEMENTS.

THE contemplation of the great increase in the crude rubber supply within the next few years invariably prompts the question—what will we do with it? And the readiest answer to the question seems to be—rubber pavements.

Any consideration of the practicability of rubber pavements brings us at once to the three examples of this sort of road construction to be found in London, viz., the court yards of the Savoy and Claridge's hotels and the approach and exit of the Euston railway station. These are the noteworthy instances of rubber pavements which have been laid a sufficient length of time to afford a practical basis for discussion. The two hotel court yards were paved with rubber, one ten and the other thirteen years ago, the primary object being to deaden the clatter of the horses' hoofs and the rumble of the wheels. The pavement was in the form of slabs about 2½ inches in thickness. These slabs seem to have served their purpose very satisfactorily. They have worn in spots to one-half their original thickness, but from present appearance give promise of several more years of service. To be sure, they have not been subjected to the extreme wear of the heavy trucking on the ordinary roadway, but in one respect their treatment has been unusually severe, for they have had to endure the wear of the constant turning of vehicles. Another trying experience that has come to them latterly has been the use of studded tires. These steel studs are not beneficial to any sort of roadway, but on rubber their effect is naturally especially injurious. The oil of the motor car is another foe to rubber roads; but notwithstanding these unfavorable conditions the rubber covering in these London hotel yards has given a good account of itself.

The case of Euston station presents even a stronger argument for the possibilities of rubber paving, for part of this paving that is under the arch through which vehicles depart from the station was laid thirty-two years ago and, tho worn in some places to an inch and a half from an original thickness of two inches, is still serviceable and in no immediate need of relaying.

Renewed interest in this subject has recently been awakened by a lecture delivered before the Chemical Engineers of London by Dr. Philip Schidrowitz, the well known writer on matters pertaining to rubber. He devoted much of his paper to the practicability of rubber pavements, going into carefully estimated details regarding the initial cost of the pavement, the expense of laying it and of its subsequent maintenance. Basing his calculations on crude rubber at two shillings per pound, and on a composition that should be one-third rubber, he estimates that a ton of paving material would cost £100, as compared with a cost for asphalt of £2 to £3 and of cement, concrete or stone of £2 to £5. He then compares the cost per square yard of rubber pavement with that of the materials now generally in use, and finds that a rubber road surface of the proper thickness would cost about fourteen times as much as asphalt or macadam and about seven times as much as granite or wood. On the whole, considering its large initial cost, Dr. Schidrowitz doubts the practicability of the rubber pavement, but, he observes, in concluding his discussion of the subject, "the question is replete with interest, and in view of its possibly important bearing on the future of the rubber industry, is at least worthy of a serious experiment."

This lecture before the London chemists will undoubtedly be widely read. It is a valuable contribution to a highly important discussion. Its figures are the result, we may rest assured, of most careful calculations. The initial cost of rubber roadways on a large scale, even with

fifty-cent rubber, would be prohibitive, but with rubber at fifty cents such roadways on a limited scale are sure to come. Their noiselessness and cleanliness—their freedom from rattle, jar and dust—are bound to bring them into constantly increasing favor where these advantages are most desired—as around hospitals, churches, schools and lecture halls, around courts, in fine residential avenues, and even about apartment houses and office buildings of the better sort. When rubber sells at fifty cents there will be plenty of rubber paving.

PRIZES FOR NEW USES OF RUBBER.

IN the department entitled "Some Rubber Interests in Europe," found elsewhere in this number, there is reproduced a letter recently sent out by the Secretary of The Mincing Lane Tea and Rubber Share Brokers' Association Ltd. to the rubber plantation companies—of which there are between 500 and 600—inviting their co-operation in a plan of offering substantial prizes for the suggestion of new uses for rubber. The association gives an earnest of its own interest in this matter by offering a prize of 100 guineas, to be given at the Rubber Exposition to be held in London next summer, for the best new use of rubber submitted at that time; and also by its further offer to subscribe £50 to any fund contributed by the planters.

This episode shows the changing conditions of the rubber industry. Hitherto prizes have been offered for inventions and discoveries looking to an increase in the amount of crude rubber produced, but these new offers are for inventions and discoveries that shall lead to the increased consumption of rubber.

There is no danger—although some pessimistic surveyors of the situation occasionally express such a fear—that there will be too much rubber. Even should the estimates of experts be fulfilled, that the year 1919 will see a production of plantation rubber amounting to over 300,000 tons, which—assuming that the wild output from the Amazon and other localities continues at its present level—will bring the total production well towards 400,000 tons, this amount, vast as it is, could undoubtedly be utilized through the present channels of consumption. When rubber becomes cheap enough it will probably become the universal flooring, and its employment in the paving of streets is capable of an almost unlimited extension. But the problem before the rubber industry today is not so much how to utilize the constantly increasing rubber supply as it is how to use it to the best advantage. That is a problem worthy of the diligent application of the most acute inventive minds. And if the planters shall co-operate to offer substantial rewards for the discovery of new uses of rubber, new uses would undoubtedly be discovered by the thousands; and some of them certainly would be sufficiently practical to utilize all the surplus product of the plantations for many years to come.

GUARANTEEING THE UNGUARANTEEABLE.

AS a matter of fact, isn't the whole tire guarantee idea a fight against nature, an attempt to accomplish the manifestly impossible? From the very character of the service a tire is called upon to perform, can the duration of that service possibly be guaranteed?

It is logical enough to guarantee a watch, because one can predicate the normal treatment of a watch, viz.: that it will be carried quietly in the pocket during the day and wound up with great regularity about the same time each night. The piano can be guaranteed, for the piano runs a normal course. Generally speaking, it stands unmolested in its corner, to be played on with more or less discretion a few minutes or possibly a few hours a day.

But with a tire it is quite different—that has no normal career. When it leaves the factory a dozen different futures may be open to it. It may possibly fall into the hands of a cautious, conservative person who wants to get full service from it and who takes particular pains to inform himself as to how a tire should be treated for its own good, and to the best advantage of its owner. Or possibly it may fall into the hands of the owner's son, just home from college, a reckless scapegrace who regards not principalities or powers, much less tires, and whose only idea of a car is to make it cover the greatest amount of the earth's surface in the least possible time.

Or the tire may be turned over to the tender mercies of a chauffeur, whose business relations with the proprietor of the neighboring repair shop are such that the more abuse the tire receives the better is the chauffeur's financial status. Or, more likely, the tire will fall into the hands of just an average sort of man who has no malicious intention of abusing it, but who doesn't take the trouble to find out how it should be cared for, and who doesn't bother very much about such a trivial matter as proper

inflation, and is likely to let his car stand on its tires all winter long.

So, everything considered, while a tire may leave the factory good for 5,000 miles of travel, it is humanly impossible to guarantee one-half or one-quarter of that amount. So would it not be better if the manufacturer would simply make the best tire within his ability and say "This tire, properly treated, will do 5,000 miles, but I have no idea how it is going to be treated; so here it is and I am through with it"? It would be a great relief, certainly, to the manufacturer, and he could afford to give the consumer considerably lower prices. It would tend to make the sensible consumer much more careful in his use of the tire; and it would make strongly for general veracity, for since time began there has been no other such tremendous temptation to prevarication as the tire guarantee.

DEPENDING ON THE POINT OF VIEW.

A DAILY paper, ruminating on rubber matters, makes the interesting statement that the yearly production and consumption of automobile tires in this country has now reached 60,000,000. As there are about 1,000,000 motor cars in commission, it requires no very profound process of mathematics to determine that each car would be consuming, on an average, sixty tires a year. Making a conservative allowance of $25 per tire, it becomes clear that the average car owner must lay aside from his annual income an item of $1,500 to meet the unescapable tire cost. Possibly there are some timid souls that might shrink from the ownership of an auto if compelled each year to part with $1,500 simply to keep it shod.

But let them take heart, for there is another chapter to this mathematical story. The same writer goes on to say that this yearly output of tires is worth $120,000,000. From which it will appear that the value of tires has dropped to $2 each. Now many a careful car owner who avoids driving over broken bottles and grazing the curb, goes comfortably through the year on a single set of tires —which, at $2 each, brings the auto-shoeing bill down to $8 for the twelve months, or a trifle over two cents a day. Looking at it from this angle, owning an auto is cheaper than staying at home and reading the paper. It all depends on the point of view.

In the meantime, if the statistician of the daily referred to were to revise his figures, placing the annual American consumption of auto tires at six instead of at sixty million, he probably would come appreciably nearer to the facts.

THE DEBT TO THE CHEMIST.

THE motorist, as he skims along the smooth road at 25 miles an hour—or faster, if the fear of the local constabulary has been removed from his heart—may possibly give an occasional thought to the debt he owes to the big factory, with its brawny men and clangorous machinery, that has turned out the tire which enables him to ride on air, while still sticking to the earth. He may even, if he is a man of some imagination, think of the lonely *seringueiro* threading his way through the Brazilian jungle, extracting the latex from one *Hevea* after another. But, as a matter of fact, his real debt is to the patient man who is silently working away in his laboratory surrounded by his tubes, bottles and retorts. The most notable of all laboratories was Mrs. Goodyear's kitchen stove, where, between bakings of the family bread, her indefatigable husband utilized the oven for his interminable batches of rubber, variously compounded. But as he, by the aid of this little kitchen oven, discovered the secret that gave the whole rubber industry its start and made any sort of a pneumatic tire possible, the chemist of to-day in his perfectly appointed laboratory must discover the secrets that will enable the manufacturer to make tires still better, tougher and cheaper.

A WESTERN PAPER HAS MADE THE IMPORTANT DISCOVERY that the rubber plant has been driven from the home and that it no longer dignifies the six rooms and bath that constitute the domicile of the city dweller, nor decorously decorates the craftsman cottage of the suburbanite. According to this authority, it has ceased to be catalogued among the Lares and Penates of American life. And the cause also for this great change is assigned, viz.: that the rubber plant has been of late so extensively exploited in the show windows of the automobile emporiums that it has become thoroughly commercialized and therefore unfitted for the quiet family fireside. Probably the disappearance of the rubber plant from the home—if in reality it has disappeared—is simply one of the whims of fashion; for fashions swing back and forth in matters of household decoration just as they do in the vogue of literature, the choice of dogs and the popularity of dances. The *Ficus elastica* is a comely plant and will undoubtedly be able to maintain its position as an ornament in the home, even tho it has not done very much in the way of adding to the crude rubber supply of the world.

Rubber in Argentina.

By the Editor of The India Rubber World.

Argentine Possibilities—Wild Rubber in the Chaco—The Most Southern Rubber Mill—The Journey to the River Plate—Quebracho—Off Lobo Island—A "Pampero"—Up the River—First View of the City—A South American Paris—Characteristics of the People—To the Rubber Mill.

IT is the habit of Americans to speak wisely and albeit sadly of the immense possibilities of Argentina and of the fact that Europe is profiting hugely by its exploitation while the Yankee is doing nothing. To see if this was notably apparent, and further, because of the rubber interests there, I went to Buenos Aires after visiting Bahia, Rio, Santos and other Brazilian cities.

The rubber interests appeared to be three-fold. In the first place, there was the statement of Ernesto Costa, said to have acquired rubber experience in Madagascar, on the Congo, and in the Bolivian Montana, who discovered rubber trees in the northwestern part of the "Chaco." The Argentine Minister of Agriculture at once dispatched one of his men to explore. He reported that he found a variety of trees called *lecherones* and others called *Ebeas* (*Heveas?*). The latter were the best.

The "Avenida," Buenos Aires.

Across the Plains.

The agent gave as the product of the large *lecherones* from 16 to 20 pounds of gum per tree. He further reported that there were localities where rubber gathering was going on, regular camps having been established, estradas laid out, and workmen employed every year. A year later the government commissioned two agricultural experts to take up the study of these trees, and, as far as known, they started for the province of Salta, where the trees were located. It was further light on this interesting matter that I was seeking.

Then there was another matter. Buenos Aires has a rubber factory, which is undoubtedly the farthest south of any in this hemisphere. I wanted to see that, and a lot more.

The boat that I embarked upon at Rio was English and carried tourists chiefly, with a sprinkling of American, English and Brazilian business men. For example, there was one who represented the American dyewood agglomeration. He was interested in quebracho, a wood much used in tanning. He told of thousands of acres controlled by his company — 400,000 in Argentina and 900,000 in Paraguay — of big mills and up-to-date shipping plants. Then there were men from the American Harvester Co., who told of the use of American machines, "because they couldn't get anything else." Again, there were the freight and passenger-car salesmen, who told of contracts given to Americans only when it was impossible to get goods in France or England or Germany. Allowing for individual prejudice, it did seem as if there was a decided leaning away from things American.

The Docks, Buenos Aires.

The journey was pleasant in that the sea was smooth and the company good. As it was winter north, it was, of course,

midsummer there, and quite hot. Finally we sighted Lobo Island, and passing between it and the sandy shore of the mainland we were in the mouth of the River Plate. While we were ploughing up its coffee-colored flood we ran into

The Writer, Mr. Wilson, Manager, and Mr. Smith, Superintendent.

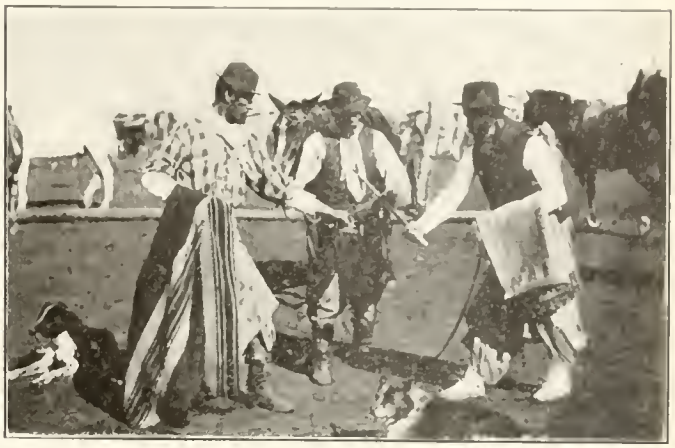
a "Pampero," a cold wind of the "Texan Norther" order, which promptly brought the thermometer down to 30 or 40 degrees, and instead of sweating we were all shivering.

Be it noted, the River Plate is not attractive from a scenic viewpoint. It is from thirty to one hundred miles in width, and the channel, excellently buoyed, is never more than twenty-three feet deep. Big boats therefore cannot get up to Buenos Aires.

The city from the distance, with its big grain elevators and cold storage plants, reminds one of Chicago. We followed a long procession of steamers up the narrow channel and finally tied up at fine granite docks in a basin that is almost in the city's center.

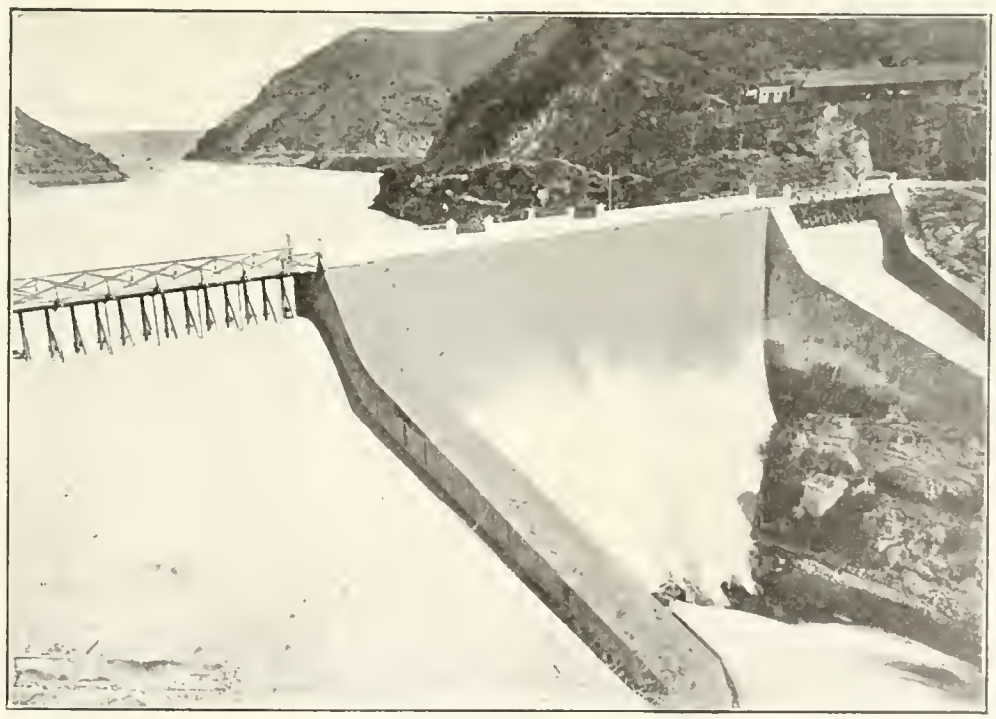
The Aduana passed our luggage quickly and politely, and soon we were at the Plaza, the best hotel, where they charge $12 a day for room and bath and joyfully extort an even larger rate for meals.

Once in the city, it impressed one as being patterned after Paris. The "Avenida" is a wonderful street lined with beautiful buildings and crowded with jewelry stores. No city in the world has the like. Any attractive novelty sells here, no matter what the price may be, for Buenos Aires is the center of everything Argentine. It is the Mecca of all of the



Among the Cattlemen.

well-to-do for the whole country, and it is here that the money made from the vast wheat fields and cattle ranches is lavishly spent. It is a busy city full of electric cars, that almost crowd one off the narrow sidewalks; the people alert, careless, and in spite of the many beautiful saloons, wonderfully sober. There are magnificent public buildings, a jockey club that holds horse races almost daily—with horses that are wonders—and incidentally makes millions annually; and so on. Then only a short distance away is the other side of the picture, the picturesque ranch and farm life shown on as large a scale as anywhere in the world.



The Falls of Igassu.

But about the rubber factory. It is owned by the India Rubber, Gutta Percha & Telegraph Works at Silvertown, England. Mr. Wilson, the manager, whom I met at their well appointed rubber store in the city, took me to the mill. It is situated far out beyond the Golf Club, and while not close to the river, so flat is the land that in time of high water they go to it in boats instead of carriages. The factory makes small molded goods, battery jars and valves, and perforce repairs all of the city's tires, even tho they be nearly beyond help.

The equipment is a washer, mixer, warmer, calender, spreader, two tubing machines and several vulcanizers. It is run in conservative English fashion, not really as an enter-

The Factory from the Railroad.

prise, but as an adjunct to the warehouse and an accommodation to its customers.

Speaking of tires, there are lots of autos in the city and every known make of tire is used. It may be interesting to note also that there are the following who handle rubber goods:

S. Borok, Buchanan Jordan & Co., Buxton Cassini & Co., Continental Tyre Co., B. J. Ebsworth (agents for Dunlop Tyre Co.), Edwards & Fase (agents for Northern Rubber Co.), Harris & McDonald (agents for North British Rubber

Department for Tire Repair.

Co.), David Hogg y Cia., India Rubber, Gutta Percha & Telegraph Works Co., Limited, and Recht & Lehmann (agents for "Michelin" tires).

There is also in the city a worthy Italian—said to have been employed by the Pirellis in Milan at one time—who does more or less in proofing fabrics for his own clothing business. I was not able to visit his factory, nor could I find him. The story was rife, also, that the "American Goodyear Co." was to establish a large factory in "B. A." and that the Jockey Club had subscribed millions—more or less—to the scheme. The story was absurd, of course, but was nevertheless told and retold, with additions, until the project assumed proportions almost gigantic.

(To be continued.)

BRAZILIAN RUBBER EXPORTS.

In a comprehensive report, Consul General Julius G. Lay, of Rio de Janeiro, has grouped various interesting figures regarding the exports of Brazil during the last three years. The totals amounted to: 1910, $310,006,433; 1911, $324,919,767; 1912, $362,346,951.

Of the 1912 exports the United States took about 40 per cent.; Great Britain about 12 per cent.; Germany about 14 per cent.; France about 10 per cent., and other countries about 24 per cent.

The exports of rubber alone were as follows:

	1911		1912	
	Tons.	Value.	Tons.	Value.
Total	36,547	$73,261,558	42,286	$78,125,250
	1911		1912	
Including exports to—	Tons.	Value.	Tons.	Value.
United States	16,146	$31,359,386	21,322	$39,344,927
Great Britain	15,662	32,886,456	14,728	27,042,375
Germany	1,058	1,660,302	1,660	2,399,485
France	3,221	6,403,342	4,436	8,091,635
Belgium	156	316,429	126	433,818

An increase of quantity is thus shown for the United States in 1912, coupled with a reduction for Great Britain. The two countries took between them the bulk of the Brazilian rubber exports.

MANICOBA CULTIVATION IN BRAZIL.

At the recent meeting of the British and Brazilian Rubber Planters and Manufacturers, Ltd., the chairman reported that their representative had been shown a plantation of *Maniçoba* rubber trees which the manager estimated to number 30,000 and to be about seven years old. They had only been experimentally tapped, but they showed plenty of latex, altho it refused to flow freely. The manager thought that there must be some method of inducing the trees to yield fully. In that case they would have an immediate and profitable source of income. Their representative at Lagoa had been making experiments, which he believed to be successful, with that object in view.

According to latest details, 100,000 rubber trees have been planted, mostly ranging in age from one to three years. There are said to be in addition several hundred thousand indigenous *Maniçoba* trees. The company's properties are in the State of Bahia, Brazil.

BRAZILIAN PROSPECTS AS VIEWED FROM MALAYA.

Commenting on a statement that Brazil is getting 17,000 Japanese coolies, the "Malay Mail" remarks:

"Respecting the above we doubt whether the Japanese government will permit its natives to work under anything like existing conditions of rubber collecting in Brazil. If proper plantations are started it may be another question, but serious competition from this source could hardly be expected under, say, ten years. The real fight between the two classes of the product must be such that the fittest will survive. Brazil seems alive to this aspect, and to be doing all she can to prevent the loss of what is to her a very important industry. Plantation interests should not rest under the possibly false security that when rubber is below 3s. per pound, Brazil will cease to be a producer. The selling price will have to be well under that, before hard Pará will cease to come to market."

WILD VS. PLANTATION RUBBER.

A statement is attributed to Mr. A. Lampard, to the effect that against an estimated world's consumption this year of 120,000 tons of rubber, the supply from the plantations cannot be expected to exceed 45,000 tons. The balance must, therefore, come from wild sources of supply. He expresses the opinion that if rubber drops to an unremunerative price for the gatherers of the wild article, it is bound to rise again to a point which will admit of its collection on a profitable basis.

Dr. Muller Holds a Farewell Reception.

DR. LAURO MULLER, Brazilian Minister of Foreign Affairs, and special envoy to this country, sailed for home on the 16th of July on the Brazilian warship "Minas Geraes." A few days before his departure—on Friday, July 11—he tendered a reception on this warship, which was then anchored in the North River at the foot of 79th street, New York, to the officers and representatives of the various official, civic and commercial organizations whose hospitality had kept the ambassador so extremely busy during the four weeks of his visit. About six hundred invitations were extended, including some to people not connected with official or civic bodies but personally interested in Brazil and the development of her vast resources. Among these invitations was one to the editor of THE INDIA RUBBER WORLD, who spent some months last winter in the great South American Republic, and who had the honor at that time of meeting the eminent Brazilian secretary.

THE BRAZILIAN WARSHIP "MINAS GERAES."

The reception was held from 5 till 7 o'clock, and the launches of the worship were kept constantly plying to and from the pier, bringing the coming and returning the departing guests. The ship itself was an extremely attractive spectacle, being decorated from stem to stern with the flags of all nations, but particularly with a great number of American and Brazilian flags, which practically formed a canopy over the deck. The band of the "Minas Geraes" proved adept in American music—not to mention a variety of "tango" and "turkey-trot" pieces; which by no means went to waste, as at least two hundred couples took part in the dancing on the deck, which continued through the greater part of the reception. The young Brazilian officers, by the way, showed themselves quite as clever at these dances as the American girls who acted as their partners. They could dance together even if they could not converse together, for very few of the younger officers knew much English, and not many New York girls are very deeply versed in Spanish or Portuguese. But this lack of a common linguistic ground was merely an incident and did not interfere at all with the general enjoyment of the occasion.

Among those present were Major General Thomas Barry, commander of Governor's Island; Captain Gleaves, of the Navy Yard; Captains Smith and Rodeman, of the American dreadnaughts "Arkansas" and "Delaware," which acted as convoys for the "Minas Geraes"; Ambassador De Gama; Lewis Nixon, Charles M. Schwab, and many other representatives of American industries particularly related to matters in Brazil. It might be said in passing, that the refreshments, including wines and cigars, were supplied on a lavish scale, and were enjoyed with hearty American appreciation.

Dr. Müller paid a very graceful tribute to American hospitality in the following words: "I came to America to pay off a debt, but I find I will leave it owing a still greater one. The people here are most cordial, in spite of their industrial energy. In fact, I think the United States a great nation. I regard your country as a world within a world. Your progress has been wonderful in commerce and everything else as well. I am delighted with this event." He gave further expression to this feeling of pleasure

over his treatment at American hands in an official letter which he sent to Secretary Bryan on the day of his departure.

It might be added that the "Minas Geraes," the latest addition to the Brazilian navy, is a first-class battleship of 21,000 tons, with a speed of over twenty-one knots. It has 100 officers and 900 men and marines. It carries twelve 12-inch guns and twenty-two 4.7-inch guns, and is altogether a ship of which any navy might well be proud.

THE PARA RUBBER CONGRESS AND EXHIBITION.

THE program drawn up by the organizing committee enumerates the following subjects for discussion at the Rubber Congress to meet at Pará, August 15, on the invitation of the Commission of Economical Defence of Amazonia:

SUBJECTS FOR DISCUSSION AT CONGRESS.

I. Old and new methods of extracting and preparing rubber.
II. Measures against adulteration and abuses.
III. Measures for improving the situation of the *Seringueros*.
IV. Reorganization of the commerce in rubber.
V. Organization of the agricultural industry of rubber.
VI. The cultivation of cacao.
VII. Other cultures to be recommended.
VIII. Stock-raising industry.
IX. Instruction in agriculture and stock-raising.
X. Colonization.
XI. Economical and commercial defence.
XII. Manufacturing industries. Do our economical and social conditions allow of their advantageous organization and maintenance? Development of indigenous raw materials.

RUBBER EXHIBITION.

The exhibition to be held at the same time will be divided into the following groups: A—Botanical; B—Technical; C—Commercial; D—Economical and Social; E—Agricultural.

Group B is divided into four sections and nine classes, as follows:

SECTION I. EXTRACTION OF LATEX.

Class 1. Processes now in use. Implements. Trunks of rubber trees cut with the *machadinho*. Drawings and photographs.

Class 2. Improved instruments invented in Brazil. Trunks or photographs showing their operation.

Class 3. Instruments used in the East and their application.

Class 4. *Tigellinhas* and other vessels for collecting and holding latex. Ingredients for the preservation of latex in a liquid state.

SECTION II. METHODS OF PREPARING HEVEA RUBBER.

Class 5. Smoking and its adjuncts, old and new.

Class 6. Appliances for smoking in sheets.

Class 7. Other methods of preparation.

SECTION III. CAUCHO.

Class 8. Methods of extracting and preparing caucho.

SECTION IV. MURUPITA

Class 9. Methods of extracting and preparing the latex of "Murupita."

Group C has the following sub divisions:

Class 1. Types of rubber now on the market.

Class 2. Present mode of treatment and samples of rubber prepared by any process.

Class 3. New types of rubber to be introduced in commerce.

Class 4. Preparation and packing of rubber for export; types of cases, bales, etc.

Class 5. Diagrams and statistical tables.

Group D includes maps and plans illustrative of the rubber industry from an economical standpoint.

Group E includes plans and photographs relating to the agricultural phase of the subject.

Such are the principal features of the proposed congress and of the exhibition in connection with same.

OFFICIAL PROGRAM.

According to the official program, just to hand, the congress will be formally opened on August 15, and closed on August 24; this arrangement leaving eight days clear for discussing the subjects to be presented.

The officials of the Congress will be formally elected at the preparatory session of August 15; while the Exhibition will be open from the 15th to the 24th. During the time of the Exhibition and the Congress, papers of an economic or scientific character will be read by experts on the subjects named in the above schedule.

On certain days, excursions will take place to various points of interest; such as: Mojú Rubber Plantation and Improvement Co., Ltd.; Museu Goeldi; the Pará Experimental Station, and the Agricultural Institute of Santo Antonio.

Meetings of the Congress will be held from 7:30 to 10 p. m. Each speaker will be entitled to 20 minutes for his address, with privilege of the same length of time for his reply to any criticisms.

In the July issue of The India Rubber World, on page 514, particulars were given as to the composition of the Organizing Committee and other points of interest regarding the Congress and Exhibition.

A BRAZILIAN CONSUL GIVES ADVICE ON GETTING TRADE.

Consul General Julius G. Lay, stationed at Rio de Janeiro, contributed to the June 26 number of the "Daily Consular and Trade Reports" a valuable article entitled "Imports into Brazil for Last Year." It will be well worth the while of any manufacturer wishing to establish trade connections with Brazil to get this number and read the consul's report. There is one particularly interesting paragraph, with the caption "How to increase American trade," and which reads as follows:

"The only way to get business in this country is to get after it, and when it pays, establish a branch and not depend on European commission houses here just because they are willing to pay cash in advance. These houses have already more lines of goods than they can handle properly, and in the majority of cases cannot possibly secure the amount of business that this important field offers. The trade in very few articles justifies the large expenditure of sending a capable representative to Brazil and Argentina even to remain long enough to establish selling connections, and in still fewer articles will it justify establishing branches in these expensive countries, but often concerns making non-competitive but allied lines can jointly afford the expense of a traveler. If it can be avoided, agency arrangements should not be brought about by correspondence."

PLANTATION REQUIREMENTS.

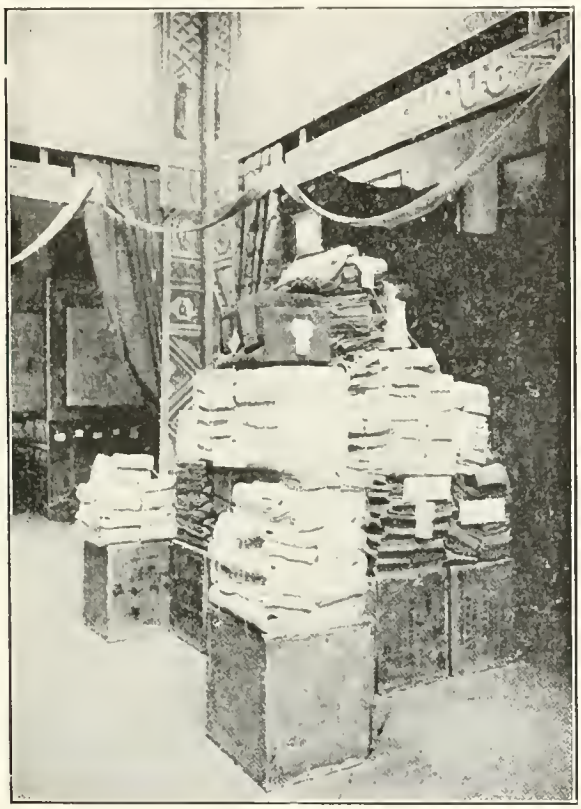
Under Number 11,111 the Bureau of Foreign and Domestic Commerce, Washington, reports an inquiry received by an American consulate from a foreign business firm for plantation requirements. This firm wishes to deal with American manufacturers, if their prices and goods compare favorably with those of European makers. The principal articles required are machinery for dessicating factories, rubber machinery, pumps, steel wire rope, lubricating oil, motor cars and appliances, steel plates and sheets, pig iron, etc. Prices to include cost, with freight and insurance to foreign port.

RUBBER AT THE GHENT EXHIBITION.

IT will be recalled that a "Universal Exhibition" is now open at Ghent, with the object of concentrating displays of Belgian and other products. A prominent section is the "Colonial Exhibition," representing the varied exports of the Belgian colonies. Of these rubber forms one of the most salient features, coming under the heading of "Colonial Cultures."

The arrangements of the rubber section have been under the skilled direction of the "Association des Planteurs de Caoutchouc" or "Rubber Planters Association," the headquarters of which are in Antwerp, and which has been one of the most important factors in the development of rubber cultivation by the aid of Belgian capital.

At the head of the Committee of Patronage is M. Jules Renkin, the Belgian Colonial Minister, the other members of the committee being leading government officials. The



Lot of Rubber Exhibited by the Societe Financiere des Caoutchoucs.

corresponding technical members of this committee include M. Auguste Chevalier, of Paris, Professor D. O. Warburg, of Berlin, and Professor W. Dunstan, Director of the Imperial Institute, London.

In addition to the Committee of Patronage, there is a working committee, under the presidency of M. Ed. Bunge, of Antwerp, president of the Federated Malay States Rubber Co., Limited. Among the vice-presidents are MM. Paul Osterrieth and Emil Grisar, of Antwerp; while the body of the committee includes Dr. E. de Wildemann, of Brussels; MM. Alfred Grisar and Léon Osterrieth, of Antwerp; Dr. W. R. Tromp de Haas, of Java, and Mr. Herbert Wright, of London.

The Editorial Committee numbers among its members M. Emil Grisar, of Antwerp, and Dr. E. de Wildemann, of Brussels, the secretary being M. Jules Tilmant, of Antwerp.

The subject of "Colonial Cultures" has received full attention from these prominent technical and commercial authorities on rubber. It had been confided to them by the Belgian Colonial Minister, with the co-operation of M. E. Leplae, director general of agriculture for the African colonies of Belgium. The actual carrying out of the preparatory arrangements was undertaken by a special committee, which included M. Robert de Decker, M. R. Ehrhardt and M. Léon Osterrieth. The services of the last named gentleman largely contributed to the successful display made by the association at London in 1911.

The May and June issues of the "Bulletin" of the association deal with the general features of the exhibition. These include the compilation of a "History of Rubber," in which its later developments are touched upon, in addition to its earlier features. Tapping and coagulation are then dealt with, as well as rubber in its finished condition. The various subjects are illustrated by specimens and photographs grouped in the various sections of the "Rubber Museum," which constitutes a leading feature of the exhibition. A neat folder accompanies the May issue of the "Bulletin," with several cuts illustrating, amongst other subjects, "Clearing on a Katanga farm," and "Rubber plants from Elizabethville (Katanga)."

While the subject of rubber cultivation is thus fully represented by the exhibits, special interest attaches to those dealing with rubber in its complete form. The Société Financière des Caoutchoucs has an effective display of the grades made by the companies it controls. One lot of exhibits is reproduced by annexed illustration. An interesting feature is a collective display of the various grades of rubber handled on the market of Antwerp.

With over 1,000 exhibits, it cannot be questioned that the rubber section at Ghent has done full justice to the subjects with which it has been called on to deal.

That the organizers of the exhibition appreciate the importance of the subjects handled may be seen by the subjoined extract from the "History of Rubber," already referred to.

"Modern life without rubber cannot be imagined. It is the necessary associate of copper in all the electrical industries—telegraphs—telephones—lighting. Rubber is the creator of the cycle and of the automobile, for which it is indispensable. . . . The astonished mind asks—not what rubber is used for, but rather, what are the purposes for which it is not employed?"

COLONIAL CONGRESS AT GHENT.

The program has been issued of an International Colonial Congress to be held from August 24 to 28 at the Ghent Universal Exhibition. Among the papers to be read are the following:

Regulations to be applied to vines. Dr. E. de Wildemann, of Brussels.

The cultivation of rubber in the Belgian Congo. M. Gisseleire, Minister of the Belgian Colonies.

RUBBER EXPORTS FROM THE FEDERATED MALAY STATES.

According to information cabled by the Federated Malay States Government to the Malay States Information Agency, the exports of plantation rubber from the Federated Malay States for the month of June amounted to 4,491,200 pounds, as compared with 2,744,000 pounds in May, making the total for the six months of the present year 23,492,129 pounds, as compared with 15,382,265 pounds last year.

Appended are the comparative statistics for 1911 and 1912:

	1911.	1912.	1913.
January .....*pounds*	1,329,170	2,730,576	4,787,280
February	1,490,849	2,715,767	3,936,529
March	1,916,219	3,089,583	3,890,880
April	1,235,917	2,285,390	3,642,240
May	1,147,488	2,255,034	2,744,000
June	1,229,754	2,305,915	4,491,200
Total	8,349,397	15,382,265	23,492,129

LAMP BLACK AND CARBON BLACK.

THE valuable and interesting paper read by Mr. Godfrey L. Cabot, of Boston, at the recent New York Congress of Applied Chemistry, on the subject of "Lamp Black and Carbon Black," deals with the question under its technical and industrial aspects.

According to the definition in Webster's dictionary, lamp black is the fine impalpable soot obtained from the smoke of carbonaceous substances only partly burnt. This definition is correct from the chemist's point of view, covering also the substance known to the trade in this country and elsewhere as "carbon black." In his title Mr. Cabot has used both names, because in the American trade the term "lamp black" is usually understood to be a soot deposited by the smudge process and made from oil, resin, or some other solid or liquid raw material. "Carbon black," on the other hand, is the term applied to a black deposited by actual contact of a flame upon a metallic surface.

LAMP BLACK.

Using the term "lamp black" in its wider sense, as embracing any commercial form of soot, it may be prepared in three different ways—first, by the combustion of dead oil of tar, pitch, resin or some other carbonaceous raw material with an inadequate supply of air, and the collection of the floating particles of soot which escape unburned from the flame and slowly deposit themselves on the walls and floors of the collecting chambers; or second, it may be formed by the direct impact of a flame upon a collecting surface; and third, it may be formed by heating carbonaceous vapors to a decomposing point, apart from the air or flame.

Soot has ceased to be used for its former purposes, its composition of 50 per cent. of grit, empyreumatic matter and other impurities rendering it unsuitable.

Considering "lamp black" in its more restricted sense of a commercial soot, deposited by the smudge process from various dead oils, from 15 to 35 per cent. of its weight can be obtained in the form of lamp black by deposition in suitably arranged chambers.

The quality of the black is determined by the size and shape of the furnaces in which the oil is burned, by the heat to which it is subjected and other attendant circumstances. It has been found that the best grades of black, generally speaking, are obtained in furnaces of moderate size.

Mechanical devices have been used for churning the air, and causing the condensation of the smoke in masses sufficiently large for it to deposit itself.

Resin, resinous woods, tar, pitch and other raw materials are to a certain extent used in the manufacture of lamp black, but the quality is greatly inferior to that obtained from the dead oil of tar and other substances.

Still another source of lamp black is acetylene gas, obtained from the refuse of carbide of calcium factories. This process is very hard on the apparatus, the black produced being very inferior in color and strength to that obtained from natural gas. The irregularity of its supply and price limits its use to cases where its bluish tinge obtains for it a preference in certain trades.

CARBON BLACK.

Carbon black, as already remarked, is the trade name given in this country, and to a certain extent abroad, to lamp black made upon the surfaces of metal or stone by direct impact of flame. The first carbon black produced in this country and sold commercially was made in 1864 by J. K. Wright, an ink maker of Philadelphia, for use in printing ink. This industry is thus a comparatively new one in this country. Mr. Wright made black on sheet iron cylinders, revolved over gas jets, from which the black was removed by stationary scrapers.

The first process of commercial importance patented was that of John Howarth, who received in September, 1872, a patent for the manufacture of carbon black from natural carbureted hydrogen gas. Owing to the cheapness of the raw material, as compared with the artificial gas previously employed, the price gradually dropped from $5 to $1.25 per pound.

Mr. Howarth worked his patents with success at New Cumberland, West Virginia, and later at Saxonburg, Pennsylvania. Owing to his superior ability, Mr. A. V. Nolan, who had started a competing factory at West Cumberland, West Virginia, bought out the original company. In 1883, L. Martin & Co., of Philadelphia, became interested in a plant at Foster's Mills, Pennsylvania.

A factory was started by Samuel Cabot about the same time at the village of Worthington, Pennsylvania, where efforts were made to confine and economize the gas. Owing, however, to the inefficiency of the foreman, the plant remained to a great extent fruitless for some years.

The Grantsville, West Virginia, works of Samuel Cabot now produce about 10,000 pounds of black a day, and are operated by five gas engines. This is said to be the largest factory in existence. The leading position of this factory was largely due to the system it had introduced of 24 inch plates, with a rotating burner and a black box radially placed.

In 1883 E. R. Bland, of Warren, Pennsylvania, began making black on the roller principle, the details of manufacture being subsequently improved by his son's processes, until the black has been shown to possess some valuable qualities, and is very profitable to its owners—the Peerless Carbon Black Co., of Pittsburgh. This company was for many years the only one in this country making carbon black from natural gas, but there are now three such factories.

In the decade 1883-1892 the process of making carbon black introduced by Mr. A. R. Bland, became the most important as to output and total value of black produced. The prices of black rapidly fell, reaching 7 cents per pound in 1887 and 4 cents in 1889. They then considerably improved, the total output at the close of 1902 reaching about 10,000 pounds a day, worth at that time on the average about 6 cents per pound.

TOTAL PRODUCTION.

The total value of the carbon black made in a year would, it is said, represent about one million dollars, while the total value of the world's output of lamp black would probably be two or three times as much. Yet the real importance of these two commodities to humanity is inadequately represented by these figures. These articles form the basis of black printing inks, are largely used in black paints and for coloring rubber, leather and other substances. Each has its distinct uses; carbon black being preferred for black ink, stove polish and vulcanized rubber. Lamp black is much better for coloring oilcloth, leather and certain forms of rubber, being much more widely used in paint than carbon black.

Within the last ten years the Pennsylvania factories (with three unimportant exceptions) have all been moved to West Virginia.

The total value of United States imports of carbon black, gas black and lamp black were: 1908, $493,907; 1909, $514,951; 1910, $679,607; 1911, $640,911; 1912, $907,623.

Such are a few of the points brought out by Mr. Cabot in his interesting paper.

FRENCH EXPORTS OF RUBBER GOODS TO UNITED STATES.

In a recently issued report, Consul General Frank H. Mason, of Paris, calls attention to the increased exports to the United States of rubber goods from his district. The figures were: 1911, $272,836; 1912, $474,850.

Notes on the Acclimatization and Cultivation of the Guayule

(Parthenium Argentatum Gray.)

By Francis E. Lloyd, MacDonald Professor of Botany, McGill University, Montreal, Canada.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

SINCE the time when, as a result of the then probable prejudice to the natural supply of guayule shrub, the problem of its cultivation was attacked, the question as to: What changes in the responses of the plant might be expected on the increase of water supply—has been uppermost. An answer has been obtained as yet only in general terms, and, from the practical point of view of the guayule rubber manufacturer, it is less satisfactory than from that of the plant physiologist. Indeed, in searching for a complete answer, the time element is so great that a number of years is required for working out satisfactory data. Those available to the present writer have been obtained from plants

PROFESSOR FRANCIS E. LLOYD.

grown for two seasons at Cedros, Zacatecas, Mexico; for three seasons at Tucson, Arizona, from material derived from Cedros, and from the Stockton plateau, Texas; from a single plant grown by Dr. H. H. York, at Austin, Texas, also from Stockton plateau material. At Auburn, Alabama, plants have been grown both in the open and in the glasshouse, both from Cedros seed and from Texas stocks, for three years. Seedlings two years old, grown in Tucson, have also been available.

The information based upon the above material will be briefly presented in what follows. The situations indicated include the semi-arid Chihuahuan and Sonoran deserts—within the former of which the guayule has its natural habitat—the moister climate of Eastern Texas, and the relatively wet region of middle Eastern Alabama, which has a rainfall of 45 to 55 inches. Before contrasting the plants from these widely different places we may profitably compare those growing naturally within the proper area of distribution. It has already been shown* that the guayule is by no means uniform in structure within this area, the differences being such as may be referred to differences in the amount of available moisture, which may in turn be attributable either to greater rainfall or to the character of the soil, chiefly mechanical. The structural differences referred to are those of relative thickness of the "bark," or, more properly speaking, the cortex, these being such that, the greater the available water, the relatively thinner the cortex.

Correlated differences in the length of the annual accretions of stem are to be noted. The more rapidly grown stems display a greater tendency to obvious shrinkage of the cortex, so that, in place of the rounded surfaces of the slowly-grown stem, longitudinal corrugations are to be seen. I am creditably informed that such characters are displayed by the guayule from the easternmost region of its distribution area, in the State of Nuevo Leon, to an extent so marked that the practical extraction of crude rubber is reduced, roughly speaking, to about 4 to 5 per cent. on mill weight. This may not necessarily be taken to mean that the amount of rubber relative to the volume of the rubber-bearing tissues is less than elsewhere, but that the volume of woody tissues (wood, hard bast, etc.) is greater. Nevertheless, this may be the case, and I know of no studies which have been made to settle the point. But, in the light of what we do know about the relation of water supply to the amount of rubber secreted, it is not improbable that the actual intracellular secretion in these Nuevo Leon plants is somewhat less than in dryer regions.

The well-known habital differences between the so-called *"macho"* and *"embra"* guayule furnish another case in point. *Macho* guayule is sparingly branched, has thick "bark," and the younger branches shrink little on drying, and, at all events, do not show longitudinal wrinkles. *Embra*, on the other hand, is very much branched, the younger twigs become furrowed on drying, and the bark is relatively thin. In the former the flowering shoots are sharply delimited from the leafy shoots; in the latter, the *embra* guayule, they are not. Whether these two types represent racial differences or not I do not care to discuss here, but it is well known in Mexico that, from the practical point of view, the distinction is important, as *macho* guayule is considered distinctly better as regards rubber content. Since both types may be found associated in the same locality it seems improbable that the intracellular secretion is unequal in them, but that the inferiority of the *embra* is due to the greater relative volume of the woody cylinder, and the relatively greater number of smaller branches. It is significant that when guayule of any type is put under cultural conditions, and supplied with abundance of water, the habit of the plant swings away from the *macho* toward the *embra* type of growth, in that there is a tendency for the leafy shoots to run out into flower stalks, and toward the greater development of wood.

These tendencies are to be seen whether the plant is grown in the desert under irrigation or in regions of higher rainfall, and are a summation of differences in minor details which I have treated more fully elsewhere. Of these I need mention but one, and that, in general terms, to the effect that the greater the water supply, up to the limits thus far observed, the greater the rubber-barren, fibrous or woody tissues in volume and in hardness, the greater the irregularity of growth, and the larger the number of smaller twigs and of leaves. This condition is one which presents difficulties to the manufacturer of guayule rubber due to the greater relative volume of the bagasse, and this will obtain wherever the plant may be grown with an abundant water supply. In speaking of acclimatization, therefore, we may avoid, for the purpose of this paper, further description of the tissue development. It will suffice to confine attention to the rate of growth, tenure of life and the total amount and rate of rubber secretion.

TENURE OF LIFE.

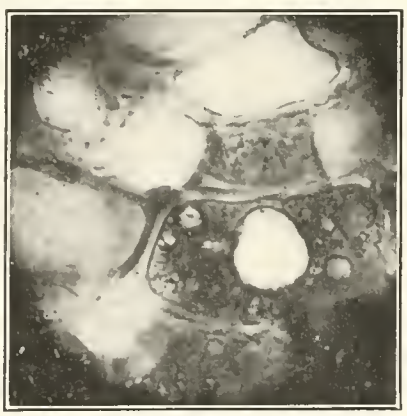
When a plant is removed from its own to another habitat, the

*Publication 139, Carnegie Institution of Washington.

new combinations of environmental factors may prove fatal, whereas any one factor, taken in different combination, might not. So it comes about that the guayule can withstand a greater cold much more effectually under arid than under moist conditions. Of a lot of guayule plant grown outdoors at Auburn, Ala., both from seed and from stocks, in 1910, only one in 25 was living in 1912. In no case did death overtake them in the warmer periods, nor early in the winter, but rather late in winter during a cold snap following heavy precipitation. The evidence that the winter of Alabama offers untoward conditions is clear, however, before the plant is killed—it has a bad color, and a generally disheveled look, due to the numerous dead unshed leaves. The wet and cold weather conjoined constitute the limiting factor. This may be taken to mean saturated soil and a minimum temperature of 10 degs. Fahr., approximately that of the normal habitat. The part immediately affected appears to be the root, the cortex of which quickly disintegrates.

The tenure of life in a new habitat depends further upon the ability of the plant to resist new enemies. In Alabama, thrips and nematodes have been seen to affect the guayule badly. A strong tendency to form large and irregular lenticels on the lower portions of the plant in contact with the soil and nearby above its surface may be due to this proximity alone or to insect stimulation. The seed is poorly developed.

In the semi-arid desert, on the contrary, no case of death has been noted during three years, save as the result of insufficient irrigation. It is clear from this behavior that the resistance of an irrigated plant to drought is much less effective than that of



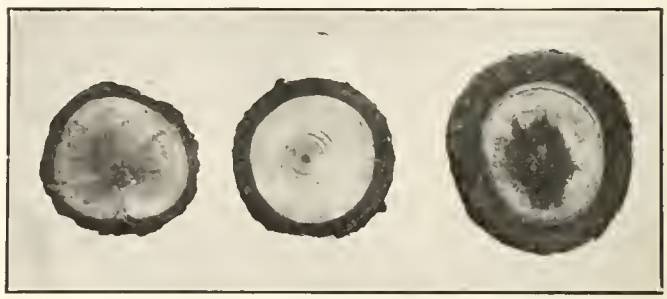
Typical Cell from Bark; Rubber Foamy in Appearance, Filling the Cell.

one grown under the usual conditions. Though attacked by a fungous parasite, it has never been known to be seriously affected. The development of seed is abundant, and it has a vitality approximately equal to that of field plants.

Rate of Growth.

When grown under irrigation in the semi-arid desert plants from transplanted stocks have attained in two seasons a maximum weight of 4.5 pounds, 3.5 pounds being a good-sized plant. These were a meter and over in diameter. The average weight for such plants would probably be 2 pounds. The dry weight of such plants, by which the rubber content must be calculated, is about 30 per cent. of the fresh weight. Allowing, therefore, a dry weight per plant of one pound, a not too conservative estimate, and assuming 10,000 plants to the acre, a 2 per cent. rubber content would yield 200 pounds of rubber in two growth seasons, followed by, say, six months of suppressed irrigation. At 60 cents per pound we have a return of $120 per acre for two years, or $60 per acre per year, against which should be charged, in addition to the usual costs, that of obtaining plants from seed for planting the ground. There is no evidence forthcoming that the percentage of rubber is greater, under the above-described conditions, than about 2 to 4 per cent. Assuming it, however, to be 6 to 7 per cent., guayule would even then scarcely be able to compete with onions in irrigated land.

The assumption is made that it would not pay to grow the plants longer than two years. In what follows under the head of rate of rubber secretion the reason for this will be seen in part. As to the rate of growth merely it may be said that the



Stem of Good Field Guayule from Zacatecas. | Stem of Guayule from Isidro, Chihuahua. | Irrigated Guayule from Zacatecas.

[Same amount of wood in each stem.]

rate of increase of weight will be found to drop off rapidly after the second season's growth, to which must be added the fact that the smaller and therefore younger twigs contribute little to the accumulation of rubber. The rapid production of cork characteristic of the irrigated plant, results, it is probable, in the destruction of rubber. I find that the rubber in the cells which are active in giving off the innermost and therefore younger cork cells becomes broken up into small globules, and these disappear before the cork cell in which they are found gets very old. The cork as a whole appears, as a result, to be devoid of rubber, although in point of fact minute quantities are present in the cells referred to. It is practically impossible to measure this loss directly, but it may very well offset the further gain by growth quite materially. The death of various twigs and branches due to competition *inter se* must also contribute to loss of rubber. These circumstances, coupled with the reduction of the growth rate after the second season, indicate the economic maximum to have been reached.

In the moister climate of Auburn, Alabama, one suitable, as everyone knows, to the development of cotton, the rate of growth is less rapid than in the desert under irrigation. In the first season, a height of 8 to 10 inches is attained, but in the second season the additional growth is meagre. This fact, coupled with the uncertain tenure of life during the winter, would force the issue of considering the rubber secretion of the first season alone. This, as we shall see, is practically nil. It must be concluded that the possibility of growing guayule in this region is excluded by its abnormal development and slow growth, quite aside from other considerations. I do not raise the question of the character of the soil and its possible causal relation to the manner of growth, beyond saying that it is not related, it would seem, to the lime content, since the plant grown in the limestone soil of Austin, Texas, behaved in a very similar manner.

Rate and Character of Rubber Secretion.

Normal field plants. In the study of the rate and character of rubber secretion in experimental plants, the field plant has always been taken as a standard. The method, that of microscopic observation, does not enable one to state the results in terms of percentage relative to the total weight of the plant. Only chemical methods can be used for this purpose. Nevertheless much useful information can be gained by means of the microscope, particularly in regard to the method of secretion and the amount of rubber within the cells which secrete it

METHOD OF SECRETION.

The first evidence of secretion is seen in the occurrence of very minute granules in the protoplasm. With the increase in their number and size they migrate into the sap-vacuole, and can be seen there by their Brownian movements. The analogy of this condition with that in the latex vessels of latex rubber plants is obvious, and indeed there may be more than mere analogy. In the definitive condition the rubber takes the form of a large droplet, almost filling the sap-vacuole, and rendered heterogeneous in its internal structure by the inclusion of encystments of solutions containing, probably, albuminous, carbohydrate and hydrocarbon

Two Seasons' Growth from Stock Under Irrigation, Zacatecas.

substances. It is important to note here that the rupture of the wall separating two adjoining cells would be followed by the contact and merging of the two contained rubber droplets. This is the more sure result, the larger the droplets, and this explains the ready agglomeration of guayule rubber into "worm rubber" in the pebble mill when field plants rich in rubber are used. Conversely, the smaller the droplets, the more increasingly difficult is the same result, calling for special methods of treatment. The droplets can be so small as to be impossible of mechanical extraction in the usual sense; this happens when they are so small as to form a suspension. The agglomeration of the suspensoids might be possible by the use of a minimum of water and the action of a "coagulating" agent, involving technical difficulties, the overcoming of which would be of the highest interest, but probably not economically of importance in this special case.

The largest rubber content under irrigation with known conditions was attained by plants of two seasons' growth in Zacatecas. At the close of the second season's growth the rubber content appeared as in the first stage of development, namely as minute droplets or granules. Seven months later, after practically continuous drought, the amount of rubber in the cell was less than the maximum, but not by more than, say, one-fifth. It occurred as a continuous mass, almost identical in appearance with the normal. In this case, the small percentage of rubber, on dry weight, is due in very large part to the great development of tissues which do not contain rubber in appreciable quantities. The use of abundant water in irrigation cannot be said to have inhibited the secretion of rubber, but rather to have increased the growth of barren tissues.

The problem from the economic viewpoint is, therefore, in such case not the possibility of extraction so much as the increased cost of handling a much greater volume of bagasse, though it is probable that this in itself would lend some hindrance to extraction.

The material grown at Tucson from stocks showed its rubber cells to contain a dense emulsion-like mass, filling the sap cavity in August of the third season's growth. In the previous August the same cells showed only minute granules. Seedlings in August of their second seasons contained in each cell an irregular solid mass of rubber occupying one-tenth to one-eighth of the sap-cavity, accompanied by quite small droplets elsewhere. As the irrigation had not been controlled or definitely applied and suspended, it is probable that the conditions had not been the best possible for the secretion of rubber.

Practically the same result was obtained for plants grown from stocks at Auburn when examined early in September (1912) in their third season. If we compare these cases from Alabama and from Arizona with the mariola (*Parthenium incanum*) we find but little difference between them, either as regards the amount of rubber in the cells or its character.

Two Seasons' Growth at Auburn (Ala.) from Texas Stock.

The conclusion is inevitable, I believe, that the determining factor in the cultivation of the guayule is: control of the water supply. In the presence of an abundance of water applied irregularly and at too frequent intervals, it will require more than three years for the maximum cell content of rubber to be attained. A quantum approaching the maximum is reached, on the other hand, if plants which have been well irrigated for two seasons are then subjected to drought conditions for six to eight months. That merely rate of growth is not correlated with the secretion of rubber is shown by the condition found in a plant grown from seed in a 12-inch pot in limestone soil for two years, and planted out for a season (summer of 1912) at Auburn. These plants were in some cases at a standstill for a year previous to planting out, and for various reasons grew but little in the open.

BEST TYPE OF FIELD GUAYULE.

In all the specimens examined, the rubber was in the form of a dense suspension, and had not formed a solid mass.

TO PREVENT THEFTS OF EXTRA TIRES.

The number of people who would like to help themselves to another man's automobile when they see it left unprotected in the street is unfortunately very large; and the number of those who, while they would hardly care to run the risk of taking the whole machine, are quite willing to run the risk of taking any movable part of it, is still larger. The extra tire which most motorists carry with them is particularly attractive to the motor sneak thief, and many tires have been lost in this way. The American Chain Co., of Sherrill, New York, has put on the market a chain made of flat links covered with duck or leather, that, with the help of a padlock, secures the extra tire to the running board or to some other part of the car.

AN OLD INNER TUBE AS A LIFE PRESERVER.

A correspondent writing to one of the popular magazines describes an inexpensive life preserver that he has devised. He has taken a discarded inner tube and cut it to the proper length, to fit around his body under the shoulders, leaving a sufficient length so that the two ends can be joined. This he accomplishes by sandpapering the outside of one end and the inside of the other, inserting the smaller in the larger, and fastening together by rubber cement. He finds that this improvised preserver will hold the weight of any ordinary man.

This home-made life preserver will undoubtedly work well, provided the joint is secure, but it would be rather unfortunate to have it in operation in deep water on a non-swimmer and have the joint separate.

PROOFERS WANT PROTECTION AGAINST DISHONEST PRACTICES.

WE print below a letter received from a proofing company, which seems to indicate that this particular company has had some unfortunate experiences with certain raincoat manufacturers. If many of the proofers have had similar experiences, it would seem to be wise for them to follow out the suggestion made in this letter and to confer as to the best means of protecting themselves from any manufacturer who might be given to the sharp practices described.

Mr. Pearson, Editor,
INDIA RUBBER WORLD, New York City.
Dear Sir:

Having heard of you as being at all times interested in using your influence and prestige in doing good for the various branches of the rubber trades, we wish to acquaint you with some of the abuses of the raincoat proofing trade, and ask your assistance in getting the various proofers to meet in a convention and agree to rules to eliminate such abuses.

Raincoat manufacturers ship converted cloths to proofers to rubberize or waterproof, and we reliable proofers use a compound that we guarantee waterproof and warrant against decomposing or becoming hard or soft within six months after proofing; but a certain percentage of the raincoat manufacturers are unscrupulous and there have been proven instances where a raincoat manufacturer has purposely kept his goods in conditions that are destructive to rubber and then has returned such made-up coats to the proofer charging him a higher price per coat than he sells for to the trade —and the proofer, fearing to let the case go to court, with all the uncertainty involved, will very often deem it the wiser course to allow these charges, extortionate though they may be, in order to avoid a law suit, though in paying these charges the profit of an entire season may be wiped out.

We issue with our acceptance of orders a provision, in the shape of a printed form, which describes very thoroughly the proper handling of waterproof material in order to prevent any subsequent damage; but this is no protection against the dishonest manufacturer who takes advantage of the keen competition among the proofers in order to make the proofer the scape-goat for any loss that should fall upon him by reason of having bought poor cloth in the first instance, or by reason of mistakes in his work shop, or lack of proper care in stocking and handling after his goods are made up.

These are but a few of the abuses which the proofing trade is called upon to endure at the hands of an unscrupulous manufacturer, but they could be eliminated if all the proofers were to get together and agree on uniform conditions and rules under which they would allow claims for any defects for which they are responsible, but would refuse to allow any claims obviously dishonest in their character.

Very sincerely yours,

FAIR PLAY.

BOOKLET OF THE COTTICA RUBBER AND COFFEE CORPORATION.

The Cottica Rubber and Coffee Corporation, incorporated under the laws of the State of New York, with headquarters in Buffalo, has just issued a booklet of 32 pages describing the purpose of the company, which is "to obtain and develop plantation estates in Surinam (otherwise known as Dutch Guiana), the principal object being the planting of rubber trees (*Hevea Brasiliensis*), coffee and cacao trees, bananas and various catch crops, such as corn; also the carrying on of this business in all its branches from planting to gathering and marketing all of its products."

The little booklet is generously illustrated and contains a good deal of interesting information, whether one is anxious to invest in rubber plantations or not. Incidentally, it quotes quite freely from letters by Mr. Pearson which appear in THE INDIA RUBBER WORLD of the first five months of 1911, in which he described Dutch Guiana, where the company's plantations are located. The company is capitalized at $250,000, divided into 50,000 shares of $5 each, and this little pamphlet is intended to convince the reader that it is to his interest to own some shares.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

THE Boston market is in its usual midsummer condition. Some branches are above normal, while others are simply holding their own. The makers of automobile tires continue to report good business, and most, if not all, are prospering. Despite the fact that many concerns have increased their output, there seems to be no great accumulation of tires in the factories or salesrooms. The druggists' goods business seems to be affected somewhat by the large consolidated interests in the retail drug trade. Those corporations which run chains of stores have formed a habit of advertising fountain syringes, hot water bags and similar lines at remarkable cuts from the usual drug store prices, with the result that while these corporations are large buyers, the smaller stores suffer, and jobbers find their sales of these goods falling far below normal. As the large buyers are probably enabled to secure as good as, or even better terms than the jobbers, the result must be a falling off in the total demand, unless these buyers purchase as much more in the aggregate as the orders from jobbers fall short.

* * *

The clothing trade continues prosperous, with a demand which keeps the factories busy. Few mills making these goods are willing to extend vacations for longer periods than the usual two weeks. Mechanical concerns have had a good trade in hose, which, however, is now falling off, while the call for belting and packing is rather unsatisfactory. There is but little doing in the boot and shoe business, and many of the factories have shut down for a longer or shorter term during the month just closed.

* * *

During the early part of the month, while the shoe buyers were in Boston, according to their semi-annual custom, the selling agencies of the United States Rubber Co. were well represented in this city. W. H. Jones, Southern selling agent, of Baltimore; Richard C. Hall, Western selling agent, and A. F. Solberg, of Chicago; Wm. E. Barker, manager of sales, of New York, and Homer E. Sawyer, general manager, were —for different periods of time—at the Boston office. The selling agents are here not so much for the purpose of selling goods as to meet their customers, who come here at this time to purchase leather goods.

* * *

Will we ever hear the last of that case against Warren B. Wheeler, Stillman Shaw and G. Alden Whittemore? They have been indicted again in connection with the sale of stock of the North American Rubber Co., makers of synthetic (?) rubber, and are now claiming irregularity in the proceedings, contending that, by reason of their books being seized before the grand jury proceedings were started, they were forced to give testimony which was later used against them; while Whittemore further claims immunity on the ground that when he testified before the grand jury he was not informed that his testimony might be used against him. At present writing, Judge Dodge, of the United States District Court, before whom the hearing was held, has not rendered any decision.

* * *

Improvement is the order of the day at the B. & R. Rubber Co.'s factory at North Brookfield, where a fine new engine has just been installed, in place of the old Brown engine of ancient type which has done excellent duty for many years. The company is prospering, and the town (which for some years went backward when the old Batcheller shoe business was discontinued) is now more flourishing and gives employment to more workmen than at any previous time in its more than two hundred years of existence.

* * *

A certificate of incorporation has been granted the Granite City Rubber Co., which will soon start manufacturing in the neighboring city of Quincy, where the two principal incorporators reside. W. A. Prince was until recently manager of the American Chemical Co., of Cambridge. George Reinhalter was an assistant in the chemical laboratory of the Hood Rubber Co. at East Watertown. The third incorporator is I. W. Pollard. It is an interesting fact that the two first named gentlemen began their business careers in the local drug store of C. C. Hearn, Quincy, an experience which not only led them into scientific experimental work, but also sealed a friendship and a mutuality of interests which have led to this union in a business enterprise.

* * *

The Aetna Rubber Co. is the style of a concern which was incorporated last month, with a capital stock of $2,500. The incorporators are Abe Kosow, Philip Samack and Samuel Goldstein.

* * *

A new industry somewhat allied with the rubber business is the Bay State Felt Co., which will soon start manufacturing at Westboro, Massachusetts. This is a new Massachusetts corporation, with a capital stock of $250,000. James Whitaker is president and Benjamin Kendrick treasurer.

* * *

The American Rubber Co.'s clothing department has been somewhat crippled the past month, through a strike of a few of the cutters. Business has been good right along, and the company has enough orders ahead to keep the factory running to full ticket—which was the intention until this trouble started. The management will, however, be likely to shut down for a few weeks if the strike assumes sufficiently large proportions to seriously interfere with the work.

* * *

The murder of one man, the wounding of another and the suicide of the murderer served to raise a portion of the Hood Rubber Co.'s employes to a high pitch of excitement one day last month. The aggressor, having been nagged by his fellow workers until his patience was exhausted, assailed his tormentors, then fled, and, being pursued, turned the pistol upon himself with fatal result.

* * *

The newspapers have just become cognizant of the fact that young Elisha S. Converse, son of Col. Harry E. Converse, and namesake and grandson of the late Deacon Converse, is working at the Edgeworth mill of the Boston Rubber Shoe Co. The fact has been blazoned forth under such scareheads as "Millionaire Converse Works at the Bench," "Rich Man's Son Now a Worker" and similar sensational titles. The report goes on to state that the young millionaire drives over from Brookline in his automobile, dons overalls and jumper at 7 a. m. and works until 5 p. m. in one of the hottest rooms of the factory, where the thermometer is never less than 100 degrees. "At present," this account says, "he is clipping red-hot heels from the furnaces (sic) to be placed on rubber boots. At 5 o'clock he enters his touring car, which awaits him at the factory entrance, and speeds to his home."

While this may seem somewhat marvelous to the average reader, it is nothing surprising to those who are familiar with the policy of the Boston Rubber Shoe Co. Many a man who afterwards became prominent in the rubber footwear business began learning the rudiments of the trade in that Edgeworth factory, or in the Fells factory of that company. General Manager Homer E. Sawyer served his apprenticeship making boots; some of the men now in the factory were his fellow workmen and today consider him a personal friend. There are other men in the United States Rubber Co.'s plant who can build a Boston short boot as well as any man now

in the place, while other graduates from that Edgeworth factory are holding various offices in the company.

Young Elisha Converse, grandson of Deacon Elisha S. Converse, founder of the Boston Rubber Shoe Co., and also grandson of Deacon John H. Parker, of leather sole rubber boot fame, is but working out the practical policy, long established, of learning the business "from the ground up," and the knowledge thus gained is likely to stand him in good stead when he is called higher in the interests of the business started so long ago by his distinguished and revered ancestor.

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE large balloon "Goodyear," which has been given many trials in and about Akron during the last few months, was a winner in the National Race held July 4 from Kansas City, which makes it one of the contestants representing America in the International contest to be held in France in October. The "Goodyear" in its flight from Kansas City on the Fourth was in the air twenty hours and during that

The "Goodyear" Balloon at Kansas City.

time traveled approximately 650 miles. The landing was at West Branch, Michigan. The balloon was in charge of Ralph Upson, pilot, and R. A. D. Preston, aide. One severe storm was encountered, at 2 o'clock July 5, when passing the state line between Iowa and Illinois—a severe wind and rainstorm, which cooled the atmosphere materially, thus causing the gas in the immense bag to contract, thereby shortening the flight. Mr. Preston obtained many interesting views during his trip, several of which were taken above the clouds.

The Goodyear Tire and Rubber Co. is building another new branch, in Long Island City, New York, to be completed in about six weeks. It is located at the corner of Jackson avenue and Honeywell street and is to be four stories high, 275 feet long and 50 feet wide, equipped with a complete showroom, warehouse, wheel shop and general repair shop.

The Goodyear company is promoting a new system of advertising, whereby at a minimum cost dealers are supplied with signs which will advertise their local business and at the same time carry mention of the Goodyear company. This minimum cost is brought about by the purchasing of a great number of these signs and supplying them to the trade at less than purchase price.

The wireless apparatus of the Goodyear company's Detroit branch supplied the news to the steamer "City of Detroit," cruising from Detroit to Cleveland, on which the semi-annual meeting of the Society of Automobile Engineers was held. This apparatus, which has been in service over a year, was installed in order to gain quick and at all times efficient communication with the factory in Akron. During the recent flood, when all other lines of communication failed, the Goodyear home office was in close touch with the branch at Detroit, and during the terrific windstorm on the Lakes this tower was gratuitously offered to the D. & C. company, which was thus enabled to keep in connection with its boats.

A large number of Englishmen and members of the Society of Automobile Engineers made a trip from Cleveland to Akron to visit various rubber factories, having attended the semi-annual meeting of this society aboard the steamer "City of Detroit." The point that impressed the English visitors most was the idea of specializing, as being developed in the American tire factories.

E. R. Hall, chief of the experimental department of The Goodyear Tire and Rubber Co., says: "Several years ago America looked to Europe for ideas in not only structural tendencies in foreign motor cars, but also in tire designing. But now the tables are turned and it is safe to say that America is fully several years ahead. In this country we have special tires made for different classes of work; special tires for electrics and gasoline cars; special tires for trucks. The tires are being built more for the particular work they must do than formerly."

Storage room during business hours for the automobiles of the Goodyear company's officers and department heads is requiring more space as the capacity of the plant and the working force increase. The East Market street building, which has been occupied as a garage, is now found to be inadequate for this purpose, and another building of equal capacity is soon to be erected by the company.

* * *

The Firestone Tire and Rubber Co., which only recently took possession of a new addition to its already extensive plant, has started work on another new structure, a building permit having been granted for a four-story brick and steel factory building, to cost $90,000. The Firestone plant, which now covers fifteen acres and gives employment to more than 3,000 persons, is said to be the largest plant in the world devoting its energies exclusively to the manufacture of tires, the daily output of its finished product having been stated by a director of the company to be fifty tons. This enormous business was started about fifteen years ago, when H. S. Firestone, president of the company, commenced operations in a small way at Miller and Sweitzer streets, manufacturing "The Firestone Side-Wire Carriage Tire." With the growth of the enterprise, additions have been erected from time to time, each in its turn embodying all the latest ideas in sanitation, fire prevention, etc. It is aimed to complete this latest

structure about the time the president of the company, H. S. Firestone, returns from Europe. Mr. Firestone and his family are now enjoying a motor trip on the continent, their intention being to tour Italy, Switzerland, France and possibly Germany.

Robert E. Lee, former superintendent of the Cincinnati Traction Co. in Cincinnati, is now in the employ of The Firestone Tire and Rubber Co., at its home office.

Mr. A. G. Partridge, assistant sales manager, left Akron July 9 for a six weeks' trip to Northwestern Canada, Washington, Oregon and British Columbia. On this trip Mr. Partridge will visit 30 or 40 cities where the Firestone company is represented.

The "Panama-Pacific Road Race" from Los Angeles to Sacramento—443.6 miles—July 4 was won by Verbeck in a Fiat; Waterman in a Buick, second; Oldfield in a Fiat, third. All three used Firestone tires, and the first and second cars never changed a tire during the whole race.

On Saturday, July 5, The Firestone company held its annual picnic at Silver Lake. A special program was furnished until late at night and the expenses were paid by the company.

* * *

The same day was given by the B. F. Goodrich Co. to its employes as a holiday, and in addition each employe was presented with a dollar, this to take the place of the regular Goodrich picnic, which, on account of the large number of employes, it was found very difficult to have at one pleasure resort on a single day.

The Goodrich company, which recently paid a semi-annual tax of $96,400, is the largest taxpayer in the city of Akron.

Mr. C. S. Thompson, formerly advertising manager of the Diamond Rubber Co., and since its consolidation with the B. F. Goodrich Co., connected with that concern, has resigned, Mr. Tibbets now having full charge of the advertising department.

* * *

All Akron rubber factories are running day and night and are still unable to fill all their orders.

* * *

Manufacturers of rubber goods of all kinds are now using more aluminum flake in their work than ever before. This is due to the high quality of this pigment, combined with the low prices which now prevail.

Aluminum Flake, which is the product of The Aluminum Flake Co., Akron, is claimed by this company to have a distinct toughening effect on the rubber and at the same time to add life and elasticity. New concerns are being added almost daily to the already long list of satisfied users, and the older ones are using more than they have in the past. The trial of a sample by a prospect almost invariably results in an enthusiastic and steady customer. The officers of the company are very well pleased with the increase in its business.

THE RUBBER FACE AND THE POET.

A "fakir" I have seen upon Broadway,
Who holds between his finger and his thumb
A small red rubber face, now grave, now gay,
On which both smiles and frowns by turns will come.

A pressure slight—it wears an awful frown,
A little twist—a smile will wreathe the face.
I envy quite that small red rubber clown,
That smiles with such calm courage into space.

I would that I could wear a smiling face,
When down my lofty idols all are hurled;
Would I, tho weary in a prizeless race,
Could look with smile serene upon the world!

O. C. A. C.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

THE employes of the United States Tire Co. held a meeting a few evenings ago at 355 Valley street, Providence, to take steps for the organizing of a permanent social, literary and athletic association to promote a feeling of harmony and good fellowship among the men. A provisional association was formed with temporary officers, and working committees on by-laws were appointed. It was decided to hold a moonlight excursion on August 15 for the benefit of the association. A membership of 52 names has already been secured.

* * *

The Alice rubber shoe mill of the Woonsocket Rubber Co. at Woonsocket, and the Millville rubber boot mill at Millville, shut down on July 24 for four weeks, ending August 22. For several years it has been customary for these mills to close for one or two weeks during August, but this year the vacation period will be extended to four weeks, as the company intends making a number of unusual alterations. It is also going to install considerable new machinery, which, it is said, may necessitate the erection of another building. If this is done, the new structure will probably be located on Fairmount street, Woonsocket. It is stated that the company has orders enough ahead to guarantee work for a long time. The Alice mill employs 1,500 hands and the Millville plant 800.

* * *

One of the most interesting features of the Fourth of July parade at Bristol was an ancient coach belonging to Col. Samuel P. Colt. It is more than a century old and the family history of the Colts refers to one of Col. Colt's ancestors, James De Wolf, who rode from Bristol to Washington when he was elected a United States senator. The coach attracted much attention in the Natal Day parade, and its occupants—Col. Samuel P. Colt and his brother, United States Senator Le Baron C. Colt—received frequent applause.

* * *

The work of installing a first-class steam engine plant at the factory of the International Rubber Co., West Barrington, is progressing rapidly. It will be fully equipped with all modern improvements as regards boilers and pumps.

The shop recently vacated by N. C. Wallenthin in the Snell building on County street, Attleboro, has been taken by the Hospital Rubber Co., of which George J. Kelley, of Attleboro, is the principal owner and general manager. Extensive alterations and improvements are being made in the new plant.

* * *

A baseball diamond has been laid out on the grounds of the National India Rubber Co.'s factory at Bristol, and bats, balls and suits have been supplied for those of the employes desirous of playing the game.

* * *

Manager Le Baron C. Colt, of the National India Rubber Co., Bristol, arrived a few days ago from an extended business trip to Canada and the West. He at once assumed charge of the improvements being made at the company's plant. The erection of new structures to accommodate the cable wire department is being pushed, and the size contemplated in the original plans has been materially extended.

* * *

On July 15 the American Wringer Co., of Woonsocket, began paying its quarterly dividend to its stockholders, both common and preferred.

* * *

The Davol Rubber Co., 69 Point street, Providence, has

been calling for a number of girls to whom permanent employment will be furnished in the various departments of the plant.

THE RUBBER TRADE IN SAN FRANCISCO.

(By a Resident Correspondent.)

IF each of the automobiles sold to residents of this state beginning with February of this year averaged $2,000 in value, then there would have been spent for automobiles during that time $36,000,000. No matter what other departments of the rubber trade may be doing, it stands to reason that the tire business on this coast is good. There does not seem to be a great deal of activity in regular mechanical lines, but the demand for tires goes on without abatement and seems to be growing all the time. The duality of trade conditions indicates that the quietness in the mechanical branch must be of a temporary nature. There is money in the state, as is shown by the activity in automobile sales, but new projects of development, investments of capital, and the like, to cause renewed activity in the mechanical departments, are lacking for the time being, owing to the general conditions throughout the country which have affected capital—the tariff, the currency banking bill, etc.

* * *

The American Rubber Manufacturing Co., whose factory is situated at Emeryville, California, and whose offices have heretofore been located on Beale street, near Market, has taken fine new quarters at 408-410 Mission street. Here it has the first floor and basement of a recently erected concrete building, 45 by 113 feet in dimensions. This firm is doing a good steady trade, and has found it necessary to acquire bigger warerooms and salesrooms in order to handle the increased business. It has recently taken on the Hoyt Short Lap Leather Belt line, and has also undertaken an agency for the new Perkins Rubber Heel. This heel is being manufactured at its Emeryville factory, and is proving a good seller. The inventor is Wm. Perkins, a man well known to the rubber trade on this coast. He has made a heel which shows many marks of superiority to the regular rubber heel, and believes that it is going to be a success.

* * *

R. H. Pease, Jr., treasurer of the Goodyear Rubber Co., returned from his visit to Europe some weeks ago. He was to start on July 22 for a motor car trip to Portland, accompanied by A. B. Watson, assistant treasurer of the company, Mrs. Watson and Mrs. Howell. They expected to make the run to Portland in four or five days. Mr. Pease will remain in Portland indefinitely, taking charge of the business there. Mr. Watson, however, expects to return in a few days, by rail. Mr. R. H. Pease, Sr., reports that business is keeping up as well as at this time last year, altho there is still room for improvement.

* * *

B. H. Pratt, Pacific Coast manager for the Fisk Rubber Co., states that the double pneumatic tires which are being used on trucks are doing very well on this coast. Here the test is severe, because automobile trucks are bought with the idea of increasing the speed of delivery, and the roads are in many instances rough and not kept in good repair. The pneumatic double tire, however, seems to be better for the auto truck—for cars having a carrying capacity of from one to two and a half tons—than solid tires.

H. E. Argus, who had charge of the Pacific Coast mechanical department for the Diamond Rubber Co., has resigned his position, and will leave shortly for Akron. He has been with the Diamond company for 16 years, and has been in San Francisco with the firm during the past eight years.

W. G. Rigdon has just returned from his Eastern trip in the interests of the Gorham-Revere Rubber Co. This company reports a steady business in all branches, but an exceptionally lively trade in tires. Mr. Gorham is in San Francisco now, and is planning a campaign which will bring in plenty of business for all departments.

J. E. Newerf, manager for the northern California territory of the W. D. Newerf Rubber Co., reports that Miller tires are holding their own with excellent results on this coast. The fast road race in which many automobilists participated, between Los Angeles and Sacramento, showed not only the resisting qualities of the Miller tire, but also what an improvement has been made in all tires, to stand the present day tests.

Mr. Dodge, of the Western Belting and Hose Co., has returned from his six months' visit to Los Angeles, where he went to see that the branch store in that city got well established.

The Western I. & A. L. Purchasing Corporation, of Los Angeles, has changed its name to the I. A. L. Tire Co.

The Frontera Hardwood Rubber Co. has recently been incorporated at Tacoma, Washington.

THE RUBBER TRADE AT TRENTON.

(By a Resident Correspondent.)

THE fire which on July 2 destroyed one of the buildings of the Woven Steel Hose and Rubber Co., of Trenton, New Jersey, has not seriously interfered with the filling of that company's orders, shipments being made with reasonable promptness. Plans are under way to replace the burned building with others of improved construction which will afford more than double the floor space. The line of Squirt Hose for locomotives which this company has lately added to its manufactures is meeting with favor, in the Canadian market as well as here. This steam hose embodies the same ideas that have made so increasingly popular the "Protector" brand Woven Steel Pneumatic Tool Hose put out by this company, which also includes among its products Automobile Brake Lining and Friction Rings for automobile clutches.

John S. Broughton, of the United and Globe Rubber Co., is president of the company; Karl G. Roebling, treasurer; J. R. Kelson, vice-president and general manager.

The Mercer Rubber Co.'s plant is one of the busiest in this section of the country; orders for garden hose, fruit jar rings and fire hose keeping the operatives working day and night. Fruit jar rings are a specialty with this concern, millions of rings having been made during the past six months, the most successful half year in the history of the company. This concern has made big shipments of late to Mexico.

Every local rubber plant is rushed with business these days.

DEVELOPMENT OF MEMPHIS, TENNESSEE.

Those whose ideas of Memphis are mainly associated with cotton in its various forms, would be struck by the artistic "Views of Memphis," a copy of which (through the courtesy of Messrs. Towner & Co., of that city) has reached The India Rubber World. Memphis has much to be proud of, with its magnificent park system, its unequaled driveways and its boulevards. It has also high class residences with private grounds. Progress on a more extensive scale than that achieved by other cities with a population of 130,000, is shown by the handsome booklet received. One of the features of the city is constituted by its manufacturing districts, which are rapidly growing.

The Annual Mid-Summer Outing of the Rubber Club of America.

WHENEVER a notice goes out that the Rubber Club of America will hold an outing, the members send the return post-card to the Secretary and at once proceed to restring their tennis racquets, to polish up their golf clubs and to hunt up their baseball bats, catching gloves and wire-cage mats—for the outing of this club numbers among its regular features tournaments of athletic sports, with worth-while prizes attached thereto; and while most of the contestants play for the sport of it, no one has ever been known to decline any prize which the judges have awarded to him.

The edict went forth that the outing this summer would be held at the grounds of the Belmont Springs Country Club, a beautiful spot in Waverly, a suburb of Boston. Thither on Monday, July 14, went the members and their friends, to the number of nearly a hundred and fifty. Many went in their private automobiles, but others were content (or had to be) to take the special trolley cars provided by the committee to carry them to Waverly station, whence, some law or ruling preventing the trolley's crossing the steam railway track, automobiles conveyed the pilgrims the remaining two or three miles to the clubhouse and grounds.

The day was perfect, neither too hot nor too cold. There were comfortable piazza chairs for the lazy and plenty of sport for the active. The tennis players found well made courts on which to try out their prowess. The golfers found a course which gave them plenty of opportunities to show their ability, and the baseball enthusiasts, players and spectators, secured a fairly satisfactory field, not more than a mile away, reached by trespassing through a hay-field and a dog-protected chicken yard.

The company scattered somewhat, by reason of the various contests in progress, but by far the largest contingent strode over hill and dale to the extemporized ball field, where a stone wall served as grandstand and a prostrate picket-fence as the "bleachers."

The two nines were convened and duly named. Captain Clapp called his nine the "Red Sox," though no one was able to find any hosiery of that particular hue. Captain Pitcher's nine rejoiced in the name of "The Giants," yet none of them measured more than six feet-eight. C. H. Booth, of the Michigan Shoe Co., umpired the game. Some of his decisions were remarkable, but only once did the spectators arise in their wrath and run him off the field. On his promise to do better he was allowed to return and finish out the six innings allotted to the game.

There were some wonderful plays, in fact so many that it would be invidious to mention any in particular. No severe casualties were recorded, but enough to make noticeable the absence of Doctor Stedman, who has never before deserted the club at an outing.

Members and Guests of the Rubber Club at the Annual Outing.

The personnel of the two nines, and the number of runs made were as follows:

"Red Sox."			"The Giants."

Chickering, the Boston photographer, as usual, was present as official photographer, and the company present looked as "pleasant" as requested, when the lens was uncapped. A half-tone of the result is presented as an illustration to this veracious narrative.

After the base-ball, there was a putting contest and a quoit pitching tournament, both of which found numerous entrants. W. L. Proctor, of the Enterprise Rubber Co., had supervision of the putting, and the score is given here in full, to show how close was the contest.

The tennis prizes interested but four experts. C. H. Roper defeated Quincy Tucker 6 to 1 and 7 to 5. F. S. Dane beat R. B. Price 6 to 1 and 6 to 1. Roper beat A. A. Glidden 6 to 0 and 6 to 3, and Dane beat Roper 6 to 2 and 6 to 3.

By this time all the score cards had been turned in on the golf tournament, the full score of all the contestants being as follows:

	Gross.	Handi-cap.	Nett.		Gross.	Handi-cap.	Nett.

The quoit pitching tournament, in which the winners were decided by elimination, resulted in favor of McGraw and Benchley.

So much for the sports, which interested the rubber men during the entire afternoon. The dinner, which was to have been served at 6 o'clock, was still untasted at 7, as it was found difficult to tear people away from the putting and the quoit matches. The Lynn Cadet Band did its full duty in rendering music, from opera to ragtime, and although nothing stronger than pop and ginger ale was dispensed, everybody was jolly and happy, but also hungry, and when the line of march was taken to the handsome club-house, which had been transformed to a dining hall, all took their appetites with them.

The tables formed an immense E, the little middle portion taking care of the tail-enders who found all the other seats filled. However, there was room for every one, and food for every aching void. Though there was no sea-shore within an appreciable distance, there were clams, fish and lobsters, all hot, and swiftly absorbed.

Between mouthfuls, the diners, musically bent, sang chorus after chorus—most of them in tune. One song, however, did not get beyond the first few lines. Some one—unaware of the club's loss in May of a much esteemed member—started up "Has Anybody Here Seen Kelly?" That tune has always been a signal, at past dinners and outings, for a march down the hall and a stately measure back by the two Kellys—Wm. J., of Poel and Arnold, and Edward B., of the Mechanical Rubber Co. This time, the music stopped almost as soon as it began, and William Kelly spoke feelingly of the loss, by death, of Edward B., and proposed a silent toast to the departed. Captain Appleton, in a few well-chosen remarks, seconded this request, and Mr. Kelley's memory was honored in a silent tribute.

As is the invariable rule at these dinners, no set speeches were made. President Hodgman awarded the prizes, as follows, with short and appropriate remarks:

Golf.

First Prize, Gold Pocket Knife to F. C. Hood.

Second Prize, Thermos Carafe to Wm. L. Wadleigh.

Tennis.

First Prize, Smoking Set to F. S. Dane.

Second Prize, Cocktail Shaker to C. H. Roper.

Putting Contest.

First Prize, Cut Glass Vase to A. W. Stedman.

Second Prize, Tray and Coasters to F. C. Hood.

Quoits.

First Prize, Cheese and Cracker Dish to E. L. McGrew.

Second Prize, Gold Cigar-Cutter to H. C. Benchley.

The supper ended at 8:45 and soon the automobiles were speeding away for the city. Every car owner had plenty of friends to fill the extra seats, and the two cars provided by the management made several trips to the railway station.

During the day a meeting was held of the Executive Committee, at which President Hodgman presided. At that meeting, resignations as officers were received from Secretary H. P. Fuller and Assistant Secretary John P. Lyons. These were accepted, and resolutions were passed appreciative of their services. In accordance with a previous action of the management to employ the services of a paid secretary, Mr. H. S. Vorhis was appointed to that position with offices at 354 Fourth avenue, New York City.

The following applications for membership were received and approved:

ASSOCIATE MEMBERSHIPS.

F. J. Dunleavy, Boston-Bolivia Rubber Co., Boston;

Frederic Feinburg, D. Feinburg Co., Boston;

Jas. J. Clifford, Technical Supt. Boston Woven Hose Co., Cambridge;

W. H. Norton, Enterprise Rubber Co., Boston;

F. E. Lovejoy, American Rubber Co., Cambridge.

FIRM MEMBERSHIPS.

Chicago Rubber Clothing Co., G. G. Bryant, Secy., Chicago;

Walpole Tire & Rubber Co., A. T. Baldwin, Walpole and Boston, Massachusetts;

Lee Tire & Rubber Co., Edward Lee, President, Conshohocken, Pennsylvania.

Some consideration was given plans for the coming season, and the meeting adjourned, to meet at call of the president in September.

The Hodgman Glen Island Outing.

OF the many annual field days and outings that the Hodgman Rubber Co. has given to its employes none have approached that of June 28 in this the 75th year of the company's existence. Beautiful Glen Island was the place chosen for the day's outing. A most capable committee arranged everything, to the smallest detail, far in advance, so that every event came in its proper place, every employe had a good time, and there were no delays and no accidents. When the 2,000 employe guests arrived at Glen Island at noon they found a big barbecue just ready to be discussed. Then came a hotly contested ball game, in which the Hodgman nine came off victorious. Then in rapid succession followed events such as "Shoe race" (boys)—Fifty-yard dash (girls)—Potato race (girls)—One-third mile run (men)—Egg and Spoon race (girls)—Hobble skirt race (girls); and a Tug of war between representatives of the Mt. Vernon and the Tuckahoe factories, which the latter won. In addition, the regular amusements at the Island—such as roller coasting, bowling, billiards and bathing—were all well patronized by the visitors.

A monster banquet was the beginning of the evening's entertainment. After the dinner—which was excellent—President George B. Hodgman made a brief speech of welcome. He was followed by Mayor Fiske of Mt. Vernon, and he in turn by the editor of THE INDIA RUBBER WORLD. Then came the adjournment to the dancing pavilion, and some hours later the return to Mt. Vernon and Tuckahoe, and the "Best Hodgman Outing" and one worthy to commemorate 75 years of successful existence came to an end.

BALL GAME AT THE HODGMAN GLEN ISLAND OUTING.

BANQUET AT THE HODGMAN GLEN ISLAND OUTING.

NEW TRADE PUBLICATIONS.

CINCINNATI RUBBER MANUFACTURING CO.

In catalog C, lately issued, the various features of the mechanical rubber goods made by the Cincinnati Rubber Manufacturing Co., Cincinnati, Ohio, are fully listed and illustrated. Commencing with an effective cut of the factory buildings, the reader's attention is called by the catalog to the four varieties of plain belting, followed by two of stitched and three varieties of friction surface. Next in order come beltings for various special uses, such as oil wells, conveyors, elevators and other purposes. Several pages are devoted to the use of rubber belting, with a formula for determining the horse power represented.

The subject of hose is a big one and is appropriately dealt with by comprehensive illustrated lists of steam, water, lawn, fire, mill, brewers' and pneumatic tool varieties. Other specialties are qualities for use in automobiles, chemical engines, etc.

Packing includes the well-known "Norka," "Old Crow" and "Cincinnatus" grades in various forms, while a complete line of tubing is also represented. Rubber covered rolls make a special feature of this concern's product.

Numerous other specialties complete the line as shown in this highly useful and interesting catalog, dealing with the entire range of mechanical rubber goods.

A COMPREHENSIVE CATALOG.

Covering as it does druggists', chemists' and perfumers' glassware, as well as druggists' sundries, the annual price list of the Whitall Tatum Co. gives a comprehensive idea of the lines manufactured and carried by this enterprising concern. The number of articles handled may be inferred from the fact that the index to the principal ones includes nearly 600 items; while the catalog itself numbers 198 pages, copiously illustrated. Glassware occupies 72 pages, the remainder of the space being given to druggists' sundries.

The importance of rubber as an element in the manufacture of druggists' sundries is shown by the catalog itself. That the baby from its earliest age is a factor in the consumption of rubber is shown by the cuts of nipples, comforters and "toothers," of which a large variety is displayed. Following these are various makes of hard rubber syringes, after which come water bottles, atomizers and sanitary goods. Hospital specialties, such as ice bags, invalid's feeding cups, bandages and thermometers carry the line further, till the important heading of hard rubber combs is reached, of which some forty numbers are listed, many of them being illustrated.

Attractive in form and compiled with much care, this catalog is a handy guide in the purchase of druggists' glassware and sundries, and as such will be appreciated by all interested in that branch of trade.

SOME NEW GOODRICH ISSUES.

GOODRICH ROAD GUIDES.

Among the many advantages offered by the automobile is the facility it affords of traversing the distance between populous centers. To fully appreciate this point it is necessary to accompany the motorist in spirit on his journey. Such an opportunity is afforded by a perusal of the folder issued by The B. F. Goodrich Co., "Omaha to Kansas City." The intending or actual tourist finds in this convenient pocket guide a full reference to the landmarks distinguishing the way between the two cities named. The fullness of the information may be inferred from the fact that there are no less than about 150 references, covering the distance of 221 miles.

Niagara Falls being the objective point of numerous summer motorists, a neat card issued by the Goodrich Co. is of special value just now. The route from Buffalo to Niagara Falls (22½ miles) is indicated, with references to eight points on the way. For the benefit of the motorist continuing his journey into Canada, the routes to Hamilton (49½ miles), and thence to Toronto (42½ miles), are shown on the same principle as that of the guide from Buffalo to Niagara Falls.

FURTHER GOODRICH LITERATURE.

In a new group of folders the B. F. Goodrich Co. has further emphasized the merits of certain specialties in its product. These include the ever present subject of rubber bands. As the folder explains, the peculiarity of rubber bands is that they are often not to be found when wanted; this elusiveness being obviated through the "Goodrich Bank Band Assortment," which contains seven sizes in a neat box. This handy device is sufficiently large not to be easily misplaced, forming a useful adjunct of the busy man's desk. The bands, moreover, are of the standard Goodrich quality and are guaranteed for five years against defects of material and manufacture.

Another specialty, tho different in character, is the "Goodrich Rubber Bucket" holding over two gallons and when collapsed taking up a space of only 9 x 2½ inches. Its practical advantages include a strainer in the spout which keeps back all impurities. This convenient motor accessory is more easily handled than the ordinary bucket and deserves the attention of every motorist.

Lawn tennis retaining its popularity as an outdoor game, it is of interest to note from still another folder that the Goodrich ball has been adopted for the season of 1913 by the United States National Lawn Tennis Association. It may be used in all tournaments under association rules.

POPULARIZING A PASTIME.

While the automobile and the motorcycle have done much to affect the popularity of the bicycle, there are still many adherents of the latter. To such the question of tires is of primary interest. A neat folder recently issued by the B. F. Goodrich Co. explains the advantages of two special tires: "Roadworthy," price $5.50 per pair, and "Maxecon," price $5 per pair, in the standard sizes. It is claimed that these tires embody the highest quality consistent with their low prices.

POCKET RULE BOOK OF GOLF—1913.

Seeing that handiness is the chief desideratum in a booklet containing the rules of any popular game, the B. F. Goodrich Co. has assuredly furnished golf players with just what they want. In a neat stiff-covered booklet, 6 x 3, are condensed into 42 pages the rules of golf, both for ordinary playing and matches; while in the remaining six pages the merits of the Goodrich golf balls are fully explained and illustrated. The "Stag," "Moose," "Comet," "Meteor," "Scotty," "Final" and "Bantam" are no longer mere names, but by the aid of the cuts become realities, of interest to all golf players.

THE GOODRICH FOREIGN SERVICE.

Now that a large number of American motorists are in Europe, a folder issued by the B. F. Goodrich Co. has a special interest for the actual or intending tourist. It gives just the information needed by the automobilist or bicyclist as to where he can obtain standard Goodrich tires in American sizes with inch measurements, distinguished from those in millimeters. The company has its own houses in England, Germany, France and Belgium with agents carrying a stock of tires at some fifteen various points in nine different European countries. For the benefit of motorists, the Goodrich company issues an "Auto Map and Guide to Europe," which is available free, on request made to the Goodrich Touring Bureau, Akron, Ohio.

REDUCTION IN REPAIR PRICES.

The retail tire dealers and repairers of Toledo, Ohio, have done a wise thing. The last of June they made a general agreement to reduce their prices for tire repairs and materials, on the ground that the cost of tires had been considerably lessened during the last two years. Charges now are 25 cents for vulcanizing a nail puncture, as against 50 cents, the former price. The charge for patches has been reduced about 40 per cent., and the price for re-treading has been lowered 15 per cent.

The Editor's Book Table.

L'APPAREIL LATICIFERE DES CAOUTCHOUTIERS. BY DR. Alphonse Meunier, Professor at the University of Louvain; 1912, Brussels. Imprimerie Industrielle & Financiere. [Paper; text, 52 pages; plates, 8 pages.]

This highly artistic treatise constitutes the first section of a series of "technical memoranda," published by the Agricultural Service of the Belgian Colonial Ministry, and deals with the latex-conveying system of the rubber tree. In his introductory remarks, the author comments on the fact that the discernment of suitable varieties, and the choice of the forms of cultivation and exploitation most appropriate to each description, are questions of grave interest; particularly when plants are removed from their natural habitat, for the benefit of regions newly opened to human activity. This subject, it is added, specially affects the Belgian Colonial Ministry, with a view of avoiding the recurrence of the difficulties experienced in the past, and of assuring future success.

In this connection, the anatomical structure of trees containing rubber calls for attention, the scientific knowledge of the distribution of the latex-conveying system being the necessary foundation of any judgment formed on the question.

Dr. Meunier, in view of the importance of the subject to the Belgian Colonial Administration, has devoted hs initial researches to the following varieties which have been adopted in the colonies for systematic cultivation:

I. Asclepiadaceæ—*Periploca* and *Cryptostegia.*
II. Apocynaceæ—*Clitandra, Landolphia* and *Funtumia.*
III. Euphorbiaceæ—*Hevea* and *Manihot.*
IV. Urticaceae—*Ficus* and *Castilloa.*

As known, the structure of the latex conveying system, as well as that of the other constituent systems, remains more or less alike in the different representatives of the same natural group; harmony being thus demonstrated between the internal and external characteristics displayed by members of the one family. This fact has enabled the author to dispense with the multiplication of the subjects treated.

In the text of this comprehensive summary, the four varieties named are treated in detail, and conclusions drawn regarding them.

The eight graphically executed colored plates. each containing some ten botanical representations, form a valuable addition to the work and emphasize its salient features. Much credit is due to the author and artists engaged in the production of this compendium.

TRADE MARK LAWS OF THE WORLD AND UNFAIR TRADE. By B. Singer. Chicago, 1913. [Cloth, 686 pages. Price, $5.]

While the American import commission merchant has plenty of worries in his relations with foreign countries, the export merchant is exposed to special troubles in the matter of trade marks. Owing to the lack of uniformity in the laws of the various commercial nations of the world, experience with one country is of little service when dealing with another. Hence the value of such a detailed and comprehensive work as that of Mr. Singer..

It is not sufficient for a work to contain information. but it must be in such form as to be easily accessible when wanted. This object has been attained in the case of Mr. Singer's book, by alphabetical division of the countries of the world, and a classification of the regulations affecting each branch of the trade.

A feature of practical utility consists in the introductions leading up to the details regarding the respective countries, in which the principal geographical and statistical facts affecting each nation are condensed. The work displays the result of much painstaking and arduous labor, involving close study of international trade-mark legislation.

ZOLL-HANDBUCH FUR DIE GUMMI INDUSTRIE. BERLIN, 1910. Union Deutsche Verlagsgesellschaft. [Cloth, 232 pages.]

Duties form such an important factor in modern business calculations that anything tending to their simplification is necessarily of value. Hence the "Handbook of Duties for the Rubber Branch" is a valuable help to those engaged in the export trade. The duties levied on rubber goods in 71 countries of the world are shown in detail. As a work of reference this summary will be appreciated for its careful and accurate compilation.

DUNGUNGSVERSUCHE IN DEN DEUTSCHEN KOLONIEN. BERlin, 1912. Reichs-Kolonial Amt. [Paper, 72 pages.]

One of the principal characteristics of the last decade in German agriculture has been the recognition of the necessity existing for the systematic use of artificial fertilizers, to replace the nutriment drawn from the soil by the constantly increasing volume of the crops harvested. Even in the least progressive districts of Germany there is hardly an agriculturist who has not tried these substitutes, and in consequence incorporated them in his plans.

In the above report on "Trials of Fertilization in the German Colonies," the Imperial Colonial Office remarks that the practical neglect of this subject in the German possessions may be explained by two facts. In the first place, the idea has been prevalent that the virgin soil of the hitherto uncultivated area is sufficiently rich not to require, for a long time to come, the same measures as have been found necessary in Germany as to fertilization. Another reason has been that the principal forms of cultivation in the German colonies are without a parallel in agriculture at home, belonging there rather to the forest industry. Hence it was concluded that fertilization was not required in the German possessions.

The Colonial Office expresses the opinion that, however plausible these two views may seem as to the needlessness of artificial (or of any) fertilization, they will not stand close investigation.

In the year 1911-1912 there were made in the German colonies 97 tests of fertilization, including 14 of rubber. The number for 1912-1913 was estimated at 139. Full details of the various tests are quoted in this valuable report.

WORLD-WIDE ECONOMICS.

In an issue of 376 pages, the new German quarterly, the "Weltwirthschaftliches Archiv" has taken its place in the economic field, under the direction of Dr. Bernhard Harms. The first number contains an editorial on "Universal Economics." Herr Karl Thiess, of Dantzig, deals with "The Universal Railway Gauge," while Herr Fitger handles the subject of "Marine Insurance in the World's Commerce." Professor Liefmann describes the "International Organization of the Frankfurt Metal Trade," and there are other interesting articles on economic subjects.

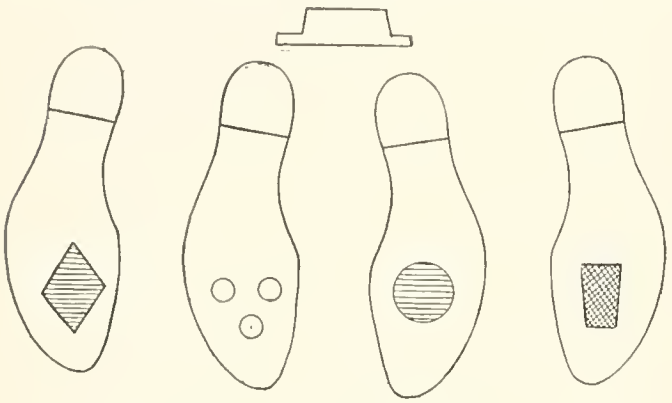
The current literature affecting international commerce is fully noticed. and certain sections deal with the newest books on the various subjects of special or general commercial interest. Statistical returns of the international trading of the leading nations form an interesting feature and enhance the value of the publication as a work of reference. It is evidently the result of much careful investigation and compilation.

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Country of the Amazon; Rubber Trade Directory of the World.

NON-SKID SHOES FOR DANCING.

THE old adage says "There's nothing like leather." But this does not mean that there's nothing better than leather. The up-to-date faddist finds that leather can be less satisfactory for some purposes than some other substance. And the up-to-the-minute dancer has found that rubber, as an auxiliary, at least, has it uses in the Terpsichorean freaks and fads of the concert hall and ball room.

Time was, and not so long ago, either, when the dancing-pump had a sole as polished and shiny as brush and burnisher and heel-ball could make it, and the dancer could glide over



Rubber Plugs for Dancing Pumps.

the polished floor with lissome grace to the strains of the seductive waltz. The janitors, however, learned new stunts in waxing and polishing, until the floors rivaled plate glass in smoothness, and glacier ice in slipperiness.

Meanwhile, the character of the dances changed, and even as the stately minuet of past cultures gave way to the polka and the galop, these have been followed by the "barn dance," the "turkey trot," the "tango," and by steps and dizzy gyrations which would make a whirling dervish turn green with envy, could anything change his color, or reveal it, under the dirt incrusted on his skin.

There are modern dances which require a course in gymnastics as a preliminary to their accomplishment. Perhaps the stunts of the cabaret and the vaudeville stage are responsible for the present-day fad. At any rate, modern dancing is to some degree dangerous, and the remedy is—rubber.

Today dancing pumps have as glassy soles as ever, but not all over. Even as the automobile must have a brake, the pump requires one friction-spot, at least, to save the wearer from the slip and fall which are made possible by the wild contortions, the speedy steps and the quick changes of direction in the dances. And the remedy is a little piece of rubber in the sole.

There are two stories as to the origin of this marked improvement, which is now becoming so popular that manufacturers are adding it to their lines of samples; so that what has hitherto been a made-to-order specialty is now a mercantile proposition.

It is said that a couple of vaudeville stars, whirlwind dancers, found that while their act required them to wear shoes or slippers with polished, slippery soles, some of their steps were difficult and positively dangerous, because of this very fact. How to combine two opposite qualities in a sole was solved by inserting a plug of rubber where it would serve as a safety tread, much the same as the friction plug does in the rubber heels of the present day. These actors, having found by experiment the value of such a combination, imparted their discovery to others, and in the end brought about a demand for dancing pumps having this improvement.

The other story is that a well-known firm of Boston shoe dealers, which makes a practice of sending its salesmen, with samples, to all the college towns throughout the country, found that the young college chaps complained that the glassy soles of the dancing pumps were too slippery. The head of the house, himself a society man and a dancer, set to work experimenting. First a half sole of rubber was tried. It didn't slip, but it didn't slide. Further experiment proved that the insertion of rubber golf plugs at the ball of the foot was fairly effective. The smaller ones, of half an inch in diameter, were not large enough, but the inch-wide circular golf studs or plugs, set three in each sole, and pared down even, or nearly so, with the sole, answered the purpose. But as is usually the case, tastes or experiences differ, and while some prefer an irregular square of corrugated soling, others order a two or a two and a half inch circle, while another favorite shape is a square, set corner-ways, as shown in the diagrams.

The method of inserting these safety patches is to cut out a portion of the sole to the shape of the rubber, which is cut with a flange all around, similar to a golf plug. This lip or flange is cemented to the under surface of the sole, thus securing it in place. Some are finished even with the face of the sole, while others are left with their corrugated surfaces slightly higher than the leather.

In use it has been found that the leather wears away faster than the rubber, thus allowing the latter to do its work. The dancers soon learn to glide on the shiny leather surface, and to stand firmly on the rubber.

As has been said above, manufacturers are now showing these new pumps among their samples, and shoe dealers who cater to the society and the college trades are carrying them in stock, and working up an increasing business. Thus a new use of rubber has been discovered and utilized.

BALATA BELTING AS VIEWED BY AN EXPERT.

IN the Akron letter in our June issue mention was made of the fact that Mr. Anthon Berg, of Christiania, Norway, had just completed the installation of a balata belting and asbestos sheet packing plant for the Goodyear Tire & Rubber Co. of that city. Mr. Berg recently sailed for his home in Norway, but expects to return in the fall and may install other balata belting plants. He is a great enthusiast on this sort of belting. It is a well known fact that balata belting is the toughest kind made. In Mr. Berg's opinion it is at least 100 per cent. stronger than leather belting. He states that in Norway twenty years ago belting was about evenly divided between leather and rubber, but that now there is no rubber belting in that country, about one-third of the belting there used being made of leather, the other two-thirds of balata; and he states that this same condition exists practically all over Europe.

In this country probably not over 5 per cent. of the belting used is made of balata, but the proportion is constantly increasing. Besides the Goodyear Tire and Rubber Co., where balata belting machinery was recently installed, there are three other companies, viz., the New York Belting & Packing Co., the Republic Rubber Co. and the R. & J. Dick Co., Ltd., which are making balata belting.

In addition to its superior strength, a balata belt takes a more tenacious hold on the pulley and is practically stretchless, while other belting stretches from 6 to 10 per cent. This stretchless quality, which eliminates the necessity of stopping machinery to tighten up a belt, makes it less expensive to use, and its lightness also makes it economical.

The Obituary Record.

FREDERICK M. SHEPARD.

FREDERICK M. SHEPARD, for five years president of the United States Rubber Co., for over a third of a century president of the Goodyear Rubber Co., and for sixty years a prominent figure in the rubber industry of America, passed away after an attack of appendicitis, at his summer home in Norfolk, Connecticut, on June 30, in his 86th year.

Mr. Shepard was born in Norfolk, on September 24, 1827. His father was Captain John Andrus Shepard, a farmer, hotel-keeper, the postmaster of his town, and a prominent character in that community. Mr. Shepard's original American ancestor was Edward Shepard, who came from England and settled in Cambridge, Mass., in 1638—from which it will be seen that Mr. Shepard might very properly be referred to as belonging to the "old stock." After graduating from the local school he helped his father for a short time, and then, being an ambitious youth, went to Hartford and secured a position in one of the largest stores of that city. But he had his eyes on a still wider field, and about the time he reached his majority he went to New York and became connected with a retail shoe store. Soon after, in 1853, he entered the rubber industry (where he was destined to be conspicuous for two generations), becoming secretary of the Union India Rubber Co., of which he was later the president.

In 1872, in association with the late Joseph A. Minott, he established the Goodyear Rubber Co., becoming its president, a position that he continued to occupy until seven years ago, when he retired because of advancing years; still, however, remaining on the board of directors. In 1896 he was elected president of the United States Rubber Co., which important post he held for five years. During his incumbency, and largely through his activities, this corporation secured control of the Boston Rubber Shoe Co., then—as for many years before that time—the largest rubber footwear manufacturing concern in the world. In addition to these rubber associations Mr. Shepard was connected in an influential capacity with the Lambertville Rubber Co. and the Rubber Clothing Co.

Important and commanding as were his relations with the rubber industry, they by no means engrossed his entire attention, as he was an active director during the greater part of his life in a variety of other undertakings. In 1868 he took up his residence in East Orange, New Jersey, and soon became prominent in its business and civic affairs. He was chiefly instrumental in establishing the East Orange Safe Deposit and Trust Co., The East Orange National Bank and the Orange Water Co. He was also one of the commissioners who constructed the fine system of parks in Essex County, for which $4,000,000 were raised. He took a profound interest in the social and religious welfare of the community, acting as president of the Free Library, and as a member of the advisory board of the Orange Memorial Hospital, erecting and equipping for that institution a large pavilion for the treatment of tubercular diseases, as a memorial to his son. He was extremely active all his life in the work of the local Presbyterian Church and officiated as superintendent of the Sunday School for over a quarter of a century. His chief benefactions, however, were directed toward the welfare of the little Connecticut village where he was born. They included a public park for the town, a lawn and fountain adjoining the railroad station, ample grounds for one of the churches, and various school improvements; and in all possible ways he showed his interest in the development and well-being of the village where he continued to have his summer home during the greater part of his life.

Mr. Shepard was a man of the soundest business judgment, which was reflected in the practically uniform success of every undertaking upon which he embarked; but, notwithstanding his financial success—which enabled him to accumulate a fortune generally estimated at several millions—he was personally most unassuming and democratic. He showed the same discrimination in his charities as in his business affairs, and his benevolences were all of a practical character. It was his good fortune to be permitted to round out a long life of honorable and successful industry and continuous tho unobtrusive usefulness.

FREDERICK M. SHEPARD.

He was married in 1854 to Annie C. Rockwell, who, together with two sons and three daughters, survives him. The funeral was held at his summer home in Norfolk, and the burial was in Greenwood cemetery, Brooklyn.

ANTHONY N. BRADY.

The death of Anthony N. Brady on July 22 in London, at the age of 70, has removed from the scene a noted financier of the later school. Wall Street did not know of his existence previous to 1891, when he secured a suburban trolley contract and rapidly rose to power in the world of finance. Apparently, everything he touched prospered, and he gradually extended his operations to include railroads; gas, electric light and power companies; banks and industrial enterprises.

Mr. Brady was born August 22, 1843, in Lille, France, whither his parents had fled from Ireland to escape political persecution. They emigrated shortly afterwards to America, settling at Troy, New York, where the son attended school till he reached the age of 13, when he had to assist in the support of the family. He occupied one position after another at the Delevan House, Albany. This brought him into touch with many public men, and was the foundation of ultimately valuable friendships, which later on helped him to carry out his different plans.

At the age of 21 he found the wished-for opportunity of starting in business on his own account, opening a tea store in Albany. This venture proving successful, he established a chain of such stores in Albany, Troy and other neighboring cities. The money he made in tea, he invested in stone, cornering the supply of granite available for paving and building operations in Albany.

The boldness of this stroke impressed various prominent

financiers, such as Roswell P. Flower, E. C. Benedict and Edward Murphy. Consequently, when Mr. Brady sought their aid in consolidating the Albany gas companies, he readily secured it, and was made president of the new combination. The results obtained by the use of a new water-gas process were highly profitable for the four members of the syndicate.

He next turned his attention to the electrification of the Albany and Troy horse car lines, being a pioneer in the substitution of overhead electrical wire for horse traction. Subsequently, he reorganized and consolidated the Chicago gas companies.

Anthony N. Brady.

His Western connections brought him into touch with oil, the possibilities of development in Ohio attracting him in connection with fighting the Standard Oil Co. The Manhattan Oil Co., of Lima, Ohio, was pushed into competition with the former. Mr. Brady soon got into touch with leading financiers regarding a score of ventures in which oil and gas figured. Electricity followed, until he came to be regarded as the most influential single factor in traction, lighting and power lines.

Pursuing his onward way, Mr. Brady came to New York in 1891, securing a contract for equipping with new rails a street railway in the Bronx, nicknamed the "Huckleberry." Being unable to collect the money due him, he took over the road, organizing for its operation the Union Railway Co., afterwards leased to the Metropolitan Street Railway Co., which Mr. Brady helped to organize, and which had a capitalization of $30,000,000.

About this time, in conjunction with Thomas Ryan and the late W. C. Whitney, he acquired the Edison Co., capitalized at $25,000,000; and having purchased other companies in the same field, he organized the New York Gas and Electric Light, Heat and Power Co. The last named combination was taken over by the Consolidated Gas Co., with $80,000,000 capital, of which Messrs. Brady, Whitney and Ryan were elected trustees.

Later on, Messrs. Ryan and Brady had a disagreement, after the former had suffered in the Wall and Cortland street deal.

In 1894, Mr. Brady, in conjunction with the late Roswell P. Flower, secured control of 250 miles of Brooklyn surface railways, organizing the Brooklyn Rapid Transit Co., with a capital of $20,000,000, and becoming chairman of the executive board. The efforts made some half a dozen years ago by Metropolitan interests to control the Brooklyn Rapid Transit Co. forced Mr. Brady to make a counter alliance and to repel the attack.

Among other combinations, Mr. Brady organized the Metropolitan Traction Co., which was the foundation of the present New York trolley system, and which is now the New York Railways Co. Providence, Washington, Philadelphia and many other cities also engaged his attention in public utility organizations.

To tell the story of Mr. Brady's career in Wall Street would be to recount the financial history of the past 20 years. Some sixty corporations are said to have been working under his guidance, while his heavy investments are understood to have been in Brooklyn Rapid Transit, American Tobacco and United States Rubber. In addition to these, a number of smaller holding go to make up the total of $100,000,000 at which his estate is estimated. Since 1898 all of the New York lighting and power companies have been under his control, and his son is president of the New York Edison Co.

One of the most noteworthy events of Mr. Brady's life was the merger which he brought about in 1905, between the Rubber Goods Manufacturing Co. and the United States Rubber Co., a work for which he was probably better fitted than any other man in the financial world.

Mr. Brady was a member of the syndicate which in January, 1899, organized the Rubber Goods Manufacturing Co. In May, 1905, a new syndicate was formed which secured control of the capital stock of the company. He acted on behalf of that syndicate (known as the "Brady" Syndicate) in the negotiations with the United States Rubber Co., which resulted in the merger of the two corporations. In June, 1904, Mr. Brady became a director of the United States Rubber Co.

Mr. Brady recently sailed from this country for Europe, intending to spend his vacation abroad. His trip was undertaken against the advice of his physicians, who regarded his condition as being unfit for prolonged travel. When the gravity of his illness became apparent, Mrs. Brady was called from this side, and reached London before her husband's death. The remains have been brought over by the *Baltic*. He is survived by his wife, Mrs. Marcia Myers Brady; two sons, Nicholas F. and J. C. Brady; and three daughters, Mrs. James Farrell, Mrs. Marcia Tucker and Mrs. Mabel Garvan.

Mr. Brady, while able to do twice the average man's work, never seemed in a hurry. His mind was extremely active and he got at the bottom of things quietly and accurately. He was considered a firm friend, never forgetting a favor.

Z. T. LINDSAY.

Zachary T. Lindsay, one of the most highly esteemed members of the rubber jobbing trade in this country, died on June 30, after an illness of a few weeks, at his home, "Highridge," Omaha, Nebraska. Mr. Lindsay was born in Iowa in 1848, and at the age of 16 he showed the sterling stuff of which he was made by enlisting in the Iowa 45th Infantry. Tho the war came to a close not very long after, he saw much active service. In 1868, at the age of 20, he joined the Western pioneers and went across the plains in a wagon to California, where he tried his luck at mining—a very uncertain occupation then as now. Three years later he returned to Iowa and opened a shoe store, which was the beginning of the career that he was to continue for over forty years. In 1878 he moved to Council Bluffs, where he opened a larger store; and six years later he made another move, to Omaha, and soon had under his management four shoe stores, in which rubber footwear formed an important department, the business soon developing into a large wholesale rubber trade. This enterprise was so successful that in 1898 the business was purchased by the United States Rubber Co., and the name changed to The Interstate Rubber Co., Mr. Lindsay being retained as president and manager, a position he continued to hold to the day of his death. In the management of this large Omaha distributing concern he held not only the confidence of the great corporation with which he was connected, but of every member of the local trade—and this implicit trust imposed in him by all who had any business relations with him was perhaps the largest factor in his success.

He did not, however, confine his attention solely to his own private affairs. He was conspicuous in all civic and community interests. He was one of the charter members of the Commercial Club of Omaha and served at different times on nearly all its important committees. He acted as chairman at the Board of Trade meeting which decided on the Trans Mississippi Exposition held a few years ago at Omaha; and the success of that enterprise was very considerably due to his initiative and good

Zachary T. Lindsay.

judgment. He was also deeply interested in the religious life of his community, being a staunch Presbyterian and continuously active in the work of that church.

He is survived by his wife, who has been prominent for many years in the artistic and literary life of Omaha, and by two children—a son, Harry S. Lindsay, of Excelsior Springs, Iowa, and a daughter, Mrs. George N. Peek, of Moline, Illinois.

The accompanying illustration is made from a recent photograph and gives an excellent likeness of Mr. Lindsay as he appeared in his later years.

WELLING SICKEL KATZENBACH.

A remarkable instance of bravery during a long illness is afforded by the last years of Welling Sickel Katzenbach, of Trenton, who died July 18 at the early age of 29. His career, tho short, was notable.

Born on April 18, 1884, after passing through the Phillips Academy, Andover, Massachusetts, he entered Princeton University in 1900. His work there was largely in the department of chemistry, rendering him a master of that profession. In 1904 he graduated from Princeton, with the degree of A. B. and high distinction in chemistry.

After his graduation he was engaged in analytical chemistry, being subsequently appointed secretary of the Charles F. Scholes Chemical Co. of New York. Altho' the state of his health caused him to resign that position and while a great sufferer, he organized and established the business now conducted by the Katzenbach & Bullock Co. of Trenton and New York, with extensive connections both in America and Europe. Some three years ago, with his father and Mr. E. L. Bullock, an old friend, he incorporated the company, being made its president.

His unfailing courage and ability enabled him during his illness to so formulate and guide the policies of this company that it has materially developed since its first establishment. By the help of the long distance telephone, which he had constantly by his bedside even in the hospital, he was in a position to watch over the growing business in detail.

His popularity at college was such that his classmates at their reunion of 1912 were placed in communication with him by telephone, being thus able to express appropriate greetings.

The brief yet eventful life of the deceased has been a notable instance of a courageous fight against a fatal disease and will serve as an inspiration to his surviving associates.

THE RUBBER INDUSTRIES OF NEW JERSEY.

THE annual volume of industrial statistics of New Jersey has been issued, bearing testimony to the labors of Hon. Winton C. Garrison, Chief of the Bureau of Statistics of that State. It embodies the records of the factories for 1911 as collected by the State census officials in 1912.

In the State there are 2,475 factories, of which 2,172 are divided among 70 industries. Among the latter are 53 rubber factories (hard and soft) in respect to which the following results are shown:

Persons Employed.—The total number was 8,221, composed as follows: Men over 16, 6,832; women over 16, 1,287; children under 16, 102. The total of 8,221 showed a decrease of 238 as compared with 1910, when there were 8,459 workers in the same number of 53 factories. The average yearly earnings per worker were in 1910, $514.96, and in 1911, $533.25.

Of the 53 factories only 2 were operated by private firms, the remaining 51 being corporations. The total amount of capital invested in the rubber industry of New Jersey was $30,140,119, made up as follows: Land and buildings, $5,414,299; machinery and tools, $5,489,063; bills receivable, stock in process of manufacture and cash on hand, $19,236,757. The capital invested in 1910 in the 53 factories represented $28,902,913; there having been thus an increase of $1,238,206.

The production of the 53 factories amounted in 1910 to $34,733,592, and in 1911, to $36,057,242. An analysis of the principal elements of cost would show that the stock used represented in the earlier year $23,647,377 and in the later, $23,657,966. Thus a production increase to the extent of 4 per cent. was obtained from about the same value of raw material. The production in 1911 of $36,057,242 involved among other payments: Stock, $23,657,966, and wages, $4,383,385, the margin left applying to other elements of cost.

Steam was used for driving 117 engines, with 22,575 h. p., and electricity for 188 motors, with an aggregate of 1,966 h. p. The business done represented 78.77 per cent. of the total capacity of the factories, a result surpassed by only about 10 of the 90 classifications of New Jersey factories. The rubber industry of New Jersey thus seems to be steadily improving its position.

A RUBBER TOY PUT TO USE.

Occasionally an article meant for a serious purpose is diverted into the channels of amusement. And the reverse is also true, where an article intended for a plaything is put to serious purpose. For instance, a storage battery that doesn't quite fill its box can be effectively packed by the insertion of a few of the little toy rubber balls sold in toy stores and general stores. They can be secured in various sizes and squeezed in between the battery and the outer box, serving very satisfactorily as bumpers to lessen jars and jolts.

An American consular officer in Canada reports under No. 11,367 that $2,500 have been appropriated by a city in his district for the purchase of an automobile fire truck and hose. Further particulars can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, D. C.

Under No. 11,328, a consular officer in a European country sends the Bureau of Foreign and Domestic Commerce, Washington, D. C., an inquiry from a business firm for "paracote" roofing, said to be a prepared material resembling paper, manufactured in the United States.

New Rubber Goods in the Market.

RUBBER FLOWERS FOR BATHERS.

ORIGINALLY, of course, the province of the bathing suit was to be worn while bathing, and the plainer the better. But with the increasing popularity of the seaside resort the bathing suit has come to be an outfit for general display on the beach, and consequently it has grown more ornate with each succeeding year. However, as it has not yet come to be quite good form to put on a bathing suit and not bathe at all, it is still customary before returning to the dressing room to take at least a momentary dip, which necessitates a suit that will stand water. Hitherto bathers in search for adornment have been barred from the use of feathers and flowers, because these would be ruined in even a momentary dip; but the coming summer, so the fashion experts say, will see fine floral decorations on many a bathing suit at the smarter beaches—roses, violets and everything else known to decorative botany. Nor will they

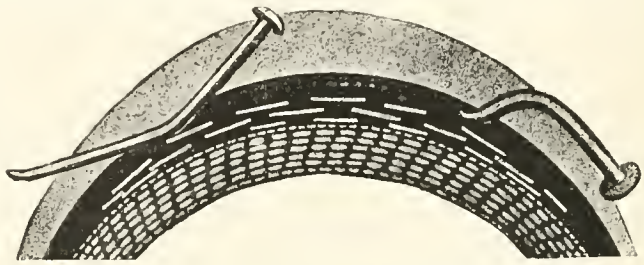
be injured, no matter how delicately hued, even tho the bather remains in the water indefinitely, and they can be worn day after day through the season, for they will be made of rubber.

GOOD FORM WHILE BATHING.

A keen summer correspondent at New Bedford writes to one of the Boston dailies of a great discovery that he has made, viz., that the women bathers at that resort are employing rubber corsets, made, as he describes them, of two sheets of rubber with pieces of whalebone between. He says that the whalebones are taken direct from the local whaling wharves, and he appears to think that this is entirely a local industry; but in this he is in error, because these rubber corsets for particular ladies came on the market a year ago and are to be had at nearly all the large city stores as well as at the seaside emporiums. The sale of this particular article has not yet assumed vast proportions, but it is growing.

STEEL PLATES TO PREVENT PUNCTURES.

A puncture proof tire is something that every motorist wants. Of that there can be no doubt. There are many tires so named, but unfortunately a good many of them, notwithstanding this designation, will puncture. Here is an illustration of a tire of English construction, in which, in a very thick layer of rubber and cotton—or rather a series of such layers—coming immediately under the tread, small steel plates are inserted in such a way that, while they do not touch, they overlap, making it impossible for a nail or tack to get through them. The manu-

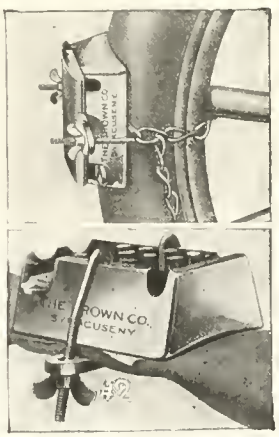


A Puncture Proof Tire.

facturers claim that on a trial of 54 of these tires on vans which, with their load, weighed nearly three tons, the average distance covered by the tires, without a puncture or road stop of any kind, was a little over 6,000 miles. (Non-Puncture Inner Case Syndicate, Ltd., Kensington, England.)

A LIGHT, INEXPENSIVE VULCANIZER.

To repair a tire so that it will stay repaired it has been found necessary in most cases to use a vulcanizer; and the light and inexpensive vulcanizer which can be quickly and easily used has come to be in great demand. Here are two illustrations of the "B. Co. Gasoline Vulcanizer." It weighs only 3 pounds and can be tucked away in the tool-box. It is quite simple, consisting only of the body, the cover, measuring cup and two clamping fixtures. Cut No. 1 shows this vulcanizer at work on the outer shoe, where it is used perpendicularly, being clamped around the tire and rim with a chain. In this position it is necessary to pour the gasoline into the little cup before it is ignited. In cut No. 2 the vulcanizer is shown in a horizontal position as it is used on an inner tube. In that case the cover is put under the tube so as to press the place to be repaired up against the body of the vulcanizer. When used in this way the gasoline is simply poured into the body and ignited. It will be noticed that in the body of the vulcanizer there are a number of upright iron rods, which serve to absorb and distribute the heat and carry it down to the rubber. [The Brown Co., Syracuse, New York.]



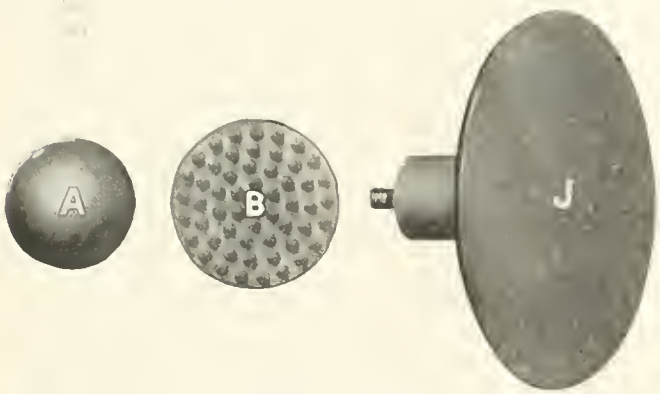
The B. Co. Gasoline Vulcanizer.

A WAX FOR INSULATING WIRE.

An English firm is introducing a new wax for insulating and impregnating cables and wires. It apparently has no rubber in it, but it is described as being a "rubber-like product," resistant to weather and to water, and also to acids, and with a high electrical resistance. This compound can be vulcanized and can be melted at 75 deg. C., but is not sticky in hot weather nor brittle in cold.

RUBBER TO START CIRCULATION.

A hundred years ago when a doctor got a new patient he proceeded immediately to cup him, and the more blood he could draw the greater doctor he was. Fortunately our ancestors were fairly hardy and quite a number of them survived this treatment. Then came the era of drugs, and thousands of worthy citizens were dosed to death. But matters are improving, and now it is a very general opinion that the less we have to do with pills, powders and serums and the more we rely upon the forces of nature, the more likely we are to enjoy good health. Among the natural contributions to health now generally recognized is a proper amount of exercise; and under this heading comes massage. The value of massage has been recognized for many years, but its application has only been perfected within the last few years—since the invention of electrical appliances by which the patient could give himself massage, or at least could get it through the aid of his friends, without calling in experts. The accompanying picture of a case, with its contents, shows a massage outfit which can be used by connecting the little motor with the ordinary electric lighting current. It contains various appliances, made of either hard or soft rubber, three of which are shown more in detail, viz.: the cut marked "A," which is a hard rubber ball applicator, to be used where deep vibration is required; the disc marked "B," which is a soft rubber brush applicator used for scalp and spinal treatment, and the large disc, "J," which is a hard rubber applicator used in abdominal treatment. While this outfit can be used by the patient himself, it is also popular among the doctors for use in their practice. [Shelton Electric Co., 4 East Forty-second street, New York.]



Shelton Vibrator Appliances.

A COAT THAT WILL FLOAT A HALF-DOZEN MEN.

A coat, which is described as looking like any ordinary Norfolk, and which is made of khaki in brown or blue, lined with some sort of fibrous material much lighter than cork, is alleged by its manufacturers to be so buoyant that it will sustain in the water a dead weight of 21 pounds—which is enough to hold up several men. Its description does not indicate that any rubber is used in the coat, but it is an interesting article and is vouched for by a number of reputable people,—State quarter-masters and other officials. It is made by the American Life Saving Garment Co., 53 State street, Boston, Massachusetts.

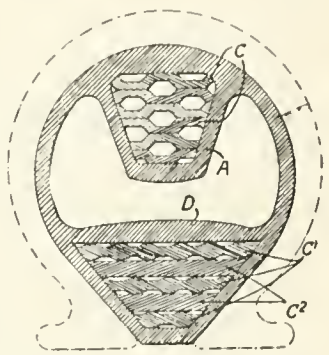
A FIRM SUPPORT FOR WEAK ANKLES.

Probably the noble red man who ranged the primeval forests was not greatly troubled with weak ankles or falling arches, but our vaunted civilization has brought with it both of these troubles, and a great many people find it extremely difficult to get about without some artificial support. A New England manufacturing concern has contributed to the comfort of weak-ankled people by making the ankle support shown in this illustration. The front of it consists of seamless rubber, and the back is of elastic construction, sufficiently strong to give the ankle firm support. This same support serves equally well for fallen arches. [H. J. Collis Manufacturing Co., Taunton, Massachusetts.]

The Collis Ankle and Arch Support.

A PNEUMATIC THAT WORKS WHEN DEFLATED.

A Frenchman has invented a pneumatic tire—cut of which is here shown—which is designed to work, at least comfortably well, even when it is entirely deflated. In addition to the air chamber, which is of peculiar shape—shown by the white space in the center of the cut—there is an upper chamber (A) and a lower chamber (D) which are packed with elastic strips (C). While of course the tire is intended to be inflated, if a puncture should occur it would be possible, according to the inventor's idea, to get along without discomfort on the resiliency imparted to the tire by these two bodies of elastic strips.



A SLEEVE FOR INNER TUBES.

The accompanying illustration shows an inner tire sleeve made of heavy chrome leather with strong metal buttons along one edge, and a corresponding series of button-holes along the other, with an inside flap. Each sleeve has two rows of button-holes, so as to fit two different sizes of tires. The sleeves come in two lengths, 10 and 15 inches, or can be made any other length if so desired. [The Leather Tire Goods Co., Niagara Falls, New York.]

PROTECTING THE EAR IN TARGET PRACTICE.

There is something very fine and heroic in firing off these enormous 10-inch, 12-inch and 14-inch guns that carry their missiles so accurately five, six and even eight miles. But it is terrifically hard on the ears of the gunners; in fact many of them have been made deaf for life by the awful concussion. A simple little protector has been devised, consisting of a celluloid tube on which there are two rubber discs, the whole being small enough to insert in the ear, over the drum. A peculiarity of this device is that, while it enables the wearer to hear ordinary conversation without difficulty, it is a perfect protection against injury from the concussion made by the discharge of these enormous guns.

News of the American Rubber Trade.

THE DERBY PEOPLE HAVE AN OUTING.

THE annual outing given for the employes of The Derby Rubber Co. was held on July 5 at Morris Cove, near Lighthouse Point, Connecticut. They were taken by special car to the grove, a ride of about an hour and a half through the Connecticut hills. There were athletic contests, handsome prizes being awarded the winners, and after an hour of salt water bathing the men sat down to a shore dinner. After-dinner speeches were made by General Manager P. B. Price and others. In the afternoon a baseball game was played which lasted until time to return.

Mr. A. W. Paige, president of the company, attended the outing and took part in the sports

THE WORK OF THE FORSYTH DENTAL INFIRMARY.

The Forsyth Dental Infirmary for children, recently established in Boston by Thomas Alexander Forsyth and John Hamilton Forsyth as a memorial to James Bennett Forsyth and George Henry Forsyth, has already been extensively described and also illustrated in this publication. A recent article by a Boston doctor in the "Boston Medical and Surgical Journal" calls attention to the enormous field which this institution is bound to fill. An examination of 118,000 school children in Boston showed that over 51,000 of them had defective teeth. This Infirmary will be able to take care of this entire number and even more, for it will have a maximum equipment of 106 chairs and it is estimated that 12 patients a day can be cared for in each chair. Assuming that each child receives three treatments a year, over 76,000 children can be cared for in this great charitable institution.

OFFICIALS OF REPUBLIC RUBBER CO. ENTERTAINED.

On Monday evening, July 14, some thirty-six branch managers, officials and department heads of the Republic Rubber Co., were entertained by President Thomas L. Robinson at the Country Club, Youngstown, Ohio. Among those present were: T. L. Robinson, president; L. T. Petersen, first vice-president; J. H. Kelly, second vice-president and general sales manager; A. H. Harris, superintendent; C. F. Garrison, secretary, and M. I. Arms 2nd, treasurer.

In the course of the social session which followed the dinner, there was some excellent speaking. All the branch managers reported splendid business and were enthusiastic as to prospects of "Quality Tires."

THE RUBBER CLUB OF AMERICA HAS PERMANENT OFFICE.

In accordance with the recommendation of the Executive Committee and the approval of the directors, a permanent office of the Rubber Club of America has been established at 354 Fourth avenue, New York, occupying a portion of the offices of the Silk Association of America. This new office will hereafter be the center of the activities of the Rubber Club and is in charge of Mr. E. S. Vorhis, who has been appointed Club Secretary. It is expected that with these new facilities the work of the Rubber Club will be broadened and extended and will become an instrument of great usefulness and benefit to its members and the trade at large.

INSTALLING GENERAL ELECTRIC CO. MOTORS.

The installation of new machinery in the Fisk Rubber Co.'s works at Chicopee Falls, Massachusetts, will include a 150 h. p. motor, two 400 h. p. motors and switchboard apparatus, ordered from the General Electric Co. This company is doing an enormous business in the way of installing its motors in all sorts of industrial institutions—cement companies, biscuit companies, printing concerns, soap factories—all over the country, as well as in the power plants of a great many railroads.

STATEMENT OF THE UNITED STATES TIRE CO.

The United States Tire Co., incorporated under the laws of New York, has filed with the Massachusetts secretary of state a statement of its financial condition, dated May 28, 1913. A comparison is shown below of this statement and that made by the company in 1912:

ASSETS.	May 28, 1913.	March 1, 1912.
Real estate	.....	$41,784
Real estate and investment	$330,475	....
Machinery, fixtures, etc	.....	120,183
Material, stock in process and equipment	9,395,452	2,981,686
Cash and debts receivable	4,193,728	2,535,540
Total	$13,919,655	$5,679,193
LIABILITIES:		
Capital stock	$500,000	$500,000
Accounts payable	12,925,512	5,148,785
Surplus, reserve	494,143	30,408
Total	$13,919,655	$5,679,193

OFFICIALS OF THE REPUBLIC RUBBER CO.

A new and most favorable connection has been made by William H. Scheel, of 159 Maiden lane, New York, with the Societé des Blancs de Zinc de la Mediterranée, noted producers of zinc oxide. This step is due to increased calls that Mr. Scheel has had for these goods, which are especially adapted for the use of tire manufacturers, many of whom have already substantially testified their appreciation of this particular brand of oxide.

In arranging to care for the increased business anticipated for the coming fall, the Monatiquot Rubber Works Co., of South Braintree, Massachusetts, has increased its power equipment by the installation of another boiler, and its plant by the addition of a new boiler house. This company manufactures Naturized rubber, a product so much in demand by the trade as to necessitate the day and night operation of its factory.

The Firestone Tire and Rubber Co. is offering to its dealers, free of charge, imprinted metal or muslin road signs. This enables the dealer to mark all the highways leading into his town, and the motorist in need of a tire or other sundry is thus directed right to the dealer's door—which incidentally gives the dealer a fine type of free advertising.

The Danversport Rubber Co. has recently changed its Boston offices to 79 Milk street, where it is most favorably located. Under the direction of J. C. Walton, president and treasurer, this company has made material progress.

H. L. Alperin, 45 W. Canton street, Boston, has developed an extensive business in waste rubber and is now among the important operators in that city.

The Rubber Step Manufacturing Co., Exeter, New Hampshire, which makes a line of specialties on order for the trade, has added to its output a line of molded specialties, this new department being under the management of William F. Stearns, a rubber man of wide and successful experience.

The Walpole Tire and Rubber Co., of Walpole, Massachusetts, at a recent meeting of its directors, decided to defer the quarterly payment of 1¾ per cent. on its preferred stock, and passed the usual quarterly dividend of 1 per cent. on its common stock. This action is attributed to the recent failure of the Atlantic National Bank of Providence, which has interfered temporarily with the company's plans for financing the large increase of business that has recently come to it. The company has sent out a circular to its stockholders in which the following paragraph appears:

"Your company has had an unusual increase in the amount of business tendered to it and this expansion we have found extremely hard to finance, owing to the small available working capital the company now has on hand. The issue of notes which was recently offered to the stockholders to provide an adequate working capital, which would place the company in an independent position as regards its bank loans, did not meet with the success anticipated. This is one of the reasons for our feeling that it is to the company's best interest to retain at the present time all of its cash in hand."

Telling the news is all right, provided it is correct. An instance of mistaking shadow for substance has recently occurred, in the printing by the daily press of a report to the effect that the Hood Rubber Co. had decided to discontinue the manufacture of tires and had closed out its entire stock. Tho the report did not appear in this journal, The India Rubber World is authorized to contradict it.

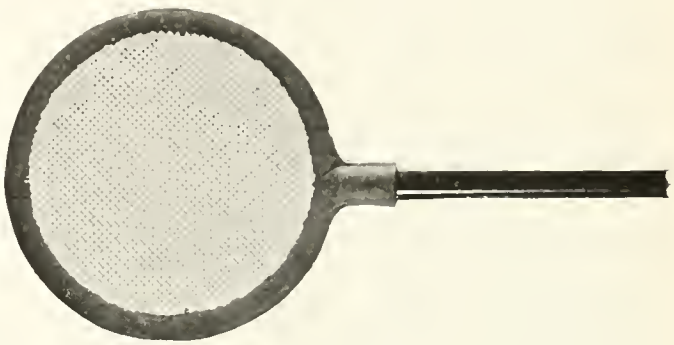
A Business Firm in a Latin-American country informs an American consulate that it desires to be put in touch with American manufacturers of raincoats. The report is No. 11083.

Mr. D. A. Cutler is now associated with the Acushnet Process Co. of New Bedford, Massachusetts, and has become an active member of that corporation.

The Standard Woven Fabric Co., formerly located at Worcester, is now established in its new factory at Framingham, Massachusetts, where, with every facility and equipment tending to promote quality and economy of production, it will be able to serve the trade on a much larger scale with not only the brake lining, woven belting and hose fabrics to which its attention has in the past been directed, but also with a complete line of woven fabrics for mechanical purposes.

A SANITARY "SWATTER."

A Sanitary Insect Destroyer is one of the latest inventions in which is embodied the use of rubber; and we illustrate herewith such an article—manufactured by the Rubber Step Manufacturing Co., of Exeter, New Hampshire—which is sure to meet with appreciation because of the effective manner in which it disposes of flies, mosquitoes and other of the insect pests of the summer months. A fly-swatter has become now almost a household necessity, and this particular style—the rubber edge of which is of sufficient weight that a severe blow can be dealt—includes among its features of special merit a flexible handle which can be detached from the regular wooden member, making it possible to wash the destroyer in hot water or antiseptic solution. The "swatter" is protected by patents issued during this year in the United States and Canada.



PNEUMATIC TIRES MADE OF HORSEHAIR.

A thousand people of all nationalities are working all the time on some substitute for the pneumatic tire now in general use. A couple of Frenchmen have hit on something different from the rest. They have taken out a patent for a resilient tire to be made of sheets or bands of compressed horsehair wound around a core; this core may be either solid or hollow metal, or it may be a rubber air chamber, or may consist of still more compressed horsehair. There may be few or many layers of horsehair, an outside cover being made of canvas; but the body of the tire is to be of horsehair, and it is from that article that its resiliency is to come.

This is certainly adding insult to injury; not only is the poor old horse driven out of his job by the motor car, but his mane and tail are to be plucked to constitute the tires. Why not go a few steps further and make the rims out of compressed horsehoofs, and the spokes out of his ribs, and upholster the car with the poor old fellow's hide?

A number of new general specifications are now being issued by the United States Navy Department, superseding those hitherto in force. The first instalment of these has come to hand and will be dealt with in the next issue.

MILLER STOCK TO BE INCREASED TO $2,000,000.

It has been decided by the stockholders of the Miller Rubber Co., Akron, Ohio, to increase the stock from $1,000,000 to $2,000,000; $500,000 to be 7 per cent. cumulative preferred stock, which is to be sold at once to raise funds to take care of the rapidly increasing business, and $500,000 to be common stock which is to be placed in the treasury for future disposition.

SUPERINTENDENTS OF THE CANADIAN CONSOLIDATED.

The picture shown below was taken at the convention of the superintendents of the Canadian Consolidated Rubber Co., Limited, which was held recently at the factory of the Granby Rubber Co., Limited, Granby, Quebec. From left to right they are as follows: D. A. Fisher, superintendent of the Canadian Rubber Co., Montreal; A. D. Weber, sales department, Canadian Consolidated Rubber Co., Montreal; John H. Pearce, Sr., general superintendent of the same company; Walter R. Legge, secretary-treasurer of the Granby Rubber Co.; P. Y. Smiley, superintendent of the Merchants Rubber Co., Berlin, Ontario;

Superintendents of the Canadian Consolidated Rubber Co., Limited.

C. K. Hutchinson, Canadian Consolidated; F. W. Kramer, superintendent of the Dominion Rubber Co., St. Jerome, Quebec; John H. Pearce, Jr., superintendent of the Granby Company; I. W. Kuehner, superintendent of the Maple Leaf Rubber Co., Port Dalhousie, Ontario; F. R. Fogerty, superintendent of the Granby Last Factory, and C. S. Johnson, of the Granby company.

These conventions are held monthly at the various mills of the Canadian Consolidated Rubber Co., Limited, and are of undoubted benefit to the superintendents of the factories.

DIVIDENDS PAID BY RUBBER COMPANIES.

The Hood Rubber Co., Watertown, Massachusetts, has declared a quarterly dividend of 1¾ per cent. on its preferred stock, payable August 1 to stock of record on July 31.

The Firestone Tire and Rubber Co., of Akron, Ohio, paid on July 15 the usual quarterly dividend of 2½ per cent. on its common and 1¾ per cent. on its preferred stock.

The Lee Tire and Rubber Co., Conshohocken, Pennsylvania, paid on July 10 its regular quarterly dividend of 1¾ per cent.

The Batavia Rubber Co., of Batavia, New York, has declared the regular quarterly dividend of 1½ per cent. on its preferred and 1 per cent. regular on its common, with ½ per cent. additional on the common.

The United States Rubber Co. paid on July 31 a quarterly dividend of 2 per cent. on its first preferred stock and a quarterly dividend of 1½ per cent. on its common stock.

TRADE NEWS NOTES.

In the competition between Newark, Columbus and Chillicothe, Ohio, as a site for the new plant of the Pharis Tire and Rubber Co., of Columbus, Ohio, the first named city has been selected as offering the greatest advantages, and it is soon to have a tire factory equipped at a cost approximating $30,000.

The Vulcan Rubber Co., of Erie, Pennsylvania, which has been incorporated for $200,000, and which has been engaged in the manufacture of rubber goods and inner tubes, is now to take up on a large scale the manufacture of tires for commercial vehicles. These tires are to follow a design made by C. A. Swinehart, the new general manager, who, with H. F. Burger, has recently purchased an interest in the company. Both Mr. Swinehart and Mr. Burger were formerly connected with the Swinehart Tire and Rubber Co., of Akron, Ohio, the former for several years, in the capacity of sales manager.

The Goodyear Manufacturing Raincoat Co., of New York City, recently incorporated with a capital stock of $100,000, expects to secure a plant—probably in New Jersey—in which to manufacture raincoats. The incorporators are F. D. Clayton and David Gross, of Englishtown, New Jersey, and William Schor, of New York City.

Reid Brothers, of Seattle, Washington, have been appointed Pacific Coast representatives of The Gordon Rubber Co., of Canton, Ohio.

Diamond and Goodrich tires are to be mutually represented in Pittsburgh, at 414 North Craig street, by The Diamond-Goodrich Pittsburgh branch, under the management of C. A. Dunham, who has for some time been manager of the agency formerly devoted exclusively to the Diamond Rubber Co.'s product.

A service plant, where tire, rim and wheel changes can be made on automobiles and trucks, is being erected for the Firestone Tire and Rubber Co. at Sixty-third street and West End avenue, New York.

The Monarch Rubber and Oil Cloth Co. has moved to the Drexel Building, Philadelphia, a better and more suitable location than that previously occupied at 41 North Seventh street.

The Motz Tire and Rubber Co., Boston, Massachusetts, has moved to 669 Boylston street from its former place of business at 4 Dundee street.

1084 Boylston street is the present Boston address of the Ajax-Grieb Rubber Co., located until recently at 15 Park square.

The Goodyear Tire and Rubber Co., of Akron, Ohio, has completed arrangements by which its product is to be distributed throughout Northwestern Russia, Messrs. Sorge & Sabeck, of Riga, having taken the agency for that city, as well as the management of the St. Petersburg agency recently opened by the Goodyear company.

A rubber manufacturing plant is to be established at Joplin, Missouri, by the Independent Rubber Co. lately incorporated in that city by J. L. and J. H. Coesir and B. H. and F. A. Wilbur. The capital stock of this new company is $10,000.

The Brookville Rubber Co., of Trenton, New Jersey—incorporated on June 12, under the laws of that State, with an authorized capital of $100,000, of which $35,000 has been paid in—has taken over the plant formerly operated by the Elwell Rubber Co., where it will manufacture, in addition to various lines of mechanical rubber goods for jobbers, a line of rubber soles and heels for the shoe trade. This latter will be the company's specialty, and will be disposed of directly to the manufacturers. The officers of the company are: Ezra Evans, president; Edward A. Fischer, secretary and treasurer, and Charles A. Joslin, general manager.

PERSONAL MENTION.

E. J. McMartin has been appointed manager of the Butte, Montana, branch of the Fisk Rubber Co., with the Minneapolis branch of which he was formerly connected.

J. G. Goudie is now in charge of the Detroit office of the Pennsylvania Rubber Co., of Jeannette, Pennsylvania, and is to cover for that company the states of Michigan and Ohio. Mr. Goudie has been for some time manager of the Diamond Rubber Co.'s Detroit branch.

Charles White has been promoted to the position of manager of the Detroit house of the Firestone Tire and Rubber Co., from a similar position in its office at Syracuse, New York.

J. S. Sleeper, who has recently become sales manager of the Colonial Printing Co., of Cleveland, Ohio, was formerly connected with the Firestone Tire and Rubber Co., as advertising manager.

W. A. Earley has been made manager of the Pittsburgh branch of the Motz Tire & Rubber Co., of Akron, Ohio.

J. J. Moriarty, at one time engaged in laboratory work in the plant of The B. F. Goodrich Co., later in the employ of the Pennsylvania Rubber Co. as assistant superintendent of its plant at Jeannette, Pennsylvania, and since that time general superintendent of the Canadian factory of the Goodyear Tire and Rubber Co., has lately been made superintendent of the factory of the Frontier Tire and Rubber Co., of Buffalo, New York.

Mr. M. B. Fetcher, formerly connected with the Maxwell Motor Co., has been engaged by the Findeisen & Kropf Manufacturing Co., makers of the Rayfield Carburetor, as manager of its branch recently moved to 1211 Woodward avenue, Detroit, Michigan.

Mr. Charles E. Wood, who for many years was connected with the New York Commercial Co., but now in the crude rubber business for himself at 26 Stone street, New York City, has taken the selling agency for The Derby Rubber Co. Mr. Wood will handle all of its several grades of reclaimed rubber in the West, as well as in New York and vicinity.

MR. W. E. BARKER'S EUROPEAN TRIP.

Mr. W. E. Barker, manager of sales of the United States Rubber Co., left for Europe on July 26, by the "Prinz Friedrich Wilhelm." During his trip he will visit Continental Europe and Great Britain, combining business with pleasure. He expects to return about the middle of September.

VACATION SCHEDULE OF UNITED STATES RUBBER CO.'S OFFICIALS.

The vacation schedule of the officials of the United States Rubber Co. is as follows:

Colonel S. P. Colt, president, is spending his vacation at Bristol, R. I., and later may take a short trip to Europe. Mr. James B. Ford, vice-president, will be yachting most of the time. Mr. Homer E. Sawyer, general manager of footwear business, after passing some time at Easthampton, expects to spend August at the Mount Washington, Bretton Woods, New Hampshire. Mr. W. E. Barker, manager of sales, has gone to Europe. Messrs. Palmer and Hichborn have sailed for Panama. Mr. Lester Leland, second vice-president, will remain for most of his vacation at Manchester-by-the-Sea. Mr. W. S. Ballou, director, is spending the time in Europe.

Mr. W. G. Parsons, treasurer, is commuting from Greenwich, Connecticut. Mr. S. Norris, secretary, expects to pass his vacation at Newport, Rhode Island, and to enjoy some automobile tours. Mr. N. Myers, counsel of the company, will take a trip to Europe, while Mr. John D. Carberry, assistant secretary, intends to do some automobile touring and to spend a short holiday in Vermont.

THE MYSTIC RUBBER CO.

The Mystic Rubber Co., with offices and factory at West Medford, Massachusetts, manufacturing high grade rubber sheeting for hospitals, dress shields and novelties, besides doing a large business in rubberizing of clothing, auto tops and ducking, reports a very satisfactory business and a steady and increasing demand for its product. The plant of this company, illustrated herewith, is located on the Mystic River,

Plant of the Mystic Rubber Co.

a short distance from Boston, and is possessed of splendid shipping facilities. This is one of the newer companies in the rubber industry, and it is well organized, its equipment is strictly up to date, and its management thoroughly efficient. It is a Massachusetts corporation, the officers of which are: Herman T. Dean, president; William B. Marshall, treasurer, and Herbert A. Derry, managing director.

FEDERAL RUBBER MFG. CO. AND BABY-CARRIAGE TIRES.

Baby-carriage tires to the amount of 8,900,000 feet—a quantity sufficient to equip about 875,000 infant vehicles—have been sold by The Federal Rubber Mfg. Co., of Milwaukee, thus far this year, a period of less than seven months; in addition to which it is stated by an officer of the company that it will produce 1,000,000 pneumatic tires.

THE STAR RUBBER COMPANY.

Having decided to sell only the jobbing trade, the Star Rubber Co., of Akron, has just reorganized its arrangements. W. W. Smith, formerly with the Firestone Tire and Rubber Co. and the Faultless Rubber Co., is the new manager of sales; the Eastern representative being Howard H. McGee, previously with the Seamless Rubber Co., the Davol Rubber Co. and the Ajax-Grieb Rubber Co. This firm makes a complete line of rubber druggists' sundries, having one of the most complete plants in that branch. George Clark has been appointed superintendent of the factory.

THE MADERO BROTHERS INCORPORATE.

Ernesto and Salvador Madero, brothers of the late President of Mexico, Francesco I. Madero, have incorporated under the laws of the State of New York, in the name of Madero Brothers, Incorporated. They intend to do a general commission, export and import business with Mexico, and will act as selling agents of the Madero guayule rubber interests there. They do not intend to take any part whatever in Mexican politics, which is not at all to be wondered at in view of the unhappy fate of their distinguished brother.

FIRE DEPARTMENT ANNUAL REPORT FOR 1912.

Among the features of the 1912 report of the New York City fire department is the statement that there is an urgent need for the replacement of fire hose. The total shortage in various sizes was 178,200 feet, the estimated cost of replacing which would be $202,370. The total purchases for 1912 represented 109,210 feet.

THE EUREKA'S NEW AGENT ON THE PACIFIC COAST.

The Eureka Fire Hose Manufacturing Co. has appointed Mr. W. S. Harley as its agent for fire department hose in the states of Montana, Oregon, Idaho and Washington, with offices in the Paulsen Building, Spokane, Washington.

NEW INCORPORATIONS.

The Askam Rubber Co., June 18, 1913; under the laws of Connecticut; authorized capital, $30,000. Incorporators: I. W. S. Hawes, William F. and Leroy Askam.

Otto Braunworth, Inc., July 23, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Albert Bracht, 751 East 229th street; Louis A. and Otto Braunworth—both of 3013 Kingsbridge Terrace, New York. Location of principal office, New York. To deal in rubber, etc.

Brookville Rubber Co., June 12, 1913; under the laws of New Jersey; authorized capital, $100,000. Incorporators: Edward A. Fischer, Ezra Evans and Charles A. Joslin—all of Trenton, New Jersey. To manufacture, purchase and sell all kinds of mechanical rubber goods.

The Canton Tire Saver Co., April 8, 1913; under the laws of Ohio; authorized capital, $25,000. Incorporators: J. A. and A. H. Calhoun and A. H. Wilson. To manufacture and sell a liquid preparation used in automobile tires to prevent and stop punctures, etc.

Carlton Raincoat Co., Inc., July 7, 1913; under the laws of New York; authorized capital, $100,000. Incorporators: John E. Mellon, 1011 East One Hundred and Seventy-eighth street, New York; Jacob H. Lampert and Otto Will, both of 1894 Lexington avenue, New York. Location of principal office, New York.

The Club Scrap Rubber and Tire Co., June 23, 1913; under the laws of New York; authorized capital, $2,500. Incorporators: Harry Dolkart, 210 Henry street; Abraham Kalbalkin, 318 East Thirteenth street, and William Adinoff, 69 East One Hundred and Eleventh street—all of New York.

The Diamond Rubber Co., April 28, 1913; under the laws of Ohio; authorized capital, $10,000. Incorporators: A. H. Marks, O. C. Barber and Guy E. Norwood. To manufacture, buy, sell and deal in and with rubber and rubber goods, etc.

Essenkay Products Co., May 28, 1913; under the laws of Illinois; authorized capital, $10,000. Incorporators: Franc D. Mayer, William L. Weber, and William R. Russell. To manufacture rubber and rubber compounds.

Eureka Tire Co., June 18, 1913; under the laws of New Jersey; authorized capital, $100,000. Incorporators: John E., Peter D. and Frank W. Thropp—all of Trenton, New Jersey. To control patents covering a special method of tire manufacture, with the intention of leasing to mills now making tires the right to use this patented method.

Goodyear Manufacturing Raincoat Co., Inc., June 25, 1913; under the laws of New York; authorized capital, $100,000. Incorporators: F. D. Clayton, David Gross—both of Englishtown, New Jersey, and William Schor, 15 East Sixteenth street, New York. Location of principal office, New York.

Hubmark Rubber Co., June 23, 1913; under the laws of Michigan; authorized capital, $25,000. Incorporators: Henry B. Hubbard, 1540 Seventy-second street, Brooklyn, New York; George H. Mayo, Brookline, Massachusetts, and William E. Barker, 366 Sanford avenue, Flushing, New York. Location of principal office, Detroit, Michigan. To purchase, sell and deal in rubber goods and footwear of all kinds, etc.

Independent Rubber Co., June 23, 1913; under the laws of Missouri; authorized capital, $10,000. Incorporators: John L. and James Coesir, and Arthur James—all of Joplin, Missouri. Location of principal office, Joplin, Missouri. To manufacture, repair, buy and sell automobile tires, tubes, etc.

Johnstown Rubber Co., June 5, 1913; under the laws of Pennsylvania; authorized capital, $25,000. Incorporators: Nelson MacReynolds, Thomas Y. Brent, and A. C. Simler—all of Johnstown, Pennsylvania. Location of principal office, Johnstown, Pennsylvania. To devulcanize and refine rubber, and to manufacture articles and merchandise.

Keaton Patents Co., Inc., June 14, 1913; under the laws of New York; authorized capital, $100,000. Incorporators: H. O. Coughlan, Joseph F. Curter, and J. R. Nevin—all of 34 Nassau street, New York. To carry on a tire business.

S. A. Levine & Co., Inc., June 25, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Samuel A. and Augusta Levine—both of Lawrence street, Spring Valley, New York, and Joseph Levine, 625 Hendrix street, Brooklyn, New York. Location of principal office, New York. To deal in raincoats and other rubberized goods.

The National Rubber Co., July 14, 1913; under the laws of Delaware; authorized capital, $2,500,000. Incorporators: F. R. Hansell, Philadelphia, Pennsylvania, George H. B. Martin, Camden, New Jersey, and G. U. Martin, Philadelphia, Pennsylvania. To manufacture and deal in automobiles, cars, wagons, boats, etc., together with their equipments.

Presto Garter Manufacturing Co., Inc., July 7, 1913; under the laws of New York; authorized capital, $3,000. Incorporators: Maurice Berkowitz, 822 Beck street, Harry Troupiansky, and Jacob Trow—both of 101 Chrystie street, New York.

The Puncturement Co., April 24, 1913; under the laws of Ohio; authorized capital, $1,000. Location of principal office, Cleveland, Ohio. To manufacture and deal in all articles to be used in connection with automobiles.

The Reliable Puncture Seal Co., May 26, 1913; under the laws of Ohio; authorized capital, $25,000. Location of principal office, Canton, Ohio. To manufacture and market motor vehicle accessories.

Ten Broeck Tire Co., June 18, 1913; under the laws of Delaware; authorized capital, $250,000. Incorporators: S. S. Adams, Jr., John B. Gray, and M. B. F. Hawkins—all of Wilmington, Delaware. To manufacture automobile tires, tubes, etc.

The Tire Place, Inc., July 2, 1913; under the laws of Delaware; authorized capital, $100,000. Incorporators: John G. Hughs, Haddonfield, New Jersey; Harry Fisher, Philadelphia, Pennsylvania, and Harry W. Davis, Wilmington, Delaware. To carry on business of manufacturing, dealing in automobile tires and fitting parts and sundries.

Trautman Corporation, July 14, 1913; under the laws of New York; authorized capital, $1,000. Incorporators: Evelyn M. Trautman, 191 Park Place, Florence A. Webb, 227 Flatbush avenue, and Charles Colsten, 903 Sixteenth street—all of Brooklyn, New York. Location of principal office, Brooklyn, New York. To carry on auto tire business.

Triumphant Tire Society, Inc., May 27, 1913; under the laws of New York; authorized capital, $500. Incorporators: Elbert R. De Tamble, Nyack, New York; Louise Bennett, 216 West 127th street, New York, and Esther A. Swanson, Kenilworth, New Jersey. Location of principal office, Manhattan. To manufacture and deal in rubber goods, tires, etc.

Vacuum Tire Corporation, July 17, 1913; under the laws of New York; authorized capital, $50,000. Incorporators: Williard J. Woodcock, 102 Gates avenue, Charles G. Ross, 66 Hancock street, Frederick L. B. Gartner, 150 Classon avenue—all of Brooklyn, New York. Location of principal office, Brooklyn, New York. To manufacture and deal in auto tires and accessories.

TRADE NEWS NOTES.

A new building 220 x 80 feet, and 4 stories high, with a floor space of nearly 74,000 square feet, is being added to the plant of the Continental Rubber Works at Erie, Pennsylvania.

The Electric Hose and Rubber Co., of Wilmington, Delaware, has arranged for the opening of a new store at Chicago

A new factory, with floor space of 10,000 square feet, is being erected at Seattle, Washington, by the Goodyear Tire and Rubber Co., of Akron, Ohio.

The Spokane Stamp Works, of Spokane, Washington, has recently purchased the entire plant and business of the Phoenix Stamp Works of that city, which had been in continuous operation in the manufacture of rubber stamps for 25 years. The Spokane Stamp Works has now the greatest capacity of any concern of its kind in that section of country.

Work has been started on a new four-story addition—intended for office and warehouse use—to the plant of the C. Roberts Rubber Co., New street, Newark, New Jersey. It is estimated that this addition will cost $27,000, and it will occupy a space of 50 x 100 feet.

A four-story concrete building, 50 x 200 feet, is being erected by The La Crosse Rubber Mills Co., of La Crosse, Wisconsin, as an addition to its present plant. This extra space will enable the company to increase its production of rubber boots and shoes very materially.

The stockholders of the Columbiana Rubber Co., of Youngstown, Ohio, recently voted an increase of the capital stock of that company, the additional capital being intended for use in the enlargement of the plant and for the purchase of new machinery. Papers have been filed by the company increasing the capital stock to $400,000, the former capitalization having been $100,000.

Brandt Bros., Indianapolis agents for Lozier and Chandler automobiles, have taken the agency for that city of Braender tires.

Plans have been prepared for a 32 x 224 feet addition to the plant of The Electric Hose and Rubber Co., at Wilmington, Delaware. This addition—which will enable the company to increase its output by about 25 per cent.—is to be of brick construction, two stories high.

The John A. Roebling's Sons Co., which includes among its manufactures large quantities of rubber insulated wire, has contracted for a new brick and steel building, 65 x 208 feet, to be added to its wire mill at Dollar Bay, Wisconsin.

A Massachusetts branch, intended to supply the Eastern manufacturers with their requirements in the way of cement, has been established by the St. Louis Rubber Cement Co., at 652 Summer street, West Lynn.

The new Philadelphia agency of the Hardman Tire and Rubber Co., of New York, is to be carried on under the management of J. A. McTaggart, with location at 1923 Sansom street.

Gutta Percha and Rubber Limited, formerly the Gutta Percha and Rubber Manufacturing Company, of Toronto, Limited, has just completed, and is now occupying another substantial addition to its factory group in the Parkdale section of the city. This is a six-story and basement building, 170 x 50 feet, with a one-story wing, giving a floor area of 60,000 square feet. The building is of reinforced concrete throughout with fire-proof doors, steel sashes, etc., and is equipped with all modern conveniences. The greater part of the newly acquired space is devoted to the increased production of Maltese Cross rubber footwear and Maltese Cross automobile tires.

A new Canadian company known as the Sterling Rubber Co., Ltd., is now manufacturing a line of drug sundries at Guelph, Canada. F. S. Friedman is the secretary and treasurer of the company.

A HANDSOME PENNSYLVANIA PANEL.

The world will never tire of handsome pictures, and many astute advertisers have taken advantage of this unescapable fact. The Pennsylvania Rubber Co., of Jeannette, Pennsylvania, has recently sent out to its customers a striking panel 15 inches wide and 40 inches long, showing the full length figure of a thoroughly modern young woman. She is evidently dressed for the opera or some other gala occasion, and she is quite dazzling in costume and millinery, with an opera cloak which the average woman would undoubtedly describe as "a dream," but to the hapless male who had to pay for it would doubtless prove a stern reality. The picture is lithographed in ten or twelve colors on heavy paper embossed so as to have the effect of canvas. It is a thoroughly artistic piece of work. The panel is entitled "Vecelia," a name derived from "V. C.," the trade mark of the Vacuum Cup Tires made by the company. "Vecelia" is a companion piece to "Jeannette," a striking panel sent out by the company a little while ago, showing the vacation girl sitting in her canoe. Both of these pictures were painted specially for the Pennsylvania Rubber Co. by the well-known artist, C. Everett Johnson.

INDIA-RUBBER GOODS IN COMMERCE.

EXPORTS FROM THE UNITED STATES.

OFFICIAL statement of values of exports of manufactures of india-rubber and gutta percha for the month of April, 1913, and for the first ten months of five fiscal years, beginning July 1:

Months.	Belting, Packing and Hose.	Boots and Shoes.	All Other Rubber.	Total.
April, 1913	$188,529	$88,539	$655,466	$932,534
July-March	1,966,639	1,178,268	6,194,003	9,338,910
Total, 1912-13	$2,155,168	$1,266,807	$6,849,469	$10,271,444
Total, 1911-12	1,918,285	1,323,060	5,984,379	9,225,724
Total, 1910-11	1,742,683	1,894,282	5,198,295	8,835,260
Total, 1909-10	1,580,088	1,593,696	4,082,427	7,256,211
Total, 1908-09	1,225,882	1,139,271	3,165,096	5,530,249

The above heading "All Other Rubber," for the month of April, 1913, and for the first ten months of three fiscal years, beginning July 1, includes the following details relating to tires:

Months.	For Automobiles.	All Other.	Total.
April, 1913	$305,362	$48,275	$353,637
July-March	2,809,917	445,826	3,255,743
Total, 1912-13	$3,115,279	$494,101	$3,609,380
Total, 1911-12	2,063,603	467,290	2,530,893
Total, 1910-11	1,528,136	479,213	2,007,349

The India Rubber Trade in Great Britain.

(By Our Regular Correspondent.)

THE FALL IN PRICE OF RUBBER.

THIS topic continues an all-absorbing one, though it affects the peace of mind of the manufacturer less than it does that of the plantation shareholder. Now that best plantation brands have fallen appreciably under 3s. per pound, the opinions of those who predicted 3s. as the limit for this year have been falsified, and there is little disposition in the trade to cast the horoscope for even a couple of months ahead. Forgetful of the huge dividends that they have declared in recent years, plantation chairmen are complaining that everything is against rubber.

Renewed attention is directed to the potentialities of that material for pavement, which was so confidently pointed to three years ago as the future salvation of the planting industry. On this head some interesting details were given by Dr. Schidrowitz in a lecture at the recent Chemical Exhibition in London. I cannot follow him in detail here, but one of his main conclusions was that the useful life of rubber paving would have to extend to 40 or 50 years if it was to compete with wood or asphalt, when the first cost and maintenance are taken into account. The main difficulty in estimating comparative costs is that we are at present, as he points out, without any definite figures as to wear and tear of rubber roadways. Rubber pavement has, of course, been in use in London for a great number of years, but only on a small scale, under cover, and where its cost has been quite a secondary matter. I do not find that the trade is looking with any confidence to the rubber road as the main panacea for keeping up the price of raw rubber.

There is, however, a decided feeling that the use of rubber might be considerably extended in other directions, if some trouble were taken in the matter. During the last year or two, however, as a prominent manufacturer told me, the works have been too busily engaged filling orders on standard lines to pay much attention to experiment. Probably the valuable honorarium to be offered at the 1914 Exhibition for suggestions as to new applications of rubber, coupled with the decided slackness now being experienced in many branches, will act as the necessary stimulant on the manufacturers' brains.

At the same time, I may say there is no general feeling that a glut of raw rubber is impending, the opinion being expressed in authoritative quarters that the present lull in the demand will be succeeded by increased requirements, which will absorb supplies at prices certainly no lower than those at present ruling. The premium at which Brazilian fine stands over plantation crepe cannot be explained away on any basis except that of intrinsic quality. This fact is now being recognized by plantation shareholders, who had perforce to sadly admit that the reports of this or that eminent chemist to the contrary do not carry much weight in the trade. Schemes are now being mooted whereby plantation rubber may be valued and sold on a strict basis of quality, determined by analysis. This, of course, is by no means a new question, but it is doubtful whether it will receive more consideration at the hands of the trade in the near future than it has in the past. It will take a good deal to convince manufacturers that a system of scientific testing is better than, or as good as, inspection based on experience.

A more important matter, in their opinion, would be the adoption of a uniform method of coagulation, so as to bring the plantation industry more into line with the Brazilian. The efforts which are being made in certain quarters to induce large contractors, like the government departments and the railway companies, to specify plantation (all-British) rubber as an alternative to Brazilian fine, do not seem likely to meet with much success; more especially in view of recent events, which, rightly or wrongly, have caused blame to be attributed to plantation rubber having been used in place of fine Pará.

PROJECTED NEW USE FOR RUBBER.

In textile mills, the operation known as "kissing the shuttle" has in recent years come under condemnation as being unhygienic; and in England, at any rate, strong pressure has been brought upon the government authorities to make the practice illegal. Nothing definite, however, has as yet been done in this direction as the officials say they are not satisfied as to the evils said to ensue. In a recently patented contrivance to obviate the necessity of "kissing the shuttle," rubber forms an important part. If this —the Wilson-Shackleton Patent Shuttle Threader—came into extended use, a considerable amount of rubber would be required, though perhaps not sufficient to prevent overproduction.

The present position of affairs with regard to this device appears, however, to be that the mill owners are disinclined to incur the expense of its installation, until the adoption of something of the sort is made compulsory; so the immediate prospects of the patentees are not too bright.

A. O. FERGUSON & CO., LTD.

With regard to the legal action reported in my last letter, and in which Mr. A. O. Ferguson was involved, I may state that the above newly established proofing firm at Hollinwood, Manchester, will not be affected. The injunction referred specifically to the use of certain proofing formulæ, but these, of course, do not comprise all the formulæ which are available for carrying on a successful proofing business. It might be thought that there was hardly room for another business of the kind in a district which has for so long been associated with the proofing industry, but I may point out that the export trade, especially in proofed cloth, has largely developed in late years, the manufacturers not having to depend so much upon the home trade as was the case in former times. With regard to this branch generally, at the present time it cannot be said that things are particularly brisk. Last summer, of course, was exceptionally wet and a bumper trade was done. This year, however, is more favorable to the sale of tennis balls and garden hose.

PROBLEMS OF THE RUBBER INDUSTRY.

A paper under this title was read a few months ago before the Liverpool section of the Society of Chemical Industry, by Mr. H. E. Potts, who will be known as the author of a book on the chemistry of rubber manufacture. Various problems came under review, but very little was put forward as to their elucidation, which still remains a matter for the future. The problems of importance were grouped as follows: 1. Quality of natural raw rubber. 2. Synthetic rubber. 3. Vulcanization. 4. Regeneration.

With regard to raw rubber, the present conditions of sale were condemned; the establishment of a conditioning house, where representative samples of plantation rubber could be vulcanized as a guide to value of the bulk, being strongly recommended. Mr. Potts had nothing to say against synthetic rubber except its high cost of production. Under vulcanization, reference was made to the action of litharge, which has recently been shown to cause a rise of temperature, owing to chemical reaction in the mixing. The reclaiming of rubber after being finely pulverized was said to yield surprisingly good results. I doubt whether this statement would be endorsed by manufacturers and users generally. An important desideratum of the trade was some method

of accurately prognosticating the life of rubber goods directly they were made, so as to obviate dependence upon the time test. Of course, this is what we have all been waiting for the last fifty years, and it would seem as if the period of waiting will be further prolonged. Rubber, Mr. Potts said, in reply to a question, was dried at 110° C, which from a chemical point of view was a low temperature. According to the usual procedure in British rubber works, 110° C would be considered a very high temperature; about 110° F being the ordinary figure, though in certain special cases higher degrees are used. As I am referring to the Society of Chemical Industry at Liverpool, I may add that the annual meeting of the society took place there in July, when the president, Prof. Marston T. Bogert, of America, gave his address.

NEW WORKS.

Mr. E. L. Curbishley, lately connected with the Reinforced Rubber Co., Ltd., at Hull, has commenced manufacturing on his own account as the Lloyd Rubber Co. at West Didsbury, Manchester; and with the long experience of the trade he has behind him should do well. The business is at present confined to rubber heels, though it is intended shortly to put several other lines on the market. Mr. George Spencer, who was for some time associated with Mr. Curbishley at the Gorton Rubber Co.'s works, has started in the proofing business for himself, under the title of the Monarch Waterproof Co., at Victoria works, Prinblett street, Manchester, thus adding another house to this well-known quarter of the proofing trade. The works will be under the charge of Mr. F. Dale, who has had considerable experience. It is understood that rainproof as well as macintosh garments will be manufactured.

RUBBER PAVING IN LONDON.

AMONG the many prospective new uses for rubber, none is more important than its employment as a paving material. Hence special interest attaches to details lately published of results obtained at two noted London hotels and one railway station.

In this connection, two essential points call for attention—efficiency and durability. Some ten years ago rubber sheets two to three inches thick were laid in the courtyard of the Savoy Hotel, for the purpose of deadening the clatter of horses' hoofs and the noise of vehicles. These are reported as being in very fair condition, although the slabs do not in all cases fit very closely. Certain portions have been subjected to special wear, owing to the stopping and restarting of vehicles, particularly where studded tires were used. Oil dropping from motor cars has likewise affected the surface of the rubber paving, and it has been found necessary to relay some of the slabs, possibly owing to their not fitting well.

Claridge's Hotel, the resort of crowned heads and aristocratic travelers, has less exacting traffic than the Savoy, and its rubber paving, laid 13 years ago, is only about one inch thick. In no case has it been necessary to replace the paving, but the old slabs have been relaid, as they were working out of position. This was caused by their not having been securely fastened down in the first instance. At neither hotel has the pavement been slippery for horses.

Owing to the nature of the traffic, a better judgment can be formed of the possibilities of rubber as a road material from the results obtained at Euston station than from those recorded for the two hotels named.

At Euston the vehicles reach the station by one archway and leave by another, the roadway under the arches being rubber paved. The paving was originally put down in 1881, the slabs used having a thickness of two inches. Twenty-one years later the approach portion had been worn down to half an inch and the outgoing paving to an inch and a half. The former was re-laid, the slabs being fresh, while the rubber in the latter is the same that was originally put down thirty-two years ago. Its early renewal is, however, anticipated. This unequal wear has been attributed to the grit brought from outside by incoming vehicles, from which outgoing ones are relatively free.

The fact that rubber pavement has been in use for respectively 10, 13, 21 and 32 years in the cases quoted, is considered to show the durability of rubber paving. It is no longer in the experimental stage and it has been suggested that its efficacy should be tested on some busy thoroughfare; but, as it has been remarked, tests of durability take a long time, and necessitate the lapse of many years before their results can be conclusively established.

THE FUTURE OF THE RUBBER INDUSTRY.

MUCH interest has been shown in London in the recent lecture of Dr. Philip Schidrowitz at the Chemical Engineering Exhibition on the "Future of the Rubber Industry." The lecturer recalled the fact that the increased supplies attracted by the "boom" of three years ago again brought prices to a reasonable level. He considered, however, that some critical years were at hand, involving for manufacturers a period of interest and difficulty.

The problems of the future he briefly summarized as follows: "How much rubber may we expect on the market, and how will price be affected thereby? What are we going to do with all this rubber that is coming? Will it be for the benefit or to the detriment of the industry?"

Apart from the question as to whether the new Brazilian "Defence Law" would produce the anticipated results of increased yield and reduced cost, Dr. Schidrowitz expressed the opinion that the production of plantation rubber is sufficiently large to make it the dominant factor in the world's rubber markets. The future increase in that production might effect a radical change in the various branches of the industry. Assuming this year's plantation output as 50,000 tons, he estimated the quantity for 1915-16 as possibly 100,000 to 150,000 tons, and for 1920 as 200,000 to 300,000 tons. Even without any material increase from Brazil, the world's production in two or three years' time might be quite double that of the present day, while in six to seven years the supplies might have trebled or quadrupled.

The variable quality of plantation kinds has militated against their general use as compared with Brazilian hard fine, which, the lecturer remarked, is a commodity of known qualities. A scientific method of valuation he regarded as one of the most urgent requirements of the crude rubber industry.

SCIENTIFIC VALUATION.

The lecturer urged the need of some system by which manufacturers might test the value of samples offered to them. What might be expected from Amazonian rubber they know roughly, but they are puzzled by the variations in the plantation article. It is only possible for works with highly specialized technical laboratories to form a reliable opinion. A manufacturer with the ability to select a batch of rubber worth 10 to 25 per cent more than its price is in a position to pick and choose in his purchases.

The lecturer, while advocating the importance of standardization, considered that subject as less urgent than the establishment of a scientific basis of valuation.

In conclusion, he referred to the relatively small amount of £3,000, annually devoted to scientific investigation by the leading association of plantation rubber producers, although millions are at stake in the industry.

TO ENCOURAGE NEW USES OF RUBBER.

THE secretary of the Mincing Lane Tea & Rubber Share Brokers' Association, Limited, of London, has sent out a letter—which is reproduced below—to the plantation companies of the East, suggesting that they co-operate to encourage the devising of new ways in which rubber can be put to practical and profitable use.

THE MINCING LANE TEA & RUBBER SHARE BROKERS' ASSOCIATION, LTD.

6, MINCING LANE, LONDON, E. C., June 11, 1913.

To the Secretary.

Dear Sir:

The increasing output of rubber from the East, points to the advisability of those interested in rubber plantations organizing, with the object of fostering new uses for the product.

My committee would point out that an organization exists, both in India and Ceylon, for pushing the sale of tea from these countries, but so far no steps have been taken by the plantation rubber industry to find new outlets for the product.

The committee of this association, in order to give some incentive to place rubber to new uses, proposes to offer one hundred guineas at the Rubber Exhibition to be held in London next year, for the best new use for rubber.

It has been in the mind of the committee that if each individual company took a small interest in the object of pushing plantation rubber, it would probably result in a larger consumption, and it is suggested that an association be formed with a view to achieving this end.

There are some 530 rubber companies mentioned in the new book about to be published by this association, and if each company would subscribe a small amount, say 10s. for every £1,000 capital, to such a scheme, a fair sum would be available, and, with a practical committee would be in a position to consider any scheme, such as laying experimental rubber roads, etc., and if thought desirable to foster such enterprises.

As there would be no promotion expenses in forming such an association, all moneys subscribed would be available for expenditure for practical benefit to the industry.

My committee will willingly subscribe £50 to such an association, and will be pleased to hear the views of your directors on the proposition.

Should a sufficient number of approving replies be received, my committee are prepared to take further steps to formulate a practical scheme.

By Order of the Board,

A. KENDALL, Secretary.

RUBBER AT THE LONDON BUILDING EXHIBITION.

Rubber occupied a leading position at the recent Building Exhibition, held at Olympia, London. Its various uses in connection with floor covering were illustrated by the exhibit of the India Rubber Flooring Co., of London, which likewise showed mosaic tiles of rubber.

Another prominent exhibit was that of the India Rubber, Gutta Percha and Telegraph Works Co., of Silvertown, which displayed a full line of its products applicable to the building industry.

Noticeable among the articles which attracted attention were rubber stair treads, which have in England practically superseded those made of brass.

There was a full exhibit of the wall protecting appliances known in England as "Damp Courses," which were shown by 17 firms. Storm- and rain-proof roofing was likewise an item of interest.

It has been remarked that the use of rubber in the building industry is making progress, but various misconceptions have to be overcome, arising from insufficient acquaintance with the properties of the article.

NEW USE FOR BALLOON MATERIALS.

Recent European fashion journals report the introduction for wear in traveling and at the seaside of dust cloaks composed of the material used for balloons. They are of course provided with ventilation.

AN ENGLISH VIEW OF PROSPECTIVE RUBBER CONSUMPTION.

In discussing the question of future rubber consumption, the "Economist" of London remarks:

"If prices fall to 2s. a pound, it is perhaps not unreasonable to assume that consumption will continue to increase in the existing uses of rubber, and rise, perhaps, to 150,000 tons or even 200,000 in a few years, for as prices fall, not only will the consumption of rubber goods increase, but also genuine, good rubber will be substituted for the poor and composite materials which so frequently masquerade as 'rubber.'

"Unless, however, a very large demand arises for new industrial purposes which are not yet apparent, it will be impossible to dispose of the enormous quantities mentioned except at very much lower prices than have ever yet been known in the rubber market. In these circumstances clearly one of two things must happen. Either large tracts of land that have been planted must be abandoned to the jungle, or else the cost of working the estates must fall to the neighborhood of 6d. a pound—a cost which has already been realized in favorable circumstances in Ceylon."

RUBBER SOLES FOR MALTSTERS.

German malt workers have found that the soles and heels of their wooden shoes were liable to make them fall on the slippery floors of malt houses. Felt soles and heels failed to fulfil expectations. Some thirty years ago rubber shoes were introduced and were found to answer the purpose intended, but the price was prohibitive; a pair of maltster's shoes coming as high as $10. A way out of the difficulty was found by putting rubber soles and heels on the wooden shoes, which thus cost much less than all-rubber shoes. This plan has since continued in vogue. In some cases the soles are provided with a rubber sponge foundation, which obviates any pressure on the malt.

DIRECT SHIPMENTS OF RUBBER TO NEW YORK.

MR. C. A. LAMPARD of London being a recognized authority on plantation rubber from the companies' standpoint, it is of interest to note his remarks at the recent meeting of the Malayalam Company, on the subject of direct shipments:

"I believe that the future developments in regard to rubber will necessitate our shipping the produce more freely than we have done hitherto to the market where it is consumed, and that we do not penalize our product by bringing it to this market and saddling it with a load of expenses, which are really unnecessary, when we have shipping facilities for selling it direct to the markets of consumption, and where, if we did that, it would meet with a very cordial reception."

In commenting on these remarks of Mr. Lampard, the "Financier" adds:

"The foregoing should serve as a hint to those who are interested in the preservation of the London rubber market, and a warning to the shipping ring, which, by its exorbitant freight charges, threatens the life of the goose which lays the golden eggs. It was prominently stated by large American rubber consumers at the late exhibition in New York that they could obtain supplies at less cost and of a more satisfactory character by purchasing the same on the spot, and shipping direct from mid-eastern ports. It was furthermore complained that the consignment of plantation rubber to London and the subsequent handling and sorting which it underwent before reshipment sometimes resulted in such a mixup of plantation grades as no manufacturer cared to accept. Needless to say, such results are very prejudicial to plantation rubber as a whole, exaggerating as they do the lack of uniformity in the cultivated product."

Some Rubber Interests in Europe.

GERMAN PRODUCTION OF TIRES.

ACCORDING to statistics lately published, the German production of rubber goods some years ago represented $75,000,000. In 1911 the production of tires alone was estimated at about $34,000,000, including: automobile tires, $17,500,000; bicycle tires, $10,000,000, and solid tires, $4,500,000. In the manufacture of tires there were 8,310 hands engaged, with total wages exceeding $2,500,000.

RUBBER INVESTIGATION IN GERMANY.

Dr. Fritz Frank, of the Henriques Chemical Laboratory, Berlin, has received from the Jager Endowment a sum equalling $750 for the prosecution of a work regarding the composition and proportion of the albuminous substances in latex and in rubber.

FRANKFURT ASBESTOS MANUFACTURING COMPANY.

The annual report for 1912 shows that the amounts written off in accordance with the resolution of the general meeting of May 29, 1912, equaled $150,000. It is proposed to transfer the net profit for 1912 to the reserve and guarantee accounts.

GOOD DIVIDEND OF LEIPZIG COMPANY.

The Philip Penin Rubber Manufacturing Co., of Leipzig, reports favorable conditions. After liberal allowances for various reserve accounts, a dividend of 25 per cent. has been declared.

LIVERPOOL RUBBER TRADE WITH THE UNITED STATES.

Returns of crude rubber exports from Liverpool to the United States show for 1912 a reduction from those of 1911. The figures are: 1911, $10,548,240; 1912, $8,299,515. This falling off is attributed to the increased demand for plantation rubber in the States, which affected the shipments from Liverpool of African and other descriptions, for which that port is both an importing and exporting center.

HUNGARIAN COMPANY TO MAKE TIRES.

Under the auspices of the Hungarian government, the Matador Rubber and Balata Works, of Pressburg, Hungary, are enlarging their plant by the addition of a tire factory.

LIBERIAN RUBBER PRODUCTION.

As a large percentage of the rubber produced in Liberia was carried across the borders by natives and disposed of in neighboring European colonies, the total production cannot be accurately stated. The quantity exported in 1912 was, however, 93,822 pounds.

The Liberian Rubber Corporation, an English company, has a concession for gathering rubber in Liberia. A rubber plantation was started some years ago on modern lines, about 25 miles from Monrovia. Out of 300,000 trees set out in this plantation, 9,000 are now ready for tapping. A good quality of crude rubber is expected if a careful oversight is exercised of tapping and gathering. This is the only attempt at cultivating rubber trees made in Liberia.

ITALY'S RUBBER TRADE.

According to a report from Consul General James A. Smith, of Genoa, the Italian imports of crude rubber and gutta percha amounted in 1911 to $7,939,692 and in 1912 to $9,009,240. Of these amounts the United States furnished, respectively, $303,203 and $228,126.

PROGRESS OF DANISH CABLE CO.

The Nordiske Kabel og Traadfabriker (Northern Cable and Wire Factory), of Copenhagen, has paid for 1912 a dividend of 7 per cent. upon its enlarged capital equalling $600,000. Consumption of its products is said to be increasing in Denmark, and the installation of rubber, as well as spinning machinery, has been augmented. Additional premises for the manufacture of high tension cables are being at present erected.

NEW RUSSIAN ASBESTOS SYNDICATE.

ACCORDING to a communication from a correspondent of the "Gummi-Zeitung," five of the most important Russian asbestos firms have formed a syndicate. The yield of Russian asbestos has much increased in the last five years, owing to the large demand for export and the increased industrial employment of the article in Russia. The Ural production has attained unprecedented importance, having reached last year the quantity of 15,000 tons, due to some firms having doubled or tripled their output. Three quarters of the entire yield is exported, and one quarter used in Russia, the latter proportion chiefly composed of lower grades.

Russia supplies only a small portion of the American import of asbestos, the figures for 1911 having been: Canada, 56,950 tons; Germany, 123 tons; Russia, 50 tons. Russia had furnished in 1909, 45 tons and in 1910, 92 tons.

HAVRE'S TRADE IN RUBBER.

Mr. John B. Osborne, United States Consul at Havre, France, contributes a report on the commerce and industries of that port in the June 11 issue of the "Daily Consular and Trade Reports" which is a valuable document, as it goes much into detail in regard to the business of that important town. But there is one paragraph—given below—that is particularly interesting to the rubber trade, as it refers to the amount of rubber that passes through that port each year:

In recent years about one-half of the total rubber imports of France have been entered at Havre. In 1911 the value of the Havre imports of this article in the general commerce was no less than $26,762,000, surpassed only by the valuation of the cotton imports in that year. The imports of 1912 were still heavier, being 24,344,275 pounds, with a probable valuation of about $28,130,000. The imports for consumption were far greater in 1912 than in the previous year, being 9,310.9 metric tons as compared with 8,692.2 metric tons in 1911.

The principal dealers in rubber in Havre do not come into direct contact with the French manufacturers, who are located outside this consular district almost exclusively; their work is to superintend the arrivals and shipments on behalf of houses in Brazil, England, and the United States. They receive the goods and attend to forwarding them, although they are often called upon to examine and classify the merchandise. At the same time they buy large quantities at the public auctions of rubber, which take place here once a month. Most of the rubber from the French Kongo is shipped to Havre and sold in this market. The quantities sold at auction are about 1,000 tons a year, the bulk of which is exported to the United States. The rubber industry is reported to be very prosperous, and local dealers say that the large manufacturers made big profits last year.

Quotations for rubber at Havre on December 31, 1911 and 1912, respectively, were as follows, per pound:

Kinds.	Dec. 31, 1911.	Dec. 31, 1912.	Rise (+) or decline (—).
Kongo:			*Per Cent.*
Upper-Oubangui	$1.04-$1.06	$0.98-$1.08	—3.73
Kotto	1.04- 1.04	.98- 1.08	—3.73
Sangha-Oubangui	1.03- 1.06	.98- 1.00	—5.76
Fine Para	1.02- 1.03	1.09- 1.10	+6.77

ANNUAL REPORT OF HENRIQUES LABORATORY, BERLIN.

AS will be recalled, the "Chemical Laboratory for Commerce and Industry," of Dr. Robert Henriques, Berlin, has been carried on since his death by his successors, Dr. Edward Marckwald and Dr. Fritz Frank. The special section devoted to rubber was established in April, 1910, under the name of "Central Rubber Bureau for the Colonies," and has just issued its third annual report.

Upon its removal to its present more commodious quarters at 88 Lützowstrasse, the rubber section was equipped with a vulcanizing boiler and regenerating plant, as well as grinding and sifting machinery. During the year under review, washing machinery on the system of Werner & Pfleiderer has been added. The number of plantation companies belonging to the Bureau has, within that period, increased from 24 to 26.

Cordial interest has been shown in the work of the Bureau by the German Colonial Office and its representatives at different points. A lecture delivered by Dr. Marckwald, dealing with his visit to the Usambara plantations and the measures proposed for improving the quality of the rubber produced, was attended by Dr. Schnee, Governor of German East Africa, and other important officials. In this lecture the cultivation of *Hevea* in suitable locations was advocated. Frequent communications were maintained by the Bureau with the various organizations in the German colonies.

TECHNICAL WORK.

Among the features of the technical work were the investigations as to the albumen content in rubber goods and the determination of albumen in crude rubber. Another feature was the investigation of the "Mengwerl" juice, used by the natives of East Africa in the coagulation of *Manihot* latex, in conjunction with other coagulants. Various other technical points were dealt with as more urgent work permitted.

GENERAL WORK.

Besides the strictly technical questions, a number of others of a more general character were taken up. Castor oil seeds from German New Guinea were found to yield an oil of first class quality, while a variety of drugs from the German possessions were also examined. Tests made with wild lemons from West Africa showed that they yielded 5 to 7 per cent. of citric acid, which can be used in the coagulation of rubber.

East African tests of manuring and soil had to be partially interrupted, in consequence of the difficulty experienced in procuring the necessary labor. The results obtained, however, showed that the rubber tree does not require a rich, heavy soil, but that the fineness and depth of the earth have a material effect upon growth and yield.

SYNTHETIC OR ARTIFICIAL RUBBER.

The so-called "fish-rubber" was examined, and found perfectly valueless. Regarding synthetic rubber, in confirmation of previous utterances of Dr. Marckwald, the situation is said to be that the production of synthetic rubber has been successful in the laboratory, and to a small extent in the factory. For its production, however, on a large scale, very important difficulties have to be overcome. The opinion is expressed that a parity of price with that of natural rubber may be expected in the future, but up to the present no way has been shown of obtaining a parity in quality, particularly as natural rubber, besides the rubber substance proper, contains other and important elements, the introduction of which into the artificial product has not so far been successfully accomplished.

ESTABLISHMENT OF STANDARD QUALITY.

At the conference of East African plantation companies which took place in April, Dr. Marckwald referred to the difficult position of the German East African plantations, advocating united action on the part of planters and planting companies as well as the establishment of a first-class standard quality. While these proposals encountered some opposition, they met with the expressed approval of such expert authority as Professor Zimmermann. The effect upon East African rubber of unskilful preparation is illustrated by the statement that from March to December, 1912, German market quotations for first class Pará rubber fell about 7 per cent., while the reduction on *Manihot* rubber was about 27 per cent. The trials of washing under water, which have been in progress for a year at the Bureau with Werner and Pfleiderer's automatic machine, have led to favorable results.

TESTS MADE.

In the rubber section, 214 tests were made; including: *Manihot Glaziovii*, 104; *Kickxia*, 47; *Ficus, etc.*, 18; *Hevea*, 20; *gutta* percha 7; balata, 3; other kinds, 15.

The following results are deduced from these tests:

1. That it is quite possible to obtain in German Africa *Manihot* rubber of first class quality.

2. That the *Manihot* rubbers obtained from latex, without the addition of coagulating agents, are only of medium quality.

3. That through the addition of certain salts in coagulation, rubbers of special nerve are obtained.

4. That the present method of the preliminary treatment of *Manihot* rubbers in German East Africa, through washing, etc., in very many cases has not the anticipated favorable effect either qualitatively or commercially. In commenting on these results it is remarked that rubbers coagulated with acetic acid were of medium quality, while the treatment of the rubbers with the roller produced unfavorable results.

COMPARATIVE RESULTS OF VARIOUS COAGULANTS.

Different coagulants were used with four groups of samples: 1, citric acid and calcium-phosphate; 2, magnesium-sulphate and citric acid; 3, magnesium-sulphate; 4, magnesia-salt. All these rubbers were much superior to the products obtained with chloride of calcium and acetic acid. Some rubbers were produced which in strength and nerve surpassed all products hitherto obtained. Citric acid, on account of its high market price, can only be used where there is abundance of wild lemons. Such, as has already been remarked, is the case in West Africa. On the other hand, magnesium-sulphate is an extremely cheap coagulant, a trial of which is recommended.

NEW COAGULATION PROCESS.

Attention is called to a new process of coagulation patented by Dr. Collosseus, based on the double transposition of the albumen components in the latex. Even when used cold, this process is said to be satisfactory, both as to speed and quantity. It is claimed that rubbers thus produced vulcanize in half the time required by others of like origin but differently prepared. Mechanical tests are said to have shown them to be of exceptional quality, the vulcanized product having considerable nerve. Such are a few of the salient points of this interesting report. Though dealing specially with the German colonies, it contains many features of general interest on the subject of rubber cultivation.

A GERMAN VIEW OF THE BRAZILIAN SITUATION.

In commenting upon the recent happenings in Brazil, the "Gummi Zeitung" expresses doubt as to the prospects of rubber goods manufacture in that country. Should the Brazilian industry, however, gradually acquire importance, the abstention of European countries, particularly Germany, from purchases of Brazilian rubber might be anticipated. It is added that a heavy loss for Brazil would be thus implied, as the consumption within that country of its rubber production is not to be seriously considered.

AUSTRIAN TALC ASSOCIATION.

ACCORDING to the booklet issued by the Austrian Talc Association (Association of Those Interested in Talc), an effort is being made by that body to promote the sale of the article in various industries. With this object a summary has been compiled of its industrial uses, among which rubber manufacture occupies a leading position. On this subject the report says:

"Talc is used for various purposes in the rubber industry, but a further extension of its use could be attained by its employment at the points of production, for the preservation of crude rubber against oxidation, by which the value of the rubber would be increased. The Association has approached the Brazilian government on this matter. Talc is used in rubber manufacture in vulcanization, and as a filling material for various rubber products. It is of special importance in the manufacture of cables and in that of insulating rings for electrical connections. For this purpose there is required a very light quality, with a considerable resistance to electricity, absolutely free from sand and other impurities. In the testing of current, any ring which contains even a small grain of sand is at once penetrated and becomes useless. Talc is likewise used for packing intended to resist heat, steam, acids and water."

This association does not engage in the sale of talc, but is prepared at all times to answer questions about the article and its sources of supply in Austria and Hungary. Its address is Schwarzenbergplatz 4, Vienna, Austria.

United States imports of talc (ground or prepared) varied of late years as follows: 1910, 18,158,871 pounds; 1911, 12,878,292 pounds; 1912, 20,465,942 pounds. The chief sources of imports were in 1911: Italy, 6,531,256 pounds; France, 3,580,501 pounds; Canada, 1,282,772 pounds; Austria-Hungary, 1,174,976 pounds.

Austria thus stands lowest among the larger sources of the American supplies of talc, but is evidently desirous of a larger share of United States trade.

THE RUBBER TRADE IN JAPAN.

By a Resident Correspondent.

JAPANESE INTERESTS IN MALAYA.

ACCORDING to recent statistics there are in the Malay Peninsula 87 Japanese rubber plantations, with a total area of 85,069 acres, of which 16,455 are under cultivation. The total investment of Japanese capital in Malaya is estimated at about $1,000,000. About $10,000,000 would, however, be required for the exploitation of the uncultivated holdings. Of the investors, two-thirds are small, planting being with them an additional occupation. They are consequently unable to wait several years for profits, and growing discouraged at the low price of rubber, are considering whether it would not be better to sell their plantations than to invest more money in them.

JAPANESE EMIGRATION.

By the latest official figures, the population of Japan is 69,148,980 and the area of the country 268,897 square miles. Four years' returns show the average yearly increase in population as 4.3 per cent. The young men of Japan have therefore been giving attention to emigration as an outlet for this growing population, being encouraged by the press in their aspirations. Instances are recorded of some of them having taken up rubber planting in the South Sea Islands, with satisfactory results.

Upon finally venturing to go to the Malay Peninsula they at first suffered from fever, but after vanquishing this and other difficulties, became successful planters and prominent among the local Japanese population.

A PLANTER'S OPINION.

An optimistic rubber planter lately said:

"Three problems are before the Japanese rubber planter: 1, artificial rubber; 2, white ants, and 3, future lower prices of rubber. With regard to the first, it is not considered as likely to rival Pará rubber, and even if it corresponded with the latter in chemical and physical conditions, would never rank with it as a practical industrial raw material. As to the second, if proper care is exercised on the plantation, serious damage need not be anticipated from this cause. With reference to the third, it may be anticipated that reduced prices will come in the near future, but this reduction will of itself bring about many new forms of consumption. The lower the price, the more will demand increase.

"No serious damage will ensue for rubber plantations unless the price descends below two shillings per pound.

"Rubber planting in the Malay Peninsula is certainly a profitable business, and the only problem is how to plant so as to make it as much so as possible."

The above is an optimistic opinion. Others of a pessimistic character have of late been expressed, based on the most recent conditions. However, Japanese planters are much encouraged by the report that Baron Shibuzawa, the most important business man in Tokio, has bought a plantation of 1,000 acres, and it is thought that his example will encourage other investors.

THE B. F. GOODRICH CO. MOVES TOKIO BRANCH.

The B. F. Goodrich Co. recently moved its Tokio branch to No. 1 Chome Yurakucho, Kojimachi, Tokio. It has been handling tires and other rubber goods for the last twelve years, and now contemplates importing full lines of automobile and cycle tires, belting, hose, packing and surgical goods; as well as specialties for railways, electric car works, paper mills, etc.

COMPARATIVE IMPORT STATISTICS.

The following are statistics of Japanese imports of rubber goods for 1911:

	Pounds	Value
Insulating Tape—		
United States	198,108	$75,161
Great Britain	20,679	13,627
Germany	5,415	1,689
Sheets—		
United States	66,088	67,217
Germany	37,676	22,215
Great Britain	4,244	6,354
Sweden	8,080	10,812
Switzerland	1,833	1,964
Tubes and Hose—		
United States	19,569	16,975
Germany	36,179	31,007
Great Britain	8,299	10,603
Rubber Webbings for Shoes—		
Germany	.....	49,370
Great Britain	.....	21,195
Rubber Cords and Threads—		
United States	.....	3,149
Germany	.....	4,352
Great Britain	.....	14,444
Other Rubber Goods—		
United States	.....	95,996
Germany	.....	140,211
Great Britain	.....	66,060
Overshoes .....(pairs)	40,293	19,852
Rubber shoes .....(pairs)	9,627	20,579
Air pillows .....(number)	24,207	13,606

All imports of overshoes were from the United States. Air pillows were mostly from Germany.

Some Rubber Planting Notes.

HON. E. ROSLING LEAVES CEYLON.

THE departure of the Hon. E. Rosling from Ceylon was the occasion of a farewell demonstration quite unusual.

Mr. Rosling was the head of the Dimbula Planting Association from 1897 to 1899, and of the Ceylon Planters' Association from 1900 to 1901, and from 1909 to 1910. He was one of the most prominent men in the Ceylon planting community and his departure has caused much regret. Satisfaction is expressed at the prospect of his continuing in England to further the interests of Ceylon.

Before leaving Ceylon for Europe he gave expression to his views as to cost of producing rubber. He said:

"As regards the cost of production in rubber, with up-to-date cultivation, trees growing older and a liberal period allowed for the renewal of the bark, I believe that Ceylon will produce its rubber cheaper than any other country.

"I should say that it is quite within the bounds of possibility that in the future the superintendent who cannot put his rubber f. o. b. for 8d. will be looked upon as a very expensive worker."

RESULTS OF RUBBER TAPPING IN CEYLON.

At a recent meeting of the Committee of Agricultural Experiments, held at Peradeniya, Ceylon, it was decided to keep records as to how many trees could be tapped per day in each experiment.

The chairman, Mr. R. N. Lyne, quoted figures showing the large average yield of the trees at Heneratgoda on the outside of the three small plantations there, indicating the beneficial effects of light and room. He exhibited diagrams showing how plantations could be laid out reproducing the conditions of these trees.

AMERICAN TRADE EMISSARY IN CEYLON AND INDIA.

Mr. Henry D. Baker, American consul at Nassau, is spending some eight months in India and Ceylon, with a view to investigating the opportunities for extending American trade with the East. Rubber forms part of his program. His reports will in due time be published by the United States Department of Commerce and Labor. Mr. Baker was formerly American consul at Hobart, Tasmania, and spent five years in collecting information in Australia and New Zealand.

RUBBER CHEMIST FOR CEYLON.

Mr. L. E. Campbell has entered upon his duties as assistant chemist to the Ceylon Rubber Research Committee.

The new expert's work, it is understood, will lie chiefly in the study of rubber trees and their diseases; and a committee of five planters will assist him. Local opinion is that much good should result from this new appointment, for the chemistry of the rubber industry calls for every care and research.

PRESIDENCY OF CEYLON ASSOCIATION.

Mr. Loudoun Shand has been re-elected president of the Ceylon Association, London, for another year.

THE ALL-CEYLON EXHIBITION.

Last year's All-Ceylon Exhibition has realized a surplus equaling nearly $2,000, which it is proposed to hold in anticipation of the next exhibition, scheduled for 1917.

CEYLON (PARA) RUBBER COMPANY, LIMITED.

At the recent London annual meeting of the Ceylon (Pará) Rubber Co., Limited, Mr. R. B. Magor, the chairman, expressed the conviction that in the course of a few years the cost of delivery in London will not exceed 1s. per pound. By that time, he remarked, the whole of the company's area will be in full bearing. This company was registered in 1904 and by 1910 had its land nearly all planted with rubber

ENGLISH VIEW OF THE FUTURE OF RUBBER.

At the annual meeting of the Rubber Growers' Association Mr. Noel Trotter, acting chairman, said:

"So long as the world's demand for rubber progresses in the way it has done in recent years, there can be little doubt that a very large further increase in supplies will be necessary to satisfy the growing requirements. For instance, we, in London, have before our eyes the enormous growth of the omnibus traffic, since horse-drawn conveyances were superseded by rubber-tired motor-buses. It is reported that shortly the existing public carrier vans will be scrapped and replaced by motor vans extending their sphere of direct delivery, and competing with the railways. The effect on our country roads will be appalling, but it all means more rubber."

JAVA RUBBER PRODUCTION.

Exports of rubber from Java for the year 1912 were 2,233,117 pounds, against 982,000 pounds in 1911. According to the report of the British acting consul for Java, this quantity was principally composed of *Ficus* and *Hevea*, very small quantities of Ceará and *Castilloa* having been produced.

RUBBER IN SUMATRA.

According to a British consular report, the area under rubber on the east coast of Sumatra at the end of 1912 was about 208,000 acres, divided as follows: British companies, 84,000; Dutch companies, 69,500; United States companies, 27,500; Belgian and other companies, 27,000; total 208,000 acres. It is estimated that there were 44 British companies working on the east coast, with a total issued capital equaling $26,500,000. Exports of rubber from the east coast of Sumatra were, in 1910, 539 tons; 1911, 813 tons; 1912 (estimated), 1,800 tons.

The report adds that the plantation rubber produced has, on the whole, shown careful preparation, while the prices realized have been good. It is thought that when the large areas planted are in full bearing the cost of production will be comparatively low.

RUBBER EXPORTS OF PORTUGUESE EAST AFRICA.

According to the report of Consul G. A. Chamberlain, Lourenço Marquez, the rubber exports of that province for 1912 represented the following values from the various ports:

Lourenço Marquez	$9,369
Inhambane	22,785
Chinde	2,661
Quelimane	6,687
Mozambique	41,903
Beira	55,317
Total	$138,722

It has been estimated that, with the extensive installation of machinery, the output of the province would exceed 500 tons annually.

Vine bark produces 4.97 per cent. of rubber, bone dry and free from resin; root bark producing 6.97 per cent.

PROPOSED RUBBER REFORMS IN PORTUGUESE COLONIES.

A measure which is under consideration by the Portuguese legislature provides for immunity from export tax, during twenty-five years, of rubber extracted from the *Ficus elastica*. Similar immunity would extend during fifteen years to *Hevea* and *Castilloa* rubber, and during ten years to *Manihot* and other varieties. Articles needed for the cultivation and tapping of rubber trees, and for the preparation of latex, it is proposed to admit free of duty.

THE TROPICAL AGRICULTURAL COLLEGE.

THE proposal to establish a Tropical Agricultural College still continues to be discussed in London. Sir Henry McCallum, the late governor of Ceylon, wrote to the "Times" advocating the claims of the island for such an institution. He urged that the whole of Ceylon is devoted to tropical agriculture, while the student would have an opportunity of obtaining a colloquial knowledge of the essential Tamil language by intercourse with the laborers, mostly of that race.

Another point brought forward by Sir Henry in favor of Ceylon is that the Peradeniya Gardens offer a unique and ready-made site.

Nor will Sir Henry be alone in his championship of Ceylon. The Hon. E. Rosling, before his recent departure from there for England, was appointed deputy of the Board of Agriculture, by the following resolution:

"That the Hon. Mr. E. Rosling be appointed deputy of the Board of Agriculture, Ceylon, to the London Committee, to arrange a deputation to the Secretary of State to urge the claims of Ceylon as a site for the Imperial College of Tropical Agriculture."

Mr. Rosling's views on the subject were expressed as follows: "If there is to be only one college, Ceylon is the only site for it. In Ceylon we have a rainfall varying from 25 inches to 200 inches; we have variations in elevation and soil, and we could grow almost every commercial product that could be grown in the tropics. Therefore, if a college were started here men could get practical experience at their doors; at any rate a short day's journey would take them into any one of the districts. We can only hope that the Secretary of State will view it in a similar light."

While the cause of Ceylon is being urged by Sir Henry McCallum, Sir Henry Blake, Hon. E. Rosling, and Mr. Crosbie-Roles, the claims of Trinidad and the West Indies are being put forward by Dr. Francis Watts, Sir Richard Morris, Mr. Norman Lamont and other advocates of that location for the college. According to the June issue of "Tropical Life," it was intended to hold an informal discussion between the representatives of Ceylon and those of the West Indies, with the view of further meetings. The readers of THE INDIA RUBBER WORLD will recall the editorial on the subject which appeared in the April issue on page 339.

The "Malay Mail" suggests the possibility of several colleges being required, in view of the wide field to be covered, adding that it would fain see a college in the West Indies, another in Ceylon or Southern India, another in Burmah, one in the Federated Malay States, and finally, one in Queensland to serve the needs of tropical Australia and the islands of Oceania. The Malay college would have no financial relations with the colonial scheme, being run and supported by the Federated States. In the concluding words of the article: "We have heaps to learn yet about the rubber tree, and almost as much about the coco-nut palm."

VALUE OF SCIENTIFIC RESEARCH TO RUBBER PLANTERS.

At the recent London meeting of the Consolidated Malay Rubber Estates, Limited, Mr. J. L. Loudoun Shand, the chairman, in reporting the contribution of £80 ($400) to the Malaya Research Fund, said:

"Various systems of tapping adopted have been under careful observation, and the distances at which our trees should be planted, methods of cultivation and prevention of diseases are all now carried out under scientific guidance. I should like to take this opportunity of saying how great I believe has been the benefit to the cultivation and preparation of rubber, which the light of science has conferred upon us; and I believe that no expenditure could have been more fully justified. We have learned much, but there is still much to learn as to the cultivation and manufacture of rubber."

BELGIAN RUBBER INTERESTS IN MALAYA AND SUMATRA.

IN a neat and attractive booklet of 88 pages, recalling the general features of the literature distributed by the Malaya Section of the New York Rubber Exhibition, Mr. Charles Grenier, editor of "Grenier's Rubber News," has dealt with the special subject of "Belgian Rubber Interests in Malaya and Sumatra." Being intended for distribution at the Ghent Exhibition, it is to a great extent in French, the most interesting parts of the work being in that language as well as English.

The most important Belgian rubber financial corporation is the Société Financière des Caoutchoucs, or Rubber Financial Company, which has a cultivated area of nearly 40,000 acres, including the holdings of some 10 companies, with estates in Malaya and Sumatra. Of these the most important is the Federated Malay States Rubber Co., Ltd., with headquarters at 21 Rue Arenberg, Antwerp. The area owned by this last named company is about 7,600 acres, nearly two-thirds of which is planted. Up to the end of January about 376,000 trees had been tapped.. An estimate of the yield for the season 1912-13 had been made as 1,000,000 pounds.

Another important company under Belgian control is the Kuala Lumpur Rubber Co., with a cultivated area of 5,000 acres, about half of which is in bearing.

Of the Sumatra estates controlled by the Société Financière, the Sennah Rubber Co. has a total cultivated area of 3,321 acres.

Belgian capital is thus finding an outlet in the Middle East and keeping in touch with the progress of rubber cultivation in that quarter.

THE FUTURE CONSUMPTION OF RUBBER.

The Batavia Plantation Investments, Limited, recently held a meeting in London, at which Mr. G. St. Lawrence Mowbray, chairman, said:

"The rubber industry is closely bound up with the motor business; indeed, it is the use of motors that has made it possible to transport rubber plantation supplies, and eventually rubber plantation crops, to and from estates that otherwise must have remained inaccessible jungle and wilderness. I am looking forward to the time when rubber will be enormously used not only for cycles and motor-cars, but in the manufacture of aeroplanes and waterplanes. There is another purpose to which it may be applied, and that is for spring buffers to railway carriages.

"We already have rubber flooring for business offices, courtyards of hotels, and other places—a practical reality which the reduction in price would bring into widespread use. Let us imagine, for instance, the Palm Court at Selfridge's, or the promenade at Olympia, floored with rubber, or go even further and picture to ourselves the Strand or Threadneedle street paved with it. We might then realize the ideal of a noiseless London. Just consider the quantity of rubber that would be required to pave the main streets of the City of London, and then conjecture how much more would be needed for the principal thoroughfares of our great provincial cities, and those of the Continent, and the United States of America. Well, even if the world's output of rubber did rise to the 300,000 tons per annum in 1919 that a well-informed writer estimates, I think there need be very little fear of lack of demand for it, and the cheaper it becomes the more of it will be required."

RUBBER ESTATE IN BURMA REORGANIZED.

Advices from Burma report that the estate of the Shevegyin Rubber Co. has been put on a proper basis, under the direction of Mr. W. R. Shelton Agar, the Gampola (Ceylon) planter. The estate has a new factory fully equipped for the preparation of rubber, which has cost the equivalent of $30,000.

HEVEA RUBBER IN BRITISH GUIANA.

THE accompanying illustrations show decided progress in Pará rubber planting in British Guiana. They are from photographs taken some forty miles up the Mazaruni river on the Bartica estate. This estate now has about 65,000 trees, and

Tapping Hevea Trees at Bartica Estate.

when those in the nursery are in place will have 100,000. Between 500 and 600 acres will be ready for tapping in the

Hevea Trees Two Years and Ten Months Old at Bartica Estate.

latter part of 1914. The trees show just as rapid growth and as notable wound response as has been seen in the Malay States.

NOTES FROM BRITISH GUIANA.

By Our Regular Correspondent.

SOME developments of considerable importance in connection with the local rubber industry are foreshadowed by the formation of a new American company called the British Guiana Consolidated Co., Limited, whose offices are at Mills building, 35 Wall street, New York. The capital of this company, I find from the prospectus, is to be 300,000 shares at $5 each 7 per cent. preference stock, and 1,000,000 shares at $5 each common stock. The 7 per cent. preference stock is preferential as to dividend and assets, and furthermore will share equally with the common stock in any and all profit distributions after 10 per cent. per annum shall have been paid upon the latter. The company is described as a consolidation of certain interests, united with a view to simplifying and economizing operations in a number of industries, prominent among these being the cultivation of the Pará rubber tree. "This tree," says the prospectus, "in its native or uncultivated state, at present yields the best quality of rubber, but a larger proportion is of inferior rubber obtained from a tree producing what is known as balata. Trial plantations established at the Government Agricultural Stations, after upwards of four years' experimental cultivation, have so far demonstrated the suitability of the climate and soil of the colony for the successful growth of the Pará rubber tree, that some of the larger estates and also corporations organized exclusively for the purpose have begun the setting out of this species of tree on a commercial scale. With these assurances of success, this company purposes to follow the clearing of the forest by the systematic planting of rubber trees."

As regards the results which can be accomplished in rubber planting, the prospectus says: "The company's logging operations will clear about two acres of land per day, or in a year 700 acres. Out of this area, it is a safe assumption that 350 acres will be suitable for planting the superior grades of rubber. Now if the work of planting rubber follows close behind the clearing of the land, the entire 350 acres available will be planted within the first year of the company's operations. At the expiration of the third year, there would be somewhat over 1,000 acres planted with rubber. It is proposed, in this planting, to follow, as closely as local conditions permit, the Ceylon practice, which may be taken as the standard for the scientific growing of this class of rubber tree. After the eighth year there will be a steady increase in production until all trees reach a size sufficient to produce an annual yield of from one to three pounds."

YIELD OF BALATA.

In spite of the rumors of shortage of rain in the interior of the Colony, of which I wrote some time ago, and which I said last month had been substantiated, it appears that the impossibility of bleeding operations being carried out is not general. While it is perfectly true that the members of the expedition of the Demerara Rubber and Produce Co. in the Rupununi District have found the bullet trees on its grants building, and have consequently been unable to bleed them, it is nevertheless correct that balata is coming to town in large quantities from the grants of other parties operating in the same district. Only a few days ago, for instance, no less than 60,000 pounds of balata arrived from the Rupununi grants of Messrs. Bugle & Co., and more large consignments are expected shortly. News regarding the progress of the Demerara Rubber and Produce Co.'s expedition to the Rupununi District is hard to obtain. The director of the company, Mr. R. Morrison, as I wrote last month, has left the Colony. The superintendent of the expedition, Mr. Aethy, who followed Mr. Morrison to town, owing to the bleeders having absconded over the boundary into Brazil, has now left again to return to the bush, but he has not engaged any men to fill the places of those who have absconded.

The exports of balata from the colony continue to show a large increase over those during the corresponding period of last year. The amount shipped between January 1 and early in July was 256,881 pounds, as compared with 35,483 pounds in the same period of 1912.

There was a busy time one day recently at the office of the Official Receiver, when a large number of the creditors of the Amsterdam Balata Co., whose affairs are being administered by the Official Receiver, put in an appearance to receive the

further dividend of 4½ per cent. which has now been declared payable. The creditors consisted entirely of the laborers who were in the service of the company when it failed, and their representatives—their wives and female relatives—attended at the office and were paid on their behalf. The payments varied from thirty-three cents to $8, and the amount disbursed in that way exceeded $500, the proceeds of the sale of the company's property.

A GLIMPSE OF THE EXISTING CONDITIONS IN THE BALATA INDUSTRY IN DUTCH GUIANA.

By a Resident Correspondent.

UPON a recent trip into the interior of the Colony I had an opportunity of witnessing the felling operations carried on by one or two balata companies on their concessions in the Sara Creek district. This interesting method of gathering the latex from the fallen trees would prove highly remunerative to the concessionaires if experienced labor could be obtained, but owing to the fact that most of the workers so engaged are men with little or no practical knowledge of the business, on one hand, and because of a dislike for the method, on the other hand, the system has proved to

Balata Bleeders on Holiday in Paramaribo, D. G.

be rather costly so far. There is no doubt, however, that if a class of laborers could be procured possessing the necessary knowledge of felling and handling the trees, the present high cost in connection with this method of balata collecting could be greatly reduced. Until expert wood-cutters can be had to do the work, it is my opinion that the industry would be better safeguarded by continuing the old systems, viz.: ladder work and spur climbers. So far, this new craze of cutting down the trees has not brought about any marked increase in the colony's output; on the contrary it has been the source of no end of disputes between masters and servants, government officials and concession holders, and last but not least, it has been the occasion of very strong press comments. What the future has in store—so far as this system is concerned—time alone will prove.

There are many hardships associated with balata collecting in Dutch Guiana, and those who invest in the business can hardly realize the amount of labor and suffering endured by those sturdy sons of Africa, who are sometimes harshly and cruelly treated, and even robbed of their hard earnings for the profit of the speculators. For instance, the contracts (sometimes) drawn up between employer and employe are all one-sided; they are made up entirely in favor of the employer, and the bleeders in most cases are so illiterate as to consent to the terms of agreement without ever reading the contents of the document, having confidence in what is told them. The unfortunate men, eager to obtain the tempting advance, sign their own death warrant; they only realize the injustice when it is too late and the advances are all spent.

Balata contracts are tangled webs in Surinam and some of them have been the cause of much unpleasantness between the British Consul and the Colonial officials, for many of the men are British subjects from the neighboring colony of British Guiana. I do not pretend to say that the balata man is all virtue; he has his shortcomings, and if not watched will very often clear off with an advance, or, if he finds himself heavily indebted to his employer (with no ghost of a chance of clearing off that debt) he will, on opportunity, put many miles between himself and the colony. Notwithstanding this fact, the men are not unreasonable, and only require proper management. The police, who hold a strong arm over the laborers, can arrest them—by the laws of the colony—on the least suspicion. They are, practically speaking, under police supervision from the day they enter into contract with a balata firm; so, as one can see, the investor is thoroughly safe-guarded. Why, then, in the face of such protection, do the companies or individuals employing these men stoop so low as to take advantage of them by drawing up unfair and deceptive contracts? I cannot see the sense in such high-handed methods; they certainly call forth disapproval from all honest people, and cause endless trouble and dissatisfaction when the bleeders are once convinced that they have been "done."

In the early nineties when the industry was booming, Mr. Henry Benjamins (then a partner of the balata firm Von Hemert) was looked upon as a father by the balata bleeders in Surinam. What he said was law, and every man obeyed him implicitly. He was kind and generous, yet firm as a rock, and above board. It is to be deplored that this gentleman has retired from the business; the industry has lost a man who can never be replaced.

It may be interesting to know that the exploitation of a balata concession can safely be left entirely to the black foremen, who will get out of the laborer all that he is capable of accomplishing. Moreover, the men are docile; few or no quarrels occur among them, and obedience is secured without force or threats. Another subject of congratulation is the honest accounting for and security of every pound of balata taken from the concessions, and its absolutely safe transportation from the bush to the consignee at Paramaribo.

Looked at in whatever light we choose, we are driven to the conclusion that there is no place in tropical America where law and order and the rights of capital are more sacredly regarded than in Dutch Guiana, which is all the more reason why the companies should not resort to measures for robbing the laborer by means of dishonest contracts.

If the balata industry is to flourish in future, a better understanding between employer and laborer must be effected. It is painful to think that by the unscrupulous actions of some of the concerns the balata industry, which promises so much, may be destroyed, if proper legislation does not step in and correct the present iniquitous state of affairs.

With proper men at the head of companies, and suitable weather conditions, Dutch Guiana could produce enormous quantities of balata. For instance, from January 1 to April 30, 1912, when the drought was at its height, even then, the colony produced 7,750 kilograms (17,050 pounds). The weather conditions are somewhat better this year, but not yet satisfactory; still the production from January 1 to April 30 has been 83,343 kilograms (183,354 pounds), an increase of 75,593 kilograms (166,304 pounds) over the same period in 1912. This alone is sufficient proof that Dutch Guiana is a balata producer of no mean order, if she is only given a fair chance. With the advent of fresh blood, backed by sufficient capital, I predict quite a brilliant future for her balata industry.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED JUNE 3, 1913.

68,365. The Portage Rubber Co., Barberton, Ohio. The word *Daisy*. Rubber vehicle tires.
69,485. Stone-Ordean-Wells Co., Duluth, Minn. The word *Hiawatha*. Fruit jar rings.
70,392. J. W. Buckley Rubber Co., New York. The word *Hydraulic*. Rubber tubing, hose, etc.

ISSUED JUNE 24, 1913.

1,065,758. Device for adjusting tire chains. W. E. Woodwell, Pittsburg, Pa.
1,065,787. Repair device for pneumatic tires, etc. T. C. Dobbins, Los Angeles, Cal.
1,065,836. Inner tube for pneumatic tires. Alfred and Albert Raymond, Washington, D. C.
1,065,849. Pnumatic tire. G. A. Shaw, Barberton, Ohio.
1,065,900. Suspenders. H. C. Hine, assignor to the Traut & Hine Mfg. Co.—both of New Britain, Conn.
1,065,907. Tire. F. W. Redding, Jacksonville, Mo.

Designs.

44,235. Automobile tire. J. Christy, Akron, Ohio.
44,241. Casing for pneumatic tires. F. E. Holcomb, Akron, Ohio, assignor to Consolidated Rubber Tire Co., Trenton, N. J.
44,253. Tire. F. Nolte, Akron, Ohio.

Trade Marks.

69,495. Stone-Ordean-Wells Co., Duluth, Minn. The word *Wampum*. Fruit jar rings.
70,571. Mystic Rubber Co., Medford, Mass. The initials *D. M. D.* in diamond shape. Hospital rubber sheeting.

[NOTE.—Printed copies of specifications of United States patents may be obtained from THE INDIA RUBBER WORLD office at 10 cents each, postpaid.]

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1912.

**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JUNE 4, 1913.]

3,285 (1912). Tools for replacing elastic tires. T. D. Staples, 1 Coronation Cottages, Exning Road, Newmarket.
*3,311 (1912). Detachable rubber heels. F. A. Nolan, 557 Rondo street, St. Paul, Minn., U. S. A.
3,312 (1912). Substitute for vulcanized rubber. F. C. Schneider, R. Reinecke and E. Knoll, Leipzigerstrasse, Meiningen, Germany.
3,396 (1912). Air tubes for tires. E. Andrieu, 1 Place de la Gare, Roubaix, France.
3,411 (1912). Rubber connection for sandals. R. Weidt, 54 Lerchenfelderstrasse, Vienna.
*3,430 (1912). Detachable rubber heels. F. A. Nolan, 557 Rondo street, St. Paul, Minn., U. S. A.
3,455 (1912). Flexible rubber hood held by umbrella stick. S. and W. Griffiths, 4 Swan Court, and T. L. Barlow, 15 Penzance street, Hulme Hall Lane, Newton Heath—both in Manchester.
3,653 (1912). Rubber toe spreading device. F. J. Scholl, 5 Manchester avenue, London.
3,755 (1912). Puncture closing apparatus. J. Eilers and J. Hinrichs, 9 Milchstrasse, Oldenburg, Grand Duchy of Oldenburg, Germany.
3,835 (1912). Detachable rim for wheels. F. W. Brampton, Abbots Croft, Sion Hill, Kidderminster.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JUNE 11, 1913.]

3,940 (1912). Air tubes for tires. J. J. D. Cleminson, 73 Cheapside, London.

3,945 (1912). Heel protectors. S. Sokal, 14 Southampton Bldgs., London.
3,989 (1912). Rotary duplicators. G. A. W. Rushworth, Great Western street, Moss Side, Manchester.
4,062 (1912). Lubricating and inflating pumps. A. Jaekel, 24 Rue Spontini, Paris.
*4,109 (1912). Rubber ring for spring wheels. C. D. Galvin, Merchantville, N. J., U. S. A.
4,210 (1912). Feeding bottles. A Prox, 6 Hough Lane, Leyland, near Preston, Lancashire.
4,212 (1912). Molding india-rubber, etc., by dipping. W. Heaton, 54 Town Gate, Leyland, Lancashire.
*4,287 (1912). Molding tires. A. Adamson, Akron, Ohio, U. S. A.
*4,291 (1912). Puncture closing apparatus. T. C. Dubbins, 211 West 32d street, Los Angeles, Cal., U. S. A.
4,317 (1912). Tread bands. T. Caudwell, 30 Denham Road, Ecclesall Road, Sheffield.
4,332 (1912). Use of rubber in imitation leather. H. Jackson, Oakenclough Paper Mills, Garstang, Lancashire.
4,395 (1912). Rubber layers in tires. S. C. Caddy, Rook Hill House, Keynsham, near Bristol.
*4,415 (1912). Pneumatic rubber ring for spring wheels. F. Morris, 2912 Farnam street, Omaha, Neb., U. S. A.
4,567 (1912). Rubber tapping knives. P. A. Reuss, 169 West street, Sheffield.

[Abstracted in The Illustrated Official Journal, June 18, 1913.]

4,600 (1912). Pads for chair legs, etc. D. Andreessen, Walle, near Aurich, Germany.
4,628 (1912). Device for inflating tires. W. Hall, near Barker's Farm, South Lopham, and E. Warren, Hopton—both in Thetford, Norfolk.
4,725 (1912). Direct vulcanization of solid tires. A. C. Stevenson, 83 Camperdown Road, Scotstoun, Renfrewshire.
4,833 (1912). Improved appliance for tapping. J. J. Hutton, Newlands, Ridgeway, near Sheffield.
4,866 (1912). Reinforced beads for tires. C. Burnett, Belmont House, Durham.
4,944 (1912). Use of powdered aluminium in resilient compositions. C. H. Wilkinson, Chapel Hill Mill, Huddersfield, Yorkshire.
4,985 (1912). Use of intercoiled wire in tires. A. E. Wale, Coleshill, near Birmingham, and Wale's Invulnerable Tyre Syndicate, Broad Street House, London.
5,078 (1912). Improvements in abdominal belts. M. J. W. Lumley, 67 Gloucester street, Warwick Square, London.

[Abstracted in The Illustrated Official Journal, June 25, 1913.]

5,234 (1912). Intertwined ring effects in golf balls. British Murac Syndicate, and M. N. Dessau, 17 Mincing Lane, London.
5,346 (1912). Use of prepared chalk for closing punctures. F. K. Loewenthal, 40 Synagogue Road, Kimberley, South Africa.
5,350 (1912). Waterproof cement for leather. F. Rampichini, 7 Via delle Acque, Triest, Austria.
5,421 (1912). Layers of rubber in heels. H. Bruhlmann, 42 Zurcherstrasse, Winterthur, Switzerland.
5,430 (1912). Products similar to vulcanized caoutchouc. J. Y. Johnson, 47 Lincoln's Inn Fields, London.
5,535 (1912). Tire building machine. P. A. Newton, 6 Breams Bldgs., Chancery Lane, London.
5,567 (1912). Rubber facing rings in valves. R. Ames, 145 Ditchling Road, Brighton.
5,619 (1912). Thumb stall for barbers. C. Davies, 15 High street, Cowbridge, Glamorganshire.
5,667 (1912). Caoutchouc substances. J. Y. Johnson, 47 Lincoln's Inn Fields, London.
*5,678 (1912). Rubber buffers in wheels. E. M. Deal, 5713 Spruce street; J. J. Scheiter, 1957 N. 23rd street, and E. A. Schneider, 2217 N. Howard street—all in Philadelphia, Pa., and L. B. Wilson, Sykesville, Md.—all in U. S. A.
5,705 (1912). Air tight rubber tubes for attachment to boats. C. L. Menzel, Nobby, Queensland, Australia.
5,718 (1912). Improvement in solid rubber treads. J. Elias, 96 Regent Road, Salford, Manchester.
5,769 (1912). Improvement in bottle stoppers. L. M. Pink, Staple street, Borough, London.
5,802 (1912). Impregnation of packing cord. O. Jordan, 36 Goethe Strasse, Hamburg, Germany.
5,847 (1912). Waterproof coverings for cycle saddles. W. Thomson, Lockwood avenue, Poulton-le-Fylde, and W. Thomson, 3 Taylor street, Atherton—both in Lancashire.
5,901 (1912). Compound woven beltings. H. F. Wragg, 115 Holly Road, Handsworth, Birmingham.

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

261,625 (April 13, 1912). Elastic tires with protected inner portion of rubber or the like. Alfred Steinhauser, Philadelphia, U. S. A.
261,679 (June 10, 1911). Improvements in parachutes. Karl Schultze, Berliner Strasse 28, Berlin-Pankow.
261,921 (January 4, 1912). Process for manufacture of rubberized fabrics. Erik Mündel & August Kurpneek, Riga, Russia.
261,876 (May 31, 1912). Process for manufacture of erythrene and isoprene. Farbenfabriken, vorm. F. Bayer & Co., Leverkusen.
261,951 (January 4, 1912). Vulcanizing apparatus for improvement of rubber tires. Cecil F. Adamson, Akron, U. S. A.
262,093 (December 13, 1911). Process for manufacture of a mass resembling rubber. Georges Reynaud, Paris.
262,137 (September 11, 1912). Tires composed of separate perforated rubber blocks. Maurice Dechamps, Brussels.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

451,508 (December 4, 1912). V. Boutier. Non-bursting armored anti-skid tread for pneumatic tires.
451,551 (December 6). H. Graveley. Mud guard for wheels of automobiles and other vehicles.
451,576 (December 7). E. Clark & C. N. L. Winter-Irving. Improvements in manufacture of pneumatic tires and covers.
451,579 (December 7). L. Gerard & G. Hidoux. Elastic tire for vehicles.
451,598 (February 15). C. Donaudy. Improvements in cellular air chambers for pneumatic tires.
451,613 (December 9). E. Charles. Anti-skid system for heavy loads.
451,615 (December 9). M. Kaufmann. Rubber piece for toes of footwear, and process of manufacture.
451,661 (December 10). D. L. Crosbie. Elastic wheel.
451,770 (December 11). W. H. Crawford. Elastic wheel tire.
451,787 (December 11). N. Isambert. Pneumatic tire with protected air chamber.
451,845 (December 13). C. Foldessy & C. G. Ashmore. Elastic tire with certain movable parts.
451,916 (December 14). E. M. Dubus. Pneumatic tire, with air chamber protected by perforations.
452,018 (December 18). E. Chassenet. Protective foundation of rim for pneumatic tires.
452,111 (November 28). A. Serenne. Instantaneously adjusted pneumatic tire.
452,141 (December 4). A Brasseur. Non-bursting tire for automobiles, motorcycles and bicycles.
452,006 (December 17). Farbenfabriken, vorm F. Bayer & Co. Process for production of substance resembling rubber.
452,015 (December 18). R. Bobet. Hot air vulcanizer.
452,277 (December 21). A. Olier & Co. Appliance for automatic adjustment of vulcanizing presses.
452,291 (December 23). A. Rokkel. Metallic toe for footwear with interior interchangeable piece of rubber or other substance.
452,440 (December 27). A. Amelot. Vehicle tires.
452,456 (December 27). W. E. Muntz. Improvements in pneumatic tires.
452,483 (December 28). K. Klotzmann and B. Klotzmann. Mud guard for automobiles.
452,506 (December 30). C. Chaigneau and M. Breillat. Movable anti-skid cover for pneumatic tires.
452,562 (December 10). R. C. Hulbert. Improvements in regulators of electric appliances; specially for vulcanizers.
452,389 (December 26). S. Saul. Rubber heels, adapted for use with press buttons.
452,497 (December 28). W. Eggers. Improved mold for manufacture of rubber goods.
452,580 (March 9). G. Fretard. Elastic vehicle tire.
452,772 (December 31). J. M. Laforet. Improvements in wheels with twin pneumatic or other tires.

[Note.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

A GAUGE FOR MOTORCYCLE RIMS.

The dealer in motorcycles has been considerably puzzled during the last few years to know what tire should go on what rim; for there have been three standard motorcycle rims, the "Old Style," the "B B" and the "C C." But this puzzle has been solved for the dealer by a gauge which instantly tells what size of tire should be used on any particular rim. The gauge is herewith illustrated. It is necessary simply to insert this gauge into the rim to get at the correct gauge length. The proper size tire to go with that rim is noted on the section of the gauge that fits the rim. This gauge is a Goodyear invention and is supplied to those in the trade interested in motorcycle rims, on application. [The Goodyear Tire & Rubber Co., Akron, Ohio.]

The Goodyear Motorcycle Rim Gauge.

Report of the Crude Rubber Market.

IT will be recalled that about the end of April fine Pará stood in London at 3*s.* 4½*d.*, while plantation crepe was quoted at 3*s.* 2½*d.* By the end of May the prices were respectively 3*s.* 8½*d.* and 3*s.* 2¼*d.*, the Brazilian article having gained 4*d.* within the month, while plantation rubber was practically unchanged. By June 25 a still wider discrepancy was reported, owing to a fall in the Asiatic product, which stood on June 25 at 2*s.* 11*d.*, as compared with 3*s.* 8¾*d.* for fine Pará.

During the month of July fine Pará fluctuated between 3*s.* 8½*d.* and 3*s.* 10*d.* A downward tendency prevailed, however, during the latter part of the month. The highest point touched was 3*s.* 10*d.* on the 16th, the other stages reached being: 3*s.* 9½*d.* on the 17th, 3*s.* 9*d.* on the 19th, 3*s.* 8½*d.* on the 23rd., 3*s.* 8*d.* on the 25th, and 3*s.* 7*d.* on the 20th, at time of writing. Thus, after being relatively steady for the first half of the month, the market has fallen 3*d.* within the last ten days.

Plantation crepe, which stood on June 25 in London at 2*s.* 11*d.*, reached 2*s.* 8¾*d.* (its lowest point for July) on the 9th. After a slight recovery it closed on the 26th at 2*s.* 9½*d.*, while fine Pará was at 3*s.* 7*d.* In other words, the premium on fine Pará now stands at 9½*d.*, as compared with 9¾*d.* a month ago.

That supplies have increased is illustrated by the statistics of the Federated Malay States exports for the six months ending June 30, which show in the last three years: 1911, 8,349,397 pounds; 1912, 15,382,265 pounds; 1913, 23,492,129 pounds. Exports from Ceylon for the first five months of 1913 represented 9,675,521 pounds, against 4,823,253 pounds for the same period of 1912. The records of the London auctions for the first six months of 1913 show a total of 11,202 tons, as compared with 6,821 tons for the earlier half of 1912. Thus no fears are entertained of a shortness of supply.

The plantation auction of July 1 included 445 tons, and tho the relative smallness of the quantity had led to anticipations of firmer prices, there was a falling off to the extent of 1*d.* to 2*d.* per pound. This situation was attributed to the lack of confidence in the financial prospect, rather than to the statistical position of the article.

At the sales of July 15, the quantity offered was 646 tons, which, tho larger than that of the previous sale, met with a good demand at 1*d.* to 1½*d.* above the price current in the recent private market.

The Havre auction of June 26 included 47 tons, principally Congo, of which six tons were sold with a reduction of 12½ per cent. About 40 tons were declared for the sale of July 30.

For the Amsterdam sale of July 10 there had been announced 59 tons *Hevea*, which realized 13 per cent. below valuations, and 17 tons *Ficus*, which sold at 18 per cent. reduction. Satisfaction has been expressed at the offerings being sold, though at reduced prices.

At the Rotterdam sale of July 4 about 25 tons were offered, including 15 tons *Hevea* and 9 tons *Ficus*. Nearly all the lots were sold at a reduction on valuations.

The Antwerp sale of June 25 included 53 tons Congo and 21 tons plantation. Of the former, 20 tons were sold, and of the latter a similar quantity, at prices unsatisfactory to holders.

New York Quotations.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During July the demand for commercial paper has continued light, and almost entirely from out of town banks, the same as in June; rates have ruled very firm at 6@6½ per cent. for the best rubber names."

WM. WRIGHT & CO.,
Liverpool, 3rd July, 1913. Brokers.

During the month 120 tons, including 10 tons Caucho, have been shipped from Europe to America.

Amsterdam.

Joosten & Janssen report [July 10]:

Considering the recent depressed condition of the market, today's sale may be considered satisfactory. The bulk of the offerings were sold at about the equivalent of market rates.

Rotterdam.

Havelaar & De Vries report [July 8]:

Prices at sale of 4th were below valuations. Quantity offered included 15 tons *Hevea* and 9 tons *Ficus*.

To Holland	2,282	992
To Sweden	39	....
To India	....	209
Total	4,823,253	9,675,521

(Same period 1911, 2,143,238; same 1910, 1,046,715.)

The export figures of rubber for 1913 given in the above table include the imports re-exported. (These amount to 893,866 lbs.—710,500 lbs. from the Straits and 183,366 lbs. from India.—Ed. C. O.) To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date, deduct the quantity of imports from the total exports. In previous years the exports of Ceylon rubber only were given.

TOTAL EXPORTS FROM MALAYA.

(From January 1 to dates named. Reported by Barlow & Co., Singapore. These figures include the production of the Federated Malay States, but not of Ceylon.)

Edited by HENRY C. PEARSON—Offices, No. 15 West 38th Street, NEW YORK.

Vol. XLVIII. No. 6. SEPTEMBER 1, 1913. 35 CENTS. $3.00 Per Year. $3.50 Abroad.

INDIA RUBBER WORLD
CAOUTCHOUC GUTTA-PERCHA

Published on the 1st of each Month by

THE INDIA RUBBER PUBLISHING CO.
No. 15 West 38th Street, New York.

CABLE ADDRESS: IRWORLD, NEW YORK.

HENRY C. PEARSON, Editor

Vol. 48. SEPTEMBER 1, 1913. No. 6

SUBSCRIPTIONS: $3.00 per year, $1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, $3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank or draft, Postoffice or Express money orders on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

Entered at the New York postoffice as mail matter of the second class.

THE MONROE DOCTRINE AND THE RUBBER INTERESTS.

WHEN that historic, much discussed and exceedingly interesting piece of international polity, formulated by John Quincy Adams—then Secretary of State—and promulgated by his chief, President Monroe, in 1823, and known ever since as the "Monroe Doctrine," was first given to the world, it undoubtedly was timely, salutary and effective. At that time most of the South American republics had all the weakness of early infancy. They were absolutely incapable of protecting themselves, and any little jolt from a European power would have taken them off their feet. It was of vital importance to their continued existence that the protecting arm of the United States (to be sure, this arm, itself, was none too strong in those days, but strong in comparison with our neighbors of the South) should be thrown about them. The result was not only beneficial to them but beneficial to the whole family of nations.

But that was 90 years ago. Both the conditions and the "doctrine" have changed vastly since that time. Most of the South American Republics have now celebrated the centennial of their establishment. Many of them are populous and prosperous. Some of the largest warships floating the seas belong to their navies. And while they of course do not compare in military and naval strength with the European powers, still, no one would be likely to interfere with them now, as long as they behave themselves with moderate propriety. They realize the changed conditions, themselves, very fully; and while 90 years ago and for many years thereafter they were extremely glad to feel that they had a place of refuge in the great republic of the North, it is common comment among travelers in South America that the citizens of these various republics have long entertained a feeling of resentment at the patronizing and protecting attitude still maintained by the United States.

But more important than the change of conditions and of general sentiment in South America toward this doctrine, is the change in the doctrine itself. As stated by President Monroe, it simply gave the European nations to understand that the Western Hemisphere was no longer open for the establishment of new dependencies, and that any attempt on their part to establish such dependencies on this or the southern continent would be looked upon by this government as an unfriendly act. But the Monroe Doctrine as interpreted by our statesmen during the last two or three decades—and particularly as announced by Mr. Olney in 1895, when he was Secretary of State under President Cleveland—and when he gave the British lion's tail such a merry twist—is vastly broader and more far reaching. Mr. Olney announced, in fact, that the United States was supreme on this hemisphere, and practically informed the world that it could run things from Behring Strait to Magellan Strait, and would regulate all international and internal difficulties between these two points. European nations were not only not to be permitted to establish any colonies on this hemisphere, but they were not to be permitted to seek any redress if they or their citizens were treated with injustice in their dealings with any American republic; the United States would see that justice was done in all directions.

This certainly was a tremendous undertaking, or would be if it were carried out—but, as a matter of fact, it is not. We forbid other nations from making any show of force in the protection of their interests or those of their subjects, practically guaranteeing that we will look after their interests for them and see that the peace is kept and that order is maintained. But do we do it? Is not this part of the Monroe Doctrine—the fulfilling of our obligation to see that general order is maintained—mostly a pretense? Take Mexico, for instance.

It is not necessary to dilate upon the condition of affairs in Mexico during the last three years, and particularly during the last twelve months. If there were no Monroe Doctrine, the powers, by concerted action, in order to protect their citizens and their interests in Mexico, would undoubtedly have quelled the disorder in that republic long ago. We would not permit them to make any move, on the theory that the restoration of order in that unhappy country was our particular work; but we are not doing this particular work, and our failure to do so has entailed tremendous loss, not only upon Mexicans, but upon a great number of foreigners and upon a particularly large number of Americans. The polished and scholarly gentleman who is now President of the United States, and the gifted orator with the musical voice who is his Secretary of State, confer together much and frequently—and then confer some more—while matters go from bad to worse.

Americans probably have $20,000,000 invested in rubber plantations in Mexico, and it is safe to say that the Guayule interests before the Mexican outbreak were worth $20,000,000 or $25,000,000 more—$50,000,000 would not be an excessive valuation of the American rubber holdings in Mexico. But as matters are now, and as they have been for some time past, this property is rendered, for the time being at least, quite valueless. Undoubtedly when (or perhaps we might properly say if) peace is restored in that country a considerable part of the value of this property will be recovered, but the aggregate loss both in the original investment and in the long cessation of production will be enormous.

It really would be of vast advantage to the commercial interests of this country—not to mention those of Europe—if the Monroe Doctrine could be conveyed out beyond the three mile limit and dropped noiselessly into the sea.

WHEN RUBBER SOLD FOR 25c.

A SALESMAN connected with one of the automobile companies, in explaining the high cost of rubber tires recently, charged it to the fact that increase in the demand for rubber has far outstripped the increase in its supply, and made these two statements: "The natural rubber sources are no greater today than a century ago. Some of the older rubber manufacturers are paying four or five times as much for fine rubber as when they first entered the business."

At first thought one would be inclined to doubt the accuracy, or even the approximate accuracy, of both of these assertions, but on second thought it would have to be conceded that the statements are closely in harmony with the truth. Interpreting "natural sources of rubber" as those for which nature is solely responsible, as distinguished from those started by the hand of man, it is probably not only true that the natural rubber supply is no greater than it was a century ago, but it might be stated with perfect safety that the natural sources of supply are even less than they were a century ago, for during the past century there has been a very considerable destruction of the natural rubber trees, particularly those of the Castilloa family and of the rubber vines in Africa.

The second statement, that some of the older manufacturers paid in early days only one-quarter or one-fifth of the present prices for crude rubber, will probably be received with some incredulity by many people in the trade; but this also is not very far from the mark. There are some manufacturers still living—not many, it hardly need be said, but a few—who can remember when they bought fine Pará rubber at a shilling a pound; and some of the older manufacturing companies, if they have kept their records intact, will be able, by referring back to their early days, to find many instances of fine rubber purchased at this price. To be sure the price did not remain long at this figure, because the early annals of the American rubber trade contain a complaint made by the New England manufacturers, some sixty years ago or more, that they were often compelled to pay as high as 50 cents a pound for Pará rubber—and they looked upon it as pure extortion.

On glancing back at the price of crude rubber in the early days, the inquiry naturally suggests itself: How is it that the people along the Amazon maintain that they could not by any possibility deliver fine Pará rubber at American or European ports of entry under 65 cents a pound, and that if the price should go below that they would have to cease shipments, when it was possible for them sixty years ago to deliver rubber for 35 cents and even 25 cents? Transportation facilities certainly are vastly better now than then, while the primitive style of living of the earlier days still obtains along the banks of the Amazon. Why has the cost of gathering rubber increased so greatly?

NOT ALL RUBBER GATHERING INHUMANE.

THE report of the House of Commons Committee on the Putumayo situation, mentioned in the July issue of this publication, contained the following paragraph: "The committee further expresses the belief that the Putumayo incidents are but a shocking instance of the conditions that are found over a wide area in South America."

A correspondent who has passed five years in the Amazon country as manager of a rubber gathering company, sends THE INDIA RUBBER WORLD a letter—which will be found on a later page in this issue—in which he takes very strong exception to this particular statement of the House of Commons Committee and goes on to describe in considerable detail the conditions under which rubber is gathered along the Amazon, as typified by the station with which he was connected.

Of course, no one believes for a moment that the situation in the Putumayo has any duplicate along the Amazon. Hardships there necessarily are, but the letter of our correspondent is extremely interesting as showing under what humane conditions this work can be carried on. Undoubtedly his camp as he describes it is a type of many others along the great rubber river. Naturally, the manager of such a rubber gathering station is supreme—his word is law—and the conditions of the camp are very much as he chooses to make them. The chief explanation for the horrors of the Putumayo lies in the system of practical slavery that has obtained there, under which the rubber gatherer when once in debt to the company—and that occurs practically as soon as he begins to work for the company—comes completely under its power and so remains until he has worked off his debt, which, in the majority of cases, is a matter of so much difficulty as to amount practically to an impossibility. Along the Amazon, where the rubber gatherers are free agents and no such system of peonage obtains, the barbarities of the Putumayo could not occur.

The counsel of the Brazilian embassy in this country, Mr. C. L. Chermot, corroborates our correspondent in regard to the treatment of the rubber gatherers along the Amazon. Being interviewed a few days ago on this subject, he said that the situation of Indians living in Brazil is very different from that described in the Putumayo district. He continues: "They have been constantly cared for by the government. Since 1910 there has existed in the agricultural department a bureau of protection for the Indians as well as an arrangement for localizing native labor.

"For that purpose Brazil is divided into ten regions, each in charge of an inspector and several employes, chosen with great care, all of them being subordinate to a central bureau in Rio Janeiro. Four of those regions are situated in the basin of the Amazon, from which comes the principal rubber production of Brazil, and it is well to notice that for this service Brazil, as shown by the budget of last year, spent over $666,000."

INSURANCE IN WHOLESALE LOTS.

MUCH has been said during the last decade about the ever increasing efficiency of our American business methods, but there is one particular branch of industrial activity which certainly has been open to the charge of wastefulness—and that is the system of life insurance for wage earners. As it has been carried on, its cost has been out of all proportion to the results obtained. There has been altogether too much machinery for the output. The working man and working woman have been insured for small amounts, against which there have had to be charged the commission of the agent, the doctor's fee for examination, and then the extremely expensive weekly collections, where the collector went from policy-holder to policy-holder, getting 10 cents, or even less, at a time. The extravagance and general inefficiency of this system are obvious.

But a new sort of insurance has recently been introduced to cover just this class of people, which eliminates all this waste. It is "Group Insurance"—insurance by wholesale—under which a blanket policy is written for a large number of people, without the expense of medical examination. While the insurance covers many lives, there is but one policy and but one transaction. For instance: A Chicago company employing about 3,500 men took out a policy which gave each man in its employ insurance equal to twice the amount of one year's pay. The face of the policy was for over $6,000,000, but by the avoidance of commissions and medical fees and much clerical work, there was an initial saving of $50,000 on the transaction. Insurance companies have found from experience that it is a perfectly safe risk to insure a body of working men—whose condition of health permits them to discharge their duties efficiently—without any individual examination, as in such a group of men a normal death rate can be relied upon.

A good many employers are availing themselves of

this new system of insurance, for it has a double benefit. It is obviously beneficial to the workman, for it gives him a fair amount of insurance without cost to himself, and it further enables him to increase his insurance, if he so elects, at the same rate under which the blanket policy is written—which often reduces the cost to one-fifth of the amount under the old system. This system, moreover, is beneficial to the employer, as the moderate expense to which he is put is undoubtedly more than compensated by the increased regard and loyalty of his workmen and by the greater quantity and better quality of work that they can be depended upon to do under these conditions.

A PROTEST THAT SOUNDS REASONABLE.

THE manager of a motor car manufacturing company has written to one of the automobile papers protesting against the continual harping by the advertising departments of the various automobile makers on the fact that they are equipping their cars with "over-size tires." He remarks: "This has assumed the proportions of a fad. Every motor-car advertisement writer seems to think he must use this term. It seems not to make any difference with what size of tires his car is equipped. He uses the term anyway." Then he goes on to say that there is a right-sized tire for the wheels of every car and that is the tire with which the car properly should be equipped, and any tire larger than that is just as much out of place on the car as one that is too small and too light.

This seems to be a very reasonable contention. If "over-size" means anything it means a size that is too large; and it does not seem logical that a motor car wheel should be improved by wearing excessively large shoes any more than it would be of advantage to a man with a number 7 foot to equip himself with number 12 rubbers.

SOME INTERESTING COMPARISONS.

THE prodigious growth in the manufacture of automobiles has been commented on much and often, but every few days some new figures are disclosed that compel the editorial mind to abandon its resolve not to mention this subject again. Official estimates place the value of the exports of complete automobiles for the year ending with last June at $40,000,000, including exports of tires valued at $4,000,000. The value of automobiles, including all accessories, exported in the year 1902-3—that is just ten years ago—was $1,000,000. In 1907 it had increased to 3,000 cars, with a value of about $5,000,000; but the imports during that year almost balanced the exports, being valued at $4,000,000. But in the last six years the imports of automobiles, including all parts, have almost steadily dropped in value, until for the year ending with last June they amounted only to $2,000,000. In other words, while during the last six years the imports have fallen off one-half, the exports have increased eight-fold, and the value of the tires exported last year was almost equal to the entire automobile exports of six years ago and was four times as great as the entire automobile exports of ten years ago.

The foreign field, moreover, is one that is susceptible of still greater enlargement, for the proportion of the population in foreign countries already supplied with motor cars is very much smaller than it is in this country, while the temptation to get an auto, in Europe at least—owing to the shorter distances between cities and the better road-ways—is very much greater.

WHY NOT WASHABLE SHOES?

A REPORTER on one of the New York dailies, in his busy quest for news, recently ran across a shoe dealer who lamented that there were no washable shoes on the market. In order to complete his story he went to a manufacturer of footwear with the suggestion, but was told forthwith that the idea was absolutely impracticable.

But is it?

To be sure, the ordinary footwear of today could not be washed to advantage. Immersion is not especially beneficial for leather shoes, nor is it particularly advantageous for shoes made of cloth; but would it not be possible to treat both leather and cloth shoes with some sort of rubberizing preparation which, while not preventing ventilation, would permit them to be duly immersed and properly washed without any detriment? People—at least those in the more orderly walks of life—are accustomed to having their hosiery laundered from time to time, so why not their shoes?

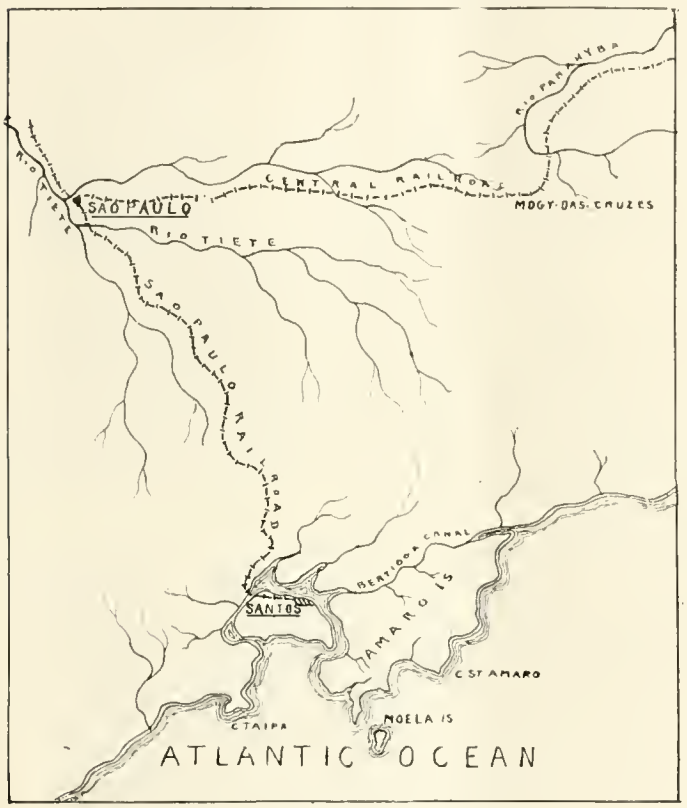
At any rate, now that September has arrived and everyone is back from the summer outing, refreshed by the delights of the mountains and the joys of the seashore, and ready to confront new problems and to engage afresh situations which have hitherto proved baffling, why is not this a good time for some energetic intellect to get to work on the subject of washable shoes?

Santos and Sao Paulo.

By the Editor of The India Rubber World.

From Rio to Santos—Railroad Thrills—The Journey by Boat—Off Moela Island—A Dangerous Passage—An Ancient Death Trap—Sanatized Santos—The Great Docks—The Coffee Mart of the World—Immigration System—Coffee Loading Machinery—Miles of Conveying Belts.

AS I was beginning a letter on South Eastern South America there came a friend in a hurry to know all about Santos. He seemed full of "the deadly unhealthfulness of the place." What literature he had been reading I do not know,



MAP OF SANTOS AND SAO PAULO.

but I promised that I would at once try to picture this important port as it appeared to me during my two visits there.

One's thought turns particularly to Santos when a visit to Rio is about to close, for it is only a short distance to the South. There are two ways of reaching it. One by railroad, by way of the city of Sao Paulo, and the other by steamer. The latter is preferable unless one is in search of thrills. If so they can be secured from the terrific speed at which the huge Baldwin locomotives snatch the trains across country, around curves, down steep inclines, and across bridges. According to popular report they run off the rails very often, but usually are lucky enough to choose a place where only the rolling stock is damaged.

By boat we go therefore, leaving Rio harbor at nightfall, and awakening the next morning with the dim outlines of Moela Island off the starboard bow. Just as we got on deck the order for half speed was given, and the big steamer swung slowly past Cape Monduba, the quartermaster heaving the lead, for entrance to Santos is difficult and often dangerous. We appreciated this when, as we were passing slowly through the buoy-marked channel, close under the bare granite slopes of Cape Roza, a sudden tropical rainstorm shut out the land and enveloped us in darkness. The engines were promptly reversed, the anchor let go, and the fog-horn started, for we were directly in the channel, inviting collision with other craft. The decks were soon crowded with startled passengers, who besieged officers and stewards with the usual foolish questions. In a few moments, however, the rain cloud lifted, showing sinister looking rocks on our port quarter and a bar with white water breaking over it not a great distance away, and it did not require much of an imagination to picture our fate had the steamer been less skilfully handled.

The port of Santos formerly had a most forbidding reputation as a fever hole and a death trap. It was customary for the officers and crew of vessels clearing for this port to demand extra pay before signing the articles, as there was the chance that none would return. In that case their ships were left to rot, for the yellow fever was swift and deadly when once it had laid hold of them. Nor could the owners get another crew to bring home a fever ship. This is all past now and the last vestiges of the abandoned ships have been removed. Modern sanitation has cleaned this once pestilential spot and made this port second in importance to Rio de Janeiro—that is in respect to the tonnage of vessels entering and clearing.

But to continue, the rain over, we steamed slowly up the nar-

PARTIAL VIEW OF CITY OF SANTOS AND HARBOR.

row river channel that leads to the inner harbor. On both sides were low, level, *banjos* (flat lands) covered with dense tropical growth. The luxuriance of the verdure attested to the richness of the soil and suggested its wonderful adaptability to banana culture. Bright vegetation, damp, earthy smells, and slowly rising morning mist-clouds are ever sure indications of tropical fertility.

Near the river's mouth is the harbor-master's station, and adjoining buildings straggle off along the bank, forming a small town. Severely plain in structure, the edifices are fearfully and colorfully painted. The sleepy inhabitants glanced at the passing steamer, and then resumed thumping an inquisitive pig, shooing a thieving hen, slapping a squalling brat or whatever their strenuous labor interrupted by our arrival.

The lofty steel towers, standing like sentinels on either side of the river, support an electric cable which transmits power from Parahyba to Santos, where it operates the street railroads and the complicated dock machinery. As we pass these towers, which look strangely familiar, we are reminded that when Brazil wants the best and most modern electrical machinery she places her order in the United States.

The long docks, crowded with steamers of every nation, next appeared, and we anchored in mid-stream awaiting our turn to be berthed at the dock. The Companhia Docas do Santos (Guinle & Co.) own and operate these docks and their great warehouses. The former extend for more than a mile and a half along the south bank of the channel, which was never very wide or deep until powerful suction dredges made it so, and incidentally filled in the low land where now the coffee warehouses stand. In docking, great rope hawsers were let down from the bow and stern of the steamer and carried in small boats by swarthy, barefooted watermen to the docks, where they were made fast in huge iron rings set in solid masonry. Then the ship was slowly warped sidewise to her allotted place. Shouts, yells and Spanish oaths (badly pronounced) in profusion were required before we were securely tied up and the gangway let down. Then—and not before—the purser hung out the mussy little blackboard that announced in a chalky smear the hour of the steamer's departure, and the sight-seers rushed frantically to catch trolley car, train or steamer, and we were ashore. What rubber is to Pará or Manáos, coffee is to Santos, and more. It is the largest coffee exporting city in the world. In the year 1906-7, 15,392,000 bags were shipped from this little city of only 50,000 inhabitants.

It is the chief seaport of the province of Sao Paulo, famous for the enterprise of its people, who are called the "Yankees of Brazil." This is by no means a misnomer, for their forbears, the fierce Mamelucos, were a mixture of Portuguese and Indian blood, a warlike race that settled, conquered, and defended the country—the true pioneers of Brazil. The climate of Santos is wholly tropical, with 90 inches of rainfall, and an average yearly temperature of 71 degs. F. The municipality of Santos includes the island of St. Vincent and the island of Santo Amaro. The city is located on the northeastern end of the former island,

OFFICES OF THE INSPECTORS OF IMMIGRATION.

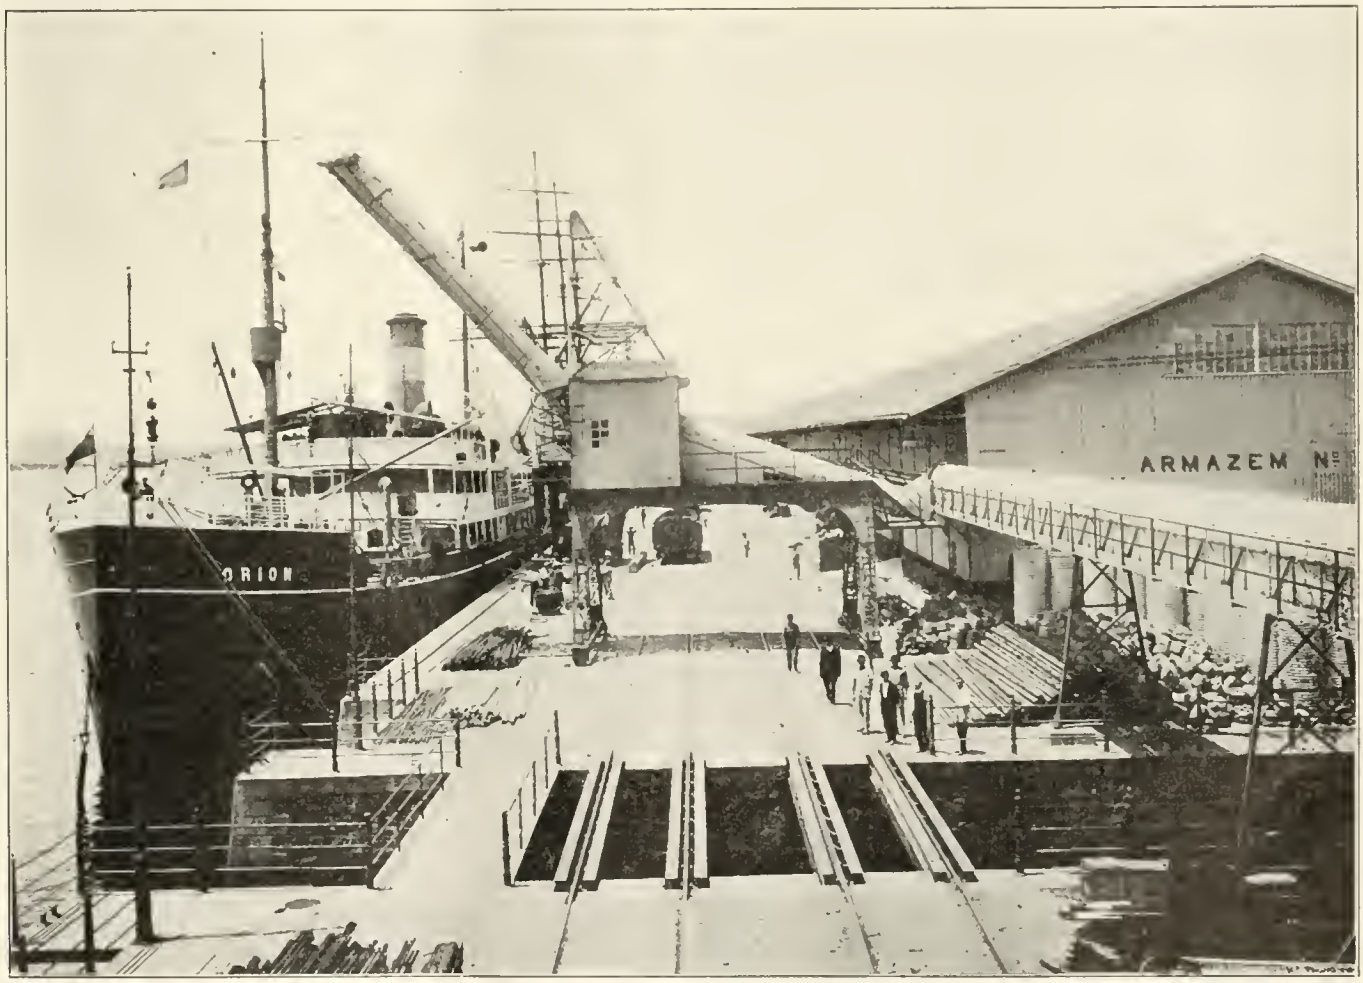
near the foot of a hill on the summit of which is the church of Our Lady of Montserrat, one of the oldest shrines in Brazil. The streets are well paved and scrupulously clean. The houses are Spanish, of the one or two-story type, built out to the sidewalk, with wide open windows, usually occupied by the feminine portion of the family. The ladies of Santos occupy these windows in order to see and be seen by the passers by, who are saluted, if friends, and stared at if strangers. On fiesta days and special occasions it looks like a panorama of box parties, and creditably upholds the reputation that Santos enjoys for beautiful women and expensive costumes.

There are many parks or public squares, with shade trees, flowers and inviting benches that urge the weary to rest. The post office and better shops are on a central square, or near by, so that the retail commerce of the city can be observed by stroll-

BIRD'S-EYE VIEW OF THE CITY OF SAO PAULO.

ing through the macadamized streets which radiate from this point.

The Praca do Commercio is not far away, and just across the street from the little hotel, famous for the black coffee served, is the building of the Commercial Association of Santos, where a polite attendant furnishes you with printed statistics, reports and all sorts of commercial information. From here it is only a short distance to the *Inspectoria de Immigracao*—or "The Inspection of Immigration"—located in a modern two-story building with large well furnished offices, where capable officials and clerks attend to this very important branch of the department of commerce. They look especially after immigrants who land in Santos with the intention of settling in the state of Sao Paulo. They also compile statistics on immigration and emigration for the port of Santos, secure and list information on all conditions of the state in order to give full and accurate reports to inquirers, and maintain a comprehensive exhibition room provided with maps, samples of products, statistical tables, etc.



DOCKS AT SANTOS.

Each steamer on arrival is visited by an immigration official who makes a formal offer of free board and lodging to all third-class passengers for Santos who pass satisfactory inspection, also free transportation and board at the Hotel of Immigrants in Sao Paulo, where the home-seeker awaits the department's instructions. Later the immigrants are "placed" in accordance with their previous experience or trade. In 1910 the monthly average of immigrants landed in Santos was 3,140 or about 104 a day.

When the docks of Santos were building, the most experienced engineers were employed to evolve a modern system that would be second to none in the world. How well they have succeeded can only be fully realized by walking along the wide ganite-paved quays teeming with activity. Fussy little engines are puffing up and down the tracks, switching empty freight cars in place or hauling loaded ones out of the way. The strident, incessant toot of the whistle is most effective in keeping the tracks clear. Powerful steel cranes operated by electricity move slowly alongside the steamer and quietly unload cargo on flat cars, or swinging with full radius drop the burden within the shelter of the warehouse. Freight from all parts of the world lies about in apparent confusion. There are great tubs of fish from Norway, bundles of tools from Germany, canned goods from Spain and Italy, boilers from Scotland and barbed wire from the United States. Sao Paulo cargo is loaded directly on the cars and hauled out every night, reaching its destination the next morning. Mixed freight and broken lots are delivered by the cranes to the doors of modern, steel-construction, absolutely fire-proof warehouses. These are built on the unit system and extend along the quays, parallel to the docks, with fenced spaces between the warehouses where heavy freight is stored. In these open bays is the inclined belt-conveying machinery used for loading sacks of coffee. Across the street from the docks millions of bags of coffee are stored in great warehouses, which extend as far as one can see, occupying the entire area back of the docks.

When ready for export it is loaded by conveying belts which are permanently in place in the bays between the dock warehouses. The installation consists of a platform which extends along the sides of the dock warehouses for about a mile. This

supports the main belt conveyor. Inclined conveyors deliver the coffee to this long endless belt, which in turn carries the sacks along until they are intercepted by one of the loading machines and automatically delivered aboard the steamer. These loading machines run on tracks and move by their own electric power up and down the dock. In them are the motors that operate the belt conveyors and indeed all of the complicated machinery of this huge loading device. It is too bad, but of the miles of belting used not one foot of it is rubber. Stitched canvas is what they use, and they are convinced that rubber belting would not stand up in that hot, humid atmosphere.

(To be continued.)

HOW MOTORCAR TANKS ARE FILLED IN COLORADO.

By a Western Correspondent.

THEY were discussing their summer vacations, back there in the smoker, and the practical results, if any, attendant on the purely pleasure jaunt.

The quiet, dapper man who had sat still and said nothing, stepped in at this point and remarked:

"I've been summering out in Colorado and the Rockies, and that sort of thing—and I've picked up one new idea that I intend to put to personal use forthwith. Almost the whole country over, except there in Colorado, the automobilist whose machine requires water contents himself with the nuisance of opening seat or tool-box, bringing from it a collapsible bucket, 'hiking' to some farm-house, begging right to use the nearest cistern, and paying for the privilege with cigars, if not in cash itself. Not so in Colorado.

"There the owners of machines—big and little—purchase from the nearest hardware shop a cheap foot-pump, the sort you hold in place by putting your feet on the bars protruding from each side. Then, they buy a good length of hose, coiling this up either at the side (say inside the extra tire), or attaching it underneath the car. There is hardly an automobile jaunt anywhere in this great and glorious republic, of sufficient length to use up one's supply of water, that doesn't take one over some creek, brook, pond or the like. And at such time our western autoists simply throw one end of their hose overboard, the other staying fixed to the tank. A moment or two with the foot-pump and they have pumped up as much water as they will need till the next stop at least. It's a wonderfully handy arrangement, especially on tours away from the beaten paths; and if I were a rubber dealer I would lay in a big supply of hose, and then I would see that every motorist in my neighborhood knew about this new scheme; and as fast as one tried it he'd tell the next.

FILLING TANK WITH GARDEN HOSE.

RUBBER HOSE AS AN AUTO SIPHON.

And it's my guess that every man of them who bought the hose would come back afterwards and thank me for the idea."

A MEXICAN RUBBER COMPANY INVESTS IN A MALAY PLANTATION.

It is a new departure for American rubber companies interested in Mexican plantations to divert any part of their energies to rubber planting in the Far East—but this is what has been done by the Mexican Crude Rubber Co., of Detroit. In the report submitted by the general manager at the recent annual meeting, these two interesting paragraphs may be found: "It is with a feeling of optimism that your manager turns to the subject of the company's new enterprise, its operations in the Federated Malay States. This was undertaken after very careful though by your board of directors following the report of the investigations made by two of the company's most trusted employees. The Mexican Crude Rubber Co. has acquired by purchase three plantations, all of which are cleared and planted, from which the company will commence to market rubber during the year 1914. These plantations are situated in the State of Selangor, which is the best proven rubber district in the Far East. They are known as the Waterfall Estate, comprising 189 acres; the Kuala Garing Estate of 590 acres, and the Bukit Rawang Estate of 456 acres, or a total of 1,235 acres, which was all planted at the time of purchase."

The company has also leased from the Government a wild tract of 1,500 acres adjoining these plantations, which it is now clearing and which it intends to plant to rubber.

GUAYULE RUBBER FACTORY CLOSING DOWN.

The directors of the Guayule Rubber Co., Ltd., London, announce that owing to the disturbed state of Mexico, and particularly in the regions whence the company draws its supplies of raw material, it has been found necessary to practically close down the factory. This has been done temporarily and the staff reduced as far as it is possible to do so. Cable advices to the home office state that for the present it is impossible to guarantee any specific quantity of production. Further sales of rubber are, therefore, not being made, in anticipation of lack of probable output.

AMERICAN RUBBER GOODS FOR FRANCE.

A business man in a French consular district expresses through the United States consul the desire to obtain an agency for American rubber goods. Replies should be addressed to the Bureau of Foreign and Domestic Commerce, Washington, D. C., under No. 11523.

Navy Specifications.

By E. S. Land, Naval Constructor, U. S. N.

A PAPER READ AT THE THIRD INTERNATIONAL RUBBER CONFERENCE, HELD IN NEW YORK, 1912.

IN purchasing material of all kinds it is necessary, particularly where competitive bids are invited, to prepare certain data to enable the manufacturers to submit an intelligent bid. Such data are usually termed specifications. To prepare satisfactory specifications is an art in itself—one that is the subject of keen discussion, wide divergence of opinion and considerable abuse.

In order to cover the ground properly, great care and infinite pains as to details are required, yet the limits must be broad enough to admit of the widest competition available. Considerable care must be exercised not to incorporate clauses which would exclude certain manufacturers or prejudice them against competing; yet at the same time it is essential to incorporate certain clauses which indicate in sufficient detail the quality of the material or the design of the apparatus being purchased.

To avoid the incorporation of proprietary clauses, and clauses calling for patented articles, needs a nicety of judgment difficult to find.

One is apt to hear the statement that "specifications are all rot," that they increase the cost unnecessarily, that they are made only to be "skinned," that one should buy an article because one knows by experience that it is satisfactory for the purpose intended, without going to the infinitesimal and useless detail of specifications. It is freely acknowledged that there is some truth in each of the statements, but that they are basically erroneous as far as Government business is concerned is stoutly maintained.

A private concern can, and a great many of them do, purchase material without specifications of any kind, but they are at liberty to choose the manufacturer who furnishes such material, and if the material furnished proves defective they are at liberty to cease dealing with said manufacturer; not so the Government, which is required by law to purchase material of the lowest bidder offering satisfactory material; and in case the material proves defective there is a certain amount of redress in attempting to eliminate the manufacturer of inferior material when future bids are being considered. Theoretically the Government is on the same plane in this respect as the private concern; practically this is far from being true. It is exceedingly difficult to eliminate unsatisfactory dealers from competition for Government business; only after the most flagrant abuse of the Government's confidence is it practicable to eliminate such dealers, and even if once eliminated the elimination only obtains for a short period of time.

Government business is more or less successfully hedged in by politics, and by the great American spread eagle spirit sometimes embodied in the expression "the Government owes me a living"; and more often by the underlying statement, "Well, I'm a taxpayer and support the Government; therefore I've such and such rights." When you run across such statements as these there is no answer.

If it were possible to deal only with reputable, reliable concerns most of the difficulties would be solved, but it is a recognized fact that one is up against all gradations of dealers, from the man whose material is *par excellence* to the man who wishes to furnish you with something "just as good"; from the man whose trade name is a guarantee of quality to the jobber who intends to give you the very poorest material he thinks there is any chance of having accepted; from the man whose establishment represents years of business skill, sagacity and experience, to the man who "carries his office in his hat."

In dealing with all kinds of people it is absolutely essential to safeguard the interests of the Government by covering material desired with detailed specifications carefully prepared and as adequate as practicable.

To prepare these specifications it is frequently necessary to consult a number of manufacturers whose life-long experience enables them to adequately cover the ground; it is manifestly impossible for any person to have an intimate knowledge of the manufacture of all material used by the Department.

Department officials have always received the greatest consideration and assistance from manufacturers in the preparation of suitable specifications for naval purposes. With this information and with a knowledge of naval requirements, the problem then becomes a matter of digesting the information available and producing therefrom a broad statement of the material desired for the specific purpose, together with sufficient details to enable the manufacturer to obtain a reasonable understanding of what is desired.

It frequently happens that the limits at first evolved are too narrow for adequate competition; revision is then necessary, as it is the Department's desire to approach commercial standards as closely as possible.

ESSENTIAL FEATURES.

1. The title should state in general terms the type of the article and purpose for which it is intended, viz.: "Specifications for cast iron porcelain lined lavatories for ships' use." "Specifications for metal uniform case locks." "Specifications for ship's electric ranges."

2. If a revised specification, the title should state the specifications which it supersedes, viz.: Superseding specifications 3-C-1," issued August 8, 1901.

3. The first paragraph of specifications should state in general terms the type, character and number of parts.

4. The second paragraph should give general dimensions and capacities.

5. The following paragraph should give detailed description of parts. If an article is composed of several complete units which when combined make a complete whole, the separate units should be sub-headed and each described in detail. For examples see "Specifications 57S2, Combination Sterilizing Outfits for Operating Rooms; sub-heads: Water Sterilizers, Bowl and Utensil Sterilizer, Instrument Sterilizer, Dressing Sterilizer, Valves and Fittings," etc.; also "Specifications 26-C-1, Chairs for the United States Navy."

6. Requirements for tests, if any are necessary.

7. Tolerances allowed, and terms for acceptance if material does not meet the specifications in certain respects.

8. Instructions as to packing or shipment, where applicable.

9. A statement to the effect that questions as to interpretation of the specifications should be referred to the Yard, station, or place where the inspecting officer for the material in question is located.

10. Paragraph stating where specifications can be obtained.

11. References—In this connection abbreviate, i. e.:

"Con. Off. New York, 2119 UX Apr. 15, 1911," signifies Construction Officer, Navy Yard, New York, letter number 2119 UX, dated April 15, 1911.

12. When illustrations are considered necessary the tracings for reproduction should be made on sheets 5 inches x 8 inches, so that they may be reproduced that size without reducing. If the article to be shown is too complicated or on account of the arrangements to be shown could not be drawn clearly on the above size sheet, it should be drawn so that it can be reduced to that size for printing and yet have all lines and figures readily readable. Tabulations, titles and other information which can be

embodied in the text of the specifications should be omitted from such tracings. The ink should be black and the lines drawn slightly heavier than ordinary in order that a clear reproduction may result. If impracticable to show all of the illustrations desired on one sheet 5 inches x 8 inches, other parts required should be arranged so as to appear on one or more other sheets of the same size. The drawing itself should not go beyond the limits of ½ inch from the edge of the 5 inch x 8 inch sheet.

New Navy Department Specifications.

THE Navy Department is now issuing a number of revised specifications to supersede those hitherto in force. The principal features of those issued up to the present time, so far as they relate to rubber, are shown below:

RUBBER EAR CUSHIONS FOR FIRE CONTROL INSTALLATIONS.

(Specification No. 17C3a, July 5, 1913.)

MATERIAL: To be properly vulcanized and to be made from a compound containing not less than 45 per cent. of washed and dried fine Pará rubber, not more than 3.5 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: Permanent elongation not exceeding 20 per cent., tensile strength at least 2,200 pounds per square inch.

GAUGE GLASS GROMMETS.

(Specification No. 33G1a, July 15, 1913.)

MATERIAL: Rubber compound—to be properly vulcanized and to be made from a compound containing not less than 35 per cent. of washed and dried fine Pará rubber, not more than 2.5 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: Permanent elongation not exceeding 25 per cent., tensile strength at least 1,500 pounds per square inch.

SHEET PACKING, CLOTH OR WIRE INSERTION.

(Specification No. 33P4a, July 15, 1913.)

MATERIAL: Rubber parts—rubber layers to be properly vulcanized and to be made from a compound containing not less than 25 per cent. of washed and dried fine Pará rubber, not more than 2 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: To bend double in any direction without cracking; to stand four hours' exposure to boiling water without injury to layers, and after four hours' exposure to steam at 150 pounds pressure to show considerable flexibility.

RUBBER HOSE FOR USE IN ENGINEERS' DEPARTMENT.

(Specification No. 34H6a, July 15, 1913.)

MATERIAL: Cotton canvas layers of duck (three plies), free from unsightly defects.

Rubber parts: Tube, cover and washers to be properly vulcanized and to be made from a compound containing not less than 35 per cent. of washed and dried fine Pará rubber, not more than 3 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: Tests on the hose as a whole to be as indicated in general specifications for rubber material.

GUARANTEE: Manufacturers to guarantee hose to be made according to best principles of construction and free from defects of material and workmanship; if defects shown within 2 years the rubber parts to be replaced with new hose.

1¼-INCH RUBBER HOSE.

(Specification No. 34H9a, July 15, 1913.)

MATERIAL: Cotton canvas layers (three plies) free from unsightly defects.

RUBBER PARTS: Tube, cover and washers to be properly vulcanized and made from a compound containing not less than 35 per cent. of washed and dried fine Pará rubber—not more than 3 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: Tests on the hose as a whole to be as indicated in general specifications for rubber material.

Tests of Rubber Compound: Adhesion of friction coat of rubber between plies to stand a weight of 15 pounds without plies separating at greater rate than 1 inch per minute.

Tube and Cover: Tensile strength at least 1,500 pounds per square inch in tube and not less than 1,300 pounds per square inch in cover.

RUBBER PUMP VALVES.

(Specification No. 45V3a, July 15, 1913.)

MATERIAL: Hard valves. To be properly vulcanized and to be made from a compound containing not less than 30 per cent. of washed and dried fine Pará rubber, nor more than 10 per cent. of sulphur. Remainder mineral fillers.

Medium valves. To be properly vulcanized and made from a compound containing not less than 35 per cent. of fine Para, nor more than 5 per cent. of sulphur. Remainder mineral fillers.

Soft valves. To be properly vulcanized and made from a compound containing not less than 35 per cent. of fine Pará rubber, nor more than 2.5 per cent. of sulphur. Remainder mineral fillers.

TESTS: Test on valves as a whole. Valves taken at random to stand a dry heat of 270° F. for one hour, and 400° F. in saturated steam for three hours, without disintegrating or blistering.

SHEET RUBBER TILING.

(Specification No. 59T1a, July 15, 1913.)

CONSTRUCTION: To be built up in two layers, ⅛ inch thick with backing of 10-ounce cotton duck.

MATERIAL: Top layer to resist ordinary wear. Bottom layer of black India rubber, acting as cushion for top layer. Backing of 10-ounce duck free from unsightly defects.

TESTS: Top layer, special test for elasticity. Bottom layer, special test for stretch. Cotton canvas backing, special test for being firmly secured to back of tiling.

RUBBER LIFE BELTS.

(Specification No. 12B1a, March 31, 1913.)

MATERIAL: The fabric to be of the best quality rubber and cotton drill, the rubber having not less than 60 per cent. pure Pará rubber.

TEST: Air pressure test of 5 pounds to the square inch for 8 hours. To support 20 to 22 pounds dead weight in water.

GUARANTEE: Three years.

RUBBER MATTING.

(Specification No. 28M2a, July 15, 1913.)

MATERIAL: The rubber face made from a properly vulcanized rubber compound free from fiber, to show on analysis not more than 60 per cent. mineral matter, not more than 6 per cent. organic acetone extract, nor more than 6 per cent. sulphur. The composition shall be free from objectionable odors.

RUBBER FIRE HOSE.

(Specification No. 34H3a, July 30, 1913.)

MATERIAL: The tube, cover and washer shall be properly vulcanized and have not less than 45 per cent. of washed and dried fine Pará rubber, not more than 3.5 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: The hose shall be tested as indicated in general specifications for rubber material, 33 R. 3 (latest issue).

STEAM HOSE.

(Specification No. 34115a, July 30, 1913.)

MATERIAL: The tube, cover and washers to be properly vulcanized, and made from a compound containing not less than 35 per cent. of washed and dried fine Pará rubber, not more than 3 per cent. of total sulphur, and not more than ½ of 1 per cent. of free sulphur, with the remainder suitable mineral fillers.

TESTS: The hose shall be tested as indicated in general specifications for rubber material, 33 R. 3 (latest issue).

AIR HOSE FOR USE WITH PNEUMATIC TOOLS.

(Specification No. 34118, January 2, 1913.)

RUBBER PARTS: The tube, cover and washers to be made of a properly vulcanized rubber compound. The friction shall consist of a properly vulcanized rubber compound best adapted for the required service.

PURE GUM RUBBER TUBING.

(Specification No. 33T1a, July 25, 1913.)

MATERIAL: The tubing shall be properly vulcanized and made from a compound containing not less than 35 per cent. of washed and dried fine Pará rubber, not more than 2.5 per cent. of sulphur, with the remainder suitable mineral fillers.

TESTS: When test piece is stretched 2 to 8 inches, permanent elongation not to exceed 25 per cent. Tensile strength shall be at least 1,000 pounds per square inch.

HARD RUBBER.

(Specification No. 33R2a, July 25, 1913.)

CONSTRUCTION: The hard rubber shall be furnished in slab, rod or tube form and shall conform to the dimensions specified in original proposal. If required in sheet form, it shall be of uniform thickness, smooth finish, perfectly flat and polished on both faces.

MATERIAL: The hard rubber shall be made from a properly vulcanized compound best adapted for the required service.

TESTS: When broken, to show a shiny black fracture. To be sufficiently tough to be worked with machine tools, and to take a jet-black polish. To show a high insulation and dielectric strength. To stand exposure to live steam at 212° F. for 2 hours.

RISKS OF POISONING IN RUBBER INDUSTRY.

WITH the increased variety of chemicals employed in the rubber industry, there is a corresponding increase in the risks of poisoning arising from their use. This subject is treated in a lucid and comprehensive manner in the "Gummi-Kalender" for 1912, by Dr. Rambousek.

CARBON DISULPHIDE.

Chronic disulphide of carbon poisoning has formed the object of researches by various experts. According to the results obtained, the minimum proportion of sulphide producing noxious effects is one milligram (0.015432 grain) of disulphide to one liter (61 cubic inches) of air. A protracted stay in such an atmosphere, to which rubber workers are in some cases exposed, is sufficient to cause chronic poisoning. This limit is often exceeded in vulcanizing workrooms, particularly in the absence of special protective measures. It is remarked, however, that the limit of safety is not likely to be exceeded in modern plants, if the ventilation is even moderately satisfactory. In some cases the air in older Berlin factories has been found to contain 3 to 6 times the minimum quantity of carbon disulphide where poisonous effects commence.

Laudenheimer, while recording the comparatively favorable results of precautionary measures at the principal Leipzig factories, adds that the percentage of mental and nervous affections among rubber workers, caused by carbon disulphide, is higher than in other branches of industry under like working conditions. In the years 1896 to 1898 there were in the Leipzig rubber plants averages of 1.95 per cent. of nervous and 0.22 per cent. of mental affections, while in the textile branch the proportions were respectively only 0.92 per cent. and 0.03 per cent.

Recent statistics of Berlin rubber factories showed that with a total working staff of 2,228 there had been in one year 1,041 cases of illness and 20 deaths. Of the former, the percentage of nervous disorders was 2.83 per cent., and of poisoning 1.40 per cent. Compared with the Leipzig averages for the years 1896 to 1898, it would seem that the proportion of nervous diseases had increased in the rubber industry.

BENZINE AND BENZOLE.

Benzine poisoning seems to be of minor importance in the rubber industry, and of much less moment than that resulting from carbon disulphide. Benzole poisoning has been described by Santesson as having occurred in a factory at Upsala (Sweden), where nine young women, employed in making pneumatic tires, became seriously ill, four of them dying.

In another case quoted, rubber dissolved in benzole was applied in the usual way by a spreading machine. Of the three workers occupied on this machine, one became unconscious and succumbed to the poison. In a rubber extracting plant, a worker tending a benzole distilling apparatus was overcome by the fumes of the benzole. Two other workers, who tried to save him, were affected in a similar way, only one of the three escaping with his life. Dr. Rambousek criticizes the manner in which two substances so different as benzine and benzole have been confounded by certain technical writers.

ANILINE.

At a plant engaged in the extraction of crude rubber from rosin by means of aniline, out of seventeen workers eleven fell ill within two months.

HARD RUBBER WASTE.

Crzellitzer has recorded a case of poisoning through the grinding of hard rubber waste, which affected the workers engaged in the process.

VULCANIZING FLUIDS.

Attention is called to the noxious effects on the skin, of the liquids used in vulcanizing. This result is attributed in the first place to the benzine and carbon disulphide present in the solutions.

Such are a few of the principal sources of poisoning in rubber manufacturing, quoted by Dr. Rambousek, who has, moreover, given copious references to various authorities on the subjects treated.

TO GET RUBBER FROM THE SAGEBRUSH.

Congressman Baker, of California, recently introduced a resolution in the House, asking for an appropriation of $5,000, to be used in analyzing and testing the sagebrush and greasewood which grow so extensively in California, Nevada and other parts of the far West. In fact they grow far too extensively for the comfort of the farmers, who have found these growths a tremendous pest. Some experiments tried a while ago, however, by chemists, brought out the fact that sagebrush has quite a large content of rubber, alcohol and acetic acid, and it is hoped that some system of treatment may be discovered that will render it possible to extract these constituents, and especially rubber, in profitable quantities.

INCREASED AMERICAN TRADE WITH TASMANIA IN RUBBER GOODS.

Statistics from Consul George M. Hanson, of Hobart, show imports of American rubber goods into that colony as $5,508 in 1911 and $9,408 in 1912.

The Struggle Between Brazil and the Far East.

WHILE the "Awakening of Brazil" has been generally recognized as one of the most interesting factors in the economic history of the day, it has given rise to criticism in Europe. In particular, the question is discussed by M. Jules Tilmant, in the "Bulletin de l'Association des Planteurs de Caoutchouc," and being published in the organ of that representative body, his remarks, while specially intended for European capitalists, invite general attention and consideration.

One of the chief points urged is that what might have been possible in Brazil had systematic plantations been established ten years ago, is now difficult, if not impossible of execution. In other words, had Brazil gone in for rubber planting at the same time as the Far East, she would now have been in a better position to meet Asiatic competition. Taking matters, however, as they are, M. Tilmant asks whether it is still possible to make up for lost time, and whether the measures proposed are of such a nature as to offer a prospect of the desired results being accomplished.

INCREASED PRODUCTION.

In view of the position occupied by plantation rubber as a result of larger production, the increase of Brazilian output has naturally engaged primary attention. This end would apparently be attainable through planting on an extensive scale and through the adoption of modern methods of tapping. But, as M. Tilmant remarks in speaking of the former subject:

"This augmented output might have been anticipated had planting been undertaken at an earlier date and had the necessary labor been available in Brazil. But, apart from the difficulties and tentative methods inherent to every new industry, and the obstacles presented by the unhealthy climate to the introduction of foreign labor—some five years must elapse before the first results can be looked for. By that time, what will be the price of the article? Admitting simply that the actual progress of the Far Eastern plantations will be continued upon the same scale, a new and serious fall in rubber must be foreseen."

ADOPTION OF EASTERN TAPPING METHODS.

With reference to the adoption of Eastern tapping methods, M. Tilmant expresses the opinion that the advantages of modern processes will only exercise any real effect when the system as carried out in the Far East has been fully introduced. This would consist in the establishment of regular plantations, forming blocks containing several thousands of *Hevea* trees, which, by the concentration of their working, would allow of intensive and regular tapping by a relatively small number of native laborers.

Concentrated exploitation being an indispensable factor of remunerative working, M. Tilmant asks whether this method could at present be applied in Brazil to the extraction of wild rubber. He does not regard such a course as probable, the *Hevea* trees being generally in small groups. If the Malayan system were applied, the *seringueiros* would have to remain all the season at the same place, tapping at the most forty or fifty trees every two or three days. In order that their work may be remunerative, they should tap at least 100 to 200 trees a day, which is impracticable, seeing that the *Hevea* trees are scattered in small groups, sometimes at great distances.

SUITABLE LOCATIONS FOR PLANTATIONS.

While expressing doubt as to the general policy of Brazilian plantations, M. Tilmant calls attention to the fact that there are regions not far from Pará where plantations might be established. It would, however, be necessary to choose relatively elevated locations, above the level of inundations and with good facilities of transportation to the point of export. Among the general heads calling for investigation would be that of obtaining labor at a rate which would not be prohibitive. As the climate in the immediate vicinity of Pará is far from being as unhealthy as in the forests of the Upper Amazon, it is considered likely that workers could be obtained on suitable terms for the former region. It is added that the above subjects deserve thorough investigation on the spot.

EXPERIMENTAL STATIONS.

It is recommended to follow in Brazil the policy at first adopted in Ceylon, of being guided by the results shown by the experimental stations, before planting on a larger scale. Trials should be conducted for several years and the results compared with those of the Far East. In the establishment of these experimental stations it is suggested that an examination be made of the chemical composition of the soil, as well as of the drainage. The latter point is indispensable for the successful cultivation of *Hevea*, in view of the height attained by the waters of the Amazon during the rainy season. Another subject of investigation should be the supply of water available in the dry season.

FISCAL MEASURES.

Attention is called to the fact that the graduated reduction of export duty, which would diminish that charge by one-half within five years, would still leave it at 10 per cent., as compared with 2 per cent. in the Far East. Disapproval is expressed of the granting of premiums for planting rubber, as being detrimental to the finances of Brazil.

RAILWAYS.

While the advantages of the proposed new railways are conceded, M. Tilmant asks whether with the unhealthy climate of the districts to be traversed, the necessary labor would be available.

WASHING AND REFINING RUBBER.

Referring to the proposed establishment of washing plants, M. Tilmant remarks that the rubber intended for washing is entirely coagulated and partially dried, expressing doubt as to whether in its new form it would stand a journey without being thereby affected. Washing takes place in the East within at latest twenty-four hours after collection, when the latex has scarcely coagulated. Another point referred to is that the presence of a relatively large quantity of water allows of Pará rubber being kept for years, while plantation rubber, being dry, does not keep so well.

Crude rubber now enters most industrial nations free of duty. M. Tilmant, however, calls attention to the possibility of washed rubber being regarded as a partially manufactured article, and therefore not entitled to such free admission.

PROPOSED RUBBER GOODS FACTORY AT PARA.

M. Tilmant regards as practicable only to a limited extent the idea of establishing a rubber goods factory at Pará. Such a factory, making a variety of articles, would require other grades besides Pará rubber, unless it confined itself to a limited range of products for domestic consumption. This business alone would be insufficient for such a factory.

The export business in rubber goods of Brazilian manufacture is considered problematical in view of the duties imposed by consuming nations.

THE AKERS REPORT.

In criticizing the Akers report, M. Tilmant refers to a prospective rubber cost of 1*s.* 8*d.* (40 cents). This cost is apparently reached by estimating the possible saving as 16*d.* (32 cents) out of the present estimated cost delivered in Europe of 3*s.* (72 cents). He disputes the propriety of including export duties and commissions among the reductions, but if they figure among the elements of cost, any decrease in these items should be

taken into consideration. In the June issue of THE INDIA RUBBER WORLD, page 473, the f. o. b. cost in Brazil was shown as 32½ pence (65 cents), to which the addition of 7 cents for freight to Europe makes the European delivered cost of 72 cents as shown above.

The estimated reduction of 10*d.* (32 cents) out of 3*s.* (72 cents) includes 8*d.* (16 cents) under the head of "augmented production." This figure is specially disputed. M. Tilmant, basing his statement on the facts quoted, expresses the opinion that the introduction into Amazonia of the tapping system of the Far East is scarcely practicable, no increased yield being therefore in prospect from that cause. The cost of production in the Far East, in M. Tilmant's opinion, will constantly diminish, but not that of Amazonia.

As to Chinese immigration, it is pointed out that with a mortality of 30 per cent. among acclimatized workers, the conditions for newly-arrived laborers would be still worse. He further remarks:

"It would seem that Mr. Akers has not sufficiently studied the deadly climate of Amazonia. The question of climate forms the crux of the Brazilian plan, there being a natural obstacle to be overcome."

In conclusion, M. Tilmant adds:

"There is another cause which prevents us from believing in the success of the Brazilian projects. It is that there exist as a fact in Brazil immense reserves of *Hevea* forests, sufficient to furnish the world with rubber. It seems at least Utopian under these conditions to proceed with new plantations. It is just the want of labor which renders impossible the exploitation of these reserves.

"It is under these unfavorable conditions that Brazil is asking the co-operation of foreign capital in the execution of its "Plan of Defence."

As showing the other side of the case, M. Tilmant's remarks afford an opportunity of seeing how the Brazilian proposals are looked at in Europe and particularly in Belgium. A matter of such importance should be discussed from all points, with a view to the best solution of the existing difficulties.

STANDARDIZATION OF LATEX.

In discussing the lack of uniformity in plantation rubber, Mr. Robert T. Byrne, chairman of the Leyland and Birmingham Rubber Co., Ltd., and also chairman of a planting company, lately said planters would never get the proper value, from a market point of view, for their rubber until they had some recognized system of standardizing their latex, so that when the manufacturer bought standard No. 1 quality rubber he did not mind whether it came from Ceylon, or from the Straits, or from Malaya, or from Borneo, or from anywhere else. The rubber should be all the same to him, and he should be able to deal with it in the same way. The existing state of things was, to his mind, nothing short of chaos from the manufacturer's point of view.

AN ENGLISH OPINION ON STANDARDIZATION.

In discussing the above question the "Financier" remarks: "If plantation latex were treated in the same way as the Brazilian collector treats the milk, the product would be fine hard Pará. It is entirely a matter of preparation. Under existing methods it is contended that two essentially different products are obtained in Brazil and in the Orient. But it does not follow that because plantation rubber differs from Brazilian it is necessarily inferior. The manufacturer has apparently not yet come to a definite conclusion himself on this point. The trouble arises out of the fact that no two plantations adopt precisely the same formula and process in treating their latex. It would seem to be a simple matter for a recognized body, such as the Rubber Growers' Association, to frame a standard formula for general adoption in rubber factories throughout the plantation region."

MR. C. A. LAMPARD ON THE SITUATION.

As chairman of the recent London meeting of the Rubber Plantations Investment Trust, Mr. C. A. Lampard stated, regarding the cost of production in Sumatra, that, while the United Serdang Co.'s properties are not nearly in full bearing, the estimate for next year's f. o. b. cost is 11 *d.*, while he expects the facts would in due time justify the anticipations formed of a still further reduction. He thought 2*s.* 6*d.* per pound would be a safe figure at which to estimate the cost of producing Amazonian and African rubber.

He further pointed out that the American consumption of crude rubber in 1912 was 50,210 tons, against 34,404 tons in 1911, showing an increase of about 45 per cent. The net American imports this year from January to April had dropped, as compared with last year, from 20,453 to 18,113 tons, or about 11 per cent. This result he considered due to the Akron strike and the floods.

While Brazilian rubber was being held in March and April, plantation companies decided to sell and by getting their rubber into use in the factories prevent any accumulation. As a result, stocks of plantation are now 100 tons less than in February last.

American manufacturers, he added, now that the Antwerp and Brazilian people want to sell in America, say: "No, we have altered our compounds now to suit the use of plantation rubber. Unless you are going to give us very strong inducements, not temporary, but extending over a lengthened period, we are not going to switch back to wild rubber." The prospective decrease in the production of the wild article with the increasing consumption would place plantation rubber in the very strongest position.

In conclusion, Mr. Lampard urged two points: First, that under proper management, plantation rubber can be produced more cheaply in the middle East than in any other part of the world; and second, that the middle East can produce and manufacture rubber in every respect and for all purposes equal to that previously produced elsewhere. Out of an estimated consumption for 1913 of 120,000 tons, the plantation industry expects to produce 45,000 tons.

WHY ENGLISH MANUFACTURERS USE BRAZILIAN RUBBER.

The "London and China Express" lately wrote:

"At present the manufacturers are content to use the Brazilian article because they have not to alter their mixing formulæ, which they are loth to do until they are certain of the qualities of the rubber used. Formerly they were not certain as to the supply; now they require a recognized standard of quality they can work to.

"The reason plantation rubber is not the equal of the wild rubber from a manufacturer's point of view lies in the different methods of curing these rubbers. It is the fact, too, that nearly every plantation company has its own ideas of preparing its rubber, whereas if all plantation rubber were prepared in a standard manner rubber manufacturers would be able much more readily to adopt their methods to plantation rubber than is at present the case."

It is stated that the Rubber Growers' Association expects, after a series of exhaustive experiments, that it will be possible to convince manufacturers that plantation rubber is equal to fine hard Pará.

TO MAKE ENGLISH TIRES IN BRAZIL.

A new company, known as the Dunlop Pneumatic Tyre Co. (South American, Ltd.), has been formed with the purpose of erecting and operating a factory in Brazil for the manufacture of tires. This company, which is capitalized at $25,000, divided into 5,000 shares, is a subsidiary of the English company of the same name.

PLANTATION RUBBER AND DIRECT PURCHASES.

TWO communications in the "Tropical Agriculturist" deal with the questions of the intrinsic qualities of plantation rubber and with the manner in which it reaches the American consumer.

In the first of these, Mr. A. D. Thornton, managing director of the Canadian Consolidated Rubber Co., relates how his first experience in 1905 led to his finding out how to use plantation rubber, in which he is a great believer, being convinced that within a few years wild rubber will prove a very poor second.

In the meantime, he remarks, both planter and consumer have much to study, particularly as to uniformity. A five-ton lot he had lately received from London contained eight very distinct grades, while with several parcels bought direct from Colombo he had no such trouble. He is aiming to find some means of being able to tell what he is buying when offered a parcel by cable.

In the opinion of a New York authority, who does not wish his name mentioned, a margin of about 5 per cent. between plantation and fine Pará is not sufficient, but with a uniform difference of, say, 15 per cent., a greater amount of plantation rubber would be used. He likewise urges the need of uniformity in quality, which he thinks will probably be attained with the increased production anticipated.

Contrasting the advantages of direct purchases as compared with operations via London, he points out that while at that point heavy commissions are paid, inasmuch as rubber has to be warehoused, sampled and repacked, numerous charges of this kind are not incurred at New York. The only expenses on direct shipments would be freight, insurance, selling commission of 1 per cent. and a small charge for weighing and custom house entry. On arrival the rubber would be delivered ex dock, with no more charges attached.

It is added that America uses today the largest percentage of the output of the Middle East, and should not be required to purchase through London.

WHY PLANTATION RUBBER IS CHEAPER THAN BRAZILIAN.

In replying to a shareholder, at the recent meeting of Perak Rubber Plantations, Ltd., the chairman, Mr. Keith Arbuthnot, said that the reason why plantation rubber was selling below Brazilian rubber must be clear to everybody; that the plantation industry had a large crop coming in from day to day, which was put up at auction and sold without reserve, whereas the Brazilian crop was practically all controlled by one hand. Efforts were being made to regulate and improve the selling of the crops from the East. At present there were very many sellers and only about six buyers, but they would very likely be able to reverse that order of things.

HONDURAS RUBBER.

A Honduras report speaks of an offer made to the government by Dr. Fausto Davila, of Honduras. He has asked the sole right during fifty years of gathering rubber, obtained from the *Castilloa, Siphonia Elastica, Hevea Brasiliensis, Manihot Glaziovii* and other varieties which are found in the provinces of Colon, Olancho and Yoro. He likewise asks for permission to gather rubber upon government land. An export tax of 10 per cent. on the value of rubber shipped would revert to the government.

DEPRECIATION OF PLANTING MACHINERY.

At the meeting of the Merlimau Rubber Estates, the chairman reported that while the sum allowed for depreciation of machinery represented for last year 2½d. per pound, the anticipated increase of production would probably reduce that charge for this year to the equivalent of 1d. per pound.

REDUCED BRAZILIAN EXPORT AND IMPORT DUTIES.

BY a Brazilian Presidential Ordinance of June 2, the Minister of Agriculture was authorized to make an agreement with the State of Pará for the exemption of cultivated rubber from export tax during twenty-five years, and the reduction of the export duty levied on wild rubber in that state. An agreement made the same day provided for the reduction of the duty by 2 per cent. on January 1, 1914, and a successive annual diminution of like extent during five years. In this way the present rate of 20 per cent. would be cut in two within the time named.

The Brazilian government has, morever, expressed its willingness to recommend to the Federal Congress, the reduction by at least 20 per cent. of the duties on necessaries imported by the rubber producing territories. These include: condensed milk, kerosene, cordage, fishing lines, fire-arms for hunting, cartridges and ammunition, clothing, provisions and medicines.

AFTER THAT THIRTY-MILLION-DOLLAR TRADE IN SOUTH AMERICA.

THE April issue of THE INDIA RUBBER WORLD contained a full and detailed account of the rubber manufacturing plant which the Goodyear Tire and Rubber Co. of Akron, Ohio—through a subsidiary company known as the Goodyear Tire and Rubber Co., of South America—contemplates building in Rio Janeiro. Mr. J. C. MacFadyean, the vice-president and general manager of this South American company, who has been in this country for the last few months, sailed on August 9 by way of Europe for Brazil, and, being interviewed just before sailing, gave some interesting additional information regarding the company's expectations in that new field.

He estimates that South America consumes $30,000,000 worth of manufactured rubber goods in a year, one-third of this amount being consumed in Brazil. He states that Rio Janeiro alone has 4,800 automobiles and uses up $3,000,000 worth of tires annually. As there is at present no rubber factory anywhere in South America, his company hopes to get this entire rubber business, all of which practically now goes to European manufacturers. He mentioned two tremendous advantages which his company will enjoy, viz., its immunity from the 20 per cent. export tax on crude rubber, and from the 50 per cent. import tax levied on the manufactured article. The cost of the Goodyear plant in Rio Janeiro is placed at $1,300,000, and Mr. MacFadyean estimates that the company will start in about a year's time, with 600 workmen, none of whom will be North Americans except the superintendents and heads of departments.

Mr. MacFadyean thinks there is a great field for Americans on the Southern continent. "American manufacturers," he says, "make a great mistake by not going down there to investigate. In my opinion, and I have traveled over most of the known world, there is no place that offers so many opportunities as South America, and opportunities of so many sorts. England and Germany now control those markets, and it is just because American manufacturers have never gone after them in the right way. We are trying to get American manufacturers to go down there. Land is to be had almost anywhere—and you can get better land down there for 50 cents an acre than you can buy in many Western States at much higher figures, and there are thousands of acres of it.

"It is a mistake to contend that Rio is an expensive place to live. It doesn't touch New York. You can get a suite of rooms and three square meals there or in Buenos Aires for what you might pay simply for the rent of a suite here.

"It is getting time for American manufacturers and exporters to wake up to what is going on down there. If they don't go after that trade energetically soon, there won't be any chance."

Sources of Error in Determining the Acetone Extract in Rubber Compounds.

By Professor W. Jones.

SOME years ago the total acetone extract obtained from a rubber compound, less the free sulphur, was considered as belonging to the rubber in the compound, and as a result we often had an abnormal increase in the percentage of extract above that contained in the rubber used. Whether this was fair to the manufacturer or not, seemed not to be considered. However, as the examination of rubber compound progressed, and paraffine began to be used in the compound, it became quite clear that this method must be modified, that not only the free sulphur should be deducted, but all paraffine and mineral oil as well. This is now the general practice and gives a much more accurate composition of the compound. In making these determinations we find it quite necessary to watch certain sources of error, some of which are still overlooked by many very careful chemists.

To start these determinations, of course the rubber has to be cut fine, not necessarily to pass a certain sized sieve, but should be cut thin, so as not to make the time of extraction unduly prolonged.

The extracting apparatus should be one in which the extraction is made at near the boiling point of the acetone, and where the acetone passes through the rubber at this heat. All joints should be ground glass. We generally use one gram of the dried compound in making the extract.

In placing this in the extractor, we may use either of two methods. First, we may use a Gooch crucible to hold the rubber, or we may use a paper thimble or filter paper. This at first sight might seem to be immaterial, but we do not think so.

If we use a Gooch crucible, we will find that in case the compound contains lampblack, some of this black is carried into the extract. This being black can be plainly seen. We find, too, that a small amount of mineral filling is also carried into the extract. This being white does not show, and is quite likely to be overlooked.

If a paper is used, we can get the extract free from any lampblack or mineral. The only objection to the paper is, that while they are ether-extracted, they still contain much resin, which is given up to acetone, and we have found that before using a paper it is absolutely necessary to extract it with acetone until nothing more is dissolved from it, and that this takes often from two to three days' extraction.

If we use the crucible, it is quite necessary to look for mineral in the extract, and deduct its weight from the total, before proceeding further.

The second point to be observed is the acetone itself. We rarely, if ever, buy acetone that does not give a residue upon evaporation, and it is therefore the practice to redistil it. This, however, must be done within a short time of its use, as it is found that acetone does not keep.

Acetone after careful redistilling, so that it leaves no residue, will, after keeping a short time, develop a yellow tint and again give a residue. This is more pronounced if it has been kept in a clear glass bottle in strong daylight. If it is kept in a dark bottle, there is very little change. We think it better in all cases to test the acetone immediately before using. After taking these precautions we will get a correct percentage of total extract.

This extract will contain free sulphur, paraffine, mineral oil, and organic extract, due to the rubber, and which is saponifiable. In separating the extract into these items, we are again liable to error.

The first thing we do is to saponify with alcoholic potash. This is done in the usual manner, by evaporating over steam.

Upon adding water, and extracting with ether, we obtain an ether solution of the paraffine and mineral oil, while the organic extract remains in the water solution as soap, together with the free sulphur, which is probably taken up as sulphide of potash.

If now we evaporate the ether solution, we will get the combined paraffine and mineral oil; then by deducting this weight, plus the free sulphur, from the total extract, we obtain the organic.

We have found in many cases when the reverse of this has been done; instead of weighing the mineral fats, the soap solution has been acidified and extracted with ether, evaporating this to get the organic, then by taking this organic plus the sulphur, from the total extract, to give the mineral.

We learn that parties using this method have generally found the mineral or paraffine much less than what was used, and they could not account for it. The reason for this is, that they got the organic figure too high, so making the mineral oils too low. This is readily accounted for by the use of alcoholic potash, which has become only slightly yellow upon keeping, when there is found in it what appears to be aldehyde resin, which being saponified, is weighed with the organic from the rubber, making this figure too high.

The free sulphur we determine from the soap solution, after extracting the paraffine, in the following way: To the solution we add a small excess of nitric acid and a few drops of bromin. We then evaporate this down to one or two cubic centimeters, add carbonate of soda in large excess, transfer to a platinum dish and fuse, to get rid of organic matter; dissolve in water and hydrochloric acid, and precipitate the sulphur in the usual way with barium chloride. We thus get all determinations from one extraction.

Recapitulation:

The errors to be guarded against in these determinations are:

1st: In the condition of the acetone used.

2nd: Resin in the paper thimble or filter paper.

3rd: In using a Gooch crucible, the liability of carbon or mineral matter going into the extract and being weighed up as extract.

4th: In weighing the organic extract instead of the mineral. The condition of the alcoholic potash is liable to cause errors. In all these cases the liability is to make the organic extract too high.

We have found that in following these methods, we at times get an extract which might appear to be abnormally low; that is, we find the organic extract to be less than that contained in the rubber used, while the general idea has been that we should in all cases get more; the increase being accounted for by the vulcanization, which is credited with increasing the organic extract in the compound.

This has led us to a long series of tests, to determine why in some cases we get less and in others we get more extract than was contained in the rubber used. We find that if the compound is properly made there is no increase in the organic extract, while as it is usually made, and with the same ingredients, there is a considerable increase. This increase does not take place during vulcanization, as is thought, but during the mixing on the rolls, so that the maximum of extract will be found after mixing and before vulcanization.

PLANTATION RUBBER AND DIRECT PURCHASES.

TWO communications in the "Tropical Agriculturist" deal with the questions of the intrinsic qualities of plantation rubber and with the manner in which it reaches the American consumer.

In the first of these, Mr. A. D. Thornton, managing director of the Canadian Consolidated Rubber Co., relates how his first experience in 1905 led to his finding out how to use plantation rubber, in which he is a great believer, being convinced that within a few years wild rubber will prove a very poor second.

In the meantime, he remarks, both planter and consumer have much to study, particularly as to uniformity. A five-ton lot he had lately received from London contained eight very distinct grades, while with several parcels bought direct from Colombo he had no such trouble. He is aiming to find some means of being able to tell what he is buying when offered a parcel by cable.

In the opinion of a New York authority, who does not wish his name mentioned, a margin of about 5 per cent. between plantation and fine Pará is not sufficient, but with a uniform difference of, say, 15 per cent., a greater amount of plantation rubber would be used. He likewise urges the need of uniformity in quality, which he thinks will probably be attained with the increased production anticipated.

Contrasting the advantages of direct purchases as compared with operations via London, he points out that while at that point heavy commissions are paid, inasmuch as rubber has to be warehoused, sampled and repacked, numerous charges of this kind are not incurred at New York. The only expenses on direct shipments would be freight, insurance, selling commission of 1 per cent. and a small charge for weighing and custom house entry. On arrival the rubber would be delivered ex dock, with no more charges attached.

It is added that America uses today the largest percentage of the output of the Middle East, and should not be required to purchase through London.

WHY PLANTATION RUBBER IS CHEAPER THAN BRAZILIAN.

In replying to a shareholder, at the recent meeting of Perak Rubber Plantations, Ltd., the chairman, Mr. Keith Arbuthnot, said that the reason why plantation rubber was selling below Brazilian rubber must be clear to everybody; that the plantation industry had a large crop coming in from day to day, which was put up at auction and sold without reserve, whereas the Brazilian crop was practically all controlled by one hand. Efforts were being made to regulate and improve the selling of the crops from the East. At present there were very many sellers and only about six buyers, but they would very likely be able to reverse that order of things.

HONDURAS RUBBER.

A Honduras report speaks of an offer made to the government by Dr. Fausto Davila, of Honduras. He has asked the sole right during fifty years of gathering rubber, obtained from the *Castilloa, Siphonia Elastica, Hevea Brasiliensis, Manihot Glaziovii* and other varieties which are found in the provinces of Colon, Olancho and Yoro. He likewise asks for permission to gather rubber upon government land. An export tax of 10 per cent. on the value of rubber shipped would revert to the government.

DEPRECIATION OF PLANTING MACHINERY.

At the meeting of the Merlimau Rubber Estates, the chairman reported that while the sum allowed for depreciation of machinery represented for last year 2½d. per pound, the anticipated increase of production would probably reduce that charge for this year to the equivalent of 1d. per pound.

REDUCED BRAZILIAN EXPORT AND IMPORT DUTIES.

BY a Brazilian Presidential Ordinance of June 2, the Minister of Agriculture was authorized to make an agreement with the State of Pará for the exemption of cultivated rubber from export tax during twenty-five years, and the reduction of the export duty levied on wild rubber in that state. An agreement made the same day provided for the reduction of the duty by 2 per cent. on January 1, 1914, and a successive annual diminution of like extent during five years. In this way the present rate of 20 per cent. would be cut in two within the time named.

The Brazilian government has, moreover, expressed its willingness to recommend to the Federal Congress, the reduction by at least 20 per cent. of the duties on necessaries imported by the rubber producing territories. These include: condensed milk, kerosene, cordage, fishing lines, fire-arms for hunting, cartridges and ammunition, clothing, provisions and medicines.

AFTER THAT THIRTY-MILLION-DOLLAR TRADE IN SOUTH AMERICA.

THE April issue of THE INDIA RUBBER WORLD contained a full and detailed account of the rubber manufacturing plant which the Goodyear Tire and Rubber Co. of Akron, Ohio—through a subsidiary company known as the Goodyear Tire and Rubber Co., of South America—contemplates building in Rio Janeiro. Mr. J. C. MacFadyean, the vice-president and general manager of this South American company, who has been in this country for the last few months, sailed on August 9 by way of Europe for Brazil, and, being interviewed just before sailing, gave some interesting additional information regarding the company's expectations in that new field.

He estimates that South America consumes $30,000,000 worth of manufactured rubber goods in a year, one-third of this amount being consumed in Brazil. He states that Rio Janeiro alone has 4,800 automobiles and uses up $3,000,000 worth of tires annually. As there is at present no rubber factory anywhere in South America, his company hopes to get this entire rubber business, all of which practically now goes to European manufacturers. He mentioned two tremendous advantages which his company will enjoy, viz., its immunity from the 20 per cent. export tax on crude rubber, and from the 50 per cent. import tax levied on the manufactured article. The cost of the Goodyear plant in Rio Janeiro is placed at $1,300,000, and Mr. MacFadyean estimates that the company will start in about a year's time, with 600 workmen, none of whom will be North Americans except the superintendents and heads of departments.

Mr. MacFadyean thinks there is a great field for Americans on the Southern continent. "American manufacturers," he says, "make a great mistake by not going down there to investigate. In my opinion, and I have traveled over most of the known world, there is no place that offers so many opportunities as South America, and opportunities of so many sorts. England and Germany now control those markets, and it is just because American manufacturers have never gone after them in the right way. We are trying to get American manufacturers to go down there. Land is to be had almost anywhere—and you can get better land down there for 50 cents an acre than you can buy in many Western States at much higher figures, and there are thousands of acres of it.

"It is a mistake to contend that Rio is an expensive place to live. It doesn't touch New York. You can get a suite of rooms and three square meals there or in Buenos Aires for what you might pay simply for the rent of a suite here.

"It is getting time for American manufacturers and exporters to wake up to what is going on down there. If they don't go after that trade energetically soon, there won't be any chance."

Sources of Error in Determining the Acetone Extract in Rubber Compounds.

By Professor W. Jones.

SOME years ago the total acetone extract obtained from a rubber compound, less the free sulphur, was considered as belonging to the rubber in the compound, and as a result we often had an abnormal increase in the percentage of extract above that contained in the rubber used. Whether this was fair to the manufacturer or not, seemed not to be considered. However, as the examination of rubber compound progressed, and paraffine began to be used in the compound, it became quite clear that this method must be modified, that not only the free sulphur should be deducted, but all paraffine and mineral oil as well. This is now the general practice and gives a much more accurate composition of the compound. In making these determinations we find it quite necessary to watch certain sources of error, some of which are still overlooked by many very careful chemists.

To start these determinations, of course the rubber has to be cut fine, not necessarily to pass a certain sized sieve, but should be cut thin, so as not to make the time of extraction unduly prolonged.

The extracting apparatus should be one in which the extraction is made at near the boiling point of the acetone, and where the acetone passes through the rubber at this heat. All joints should be ground glass. We generally use one gram of the dried compound in making the extract.

In placing this in the extractor, we may use either of two methods. First, we may use a Gooch crucible to hold the rubber, or we may use a paper thimble or filter paper. This at first sight might seem to be immaterial, but we do not think so.

If we use a Gooch crucible, we will find that in case the compound contains lampblack, some of this black is carried into the extract. This being black can be plainly seen. We find, too, that a small amount of mineral filling is also carried into the extract. This being white does not show, and is quite likely to be overlooked.

If a paper is used, we can get the extract free from any lampblack or mineral. The only objection to the paper is, that while they are ether-extracted, they still contain much resin, which is given up to acetone, and we have found that before using a paper it is absolutely necessary to extract it with acetone until nothing more is dissolved from it, and that this takes often from two to three days' extraction.

If we use the crucible, it is quite necessary to look for mineral in the extract, and deduct its weight from the total, before proceeding further.

The second point to be observed is the acetone itself. We rarely, if ever, buy acetone that does not give a residue upon evaporation, and it is therefore the practice to redistil it. This, however, must be done within a short time of its use, as it is found that acetone does not keep.

Acetone after careful redistilling, so that it leaves no residue, will, after keeping a short time, develop a yellow tint and again give a residue. This is more pronounced if it has been kept in a clear glass bottle in strong daylight. If it is kept in a dark bottle, there is very little change. We think it better in all cases to test the acetone immediately before using. After taking these precautions we will get a correct percentage of total extract.

This extract will contain free sulphur, paraffine, mineral oil, and organic extract, due to the rubber, and which is saponifiable. In separating the extract into these items, we are again liable to error.

The first thing we do is to saponify with alcoholic potash. This is done in the usual manner, by evaporating over steam.

Upon adding water, and extracting with ether, we obtain an ether solution of the paraffine and mineral oil, while the organic extract remains in the water solution as soap, together with the free sulphur, which is probably taken up as sulphide of potash.

If now we evaporate the ether solution, we will get the combined paraffine and mineral oil; then by deducting this weight, plus the free sulphur, from the total extract, we obtain the organic.

We have found in many cases when the reverse of this has been done; instead of weighing the mineral fats, the soap solution has been acidified and extracted with ether, evaporating this to get the organic, then by taking this organic plus the sulphur, from the total extract, to give the mineral.

We learn that parties using this method have generally found the mineral or paraffine much less than what was used, and they could not account for it. The reason for this is, that they got the organic figure too high, so making the mineral oils too low. This is readily accounted for by the use of alcoholic potash, which has become only slightly yellow upon keeping, when there is found in it what appears to be aldehyde resin, which being saponified, is weighed with the organic from the rubber, making this figure too high.

The free sulphur we determine from the soap solution, after extracting the paraffine, in the following way: To the solution we add a small excess of nitric acid and a few drops of bromin. We then evaporate this down to one or two cubic centimeters, add carbonate of soda in large excess, transfer to a platinum dish and fuse, to get rid of organic matter; dissolve in water and hydrochloric acid, and precipitate the sulphur in the usual way with barium chloride. We thus get all determinations from one extraction.

Recapitulation:

The errors to be guarded against in these determinations are:

1st: In the condition of the acetone used.

2nd: Resin in the paper thimble or filter paper.

3rd: In using a Gooch crucible, the liability of carbon or mineral matter going into the extract and being weighed up as extract.

4th: In weighing the organic extract instead of the mineral. The condition of the alcoholic potash is liable to cause errors. In all these cases the liability is to make the organic extract too high.

We have found that in following these methods, we at times get an extract which might appear to be abnormally low; that is, we find the organic extract to be less than that contained in the rubber used, while the general idea has been that we should in all cases get more; the increase being accounted for by the vulcanization, which is credited with increasing the organic extract in the compound.

This has led us to a long series of tests, to determine why in some cases we get less and in others we get more extract than was contained in the rubber used. We find that if the compound is properly made there is no increase in the organic extract, while as it is usually made, and with the same ingredients, there is a considerable increase. This increase does not take place during vulcanization, as is thought, but during the mixing on the rolls, so that the maximum of extract will be found after mixing and before vulcanization.

We also find that during the vulcanization there is a gradual decrease in the extract, up to about two and a half hours' vulcanization, after which it remains nearly stationary.

When we have taken a rubber with a certain extract, and made a careful mixture, we find there is no increase after mixing and that during vulcanization we have a decrease, so that the final product has less than the original rubber.

Again when we have put the same ingredients into a compound in the ordinary way, we have had a considerable increase after mixing, and the usual decrease during vulcanization. In some cases this decrease may counterbalance the increase, so that the final product will show the same amount as the rubber, while in other cases the increase has been too much to be offset by the decrease, leaving the final product with a higher extract than the rubber.

This decrease we think is due to some of the organic extract being volatile at the heat of vulcanization, so that if there is no increase due to improper mixing, we should find the final product to contain a lower percentage of extract than the rubber used.

TWO NEW KINDS OF RUBBER FOR MEXICO.

IN a late number of the Bulletin of the Mexican Director General of Agriculture, reference is made to a recent study by Professor Ule of two varieties of rubber:

1. *"Manihot Dichotoma"*—Maniçoba—of the valley of Piauhy.
2. *"Manihot Piauhyensis"*—Piauhy and Pernambuco, Brazil.

Commenting on this study, Professor David Thomatis expresses the opinion that these varieties are particularly suited to the tropical districts of Mexico. Their native habitat, in the Piauhy Sierra, is in rocky and stony soil, in argillaceous, sandy and granitic sections, precisely similar to those of the Isthmus of Tehuantepec. The Piauhy Sierra is exposed to much wind, and the varieties mentioned are stated to be low in height.

GROWTH.

There is but little difference between the two varieties, the "Dichotoma," however, being the taller, reaching 40 feet, while the "Piauhy" never exceeds half of that height. It is thus better able to stand the wind, preferring sandy soils and resisting extreme dryness.

On the other hand, the "Dichotoma" prefers argillaceous and calcareous soils. With these new varieties, it is remarked, it will be possible to utilize locations with stiff argillaceous earth and with loose, dry and sandy soil. The saying that nature abhors a vacuum may be paraphrased as implying that she likewise abhors useless soil. It is for man to study how to utilize waste tracts, and in Professor Thomatis' opinion, the varieties of rubber named, which are new to Mexico, will achieve that object.

Both of them shed their leaves during the dry season, when there is more wind, which, however, does not affect them much. They grow rapidly, attaining within the first four months about seven feet, with a trunk circumference of 6 inches, commencing to produce good latex in the third year.

CULTIVATION.

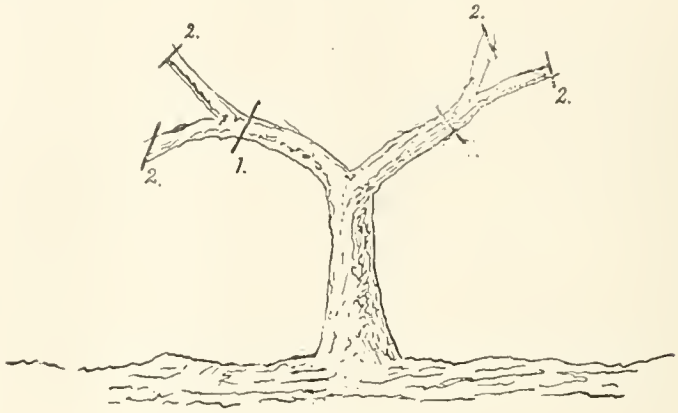
The simplest and most economical arrangement is to plant the trees about 8 feet apart, there being about 600 to the acre. This figure is about four times that usual for Ceará, Pará and *Castilloa*.

In the first year, the plant assumes the shape of a single trunk, which forms in the second year two branches, each of which develops two secondary branches in the third year.

PRUNING.

At this stage, the four branches should be pruned, being left 12 inches in length. Pruning should take place shortly before the rainy season, during which many shoots or buds are put forth. In Brazil, instead of pruning these shoots they are allowed to grow, probably because in the forest conditions they do not grow close together, but at wider intervals.

Upon a systematic plantation, these shoots should be entirely cut every year, thus obliging the secondary branches to give



PROPOSED SYSTEM OF PRUNING.

birth to a new array of shoots. Through this annual pruning the ground gets more light and sun. The annexed figure illustrates the above remarks as to pruning.

TAPPING.

All other varieties of rubber trees are tapped during the dry season. The latex is being formed all the year but becomes finally concentrated when the leaves are falling.

Dichotoma and *Piauhyensis*, on the other hand, require some moisture to develop their latex, and are therefore generally tapped during the rainy season. This fact is attributed to their being cultivated in a dry and well-ventilated soil. In the Upper Congo varieties resembling *Dichotoma* are tapped in both the dry and wet seasons. Dr. Thomatis recommends tapping during the dry season, accustoming the tree to develop and produce its latex at that period, when it would be of better quality and less resinous than at other times. He repeats that with these new varieties tapping can be commenced the third year, while six years is the age to be allowed for *Castilloa*, and about ten for other trees. Each tree in these new categories can produce annually more than 2 pounds of latex, which will give 50 per cent. of excellent block rubber. This, it is added, is twice the yield of any other rubber tree.

ADVANTAGES OF NEW VARIETIES.

To use the author's own words: "All these advantages represent large amounts saved in labor and materials for extensive plantations, and I would venture to say that in this way, if all the above points are taken into consideration, 50 per cent. of the expenses of tapping would be saved. It will easily be seen, that by cultivating these new varieties, the yield per tree only requires three years to be doubled. There are four times more trees to the acre and the expenses of incisions are reduced by one-half.

"In the same way as I recommended Mexican planters to cultivate our own *Castilloa* in preference to Ceará and Pará, so do I today forcibly recommend the cultivation of these two new varieties. I have shown all the advantages as to soil, cultivation, tapping and yield. With these two new varieties there will be produced high yields of rubber in many large districts of Mexico where it has been impossible to cultivate other varieties to advantage. The subject appeals to the inhabitants and property owners of the districts along the Isthmus of Tehuantepec and the Pacific coast from Salina Cruz to Tonala."

THE RUBBER TRADE IN AKRON.

By a Resident Correspondent.

THE annual dull season for the rubber business is now on, and while some of the companies state that none of their help will be laid off, it is reported that in some other plants two eight-hour shifts are being run instead of the usual three, and that working forces will be cut down as trade slows off.

* * *

The seventeen factories engaged in the rubber industry in Akron are said to have employed in 1912 about 22,600 workers, at a maximum wage for men of 60 cents per hour—minimum, for beginners, 17 cents per hour—and for women a maximum of 30 cents with 10 cents for beginners. The capitalization of these seventeen companies is $112,949,000, and of the six largest the total output for 1912 amounted in value to $94,445,000, with an aggregate pay roll for these six companies of $12,022,780.

* * *

A fire which was discovered Sunday night, August 17, in the warehouse of The Loewenthal Rubber Co., destroyed from $25,000 to $30,000 of the company's property before it could be subdued. This company deals in scrap rubber, and the warehouse was well filled at the time. The fact that the windows fell in immediately firemen started to play the hose on the building and that flames in large volume at once burst therefrom, leads to the belief that the fire must have been smouldering for some time, rubber being very slow to catch fire. The office of the company was not damaged, and its business has not been seriously interfered with. A new building will be erected at once to replace this old one-story structure.

* * *

The balata belting and tire departments of The Goodyear Tire & Rubber Co. continue to run day and night. Sales for this year are reported to be 40 per cent. greater than those of last year. This company is working on plans for remodeling the old plant of The Great Western Cereal Co., which will probably be accomplished before the rush of next year's business. H. S. Quine, who has resigned his position as advertising manager of the company to become secretary to the president, F. A. Seiberling, has been succeeded by L. L. King.

THE PLANT OF THE B. F. GOODRICH CO.

Here is the latest photograph of the mammoth plant of The B. F. Goodrich Co., at Akron, Ohio. This is the largest aggregation of factories, belonging to a single rubber company, in the world. It comprises 65 acres of floor space and employs 15,000 operatives. The growth of this company has been the most interesting phenomenon in the entire rubber industry. It was only 43 years ago, in 1870, that the late B. F. Goodrich moved his little rubber factory from the banks of the Hudson to the small but ambitious town of Akron. He bought an unused factory property for $1,800, and he succeeded in borrowing on his note, from Akron business men, $13,000, which was the company's entire capital. It started—with 25 employes—under the name of the Akron Rubber Works, but ten years later the name was changed to The B. F. Goodrich Co., and its capitalization increased to $100,000. A year and a half ago, when it absorbed the Diamond Rubber Co., the Goodrich capitalization was $20,000,000, which, after the absorption, was increased to $90,000,000. It would, of course, be foolhardy to predict what great developments may take place in the rubber industry of this country in the future, but it certainly seems fairly safe to hazard the opinion that never again will a company grow from so humble and feeble a beginning to such great magnitude.

PLANT OF THE B. F. GOODRICH CO., AKRON, OHIO.

* * *

The B. F. Goodrich Co. is to have Goodrich Road Markers on two official transcontinental routes, one of which is by way of the Santa Fe Trail and the other to San Francisco via Denver, Salt Lake and Reno. This company expects soon to have completed the building under erection at Woodward and Hancock avenues, Detroit, Michigan, the anticipated cost of which is $100,000.

* * *

A fire, the cause of which is attributed to spontaneous combustion, and which engaged the entire fire-fighting force of Akron, was discovered at an early hour on the morning of August 11 at the plant of the Goodyear Tire and Rubber Co. It was subdued after a nine-hour struggle by the fire department, having damaged the plant to the extent of $30,000.

* * *

The annual picnic of the Miller Rubber Co.'s employes was held at Cedar Point, Saturday, August 16. The picnickers left Akron on a special train, from which they were transferred at Cleveland to the steamer "Eastland" for Cedar Point. Special

prizes were offered for unique stunts, both on board the boat and on land, and all report a most enjoyable time.

* * *

The Buckeye Rubber Co. (the Kelly-Springfield tire factory) is extending the building of its vulcanizing department and adding three large, new vulcanizing machines, running full force day and night and employing all the men they can secure.

* * *

The Taplin-Rice-Clerkin Co., which manufactures rubber machinery and furnaces, has increased its capital stock from $250,000 to $350,000.

* * *

A. C. Partridge, assistant sales manager of The Firestone Tire & Rubber Co., has started on a six weeks' trip, during which he will visit western Canada, the Pacific Coast and the main towns west of the Mississippi. Mr. Partridge is keeping close tab on the company's business, developing new avenues of trade and promoting enthusiasm among the employees.

* * *

W. W. Smith, formerly with the Faultless Rubber Co., has accepted a position as sales manager of the Star Rubber Co.

* * *

Emil Gammeter, general manager of the Gammeter-Brodbeck Sales Agency, has returned from Europe where he was pushing the sale of shells for holding fabric and aluminum flake.

THE RUBBER TRADE IN BOSTON.

By a Resident Correspondent.

WHEN one speaks of the trade in Boston, it may bring out the pessimistic question—"Is there any trade in Boston?"—for there are those in the rubber business who are just at this time taking a somewhat dreary view of the state of trade. The fact is that things are none too lively, but then, people who know anything about it know that August is the dullest month in the year in more than one line. However, taking into consideration all the facts, business is not so bad, after all, and the outlook for a start-up by the time this letter gets into print is most encouraging.

Trade in hose, especially garden hose, has been excellent all through the spring and summer, but it has let up just now—which is natural. Dealers are sold out, and they must order later, to be prepared for next spring's demand. Belting and packing are going steadily, though moderately. Druggists' goods have a normal and satisfactory call. The boot and shoe business is hardly up to average, which is largely explained by the fact that many dealers, having carried over fair-sized stocks from last season and in the absence of any inducement to order early, have delayed re-stocking; and many thousand cases are likely to be called for later in the season which under other circumstances would have been ordered prior to June 30. The clothing situation is somewhat uncertain, as the tariff is considered likely to interfere with the season's sales, but traveling men are now on the road, and early reports of orders are extremely gratifying. The tire business has been good all the season, and continues so. There has come to be a steady demand for tires which each year begins earlier and extends later, and which is larger and larger each recurring period.

It is somewhat interesting to note the influence of the weather on the fruit-jar ring trade. This was excellent up to July or August, but when the unseasonable weather set in the demand ceased as suddenly as if there never was such a thing as a preserve jar. Surely there are branches of the rubber manufacturing trade which are as uncertain as the weather on which they depend.

* * *

The Patterson Rubber Co.'s new plant at Lowell is now in operation, with a moderate force of workmen, turning out tires which are well spoken of by the trade. The plant is thoroughly modern, new from the ground up, and furnished with the very latest in the way of machinery. It is near the Merrimac River, in open ground, is supplied with an abundance of light and air, and has a spur track which facilitates the receipt and shipment of material and goods. Mr. Patterson is a thorough rubber man, who knows the business in all its details, and he has surrounded himself with a force of assistants, experts and workmen, whose *esprit-de-corps* promises well for the product of the factory.

* * *

The automobile is changing the vacation habit to a marked degree. In former years many men in the trade would take the month of July, or August, or perhaps both, and hie to the summer resorts at the mountains or the seaside. Today it's decidedly different. In place of "stiving" one's family in a three-room suite at a fashionable hotel for a month, and spending his time in the billiard room or on the piazza, the business man concludes that his own spacious home and his own bed and bath are far more comfortable and convenient, while there are resorts near enough to be reached by his own automobile; so he piles his family into his car and starts off for a week-end at the mountains or the sea-shore, and is back again at his home in Boston's suburbs by Monday or Tuesday. Perhaps the family stays at the hotel for a week or two, but not so the business man. The automobile has worked a wondrous change in just this way—and, incidentally, the rubber business gets its share of the benefit.

* * *

The Boston office of the Monatiquot Rubber Works Co., which for some years has been on Atlantic avenue, will be removed to Weld Building, 176 Federal street, October 1, where comfortable and appropriately arranged offices have been secured. Meanwhile, the receiving and shipping department, which occupied the rear of the Atlantic avenue building, with entrance on Congress street, is being fitted and furnished for occupancy by a shoe jobbing house, and the Monatiquot Rubber Works Co. has arranged for all its shipments to be made to and from its South Braintree establishment.

* * *

The Seamless Rubber Co. has discontinued its store at 103 Massachusetts avenue, where it exploited its specialty of tires and inner-tubes, but continues its Boston office at 18 Elm street, where it has hitherto carried only lines of druggists' goods. The Seamless tire will also be carried hereafter at this location.

* * *

The Apsley Rubber Co., of Hudson, has maintained a Boston office at Summer and High streets for several years. Last season the company opened a jobbing house at 520 Atlantic avenue, which is run under the name of the Arco Rubber Co., and here is carried a stock of the clothing and footwear manufactured by the Apsley company. Last month it was decided to unite the two establishments, and so the Apsley Rubber Co.'s Boston office and sample room has been moved to the above named location, where a fine private office is provided for Treasurer Laighton, and suitable accommodations for Messrs. Norbury and Lockwood. This office is in the shoe district, and the move is therefore considered an excellent one.

* * *

The Boston agency for Diamond tires has been transferred from 867 Boylston street to the salesrooms and offices of the B. F. Goodrich Co., which company now manufactures this brand of automobile tires.

* * *

G. Edwin Alden, for many years prominent in the rubber business, has taken an office in the Rice & Hutchins Building, 10 High street, and will deal in crude rubber, also acting as agent in New England for the Standard Asphalt and Rubber Co. of New

York, whose mineral rubber, M. R. X., is so well-known in the rubber manufacturing industries. Mr. Alden has been connected with the rubber trade during his whole business life, either as a manufacturer or as a dealer, and has a host of friends in the trade who wish him renewed success and prosperity in his new enterprise.

* * *

A. H. Elder, secretary of the Boston Belting Co., who has been spending his vacation at Chatham, "down on the Cape," is now back, ready for another season's hustling business. B. F. Elson, assistant manager of the same company, is at present writing at Cape Porpoise, Maine, where fishing and boating are among the vacation attractions.

Another sojourner at Cape Porpoise was William B. Laighton, treasurer of the Apsley Rubber Co., of Hudson. Mr. Laighton is modest and will not communicate to your correspondent any information as to his prowess as a fisherman.

* * *

Charles A. Coe, of the United States Rubber Co., is spending the summer at Annisquam, taking his vacation in installments, coming up to the city on market days, and on other days spending much of the time on his motor-boat, one of the fastest of its class in the harbor.

THE RUBBER TRADE IN CINCINNATI.

By a Resident Correspondent.

LABOR trouble at the various rubber factories throughout the country, followed locally by a strike of teamsters which has continued for several weeks and tied up freight traffic, has resulted in dealers in rubber goods entering the fall trade with very limited stocks, and in consequence business is quiet despite the fact that jobbers are well supplied with orders, being without any way of filling them. The rubber tire houses have no complaint to make, business in this line continuing to surpass that of last year. Perhaps the branch to feel the present labor trouble the most is that of rubber clothing. Jobbers in these goods have hundreds of orders on hand to be filled, but, having only limited stocks, and being hindered in the receipt and shipment of goods, the trade is almost demoralized.

* * *

Ira J. Cooper, head of the firm of I. J. Cooper & Co., who has fixed his metier as tiremaster by distributing in this section one third of the output produced by the Racine Tire Co., spent several days at the company's plant in Racine, Wisconsin, and reports that the plant is swamped with orders, to fill which it is working double shifts.

* * *

An amended bill of complaint has been filed in the United States District Court here in the patent infringement suit of Cecil F. Adamson, of East Palestine, Ohio, against J. Everett Inman and George Inman, doing business as the Victor Inner Tire and Rubber Co., of Dayton, Ohio. The patent involved in this litigation covers improvements in tire vulcanizing repair apparatus. The complainant asks for an injunction and an accounting of damages and profits.

* * *

William E. Schaefer, of the Schaefer Rubber Co., accompanied by his wife, is making a two months' tour of the West. Most of their time will be spent visiting the principal points in Colorado.

* * *

Prosperity of an extraordinary sort is attending the activities of the Motor Supply and Tire Co., at 919 Race street. This concern has undergone a thorough reorganization under the direction of F. W. Stukenberg, manager, and now is part of the chain series whose other links are at Cleveland and Columbus. The business of the local branch has assumed immense proportions, extending to eight of the nearby states.

* * *

B. M. Lovell, manager of the local branch of the B. F. Goodrich Co., has arranged an elaborate display in the huge show windows of the company's branch house at 1110 Race street. The display consists of a reproduction of the mammoth plant of the company in full operation. It is one of the most interesting exhibits seen here and is attracting considerable attention.

* * *

The managers and tire salesmen connected with branch houses in this city have organized a club known as the Queen City Tire Club. The purpose of the organization is to give the members a chance to get acquainted with their competitors, and to promote social intercourse and good fellowship. W. C. Price has been elected president, and Harry C. Falkell, connected with the Goodyear branch, is secretary and treasurer.

* * *

Rudolph Greiss, president of the Western Surgical Supply Co., and who is well known in rubber circles in the state, recently treated his friends to a surprise by announcing that he was secretely married more than a month ago to Mrs. Zesta Wilcox, of Kenton, Ohio.

* * *

The annual convention of the National Retail Druggists' Association, which will be held here the week of August 25, will have, in connection, an exposition in which leading manufacturers of pharmaceutical goods, chemists and surgical instrument dealers will have a big display. The entire ninth floor of the Hotel Sinton has been engaged for the exposition. A number of the rubber factories throughout the country manufacturing druggists' sundries have arranged for space.

* * *

"Vulcorine" is the name of another product just placed on the market by the Vulcorine Company. This is guaranteed to heal a puncture in a pneumatic tire as large as a thirty-penny spike. The main office and laboratory of the company are located in Atlanta, Georgia, but Cincinnati has been selected in which to promote the sale of the new product. H. A. Lonshore, manager—and the inventor—describes his new product as a liquid fiber compound for use in all pneumatic tires. It stops punctures, rim cuts, slow leaks and pinches, does not injure the tires, and is a preservative of rubber. Mr. Lonshore, while here, located a branch at 141 East Fourth street, and also looked over several available manufacturing sites, as the company contemplates moving to this city.

* * *

Following the plans so successfully operated by the Automobile Club of America in New York, and motor organizations at Philadelphia and Louisville, the Cincinnati Automobile Club is about to make an advanced move—that of conducting a motor supply accessory and tire depot in the exclusive behalf of its members. Secretary L. S. Colter visited New York and Philadelphia recently to gather ideas, and after his return the club authorized him to work out the plan in detail and have it in operation by fall. A salesroom is to be obtained and a complete stock of tires and other automobile requisites is to be installed, to be sold at a profit just sufficient to defray expenses of operation.

* * *

The Miller Rubber Co. has entered the local tire field by establishing an agency with the Miami Vulcanizing and Rubber Co. This concern for years represented the Firestone Tire and Rubber Co., but since the establishment of a direct factory branch of the Firestone company at Ninth and Sycamore streets,

the Miami company has been looking around to secure the agency for another good tire concern, as it has one of the best established trades in this city.

* * *

W. G. Brown & Co., distributors of crude rubber, have removed their offices from 701 Provident Bank Building to room 2802 Union Central Life Insurance Building.

THE RUBBER TRADE IN CHICAGO.

By a Resident Correspondent.

A FEELING of optimism again predominates in the rubber trade of Chicago, which for some little time has been extremely dull. An improvement in the mechanical rubber goods line is especially noticeable; and rubber belt manufacturers report some excellent orders from western Canada, where many grain elevators are being built in which to store the abundant wheat crop now being harvested in that country. Local tire men state that the summer's business in automobile tires has not only exceeded that of any previous summer, but has also exceeded their expectations, and that hereafter they will devote greater attention to this branch of the industry. While the weather has not been favorable to the sale of rubber clothing, the popularity of the rubber coat has not been diminished, and the outlook for fall in this line is encouraging.

* * *

Much interest is expressed in the contemplated opening by the Electric Hose Co. of a Chicago branch, but details of the company's plans have not thus far been disclosed.

* * *

Local hose and belt manufacturers, whose contracts for cotton used in these products have now expired, are viewing with some apprehension the making of new contracts, because of the effect the dry weather may have had on the cotton crop.

* * *

A building 121 x 125 feet is soon to be erected in this city by the Mechanical Rubber Co., at West Division street and Claremont avenue. It is intended for store and garage purposes and will probably cost in the neighborhood of $50,000.

THE RUBBER TRADE IN RHODE ISLAND.

By a Resident Correspondent.

AN involuntary petition in bankruptcy against the Consumers' Rubber Co. was filed with William P. Cross, Clerk of the United States District Court at Providence, on July 31, signed by the following creditors: R. L. Curtis, receiver of the Atlantic National Bank, Providence; Brown Bros., of Providence, and John J. Kenyon Manufacturing Co., of Pawtucket. Receiver Curtis claimed that there was due the Atlantic National Bank on money loaned and on promissory notes the sum of $42,685.54, while Brown Bros. declared they held a bill for $4.30 and John J. Kenyon Mfg. Co.'s bill was for $57.

At a meeting of the preferred stockholders of the company, held a few days previous to the institution of bankruptcy proceedings, a report as to the business and financial conditions of the concern was presented by a committee consisting of James W. Freeman, Robert S. Emerson and Percy W. Gardner, previously appointed to make a thorough investigation in the interests of the stockholders.

A statement contained in this report would seem to indicate that the committee was of the opinion that the firm's plant was shut down and the business discontinued to comply with the wishes of Receiver R. L. Curtis, of the Atlantic National Bank. So far as the records and correspondence appear, other creditors or stockholders were not consulted in this action. This conclusion is arrived at after the committee in its report goes into the details of the Consumers' company's business before and after it was taken in hand by the Walpole Rubber Co.

The committee makes fifteen different statements in its report, the first of which is as follows: "From May 1, 1912, to January 1, 1913, the books of the Consumers' Rubber Co., show that they made a profit of $30,067.15. Between January 1, 1913 and July 14, 1913, the books of the company show that they lost $82,774.36."

The report then goes on to show that a substantial loss was made in the wire department, amounting to $10,486.72. The wire mill was equipped so that all sizes of wire from No. 20 to 800,000 circular mill cable could be manufactured, but during the past year changes were made in that department so that only No. 19 wire could be manufactured.

The report shows "other substantial losses," and gives a table in which these are shown. According to this table the largest of these "losses" were: $40,863.44, which was met with in the sale of arctics and gum shoes to S. B. Thing & Co., of Boston; $4,152.56 to E. G. Stearns & Co., credit to equal prices to S. B. Thing & Co.; $3,824.38, tennis shoes sold to S. B. Thing & Co.; $1,378.16, arctics and tennis shoes sold to S. Rosenberg. Another loss was an "extra allowance to get cash" from A. J. Bates & Co., amounting to $700.

The report states "the outstanding accounts payable are approximately $33,020.71 and the outstanding notes payable are $83,079.61. These include notes to the amount of $15,000 which represent money borrowed by the Consumers' Rubber Co. from the Traders' National Bank of Lowell, Massachusetts, and the Atlantic National Bank of Providence, in November, 1912, for the purpose of paying off a $15,000 mortgage."

The report shows a mass of figures, among which are the following: Amounts receivable, according to the company's books, $30,292.30; inventory of raw materials, manufactured goods and merchandise in process of manufacture, as of July 12, 1913, $60,877.12.

The committee then makes some very interesting statements. "The real estate and machinery," says the report, "stands on the books of the company at $164,242.03. It would be difficult to sell the same for $25,000. Trade-marks, good will and patents stands on the books at $360,462.27. Your committee believes that this item of assets has no value."

The report then says that the books of the Consumers' Rubber Co. show that the concern is indebted to the Walpole Co. in the amount of $9,575.75 but in the opinion of the committee this indebtedness should be reduced by $4,700. The committee states that the records of the Superior Court show that the Walpole Co. received $150,000 worth of common stock of the new Consumers' Rubber Co. and that a consideration of this was that the Walpole company should pay a sufficient amount of money to cover the claims of the creditors of the Consumers' Rubber Co., incorporated in 1905. The amount paid was $4,700 and it was paid to Robert S. Emerson, receiver. "But," says the committee, "the Walpole Rubber Co. has charged this item to the Consumers' Rubber Co.'s account, thereby reimbursing themselves."

The committee declared that the mill was closed, goods sold at a sacrifice and other important matters done without consultation with the stockholders. Then comes the reference to Receiver Curtis and finally the recommendation that the concern be liquidated in bankruptcy.

The referee in bankruptcy appointed Robert S. Emerson, an attorney, as temporary receiver and John P. Williams of Providence, James S. Franklin of Bristol and C. W. Littlefield of Warwick as appraisers. Notice was also given that J. H. Lane & Co. of Providence had filed an attachment of $2,500 against the Consumers' Rubber Co. at Bristol.

The factory of the company, which has been closed down for the past five weeks in consequence of having gone into the hands of a receiver, resumed operations on August 20, in charge of the receiver, R. S. Emerson. There are orders for the product of the plant in plenty, and the full complement of upwards of 500 hands will be employed. The plant is being operated by Terence McCarthy of Bristol, the man who instituted the industry several years ago and who now is arranging to work up the raw rubber and other ingredients of the shoe business. Messrs. McCarthy and Emerson expect to operate the mill in full, and permanently, hereafter.

* * *

Col. Samuel P. Colt arrived at his home in Bristol on August 13, after an extended automobile trip with a party of friends, the itinerary including a tour through the White Mountains, Berkshires and eastern New York.

* * *

The big refrigerating plant under construction for the Revere Rubber Co. at its home on Valley street, Providence, is nearing completion. It should be ready for use soon after Labor Day and is expected to prove an important acquisition to the company's equipment.

Electricians have been employed for some time in establishing an extensive auxiliary fire alarm system in the company's new buildings.

H. W. Waite, who is the general manager of the plant, has been on his vacation during the month of August, spending much of the time on his boat, off Cape Cod.

* * *

The Davol Rubber Co. has completed the new factory building which has been added to its plant on Point street, Providence, and has begun the installation of machinery. The ground floor has already been equipped and the rest of the building will be fitted up as rapidly as possible. The new structure is of the highest type of up-to-date mill construction and is designed to give a maximum of light to all parts of each room. It is 281 feet in length, 50 feet in width and three stories high.

The annual outing and field day of the Mikado club, composed of employes of this company, was held at Emery Park on August 3, nearly a hundred participating in the event. They enjoyed a luncheon of shore delicacies early in the day, following which athletic sports were indulged in, a feature being a six inning game of base ball between teams representing the married and single men. The married men won by a score of 8 to 6. Later in the day a Rhode Island clam bake was partaken of.

* * *

Plans have been completed for another new building to be erected at Bristol for the National India Rubber Co. It is to be a one-story brick structure, with cement foundation and saw-tooth roof, and will cover 38,000 square feet. It will be of steel beam construction, with floors of concrete. Large metal ventilators are to be used. Lighting will be by electricity and heating by steam.

The wire department at the factory was shut down on July 31 for a couple of days, to take the annual account of stock. Business in the rubber shoe department is somewhat dull at present, and on August 2 the gum shoe ticket was reduced to fifty cases a day. It was announced that the tennis ticket would remain the same, at 500 cases per day.

* * *

Installation of a steam engine plant has been completed at the factory of the International Rubber Co. at West Barrington, the equipment in regard to boilers, pumps, etc., being in every way complete and strictly up-to-date as to construction.

* * *

The "moonlight sail to Newport and return," so pleasantly anticipated by employes of the Revere Rubber Co. and their friends, was enjoyed in realization by but a portion of the number, either on account of insufficient accommodations or through confusion which occurred at the boat landing, 400 of the 2,400 who had assembled with tickets to take the trip having been left on the pier. Those who were successful in getting on board the boat were served with refreshments and enjoyed all the usual features attendant upon excursions of this kind.

THE RUBBER TRADE IN TRENTON.

By a Resident Correspondent.

THE LEICESTER RUBBER CO., of this city, composed of William M. Maher, Joseph F. Maher and Antonio dePianio, has sold its plant on Perrine avenue to David H. Brand and Joseph Gordon. Messrs. Maher and dePianio disposed of the local plant because of the rapid growth of their business, which necessitated larger quarters. They have purchased a large factory building at Catasaqua, Pennsylvania, and will continue the manufacture of rubber specialties, such as rubber soles, fruit jar rings, mats, rubber heels, etc.

* * *

David H. Brand and Joseph Gordon, who have acquired the Perrine avenue plant, will conduct business under the firm name of the American Rubber Co. and will manufacture specialties, making a feature of rubber soles and heels.

* * *

The Essex Rubber Co. has had plans prepared for a brick and steel building addition to its plant in North Trenton. This will be 60 by 200 feet and one story in height. Work of construction is to be rushed with all possible speed, as the increasing business of the concern demands more working space for its operatives.

* * *

Charles Edward Murray, son of General C. Edward Murray, treasurer of the Empire Rubber Co., and the Crescent Belting and Packing Co., is to wed Miss Louise Morrison, of Pittsburgh this fall. The bride-elect is a daughter of Robert Morrison, one of the millionaire iron men of the Smoky City. Cornell Murray, eldest son of General Murray, is to marry this fall, Miss Mildred Apgar, daughter of former Prosecutor W. Holt Apgar, of this city.

Miss Marguerite Broughton, daughter of John S. Broughton, vice-president of the United & Globe Rubber Co., was married in August to John Zane Batten, of Montclair.

* * *

The local rubber plants are almost without exception running day and night, at full capacity, such concerns as the Empire, Hamilton, Mercer, Thermoid, Home, and Essex Rubber companies, and the Woven Hose Co., and Ajax-Grieb Tire and Rubber Co. being rushed with orders.

The Woven Hose Co. expects to have the building which was destroyed by fire July 4 replaced with a brick and steel structure by November next.

* * *

Serious charges have been brought against a rubber scrap dealer of Trenton. The complaint—made by the Ajax-Grieb company, against Harry Freedman of the Trenton Scrap Rubber Co.—charges him with having bribed an employe of the former company to add extra bundles of scrap on his orders in excess of those supposed to be supplied him, these offences covering a period which extends back to February last. Mr. Freedman's interests are being looked after by former prosecutor, W. Holt Apgar, while the state is represented by Prosecutor Devlin.

* * *

The Rubber Workers' Union, formed in Trenton last March, is now said to be one of the largest in the city, having steadily increased in membership. Meetings are held weekly, on Monday evenings, in the Ribsam building.

* * *

A novel use for a discarded fire engine was that devised re-

cently by John E. Thropp, president of John E. Thropp's Sons Co. and a director of the Eureka Tire Co. This engine was used to pump water from the Delaware river into ditches which had been dug through his potato patch, the potato crop being endangered by drought. The plan is said to have been entirely successful.

* * *

Rumors that have been afloat regarding the contemplated removal of the India Rubber Co.'s plant from New Brunswick, New Jersey, to New York City, have been denied by Mr. W. L. Melvin of that company, who explains that these have arisen probably from the fact that its laboratory is to be transferred to the city, where a new building has been erected for its accommodation. The factory will continue to be operated at New Brunswick, as heretofore, with a force of about 300 operatives. This laboratory removal will transfer from New Brunswick to New York some of the bright young men of the former city, 30 of whom are expected to continue their work in the new quarters, where also any of the young women now employed by the company in this department will be transferred should they desire.

THE RUBBER TRADE IN SAN FRANCISCO.

By a Resident Correspondent.

WHILE the rubber trade in this city is somewhat slack, as usual at this season, manufacturers are well satisfied with the prospects of an early trade revival.

* * *

The local industry has just lost one of its most popular members, by the death of C. H. Chase, manager of the Bowers Rubber Works. Mr. Chase was sixty years of age, had been with the Bowers company for seven years, and was highly esteemed by all who knew him. His death, which was due to heart failure, terminated an illness of only a few days.

* * *

The injuries sustained by R. D. Barr, manager of the Firestone Tire & Rubber Co.'s Los Angeles branch, in the automobile accident at Encinitas recently, resulted in his death, physicians being unable to check the progress of blood-poisoning which was caused by the fracture of his leg. Mr. Barr was well known not only in Southern California, where he has met with excellent business success, but in New York as well, having been previously connected with the Firestone company at that point.

* * *

A. J. Straney, who some time ago left the employ of the Diamond Rubber Co. to take a position with another concern, has returned to the employ of the Diamond company.

W. D. Albright, who has been in charge of the company's branch at Sacramento, has been transferred to the Portland, Oregon, house operated by this company, in a similar capacity.

* * *

The factory of the Goodyear Tire & Rubber Co. is being operated at full capacity and reports a very satisfactory business.

J. E. Argus, newly-appointed agent of this company for the Pacific Coast, has recently returned from a visit to the factory, and assumed his new duties, for which he is especially qualified, having been for sixteen years connected with the Diamond Rubber Co., for some time past in charge of its Pacific Coast Mechanical department.

* * *

Mr. Bennett, president of the Los Angeles Rubber Co., visited this city late in August and bought out the stock of rubber goods on hand at the store of Eccles & Smith Co.

W. L. Eaton, with the San Francisco office of the New York Belting & Packing Co., has gone to the Hawaiian Islands on a trip in the interests of the firm.

* * *

W. J. Gorham, president of the Gorham Revere Rubber Co., is now in Seattle, Washington, looking after the interests of the firm in that territory. He writes that conditions in the Northwest are very favorable.

* * *

The Pneumatic Hose Co., of Chicago, has given up its branch store on Howard street, and Mr. Anderson, the manager, has returned to Chicago.

* * *

The Acme Rubber Co., incorporated with the object of putting on the market a new substitute for rubber, has closed down, temporarily at least, owing to internal dissensions. This firm had installed some special machinery and appeared to be successful. The substitute is a mineral compound, prepared in a certain patented manner which produces an article to all outward appearance much like genuine rubber.

* * *

The Perfection Autotube Co., of Colorado, located at Denver, has dissolved partnership.

* * *

The Diamond Rubber Co.'s branch at Oakland, California, will be managed hereafter by Mr. W. A. Knapp, who has been for a long time connected with Diamond tire interests.

* * *

The Goodyear Tire & Rubber Co. is erecting a factory building at Seattle, Washington. The latest Goodyear plant is to be of modern construction, two stories high, with basement, and will give a total floor area of about 10,000 square feet. It is located at Eleventh avenue and East Pike street.

* * *

The Savage Tire Co., of San Diego, California, is one of the most prosperous and progressive concerns on the coast. It is also thoroughly loyal to San Diego, its entire plant, building materials, machinery, etc., having been purchased from home firms, and all its factory operatives being obtained from the home supply. The company is said to carry a stock of rubber valued at $100,000 and to be making every day 400 tires and 400 inner tubes.

* * *

Recent California incorporations in industries employing or associated with rubber are:

The Oakland Tire Company, at Oakland, California.

The National Cushion Inner Tire Co., at Los Angeles, California.

The Vinson Indestructible Pneumatic Tire Co., at Los Angeles, California.

The King Rubberoid Co. at Los Angeles, California.

LARGE PRIZE FOR A GOOD AUTO-TRUCK TIRE.

If there are any American inventors who are hoping to submit automobile truck tires to the Austrian War Department for the $10,000 prize that the Austrian Minister of War has offered for the best tire of this sort, they must use some expedition in entering their designs, for the competition—which is open to people of every nationality—closes on October 1 next. The prize is offered for a tire which will combine the greatest cheapness with durability. Those who contest are required to furnish models in either natural or in reduced size, together with proper drawings and descriptions.

Interesting Letters From Our Readers.

WHAT LONDON RUBBER SCHOOLS ARE DOING.

AN editorial which appeared in the June issue of THE INDIA RUBBER WORLD, entitled "The Best Rubber School," has attracted the attention of some of those interested in technical rubber instruction in English schools, as is shown by the letter reproduced below, from Frederick Kaye, A. R. C. Sc., Lecturer on the Chemistry of Rubber in the Northern Polytechnic Institute, Holloway, London:

Research & Analytical Laboratory,
2, St. Dunstan's Hill
LONDON, E. C., June 23, 1913.

The Editor INDIA RUBBER WORLD,
New York.

Dear Sir:

In your June number you make some comments upon the inauguration of the School of Rubber at the Northern Polytechnic Institute, Holloway, London. Perhaps you will be interested to know that the courses on rubber chemistry, rubber manufacture, and analysis, etc., are fulfilling a very useful role in England. There has never been any idea of taking the place of the real practical school of the factory of which you speak so well.

It should be remembered, however, that London is the centre of a world-wide financial and commercial activity associated with the production, importation, sale and distribution of crude rubber, as well as having many important rubber factories within its borders. The directorates of the innumerable rubber producing companies are constantly needing young men to go abroad as plantation assistants on many of the Eastern plantations. Hitherto most of these young men have gone out without any scientific knowledge of rubber and its production.

The students who have enrolled themselves at the School of Rubber have found the opportunities it affords of great service to them. Amongst the students taking the day course are sons of rubber manufacturers, who are intended to take a place in their father's factory or laboratory; young foremen of rubber works wishing to widen their knowledge on the scientific side; young men preparing for plantation appointments, as well as assistant chemists home from the East, using the opportunity to keep pace with the scientific advancements in Europe and to take up some parts of practice and theory which experience has shown they need.

The evening students, who are by far the most numerous, are all men actively engaged in some branch of the rubber industries. They are foremen of works, travellers for rubber brokers, chemists, or rubber manufacturers, samplers at the wharves, clerks in rubber offices, etc. These all find that the scientific study of methods of manufacture, and of the materials which they are dealing with daily, is of great help commercially.

Your esteemed journal is, in a sense, a school of rubber, while our school is a personal, immediate, practical one.

Yours faithfully,

FREDERICK KAYE,
Lecturer on the Chemistry of Rubber, Northern Polytechnic Institute, Holloway, London.

ANOTHER VIEW OF THE PUTUMAYO MATTER.

July 10, 1913.

To the Editor of THE INDIA RUBBER WORLD:

Dear Sir: In your July issue, the following paragraph occurs under "House of Commons Committee on Putumayo Horrors:"

"The committee further expresses the belief that the Putumayo incidents are but a shocking instance of the conditions that are found over a wide area in South America."

As a manager of a large rubber property in the Amazon basin for over five years, permit me to make a few observations on this so-called inquiry into alleged atrocities.

First of all, I may state that no person in the Amazon Valley, intimately connected with the conditions surrounding the exploitation of wild rubber, believes the statements in the Casement Report, the basis of which is testimony given by Indians, half breeds, Barbadian negroes and some whites who had ulterior motives in formulating such allegations.

Any sane person must see at a glance that as the report states the Arana Estate had to give advances to the rubber pickers in order to get supplies of rubber, it would be worse than folly to injure or destroy the debtors of the company, after they had the advances mentioned, to say nothing of it being bad business.

In all my experience I have only heard of one company that abused the Indians in the Amazon Valley; and curiously enough, it was an English company, with the usual titled person for a chairman. This company used to make raids on the outlying portions of its neighbors' property, surprise the Indian rubber pickers, seize them, take them to the English property and there place them in the stocks, for safety for a time, then place them away in a Barraca to pick rubber for their company. This illegal seizure was made under the pretence that the said Indians were indebted to the English company.

It is true that abuses creep into every administration of a property where it is situated far away from headquarters, difficult of access; and those abuses are aggravated when the company has to depend on an ignorant half-breed batch of superintendents.

While one hears a great deal from the English press of the alleged Putumayo atrocities, they say nothing about the advantages a rubber picker enjoys who works under the Amazon conditions, and how much better off he is than the Eastern plantation coolie, or even better off than the best paid English mechanic.

Take my own case. On assuming the management of the property I found some minor abuses against the Indians, by the half-breed overseers, but the greatest abuses were against the company itself. I fired everybody, broke up the contract system, and dealt with the rubber pickers as individuals, and placed over them reliable overseers; in addition to making other alterations.

The result of this system was that each rubber picker was dealt with as an individual; and they came to the property of their own volition, walking over the worst trails in the world, for several days, in order to reach it.

On arrival at headquarters on the property, the picker, without any agreement beyond his word of honor, was given rations, a shot-gun and rubber picking tools; and from 150 to 300 trees to pick (this latter varying according to the ability and activity of the picker); and then he disappeared into the forest to carry on his work. The only superintendence he had was to see that the trees were properly picked without destroying them, and that he did not get sick; and if he did to bring him into the headquarters, treat him and cure him free of charge. Every week, the picker delivered the rubber he had picked to headquarters, sometimes making the deliveries every two weeks or longer according to distances he must travel.

On delivery the rubber is weighed on a Fairbanks scale (the weigher being a fellow rubber picker). The amount received is credited to the picker, and an entry made in a small book, given to him for this purpose. He then goes to the store, taking his book along, and after he makes his purchases he is debited with same in his book. The account is balanced at once, and if he has a balance in his favor he can draw it out in cash at once, or leave it until the end of the picking season, which they usually do. After making his deliveries of rubber and purchases of merchandise, and the entries being made in his book, they are copied in the journal and ledger, and the book handed back to the picker, who takes it to the forest with him again, until he comes out with the next delivery of rubber.

In addition to the above, and as a part of the system, a good druggist and medical outfit are kept on hand, and all is free to everyone on the property. No alcohol or cocaine is allowed or permitted to be used by the pickers or others; and the management sees that the pickers are well fed.

The result of this treatment, physically, industrially and financially, is that the pickers who arrived on the Hacienda in a half-starved condition, sometimes sick and always "broke," have their productive capacity increased from 50 per cent. to 100 per cent. They are kept in good health and spirits, have ambition to work and acquire something; and there has never been a rubber picker who has left the property, at the end of the season, without a substantial balance of cash in his pocket, varying from $100 to $500, United States currency. Any picker who cares to work fifteen days out of the month can earn from two to five dollars

United States currency a day. The pickers are well provided for, armed and free to run away at any moment, but never do. From the above it will be apparent to the least informed that the rubber picker is infinitely better off and better paid than the English mechanic, while there is no comparison between his free and independent life and that of his contract coolie brother on the Eastern plantations.

I have followed this English inquiry of the alleged Putumayo atrocities from beginning to end, have read the book published by the Aborigine Protection Society, on the subject; and to my mind all the evidence adduced condemns those who gave it against Arana, more than it convicts Arana on any serious charge other than neglect.

For instance in the evidence given by Mr. Hardenburg, he admitted that after he had heard of the alleged atrocities governing the collection of rubber in the Putumayo, he was willing to buy or acquire a half interest in the adjoining rubber property to Arana. If he knew that rubber could only be secured by such outrages, why did he want to share in the business? Again, an officer, who had been, or hoped to be, appointed to go to Peru, to investigate the said alleged atrocities on the Arana Estate, came to Senor Arana, and asked him to give him £1000. This request was made in writing and the original and a copy of the letter were produced at the inquiry. As he had performed no service for Arana up to that time, we can assume that he had his own idea as to what was the best way to make money out of the Arana charges.

Again when we remember that these charges were sprung on the public at the beginning of the rubber boom; and that the English papers took up the cry and yelled "Red Rubber! Slave Rubber of the Amazon! Don't invest your money in slavery! Come to the East, under English rule, where we have a well organized system of contract labor," and so on, it tempts the Amazon exploiters of wild rubber to ask whether they were simply willing or unconscious tools of the promoters of rubber properties, who used the cry in their efforts to reach the pockets of the investors and boost the Coolie colonies of the East.

F. J. D.

HAMILTON INCREASES RUBBER GOODS TRADE WITH UNITED STATES.

Exports of rubber goods to the United States from Hamilton, Ontario, were: 1911, $1,559; $1912, $8,028.

AMERICAN CAPITAL PREFERRED IN LIBERIA.

The acquisition by an English company of a concession for gathering rubber in Liberia was reported in the August issue of the INDIA RUBBER WORLD, page 591.

Further particulars received show that an effort was made during the last legislative session to pass a measure prohibiting the shipment of contract laborers, the failure of which is attributed to the fact that the receipts from this source constitute part of the Liberian revenues. The practice of shipping laborers from Liberia has aroused complaints from the commercial and agricultural interests of the country.

It is said that American capital would be considered preferable to English for cultivating the resources of Liberia. There is little or no capital in that country available for the purpose.

THREE YEARS' RUBBER STATISTICS.

BY the figures given below three years' progress of imports and exports is shown, the returns being brought down to the close of the last fiscal year, June 30, 1913. The total imports of unmanufactured rubber in 1913 represented about $101,000,000, against $105,000,000 in 1912, and $93,000,000 in 1911. These amounts include for 1913, crude rubber to the extent of 113,000,000 pounds, value $90,000,000; as compared with 110,000,000 pounds, value $93,000,000, in 1912. Conditions do not seem to have materially altered in rubber between the two last years, while balata shows a falling off, and Guayule imports have been reduced by about 50 per cent., as compared with 1911, the figures now being less than half of that for 1911.

A large increase is shown in the imports of scrap, which are for 1913 nearly double those for 1912.

While the exports of domestic manufactures for 1911 and 1912 remained practically the same, the figure increased for 1913 by about 12 per cent., the gain having been practically in automobile tires. Re-exports of foreign goods show a slight falling off for 1913, as compared with 1912:

THREE YEARS' RUBBER IMPORTS. (FISCAL YEARS TO JUNE 30.)

	1911.		1912.		1913.	
Unmanufactured.	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.
India-rubber	72,046,200	$76,244,603	110,210,173	$93,013,255	113,384,359	$90,170,316
Balata	878,305	624,702	1,517,066	984,012	11,318,598	766,772
Guayule gum	19,749,522	10,443,157	14,238,625	6,463,787	10,218,191	4,345,088

		$12,452,562		$12,822,918		$14,324,894

News of the American Rubber Trade.

WHY THE MILLER RUBBER CO. INCREASES ITS CAPITAL.

THE August issue of this publication called attention to the fact that the stockholders of the Miller Rubber Co., of Akron, Ohio, had voted to increase the capital stock from $1,000,000 to $2,000,000, $500,000 of the increase to be in 7 per cent. cumulative preferred stock, the rest being common stock. The reason of this increase in capitalization is found in the large increase recently made in the factory buildings and facilities. The addition to its plant has doubled the factory's producing capacity. This increase was necessitated by the growth of the company's business, which during the first seven months of the present fiscal year advanced 55 per cent. over the same period for last year. The company will now be able to make 1,000 pneumatic automobile tires per day, and has doubled its capacity in molded surgical and sundries departments.

MR. DUNLOP AT THE GOODRICH FACTORY.

Among the recollections of the recent joint convention of the American Society of Automobile Engineers and the English Institute of Automobile Engineers, none is more vivid than that of the visit to Akron of a party of members from the two bodies. This visit had been carefully planned, its details having been arranged by the advance guard of the Goodrich Reception Committee, who visited Detroit for the purpose of formally extending the invitation.

Upon arriving at the factory the visitors (about 80) were divided into groups of twelve and enjoyed a thorough inspection of its many interesting features, thanks to the excellent arrangements made by W. O. Rutherford, assistant general sales manager.

One of the noticeable and appropriate features of the day was the presence among the visitors of Mr. J. B. Dunlop, the veteran inventor of the pneumatic tire. From his ideal to its realization at the Goodrich factory with its 9,000 tires a day is a "far cry." His interest in this great factory with its vast production of tires can readily be imagined.

An excellent page of photographs illustrating the visit is a feature of the July number of "The Goodrich," an interesting publication issued by the Goodrich company, and will serve as an interesting souvenir of this memorable occasion.

DIVIDENDS PAID BY RUBBER COMPANIES.

The directors of the Boston Woven Hose and Rubber Co., of Boston, have declared a quarterly dividend of $3 per share on the common stock of the company, payable September 13 to stock of record September 5, 1913.

The Plymouth Rubber Co. of Canton, Massachusetts, has declared a quarterly dividend of $1.75 per share on its preferred stock, payable September 1 to stock of record August 25, 1913.

The B. F. Goodrich Co. has declared a quarterly dividend of 1¾ per cent. on its preferred stock, payable on October 1 to stock of record September 20.

KATZENBACH & BULLOCK COMPANY ELECTS OFFICERS.

At a meeting of the board of directors of the Katzenbach & Bullock Co., Inc., held in the main office of the company in Trenton, New Jersey, August 13, the following officers were elected to fill the vacancy caused by the death of Welling S. Katzenbach: Edward L. Bullock, of New York, president; Frederick F. Katzenbach, of Trenton, vice-president and treasurer, and Robert F. McGrory, of Trenton, secretary.

The United States Tire Co. is now occupying its new building at 2109 Commerce street, Dallas, Texas.

BUSINESS GOOD WITH THE HOOD CO.

If there is any such thing as business depression in the country, it does not seem to have reached the factory of the Hood Rubber Co., Watertown, Massachusetts. The company's business for the first six months of the current year showed a gain over the corresponding six months of 1912 of more than 15 per cent.—and the business of 1912 exceeded that of any former year. The company closed down its factory early in August for the usual ten days' vacation.

FIRESTONE TIRES ON MANY WINNING CARS.

The Firestone Tire and Rubber Co. certainly has no reason to complain at the record established by the company's tires in the various automobile races that have taken place this summer. In the 500-mile International Sweepstakes at Indianapolis, May 30, first and second places were won by cars equipped with Firestones. Firestone-equipped cars took first, second and third places in the Panama-Pacific road race on July 4. Firestones were also on the winning cars in the three Montamara Festo races of July 5 and 7; and at the Santa Monica race at Los Angeles, on August 9, the first and second winners were equipped with these tires, the time made being over 73 miles an hour.

THE ADAMSON CO. GETS AN INJUNCTION.

The Adamson Mfg. Co. of East Palestine, Ohio, was recently granted an injunction to restrain the Marshall Iron Works from making or selling a portable tire vulcanizing device infringing on U. S. Patent No. 1,057,911.

TRADE NEWS NOTES.

The addition now under way at the Elm street plant of the Rubber Regenerating Co. at Naugatuck, Connecticut, will enable the company, when completed, to double its present output.

A strike of the raincoat workers at the factory of the Wilson Manufacturing Co. at 134 Main street, Yonkers, has led to the arrest of several strikers. Similar difficulties have been going on in New York for several weeks, the workers contending, through their union, for a forty-eight hour week at 75 cents an hour. The Wilson brothers, who only recently removed from New York to Yonkers, declare that they will not make any agreement through the union.

The rubber plant of the W. G. Hendrie Rubber Co. at Torrence, California, has been completed at a cost to the company of $180,000, and was formally opened on August 16.

The use of motor vans has been adopted by the post office department at Rio Janeiro, where six cars of this class, imported from Germany, are now in use; and it is the intention of the government, should the operation of these trial cars be found economical, to install them generally throughout Brazil.

A company is being organized at Columbus, Ohio, for the manufacture of a new motor truck tire. One of the new features about this tire—which is covered by patent—is that the tread is fitted with a steel shoe to receive the wear. The patentees are C. E. Herman and S. C. Munson, 55 West Blake avenue, Columbus.

Work on the S. & M. Rubber Co.'s plant at Coshocton, Ohio, is now under way, and most of the necessary equipment therefor has been purchased, so that no delay may be experienced in installation after the building operations have suitably advanced.

The Chester Tire & Rubber Co., incorporated under the laws of Delaware, with a capital stock of $250,000, has located at Pittsburgh, Pennsylvania, where it will engage in the manufacture of automobile tires.

NEW INCORPORATIONS.

Amazon Rubber Co., July 22, 1913; under the laws of Missouri; authorized capital, $100,000. Incorporators: W. H. Schewe, Carl G. Schwarz and E. F. Schewe—all of St. Louis, Missouri. To rubberize cloth, manufacture garments, rubber goods and auto supplies of all kinds.

Army Tire Co., August 8, 1913; under the laws of Delaware; authorized capital, $1,000,000. Incorporators: George W. Griffin, Frank P. Kissel and Lorenzo J. Roel—all of 25 Broad street, New York. To manufacture and deal in automobiles, etc.

Atlantic Raincoat Co., Inc., August 15, 1913; under the laws of New York; authorized capital, $1,000. Incorporators: Abraham Karpel, 351 Elton street, Brooklyn, New York; Abraham and Jennie Miller—both of 111 Sheffield avenue, Brooklyn, New York. Location of principal office, Brooklyn, New York. To manufacture raincoats, etc.

Auto Pedal Pad Co., August 11, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: Henry Reich and Edgar M. Lichter—both of 316 West Forty-fourth street, and G. Thomas Young, 706 Amsterdam avenue—all of New York. Location of principal office, New York. To manufacture pedal pads and other auto accessories.

Auto Sand Grip Co., May 24, 1913; under the laws of Michigan; authorized capital, $40,000. Incorporators: Phillip G. Sanderson, J. F. and J. B. Williams—all of Detroit, Michigan. Location of principal office, Detroit, Michigan.

Boston Prest-O-Ceal Co., August 6, 1913; under the laws of Massachusetts; authorized capital, $25,000. Incorporators: William G. Todd, Merrill F. Hubbard and Sumner M. Teele—all of 35 Congress street, Boston, Massachusetts. To deal in automobiles and motors with their appliances and accessories.

Chemical Rubber Co., of Western Pennsylvania, August 5, 1913; under the laws of Pennsylvania; authorized capital, $20,000. Incorporators: William F. Boxmyer, W. F. Vegeler—both of Garrick, Pennsylvania, and Robert A. Fulton, Cheswick, Pennsylvania. Location of principal office, Pittsburgh, Pennsylvania. To manufacture, buy and sell articles used in the construction and operation of motor vehicles and manufacturing, buying and selling and leasing a chemical product known as chemical rubber, etc.

Chester Rubber Tire and Tube Co., August 9, 1913; under the laws of Delaware; authorized capital, $250,000. Incorporators: Morgan Howells, Ephraim Lyon and C. E. Jarvis—all of Pittsburgh, Pennsylvania. To manufacture and deal in rubber tires for vehicles, rubber tubes, rubber hose and rubber specialties.

Chicago Tire Goods Co., Agust 7, 1913; under the laws of Illinois; authorized capital, $10,000. Location of principal office, Chicago, Illinois.

James J. Fero, Inc., July 31, 1913; under the laws of New York; authorized capital, $20,000. Incorporators: James J. Fero, 172 Manhattan street, New York; George D. Brown, 108 West Eighty-fourth street, and William S. Foos, Hudson Heights, New Jersey. Location of principal office, New York. To carry on tire business.

El Paso Rubber Vulcanizing and Auto Supply Co., July 22, 1913; under the laws of Texas; authorized capital, $10,000. Incorporators: C. W. and William Mace, and C. Fowser. To buy and sell merchandise and especially automobile supplies, etc.

The Forrest Rubber Co., July 30, 1913; under the laws of Ohio; authorized capital, $10,000. Incorporators H. H. Forrest, E. C. Purdy and A. D. Evans. Location of principal office, Canton, Ohio. To manufacture and deal in all kinds of rubber goods, etc.

Granite City Rubber Co., June 30, 1913; under the laws of Massachusetts; authorized capital, $25,000. Incorporators: Wallace A. Prince, George E. Reinhalter—both of Quincy, Massachusetts, and Irving W. Pollard, Cambridge, Massachusetts. To manufacture and sell rubberized goods and fabrics and the carrying on of a general rubber manufacturing business.

The Greensburg Tire & Rubber Co., July 17, 1913; under the laws of Pennsylvania; authorized capital, $100,000. Incorporators: George S. Rombaugh, W. Dunbar and John B. Hayden—all of Greensburg, Pennsylvania. Location of principal office, Greensburg, Pennsylvania. To manufacture and sell automobile tires and tubes and other rubber goods.

Hercules Rubber Co., Inc., August 22, 1913; under the laws of New York; authorized capital, $50,000. Incorporators: George H. Duennard, Mlendale, Pennsylvania; Gilbert C. Shepard, 311 West 118th street, and Mabel McSween, 119 West 64th street—both of New York. Location of principal office, New York. To manufacture rubber goods.

Peerless Non-Puncture Co., Inc., August 7, 1913; under the laws of New York; authorized capital, $600. Incorporators: Maurice Uran, 1652 Lexington avenue; Harry Citret, 980 Tiffany street, and Frank Eber, 152 West 114th street—all of new York. Location of principal office, New York. To manufacture preparations for rendering tires puncture-proof.

The Pittsburgh Tire Protector Co., July 17, 1913; under the laws of Pennsylvania; authorized capital, $5,000. Incorporators: John A. Martin, Patrick Cousins and Thomas Skarry—all of Pittsburgh, Pennsylvania.

S. & K. Tire Co., Inc., August 18, 1913; under the laws of New York; authorized capital, $10,000. Incorporators: James J. Coomber, 358 West Fifteenth street, New York, Herman Senner and Bernard J. Kaplan—both of 115 West Thirtieth street, New York. Location of principal office, New York. To manufacture rubber tires, etc.

Schick Wheel & Tire Co., July 7, 1913; under the laws of West Virginia; authorized capital, $150,000. Incorporators: Adolph Schick, J. E. Morgan and D. H. Taylor—all of Wheeling, West Virginia. Location of principal office, Wheeling, West Virginia. To manufacture, buy and sell rubber tires and automobile wheels, etc.

The Valuable Raincoat Co., Inc., July 30, 1913; under the laws of New York; authorized capital, $2,000. Incorporators: Louis Odessky, 650 East Twelfth street, New York; Louis Miller, 450 Powell street, Brooklyn, New York, and Abraham Reiman, 112 Second street, New York. Location of principal office, New York. To manufacture rubberized clothing, etc.

A PROFESSOR'S WIFE MAKING RUBBER SHOES.

Among the women operatives making rubber shoes at the Goodyear company's plant in Middletown, Connecticut, is the wife of a Wesleyan professor. She goes to work at 7 o'clock in the morning and continues diligently at her task until 5 o'clock in the afternoon, with the usual hour for dinner; and her compensation—as she is a green hand—is something in the neighborhood of $5 or $6 a week. She is the wife of Charles A. Tuttle, Professor of Economics in Wesleyan, and she is engaging in this arduous mill work as a preparation for a book which she plans to write on conditions of wage earners in New England factories.

CLOSING DOWN FOR SUMMER REPAIRS.

A number of the factories belonging to the United States Rubber Co. were closed down during the greater part of August, for the usual summer vacation and for the making of repairs. The Candee factory at New Haven, the Boston Rubber Shoe Co. at Edgewater, Massachusetts, and the factory of the American Rubber Co. at Cambridge, closed on July 24, re-opening on August 24.

Some of the independent companies also closed their plants temporarily. The Converse Rubber Shoe Co., Malden, Massachusetts, shut down for two weeks early in August.

A NEW PRESIDENT OF THE INTERSTATE RUBBER

Mr. William McAdam, who has been connected for the last nine years with the Duck Brand Co. of Chicago, being in charge of its rubber boot and shoe department during the last four years, has been elected president and treasurer of the Interstate Rubber Co. of Omaha, Nebraska, the place filled for so many years by the late Z. T. Lindsay.

THE NEW PRESIDENT OF THE INTERNATIONAL STAMP MANUFACTURERS' ASSOCIATION.

Mr. Gus. A. Meyer, junior, a member of the firm of Meyer & Wenthe, is the new president of the International Stamp Manufacturers' Association, elected at its recent convention. Mr. Meyer is one of the most popular of the younger members of the stamp trade, and this, combined with his excellent business ability and training, especially fits him for the presidency of so important an association.

THE NEW SECRETARY OF THE RUBBER CLUB OF AMERICA.

Here is a photograph of Mr. Harry S. Vorhis, recently elected secretary of the Rubber Club of America. He is a Yale man, having left that famous institution under the elms some dozen or fifteen years ago. After graduating he made straight for a newspaper office in New York—which shows his *penchant* for work. For some time he wrote for the financial papers of the metropolis, and then did the same kind of work in Boston. The

HARRY S. VORHIS.

goal of every young newspaper man's ambition is the office of the "New York Sun," and Mr. Vorhis made it early in his career. He was on the staff of that brilliant journal for six years, leaving to take up the publishing and editing of technical publications, in which work he has been engaged very successfully for several years.

He has not been associated hitherto with the rubber trade, but his general knowledge of financial and industrial conditions in this country, together with his all-around capacity, marked him as a very desirable man for the secretaryship of the club in its ambition to carry out a number of important undertakings for the benefit of the rubber trade at large. Mr. Vorhis expects to devote a very considerable part of his time and energy to the work of his new position, and the plans which the officers of the club have had in mind for some time to make the club helpful in a large way to the trade, and which have not hitherto matured because no one had sufficient time to devote to them, will now undoubtedly be carried to a successful issue.

CHARLES E. WOOD.

Mr. Charles E. Wood, who was with the New York Commercial Co. for nineteen years, is now operating as a broker with offices in the Importers' & Traders' building, 24 Stone street, New York, where he has already developed a considerable clientage. Mr. Wood was born at Piermont-on-Hudson, in 1876, and received his early education in the public schools, finishing

CHARLES E. WOOD.

at Trinity school, after which he entered the employ of the New York Commercial Co., with which house he remained until its assignment, when he commenced on his own account as above stated. He is regarded as an excellent judge of the various gums, and his many friends in the trade are giving him gratifying support.

Mr. Wood has established several important connections, among them being the agency of the Derby Rubber Co., Derby, Connecticut.

PERSONAL MENTION.

Mr. George B. Hodgman, president of The Hodgman Rubber Co., and also president of the Rubber Club of America, spent the greater part of August on a canoeing trip in the wilds of Maine.

Mr. A. L. Comstock, superintendent of The American Rubber Co., Cambridge, Massachusetts, returned the middle of August from a trip to Europe, taken for rest and pleasure.

W. H. Elenbeck, former special representative of the United States Tire Co., is the new manager of the company's Worcester branch, L. E. Hevaner, who formerly had charge of this station, having given up the sale of tires in favor of a motor car agency.

Mr. Frederick A. Smith, who for the last 18 years has been superintendent of the United States Rubber Co.'s reclaiming plant at Naugatuck, Connecticut, and who has been connected with the rubber interests in that city for a quarter of a century, has resigned his position, to take charge of the reclaiming plant of the Boston Woven Hose and Rubber Co. of Cambridge, Massachusetts.

THE VULCAN COMPANY DOUBLES ITS CAPITAL STOCK.

The Vulcan Rubber Co., which was organized in Erie, Pennsylvania, a year ago with a capital stock of $100,000, has decided to double this amount and to make extensive additions to its plant and equipment. The company's chief product consists of solid and pneumatic tires.

DON'T MAKE BALATA BELTING.

In a paragraph in the August issue of this publication on balata belting, which gave the names of a few of the manufacturers of this belting in the United States, the New York Belting and Packing Co. was included, this information appearing to come from reliable sources; but a letter has since been received from that company saying that this was an error and making the statement: "We do not make balata belting, nor do we recommend its use."

MAKING BALATA BELTING IN MANHEIM.

Mr. W. J. Glendenning, the works manager of the Manheim Manufacturing and Belting Co., of Manheim, Pennsylvania, sailed for England on the 20th of August for a brief holiday, expecting to return by the end of September. Mr. Glendenning came to this country two years ago to start the Manheim works in the manufacture of "Veelos" balata belting. The company has been very successful in this sort of manufacture, and its sales of balata belting have constantly increased. The president of the company is Charles Bond, of Philadelphia, and the general manager and treasurer is M. G. Hess, of Manheim.

AMERICAN HAND SEWED SHOE CO.

The American Hand Sewed Shoe Co., of Omaha, Nebraska, has manufactured leather shoes for the last thirty years, and in addition to this work it has been a large distributor of rubber footwear. The "Omaha News," published in that city, in its issue of August 8 contained the following paragraph:

"Damaged credit, due to unfortunate investments, close money conditions, and the prolonged illness of A. T. Austin, president of the corporation, has forced the American Hand Sewed Shoe Co. of Omaha into straitened financial circumstances. There is some question as to whether the firm will continue in business, A. A. McClure, the manager, stated. A reorganization is sure in any event. Mr. Austin will probably not continue as head of the company. The largest creditor is the United States Rubber Co. The American Hand Sewed Shoe Co. was organized here in 1884 by A. T. Austin, the present head."

Later advices from Omaha state that Mr. R. F. Spencer, the comptroller of the United States Rubber Co., has spent quite a good deal of time in that city trying to straighten out the shoe company's affairs, and the information is added that if the company resumes business it will be operated by the United States Rubber Co.

A THREE-DAYS' CONVENTION WITH SIXTY SPEAKERS.

President H. M. Swetland of the Federation of Trade Press Associations in the United States announces that the program has been completed for the eighth annual convention at the Hotel Astor, New York, September 18 to 20. Acceptances have been received from over sixty speakers of national reputation in the manufacturing, selling, advertising and publishing fields. There will be fifty ten-minute addresses at the editorial, circulation, advertising and publishing symposiums on vital questions affecting all those who have dealings with the business press of America.

Other features of the convention will be an exhibit of successful class, technical and trade journal advertising campaigns, a business meeting at which will be told the inside stories of the big trade paper publishing successes and an "inspirational mass-meeting" with addresses by representative business and professional men on subjects of live interest to editors, publishers and advertisers. All the regular sessions of the convention will be open, but tickets must be secured for the "inspirational mass-meeting." These may be obtained from any member of the Federation or from W. H. Ukers, chairman of the Committee on Arrangements, 79 Wall street, New York.

TRADE NEWS NOTES.

An ordinance which has been passed by several Alabama cities, after some agitation by the local automobile clubs, makes liable to a fine of from $25 to $100 anyone found guilty of placing in the street any article that might do injury to automobile tires.

The Knight Tire and Rubber Co. of Canton, Ohio, has recently established a branch in St. Louis, Missouri, to handle its product in that city and vicinity, under the name of The Knight Tire Co.

The machinery of the Leicester Rubber Co., formerly of Trenton, New Jersey, is being moved as rapidly as possible to the company's new location at Catasauqua, Pennsylvania, and operation of the plant at this latter point is expected to commence early in September.

A new rubber industry is to be started at Regina, Saskatchewan, it being the intention of the Gutta Percha & Rubber Mfg. Co., Ltd., of Toronto, Ontario, to open a branch in that city. If arrangements satisfactory to the company can be consummated, it purposes building a new plant, and negotiations tending to this end are now under way with the Mayor of the city.

Certificate of incorporation has been issued to the Amazon Rubber Co., under which it is authorized to engage in the business of rubberizing cloth, manufacturing rubber goods, auto supplies, rubber boots and shoes, rubber surgical supplies, etc. The authorized capital stock of the company is $100,000, and the incorporators, all of whom are residents of St. Louis, are: W. H. Schewe, Carl G. Schwarz, E. F. Schewe, H. F. Schewe, and Andrew Peterson. The company's plant located at Switzer avenue and the Wabash Railway tracks, St. Louis, Missouri, will be in operation by November.

An estimate of the quantity of tires that will be needed to equip the 1913 output of the Ford factory places the number at 800,000. This would indicate that the Ford people expect to market about 200,000 cars this year.

Building contracts have been entered into for a number of cottages at Hanover, Massachusetts, to be erected by the E. H. Clapp Rubber Co. of that place for occupancy by its factory operatives and their families. The lack of suitable homes has been a contributing element in the difficulty experienced in the past by this concern in securing or retaining desirable employes, and it is hoped that by these building operations this condition may be relieved. A number of the cottages are to be ready for tenancy by September 1.

The employes of the Tyer Rubber Co., of Andover, Massachusetts, held their annual outing this year on Saturday afternoon, August 9, assembling in Boston and proceeding thence to Nantasket. In addition to the usual features which go to make the success of the average outing, one of special interest was afforded in this case, on both the outgoing and return trips, by the spectacle, off Governor's Island, of the burning of a steamboat.

The Detroit Rubber Co.'s business in the city from which it takes its name is now in charge of Mr. Louis K. Rittenhouse, who for some time previously had held a position in the company's Boston branch.

The management of the Philadelphia branch of the Republic Rubber Co.—left open by the disappearance some time ago of J. W. Lyman—has been filled by the appointment of B. C. Swinehart, former manager of the Cleveland division, to that post. The business of this company in the northwest will hereafter be taken care of from its station at 13th and Hennepin avenues, Minneapolis, Minnesota, to which point it has moved from St. Paul.

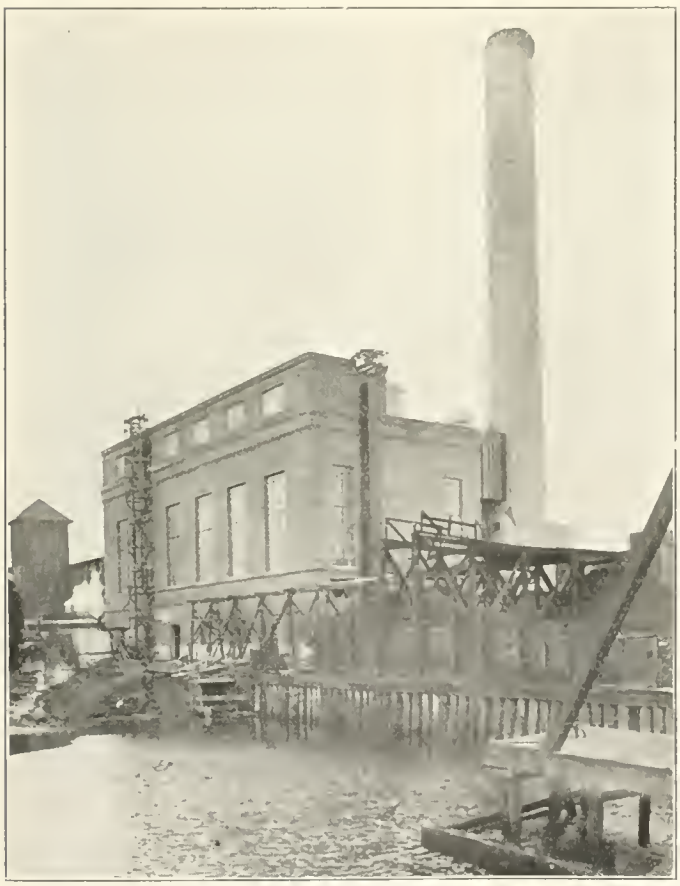
Plans are being considered by the Ohio Seamless Tube Co., of Shelby, Ohio, for additions and extensions the cost of which is approximated at $400,000, and for the opening of a stock warehouse at Detroit, Michigan. This expansion is planned with a view to securing automobile trade.

Fine New Buildings of the Boston Woven Hose.

THE completion of the handsome and efficient new power-house of the Boston Woven Hose and Rubber Co. marks another important step in the notable series of enlargements and improvements in the plant of this enterprising concern, and well serves as an example of the thorough rehabilitation of the factory, and the modernization of its modes and methods of production.

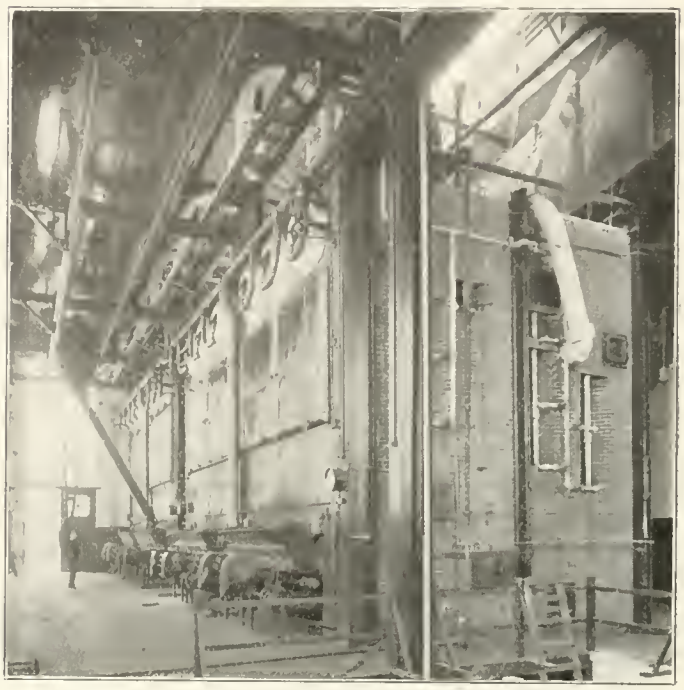
This new power-house is built upon twentieth century lines, and contains the very latest devices for economical and efficient service. The building is of cream brick with steel window casings and sash, glazed with wire glass. The graceful chimney rises to a height of 167 feet and can be seen for many miles. A glance at the boiler-room shows the liberal height of the structure. Here four Babcock and Wilcox, Foster superheating boilers, of 600 horse-power each, are already in operation, while there is room to install as many more when the occasion requires. Adjacent to this building is the coal pocket where the coal is dumped direct from the cars, or from lighters which come to the wharf. By means of the Taylor system the coal is carried from here to the loft above the boiler-room, discharged into chutes, where it is weighed and then stoked under the boilers as required, without a particle of hand labor.

There is an air-compressor of the latest construction, made by the Sullivan Machine Co. Two 750-kilowatt Westinghouse-Parsons turbines are already at work, and two similar engines,



THE NEW POWER HOUSE WITH CHIMNEY 167 FEET HIGH.

but of 1,250 k.w. each, will be installed by January 1, with another of 2,000 k.w. to come later. When these are all in place the new power plant will be, perhaps, the most modern and up-to-date in all its appointments in this country. It will be capable of generating sufficient electricity to furnish power for running all the machinery of the present plant, with sufficient reserve for



BOILER ROOM, SHOWING FOUR 600 H. P. BOILERS.

further enlargements, and to furnish the lighting for all the buildings of this great manufacturing establishment.

The whole aspect of this new building is one of safety, comfort, convenience and efficiency. There is almost an over-abundance of space, light and air, but withal it is thoroughly business-like, strong and substantial.

Immediately adjoining this new power-house there is now approaching completion the new mill-room, which when finished will be in every respect as modern as the engine-room in all its appointments. The building, which is of reinforced concrete, is 240 feet long by 100 feet wide. One half of this is of one double-height story, with saw-tooth roof skylights. The other half of the structure is four stories high. Built entirely of fire-proof materials, with all the bolts for the heavier machinery accurately placed and imbedded in the original concrete, this building will be one of the largest and most complete mill-rooms connected with a mechanical rubber manufacturing concern. The completion of this building marks the passing of all of the original plant, the doing away with all of the wood-constructed buildings, and results in the most modern mechanical plant in the country.

As soon as this new building is occupied, the office building, which was the original mill, will be reconstructed and rearranged for the selling and executive business of the company. Only one-half of the building is now so occupied, but the demands of the steadily increasing business require still further expansion of the cost, auditing, selling and accounting departments.

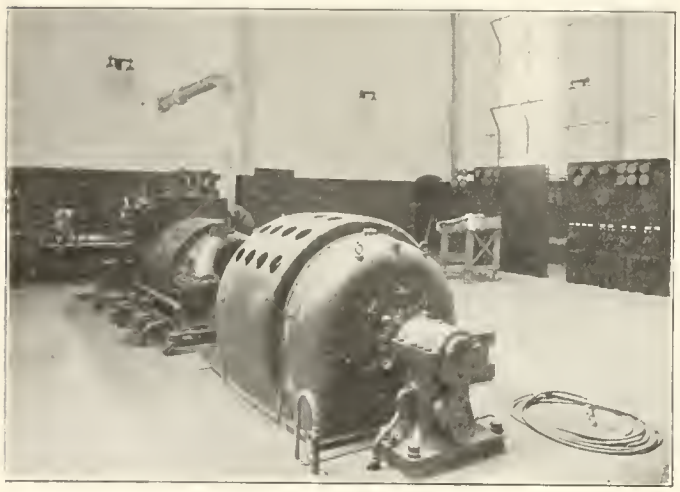
The Boston Woven Hose and Rubber Co. of today is the outgrowth, or reorganization, of a concern founded in 1870 by Theodore A. Dodge. The present company was incorporated under the laws of Maine on May 17, 1899, and capitalized at $1,200,000. The charter of the corporation was changed, in 1906,

to conform with the state laws of Massachusetts. The board of directors, elected in 1899, comprised: J. N. Smith, president; B. F. Spinney, vice-president; H. B. Sprague, treasurer; J. Q. Bennett, secretary, and W. A. Bullard.

All of these directors served in their various capacities until 1912, when death very suddenly claimed Mr. Bullard, and less than two months later, Mr. Smith. Vice-President Spinney was elected president to succeed Mr. Smith, and Mr. Creighton has been chosen as a successor to Mr. Bullard, and these were added to the board: George E. Hall and J. Newton Smith.

Soon after the reorganization Mr. A. M. Paul became general manager, continuing in that position until April, 1907, when he resigned to become owner and manager of the Davidson Rubber Co. of Charlestown, Mass. Mr. George E. Hall, the present manager, succeeded Mr. Paul, taking active charge July 15, 1907.

The growth of the concern has been phenomenal, as is



TWO 750 K. W. WESTINGHOUSE-PARSONS TURBINES.

graphically told in tabular form, showing the gradual yet steady expansion during the last fourteen years:

	No. Employed.	Sq. Ft. Occupied.	Pounds Produced.
1899	530	247,530	2,327,000
1900	582	"	3,732,112
1901	612	"	3,589,608
1902	679	"	6,072,532
1903	726	"	6,149,655
1904	750	"	6,278,748
1905	815	250,400	7,144,853
1906	987	"	8,672,515
1907	1,011	"	10,399,711
1908	1,012	378,200	9,456,028
1909	1,050	470,575	12,745,216
1910	1,127	600,566	13,727,532
1911	1,196	601,943	13,379,156
1912	1,288	627,780	17,891,811
1913	1,304	719,310	18,996,410

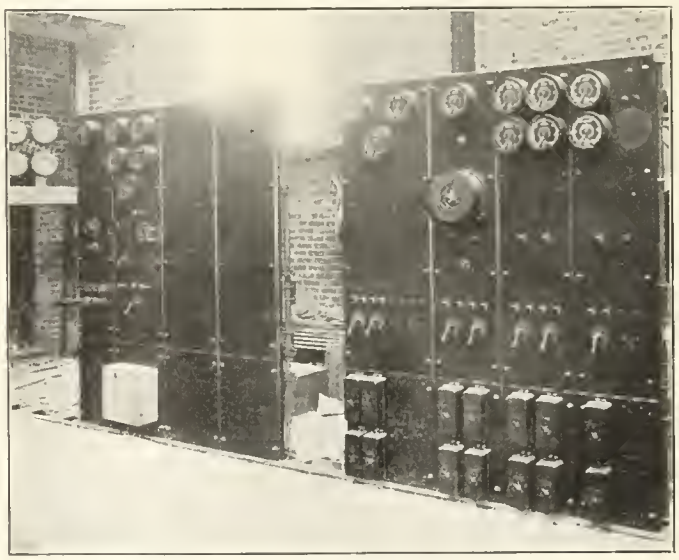
To date, August 2.

The product of the company comprises nearly every variety of mechanical rubber goods, the largest or principal items being garden hose and fruit jar rings, altho rubber belting, fire hose and rubber tape are hard pressing these lines for supremacy. Over ten miles of garden hose are produced daily, tho sometimes the production of a single day is more than double that amount. The jar ring output is tremendous. If one day's product were piled, one ring above another, the column would be 3.8 miles high. These rings laid down in a straight line, touching at their edges, would extend 208 miles. The tape produced each day, figured on ¾-inch width, if run in one continuous line would reach nearly 350 miles. Rubber heels are produced at the rate of 16,000 pairs per day. Both woven and braided fire hose are manufactured, a million pounds of yarn being used annually for this purpose, while for garden hose, etc.,

THE COAL CONVEYOR.

over 3,500,000 pounds of cotton duck and sheeting are required. This is claimed to be the only concern in the country making the hose complete, with all the fittings and metal accessories; a large foundry and machine shop being an auxiliary of the factory.

Connected with this concern, but operated at Plymouth, Massa-



ELECTRIC SWITCHBOARD.

chusetts, is a reclaiming plant producing over 5,000,000 pounds of reclaimed rubber annually.

A MOTORCYCLE FOR A HORSE.

There is a hardware man in a little town in Missouri who is evidently willing—living up to the peculiar reputation of his state—to "show" people. He is proving that a motorcycle can do the work of the horse. He has hit upon a device which is not only a great convenience in his business, but must necessarily prove a good advertisement. He has made a light delivery wagon, equipped with bicycle wheels, and has arranged it so that it can be attached to the back of a motorcycle. He puts his wares in his delivery wagon, the boy mounts the motorcycle, which, taking the place of the horse, draws the wagon about town. And it has this further advantage over the horse, that when it isn't working it isn't eating.

THE OUTLOOK FOR THE WALPOLE TIRE AND RUBBER CO.

ON August 2, on a petition by Mr. Rensselaer L. Curtis, receiver of the Atlantic National Bank of Providence, Rhode Island, Judge Dodge of the United States District Court in Boston, appointed Robert G. Fisher temporary receiver for the Walpole Tire and Rubber Co.

It might be stated at the beginning that it is believed by the receiver, the creditors and stockholders that the Walpole company is entirely solvent, that it has a wide margin of assets over its liabilities, that the receivership will be only temporary and that the company will soon be able to continue its business as successfully as hitherto.

To give a proper history of the Walpole Tire and Rubber Co. it is necessary to mention its parent, the Massachusetts Chemical Co., which was established in Walpole, Massachusetts, in 1891 and which for many years did a highly successful business in the preparation of insulating compounds, impregnating fabrics with these compounds, and the manufacture of insulating tape. In June, 1910, the Walpole Rubber Co. (which name was later changed to the Walpole Tire and Rubber Co.) was formed by the merger of the Massachusetts Chemical Co., the Walpole Varnish Works, the Walpole Shoe Supply Co., The Valveless Inner Tube Co., of New York, and the Walpole Rubber Co., Ltd., of Granby, Quebec. The company was capitalized at $3,000,000, divided equally between 7 per cent. cumulative preferred and common stocks.

This new company engaged in a wide variety of rubber manufacture, including friction, rubber tapes, varnishes, paints, compounds, druggists' sundries, molded rubber goods, rubber heels, and later, rubber tires. Its business grew at a very satisfactory rate. In the first six months of 1912 its sales aggregated $667,587.65, while for the first six months of the present year the sales aggregated $1,197,194.58, showing an increase over the year before for the same period of 80 per cent.; and this business, it is stated on excellent authority, has been done at a very fair profit, amounting during the present year at least to 10 per cent. net.

It was the ambition of the company to work its tire department up to a position where it would turn out 500 automobile tires a day, but this great increase in its tire business as well as its general business required a big increase in its financing operations, for rubber goods are sold on long-time credit. When, consequently, the Atlantic National Bank of Providence—through which it was accustomed to get its accommodations—went into a receiver's hands last April it proved very embarrassing for the Walpole company, as it had almost $900,000 locked up in its merchandise inventory which could not be turned into ready cash without a great sacrifice.

The company had also been carrying an additional burden in attempting to put the Consumers' Rubber Co. on its feet. This company, located at Bristol, Rhode Island, went into the hands of a receiver in the spring of 1912. Quite a little of its paper was held by the Atlantic Bank, which prevailed upon the Walpole company to assume the management of the Consumers' company—and it was reorganized and started afresh, the Walpole company controlling the bulk of its common stock. But this reorganization was evidently not successful, as the Consumers' company is said to have been run during the past year at a considerable loss. A receiver was appointed for it on August 1, and thereupon, the following day, the receiver of the Atlantic National Bank—to which the Walpole company was indebted, directly and indirectly, through its subsidiary companies, for an amount somewhat in excess of $100,000—applied for a receiver for the Walpole company.

The receiver appointed by the court, Mr. Robert G. Fisher, has been acting as treasurer of the Walpole company since its partial reorganization a few weeks ago. He was made receiver on the request of Mr. McAdoo, Secretary of the Treasury. Soon after his appointment a movement was started among certain of the creditors to have an additional receiver named, on the ground that Mr. Fisher's experience had not properly qualified him for this difficult position. The stockholders, in the meantime, were anxious to have an additional receiver appointed so that their interests might be safeguarded. The largest stockholders, with the amount of their holdings, are given as follows.

Otis N. Pierce, New Bedford	$66,000
E. Draper Blair	30,000
Clair Draper, Hopedale, Massachusetts	24,000
Montgomery Clair, Washington	20,000
S. P. Chandler, Nashua, New Hampshire	15,800
W. J. Fallon, Roxbury, Massachusetts	15,000

The largest merchandise creditors on notes are:

Edward Maurer, New York	$92,226
Endurance Tire and Rubber Co., New York	30,000
Charles T. Wilson, New York	27,980
Robinson & Co., New York	20,338
Heidelbach & Ickelheimer, New York	17,986
L. Littlejohn & Co., New York	16,364
Adamson Machine Co., Akron, Ohio	15,500

The capitalization of the company, which, at the time it was formed in 1910, consisted of $1,500,000 each of preferred and common stock, was later increased to $4,500,000, $3,000,000 preferred and $1,500,000 common, the actual outstanding stock at the present time being $1,903,900 preferred and the full amount of common. From the time of its organization, three years ago, until last spring, the company paid 7 per cent. dividends on its preferred stock and 4 per cent on its common.

The company's assets and liabilities as of June 30 are set forth in a statement submitted to the court in connection with this petition. The figures which are given below indicate the essentially sound condition of the company's position.

ASSETS.

Plant	$1,230,815
Patents, goodwill, etc.	1,312,419
Stock other companies	20,450
Treasury preferred stock	103,000
Cash	23,860
Trade	197,805
Sub. and coup. notes	15,944
Other accounts receivable	89,954
Consumers' Rubber Co.	27,030
Notes receivable	40,090
Prepaid accounts	10,678
Merchant inventory	863,998
Contingent assets	190,595
Total	$4,126,638

LIABILITIES.

Accounts payable	$258,705	
Notes payable	847,800	
Contingent liabilities	190,595	
Accrued taxes	3,600	
Accrued payroll	9,609	
Reserves:		
L. O. Duclos com.	3,000	
Disc. and doubtful accounts	30,534	
Doubtful notes received	9,514	
		$1,353,357
Balance of assets		$2,773,281

It is set forth in the petition to the court, and corroborated through other channels, that the company's plant is now in full operation, with a fine volume of orders ahead, upon which substantial profits will naturally be realized—so that it would appear that the creditors need not feel any particular apprehension about the outcome.

Anyone who is at all familiar with the rubber trade can recall to mind other companies which in past years have been temporarily embarrassed but which have emerged most successfully from their difficulties and for years have been numbered among the most prosperous members of the rubber manufacturing fraternity.

On August 26, Judge Dodge in the United States District Court, appointed Robert O. Harris of Bridgewater, Massachusetts, co-receiver of the Walpole Tire and Rubber Co., to act in association with Robert M. Fisher of New York, appointed receiver early in August.

THE CONSUMERS' RUBBER CO. RECEIVERSHIP.

The Consumers' Rubber Co., of Bristol, Rhode Island, which was organized in 1905, and whose experience during the past eight years has not been altogether a bed of roses, was petitioned into bankruptcy and a receiver appointed on August 1. The chief petitioner was R. L. Curtis, receiver of the Atlantic National Bank of Providence, to recover $42,685.54 loaned on notes. The receiver is Robert S. Emerson, of Pawtucket, Rhode Island, clerk of the Tenth District Court. This company was petitioned into receivership a year ago last spring, but the Walpole Tire and Rubber Co. took over a controlling interest in its common stock and assumed its general management, with the hope that it might be put upon a paying basis. For the first few months after this arrangement went into effect the prospects of the company seemed fairly bright, but its business during the last few months has been carried on at a considerable loss. The petition states that the company is willing to be adjudged bankrupt and unable to pay its debts.

Our Providence correspondent, in his letter, "The Rubber Trade in Rhode Island," in this issue, goes into the affairs of this company in considerable detail.

A RUBBER MILL STOREHOUSE BLOWS UP.

The population of Reading, Massachusetts, particularly that part of it nearest the Reading Rubber Works, was thrown temporarily into a condition of panic on August 5 by the blowing up of the storehouse belonging to the rubber company, in which there was stored a variety of explosives and inflammables, including several tons of celluloid, 50 gallons of naphtha and solvent, 50 barrels of alcohol and a number of barrels of a combination of alcohol and lamp black. The roof of the building, which was made of steel, was blown 60 feet away. Three of the brick walls of the building were blown out and scattered over a radius of several hundred yards. Fortunately the 50 barrels of alcohol, being protected by a wall, did not explode. By rare good fortune, the rubber works, about 150 feet from the storehouse, were closed down, only a few workmen repairing machinery being in the building. These escaped without injury. There was no one in the storehouse at the time, so there was no loss of life. The building, however, was a complete wreck, and its contents, valued at $13,000, were also destroyed. The fire department appeared on the scene but was unable to get near enough to the building to be of any assistance, owing to the tremendous heat, the flames rising to a height of 200 feet.

FOR WEEK-END AUTO TOURS NEAR NEW YORK.

The touring bureau connected with the B. F. Goodrich Co. has issued a map of a fine week-end tour near New York City. The map covers the distance from the city to the Delaware Water Gap, through Tuxedo, Port Jervis and Bushkill, and a return trip through German Valley and Morristown.

TRADE NEWS NOTES.

When the new mill of the LaCrosse Rubber Mills Co., La Crosse, Wisconsin, now under construction, is completed, the company will have a building 260 x 70 feet, entirely of concrete and steel, and its manufacturing capacity will be doubled. The company makes rubber footwear and employs a very large corps of traveling salesmen.

The annual convention of the Federation of American Motorcyclists, held late in July in Denver, was attended by representatives of a number of tire companies, among them—C. J. Welch of the United States Tire Co., New York; J. F. Reddick and A. C. Goodwin of the Goodyear Tire and Rubber Co., Akron, Ohio, and L. B. Lyman of the Diamond Rubber Co., Akron, Ohio.

Additions which will cost approximately $75,000 are being made to the plant of the Pennsylvania Rubber Co. at Jeannette, Pennsylvania. These consist of a four-story concrete and brick building 40 x 120 feet, and a one-story concrete and brick structure 120 x 120 feet, both supplied with all the latest ideas in the way of factory equipment.

The Ten Broeck Tyre Co., of Wilmington, Delaware, recently incorporated, will operate a factory in Louisville, Kentucky, devoted to the manufacture of automobile tires.

The value of the automobile tires exported from the United States during May of the present year was $396,816, and for June, $431,125.

A service station intended exclusively for the convenience of users of Goodyear tires is to be established in Cleveland, Ohio, by The Goodyear Tire and Rubber Co., of Akron, as soon as the three-story building at 5213 Windsor avenue, which has been leased for the purpose, can be remodeled.

The National Leather and Shoe Finders' Association—formed in 1904, and now having a membership of 387—held its ninth annual convention this year from July 22 to 24, in Philadelphia; and on Tuesday, the 23, after the regular meeting of the association, the members were entertained by the Foster Rubber Co., the steamer "Columbia" having been chartered for a trip on the Delaware river, with a view of Cramp's shipyards and the League Island navy yard, where all those who wished were permitted to visit the warships in dock. The return trip was devoted to dinner, which was served on deck, and to admiration of the beautiful souvenirs of the occasion which were presented to the members of the association and the ladies who accompanied them. These souvenirs consisted of leather vanity cases for the ladies and brown ooze leather collar boxes for the men.

The Philadelphia branch of the Federal Rubber Mfg. Co.—of which Edward J. McCaffrey has been made manager—has become one of the busiest in that company's chain of agencies, and has been instrumental in greatly increasing the demand for its product.

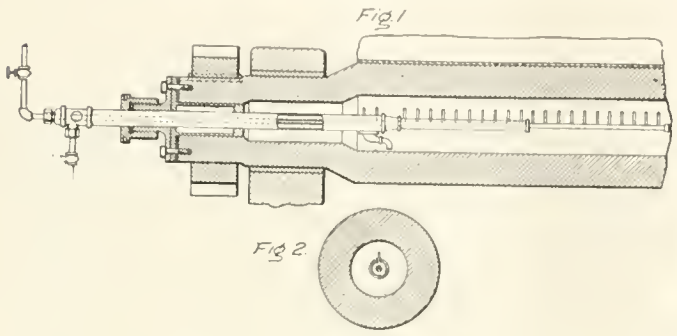
Mr. J. B. Abler, who has been connected with rubber manufacture in Akron for the last 20 years, is now acting as superintendent of the Sterling Rubber Co., Ltd., of Guelph, Canada, of which company Mr. F. L. Freudeman is secretary and treasurer. This company was organized in September, 1912 and has been making goods since the beginning of this year. It manufactures high grade rubber specialties for surgeons and electricians, and druggists' sundries.

The Boston, Massachusetts, branch of the Dayton Tire Co. will in future be managed by Joseph M. Everett, whose interests in the tire business of that city have heretofore been divided between the Walpole and Diamond companies, with both of which he has been connected. This appointment was made possible by the promotion of E. C. Newcomb, former manager.

New Rubber Goods in the Market.

A COMBINATION DOUBLE TUBE TEMPERATURE REGULATOR.

THE Florence Combination Double-Tube Temperature Regulator, adapted for the regulation of heating and cooling mills, calenders and mangles, is made by Frank L. Trefethen, whose factory is at 199 Broad street, Lynn, Massachu-

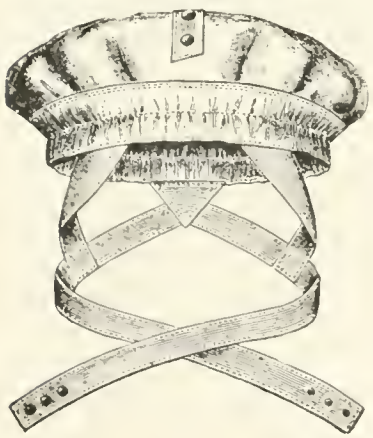


"FLORENCE" TEMPERATURE REGULATOR.

setts. It is claimed that this device insures even temperature of the entire length of a roll, maintains position under steam or water pressure and can exhaust direct to atmosphere.

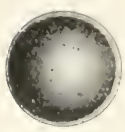
TO HOLD ICE BAGS ON THE HEAD.

It is a well known fact that fever patients or children are apt to throw off the ice bags placed on their heads which have to be replaced. The necessity of constant watchfulness is avoided by the use of the new ice-bag holder, which is made of rubber material and shaped like a cap. The ice bag (not too full) is inserted through an opening in the cap. A bandage holder is made, likewise of rubber material, on the same principle. [Sächsische Gummiwaren Industrie, Johannes Steinbruck, Dresden.]



A GUN THAT SHOOTS A RUBBER BALL.

Probably a ball was the first article ever made of rubber. The South American Indians have been amusing themselves with rubber balls for centuries—Columbus saw them playing with them when he was over here. Here is an air gun that shoots a rubber ball. The advantage of using a rubber ball is that the youngster can use the gun in the house, practicing at any target he chooses without doing very much damage. This rifle is called the "3-in-one," because, in addition to its ability to use a rubber ball as ammunition, it can be used with a cork on the end of a string—chiefly for the amount of explosive sound that can be extracted from it in

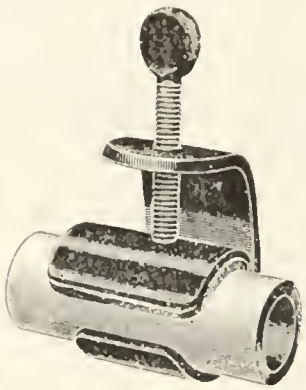


THE KING 3-IN-ONE.

this way—and also for regular shot, where the range is out of doors and the target a suitable one. (The Markham Air Rifle Co., Plymouth, Michigan.)

A TEMPORARY LEAK STOPPER.

The accompanying illustration shows a device, called "The Aqua Stopper," for repairing temporarily leakages in lead or iron pipes used for water, gas or steam. It consists of a screw clamp with an iron shield and a rubber washer. The rubber washer is loose, so that it can be put at any point under the shield where its services are required. The screw presses the shield against the washer and closes up, for temporary purposes, the leakage in the pipe.



A TEMPORARY LEAK STOPPER.

This, of course, is not intended as a permanent repair, but it will serve well enough until the plumber can find it convenient to get around. It is simple and inexpensive and can be used an indefinite number of times.

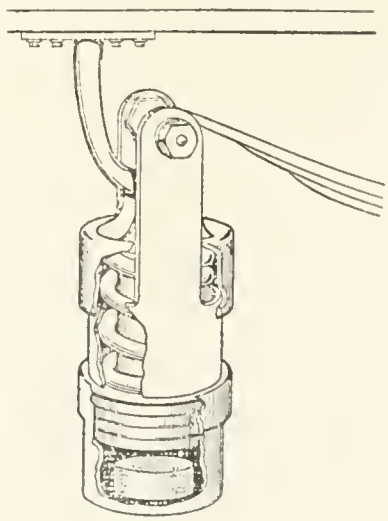
A NEW ANTI-SKID TIRE.

To be sure there is nothing particularly new about an anti-skid tire—anti-skid tires of many types have been on the market for some time—but here is a new type. It is the Lee Anti-skid, and, as the accompanying illustration shows, it has a zig-zag tread, with various lugs or knobs interspersed with the zig-zag band, and with fairly deep channels running between the designs, so that the edges of these various lugs —not to mention the continuous zig-zag lines —have a good opportunity to get a tenacious hold on the surface of the road.

The same manufacturers have previously made a zig-zag tread, but this new tread differs a little in design from the old, and also has a greater thickness of rubber. (Lee Tire and Rubber Co., Conshohocken, Pennsylvania.)

A COMBINATION OF STEEL AND AIR AND RUBBER.

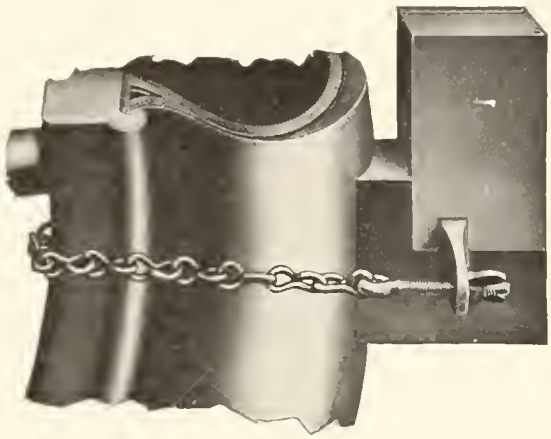
Here is a shock absorber that combines a trinity of resiliency. In the first place it has a steel coil within a cylinder; that absorbs quite a little of the shock. Connected with this steel coil is a piston that plays up and down in an air chamber, adding the elasticity of air to that of steel, to deaden the jolt. And then beneath the air chamber—as will be noticed in the accompanying illustration—there is a block of rubber, which lends its valuable aid to the good work. Co-operation is the great law of life—and this absorber is certainly built on the co-operative plan. (C. G. Polley & Co., Cambridge, Massachusetts.)



POLLEY'S SHOCK ABSORBER.

A PORTABLE STEAM TIRE VULCANIZER.

It is a great convenience when a repair on a tire is to be vulcanized to have the vulcanizer in the tool box of the car where it can be applied in a moment. The "Positive" Vulcanizer is certainly easy to carry about as it is small in size and weighs only 3 pounds. It is a steam vulcanizer and can be used on the shoe when the tire is inflated, without even jacking up the wheel, and can also be used on the inner tube. It will be noticed by the illustration that there are two sets of compartments; one is for water and the other is for gasolene or other fuel. The operation is simple and quick. The proper amount of each fluid is inserted in the proper compartments, and enough gasolene ignited to burn 20 minutes. Then, allowing 10 minutes for the repair to cool, the motorist can go on his way. While steam does the vulcanizing, it will be seen that the steam compartments are open at the top, so that there is no pressure and therefore no liability to injury on this score. Where the inner tube is to be vulcanized it can be laid over an inflated casing or on the special block which is furnished with each outfit. (Positive Tire Vulcanizing Co., Davenport, Iowa.)



"POSITIVE" PORTABLE STEAM TIRE VULCANIZER.

RUBBER BALL SUGGESTION FOR THE RETAILER.

A recent entertainment given by the University of Cincinnati—the institution upon whose legal faculty ex-President Taft until recently held the post of honor—affords an excellent suggestion to dealers in large rubber balls, especially such as may have a surplus of these on their hands which they do not wish to carry over to the Christmas holiday season.

A market for such may be discovered by keeping an eye on the doings of the high school or college in the dealer's home city, and when the students are found to be contemplating an entertainment of one sort or another, giving them the suggestion as carried out in the institution aforesaid. In brief, the idea is this—that a Greek dance be introduced into the program, either as an *entr 'acte* or at some appropriate point where play or program may be interrupted.

The players in the Cincinnati entertainment were girls, the most comely of course in the class, and in order to minimize expense each of these girls fashioned for herself a Grecian tunic,—a simple robe costing very little. Any young woman who is able to dance at all can quickly acquire the rhythmic round dances of the Greeks, given to an accompaniment of appropriate music. The more young women taking part, the more kin, friends, admirers of course will come to see; and hence the greater the net results of the entertainment. Therefore this particular university dance was composed of as many performers as the stage would conveniently allow.

In order to make the dance unique, Prof. Joseph Harry, who introduced it in connection with the "Frogs of Aristophanes"—the first performance of this play in two thousand years—equipped each of these pseudo-Grecian maidens with a big rubber ball, handsomely gilded over by rolling in a bath of gilt paint. In the course of the dance the balls are tossed high in air, then caught in the two hands by the girls, every so often. Of course the balls are too big not to be caught every time; nor are they thrown so high as to be missed.

It is very obvious that the use of these gilded balls is open to a variety of permutations and combinations. For instance, the dancers in the front and in the rear rows can throw their balls into the air simultaneously, and then the dancers in the intervening rows can go through the same exercise. By alternating different rows, and then by alternating individuals, there is opportunity for great variety of movement and effect. In the dances given in Cincinnati a great many of these combinations were used, but it is not necessary to state just what ones, as anyone devising such a dance can suit himself. This feature was a great success when given during the college exercises above mentioned, and this success can be duplicated anywhere else under similar circumstances. So any dealer in rubber toys who has an overstock of large hollow rubber balls can work out this suggestion for what he may find in it.

COLLEGE GIRLS IN A GREEK DANCE WITH RUBBER BALLS.

A NEW TIRE FILLER CALLED "BETTERN-AIR."

It would be possible, of course, to fill most of the pages of this publication each month with descriptions of substitutes for the pneumatic tire, for they are legion; but occasionally one comes along that seems more promising than its thousand and one companions. A new substitute recently brought on the market is called "Bettern-Air." It is the invention of a German chemist who has been working on it for the past six years. This "Bettern-Air" composition is intended to take the place of the inner tube. It is made in rolls of various sizes to fit various tires and is cut to the proper length. It is then inserted in the outer shoe and a small wedge piece put at the point where the two ends come together. The tire is then ready for use. The manufacturers claim that they have given it two years' test, with extraordinary results. They say that it has been used in tires where after 4,500 miles of travel it shows no effects of wear. The claim is not made that it is good for racing tires—it is not lively enough in its resiliency for a 60-mile clip—but for 30 miles an hour and anything under that it is said to be as resilient as air. It is being marketed by The Galvanizing Co., of Philadelphia, and the agents in the New York district are Bailey & Johnson, of Brooklyn.

NEW TRADE PUBLICATIONS.

THE NEW ALLEN CATALOG.

ONE of the best catalogs of metal and rubber goods issued of late is that of the W. D. Allen Manufacturing Co., of Chicago (No. 28), just to hand. Some idea of its completeness is afforded by the fact that the index of the principal articles comprises some 1,200 items.

Belting occupies the leading position, 20 pages being devoted to leather belting, 16 to belt accessories, and 7 to cotton belting. Rubber belting next claims attention, the brands "Lexington," "United States," "Yale," "Defiance," "Special," "Three Star" and "Mascot" being described and illustrated. The various styles of hose follow, including fire, water, steam, suction, oil, acid, sandblast, air drill, pneumatic, vacuum, air brake and other classes, among which are garden hose and special fire hose for factory and inside protection.

Mechanical rubber goods are represented by sheet, piston and spiral packing, rubber pump valves and gaskets; while a full line of rubber matting is likewise included. Lawn mowers, spray nozzles and sprinklers follow in appropriate connection, in addition to other hose accessories.

The metal portion includes shafting, couplings, pulleys, sheaves, gearing, link belting, elevator buckets and spouts, spray and other pumps, drills, valves and other forms of mechanical hardware.

In most cases the various articles are illustrated, and the 638 pages are replete with matter of interest and value to buyers of the lines of rubber and brass goods described.

"SALAMANDER" INSULATED WIRE.

In its new catalog (7 x 4½, 18 pages) the Independent Lamp and Wire Co., Inc., York, Pa., has grouped in attractive shape its principal specialties. This has been done with the view of affording in convenient form such information as may be of service to prospective customers for its wire and other products, sold under the brand "Salamander." Among its specialties are magnet wire, asbestos insulated and braided copper wire conductors, and motor coils.

The booklet is replete with information, of both a general and a special character, including the weights of copper wire in various diameters and other useful tables. Of practical value are the directions for handling "Salamander" Asbestos Insulated Wire, in which a dozen rules are laid down for the guidance of the worker using it.

The text is rendered more effective by well executed illustrations. One cut represents a heap of old burned out field coils, showing the condition in which they are received by the company for the purpose of re-insulation by its new process.

"NO RIM CUT" NEWS.

Among the salient features of the activity displayed this year by the Goodyear Tire and Rubber Co., of Canada, is the continuation of its policy indicated by the slogan "With and for the Dealer." In its new monthly issue, the "No Rim Cut News," the company outlines its principle of working only for the dealer, and never against him.

By this publication it is hoped to bring about a "get-together" feeling between the company and dealers; and if the trade develops the idea, the result must be mutually satisfactory. This expression of the company's views is much aided by the excellent illustrations, depicting various appropriate Canadian subjects relating to its operations. [Goodyear Tire and Rubber Co. of Canada, Ltd., Toronto.]

OXFORD RUBBER CO.

One of the most attractive and comprehensive catalogues recently issued in the rubber clothing trade has been put out by the Oxford Rubber Co., which has received a great many flattering comments with reference to its completeness and physical construction.

FISK TIRES.

Prominent in the interesting collection of recent tire literature is the handsome booklet issued by the Fisk Rubber Co., Chicopee Falls, Massachusetts, devoted to the merits of the "Heavy Car Type" of Fisk Tires.

Among the leading features of the construction of this tire is the perfect equilibrium maintained between its several parts. To obtain this result, high-grade material and expert workmanship are not sufficient. What is needed is to find the exact proportion of strength necessary in each layer of rubber and ply of fabric. Too much weight in any part of a casing is as dangerous as too little.

Such is the general principle emphasized in this review of the merits of Fisk tires in general, and of the "Heavy Car Type" in particular. The Fisk company claim to be the only manufacturers who have maintained four plies of fabric in their three inch tires.

The text is supplemented by effective illustrations of the Clincher Tire Bailey Tread, Clincher Town Car Tread, Fisk-Dunlop Tire, Plain Tread and the Fisk Removable Rim. To those already using Fisk tires this booklet gives additional reasons for continuing to do so, while its forcible reasoning equally appeals to those contemplating their adoption.

NORTH BRITISH BALLOON FABRICS.

In its present development of Balloon and aeroplane fabrics, the North British Rubber Co. is carrying out the policy which has marked its operations for considerably over 50 years, claiming that its rubber manufacturing plant is the most complete within the British Empire. Thus for the delicate processes connected with the above fabrics it has had special facilities.

The importance of this branch of its product has led to its bringing out two attractive booklets, "Concerning Aeronautics" (32 pages) and "North British Aeroplane and Balloon Fabrics" (8 pages), in which the general and special features of the subject are fully explained.

Prominence is given to the tests of diffusion, strength, tearing, bursting and moisture absorption. One of the most striking features of the larger booklet is a list of the various cloths for aeronautic purposes, with specifications of their different constructions. The text is supplemented by a number of artistic illustrations, showing the North British fabrics in use.

Anyone interested in the subjects treated will benefit by the perusal of these two contributions to the literature of aviation.

ATLANTIC WIRE.

Few lines of manufacture involve so much detail as that of wires and cables, by reason of the multiplicity of sizes and the various forms in which they are used. This fact is exemplified in the case of the Atlantic Insulated Wire and Cable Co., Stamford, Connecticut, which has issued its price list in the form of three separate booklets, uniform in size and arrangement, applicable to its three standard grades of rubber-covered wires and cables of the National Electric Code Standard of 600 volts.

The three booklets represent first the "Dolphin Atlantic" new code wire, the list bearing date January 1, 1913, and filling 11 pages 7 x 4. In the second booklet is the list of "Triton Atlantic," dated June 1, 1913, filling 15 pages and containing all particulars regarding that high-grade wire. The third booklet gives the price list, dated June 1, 1913, of the "Neptune Atlantic" wire (30 per cent rubber), the details occupying 15 pages.

Three main divisions are shown in the respective lists: B. & S. gauge, solid and stranded wire, and circular cables. Considerable work has evidently been involved by the compilation of these three booklets, the handy form of which renders them convenient for buyers. This company is to be congratulated on the way in which the details have been presented.

The Editor's Book Table.

FIRES AND FIRE FIGHTERS. BY JOHN KENLON, CHIEF OF NEW York Fire Department. New York, 1913. George H. Doran Company. [Cloth, 410 pages, with 45 plates. Price $2.50 net.]

WHEN a big subject is handled by a competent man a satisfactory result is to be anticipated. This has undoubtedly been the case in the instance of the volume by Chief Kenlon, who by his thirty years' experience as a fire-fighter and in the higher ranks of the fire department, has a distinct claim to attention.

Starting from the palmy days of Rome under the Caesars, he conducts the reader through the decadence which marked the dismemberment of the Roman Empire up to the renewed interest in fire-fighting which marked the last century and has since been manifested.

CAPACITY TEST, HIGH PRESSURE SYSTEM, NEW YORK.

Prominent among the events recorded was the designing by Richard Newsham in the eighteenth century of a practicable hand engine from which water was pumped through a hose, being thus the predecessor of the manual engine, which in turn gave way to the steam fire engine. In 1808 a Philadelphia house introduced riveted leather hose, while about 1820 an English firm started to manufacture rubber hose.

Proceeding to deal with his personal recollections, Fire Chief Kenlon devotes twenty pages to reminiscences of his thirty years' life as a fire-fighter; also drawing largely upon his own experiences in the chapters on "Great Fires and How They Were Fought," "The Hotel Peril," and other branches of the subject in its modern aspect. The personal character of the work is throughout prominent.

Special interest attaches to the chapter on "Apparatus for Fire Fighting," in which the merits of the steam pump, water tower and other appliances are fully discussed. As to chemicals, the author expresses the opinion that while useful in residential districts with detached houses, they are not applicable to large commercial buildings.

The decisive feature governing fire-fighting in all countries and under all conditions may be summed up in the two words "water supply." This problem, according to the author, is solved by the high pressure system, which he regards as the most up-to-date plan of water supply known to science. This service in the Borough of Manhattan protects approximately 2,600 acres, in Brooklyn about 1,000 acres, and at Coney Island about 146 acres. The system was put into regular use in New York in 1908.

The value of the work as a text book on the subjects treated is enhanced by the chapters on "The New York Fire Department," and "Underwriters and Salvage Corps." The appendix contains a series of practical tests for fire engines. These include the friction loss in fire hose, based on tests of best quality rubber-lined fire hose, as well as nozzle pressure through various lengths of rubber-lined hose in different widths.

Nor is Chief Kenlon's survey of the subject confined to this country. Special chapters deal with the conditions and past history of the question in England, France, Germany, Austria-Hungary, Switzerland and Italy. A chapter of particular value deals with "Fire Control in Schools, Factories and Hospitals."

In this brief review it is impossible to do more than indicate the various points covered by the author. The work should undoubtedly be in the hands of everyone in any way connected with the inter-elemental struggle of fire-fighting.

HANDBOOK OF BRITISH GUIANA. EDITED BY ALLEYNE LEECHman. Georgetown, 1913. Permanent Exhibition's Committee. Price 2 shillings. [Cloth, 8vo, 284 pages, with 74 illustrations.]

To make a work of reference attractive is a task involving much constructive ability and a close attention to detail. That the editors and compilers of this Handbook have succeeded so well is a testimony to the completeness of their work.

British Guiana enjoys the advantage of having at its service the Permanent Exhibitions' Committee, a body which looks after

the interests of the colony as regards publicity; the issue of the Handbook belonging therefore to its regular functions. The committee in 1909 brought out a work of this description, but as the issue was rapidly exhausted it decided upon publishing a larger edition in more condensed form. This intention has been carried out by the publication of the above volume.

The Handbook sub-committee was composed of Professor J. B. Harrison, Mr. Frank Fowler and Mr. J. Wood Davis, while the general editorial work has devolved upon Mr. Alleyne Leechman of the Department of Science and Agriculture, with the assistance of various prominent officials.

The scope of the Handbook includes four divisions: The Country, Political, Economical and Statistical. In the opening section the history of British Guiana is first dealt with, its geography and geology following and the division concluding with the climate and hygiene of the colony. From the geographical section it is seen that British Guiana has a coast line of 270 miles and an area of 90,277 square miles.

Under the political heading we find that the population in 1911 was 296,041, of which number 126,517 were East Indians and 115,486 blacks and Africans, Europeans only representing 3,937. Immigration is next treated, followed by details of the constitution and government, this section terminating with a description of the educational system.

In the economical section are grouped the various subjects affecting the productiveness of the colony and which go to make up its eleven million dollars worth of annual exports. Imports represent about nine million dollars a year. The agricultural products of British Guiana are next passed in review, including sugar, rum, rice, cocoanuts, cacao, coffee, plantation rubber, limes, fruits and fibers; while the next chapter takes up the forest industries, including balata, wild rubber and timber. The consideration of the mining industries closes the discussion of the economical resources of the colony. A brief but suggestive chapter deals with the manufacture of sugar and rice and calls attention to the special opportunities existing for the establishment of factories in various lines.

In the statistical section a number of interesting tables give figures of immigration, rainfall, revenue and expenditure, imports and exports, etc. One table shows the average yearly exports of balata for quinquennial periods to have been: 1893-1897, 226,625 pounds; 1898-1902, 401,956 pounds; 1903-1907, 497,790 pounds; 1908-1912, 1,075,216 pounds. The bulk of the balata exports is to the United Kingdom, but increasing quantities are now being shipped to the United States. The exports to that market increased from 9 per cent. of the total in 1904-5 to 15 per cent. in 1911-12.

Trade with the United States, according to American returns, is far from having attained its possible development. Of the nine million dollars of British Guiana's imports this country furnishes only 1¾ millions, while we take only about 1¼ million dollars worth, out of total exports from the colony of 11 millions.

MR. ANTHONY N. BRADY'S WILL.

The will of the late Anthony N. Brady was made public August 4. The widow receives $1,000,000 and an annuity of $60,000, together with the Brady residence in Albany and all its contents; $100,000 is given to charitable institutions, being equally divided among the Albany Hospital, Albany Hospital for Incurables, St. Peter's Hospital of Albany and the Homeopathic Hospital. The rest of the estate—which is variously estimated at from $75,000,000 to $100,000,000—is divided into six equal parts and bequeathed to his two sons, three daughters and to a granddaughter, the child of a deceased daughter. It is estimated that nearly one-third of his fortune was represented in his tobacco interests. His interests in the rubber trade, especially in the United States Rubber Co., General Rubber Co. and Rubber Goods Mfg. Co., are known to have been very large, but just how large has not been divulged.

OBITUARY RECORD.

JOHN D. CHEEVER.

THE death of John D. Cheever occurred very suddenly on August 16, at Coburg, Ontario, where he had gone a few days before for a short summer vacation. Mr. Cheever was formerly a prominent figure in the rubber trade but retired from his

JOHN D. CHEEVER.

active interests in this industry about ten years ago. Mr. Cheever was born in New York City in 1859 and was the son of John H. Cheever, founder of the New York Belting & Packing Co. He was a graduate of Trinity College, and upon leaving there became connected with the New York Belting & Packing Co., of which his father was then president. Mr. Cheever continued his connection with the company until it became a part of the Rubber Goods Corporation, when he became identified with the Mechanical Rubber Co., of Cleveland, remaining with that concern for a short time. Subsequent to this, Mr. Cheever became associated with Henry W. Poor & Co., with which house he remained for four or five years, this constituting the last of his active business career, tho for a number of years afterwards he gave attention to his important iron ore interests.

He was a director of the Okonite Co. from its inception until the time of his death. Mr. Cheever was one of the originators of the National Horse Show Association, the organizer and first president of the Rockaway Hunt Club, and a member of the Union, Racket and Tennis, New York Yacht, Brook, and Turf & Field clubs.

He left an estate said to be "at least $50,000," the principal beneficiaries under the will being his widow, his daughter, Mrs. Gertrude G. Porter, 969 Park avenue, New York, and his brother, Henry D. Cheever, who, in conjunction with Clifton P. Williamson, is an executor of the estate.

MR. F. M. SHEPARD'S WILL.

The will of the late Frederick M. Shepard was admitted to probate in Newark, New Jersey, on July 31. Under its terms, the estate—the value of which is not given—is left to the widow and five children. The widow is bequeathed the home in East Orange, stocks and bonds of the Orange Water Co., stocks of the East Orange Safe Deposit and Trust Co., and a parcel of land in East Orange. The rest of the estate is divided equally among his five children, except that his daughter, Annie R. Shepard, receives in addition his real estate at Delaware Water Gap, and his daughter, Edith M. Shepard, all his real estate at Norfolk, Connecticut.

Some Rubber Interests in Europe.

NETHERLANDS RUBBER TRADING.

ACCORDING to the report of United States Consul General Listoe, of Rotterdam, the local rubber market was exempt from wide fluctuations during 1912. Forest rubber in unclean and lower qualities was in much less demand than plantation rubber, which found a ready market through the whole year. Only small quantities of *Castilloa* and *Manicoba* were imported during that period.

The prices paid in Amsterdam and Rotterdam were in general quite satisfactory and above the level of other markets. Several shipments of rubber were sent to the Netherlands, which in former years had been consigned elsewhere. United States purchasers were regular buyers in Rotterdam, a continued expansion of which market is anticipated.

In the twelve monthly inscriptions of 1912, a total of 1,034,440 pounds was disposed of, four-fifths of which consisted of plantation rubber. A further total of about 100,000 pounds was sold outside of the public auctions.

Some 35,200 pounds of leaf gutta was sold by inscription in 1912. The crop of balata suffered from the drought in Surinam, the quantity marketed in the Netherlands amounting to only 400 tons.

The exports from the Rotterdam district to the United States included the following amounts:

	1911.	1912.
Crude	$165,168	$316,950
Waste	54,757	16,178

Exports of rubber from Amsterdam to the United States represented in 1911, $30,975, and in 1912, $278,495.

RUBBER ORGANIZATION FOR AMSTERDAM.

An association of 30 houses has been formed at Amsterdam in the interest of the local rubber trade. It is preparing regulations for the conduct of business and will include an arbitration committee for the settlement of disputes as to quality and other matters. Further applications for membership are pending.

RUBBER MANUFACTURERS IN BOGOTA.

NOT very much has been heard regarding rubber manufacture in Colombia, but a recent inquiry of one of the public officials in Bogota brought out the fact that there is at least one man in that city who has devoted a great deal of time and thought to the possibilities of rubber. He is Ismael José Romero. Being a traveler and quite a good deal of a scientist, he began about twenty-five years ago to make a theoretical and practical study of the botany of the rubber tree as found in Colombia, traversing the country and exploring many of its forests. He related his experiences in a little book, which has proved so popular that it has run through several editions.

Having informed himself very thoroughly as to the botany of rubber and the extent of its growth in that republic, he began in an experimental way to do some manufacturing, producing quite a variety of waterproof fabrics and some other articles. His products were awarded a gold medal and diploma at the Fair held in Bogota in 1891; a gold medal, silver medal and diploma at the Exposition of Arts and Commerce held in Medellin in 1898; and first prize, gold medal and diploma of honor at the Centennial Exposition in Bogota in 1910.

Owing to lack of resources, he states he has not been able to establish a rubber factory in that city for all classes of fabrics, but believes that such a factory would be eminently successful.

GERMAN CRUDE RUBBER STATISTICS.

GERMAN statistics for the first five months of the last five years show that up to 1911 the quantity had increased, while it fell slightly in 1912 and 1913. Exports followed more or less the same course, but the reduction was much more important in 1913.

The exact figures are:

January-May.	1909.	1910.	1911.	1912.	1913.
Imports ..*pounds*	5,534,100	8,419,300	9,593,100	9,066,460	8,846,300
Value in millions of dollars	12.02	18.29	18.24	17.90	17.47
Exports ..*pounds*	1,364,800	2,307,100	1,902,200	2,309,000	1,639,400
Value in millions of dollars	2.31	4.97	4.11	4.39	2.63
Cons'ption *pounds*	4,169,300	6,112,200	7,690,900	6,757,460	7,206,900

The largest quantities of rubber were imported from Brazil, while a good deal was received from Mexico, Congo and Camerun. German East Africa showed a remarkable increase in its production. The quantity shipped to Germany during the first five months rose from 86,600 pounds for 1910 to 357,500 for 1913.

Owing to the importance of Germany in the distribution of rubber, it is necessary to consider the imports and exports together, thus arriving at the net consumption. Treating the figures in this way it will be seen that the quantity of rubber used in Germany increased by 80 per cent. between the first five months of 1909 and 1913.

Prices have this year considerably fallen in Germany and stand lower than in 1909, as will be seen by subjoined table, giving the average price of different grades of rubber for the month of May for the past five years. Equivalents in American currency per pound:

	1909.	1910.	1911.	1912.	1913.
South Camerun	$0.77	$1.32	$0.66	$0.77	$0.57
Upper Congo	1.01	1.76	.99	1.19	.70
Peruvian balls	.89	1.59	.82	.87	.58
Mexican rubber	.90	1.54	.82	.91	.61

THE HACKETHAL INSULATING PROCESS.

Herr Louis Hackethal, Director of the German Telegraphs, discovered, in 1899, after many years' trials, a process for the effective insulation of overhead electric wires. It consisted in wrapping the bright or already insulated wire with layers of paper and fiber, saturated by a special process with a patented composition.

Among the advantages claimed for this system is the protection of all electrical connections against reciprocal disturbances. Hence, it has been adopted for fire engine and signal stations, alarms, block stations and electric clocks.

REMARKABLE MILEAGE FOR SOLID TIRES.

They appear to be getting some remarkable solid tire mileage on the other side of the water. The Paris General Omnibus Co. reports that it has used some tires for 30,000 miles before it was found necessary to take them off the wheels; and some of the tires on French army trucks have shown a mileage exceeding 20,000 miles. To be sure the omnibus tires are probably used on more than ordinarily good streets, but in the use of army trucks it is not possible usually to pick out just the roadways on which tires could be used to the best advantage.

SOME RUBBER NOTES FROM LONDON.

ONE of the features of recent parliamentary proceedings at Westminster has been the annual review of Colonial trade by Mr. Harcourt, the Colonial secretary. He referred to the comparative steadiness of receipts of rubber from British West Africa, which, however, were no larger today than seven years ago, describing the increased output of Ceylon and Malaya as "a marvelous result of science applied to forestry." The growth of balata exports from British Guiana was also commented upon, with special reference to the rise from £40,000 to £140,000 within six years.

BRITISH RUBBER GOODS EXPORTS.

British Exports of rubber goods, excluding tires, for the first six months of 1913 amounted to £1,443,778, as compared with £1,322,299 for the corresponding period of 1912 and £1,333,239 for that of 1911. Tires have only been quoted for the first time this year, so an exact comparison is in that case impracticable. The value of tire exports for the first half of this year was £731,361. Insulated wire and cables show for the first six months of 1913 marked advances on the corresponding periods of the two previous years, having been £1,437,803, against £1,041,712 in 1912 and £571,885 in 1911.

SPALDING VS. GAMAGE.

In the judgment lately rendered by the court, the claims of A. G. Spalding & Bros. have been fully supported in the now celebrated "Orb" football case. An order has been issued restraining A. W. Gamage, Ltd., the sporting goods dealers, from advertising and offering for sale as firsts, footballs which had been rejected as inferior by Messrs. Spalding, the manufacturers. Beyond the question of stopping the defendants from selling, was that of damages. In its decision the court evinced a disposition to award compensation for the losses sustained, remarking that a "tort" had been committed. While affirming the principle of awarding damages, it added that the needful details on that subject had not yet been presented.

The case, it will be remembered, grew out of the rejection by Messrs. Spalding of some 6,000 "Molded Orb" footballs which had been found unsatisfactory in 1910, at which time they stopped making balls of this type. In 1912, while still holding the old stock, they brought out the new "Improved Sewn Orb." About May of the last-named year, these old balls were sold to Mellis, Schein & Co. as waste material. This firm sold the balls to the Gamages, who seem to have offered them as the "Improved Sewn football," then being sold by the plaintiffs. The evidence tended to show want of care on the part of the defendants in the advertisements inserted. In handing down its decision the court said that the plaintiffs had every right to complain of the grave damage they had sustained.

THE GORTON RUBBER COMPANY'S STAFF.

In consequence of the recent changes in the Gorton Rubber Co., its staff is evidently making new arrangements. Mr. W. Downs, late sales manager of the company, has joined the Russian Tire and Export Co. in order to develop the band tire business of the Prowodnik Co. Mr. F. G. Billett has been appointed agent for London, Belgium, Holland and Denmark for Redfern's Rubber Works, while Mr. R. S. Humphries, the Gorton Co.'s representative in the Midlands, has taken up that territory for the St. Helen's Cable Co.

RUBASTIC, LTD.

This new rubber substitute, referred to in the European press, is the invention of Mr F. J. Healey, who belongs to the scientific department of the Faraday Institute London. Mr. Healey is said to have carried out the preliminary investigations and to have subsequently founded a company in Basle to continue his work.

A company has been registered in England with a capital equaling $5,375,000, of which $5,000,000 is in preference shares. The common stock is in shares of one shilling each.

The objects of the company include the smelting of metals, the reason for which is not considered apparent in connection with artificial rubber. Its offices are in Southall, Middlesex, and the officials are said to be French.

The English press is recommending caution, in view of the limited information available. Altho it is said to be adapted for printing rollers, hose and balls, the new article is apparently not claimed in England to be an "artificial rubber."

RUBERITE.

Among the claims made for this newly introduced compounding ingredient, is that of increased elasticity and resiliency in the manufactured product, through mixing with new, waste or reclaimed rubber. It is claimed that it takes the place of carbons, another advantage being that of preventing the adhesion of rubber to the mold. The inventor, Mr. Robert Currie, of 7 Normandy street, London, is known to rubber manufacturers in connection with other improvements.

ELECTRICITY IN MINES.

With reference to the subject of the New Home Office rules as to electricity in mines, Mr. W. T. Anderson of W. T. Glover & Co., Manchester, has called attention to four classes of coverings for light and power cables: rubber; paper lead covered; paper leadless; bitumen. Of these he considers rubber-insulated metal sheathed cables the best, tho their cost renders their adoption in many cases impracticable. Rubber cable is, however, nearly always used for "tailing" cables of other descriptions.

COMMERCIAL VEHICLE SHOW.

The tire section of the Commercial Vehicle Show at Olympia (lasting from July 18 to 26), included 27 exhibits, forming an unprecedently complete display of solid vehicle tires. Among the notable exhibitors was The B. F. Goodrich Co., Ltd., which made a special feature of its rubber studded tires with side flanges. The North British Rubber Co. made a specialty of the "Dueasble" tire, fitted to clincher wheels, while the Michelin Tire Co. showed the "Semelle" non-skid tires, which have for some time been a feature of its product. The regular standard makes of British solid tires were well represented. The "Liga Gummiwerke" of Frankfort, Germany, exhibited their continuous solid band tires, in addition to their rubber matting.

LIGA TIRES, LTD.

This company has been formed to undertake the agency for England of the "Liga Gummiwerke" of Frankfort, German, which was established last year. Mr. S. Patterson is sole director and manager of the company, which claims to have shown for its product excellent records for mileage.

RUBBER TANNED LEATHER CO.

Mr. E. C. C. Smith was lately appointed receiver and manager. He reported at the adjourned meeting that arrangements were pending for the formation of a company with considerable capital. If negotiations were successful, the company would be continued and the creditors paid in full.

RUBBER REGENERATING CO.

This Manchester company is now installing a new horizontal cross-compound condensing engine of 1,000 h. p. It is expected to shut down during the first week of September for the purpose of connecting and starting the new engine.

ALUMINUM FLAKE.

Typke & King are understood to have made arrangements for distributing this product in the United Kingdom, acting for the Gammeter-Brodbeck Sales Co. of Akron, Ohio.

MACINTOSH CABLE CO.

This new company has been registered in London with a capital of £25,000 for the manufacture and sale of cables, chains, wire or ropes. The directors are Sir Frederick H. Smith, Bt., Frederick M. B. Smith and T. H. M. Harvey.

COMPETITIONS AT NEXT YEAR'S LONDON RUBBER EXHIBITION.

THE fourth International Rubber and Allied Trades Exhibition, to be held in London from June 24 to July 9, 1914, includes a number of highly interesting competitions, a special program of which has been issued.

Among the principal competitions are:

INDIA RUBBER WORLD Trophy: Silver cup, value $1,000, for best process of extracting latex from wild *Hevea, Castilloa* or *Manihot* trees;

"Grenier's Rubber News": Silver trophies, value £50 and £15. Best samples of commercial rubber from Malaya, Java, Sumatra and Indo-China;

Association des Planteurs de Caoutchouc, Antwerp: Silver cup for best sample of plantation rubber grown in Dutch East Indies and Indo-China;

Mincing Lane Tea and Rubber Share Brokers' Association: 75 guineas and 25 guineas. New ideas for use of plantation rubber;

President's Trophy: For most interesting exhibit affecting rubber;

West India Committee Competition: Three silver cups for West India Exhibit;

Rubber Growers' Association: (1) Medals—Best commercial samples of plantation rubber; (2) Gold medal—Best exhibit of plantation rubber; (3) £50 and gold medal—Improvements in plantation rubber; (4) Medals—Exhibit of rubber flooring; (5) Gold medal—Rubber articles for commercial purposes; (6) £50 and gold medal—New applications of plantation rubber.

Planters' Association of Ceylon Diamond Jubilee Competition: Trophy. Samples of commercial rubber.

"India Rubber Journal": £25. Plan and description of rubber estate factory; £25, photographs of factory work.

"Rubber World": Trophies, silver cup and salver—Ideal Rubber Estate; Special trophy, Wild rubber.

"Tropical Life": Gold medal. Best sample *Ceará rubber.*

"Gummi-Welt": Gold medal—Rubber manufacturing machine of German manufacture

Inquiries should be addressed to The Awards Committee, care of A. Staines Manders, 75 Chancery Lane (Holborn), London, W. C., England.

USES OF RUBBER.

Special interest attaches to three of the competitions at the London Rubber Exhibition of 1914, forming Nos. 4, 5 and 6 of the series of six competitions inaugurated by the Rubber Growers' Association.

COMPETITION 4 offers gold, silver and bronze medals for the three best exhibits of rubber flooring in tile or sheet form; open to manufacturers of any country.

COMPETITION 5 offers a gold medal for the greatest variety of articles made from rubber for commercial purposes.

COMPETITION 6 offers a prize of £50 and a gold medal for the discovery and application of each new use for plantation rubber, as may be adjudged the most valuable, special consideration being given to the weight of such rubber which the application is likely to consume.

The scope of these three competitions renders them of special interest to manufacturers.

PRIZES FOR ESSAYS AND PHOTOS.

The "India Rubber Journal," of London, will offer two prizes, to be awarded at the rubber exposition to be held in that city next summer. One prize, of £25, will be offered for the best essay, with diagrams, on rubber estates; and the second, for a like amount, for the best series of photographs of rubber estates.

A NEW RUBBER FROM QUEENSLAND.

READERS will no doubt be interested in a sample received by THE INDIA RUBBER WORLD from Mr. Joseph Campbell, M. A., M. I. M. E., of Cairns, North Queensland, of a rubber extracted by him from a species of Apocynaceous tree, which grows abundantly in and near the North Queensland "scrubs." This, he claims, is the first time wild rubber has been extracted in any quantity in North Queensland.

Rubber planting has been for some time carried on in that state; among others by the Gossypium Park Estates, Limited, of which Mr. Campbell is managing director.

While the company is chiefly interested in the production of cotton, it is engaged to a limited extent in the manufacture of rubber solution and vulcanized sheets; and this fact has caused the members of the company to feel much interested in the general subject of rubber, including both the production of the crude article and its manufacture.

Mr. Campbell's discovery grew out of his work in the laboratory of the company. In his earlier experiments he had used chemically prepared cotton in conjunction with the juices of the trees referred to, but later on he found it was not necessary to do so. His object was to bring about polymerization, on the degree of which the quality of a rubber depends; and by the use of these juices he was able to make three or four different qualities, of which he preserved careful records, being thus in a position to reproduce them at any time.

The rubber made by Mr. Campbell's process has been valued at 3/ per pound, taking the basis of fine hard Pará at 4/2. He estimates that when the company's rubber plantation comes into bearing next year, by mixing his compound with natural rubber latex he can greatly increase the yield. In order to carry his process through the initial stages he has formed a small syndicate. According to Mr. Campbell's report to the London directors of the company, the plantation now approaching the bearing stage includes three acres in *Manihot Dichotoma* and two in *Manihot Glaziovii.* The hurricane of January 30 last put back the trees about six months. He is, however, so satisfied with rubber prospects that he intends bringing the plantation up to 12 acres, ploughing out poor cotton with that end in view.

Queensland has the reputation of extreme fertility, and its needs on the subject of agricultural instruction have been put forward in the present discussion as to the proposed college. As it is understood there are millions of rubber trees in the State, there would seem to be possibility of important results from Mr. Campbell's "Queensland Rubber," provided it has the properties claimed for it, including that of vulcanizing perfectly.

QUEENSLAND AS A SOURCE OF RUBBER.

In a recent press interview Sir Rider Haggard, who has been traveling through Australia and New Zealand on behalf of the Dominion Royal Trade Commission, said the fertility of Queensland was such that he firmly believed there was nothing grown in Ceylon which could not be produced with equal success in that colony. He added that he considered it would be possible to grow rubber in many parts of Queensland, were it not for the labor problem. He added:

"At the present time Queensland is very largely undeveloped, but its wealth is almost unlimited and the natural resources only need the necessary labor to be put into practical use. It is all virgin soil and its fertility is extraordinary."

The principal difficulty as to labor in Australia consists in the objection by the white population to the importation of lowly paid black labor. As a result of the opposition developed, the latter class of workers was all sent out of the country.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude and Compounding Ingredients."

Some Rubber Planting Notes.

THE MALAYAN RUBBER INDUSTRY.

IN view of the present and prospective importance of the Malayan rubber production, special interest attaches to statistics on the subject, lately compiled by Mr. Lawton Brain, Director of Agriculture of the Federated Malay States.

The growth of the industry is shown by the annexed figures:

STATISTICS OF MALAYAN ACREAGE AND YIELD.

Years.	Area under Rubber—acres.	Crop pounds.
1906	99,230	935,056
1907	179,227	2,278,870
1908	241,138	3,339,922
1909	292,035	6,741,509
1910	362,853	14,368,863
1911	542,877	24,904,043
1912	621,621	42,462,401

It will thus be seen that the increase of output has been far in excess of that shown for acreage, representing per acre for 1906 about 10 pounds, for 1911 about 50 pounds, and for 1912 about 70 pounds.

An indication of the growing productiveness of the Malay Peninsula is afforded by the fact that between 1911 and 1912 the acreage increased about 15 per cent. and the number of workers about 12 per cent., while the output showed a gain in quantity of 75 per cent. The value would seem to have advanced from £6,000,000 in 1911 to £9,000,000 in 1912—a rise of 50 per cent. Such a result is evidently due to working the estates up to their productive capacity, and at the same time as far as possible economizing the cost of labor.

The relative importance of the area planted with rubber in the various territorial divisions is shown as follows: Federated Malay States, 399,197 acres; Straits Settlements, 94,263 acres; Johore, 91,827 acres; Kelantan and Kedah, 34,837 acres; Trengganu, 1,497 acres; total, 621,621 acres. About two-thirds of the area thus belongs to the Federated Malay States.

Such are a few salient points of this interesting group of statistics, which has been supplemented by another table, showing the area under cocoanuts to be 60,997 acres, or about one-tenth of that under rubber.

PAHANG RUBBER CO., LTD. (FEDERATED MALAY STATES).

The report of the Waterhouse Co., Ltd., of Honolulu, agents for the Pahang Rubber Co., expresses the belief that the manager's estimate of 140,000 pounds of rubber for this year's crop will easily be attained. Last year's production was 60,138 pounds. Attention is called to the natural advantages possessed by the state of Pahang, which, should the labor question be solved, would render the company's property one of the most productive estates in the Malay Peninsula.

PERAK RUBBER PLANTATIONS, LTD. (FEDERATED MALAY STATES).

The report presented at the recent London meeting of this company, shows that its area is now 2,045 acres, of which 1,299 are cultivated. During 1912, 640 acres were tapped, an average of 5¼ pounds each having been produced by 59,200 trees.

For the year 1912 the cost f. o. b. had been 1*s.* 0 1/2*d.* per pound, as compared with 1*s.* 4½*d.* for the previous year. A still further reduction is looked for in the future.

KUANG RUBBER PLANTATIONS (FEDERATED MALAY STATES).

This company (which is under the control of the Société Financierè des Caoutchoucs) in its report for 1912, states that the crop was 11,822 pounds. A yield of 64,500 pounds is estimated for 1913.

RUBBER IN BRITISH ADMIRALTY CONTRACTS.

On a recent occasion Mr. Denman, M.P., asked a question in the British House of Commons affecting rubber. He inquired from the Secretary to the Admiralty as to whether any contracts with that department stipulated that the rubber used should come from foreign sources, asking that such discrimination should be avoided in future.

In his reply, Dr. Macnamara said that the stipulation as to a particular source was generally removed from Admiralty specifications in 1897, the condition as to the supply of Pará rubber being only retained in the case of some unimportant items.

He added: "Our general stipulation is for pure caoutchouc, irrespective of country of origin, and we will consider whether there are still adequate reasons for the retention of Pará in the few cases referred to."

In a detailed report by Messrs. Clayton Beadle & Stevens, the Rubber Growers' Association has put forward a number of arguments in favor of plantation rubber, emphasizing the contention that manufacturers should have the option of using either variety in Admiralty and other government contracts. It is urged that plantation smoked sheet rubbers not only satisfy the claim for the highest class of material, but that the results obtained are practically the same as those secured with hard Pará. Even if the figures are slightly lower, they satisfy the Admiralty tests.

It is added that as plantation Pará passes the rigorous tests of the English government, there is no reason for its exclusion from specifications, particularly as it is a British-grown product.

COMMITTEE OF RUBBER GROWERS' ASSOCIATION.

A representative committee was recently appointed by the Rubber Growers' Association, London, to investigate the late fall in the price of plantation rubber, as well as to report on the possibility of arriving at some arrangement for protecting the interests of producers.

The committee includes: Mr. Noel Trotter, Sir Edward Rosling, Mr. Arthur Lampard, Mr. Richard Magor and Mr. Herbert Wright.

VALLAMBROSA RUBBER CO., LTD. (FEDERATED MALAY STATES).

An interesting report of this company's business was presented at the ninth ordinary general meeting of shareholders held on August 7. Its position is historical, it being among the oldest—if not in fact the oldest—of the successful eastern companies, and having been registered early in 1904.

The total extent planted under rubber is 3,346 acres, of which 1,767 acres planted before 1910 were tapped during the year ending March 31, 1913, while the remaining 1,579 were planted in 1910, 1911 and 1912, and are not yet in bearing.

Returns of the yields for the last seven years to March 31 show: 1906-7, 156,922 pounds; 1907-8, 225,302 pounds; 1908-9, 272,741 pounds; 1909-10, 371,316 pounds; 1910-11, 411,476 pounds; 1911-12, 409,880 pounds; 1912-13, 426,484 pounds. The total cost of production and sale in 1912-13 was 1*s.* 5.49*d.* per pound, while the net price realized was 3*s.* 10.75*d.* per pound, as compared with 4*s.* 8.12*d.* for the previous year.

Dividends have been for 1906-7, 55 per cent.; 1907-8, 55 per cent.; 1908-9, 80 per cent.; 1909-10, 250 per cent.; 1910-11, 175 per cent.; 1911-12, 130 per cent.; 1912-13, 100 per cent. The rate of dividend in 1909-10 was due to the exceptionally high price of rubber.

Three estates form the property of the company, situated in the Kapar District, Klang, Selangor. Its progress is interesting as showing the operation of an old company.

TITLE FOR MR. ROSLING.

Shortly after his recent arrival in England, Mr. Rosling, so prominently connected with the Ceylon rubber industry, received from the King the title of "Sir Edward Rosling."

BAMBRAKELLY (CEYLON) TEA AND RUBBER CO.

During the financial year ended March 31 last, the yield secured by the above company was 80,003 pounds, as compared with 47,595 pounds for the preceding annual period. The area tapped was 338 acres, the average per acre being thus about 250 pounds.

SIAK (SUMATRA) RUBBER ESTATES, LIMITED.

In order to meet the requirements of their increasing output, the Siak Rubber Estates are putting up a new factory, at an expense of £3,000 ($15,000), the cost of which will be shared by the neighboring Pakan Baroe Estates, Limited. The factory will be the joint property of the two companies, and will have a joint manager and joint medical arrangements; so that the principle of co-operation is fully carried out.

REPLACING TOBACCO BY RUBBER.

In his address at the recent meeting of the Toerangie (Sumatra) Rubber and Produce Estates, Ltd., Mr. C. A. Lampard stated that after harvesting the area now planted with tobacco, it was intended to discontinue that cultivation and to devote attention solely to rubber. The area under the latter is now about 1,260 acres, and it is contemplated to plant a further 800 acres.

DIRECTOR OF RUBBER CULTURE FOR NETHERLANDS INDIES.

According to a report from Medan (Sumatra), the Netherlands Government has decided on appointing a Director of Rubber Culture. His salary will at first equal $280 per month, rising by annual increments to $400 a month.

TANDJONG RUBBER CO. (SUMATRA).

Returns for the twelve months ended June 30, 1913, show for the above company a crop of 217,284 pounds against 34,864 pounds for the corresponding period of 1911-1912.

THE PROSPECT FROM A JAVA COMPANY'S STANDPOINT.

At the recent London meeting of the Djember Rubber Estates, Limited, Mr. H. C. Hadfield, chairman, expressed the opinion that motor traction is only in its infancy. He added that if rubber dropped to 2s. 6d. per pound, it would be a risky matter to equip and send expeditions to the interior of Brazil, which require a large outlay before any rubber can be marketed. He quoted an estimate that Java would soon be able to place rubber on the London market at 1s. per pound, adding that should the price go down to 2s. 6d. the company would still have a very lucrative article to dispose of.

JAVA PARA RUBBER ESTATES, LIMITED.

On the occasion of the London meeting of the Java Pará Rubber Estates, Limited, Major Frank Johnson, the chairman, referred to the generally admitted opinion that Brazil could not produce wild rubber under 3s. per pound. If the article permanently reached that price or less, the production of wild rubber would slowly but surely cease; leaving the world's demands to be met by the product of the plantations. It would then, he added, be a case of the survival of the fittest.

PLANTATION RESULTS PER ACRE.

In addressing the recent London meeting of the British Rubber Estates of Java, Mr. Stanlake Lee, chairman, said that with rubber at its present price, or much less—say 2s. 6d.—the rubber plantation industry would still remain one of the most profitable fields for the investment of capital.

A fair average production, he added, is represented by 400 pounds per acre per annum. At 6d. per pound profit this makes £10; that is, 20 per cent. on a capital of, say, £50 per acre.

RUBBER PLANTATIONS IN THE DUTCH EAST INDIES.

Apropos of the International Congress and Exhibition which are to be held in Java in the Fall of 1914, it is interesting to note the extent of foreign rubber plantations in the Dutch East Indies—which comprise Sumatra, Java, the greater part of Borneo, most of New Guinea and various smaller islands. The foreign capital invested in rubber estates in these islands amounts to $92,000,000, the greater part of which represents British investments. A recent consular report places the amount of American capital invested in rubber plantations in these islands as $4,000,000. This probably is rather an under-estimate and does not take into consideration the large amount of money the United States Rubber Co. has recently put into its 80,000-acre tract in Sumatra.

LAND BANK FOR DUTCH GUIANA.

In its annual report on conditions in Dutch Guiana, the British Legation at the Hague records the fact that the colony had an unsatisfactory year in 1912. The causes assigned for this situation include drought and scarcity of labor, the balata industry being thereby particularly affected.

With a view to affording Surinam agriculturists much needed credit facilities, the establishment of a "Land Bank" has been proposed. This undertaking, it has been hoped, would meet with the support of the Netherlands government, but a measure introduced for that purpose has been defeated in the Dutch Second Chamber.

LOK KAWI RUBBER, LTD. (NORTH BORNEO).

The yearly report of the above company to December 31, 1912, shows a total of 1,685 acres under rubber, with approximately 221,000 trees. It is added that the labor force consists of 307 Chinese.

CASTILLOA PROGRESS IN COSTA RICA.

RUBBER AND BALATA IN BRITISH GUIANA.

AMONG the characteristics of the great tropical forest of the South American continent are its dampness and its luxuriant vegetation. It is in these regions of Brazil that the *Hevea Brasiliensis* grows indigenously, thriving in a humid atmosphere. These features being reproduced in the forest region of British Guiana, it is natural to look to that section as affording facilities for the growth of Pará rubber.

This variety grows best on the flat but well-drained lands along the banks of rivers, as well as upon the lower slopes of hills. An official estimate places at nearly 11,000,000 acres the area of accessible lands in the colony, of which 9,000,000 are as yet not alienated from the Crown. A large part of these lands is considered suitable for Pará rubber, and in order to develop this cultivation the government has established in various districts experimental plantations. The points sought to be ascertained have been the rate of growth, the best cultural methods and the yields of the different trees.

Results of experiments have shown that *Hevea Brasiliensis* grew vigorously in most instances. Experiments were undertaken in 1905 with *Sapium*, the outcome of which was so encouraging that all land now being put into rubber is practically being planted with *Hevea Brasiliensis*.

Figures issued by the Board of Agriculture are instructive. In 1907-8 the total was 416 acres, while in 1911-12 it had increased to 2,259 acres, of which about 1,700 are under Pará rubber and the remainder the indigenous *Sapium*. Owing to the active demand for Pará seedlings it is anticipated that the area under rubber will be greatly increased during the next few years.

SEEDS.

In 1897-1899 several Pará rubber trees were distributed from the Botanic Gardens. These have grown well, and their seeds have been collected and planted, but the colony will for some years have to depend on supplies of seeds from the East for the expansion of rubber cultivation.

Within the last four years more than a quarter of a million seeds have been imported by the government, from which the average germination has been nearly 80 per cent. The plants raised from these seeds have been sold at cost to cultivators. Increased orders have been placed by the government for seeds to meet the larger demands for plants.

TAPPING.

Tapping of Pará rubber has been started at two estates on the Demerara, one in Berbice and at the experimental stations of Onderneming and Issorora, the yields having been reported as satisfactory, and the product of good quality. At Issorora experimental station in the northwestern district, one-fourth of the Pará rubber trees at four years of age were of tappable size.

COST OF CULTIVATION.

On flat lands requiring drainage, the cost, including superintendence and the purchase of plants, represented $65-$70 per acre for the first year, and $25-$30 in subsequent years. On higher ground, where the initial expenses of drainage are less, the first year's cost might be reduced to $48 per acre.

LABOR.

No complaints have been heard of scarcity of labor for the operations of plantation companies, and it is considered that a sufficient supply will be available for the next five years. The opinion has, however, been expressed that, as with the sugar industry, it may be ultimately necessary to obtain indentured labor from the East.

WILD RUBBER.

The indigenous *Sapium* furnishes small quantities of rubber from the forests. This, it is said, has been exported for many years as "Orinoco Scrap." In 1904-5 the exports of rubber were shown separately as 950 pounds. In 1907-8 nearly 7,000 pounds were exported, since which time the quantity has fallen off. It is said that this reduced collection of rubber is due to the higher profits made by collecting balata.

BALATA.

While the development of the British Guiana rubber industry is to a great extent prospective, balata collection has attained a steady position, the average annual yield since 1908 having been about 1,000,000 pounds. For the three preceding quinquennial periods the figures had been:

	Yearly Average. *Pounds.*
1893-1897	226,625
1898-1902	401,956
1903-1907	427,790

Of the quantity produced, the largest proportion goes to the United Kingdom, the share of the United States having been 9 per cent. of the total in 1904-5 and 15 per cent. in 1911-12.

According to the "Handbook of British Guiana, 1913," balata takes the third rank in the exports of the colony. The total annual exports represent about $11,000,000, of which about $7,000,000 consist of sugar, $1,000,000 of gold and nearly $750,000 of balata.

GROWTH OF BALATA.

The balata trees of British Guiana are to be found all over the colony, particularly on the banks of the smaller rivers and creeks in the low-lying lands. They are possibly more abundant in the county of Berlice, where the industry of balata collecting has been established for thirty years, practically all the male population in the Canje district taking part in the work.

With the growing demand for balata its value has increased, and search has been made for the article in the districts of the far interior, notably in the upper reaches of the Essequibo river, from which point some of the best shipments are being received.

TAPPING.

Changes in meteorological conditions considerably affect the yield per tree, the average of one gallon of latex each which they usually give at the first tapping equaling about five pounds of dry balata.

In tapping balata trees, incisions not exceeding 1½ inches in width are made, about 10 inches apart, with a cutlass. The cuts are in a "feather stitch" pattern, going up the trunks. Tapping starts at the base of the tree and at first only reaches a height of 12 to 15 feet, but later on is often conducted as high as the principal branches. A zig-zag course is pursued by the latex from cut to cut, till it reaches a calabash at the base of the tree. From these calabashes it is gathered into gourds or kerosene tins. Being then taken to the camp, it is poured into shallow trays (*dabrees*), with a capacity of five to thirty gallons, where it congeals and from which it is removed in sheets. After being allowed to drain these are hung up in a drying shed, and are forwarded when dry to town for the purpose of transshipment. It takes four to five years for the cuts to heal, and no further tapping is permitted during that time.

The minimum girth at which bleeding is allowed is 36 inches at the height of four feet. Only one-half of the girth may be bled at one time.

Owners of balata grants have to take out licenses for the sections in which they propose to operate. These licenses run for fifteen years, or during the King's pleasure, and do not include any planting rights.

BALATA BLEEDERS.

Balata is collected by black and colored laborers, who are paid according to the quantity gathered, and have to be registered before employment. At that time they usually get money advanced for the purchase of food and implements. After reaching the tract to be worked, a camp of rough leaf-covered huts is constructed, and preparations are made for the collection and congelation of the latex. Small cuts are made in the nearest trees to ascertain their condition and the prospects of their repaying tapping.

Recent Patents Relating to Rubber.

UNITED STATES OF AMERICA.

ISSUED JULY 1, 1913.

No. 1,065,942. Vehicle wheel. F. Hopkinson, East Orange, N. J.
1,065,978. Tire. W. T. Smith, Bolton, England.
1,066,121. Bath apparatus. J. F. King, Milwaukee, Wis.
1,066,210. Tire shoe releasing tool. P. T. Mahon, Cranston, R. I.
1,066,217. Swimming and life preserving belt. M. D. Nekarda, New York.
1,066,268. Combined eraser and brush. A. M. Goldzier, New York.
1,066,381. Foot cushion for sewing machine. R. E. Daniel, Spartanburg, S. C.

Trade Mark.

66,634. Revere Rubber Co., Providence, R. I. The initials *H. C.* Belting, hose and packing, etc.

ISSUED JULY 8, 1913.

1,066,480. Artisan's india-rubber glove. H. C. Finlay, Sydney, New South Wales, Australia.
1,066,516. Life saving suit. J. E. Moore, Nelson, British Columbia, Can.
1,066,524. Garter. B. W. Parker, New York.
1,066,697. Swimming glove. L. M. Baker, Columbus, Ohio.
1,066,759. Elastic cord or strand. M. W. Schloss, New York.
1,066,784. Elastic tire for automobiles. C. W. Barrett, San José, Cal.
1,066,851. Tire protector. T. Y. Stewart, Winnipeg, Manitoba, Can.
1,066,873. Vent for nursing nipples. P. Wisotzky, Frankfort-on-the-Main, Germany.
1,067,012. Eraser. E. Faber, New York.
1,067,051. Atomizer comb. J. J. Moore, South Charleston, Ohio.

Design.

44,298. Rubber vehicle tire. J. Connolly, Detroit, Mich.

Trade Marks.

66,101. Adhesive Vulko-Fiberene Co., Oklahoma, Okla. The words *Vulko-Fiberene* in a disconnected circle. A liquid compound for preventing and stopping leaks in pneumatic tires.
67,467. The Russell Mfg. Co., Middletown, Conn. The word *Rusco.* Woven machine belting.

ISSUED JULY 15, 1913.

1,067,239. Guard for tires. A. W. Crain, Petroleum, Ind.
1,067,307. Vehicle tire. J. Christy, Akron, Ohio.
1,067,337. Hose coupling. H. H. Hewitt, Buffalo, N. Y.
1,067,361. Wheel tire. T. Midgley, assignor to The Hartford Rubber Works Co.—both of Hartford, Conn.
1,067,386. Vehicle wheel. J. J. van Iderstine, Kansas City, Mo.
1,067,497. Vaginal syringe. H. S. Williams, San Diego, Cal.
1,067,507. Antiskidding vehicle wheel tire. M. A. Dees, Pascagoula, Miss., and T. M. Dees, Midlothian, Texas, assignors to American Tire Co., St. Louis, Mo.
1,067,558. Pneumatic tire for vehicle wheels. Jacques Steinberg, Paris, France.
1,067,563. Armored tire. A. G. Wagner, Akron, Ohio.
1,067,639. Resilient tire. W. E. Budd, Elizabeth, N. J.

GREAT BRITAIN AND IRELAND.

PATENT SPECIFICATIONS PUBLISHED.

The number given is that assigned to the Patent at the filing of the application, which in the case of these listed below was in 1911 and 1912.
**Denotes Patents for American Inventions.*

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 2, 1913.]

5,942 (1912). Tread band projections. A. E. Wale, Coleshill, near Birmingham, and Wale's Invulnerable Tyre Syndicate, Broad Street House, London.
5,948 (1912). Rubber protectors for boots. J. A. Redfern, The Cottage, Raglan street, Hyde, Cheshire.
6,081 (1912). Rubber in tire covers. J. B. Salmon and E. W. Roy, 213 Princes street, Dunedin, New Zealand.
6,085 (1912). Anaesthetic inhalers. W. de C. Prideaux, 12 Frederick Place, Weymouth, Dorset.
6,216 (1912). Life belts. C. L. Menzel, Nobby, Queensland, Australia.
6,299 (1912). Synthetic caoutchouc. I. Ostromislensky, and Obstchestvo Proizvodstva and Torgovli Resinovymi Izdeliami "Bogatyr" 15, Miasnitzkaia, Moscow, Russia.
6,300 (1912). Synthetic caoutchouc. I. Ostromislensky, and Obstchestvo Proizvodstva and Torgovli Resinovymi Izdeliami "Bogatyr" 15, Miasnitzkaia, Moscow, Russia.
6,301 (1912). Erythrene and isoprene. I. Ostromislensky, and Obstchestvo Proizvodstva and Torgovli Resinovymi Izdeliami "Bogatyr" 15, Miasnitzkaia, Moscow, Russia.
6,324 (1912). Tire jackets and covers. A. E. Wale, Coleshill, near Birmingham, and E. H. Jones, 318 Euston Road, London.
*6,581 (1912). Improvements in elastic tires. M. Overman, 391 West End avenue, Manhattan, N. Y.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 9, 1913.]

*6,594 (1912). Resilient sections in tires. P. G. Seward, Petersburg, Va., U. S. A.
*6,663 (1912). Tread band surfaces. N. H. Horne, 2511 E. 9th street, Kansas City, Mo., U. S. A.
6,688 (1912). Boot containing strips of rubber. C. M. Hart, The Studio, The Lizard, Cornwall.
*6,734 (1912). Cover of pneumatic tire. C. Orsett, 156 Mount Auburn street, Cambridge, Mass., U. S. A.
6,736 (1912). Rims for beaded edge tires. Margetts International Sectional Tyre Co., 56 Moorgate street, and A. J. M. Smith, Venner Villa, Venner Road, Sydenham—both in London.
6,762 (1912). Two-part rubber tread. G. J. Krol, 76 Boulevard de Versailles, Suresnes, Seine, France.
*6,791 (1912). Fabrics treated with rubber, etc. A. H. Henderson, 2624 North Calvert street, Baltimore, Md., U. S. A.

6,798 (1912). Coating aeroplane fabrics, etc. Ledoc, Heitz & Co., 79 Boulevard du Montparnasse, Paris.

*6,801 (1912). Resilient tires. G. S. Adams, Seaville, and Eureka Double Resilient Tire Mfg. Co., 220 Erie street, Camden—both in New Jersey, U. S. A.

6,877 (1912). Device for catching balls. O. Bischof, 128 Ringbahnstrasse, Berlin-Hallensee.

6,903 (1912). Caoutchouc substances; intermediate compounds. W. H. Perkin, University, Manchester, and F. E. Matthews and E. H. Strange, 7 Maple Inn, London.

7,045 (1912). Studs for football boots. W. W. Moren, 129 Yorkshire street, and H. F. Hart, 174 Horsedge street—both in Oldham, Lancashire.

7,143 (1912). Moulded emergency tire. A. Turnbull, Mungo Works, Bishopbriggs, Glasgow.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 16, 1913.]

*7,298 (1912). Rubber tread in spring tires. G. Gray, Sisseton, South Dakota, U. S. A.

7,333 (1912). Overlapping of inner tubes. Continental-Caoutchouc und Gutta-Percha Cie, Hanover, Germany.

7,392 (1912). Tread band projections. M. A. Kennedy, 18 Bloor street, East, Toronto, Canada.

*7,443 (1912). Suspenders. W. Kops, 16th street, New York, U. S. A.

*7,444 (1912). Elastic webbing. W. Kops, 16th street, New York, U. S. A.

7,457 (1912). Synthetic caoutchouc. Obstchestvo Proizvodstva and Torgovli Resinovymi Izdeliami "Bogatyr" and I. Ostromislensky, 15 Miasnitzkaia, Moscow, Russia.

7,465 (1912). Mud guards. J. T. Catling, 60 Western Road, Plaistow, London.

7,474 (1912). Corsets. J. F. Gems, Bayford House, Lyndhurst Road, Hampstead.

7,509 (1912). Vessels for collecting latex, etc. F. Worthington and W. Hilliers, 27 Mincing Lane, London.

7,512 (1912). Punching balls. W. M. Brooks, Criterion Works, Great Charles street, Birmingham.

7,513 (1912). Wrappers for spare tires. B. Brooks, Criterion Works, Great Charles street, Birmingham.

7,537 (1912). Fastenings for ends of tires. T. Slack, Wellington Works, Stockport, Cheshire.

7,559 (1912). Solution for finishing fabrics. S. Schreiber, 23 Cloth Fair, and M. Semet, 13 Australian avenue—both in London.

7,579 (1912). Detachable tread bands. E. Scott, Cycle Works, Market Place, Wooler, Northumberland.

7,681 (1912). Block tread of rubber. M. Bouchet, 22 Rue Alphonse de Neuville, Paris.

7,751 (1912). Solid rubber tires. L. Brown and C. Macintosh & Co., Cambridge street, Manchester.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 23, 1913.]

7,856 (1912). Air tubes. F. Arnold, Virginia, and W. H. Johnson, Pefferlaw—both in Ontario, Canada.

7,875 (1912). Reservoir shaving brush. E. A. Wixcey, 13a Finsbury Square, London.

*7,884 (1912). Rubber bottle stoppers. H. B. Smith, Bayside, L. I., N. Y., U. S. A.

7,927 (1912). Tapping rubber trees. H. A. Wickham, Royal Colonial Institute, Northumberland avenue, London.

8,065 (1912). Caoutchouc substitute. P. A. Newton, 6 Breams Building, Chancery Lane, London.

8,187 (1912). Backing of rubber in capsuling bottles.

[ABSTRACTED IN THE ILLUSTRATED OFFICIAL JOURNAL, JULY 30, 1913.]

8,215 (1912). Rubber parts in vent pegs. H. Packard, 240 Barkerend Road, and G. Robinson, 244 Barkerend Road—both in Bradford.

*8,241 (1912). Solid rubber tires. J. D. Ingram, Washburn, Texas, U.S.A.

8,259 (1912). Corsets. R. Cownie, Greenbank, Dalrymple Crescent, Edinburgh.

8,309 (1912). Point protectors for pins. D. J. Thomas, Beckett street, Mountain Ash, Glamorganshire.

8,314 (1912). Elastic waistband for ladies' wearing apparel. C. de Lacote, 37 Mark Lane, London.

8,345 (1912). Elastic bandages. G. Haertel, Kommandit-Ges., 1 Ziegelstrasse, Berlin, and G. Haertel, 42 Albrechtstrasse, Breslau, Germany.

8,353 (1912). Securing reserve tires. W. Banner, Brooklands, Branksome Wood Road, Bournemouth, and H. J. Winton, Motor Works, Hill street, Poole, Dorset.

8,361 (1912). Rubber device for locking vehicle wheels. G. R. Lusty, 66 Dean's Way, Gloucester.

*8,374 (1912). Annular cushion tire. A. Steinhauser, 502 Tabor Road, Philadelphia, Pa., U. S. A.

8,402 (1912). Elastic compositions. G. G. Diesser, 513 Seestrasse, Zurich, Switzerland.

8,407 (1912). Pneumatic cushion tire. W. Wunderli, Nanen-Rüti, Canton Zurich, Switzerland.

8,408 (1912). Cow milkers. A. Sabroe, 2 Am Naff, Hadersleben, Schleswig-Holstein, Germany.

*8,413 (1912). Postmarking machines. F. C. Ielfield, 12 Buffalo street, Silver Creek, N. Y., U. S. A.

8,459 (1912). Air balls for measuring skirts. D. K. Stobie, 44 Chiswick street, Brixton, Johannesburg, Transvaal.

8,496 (1912). Rubber balls in tires. W. Freakley, 86 Wellesley street, Shelton, and H. Avnsley, Portland House, Blyth Bridge—both in Stoke-on-Trent.

*8,519 (1912). Improvements in fountain pens. F. W. Howard, 509 West 161st street, New York, N. Y., U. S. A.

8,523 (1912). Rubber-like material from fish. Naamlocze Vennootschap Algemeene Uitvinding Exploitatie Maatschappij, 245 Haarlemmerweg, Amsterdam.

8,554 (1912). Reformed and vulcanized rubber. T. Gare, Bristol Road, Birmingham.

8,597 (1912). Rubber rings in friction gearing. G. P. Otting, 33 Chichester Road, Kilburn, London.

8,610 (1912). Pneumatic cushions for wheels. R. Tickner, 149 Armagh Road, Old Ford Road, Bow, London.

8,621 (1912). Pneumatic tire of felt, etc. S. Jamiolkowski, 21 Przemyslowa, Warsaw, Russia.

8,630 (1912). Preventing the rattling of windows. V. Trevett, 93 Branfield Road, New Wandsworth, London.

8,676 (1912). Extracting rubber from Landolphia and other vines. S. Goldreich, 2 Broad Street Place, London.

8,723 (1912). Separate molding and vulcanizing of tread bands. W. C. Johnson, Broadstone Farm, Colemans Hatch, Sussex.

THE FRENCH REPUBLIC.

PATENTS ISSUED (with Dates of Application).

452,788 (December 31, 1912). J. W. H. Dew and The Azolay Syndicate, Ltd. Improvement in manufacture of covers for pneumatic tires.

452,789 (December 31). J. W. H. Dew and The Azulay Syndicate, Ltd. Improvements in manufacture of solid rubber and other tires.

452,806 (December 31). W. J. Woodcock. Automobile tires.

452,836 (January 3, 1913). J. L. Vincent. Movable tires for motor trucks.

452,893 (January 6). A. Haller. Elastic vehicle wheel.

452,899 (January 6). W. C. Sneyd and D. V. Jones. Repairs to solid elastic tires during progress of vehicles.

452,903 (January 6). Mme. Du Michel. Manufacture of rubber articles.

452,943 (January 7). Mablou and Carnell. Preparation of artificial gums from starchy substances.

452,969 (January 7). T. Goldmeyer. Sectional air chamber for automobiles.

452,916 (January 7). G. Evans. Improvements in movable rubber heels.

453,008 (January 10). M. P. Prince and C. M. Bernheimer. Improvements in sectional pneumatic tires.

453,054 (January 11). Mold for making hollow rubber objects, especially air chambers for pneumatic tires.

453,097 (January 13). Improvements in the manufacture of "gaiters" for repairing pneumatic tires or in the manufacture of tires.

453,199 (January 15). M. D. Rucker. Improvements in elastic tires.

453,323 (January 17). G. Schneider. Skating sole in rubber of special design.

453,215 (January 15). Zieger and Wiegand. Rubber glove for surgical operations.

453,394 (January 20). L. Collardon. Basic substances for rubber.

453,408 (January 21). W. D. McCormack. Elastic vehicle tires.

453,418 (January 21). C. Martin. New rubber composition.

453,513 (January 21). J. T. Sipe and H. E. Sipe. Improvements in elastic wheels.

453,575 (January 25). W. F. Bersley. Vehicle tires.

453,687 (January 27). C. Sougues. Mudguard with elastic suspension and continuous lubrication.

453,747 (January 29). L. Hervé and C. Marchand. Mudguards for vehicle wheels.

453,890 (January 13). G. Frot. Mudguard for automobiles.

453,915 (February 1). R. W. Sampson. Improvements in plugs for repairing perforations in pneumatic tires.

453,908 (February 1). E. H. Grenet. Rubber valve.

[NOTE.—Printed copies of specifications of French patents can be obtained from R. Bobet, Ingenieur-Conseil, 16 avenue de Villiers, Paris, at 50 cents each, postpaid.]

THE GERMAN EMPIRE.

PATENTS ISSUED (with Dates of Validity).

263,398 (November 28, 1912). Stuffing box packing. Wilhelm Strube, G. m. b. H., Madgeburg.

262,956 (January 15, 1911). Cement for bicycle tires. Pneudichtol Gesellschaft, G. m. b. H., Hanover.

263,109 (September 16, 1909). Manufacturers of insoluble masses from phenols and formaldehyde. Dr. Fritz Pollak, Berlin, Nürnbergerstrasse, 67.

262,903 (March 5, 1912). Rubber tubes for pneumatic tires. Hermann Zeumer, Karlsruhe.

262,904 (July 25, 1911). Vulcanizing appliance for repair of rubber tires. Toledo Computing Scale Company, Toledo, U. S. A.

263,174 (October 22, 1912). Rubber tires with cross-borings and cross-grooves. Benjamin Wladimirowitsch, Wittenberg, Riga.

THE FARMER WHO DARNED HIS TIRE.

An exchange has a story about a Kansas farmer whose inner tube gave way and who thought he could take care of the matter without expert assistance. Accordingly—so the story runs—he secured a strip of rubber and a darning needle and thread and proceeded to sew the strip of rubber on the tube over the puncture; but as it still leaked he took it to the agent in town and told him what he thought of it. Whatever else may be said about this particular agriculturist, this certainly is true, that any man who has a blow-out and only darns his tire is a model of moderation.

Report of the Crude Rubber Market.

THE crude rubber market during the last month has been exceedingly quiet. Prices have fluctuated within narrow limits. Buying has been only for present requirements and on a small scale. It is fairly obvious that big interests are not disposed greatly to increase their stocks at present prices; and on the other hand, sellers are not inclined, at present at least, greatly to shade the current quotations. In a general way the trend of prices for the month has been upward. On July 26 (the report in the August issue of THE INDIA RUBBER WORLD covered the month of July up to the 25th) upriver fine sold in London for 3s. 7d., and plantation pale crepe at 2s. 9½d. With various fluctuations, these prices increased to August 16, when upriver fine sold at 3s. 10¾d., and plantation crepe at 2s. 10d. From that point there has been a gradual and slight subsidence, the closing figures on August 27 being 3s. 9½d. for upriver fine and 2s. 8d. for plantation crepe. The month ended with a larger difference between Pará and plantation than was shown a month ago, the difference on July 26 being 9½d., and on August 27 1s. 1½d.

In New York the lowest figures for the period covered was on July 26, when upriver fine was quoted at 86c. to 87c., and plantation crepe at 69 to 70c. The highest figure for upriver fine in this market was 94c., at which price it was quoted on six different days, viz., August 11th and 12th, and from the 16th to the 20th, inclusive. One interesting feature of the local market during the month was the fact that on July 31 islands fine sold at 72c., the lowest figure for this grade in some years.

The auction sales in London developed nothing particularly exciting. At the fortnightly sale, held on July 29, there were moderate offerings of about 650 tons, which did not affect prices appreciably. At the auction four weeks later (that was on the 26th of August) 1,000 tons of plantation grades were offered, but only 400 tons were sold, smoked sheets selling at 2s. 9d., while pale crepe opened at 2s. 7¾d., and later declined to 2s. 7¼d.

Below is a brief table showing the prices for upriver fine and plantation crepe at the closing (as given in this publication) for the last five months, together with the difference in price between these two grades of rubber:

	Upriver Fine	Plantation	Difference.
April 26	3s. 4½d.	3s. 2½d.	2d.
May 26	3s. 8½d.	3s. 2½d.	6d.
June 25	3s. 8¾d.	2s. 11d.	9¾d.
July 26	3s. 7d.	2s. 9½d.	9½d.
August 27	3s. 9½d.	2s. 8d.	1s. 1½d.

New York.

In regard to the financial situation, Albert B. Beers (broker in crude rubber and commercial paper, No. 68 William street, New York) advises as follows: "During August the market conditions regarding commercial paper have continued just about the same as in July, the demand being light and principally from out-of-town banks, with rates 6@6¼ per cent. for the best rubber names and 6½@6¾ per cent. for those not so well known.

WM. WRIGHT & CO., Brokers.

Liverpool, 5th August, 1913.

During the month 170 tons, including 50 tons Caucho, have been shipped from Europe to America.

Liverpool.

WILLIAM WRIGHT & Co. report [August 1.]

Fine Pará.—The market has been dull owing to the high prices ruling for the near positions, distant offers at a decided discount but buyers holding aloof. Prices have declined somewhat, but the tone at the close is firm. Receipts are larger than last year, but the increase is in Caucho, being 2,160 tons, including 730 tons Caucho, against 2,100 tons last month, and 1,940 last year, showing a decrease of 40 tons in Rubber and an increase of 260 tons in Caucho.

Plantation Rubber From the Far East.

EXPORTS OF CEYLON-GROWN RUBBER.

(From January 1 to July 28, 1913. Compiled by the Ceylon Chamber of Commerce.)

	1912.	1913.
To Great Britain ..... *pounds*	3,460,030	6,376,151
To United States	1,904,536	3,627,080
To Belgium	615,834	1,831,354
To Australia	104,874	303,049
To Germany	91,819	124,449
To Canada	16,065	.....
To Japan	15,154	132,051
To Austria	12,563	26,716
To Italy	5,885	36,507
To Holland	2,282	992
To France	1,120	.....
To India	100	881
To Norway and Sweden	39	.....
To Straits Settlements	.....	20,064
Total	6,230,301	12,479,294

(Same period 1911, 2,754,085; same 1910, 1,489,878.)

The export figures of rubber for 1913 given in the above table include the imports re-exported, viz., 1,102,718 pounds. To arrive at the approximate quantity of Ceylon rubber exported for 1913 to date, deduct this quantity from the total exports. In previous years the exports of Ceylon rubber only were given.
